DAYLIGHT RESPONSIVE CONTROL. A device or system that provides automatic control of electric light levels based on the amount of daylight in a space.

GENERAL LIGHTING. Lighting that provides a substantially uniform level of illumination throughout an area. General lighting shall not include decorative lighting or lighting that provides a dissimilar level of illumination to serve a specialized application or feature within such area.

OCCUPANT SENSOR CONTROL. An automatic control device or system that detects the presence or absence of people within an area and causes lighting, equipment or appliances to be regulated accordingly.

TIME SWITCH CONTROL. An automatic control device or system that controls lighting or other loads, including switching off, based on time schedules.

Revise as follows:

SECTION 1008 MEANS OF EGRESS ILLUMINATION

1008.1 Means of egress illumination. Illumination shall be provided in the *means of egress* in accordance with Section 1008.2. Under emergency power, means of egress illumination shall comply with Section 1008.3.

1008.2 Illumination required. The *means of egress* serving a room or space shall be illuminated at all times that the room or space is occupied.

Exceptions:

1. Occupancies in Group U.
2. *Aisle accessways* in Group A.
3. *Dwelling units* and *sleeping units* in Groups R-1, R-2 and R-3.
4. *Sleeping units* of Group I occupancies.

~~**1008.3**~~**1008.2.1** ~~**Emergency**~~**Illumination power** ~~**for illumination**~~**supply.** The power supply for means of egress illumination shall normally be provided by the premises' electrical supply.

Add new text as follows:

1008.2.1.1 Lighting controls. General lighting in the means of egess shall be permitted to use daylight responsive controls, occupant sensor controls and time switch controls. In rooms and spaces where emergency lighting is required in Sections 1008.3, 1008.3.1 and 1008.3.2, the lighting controls for the general means of egress lighting shall comply with all of the following:

1. The daylight responsive controls, occupant sensor controls and time switch controls are listed and evaluated to automatically energize the controlled lights upon device failure or loss of normal power.
2. For occupant sensor controls, the control is activated by any occupant movement in the area served by the controlled lights and illumination timers are set for a durations of 15 minutes minimum.
3. A daylight responsive control or occupant sensor control does not control lights required as a charging source for photoluminescent egress path markings in accordance with Section 1025.
4. A daylight responsive controls, occupant sensor controls or time switch controls does not control electrical power to, or illumination for exit signs in accordance with Section 1013.
5. A daylight responsive controls, occupant sensor controls or time switch controls does not control emergency egress lighting required in Section 1008.3.

Revise as follows:

~~**1008.2.1**~~**1008.2.2 Illumination level under normal power.** The *means of egress* illumination level shall be not less than 1 footcandle (11 lux) at the walking surface.

Exception: For auditoriums, theaters, concert or opera halls and similar assembly occupancies, the illumination at the walking surface is permitted to be reduced during performances by one of the following methods provided that the required illumination is automatically restored upon activation of a premises' fire alarm system:

1. Externally illuminated walking surfaces shall be permitted to be illuminated to not less than 0.2 footcandle (2.15 lux).
2. Steps, landings and the sides of ramps shall be permitted to be marked with self-luminous materials in accordance with Sections 1025.2.1, 1025.2.2 and 1025.2.4 by systems listed in accordance with UL 1994.

~~1008.2.2~~<u>1008.2.3</u> Exit discharge. In Group I-2 occupancies where two or more exits are required, on the exterior landings required by Section 1010.6.1, means of egress illumination levels for the exit discharge shall be provided such that failure of any single lighting unit shall not reduce the illumination level on that landing to less than 1 footcandle (11 lux).

~~1008.3.1~~<u>1008.3</u> ~~General~~<u>Illumination of the means of egress under emergency power</u>. In the event of power supply failure in rooms and spaces that require two or more means of egress, an emergency electrical system shall automatically illuminate all of the following areas:

1. *Aisles*.
2. *Corridors*.
3. *Exit access stairways* and *ramps*.

~~1008.3.2~~<u>1008.3.1</u> Buildings. In the event of power supply failure in buildings that require two or more *means of egress*, an emergency electrical system shall automatically illuminate all of the following areas:

1. *Interior exit access stairways* and *ramps*.
2. *Interior* and *exterior exit stairways* and *ramps*.
3. *Exit passageways.*
4. Vestibules and areas on the level of discharge used for *exit discharge* in accordance with Section 1028.1.
5. Exterior landings as required by Section 1010.1.6 for *exit doorways* that lead directly to the e*xit discharge*.

~~1008.3.3~~<u>1008.3.2</u> Rooms and spaces. In the event of power supply failure, an emergency electrical system shall automatically illuminate all of the following areas:

1. Electrical equipment rooms.
2. Fire command centers.
3. Fire pump rooms.
4. Generator rooms.
5. Public restrooms with an area greater than 300 square feet (27.87 m^2).

~~1008.3.4~~<u>1008.3.3</u> Duration<u> and controls</u>. The emergency power system shall provide power for a duration of not less than 90 minutes and shall consist of storage batteries, unit equipment or an on-site generator. <u>Lights for the emergency illumination of the means of egress shall not be controlled by daylight responsive controls, occupant sensor controls or time switch controls. </u>The installation of the emergency power system shall be in accordance with Section 2702.

~~1008.3.5~~<u>1008.3.4</u> Illumination level under emergency power. Emergency lighting facilities shall be arranged to provide initial illumination that is not less than an average of 1 footcandle (11 lux) and a minimum at any point of 0.1 footcandle (1 lux) measured along the path of egress at floor level. Illumination levels shall be permitted to decline to 0.6 footcandle (6 lux) average and a minimum at any point of 0.06 footcandle (0.6 lux) at the end of the emergency lighting time duration. A maximum-to-minimum illumination uniformity ratio of 40 to 1 shall not be exceeded. In Group I-2 occupancies, failure of any single lighting unit shall not reduce the illumination level to less than 0.2 foot-candle (2.2 lux).

SECTION 1013 EXIT SIGNS

1013.6.3 Power source. Exit signs shall be illuminated at all times<u>. Lights for the illumination of exit signs and the electrical power to the exit signs shall not be controlled by daylight responsive controls, occupant sensor controls or time switch controls</u>. To ensure continued illumination for a duration of not less than 90 minutes in case of primary power loss, the sign illumination means shall be connected to an emergency power system provided from storage batteries, unit equipment or an on-site generator. The installation of the emergency power system shall be in accordance with Chapter 27.

Exceptions:

1. *Approved* exit sign illumination means that provide continuous illumination independent of external power sources for a duration of not less than 90 minutes, in case of primary power loss, are not required to be connected to an emergency electrical system.
2. Group I-2 Condition 2 exit sign illumination shall not be provided by unit equipment battery only.

SECTION 1025 LUMINOUS EGRESS PATH MARKINGS

1025.5 Illumination. Where *photoluminescent* exit path markings are installed, they shall be provided with not less than 1 footcandle (11 lux) of illumination for not less than 60 minutes prior to periods when the building is occupied and continuously during occupancy.<u> Lighting that is the charging source for photoluminescent egress path markings shall not be controlled by daylight responsive controls or occupant sensor controls.</u>

Reason: The entire Section 1008 is being shown so that the reorganization for means of egress lighting sections and references are clear. The four definitions match those currently in the IECC for these types of controls.
The proper operation of (electrical) general lighting used to provide minimum illumination in the means of egress must not be compromised when operated under normal electrical power. In areas where emergency lighting is installed – aisles, corridors, exit access stairways and

ramps – the need for reliable (electrical) general lighting and electrical emergency lighting cannot be overestimated. This proposal seeks to impose minimum listing, testing and performance requirements on lighting controls if they are used in the means of egress in areas where electrical emergency lighting are required.

The overwhelming majority of emergency evacuations take place when the (electrical) general lighting is operating properly – providing a minimum of 1 ft-c of illumination when measured at floor level. In areas of the means of egress where (electrical) emergency lighting is required to be installed and maintained, these luminaires provide safe illumination during emergency evacuations. Proper illumination in exit stairs and exit access corridors has been shown to be so valuable to safe egress during emergency evacuations that code authorities now require (non-electrical) luminous egress path markings in the exit stairs of high rise buildings. Some local jurisdictions also require luminous egress path markings installed at the perimeter of exit passageways in public buildings, schools, healthcare facilities and hotels.

Lighting controls – daylight responsive controls, occupant sensor controls and time switch controls - currently installed in the areas of the means of egress of some buildings where electrical emergency lighting is required to be installed and maintained - are being used to reduce illumination levels below 1 footcandle at the walking surface when normal electrical power is available. If the egress capacity of a specific means of egress is required during periods of reduced or completely powered off illumination, the building owner is creating an unsafe condition. Worse, if the lighting controls fail to operate properly during an emergency evacuation, the remaining egress capacity may not be sufficient to safely and quickly evacuate the building.

To meet code requirements, the building owner should maintain minimum illumination levels where electrical emergency lighting is required to be installed and maintained at all times the specific means of egress is required, or he should use lighting control devices that meet the conditions above. The proper operation of emergency lighting must not be compromised when operated under normal power. Lighting controls and occupancy sensors currently installed in the means of egress of some buildings are causing the improper activation of emergency lighting when normal electrical power is still available. Although these lighting controls are likely improperly installed, there should be specific language in the building and fire codes that this is not allowed. In other facilities, lighting controls on luminaires used for emergency illumination in the means of egress control illumination levels during operation with normal power. In these buildings, there should be emergency luminaires in the means of egress without lighting controls or occupancy sensors to provide the minimum illumination levels required under emergency power.

The Commercial Energy Chapter of the IEC 2015 specifies the use of various lighting controls and interior lighting power allowances for commercial buildings. Paragraph C405.2 Lighting Controls (Mandatory) states that lighting controls are not required in areas required to be continuously illuminated, interior exit stairways, interior exit ramps and exit passageways. Yet, lighting controls are increasingly installed in these areas. Additionally, it is commonly thought that the requirement for these lighting controls is to power off the general lighting in these areas. The IEC allows for the dimming of lights. Minimum illumination levels required by the IBC 2015 and IFC 2015 in the means of egress can be easily accomplished with dimming controls.

There is NO specific code requirement that prohibits the use of lighting controls on electrical emergency lighting or electrical exit signs. There is NO specific code requirement the prohibits the use of lighting controls on (electrical) general lighting - where electrical emergency lighting is required to be installed and maintained - that might affect the normal operation of electrical emergency lighting or electrical exit signs. There is NO specific code requirement in Section 1008 Means of Egress Illumination that qualifies the use of lighting controls used to control general lighting in the means of egress – areas such as rooms and spaces where emergency lighting is required. There is NO specific code requirement for the use of lighting controls used to control (electrical) general lighting where photoluminescent egress path markings are installed.

Cost Impact: Will not increase the cost of construction
There should be no additional cost to the building owner. This proposal suggests that lighting controls – daylight responsive controls, occupant sensor controls and time switch controls - should not be used to save energy and money at the expense of life safety.
Traditionally, building and fire codes have required continuous and minimum illumination in the means of egress, for reasons of life safety. During periods when normal electrical power operates properly, this minimum illumination level is 1 ft-candle when measured at the walking surface. For periods when normal electrical power fails and emergency electrical power sources ONLY are available, the average illumination is 1 ft-c with a minimum of 0.6 ft-c along the path of egress where electrical emergency lighting is required to be installed and maintained. Power for electrically powered emergency lighting and exit signs is required to maintain required illumination levels for at least 90 minutes after the failure of (electrical) general lighting.

BARLOW4492

E 32-15

1008.2.2, 1008.3.5; (IFC[BE] 1008.2.2, 1008.3.5)

Proponent: John Williams, CBO, CBO, Chair, Adhoc Healthcare Committee, representing Adhoc Health Care Committee (AHC@iccsafe.org); Carl Baldassarra, P.E., FSFPE, Chair, Code Technology Committee, representing Code Technology Committee (CTC@iccsafe.org)

2015 International Building Code

Revise as follows:

1008.2.2 Exit discharge. In Group I-2 occupancies where two or more exits are required, on the exterior landings required by Section 1010.6.1, means of egress illumination levels for the exit discharge shall be provided such that failure of any single ~~lighting unit~~bulb or ballast shall not reduce the illumination level on that landing to less than 1 footcandle (11 lux).

1008.3.5 Illumination level under emergency power. Emergency lighting facilities shall be arranged to provide initial illumination that is not less than an average of 1 footcandle (11 lux) and a minimum at any point of 0.1 footcandle (1 lux) measured along the path of egress at floor level. Illumination levels shall be permitted to decline to 0.6 footcandle (6 lux) average and a minimum at any point of 0.06 footcandle (0.6 lux) at the end of the emergency lighting time duration. A maximum-to-minimum illumination uniformity ratio of 40 to 1 shall not be exceeded. In Group I-2 occupancies, failure of any single ~~lighting unit~~bulb or ballast shall not reduce the illumination level to less than 0.2 foot-candle (2.2 lux).

Reason: The proposed language would better define what constitutes a failure of a lighting unit.

The ICC Ad Hoc Committee on Healthcare (AHC) has just completed its 4th year. The AHC was established by the ICC Board to evaluate and assess contemporary code issues relating to hospitals and ambulatory healthcare facilities. This is a joint effort between ICC and the American Society for Healthcare Engineering (ASHE), a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. Information on the AHC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the AHC effort can be downloaded from the AHC website at: http://www.iccsafe.org/cs/AHC/Pages/default.aspx.

The ICC Code Technology Committee (CTC) has just completed its 10th year. The ICC Board has decided to sunset the CTC. The sunset plan includes re-assigning many of the CTC Areas of Study to the applicable Code Action Committee (CAC). The two remaining CTC Areas of Study are Care Facilities and Elevator Lobbies/WTC Elevator issues. This proposal falls under the Care Facilities Area of Study. Information on the CTC, including: the sunset plan; meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the CTC website at: http://www.iccsafe.org/cs/CTC/Pages/default.aspx.

Cost Impact: Will not increase the cost of construction
This is a clarification of requirements; therefore there is no change in construction cost.

E 32-15 : 1008.2.2-WILLIAMS4242

E 33-15

1008.2.2, 1008.2.3 (New); (IFC[BE] 1008.2.2, 1008.2.3 (New))

Proponent: Daniel Nichols, New York State Division of Building Standards and Codes, representing New York State Division of Building Standards and Codes (dnichols@dos.state.ny.us)

2015 International Building Code

Revise as follows:

1008.2.2 ~~**Exit discharge.**~~**Group I-2.** In Group I-2 occupancies where two or more exits are required, on the exterior landings required by Section 1010.6.1, means of egress illumination levels for the exit discharge shall be provided such that failure of any single lighting unit shall not reduce the illumination level on that landing to less than 1 footcandle (11 lux)..

Add new text as follows:

1008.2.3 Exit Discharge.
Illumination shall be provided along the path of travel for the exit discharge from each exit to the public way.

> **Exceptions:** Illumination for the exit discharge is not be required to the public way when the path of the exit discharge meets all of the following requirements:

1. The path of exit discharge is illuminated from the exit for a travel distance of 50 feet (15 240 mm) minimum or a distance of 1.5 times the total building height, whichever is greater.
2. A dispersal area shall be provided with all the following:
   - 2.1. The dispersal area is illuminate.
   - 2.2. The area is sized to accommodate not less that 5 square feet (0.46 m^2) for each person using the exit discharge and wheelchair spaces in accordance with Section 1009.6.3.
   - 2.3. The dispersal area shall be located on the same lot and located at the end of the illuminated path of exit discharge.
   - 2.4. The area is permenantly maintained and identified as an illuminated dipersal area.
   - 2.5. The area shall be provided with a safe and unobstructed path of travel from the building.

Reason: The purpose of this code change proposal is to limit the amount of light required for safe exiting from a building. On large parcels and when buildings are construted on existing private campuses (i.e. business parks, college/university), the need to provide required lighting to the public way can be significant. In such locations, it is appropriate to provide a termination of illumination requirements (both continuous and emergency) at a safe distance from the building requiring egress.
IBC Section 1028.5 already permits the use of a safe dispersal area when access to a public way is cannot be provided. This proposal builds off of the same requirements found in 1028.5 to create a termination point of illumination without the requirement of not having access to a public way. The only two changes to the safe dispersal area is the addition of the wheelchair spaces to the total termination area sizing (matching the size and ratio of spaces from the area of refuge requirements) and the addition of a 150% safety factor to address buildings over 35 feet tall.

With an increased concern about energy usage and light pollution in some communities, having appropriate safeguards within the code that address building occupant safety and ways to minimize required illuminiation is mutually beneficial.

Cost Impact: Will not increase the cost of construction
The allowed reduction in illumination will provide a reduction in cost of construction since illumination requirements will be limited. This applies to both illuminiation provided under normal power and emergency power.

E 33-15 : 1008.2.2-NICHOLS5480

E 34-15

1009.1; (IFC[BE] 1009.1)

Proponent: Gene Boecker, representing Code Consultants, Inc. (geneb@codeconsultants.com)

2015 International Building Code

Revise as follows:

1009.1 Accessible means of egress required. Accessible *means of egress* shall comply with this section. *Accessible* spaces shall be provided with not less than one accessible *means of egress*. Where more than one *means of egress* are required by Section 1006.2 or 1006.3 from any *accessible* space, each *accessible* portion of the space shall be served by not less than two accessible *means of egress*.

Exceptions:

1. Accessible *means of egress* ~~are not required to~~ in existing buildings shall be provided in ~~existing buildings~~compliance with the *International Existing Building Code*.
2. One accessible *means of egress* is required from an *accessible mezzanine* level in accordance with Section 1009.3, 1009.4 or 1009.5.
3. In assembly areas with ramped *aisles* or stepped *aisles*, one accessible *means of egress* is permitted where the *common path of egress travel* is *accessible* and meets the requirements in Section 1029.8.

Reason: This blanket exception should be removed from the IBC for two reasons. First, with the change to Chapter 34 of the IBC during the last code change cycle, all existing buidling requirements are now located in the IEBC. Exception 2 to IEBC Section 410.6 and exception 2 to IEBC Section 705.1 already contain this language, so it is simply redundant to be placed in the IBC. Second, the excpetion has been misused as a reason for eliminating existing accessible means of egress. Buildings which have been constriucted since the adoption of the accessible means of egress provisions in the IBC (and some legacy codes) should be required to maintain these accessible means of egress elements and sectinos within the IEBC support that concept. By making a blanket statement in the IBC that they are simply not requried because the buidling is "existing" can be construed as meaning that the accessible means of egress are no longer needed. This confusion should be removed from the IBC and allow the IEBC to note how this is supposed to be addressed in existing buidlings.

Cost Impact: Will not increase the cost of construction
The proposal changes nothing except where the references are to be found.

E 34-15 : 1009.1-BOECKER5614

E 35-15

1009.1 (IFC[BE] 1009.1)

Proponent: Edward Kulik, Chair, representing Building Code Action Committee (bcac@iccsafe.org)

2015 International Building Code

Revise as follows:

1009.1 Accessible means of egress required. Accessible *means of egress* shall comply with this section. *Accessible* spaces shall be provided with not less than one accessible *means of egress*. Where more than one *means of egress* are required by Section 1006.2 or 1006.3 from any *accessible* space, each *accessible* portion of the space shall be served by not less than two accessible *means of egress*.

Exceptions:

1. Accessible *means of egress* are not required to be provided in existing buildings.
~~2.~~ ~~One accessible *means of egress* is required from an *accessible mezzanine* level in accordance with Section 1009.3, 1009.4 or 1009.5.~~
2. In assembly areas with ramped *aisles* or stepped *aisles*, one accessible *means of egress* is permitted where the *common path of egress travel* is *accessible* and meets the requirements in Section 1029.8.

Reason: Section 1009.1 Exception 2 should be deleted.
When originally proposed there was a conflict between accessible means of egress and mezzanine requirements. Accessible means of egress would have required mezzanines in non-sprinklered buildings to have two enclosed stairways with areas of refuge, wider stairways and two-way communication. Mezzanine requirements allowed for two open stairways. Requiring one enclosed stairway and one open stairway for an accessible mezzanine was considered a compromise.

The concept of where open stairways can serve as part of a means of egress has evolved. Mezzanine stairways are now specifically addressed in Section 1009.3 Exception 1. The proposed deletion in Section 1009.1 would make mezzanine requirements consistent with the accessible means of egress requirements for a two story building. For non-sprinklered buildings, both stairways would need to meet the 48" width provisions so that both stairways could be utilized for assisted rescue; but at the same time allow for both stairways to be open. For sprinklered buildings, due to the exceptions in Section 1009.3, the required stairway widths can remain 36"or 44" as applicable. The end result will be a clarification of the codes and an increase in options for assisted rescue; at the same time a decrease in construction costs from what would have been required under previous codes.

With Section 1009.1 Exception 2 removed, this will increase the level of safety for persons with disabilities and fire fighters because two options for accessible means of egress will be provided.

In July/2014 the ICC Board decided to sunset the activities of the Code Technology Committee (CTC). This is being accomplished by re-assigning many of the CTC Areas of Study to the applicable Code Action Committee (CAC). This proposal falls under the CTC Area of Study entitled Unenclosed Exit Stairs. Information on the CTC, including: the sunset plan; meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the CTC website.http://www.iccsafe.org/cs/CTC/Pages/default.aspx

This public proposal is submitted by the ICC Building Code Action Committee (BCAC). The BCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the BCAC has held 13 open meetings and numerous workgroup calls which included members of the BCAC as well as any interested party to discuss and debate the proposed changes and the public comments. Related documentation and reports are posted on the BCAC website at: http://www.iccsafe.org/cs/BCAC/Pages/default.aspx.

Cost Impact: Will not increase the cost of construction
This proposal offers design options that can reduce overall costs.

E 35-15 : 1009.1-KULIK3643

E 36-15

1009.2; (IFC[BE] 1009.2)

Proponent: Gene Boecker, representing Code Consultants, Inc. (geneb@codeconsultants.com)

2015 International Building Code

Revise as follows:

1009.2 Continuity and components. Each required accessible *means of egress* shall be continuous to a *public way* and shall consist of one or more of the following components:

1. *Accessible routes* complying with Section 1104.
2. *Interior exit stairways* complying with Sections 1009.3 and 1023.
3. *Exit access stairways* complying with Sections 1009.3 and 1019.3 or 1019.4.
4. *Exterior exit stairways* complying with Sections 1009.3 and 1027 and serving levels other than the *level of exit discharge*.
5. Elevators complying with Section 1009.4.
6. Platform lifts complying with Section 1009.5.
7. *Horizontal exits* complying with Section 1026.
8. *Ramps* complying with Section 1012.
9. *Areas of refuge* complying with Section 1009.6.
10. Exterior areas for assisted rescue complying with Section 1009.7 serving exits at the *level of exit discharge*.

Exception: In existing buildings, the components shall comply with the applicable sections within the *International Existing Building Code.*

Reason: The added exception to Section 1009.2 makes it clear that if an acessible means of egress is provieded within an existing building, the components acceptable for the accessible means of egress are the components acceptable according to the IEBC. For example, the ramp slope is permitted to be steeper for short rises to meet the access requirements of the IEBC. Thos esame elements should be allowed to be used for the accessible egress. It makes no sense to allow a slope of 1:8 for a 3 inch vertical rise for access to a space but then requrie a 1:12 slope if that is to be a part of the accessible means of egress. If the ramp is good for access it should be good for egress.

IEBC 410.8.5 Ramps. Where slopes steeper than allowed by Section 1012.2 of the International Building Code are necessitated by space limitations, the slope of ramps in or providing access to existing facilities shall comply with Table 410.8.5.

TABLE 410.8.5
RAMPS

SLOPE	MAXIMUM RISE
Steeper than 1:10 but not steeper than 1:8	3 inches
Steeper than 1:12 but not steeper than 1:10	6 inches

Cost Impact: Will not increase the cost of construction
Using the IEBC provisions will not increase costs. It may decrease costs.

E 36-15 : 1009.2-BOECKER5669

E 37-15

1009.2

Proponent: Edward Kulik, Chair, representing Building Code Action Committee (bcac@iccsafe.org)

Revise as follows:

1009.2 Continuity and components.
Each required accessible *means of egress* shall be continuous to a *public way*. The accessible means of egress shall provide a path of travel along an accessible route in accordance with Section 1009.2.1 through 1009.2.3. ~~*and shall consist of one or more of the following components:*~~

1. ~~*Accessible routes* complying with Section 1104.~~
2. ~~*Interior exit stairways* complying with Sections 1009.3 and 1023.~~
3. ~~*Exit access stairways* complying with Sections 1009.3 and 1019.3 or 1019.4.~~
4. ~~*Exterior exit stairways* complying with Sections 1009.3 and 1027 and serving levels other than the *level of exit discharge.*~~
5. ~~Elevators complying with Section 1009.4.~~
6. ~~Platform lifts complying with Section 1009.5.~~
7. ~~*Horizontal exits* complying with Section 1026.~~
8. ~~*Ramps* complying with Section 1012.~~
9. ~~*Areas of refuge* complying with Section 1009.6.~~
10. ~~Exterior areas for assisted rescue complying with Section 1009.7 serving exits at the *level of exit discharge.*~~

Add new text as follows:

1009.2.1. Accessible exit access. The path of travel for exit access shall be along an accessible route and shall consist of one or more of the following components:

1. Accessible routes complying with Section 1104
2. Platform lifts complying with Sections 1009.5 and 1109.7.
3. Ext access ramps complying with Section 1012.

Exception: Exit access stairways between stories and mezzanines and complying with Section 1009.3 and complying with either Section 1019.3 or 1019.4.

1009.2.2 Accessible exits. The path of travel within the exit shall be along an accessible route.

Exceptions:

1. Interior exit stairways complying with Sections 1009.3 and 1023.
2. Exterior exit stairways complying with Section 1009.3 and 1027 and serving levels other than the level of exit discharge.
3. Elevators complying with Section 1009.4 and 1109.6.
4. Exterior areas of assisted rescue complying with Sectin 1009.7 serving exits at the level of exit discharge.

1009.2.3 Accessible exit discharge. At the level of exit discharge the path of travel for the exit discharge shall be along an accessible route connecting the exit to the public way.

Exceptions:

1. The accessible route connects to an exterior area for assisted rescue complying with Section 1009.7.
2. The accessible route connects to an area of refuge complying with Section 1009.6.
3. The accessible route connects to a safe dispersal area in accordance with the exception to Section 1028.5.

Reason: This public proposal is submitted by the ICC Building Code Action Committee (BCAC). The BCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the BCAC has held 13 open meetings and numerous workgroup calls which included members of the BCAC as well as any interested party to discuss and debate the proposed changes and the public comments. Related documentation and reports are posted on the BCAC website at: http://www.iccsafe.org/cs/BCAC/Pages/default.aspx.
It is not the intent of this proposal to change the requirements for accessible means of egress, but rather to clarify what is expected. This is also updated with new terminology for exit access stairways and ramps.

Ideally everyone should be able to self-evacuate to a public way. However, there are many situations where people who cannot use stairways are on upper floors of buildings; or situations where the slope and size of the site does not allow for an accessible route all the way to a road that is permanently deeded and dedicated to the public (i.e., public way). The primary safety focus is to allow for an accessible route to a location where persons needing assistance and emergency responders can connect. These locations are part of the fire and safety evacuation plans and on building signage so both occupants and emergency responders will be informed.

All the exceptions are in recognition that an accessible route is not possible in some situations. Where a person with mobility impairment gets to a stairway, an elevator that has gone to fire department recall, or an exit discharge that is not accessible, alternative means of rescue or protection must be available. Protection and/or assistance is provided at stairways, elevators with standby power, horizontal exits, areas of refuge and exterior areas for assisted rescue. This is not an exception for access to the public way. This is an exception for an accessible route along the stairway or from the exterior area of assisted rescue. Elevators will be used with fire-department assistance - and are not permitted for self-evacuation during a fire emergency. Horizontal exits also allow for a safe place to wait within a facility till the fire department or other emergency responders can assist.

The following is the purpose of each subsection.

1009.2 - All means of egress must be continuous to a public way. If this route is accessible, than this would constitute an accessible means of egress.

1009.2.1 - Exit access is defined as –

EXIT ACCESS. That portion of a *means of egress* system that leads from any occupied portion of a building or structure to an *exit*.

The exit access is always required to be accessible. The three items listed are in the current text as Items 1, 6 and 8. If a platform lift is utilized, it has to have battery backup (1009.5) as well as meet the ASME A18.1 safety provisions (1109.7). This route can include exit access ramps. The exception, exit access stairways are listed in the current text as Item 3. The clarification of the exit access stairways only being allowed as part of the accessible means of egress when the serve changes in level of a story or from a mezzanine is consistent with Section 1009.3. Exit access steps within the same level are not permitted to serve as part of the accessible means of egress. Ramps or platform lifts would be required to provide an accessible means of egress.

1009.2.2 - Exit is defined as –

EXIT. That portion of a *means of egress* system between the *exit access* and the *exit discharge* or *public way*. Exit components include exterior exit doors at the *level of exit discharge*, *interior exit stairways* and *ramps*, *exit passageways*, *exterior exit stairways* and *ramps* and *horizontal exits*.

Accessible routes along exits could be exit passageways, exit ramps, exterior exit doorways at the level of exit discharge and horizontal exits (current item 7). Since this list is in the definition, it does not need to be repeated in the text. The exceptions are where people who cannot use the stairways to evacuation can wait for assistance; exit stairways (interior and exterior) and elevators with standby power. Areas of refuge (Item 9) are not listed because they are a requirement directly associated with the exit stairway or elevators in Sections 1009.3 and 1009.4. Depending on their location, they could be part of the exit access or exit. Listing them in both places would be confusing.

1009.2.3 - Exit discharge is defined as –

EXIT DISCHARGE. That portion of a *means of egress* system between the termination of an *exit* and a *public way*.

The accessible route at the level of exit discharge is along the exit discharge can include ramped or level surfaces outside the building. If an accessible route is not possible to the public way, the options are an area of refuge(current item 9), an exterior area of assisted rescue (current Item 10) or a safe dispersal area (permitted in 1028.5).

This proposal was originally brought up as a point of discussion because the current language for exterior areas of assisted rescue has been incorrectly interpreted to say asking people to wait 10 feet away from the building is acceptable, and then a separation is not required. Since you are asking persons with mobility impairments to wait at that location for assistance rather than continually move to the public way, 10 feet is not an acceptable alternative. The 50 feet with safe dispersal area is a system that has worked for assembly facilities for a number of years.

Cost Impact: Will not increase the cost of construction
The proposal is a clarification of current requirements; therefore, there is no impact on the cost.

E 37-15 : 1009.2-KULIK3333

E 38-15

1009.2.1; (IFC[BE] 1009.2.1)

Proponent: Gene Boecker, representing Code Consultants, Inc. (geneb@codeconsultants.com)

2015 International Building Code

Revise as follows:

1009.2.1 Elevators required. In buildings where a required *accessible*~~floor~~story or occupied roof is four or more *stories* above or below a *level of exit discharge*, not less than one required accessible *means of egress* shall be an elevator complying with Section 1009.4.

Exceptions:

1. In buildings equipped throughout with an *automatic sprinkler system* installed in accordance with Section 903.3.1.1 or 903.3.1.2, the elevator shall not be required on floors provided with a *horizontal exit* and located at or above the *levels of exit discharge*.
2. In buildings equipped throughout with an *automatic sprinkler system* installed in accordance with Section 903.3.1.1 or 903.3.1.2, the elevator shall not be required on floors provided with a *ramp* conforming to the provisions of Section 1012.

Reason: The language is proposed to be changed to clarify that an occupiable roof must be included where determining the elevator requirement. The existing text is interpretive at best. The proposal makes if clear that if a four story buidling has a roof garden area which the occupants can use, then the elevator to that roof level must be a part of the accessible means of egress.

Cost Impact: Will not increase the cost of construction
The proposal is a clarification. This is how it should be and should have been applied.

1009.3, 1009.4 (IFC[BE] 1009.3, 1009.4)

Proponent: Edward Kulik, Chair, representing Building Code Action Committee (bcac@iccsafe.org)

2015 International Building Code

Revise as follows:

1009.3 Stairways. In order to be considered part of an accessible means of egress, a stairway between stories shall comply with Section 1109.3.1 through 1009.3.3~~have a clear width of 48 inches (1219 mm) minimum between handrails and shall either incorporate an area of refuge within an enlarged floor-level landing or shall be accessed from an area of refuge complying with Section 1009.6~~.

1009.3.1 Exit access stairways. Exit access stairways that connect levels in the same story are not permitted as part of an accessible means of egress.
~~Exceptions~~Exception: ~~1.~~ Exit access stairways providing means of egress from mezzanines are permitted as part of an accessible means of egress.

1009.3.2 Stairway width. Stairways shall have a clear width of 48 inches (1219 mm) minimum between handrails.
Exceptions:

1. The clear width of 48 inches (1219 mm) between handrails is not required in buildings equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2.
2. The clear width of 48 inches (1219 mm) between handrails is not required for stairways accessed from a refuge area in conjunction with a horizontal exit.

1009.3.3 Area of refuge. Stairways shall either incorporate an area of refuge within an enlarged floor-level landing or shall be accessed from an area of refuge complying with Section 1009.6.

Exceptions:

1. Areas of refuge are not required at exit access stairways where two-way communication is provided at the elevator landing in accordance with Section 1009.8.
2. Areas of refuge are not required at stairways in buildings equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2.
3. Areas of refuge are not required at stairways serving open parking garages.
4. Areas of refuge are not required for smoke-protected assembly seating areas complying with Section Sections 1029.6.2 and 1029.6.3.
5. Areas of refuge are not required at stairways in Group R-2 occupancies.
6. Areas of refuge are not required for stairways accessed from a refuge area in conjunction with a horizontal exit.

1009.4 Elevators. In order to be considered part of an accessible means of egress, an elevator shall comply with Section 1009.4.1 and 1009.4.2.

1009.4.1 Standby power. The elevator shall have~~the~~ emergency operation and signaling device requirements of Section 2.27 of ASME A17.1. Standby power shall be provided in accordance with Chapter 27 and Section 3003.

1009.4.2 Area of refuge. The elevator shall be accessed from an area of refuge complying with Section 1009.6.

Exceptions:

1. Areas of refuge are not required at the elevator in open parking garages.
2. Areas of refuge are not required in buildings and facilities equipped throughout by an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2.
3. Areas of refuge are not required at elevators not required to be located in a shaft in accordance with Section 712.
4. Areas of refuge are not required at elevators serving smoke protected seating areas complying with ~~Section~~Sections 1029.6.2 and 1029.6.3.
5. Areas of refuge are not required for elevators accessed from a refuge area in conjunction with a horizontal exit.

Reason: In July/2014 the ICC Board decided to sunset the activities of the Code Technology Committee (CTC). This is being accomplished by re-assigning many of the CTC Areas of Study to the applicable Code Action Committee (CAC). This proposal falls under the CTC Area of Study entitled Unenclosed Exit Stairs. Information on the CTC, including: the sunset plan; meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the CTC website.
This public proposal is submitted by the ICC Building Code Action Committee (BCAC). The BCAC was established by the ICC Board of Directors to pursue

opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the BCAC has held 13 open meetings and numerous workgroup calls which included members of the BCAC as well as any interested party to discuss and debate the proposed changes and the public comments. Related documentation and reports are posted on the BCAC website at: http://www.iccsafe.org/cs/BCAC/Pages/default.aspx.

The intent of this proposal is for editorial clarification. The current text in Section 1009.3 has exceptions to each of three basic requirements; therefore it is long and can be confusing. (During the 2012 IBC development cycle the CTC Unenclosed Exit committee proposed adding the last sentence to Section 1009.3 and exception 1.) Sections 1009.3 and 1009.4 have been subdivided in order to clarify the requirements and when the exceptions are applicable. The exception for Group R-2 is not relocated. Since all Group R-2 are required to be sprinklered, they can use the sprinkler exception, so it is redundant.

The reference to Section 1029.6.3 was added to clarify that areas of refuge are not needed in assembly seating where the seating is open to the outside air as well as smoke protection assembly seating that is protected mechanically.

Cost Impact: Will not increase the cost of construction
This proposal is a clarification of provisions. There will be no change in construction requirements.

Staff note: ASME A17.1 is also referred to as CSA B44.

E 39-15 : 1009.3.2 (NEW)-KULIK3646

E 40-15

1009.7.2; (IFC[BE] 1009.7.2)

Proponent: Lawrence Lincoln, representing Utah Chapter of ICC (larry.lincoln@slcgov.com)

2015 International Building Code

Revise as follows:

1009.7.2 Separation. Exterior walls separating the exterior area of assisted rescue from the interior of the building shall have a minimum *fire-resistance rating* of 1 hour, rated for exposure to fire from the inside. The fire-resistance-rated exterior wall construction shall extend horizontally 10 feet (3048 mm) beyond the landing on either side of the landing or equivalent fire-resistance-rated construction is permitted to extend out perpendicular to the exterior wall 4 feet (1220 mm) minimum on the side of the landing. The *fire-resistance-rated* construction shall extend vertically from the ground to a point 10 feet (3048 mm) above the floor level of the area for assisted rescue or to the roof line, whichever is lower. Openings within such *fire-resistance-rated* exterior walls shall be protected in accordance with Section 716.

Exception: Buildings equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2.

Reason: It seems unreasonable for the IBC to mandate more passive fire protection for a mobility impaired occupant 'that is already located outside of the building' (at the area of assisted rescue) than it does for a mobility impaired occupant that is 'within a building'. IBC section 1009.3 exception #5 allows for the elimination of area of refuges in stairways and IBC section 1009.4 exception #2 allows for the elimination of area of refuges to access elevators when the building is equipped throughout with an automatic fire sprinkler system. On the other hand, a mobility impaired person located at the exterior area of assisted rescue stair landing (already located outside of the building) is afforded the protection of 1-HR fire-resistance rated exterior wall construction and protection of openings as put forth by section 1009.7.2 whether the building is equipped with an automatic sprinkler system or not. This fire sprinkler exception is both logical and reasonable.

Cost Impact: Will not increase the cost of construction
Will not increase the cost of construction.

E 40-15 : 1009.7.2-LINCOLN4114

E 41-15

1009.7.2, 1009.7.4 (IFC[BE] 1009.7.2, 1009.7.4)

Proponent: Edward Kulik, Chair, representing Building Code Action Committee (bcac@iccsafe.org)

2015 International Building Code

Revise as follows:

1009.7.2 Separation. Exterior walls separating the exterior area of assisted rescue from the interior of the building shall have a minimum *fire-resistance rating* of 1 hour, rated for exposure to fire from the inside. The fire-resistance-rated exterior wall construction shall extend horizontally a minimum of 10 feet (3048 mm) beyond the landing on either side of the landing or equivalent fire-resistance-rated construction is permitted to extend out perpendicular to the exterior wall a minimum of 4 feet (1220 mm) minimum on the side of the landing. The *fire-resistance-rated* construction shall extend vertically from the ground to a ~~point~~ minimum of 10 feet (3048 mm) above the floor level of the area for assisted rescue or to the roof line, whichever is lower. Openings within such *fire-resistance-rated* exterior walls shall be protected in accordance with Section 716.

1009.7.4 Stairways. *Stairways* that are part of the *means of egress* for the exterior area for assisted rescue shall provide a clear minimum width of 48 inches (1220 mm) between *handrails*.

> **Exception:** The minimum clear width of 48 inches (1220 mm) between *handrails* is not required at *stairways* serving buildings equipped throughout with an *automatic sprinkler system* installed in accordance with Section 903.3.1.1 or 903.3.1.2.

Reason: The requirements for the wall separation and stairway width for an exterior area for assisted rescue should be minimum requirements, not absolute dimensions.
In July/2014 the ICC Board decided to sunset the activities of the Code Technology Committee (CTC). This is being accomplished by re-assigning many of the CTC Areas of Study to the applicable Code Action Committee (CAC). This proposal falls under the CTC Area of Study entitled IBC Coordination with the New ADAAG. Information on the CTC, including: the sunset plan; meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the CTC website.

This public proposal is submitted by the ICC Building Code Action Committee (BCAC). The BCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the BCAC has held 13 open meetings and numerous workgroup calls which included members of the BCAC as well as any interested party to discuss and debate the proposed changes and the public comments. Related documentation and reports are posted on the BCAC website at: http://www.iccsafe.org/cs/BCAC/Pages/default.aspx.

Cost Impact: Will not increase the cost of construction
The proposal is a clarification of current requirements; therefore, there is no impact on the cost.

E 41-15 : 1009.7.2-KULIK3335

E 42-15

1009.8; (IFC[BE] 1009.8)

Proponent: Stephen DiGiovanni, Clark County Building Department, representing Southern Nevada Chapter of ICC (sdigiovanni@clarkcountynv.gov)

2015 International Building Code

1009.8 Two-way communication. ~~A~~
<u>Where elevators are provided as part of an *accessible means of egress*, a </u>two-way communication system complying with Sections 1009.8.1 and 1009.8.2 shall be provided at the landing serving each elevator or bank of elevators on each accessible floor that is one or more stories above or below the *level of exit discharge*.

Exceptions:

1. Two-way communication systems are not required at the landing serving each elevator or bank of elevators where the two-way communication system is provided within *areas of refuge* in accordance with Section 1009.6.5.
2. Two-way communication systems are not required on floors provided with *ramps* conforming to the provisions of Section 1012.
3. Two-way communication systems are not required at the landings serving only service elevators that are not designated as part of the accessible *means of egress* or serve as part of the required *accessible route* into a facility.
4. Two-way communication systems are not required at the landings serving only freight elevators.
5. Two-way communication systems are not required at the landing serving a private residence elevator.

Reason: Current code requires two-way communication for elevator landings in all buildings two stories or greater, regardless of the design for accessible means of egress. This proposal attempts to tie the requirement for two-way communication to only serve when elevators are provided as a part of the accessible egress.

Section 1009.2.1 only requires elevators to be part of the accessible means of egress when the building has a required accessible floor that is four or more stories above or below the level of exit discharge. In buildings that are less than these limits, the accessible means of egress may be provided by other means, such as stairs, ramps, and other components permitted by Section 1009.2, such that any elevators in such a building are not required to be constructed in accordance with Section 1009.4. Due to the standby requirements in Section 1009.4, designers may choose to not provide accessible egress via the elevator, when permitted to by Section 1009.2.1, instead designing the accessible egress via other components. There is concern that placing the two-way communication in every elevator will lead occupants away from the actual means of egress.

This change is intended to associate the elevator two-way communication system from 1009.8 to elevators that are constructed in accordance with Section 1009.4 to be a part of the accessible route, where such accessible elevators are either required by Section 1009.2.1, and optioned by the designer in accordance with Section 1009.2.

Cost Impact: Will not increase the cost of construction
This proposal will not increase the cost of construction as the proposal may lead to less installations of two-way communication systems.

E 42-15 : 1009.8-DIGIOVANNI3845

E 43-15

1009.8; (IFC[BE] 1009.8)

Proponent: Edward Kulik, Chair, representing Building Code Action Committee (bcac@iccsafe.org)

2015 International Building Code

Revise as follows:

1009.8 Two-way communication. A two-way communication system complying with Sections 1009.8.1 and 1009.8.2 shall be provided at ~~the~~each landing serving each elevator or bank of elevators~~ on each~~ required by Section 1009.2.1 to serve as part of the accessible ~~floor that is one or more stories above or below the~~ ~~*level*~~*means of* ~~*exit discharge*~~egress.

Exceptions:

1. Two-way communication systems are not required at the landing serving each elevator or bank of elevators where the two-way communication system is provided within *areas of refuge* in accordance with Section 1009.6.5.
2. Two-way communication systems are not required on floors provided with *ramps* conforming to the provisions of Section 1012.
3. Two-way communication systems are not required at the landings serving only service elevators that are not designated as part of the accessible *means of egress* or serve as part of the required *accessible route* into a facility.
4. Two-way communication systems are not required at the landings serving only freight elevators.
5. Two-way communication systems are not required at the landing serving a private residence elevator.

Reason: This public proposal is submitted by the ICC Building Code Action Committee (BCAC). The BCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the BCAC has held 13 open meetings and numerous workgroup calls which included members of the BCAC as well as any interested party to discuss and debate the proposed changes and the public comments. Related documentation and reports are posted on the BCAC website at: http://www.iccsafe.org/cs/BCAC/Pages/default.aspx.
Code proposal does not change the existing requirements in the Code. Some users of the Code have interpreted that the literal text of Section 1009.8 also applies to any floor that is accessible to the handicap because the elevator(s) has been provided for convenience of the occupants of the building, even though it was not required by Section 1009.2.1.

If the elevators are required to be an accessible means of egress under Section 1009.2.1, then the additional elevator requirements under Section 1009.4 are also required (i.e. special emergency operation and signaling per ASME A17.1, standby power, and accessed from an area of refuge). Because of these extra life safety design features for the handicap for such elevators being a required accessible means of egress under the Code, the requirement for two-way communication is also required for their elevator landings on the floor.

However, there are buildings with elevators that are accessible to the handicap because they have elevators, but such elevators are not required accessible means of egress under Section 1009.2.1. As such, the elevator landings are not required to comply with the additional requirements under Section 1009.4. Providing two-way communications at such elevator landing that are not required to meet the requirements for a required accessible means of egress makes no sense and would provide a false sense of security.

In summary, this code proposal is only intended as a clarification of the existing requirement for placement of two-way communication at elevators landings that are required by the Code to be a required accessible means of egress.

Cost Impact: Will not increase the cost of construction
Clarification of the existing code requirement. Therefore, could be a cost saving.

E 43-15 : 1009.8-KULIK3670

E 44-15

1009.8; (IFC[BE] 1009.8)

Proponent: Masoud Sabounchi, Representing Colorado Chapter of ICC , representing masoud sabounchi (masoud@acecode.com)

2015 International Building Code

1009.8 Two-way communication. A two-way communication system complying with Sections 1009.8.1 and 1009.8.2 shall be provided at the landing serving each elevator or bank of elevators on each accessible floor that is one or more stories above or below the *level of exit discharge*.

Exceptions:

1. Two-way communication systems are not required at the landing serving each elevator or bank of elevators where the two-way communication system is provided within *areas of refuge* in accordance with Section 1009.6.5.
2. Two-way communication systems are not required on floors provided with *ramps* conforming to the provisions of Section 1012.
3. Two-way communication systems are not required at the landings serving only service elevators that are not designated as part of the accessible *means of egress* or serve as part of the required *accessible route* into a facility.
4. Two-way communication systems are not required at the landings serving only freight elevators.
5. Two-way communication systems are not required at the landing serving a private residence elevator.
6. <u>Two-way communication systems are not required in Group I-2 Condition 2 occupancies.</u>

Reason: Group I-2 Condition 2 includes facilities that provide nursing and medical care on a 24 hour basis. These facilities have life-safety and fire protection system as well as staffing that allow defend in place emergency procedures. Providing 2-way communication at elevator landings in a hospital building and having physically challenged individuals go to an elevator lobby/landing and wait for evacuation by emergency responders creates conflict with the emergency evacuation plan of the facility where occupants are relocated from one smoke compartment to another.

Cost Impact: Will not increase the cost of construction
This proposal will not increase cost of construction

E 44-15 : 1009.8-SABOUNCHI4366

E 45-15

1009.8; (IFC[BE] 1009.8)

Proponent: John Williams, CBO, CBO, Chair Adhoc Healthcare Committee, representing Adhoc Health Care Committee (AHC@iccsafe.org); Carl Baldassarra, P.E., FSFPE, Chair, Code Technology Committee, representing Code Technology Committee (CTC@iccsafe.org)

2015 International Building Code

Revise as follows:

1009.8 Two-way communication. A two-way communication system complying with Sections 1009.8.1 and 1009.8.2 shall be provided at the landing serving each elevator or bank of elevators on each accessible floor that is one or more stories above or below the *level of exit discharge*.

Exceptions:

1. Two-way communication systems are not required at the landing serving each elevator or bank of elevators where the two-way communication system is provided within *areas of refuge* in accordance with Section 1009.6.5.
2. Two-way communication systems are not required on floors provided with *ramps* conforming to the provisions of Section 1012.
3. Two-way communication systems are not required at the landings serving only service elevators that are not designated as part of the accessible *means of egress* or serve as part of the required *accessible route* into a facility.
4. Two-way communication systems are not required at the landings serving only freight elevators.
5. Two-way communication systems are not required at the landing serving a private residence elevator.
6. <u>Two-way communication systems are not required in Group I-2 facilities.</u>

Reason: It is important to note that this is not the two way communication system typically utilized by the fire department. That system is defined in the IFC and will remain as required.
A two way communication system is part of accessible means of egress and required to allow for persons with disabilities to contact emergency responders. In Group I-2 facilities the strategy for emergencies is defend in place, with trained staff. Most of the patients will be considered persons with disabilities, and their safety will be addressed through the fire and safety evacuation plans with staff assistance. Therefore, the need for the two way communication system is addressed by an alternative means and would not be used in these types of facilities. Since this was not added to the code in 2009, deleting this issue would not be conflict with what is referenced in the 2010 ADA Standard for Accessible Design.
This system could also be confused as being used for medical emergencies or as a general information phone.

The ICC Ad Hoc Committee on Healthcare (AHC) has just completed its 4th year. The AHC was established by the ICC Board to evaluate and assess contemporary code issues relating to hospitals and ambulatory healthcare facilities. This is a joint effort between ICC and the American Society for Healthcare Engineering (ASHE), a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. Information on the AHC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the AHC effort can be downloaded from the AHC website at: http://www.iccsafe.org/cs/AHC/Pages/default.aspx
The ICC Code Technology Committee (CTC) has just completed its 10th year. The ICC Board has decided to sunset the CTC. The sunset plan includes re-assigning many of the CTC Areas of Study to the applicable Code Action Committee (CAC). The two remaining CTC Areas of Study are Care Facilities and Elevator Lobbies/WTC Elevator issues. This proposal falls under the Care Facilities Area of Study. Information on the CTC, including: the sunset plan; meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the CTC website at: http://www.iccsafe.org/cs/CTC/Pages/default.aspx.

Cost Impact: Will not increase the cost of construction
The deletion of two way communication system will be a saving in initial construction and maintenance/monitoring of the system.

1009.8; (IFC[BE] 1009.8)

Proponent: Robert Davidson, Davidson Code Concepts, LLC, representing Davidson Code Concepts, LLC (rjd@davidsoncodeconcepts.com)

2015 International Building Code

Revise as follows:

1009.8 Two-way communication. A two-way communication system complying with Sections 1009.8.1 and 1009.8.2 shall be provided at the landing serving each elevator or bank of elevators on each accessible floor that is one or more stories above or below the *level of exit discharge*.

Exceptions:

1. Two-way communication systems are not required at the landing serving each elevator or bank of elevators where the two-way communication system is provided within *areas of refuge* in accordance with Section 1009.6.5.
2. Two-way communication systems are not required on floors provided with *ramps* conforming to the provisions of Section 1012.
3. Two-way communication systems are not required at the landings serving only service elevators that are not designated as part of the accessible *means of egress* or serve as part of the required *accessible route* into a facility.
4. Two-way communication systems are not required at the landings serving only freight elevators.
5. Two-way communication systems are not required at the landing serving a private residence elevator.
6. <u>Two-way communication systems are not required in Group I-3 facilities.</u>

Reason: It is important to note that this is not the two way communication system typically utilized by the fire department. That system is defined in the IFC and will remain as required.
A two way communication system is part of accessible means of egress and required to allow for persons with disabilities to contact emergency responders. In Group I-3 facilities the strategy for emergencies is defend in place, with trained staff. Therefore, the need for the two way communication system is addressed by an alternative means and would not be used in these types of facilities. There is also a high chance of vandalism in these facilities. Since this was not added to the code in 2009, deleting this issue would not be conflict with what is referenced in the 2010 ADA Standard for Accessible Design.

Cost Impact: Will not increase the cost of construction
The deletion of two way communication system will be a saving in initial construction and maintenance/monitoring of the system.

E 47-15

1010.1.1, 1010.1.1.1; (IFC[BE] 1010.1.1, 1010.1.1.1)

Proponent: Edward Kulik, Chair, representing Building Code Action Committee (bcac@iccsafe.org)

Revise as follows:

1010.1.1 Size of doors. The required capacity of each door opening shall be sufficient for the *occupant load* thereof and shall provide a minimum clear opening width of 32 inches (813 mm). ~~Clear openings~~ The clear opening width of doorways with swinging doors shall be measured between the face of the door and the stop, with the door open 90 degrees (1.57 rad). Where this section requires a minimum clear opening width of 32 inches (813 mm) and a door opening includes two door leaves without a mullion, one leaf shall provide a minimum clear opening width of 32 inches (813 mm). In Group I-2, doors serving as *means of egress* doors where used for the movement of beds shall provide a minimum clear opening width of 41$^1/_2$ inches (1054 mm). The maximum width of a swinging door leaf shall be 48 inches (1219 mm) nominal. ~~*Means of egress* doors in a Group I-2 occupancy used for the movement of beds shall provide a clear width not less than 41$^1/_2$ inches (1054 mm).~~ The minimum clear height of door openings shall be ~~not less than~~ 80 inches (2032 mm).

Exceptions:

1. In Group R-2 and R-3 dwelling and sleeping units that are not required to be an Accessible unit, Type A unit or Type B unit, the minimum and maximum width shall not apply to door openings that are not part of the required *means of egress* ~~inGroup R-2 and R-3 occupancies.~~
2. In Group I-3, door openings to resident *sleeping units* *that are not required to be and Accessible units* ~~in Group I-3 occupancies~~ shall have a minimum clear opening width of ~~not less than~~ 28 inches (711 mm).
3. Door openings to storage closets less than 10 square feet (0.93 m^2) in area shall not be limited by the minimum clear opening width.
4. Width of door leaves in revolving doors that comply with Section 1010.1.4.1 shall not be limited.
5. Door openings within a *dwelling unit* or *sleeping unit* shall ~~be not less than~~ have a minimum clear opening height of 78 inches (1981 mm) ~~in height~~.
6. In dwelling and sleeping units that are not required to be Accessible, Type A or Type B units, exterior door openings ~~in *dwelling units* and *sleeping units*~~, other than the required *exit* door, shall ~~be not less than~~ have a minimum clear opening height of 76 inches (1930 mm) in height.
7. ~~In other than Group R-1 occupancies~~ In Groups I-1, R-2, R-3 and R-4 occupancies, in dwelling and sleeping units that are not required to be Accessible, Type A or Type B units, the minimum clear opening widths shall not apply to interior egress doors ~~within a *dwelling unit* or *sleeping unit* that is not required to be an *Accessible unit*, *Type A unit* or *Type B unit*~~.
8. Door openings ~~required to be *accessible*~~ within *Type B units* intended for user passage shall have a minimum clear opening width of 31.75 inches (806 mm).
9. Doors to walk-in freezers and coolers less than 1,000 square feet (93 m^2) in area shall have a maximum width of 60 inches (1524 mm) nominal.
10. ~~In Group R-1 *dwelling units* or *sleeping units* not required to be *Accessible units*,~~ The minimum width shall not apply to doors for non-accessible showers or saunas compartments.
11. The minimum width shall not apply to the doors for non-accessible toilet seats.

1010.1.1.1 Projections into clear width. There shall not be projections into the required clear opening width lower than 34 inches (864 mm) above the floor or ground. Projections into the clear opening width between 34 inches (864 mm) and 80 inches (2032 mm) above the floor or ground shall not exceed 4 inches (102 mm).

Exception: Door closers and door stops shall be permitted to be 78 inches (1980 mm) minimum above the floor.

Reason: In July/2014 the ICC Board decided to sunset the activities of the Code Technology Committee (CTC). This is being accomplished by re-assigning many of the CTC Areas of Study to the applicable Code Action Committee (CAC). This proposal falls under the CTC Area of Study entitled IBC Coordination with the New ADAAG. Information on the CTC, including: the sunset plan; meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the CTC website.
This public proposal is submitted by the ICC Building Code Action Committee (BCAC). The BCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the BCAC has held 13 open meetings and numerous workgroup calls which included members of the BCAC as well as any interested party to discuss and debate the proposed changes and the public comments. Related documentation and reports are posted on the BCAC website at: http://www.iccsafe.org/cs/BCAC/Pages/default.aspx.

The intent of a large portion of this change is consistent use of the terminology (e.g., minimum clear opening width/height) throughout this section. There is also the intent of putting the modifier first within the specific requirements (Group I-2, ambulatory care) and the exceptions. The maximum door width sentence is relocated to be after all the minimum door width requirements and to coordinate with the order of requirements in IFC 1104.7.

Exceptions 1, 2, 6 and 7 cannot be used in Accessible, Type A or Type B units; that would conflict with ICC A117.1, ADA and FHA. Also in Exception 7: dwelling units and sleeping units in Group I-2 and I-3 have specific criteria elsewhere in this section, and the ADA does not allow Group R-1 units to use this exception, therefore, the more specific limitation to allow this in Group I-1, R-2, R-3 and R-4.

Exception 8 is revised to be consistent with the language used for Type B dwelling units in ICC A117.1.

Code change E52-12 added exception 10 as part of the coordination with ADA 224.1.2. Questions that has risen are: Is the intent to require 32" clear width shower stall doors in all showers Group I-1, R-2, R-3 and R-4 or multi-stall shower rooms? Is the intent to require 32" clear width shower doors in the 2nd bathrooms in Accessible units that are not required to have clearances? Elimination first part of the sentence would not change the allowances for Accessible hotel rooms, and would eliminate the question.

Exception 11 is proposed to be added to address a similar question for doors on toilet stalls. The width of 32" is especially a problem with IPC since the stall is only required to be 30" wide.

The ICC Fire Code Action Committee supports this proposal and will be submitting a Group B a correlative language change proposed to IFC Section 1104.7.

Cost Impact: Will not increase the cost of construction
The proposal is a clarification and coordination of current requirements; therefore, there is no impact on the cost.

E 47-15 : 1010.1.1-KULIK3338

E 48-15

1010.1.1; (IFC[BE] 1010.1.1)

Proponent: John Woestman, representing Builders Hardware Manufacturers Association (BHMA) (jwoestman@kellencompany.com)

2015 International Building Code

Revise as follows:

1010.1.1 Size of doors. The required capacity of each door opening shall be sufficient for the *occupant load* thereof and shall provide a minimum clear width of 32 inches (813 mm). Clear openings of doorways with swinging doors shall be measured between the face of the door and the stop, with the door open 90 degrees (1.57 rad). Where this section requires a minimum clear width of 32 inches (813 mm) and a door opening includes two door leaves without a mullion, one leaf shall provide a clear opening width of 32 inches (813 mm). ~~The maximum width of a swinging door leaf shall be 48 inches (1219 mm) nominal.~~ *Means of egress* doors in a Group I-2 occupancy used for the movement of beds shall provide a clear width not less than $41^1/_2$ inches (1054 mm). The height of door openings shall be not less than 80 inches (2032 mm).

Exceptions:

1. The minimum ~~and maximum~~ width shall not apply to door openings that are not part of the required *means of egress* in Group R-2 and R-3 occupancies.
2. Door openings to resident *sleeping units* in Group I-3 occupancies shall have a clear width of not less than 28 inches (711 mm).
3. Door openings to storage closets less than 10 square feet (0.93 m^2) in area shall not be limited by the minimum width.
4. ~~Width of door leaves in revolving doors that comply with Section 1010.1.4.1 shall not be limited.~~
4. Door openings within a *dwelling unit* or *sleeping unit* shall be not less than 78 inches (1981 mm) in height.
5. Exterior door openings in *dwelling units* and *sleeping units*, other than the required *exit* door, shall be not less than 76 inches (1930 mm) in height.
6. In other than Group R-1 occupancies, the minimum widths shall not apply to interior egress doors within a *dwelling unit* or *sleeping unit* that is not required to be an *Accessible unit*, *Type A unit* or *Type B unit*.
7. Door openings required to be *accessible* within *Type B units* shall have a minimum clear width of 31.75 inches (806 mm).
8. Doors to walk-in freezers and coolers less than 1,000 square feet (93 m^2) in area shall have a maximum width of 60 inches (1524 mm).
9. In Group R-1 *dwelling units* or *sleeping units* not required to be *Accessible units*, the minimum width shall not apply to doors for showers or saunas.

Reason: This proposal deletes the maximum width requirement for swinging doors.
From the 2012 IBC Commentary: The maximum width for a means of egress (swinging) door leaf in a swinging door is 48 inches (1219 mm) because larger doors are difficult to handle and are of sizes that typically are not fire tested.

We somewhat agree with this statement in the 2012 IBC Commentary. However, it is the width plus the height and the construction of the door (i.e. weight) which results in a door which may be difficult to open and / or close. Our perspective is the performance requirements in IBC Section 1010.1.3 and the Chapter 11 Accessibility requirements effectively result in the design and installation of appropriately- sized doors.

Regarding fire tested (i.e. fire-rated) doors – the solution is simple – install fire-rated doors which meet the previously mentioned performance requirements.

From a different perspective, NFPA 101 has not had a requirement for maximum swinging door leaf width since the 1997 edition, stating there is insufficient reason to limit the maximum width of a door leaf provided the door is maintained in good working order.

Also proposing to delete the 4th exception to this section, as this exception would no longer be need or appropriate.

Cost Impact: Will not increase the cost of construction
No cost implications could be identified.

E 48-15 : 1010.1.1-WOESTMAN5528

E 49-15

1010.1.1 (IFC [BE] 1010.1.1)

Proponent: Edward Kulik, Chair, representing Building Code Action Committee (bcac@iccsafe.org)

2015 International Building Code

1010.1.1 Size of doors. The required capacity of each door opening shall be sufficient for the *occupant load* thereof and shall provide a minimum clear width of 32 inches (813 mm). Clear openings of doorways with swinging doors shall be measured between the face of the door and the stop, with the door open 90 degrees (1.57 rad). Where this section requires a minimum clear width of 32 inches (813 mm) and a door opening includes two door leaves without a mullion, one leaf shall provide a clear opening width of 32 inches (813 mm). The maximum width of a swinging door leaf shall be 48 inches (1219 mm) nominal. *Means of egress* doors in a Group I-2 occupancy used for the movement of beds shall provide a clear width not less than $41^{1}/_{2}$ inches (1054 mm). The height of door openings shall be not less than 80 inches (2032 mm).

Exceptions:

1. The minimum and maximum width shall not apply to door openings that are not part of the required *means of egress* in Group R-2 and R-3 occupancies.
2. Door openings to resident *sleeping units* in Group I-3 occupancies shall have a clear width of not less than 28 inches (711 mm).
3. Door openings to storage closets less than 10 square feet (0.93 m^2) in area shall not be limited by the minimum width.
4. ~~Width~~The width of door leaves in revolving doors that comply with Section 1010.1.4.1 shall not be limited.
5. The width of door leaves in bi-parting power-operated doors that comply with Section 1010.1.4.2 shall not be limited
6. Door openings within a *dwelling unit* or *sleeping unit* shall be not less than 78 inches (1981 mm) in height.
7. Exterior door openings in *dwelling units* and *sleeping units*, other than the required *exit* door, shall be not less than 76 inches (1930 mm) in height.
8. In other than Group R-1 occupancies, the minimum widths shall not apply to interior egress doors within a *dwelling unit* or *sleeping unit* that is not required to be an *Accessible unit*, *Type A unit* or *Type B unit*.
9. Door openings required to be *accessible* within *Type B units* shall have a minimum clear width of 31.75 inches (806 mm).
10. Doors to walk-in freezers and coolers less than 1,000 square feet (93 m^2) in area shall have a maximum width of 60 inches (1524 mm).
11. In Group R-1 *dwelling units* or *sleeping units* not required to be *Accessible units*, the minimum width shall not apply to doors for showers or saunas.

Reason: The proposed revisions are intended to improve clarity and consistency of the language of these sections of the code, and appear to be essentially editorial. The maximum width of power-operated doors which comply with IBC Section 1010.1.4.2 should not be limited as these doors are either fully automatic or power-assisted, and must comply with all the requirements of Section 1010.1.4.2 including the safety requirements incorporated in the BHMA standards referenced in 1010.1.4.2. This revision addresses a potential conflict between the IBC and the relatively few power-operated swinging doors currently being installed which exceed 48" inches in width.
This public proposal is submitted by the ICC Building Code Action Committee (BCAC). The BCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the BCAC has held 13 open meetings and numerous workgroup calls which included members of the BCAC as well as any interested party to discuss and debate the proposed changes and the public comments. Related documentation and reports are posted on the BCAC website at: http://www.iccsafe.org/cs/BCAC/Pages/default.aspx.

Cost Impact: Will not increase the cost of construction
Editorial changes only. No technical changes intended.

E 49-15 : 1010.1.1-KULIK3671

E 50-15

1010.1.1; (IFC[BE] 1010.1.1)

Proponent: Barry Greive, representing Target Corporation (barry.greive@target.com)

2015 International Building Code

1010.1.1 Size of doors. The required capacity of each door opening shall be sufficient for the *occupant load* thereof and shall provide a minimum clear width of 32 inches (813 mm). Clear openings of doorways with swinging doors shall be measured between the face of the door and the stop, with the door open 90 degrees (1.57 rad). Where this section requires a minimum clear width of 32 inches (813 mm) and a door opening includes two door leaves without a mullion, one leaf shall provide a clear opening width of 32 inches (813 mm). The maximum width of a swinging door leaf shall be 48 inches (1219 mm) nominal. *Means of egress* doors in a Group I-2 occupancy used for the movement of beds shall provide a clear width not less than $41^{1}/_{2}$ inches (1054 mm). The height of door openings shall be not less than 80 inches (2032 mm).

Exceptions:

1. The minimum and maximum width shall not apply to door openings that are not part of the required *means of egress* in Group R-2 and R-3 occupancies.
2. Door openings to resident *sleeping units* in Group I-3 occupancies shall have a clear width of not less than 28 inches (711 mm).
3. Door openings to storage closets less than 10 square feet (0.93 m^2) in area shall not be limited by the minimum width.
4. Width of door leaves in revolving doors that comply with Section 1010.1.4.1 shall not be limited.
5. Door openings within a *dwelling unit* or *sleeping unit* shall be not less than 78 inches (1981 mm) in height.
6. Exterior door openings in *dwelling units* and *sleeping units*, other than the required *exit* door, shall be not less than 76 inches (1930 mm) in height.
7. In other than Group R-1 occupancies, the minimum widths shall not apply to interior egress doors within a *dwelling unit* or *sleeping unit* that is not required to be an *Accessible unit*, *Type A unit* or *Type B unit*.
8. Door openings required to be *accessible* within *Type B units* shall have a minimum clear width of 31.75 inches (806 mm).
9. Doors to walk-in freezers and coolers less than 1,000 square feet (93 m^2) in area shall have a maximum width of 60 inches (1524 mm).
10. In Group R-1 *dwelling units* or *sleeping units* not required to be *Accessible units*, the minimum width shall not apply to doors for showers or saunas.
11. <u>Where a pair of double acting doors without a latch, mullion or stop is installed, both leaves shall be considered to determine the minimum clear opening width of 32 inches (813 mm).</u>

Reason: This code change is necessary to address the issue of double acting / impact / saloon and traffic doors being regulated as double doors with a manually operated edge or surface-mounted bolts for locking. Double acting doors are used in many applications from Retail, Warehouses, Factories and Restaurants. These doors do not have a latch, closer or mullion that could impede the function of the doors. Any person who needs to utilize the full 32 inches of clear width required in the code can easily push through both doors simultaneously which will provide the proper clearance needed. These types of doors in no way impact egress or accessibility, therefore they do not need to meet the provision of "at least one leaf being 32 inches". In many situations these doors are installed in 4 or 5 foot openings. This also allows for more architectural flexibility in the design of buildings.

Cost Impact: Will not increase the cost of construction
This will not increase the cost of construction, it could actually save money since specialty doors are not needed nor would the size of the opening need to be altered.

E 51-15

1010.1.2.1; (IFC[BE] 1010.1.2.1)

Proponent: Chadley Root, Park City Utah, representing Utah Chapter ICC (chad.root@parkcity.org)

2015 International Building Code

Revise as follows:

1010.1.2.1 Direction of swing. Pivot or side-hinged swinging doors shall swing in the direction of egress travel where serving a room or area containing an occupant load of 50 or more persons or a Group H occupancy and doors serving public restrooms.

Reason: This proposal is for Health and Safety of the general public. This code change is for health and safety with the increase of population comes more communicable diseases, throughout history there have been plagues that have killed off numbers of people. In bathrooms/restrooms bodily fluids are present all over. It makes no sense to health and safety to wash your hands and clean yourself up to be required to pull open a door that someone else just opened with there hands that they just sneezed, spit, wiped there nose or wiped themselves without washing their hands and also just grasped the bathroom door to pull open.

Doors that swing outward from the bathroom can be opened with feet, arms, or the back this would eliminate the requirement of grabbing onto a door knob that was just opened by a person that failed to wash their hands after wiping or exposing bodily fluids to their hands.

E 52-15

1010.1.4.1.1, 1010.1.4.1.2; (IFC[BE] 1010.1.4.1.1, 1010.1.4.1.2)

Proponent: Dale Gigandet, Boon Edam Inc., representing Boon Edam Inc. (dgt@boonedam.us)

2015 International Building Code

Revise as follows:

1010.1.4.1.1 Egress component. A revolving door used as a component of a *means of egress* shall comply with Section 1010.1.4.1 and the following three conditions:

1. Revolving doors shall not be given credit for more than 50 percent of the minimum width or required egress capacity.
2. Each revolving door shall be credited with ~~a~~ an egress capacity based on not more than a 50-person *occupant load* or, where 9 feet (2745 mm) in diameter or greater, a revolving door assembly shall be credited with an egress capacity based on the clear opening width provided when collapsed or situated into an egress position.
3. Each revolving door shall provide for egress in accordance with BHMA A156.27 ~~with~~when a *breakout* force of not more than 130 pounds (578 N) is applied to the wings within 3 inches (75 mm) of the outer edge.

1010.1.4.1.2 Other than egress component. A revolving door used as other than a component of a *means of egress* shall comply with Section 1010.1.4.1. The *breakout* force of a revolving door not used as a component of a *means of egress* shall not be more than 180 pounds (801 N) applied to the wings within 3 inches (75 mm) of the outer edge.

Exception: A *breakout* force in excess of 180 pounds (801 N) is permitted if the collapsing force is reduced to not more than 130 pounds (578 N) when not less than one of the following conditions is satisfied:

1. There is a power failure or power is removed to the device holding the door wings in position.
2. There is an actuation of the *automatic sprinkler system* where such system is provided.
3. There is an actuation of a smoke detection system that is installed in accordance with Section 907 to provide coverage in areas within the building that are within 75 feet (22 860 mm) of the revolving doors.
4. There is an actuation of a manual control switch, in an approved location and clearly identified, that reduces the *breakout* force to not more than 130 pounds (578 N).

Reason: The proposed change reflects NFPA 101, Life Safety Code (2015 Ed.) and current accepted practice for calculating egress capacity, and gives credit for larger door opening that provide clear unobstructed width for emergency egress.

Bibliography: Reference NFPA 101 Life Safety Code (2015 ed.), Sections 7.2.1.10.2 and 7.2.1.10.3.

Cost Impact: Will not increase the cost of construction
No material or labor costs increases will occur as the result of the proposed changes. The changes reflect the text included in the NFPA 101 Life Safety Code (2015 edition).

E 52-15 : 1010.1.4.1.1-GIGANDET3468

E 53-15

1010.1.4.1.2; (IFC[BE] 1010.1.4.1.2)

Proponent: John Woestman, Kellen Company, representing Builders Hardware Manufacturers Association (BHMA) (jwoestman@kellencompany.com)

2015 International Building Code

Revise as follows:

1010.1.4.1.2 Other than egress component. A revolving door used as other than a component of a *means of egress* shall comply with Section 1010.1.4.1. The *breakout* force of a revolving door not used as a component of a *means of egress* shall not be more than 180 pounds (801 N).

> **Exception:** A *breakout* force in excess of 180 pounds (801 N) is permitted if the ~~collapsing~~breakout force is reduced to not more than 130 pounds (578 N) when not less than one of the following conditions is satisfied:
> 1. There is a power failure or power is removed to the device holding the door wings in position.
> 2. There is an actuation of the *automatic sprinkler system* where such system is provided.
> 3. There is an actuation of a smoke detection system that is installed in accordance with Section 907 to provide coverage in areas within the building that are within 75 feet (22 860 mm) of the revolving doors.
> 4. There is an actuation of a manual control switch, in an approved location and clearly identified, that reduces the *breakout* force to not more than 130 pounds (578 N).

Reason: This proposal fixes an oversight on my part. The requirements for revolving doors were revised / updated for the 2015 IBC, including a definition of "breakout" and the use of that term which took the place of the term "collapsing". I missed this revision during the code development cycle for the 2015 IBC, and ICC staff suggested this was more than an editorial fix. Hence this proposal.

Cost Impact: Will not increase the cost of construction
Editorial fix.

E 54-15

202, 1010.1.4.2; (IFC[BE] 1010.1.4.2), Chapter 35

Proponent: John Woestman, Kellen Company, representing Builders Hardware Manufacturers Association (BHMA) (jwoestman@kellencompany.com)

2015 International Building Code

Revise as follows:

SECTION 202 DEFINITIONS

LOW-ENERGY POWER-OPERATED DOOR. Swinging, sliding, or folding door which opens automatically upon an action by a pedestrian such as pressing a push plate or waving a hand in front of a sensor. The door closes automatically, and operates with decreased forces and decreased speeds (see "Power-assisted door" and "Power-operated door").

1010.1.4.2 Power-operated doors. Where *means of egress* doors are operated or assisted by power, the design shall be such that in the event of power failure, the door is capable of being opened manually to permit *means of egress* travel or closed where necessary to safeguard *means of egress*. The forces required to open these doors manually shall not exceed those specified in Section 1010.1.3, except that the force to set the door in motion shall not exceed 50 pounds (220 N). The door shall be capable of ~~swinging open~~opening from any position to the full width of the opening in which such door is installed when a force is applied to the door on the side from which egress is made. Power-operated swinging doors, power-operated sliding doors and power-operated folding doors shall comply with BHMA A156.10. Power-assisted swinging doors and low-energy power-operated swinging doors shall comply with BHMA A156.19. Low energy power-operated sliding doors and low energy power-operated folding doors shall comply with BHMA A156.38.

Exceptions:

1. Occupancies in Group I-3.
2. Horizontal sliding doors complying with Section 1010.1.4.3.
3. For a biparting door in the emergency breakout mode, a door leaf located within a multiple-leaf opening shall be exempt from the minimum 32-inch (813 mm) single-leaf requirement of Section 1010.1.1, provided a minimum 32-inch (813 mm) clear opening is provided when the two biparting leaves meeting in the center are broken out.

Add new standard(s) as follows:
BHMA A156.38-2014 Low Energy Power Operated Sliding and Folding Doors

Reason: The Builders Hardware Manufacturers Association (BHMA), an ANSI accredited standard development organization, received ANSI approval last year of A156.38-2014 Low Energy Power Operated Sliding and Folding Doors. This new standard has mandatory performance and safety requirements for low energy power operated sliding and folding doors, and "rounds out" this section of the IBC to now include most types of power operated doors. The standards currently referenced in this section are BHMA A156.10 Power Operated Pedestrian Doors (for swinging, sliding, and folding doors) and BHMA A156.19 Standard for Power Assist and Low Energy Operated Doors (for swinging doors).
The proposed deletion of "swinging" in IBC Section 1010.1.4.2 considers the configurations of power-operated doors, as they may be swinging, sliding, or folding.

Cost Impact: Will not increase the cost of construction
No cost implications. Manufacturers of low energy power-operated sliding or folding doors are voluntarily complying with this standard.

Analysis: A review of the standard proposed for inclusion in the code, BHMA A156.38, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2015.

E 54-15 : 1010.1.4.2-WOESTMAN5532

E 55-15

709.5, 1010.1.4.2; (IFC[BE] 1010.1.4.2)

Proponent: John Woestman, Kellen Company, representing Builders Hardware Manufacturers Association (BHMA) (jwoestman@kellencompany.com)

2015 International Building Code

Revise as follows:

709.5 Openings. Openings in a *smoke barrier* shall be protected in accordance with Section 716.

Exceptions:

1. In Group I-1 Condition 2, Group I-2 and ambulatory care facilities, where a pair of opposite-swinging doors are installed across a corridor in accordance with Section 709.5.1, the doors shall not be required to be protected in accordance with Section 716. The doors shall be close fitting within operational tolerances, and shall not have a center mullion or undercuts in excess of $^3/_4$ inch (19.1 mm), louvers or grilles. The doors shall have head and jamb stops, and astragals or rabbets at meeting edges. Where permitted by the door manufacturer's listing, positive-latching devices are not required.
2. In Group I-1 Condition 2, Group I-2 and *ambulatory care facilities*, special purpose horizontal sliding, accordion or folding doors installed in accordance with Section 1010.1.4.3 and protected in accordance with Section 716.

1010.1.4.2 Power-operated doors. Where *means of egress* doors are operated or assisted by power, the design shall be such that in the event of power failure, the door is capable of being opened manually to permit *means of egress* travel or closed where necessary to safeguard *means of egress*. The forces required to open these doors manually shall not exceed those specified in Section 1010.1.3, except that the force to set the door in motion shall not exceed 50 pounds (220 N). The door shall be capable of swinging open from any position to the full width of the opening in which such door is installed when a force is applied to the door on the side from which egress is made. Power-operated swinging doors, power-operated sliding doors and power-operated folding doors shall comply with BHMA A156.10. Power-assisted swinging doors and low-energy power-operated swinging doors shall comply with BHMA A156.19.

Exceptions:

1. Occupancies in Group I-3.
2. ~~Horizontal~~Special purpose horizontal sliding, accordion or folding doors complying with Section 1010.1.4.3.
3. For a biparting door in the emergency breakout mode, a door leaf located within a multiple-leaf opening shall be exempt from the minimum 32-inch (813 mm) single-leaf requirement of Section 1010.1.1, provided a minimum 32-inch (813 mm) clear opening is provided when the two biparting leaves meeting in the center are broken out.

Reason: This proposal updates references to IBC 1010.1.4.3. Special purpose horizontal sliding, accordion or folding doors as the name of this section and related text were revised for the 2015 IBC and IFC. Most of the references to 1010.1.4.3 were updated for the 2015 IBC and IFC. These were not.

Cost Impact: Will not increase the cost of construction
No technical changes.

E 56-15

202 (New), 1010.1.4.4 (New); (IFC[BE] 1010.1.4.4 (New))

Proponent: John Woestman, Kellen Company, representing Builders Hardware Manufacturers Association (BHMA) (jwoestman@kellencompany.com)

2015 International Building Code

Add new definition as follows:

SECTION 202 DEFINITIONS

CONTROL VESTIBULE A space with a door locking arrangement of two doors interconnected such that the first door must close or lock before the second door is openable and unlocked.

Add new text as follows:

1010.1.4.4 Control vestibule. Doors in the means of egress configured as a control vestibule shall provide for emergency egress and shall be subject to approval by the code official.

Reason: Control vestibules (interlocked doors) are being installed. The code currently is silent regarding requirements for doors in the means of egress configured as a control vestibule. The configuration of control vestibules which provide for ingress control (access control) is outside the scope of the IBC. However, egress MUST be provided for, and how egress is provided with control vestibules should be subject to approval by the AHJ.

Cost Impact: Will not increase the cost of construction
No cost increase. Control vestibules are not required by the code.

E 56-15 : 1010.1.4.4 (New)-WOESTMAN5535

E 57-15

Part I:

202 (New), 1010.1.4.4 (New), 1010.1.4.4.1 (New); (IFC[BE] 1010.1.4.4 (New), 1010.1.4.4.1 (New))

Part II:

202 (New), 406 (New), 406.1 (New), 406.2 (New), 406.2.1 (New), 704.2 (New), 704.2.1 (New)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IBC-MEANS OF EGRESS COMMITTEE. PART II WILL BE HEARD BY THE IEBC COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

Proponent: John Woestman, Kellen Company, representing Builders Hardware Manufacturers Association (BHMA) (jwoestman@kellencompany.com)

Part I

2015 International Building Code

Add new definition as follows:

SECTION 202 DEFINITIONS

CREDENTIAL. A tangible object, knowledge, or human physical characteristic required for locking and unlocking. A key to operate a lock cylinder; a magnetic card to swipe in a magnetic card reader; knowledge of a specific code for keypad operations; and a fingerprint for a fingerprint scanner; are examples of credentials, and their potential uses.

Add new text as follows:

1010.1.4.4 Group E classrooms. In Group E occupancies, classroom doors shall be lockable from within the classroom without opening the classroom door. All the following conditions shall apply:

1. The classroom door shall be unlockable and openable from within the classroom and shall comply with Section 1010.1.9.
2. The classroom door shall be unlockable and openable from outside the classroom by the use of a key or other credential.

1010.1.4.4.1 Remote operation of locks. Remote operation of locks complying with Section 1010.1.4.4 shall be permitted.

Part II

2015 International Existing Building Code

Add new definition as follows:

SECTION 202 DEFINITIONS

CREDENTIAL. A tangible object, knowledge, or human physical characteristic required for locking or unlocking. A key to operate a lock cylinder; a magnetic card to swipe in a magnetic card reader; knowledge of a specific code for keypad operations; and a fingerprint for a fingerprint scanner; are examples of credentials, and their potential uses.

Add new text as follows:

SECTION406 MEANS OF EGRESS

406.1 General. Alterations shall be such that the existing building or structure is no less conforming to the provisions of the International Building Code than the existing building or structure was prior to the alteration.

406.2 Existing occupany Group E classrooms. In Group E occupancies, existing classroom doors shall be lockable from within the classroom without opening the classroom door. All the following conditions shall apply:

1. The classroom door shall be unlockable and openable from within the classroom and shall comply with Section 1010.1.9. of the International Building Code.
2. The classroom door shall be unlockable and openable from outside the classroom by the use of a key or other credential.

406.2.1 Remote operation of locks. Remote operation of locks complying with 406.2 shall be permitted.

704.2 Group E occupancy classroom. In Group E occupancies, classroom doors shall be lockable from within the classroom without opening the classroom door. All the following conditions shall apply:

1. The classroom door shall be unlockable and openable from within the classroom and shall comply with Section 1010.1.9. of the International Building Code.
2. The classroom door shall be unlockable and openable from outside the classroom by the use of a key or other credential.

704.2.1 Remote operation of locks. Remote operation of locks complying with 704.2 shall be permitted.

Reason:

Part I: Many jurisdictions have taken measures to address the high priority concern of safety of occupants in K-12 classrooms in the event of a threatening situation. While well-intended and likely to have a degree of positive impact, these actions create disparate requirements from jurisdiction to jurisdiction, and some actions may inadvertently compromise certain aspects of life safety while attempting to address others.
This proposal for the IBC provides requirements which balance the challenges of providing protection for students and teachers in the classroom with that of free and immediate egress at all times without use of keys, tools, or special knowledge.

In addition to the security concerns, classroom doors are required to meet accessibility requirements which include door operating hardware configuration and location, door hardware operational forces, and a smooth surface of the bottom 10" of the push side of the door.

Door locksets with "classroom security function" are readily available today at the same cost as traditionally-used "classroom function" door locksets. The most common configuration of a classroom security function lockset is the ability to lock the door from inside the classroom with a key preventing entry to the classroom; and for egress, the door may be unlatched and opened from inside the classroom without a key by rotating the lever handle. On the outside of the classroom, consistent with tradition, the door may be locked with a key, and unlocked and opened with a key.

This code change proposal will require all Group E classroom doors to be lockable from the inside of the classroom preventing entry to the classroom, without the need to open the door. This proposal does not prescribe specifically how the door is to be lockable from inside the classroom.

Additional requirements are the door is to be unlockable and readily openable inside the classroom without the use of a key or special knowledge or effort, as required in IBC Section 1010.1.9. Subsections of 1010.1.9 include requirements for hardware height (between 34 and 48 inches above the floor), and for hardware configuration (for doors required to be accessible, which would be almost all classroom doors, the door operating hardware shall not require tight grasping, tight pinching or twisting of the wrist to operate). An additional requirement of this proposal is the classroom door is to be unlockable and openable from outside the classroom by a key or other lock credential.

Part II: Many jurisdictions have taken measures to address the high priority concern of safety of occupants in K-12 classrooms in the event of a threatening situation. While well-intended and likely to have a degree of positive impact, these actions create disparate requirements from jurisdiction to jurisdiction, and some actions may inadvertently compromise certain aspects of life safety while attempting to address others.
This proposal for the IEBC provides guidance which balances the challenges of providing protection for students and teachers in the classroom with that of free and immediate egress at all times without use of keys, tools, or special knowledge.

In addition to the relatively recent demand to protect students and teachers from outside-the-classroom threats, many classroom doors are required to function as fire-rated doors (opening protectives); and fire-rated doors are required to be always self-latching when closed to ensure the doors perform its fire protection function in the event of a fire. Additionally, classroom doors are required to meet accessibility requirements which include door operating hardware configuration and location, door hardware operational forces, and a smooth surface of the bottom 10" of the push side of the door.

This code change proposal will not require existing Group E classroom doors to be lockable from the inside of the classroom without the need to open the door. This proposal does provide guidance if modifications are made to the door in an effort to control access to the classroom.

This proposal does not prescribe specifically how the door is to be lockable from inside the classroom.
Additional requirements are the door is to be unlockable and readily openable inside the classroom without the use of a key or special knowledge or effort, as required in IBC Section 1010.1.9. Subsections of IBC 1010.1.9 include requirements for hardware height (between 34 and 48 inches above the floor), and for hardware configuration (for doors required to be accessible, which would be almost all classroom doors, the door operating hardware shall not require tight grasping, tight pinching or twisting of the wrist to operate). An additional requirement of this proposal is the classroom door is to be unlockable and openable from outside the classroom by a key or other lock credential.

If the door locking hardware is under consideration for replacement, door locksets with "classroom security function" are readily available today at essentially the same cost as traditionally-used "classroom function" door locksets. The most common configuration of a classroom security function lockset is the ability to lock the door from inside the classroom with a key preventing entry to the classroom; and for egress, the door may be unlatched and opened from inside the classroom without a key by rotating the lever handle. On the outside of the classroom, consistent with tradition, the door may be locked with a key, and unlocked and opened with a key.

Cost Impact:

Part I: Will not increase the cost of construction
No cost impact. Door locksets with the classroom security function are the same cost as traditionally specified door hardware locksets (with the classroom function).

Part II: Will not increase the cost of construction
This proposal does not require retrofitting of existing doors with new hardware. IF door locking hardware replacement is being considered, the requirements of this proposal provide guidance.

E 57-15 : 1010.1.4.4 (New)-WOESTMAN5537

E 58-15

202(New), 1010.1.2, 1010.1.4.5 (New); (IFC[BE] 1010.1.2, 1010.1.4.5 (New))

Proponent: Joseph Hetzel, representing Door & Access Systems Manufacturers Association (Jhetzel@thomasamc.com)

2015 International Building Code

Add new definition as follows:

SECTION 202 DEFINITIONS

HIGH SPEED DOOR. A non-swinging door with a minimum opening rate of 32 inches per second, a minimum closing rate of 24 inches per second, and an automatic closing device.

Add new text as follows:

1010.1.4.5 High speed doors In other than Groups A, E and H occupancies, high speed door assemblies permitted to serve as a component of a means of egress in accordance with Exception 10 to Section 1010.1.2 shall comply with at least one of the following criteria:

1. The door shall be openable by a simple method from either side of the opening without special knowledge or effort. The force required to operate the door shall not exceed 30 pounds (133 N) to set the door in motion.
2. The door assembly shall have an integrated standby power supply, shall be electrically supervised, and shall open to a minimum height of 80 inches (2.03 m) within 10 seconds after activation of the operating device.
3. The door panels shall be capable of being broken out manually in the event of power failure by a simple method from both sides without special knowledge or effort. A minimum 32-inch (813 mm) wide by 80-inch (2.03 m) high opening shall be capable of being provided when the door panels are broken out. The force required to break out the door panels shall not exceed 30 pounds (133 N).

Revise as follows:

1010.1.2 Door swing. Egress doors shall be of the pivoted or side-hinged swinging type.

Exceptions:

1. Private garages, office areas, factory and storage areas with an *occupant load* of 10 or less.
2. Group I-3 occupancies used as a place of detention.
3. Critical or intensive care patient rooms within suites of health care facilities.
4. Doors within or serving a single *dwelling unit* in Groups R-2 and R-3.
5. In other than Group H occupancies, revolving doors complying with Section 1010.1.4.1.
6. In other than Group H occupancies, special purpose horizontal sliding, accordion or folding door assemblies complying with Section 1010.1.4.3.
7. Power-operated doors in accordance with Section 1010.1.4.2.
8. Doors serving a bathroom within an individual *sleeping unit* in Group R-1.
9. In other than Group H occupancies, manually operated horizontal sliding doors are permitted in a *means of egress* from spaces with an *occupant load* of 10 or less.
10. In other than Group A, E and H occupancies, high speed doors complying with Section 1010.1.4.5.

Reason: High speed doors, typically designed as nonswinging doors, have been successfully installed as egress doors. They are often used in locations where pivoted or side-hinged swinging doors are not present.
In order to be found compliant with the IBC other than using the Alternative Methods provisions, high speed doors should be included as an Exception to side-hinged or swinging doors. The exclusion from Groups A, E and H is consistent with the limitation currently applied to using delayed egress locking systems.

The definition proposed for the term "high speed door" is similar in description of action to the definition of the term as contained in the International Energy Conservation Code.

The three options are commonly and successfully used by the high speed door industry where such doors are a component of a means of egress. The requirements in each option are similar to those listed in Section 1010.1.4.3 for special purpose horizontal sliding, accordion and folding door assemblies. Each option is viable in itself, but only one is needed from a cost/benefit standpoint.

Cost Impact: Will not increase the cost of construction
None.

E 58-15 : 1010.1.2-HETZEL4785

E 59-15

1010.1.4.5 (New), 1030.4; (IFC[BE] 1010.1.4.5 (New), 1030.4)

Proponent: Jeffrey Stone, Retired, representing self (JStone7@tampabay.rr.com)

2015 International Building Code

Add new text as follows:

1010.1.4.5 Protection devices for emergency escape and rescue openings In Group R-2 and R-3 occupancies, the temporary installation or closure of storm shutters, panels and other approved hurricane protection devices shall be permitted over emergency escape and rescue openings during the threat of a storm. Such devices shall not be required to comply with the operational constraints of Section 1030.4. When such protection is installed or closed, at least one means of egress from the dwelling unit shall be required.

Revise as follows:

1030.4 Operational constraints. *Emergency escape and rescue openings* shall be operational from the inside of the room without the use of keys or tools. Bars, grilles, grates or similar devices are permitted to be placed over *emergency escape and rescue openings* provided the minimum net clear opening size complies with Section 1030.2 and such devices shall be releasable or removable from the inside without the use of a key, tool or force greater than that which is required for normal operation of the *emergency escape and rescue opening*. Where such bars, grilles, grates or similar devices are installed in existing buildings, *smoke alarms* shall be installed in accordance with Section 907.2.11 regardless of the valuation of the *alteration*.

> **Exception:** Security and hurricane devices shall be permitted to be installed over emergency escape and rescue openings in accordance with Section 1010.1.4.5.

Reason: Opening protection is of major importance during a hurricane event. The proposed modification will assist in safeguarding the public during high wind events. The intent for requiring such openings is to provide an opening of adequate size for the ingress of firefighters wearing full bunker gear and self-contained breathing apparatus. The opening size stipulated is still based on the ability of a fully bunkered firefighter to reach into the window and perform a rescue or to climb into the room. The provisions as currently contained in the code create a conflict between two life safety issues: escape during a fire emergency and structural integrity during a high wind event.

While it is acknowledged there is a risk of fire during a hurricane, structural integrity must be considered the greatest concern. Clearly the damage wrought by hurricanes is wind damage, not fire damage. The provisions related to escape and rescue from bedrooms are based on a scenario where occupants are sleeping and a fire starts in another part of the house. The occupant awakens and finds the fire has blocked access to the primary means of egress. During a hurricane, it is doubtful that the occupants will be sleeping. We also acknowledge the potential for the opening protection to be installed a day or two in advance of a storm and to remain in place a day or two after the storm. However, storm protection devices are not closed or installed unless there is a serious threat of a storm approaching. Should entry by firefighters become necessary, tools to allow rapid entry from outside the structure are available on responding vehicles.

Bibliography: 2013 Florida Building Code (Draft).

Cost Impact: Will not increase the cost of construction
This proposal will not impose an increase to construction or enforcement costs.

E 59-15 : 1008.1.4.5 (New)-STONE5222

E 60-15

1010.1.9.3 (New); (IFC[BE] 1010.1.9.3 (New))

Proponent: Edward Kulik, Chair, representing Building Code Action Committee (bcac@iccsafe.org)

2015 International Building Code

Add new text as follows:

1010.1.9.3 Monitored or recorded egress. Where electrical systems which monitor or record egress activity are incorporated, the locking system shall comply with Sections 1010.1.9.6, 1010.1.9.7, 1010.1.9.8, 1010.1.9.9 or 1010.1.9.10.

Reason: Monitored egress is where an active device requiring credentials is used to monitor who is egressing. The active device could be a card reader, keypad, iris scan, finger scan, etc. A monitored egress device could be utilized on any of the five "special locking arrangements" of Sections 1010.1.9.6, 1010.1.9.7, 1010.1.9.8, 1010.1.9.9 or 1010.1.9.10 provided the functions of that specific locking arrangement are retained and maintained. Examples: a keypad could be installed next to an electromagnetically locked egress door; a card reader could be installed next to a delayed egress door; or a keypad installed in the approach area of a sensor release door. The special locking arrangement would need to fully comply with its requirements.
This public proposal is submitted by the ICC Building Code Action Committee (BCAC). The BCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the BCAC has held 13 open meetings and numerous workgroup calls which included members of the BCAC as well as any interested party to discuss and debate the proposed changes and the public comments. Related documentation and reports are posted on the BCAC website at: http://www.iccsafe.org/cs/BCAC/Pages/default.aspx.

Cost Impact: Will not increase the cost of construction
No cost impact unless the building owner chooses to install a system to monitor or record egress.

E 60-15 : 1010.1.9.3 (New)-KULIK3673

E 61-15

1010.1.9.3 (New); (IFC[BE] 1010.1.9.3 (New))

Proponent: John Woestman, Kellen Company, representing Builders Hardware Manufacturers Association (BHMA) (jwoestman@kellencompany.com)

2015 International Building Code

Add new text as follows:

1010.1.9.3 Monitored or recorded egress. Where electrical systems which monitor or record egress activity are incorporated, the locking system shall comply with Sections 1010.1.9.6, 1010.1.9.7, 1010.1.9.8, 1010.1.9.9 or 1010.1.9.10 or shall be readily openable from the egress side without the use of a key or special knowledge or effort.

Reason: Monitored egress is where an active device requiring credentials is used to monitor who is egressing. The active device could be a card reader, keypad, iris scan, finger scan, etc. A monitored egress device could be utilized on any of the four "special locking arrangements" of Sections 1010.1.9.6, 1010.1.9.7, 1010.1.9.8, or 1010.1.9.9 provided the functions of that specific locking arrangement are retained and maintained. Examples: a keypad could be installed next to an electromagnetically locked egress door; a card reader could be installed next to a delayed egress door; or a keypad installed in the approach area of a sensor release door. The special locking arrangement would need to fully comply with its requirements.
The BHMA members, while conducting a final review of the Building Code Action Committee (BCAC) proposal on the same topic realized the proposed language without the "or shall be readily openable . . . ." phrase could be interpreted as requiring one of the special locking arrangements of 1010.1.9.7, 1010.1.9.8, or 1010.1.9 if a monitored egress system is installed. This added phrase helps to clarify a monitored egress system may also be installed where doors are readily openable, as required in 1010.1.9. We apologize for not catching this nuance in adequate time to offer this suggestion to the BCAC during one of the BCAC meetings.

Cost Impact: Will not increase the cost of construction
No cost impact unless the building owner chooses to install a system to monitor or record egress.

E 61-15 : 1010.1.9.3 (New)-WOESTMAN5543

E 62-15

1010.1.9.3; (IFC[BE] 1010.1.9.3)

Proponent: John Woestman, Kellen Company, representing Builders Hardware Manufacturers Association (BHMA) (jwoestman@kellencompany.com)

2015 International Building Code

Revise as follows:

1010.1.9.3 Locks and latches. Locks and latches shall be permitted to prevent operation of doors where any of the following exist:

1. Places of detention or restraint.
2. In buildings in occupancy Group A having an *occupant load* of 300 or less, Groups B, F, M and S, and in *places of religious worship*, the main door or doors are permitted to be equipped with key-operated locking devices from the egress side provided:
    2.1. The locking device is readily distinguishable as locked.
    2.2. A readily visible durable sign is posted on the egress side on or adjacent to the door stating: THIS DOOR TO REMAIN UNLOCKED WHEN THIS SPACE IS OCCUPIED. The sign shall be in letters 1 inch (25 mm) high on a contrasting background.
    2.3. The use of the key-operated locking device is revokable by the *building official* for due cause.
3. Where egress doors are used in pairs, *approved* automatic flush bolts shall be permitted to be used, provided that the door leaf having the automatic flush bolts does not have a doorknob or surface-mounted hardware.
4. Doors from individual *dwelling* or *sleeping units* of Group R occupancies having an *occupant load* of 10 or less are permitted to be equipped with a night latch, dead bolt or security chain, provided such devices are openable from the inside without the use of a key or tool.
5. *Fire doors* after the minimum elevated temperature has disabled the unlatching mechanism in accordance with *listed fire door* test procedures.
6. <u>Doors serving roofs not intended to be occupied shall be permitted to be locked preventing entry to the building from the roof provided that when accessing the roof from the building the locks do not automatically lock preventing re-entry into the building from the roof.</u>

Reason: Questions are being asked of BHMA members as to what is allowed and / or required for locking of doors to roofs not intended to be occupied. This proposal attempts to address these questions.
The intent of this proposal is to allow doors to roofs not intended to be occupied to be locked preventing access into the building from the roof, especially for security reasons. However, in an effort to prevent locking out an authorized person who goes to the roof from inside the building, this proposal includes a requirement for the door to not automatically lock behind this person.

This proposal does not address locking of doors preventing access to the roof. Also, egress from occupied roofs is addressed in Section 1006.3.

Cost Impact: Will not increase the cost of construction
No costs unless doors providing access to the roof are desired to be locked. If these doors are to be locked, this proposal provides guidance for selecting locking hardware.

E 63-15

1010.1.9.3; (IFC[BE] 1010.1.9.3)

Proponent: Lee Kranz, City of Bellevue, WA, representing The City of Bellevue Washington

2015 International Building Code

Revise as follows:

1010.1.9.3 Locks and latches. Locks and latches shall be permitted to prevent operation of doors where any of the following exist:

1. Places of detention or restraint.
2. In buildings in occupancy Group A having an *occupant load* of 300 or less, Groups B, F, M and S, and in *places of religious worship*, the main door or doors are permitted to be equipped with key-operated locking devices from the egress side provided:
    2.1. The locking device is readily distinguishable as locked.
    2.2. A readily visible durable sign is posted on the egress side on or adjacent to the door stating: THIS DOOR TO REMAIN UNLOCKED WHEN THIS SPACE IS OCCUPIED. The sign shall be in letters 1 inch (25 mm) high on a contrasting background.
    2.3. The use of the key-operated locking device is revokable by the *building official* for due cause.
3. Where egress doors are used in pairs, *approved* automatic flush bolts shall be permitted to be used, provided that the door leaf having the automatic flush bolts does not have a doorknob or surface-mounted hardware.
4. Doors from individual *dwelling* or *sleeping units* of Group R occupancies having an *occupant load* of 10 or less are permitted to be equipped with a night latch, dead bolt or security chain, provided such devices are openable from the inside without the use of a key or tool.
5. *Fire doors* after the minimum elevated temperature has disabled the unlatching mechanism in accordance with *listed fire door* test procedures.
6. <u>Required egress doors serving outdoor areas, other than egress courts, having an occupant load of 300 or less where occupants must use one or more exits or exit access doors to egress through the building are permitted to be equipped with key-operated or thumb-turn lever locking devices. The locking device shall be installed and operated in accordance with all of the following:</u>
    6.1. <u>For other than Group R occupancies, the locking device shall be readily distinguishable as locked.</u>
    6.2. <u>A clear window or glazed door opening, not less than 5 square feet (0.46 m^2) in area, shall be provided in the wall separating the inside of the building from the outdoor area to allow visual confirmation to determine if there are occupants using the outdoor area. The minimum net clear opening height dimension shall be 24 inches (610 mm). The minimum net clear opening width dimension shall be 20 inches (508 mm). The center of the glazed opening shall be located 48 inches (1220 mm) to 60 inches (1525 mm) above the finished floor level.</u>
    6.3. <u>For other than Group R occupancies, a readily visible durable sign is posted on the interior side on or adjacent to the required egress door or doors serving the outdoor area stating: THIS DOOR TO REMAIN UNLOCKED WHEN THE OUTDOOR AREA IS OCCUPIED. The letters on the sign shall be not less than 1 inch (25 mm) high on a contrasting background.</u>
    6.4. <u>The door hardware shall not be capable of locking or unlocking except by the use of a key or thumb-turn lever.</u>
    6.5. <u>The use of key-operated or thumb-turn lever locking devices is revocable by the building official for due cause.</u>

Reason: All outdoor areas that are accessible to and usable by the building occupants, where people must use one or more required exits or exit access doors to re-enter the building, are considered for means of egress purposes to be the same as any occupied room in the building and therefor be provided with free egress at all times. Doors serving outdoor areas must remain unlocked at all times to permit safe egress. To insure security for their building or tenant space, owners and tenants typically want to have locks to be installed on required egress doors serving outdoor areas, even on levels above and below the level of exit discharge. This proposal adresses the issue by allowing these required egress doors to be locked for security purposes as long as all of the listed conditions are met. The proposed code change will apply to all outdoor areas where occupants must egress through the building, including those located at the level of exit dischare and those above or below the level of exit discharge. Group R occupancies are not required to provide distinguishable locks or interior signage as required for all other occupancies.
Important required elements include:

1. a vision panel that would allow someone on the inside of the building to see if there are people using the outside area to reduce the potential for doors serving outdoor areas to be locked,
2. signage on the interior side indicating that the door(s) must remain unlocked when people are using the outdoor area, and
3. the requirement to use door hardware that will prevent the door from accedently locking when someone goes outside.

Cost Impact: Will not increase the cost of construction
Locks are being placed on doors serving outdoor areas illegally. This proposal provides an avenue to install the locks legally as long as certain conditions are met. It should not impact the cost of construction.

E 64-15

1010.1.9.5.1 (IFC[BE] 1010.1.9.5.1)

Proponent: Carl Baldassarra, P.E., FSFPE, Chair, ICC Code Technology Committee, representing Code Technology Committee (CTC@iccsafe.org)

2015 International Building Code

Delete without substitution:

~~**1010.1.9.5.1 (IFC[BE] 1010.1.9.5.1) Closet and bathroom doors in Group R-4 occupancies.** In Group R-4 occupancies, closet doors that latch in the closed position shall be openable from inside the closet, and bathroom doors that latch in the closed position shall be capable of being unlocked from the ingress side.~~

Reason: This is proposed to be deleted because it is an inconsistent requirement. If there is a concern that a person receiving custodial care might lock themselves in a bathroom or closet, this should be required in Group I-1, not just Group R-4. Also, this should not be a overall minimum code requirement, but more an option for a facility to provide where needed. Literally this would applied to storage closets that are not used by residents and closets that you would not walk into at all.

The ICC Code Technology Committee (CTC) has just completed its 10th year. The ICC Board has decided to sunset the CTC. The sunset plan includes re-assigning many of the CTC Areas of Study to the applicable Code Action Committee (CAC). The two remaining CTC Areas of Study are Care Facilities and Elevator Lobbies/WTC Elevator issues. This proposal falls under the Care Facilities Area of Study. Information on the CTC, including: the sunset plan; meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the CTC website at: http://www.iccsafe.org/cs/CTC/Pages/default.aspx.

Cost Impact: Will not increase the cost of construction
This is eliminating a requirement for locks.

1010.1.9.6; (IFC[BE] 1010.1.9.6)

Proponent: Johnna Grizzard, Chesterfield County (Virginia) Department of Building Inspection, representing Virginia Building and Code Officials Association (grizzardj@chesterfield.gov)

2015 International Building Code

Revise as follows:

1010.1.9.6 Controlled egress doors in Groups I-1 and I-2. Electric locking systems, including electro-mechanical locking systems and electromagnetic locking systems, shall be permitted to be locked in the means of egress in Group I-1 or I-2 occupancies where the clinical needs of persons receiving care require their containment or where there is a risk of child abduction from nursery and obstetric areas. Controlled egress doors shall be permitted in such occupancies where the building is equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1 or an *approved automatic smoke* or *heat detection system* installed in accordance with Section 907, provided that the doors are installed and operate in accordance with all of the following:

1. ~~The door locks shall unlock on actuationresult of the automatic sprinkler system or automatic fire detection system.~~A key-operated switch or other manual device is provided adjacent to each door equipped with the locking device. Such switch or other device, when operated, shall result in direct interruption of power to the lock--independent of the *control system* electronics. All clinical staff shall have the keys or other means necessary to operate the locking systems.
2. ~~The door locks shall unlock on loss of power controlling the lock or lock mechanism~~. Loss of power to the lock or locking system shall automatically unlock the dors.
3. The door locking system shall be installed to have the capability of being unlocked by a switch, keypad, or other approved device located at the *fire command center*, a nursing station or other approved location. ~~The switch shall directly break power to the lock.~~All clinical staff shall have the keys, codes or other means necessary to release the locking systems.
4. A building occupant shall not be required to pass through more than one door equipped with a controlled egress locking system before entering an exit.
5. The procedures for unlocking the doors shall be described and approved as part of the emergency planning and preparedness required by Chapter 4 of the *International Fire Code*.
6. ~~All clinical staff shall have the keys, codes or other means necessary to operate the locking systems.~~
7. Emergency lighting shall be provided at the door.
8. The door locking system units shall be listed in accordance with UL 294.

> ~~**Exceptions:**~~
> ~~1. Items 1 through 4 shall not apply to doors to areas occupied by persons who, because of clinical needs, require restraint or containment as part of the function of a psychiatric treatment area.~~
> ~~2. Items 1 through 4 shall not apply to doors to areas where a *listed* egress control system is utilized to reduce the risk of child abduction from nursery and obstetric areas of a Group I-2 hospital.~~

Reason: As currently written, these systems could be designed and installed such that they are totally dependent upon digitally programmed "request to exit" control functions. Loss of power to the control system, programming error, or loss of input-output digital signals could prevent the system from releasing. Where systems are designed to prevent egress from occupied areas, they must be designed with an absolutely positive releasing function only possible by "direct interruption of power to the lock—independent of the control system electronics" (2015 IBC 1010.1.9.8). Similar code language has been used under previous "Special Locking Device" code provisions and is currently used under "Sensor Release of Electrically Locked Egress Doors," Section 1010.1.9.9, "Electromagnetically Locked Egress Doors," Section 1010.1.9.9.

While the code provisions must be adaptable to meet safety and security concerns while enabling the utilization of rapidly changing technology, the basic premise of code development has been providing safe egress for building occupants.

In I-1 and I-2 occupancies, trained staff is always present. So, modifying from the public-accessible special locking locking system bypass required by other egress-controlled conditions (e.g. delayed egress, sensory-release of electromagnetically locked egress doors), to staff-operated, key-secured bypass mechanisms that meet the performance provisions of proposed Items 1 – 7 provides occupant safety while providing greater flexibility to address security concerns.

Strike Item 1: Automatically releasing exit/egress upon fire protection system activation may not provide improved life safety. Releasing the entire locking system upon activation of sprinkler system or fire alarm activation in areas not immediately affecting secured areas could create a greater occupant safety hazard than providing staff-assisted egress or controlled relocation of occupants to protected areas.

Often in I-1/I-2 occupancies, there are secured and unsecured wings/sections. By requiring the doors to unlock upon activation of the fire sprinkler and fire detection system, doors in secured areas could be unlocked even if they are not affected by the event. For example, the sprinkler system piping would have to be subdivided so that there is a different waterflow alarm for each wing. This would provide a defend-in-place design where secured areas would not be unlocked if there was an event on the other side of the floor or building. In other words, based on the current Item 1, the "security zones" would need to coincide with the smoke zones and sprinkler waterflow zones in order to prevent the entire building from unlocking. This would require complicated fire alarm system programming and possibly expensive changes to the sprinkler, smoke-management, and fire alarm designs.

This provision would not prohibit the locking device(s) to unlock upon activation of the fire sprinkler or fire detection system activation, but would remove the requirement to do so while adding the requirement for a device at each door that would manually interrupt power to the lock.

New Item 1: All locking mechanisms preventing passive egress require power to the locking mechanism when locked in order to meet the definition of "fail safe." Locking mechanisms that require power to release the lock function are defined as "fail secure," and are therefore not permitted to be installed in a means of egress. This new provision assures that the power to the lock must be removed without requiring any dependency on "request to exit" digital programming or input signal processing. The provision permitting the use of a keyed switch maintains occupant security and safety directly under the control of trained staff. Where installed correctly to "direct interruption of power to the lock—independent of the control system electronics," the reliability of this circuitry exceeds all other integrated circuit configurations such as digitally-controlled fire alarm system interface.

Revised Item 2: This provision requires egress-controlled locks to be "fail safe." The locking system could be provided with standby power such as a UPS or generator circuit. Hospitals and larger I-1 facilities utilize a generator(s) to power life safety systems, and the locking systems could be integrated into the emergency standby power circuits.

"System" is included in "loss of power to the locking system," because by definition loss of power to a "fail safe" locking mechanism shall release the lock. The important issue is actually loss of power to the locking system. If the lock was tied without power the system may not perform digitally programmed input-output release functions. This language is consistent with Item 2 of "Sensor Release of Electrically Locked Egress Doors," Section 1010.1.9.8 and Item 4 of "Electromagnetically Locked Egress Doors," Section 1010.1.9.9.

Revised Item 3: This provision is significantly different than Item 1, because this item permits the use of a "request to exit" device that is dependent upon digital programming or input signal processing. While a digital device requires system power and programmed input-output logic to perform unlocking functions, which does not meet the definition of "fail safe," this provision provides greater flexibility without requiring a continuous power circuit. Specific areas immediately affected by the hazard could be released while other non-affected areas requiring security or occupant containment could be maintained. This circuit configuration is consistent with typical installations found in special locking systems installed in I-1/I-2 occupancies under current and previous code editions.

Delete Exception 1: This is sufficiently addressed under application provisions "clinical needs of persons receiving care require their containment."

The qualifying conditions to utilize the referenced locking provisions should be sufficient to strictly limit application of restricted egress-only hardware to areas requiring high priority for occupant safety and security.

This exception greatly reduces life safety by omitting the requirement for controlled egress arrangements in areas such as memory care wings from meeting the performance criteria in Items 1-7. With the proposed Items 1-7, means of egress and security can be achieved.

Delete Exception 2: This is relocated to the code section above to be included in the application provisions: "where there exists a risk of child abduction from nursery and obstetric areas."

This exception greatly reduces life safety by omitting the requirement for controlled egress arrangements in areas such as nursery and obstetric areas from meeting the performance criteria in Items 1-7. With the proposed Items 1-7, means of egress and security can be achieved.

Cost Impact: Will not increase the cost of construction
This proposed code modification should actually reduce costs. Providing a key or secure-switch mechanism located adjacent to the door to interrupt a low-voltage circuit would be a minor expense. Permitting digitally controlled release devices to be located remotely provides system design flexibility, which reduces cost. Deleting presently mandated digitally controlled release devices should be a significant a cost reduction.

2015 International Building Code

Revise as follows:

1010.1.9.7 Delayed egress. Delayed egress locking systems shall be permitted to be installed on doors serving any occupancy except Group A, E and H in buildings that are equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1 or an *approvedautomatic smoke* or *heat detection system* installed in accordance with Section 907.

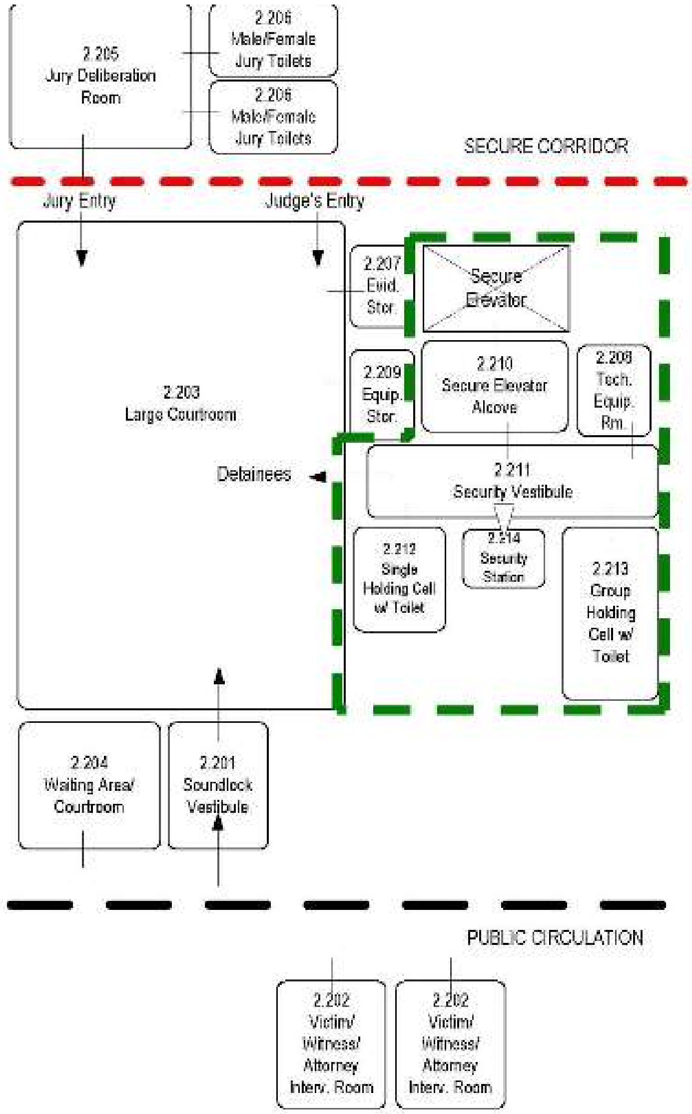
> **Exception:** Delayed egress locking systems shall be permitted to be installed on doors serving courtrooms within a Group A occupancies that are in buildings that are equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1.

1010.1.9.7.1 Delayed egress locking system. The delayed egress locking system shall be installed and operated in accordance with all of the following:

1. The delay electronics of the delayed egress locking system shall deactivate upon actuation of the *automatic sprinkler system* or *automatic fire detection system*, allowing immediate, free egress.
2. The delay electronics of the delayed egress locking system shall deactivate upon loss of power controlling the lock or lock mechanism, allowing immediate free egress.
3. The delayed egress locking system shall have the capability of being deactivated at the f*ire command center* and other *approved* locations.
4. An attempt to egress shall initiate an irreversible process that shall allow such egress in not more than 15 seconds when a physical effort to exit is applied to the egress side door hardware for not more than 3 seconds. Initiation of the irreversible process shall activate an audible signal in the vicinity of the door. Once the delay electronics have been deactivated, rearming the delay electronics shall be by manual means only.
   Exception: Where approved, a delay of not more than 30 seconds is permitted on a delayed egress door.
5. The egress path from any point shall not pass through more than one delayed egress locking system.
   Exception: In Group I-2 or I-3 occupancies, the egress path from any point in the building shall pass through not more than two delayed egress locking systems provided the combined delay does not exceed 30 seconds.
6. A sign shall be provided on the door and shall be located above and within 12 inches (305 mm) of the door exit hardware:
   6.1. For doors that swing in the direction of egress, the sign shall read: PUSH UNTIL ALARM SOUNDS. DOOR CAN BE OPENED IN 15 [30] SECONDS.
   6.2. For doors that swing in the opposite direction of egress, the sign shall read: PULL UNTIL ALARM SOUNDS. DOOR CAN BE OPENED IN 15 [30] SECONDS.
   6.3. The sign shall comply with the visual character requirements in ICC A117.1.
   Exception: Where approved, in Group I occupancies, the installation of a sign is not required where care recipients who because of clinical needs require restraint or containment as part of the function of the treatment area.
7. Emergency lighting shall be provided on the egress side of the door.
8. The delayed egress locking system units shall be listed in accordance with UL 294.

Reason: A courthouse is a unique building type that is designed with three separate and distinct circulation systems – one for the public, one for the judiciary/secure staff, and one for in-custody inmates. The three circulation systems are segregated and they only meet in a single location, the courtrooms. The public enter the courtroom from the public corridor, the judges and court staff enter from the rear secure staff corridor and the prisoners enter from the holding area at the side. Because these groups must be kept separate for security reasons, it is necessary to lock the doors where these groups interface to prevent intermixing.
Standard courtroom design provides free egress for the public out the back of the courtroom with enough egress capacity to handle the entire occupant load of the courtroom. Doors leading to the prisoner interface are locked and fail secure, which is allowed by code. Since the courtrooms have an occupant load greater than 50 (up to approximately 120), these rooms are considered an "assembly occupancy" and require a second means of egress.

Industry practice has been to utilize the exit in the front of the courtroom as the second means of egress. This egress ogenerally also serves as the entrance/egress for the judge and court staff. (Please refer to the attached functional diagram).



Large Courtroom Functional Diagram

To maintain the security separation of occupants, it is industry practice to equip this second means of egress with a delayed egress device which prevents any unauthorized person from gaining access to the secure staff areas.

A courtroom, unlike many other assembly occupancies, is a controlled environment. A bailiff is located within the courtroom when occupied by the public and/or prisoners. The bailiff, along with other court personnel, is equipped with a security access card that can override the delay.

As a precedant, all United States Federal courthouses are designed in this manner because the General Services Administration (the federal organization responsible for federal buildings/courthouses) has ruled that the Life Safety Code takes precedence over the building code with regards to egress requirements.

Another Assembly where it is common to see the use of delayed egress, even though prohibited by code, is airport terminals. Airport terminals are considered an Assembly Occupancy like the courtrooms, but the use of delayed egress devices are common in these buildings also because of security concerns.

Cost Impact: Will not increase the cost of construction
It is common to see these devices used within courthouses. Allowing this will not increase the cost of construction.

   6.3. The sign shall comply with the visual character requirements in ICC A117.1.
   Exception: Where approved, in Group I occupancies, the installation of a sign is not required where care recipients who because of clinical needs require restraint or containment as part of the function of the treatment area.
7. Emergency lighting shall be provided on the egress side of the door.
8. The delayed egress locking system units shall be listed in accordance with UL 294.

Reason: Several requests to address the needs of small educational occupancies to help prevent wandering / elopement, especially for the very young, and for special needs students. This BHMA proposal is an alternate to the BCAC approach to addressing this need for small educational occupancies via a new exception versus a modification to existing language.
The BHMA members, while conducting a final review of the Building Code Action Committee (BCAC) proposal on the same topic realized an alternative approach to allowing Group E occupancies to use delayed egress locking systems may be worth considering. We apologize for not offering this suggestion to the BCAC during one of the BCAC meetings.

Cost Impact: Will not increase the cost of construction
No cost impact unless the building owner chooses to install a delayed egress locking system.

E 67-15 : 1010.1.9.7-WOESTMAN5549

E 68-15

1010.1.9.7; (IFC[BE] 1010.1.9.7)

Proponent: Edward Kulik, Chair, representing Building Code Action Committee (bcac@iccsafe.org)

Revise as follows:

1010.1.9.7 Delayed egress. Delayed egress locking systems shall be permitted to be installed on doors serving ~~any occupancy except Group A, E and H~~ Groups B, F, I, M, R, S and U occupancies in buildings that are equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1 or an *approvedautomatic smoke* or *heat detection system* installed in accordance with Section 907.

> **Exception:**Delayed egress locking systems shall be permitted to be installed on doors serving Group E occupancies that have an occupant load of 10 or fewer and that are in buildings that are equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 or an approved automatic smoke or heat detection system installed in accordance with Section 907..

1010.1.9.7.1 Delayed egress locking system. The delayed egress locking system shall be installed and operated in accordance with all of the following:

1. The delay electronics of the delayed egress locking system shall deactivate upon actuation of the automatic sprinkler system or automatic fire detection system, allowing immediate, free egress.
2. The delay electronics of the delayed egress locking system shall deactivate upon loss of power controlling the lock or lock mechanism, allowing immediate free egress.
3. The delayed egress locking system shall have the capability of being deactivated at the fire command center and other approved locations.
4. An attempt to egress shall initiate an irreversible process that shall allow such egress in not more than 15 seconds when a physical effort to exit is applied to the egress side door hardware for not more than 3 seconds. Initiation of the irreversible process shall activate an audible signal in the vicinity of the door. Once the delay electronics have been deactivated, rearming the delay electronics shall be by manual means only.

    Exception: Where approved, a delay of not more than 30 seconds is permitted on a delayed egress door.

5. The egress path from any point shall not pass through more than one delayed egress locking system.

    Exception: In Group I-2 or I-3 occupancies, the egress path from any point in the building shall pass through not more than two delayed egress locking systems provided the combined delay does not exceed 30 seconds.

6. A sign shall be provided on the door and shall be located above and within 12 inches (305 mm) of the door exit hardware:
    6.1 For doors that swing in the direction of egress, the sign shall read: PUSH UNTIL ALARM SOUNDS. DOOR CAN BE OPENED IN 1530] SECONDS.
    6.2 For doors that swing in the opposite direction of egress, the sign shall read: PULL UNTIL ALARM SOUNDS. DOOR CAN BE OPENED IN 15 [30] SECONDS.
    6.3 The sign shall comply with the visual character requirements in ICC A117.1.

    Exception: Where approved, in Group I occupancies, the installation of a sign is not required where care recipients who because of clinical needs require restraint or containment as part of the function of the treatment area.

7. Emergency lighting shall be provided on the egress side of the door.
8. The delayed egress locking system units shall be listed in accordance with UL 294.

Reason: This proposal is in response to several requests to address the needs of small educational occupancies to help prevent wandering / elopement, especially for the very young, and for special needs students.
This public proposal is submitted by the ICC Building Code Action Committee (BCAC). The BCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the BCAC has held 13 open meetings and numerous workgroup calls which included members of the BCAC as well as any interested party to discuss and debate the proposed changes and the public comments. Related documentation and reports are posted on the BCAC website at: http://www.iccsafe.org/cs/BCAC/Pages/default.aspx.

Cost Impact: Will not increase the cost of construction
No cost impact unless the building owner chooses to install a delayed egress locking system.

E 68-15 : 1010.1.9.7-KULIK3677

E 69-15

1010.1.9.7 (IFC[BE] 1010.1.9.7)

Proponent: Carl Baldassarra, P.E., FSFPE, Chair, ICC Code Technology Committee, representing Code Technology Committee (CTC@iccsafe.org)

2015 International Building Code

Revise as follows:

1010.1.9.7 Delayed egress. Delayed egress locking systems shall be permitted to be installed on doors serving any occupancy except Group A, E and H in buildings that are equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1 or an *approvedautomatic smoke* or *heat detection system* installed in accordance with Section 907. The locking system shall be installed and operated in accordance with all of the following:

1. The delay electronics of the delayed egress locking system shall deactivate upon actuation of the *automatic sprinkler system* or *automatic fire detection system*, allowing immediate, free egress.
2. The delay electronics of the delayed egress locking system shall deactivate upon loss of power controlling the lock or lock mechanism, allowing immediate free egress.
3. The delayed egress locking system shall have the capability of being deactivated at the f*ire command center* and other *approved* locations.
4. An attempt to egress shall initiate an irreversible process that shall allow such egress in not more than 15 seconds when a physical effort to exit is applied to the egress side door hardware for not more than 3 seconds. Initiation of the irreversible process shall activate an audible signal in the vicinity of the door. Once the delay electronics have been deactivated, rearming the delay electronics shall be by manual means only.

   Exception: Where approved, a delay of not more than 30 seconds is permitted on a delayed egress door.
5. The egress path from any point shall not pass through more than one delayed egress locking system.

   ~~Exception~~ Exceptions:

   1. In Group I-2 or I-3 occupancies, the egress path from any point in the building shall pass through not more than two delayed egress locking systems provided the combined delay does not exceed 30 seconds.
   2. In Group I-1 or I-4 occupancies, the egress path from any point in the building shall pass through not more than two delayed egress locking systems provided the combined delay does not exceed 30 seconds and the building is equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1.
6. A sign shall be provided on the door and shall be located above and within 12 inches (305 mm) of the door exit hardware:

   6.1. For doors that swing in the direction of egress, the sign shall read: PUSH UNTIL ALARM SOUNDS. DOOR CAN BE OPENED IN 15 [30] SECONDS.

   6.2. For doors that swing in the opposite direction of egress, the sign shall read: PULL UNTIL ALARM SOUNDS. DOOR CAN BE OPENED IN 15 [30] SECONDS.

   6.3. The sign shall comply with the visual character requirements in ICC A117.1.

   Exception: Where approved, in Group I occupancies, the installation of a sign is not required where care recipients who because of clinical needs require restraint or containment as part of the function of the treatment area.
7. Emergency lighting shall be provided on the egress side of the door.
8. The delayed egress locking system units shall be listed in accordance with UL 294.

Reason: In Item 5, the new exception is proposed to be revised to include Group I-1 occupancies to allow up to two delayed egress systems. As in Group I-2, Group I-1 occupancies may need more than one delayed egress system. For example, if the Group I-1 occupancy is on the 2nd floor, or higher, in a building, a delayed egress system may be needed on the door to the exit stairway on that floor. And a second delayed egress locking system may be needed at the door to the exterior on the ground floor. In Group I-1 and I-4 an additional delayed egress locking system may be highly desirable to help reduce wandering or elopement by occupants.

The ICC Code Technology Committee (CTC) has just completed its 10th year. The ICC Board has decided to sunset the CTC. The sunset plan includes re-assigning many of the CTC Areas of Study to the applicable Code Action Committee (CAC). The two remaining CTC Areas of Study are Care Facilities and Elevator Lobbies/WTC Elevator issues. This proposal falls under the Care Facilities Area of Study. Information on the CTC, including: the sunset plan; meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the CTC website at: http://www.iccsafe.org/cs/CTC/Pages/default.aspx.

Cost Impact: Will increase the cost of construction

This is a design option that would allow two delayed egress locking systems in the means of egress, which would increase costs, but it is not a requirement.

E 69-15 : 1010.1.9.7-BALDASSARRA4291

E 70-15

1010.1.9.8; (IFC[BE] 1010.1.9.8)

Proponent: John Woestman, Kellen Company, representing Builders Hardware Manufacturers Association (BHMA) (jwoestman@kellencompany.com)

2015 International Building Code

Revise as follows:

1010.1.9.8 Sensor release of electrically locked egress doors. The electric locks on sensor released doors located in a *means of egress* in ~~buildings with an occupancy inGroup A, B, E, I-1, I-2, I-4, M, R-1 or R-2~~ any occupancy except Group H and entrance doors to tenant spaces in ~~occupancies in Group A, B, E, I-1, I-2, I-4, M, R-1 or R-2~~ any occupancy except Group H are permitted where installed and operated in accordance with all of the following criteria:

1. The sensor shall be installed on the egress side, arranged to detect an occupant approaching the doors. The doors shall be arranged to unlock by a signal from or loss of power to the sensor.
2. Loss of power to the lock or locking system shall automatically unlock the doors.
3. The doors shall be arranged to unlock from a manual unlocking device located 40 inches to 48 inches (1016 mm to 1219 mm) vertically above the floor and within 5 feet (1524 mm) of the secured doors. Ready access shall be provided to the manual unlocking device and the device shall be clearly identified by a sign that reads "PUSH TO EXIT." When operated, the manual unlocking device shall result in direct interruption of power to the lock—independent of other electronics—and the doors shall remain unlocked for not less than 30 seconds.
4. Activation of the building *fire alarm system*, where provided, shall automatically unlock the doors, and the doors shall remain unlocked until the fire alarm system has been reset.
5. Activation of the building *automatic sprinkler system* or *fire detection system*, where provided, shall automatically unlock the doors. The doors shall remain unlocked until the *fire alarm system* has been reset.
6. The door locking system units shall be listed in accordance with UL 294.

Reason: This proposal revises the occupancy groups to allow this locking arrangement to be used in all occupancies except occupancy Group H. Code officials and specifiers have asked why this door locking option is allowed in only the currently listed occupancy groups. No reason is known other than the current allowed occupancies in Section 1010.1.9.8 are consistent with those in Section 1010.1.9.9, which a separate proposal revises.
Just a reminder, this locking arrangement facilitates immediate egress by sensing the approaching occupant and unlocking the electric lock on the door. In many applications, the occupant is unaware the door is electrically locked as the electrical locks unlock prior to the occupant reaching the door.

Cost Impact: Will not increase the cost of construction
No cost impact unless the building owner chooses to install a delayed egress locking system.

E 70-15 : 1010.1.9.8-WOESTMAN5554

E 71-15

1010.1.9.8 (IFC[BE] 1010.1.9.8)

Proponent: Edward Kulik, Chair, representing Building Code Action Committee (bcac@iccsafe.org)

2015 International Building Code

Revise as follows:

1010.1.9.8 Sensor release of electrically locked egress doors. ~~The~~
Sensor release of electric ~~locks~~locking systems shall be permitted on ~~sensor released~~ doors located in ~~a~~ the *means of egress* ~~in buildings~~ with an occupancy in Group A, B, E, I-1, I-2, I-4, M, R-1 or R-2 ~~and entrance doors to tenant spaces in occupancies in Group A, B, E, I-1, I-2, I-4, M, R-1 or R-2 are permitted~~ where installed and operated in accordance with all of the following criteria:

1. The sensor shall be installed on the egress side, arranged to detect an occupant approaching the doors, and shall cause the electric locking system to unlock.
2. The ~~doors~~electric locks shall be arranged to unlock by a signal from or loss of power to the sensor.
3. Loss of power to the lock or locking system shall automatically unlock the ~~doors~~electiric lock.
4. The doors shall be arranged to unlock from a manual unlocking device located 40 inches to 48 inches (1016 mm to 1219 mm) vertically above the floor and within 5 feet (1524 mm) of the secured doors. Ready access shall be provided to the manual unlocking device and the device shall be clearly identified by a sign that reads "PUSH TO EXIT." When operated, the manual unlocking device shall result in direct interruption of power to the electric lock—independent of other electronics—and the ~~doors~~electric lock shall remain unlocked for not less than 30 seconds.
5. Activation of the building *fire alarm system*, where provided, shall automatically unlock the ~~doors~~electric lock, and the ~~doors~~electric lock shall remain unlocked until the fire alarm system has been reset.
6. Activation of the building *automatic sprinkler system* or *fire detection system*, where provided, shall automatically unlock the ~~doors~~electric lock. The ~~doors~~electric lock shall remain unlocked until the *fire alarm system* has been reset.
7. The door locking system units shall be listed in accordance with UL 294.

Reason: Update 1010.1.9.8 to improve clarity and consistency in the language. The charging language is proposed to eliminate redundancy in this section. With revisions to the first sentence, text late in that sentence is redundant as entrance doors to tenant spaces are commonly in the means of egress. It is uncommon that tenant doors are not in the means of egress.
The revisions to the numbered items is to clarify the required functions of the electric locking system. In Item 1, the added text describes what the sensor is required to do upon detecting an approaching occupant. The revisions in the other items clarify requirements for this electrical locking system.

This public proposal is submitted by the ICC Building Code Action Committee (BCAC). The BCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the BCAC has held 13 open meetings and numerous workgroup calls which included members of the BCAC as well as any interested party to discuss and debate the proposed changes and the public comments. Related documentation and reports are posted on the BCAC website at: http://www.iccsafe.org/cs/BCAC/Pages/default.aspx.

Cost Impact: Will not increase the cost of construction
No cost impact. No technical revisions to these shall be permitted locking systems.

E 71-15 : 1010.1.9.8-KULIK4070

E 72-15

1010.1.9.9, 1010.1.10; (IFC [BE] 1010.1.9.9, 1010.1.10)

Proponent: Edward Kulik, Chair, representing Building Code Action Committee (bcac@iccsafe.org)

2015 International Building Code

Revise as follows:

1010.1.9.9 ~~Electromagnetically~~Door hardware release of electrically locked egress doors. ~~Doors~~ Door hardware release of electric locking systems shall be permiteed on doors in the *means of egress* with any occupancy except in Group H ~~in buildings with an occupancy in GroupA, B, E, I-1, I-2, I-4, M, R-1 or R-2 and doors to tenant spaces in Group A, B, E, I-1, I-2, I-4, M, R-1 or R-2 shall be permitted to be locked with an electromagnetic locking system where equipped with hardware that incorporates a built-in switch and~~ where installed and operated in accordance with all of the following:

1. The door hardware that is affixed to the door leaf has an obvious method of operation that is readily operated under all lighting conditions.
2. The door hardware is capable of being operated with one hand and shall comply with Section 1010.1.9.5.
3. Operation of the door hardware directly interrupts the power to the electromagnetic lock and unlocks the door immediately.
4. Loss of power to the electric locking system automatically unlocks the door.
5. Where *panic* or *fire exit hardware* is required by Section 1010.1.10, operation of the *panic* or *fire exit hardware* also releases the ~~electromagnetic~~electric lock.
6. The locking system units shall be listed in accordance with UL 294.

1010.1.10 Panic and fire exit hardware. Doors serving a Group H occupancy and doors serving rooms or spaces with an *occupant load* of 50 or more in a Group A or E occupancy shall not be provided with a latch or lock other than *panic hardware* or *fire exit hardware*.

Exceptions:

1. A main *exit* of a Group A occupancy shall be permitted to be locking in accordance with Section 1010.1.9.3, Item 2.
2. Doors serving a Group A or E occupancy shall be permitted to be ~~electromagnetically~~ electronically locked in accordance with Section 1010.1.9.9.

Electrical rooms with equipment rated 1,200 amperes or more and over 6 feet (1829 mm) wide, and that contain overcurrent devices, switching devices or control devices with *exit* or *exit access doors*, shall be equipped with *panic hardware* or *fire exit hardware.* The doors shall swing in the direction of egress travel.

Reason: This public proposal is submitted by the ICC Building Code Action Committee (BCAC). The BCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the BCAC has held 13 open meetings and numerous workgroup calls which included members of the BCAC as well as any interested party to discuss and debate the proposed changes and the public comments. Related documentation and reports are posted on the BCAC website at: http://www.iccsafe.org/cs/BCAC/Pages/default.aspx.
This "special locking arrangement" allows for immediate egress with one-handed operation of the door hardware. Code officials and specifiers have asked why this option is allowed in only these occupancies. No reason is known other than the current allowed occupancies in Section 1010.1.9.9 match those in Section 1010.1.9.8.

Further, revisions clarify this section of the code to address required functions of all types of electrical locking systems which are operated (i.e. unlocked) by operation of the door hardware such as panic hardware, fire exit hardware, or door knobs or levers (where panic or fire exit hardware is not required or not utilized). Electromagnetic locks are the most common type of electrical locks, but not the only type of electric locking hardware which may be selected by the designer, specifier, and / or building owner or occupant.

Regardless of the type of electrical locking system, this section permits and requires the door hardware to be device which causes the electrical lock to unlock immediately, allowing egress.

Cost Impact: Will not increase the cost of construction
No cost impact unless the building owner chooses to install these shall be permitted locking systems.

E 72-15 : 1010.1.9.9-KULIK3681

E 73-15

1010.1.9.10 (IFC[BE] 1010.1.9.10)

Proponent: Carl Baldassarra, P.E., FSFPE, Chair, ICC Code Technology Committee, representing Code Technology Committee (CTC@iccsafe.org); Edward Kulik, Chair, Building Code Action Committee (bcac@iccsafe.org)

2015 International Building Code

Revise as follows:

1010.1.9.10 Locking arrangements in buildings within correctional facilities. In ~~occupancies in Groups A-2, A-3, A-4, B, E, F, I-2, I-3, M and S~~buildings within correctional and detention facilities, doors in *means of egress* serving rooms or spaces occupied by persons whose movements are controlled for security reasons shall be permitted to be locked where equipped with egress control devices that shall unlock manually and by not less than one of the following means:

1. Activation of an *automatic sprinkler system* installed in accordance with Section 903.3.1.1.
2. Activation of an *approved manual fire alarm box*.
3. A signal from a *constantly attended location*.

Reason: This section was brought to the attention of the CTC Care committee because Group I-1 services are provided in jails, however, they were not in this list of locking arrangements for correctional facilities. Rather than add Group I-1 to this growing list, it seems more appropriate to state that this type of locking should be allowed in all portions of a correctional facility. In addition, this list of Groups is inconsistent with how correctional facilities is defined in Section 308.5. If this system should not be allowed in certain types of jails, it should be regulated by the Condition, not a list of possible uses.
The ICC Code Technology Committee (CTC) has just completed its 10th year. The ICC Board has decided to sunset the CTC. The sunset plan includes re-assigning many of the CTC Areas of Study to the applicable Code Action Committee (CAC). The two remaining CTC Areas of Study are Care Facilities and Elevator Lobbies/WTC Elevator issues. This proposal falls under the Care Facilities Area of Study. Information on the CTC, including: the sunset plan; meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the CTC website at: http://www.iccsafe.org/cs/CTC/Pages/default.aspx.

The BCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the BCAC has held 13 open meetings and numerous workgroup calls which included members of the BCAC as well as any interested party to discuss and debate the proposed changes and the public comments. Related documentation and reports are posted on the BCAC website at: http://www.iccsafe.org/cs/BCAC/Pages/default.aspx.

Cost Impact: Will not increase the cost of construction
This proposal is a clarification of requirements.

E 73-15 : 1010.1.9.10-BALDASSARRA4289

E 74-15

1010.1.9.11; (IFC[BE] 1010.1.9.11)

Proponent: John Terry, State of New Jersey- DCA, representing State of New Jersey - Department of Community Affairs- Division of Codes and Standards (jterry@dca.nj.gov)

2015 International Building Code

Revise as follows:

1010.1.9.11 Stairway doors. Interior ~~*stairway*~~*means of egress* doors shall be openable from both sides without the use of a key or special knowledge or effort.

Exceptions:

1. *Stairway* discharge doors shall be openable from the egress side and shall only be locked from the opposite side.
2. This section shall not apply to doors arranged in accordance with Section 403.5.3.
3. ~~In *stairways* serving not more than four stories,~~*Stairway* exit doors are permitted to be locked from the side opposite the egress side, provided they are openable from the egress side and capable of being unlocked simultaneously without unlatching upon a signal from the *fire command center* , if present, or a signal by emergency personnel from a single location inside the main entrance to the building.
4. *Stairway exit* doors shall be openable from the egress side and shall only be locked from the opposite side in Group B, F, M and S occupancies where the only interior access to the tenant space is from a single *exit stairway* where permitted in Section 1006.3.2.
5. *Stairway exit* doors shall be openable from the egress side and shall only be locked from the opposite side in Group R-2 occupancies where the only interior access to the *dwelling unit* is from a single *exit stairway* where permitted in Section 1006.3.2.

Reason: As currently written, the 2015 IBC allows stairway doors to be locked from the side opposite egress on stories one through four in Exception 3 of Section 1010.1.9.11 and in high rise buildings (typically seven stories and higher) in Section 403.5.3. By deleting the limitation on the the number of stories in this section, stair doors on the fifth and sixth stories would be allowed to be locked from the non-egress side consistent with doors on all other floors.

Cost Impact: Will not increase the cost of construction
This proposal will have no impact on the cost of construction.

E 74-15 : 1010.1.9.11-TERRY3401

E 75-15

1010.1.9.11; (IFC[BE] 1010.1.9.11)

Proponent: John Woestman, Kellen Company, representing Builders Hardware Manufacturers Association (BHMA) (jwoestman@kellencompany.com)

2015 International Building Code

Revise as follows:

1010.1.9.11 Stairway doors. Interior *stairwaymeans of egress* doors shall be openable from both sides without the use of a key or special knowledge or effort.

Exceptions:

1. *Stairway* discharge doors shall be openable from the egress side and shall only be locked from the opposite side.
2. This section shall not apply to doors arranged in accordance with Section 403.5.3.
3. In *stairways* serving ~~not more than~~ four stories or less, doors are permitted to be locked from the side opposite the egress side, provided they are openable from the egress side and capable of being unlocked simultaneously without unlatching upon a signal from the *fire command center*, if present, or a signal by emergency personnel from a single location inside the main entrance to the building.
4. In other than high-rise buildings, in stairways serving more than four stories, doors are permitted to be locked from the side opposite the egress side, provided they are openable from the egress side and capable of being unlocked simultaneously without unlatching upon a signal from the fire command center, if present, or a signal by emergency personnel from a single location inside the main entrance to the building.
5. *Stairway exit* doors shall be openable from the egress side and shall only be locked from the opposite side in Group B, F, M and S occupancies where the only interior access to the tenant space is from a single *exit stairway* where permitted in Section 1006.3.2.
6. *Stairway exit* doors shall be openable from the egress side and shall only be locked from the opposite side in Group R-2 occupancies where the only interior access to the *dwelling unit* is from a single *exit stairway* where permitted in Section 1006.3.2.

Reason: For means of egress doors in stairways and corresponding stairway re-entry requirements, the IBC has a gap in this section of the code in conjunction with IBC Section 403.5.3: Not addressed in the exceptions to 1010.1.9.11 are stairways serving more than four stories and not a high-rise building. In this proposal, as a starting point for discussion and resolution, we are suggesting the same requirements as in Exception 3. However, consideration of a stairway communication system, as required for high-rise buildings in 403.5.3.1, may be considered for Exception 4. The change in exception 3 is strictly editorial to make the distinction between Exceptions 3 and 4 clear.

BHMA invites participation by stakeholders in refining this proposal.

It should be noted proposed Exception 4 would also apply to buildings of more than four stories with any number of stories below grade which is not a high-rise building. Perhaps buildings with multiple stories below grade should be included in the discussion regarding this proposed code change.

For reference, the definition for a high-rise building from IBC Chapter 2:
HIGH-RISE BUILDING. A building with an occupied floor located more than 75 feet (22 860 mm) above the lowest level of fire department vehicle access.

Cost Impact: Will increase the cost of construction
This proposal has the potential to increase costs of construction. Because the IBC currently has a gap in explicit requirements for doors in stairways serving more than four stories and not a high-rise building, the requirements which may be approved for the 2018 IBC as a result of this proposal may be different than interpretations applied based on the 2015 IBC.

E 75-15 : 1010.1.9.11-WOESTMAN5555

E 76-15

1008.3.3, 1010.1.9.12 (New); (IFC[BE] 1008.3.3, 1010.1.9.12 (New))

Proponent: Lee Kranz, representing Washington Association of Building Officials Technical Code Development Committee

2015 International Building Code

Add new text as follows:

1010.1.9.12 Electronic locking devices on elevator lobby doors. In Group B occupancies, exit access doors within secured elevator lobbies are permitted to be locked with electronic locking devices that operate with items such as a card key, a security code or other security clearance locking devices in buildings that are equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1. The locking system shall be installed and operated in accordance with all the following:

1. Loss of power to the locking system automatically unlocks the door.
2. The doors shall be arranged to unlock from a manual unlocking device located 40 inches to 48 inches (1016 mm to 1219 mm) vertically above the floor and within 5 feet (1524 mm) of the secured doors. Ready access shall be provided to the manual unlocking device and the device shall be clearly identified by a sign that reads "PUSH TO EXIT." When operated, the manual unlocking device shall result in direct interruption of power to the lock—independent of other electronics— and the doors shall remain unlocked for not less than 30 seconds.
   Exception: A manual unlocking device is not required in elevator lobbies provided with direct access to an exit doorway and a two-way communication system is installed in the elevator lobby in accordance with Section 1009.8.
3. Activation of the building alarm system, shall automatically unlock the doors and the doors shall remain unlocked until the fire alarm system has been reset.
4. Activation of the building automatic sprinkler system or fire detection system shall automatically unlock the doors. The doors shall remain unlocked until the fire alarm system has been reset.
5. Emergency egress lighting shall be provided in the secured elevator lobby at the door.
6. The door locking system units shall be listed in accordance with UL 294.
7. The use of electronic locking devices is revocable by the building official for due cause.

Revise as follows:

1008.3.3 Rooms and spaces. In the event of power supply failure, an emergency electrical system shall automatically illuminate all of the following areas:

1. Electrical equipment rooms.
2. Fire command centers.
3. Fire pump rooms.
4. Generator rooms.
5. Public restrooms with an area greater than 300 square feet (27.87 m^2).
6. Secured elevator lobbies where exit access doors are locked with an electronic device in accordance with Section 1010.1.9.12.

Reason: In order to maintain adequate security in office buildings, access to required exits may be limited by securing doors to some areas of the building. With the increasing need for office building security we are seeing the growing use of electronic locking devices on doors along the exit pathway. Many of these installations are being done without a permit and are later discovered by Fire Prevention Officers on their annual inspections. The use of electronic locking devices on elevator lobby exit access doors is a reality that must be addressed in the code for office and technology buildings. To maintain an unobstructed and undiminished path of exit travel, criteria for acceptance of these locking devices must be established to preserve the level of building safety intended by the International Building Code.

Cost Impact: Will not increase the cost of construction
Lobby doors locks are being installed without the benefit of a permit. This proposal will legitimize the use of security door locking systems thereby saving money by eliminating the need for retrofit after the original unpermitted installation.

Staff note: The number of means of egress from an elevator lobby is addressed in Section 3006.4.

E 76-15 : 1010.1.9.12 (New)-KRANZ3765

E 77-15

1010.1.10; (IFC[BE] 1010.1.10)

Proponent: William Koffel, representing WonDoor (wkoffel@koffel.com)

2015 International Building Code

1010.1.10 Panic and fire exit hardware. ~~Doors~~
Swinging doors serving a Group H occupancy and swinging doors serving rooms or spaces with an *occupant load* of 50 or more in a Group A or E occupancy shall not be provided with a latch or lock other than *panic hardware* or *fire exit hardware*.

Exceptions:

1. A main *exit* of a Group A occupancy shall be permitted to be locking in accordance with Section 1010.1.9.3, Item 2.
2. Doors serving a Group A or E occupancy shall be permitted to be electromagnetically locked in accordance with Section 1010.1.9.9.

Electrical rooms with equipment rated 1,200 amperes or more and over 6 feet (1829 mm) wide, and that contain overcurrent devices, switching devices or control devices with *exit* or *exit access doors*, shall be equipped with *panic hardware* or *fire exit hardware*. The doors shall swing in the direction of egress travel.

Reason: UL 305 is the standard by which panic and fire exit hardware is typically listed. UL 305 applies to outward-opening doors and as such does not apply to the special doors addressed in Section 1010.1.4. However, some have interpreted the current text in 1010.1.10 to require panic hardware or fire exit hardware on special doors, such as special purpose horizontal sliding, accordian or folding doors. The proposed text clarifies that panic and fire exit hardware is required for pivoted or side-hinged swinging doors.

Cost Impact: Will not increase the cost of construction
The proposal clarifies existing code text.

E 77-15 : 1010.1.10-KOFFEL4840

E 78-15

1010.1.10; (IFC[BE] 1010.1.10)

Proponent: John Woestman, Kellen Company, representing Builders Hardware Manufacturers Association (BHMA) (jwoestman@kellencompany.com)

2015 International Building Code

Revise as follows:

1010.1.10 Panic and fire exit hardware. Doors serving a Group H occupancy and doors serving rooms or spaces with an *occupant load* of 50 or more in a Group A or E occupancy shall not be provided with a latch or lock other than *panic hardware* or *fire exit hardware*.

Exceptions:

1. A main *exit* of a Group A occupancy shall be permitted to be locking in accordance with Section 1010.1.9.3, Item 2.
2. Doors provided with panic hardware or fire exit hardware and serving a Group A or E occupancy shall be permitted to be ~~electromagnetically~~electrically locked in accordance with Section 1010.1.9.8 or 1010.1.9.9.

Electrical rooms with equipment rated 1,200 amperes or more and over 6 feet (1829 mm) wide, and that contain overcurrent devices, switching devices or control devices with *exit* or *exit access doors*, shall be equipped with *panic hardware* or *fire exit hardware*. The doors shall swing in the direction of egress travel.

Reason: Revised 2nd exception allows doors in the means of egress of Group A or E occupancy with an occupant load of 50 or more to be equipped with doors complying with IBC Section 1010.1.9.8 Sensor release of electrically locked doors. These door locking systems permitted by 1010.1.9.8 are required to detect an occupant approaching the door and cause the electrical locking system to unlock the door, allowing egress.
These locking arrangements facilitate immediate egress by sensing the approaching occupant and unlocking the electric lock on the door. In many applications, the occupant is unaware the door is electrically locked as the electrical locks unlock prior to the occupant reaching the door.

Cost Impact: Will not increase the cost of construction
No cost impact unless the building owner chooses to install a sensor release of electrically locked doors locking system.

E 78-15 : 1010.1.10-WOESTMAN5556

E 79-15

1010.1.10; (IFC[BE] 1010.1.10)

Proponent: Lee Kranz, City of Bellevue, WA, representing Washington Association of Building Officials Technical Code Development Committee

2015 International Building Code

Revise as follows:

1010.1.10 Panic and fire exit hardware. Doors serving a Group H occupancy and doors serving rooms or spaces with an *occupant load* of 50 or more in a Group A or E occupancy shall not be provided with a latch or lock other than *panic hardware* or *fire exit hardware*.

Exceptions:

1. A main *exit* of a Group A occupancy shall be permitted to be locking in accordance with Section 1010.1.9.3, Item 2.
2. Doors serving a Group A or E occupancy shall be permitted to be electromagnetically locked in accordance with Section 1010.1.9.9.
3. <u>Doors serving Group A occupancies with an occupant load of 100 or fewer and accessory to Group B occupancies are not required to be provided with panic hardware or fire exit hardware.</u>

Electrical rooms with equipment rated 1,200 amperes or more and over 6 feet (1829 mm) wide, and that contain overcurrent devices, switching devices or control devices with *exit* or *exit access doors*, shall be equipped with *panic hardware* or *fire exit hardware*. The doors shall swing in the direction of egress travel.

Reason: The new exception #1 allows smaller Group A occupancies, such as conference rooms, which are accessory to Group B occupancies, such as office spaces, not to have panic hardware. In these mixed occupancies panic hardware on all doors serving the Group A occupancy, including all doors on the egress path, is not practical or needed. Typicaly the people using the conference room are the same people who occupy the office spaces.

Cost Impact: Will not increase the cost of construction
The new exception will reduce the cost of construction by exempting panic hardware in some cases. Panic hardware is typically more expensive than regular door hardware.

2015 International Building Code

Revise as follows:

1010.1.10 Panic and fire exit hardware. Doors serving a Group H occupancy and doors serving rooms or spaces with an *occupant load* of 50 or more in a Group A or E occupancy shall not be provided with a latch or lock other than *panic hardware* or *fire exit hardware*.

Exceptions:

1. A main *exit* of a Group A occupancy shall be permitted to be locking in accordance with Section 1010.1.9.3, Item 2.
2. Doors serving a Group A or E occupancy shall be permitted to be electromagnetically locked in accordance with Section 1010.1.9.9.

~~Electrical rooms with equipment rated 1,200 amperes or more and over 6 feet (1829 mm) wide, and that contain overcurrent devices, switching devices or control devices with *exit* or *exit access doors*, shall be equipped with *panic hardware* or *fire exit hardware*. The doors shall swing in the direction of egress travel.~~

Add new text as follows:

1010.1.10.1 Electric rooms and working spaces. Exit and exit access doors serving electrical rooms and working spaces shall swing in the direction of egress travel and shall be equipped with panic hardware or fire exit hardware where such rooms or working spaces contain one or more of the following:

1. Equipment operating at more than 600 volts, nominal.
2. Equipment operating at 600 volts or less, nominal and rated at 800 amperes or more, and where the equipment contains overcurrent devices, switching devices or control devices.

Exception: Panic and fire exit hardware is not required on exit and exit access doors serving electrical equipment rooms and working spaces where such doors are not less than twenty-five feet (7.6 m) from the nearest edge of the electrical equipment.

Reason: This submittal to 2015 (2018) International Building Code® (IBC®) 1010.1.10, with proposed additional wording and deletion of existing wording, is offered to align the 2015 (2018) IBC® and the 2014 NFPA 70® National Electrical Code® (2014 NEC®), and therefore create uniformity.
The additional words "and working spaces" will incorporate other areas of a structure where electrical equipment is installed. Not all electrical equipment is installed in dedicated rooms, as it may be installed in an area of a room in which other equipment, other than electrical equipment, is installed, and that room has access to and egress from doors. The 2014 NEC® considers twenty-five (25) feet (7.6m) a safe distance from electrical equipment in the event of an arc-flash, as the concern is to allow an injured worker to safely and quickly exit the room or working space without having to turn knobs or pull doors. This wording will create uniformity and better clarity between the 2015 (2018) IBC® and 2014 NEC®.

The additional words "operating at more than 600 volts, nominal, and equipment operating at 600 volts or less, nominal, and" will incorporate the two (2) nominal voltages listed in 2014 NEC® Article 110, Requirements for Electrical Installations. "Over 600 volts, nominal" does not have a minimum ampere rating in the 2014 NEC®, unlike "under 600 volts, nominal" with the ampere rating, so the distinction should be made between between the nominal voltages.

The ampere rating has been reduced from 1200 amperes to 800 amperes, for equipment operating under 600 volts, nominal, in 2014 NEC®. This change from 1200 amperes to 800 ampres would again create uniformity and clarity between the 2015 (2018) IBC® and 2014 NEC®.

The words "over 6 feet (1829mm) wide", are not in the 2008 NEC®, 2011 NEC®, and 2014 NEC®. The elimination of these words would create uniformity and clarity between the 2015 (2018) IBC® and 2014 NEC®.

The 2014 NEC® uses the term "listed panic hardware". The 2015 IBC® addresses the "listed" requirement in 1010.1.10.1, so it appears that the "listed requirement" has been adequately addressed, and therefore no proposed change to 1010.1.10.1 is submitted.

The submitted wording for the code change(s) is consistent with NFPA 70® 2014 NEC® Handbook sections and commentary as code text. In consideration of their copyright, all credit for code text pertaining to electrical is given to NFPA®. This statement is made in association with my Standard Copyright Form acceptance/acknowledgement.

Page 42 Article 110 Requirements for Electrical Installations II. 600 Volts, Nominal, or Less 110.26 Spaces About Electrical Equipment (C) Entrance to and Egress from Working Space (3) Personnel Doors *ie:* ***110.26 (C) (3)***

www.nfpa.org

Cost Impact: Will increase the cost of construction
The cost to construction may be increased if there is a entrance to or egress from door(s), that is less than twenty-five feet from the nearest edge of the equipment. That door(s) would require panic hardware or fire exit hardware, based on 2015 (2018) IBC 1010.1.10.1. This only pertains to the "working space" area, as the doors in dedicated room(s) for electrical equipment already require the panic/fire exit hardware.
The panic hardware for a single-door could cost +/- $250.00 plus labor and the panic hardware for a 2-door (double-door)(vertical rod type) installation could cost +/- $430.00 plus labor. These cost estimates are based on: Commercial Standard Duty, Aluminum, Fire Rated, ADA Compliant, ANSI/BHMA A156.3 Grade 1, "Rim Exit Device", as found on the Grainger website:

http://www.grainger.com/category/exit-devices/door-hardware/hardware/ecatalog/N-mew?cm_sp=CS_Products-_-Hardware-_-ExitDevices

Actual cost would be related to individual preferences used in "Structure Design Specifications", as provided for each construction project.

1010.3, 1010.3.2 (New), 1010.3.1, 1010.3.2; (IFC[BE] 1010.3, 1010.3.2 (New), 1010.3.1, 1010.3.2)

Proponent: Dave Frable, representing US General Services Administration

2015 International Building Code

Revise as follows:

1010.3 Turnstiles~~.~~ and Similar Devices Turnstiles or similar devices that restrict travel to one direction shall not be placed so as to obstruct any required *means of egress*, except where permitted in accordance withSections 1010.3.1, 1010.3.2 and 1010.3.3.

~~**Exception:**~~**1010.3.1** **Capacity.** Each turnstile or similar device shall be credited with a capacity based on not more than a 50-person occupant load where all of the following provisions are met:

1. Each device shall turn free in the direction of egress travel when primary power is lost and on the manual release by an employee in the area.
2. Such devices are not given credit for more than 50 percent of the required egress capacity or width.
3. Each device is not more than 39 inches (991 mm) high.
4. Each device has not less than 161/ 2 inches (419 mm) clear width at and below a height of 39 inches (991 mm) and not less than 22 inches (559 mm) clear width at heights above 39 inches (991 mm).

1010.3.1.1 **Clear width.** Where located as part of an accessible route, turnstiles shall have not less than 36 inches (914 mm) clear at and below a height of 34 inches (864 mm), not less than 32 inches (813 mm) clear width between 34 inches (864 mm) and 80 inches (2032 mm) and shall consist of a mechanism other than a revolving device.

Add new text as follows:

1010.3.2 **Security access turnstiles** Security access turnstiles that inhibit travel in the direction of egress utilizing a physical barrier shall be permitted to be considered as a component of the means of egress, provided that all the following criteria are met:

1. The building is protected throughout by an approved, supervised automatic sprinkler system in accordance with Section 903.3.1.1.
2. Each security access turnstile lane configuration has a minimum clear passage width of 22 inches (560 mm).
3. Any security access turnstile lane configuration providing a clear passage width of less than 32 inches (810 mm) shall be credited with a maximum egress capacity of 50 persons.
4. Any security access turnstile lane configuration providing a clear passage width of 32 in. (810 mm) or more shall be credited with a maximum egress capacity as calculated in accordance with Section 1005.
5. Each secured physical barrier shall automatically retract or swing to an unobstructed open position in the direction of egress, under each of the following conditions:
   - 5.1. Upon loss of power to the turnstile or any part of the access control system that secures the physical barrier.
   - 5.2. Upon actuation of a readily accessible and clearly identified manual release device that results in direct interruption of power to each secured physical barrier, remains in the open position for not less than 30 seconds.
     The manual release decice shall be positioned at one of the following locations:
     - 5.2.1. The manual release device is located on the egress side of each security access turnstile lane.
     - 5.2.2. The manual release device is located at an approved location where it can be actuated by an employee assigned to the area at all times that the building is occupied.
   - 5.3. Upon actuation of the building fire alarm system, if provided, the physical barrier remains in the open position until the fire alarm system is manually reset.
     Exception: Actuation of a manual fire alarm boxes.
   - 5.4. Upon actuation of the building automatic sprinkler or fire detection system, and for which the physical barrier remains in the open position until the fire alarm system is manually reset.

Revise as follows:

~~1010.3.1~~**1010.3.3** **High turnstile.** Turnstiles more than 39 inches (991 mm) high shall meet the requirements for revolving doors or the requirements of Section 1010.3.2 for security access turnstiles.

~~1010.3.2~~**1010.3.4** **Additional door.** Where serving an *occupant load* greater than 300, each turnstile that is not portable shall have a side-hinged swinging door that conforms to Section 1010.1 within 50 feet (15 240 mm).

Exception: A side-hinged swinging door is not required at security access turnstiles that comply with Section 1010.3.2.

Reason: Manufacturers of turnstile devices have expanded into the security access control market and currently have products that have physical barrier leaves that restrict access into and out of buildings. These devices can vary in height and sophistication to address building security concerns that may not meet safety requirements related to the means of egress. Typically, these turnstile devices are located at building entrances and elevator lobbies. The current requirements for turnstiles apply historically to the "three arm" waist-high turnstiles for entertainment or transportation venues and do not apply to the new installations. Currently, the building official is left to evaluate these new modern turnstiles to determine compliance with the egress requirements in the IBC. The intent of the revision is to provide guidance on evaluating these new modern turnstiles. Turnstiles on the market can be as narrow as 22 inches. For turnstiles that are less than 32 inches, there are additional capacity issues that need to be considered. The fail safe provisions for overriding the turnstile access restrictions are derived from existing code provisions (e.g., delayed egress locks and forces to open doors).

Cost Impact: Will increase the cost of construction
The intent of this code change is to provide additional requirements for new modern turnstiles used for security access in buildings. This code change will probbaly increase construction costs due to these new requirements; however, the new requirments will enhance overall building safety when these security access turnstiles are installed in a building.

E 82-15

1011.6; (IFC[BE] 1011.6)

Proponent: Gregory Keeler, representing Self (design_tech@windstream.net)

2015 International Building Code

Revise as follows:

1011.6 Stairway landings. There shall be a floor or landing at the top and bottom of each *stairway*. The width of landings shall be not less than the width of *stairways* served. Every landing shall have a minimum width measured perpendicular to the direction of travel equal to the width of the *stairway*. Where the *stairway* has a straight run the depth ~~need not exceed~~shall be a minimum of 48 inches (1219 mm). Doors opening onto a landing shall not reduce the landing to less than one-half the required width. When fully open, the door shall not project more than 7 inches (178 mm) into a landing. Where *wheelchair spaces* are required on the *stairway* landing in accordance with Section 1009.6.3, the *wheelchair space* shall not be located in the required width of the landing and doors shall not swing over the *wheelchair spaces*.

> **Exception:** Where *stairways* connect stepped *aisles* to cross *aisles* or concourses, *stairway* landings are not required at the transition between *stairways* and stepped *aisles* constructed in accordance with Section 1029.

Reason: The current code language does not establish a minimum depth/run for a landing due to the permissive language. This proposal will stipulate the minimum depth/run.

Cost Impact: Will not increase the cost of construction
There could be a very slight increase in contruction costs if the current language isn't interpreted as establishing a minimum landing depth/run.

E 82-15 : 1011.6-KEELER4710

E 83-15

1011.4; (IFC[BE] 1011.4)

Proponent: David Cooper, representing Stairbuilders and Manufacturers Association (coderep@stairways.org)

2015 International Building Code

Revise as follows:

1011.4 Walkline. The walkline across *winder* treads shall be concentric to the direction of travel through the turn and located 12 inches (305 mm) from the side where the *winders* are narrower. Where the winders continue beyond the turn within the straight segments of a flight the walkline shall continue parallel to the side of the stair where the winders are narrower. The 12-inch (305 mm) dimension shall be measured from the widest point of the clear *stair* width at the walking surface of the *winder*. Where *winders* are adjacent within the *flight*, the point of the widest clear *stair* width of the adjacent *winders* shall be used.

Reason: The current code does not adequately address how the walkline is located where winders continue beyond the corner of a turn. (see figure A) A portion of the winder treads often extend into the straight segments of the flight where the walkline is not concentric to the turn but parallel to the side of the stairway. This change provides the needed clarification to accurately determine the walkline location.

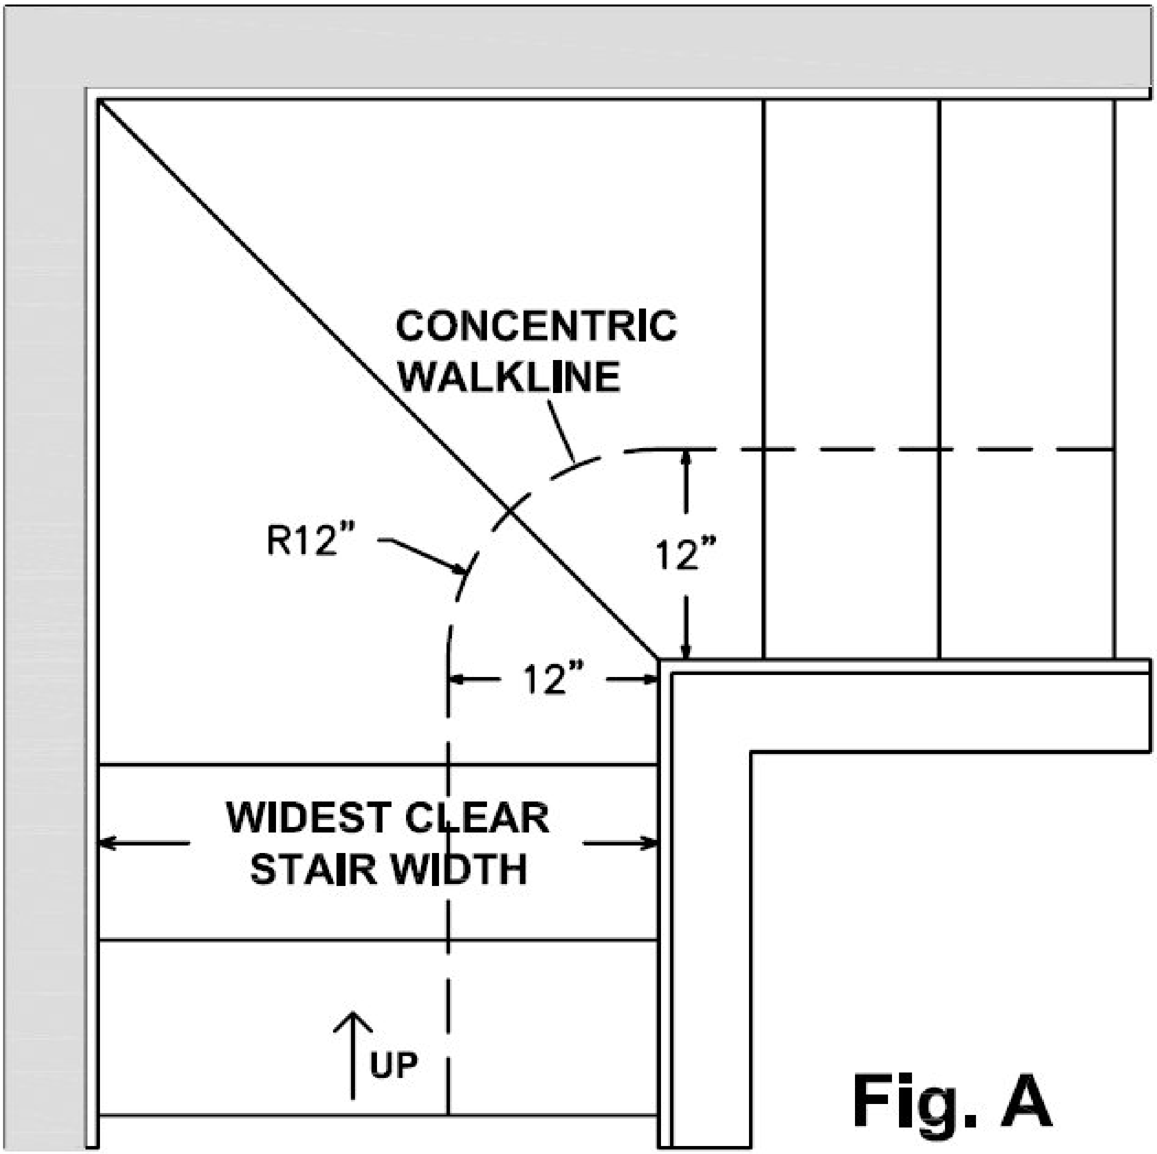

Fig. A

Cost Impact: Will not increase the cost of construction
This proposal only clarifies the code and will require no additional resources affecting the cost of construction.

E 83-15 : 1011.4-COOPER5237

E 84-15

1011.10; (IFC[BE] 1011.10)

Proponent: David Cooper, representing Stairbuilders and Manufacturers Association (coderep@stairways.org)

2015 International Building Code

Revise as follows:

1011.10 Spiral stairways. *Spiral stairways* are permitted to be used as a component in the *means of egress* only within *dwelling units* or from a space not more than 250 square feet (23 m^2) in area and serving not more than five occupants, or from *technical production areas* in accordance with Section 410.6.

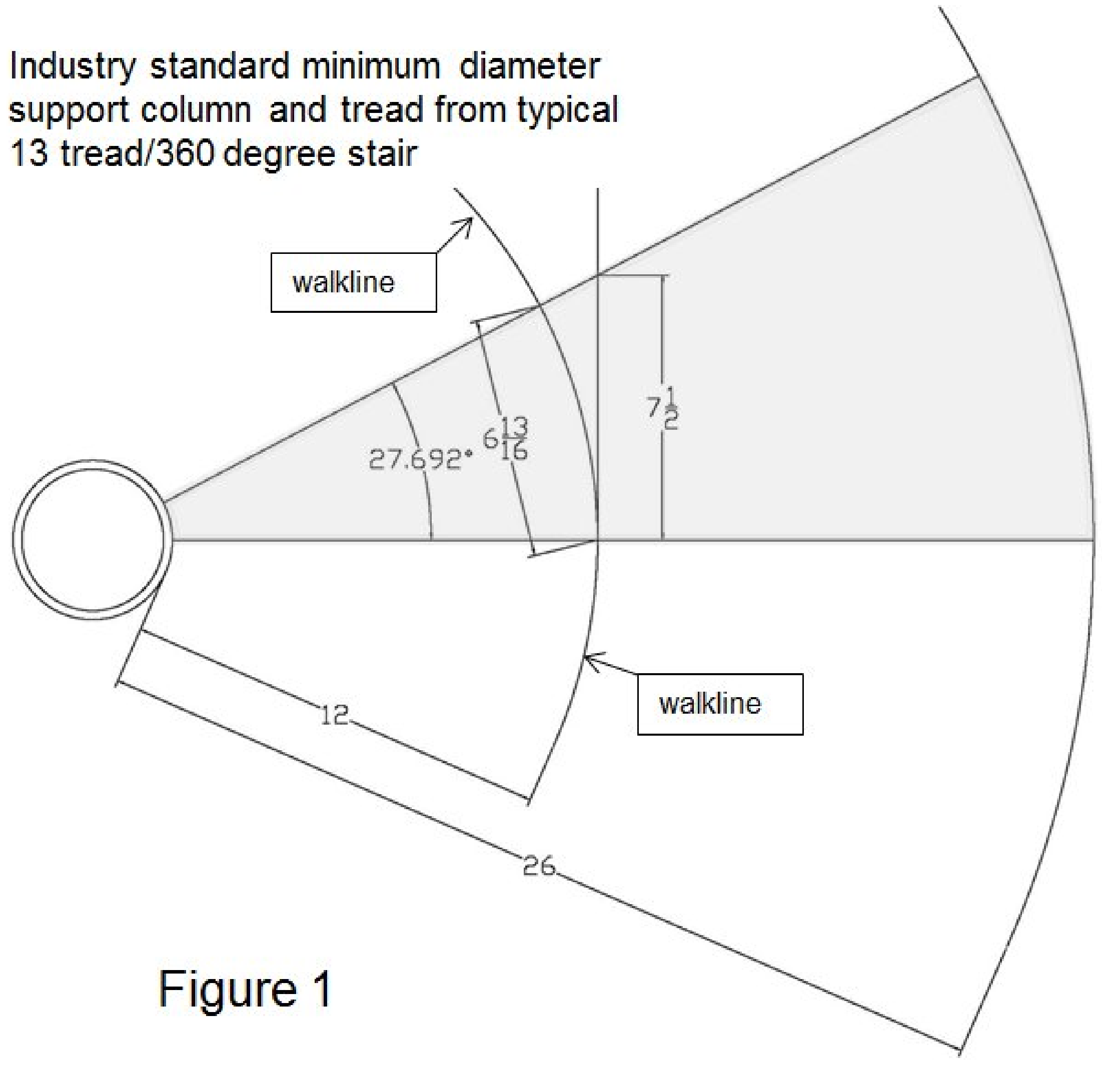
A *spiral stairway* shall have a ~~7 1/2~~ 6 3/4 inch (~~191~~ 171 mm) minimum clear tread depth at a point 12 inches (305 mm) from the ~~narrow edge~~walkline. The risers shall be sufficient to provide a headroom of 78 inches (1981 mm) minimum, but riser height shall not be more than 9 1/2 inches (241 mm). The minimum stairwayclearwidth at and below the handrail shall be 26 inches (660 mm).

Reason: We will try again in this cycle to prevent the elimination of spiral stairways!
A similar proposal was submitted in the last cycle that was misunderstood and inappropriately disapproved.

Prior to the addition of **1011.4 Walkline** and related changes in **1011.5.2 Riser height and tread depth,** the tread depth of both rectangular treads and winder treads was measured "square to the leading edge". This measurement method and the 7½ inch tread depth for spiral stairs predates the ICC codes. Since that time the method fo measuring spiral stair tread depth, inthe code, has changed with the definition of winder. Spiral treads are winder treads as defined in the code.

Winder. A tread with nonparallel edges

Winder tread depth is measured "...between the vertical planes of the foremost projection of adjacent treads at the intersections with the walkline...". The change in the method of measurement results in a smaller dimension, for the same tread, that is ¾ inch smaller intread depth as illustrated in figure 1. The figure also illustates the elemants of spiral stair tread geometry. What is critical to understand is that if the code is not changed, each tread in the typical spiral stairway would need to be increased by ¾ inch from the longstanding accepted practice.



Caption: This standard layout assures accomodation of the required headroom as the stair passes under the typical platform at the top of the stairway.

Why does the spiral tread depth need to be increased?

The proposed dimension change from 7½ to 6¾ inches results in no change and preserves what has been the industry standard for the manufacture of spiral stairways since the legacy codes. Not to stir the pot but the spiral stairway code survived the long debate and compromise on tread depth without change for good reason. Spiral stairways were discussed in the debate and remain unchanged, in the code because of their recognized benefit of saving space in certain limited situations. One of the limited areas is within residential dwelling units. A similar proposal changing the tread depth from 7½ inches to 6¾ inches was approved in the 2015 cycle of the IRC. Why not continue to coordinate? There is no substantiation for the action taken in the last cycle to change this long standing standard, and gravely restrict manufactures.

On what grounds should spiral stairs be eliminated?

Not approving this proposal will result in undue costs for the limited number of stairs that will comply with code when the riser height can be maximized. Please keep in mind that no substantiation was presented of the need for increased tread depth in spiral stairways. In fact spiral stairs actually have deeper treads than most stairs, adjacent to the handrail on the outside where the user walks. The currently required, additional ¾ inches of tread depth increase, inadvertently approved in the last cycle, and changed in the long accepted standard for a typical 360 degreee stairway will add more than one and one third treads to to each 13 tread stairway rotation. This will increasing the rotation by more than 36 degrees or 10% making it impossible in most situations to achieve the required headroom of 78 inches. **Unchanged the IBC will all but eliminate spiral stairways. Please approve this proposal.**

Cost Impact: Will not increase the cost of construction
In fact as proven in the supporting statement above, this proposal will drastically reduce the cost of construction by not eliminating space saving spiral stairs from most applications where the intent of the code is to allow their use. Space saved = $ saved.

E 84-15 : 1011.10-COOPER5239

E 85-15

1011.11, 1014.1; (IFC[BE] 1011.11, 1014.1)

Proponent: David Cooper, representing Stairbuilders and Manufacturers Association (coderep@stairways.org)

2015 International Building Code

Revise as follows:

1011.11 Handrails. ~~*Stairways*~~<u>*Flights of stairways*</u> shall have *handrails* on each side and shall comply with Section 1014. Where glass is used to provide the *handrail*, the *handrail* shall comply with Section 2407.

Exceptions:

1. ~~*Stairways*~~<u>*Flights of stairways*</u> within dwelling units and <u>flights of</u> s*piral stairways* are permitted to have a *handrail* on one side only.
2. Decks, patios and walkways that have a single change in elevation where the landing depth on each side of the change of elevation is greater than what is required for a landing do not require *handrails*.
3. In Group R-3 occupancies, a change in elevation consisting of a single riser at an entrance or egress door does not require *handrails*.
4. Changes in room elevations of three or fewer risers within dwelling units and sleeping units in Group R-2 and R-3 do not require *handrails*.

1014.1 Where required. *Handrails* serving <u>flights of</u>*stairways*, *ramps*, stepped *aisles* and ramped *aisles* shall be adequate in strength and attachment in accordance with Section 1607.8. *Handrails* required for <u>*flights of*</u> *stairways* by Section 1011.11 shall comply with Sections 1014.2 through 1014.9. *Handrails* required for *ramps* by Section 1012.8 shall comply with Sections 1014.2 through 1014.8. *Handrails* for stepped *aisles* and ramped *aisles* required by Section 1029.15 shall comply with Sections 1014.2 through 1014.8.

Reason: Other than required handrail extensions, handrails are not required at the outside periphery of landings. However long before we get to **1014.6 Handrail extensions,** the use of the defined term "stairways" in sections **1011.11** and **1014.1,** supports the interpretation that handrails are required at landings because by definition a stairway includes landings.

> **Stairway.** One or more flights of stairs, either exterior or interior, with the necessary landings and platforms connecting therm, to form a continuous and uninterrupted passage from one level to another.

The problem becomes more apparent when we look at **1014.4 Continuity**. Unlike continuity in the IRC there is no limit related to the flight. Confusion is created when 1014.4 is considered with the other handrail section references to stairways as revised in the proposal above. This is a particular problem when considering residential applications.

This propsal provides a simple solution by substituting the correct term "flights of stairways" for "stairways" and clarifies the intent of the code. The term flights of stairways is used throughout the code and in particular within **1014.6 Handrail extensions**.

Cost Impact: Will not increase the cost of construction
This proposal requires no additional resources and therefore does not affect the cost of construction.

E 85-15 : 1011.11-COOPER5254

E 86-15

1011.16 (IFC[BE] 1011.16)

Proponent: Edward Kulik, Chair, representing Building Code Action Committee (bcac@iccsafe.org)

2015 International Building Code

Revise as follows:

1011.16 Ladders. Permanent ladders shall not serve as a part of the *means of egress* from occupied spaces within a building. Permanent ladders shall be constructed in accordance with Section 306.5 of the *International Mechanical Code*. Permanent ladders shall be permitted to provide access to the following areas:

1. Spaces frequented only by personnel for maintenance, repair or monitoring of equipment.
2. Nonoccupiable spaces accessed only by catwalks, crawl spaces, freight elevators or very narrow passageways.
3. Raised areas used primarily for purposes of security, life safety or fire safety including, but not limited to, observation galleries, prison guard towers, fire towers or lifeguard stands.
4. Elevated levels in Group U not open to the general public.
5. Nonoccupied roofs that are not required to have *stairway* access in accordance with Section 1011.12.1.
6. ~~Ladders shall be constructed~~ Where permitted to access equipment and appliances in accordance with Section 306.5 of the *International Mechanical Code*.

Reason: Section 306.5 of the IMC provides guidance on where ladders can be used to access equipment and for the technical criteria to construct the ladder (see the reason of the original change for text). The concern is the exact wording of Section 1009.18, Item 6. The list in Section 1011.6 is locations where ladders can be used. Item 6 is revised to limit the reference to where the ladders are permitted in IMC Section 306.5. How ladders are to be constructed is moved to the base paragraph so it is clear what technical requirements are to be followed where a ladder is provided in any of the 6 locations.
This public proposal is submitted by the ICC Building Code Action Committee (BCAC). The BCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the BCAC has held 13 open meetings and numerous workgroup calls which included members of the BCAC as well as any interested party to discuss and debate the proposed changes and the public comments. Related documentation and reports are posted on the BCAC website at: http://www.iccsafe.org/cs/BCAC/Pages/default.aspx.

Cost Impact: Will not increase the cost of construction
This proposal is a clarification of current requirements.

E 86-15 : 1011.16-KULIK3666

E 87-15

1013.2; (IFC[BE] 1013.2)

Proponent: Stephen DiGiovanni, Clark County Building Department, representing Southern Nevada Chapter of ICC (sdigiovanni@clarkcountynv.gov)

2015 International Building Code

Revise as follows:

1013.2 Floor-level exit signs in Group R-1. Where exit signs are required in Group R-1 occupancies by Section 1013.1, additional low-level exit signs shall be provided in all areas serving guest rooms in Group R-1 occupancies and shall comply with Section 1013.5.

The bottom of the sign shall be not less than 10 inches (254 mm) nor more than ~~12~~ 18 inches (~~305~~455 mm) above the floor level. The sign shall be flush mounted to the door or wall. Where mounted on the wall, the edge of the sign shall be within 4 inches (102 mm) of the door frame on the latch side.

Reason: The base code provides just a 2-inch tolerance for where the bottom of required low-energy exit signs must be located. This 2-inch window is often challenging for designers and property owners due to field conditions or desired interior finish and trim. For example, several high-end resort properties have installed 12-inch tall base boards in the exit access corridors of the hotels. The base code requirement that the bottom of the sign be located within 10- to 12-inches above the floor level would create issues for these facilities.
The proposed amendment is to allow the bottom of the required low-level exit signs to be located between 10- and 18- inches of the floor level. The additional 6 inches provides sufficient 'wiggle room' for designers and owners. Further, there is no impact on the level of life safety of the occupants of the Group R-1 occupancies since the low-level exit signs will still be visible below a smoke layer from a fire (in the zone in which the occupants would presumably be crawling.)
NFPA 101 (Life Safety Code), Section 7.10.1.6 permits the bottom of low-level exit signs to be installed between 6- and 18-inches above the floor level. Therefore, there is another code standard that allows the bottom of the low-level exit signs to be installed up to 18 inches above the floor level. Although NFPA 101, Section 7.10.1.6 permits the bottom of the low-level exit signs to be as low as 6-inches above the floor level, this proposal does not change the base IBC's requirement that the bottom of the low-level exit signs be within 10-inches above the floor level because ICC A117.1, Section 404.2.9 requires door surfaces within 10 inches of the floor to be a smooth surface for the full width of the door. There is no reason to have the low-level exit sign installed on the door must be at least 10 inches above the floor level in order to comply with ICC A117.1.

This proposal address unique designs or systems not anticipated in the code. Further, this proposal is consistent with the upper bounds permitted by another national code (NFPA 101 Life Safety Code).

Cost Impact: Will not increase the cost of construction
The proposal provides for more flexibilityin how to meet the requirements for floor level exit signs.

E 87-15 : 1013.2-DIGIOVANNI5857

E 88-15

1013.4, 1111.3; (IFC[BE] 1013.4)

Proponent: Timothy Pate, City and County of Broomfield, representing the Colorado Chapter ICC Code Change Committee, representing City and County of Broomfield (tpate@broomfield.org)

2015 International Building Code

Revise as follows:

1013.4 Raised character and braille exit signs. ~~A~~
Where exit signs are required by Section 1013.1, a sign stating EXIT in visual characters, raised characters and braille and complying with *ICC A117.1* shall be provided adjacent to each door to an *area of refuge*, an exterior area for assisted rescue, an interior*exit stairway* or *ramp*, an exterior exit stairway or ramp, an *exit passageway* and the *exit discharge*.

1111.3 Other signs. Signage indicating special accessibility provisions shall be provided as shown.

1. Each assembly area required to comply with Section 1108.2.7 shall provide a sign notifying patrons of the availability of assistive listening systems. The sign shall comply with ICC A117.1 requirements for visual characters and include the International Symbol of Access for Hearing Loss.
   Exception: Where ticket offices or windows are provided, signs are not required at each assembly area provided that signs are displayed at each ticket office or window informing patrons of the availability of assistive listening systems.
2. At each door to an *area of refuge*, an exterior area for assisted rescue, an ~~egress~~interior exit *stairway* or *ramp*, an exterior exit*stairway* or *ramp*, *exit passageway and exit discharge doors where exit signs are required by Section 1013.1, signage shall be provided in accordance with Section 1013.4.*
3. At *areas of refuge*, signage shall be provided in accordance with Section 1009.11.
4. At exterior areas for assisted rescue, signage shall be provided in accordance with Section 1009.11.
5. At two-way communication systems, signage shall be provided in accordance with Section 1009.8.2.
6. In *interior exit stairways* and *ramps*, floor level signage shall be provided in accordance with Section 1023.9.
7. Signs identifying the type of access provided on amusement rides required to be *accessible* by Section 1110.4.8 shall be provided at entries to queues and waiting lines. In addition, where *accessible* unload areas also serve as *accessible* load areas, signs indicating the location of the *accessible* load and unload areas shall be provided at entries to queues and waiting lines. These directional sign characters shall meet the visual character requirements in accordance with ICC A117.1.

Reason: I believe that the existing code language requires raised character and braille exit signs installed at every exit discharge door even when only one is required and regular exit signs are not required. I believe that the intent is to only require the raised character and braille exit signs to be installed at exit discharge doors when exit signs are requried as per Section 1013.
This proposed change will modify the 2 different sections that have these requirements

I also modified languge in section 1013.4 to clarify that the raised character and braille exit signs are only required at doors into the vertical exit enclosures - stairways or ramps.

Cost Impact: Will not increase the cost of construction
This would potentially decrease cost for jurisdictions who have taken the interpretation to be requiring the Braille exit signs at these additional locations.

E 88-15 : 1013.4-PATE4098

E 89-15

1013.4, 1111.3; (IFC[BE] 1013.4)

Proponent: Dominic Marinelli, representing United Spinal Association (DMarinelli@accessibility-services.com)

2015 International Building Code

Revise as follows:

1013.4 Raised character and braille exit signs. A sign stating EXIT in visual characters, raised characters and braille and complying with *ICC A117.1* shall be provided adjacent to each door to an *area of refuge*providing direct access to a stairway, an exterior area for assisted rescue, an *exit stairway* or *ramp*, an *exit passageway* and the *exit discharge*.

1111.3 Other signs. Signage indicating special accessibility provisions shall be provided as shown.

1. Each assembly area required to comply with Section 1108.2.7 shall provide a sign notifying patrons of the availability of assistive listening systems. The sign shall comply with ICC A117.1 requirements for visual characters and include the International Symbol of Access for Hearing Loss.

   Exception: Where ticket offices or windows are provided, signs are not required at each assembly area provided that signs are displayed at each ticket office or window informing patrons of the availability of assistive listening systems.
2. At each door to an *area of refuge providing direct access to the stairway*, an exterior area for assisted rescue, an ~~egress~~ *exit stairway, exit passageway and exit discharge, signage shall be provided in accordance with Section 1013.4.*
3. At *areas of refuge*, signage shall be provided in accordance with Section 1009.11.
4. At exterior areas for assisted rescue, signage shall be provided in accordance with Section 1009.11.
5. At two-way communication systems, signage shall be provided in accordance with Section 1009.8.2.
6. In *interior exit stairways* and *ramps*, floor level signage shall be provided in accordance with Section 1023.9.
7. Signs identifying the type of access provided on amusement rides required to be *accessible* by Section 1110.4.8 shall be provided at entries to queues and waiting lines. In addition, where *accessible* unload areas also serve as *accessible* load areas, signs indicating the location of the *accessible* load and unload areas shall be provided at entries to queues and waiting lines. These directional sign characters shall meet the visual character requirements in accordance with ICC A117.1.

Reason: The intent is coordination with the a revision to the next edition of the ICC A117.1 standard for tactile exit signage, Section 504.10.
The point of the tactile exit signage is to let a visually impaired person know what door they should enter to exit the building. When a stairway is accessed through an area of refuge, this signage is appropriate. Where the area of refuge is at the front of an elevator with standby power, this is not appropriate. Many lobbies have double doors with hold open devices, so there is also the question about where would be the correct location for this signage. This change in language will effectively not require the tactile exit signage at an elevator lobby.

Cost Impact: Will not increase the cost of construction
This is a possible reduction in signage.

E 89-15 : 1013.4-ROETHER5713

E 90-15

1013.6.3; (IFC[BE] 1013.6.3)

Proponent: John Williams, CBO, Chair, representing Adhoc Health Care Committee (AHC@iccsafe.org)

2015 International Building Code

Revise as follows:

1013.6.3 Power source. Exit signs shall be illuminated at all times. To ensure continued illumination for a duration of not less than 90 minutes in case of primary power loss, the sign illumination means shall be connected to an emergency power system provided from storage batteries, unit equipment or an on-site generator. The installation of the emergency power system shall be in accordance with Chapter 27. Group I-2 Condition 2 exit sign illumination shall not be provide by unit equipment batteries only.

~~Exceptions~~Exception:

1. *Approved* exit sign illumination means that provide continuous illumination independent of external power sources for a duration of not less than 90 minutes, in case of primary power loss, are not required to be connected to an emergency electrical system.
2. ~~Group I-2 Condition 2 exit sign illumination shall not be provided by unit equipment battery only.~~

Reason: This exception is a requirement for Group I-2 that exceeds the base paragraph requirements. It is proposed to be moved to the main paragraph to make it a requirement. As an exception it would be a choice. This requirement was added by E103-12 AMPC.

A correllative change is planned for the Group B cycle to IFC Chapter 11.

1104.5.1 Emergency power duration and installation. Emergency power for means of egress illumination shall be provided in accordance with Section 604. In other than Group I-2, emergency power shall be provided for not less than 60 minutes for systems requiring emergency power. ~~In Group I-2, essential electrical systems shall comply with Sections 1105.5.1 and 1105.5.2.~~

~~1105.5 Means of egress. In addition to the means of egress requirements in Section 1104, Group I-2 facilities shall meet the means of egress requirements in Section 1105.5.1 through 1105.5.8.~~

~~1105.5.1 Exit signs and emergency illumination. The power system for exit signs and emergency illumination for the means of egress shall provide power for not less than 90 minutes and consist of storage batteries, unit equipment or an on-site generator.~~

~~1105.5.2 Emergency power for operational needs. The essential electrical system shall be capable of supplying services in accordance with NFPA 99.~~

The ICC Ad Hoc Committee on Healthcare (AHC) has just completed its 4th year. The AHC was established by the ICC Board to evaluate and assess contemporary code issues relating to hospitals and ambulatory healthcare facilities. This is a joint effort between ICC and the American Society for Healthcare Engineering (ASHE), a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. Information on the AHC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the AHC effort can be downloaded from the AHC website at: http://www.iccsafe.org/cs/AHC/Pages/default.aspx.

Cost Impact: Will not increase the cost of construction
This is a movement of requirements only, therefore, there is no change in cost.

E 90-15 : 1013.6.3-WILLIAMS4229

E 91-15

1014.9; (IFC[BE] 1014.9)

Proponent: Stephen DiGiovanni, Clark County Building Department, representing Southern Nevada Chapter of ICC (sdigiovanni@clarkcountynv.gov)

2015 International Building Code

Revise as follows:

1014.9 Intermediate handrails. *Stairways* shall have intermediate *handrails* located in such a manner that all portions of the *stairway* minimum width or required capacity are within 30 inches (762 mm) of a handrail. On monumental *stairs*, *handrails* shall be located along the most direct path of egress travel.

Exception: Stairways less than 88 (2235 mm) inches in width are not required to have an intermediate handrail.

Reason: Section 1011.2 requires stair widths of at least 44". Exception 1 allows 36 inch widths serving occupant loads of less than 50. Table 1020.2 requires minimum corridor widths of 44 inches, with 36 inches for occupancies of less than 50, and within a dwelling unit. 24 inches is allowed to access mechanical and electrical equipment.

The existing language in the case of a 61-75 inch wide stair would reduce the usable exit width to less than 36 inches. While this does not present an issue with intermediate handrails for stairs 88 inches and wider, it does cause concern for path widths in stairs greater than 60 inches and less than 88 in., (Stairs between 72 and 88 inches are not included in this argument since 36 inch paths are reserved for low occupancy areas, which the areas we are referencing are not).

This exception would allow for base code to allow for stairs 88 inches in width or greater, while avoiding paths less 44 inches within the stairs smaller than 88 inches.

Cost Impact: Will not increase the cost of construction
This proposal would result in a decrease of construction costs by not requiring as many intermediate handrails as currently required by code.

E 91-15 : 1014.9-DIGIOVANNI3848

E 92-15

1015.3 (IFC[BE] 1015.3)

Proponent: Edward Kulik, Chair, representing Building Code Action Committee (bcac@iccsafe.org)

2015 International Building Code

Revise as follows:

1015.3 Height.
Required *guards* shall be not less than 42 inches (1067 mm) high, measured vertically as follows:

1. From the adjacent walking surfaces.
2. On *stairways* and stepped *aisles* , from the line connecting the leading edges of the tread *nosings* .
3. On *ramps* and ramped *aisles* , from the *ramp* surface at the *guard* .

Exceptions:

1. For occupancies in Group R-3 not more than three stories above grade in height and within individual *dwelling units* in occupancies in Group R-2 not more than three stories above grade in height with separate *means of egress* , required *guards* shall be not less than 36 inches (914 mm) in height measured vertically above the adjacent walking surfaces~~ or adjacent *fixed seating*.~~
2. For occupancies in Group R-3, and within individual *dwelling units* in occupancies in Group R-2, *guards* on the open sides of *stairs* shall have a height not less than 34 inches (864 mm) measured vertically from a line connecting the leading edges of the treads.
3. For occupancies in Group R-3, and within individual *dwelling units* in occupancies in Group R-2, where the top of the *guard* also serves as a *handrail* on the open sides of *stairs* , the top of the *guard* shall be not less than 34 inches (864 mm) and not more than 38 inches (965 mm) measured vertically from a line connecting the leading edges of the treads.
4. The *guard* height in assembly seating areas shall comply with Section 1029.16 as applicable.
5. Along *alternating tread devices* and ships ladders, *guards* where the top rail also serves as a *handrail* shall have height not less than 30 inches (762 mm) and not more than 34 inches (864 mm), measured vertically from the leading edge of the device tread *nosing* .

Reason: The purpose of this proposal is coordination between the IBC and IRC. The phrase 'or adjacent fixed seating' was in exception 1 to coordinate with the provisions for guard height in the IRC. Previous edition of the IBC and IRC required guards to be placed adjacent to fixed seating that occurs on areas such as decks where the seat and guard are built integral with the deck. At those locations the guard height was measured from that seat. The requirement to measure from the fixed seating has been removed from the IBC and IRC.
In July/2014 the ICC Board decided to sunset the activities of the Code Technology Committee (CTC). This is being accomplished by re-assigning many of the CTC Areas of Study to the applicable Code Action Committee (CAC). This proposal falls under the CTC Area of Study entitled Climbable Guards. Information on the CTC, including: the sunset plan; meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the CTC website.

This public proposal is submitted by the ICC Building Code Action Committee (BCAC). The BCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the BCAC has held 13 open meetings and numerous workgroup calls which included members of the BCAC as well as any interested party to discuss and debate the proposed changes and the public comments. Related documentation and reports are posted on the BCAC website at: http://www.iccsafe.org/cs/BCAC/Pages/default.aspx.

Cost Impact: Will increase the cost of construction
This proposal could result in a reduction of the required guard height. This is coordination with the IRC.

E 92-15 : 1015.3-KULIK3331

E 93-15

1015.3; (IFC[BE] 1015.3)

Proponent: Thomas Dalton, representing Self

2015 International Building Code

Revise as follows:

1015.3 Height. Required *guards* shall be not less than 42 inches (1067 mm) high, measured vertically as follows:

1. From the adjacent walking surfaces.
2. On *stairways* and stepped *aisles*, from the line connecting the leading edges of the tread *nosings*.
3. On *ramps* and ramped *aisles*, from the *ramp* surface at the *guard*.

Exceptions:

1. For occupancies in Group R-3 not more than three stories above grade in height and within and serving individual *dwelling units* in occupancies in Group R-2 not more than three stories above grade in height with separate *means of egress*, required *guards* shall be not less than 36 inches (914 mm) in height measured vertically above the adjacent walking surfaces or adjacent *fixed seating*.
2. For occupancies in Group R-3, and within and serving individual *dwelling units* in occupancies in Group R-2, *guards* on the open sides of *stairs* shall have a height not less than 34 inches (864 mm) measured vertically from a line connecting the leading edges of the treads.
3. For occupancies in Group R-3, and within and serving individual *dwelling units* in occupancies in Group R-2, where the top of the *guard* also serves as a *handrail* on the open sides of *stairs*, the top of the *guard* shall be not less than 34 inches (864 mm) and not more than 38 inches (965 mm) measured vertically from a line connecting the leading edges of the treads.
4. The *guard* height in assembly seating areas shall comply with Section 1029.16 as applicable.
5. Along *alternating tread devices* and ships ladders, *guards* where the top rail also serves as a *handrail* shall have height not less than 30 inches (762 mm) and not more than 34 inches (864 mm), measured vertically from the leading edge of the device tread *nosing*.

Reason: Changing this section of the code will treat all types of long term residential occupancies with the same risk factors for falls and accessibility the same. Treating the exterior staircase serving individual condominium units differently from interior staircases within those units is not consistant in this type of occupancy.

Cost Impact: Will not increase the cost of construction
This change could decrease the cost of construction by reducing the amount of material and speeding up production by standardizing both the intereior and exterior guards.

E 93-15 : 1015.3-DALTON3984

E 94-15

1015.3; (IFC[BE] 1015.3)

Proponent: Jay Wallace, The Boeing Company, representing The Boeing Company (jay.s.wallace@boeing.com)

2015 International Building Code

Revise as follows:

1015.3 Height. Required *guards* shall be not less than 42 inches (1067 mm) high, measured vertically as follows:

1. From the adjacent walking surfaces.
2. On *stairways* and stepped *aisles*, from the line connecting the leading edges of the tread *nosings*.
3. On *ramps* and ramped *aisles*, from the *ramp* surface at the *guard*.

Exceptions:

1. For occupancies in Group R-3 not more than three stories above grade in height and within individual *dwelling units* in occupancies in Group R-2 not more than three stories above grade in height with separate *means of egress*, required *guards* shall be not less than 36 inches (914 mm) in height measured vertically above the adjacent walking surfaces or adjacent *fixed seating*.
2. For occupancies in Group R-3, and within individual *dwelling units* in occupancies in Group R-2, *guards* on_ the open sides of *stairs* shall have a height not less than 34 inches (864 mm) measured vertically from a line connecting the leading edges of the treads.
3. For occupancies in Group R-3, and within individual *dwelling units* in occupancies in Group R-2, where the top of the *guard* also serves as a *handrail* on the open sides of *stairs*, the top of the *guard* shall be not less than 34 inches (864 mm) and not more than 38 inches (965 mm) measured vertically from a line connecting the leading edges of the treads.
4. The *guard* height in assembly seating areas shall comply with Section 1029.16 as applicable.
5. Along *alternating tread devices* and ships ladders, *guards* where the top rail also serves as a *handrail* shall have height not less than 30 inches (762 mm) and not more than 34 inches (864 mm), measured vertically from the leading edge of the device tread *nosing*.
6. In Group F occupancies, where *exit access stairways* serve three stories or less and such stairs are not open to the public, where the top of the guard also serves as a handrail, the top of the guard shall be not less than 34 inches (864 mm) and not more than 38 inches (965 mm) measured vertically from a line connecting the leading edges of the treads.

Reason: Federal OSHA requirements restrict industrial stairway guard height to a maximum of 34"; it also intends that the top rail will be used as a handrail. The IBC range for handrails is 34 to 38 inches but also requires a guard at 42". This proposal attempts to find a reasonable middle ground making at least one solution acceptable to both IBC and OSHA requirements for non-egress stairways in factory type settings.
Factory workers are often required to carry out full range of motion activities and access work areas in tight spaces and sometimes maneuver into awkward positions. Their work often requires them to be more mobile and more athletic than their office sitting counterparts enabling them to negotiate a set of stairs with greater agility. They become very familiar with their workplace and like many of us, may spend more time on the job than they do at home.

The IBC recognizes that familiarity is a component of safe stairway design as reduced guard height and the use of the top guard rail as a handrail is already allowed for Group R-3 and in individual dwelling units of R-2 (see Exception 3 of this same section) where occupants normally experience extended time and acquire familiarity with stairway construction details in contrast to those in other Group R occupancies where visitors and residents are usually temporary. Granted, occupants in Group R occupancies may consume alcohol and other substances which could impair their ability to negotiate a set of stairs but such behavior is typically not allowed in Group F occupancies.

The three floor limit proposed is borrowed from Exception 3 to maintain the same level of safety as has been previously approved for use in the code. Exception 3 uses the term story stating that the exception is limited to 3 stories in height. This proposal limits floors to three instead of stories because the term floor in Group F correlates better with stories in Group R. In Group F, stairways could run between stories or within a single story to multiple levels of mezzanines or platforms located further above the ground floor than intended.

The focus of this proposal is on Factory workers on exit access stairways. These stairs are not intended nor required for emergency egress. They are not shared with other occupancies such as Group B or Group S which may be associated with a Group F. However, there is the reality that maintenance service may be required in these factory areas and so this proposal recognizes that maintenance service personnel may use the stairs. This distinct group of users is also highly accustomed to the facility and able to negotiate such construction details with ease.

This proposed change resolves conflicting requirements between OSHA and the IBC by applying an acceptable solution already approved for other occupancies where occupants experience similar long term exposure and familiarity.

Cost Impact: Will not increase the cost of construction
For the condition this proposal addresses, the IBC requires a 42 inch high guard and a handrail between 34 and 38 inches high. Construction cost is inherently less when the handrail and guard are one and the same.

E 94-15 : 1015.3-WALLACE5572

E 95-15

1015.6 (IFC[BE] 1015.6, IMC[BE] 304.11), 1015.7, (IFC[BE]1015.7, IMC[BE] 304.12 (New))

Proponent: Edward Kulik, Chair, representing Building Code Action Committee (bcac@iccsafe.org)

2015 International Building Code

1015.6 Mechanical equipment, systems and devices. *Guards* shall be provided where ~~various components that require service~~ appliances and equipment within the scope of this code, including but not limited to HVAC equipment, refrigeration equipment, exhaust fans, energy recovery equipment, pollution control units, smoke control fans, solar thermal equipment, are located within 10 feet (3048 mm) of a roof edge or open side of a walking surface and such edge or open side is located more than 30 inches (762 mm) above the floor, roof or grade below. The *guard* shall extend not less than 30 inches (762 mm) beyond each end of such components. The *guard* shall be constructed so as to prevent the passage of a sphere 21 inches (533 mm) in diameter.

> **Exception:***Guards* are not required where permanent fall arrest/restraint anchorage connector devices that comply with ANSI/ASSE Z 359.1 are affixed for use during the entire roof covering lifetime. The devices shall be reevaluated for possible replacement when the entire roof covering is replaced. The devices shall be placed not more than 10 feet (3048 mm) on center along hip and ridge lines and placed not less than 10 feet (3048 mm) from the roof edge or open side of the walking surface.

1015.7 Roof access. *Guards* shall be provided where the roof hatch opening is located within 10 feet (3048 mm) of a roof edge or open side of a walking surface and such edge or open side is located more than 30 inches (762 mm) above the floor, roof or grade below. The *guard* shall be constructed so as to prevent the passage of a sphere 21 inches (533 mm) in diameter..

> **Exception:***Guards* are not required where permanent fall arrest/restraint anchorage connector devices that comply with ANSI/ASSE Z 359.1 are affixed for use during the entire roof covering lifetime. The devices shall be reevaluated for possible replacement when the entire roof covering is replaced. The devices shall be placed not more than 10 feet (3048 mm) on center along hip and ridge lines and placed not less than 10 feet (3048 mm) from the roof edge or open side of the walking surface.

2015 International Mechanical Code

Revise as follows:

[BE] 304.11 Guards. Guards shall be provided where ~~various components that require service~~appliances and ~~roof hatch openings are~~equipment wihthin the scope of this code, including but not limited to HVAC equipment, refrigeration equipment, exhaust fans, energy recovery equipment, pollution control units, smoke control fans, solar thermal equipment,are located within 10 feet (3048 mm) of a roof edge or open side of a walking surface and such edge or open side is located more than 30 inches (762 mm) above the floor, roof, or grade below. The guard shall extend not less than 30 inches (762 mm) beyond each end of components that require service. The top of the guard shall be located not less than 42 inches (1067 mm) above the elevated surface adjacent to the guard. The guard shall be constructed so as to prevent the passage of a 21-inch-diameter (533 mm) sphere and shall comply with the loading requirements for guards specified in the *International Building Code*.

> **Exception:** Guards are not required where permanent fall arrest/restraint anchorage connector devices that comply with ANSI/ASSE Z 359.1 are affixed for use during the entire lifetime of the roof covering. The devices shall be re-evaluated for possible replacement when the entire roof covering is replaced. The devices shall be placed not more than 10 feet (3048 mm) on center along hip and ridge lines and placed not less than 10 feet (3048 mm) from roof edges and the open sides of walking surfaces.

Add new text as follows:

[BE] 304.12 Roof access. Guards shall be provided where the roof hatch opening is located within 10 feet (3048 mm) of a roof edge or open side of a walking surface and such edge or open side is located more than 30 inches (762 mm) above the floor, roof or grade below. The guard shall be constructed so as to prevent the passage of a sphere 21 inches (533 mm) in diameter.

> **Exception:** Guards are not required where permanent fall arrest/restraint anchorage connector devices that comply with ANSI/ASSE Z 359.1 are affixed for use during the entire roof covering lifetime. The devices shall be reevaluated for possible replacement when the entire roof covering is replaced. The devices shall be placed not more than 10 feet (3048 mm) on center along hip and ridge lines and placed not less than 10 feet (3048 mm) from the roof edge or open side of the walking surface.

Reason: There are two purposes for this proposal - both dealing with clarification and coordination.
The change last cycle to "various components that require service" has made the intent ambiguous. What are various components? The current text may be appropriate for the IBC but it is inadequate for the IMC. The text needs to spell out what equipment is expected to require service in the context of a mechanical code. There could be some type of equipment that does not require periodic service and instead would simply be replaced at the end of its life, however, the PMG CAC cannot determine what equipment that would be. Even a direct -drive permanently lubricated toilet exhaust fan installed on a roof would eventually need to be cleaned. It is assumed that solar thermal equipment requires cleaning and servicing. If the appliance or equipment ends up being close to the roof edge, then protection from falling by means of a guard is warranted. If guards are undesirable for aesthetic or expense reasons, then the appliances and equipment should not be put close to the roof edge; simple solution.

Moving roof hatches into its own section will make the IMC and IBC/IFC match. Since this section is controlled by the IBC MOE committee now, this can be viewed as editorial only. There is no intent to change requirements. There is a companion proposal to revise the exception. If that proposal is approved, the exception should also be revised from the new IMC Section 304.12.

This public proposal is submitted by the ICC Building Code Action Committee (BCAC). The BCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the BCAC has held 13 open meetings and numerous workgroup calls which included members of the BCAC as well as any interested party to discuss and debate the proposed changes and the public comments. Related documentation and reports are posted on the BCAC website at: http://www.iccsafe.org/cs/BCAC/Pages/default.aspx.

Cost Impact: Will not increase the cost of construction
This proposal will not increase the cost of construction because no additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code nor are the code requirements made more stringent.

2015 International Building Code

Revise as follows:

1015.6 Mechanical equipment, systems and devices. *Guards* shall be provided where various components that require service are located within 10 feet (3048 mm) of a roof edge or open side of a walking surface and such edge or open side is located more than 30 inches (762 mm) above the floor, roof or grade below. The *guard* shall extend not less than 30 inches (762 mm) beyond each end of such components. The *guard* shall be constructed so as to prevent the passage of a sphere 21 inches (533 mm) in diameter.

> **Exception:***Guards* are not required where permanent fall arrest/restraint anchorage connector devices that comply with ANSI/ASSE Z 359.1 are ~~affixed for use during the entire roof covering lifetime. The devices shall be reevaluated for possible replacement when the entire roof covering is replaced. The devices shall be placed not more than 10 feet (3048 mm) on center along hip and ridge lines and placed not less than 10 feet (3048 mm) from the roof edge or open side of the walking surface~~installed.

1015.7 Roof access. *Guards* shall be provided where the roof hatch opening is located within 10 feet (3048 mm) of a roof edge or open side of a walking surface and such edge or open side is located more than 30 inches (762 mm) above the floor, roof or grade below. The *guard* shall be constructed so as to prevent the passage of a sphere 21 inches (533 mm) in diameter.

> **Exception:***Guards* are not required where permanent fall arrest/restraint anchorage connector devices that comply with ANSI/ASSE Z 359.1 are ~~affixed for use during the entire roof covering lifetime. The devices shall be reevaluated for possible replacement when the entire roof covering is replaced. The devices shall be placed not more than 10 feet (3048 mm) on center along hip and ridge lines and placed not less than 10 feet (3048 mm) from the roof edge or open side of the walking surface~~installed.

2015 International Mechanical Code

[BE] 304.11 Guards. Guards shall be provided where various components that require service and roof hatch openings are located within 10 feet (3048 mm) of a roof edge or open side of a walking surface and such edge or open side is located more than 30 inches (762 mm) above the floor, roof, or grade below. The guard shall extend not less than 30 inches (762 mm) beyond each end of components that require service. The top of the guard shall be located not less than 42 inches (1067 mm) above the elevated surface adjacent to the guard. The guard shall be constructed so as to prevent the passage of a 21-inch-diameter (533 mm) sphere and shall comply with the loading requirements for guards specified in the *International Building Code*.

> **Exception:** Guards are not required where permanent fall arrest/restraint anchorage connector devices that comply with ANSI/ASSE Z 359.1 are ~~affixed for use during the entire lifetime of the roof covering. The devices shall be re-evaluated for possible replacement when the entire roof covering is replaced. The devices shall be placed not more than 10 feet (3048 mm) on center along hip and ridge lines and placed not less than 10 feet (3048 mm) from roof edges and the open sides of walking surfaces~~installed.

Reason: Section 306.5.1 of the IMC requires work platforms with guards for equipment and appliances installed on roofs with a slope 3 in 12 and greater, thus, the exception to Section 304.11 appears to apply only to roofs that are flat and up to 2 in 12 slope. The problem derives from the language referring to placement of anchors along hip or ridge lines and along roof edges. This language is not necessary for the application of the exception. Each building roof system and the equipment upon that roof system that might require access will be different and the anchors needed along with their locations will differ as well. As presently worded there has been some confusion on application and the location requirements spaced every ten feet require unnecessary expense.
This proposal eliminates confusion by deleting the unnecessary language leaving the application of the referenced standard to be applied on a case by case basis to fit the specific activities that may occur on the individual roof.

There is another change from this committee to split IMC 304.11 to make it consistent with the IRC that copies this exception. It is the intent of this committee for theese changes to be coordinated.

This public proposal is submitted by the ICC Building Code Action Committee (BCAC). The BCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the BCAC has held 13 open meetings and numerous workgroup calls which included members of the BCAC as well as any interested party to discuss and debate the proposed changes and the public comments. Related documentation and reports are posted on the BCAC website at: http://www.iccsafe.org/cs/BCAC/Pages/default.aspx.

Cost Impact: Will not increase the cost of construction
This proposal will decrease the cost of construction in those cases where fall arrest anchorage devices would be installed instead of guards by providing increased flexibility in locating the anchors.

1017.2, 1017.2.3 (New); (IFC[BE] 1017.2, 1017.2.3 (New))

Proponent: Vickie Lovell, InterCode Incorporated, representing Fire Safe North America (vickie@intercodeinc.com)

2015 International Building Code

Revise as follows:

1017.2 Limitations. *Exit access* travel distance shall not exceed the values given in Table 1017.2 except where limited by Section 1017.2.3.

Add new text as follows:

1017.2.3 Groups A, B, E and R decrease. In Groups A, B, E and R occupancies, assigned Risk Categories III and IV in Table 1604.5 and of Types IIB, IIIB and VB construction shall be limited to the travel distances in Table 1017.2 for buildings without sprinkler systems where such buildings are any of the following:

1. Assigned a Seismic Design Category C or D in Table 1613.3.5(1).
2. Located in a flood hazard area established in accordance with Section 1612.3.
3. Located in a hurricane-prone region.

Reason: As hazard events, both naturally-occurring and man-made, are increasing in number and severity in the United States and around the world, the resilience of communities and the individual buildings within those communities is becoming of vital importance.
A National Institute of Building Sciences Publication (May, 2014) entitled "Moving Forward: Findings and Recommendations", states that "while a long history of building codes has laid the foundation for addressing the impacts of natural and man-made hazards, changes in the frequency and severity of events have brought new challenges — challenges requiring the engagement and support of policymakers. While building codes serve as the minimum requirements for life-safety in the building stock, basic life-safety protections do not fully address building performance requirements to achieve resilience."

Mitigation includes, among other things, fortifying buildings so that they are less likely to be severely damaged or completely destroyed during or immediately after a disaster. It is the key to recovery after a disaster. Mitigation allows individuals and communities to lessen post-disaster disruption and rebuild more quickly. States and cities have started implementing more stringent requirements in specific geographic areas they have designated as higher-risk. The purpose of this series of code changes proposed by Fire Safe North America is to encourage the debate in the code development process to identify what constitutes resilient buildings, and begin to identify issues that will become the basis for "new minimum requirements" for increased building resiliency.

Responding to the challenge of mitigating damage and resilient buildings is an admittedly complex topic. Fire Safe North America proposals are intended to reduce the total reliance of a community and its firefighters on automatic sprinkler systems in disaster-prone areas of the country where the water supply and/or power are likely to be interrupted, or are likely to have water supply system operational issues. The proposals, if approved, will fortify the building code requirements for the most vulnerable buildings to fire - Type IIB, IIIB, and VB construction, which are also classified as Risk Category III and IV in Table 1604.5, and in high-risk, disaster prone regions. The proposals modify the following code requirements in such buildings:

1. Reduce allowable area limits
2. Protect the path of egress by limiting travel distances
3. Protect the path of egress by protecting corridors
4. Require higher fire resistance ratings for occupancy separations
5. Require higher fire resistance ratings for building elements

These proposals are intended to be conservative so as to promote community resiliency and disaster mitigation by protecting essential buildings with both sprinkler protection AND fire resistance rated compartmentation. These proposals may be fairly considered to be the proverbial "belt-and suspenders" approach, requiring both sprinkler protection and increased fire resistance rated compartmentation in specific buildings in high risk areas for disasters.

Historically, the code has been written using the general assumption that automatic sprinklers will operate satisfactorily and there will be suitable power for such building operations. Code users design and build assuming that firefighters will be able to respond at their normal efficiencies. In some parts of the country, buildings impacted by disasters may remain without reliable water and/or power for a considerable period of time, well after the occurrence of the disaster. History has shown that increased incidents of fires after a disaster can be more destructive to life and property than the disaster itself. Total reliance on an uninterrupted power and water supply may not be an acceptable risk. It may also be an unacceptable risk to assume that firefighters will be able to respond at their normal efficiencies.

For example, more than 15% of the U.S. population lives in potential major earthquake areas. 41 states and territories have moderate to high risk. There is a real likelihood of power and water supplies being interrupted following a major seismic event, along with the potential for multiple simultaneous structure fires and also building-to-building fire spread. In October 17, 1989, a 7.1 earthquake in Santa Cruz Mountains was responsible for 26 fires in San Francisco, 60 miles from epicenter. There were 67 documented breaks in water mains which effectively eliminated water pressure in the area. On January 19, 1994, a 6.8 earthquake centered in Northridge, CA. There were approximately 100 fire ignitions, 30 to 50 of those were considered significant. The water supply systems in the area were damaged causing low pressure in water distribution. On January 17, 1995, a 6.8 (approx.) earthquake near Kobe, Japan caused 90 fires to start within minutes. 85 spread to adjacent buildings and 10 approached or reached conflagration status. 1,700 water line breaks occurred within a couple of hours. There were 7,000 buildings destroyed by fire alone.

In 1997, the Red River flooded Grand Forks, North Dakota, causing $3.7 billion in flood losses, and displaced thousands of families and businesses. Similar data of increased fire incidents are available in other flood and hurricane-prone areas.

Undoubtedly, this will increase the cost of construction in these specific buildings. However, a recent FEMA's 2010 report "Mitigation's Value to Society" statement described how mitigation is an investment that needs to be made. A recent study by the NIBS Multihazard Mitigation Council (MMC) identified that each dollar spent on mitigation saves an average of $4.00 in disaster recovery.

E 98-15

1017.2.2 (IFC[BE] 1017.2.2)

Proponent: Joe McELvaney, representing self (mcelvaney@cox.net)

2015 International Building Code

Revise as follows:

1017.2.2 Group F-1 and S-1 increase. The maximum *exit access* travel distance shall be 400 feet (122 m) in Group F-1 or S-1 occupancies where all of the following conditions are met:

1. The portion of the building classified as Group F-1 or S-1 is limited to one story in height.
2. The minimum height from the finished floor to the bottom of the ceiling or roof slab or deck is 24 feet (7315 mm).
3. The building is equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1.
4. <u>High Pile combustible storage areas greater than 500,000 square feet (46,450 square meters) are provided with additional fire protection in accordance with the *International Fire Code*, Table 3206.2, footnote g.</u>

Reason: High pile combustible storage have some special fire code requirements that would apply to these type of occupancies where the travel distance is 400 feet. Once the travel distance is above 300 feet the odds increase that the storage area may be over 500,000 sq. ft.. Once the stroage area is greater than 500,000 sq. ft. the fire code offical can ask for addtional fire protection based on IFC Table 3206.2 footnote g.
By adding this information to the IBC it will alert the design professional that addtional fire protection may be required per IFC Table 3206.2 footnote g., Hence the design professional should talk with the fire code offical to determine what may be required.

This new text may help in reducing the number of change orders and open a line of communication with the design professional and fire code official for this large building.

Cost Impact: Will not increase the cost of construction
No cost increase, already required per the IFC Table 3206.2 footnote g

E 98-15 : 1017.2.2-MCELVANEY3291

E 99-15

1017.2.3 (New); (IFC[BE] 1017.2.3 (New))

Proponent: Stephen DiGiovanni, Clark County Building Department, representing Southern Nevada Chapter of ICC (sdigiovanni@clarkcountynv.gov)

2015 International Building Code

Add new text as follows:

1017.2.3 **Corridor increases.** *Exit access* travel distances specified in Table 1017.2 shall be increased an additional 100 feet (30 480 mm) where the final portion of the *exit access* is within a corridor with minimum fire-resistance rating of 1 hour. The length of such *corridor* shall not be less than the amount of increase taken.

Reason: Larger buildings that have significant footprints are difficult to design with the travel distances outlined in Table 1017.2 without some increases allowed, such as the corridor increase.

Adding a maximum 100 foot increase to the travel distances outlined in Table 1017.2 would apply to those corridors constructed with a minimum one-hour fire resistance rating. Many of the occupancies that this proposal would apply to are allowed to have a non-fire resistive rated corridor under the sprinkler system provisions of Table 1020.1. The provisions for corridor increases would only apply if the corridor is provided with a minimum one-hour fire-resistive rating thereby providing a greater level of protection than currently required by code.

This proposal is not less restrictive than the current code as added protection is provided to the exit route if the 100 foot travel distance increase is applied. In fact, this proposal would provide an incentive to designers to use rated corridors. Please note that the wording of this proposal is essentially based on Section 1004.2.5.2.3 of the 1997 edition of the Uniform Building Code (UBC), and that many existing facilities have been constructed with this corridor increase provision. Also, this proposal has been adopted in Southern Nevada for several code cycles.

Cost Impact: Will not increase the cost of construction
This proposal provides for an option, and does not increase any requirements of the base code, so there is no cost impact associated with this proposal.

E 99-15 : 1017.2.3 (New)-DIGIOVANNI3849

E 100-15

202, 1017.3; (IFC[BE[1017.3)

Proponent: Edward Kulik, Chair, representing Building Code Action Committee (bcac@iccsafe.org)

2015 International Building Code

Revise as follows:

SECTION 202 DEFINITIONS

COMMON PATH OF EGRESS TRAVEL. That portion of ~~the~~ *exit access* travel distance measured from the most remote point ~~within a *story*~~ of each room, area or space to that point where the occupants have separate and distinct access to two exits or exit *access doorways.*

1017.3 Measurement. *Exit access* travel distance shall be measured from the most remote point ~~within a story~~ of each room, area or space along the natural and unobstructed path of horizontal and vertical egress travel to the entrance to an *exit*.

> **Exception:** In *open parking garages*, *exit access* travel distance is permitted to be measured to the closest riser of an *exit access stairway* or the closest slope of an *exit access ramp*.

Reason: This public proposal is submitted by the ICC Building Code Action Committee (BCAC). The BCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the BCAC has held 13 open meetings and numerous workgroup calls which included members of the BCAC as well as any interested party to discuss and debate the proposed changes and the public comments. Related documentation and reports are posted on the BCAC website at: http://www.iccsafe.org/cs/BCAC/Pages/default.aspx.
The definition of "common path of egress travel" was modified for the 2015 Edition of the IBC. The intent of the change was to clarify the common path of egress travel and exit access travel distance are measured in the same way. The terminus of each is different, but the route is the same. This logic was based on the last sentence of the 2012 IBC definition, "Common paths of travel shall be included within the permitted travel distance." and the language in 2012 Section 1016.3, "Exit access travel distance shall be measured from the most remote point within a story…"

If applied literally, it could be interpreted such that the common path of egress travel need be considered from only one point (the most remote) on a given story. Obviously, all potential paths of egress travel need to be considered when establishing occupant remoteness for the purposes of determining multiple exit or exit access doorway requirements. Clarifying that the path of travel originating from any room, area or space should be evaluated when determining common paths of egress travel will eliminate literal interpretations of the current definition. Additionally, the reference to a single story has been eliminated. Section 1006.3 allows for access to exits at an adjacent level. Common path of egress travel requirements could potentially apply to a multi-level design condition.

For purposes of consistency, Section 1017.3 has been modified to indicate that exit access travel distance is measured from all remote points within the means of egress system. The "story" approach is a little simplistic and does not represent the level of detail necessary to properly design or analyze a means of egress system. Additionally, when accessing an exit at an adjacent level, the exit access travel distance at both stories, to include the exit access stairways, is calculated. The single story reference could be misleading. Approval of this modification will clarify the definition of common path of egress travel for the benefit of all users.

Cost Impact: Will not increase the cost of construction
Provisions simply provide clarification of current requirements.

Staff note: There is a published errata to the definition for Common Path of Egress Travel. The errata is incorporated into the definition as existing text.

E 100-15 : 1017.3-KULIK3669

E 101-15

1018.6 (New); (IFC[BE] 1018.6 (New))

Proponent: Bryan Romney, University of Utah, Salt Lake City, Utah, representing self (bryan.romney@fm.utah.edu)

2015 International Building Code

Add new text as follows:

1018.6 **Aisle measurement** The clear width for aisles and aisle accessways shall be measured to walls, edges of seating and tread edges except for permitted projections.

> **Exception:** The clear width of aisles and aisle accessways adjacent to seating at tables shall be permitted to be measured in accordance with Section 1029.12.1.

Reason: The code requirements for seating at tables for all occupancy groups and uses were relocated from the 2009 IBC Section 1017.4 to Section 1028.10.1 under the ASSEMBLY section in the 2012 IBC. Code Change Proposal E140-09/10 was approved to relocate Seating at tables to Section 1028. In the 2015 IBC this requirement was modified and relocated to Section 1029.12.1, still under the ASSEMBLY section.
The reason for this proposed change is to establish the requirements for seating at tables in Section 1018 AISLES which can only be found in Section 1029.12.1. Occupancy groups other than Assembly such as Groups B and M certainly have aisles with seating located at desks, counters, and tables which need to be regulated. It is neither logical nor possible to regulate seating at tables for non-assembly occupancy groups or uses if the requirements are located in Section 1029 ASSEMBLY.

For example, research laboratories (Group B occupancy) typically have benches and seating on double and single loaded aisles. Without this proposed change to the code, there is no direct requirement to regulate aisle widths because seating at tables and benches is located in the Assembly section 1029.

Group M occupancies also have aisles with seating at tables which need to be regulated. Section 1029 Assembly occupancies is not the place to look for these requirements.

Cost Impact: Will not increase the cost of construction
This is simply a clarification of the requirements for seating at tables for all occupancy groups and uses

2015 International Building Code

Revise as follows:

SECTION 202 DEFINITIONS

EXIT ACCESS STAIRWAY. ~~A *stairway* with the~~An enclosed or unenclosed exit access ~~portion of the means~~ component that defines and provides a path of egress ~~system~~ travel.

1006.3 Egress from stories or occupied roofs. The *means of egress* system serving any *story* or occupied roof shall be provided with the number of *exits* or access to *exits*, or combination thereof, based on the ~~aggregate~~ cumulative *occupant load* served in accordance with this section. ~~The *path of egress travel* to an *exit* shall not pass through more than one adjacent *story*.~~

1006.3.1 Egress based on occupant load. Each *story* ~~and~~ or occupied roof shall have the minimum number of independent *exits*, or access to *exits*, or combination thereof, as specified in Table 1006.3.1. A single *exit* or access to a single *exit* shall be permitted in accordance with Section 1006.3.2. The required number of *exits*, or *exit access stairways* or *ramps* providing access to *exits*, from any *story* or occupied roof shall be maintained until arrival at the *exit discharge* or a *public way*.

1017.3.1 Exit access stairways and ramps. Travel distance on unenclosed portions of *exit access stairways* or *ramps* shall be included in the *exit access* travel distance measurement. The measurement along *stairways* shall be made on a plane parallel and tangent to the *stair* tread *nosings* in the center of the *stair* and landings. The measurement along *ramps* shall be made on the walking surface in the center of the *ramp* and landings.

Add new text as follows:

1019.2 Construction. Where exit access stairways and ramps are required to be enclosed by other provisions of this section, they shall comply with the provisions of Section 1023.

Revise as follows:

~~1019.2~~1019.3 **All occupancies.** *Exit access stairways* and *ramps* that serve floor levels within a single story are not required to be enclosed.

~~1019.3~~1019.4 **Occupancies other than Groups I-2 and I-3.** In other than Group I-2 and I-3 occupancies, floor openings containing *exit access stairways* or *ramps* that do not comply with one of the conditions listed in this section shall be enclosed ~~with a shaft enclosure constructed in accordance with Section 713~~.

1. *Exit access stairways* and *ramps* that serve or atmospherically communicate between only two stories. Such interconnected stories shall not be open to other stories.
2. In Group R-1, R-2 or R-3 occupancies, *exit accessstairways* and *ramps* connecting four stories or less serving and contained within an individual *dwelling unit* or *sleeping unit* or *live/work unit.*
3. *Exit access stairways* serving and contained within a Group R-3 congregate residence or a Group R-4 facility ~~are not required to be enclosed~~.
4. *Exit access stairways* and *ramps* in buildings equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1, where the area of the vertical opening between stories does not exceed twice the horizontal projected area of the *stairway* or *ramp* and the opening is protected by a draft curtain and closely spaced sprinklers in accordance with NFPA 13. In other than Group B and M occupancies, this provision is limited to openings that do not connect more than four stories.
5. *Exit access stairways* and *ramps* within an *atrium* complying with the provisions of Section 404.
6. *Exit access stairways* and *ramps* in *open parking garages* that serve only the parking garage.
7. *Exit access stairways* and *ramps* serving open-air seating complying with the *exit access* travel distance requirements of Section 1029.7.
8. *Exit access stairways* and *ramps* serving the balcony, gallery or press box and the main assembly floor in occupancies such as theaters, *places of religious worship*, auditoriums and sports facilities.

~~1019.4~~1019.5 **Group I-2 and I-3 occupancies.** In Group I-2 and I-3 occupancies, floor openings between stories containing *exit access stairways* or *ramps* are required to be enclosed ~~with a shaft enclosure constructed in accordance with Section 713~~.

Exception: In Group I-3 occupancies, *exit access stairways* or *ramps* constructed in accordance with Section 408 are not required to be enclosed.

1023.2 Construction. Enclosures for *interior exit stairways* and *ramps* shall be constructed as *fire barriers* in accordance with Section 707 or *horizontal assemblies* constructed in accordance with Section 711, or both. *Interior exit stairway* and *ramp* enclosures shall have a *fire-resistance rating* of not less than 2 hours where connecting four stories or more and not less than 1 hour where connecting less than four stories. The number of stories connected by the *interior exit stairways* or *ramps* shall include any *basements*, but not any *mezzanines*. *Interior exit stairways* and *ramps* shall have a *fire-resistance rating* not less than the floor assembly penetrated, but need not exceed 2 hours.

~~Exceptions~~Exception:

1. *Interior exit stairways* and *ramps* in Group I-3 occupancies in accordance with the provisions of Section 408.3.8.
2. ~~*Interior exit stairways* within an *atrium* enclosed in accordance with Section 404.6.~~

Reason: Code change proposal E5-09/10 formalized the technical relationship between interior exit stairways and exit access stairways. Previously, the issue was confused by a number of exceptions to former exit enclosure provisions. This proposal is intended to further clarify the applicable provisions and accomplish some necessary technical adjustments.
First, the Section 202 definition of exit access stairway has been modified so as to be consistent with the terminology used in the definitions of two other exit access components: aisles and corridors.

Section 1006.3 has been modified to clarify that combinations of exits or access to exits at other building levels may be used to satisfy multiple exit requirements. That is, a story may have two exits, two exit access stairways or ramps leading to exits at other building levels (within exit access travel distance limitations), or one of each. Also, the term "aggregate" occupant loads has been changed to "cumulative" so as to be consistent with the provisions of Section 1004.1.1. The last sentence of Section 1006.3, which limits exit access travel to only one adjacent story, is deleted. This provision was not a part of ICC Code Technology Committee proposal E5. This issue goes to the heart of the original intent of E5. Fire and smoke migration limits have been long identified in the IBC and former legacy codes. They define acceptable atmospheric boundaries under specific design conditions. It is only logical that horizontal and vertical travel within prescribed limitations should be allowed to include that number of stories permitted by any applicable design condition as described in Section 1019.3.

2009 IBC exit enclosure provisions contained numerous exceptions that allowed for extended travel on unenclosed stairways. Examples include atriums, single family residences and open parking garages. The retention of the current adjacent story restriction will simply proliferate exceptions that will return to the former technical status quo. One such exception has already been approved for inclusion in 2015 IBC Section 1023.2 that addresses the atrium design condition. A package of exceptions addressing multi-story residential occupancies has been submitted for consideration during this code development cycle. Approval of this proposal will render that submittal as unnecessary.

It should be noted that removal of the current single adjacent story restriction will not allow for carte blanche multi-story access to exits. The default requirement at Section 1019.3 is that <u>all</u> exit access stairways be enclosed. That section contains a list of eight conditions where unenclosed exit access stairways are permitted. The first is the most commonly used and allows for two story open stairways in other than Group I-2 and I-3 occupancies. This provision inherently complies with the single adjacent story limitation. The remaining seven items are specific in nature and their tenability limits have long been contained in the IBC. To circumnavigate the adjacent story travel restriction, exceptions have been approved or are proposed for six of the seven design conditions. So effectively, removal of the provision will have virtually no effect on means of egress design. Elimination of the growing list of exceptions in favor of a comprehensive base requirement is the preferred method of addressing the design condition.

Section 1006.3.1 has been modified to recognize combinations of exits or access to exits so as to be consistent with Section 1006.3.

An important change has been made to Section 1019, exit access stairways. The technical requirements for interior exit stairways (an exit component) are easily established. Typically, all interior exit stairways are enclosed with fire resistance-rated construction and they extend to the exterior of the building. With exit access stairways, there are two issues. One is their purpose as a means of egress component. Also of concern are building fire and smoke migration limits. Recent IBC editions had clarified that it is permissible to access exits at other building levels by way of exit access stairways or ramps. The general architectural need is to have an unenclosed exit access stairway(s) within a given portion of the building having common tenancy. Historical fire and smoke migration limits, however, limit the number of open stories that an unenclosed exit access stairway can serve. Numbers of stories greater than these limits would require the enclosure of exit access stairways based on <u>shaft</u> protection requirements.

The resultant 2012 IBC system was logical and clarified previous requirements. That said, it overlooked means of egress occupant expectation concerns and some theoretical technical issues. First, there is no requirement for an enclosed exit access stairway to extend to the exterior of the building. Such a stairway may terminate at any building level. Additionally, there is no requirement to maintain exit access stairway rating continuity simialr to that required for rated corridors. It is believed that due to occupant conditioning, that there is the expectation that when a person enters an enclosed stairway, that they are in a relatively safe area that will lead to the exterior of the building. Another complication is that travel to exits at other building levels is permitted where the exit access travel distance does not exceed that allowed. An enclosed exit access stairway may allow for acceptable travel limitations; however, remaining portions of the same enclosure would exceed requirements. The point being that occupants are not aware of when they should leave the exit access stairway enclosure--an exit access component--so as to meet exit access travel distance requirements.

The original purpose of the exit access stairway concept was to allow for unenclosed, non-rated interior stairways within building spaces so as to allow for occupant circulation and access to exits at other building levels. To meet occupant expectations and increase fire and life safety, shaft enclosure requirements are proposed to be replaced by interior exit stairway construction requirements. This also resolves the extended travel within an exit access component issue because occupants would be entering a formal exit component.

This apparent upgrade is less impactful that might be thought. Construction requirements for interior exit stairways and enclosed exit access stairways are virtually identical. The primary difference ocurrs with opening and penetration protection requirements. Obviously, interior exit stairway opening and penetration provisions are better suited to protect occupants in the means of egress as opposed to present utility protection concerns.

Approval of this proposal would add balance to current IBC means of egress provisions and react to likely occupant expectation of enclosed interior stairways. Approval will result in functional and understandable provisions and increase the level of occupant safely.

Cost Impact: Will increase the cost of construction
Although the opening protection requirements for interior exit stairways are apparently more stringent, they may or may not actually be more expensive than shaft protection requirements.

Staff note: There is a published errata to Section 1006.3 and 1006.3.1. The errata is incorporated into this proposal as existing text.

E 102-15 : 1006.3-KEITH4635

2015 International Building Code

Revise as follows:

SECTION 202 DEFINITIONS

ATRIUM. An opening connecting two or more *stories* other than <u>unenclosed exit access stairways and ramps that do not connect more than four stories,</u> enclosed *stairways*, elevators, hoistways, escalators, plumbing, electrical, air-conditioning or other equipment, which is closed at the top and not defined as a mall. *Stories*, as used in this definition, do not include balconies within assembly groups or *mezzanines* that comply with Section 505.

1019.3 Occupancies other than Groups I-2 and I-3. In other than Group I-2 and I-3 occupancies, floor openings containing *exit access stairways* or *ramps* that do not comply with one of the conditions listed in this section shall be enclosed with a shaft enclosure constructed in accordance with Section 713.

1. *Exit access stairways* and *ramps* that serve or atmospherically communicate between only two stories. Such interconnected stories shall not be open to other stories.
2. In Group R-1, R-2 or R-3 occupancies, *exit accessstairways* and *ramps* connecting four stories or less serving and contained within an individual *dwelling unit* or *sleeping unit* or *live/work unit.*
3. *Exit access stairways* serving and contained within a Group R-3 congregate residence or a Group R-4 facility are not required to be enclosed.
4. *Exit access stairways* and *ramps* in buildings equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1, where the area of the vertical opening between stories does not exceed twice the horizontal projected area of the *stairway* or *ramp* and the opening is protected by a draft curtain and closely spaced sprinklers in accordance with NFPA 13. ~~In other than Group B and M occupancies, this~~<u>This</u> provision is limited to openings that do not connect more than four stories.
5. *Exit access stairways* and *ramps* within an *atrium* complying with the provisions of Section 404.
6. *Exit access stairways* and *ramps* in *open parking garages* that serve only the parking garage.
7. *Exit access stairways* and *ramps* serving open-air seating complying with the *exit access* travel distance requirements of Section 1029.7.
8. *Exit access stairways* and *ramps* serving the balcony, gallery or press box and the main assembly floor in occupancies such as theaters, *places of religious worship*, auditoriums and sports facilities.

Reason: The purpose of this proposal is to update the definition of atrium to include unenclosed exit access stairways and ramps and to modify the permitted number of stories an unenclosed exit access stairway or ramp can connect before additional fire protection features must be provided.
Prior to the 2012 edition of the IBC unenclosed exit access stairways were simply called unenclosed stairways and they were only permitted to connect more than two stories within a building if they were not part of a means of egess system or were located within an atrium. In other words they were restricted to being an extra stairway. It was not common to have an extra unenclosed stairway other than one located within an atrium.

2009 IBC

> 708.2 Shaft enclosure required.
> Openings through a floor/ceiling assembly shall be protected by a shaft enclosure complying with this section.
>
> Exceptions:
>
> 2. A shaft enclosure is not required in a building equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 for an escalator opening or stairway <u>that is not a portion of the means of egress</u> protected according to Item 2.1 or 2.2.
>
> 2.1. Where the area of the floor opening between stories does not exceed twice the horizontal projected area of the escalator or stairway and the opening is protected by a draft curtain and closely spaced sprinklers in accordance with NFPA 13. In other than Groups B and M, this application is limited to openings that do not connect more than four stories .

With changes for the 2012 IBC these stairways and ramps became "unenclosed exit access stairways and ramps", part of the egress system. The same number of stories could be connected, up to 4 stories for all Groups other than B and M which are unlimited, and the unenclosed exit access stairways and ramps are now part of the egress system. Occupants are expected to use them in evacuating/egressing from the floor or building. That was a major technical change and one that encourages increased useage in design.

Since the 2006 edition of the IBC the definition of atrium and the allowance for unenclosed stairs has overlapped. (Prior to the 2006 edition of the IBC there were specific exceptions for smoke control for these types of unenclosed stairways). From a fire protection standpoint they conflict with each other. If applied together you can have the unenclosed stairway, but if you connect three or more stories you needed smoke control.

What this proposal does is add "unenclosed exit access stairways and ramps that do not connect more than four stories" to the methods of openings in floor construction not defined as an atrrium and modifying Section 1919.3, Item 4 to limit the unenclosed exit access stairs and ramps to 4 stories. With these changes the two concepts are coordinated for application of the IBC and to provide for a level of safety for occupants traversing down an unenclosed exit access stairway or ramp, potentially towards the source of the fire and into the products of combustion.

Cost Impact: Will increase the cost of construction
I chose will increase the cost of construction only because of the limitation of 4 stories imposed upon the B and M Group stairways and ramps. However, it is my belief that increae is minimal or not at all since it doesn't increase contstruction cost, it simply limits an architectural feature that is typically unnecessary in code complaint design.

E 103-15 : 1019.3-DAVIDSON5281

E 104-15

1019.3 (IFC [BE] 1019.3)

Proponent: Edward Kulik, Chair, representing Building Code Action Committee (bcac@iccsafe.org)

2015 International Building Code

Revise as follows:

1019.3 Occupancies other than Groups I-2 and I-3. In other than Group I-2 and I-3 occupancies, floor openings containing *exit access stairways* or *ramps* that do not comply with one of the conditions listed in this section shall be enclosed with a shaft enclosure constructed in accordance with Section 713.

1. *Exit access stairways* and *ramps* that serve or atmospherically communicate between only two stories. Such interconnected stories shall not be open to other stories.
2. *In Group R-1, R-2 or R-3 occupancies, exit accessstairways and ramps connecting four stories or less serving and contained within an individual dwelling unit or sleeping unit or live/work unit.*
3. *Exit access stairways* serving and contained within a Group R-3 congregate residence or a Group R-4 facility are not required to be enclosed.
4. *Exit access stairways* and *ramps* in buildings equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1, where the area of the vertical opening between stories does not exceed twice the horizontal projected area of the *stairway* or *ramp* and the opening is protected by a draft curtain and closely spaced sprinklers in accordance with NFPA 13. In other than Group B and M occupancies, this provision is limited to openings that do not connect more than four stories.
5. *Exit access stairways* and *ramps* within an *atrium* complying with the provisions of Section 404.
6. *Exit access stairways* and *ramps* in *open parking garages* that serve only the parking garage.
7. *Exit access stairways* and *ramps* serving open-air seating complying with the *exit access* travel distance requirements of Section 1029.7.
8. *Exit access stairways* and *ramps* ~~serving~~ between the balcony, gallery or press box and the main assembly floor in occupancies such as theaters, *places of religious worship*, auditoriums and sports facilities.

Reason: This exception previously read as follows. "Stairways are permitted to be open between the balcony, gallery or press box and the main assembly floor in occupancies such as theaters, places of religious worship, auditoriums and sports facilities." The revision last cycle had an unintended consequence. The current text can be read differently without 'between'. It could be read to allow open stairways serving the main assembly floor to be open exit access stairways.
In July/2014 the ICC Board decided to sunset the activities of the Code Technology Committee (CTC). This is being accomplished by re-assigning many of the CTC Areas of Study to the applicable Code Action Committee (CAC). This proposal falls under the CTC Area of Study entitled Unenclosed Exit Stairs. Information on the CTC, including: the sunset plan; meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the CTC website.http://www.iccsafe.org/cs/CTC/Pages/default.aspx

This public proposal is submitted by the ICC Building Code Action Committee (BCAC). The BCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the BCAC has held 13 open meetings and numerous workgroup calls which included members of the BCAC as well as any interested party to discuss and debate the proposed changes and the public comments. Related documentation and reports are posted on the BCAC website at: http://www.iccsafe.org/cs/BCAC/Pages/default.aspx.

Cost Impact: Will not increase the cost of construction
This proposal is a clarification of provisions. There is no change in requirements.

E 104-15 : 1019.3-KULIK3644

E 105-15

1020.1; (IFC[BE] 1020.1)

Proponent: Vickie Lovell, InterCode Incorporated, representing Fire Safe North America (vickie@intercodeinc.com)

2015 International Building Code

Revise as follows:

1020.1 Construction. *Corridors* shall be fire-resistance rated in accordance with Table 1020.1. The *corridor* walls required to be fire-resistance rated shall comply with Section 708 for *fire partitions*.

<u>In addition, corridors in buildings of Types IIB, IIIB, and VB construction and assigned Risk Categories III and IV in Table 1604.5, other than Group I, shall have a fire resistance rating of not less than 1 hour where such buildings are any of the following:</u>

1. <u>Assigned a Seismic Design Category C or D in Table 1613.3.5(1).</u>
2. <u>Located in a flood hazard area established in accordance with Section 1612.3.</u>
3. <u>Located in a *hurricane-prone regions*.</u>

Exceptions:

1. A *fire-resistance rating* is not required for *corridors* in an occupancy in Group E where each room that is used for instruction has not less than one door opening directly to the exterior and rooms for assembly purposes have not less than one-half of the required *means of egress* doors opening directly to the exterior. Exterior doors specified in this exception are required to be at ground level.
2. A *fire-resistance rating* is not required for *corridors* contained within a *dwelling unit* or *sleeping unit* in an occupancy in Groups I-1 and R.
3. A *fire-resistance rating* is not required for *corridors* in *open parking garages*.
4. A *fire-resistance rating* is not required for *corridors* in an occupancy in Group B that is a space requiring only a single *means of egress* complying with Section 1006.2.
5. *Corridors* adjacent to the *exterior walls* of buildings shall be permitted to have unprotected openings on unrated *exterior walls* where unrated walls are permitted by Table 602 and unprotected openings are permitted by Table 705.8.

Reason: As hazard events, both naturally-occurring and man-made, are increasing in number and severity in the United States and around the world, the resilience of communities and the individual buildings within those communities is becoming of vital importance.
A National Institute of Building Sciences Publication (May, 2014) entitled "Moving Forward: Findings and Recommendations", states that "while a long history of building codes has laid the foundation for addressing the impacts of natural and man-made hazards, changes in the frequency and severity of events have brought new challenges — challenges requiring the engagement and support of policymakers. <u>While building codes serve as the minimum requirements for life-safety in the building stock, basic life-safety protections do not fully address building performance requirements to achieve resilience."</u>

Mitigation includes, among other things, fortifying buildings so that they are less likely to be severely damaged or completely destroyed during or immediately after a disaster. It is the key to recovery after a disaster. Mitigation allows individuals and communities to lessen post-disaster disruption and rebuild more quickly. States and cities have started implementing more stringent requirements in specific geographic areas they have designated as higher-risk. The purpose of this series of code changes proposed by Fire Safe North America is to encourage the debate in the code development process to identify what constitutes resilient buildings, and begin to identify issues that will become the basis for "new minimum requirements" for increased building resiliency.

Responding to the challenge of mitigating damage and resilient buildings is an admittedly complex topic. Fire Safe North America proposals are intended to reduce the total reliance of a community and its firefighters on automatic sprinkler systems in disaster-prone areas of the country where the water supply and/or power are likely to be interrupted, or are likely to have water supply system operational issues. The proposals, if approved, will fortify the building code requirements for the most vulnerable buildings to fire - Type IIB, IIIB, and VB construction, which are also classified as Risk Category III and IV in Table 1604.5, and in high-risk, disaster prone regions. The proposals modify the following code requirements in such buildings:

1. Reduce allowable area limits
2. Protect the path of egress by limiting travel distances
3. Protect the path of egress by protecting corridors
4. Require higher fire resistance ratings for occupancy separations
5. Require higher fire resistance ratings for building elements

These proposals are intended to be conservative so as to promote community resiliency and disaster mitigation by protecting essential buildings with both sprinkler protection AND fire resistance rated compartmentation. These proposals may be fairly considered to be the proverbial "belt-and suspenders" approach, requiring both sprinkler protection and increased fire resistance rated compartmentation in specific buildings in high risk areas for disasters.

Historically, the code has been written using the general assumption that automatic sprinklers will operate satisfactorily and there will be suitable power for such building operations. Code users design and build assuming that firefighters will be able to respond at their normal efficiencies. In some parts of the country, buildings impacted by disasters may remain without reliable water and/or power for a considerable period of time, well after the occurrence of the disaster. History has shown that increased incidents of fires after a disaster can be more destructive to life and property than the disaster itself. Total reliance on an uninterrupted power and water supply may not be an acceptable risk. It may also be an unacceptable risk to assume that firefighters will be able to respond at their normal efficiencies.

For example, more than 15% of the U.S. population lives in potential major earthquake areas. 41 states and territories have moderate to high risk. There is a real likelihood of power and water supplies being interrupted following a major seismic event, along with the potential for multiple simultaneous structure fires and also building-to-building fire spread. In October 17, 1989, a 7.1 earthquake in Santa Cruz Mountains was responsible for 26 fires in San Francisco, 60 miles from epicenter. There were 67 documented breaks in water mains which effectively eliminated water pressure in the area. On January 19, 1994, a 6.8 earthquake centered in Northridge, CA. There were approximately 100 fire ignitions, 30 to 50 of those were considered significant. The water supply systems in the area were damaged causing low pressure in water distribution. On January 17, 1995, a 6.8 (approx.) earthquake near Kobe, Japan caused 90 fires to start within minutes. 85 spread to adjacent buildings and 10 approached or reached conflagration status. 1,700 water line breaks occurred within a couple of hours. There were 7,000 buildings destroyed by fire alone.

In 1997, the Red River flooded Grand Forks, North Dakota, causing $3.7 billion in flood losses, and displaced thousands of families and businesses. Similar data of increased fire incidents are available in other flood and hurricane-prone areas.

Undoubtedly, this will increase the cost of construction in these specific buildings. However, a recent FEMA's 2010 report "Mitigation's Value to Society" statement described how mitigation is an investment that needs to be made. A recent study by the NIBS Multihazard Mitigation Council (MMC) identified that each dollar spent on mitigation saves an average of $4.00 in disaster recovery.

Links:
http://www.dhses.ny.gov/oem/mitigation/documents/mitigations-value-to-society.pdf

The two-volume NIBS MMC study report is available for free download at:
http://www.nibs.org/index.php/mmc/projects/nhms

Cost Impact: Will increase the cost of construction
This code change proposal will increase the cost of construction for some building types.

E 105-15 : 1020.1-LOVELL5278

E 106-15

Table 1020.2; (IFC[BE] Table 1020.2)

Proponent: John Williams, CBO, Chair, representing Adhoc Health Care Committee (AHC@iccsafe.org)

2015 International Building Code

TABLE 1020.2
MINIMUM CORRIDOR WIDTH

OCCUPANCY	MINIMUM WIDTH (inches)
Any facilities not listed below	44
Access to and utilization of mechanical, plumbing or electrical systems or equipment	24
With an occupant load of less than 50	36
Within a *dwelling unit*	36
In Group E with a *corridor* having an occupant load of 100 or more	72
In corridors and areas serving stretcher traffic in ~~occupancies where patients receive outpatient medical care, that causes the patient to be incapable of self-preservation~~ <u>ambulatory care facilities</u>	72
Group I-2 in areas where required for bed movement	96

For SI: 1 inch = 25.4 mm.

Reason: The intent of this proposal is coordination of this table with the defined term for ambulatory care facilities
.
The ICC Ad Hoc Committee on Healthcare (AHC) has just completed its 4th year. The AHC was established by the ICC Board to evaluate and assess contemporary code issues relating to hospitals and ambulatory healthcare facilities. This is a joint effort between ICC and the American Society for Healthcare Engineering (ASHE), a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. Information on the AHC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the AHC effort can be downloaded from the AHC website at: http://www.iccsafe.org/cs/AHC/Pages/default.aspx.

Cost Impact: Will not increase the cost of construction
This is a clarification; therefore, there is no change in cost.

Staff note: There is a published errata to Table 1020.2. The errata has been incorporated into the table as existing text.

E 106-15 : T1020.2-WILLIAMS4230

E 107-15

1020.4 (IFC[BE] 1020.4)

Proponent: Carl Baldassarra, P.E., FSFPE, Chair, ICC Code Technology Committee, representing Code Technology Committee (CTC@iccsafe.org)

2015 International Building Code

Revise as follows:

1020.4 Dead ends. Where more than one *exit* or *exit access doorway* is required, the *exit access* shall be arranged such that there are no dead ends in *corridors* more than 20 feet (6096 mm) in length.

Exceptions:

1. In occupancies in Group I-3 of Condition 2, 3 or 4, the dead end in a *corridor* shall not exceed 50 feet (15 240 mm).
2. In occupancies in Groups B, E, F, I-1, M, R-1, R-2~~, R-4~~, S and U, where the building is equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1, the length of the dead-end *corridors* shall not exceed 50 feet (15 240 mm).
3. A dead-end *corridor* shall not be limited in length where the length of the dead-end *corridor* is less than 2.5 times the least width of the dead-end *corridor*.

Reason: Single exit building do not have dead end corridors, therefore this should be removed. Group R-4 are permitted to have single exits per Section 1006.3.2 Item 4.
The ICC Code Technology Committee (CTC) has just completed its 10th year. The ICC Board has decided to sunset the CTC. The sunset plan includes re-assigning many of the CTC Areas of Study to the applicable Code Action Committee (CAC). The two remaining CTC Areas of Study are Care Facilities and Elevator Lobbies/WTC Elevator issues. This proposal falls under the Care Facilities Area of Study. Information on the CTC, including: the sunset plan; meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the CTC website at: http://www.iccsafe.org/cs/CTC/Pages/default.aspx.

Cost Impact: Will not increase the cost of construction
This is eliminating an erroneous requirement.

E 107-15 : 1020.4-BALDASSARRA4279

E 108-15

1020.4; (IFC[BE] 1020.4)

Proponent: Ronald Geren, representing Self (ron@specsandcodes.com)

2015 International Building Code

Revise as follows:

1020.4 Dead ends. Where more than one *exit* or *exit access doorway* is required, the *exit access* shall be arranged such that there are no dead ends in *corridors* more than 20 feet (6096 mm) in length.

Exceptions:

1. In occupancies in Group I-3 of Condition 2, 3 or 4, the dead end in a *corridor* shall not exceed 50 feet (15 240 mm).
2. In occupancies in Groups B, E, F, I-1, M, R-1, R-2, R-4, S and U, where the building is equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1, the length of the dead-end *corridors* shall not exceed 50 feet (15 240 mm).
3. A dead-end *corridor* shall not be limited in length where the length of the dead-end *corridor* is less than 2.5 times the least width of the dead-end *corridor*.
4. <u>In occupancies in Groups B, E, F, I-1, M, R-1, R-2, R-4, S and U, where the building is equipped througout with an *automatic sprinkler system* in accordance with Section 903.3.1.1, a dead-end *corridor* shall not be limited in length where the length of the dead-end *corridor* is less than 6.25 times the least width of the dead-end *corridor*.</u>

Reason: This proposal parallels the logic of Exception 2 and 3.
Exception 3 allows a nonsprinklered building to extend a dead-end corridor beyond 20 feet if the corridor is wider than 8 feet (8' × 2.5 = 20'). However, a sprinkler system will allow a dead-end corridor to extend up to 50 feet for the occupancy groups indicated in Exception 2. But, for a sprinklered building to go beyond the 50-foot limitation, the dead-end corridor would need to be wider than 20 feet per Exception 3 (20' × 2.5 = 50').

Thus, if a dead-end corridor that is wider than 8 feet can extend beyond 20 feet in a nonsprinklered building (Exception 3), then a dead-end corridor that is also wider than 8 feet in a sprinklered building should also be allowed to go beyond 50 feet (8' x 6.25 = 50').

Cost Impact: Will not increase the cost of construction
The proposed exception is an option for designers and its use would have no negative impact on material or labor costs; it will more likely have a positive impact on cost by adding more flexibility for designer in means of egress design.

E 108-15 : 1020.4-GEREN5148

E 109-15

1021.4; (IFC[BE] 1021.4)

Proponent: Victor Cuevas, representing City of Los Angeles

2015 International Building Code

Revise as follows:

1021.4 Location. Exterior egress balconies shall have a minimum *fire separation distance* of 10 feet (3048 mm) measured at right angles from the exterior edge of the egress balcony to the following:

1. Adjacent *lot lines*.
2. Other portions of the building.
3. Other buildings on the same lot unless the adjacent building *exterior walls* and openings are protected in accordance with Section 705 based on *fire separation distance*.

For the purposes of this section, other portions of the building shall be treated as separate buildings.

<u>**Exception:** Exterior egress balconies shall be permitted to have a minimum fire separation distance of 5 feet (1524 mm), where the exterior edge of the egress balcony has openings protected and limited in accordance with Section 705.8</u>

Reason: It is not practical to provide 10' setbacks for buildings. With this exception, balconies will be similar to corridors, which do not have specific fire separation distance limitations.

Cost Impact: Will not increase the cost of construction
This is a design option.

E 109-15 : 1021.4-CUEVAS4829

E 110-15

1023.3.1; (IFC[BE] 1023.3.1)

Proponent: Raymond Grill, Arup, representing Arup (ray.grill@arup.com)

2015 International Building Code

Revise as follows:

1023.3.1 Extension. Where *interior exit stairways* and *ramps* are extended to an *exit discharge* or a *public way* by an *exit passageway*, the *interior exit stairway* and *ramp* shall be separated from the *exit passageway* by a *fire barrier* constructed in accordance with Section 707 or a *horizontal assembly* constructed in accordance with Section 711, or both. The *fire-resistance rating* shall be not less than that required for the *interior exit stairway* and *ramp*. A *fire door* assembly complying with Section 716.5 shall be installed in the *fire barrier* to provide a *means of egress* from the *interior exit stairway* and *ramp* to the *exit passageway*. Openings in the *fire barrier* other than the *fire door* assembly are prohibited. Penetrations of the *fire barrier* are prohibited.

Exceptions:

1. Penetrations of the *fire barrier* in accordance with Section 1023.5 shall be permitted.
2. Separation between an *interior exit stairway* or *ramp* and the *exit passageway* extension shall not be required where there are no openings into the *exit passageway* extension.
3. <u>Separation between an interior exit stairway or ramp and the exit passageway extension shall not be required when the interior exit stair and the exit passageway extension are pressurized in accordance with Section 909.20.5.</u>

Reason: Pressurized stairs often discharge through an exit passageway. The exit passageway is also typically required to be pressurized since it is a coninuation of the pressurized stair enclosure. The system providing pressurization of the stair and passageway is typically the same system. Technical compliance would require separate systems if a separation is required to be maintained. The introduction of a door and fire barrier between the exit passageway and the stair creates an obstruction to airflow which inhibits the pressurization of the stair and passageway. The provision of a separation does not provide any added safety and could also impede egress.

Cost Impact: Will not increase the cost of construction
This code change will reduce the cost of construction where pressurized stairs discharge through an exit passageway extension. The door and fire barrier between the exit passageway extension and the stair would not be required.

E 110-15 : 1023.3.1-GRILL5191

E 111-15

1023.4; (IFC[BE] 1023.4)

Proponent: Homer Maiel, PE, CBO, representing ICC Tri-Chapter (Peninsula, East Bay, Monterey Bay) (hmaiel@gmail.com)

2015 International Building Code

Revise as follows:

1023.4 Openings. *Interior exit stairway* and *ramp* opening protectives shall be in accordance with the requirements of Section 716.

Openings in *interior exit stairways* and *ramps* other than unprotected exterior openings shall be limited to those ~~necessary~~ required for *exit access* to the enclosure from normally occupied spaces and for egress from the enclosure.

Elevators shall not open into *interior exit stairways* and *ramps*.

Reason: The word "necessary" is subjective. However, the word "required" is more definitive and has been used throughout the code consistantly.

Cost Impact: Will not increase the cost of construction
This code change proposal will not increase cost of construction.

E 111-15 : 1023.4-MAIEL4690

E 112-15

1023.5; (IFC[BE] 1023.5)

Proponent: William Koffel, representing Firestop Contractors International Association (wkoffel@koffel.com)

2015 International Building Code

Revise as follows:

1023.5 Penetrations. Penetrations into or through *interior exit stairways* and *ramps* are prohibited except for equipment and ductwork necessary for independent ventilation or pressurization, sprinkler piping, standpipes, electrical raceway for fire department communication <u>and security </u>systems and electrical raceway serving the *interior exit stairway* and *ramp* and terminating at a steel box not exceeding 16 square inches (0.010 m^2). Such penetrations shall be protected in accordance with Section 714. There shall not be penetrations or communication openings, whether protected or not, between adjacent *interior exit stairways* and *ramps*.

> **Exception:** Membrane penetrations shall be permitted on the outside of the *interior exit stairway* and *ramp*. Such penetrations shall be protected in accordance with Section 714.3.2.

Reason: Building security systems, including cameras in stairways, are becoming more prevalent. If properly protected, a limited number of penetrations for security systems will not result in an unacceptable level of safety. NFPA 101-2015 requires stairway video monitoring in high-rise buildings having an occupant load of 4,000 or more persons.

Cost Impact: Will not increase the cost of construction
The proposed language addressed a limitation in the code regarding security systems being able to penetrate exit enclosures. If anything, the cost of construction will be decreased by allowing an acceptable way for installing such systems.

E 112-15 : 1023.5-KOFFEL4844

E 113-15

1023.5, 1024.6; (IFC[BE] 1023.5, 1024.6)

Proponent: William King, City of Alexandria, representing Virginia Building Code Officials Association (william.king@alexandriava.gov)

2015 International Building Code

Revise as follows:

1023.5 Penetrations. Penetrations into or through *interior exit stairways* and *ramps* are prohibited except for equipment and ductwork necessary for independent ventilation or pressurization, ~~sprinkler piping~~*fire protection systems*, ~~standpipes~~two-way communication systems, electrical raceway for fire department communication systems and electrical raceway serving the *interior exit stairway* and *ramp* and terminating at a steel box not exceeding 16 square inches (0.010 m^2). Such penetrations shall be protected in accordance with Section 714. There shall not be penetrations or communication openings, whether protected or not, between adjacent *interior exit stairways* and *ramps*.

> ~~**Exception:** Membrane penetrations shall be permitted on the outside of the *interior exit stairway* and *ramp*. Such penetrations shall be protected in accordance with Section 714.3.2.~~

1024.6 Penetrations. Penetrations into or through an *exit passageway* are prohibited except for equipment and ductwork necessary for independent pressurization, ~~sprinkler piping~~*fire protection systems*, ~~standpipes~~two-way communication systems, electrical raceway for fire department communication and electrical raceway serving the *exit passageway* and terminating at a steel box not exceeding 16 square inches (0.010 m^2). Such penetrations shall be protected in accordance with Section 714. There shall not be penetrations or communicating openings, whether protected or not, between adjacent *exit passageways*.

> ~~**Exception:** Membrane penetrations shall be permitted on the outside of the *exit passageway*. Such penetrations shall be protected in accordance with Section 714.3.2~~.

Reason: The purpose of these two code sections are to protect the integrity of the exit enclosure and allow for safe egress for the occupants. The current exceptions, first included in the 2012 IBC, as written put the integrity of the exit enclosure at risk.
The reason statement for the creation of this exception in the 2012 code stated:

"As currently written, a pull station next to a door into the stair, fire hose cabinets, fire extinguisher cabinets, request-to-exit devices related to access control locks, notification appliances, etc., are not permitted on the outside of the exit enclosure. This exceptions needs to clarify the intent of Sections 1022.4 and 1023.6".

The commentary for this section of the code states the following:

"The intent is to maintain the integrity of the enclosure for the exit access stairway."

"The exception allows for electrical boxes, "Exit" signs or fire alarm pull stations to be installed on the outside of the enclosure provided that the boxes are installed so that the required fire-resistance rating is not reduced."

The exception as it currently exists is significantly broader than just addressing those items. Using the exception, any and all items can penetrate the membrane of an exit enclosure without limitation to size or quantity as long as they are part of a tested penetration. This puts the exit enclosure at significant risk and degrades the overall safety afforded by an exit enclosure. As the code continues to reduce the times in which a rated exit enclosure is provided, the protection of these enclosures becomes even more critical to the safety of the building's occupants.

The current proposal looks to remove the blanket allowance for any system to be placed in the exit enclosure assembly. The inclusion of additional items in the main text of the section is designed to address the items noted as the basis for the original code change, but would keep the rated exit enclosure wall from being used as a chase for plumbing, fuel gas, med gas, low voltage wiring and any of the other myriad of hazards the current exception would allow.

Cost Impact: Will increase the cost of construction
This change would not allow the rated exit enclosure wall to be used as a chase for building services. This may require an additional chase to be constructed.

E 113-15 : 1023.5-KING3314

E 114-15

1023.11; (IFC[BE] 1023.11)

Proponent: Christopher Moran, Jensen Hughes, representing Airport Traffic Control Tower Technical Working Group (cmoran@jensenhughes.com); Eric Rosenbaum, Jensen Hughes, representing Airport Traffic Control Tower Fire/Life Safety Technical Working Group (erosenbaum@jensenhughes.com)

2015 International Building Code

Revise as follows:

1023.11 Smokeproof enclosures. Where required by Section 403.5.4 ~~or~~, 405.7.2, or 412.3.2, *interior exit stairways* and *ramps* shall be *smokeproof enclosures* in accordance with Section 909.20.

Reason: Section 412.3.2 requires smokeproof enclosures for air traffic control tower stairs and refers to section 1023.11 but section 1023.11 does not reference back to 412.3.2 as it does for high-rise buildings (403.5.4) and underground buildings (405.7.2). This change is proposed to reduce potential confusion from the lack of the reference statement in 1023.11. The current code requirement from 412.3.2 is included below for reference.

> **412.3.2 Stairways.** Stairways in airport traffic control towers shall be in accordance with Section 1011. Stairways shall be smokeproof enclosures complying with one of the alternatives provided in Section 909.20.
>
> **Exception:** Stairways in airport traffic control towers are not required to comply with Section 1011.12.

Cost Impact: Will not increase the cost of construction
This proposal only reduces potential confusion and clarifies the intent of the code. No cost impact is associated with this change.

E 114-15 : 1023.11-MORAN5073

E 115-15

1023.12 (New), 1024.8 (New), 1026.5 (New); (IFC[BE] 1023.12 (New), 1024.8 (New), 1026.5 (New))

Proponent: Lee Kranz, City of Bellevue, WA, representing Washington Association of Building Officials Technical Code Development Committee

2015 International Building Code

Add new text as follows:

1023.12 **Standpipes.** Standpipes and standpipe hose connections shall be provided in accordance with Sections 905.3 and 905.4.

1024.8 **Standpipes.** Standpipes and standpipe hose connections shall be provided in accordance with Sections 905.3 and 905.4.

1026.5 **Standpipes.** Standpipes and standpipe hose connections shall be provided in accordance with Sections 905.3 and 905.4.

Reason: Placing references to Sections 905.3 and 905.4 standpipe requirements for interior exit stairways & ramps (Section 1023), exit passageways (Section 1024) and horizontal exits (Secion 1026) will help designers and reviewers to include this requirement early in the building design process. During the means of egress design process, the requirement for standpipes for interior exit stairways/ramps, exit passageways and horizontal exits are frequently overlooked and may have significant cost impacts to correct later during construction. Including the standpipe references will make the design team aware of the requirement early in the design process and help insure cost impacts are considered at the appropriate time.

Cost Impact: Will not increase the cost of construction
This code change will save money by providing a reminder to designers and plan reviewers to check for the need for standpipes when the design includes interior exit stairways or ramps, exit passageways and horizontal exits.

E 117-15

1025.1; (IFC[BE] 1025.1)

Proponent: John Williams, CBO, CBO, Chair, Adhoc Healthcare Committee, representing Adhoc Health Care Committee (AHC@iccsafe.org); Carl Baldassarra, P.E., FSFPE, Chair, Code Technology Committee, representing Code Technology Committee (CTC@iccsafe.org)

2015 International Building Code

Revise as follows:

1025.1 General. *Approved* luminous egress path markings delineating the exit path shall be provided in *high-rise buildings* of Group A, B, E, ~~I~~I-1, I-3, I-4, M, and R-1 occupancies in accordance with Sections 1025.1 through 1025.5.

> **Exception:** Luminous egress path markings shall not be required on the *level of exit discharge* in lobbies that serve as part of the exit path in accordance with Section 1028.1, Exception 1.

Reason: The intent of this proposal is to delete Group I-2 from the facilities that require luminous egress path markings. Hospitals and nursing homes have trained staff that operate with a defend-in-place strategy for fires. The emergency generators are continually monitored and maintained, so the change of the emergency egress lighting required in the means of egress (Section 1008) failing is extremely minimal. Requiring egress path marking is the stairways in high-rise hospitals and nursing homes is a redundant feature that is costly and unnecessary.
In addition, the hospitals will have the emergency lighting on their emergency generator, not just battery power. For the stripes to be utilized, both the general means of egress lighting and the emergency lighting has to have failed.

The ICC Ad Hoc Committee on Healthcare (AHC) has just completed its 4th year. The AHC was established by the ICC Board to evaluate and assess contemporary code issues relating to hospitals and ambulatory healthcare facilities. This is a joint effort between ICC and the American Society for Healthcare Engineering (ASHE), a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. Information on the AHC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the AHC effort can be downloaded from the AHC website at: http://www.iccsafe.org/cs/AHC/Pages/default.aspx.

The ICC Code Technology Committee (CTC) has just completed its 10th year. The ICC Board has decided to sunset the CTC. The sunset plan includes re-assigning many of the CTC Areas of Study to the applicable Code Action Committee (CAC). The two remaining CTC Areas of Study are Care Facilities and Elevator Lobbies/WTC Elevator issues. This proposal falls under the Care Facilities Area of Study. Information on the CTC, including: the sunset plan; meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the CTC website at: http://www.iccsafe.org/cs/CTC/Pages/default.aspx.

Cost Impact: Will not increase the cost of construction
The deletion of luminous egress markings will be a saving in initial construction, maintenance cost of the markings and a savings in energy if the lights do not have to stay on.

E 117-15 : 1025.1-WILLIAMS4232

E 118-15

1025.1 (IFC[BE] 1025.1)

Proponent: Carl Baldassarra, P.E., FSFPE, Chair, ICC Code Technology Committee, representing Code Technology Committee (CTC@iccsafe.org)

2015 International Building Code

Revise as follows:

1025.1 General. *Approved* luminous egress path markings delineating the exit path shall be provided in *high-rise buildings* of Group A, B, E, ~~I~~I-1, I-2, I-3, M, and R-1 occupancies in accordance with Sections 1025.1 through 1025.5.

> **Exception:** Luminous egress path markings shall not be required on the *level of exit discharge* in lobbies that serve as part of the exit path in accordance with Section 1028.1, Exception 1.

Reason: The intent of this proposal is to delete Group I-4 from the facilities that require luminous egress path markings. The current provisions appear to have been written for single occupancy buildings in mind. While there could be a day care in a high rise building, there is no justification for the presence of a small Group I-4 in a building to require photoluminescent stripes throughout.
Perhaps additional clarification is needed for mixed use buildings and when luminous egress path markings should be required, however, that is outside the scope of the CTC Care committees, so nothing is proposed at this time.

The ICC Code Technology Committee (CTC) has just completed its 10th year. The ICC Board has decided to sunset the CTC. The sunset plan includes re-assigning many of the CTC Areas of Study to the applicable Code Action Committee (CAC). The two remaining CTC Areas of Study are Care Facilities and Elevator Lobbies/WTC Elevator issues. This proposal falls under the Care Facilities Area of Study. Information on the CTC, including: the sunset plan; meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the CTC website at: http://www.iccsafe.org/cs/CTC/Pages/default.aspx.

Cost Impact: Will not increase the cost of construction
This will eliminate a requirement for luminous egress path markings in buildings that had a day care but were not one of the use groups named.

2015 International Building Code

Revise as follows:

1025.2.5 Obstacles. Obstacles at or below 6 feet 6 inches (1981 mm) in height and projecting more than 4 inches (102 mm) into the egress path shall be outlined with markings not less than 1 inch (25 mm) in width comprised of a pattern of alternating equal bands, of luminous material and black, with the alternating bands not more than 2 inches (51 mm) thick and angled at 45 degrees (0.79 rad). Obstacles shall include, but are not limited to, standpipes, hose cabinets, wall projections and restricted height areas. However, such markings shall not conceal any required information or indicators including but not limited to instructions to occupants for the use of standpipes.

Exception: The minimum width of 1 inch (25 mm) shall not apply to markings listed in accordance with UL 1994.

Reason: Sections 1025.2.1 steps, 1025.2.3 handrails, and 1025.2.4 perimeter demarcation lines, all provide an exception to the minimum width of 1 inch when the step, handrail and perimeter demarcation lines are listed in accordance with UL 1994, a performance standard. This exception should also apply to Section 1025.2.5 for obstacle markings as the performance has been evaluated and validated by UL 1994.

Cost Impact: Will not increase the cost of construction
This exception will simply provide an equivalent method of compliance similar to what is already provided for in 1025.2.1, 1025.2.3 and 1025.2.4.

Proponent: Lee Devito, FIREPRO Incorporated, representing FIREPRO Incorporated (ldevito@fireproincorporated.com)

2015 International Building Code

Revise as follows:

1025.4 Self-luminous and photoluminescent. Luminous egress path markings shall be permitted to be made of any material, including paint~~, provided that an electrical charge is not required to maintain the required luminance~~. Such materials shall include, but not be limited to, *self-luminous* materials ~~and~~, *photoluminescent* materials and electroluminescent materials. Materials shall comply with either of the following standards:

1. UL 1994.
2. ASTM E 2072, except that the charging source shall be 1 footcandle (11 lux) of fluorescent illumination for 60 minutes, and the minimum luminance shall be 30 milicandelas per square meter at 10 minutes and 5 milicandelas per square meter after 90 minutes.

Add new text as follows:

1025.4.1 Electroluminescent materials. Electroluminescent materials shall be powered by at least two independent and reliable power supplies in accordance with Sections 1025.4.1.1 and 1025.4.1.2 and supervised in accordance with Section 1025.4.1.3.

1025.4.1.1 Primary power source. The primary power supply shall be a branch circuit supplying no other loads and shall be supplied from a commercial light and power source, or an equivalent source acceptable to the authority having jurisdiction.

1025.4.1.2 Secondary power source. The seconday power source shall automaticaly provide power to the electroluminescent system within 10 seconds whenever the primary power supply fails to provide the minimum voltage required for proper operation.

1025.4.1.3 Supervision. Electroluminescent materials shall be supervised by the building fire alarm contol system, and the fire alarm control system shall provide a supervisior signal when a supervisory condition occurs. Supervisory conditions shall be loss of power to the electroluminescent system and breakage of the electroluminescent materials.

Reason: The intent of the Building Code is described in Section 101.3 Intent:

> The purpose of this code is to establish the minimum requirements to safeguard the public health, safety and general welfare through structural strength, means of egress facilities, stability, sanitation, adequate light and ventilation, energy conservation, and safety to life and property from fire and other hazards attributed to the built environment and to provide safety to fire fighters and emergency responders during emergency operations.

The key information in the Section 101.3 Intent is to provide "minimum requirements".

> ASTM E 2072 establishes a minimum requirement for photometric requirements for newly applied photoluminescent safety materials used to provide supplemental markings of escape routes. It requires that ten minutes after it is activated that it have a photopic luminance of 20.0 millicandelas per square meter at ten minutes and 2.8 millicandelas per square meter at sixty minutes.
>
> The deterioration of the light level of photoluminescent materials essentially establishes a time limit for the lighting from luminous path marking equipment of sixty minutes as the minimum requirement. Additionally, ASTM E 2072 specification does not cover potentially diminished performance due to wear and tear or aging, so the actual operating time may vary.

Where the building code establishes minimum requirements, the building owner may wish to go beyond the minimum requirements and establish a higher design standard. With the requirement that the egress path marking product can only be self-luminous materials and photoluminescent materials, minimum path marking illumination time is set at 60 minutes, and because of the deterioration of the photoluminescent material it also sets the maximum illumination time as also 60 minutes.

The National Institute of Standards and Technology, Technology Asminsitration of the U.S. Department of Commerce published the report "NIST Response to the World Trade Center Disaster", Federal; Building and Fire Safety Investigation of the World Trade Center Disaster, Part IV - Life safety on April 5, 2005. Based on interviews with responding personnel it was determined that it took 125 minutes for firefighters carrying equipment and not wearing PPE 125 minutes to climb 58 floors, and for firefighters carrying no equipment and not wearing PPE it toook 90 minutes to climb to the 58th floor. Using photoluminescent material for the luminous egress path markings, the light developed by the photoluminescent material will be deleted in the observed climbing time.

The building owner may desire to have the luminous path marking equipment operate for a longer time frame. That may be because the building owner's desires to have the capability to provide longer egress path lighting if the building egress may take longer than sixty minutes, or that there is a desire to provide longer lighting for the firefighters and emergency responders. Because of their deterioration properties, photoluminescent materials may not be able to provide a longer time frame for illumination that may be appropriate for the building owners desires.

Electrical systems provide the building management with more flexibility with the operaton of the exit path marking systems. Using a commercial power source the egress path marking system can be illuminated continuously. Also, battery backup can be adjusted so that when the commercial power is eliminated the batteries can provide an operating time much longer than the sixty minutes that would be provided by photoluminescent material. This can be selected at the time of the system design by the building owner.

Electrical systems do not need backup lighting which will allow building managers to control the building lighting systems in the egress path.

Furthermore, energy savings and Green/LEEDS requirements (for example through the use of motion sensor lighting) may be further achieved with electroluminescent materials, as separate continuously operational light sources for photoluminescent systems are not required for charging the proposed electroluminescent systems.

A later section of this code, 1024.5 Illumination, requires that means of egress path marking systems that use independent illumination for charging of photoluminescent exit path markings is rquired to be operational for at least 60 minutes prior to periods when the building is occupied. Electro luminescent exit path markings would not require this, relieving the energy usage burden on the building.

Electrical systems can be operated at any time since they have available power and they are protected with battery standby support. Therefore, the building management can utilize the electrical systems when ever there is an alarm activity or other situation in the buildig, whether the building power is available or not. Selfluminous and photoluminescent materials only provide lighting when the background lighting is limited.

Electrical systems are supervised so the building management will know that there is a problem. Self-luminous materials and photoluminescent materials are not supervised, so they can be damaged or removed and no one is notified until a manual check is perfomed on the system. Whereas, the path marking systems are required in some high-rise building , manual inspection will be time consuming and possibly burdonsosme, which may mean that self-luminous or photoluminescent systems may not be inspected.

The management can utilize the flexibility of the electrical system to provide further information on the availability or disruption of an egress path. Potentially by not turning on the egress path marking system in an egress path that has been interupted, it can allow the evacuees to change the egress path they are using.

Code Impact: If an adoptive organization does not agree with the use of electroluninescent technology, then through an amendment policy they can delete those sections that relate to electroluminescent technology. This allows adoptive organizations the opportunity to allow electroluninescent technology.

Bibliography: "NIST Response to the World Trade Center Disaster", Federal; Building and Fire Safety Investigation of the World Trade Center Disaster, Part IV - Life safety on April 5, 2005, pages 33 & 34

Cost Impact: Will not increase the cost of construction
The requirement for path marking already exists, therefore there would be no additional cost impact. This approach provides an option that allows building owners to choose equivalent systems that provide more features for the end user.

E 121-15 : 1025.4-DEVITO3601

E 122-15

1025.4; (IFC[BE] 1025.4)

Proponent: Manny Muniz, representing self (Mannymuniz.mm@gmail.com)

2015 International Building Code

Revise as follows:

1025.4 Self-luminous and photoluminescent. Luminous egress path markings shall be permitted to be made of any material, including paint, provided that an electrical charge is not required to maintain the required luminance. Such materials shall include, but not be limited to, *self-luminous* materials and *photoluminescent* materials. Materials shall ~~comply~~ be listed in accordance with either of the following standards:

1. UL 1994.
2. ASTM E 2072, except that the charging source shall be 1 footcandle (11 lux) of fluorescent illumination for 60 minutes, and the minimum luminance shall be 30 milicandelas per square meter at 10 minutes and 5 milicandelas per square meter after 90 minutes.

Reason: Section 1025.4 only requires that materials comply with UL 1994 or ASTM E 2072, not that they actually be listed. When materials are only tested (no listing) for compliance with a test standard, the test samples can be submitted directly to the test agency by the manufacturer with no follow up Quality Control inspections, thus making it unclear as to what was actually tested and what is being manufactured and sold.
By contrast, materials that are tested and listed must be randomly selected by the testing lab to insure the integrity of the test results and requires follow up Quality Control inspections to insure that what is manufactured and sold is what was originally tested.

Underwriters Laboratory confirmed that "As you've noted, a test certificate can be issued without any subsequent product surveillance, leaving open the question of whether the installed product actually matches the tested product. For many products, an AHJ really has few tools to validate this. Listing programs are not foolproof but they do provide a pretty significant upgrade in confidence that someone other than a fox is watching the hen house."

Cost Impact: Will not increase the cost of construction
Regardless of whether an item is listed or not, the cost of the test is the same.

E 122-15 : 1025.4-MUNIZ5601

E 123-15

1026.4; (IFC[BE] 1026.4)

Proponent: Ronald Geren, RLGA Technical Services, LLC, representing Self (ron@specsandcodes.com)

2015 International Building Code

Revise as follows:

1026.4 Refuge area. The refuge area of a *horizontal exit* shall be a space occupied by the same tenant or a public area and each such refuge area shall be adequate to accommodate the original *occupant load* of the refuge area plus the *occupant load* anticipated from the adjoining compartment. The anticipated *occupant load* from the adjoining compartment shall be based on the capacity of the *horizontal exit doors* entering the refuge area<u>, but not more than the total occupant load of the adjoining compartment</u>.

Reason: If the total occupant load of the compartment egressing through the horizontal exit is less than the capacity of the horizontal exit door, the maximum capacity of the refuge area should not be more than the legal capacity of the compartment egressing.
For example, a standard 36-inch-wide door has a clear width of 33 inches. At 0.20" per occupant, the capacity of the door is 165 occupants. For sprinklered buildings at 0.15" per occupant, the load is even greater at 220 occupants. So, if the total occupant load on one side of the horizontal exit door is less than 165 for a nonsprinklered building, or less than 220 occupants for a sprinklered building, then the refuge area on the other side should only be required to accommodate the design occupant load and not the capacity of the door in the horizontal exit.

Cost Impact: Will not increase the cost of construction
The proposed change will actually relax the requirement. Thus, building owners can maximize the use of the floor area for their buildings without having to make floor areas usuable for refuge areas in order to accommodate more occupants than the area is legally permitted to have.

E 123-15 : 1026.4-GEREN5149

E 124-15

1026.4.1; (IFC[BE] 1026.4.1)

Proponent: John Williams, CBO, Chair, representing Adhoc Health Care Committee (AHC@iccsafe.org)

2015 International Building Code

Revise as follows:

1026.4.1 Capacity. The capacity of the refuge area shall be computed based on a *net floor area* allowance of 3 square feet (0.2787 m^2) for each occupant to be accommodated therein. Where the horizontal exit also forms a smoke compartment, the capacity of the refuge area for Groups I-1, I-2 and I-3 occupancies and Group B ambulatory care facilities shall comply with Section 407.5.1, 408.6.2, 420.4.1 and 422.3.2 as applicable.

~~**Exceptions:** The *net floorarea* allowable per occupantshall beas follows for the indicated occupancies:~~

1. ~~Six square feet (0.6 m^2) per occupant for occupancies in Group I-3.~~
2. ~~Fifteen square feet (1.4 m^2) per occupant for ambulatory occupancies in Group I-2.~~
3. ~~Thirty square feet (2.8 m^2) per occupant for nonambulatory occupancies in Group I-2.~~

Reason: This proposal clarifies the capacity requirements for horizontal exit refuge areas for defend in place occupancies. Currently, the requirements for defend in place occupancies are located in the exception, rather than being located in the body of the text. Since the exception would be more restrictive than the section, we are suggesting moving the requirements by reference into the main body of the text. In addition, by a reference back to the refuge area capacities in Chapter 4, the provisions will always stay coordinated.

The ICC Ad Hoc Committee on Healthcare (AHC) has just completed its 4th year. The AHC was established by the ICC Board to evaluate and assess contemporary code issues relating to hospitals and ambulatory healthcare facilities. This is a joint effort between ICC and the American Society for Healthcare Engineering (ASHE), a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. Information on the AHC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the AHC effort can be downloaded from the AHC website at: http://www.iccsafe.org/cs/AHC/Pages/default.aspx.

Cost Impact: Will not increase the cost of construction
This is a reference to more specific requirements already in the code.

E 125-15

1027.5; (IFC[BE] 1027.5)

Proponent: Victor Cuevas, representing City of Los Angeles

2015 International Building Code

Revise as follows:

1027.5 Location. *Exterior exit stairways* and *ramps* shall have a minimum fire separation distance of 10 feet (3048 mm) measured at right angles from the exterior edge of the *stairway* or *ramps*, including landings, to:

1. Adjacent *lot lines*.
2. Other portions of the building.
3. Other buildings on the same lot unless the adjacent building *exterior walls* and openings are protected in accordance with Section 705 based on *fire separation distance.*

For the purposes of this section, other portions of the building shall be treated as separate buildings.

<u>**Exception:** Exterior exit stairways and ramps shall be permitted to have a minimum fire separation distance of 5 feet (1524 mm), where a solid masonry or concrete wall is provided at the adjacent lot line or assumed property line. The wall shall be a minimum of 6 feet (1830 mm) in height and at least the same width as the exterior exit stairway or ramp.</u>

Reason: It's not practical to provide 10'-0" setback for stairs. The stairs usually come out of the building and exit next to the building. If stairs have to have 10' setback, the buildings themselves have to have 13'-14' setback. The exception provides equivalent protection.

Cost Impact: Will not increase the cost of construction
This is a design option.

E 125-15 : 1027.5-CUEVAS4831

E 126-15

1027.5, 1027.6; (IFC[BE] 1027.5, 1027.6)

Proponent: Ali Fattah, City of San Diego Development Services Department, representing City of San Diego (afattah@sandiego.gov)

2015 International Building Code

Revise as follows:

1027.5 Location. *Exterior exit stairways* and *ramps* shall have a minimum fire separation distance of 10 feet (3048 mm) measured at right angles from the exterior edge of the *stairway* or *ramps*, including landings, to:

1. Adjacent *lot lines*.
2. Other portions of the building.
3. Other buildings on the same lot unless the adjacent building *exterior walls* and openings are protected in accordance with Section 705 based on *fire separation distance.*

For the purposes of this section, other portions of the building shall be treated as separate buildings.

<u>**Exception:** Exterior exit stairways and ramps serving individual dwelling units of Group R-3 shall have a minimum fire separation distance of 5 feet.</u>

1027.6 Exterior exit stairway and ramp protection. *Exterior exit stairways* and *ramps* shall be separated from the interior of the building as required in Section 1023.2. Openings shall be limited to those necessary for egress from normally occupied spaces. Where a vertical plane projecting from the edge of an *exterior exit stairway* or *ramp* and landings is exposed by other parts of the building at an angle of less than 180 degrees (3.14 rad), the exterior wall shall be rated in accordance with Section 1023.7.

Exceptions:

1. Separation from the interior of the building is not required for occupancies, other than those in Group R-1 or R-2, in buildings that are not more than two stories above *grade plane* where a *level of exit discharge* serving such occupancies is the first story above *grade plane*.
2. Separation from the interior of the building is not required where the *exterior exit stairway* or *ramp* is served by an *exterior exitramp* or balcony that connects two remote *exterior exit stairways* or other *approved exits* with a perimeter that is not less than 50 percent open. To be considered open, the opening shall be not less than 50 percent of the height of the enclosing wall, with the top of the openings not less than 7 feet (2134 mm) above the top of the balcony.
3. Separation from the open-ended *corridor* of the building is not required for *exterior exit stairways* or *ramps*, provided that Items 3.1 through 3.5 are met:
   - 3.1. The building, including open-ended *corridors*, and *stairways* and *ramps*, shall be equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1 or 903.3.1.2.
   - 3.2. The open-ended *corridors* comply with Section 1020.
   - 3.3. The open-ended *corridors* are connected on each end to an *exterior exit stairway* or *ramp* complying with Section 1027.
   - 3.4. The *exterior walls* and openings adjacent to the *exterior exit stairway* or *ramp* comply with Section 1023.7.
   - 3.5. At any location in an open-ended *corridor* where a change of direction exceeding 45 degrees (0.79 rad) occurs, a clear opening of not less than 35 square feet (3.3 m^2) or an *exterior stairway* or *ramp* shall be provided. Where clear openings are provided, they shall be located so as to minimize the accumulation of smoke or toxic gases.
4. <u>In Group R-3 occupancies not more than 4 stories in height, exterior exit stairways and ramps serving individual dwelling units are not required to be separated from the interior of the building where the exterior exit stairway or ramp discharges directly to grade.</u>

Reason: The proposed code change to Section 1027.5 adds an exception to limit the fire separation distance to 5 ft for an R-3 occupancy. The proposed exception # 4 to Section 1027.6 exempts an exterior exit stairway on up to a 4 story R-3 from being separated from the interior of a building. A four story R-3 should be the upper limit since the type of construction will have to be increased from type if more than 4 stories in height.
The IBC regulates Group R-3 occupancies, typically one dwelling or two dwellings units located within the same building when the building configuration is not within the scope of the International Residential Code. So Group R-3 occupancies more than three stories above grade plane andgroup R-3 occupancieswith 2 units using a common means of egress are required to comply with the IBC. Additionally, Townhouses that have a height of more than three stories above grade plane, and townhouses with only one side open to a pubic way also need to comply with the IBC.

The IBC in many instances exempts R-3 occupancies from means of egress requirements more appropriate for buildings with larger occupant loads and buildings with multiple tenant spaces/units sharing a common means of egress system.

- For example Section 1028.4.2 Exception # 2 exempts exit courts serving Group R-3 occupancies from exterior wall and opening protection requirements regardless of the occupant load served.
- Similarly Section 1019.3 Exception 2 exempts exit access stairways and ramps in Group R-3 occupancies from requirements that include enclosure requirements. Interior exit stairways within Group R-3 and within individual units classified as R-2 are not classified as exits since they are permitted to be exit access stairways per Section 1019.
- Another example is Section 1027.6 exception # 1 allows the exterior exit stairway not be protected from the interior of the buildings other than Group

R1 and R2 and 2 stories in height. The exeception recognizes a lesser hazard.

As a consequence it does not make sense to require a fire separation distance of 10 ft adjacent to an exterior stairway serving an individual unit in a Group R-3 occupancy. Additionally since stairways serving Group R-3 occupancies and individual units in Group R-2 are exempt from interior stairway enclosure requirements it makes no sense to separate the exterior stairway from the interior of the unit.

Cost Impact: Will not increase the cost of construction
This code change adds clarity to the code and codifies current practice of not requiring a separation from the dwelling unit. Additionally the reduced side yard increases buildable area.

E 126-15 : 1027.5-FATTAH4665

E 127-15

1028.1; (IFC[BE] 1028.1)

Proponent: William Koffel, Koffel Associates, Inc., representing Self (wkoffel@koffel.com)

2015 International Building Code

1028.1 General. *Exits* shall discharge directly to the exterior of the building. The *exit discharge* shall be at grade or shall provide a direct path of egress travel to grade. The *exit discharge* shall not reenter a building. The combined use of Exceptions 1 and 2 shall not exceed 50 percent of the number and minimum width or required capacity of the required exits.

Exceptions:

1. Not more than 50 percent of the number and minimum width or required capacity of *interior exit stairways* and *ramps* is permitted to egress through areas on the level of discharge provided all of the following conditions are met:
    1.1. Discharge of *interior exit stairways* and *ramps* shall be provided with a free and unobstructed path of travel to an exterior *exit* door and such ~~*exit*~~ path of travel is readily visible and identifiable from the point of termination of the enclosure.
    1.2. The entire area of the *level of exit discharge* is separated from areas below by construction conforming to the *fire-resistance rating* for the enclosure.
    1.3. The egress path from the *interior exit stairway* and *ramp* on the *level of exit discharge* is protected throughout by an *approved automatic sprinkler system*. Portions of the *level of exit discharge* with access to the egress path shall be either equipped throughout with an *automatic sprinkler system* installed in accordance with Section 903.3.1.1 or 903.3.1.2, or separated from the egress path in accordance with the requirements for the enclosure of *interior exit stairways* or *ramps*.
    1.4. Where a required *interior exit stairway* or *ramp* and an *exit access stairway* or *ramp* serve the same floor level and terminate at the same *level of exit discharge*, the termination of the *exit access stairway* or *ramp* and the *exit discharge* door of the *interior exit stairway* or *ramp* shall be separated by a distance of not less than 30 feet (9144 mm) or not less than one-fourth the length of the maximum overall diagonal dimension of the building, whichever is less. The distance shall be measured in a straight line between the *exit discharge* door from the *interior exit stairway* or *ramp* and the last tread of the *exit access stairway* or termination of slope of the *exit access ramp*.
2. Not more than 50 percent of the number and minimum width or required capacity of the *interior exitstairways* and *ramps* is permitted to egress through a vestibule provided all of the following conditions are met:
    2.1. The entire area of the vestibule is separated from areas below by construction conforming to the *fire-resistance rating* of the *interior exit stairway* or *ramp enclosure*.
    2.2. The depth from the exterior of the building is not greater than 10 feet (3048 mm) and the length is not greater than 30 feet (9144 mm).
    2.3. The area is separated from the remainder of the *level of exit discharge* by a *fire partition* constructed in accordance with Section 708.
    2.4. The area is used only for *means of egress* and *exits* directly to the outside.
    Exception: The maximum transmitted temperature rise is not required.
3. *Horizontal exits* complying with Section 1026 shall not be required to discharge directly to the exterior of the building.

Reason: Proposal E140-07/08 revised the text of the 2006 Edition of the IBC to require that the exit be visible from the discharge of the exit enclosure instead of the path of travel being visible and identifiable. The Commentary to the 2006 Edition of the IBC had similar language regarding the exit being visible. As the original proponent of the language in this section, I challenged the Commentary language and ICC Staff acknowledged that the Commentary was in error.
The Proponent of E140-07/08 described a scenario wherein the "path winds through various areas on the level of exit discharge." It should be noted that the same path would be taken by an occupant who is on the level of exit discharge at the point the stair discharges. The path is the exit access route for that occupant. If the path is acceptable as part of the exit access from that level, why is it not also acceptable for an occupant who discharges the stair into a space that is protected with an automatic sprinkler system.

The current Code text is overly restrictive by requiring that the exterior exit door itself be readily visible from the stair discharge. The current language essentially eliminates any arrangement in which the stair would discharge into a corridor unless once one enters the corridor they can immediately see the exterior door from that point. The key performance is that the occupant can effectively identify the path of travel to be taken upon arrival at the level of exit discharge.

The Proponent of E140-07/08 cited no incidents in with the existing Code text at the time presented any problems in effectively egressing from the building despite that text existing in previous codes for decades.

Cost Impact: Will not increase the cost of construction
By providing additional flexibility, the proposal will result in a reduction in the cost of construction for projects attempting to utilze the provisions.

E 128-15

403.5.1, 1028.1, 1028.2; (IFC[BE] 1028.1, 1028.2)

Proponent: Ali Fattah, City of San Diego Development Services Department, representing City of San Diego

2015 International Building Code

Revise as follows:

1028.1 General. *Exits* shall discharge directly to the exterior of the building. The *exit discharge* shall be at grade or shall provide a direct path of egress travel to grade. The *exit discharge* shall not reenter a building. The combined use of Exceptions 1 and 2 shall not exceed 50 percent of the number and minimum width or required capacity of the required exits.

Exceptions:

1. Not more than 50 percent of the number and minimum width or required capacity of *interior exit stairways* and *ramps* is permitted to egress through areas on the level of discharge provided all of the following conditions are met:
   1.1. Discharge of *interior exit stairways* and *ramps* shall be provided with a free and unobstructed path of travel to an exterior *exit* door and such *exit* is readily visible and identifiable from the point of termination of the enclosure.
   1.2. The entire area of the *level of exit discharge* is separated from areas below by construction conforming to the *fire-resistance rating* for the enclosure.
   1.3. The egress path from the *interior exit stairway* and *ramp* on the *level of exit discharge* is protected throughout by an *approved automatic sprinkler system*. Portions of the *level of exit discharge* with access to the egress path shall be either equipped throughout with an *automatic sprinkler system* installed in accordance with Section 903.3.1.1 or 903.3.1.2, or separated from the egress path in accordance with the requirements for the enclosure of *interior exit stairways* or *ramps*.
   1.4. Where a required *interior exit stairway* or *ramp* and an *exit access stairway* or *ramp* serve the same floor level and terminate at the same *level of exit discharge*, the termination of the *exit access stairway* or *ramp* and the *exit discharge* door of the *interior exit stairway* or *ramp* shall be separated by a distance of not less than 30 feet (9144 mm) or not less than one-fourth the length of the maximum overall diagonal dimension of the building, whichever is less. The distance shall be measured in a straight line between the *exit discharge* door from the *interior exit stairway* or *ramp* and the last tread of the *exit access stairway* or termination of slope of the *exit access ramp*.
   1.5. Where two or more required interior exit stairways or ramps provide means of egress from the same story and discharge through the same story at the level of exit discharge, the exit discharge doors from such interior exit stairways or ramps shall be separated by a distance of not less than 30 feet (9144 mm) or not less than one-fourth the length of the maximum overall diagonal dimension of the building, whichever is less. The distance shall be measured in a straight line between the exit doorways from such interior exit stairway or ramp.
2. Not more than 50 percent of the number and minimum width or required capacity of the *interior exitstairways* and *ramps* is permitted to egress through a vestibule provided all of the following conditions are met:
   2.1. The entire area of the vestibule is separated from areas below by construction conforming to the *fire-resistance rating* of the *interior exit stairway* or *ramp enclosure*.
   2.2. The depth from the exterior of the building is not greater than 10 feet (3048 mm) and the length is not greater than 30 feet (9144 mm).
   2.3. The area is separated from the remainder of the *level of exit discharge* by a *fire partition* constructed in accordance with Section 708.
   2.4. The area is used only for *means of egress* and *exits* directly to the outside.
   Exception: The maximum transmitted temperature rise is not required.
3. *Horizontal exits* complying with Section 1026 shall not be required to discharge directly to the exterior of the building.

1028.2 Exit discharge width or capacity and seperation. The minimum width or required capacity of the *exit discharge* shall be not less than the minimum width or required capacity of the *exits* being served. Where more than one exit is required, the path of travel for the exit discharge shall be arranged to comply with the required separation determined in Section 1007.

403.5.1 Remoteness of interior exit stairways. Required *interior exit stairways* shall be separated by a distance not less than 30 feet (9144 mm) or not less than one-fourth of the length of the maximum overall diagonal dimension of the building or area to be served, whichever is less. The distance shall be measured in a straight line between the nearest points of the enclosure surrounding the *interior exit stairways*. In buildings with three or more *interior exit stairways,* no fewer than two of the *interior exit stairways* shall comply with this section. Interlocking or *scissor stairways* shall be counted as one *interior exit stairway*. Where two or more *interior exit stairways* egress through interior areas on the level of exit discharge, the required separation for the exit discharge shall be in accordance with Section 1028.

Reason: Code change # E7-12/13 submitted by the ICC Code Technology Committee added exception # 1.4 to Section 1027.1 Exception 1 (now 1028.1 Exception 1)
The reason statement of the code change on page E-58 of the code change monograph states " 1027.1 exception #1.4-This limitation is proposed to prevent

an exit access stair and separate exit stair, which begin on the same floor, from termination to close together on the exit discharge floor. This is proposed so that one localized fire event on the exit discharge floor will not take out the termination of both means of egress components when an exit stair is permitted to discharge into the building. The 30 feet or ¼ diagonal separation distances were based on the 30 feet or ¼ diagonal that is specified for separation of interior stairways in high-rise section 403.5.1."

The ICC Code Technology Committee code change does not address maintaining separation of exits when Section 1028.1 Exception 1 permits more than one interior exit stairway to discharge through areas of the story on the level of exit discharge. Condition 1.5 is added to exception # 1 to be consistent with the code's intent that unprotected paths be separated, this condition ensures that the doorways are adequately separated to prevent both from being compromised, this condition may occur in public assembly buildings where 4 or more exits are required or large buildings where travel distance needs to be limited with exits. Egress elements can be compromised by more than fire, they can be compromised by falling debris, fire fighting operations, etc..

Section 1028.2 is modified to address separation of the means of in the exit discharge. The exit discharge includes elevated courts on podium style buildings with multiple buildings atop of a large base, exit courts, and while not called exit discharge ground floor lobbies through which interior exit stairways pas to reach the public way or exterior exit discharge. While the IBC does not consider multiple fire scenarios egress paths that converge when exterior exit doorways from an exit passageway or exit enclosure terminate adjacent to an exterior exit doorway. The means of egress requirements in Chapter 10 of the IBC have their origins in the NFPA 101 life safety. Section 7.7.3.1 of the 2015 Life Safety Code requires that means of egress in the exit discharge be separated. Without the proposed change to Section 1028.2 the IBC will continue to allow converging paths for example when a rear exit discharges to a rear yard that accesses a public way on a side opposite the court via a perpendicular exit court and the path converges with the front exit from a building when arriving at the public way. Another example is where multiple stairways terminate at a ground floor and are served by one group of lobby doors.

Section 1028.2 currently only requires the width be maintained and exterior exit discharge elements are required to be protected from a building and in some cases from adjacent lot lines. It can be assumed that the IBC does not believe that the exit discharge is as safe as the public way, whether it be within the ground floor lobby of a high rise building or the 6 ft wide exit court serving 300 occupants from an auditorium or theater. The Life Safety Code recognizes this omission and addresses exit separation do to the hazards that exist in the exit discharge.

Cost Impact: Will not increase the cost of construction
This code change may increase the cost of construction of narrow sites by limiting the size and intensity of the development to require only 1 exit or to reduce the footprint of a building. this code change is necessary to improve public safety.

E 128-15 : 1028.1-FATTAH4700

E 129-15

1028.4, 1028.4.1; (IFC[BE] 1028.4, 1028.4.1)

Proponent: Jon Siu, representing City of Seattle Department of Planning & Development (jon.siu@seattle.gov)

2015 International Building Code

Revise as follows:

1028.4 Egress courts. *Egress courts* serving as a portion of the *exit discharge* in the *means of egress* system shall comply with the requirements of Sections 1028.4.1 ~~and 1028.4.2.~~through 1028.4.3.

1028.4.1 Width or capacity.
The required capacity of *egress courts* shall be determined as specified in Section 1005.1, but the minimum width shall be not less than 44 inches (1118 mm), except as specified herein. *Egress courts* serving Group R-3 and U occupancies shall be not less than 36 inches (914 mm) in width. The required capacity and width of *egress courts* shall be unobstructed to a height of 7 feet (2134 mm).

Exception: Encroachments complying with Section 1005.7. 1028.4.2 1028.3.2 Constrution and openings.

1028.4.2 Reduction in width. Where an *egress court* exceeds the minimum required width and the width of such *egress court* is then reduced along the path of exit travel, the reduction in width shall be gradual. The transition in width shall be affected by a guard not less than 36 inches (914 mm) in height and shall not create an angle of more than 30 degrees (0.52 rad) with respect to the axis of the *egress court* along the path of egress travel. The width of the *egress court* shall not be less than the required capacity.

Exception: The reduction in width is not required to be gradual where the width of the walking surface at any point of the exit court is not less than 1.5 times the required capacity.

(Renumber subsequent sections)

Reason: This proposal is intended to provide an alternative to the "funnel" required in exit courts. There are many cases where an exit discharges into a very wide plaza, which then has a stair or gate at one end that leads to the public way. Under the current provisions in the code, a guard of unspecified length would have to be provided to reduce the width gradually. This is regardless of the width of the plaza, the number of occupants, or the actual width of the stair or gate. Our understanding is the intent is to reduce the hazards of crushing or bottlenecking at a sudden change of width, but the hazard should be low if the actual width provided is substantially larger than required for the number of occupants.
The code also appears to assume the entire width of the exit court is a walking surface that can be used for egress purposes. In our experience, this is rarely the case. Many times, landscaping is required in side yards where the exit courts are located. The landscaping can be vegetation that is planted at the ground level, or for the plazas mentioned above, may be in raised planters. This proposal makes sure a real exit capacity is maintained when the funnel is eliminated, by specifying the walking surface must be wide enough to accommodate the required extra capacity.

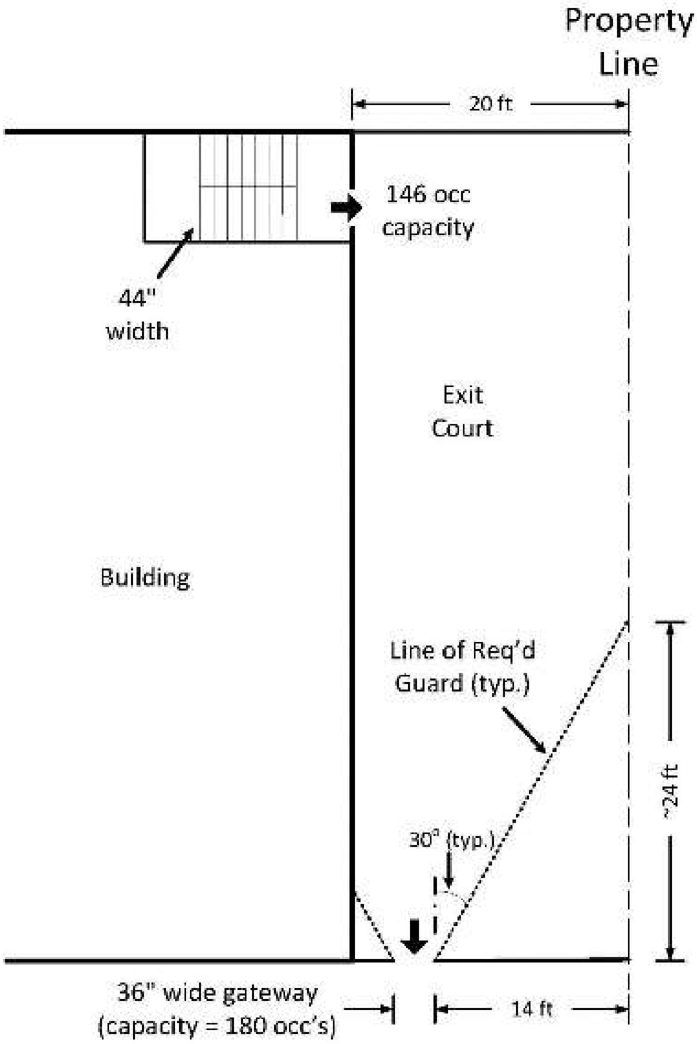

Figure 1.A

Figure 1.A shows an example of how the current code can be interpreted. A stair with the minimum 44-inch width required by the code (capacity = 44/0.3 = 146 occupants) discharges into a 20-foot wide exit court. The exit court has a 36-inch wide gateway at the front property line (capacity = 36/0.2 = 180 occupants). The current code can be interpreted to require the width to be reduced by guards at 30 degrees as shown in the figure. If one interprets the code to say that the guard must extend from the reduced section (the 36" gateway) to the widest point of the court (20'), and taking into account a 3-foot offset of the gateway, the result is a guard that extends to a point approximately 24 feet from the front property line.

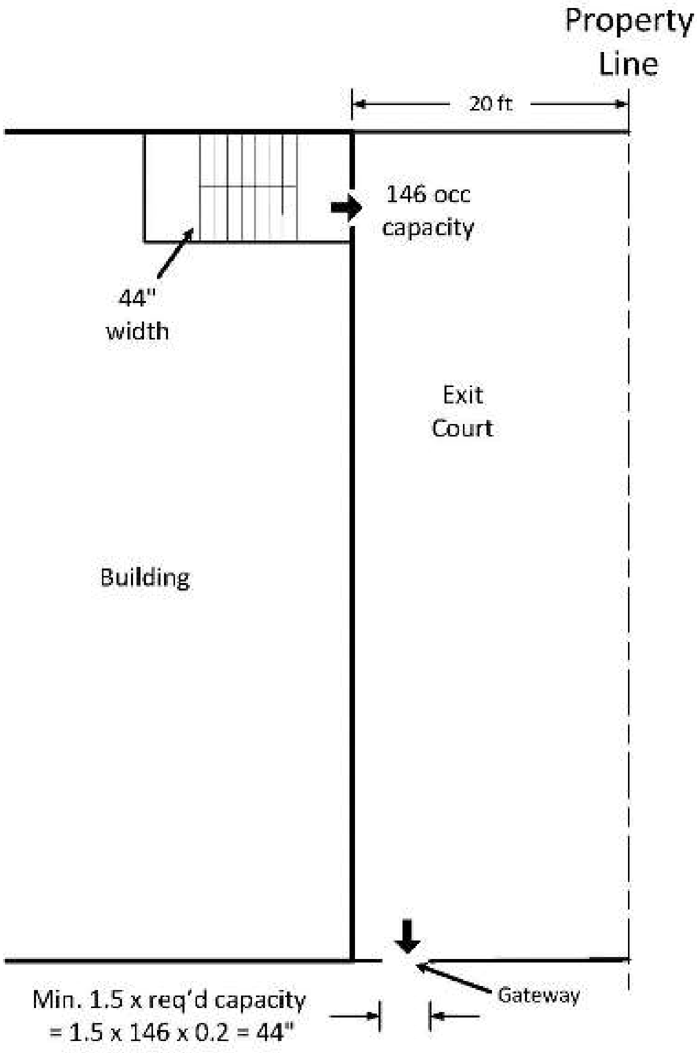

Figure 1.B

Figure 1.B shows the results if the designer opts for alternative being proposed. The gateway is now required to be 44 inches wide, but the guard is no longer required.

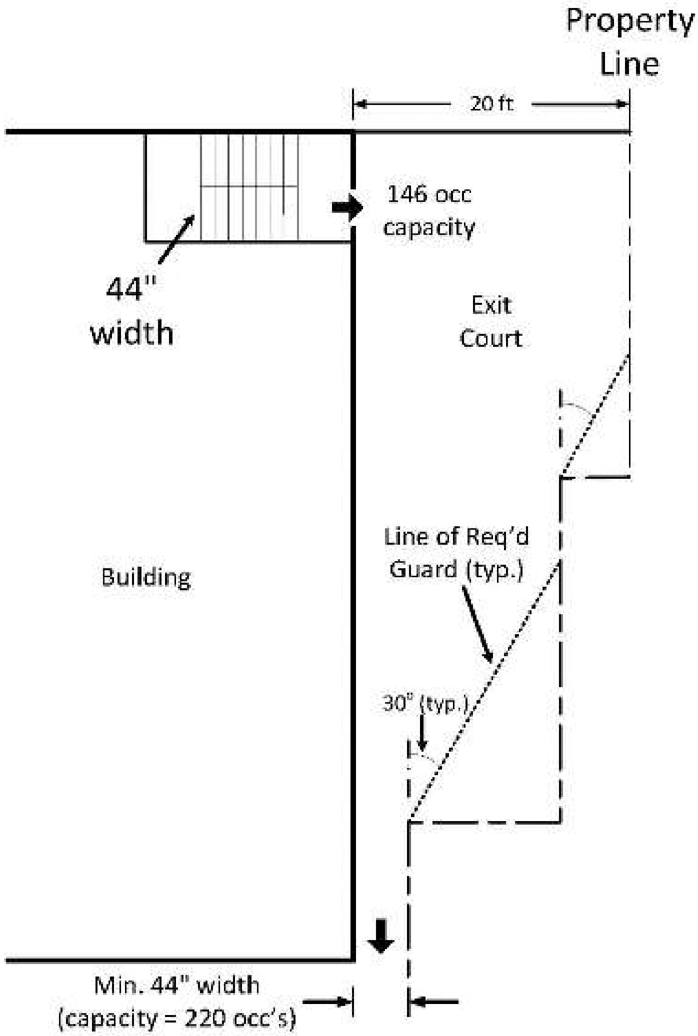

Figure 2.A

Figure 2.A depicts an exit court that reduces in width along its length and opens directly to the public way (no gateway). The same occupant load is being served by the exit court as in Figure 1.A. In this case, the code dictates a minimum 44 inch width for the exit court. The current code would clearly require the guards as shown.

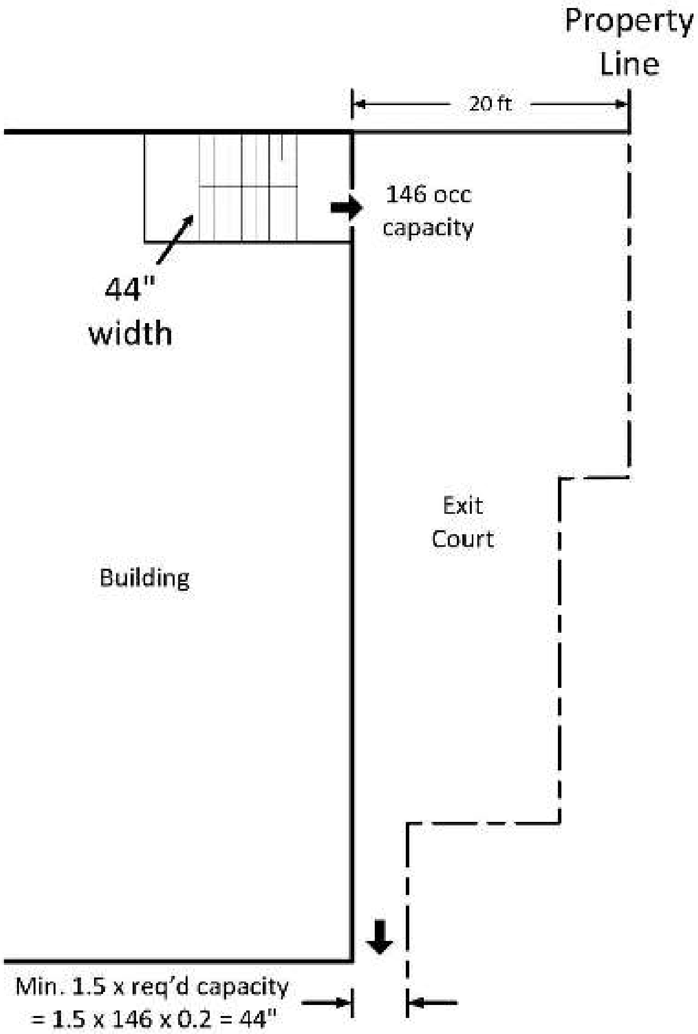

Figure 2.B

Figure 2.B shows that the minimum 44 inch exit court width required by the code would also satisfy the proposed 1.5 times the capacity requirement.

It is notable that a gradual reduction is not required anyplace else, regardless of occupant load, or required capacity. A hotel ballroom or a nightclub can have sudden changes of width at the doors, but a funnel is not required. It is therefore questionable as to what hazard in an exit court the currently required guards are addressing, and whether they are needed at all. While we would not object to eliminating the guards entirely, should it be felt there is a hazard being addressed by the guards, this proposal at least gives designers an option.

Cost Impact: Will not increase the cost of construction
Because this proposal provides an alternative to an existing code requirement, the cost of construction will not change. However, in many cases, this will reduce the cost of construction in jurisdictions that have been enforcing these "funnel" provisions.

E 129-15 : 1028.4.1-TRAXLER3475

E 130-15

1028.4.1; (IFC[BE] 1028.4.1)

Proponent: Lee Kranz, City of Bellevue, Wa, representing Washington Association of Building Officials Technical Code Development Committee

2015 International Building Code

Revise as follows:

1028.4.1 Width or capacity. The required capacity of *egress courts* shall be determined as specified in Section 1005.1, but the minimum width shall be not less than 44 inches (1118 mm), except as specified herein. *Egress courts* serving Group R-3 and U occupancies shall be not less than 36 inches (914 mm) in width. The required capacity and width of *egress courts* shall be unobstructed to a height of 7 feet (2134 mm).

Exception: Encroachments complying with Section 1005.7.

~~Where an *egress court* exceeds the minimum required width and the width of such *egress court* is then reduced along the path of exit travel, the reduction in width shall be gradual. The transition in width shall be affected by a guard not less than 36 inches (914 mm) in height and shall not create an angle of more than 30 degrees (0.52 rad) with respect to the axis of the *egress court* along the path of egress travel.~~ The width of the *egress court* shall not be less than the required capacity.

Reason: This proposal deletes an outdated and unused code requirement for egress courts. The concept of using a 36" tall guardrail to "herd" occupants toward the exit when the egress court exceeds the minimum required width is absurd and does nothing to improve the safety of occupants. Can you imagine a building owner's response when an architect shows this on a design development plan? The guard would effectively elliminate portions of the egress court exceeding the minimum required width from use by occupants. Why would anyone ever design the court to be larger than the minimum required width only to install a guardrail to prevent it's use? This is an obsolete regulation and needs to be deleted.

Cost Impact: Will not increase the cost of construction
This will save money by reducing the need to install a useless guardrail in oversized egress courts.

E 130-15 : 1028.4.1-KRANZ4316

E 131-15

1028.5; (IFC[BE] 1028.5)

Proponent: Daniel Nichols, New York State Division of Building Standards and Codes, representing New York State Division of Building Standards and Codes (dnichols@dos.state.ny.us)

2015 International Building Code

Revise as follows:

1028.5 Access to a public way. The *exit discharge* shall provide a direct and unobstructed access to a *public way*.

Exception: Where access to a *public way* cannot be provided, a safe dispersal area shall be provided where all of the following are met:

1. The area ~~shall be of a size~~is sized to accommodate not less than 5 square feet (0.46 m^2) for each person using the exit discharge and wheelchair spaces in accordance with Section 1009.6.3.
2. The area shall be located on the same lot ~~not less than~~at a distance of 50 feet (15 240 mm) minimum or a distance of 1.5 times the total building height, whichever is greater, away from the building requiring egress.
3. The area shall be permanently maintained and identified as a safe dispersal area.
4. The area shall be provided with a safe and unobstructed path of travel from the building.

Reason: This proposal is to provide improved protection and availability to a safe dispersal area.
The change in condition #1 is to size the safe dispersal area to address those with physical disabilities. The additional space that is being proposed matches the same space requirements as found in Section 1009.6.3 for area of refuge. Since the exit discharge needs to consider accessible means of egress when more than one means of egress is required (1009.1), it is appropriate to size the safe dispersal area accordingly. The addition of "occupant load of the exit discharge" is to make it clear what the basis of the area size and wheelchair spaces.

The change in condition #2 is to add an additional requirement to the distance a safe dipersal area needs to be away from a building. A 50 foot distance is not appropriate for taller buildings since falling debris from firefighting operations (such as break out windows for post-fire ventilation required inhi-rise buildings in Section 403), hazards due to exterior fire spread, and building collapse would not adequately provide a safe area. The proposal adds the requirement of 150% of the building height to address this safety issue; a number that is used in firefighting operations to determine the collapse zone of a building.

A safe dispersal area is taking a full building exit model and replacing the last portion with a defend-in-place model due to site constraints. This proposal will provide needed safety features that are currently not addressed in this exception.

Cost Impact: Will increase the cost of construction
The increase in cost or construction will occur only when this section is elected to be used by the code user. The only increase in cost would be the increased distance and area needed to be provide the proposed additional requirements.

E 131-15 : 1028.5-NICHOLS5723

E 132-15

202(New), 1005.3.1, 1005.3.2, 1009.3, 1009.4, 1019.3, 1029.6, 1029.6.3, 1029.7, 1029.8, 1029.8.1, 1029.9.5, 1029.12.2.1, Table 1029.12.2.1, 1029.12.2.2 (IFC[BE] 1005.3.1, 1005.3.2, 1009.3, 1009.4, 1019.3, 1029.6, 1029.6.3, 1029.7, 1029.8, 1029.8.1, 1029.9.5, 1029.12.2.1, Table 1029.12.2.1, 1029.12.2.2)

Proponent: Edward Kulik, Chair, representing Building Code Action Committee (bcac@iccsafe.org)

2015 International Building Code

Add new definition as follows:

SECTION 202 DEFINITIONS

OPEN-AIR ASSEMBLY SEATING. Seating served by *means of egress* that is not subject to smoke accumulation within or under a structure and is open to the atmosphere.

Revise as follows:

SECTION 202 DEFINITIONS

SMOKE-PROTECTED ASSEMBLY SEATING. Seating served by *means of egress* that is not subject to smoke accumulation within or under a structure for a specified design time by means of passive design or by mechanical ventilation.

1005.3.1 Stairways. The capacity, in inches, of *means of egress stairways* shall be calculated by multiplying the *occupant load* served by such *stairways* by a means of egress capacity factor of 0.3 inch (7.6 mm) per occupant. Where *stairways* serve more than one story, only the occupant load of each story considered individually shall be used in calculating the required capacity of the *stairways* serving that story.

Exceptions:

1. For other than Group H and I-2 occupancies, the capacity, in inches, of *means of egress stairways* shall be calculated by multiplying the *occupant load* served by such *stairways* by a means of egress capacity factor of 0.2 inch (5.1 mm) per occupant in buildings equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2 and an *emergency voice/alarm communication* system in accordance with Section 907.5.2.2.
2. Facilities with *smoke-protected assembly seating* shall be permitted to use the capacity factors in Table 1029.6.2 indicated for stepped aisles for *exit access* or *exit stairways* where the entire path for *means of egress* from the seating to the *exit discharge* is provided with a smoke control system complying with Section 909.
3. Facilities with ~~outdoor~~ ~~*smoke-protected*~~*open-air assembly seating* shall be permitted to the capacity factors in Section 1029.6.3 indicated for stepped aisles for *exit access* or *exit stairways* where the entire path for *means of egress* from the seating to the *exit discharge* is open to the outdoors.

1005.3.2 Other egress components. The capacity, in inches, of *means of egress* components other than *stairways* shall be calculated by multiplying the *occupant load* served by such component by a means of egress capacity factor of 0.2 inch (5.1 mm) per occupant.

Exceptions:

1. For other than Group H and I-2 occupancies, the capacity, in inches, of *means of egress* components other than *stairways* shall be calculated by multiplying the *occupant load* served by such component by a means of egress capacity factor of 0.15 inch (3.8 mm) per occupant in buildings equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2 and an *emergency voice/alarm communication* system in accordance with Section 907.5.2.2.
2. Facilities with *smoke-protected assembly seating* shall be permitted to use the capacity factors in Table 1029.6.2 indicated for level or ramped *aisles* for *means of egress* components other than *stairways* where the entire path for *means of egress* from the seating to the *exit discharge* is provided with a smoke control system complying with Section 909.
3. Facilities with ~~outdoor~~ ~~*smoke-protected*~~ *open-air assembly seating* shall be permitted to the capacity factors in Section 1029.6.3 indicated for level or ramped *aisles* for *means of egress* components other than *stairways* where the entire path for *means of egress* from the seating to the *exit discharge* is open to the outdoors.

1009.3 Stairways. In order to be considered part of an accessible *means of egress*, a *stairway* between *stories* shall have a clear width of 48 inches (1219 mm) minimum between *handrails* and shall either incorporate an *area of refuge* within an enlarged floor-level landing or shall be accessed from an *area of refuge* complying with Section 1009.6. *Exit accessstairways* that connect levels in the same *story* are not permitted as part of an accessible *means of egress*.

Exceptions:

1. *Exit access stairways* providing *means of egress* from *mezzanines* are permitted as part of an accessible *means of egress*.

2. The clear width of 48 inches (1219 mm) between *handrails* is not required in buildings equipped throughout with an *automatic sprinkler* system installed in accordance with Section 903.3.1.1 or 903.3.1.2.
3. The clear width of 48 inches (1219 mm) between *handrails* is not required for *stairways* accessed from a refuge area in conjunction with a *horizontal exit*.
4. *Areas of refuge* are not required at *exit access stairways* where two-way communication is provided at the elevator landing in accordance with Section 1009.8.
5. *Areas of refuge* are not required at *stairways* in buildings equipped throughout with an *automatic sprinkler system* installed in accordance with Section 903.3.1.1 or 903.3.1.2.
6. *Areas ofrefuge* are not required at *stairways* serving *open parking garages*.
7. *Areas ofrefuge* are not required for *smoke-protected* or *open-air* *assembly seating* areas complying with ~~Section~~Sections 1029.6.2 and 1029.6.3.
8. *Areas of refuge* are not required at *stairways* in Group R-2 occupancies.
9. *Areas of refuge* are not required for *stairways* accessed from a refuge area in conjunction with a *horizontal exit*.

1009.4 Elevators. In order to be considered part of an accessible *means of egress*, an elevator shall comply with the emergency operation and signaling device requirements of Section 2.27 of ASME A17.1. Standby power shall be provided in accordance with Chapter 27 and Section 3003. The elevator shall be accessed from an *area of refuge* complying with Section 1009.6.

Exceptions:

1. *Areas of refuge* are not required at the elevator in *open parking garages*.
2. *Areas of refuge* are not required in buildings and facilities equipped throughout with an *automatic sprinkler system* installed in accordance with Section 903.3.1.1 or 903.3.1.2.
3. *Areas of refuge* are not required at elevators not required to be located in a shaft in accordance with Section 712.
4. *Areas of refuge* are not required at elevators serving *smoke-protected* or *open-air* *assembly seating* areas complying with ~~Section~~Sections 1029.6.2 and 1029.6.3.
5. *Areas of refuge* are not required for elevators accessed from a refuge area in conjunction with a *horizontal exit*.

1019.3 Occupancies other than Groups I-2 and I-3. In other than Group I-2 and I-3 occupancies, floor openings containing *exit access stairways* or *ramps* that do not comply with one of the conditions listed in this section shall be enclosed with a shaft enclosure constructed in accordance with Section 713.

1. *Exit access stairways* and *ramps* that serve or atmospherically communicate between only two stories. Such interconnected stories shall not be open to other stories.
2. *In Group R-1, R-2 or R-3 occupancies, exit accessstairways and ramps connecting four stories or less serving and contained within an individual dwelling unit or sleeping unit or live/work unit.*
3. *Exit access stairways* serving and contained within a Group R-3 congregate residence or a Group R-4 facility are not required to be enclosed.
4. *Exit access stairways* and *ramps* in buildings equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1, where the area of the vertical opening between stories does not exceed twice the horizontal projected area of the *stairway* or *ramp* and the opening is protected by a draft curtain and closely spaced sprinklers in accordance with NFPA 13. In other than Group B and M occupancies, this provision is limited to openings that do not connect more than four stories.
5. *Exit access stairways* and *ramps* within an *atrium* complying with the provisions of Section 404.
6. *Exit access stairways* and *ramps* in *open parking garages* that serve only the parking garage.
7. *Exit access stairways* and *ramps* serving smoke-protected or open-air assembly seating complying with the *exit access* travel distance requirements of Section 1029.7.
8. *Exit access stairways* and *ramps* serving the balcony, gallery or press box and the main assembly floor in occupancies such as theaters, *places of religious worship*, auditoriums and sports facilities.

1029.6 Capacity of aisle for assembly. The required capacity of *aisles* shall be not less than that determined in accordance with Section 1029.6.1 where *smoke-protected assembly seating* is not provided and with Section 1029.6.2 ~~or 1029.6.3~~ where *smoke-protected assembly seating* is provided and with Section 1029.6.3 where open-air assembly seating is provided.

1029.6.3 ~~Outdoor smoke-protected~~Open-air assembly seating. ~~The~~
In open-air assembly seating the required capacity in inches (mm) of *aisles* shall be not less than the total *occupant load* served by the egress element multiplied by 0.08 (2.0 mm) where egress is by stepped *aisle* and multiplied by 0.06 (1.52 mm) where egress is by level *aisles* and ramped *aisles*.

Exception: The required capacity in inches (mm) of *aisles* shall be permitted to comply with Section 1029.6.2 for the number of seats in the ~~outdoor~~open-air *smoke-protected assembly seating* where Section 1029.6.2 permits less capacity.

1029.7 Travel distance. ~~*Exits* and *aisles* shall be so located that the~~The exit access travel distance ~~to an *exit* door~~ shall ~~be not greater than 200 feet (60 960 mm) measured along the line of travel in nonsprinklered buildings. Travel distance shall be not more than 250 feet (76 200 mm) in sprinklered buildings~~comply with Section 1017. Where *aisles* are provided for seating, the distance shall be measured along the *aisles* and *aisle accessways* without travel over or on the seats.

Exceptions:

1. In facilties with~~*Smoke-protected*~~ *smoke-protected assembly seating*~~: The~~ the total exit access travel distance shall be not greater than 400 feet (122 m). That portion of the total permitted exit access travel distance from each seat to the nearest entrance to a vomitory or concourse shall not exceed 200 feet (60 960 mm). The portion of the total permitted exit access travel distance from the entrance to the vomitory or concourse to ~~a *stairway*, *ramp* or walk on the exterior~~one of the ~~building~~following shall not exceed 200 feet (60 960 mm):
    - 1.1. The closest riser of an exit access stairway.
    - 1.2. ~~Open-air~~The closest slope of an exit access ramp.
    - 1.3. An exit.
2. In facilities with open-air assembly seating~~: The~~ of Type III, IV or V construction, the exit access travel distance ~~from each seat to~~to one of the ~~building exterior~~following shall not exceed 400 feet (122 m):
    - 2.1. The closest riser of an exit access stairway.~~ The~~
    - 2.2. The closest slope of an exit access ramp.
    - 2.3. An exit.
3. In facilities with open-air assembly seatin of Type I or II construction, the exit access travel distance shall not be limited~~ in facilities of Type I or II construction~~.

1029.8 Common path of egress travel. The *common path of egress travel* shall not exceed 30 feet (9144 mm) from any seat to a point where an occupant has a choice of two paths of egress travel to two *exits*.

Exceptions:
1. For areas serving less than 50 occupants, the *common path of egress travel* shall not exceed 75 feet (22 860 mm).
2. For *smoke-protected* or *open-air assembly seating*, the *common path of egress travel* shall not exceed 50 feet (15 240 mm).

1029.8.1 Path through adjacent row. Where one of the two paths of travel is across the *aisle* through a row of seats to another *aisle*, there shall be not more than 24 seats between the two *aisles*, and the minimum clear width between rows for the row between the two *aisles* shall be 12 inches (305 mm) plus 0.6 inch (15.2 mm) for each additional seat above seven in the row between *aisles*.

Exception: For *smoke-protected*or *open-air assembly seating* there shall be not more than 40 seats between the two *aisles* and the minimum clear width shall be 12 inches (305 mm) plus 0.3 inch (7.6 mm) for each additional seat.

1029.9.5 Dead end aisles. Each end of an *aisle* shall be continuous to a cross *aisle*, foyer, doorway, vomitory, concourse or *stairway* in accordance with Section 1029.9.7 having access to an *exit*.

Exceptions:
1. Dead-end *aisles* shall be not greater than 20 feet (6096 mm) in length.
2. Dead-end *aisles* longer than 16 rows are permitted where seats beyond the 16th row dead-end *aisle* are not more than 24 seats from another *aisle*, measured along a row of seats having a minimum clear width of 12 inches (305 mm) plus 0.6 inch (15.2 mm) for each additional seat above seven in the row where seats have backrests or beyond 10 where seats are without backrests in the row.
3. For *smoke-protected* or *open-air assembly seating*, the dead end *aisle* length of vertical *aisles* shall not exceed a distance of 21 rows.
4. For *smoke-protected*or *open-air assembly seating*, a longer dead-end *aisle* is permitted where seats beyond the 21-row dead-end *aisle* are not more than 40 seats from another *aisle*, measured along a row of seats having an *aisle* accessway with a minimum clear width of 12 inches (305 mm) plus 0.3 inch (7.6 mm) for each additional seat above seven in the row where seats have backrests or beyond 10 where seats are without backrests in the row.

1029.12.2.1 Dual access. For rows of seating served by *aisles* or doorways at both ends, there shall be not more than 100 seats per row. The minimum clear width of 12 inches (305 mm) between rows shall be increased by 0.3 inch (7.6 mm) for every additional seat beyond 14 seats where seats have backrests or beyond 21 where seats are without backrests. The minimum clear width is not required to exceed 22 inches (559 mm).

Exception: For s*moke-protected*or *open-air assembly seating*, the row length limits for a 12-inch-wide (305 mm) *aisle accessway*, beyond which the *aisle accessway* minimum clear width shall be increased, are in Table 1029.12.2.1.

TABLE 1029.12.2.1
SMOKE-PROTECTED OR OPEN-AIR ASSEMBLY AISLE ACCESSWAYS

<table>
<tr><th rowspan="3">TOTAL NUMBER OF SEATS IN THE SMOKE-PROTECTED OR OPEN-AIR ASSEMBLY SEATING</th><th colspan="2">MAXIMUM NUMBER OF SEATS PER ROW PERMITTED TO HAVE A MINIMUM 12-INCH CLEAR WIDTH AISLE ACCESSWAY</th></tr>
<tr><th>Aisle or doorway at both ends of row</th><th>Aisle or doorway at one end of row only</th></tr>
<tr><td></td><td></td></tr>
</table>

	Seats with backrests	Seats without backrests	Seats with backrests	Seats without backrests
Less than 4,000	14	21	7	10
4,000	15	22	7	10
7,000	16	23	8	11
10,000	17	24	8	11
13,000	18	25	9	12
16,000	19	26	9	12
19,000	20	27	10	13
22,000 and greater	21	28	11	14

For SI: 1 inch = 25.4 mm.

1029.12.2.2 Single access. For rows of seating served by an *aisle* or doorway at only one end of the row, the minimum clear width of 12 inches (305 mm) between rows shall be increased by 0.6 inch (15.2 mm) for every additional seat beyond seven seats where seats have backrests or beyond 10 where seats are without backrests. The minimum clear width is not required to exceed 22 inches (559 mm).

> **Exception:** For *smoke-protected*or *open-air assembly seating*, the row length limits for a 12-inch-wide (305 mm) *aisle accessway*, beyond which the *aisle accessway* minimum clear width shall be increased, are in Table 1029.12.2.1.

Reason: In July/2014 the ICC Board decided to sunset the activities of the Code Technology Committee (CTC). This is being accomplished by re-assigning many of the CTC Areas of Study to the applicable Code Action Committee (CAC). This proposal falls under the CTC Area of Study entitled Unenclosed Exit Stairs. Information on the CTC, including: the sunset plan; meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the CTC website.
This public proposal is submitted by the ICC Building Code Action Committee (BCAC). The BCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the BCAC has held 13 open meetings and numerous workgroup calls which included members of the BCAC as well as any interested party to discuss and debate the proposed changes and the public comments. Related documentation and reports are posted on the BCAC website at: http://www.iccsafe.org/cs/BCAC/Pages/default.aspx.

The intent of this proposal is to provide terminology consistent with the rest of Chapter 10 regarding exit access travel distance (Section 1017) and open-air and outdoor smoke-protected seating. Currently the term outdoor smoke protected assembly seating and open-air assembly seating appear to be used interchangeably. Also, sometime smoke-protected assembly seating is used to mean just indoors, and sometimes indoors and outdoors.

There is no intent for any technical changes to the provisions from what was permitted in the 2012 IBC and previous editions.

There are three terms being used:

• Smoke protected assembly seating - Section 410.3.5, Table 903.2.11.6, 909.16, 1005.1, 1005.3.2, 1009.3, 1009.4, 1029.6, 1029.6.2, Table 1029.6.2, 1029.6.2.1, 1029.6.2.2, 1029.6.2.3, 1029.7, 1029.8, 1029.8.1, 1029.9.5, 1029.12.2.1, 1029.12.2.1
• Outdoor smoke protected assembly seating - 1005.3.1, 1005.3.2, 1029.6.3
• Open-air assembly seating - Sections 905.3.2, 1019.1, 1029.7

Definitions: The revisions for 'smoke-protected assembly seating' and the new definition for 'open-air assembly seating' are intended to separate the two types of systems that provide smoke protection for assembly seating. The definition and the revisions throughout the proposal will coordinate the use of the terms.

Section 1029.6: This scoping section currently used the term smoke-protected to mean both indoor and outdoor.

Sections 1029.6.3 and 1005.3.2: Change outdoor smoke-protected seating to open-air seating. In addition, Section 1029.6.3 only includes the separation in the title and not the text.

Section 1029.7: In the current text of the main paragraph, the sentence for non-sprinklered building and sprinklered building requirements are confusing and inconsistent. The 200 and 250 feet exit access travel distances are already in Table 1017.2. The current text only says how to measure the travel distance in the sentence dealing with non-sprinklered buildings, not sprinklered buildings. Measuring along the natural and unobstructed path of travel is addressed in Section 1017.3; therefore, only the specific language regarding the seating is needed. A reference back to Section 1017 will allow for consistency over time and pick up all the technical criteria for exit access travel distance.

The exceptions are reworded for consistency and correct code terminology. In addition, there is a concern over consistent interpretation. The exception's current text has terminology that could be interpreted as always measuring travel distance to the building exit at grade. Where there are provisions for smoke protection, or where there are facilities that are open to the exterior, historically these facilities have allowed for open stairway where the means of egress is open to the outside.

The 2012 IBC included an exception to Section 1016.3 (now Section 1017.3) that allowed exit access travel distance to be measured to the top of an open exit access stairway or ramp in outdoor seating. This was deleted by E7-12 with the explanation in the reason that this was more appropriately addressed in this section.

Sections 1029.8, 1029.8.1 and 1029.9.5, 1029.12.2.1, 1029.12.2.2, 1009.3, 1009.4 – add 'open-air' to clarify that both smoke protection options are viable in these code sections.

Section 1019.3 Exception 7 is revised to be consistent with the allowances in Section 1029.7, which addresses other than just open air seating.

Cost Impact: Will not increase the cost of construction
This proposal is a clarification of provisions. There will be no change in the cost of construction.

E 132-15 : 1005.3.2-KULIK3641

E 133-15

1029.6.2; (IFC[BE] 1029.6.2)

Proponent: Daniel Nichols, representing New York State Division of Building Standards and Codes (dnichols@dos.state.ny.us)

2015 International Building Code

Revise as follows:

1029.6.2 Smoke-protected assembly seating. The required capacity in inches (mm) of the aisle for *smoke-protected assembly seating* shall be not less than the occupant load served by the egress element multiplied by the appropriate factor in Table 1029.6.2. The total number of seats specified shall be those within the space exposed to the same smoke-protected environment. Interpolation is permitted between the specific values shown. ~~A life safety evaluation, complying with NFPA 101, shall be done for a facility utilizing the reduced width requirements of Table 1029.6.2 for *smoke-protected assembly seating.*~~

> **Exception:** For outdoor *smoke-protected assembly seating* with an *occupant load* not greater than 18,000, the required capacity in inches (mm) shall be determined using the factors in Section 1029.6.3.

Reason: The requirements for smoke-protected assembly seating currently require a life safety evaluation by NFPA 101. These requirements have been updated in 2015 edition of NFPA 101; with further modification under NFPA TIA 101-15-3.
This proposal request the elimination of the life safety evaluation for several reasons:

Section 12.4.1.1 is the general requirements for the life safety evaluation. Item #3 requires an annual filing and approval by the AHJ. This is not appropriate within the construction requirements of the IBC.
Section 12.4.1.2 is a list of conditions for assessment; including the need to assess conditions related to earthquakes, hazardous materials within and near the facility, medical emergencies, hazarous materials, and relationships between various facility stakeholders. Whereas these are important items to overall occupant safety, there is little or no correlation between them and an allowance to utilize the narrower dimensions of aisles in assembly seating as regulated in IBC Section 1029.6.2
Section 12.4.1.3.1 requires the design team to provide all building systems documentation to the AHJ prior to the issuance of a building permit, per Section 12.4.1.4. This sounds like a good idea, but the requirements of 12.4.1.4 requires the submission of items including specific event floor plans (including exhibits), smoke control design documentation that is in conflict with the smoke control provisions of IBC Section 1029.6.2.1, and a loading diagram for the stage gridiron. Several items are either in conflict of the requirements of IBC 1029.6.2 or are not relevant to asembly seating design.
Section 12.4.1.3.2 requires a facility management plan per 12.4.1.5 (labeled in the section as a life safety management document). There are several items within the list that have no bearing on assembly seating aisle widths; such as contact information for venue personnel, first aid treatment plans, food safety plans, and terrorism operating protocols.

It is very clear that the update to NFPA 101 is comprehensive. However, it does cover hazards outside of fire and life safety provided in the purpose and scope of the IBC and has little bearing on the diminishment of assembly seating aisles. In short, the information within the life safety evaluation does not provide any additional requirements to the actual measurement of the aisle widths for smoke protected seating.

Finally, the International Fire Code is the appropriate place for emergency plans. Chapter 4 makes an emergency plan enforceable during the use of smoke protected assembly seating; not just during the filing of a building permit. IFC Chapter 4 is very comprehensive and requires these plans for all assembly occupancies and public gatherings.

Bibliography: NFPA 101- 2015 edition Section 12.4.1 (as modified by NFPA 101 TIA 15-3)

Cost Impact: Will not increase the cost of construction
This proposal is to remove requirements related to emergency plan filing prior to the issuance of a building permit

E 133-15 : 1029.6.2-NICHOLS5757

E 134-15

1029.9.1 (IFC[BE] 1029.9.1)

Proponent: Edward Kulik, Chair, representing Building Code Action Committee (bcac@iccsafe.org)

2015 International Building Code

Revise as follows:

1029.9.1 Minimum aisle width. The minimum clear width for *aisles* shall comply with one of the following:

1. Forty-eight inches (1219 mm) for stepped *aisles* having seating on ~~each side.~~both sides.
   Exception: Thirty-six inches (914 mm) where the stepped *aisles* serve less than 50 seats.
2. Thirty-six inches (914 mm) for stepped *aisles* having seating on only one side.
   Exception: Twenty-three inches (584 mm) between a stepped aisle handrail and seating where a stepped *aisle* does not serve more than five rows on one side.
3. Twenty-three inches (584 mm) between a stepped *aislehandrail* or *guard* and seating where the stepped *aisle* is subdivided by a mid-aisle *handrail*.
4. Forty-two inches (1067 mm) for level or ramped *aisles* having seating on both sides.
   Exceptions:
   1. Thirty-six inches (914 mm) where the *aisle* serves less than 50 seats.
   2. Thirty inches (762 mm) where the *aisle* serves less than 15 seats and does not serve ~~more than 14 seats~~as part of an accessible route.
5. Thirty-six inches (914 mm) for level or ramped *aisles* having seating on only one side.
   Exception:~~For other than ramped *aisles* that serve as part of an *accessible route*, 30~~ Thirsty inches (762 mm) where the ~~ramped~~ *aisle* serves less than 15 seats and does not serve ~~more than 14 seats~~as part of an accessible route.

Reason: In July/2014 the ICC Board decided to sunset the activities of the Code Technology Committee (CTC). This is being accomplished by re-assigning many of the CTC Areas of Study to the applicable Code Action Committee (CAC). This proposal falls under the CTC Area of Study entitled IBC Coordination with the New ADAAG. Information on the CTC, including: the sunset plan; meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the CTC website.http://www.iccsafe.org/cs/CTC/Pages/default.aspx This public proposal is submitted by the ICC Building Code Action Committee (BCAC). The BCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the BCAC has held 13 open meetings and numerous workgroup calls which included members of the BCAC as well as any interested party to discuss and debate the proposed changes and the public comments. Related documentation and reports are posted on the BCAC website at: http://www.iccsafe.org/cs/BCAC/Pages/default.aspx.

The intent of this proposal is consistency in language. E87-12 added the language as a reminder for the accessible route to the exception for Item 5, but missed the same concern in Item 4 exception 2. The accessible route provisions require 36" width and are required by Section 1009 and 1104 to the wheelchair spaces for ingress and egress. The reminder should be in both locations. If it is felt that this is already addressed, it should be removed from the exception in Item 5.

The strike out of 'ramped' in the exception to item 5 is because this item deals with both ramped and level aisles. The limitation of this option to 'ramped' aisles was a mistake in E87-12. Level aisles are less hazardous than ramped aisles. Changing the language to 'serve less than 15 seats' instead 'does not serve more than 14 seats' is not a technical change. It is for consistency with the language in the other exceptions.

There will be a Group B corresponding code change proposal to IFC Section 1104.23 to provide consistency and so that existing requirements are not more restrictive than new. The ICC Fire Code Action Committee (FCAC) supports this proposal and will be submitting the Group B proposal that follows:

IFC 1104.23 Minimum aisle width. The minimum clear width of aisles shall ~~be~~comply with one of the following:

1. Forty-two inches (1067 mm) for ~~aisle stairs~~stepped aisles having seating on ~~each~~both sides.
   Exception: Thirty-six inches (914 mm) where the stepped aisle serves less than 50 seats.
2. Thirty-six inches (914 mm) for stepped aisles having seating on only one side.
   Exceptions:
   1. Thirty inches (760 mm) for catchment areas serving not more than 60 seats.
   2. Twenty-three inches (584 mm) between a stepped aisle handrail and seating where a stepped an aisle does not serve more than five rows on one side.
3. Twenty inches (508 mm) between a stepped aisle handrail or guard and seating where the aisle is subdivided by the handrail.
4. Forty-two inches (1067 mm) for level or ramped aisles having seating on both sides.
   Exceptions:
   1. Thirty-six inches (914 mm) where the aisle serves less than 50 seats.
   2. Thirty inches (762 mm) where the aisle serves less than 15 seats and does not serve as part of an accessible route.
5. Thirty-six inches (914 mm) for level or ramped aisles having seating on only one side.
   Exception: Thirty inches (760 mm) for catchment areas serving not more than 60 seats and does not serve as part of an accessible route .
6. In Group I-2, where aisles are used for movement of patients in beds, aisles shall comply with Section 1105.5.8.

Cost Impact: Will not increase the cost of construction
The proposal is a clarification and coordination of current requirements; therefore, there is no impact on the cost.

E 134-15 : 1029.9.1-KULIK3617

E 135-15

1029.10.1, 1029.10.2, 1029.10.2.1, 1029.10.2.2, 1029.10.3; (IFC[BE] 1029.10.1, 1029.10.2, 1029.10.2.1, 1029.10.2.2, 1029.10.3)

Proponent: Ed Roether, representing Ed Roether Consulting (ed@edroetherconsulting.com)

2015 International Building Code

Revise as follows:

1029.10 Transitions. Transitions between *stairways* and stepped *aisles* shall comply with either Section 1029.10.1 or 1029.10.2.

1029.10.1 Transitions ~~and~~ to stairways that maintain stepped aisle riser and tread dimensions. Stepped *aisles*, transitions and *stairways* that maintain the stepped aisle riser and tread dimensions shall comply with Section 1029.13 as one *exit access* component.

1029.10.2 Transitions to stairways that do not maintain stepped aisle riser and tread dimensions. Transitions ~~to~~ between *stairways* ~~from~~ and stepped *aisles* ~~with~~ having different riser and tread dimensions ~~that differ from the *stairways*~~ shall comply with Sections 1029.10.2.1 through 1029.10.3.

1029.10.2.1 Stairways and stepped aisles in a straight run. ~~Transitions where the stairway is~~ Where *stairways*and stepped aisle are in a straight run ~~from thestepped *aisle*~~ the transition shall have one of the following:

1. A minimum depth of 22 inches (559 mm) where the treads on the descending side of the transition have greater depth ~~and~~.
2. A minimum depth of 30 inches (762 mm) where the treads on the descending side of the transition have lesser depth.

1029.10.2.2 Stairways ~~and stepped aisles~~ that change direction from stepped aisles. Transitions where the *stairway* changes direction from the stepped *aisle* shall have a minimum depth of 11 inches (280 mm) or the stepped *aisle* tread depth, whichever is greater, between the stepped *aisle* and *stairway*.

1029.10.3 Transition marking. A distinctive marking stripe shall be provided at each *nosing* or leading edge adjacent to the transition. Such stripe shall be ~~not less than~~ a minimum of 1 inch (25 mm), and ~~not more than~~ a maximum of 2 inches (51 mm), wide. The edge marking stripe shall be distinctively different from the stepped *aisle* contrasting marking stripe.

Reason: This section was extensively revised last cycle. The intent of this proposal is to provide minor revisions to clarify the language relating to the transitions between stepped aisle and stairways.

Cost Impact: Will not increase the cost of construction
This is a clarification only.

1029.11, 1029.11.1, 1029.11.2, 1029.13, 1029.13.3 (New), 1029.13.3.1 (New), 1029.13.3.2 (New)

Proponent: Gregory Cahanin, Cahanin Fire & Code Consulting (firemc2@tampabay.rr.com)

2015 International Building Code

Revise as follows:

1029.11 Construction. ~~*Aisles*~~*Aisle accessways, level aisles*, stepped *aisles* and ramped *aisles* shall be built of materials consistent with the types permitted for the type of construction of the building.

> **Exception:** Wood *handrails* shall be permitted for all types of construction.

1029.11.1 Walking surface materials. The surface of *aisle accessways, level aisles*, stepped *aisles* and ramped *aisles* shall be of slip-resistant materials that are securely attached. The surface for stepped *aisles* shall comply with Section 1011.7.1.

1029.11.2 Outdoor conditions. Outdoor ~~*aisles*~~aisle accessways, level, stepped~~*aisles*~~ and ramped *aisles* and outdoor approaches to ~~*aisles*~~level, stepped~~*aisles*~~ and ramped *aisles* shall be designed so that water will not accumulate on the walking surface.

1029.13 ~~Assembly aisle walking~~Walking surfaces. ~~Ramped~~ Walking surfaces of ramped*aisles* shall comply with Sections 1029.13.1 through 1029.13.1.3. ~~Stepped~~Walking surfaces of stepped*aisles* shall comply with Sections 1029.13.2 through 1029.13.2.4. Walking surfaces of aisle accessways shall comply with Sections 1029.13.3 through 1029.13.3.2.

Add new text as follows:

1029.13.3 Aisle accessway. Aisle accessway cross slope is measured perpendicular to the direction of travel along the aisle accessway. Aisle Accessways serving seating in rows shall have a maximum cross slope not exceeding one unit vertical in five units horizontal (20-percent slope).

1029.13.3.1 Aisle accessway to aisle transition. Where the aisle accessway transitions to an aisle and there is an elevation change there shall be a sloped transition located in the aisle accessway. Transition slope is measured in the direction of travel along the aisle accessway. The maximum slope of the transition shall not exceed one unit vertical in five units horizontal (20-percent).

1029.13.3.2 Transition contrast marking stripe. Where the elevation change exceeds 3/16-inch (4.8 mm) between aisle accessways and aisles the transitions shall be indicated with a distinctive marking stripe at the edge of the transition slope along the aisle. Such stripes shall have a width of not less than 1-inch (25 mm) but not more than 2-inches (51 mm).

Reason: An Aisle Accessway is defined as being distinctively different than an aisle while also being a part of the means of egress. Aisles have a maximum slope under Section 1029.13.1 of 12.5-percent or one in eight. Aisle accessway walking surfaces do not have a stated maximum slope or cross slope. To allow for a seating area sloped floor in a venue, the aisle accessway cross slope must be permitted to match or exceed the aisle slope. Line of sight for legitimate stage seating areas in many instances requires a slope greater than that stated in the IBC for aisles and this proposal allows for a slope up to 20-percent. Outdoor seating areas in amphitheaters are often in the range of 17 to 20-percent and have been found acceptable walking surfaces. For indoor seating some maximum slope should be defined as a part of the code since aisle accessways are part of the means of egress and the cross slope perpendicular to the aisle forming the aisle accessway must be defined because it is distinctly different than the 2-percent maximum for ramps. The proposed change also dictates that when the aisle accessway is not the same slope or elevation as the aisle there must transition to the ramped or stepped aisle. the sloped and marked transition where there is an elevation change is similar to the provisions for edge marking on stairs and ramps as newly revised in the previous edition.

The organization of the current provisions do not specify the requirements for aisle accessways, so it was difficult to determine where to add this requirement. The provions in Section 1029.12, while entitled aisle accessways, also deals with the clear width of aisles in seating at tables. It appears that the best place to locate this slope issue would be under Section 1029.13 Assembly aisle walking surfaces, because that is where slope of the aisles is defined for fixed seating.

Cost Impact: Will not increase the cost of construction
There is no cost impact to this proposal since it defines a design consideration that to this point has remained vague.

E 136-15 : 1029.11-CAHANIN5637

E 137-15

1029.11(New), 1029.11.1(New), 1029.11.2(New); (IFC[BE] 1029.11(New), 1029.11.1(New), 1029.11.2(New))

Proponent: Ed Roether, representing Ed Roether Consulting (ed@edroetherconsulting.com)

2015 International Building Code

Add new text as follows:

1029.11 Stepped aisles at vomitories. Stepped aisles that change direction at vomitories shall comply with 1029.11.1 Transitions between a stepped aisle above a vomitory and stepped aisle to the side of vomitory shall comply with 1029.11.2.

1029.11.1 Stepped aisles that change direction at vomitories. Stepped aisle treads where the stepped aisle changes direction at a vomitory shall have a minimum depth of 11 inches (280 mm) or the stepped aisle tread depth, whichever is greater. The height of a stepped aisle tread above a transition at a vomitory shall comply with Section 1029.13.2.2.

1029.11.2 Stepped aisle transitions at the top of vomitories. Transitions between the stepped aisle above a vomitory and stepped aisles to the side of a vomitory shall have a minimum depth of 11 inches (280mm) or the stepped aisle tread depth, whichever is greater.

(Renumber subsequent sections)

Reason: The intent of this proposal is to provide language addressing the most common concerns with stepped aisles around vomitories.

Cost Impact: Will not increase the cost of construction
Attempting to clarifty the language.

E 137-15 : 1029.11.1 (New)-ROETHER5823

E 138-15

1029.13.2.1; (IFC[BE] 1029.13.2.1)

Proponent: Ronald Geren, RLGA Technial Services, LLC, representing Self (ron@specsandcodes.com)

2015 International Building Code

Revise as follows:

1029.13.2.1 Treads. Tread depths shall be not less than 11 inches (279 mm) and shall have dimensional uniformity.

~~Exception~~Exceptions:

1. The tolerance between adjacent treads shall not exceed $^{3}/_{16}$ inch (4.8 mm).
2. Where *aisle accessways* provide access to stepped *aisles*, the tread depth at the transitions shall be not less than the required width of *aisle accessways*. Treads with nonuniform depths shall be indicated with a distinctive marking stripe on each tread *nosing* or leading edge adjacent to the nonuniform tread. Such stripe shall be not less than 1 inch (25 mm), and not more than 2 inches (51 mm), wide. The edge marking stripe shall be distinctively different from the contrasting marking stripe.

Reason: Section 1029.13.2.1 requires treads within a stepped aisle to have a uniform depth; but based on sightlines and row lengths (which affect aisle accessway widths), the number of risers and a uniform tread depth may place a step within the transition from aisle accessway to aisle. This can cause a tripping hazard. This proposal ensures that the full width of the required aisle accessway is provided at an aisle and that no steps encroach into this area. Section 1029.13.2.2 allows nonuniform risers, but allowing the treads to be deeper where aisle accessways enter the aisle may permit more uniform riser heights. A stair safety study conducted by Cornell University has identified riser height variation as a significant contributing factor to falls on stairs. Variations in tread depth does not even make the list. Although the study involved residential stairs, stairs are stairs regardless of the building type.

Bibliography: *Stair Safety: Causes and Prevention of Residential Stair Injuries*, Cornell Cooperative Extension; Department of Design & Environmental Analysis, Cornell Univeristy, Accessed 1/9/15, Page 2,
http://www.human.cornell.edu/dea/outreach/upload/Stair-Safety-2-2.pdf

Cost Impact: Will not increase the cost of construction
This proposal will only adjust the arrangment of steps within an aisle, but should not affect material or labor costs for installation.

E 138-15 : 1029.13.2.1-GEREN5150

E 139-15

1029.16.3; (IFC[BE] 1029.16.3)

Proponent: Scott Dornfeld, City of Delano, MN, representing Myself (sdornfeld@delano.mn.us)

2015 International Building Code

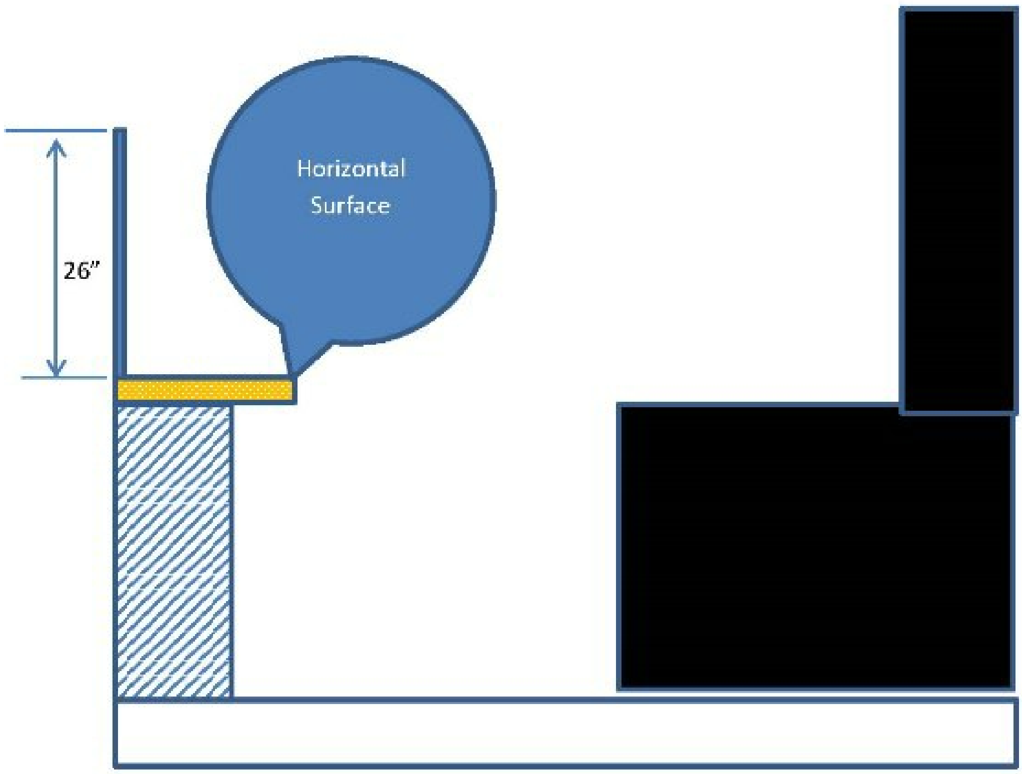
Revise as follows:

1029.16.3 Sightline-constrained guard heights. Unless subject to the requirements of Section 1029.16.4, a fascia or railing system in accordance with the *guard* requirements of Section 1015 and having a minimum height of 26 inches (660 mm) shall be provided where the floor or footboard elevation is more than 30 inches (762 mm) above the floor or grade below and the fascia or railing would otherwise interfere with the sightlines of immediately adjacent seating. <u>Where a dining or drinking surface is provided above the floor in front of the seating, the 26 inches (660 mm) guard height shall be measured from the top of the dining or drinking surface to the top of the guard.</u>

Reason: The purpose of this code change is to add a new requirement to ensure that the intended level of protection provided by guards at affected assembly venues is maintained. This proposed code is consistent with other barrier requirement found in the IBC such as swiming pool barrier requirements that do not allow barriers that are easily climbable and that effectively reduce the intended level of protection.
The code change would prohibit the installation of a climbable horizontal surface or require that a compliant guard be installed with the 26" required dimension being measured from the top of the horizontal surface to the top of the guard. The proposed does not represent a significant modification for the public in these assembly venues. Typically all of the seats that are not located adjacent to the rail do not have a horizontal area above the walking surface; therefore the change will not detract from the public enjoyment of the venue.

This code change will end the practice of trading protection of the public in order to provide a minor convenience for a limited number of seats in the venue. If the designer chooses to incorporate a horizontal surface above the walking surface; then a clear glass guard can be provided that will extend 26" above that horizontal surface.

Refer to the figure which shows how the effective level of protection is compromised by the installation of a horizontal surface.



IBC sec. 1029.16.3

Cost Impact: Will increase the cost of construction
The increase cost for the extra rail height will be minimum and is necessary for public safety. There would be no increase if the designer decides not to add the dining and drinking surface.

E 139-15 : 1029.16.3-DORNFELD5569

E 140-15

1030.1; (IFC[BE] 1030.1)

Proponent: Paul Tidwell, representing Utah Chapter ICC (ptidwell@saratogaspringscity.com)

2015 International Building Code

Revise as follows:

1030.1 General. In addition to the *means of egress* required by this chapter, provisions shall be made for *emergency escape and rescue openings* in Group R-2 occupancies on stories with a one exit or access to one exit in accordance with Tables 1006.3.2(1) and 1006.3.2(2) and Group R-3 occupancies. *Basements* and sleeping rooms below the fourth story above *grade plane* shall have at least one exterior *emergency escape and rescue opening* in accordance with this section. Where *basements* contain one or more sleeping rooms, *emergency escape and rescue openings* shall be required in each sleeping room, but shall not be required in adjoining areas of the *basement*. Such openings shall open directly into a *public way* or to a *yard* or *court* that opens to a *public way*.

Exceptions:

1. *Basements* with a ceiling height of less than 80 inches (2032 mm) shall not be required to have *emergency escape and rescue openings*.
2. *Emergency escape and rescue openings* are not required from *basements* or sleeping rooms that have an *exit* door or *exit access* door that opens directly into a *public way* or to a *yard*, *court* or exterior exit balcony that opens to a *public way*.
3. *Basements* without *habitable spaces* and having not more than 200 square feet (18.6 m^2) in floor area shall not be required to have *emergency escape and rescue openings*.

Reason: The requirements of 1030 are driven by the footnotes in tables 1006.3.2(1) and 1006.3.2(2) which is a indirect path. By stating "on stories with a one exit or access to one exit" in the first sentence of the charging statement the code user can quickly identify the requirements.

Cost Impact: Will not increase the cost of construction
This is a code clarification only, it does not change the requirements.

E 140-15 : 1030.1-TIDWELL4036

E 141-15

1030.1; (IFC[BE] 1030.1)

Proponent: Jeffrey Shapiro, National Multifamily Housing Council, representing National Multifamily Housing Council

2015 International Building Code

Revise as follows:

1030.1 General. In addition to the *means of egress* required by this chapter, ~~provisions shall be made for~~ *emergency escape and rescue openings* shall be provided in the following occupancies:

1. Group R-2 occupancies located in ~~accordance~~stories with only one exit or access to only one exit as permitted by Tables 1006.3.2(1) and 1006.3.2(2) ~~and~~
2. Group R-3 occupancies.

Basements and sleeping rooms below the fourth story above *grade plane* shall have at least one exterior *emergency escape and rescue opening* in accordance with this section. Where *basements* contain one or more sleeping rooms, *emergency escape and rescue openings* shall be required in each sleeping room, but shall not be required in adjoining areas of the *basement*. Such openings shall open directly into a *public way* or to a *yard* or *court* that opens to a *public way*.

Exceptions:

1. *Basements* with a ceiling height of less than 80 inches (2032 mm) shall not be required to have *emergency escape and rescue openings*.
2. *Emergency escape and rescue openings* are not required from *basements* or sleeping rooms that have an *exit* door or *exit access* door that opens directly into a *public way* or to a *yard*, *court* or exterior exit balcony that opens to a *public way*.
3. *Basements* without *habitable spaces* and having not more than 200 square feet (18.6 m^2) in floor area shall not be required to have *emergency escape and rescue openings*.

Reason: The proposal is simply a clarification of the current requirements. As currently worded, it is unclear in Section 1030 that emergency escape and rescue openings are only required for Group R-2 occupancies that are located on stories with a single exit. That is what the references to Tables 1021.2(1) and 1021.2(2) convey, but forcing the reader to go back to 1021.2 to determine this makes interpreting and applying Section 1030 unnecessarily cumbersome, given that most R-2 occupancies have 2 exits and are not required to comply with Section 1030.

Cost Impact: Will not increase the cost of construction
The proposal is simply a clarification of current provisions and does not increase the cost of construction.

E 141-15 : 1030.1-SHAPIRO5519

E 142-15

1030.1; (IFC[BE] 1030.1)

Proponent: Stephen Thomas, Colorado Code Consulting, LLC, representing Colorado Chapter (sthomas@coloradocode.net)

2015 International Building Code

Revise as follows:

1030.1 General. In addition to the *means of egress* required by this chapter, ~~provisions shall be made for~~ *emergency escape and rescue openings* shall be provided in Group ~~R-2~~R-3 occupancies~~ in accordance with~~, and where required by footnote a of Tables 1006.3.2(1) and 1006.3.2(2) ~~and~~for Group ~~R-3~~R-2 occupancies. *Basements* and sleeping rooms below the fourth story above *grade plane* shall have at least one exterior *emergency escape and rescue opening* in accordance with this section. Where *basements* contain one or more sleeping rooms, *emergency escape and rescue openings* shall be required in each sleeping room, but shall not be required in adjoining areas of the *basement*. Such openings shall open directly into a *public way* or to a *yard* or *court* that opens to a *public way*.

Exceptions:

1. *Basements* with a ceiling height of less than 80 inches (2032 mm) shall not be required to have *emergency escape and rescue openings*.
2. *Emergency escape and rescue openings* are not required from *basements* or sleeping rooms that have an *exit* door or *exit access* door that opens directly into a *public way* or to a *yard*, *court* or exterior exit balcony that opens to a *public way*.
3. *Basements* without *habitable spaces* and having not more than 200 square feet (18.6 m^2) in floor area shall not be required to have *emergency escape and rescue openings*.

Reason: The revision to this section has created a lot of confusion among code users as to when emergency escape and rescue openings are requried. The purpose of this revision is to clarify the requirement by rearranging the language and providing a clearer requirement for emergency escape and rescue openings.

Cost Impact: Will not increase the cost of construction
This change is a clarification of the requirements. There is no cost impact of this change.

E 142-15 : 1030.1-THOMAS4456

E 143-15

1030.1; (IFC[BE] 1030.1)

Proponent: Jay Hyde, representing Sacramento (jhyde@mognot.com)

2015 International Building Code

Revise as follows:

1030.1 General. In addition to the *means of egress* required by this chapter, provisions shall be made for *emergency escape and rescue openings* in Group R-2 occupancies in accordance with Tables 1006.3.2(1) and 1006.3.2(2) and Group R-3 occupancies. *Basements* and sleeping rooms below the fourth story above *grade plane* shall have at least one exterior *emergency escape and rescue opening* in accordance with this section. Where *basements* contain one or more sleeping rooms, *emergency escape and rescue openings* shall be required in each sleeping room, but shall not be required in adjoining areas of the *basement*. Such openings shall open directly into a *public way* or to a *yard* or *court* that opens to a *public way*or to a covered porch, deck, balcony or egress balcony that opens directly on to a yard, court or public way and provides a minimum 36-inch wide by minimum 80-inch high path of travel to the edge or guard.

Exceptions:

1. *Basements* with a ceiling height of less than 80 inches (2032 mm) shall not be required to have *emergency escape and rescue openings*.
2. *Emergency escape and rescue openings* are not required from *basements* or sleeping rooms that have an *exit* door or *exit access* door that opens directly into a *public way* or to a *yard*, *court* or exterior exit balcony that opens to a *public way*.
3. *Basements* without *habitable spaces* and having not more than 200 square feet (18.6 m^2) in floor area shall not be required to have *emergency escape and rescue openings*.

Reason: Consistency: the 2015 International Residential Code, Section R310.2.4 permits emergency escape and rescue openings under decks and porches. It also permits restricted height of 36-inches. The restricted height does not appear to be appropriate under multi-family conditions where several units may require emergency escape and rescue at the same time, therefore the Code Change Proposal specifically incorporates the minimum corridor width specified for a dwelling unit (Table 1020.2) and the minimum height for a door (Section 1010.1.1.1).

Cost Impact: Will not increase the cost of construction
This is design issue that lermits a perticular design, no construction work is mandated.

E 143-15 : 1030.1-HYDE5280

E 144-15

Table 1006.3.2(2), 1030.1; (IFC[BE] Table 1006.3.2(2), 1030.1)

Proponent: Victor Cuevas, representing City of Los Angeles

2015 International Building Code

Revise as follows:

1030.1 General. In addition to the *means of egress* required by this chapter, provisions shall be made for *emergency escape and rescue openings* in Group ~~R-2 occupancies in accordance with Tables 1006.3.2(1) and 1006.3.2(2) and Group R-3~~R occupancies. *Basements* and sleeping rooms below the fourth story above *grade plane* shall have at least one exterior *emergency escape and rescue opening* in accordance with this section. Where *basements* contain one or more sleeping rooms, *emergency escape and rescue openings* shall be required in each sleeping room, but shall not be required in adjoining areas of the *basement*. Such openings shall open directly into a *public way* or to a *yard* or *court* that opens to a *public way*.

Exceptions:

1. *Groups R-1 and R-2 occupancies are not required to provide emergency and escape openings where they comply with all of the following:*
   - 1.1. *Each story has access to two or more means of egress.*
   - 1.2. *The building is constructed of Type I, Type II, Type IIIA or Type IV construction.*
   - 1.3. *The building is equipped throughout with an approved automatic sprinkler system in accordance with Sections 903.3.1.1 or 903.3.3.2.*
2. ~~*The emergency escape and rescue opening is permitted to open onto a balcony within an atrium in accordance with the requirements of Section 404, provided the balcony provides access to an exit and the dwelling unit or sleeping unit has a means of egress that is not open to the atrium.*~~
3. *Basements* with a ceiling height of less than 80 inches (2032 mm) shall not be required to have *emergency escape and rescue openings*.
4. *Emergency escape and rescue openings* are not required from *basements* or sleeping rooms that have an *exit* door or *exit access* door that opens directly into a *public way* or to a *yard*, *court* or exterior exit balcony that opens to a *public way*.
5. *Basements* without *habitable spaces* and having not more than 200 square feet (18.6 m^2) in floor area shall not be required to have *emergency escape and rescue openings*.

TABLE 1006.3.2(2)
STORIES WITH ONE EXIT OR ACCESS TO ONE EXIT FOR OTHER OCCUPANCIES

STORY	OCCUPANCY	MAXIMUM OCCUPANT LOAD PER STORY	MAXIMUM COMMON PATH OF EGRESS TRAVEL DISTANCE (feet)
First story above or below grade plane	A, B[b] , E F[b] , M, U	49	75
	H-2, H-3	3	25
	H-4, H-5, I, R-1[a], R-2[a,c] , R-4	10	75
	S[b,d]	29	75
Second story above grade plane	B, F, M, S[d]	29	75
Third story above grade plane and higher	NP	NA	NA

For SI: 1 foot = 304.8 mm.

NP = Not Permitted.

NA = Not Applicable.

a. Buildings classified as ~~Group~~Groups R-1 and R-2 equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1 or 903.3.1.2 and provided with *emergency escape and rescue openings* in accordance with Section 1030.

b. Group B, F and S occupancies in buildings equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1 shall have a maximum *exit access* travel distance of 100 feet.

c. This table is used for R-2 occupancies consisting of *sleeping units*. For R-2 occupancies consisting of *dwelling units*, use Table 1006.3.2(1).

d. The length of *exit access* travel distance in a Group S-2 *open parking garage* shall be not more than 100 feet

Reason: The intent is to at require emergency escape and rescue openings in all Group R occupanies. Exception 1 will exempt Group R-1 and R-2 occupancies except for Type IIIB and Type V construction and Group R-1 and R-2 with one exit. Exception 2 was found in the 2009 IBC. This could be used by a hotel with balconies that open into an atrium with smoke protection rather than balconies that open to the outside. Group R-3 and Group R-4 would still be required to have emergency escape and window openings. That would not change.
The change to add emergency escape windows for Group R-1 in Table 1006.3.2(2) for single exit buildings is correllative.

Cost Impact: Will increase the cost of construction
This would be an increase for Group R-1 and R-2 buildings of Type IIIB and V construction.

E 144-15 : 1030.1-CUEVAS4873

E 145-15

1030.1; (IFC[BE] 1030.1)

Proponent: Jeffrey Shapiro, International Code Consultants, representing International Code Consultants

2015 International Building Code

Revise as follows:

1030.1 General. In addition to the *means of egress* required by this chapter, provisions shall be made for *emergency escape and rescue openings* in Group R-2 occupancies in accordance with Tables 1006.3.2(1) and 1006.3.2(2) and Group R-3 occupancies. *Basements* and sleeping rooms below the fourth story above *grade plane* shall have at least one exterior *emergency escape and rescue opening* in accordance with this section. Where *basements* contain one or more sleeping rooms, *emergency escape and rescue openings* shall be required in each sleeping room, but shall not be required in adjoining areas of the *basement*. Such openings shall open directly into a *public way* or to a *yard* or *court* that opens to a *public way*.

Exceptions:

1. *Basements* with a ceiling height of less than 80 inches (2032 mm) shall not be required to have *emergency escape and rescue openings*.
2. *Emergency escape and rescue openings* are not required from *basements* or sleeping rooms that have an *exit* door or *exit access* door that opens directly into a *public way* or to a *yard*, *court* or exterior exit balcony that opens to a *public way*.
3. *Basements* without *habitable spaces* and having not more than 200 square feet (18.6 m^2) in floor area shall not be required to have *emergency escape and rescue openings*.
4. Within individual dwelling and sleeping units in Groups R-2 and R-3, where the buildings is equipped throughout with an *automatic sprinkler system* installed in accordance with Section 903.3.1.1, 903.3.1.2 or 903.3.1.3, sleeping rooms in basements shall not be required to have *emergency escape and rescue openings* provided that the basement has one of the following:
   4.1. One means of egress and one *emergency escape and rescue opening*
   4.2. Two means of egress.

Reason: This Section has very limited application, only applying to Group R-3 and a small number of Group R-2 occupancies that have only one exit per story. It does not apply to Group R-1 or any Group I occupancy, all of which are permitted to have sleeping rooms in basements and stories of sprinklered buildings, even those with a single exit per Tables 1006.3.2(1) and 1006.3.2(2). The reason for not applying a similar allowance to Group R-3 and single exit Group R-2 is not evident considering that other occupancies pose a more significant life-safety risk.
Nevertheless, rather than seeking full equivalency with these other occupancies when sprinklers are provided, this proposal seeks only a partial credit for basements, with the hope of finding common ground with parties who have previously argued against a general exception for means of escape in fully sprinklered buildings. This proposal maintains at least one basement escape window or door or an additional means of egress in addition to the primary means of egress. Plus, it is important to remember that both sprinklers and hard-wired interconnected smoke alarms are required to qualify for the proposed exception.

This combination of sprinklers and smoke alarms is well established by the NFPA 101 - Life Safety Code as a basis for eliminating all required means of escape openings from sprinklered one- and two-family dwellings, hotels, motels, apartments and similar uses. In addition, the states of New Hampshire and Virginia have amended their statewide code adoptions by eliminating all requirement for means of escape openings when sprinklers are provided. Minnesota adopted a similar amendment, but the allowance was limited to exempting all basement escape windows (these were IRC amendments, but the logic conveys to the IBC discussion).

There are many reasons for adding this exception to the IBC. First, 16 states have legislatively preempted adoption of residential sprinkler requirements for one- and two-family dwellings, and in some cases, townhouses. Recognizing that some homes and townhouses may be built under the IBC (perhaps where IRC height limits are exceeded or where the IRC isn't adopted), it is important to provide code incentives to strongly encourage the installation of sprinkler systems. It is also fair to offer these incentives to builders and homebuyers in other states. Second, passing this exception in the IBC will remove the question of IBC-IRC correlation as a basis for arguing against a similar change that will be proposed to the IRC in the Group B code cycle. Third, there is less benefit to a basement means of escape because the dynamics of a basement fire differ from fires above grade. In a non-sprinklered fire event, it might be possible for an occupant to be rescued or escape using an above-grade window because the lower portion of the window may initially draw fresh air. However, a basement window well will quickly fill with smoke and heated gases if there's an uncontrolled fire in the basement, and the importance of fire sprinklers in providing extra egress time cannot be overstated. Likewise, by the time firefighters arrive, rescuing an occupant from a developed basement fire through a means of escape window or using such window as an escape route for a firefighter seems highly unlikely. Firefighter safety is far better assured by sprinklers.

Looking at the value of this incentive, the cost savings associated with eliminating even one basement escape window and the associated ladder and window well is significant. Combine that with the benefit of eliminating leakage and maintenance issues and tripping/fall hazards that may be associated with window wells, and the incentive grows. Finally, recognize the enormous benefit that this change will offer for homebuyers, who will gain the option of finishing a rough-in basement without the contsraint of laying out sleeping rooms based on existing window locations or having to add windows to an existing basement. This single incentive might be valuable enough to encourage voluntary sprinkler installations, and still, the level of safety will exceed what is required by the IBC for similar occupancies and by NFPA 101.

Cost Impact: Will not increase the cost of construction
The proposal adds an option to the code. There is no requirement to utilize this option; however, if it is used, the cost of construction may decrease.

E 146-15

1030.1.1(New), 1030.4; (IFC[BE] 1030.1.1(New), 1030.4)

Proponent: Edward Kulik, Chair, representing Building Code Action Committee (bcac@iccsafe.org)

2015 International Building Code

Add new text as follows:

1030.1.1 Operational constraints and opening control devices. Emergency escape and rescue openings shall be operational from the inside of the room without the use of keys or tools. Window opening control devices complying with ASTM F 2090 shall be permitted for use on windows serving as a required emergency escape and rescue opening.

Revise as follows:

~~1030.4~~1030.5 ~~Operational constraints.~~Bars, grilles, covers and screens. ~~*Emergency escape and rescue openings* shall be operational from the inside of the room without the use of keys or tools.~~

Bars, grilles, ~~grates~~covers, screens or similar devices are permitted to be placed over *emergency escape and rescue openings*, bulkhead enclosures, or window wells that serve such openings, provided that the minimum net clear opening size complies with Section ~~1030.2~~1030.1.1 through 1030.4 and such devices shall be releasable or removable from the inside without the use of a key, tool or force greater than that which is required for normal operation of the *emergency escape and rescue opening*. Where such bars, grilles, ~~grates~~covers, screens or similar devices are installed in existing buildings, *smoke alarms* shall be installed in accordance with Section 907.2.11 regardless of the valuation of the *alteration*.

(Renumber the following sections:)

~~1030.5~~1030.4 Window wells. *(No change to text.)*

~~1030.5.1~~1030.4.1Minimum size. *(No change to text.)*

~~1030.5.2~~1030.4.2Ladders or steps. *(No change to text.)*

Reason: In July/2014 the ICC Board decided to sunset the activities of the Code Technology Committee (CTC). This is being accomplished by re-assigning many of the CTC Areas of Study to the applicable Code Action Committee (CAC). This proposal falls under the CTC Area of Study entitled Child Window Safety. Information on the CTC, including: the sunset plan; meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the CTC website.
This public proposal is submitted by the ICC Building Code Action Committee (BCAC). The BCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the BCAC has held 13 open meetings and numerous workgroup calls which included members of the BCAC as well as any interested party to discuss and debate the proposed changes and the public comments. Related documentation and reports are posted on the BCAC website at: http://www.iccsafe.org/cs/BCAC/Pages/default.aspx.

2015 IRC Section R310.1.1 specifically notes that devices complying with ASTM F2090 do not jeopardize compliance with the emergency escape and rescue provisions. A similar requirement is needed in the IBC.

Note that the requirements for bars, grilles, covers and screens are addressed in IRC R310.4. This proposal splits and relocates the requirements to be consistent with what is in the IRC for emergency and escape windows operational constraints. The relocation of the provisions for window wells is to allow for the window size requirements to be grouped together for reference in the same manner as the IRC.

R310.1.1 Operational constraints and opening control devices. Emergency escape and rescue openings shall be operational from the inside of the room without the use of keys, tools or special knowledge. Window opening control devices complying with ASTM F 2090 shall be permitted for use on windows serving as a required emergency escape and rescue opening.

R310.4 Bars, grilles, covers and screens. Bars, grilles, covers, screens or similar devices are permitted to be placed over emergency escape and rescue openings, bulkhead enclosures, or window wells that serve such openings, provided that the minimum net clear opening size complies with Sections R310.1.1 to R310.2.3, and such devices shall be releasable or removable from the inside without the use of a key, tool, special knowledge or force greater than that required for the normal operation of the escape and rescue opening.

Cost Impact: Will not increase the cost of construction
The proposal is coordination with IRC allowances for emergency escape windows and allows for another design option.

E 146-15 : 1030.4-KULIK3326

E 147-15

Part I:
1030.4 (IFC[BE]1030.4)

406, 406.4 (New), 701.4 (New)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IBC-MEANS OF EGRESS COMMITTEE. PART II WILL BE HEARD BY THE IEBC COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

Proponent: Edward Kulik, Chair, representing Building Code Action Committee (bcac@iccsafe.org)

Part I

2015 International Building Code

Revise as follows:

1030.4 Operational constraints. *Emergency escape and rescue openings* shall be operational from the inside of the room without the use of keys or tools. Bars, grilles, grates or similar devices are permitted to be placed over *emergency escape and rescue openings* provided the minimum net clear opening size complies with Section 1030.2 and such devices shall be releasable or removable from the inside without the use of a key, tool or force greater than that which is required for normal operation of the *emergency escape and rescue opening*. Where such bars, grilles, grates or similar devices are installed in existing buildings, they shall not reduce the net clear opening of the *emergency escape and rescue openings* and *smoke alarms* shall be installed in accordance with Section 907.2.11 regardless of the valuation of the *alteration*.

Part II

2015 International Existing Building Code

SECTION 406
~~GLASS REPLACEMENT~~WINDOWS AND ~~REPLACEMENT WINDOWS~~EMERGENCY ESCAPE OPENINGS

Add new text as follows:

406.4 Emeregency escape and rescue openings. Emergency escape and rescue openings shall be operational from the inside of the room without the use of keys or tools. Bars, grilles, grates or similar devices are permitted to be placed over emergency escape and rescue openings provided the minimum net clear opening size complies with the code that was in effect at the time of construction and such devices shall be releasable or removable from the inside without the use of a key, tool or force greater than that which is required for normal operation of the escape and rescue opening. Where such bars, grilles, grates or similar devices are installed, they shall not reduce the net clear opening of the emergency escape and rescue openings and smoke alarms shall be installed in accordance with Section 907.2.11 of the International Building Code regardless of the valuation of the alteration.

701.4 Emergecy escape and rescue openings. Emergency escape and rescue openings shall be operational from the inside of the room without the use of keys or tools. Bars, grilles, grates or similar devices are permitted to be placed over emergency escape and rescue openings provided the minimum net clear opening size complies with the code that was in effect at the time of construction and such devices shall be releasable or removable from the inside without the use of a key, tool or force greater than that which is required for normal operation of the escape and rescue opening. Where such bars, grilles, grates or similar devices are installed, they shall not reduce the net clear opening of the emergency escape and rescue openings and smoke alarms shall be installed in accordance with Section 907.2.11 of the International Building Code regardless of the valuation of the alteration.

Staff note: Emergency escape and rescue openings provisions are also included in Sections 406.3 amd 702.5.

Reason: The emergency escape and rescue provisions within IBC section 1030.4 includes requirements that speak to installations that may take place on an existing building, yet no such provision is found within the IEBC. It is appropriate to have such a reference within the IEBC.
This public proposal is submitted by the ICC Building Code Action Committee (BCAC). The BCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the BCAC has held 13 open meetings and numerous workgroup calls which included members of the BCAC as well as any interested party to discuss and debate the proposed changes and the public comments. Related documentation and reports are posted on the BCAC website at: http://www.iccsafe.org/cs/BCAC/Pages/default.aspx.

Cost Impact:

Part I: Will not increase the cost of construction
The proposal is coordination with IRC allowances for emergency escape windows and allows for another design option.

Part II: Will not increase the cost of construction
The proposal is coordination with IRC allowances for emergency escape windows and allows for another design option.

E 148-15

[BE] 1031.4

Proponent: Stephen DiGiovanni, Clark County Building Department, representing Southern Nevada Chapter of ICC (sdigiovanni@clarkcountynv.gov)

2015 International Fire Code

Revise as follows:

[BE] 1031.4 Exit signs. Exit signs shall be installed and maintained in accordance with the building code that applied at the time of construction and the applicable provisions in Section ~~1013~~1104. Decorations, furnishings, equipment or adjacent signage that impairs the visibility of exit signs, creates confusion or prevents identification of the *exit* shall not be allowed.

Reason: Current language has been interpreted to require existing buildings to install new components to meet the provisions of Section 1013. In effect, the current code acts as a retroactive provision. Retroactive requirements should be contained in Chapter 11. This revision requires that the building have exit signs in accordance with the applicable code of record and in accordance with the applicable requirements from Section 1104. This is more appropriate for dealing with existing buildings.

Cost Impact: Will not increase the cost of construction
There is no increase in requirements

E 148-15 : [BE] 1031.4-DIGIOVANNI5858

E 149-15

1103.2.4, 1106.5

Proponent: Edward Kulik, Chair, representing Building Code Action Committee (bcac@iccsafe.org)

2015 International Building Code

Revise as follows:

1103.2.4 Utility buildings. Group U occupancies are not required to comply with this chapter other than the following:

1. In agricultural buildings, access is required to paved work areas and areas open to the general public.
2. ~~Private~~Group U private garages or carports that contain required *accessible* parking.

1106.5 Van spaces. For every six or fraction of six *accessible* parking spaces, at least one shall be a van-accessible parking space.

> **Exception:** In Group R-2 and R-3 occupancies, van-accessible spaces located within Group U private garages that serve Type B units shall be permitted to have vehicular routes, entrances, parking spaces and access aisles with a minimum vertical clearance of 7 feet (2134 mm).

Reason: The definitions and requirements for private garages was revised in the 2015 IBC. This proposal will coordinate Sections 1103.2.4 and 1106.3 with how the term is used in Section 406.3. This will also help clarify the original intent that these exceptions were intended for small garages, not larger garages that are for residents only. The latter interpretation would be a conflict with federal accessibility requirements.
In July/2014 the ICC Board decided to sunset the activities of the Code Technology Committee (CTC). This is being accomplished by re-assigning many of the CTC Areas of Study to the applicable Code Action Committee (CAC). This proposal falls under the CTC Area of Study entitled IBC Coordination with the New ADAAG. Information on the CTC, including: the sunset plan; meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the CTC website.

This public proposal is submitted by the ICC Building Code Action Committee (BCAC). The BCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the BCAC has held 13 open meetings and numerous workgroup calls which included members of the BCAC as well as any interested party to discuss and debate the proposed changes and the public comments. Related documentation and reports are posted on the BCAC website at: http://www.iccsafe.org/cs/BCAC/Pages/default.aspx.

Cost Impact: Will not increase the cost of construction
The proposal is a clarification of current requirements; therefore, there is no impact on the cost.

E 149-15 : 1103.2.4-KULIK3336

E 150-15

1103.2.14

Proponent: Edward Kulik, Chair, representing Building Code Action Committee (bcac@iccsafe.org)

2015 International Building Code

Revise as follows:

1103.2.14 Walk-in coolers and freezers. Walk-in ~~coolers~~cooler and ~~freezers intended for~~freezer equipment accessed from employee ~~use only~~work areas are not required to comply with this chapter.

Reason: The current language could be misread to allow for giant coolers where employees work all day or where they are large enough to allow fork lifts. The revised language would be clarify that this intended to address a walk-in cooler equipment provided off a restaurant commercial kitchen. It is not intended to allow for a walk-in refrigerated room that was part of a facility such as a meat packing plant. 'Employee work area' is a defined term.
In July/2014 the ICC Board decided to sunset the activities of the Code Technology Committee (CTC). This is being accomplished by re-assigning many of the CTC Areas of Study to the applicable Code Action Committee (CAC). This proposal falls under the CTC Area of Study entitled IBC Coordination with the New ADAAG. Information on the CTC, including: the sunset plan; meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the CTC website.

This public proposal is submitted by the ICC Building Code Action Committee (BCAC). The BCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the BCAC has held 13 open meetings and numerous workgroup calls which included members of the BCAC as well as any interested party to discuss and debate the proposed changes and the public comments. Related documentation and reports are posted on the BCAC website at: http://www.iccsafe.org/cs/BCAC/Pages/default.aspx.

Cost Impact: Will not increase the cost of construction
The proposal is a clarification of current requirements; therefore, there is no impact on the cost.

E 150-15 : 1103.2.14-KULIK3337

E 151-15

1104.4

Proponent: Gene Boecker, representing Code Consultants, Inc. (geneb@codeconsultants.com)

2015 International Building Code

Revise as follows:

1104.4 Multistory buildings and facilities. At least one *accessible route* shall connect each *accessible story*, ~~and~~ mezzanine and occupiable roof in multilevel buildings and *facilities*.

Exceptions:

1. An *accessible route* is not required to *stories*, ~~and~~ *mezzanines* and occupiable roof that have an aggregate area of not more than 3,000 square feet (278.7 m^2) and are located above and below *accessible* levels.This exception shall not apply to:
   - 1.1. Multiple tenant facilities of Group M occupancies containing five or more tenant spaces used for the sales or rental of goods and where at least one such tenant space is located on a floor level above or below the *accessible* levels;
   - 1.2. *Stories* or *mezzanines* containing offices of health care providers (Group B or I);
   - 1.3. Passenger transportation facilities and airports (Group A-3 or B);or
   - 1.4. Government buildings.
2. *Stories*, ~~or~~ mezzanines or occupiable roofs that do not contain *accessible* elements or other spaces as determined by Section 1107 or 1108 are not required to be served by an *accessible route* from an *accessible* level.
3. In air traffic control towers, an *accessible route* is not required to serve the cab and the floor immediately below the cab.
4. Where a two-story building or facility has one *story* or *mezzanine* with an *occupant load* of five or fewer persons that does not contain *public use* space, that *story* or *mezzanine* shall not be required to be connected by an *accessible route* to the *story* above or below.

Reason: The added phrase "occupiable roof" is proposed. As written, the current text would exclude anything that is not a story or mezzanine. Becasue "story" is defined as the space between a floor and ceiling/roof above, an occupiable roof of a hotel with a large swimming pool or a roof garden for an apartment or office would not be included as requiring an accessible route. If these roof areas contain elements which must be acessible, they should be included in the requirement for access to those levels. Simply becasue a space does not have a roof but otherwise functions as a part of the buidling, it should not be excluded from access.
During the prior code cycle the term "floor" was changed to "story." consequently, the ability to easily address the occupiable roof was lost. This propsal will restore the original intent.

Cost Impact: Will not increase the cost of construction
This is a clarification. The revised language is only addressing what should alreay be the case.

E 151-15 : 1104.4-BOECKER5548

E 152-15

1104.4

Proponent: David Kulina, representing Engel Architects (david@engelarch.com)

2015 International Building Code

Revise as follows:

1104.4 Multistory buildings and facilities. At least one *accessible route* shall connect each *accessiblestory* and *mezzanine* in multilevel buildings and *facilities*.

Exceptions:

1. An *accessible route* is not required to *stories* and *mezzanines* that have an aggregate area of not more than 3,000 square feet (278.7 m^2) and are located above and below *accessible* levels. Such aggregate area shall not include spaces already exempted by Section 1103.2. This exception shall not apply to:
   - 1.1. Multiple tenant facilities of Group M occupancies containing five or more tenant spaces used for the sales or rental of goods and where at least one such tenant space is located on a floor level above or below the *accessible* levels;
   - 1.2. *Stories* or *mezzanines* containing offices of health care providers (Group B or I);
   - 1.3. Passenger transportation facilities and airports (Group A-3 or B);or
   - 1.4. Government buildings.
2. *Stories* or *mezzanines* that do not contain *accessible* elements or other spaces as determined by Section 1107 or 1108 are not required to be served by an *accessible route* from an *accessible* level.
3. In air traffic control towers, an *accessible route* is not required to serve the cab and the floor immediately below the cab.
4. Where a two-story building or facility has one *story* or *mezzanine* with an *occupant load* of five or fewer persons that does not contain *public use* space, that *story* or *mezzanine* shall not be required to be connected by an *accessible route* to the *story* above or below.

Reason: The intent of the 3000 square foot rule was to grant relief from accessibilitiy requirements for areas of limited size. Frequently, the 3000 square foot barrier is broken because a building may have 2000 square foot of mechanical space on top of a 1500 square foot mezzanine. In the case of large factories and warehouses, the total number of equipment areas may be greater than 3000 square feet by themselves, thus all other spaces would have to be made accessible.

Cost Impact: Will not increase the cost of construction
This change will result in cost savings by alleviating the need for lifts and elevators to access limited area floor levels.

E 152-15 : 1104.4-KULINA4556

E 153-15

1105.1, 1105.1.1 (New), TABLE 1105.1.1 (New)

Proponent: Joseph Hetzel, representing DASMA (Jhetzel@thomasamc.com)

2015 International Building Code

Revise as follows:

1105.1 Public entrances. In addition to *accessible* entrances required by Sections ~~1105.1.1~~1105.1.2 through ~~1105.1.7~~1105.1.8, at least 60 percent of all *public entrance*s shall be *accessible*.

Exceptions:

1. An *accessible* entrance is not required to areas not required to be *accessible*.
2. Loading and *service entrances* that are not the only entrance to a tenant space.

Add new text as follows:

1105.1.1 Automatic Doors. For buildings or facilities having occupant loads greater than or equal to that specified in Table 1105.1.8, at least one accessible public entrance shall be either a power-operated door or a low-energy power-operated door.

TABLE 1105.1.1
PUBLIC ENTRANCE WITH POWER-OPERATED DOOR

OCCUPANCY	MINIMUM OCCUPANT LOAD
I-1, I-2	50
A-1, A-2, A-3, A-4	300
R-1	300
B, E, M, R-2	500

(Renumber subsequent sections.)

Reason:

- The proposed language is conceptually based on code language currently in existence, and successfully used, in the province of Ontario, Canada.
- It is widely accepted that automatic doors in general enhance overall accessibility.
- The occupancies cited as requiring power-operated doors are associated with locations where either a high degree of public use would be anticipated, or a serious need exists among the population using a particular occupancy.
- The Table is needed in Section 1105, where accessible entrances are governed.
- Occupant loads have been determined as follows:
  - Groups A and I-2: From Table 1604.5, where these Groups are classified as Risk Category III described as "buildings and other structures that represent a substantial hazard to human life in the event of failure".
  - Other Groups in proposed Table 1105.1.8: From Table 1006.3.1, which states that three exits or exit access doorways shall be provided from any space with an occupant load of 501 to 1000, and four shall be provided with an occupant load greater than 1000.
- The thresholds have been chosen so as not to place a disproportional economic burden on smaller occupancies such as small assembly buildings or strip mall businesses.
- The thresholds also assume that a minimum of 0.4% of the population will be in need of accessibility at any given time for the specified occupancies. The anticipated accessibility need should exceed this estimate a large enough percentage of time to constitute a critical mass of facilities needing power-operated doors when meeting the established thresholds.
- The population requiring accessibility commonly needs accommodations to enter assembly, business, mercantile, hotel/motel, and institutional facilities as part of their everyday life.

Cost Impact: Will increase the cost of construction
The code change proposal will increase the cost of construction, which will be offset by the significant enhancement of accessibility and the side benefit of increased public convenience.

E 153-15 : 1105.1-HETZEL3472

E 154-15

1106.5

Proponent: Kathleen Petrie, representing City of Seattle, Department of Planning and Development (kathleen.petrie@seattle.gov)

2015 International Building Code

Revise as follows:

1106.5 Van spaces. For every six or fraction of six *accessible* parking spaces, at least one shall be a van-accessible parking space.

> **Exception:** In Group U *private garages* that serve Group R-2 and R-3 occupancies, van-accessible spaces ~~located within private garages~~ shall be permitted to have vehicular routes, entrances, parking spaces and access aisles with a minimum vertical clearance of 7 feet (2134 mm).

Reason: As currently written, this section provides governs van accessible spaces within garages of R-2 or R-3 occupancy spaces. Garages are U occupancies not R occupancies, so this exception is actually directed toward the U occupancy that is accessory to the residential occupancy.

Cost Impact: Will not increase the cost of construction
This modification does not impact how a structure is constructed, so costs are not increased or decreased

E 154-15 : 1106.5-PETRIE3480

E 155-15

1107.5.1, 1107.5.1.1, 1107.5.1.2, 1107.6.2.2, 1107.6.2.2.1, 1107.6.2.2.2, 1107.6.2.3, 1107.6.2.3.1, 1107.6.2.3.2

Proponent: Daniel Nichols, New York State Division of Building Standards and Codes, representing New York State Division of Building Standards and Codes (dnichols@dos.state.ny.us)

2015 International Building Code

Revise as follows:

1107.5.1 Group I-1. *Accessible units* and *Type B units* shall be provided in Group I-1 occupancies in accordance with Sections 1107.5.1.1 and 1107.5.1.2.

1107.5.1.1 Accessible units. In Group I-1 Condition 1, at least 4 percent, but not less than one, of the *dwelling units* and *sleeping units* shall be *Accessible units*.In Group I-1 Condition 2, at least 10 percent, but not less than one, of the *dwelling units* and *sleeping units* shall be *Accessible units*.

1107.5.1.2 Type B units. In structures with four or more *dwelling units* or *sleeping unit*s *intended to be occupied as a residence*, every *dwelling unit* and *sleeping unit intended to be occupied as a residence* shall be a *Type B unit*and shall meet the additional following requirements.

1. Door intended for user passage required to comply with ICC A117.1 Section 1004.5.2 shall also comply with the clear width and maneuvering clearances required by Sections 404.2.2 and 404.2.3 of ICC A117.1.
2. At least one toilet and bathing facility in the *dwelling* or *sleeping unit* shall be constructed in accordance with the toilet and bathing facilities requirements of Section 1003.11 of ICC A117.1.

~~Exception~~Exceptions:

1. The number of *Type B units* is permitted to be reduced in accordance with Section 1107.7.
2. Maneuvering clearances is not required on the toilet room or bathroom side of the door in toilet rooms and bathrooms not required to comply with Section 1003.11 of ICC A117.1.
3. Where exterior space dimensions of balconies are less than the required manuevering clearance, door manuevering clearances is not required on the exterior side of the door.
4. Where closets or pantries are 48 inches (1220 mm) maximum in depth, the maneuvering clearance is not required on the closet side of the door.

1107.6.2.2 Apartment houses, monasteries and convents. *Type A units* and *Type B units* shall be provided in apartment houses, monasteries and convents in accordance with Sections 1107.6.2.2.1 and 1107.6.2.2.2.

Delete without substitution:

~~**1107.6.2.2.1 Type A units.** In Group R-2 occupancies containing more than 20 *dwelling units* or *sleeping units*, at least 2 percent but not less than one of the units shall be a *Type A unit*.All Group R-2 units on a *site* shall be considered to determine the total number of units and the required number of *Type A units*.*Type A units* shall be dispersed among the various classes of units.Bedrooms in monasteries and convents shall be counted as *sleeping units* for the purpose of determining the number of units.Where the *sleeping units* are grouped into suites, only one *sleeping unit* in each suite shall count towards the number of required *Type A units*.~~

~~**Exceptions:**~~

1. ~~The number of *Type A units* is permitted to be reduced in accordance with Section 1107.7.~~
2. ~~*Existing structures* on a *site* shall not contribute to the total number of units on a *site*.~~

Revise as follows:

1107.6.2.2.2 Type B units. Where there are four or more *dwelling units* or *sleeping unit*s *intended to be occupied as a residence* in a single structure, every *dwelling unit* and *sleeping unitintended to be occupied as a residence* shall be a *Type B unit* and shall meet the additional following requirements.

1. Door intended for user passage required to comply with ICC A117.1 Section 1004.5.2 shall also comply with the clear width and maneuvering clearances required by Sections 404.2.2 and 404.2.3 of ICC A117.1.
2. At least one toilet and bathing facility in the dwelling or sleeping unit shall be constructed in accordance with the toilet and bathing facilities requirements of Section 1003.11 of ICC A117.1.

~~Exception~~Exceptions:

1. The number of *Type B units* is permitted to be reduced in accordance with Section 1107.7.
2. Maneuvering clearances is not required on the toilet room or bathroom side of the door in toilet rooms and bathrooms not required to comply with Section 1003.11 of ICC A117.1.
3. Where exterior space dimensions of balconies are less than the required manuevering clearance, door manuevering clearances is not required on the exterior side of the door.
4. Where closets or pantries are 48 inches (1220 mm) maximum in depth, the maneuvering clearance is not required on the closet side of the door.

1107.6.2.3 Group R-2 other than live/work units, apartment houses, monasteries and convents. In Group R-2 occupancies, other than *live/work units*, apartment houses, monasteries and convents falling within the scope of Sections 1107.6.2.1 and 1107.6.2.2, *Accessibleunits* and *Type B units* shall be provided in accordance with Sections 1107.6.2.3.1 and 1107.6.2.3.2. Bedrooms within congregate living facilities shall be counted as *sleeping units* for the purpose of determining the number of units. Where the *sleeping units* are grouped into suites, only one *sleeping unit* in each suite shall be permitted to count towards the number of required *Accessibleunits*.

1107.6.2.3.1 Accessible units. *Accessibledwelling units* and *sleeping unit*s shall be provided in accordance with Table 1107.6.1.1.

1107.6.2.3.2 Type B units. Where there are four or more *dwelling units* or *sleeping unit*s *intended to be occupied as a residence* in a single structure, every *dwelling unit* and every *sleeping unitintended to be occupied as a residence* shall be a *Type B unit*and shall meet the additional following requirements.

1. Door intended for user passage required to comply with ICC A117.1 Section 1004.5.2 shall also comply with the clear width and maneuvering clearances required by Sections 404.2.2 and 404.2.3 of ICC A117.1.
2. At least one toilet and bathing facility in the *dwelling* or *sleeping unit* shall be constructed in accordance with the toilet and bathing facilities requirements of Section 1003.11 of ICC A117.1.

~~Exception~~Exceptions:

1. The number of *Type B units* is permitted to be reduced in accordance with Section 1107.7.
2. Maneuvering clearances is not required on the toilet room or bathroom side of the door in toilet rooms and bathrooms not required to comply with Section 1003.11 of ICC A117.1.
3. Where exterior space dimensions of balconies are less than the required manuevering clearance, door manuevering clearances is not required on the exterior side of the door.
4. Where closets or pantries are 48 inches (1220 mm) maximum in depth, the maneuvering clearance is not required on the closet side of the door.

Reason: The purpose of this code change proposal is to modify the level of accessibility offered in Group I-1 and R-2. The collective use of these residential occupancies is generally for occupants that are planning a long-term residency in a dwelling or sleeping unit. With that, the availability of choice is important in selecting a residential unit compared to other residential occupancies.

The language of the proposal has been utilized in New York State for the past 12 years and was developed jointly by accessibility advocates and the building industry . For Group R-2 apartments, the baseline to the proposal is that the elimination of full Type A unit requirements is offset by the expansion of certain accessibility features in the remaining units that are being designed as Type B units. The reasoning for this proposal is to offer more choice in these residential buildings to those with different types of physical disabilities and their respective mobility needs. Further, the proposal will offer more choice of residential housing to a greater number of those with physical disabilities since the requirements for doorway widths and an accessible bathroom will start at four units, instead of 20 units that count units throughout a complex.

The proposal requires the initial design of all apartments to have doorways the width as required for a Type A unit as well as one bathroom to be of Type A design. This provides the additional choice within apartments for either initial use or adaptable changes to other building features (like cabinetry or appliance access) due to change of occupant or change of occupant's abilities.

Cost Impact: Will increase the cost of construction
The code change will increase the cost of construction since the floor area that is required for the additional Type B units is generally not offset by the ellimination of the Type A units.

E 155-15 : 1107.6.2.2-NICHOLS5453

E 156-15

1107.5.1.2

Proponent: Margaret Calkins, representing Rothschild Foundation ADA Task Force (mcalkins@ideasinstitute.org)

2015 International Building Code

1107.5.1 Group I-1. *Accessible units* and *Type B units* shall be provided in Group I-1 occupancies in accordance with Sections 1107.5.1.1 and 1107.5.1.2.

1107.5.1.1 Accessible units. In Group I-1 Condition 1, at least 4 percent, but not less than one, of the *dwelling units* and *sleeping units* shall be *Accessible units*.In Group I-1 Condition 2, at least 10 percent, but not less than one, of the *dwelling units* and *sleeping units* shall be *Accessible units*.

Revise as follows:

1107.5.1.2 Type B units. In structures with four or more *dwelling units* or *sleeping unit*s *intended to be occupied as a residence*, every *dwelling unit* and *sleeping unit intended to be occupied as a residence* shall be a *Type B unit*.

~~Exception~~Exceptions:

1. The number of *Type B units* is permitted to be reduced in accordance with Section 1107.7.
2. At the water closet, two installed swing-up grab bars shall be permitted as an alternative to reinforcements for rear and side grab bars.

Reason: It has long been recognized that most older adults do not have the upper body strength and mobility/range of motion to complete a sliding transfer onto a toilet. Even individuals who use a wheelchair for mobility needs, if they are capable of bearing weight (fully or partially) use a stand-turn-sit action to transfer onto and off of the toilet, either independently or with assistance. Recently completed research by Sanford and Calkins has shown that both elders and care partners prefer bilateral swing up grab bars over the typical side and rear wall grab bar congifuration. Three test conditions included the traditional ADA congifuration with the toilet 18" from the sidde wall and a wall mounted grab bar; bilateral grab bars located at the ADA specified distances (16-18" from the center line of the toilet, mounted 34" above the floor); and a user defined configuration that varied between individuals.
From the interum report for the research:

Configuration Preference: Regardless of level of assistance (independent, 1-person assist or 2-person assist) residents overwhelming preferred the individualized configuration to either the ADA side bar or the bilater fold down grab bars are ADA dimensions. The majority of residents (70% or greater) preferred the grabbars at 13" from the center line of the toilet. The mean preferred height was 32.8" above the floor. Finally,having the wall located 24" from the center line of the toilet was felt to be sufficient for caregiver maneuverability over 84% of the time. Among 30 resident who performed independent transfers 86.2% (n=25) preferred the individualized configuration over the ADA (n=2) or bilateral ADA (n=2) grab bar configuration (missing data on 1 resident). Among 22 residents who required a 1-person assist, 78.3% (n=18) preferred the individualized configuration over the ADA (n=0) or bilateral ADA (n=4). Finally, among 23 residents who required a 2-person assist, 82.6% (n=19)preferred the individualized configuration to the ADA (n=3) or bilateral ADA configuration (n=1). Similar findings were reported by staff for assisted transfers. For those assisting with 1-person assisted transfers, 76.2% (n=16) preferred the individualized configuration to the ADA (n=1) or the bilateral ADA (n=4). For those assisting with a 2-person assisted trasnfer, 58% (n=14) preferred the individualized configuration, although 33% preferred the biateral configuration, while only 8.3% (n=2) preferred the ADA side bar.

Mean Rating for Safety: Mean ratings for the location and style of grab bar to help with safe transfers and support staff to provide assistance were also calculated. On a 5 point scale where 1=strongly disagree and 5=strongly agree. both residents and staff gave consistently higher ratings to the individualized configuration (means ranged from 4.0 - 4.7) than to either the standard ADA configuration (means ranged from 3.2 - 3.8) or the bilateral ADA configuration (means ranged from 3.4 - 3.8).

The timing of this research was such that we were unable to make proposals for changes to ANSI on specifications for either Accessible or Type B units. Thus, at this time we are only looking to specifically alow bi-lateral fold-up grab bar as an alternative to providing side and back wall blocking in Type B units. We recognize that fold-up grab bars are not prohibited in Type B units, however, in some states because this option is not specifically defined, AHJs are relcutant to allow them to be installed during construction. Our goal is to make sure that bilateral fold up grab bars are an option in Group I1 buildings.

Bibliography: [Proposal for additional to accessibility standards for nursing home and assisted living residents in toileting and bathing] [Report/Document #] [Rothschild ADA Task Force] [2012] [1-58]
[www.IDEASInstitute.org/publications.asp]

[Preliminary final report for phases 1-3] [Report/Document #] [Sanford, Calkins] [unpublished] [Page #]
[Request a copy from info@TheRothschildFoundation.us]

Cost Impact: Will not increase the cost of construction
As an option, this will have no mandatory cost implications on projects. Owners who wish to better support their residents and caregivers may choose this as an option, but it is not required.

E 156-15 : 1107.5.1.2-CALKINS4780

E 157-15

1107.5.2.2

Proponent: Margaret Calkins, representing Rothschild Foundation ADA Task Force (mcalkins@ideasinstitute.org)

2015 International Building Code

1107.5.2 Group I-2 nursing homes. *Accessible units* and *Type B units* shall be provided in nursing homes of Group I-2 occupancies in accordance with Sections 1107.5.2.1 and 1107.5.2.2.

1107.5.2.1 Accessible units. At least 50 percent but not less than one of each type of the *dwelling units* and *sleeping unit*s shall be *Accessible units*.

Revise as follows:

1107.5.2.2 Type B units. In structures with four or more *dwelling units* or *sleeping unit*s *intended to be occupied as a residence*, every *dwelling unit* and *sleeping unit intended to be occupied as a residence* shall be a *Type B unit*.

~~Exception~~Exceptions:

1. The number of *Type B units* is permitted to be reduced in accordance with Section 1107.7.
2. At the water closet, two installed swing-up grab bars shall be permitted as an alternative to reinforcements for rear and side grab bars.

Reason: It has long been recognized that most older adults do not have the upper body strength and mobility/range of motion to complete a sliding transfer onto a toilet. Even individuals who use a wheelchair for mobility needs, if they are capable of bearing weight (fully or partially) use a stand-turn-sit action to transfer onto and off of the toilet, either independently or with assistance. Recently completed research by Sanford and Calkins has shown that both elders and care partners prefer bilateral swing up grab bars over the typical side and rear wall grab bar congifuration. Three test conditions included the traditional ADA congifuration with the toilet 18" from the sidde wall and a wall mounted grab bar; bilateral grab bars located at the ADA specified distances (16-18" from the center line of the toilet, mounted 34" above the floor); and a user defined configuration that varied between individuals.
From the interum report for the research:

Configuration Preference: Regardless of level of assistance (independent, 1-person assist or 2-person assist) residents overwhelming preferred the individualized configuration to either the ADA side bar or the bilater fold down grab bars are ADA dimensions. The majority of residents (70% or greater) preferred the grabbars at 13" from the center line of the toilet. The mean preferred height was 32.8" above the floor. Finally,having the wall located 24" from the center line of the toilet was felt to be sufficient for caregiver maneuverability over 84% of the time. Among 30 resident who performed independent transfers 86.2% (n=25) preferred the individualized configuration over the ADA (n=2) or bilateral ADA (n=2) grab bar configuration (missing data on 1 resident). Among 22 residents who required a 1-person assist, 78.3% (n=18) preferred the individualized configuration over the ADA (n=0) or bilateral ADA (n=4). Finally, among 23 residents who required a 2-person assist, 82.6% (n=19)preferred the individualized configuration to the ADA (n=3) or bilateral ADA configuration (n=1). Similar findings were reported by staff for assisted transfers. For those assisting with 1-person assisted transfers, 76.2% (n=16) preferred the individualized configuration to the ADA (n=1) or the bilateral ADA (n=4). For those assisting with a 2-person assisted trasnfer, 58% (n=14) preferred the individualized configuration, although 33% preferred the biateral configuration, while only 8.3% (n=2) preferred the ADA side bar.

Mean Rating for Safety: Mean ratings for the location and style of grab bar to help with safe transfers and support staff to provide assistance were also calculated. On a 5 point scale where 1=strongly disagree and 5=strongly agree. both residents and staff gave consistently higher ratings to the individualized configuration (means ranged from 4.0 - 4.7) than to either the standard ADA configuration (means ranged from 3.2 - 3.8) or the bilateral ADA configuration (means ranged from 3.4 - 3.8).

The timing of this research was such that we were unable to make proposals for changes to ANSI on specifications for either Accessible or Type B units. Thus, at this time we are only looking to specifically alow bi-lateral fold-up grab bar as an alternative to providing side and back wall blocking in Type B units. We recognize that fold-up grab bars are not prohibited in Type B units, however, in some states because this option is not specifically defined, AHJs are relcutant to allow them to be installed during construction. Our goal is to make sure that bilateral fold up grab bars are an option in Group I2 buildings.

[www.IDEASInstitute.org.publications.asp]

Cost Impact: Will not increase the cost of construction
As an option, this will not have any mandatory cost increase. Owners may choose to install bilater grab bars if they want to better suppport their residents and caregivers.

E 157-15 : 1107.5.2.2-CALKINS5440

E 158-15

1107.5.3.2

Proponent: Margaret Calkins, representing Rothschild Foundation ADA Task Force (mcalkins@ideasinstitute.org)

2015 International Building Code

1107.5.3 Group I-2 hospitals. *Accessible units* and *Type B units* shall be provided in general-purpose hospitals, psychiatric facilities and detoxification facilities of Group I-2 occupancies in accordance with Sections 1107.5.3.1 and 1107.5.3.2.

1107.5.3.1 Accessible units. At least 10 percent, but not less than one, of the *dwelling units* and *sleeping units* shall be *Accessibleunits*.

> **Exception:** Entry doors to *Accessibledwelling units* or *sleeping units* shall not be required to provide the maneuvering clearance beyond the latch side of the door.

Revise as follows:

1107.5.3.2 Type B units. In structures with four or more *dwelling units* or *sleeping unit*s *intended to be occupied as a residence*, every *dwelling unit* and *sleeping unitintended to be occupied as a residence* shall be a *Type B unit*.

> **~~Exception~~<u>Exceptions</u>:**
>
> 1. The number of *Type B units* is permitted to be reduced in accordance with Section 1107.7.
> 2. <u>At the water closet, two installed swing-up grab bars shall be permitted as an alternative to reinforcements for rear and side grab bars.</u>

Reason: This same proposal is being included for hospitals for 2 reasons. First, the majority of patient days (roughly 65%) are used by people over the age of 65. Second, having bilateral grabbars provides better support for anyone who is frail or might have balance issues. The rest of this justification is the same.
Recently completed research by Sanford and Calkins has shown that both elders and care partners prefer bilateral swing up grab bars over the typical side and rear wall grab bar congifuration. Three test conditions included the traditional ADA congifuration with the toilet 18" from the sidde wall and a wall mounted grab bar; bilateral grab bars located at the ADA specified distances (16-18" from the center line of the toilet, mounted 34" above the floor); and a user defined configuration that varied between individuals.

From the interum report for the research:

Configuration Preference: Regardless of level of assistance (independent, 1-person assist or 2-person assist) residents overwhelming preferred the individualized configuration to either the ADA side bar or the bilater fold down grab bars are ADA dimensions. The majority of residents (70% or greater) preferred the grabbars at 13" from the center line of the toilet. The mean preferred height was 32.8" above the floor. Finally,having the wall located 24" from the center line of the toilet was felt to be sufficient for caregiver maneuverability over 84% of the time. Among 30 resident who performed independent transfers 86.2% (n=25) preferred the individualized configuration over the ADA (n=2) or bilateral ADA (n=2) grab bar configuration (missing data on 1 resident). Among 22 residents who required a 1-person assist, 78.3% (n=18) preferred the individualized configuration over the ADA (n=0) or bilateral ADA (n=4). Finally, among 23 residents who required a 2-person assist, 82.6% (n=19)preferred the individualized configuration to the ADA (n=3) or bilateral ADA configuration (n=1). Similar findings were reported by staff for assisted transfers. For those assisting with 1-person assisted transfers, 76.2% (n=16) preferred the individualized configuration to the ADA (n=1) or the bilateral ADA (n=4). For those assisting with a 2-person assisted trasnfer, 58% (n=14) preferred the individualized configuration, although 33% preferred the biateral configuration, while only 8.3% (n=2) preferred the ADA side bar.

Mean Rating for Safety: Mean ratings for the location and style of grab bar to help with safe transfers and support staff to provide assistance were also calculated. On a 5 point scale where 1=strongly disagree and 5=strongly agree. both residents and staff gave consistently higher ratings to the individualized configuration (means ranged from 4.0 - 4.7) than to either the standard ADA configuration (means ranged from 3.2 - 3.8) or the bilateral ADA configuration (means ranged from 3.4 - 3.8).

The timing of this research was such that we were unable to make proposals for changes to ANSI on specifications for either Accessible or Type B units. Thus, at this time we are only looking to specifically alow bi-lateral fold-up grab bar as an alternative to providing side and back wall blocking in Type B units. We recognize that fold-up grab bars are not prohibited in Type B units, however, in some states because this option is not specifically defined, AHJs are relcutant to allow them to be installed during construction. Our goal is to make sure that bilateral fold up grab bars are an option in Group I3 buildings.

Cost Impact: Will not increase the cost of construction
As an alterantive, this will not automatically increase construction costs. It is an option that owners can decide to install in type B units.

E 158-15 : 1107.5.3.2-CALKINS5439

E 159-15

1107.6.1, 1107.6.1.1

Proponent: Dominic Marinelli, representing United Spinal Association (nroether@accessibility-services.com)

2015 International Building Code

Revise as follows:

1107.6.1 Group R-1. *Accessible units* and *Type B units* shall be provided in Group R-1 occupancies in accordance with Sections 1107.6.1.1 and 1107.6.1.2.

1107.6.1.1 Accessible units. *Accessibledwelling units* and *sleeping units* shall be provided in accordance with Table 1107.6.1.1. ~~Where buildings~~On a multi-building site, where structures contain more than 50 *dwelling units* or *sleeping units*, the number of *Accessibleunits* shall be determined per ~~building.Where buildings~~structure. On a multi-building site, where structures contain 50 or fewer *dwelling units* or *sleeping units*, all *dwelling units* and *sleeping units* on a *site* shall be considered to determine the total number of *Accessibleunits.Accessibleunits* shall be dispersed among the various classes of units.

Reason: The purpose of this proposal is to be consitent with the language used for accessible housing, and to coordinate better with the DOJ intent.
The DOJ regulations read as follows:

Places of lodging. Places of lodging subject to this part [of the title III regulation] shall comply with the provisions of the 2010 Standards applicable to transient lodging, including, but not limited to, the requirements for transient lodging guest rooms in sections 224 and 806.
(1) Guest rooms. Guest rooms with mobility features in places of lodging subject to the transient lodging requirements of 2010 Standards shall be provided as follows--
(i) Facilities that are subject to the same permit application on a common site that each have 50 or fewer guest rooms may be combined for the purposes of determining the required number of accessible rooms and type of accessible bathing facility in accordance with table 224.2 to section 224.2 of the 2010 Standards.
(ii) Facilities with more than 50 guest rooms shall be treated separately for the purposes of determining the required number of accessible rooms and type of accessible bathing facility in accordance with table 224.2 to section 224.2 of the 2010 Standards.

It is always difficult to match ADA intent with IBC language. IBC defines 'building area' as what is defined by fire walls and exterior walls. 'Facility' is defined in the IBC as everything on a site. It seems like the intent here is to be consistent with the FHA language for Type B units - that regarless of fire walls, this is a structure that operates together as a unit, but it is not all the detached buildings on a site.

Cost Impact: Will not increase the cost of construction
No additional cost. Attempting to clarify language.

E 160-15

1107.6.2.2, 1107.6.2.2.1, 1107.6.2.3, 1107.6.3, 1107.6.4

Proponent: Carl Baldassarra, P.E., FSFPE, Chair, ICC Code Technology Committee, representing Code Technology Committee (CTC@iccsafe.org); Adolf Zubia, Chair, Fire Code Action Committee (fcac@iccsafe.org); Edward Kulik, Chair, Building Code Action Committee (bcac@iccsafe.org)

Revise as follows:

1107.6.2 Group R-2. *Accessibleunits*, *Type A units* and *Type B units* shall be provided in Group R-2 occupancies in accordance with Sections 1107.6.2.1 through 1107.6.2.3.

1107.6.2.1 Live/work units. In *live/work units* constructed in accordance with Section 419, the nonresidential portion is required to be *accessible*.In a structure where there are four or more *live/work unitsintended to be occupied as a residence*, the residential portion of the *live/work unit* shall be a *Type B unit*.

Exception: The number of *Type B units* is permitted to be reduced in accordance with Section 1107.7.

1107.6.2.2 Apartment houses, monasteries and convents. *Type A units* and *Type B units* shall be provided in apartment houses, monasteries and convents in accordance with Sections 1107.6.2.2.1 and 1107.6.2.2.2.
Bedrooms in monasteries and convents shall be counted as units for the purpose of determining the number of units. Where the bedrooms are grouped in sleeping units, only one bedroom in each sleeping unit shall count towards the number of required Type A units.

1107.6.2.2.1 Type A units. In Group R-2 occupancies containing more than 20 *dwelling units* or *sleeping unit*s, at least 2 percent but not less than one of the units shall be a *Type A unit*.All Group R-2 units on a *site* shall be considered to determine the total number of units and the required number of *Type A units*.*Type A units* shall be dispersed among the various classes of units. ~~Bedrooms in monasteries and convents shall be counted as *sleeping units* for the purpose of determining the number of units.Where the *sleeping units* are grouped into suites, only one *sleeping unit* in each suite shall count towards the number of required *Type A units*~~.

Exceptions:

1. The number of *Type A units* is permitted to be reduced in accordance with Section 1107.7.
2. *Existing structures* on a *site* shall not contribute to the total number of units on a *site*.

1107.6.2.2.2 Type B units. Where there are four or more *dwelling units* or *sleeping unit*s *intended to be occupied as a residence* in a single structure, every *dwelling unit* and *sleeping unitintended to be occupied as a residence* shall be a *Type B unit*.

Exception: The number of *Type B units* is permitted to be reduced in accordance with Section 1107.7.

1107.6.2.3 Group R-2 other than live/work units, apartment houses, monasteries and convents.
In Group R-2 occupancies, other than *live/work units*, apartment houses, monasteries and convents falling within the scope of Sections 1107.6.2.1 and 1107.6.2.2, *Accessibleunits* and *Type B units* shall be provided in accordance with Sections 1107.6.2.3.1 and 1107.6.2.3.2. Bedrooms within congregate living facilities, dormitories, sororities, fraternities, and boarding houses shall be counted as *sleeping units* for the purpose of determining the number of units. Where the ~~*sleeping units*~~*bedrooms* are grouped into ~~suites~~dwelling or sleeping units, only one ~~*sleeping unit*~~*bedroom* in each ~~suite~~dwelling or sleeping units shall be permitted to count towards the number of required *Accessibleunits*.

1107.6.2.3.1 Accessible units. *Accessibledwelling units* and *sleeping unit*s shall be provided in accordance with Table 1107.6.1.1.

1107.6.2.3.2 Type B units. Where there are four or more *dwelling units* or *sleeping unit*s *intended to be occupied as a residence* in a single structure, every *dwelling unit* and every *sleeping unitintended to be occupied as a residence* shall be a *Type B unit*.

Exception: The number of *Type B units* is permitted to be reduced in accordance with Section 1107.7.

1107.6.3 Group R-3. In Group R-3 occupancies where there are four or more *dwelling units* or *sleeping units intended to be occupied as a residence* in a single structure, every *dwelling unit* and *sleeping unit intended to be occupied as a residence* shall be a *Type B unit*.
Bedrooms within congregate living facilities, dormitories, sororities, fraternities, and boarding houses shall be counted as ~~*sleeping*~~ *units* for the purpose of determining the number of units.

Exception: The number of *Type B units* is permitted to be reduced in accordance with Section 1107.7.

1107.6.4 Group R-4. *Accessible units* and *Type B units* shall be provided in Group R-4 occupancies in accordance with Sections 1107.6.4.1 and 1107.6.4.2. Bedrooms in Group R-4 facilities shall be counted as ~~sleeping~~ units for the purpose of determining the number of units.

1107.6.4.1 Accessible units. In Group R-4 Condition 1, at least one of the *sleeping units* shall be an *Accessible unit*. In Group R-4 Condition 2, at least two of the *sleeping units* shall be an *Accessible unit*.

1107.6.4.2 Type B units. In structures with four or more *sleeping unit*s *intended to be occupied as a residence*, every *sleeping unitintended to be occupied as a residence* shall be a *Type B unit*.

Exception: The number of *Type B units* is permitted to be reduced in accordance with Section 1107.7.

Reason: ADA and FHA count bedrooms in dormitories and congregate residences when determining the number of units for accessibility requirements. With the recognition that suite designs can include more than one bedroom in a sleeping unit, the requirements here need to be tweaked to align with these federal regulations.

This is part of a group of proposals to address this style of design and group homes within single family residences. Changes are proposed for the definition for sleeping units, the Group classifications in Section 310.4 and 310.5, separation requirements in Section 420, and coordination with accessibility requirements in Section 1107. Proposals will be put forward as part of Group B for fire and smoke alarm systems. The proposals could work separately.

The ICC Code Technology Committee (CTC) has just completed its 10th year. The ICC Board has decided to sunset the CTC. The sunset plan includes re-assigning many of the CTC Areas of Study to the applicable Code Action Committee (CAC). The two remaining CTC Areas of Study are Care Facilities and Elevator Lobbies/WTC Elevator issues. This proposal falls under the Care Facilities Area of Study. Information on the CTC, including: the sunset plan; meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the CTC website.http://www.iccsafe.org/cs/CTC/Pages/default.aspx

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). This ICC committee was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the Fire-CAC has held 10 open meetings and numerous Regional Work Group and Task Group meetings and conference calls which included members of the committees as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the FAC website at: http://www.iccsafe.org/cs/CAC/Pages/default.aspx?usertoken={token}&Site=icc

The BCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the BCAC has held 13 open meetings and numerous workgroup calls which included members of the BCAC as well as any interested party to discuss and debate the proposed changes and the public comments. Related documentation and reports are posted on the BCAC website at: http://www.iccsafe.org/cs/BCAC/Pages/default.aspx.

Cost Impact: Will not increase the cost of construction
This is a clarification, not a change in requirements.

Staff note: There is published errata for Section 1107.6.4, 1107.6.4.1 and 1107.6.4.2. The errata in incorporated into this proposal as existing text.

E 160-15 : 1107.6.2.2-BALDASSARRA4296

E 161-15

1107.6.3, 1107.6.4, 1107.6.4.1, 1107.6.4.2

Proponent: Carl Baldassarra, P.E., FSFPE, Chair, ICC Code Technology Committee, representing Code Technology Committee (CTC@iccsafe.org)

2015 International Building Code

Revise as follows:

1107.6.3 ~~Group~~Groups R-3 and R-4. In Group R-3 and R-4 occupancies where there are four or more *dwelling units* or *sleeping unitsintended to be occupied as a residence* in a single structure, every *dwelling unit* and *sleeping unit intended to be occupied as a residence* shall be a *Type B unit*. Bedrooms within congregate living facilities shall be counted as *sleeping units* for the purpose of determining the number of units.

> **Exception:** The number of *Type B units* is permitted to be reduced in accordance with Section 1107.7.

Delete without substitution:

~~**1107.6.4 Group R-4.** *Accessible units* and *Type B units* shall be provided in Group R-4 occupancies in accordance with Sections 1107.6.4.1 and 1107.6.4.2. Bedrooms in Group R-4 facilities shall be counted as sleeping units for the purpose of determining the number of units.~~

~~**1107.6.4.1 Accessible units.** In Group R-4 Condition 1, at least one of the *sleeping units* shall be an *Accessible unit*.In Group R-4 Condition 2, at least two of the *sleeping units* shall be an *Accessible unit*. Bedrooms in Group R-4 facilities shall be counted as *sleeping units* for the purpose of determining the number of units.~~

~~**1107.6.4.2 Type B units.** In structures with four or more *sleeping units intended to be occupied as a residence*, every *sleeping unitintended to be occupied as a residence* shall be a *Type B unit*.~~

> ~~**Exception:** The number of *Type B units* is permitted to be reduced in accordance with Section 1107.7.~~

Reason:
Historically the Accessible unit was required because this was a small Group I-1. The Accessible unit is not required by federal regulations. The larger impact on these facilities is not the sleeping room itself but the impact on the shared facilities, such as the kitchen, the maneuvering clearances at doors and at least one bathroom. How many Accessible bedrooms are required should be a funding or operational issue. This proposed change is consistent with the Fair Housing Act.
The ICC Code Technology Committee (CTC) has just completed its 10th year. The ICC Board has decided to sunset the CTC. The sunset plan includes re-assigning many of the CTC Areas of Study to the applicable Code Action Committee (CAC). The two remaining CTC Areas of Study are Care Facilities and Elevator Lobbies/WTC Elevator issues. This proposal falls under the Care Facilities Area of Study. Information on the CTC, including: the sunset plan; meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the CTC website at: http://www.iccsafe.org/cs/CTC/Pages/default.aspx.

Cost Impact: Will not increase the cost of construction
This is a reduction in requirements, especially in a change of occupancy.

Staff note: There is a published errata to Sections 1107.6.4, 1107.6.4.1 and 1107.6.4.2. The errata is incorporated into this proposal as existing text.

E 161-15 : 1107.6.3-BALDASSARRA4280

E 162-15

1107.6.4.2

Proponent: Margaret Calkins, representing Rothschild Foundation ADA Task Force (mcalkins@ideasinstitute.org)

2015 International Building Code

1107.6.4 Group R-4. *Accessible units* and *Type B units* shall be provided in Group R-4 occupancies in accordance with Sections 1107.6.4.1 and 1107.6.4.2. Bedrooms in Group R-4 facilities shall be counted as sleeping units for the purpose of determining the number of units.

1107.6.4.1 Accessible units. In Group R-4 Condition 1, at least one of the *dwelling units* or *sleeping units* shall be an *Accessible unit.*In Group R-4 Condition 2, at least two of the *dwelling units* or *sleeping units* shall be an *Accessible unit.* Bedrooms in Group R-4 facilities shall be counted as *sleeping units* for the purpose of determining the number of units.

Revise as follows:

1107.6.4.2 Type B units. In structures with four or more *dwelling units* or *sleeping unit*s *intended to be occupied as a residence*, every *dwelling unit* and *sleeping unitintended to be occupied as a residence* shall be a *Type B unit.*

~~Exception~~Exceptions:

1. The number of *Type B units* is permitted to be reduced in accordance with Section 1107.7.
2. At the water closet, two installed swing up grab bars shall be permitted as an alternative to reinforcement for rear and side grab bars.

Reason: As with the previous proposals, this proposal just makes to cler to group home operators that if they want to install bilateral grab bars in place of reinforcement for rear and side grab bars, it is acceptable.
It has long been recognized that most older adults do not have the upper body strength and mobility/range of motion to complete a sliding transfer onto a toilet. Even individuals who use a wheelchair for mobility needs, if they are capable of bearing weight (fully or partially) use a stand-turn-sit action to transfer onto and off of the toilet, either independently or with assistance. Recently completed research by Sanford and Calkins has shown that both elders and care partners prefer bilateral swing up grab bars over the typical side and rear wall grab bar congifuration. Three test conditions included the traditional ADA congifuration with the toilet 18" from the sidde wall and a wall mounted grab bar; bilateral grab bars located at the ADA specified distances (16-18" from the center line of the toilet, mounted 34" above the floor); and a user defined configuration that varied between individuals.

From the interum report for the research:

Configuration Preference: Regardless of level of assistance (independent, 1-person assist or 2-person assist) residents overwhelming preferred the individualized configuration to either the ADA side bar or the bilater fold down grab bars are ADA dimensions. The majority of residents (70% or greater) preferred the grabbars at 13" from the center line of the toilet. The mean preferred height was 32.8" above the floor. Finally,having the wall located 24" from the center line of the toilet was felt to be sufficient for caregiver maneuverability over 84% of the time. Among 30 resident who performed independent transfers 86.2% (n=25) preferred the individualized configuration over the ADA (n=2) or bilateral ADA (n=2) grab bar configuration (missing data on 1 resident). Among 22 residents who required a 1-person assist, 78.3% (n=18) preferred the individualized configuration over the ADA (n=0) or bilateral ADA (n=4). Finally, among 23 residents who required a 2-person assist, 82.6% (n=19)preferred the individualized configuration to the ADA (n=3) or bilateral ADA configuration (n=1). Similar findings were reported by staff for assisted transfers. For those assisting with 1-person assisted transfers, 76.2% (n=16) preferred the individualized configuration to the ADA (n=1) or the bilateral ADA (n=4). For those assisting with a 2-person assisted trasnfer, 58% (n=14) preferred the individualized configuration, although 33% preferred the biateral configuration, while only 8.3% (n=2) preferred the ADA side bar.

Mean Rating for Safety: Mean ratings for the location and style of grab bar to help with safe transfers and support staff to provide assistance were also calculated. On a 5 point scale where 1=strongly disagree and 5=strongly agree. both residents and staff gave consistently higher ratings to the individualized configuration (means ranged from 4.0 - 4.7) than to either the standard ADA configuration (means ranged from 3.2 - 3.8) or the bilateral ADA configuration (means ranged from 3.4 - 3.8).

The timing of this research was such that we were unable to make proposals for changes to ANSI on specifications for either Accessible or Type B units. Thus, at this time we are only looking to specifically alow bi-lateral fold-up grab bar as an alternative to providing side and back wall blocking in Type B units. We recognize that fold-up grab bars are not prohibited in Type B units, however, in some states because this option is not specifically defined, AHJs are relcutant to allow them to be installed during construction. Our goal is to make sure that bilateral fold up grab bars are an option in Group R4 buildings.

Cost Impact: Will not increase the cost of construction
As an option, owners may choose whether to install bilateral grab bars or reinforcement for rear and side grab bars, so there is no mandatory cost implication.

E 162-15 : 1107.6.4.2-CALKINS5450

E 163-15

1107.7.1.2

Proponent: David Collins, representing The American Institute of Architects (dcollins@preview-group.com)

2015 International Building Code

Revise as follows:

1107.7.1.2 Additional stories with Type B units. On ~~all other~~ stories ~~that have a building entrance~~with entrances not included in ~~proximity~~ determining compliance with Section 1107.7.1.1, that are proximate to arrival points intended to serve units on that *story*, as indicated in Items 1 and 2 below, all *dwelling units* and *sleeping units intended to be occupied as a residence* served by that entrance on that *story* shall be *Type B units*.

1. Where the slopes of the undisturbed *site* measured between the planned entrance and all vehicular or pedestrian arrival points within 50 feet (15 240 mm) of the planned entrance are 10 percent or less, and
2. Where the slopes of the planned finished grade measured between the entrance and all vehicular or pedestrian arrival points within 50 feet (15 240 mm) of the planned entrance are 10 percent or less.

Where ~~no such~~ arrival points are not within 50 feet (15 240 mm) of the entrance, the closest arrival point shall be used to determine access unless that arrival point serves the *story* required by Section 1107.7.1.1.

Reason: The contorted language in this section is difficult to follow and should be clarified. The code is trying to make it clear that more than one entrance may provide access, and each of those entrances may serve other stories. The criteria are then used to determine if the units that are on those other floors must have Type B units.

Cost Impact: Will not increase the cost of construction
The intent of the code change is to clarify how the various routes into a building are to be considered and does not change the technical requirements, and has not impact on the cost of construction.

E 163-15 : 1107.7.1.2-COLLINS4476

E 164-15

1109.2

Proponent: David Kulina, representing Engel Architects (david@engelarch.com)

2015 International Building Code

Revise as follows:

1109.2 Toilet and bathing facilities. Each toilet room and bathing room shall be *accessible*. Where a floor level is not required to be connected by an *accessible route*, the only toilet rooms or bathing rooms provided within the facility shall not be located on the inaccessible floor. Except as provided for in Sections 1109.2.2 and 1109.2.3, at least one of each type of fixture, element, control or dispenser in each accessible toilet room and bathing room shall be *accessible*.

Exceptions:

1. Toilet rooms or bathing rooms accessed only through a private office, not for *common* or *public use* and intended for use by a single occupant, shall be permitted to comply with the specific exceptions in ICC A117.1.
2. This section is not applicable to toilet and bathing rooms that serve *dwelling units* or *sleeping units* that are not required to be *accessible* by Section 1107.
3. Where multiple single-user toilet rooms or bathing rooms are clustered at a single location, at least 50 percent but not less than one room for each use at each cluster shall be *accessible*.
4. Where no more than one urinal is provided in a toilet room or bathing room, the urinal is not required to be *accessible*.
5. Toilet rooms or bathing rooms that are part of critical care or intensive care patient sleeping rooms serving *Accessible units* are not required to be *accessible*.
6. Toilet rooms or bathing rooms designed for bariatrics patients are not required to comply with the toilet room and bathing room requirement in ICC A117.1.The *sleeping units* served by bariatrics toilet or bathing rooms shall not count toward the required number of *Accessible sleeping units*.
7. Where toilet facilities are primarily for children's use, required *accessible* water closets, toilet compartments and lavatories shall be permitted to comply with children's provision of ICC A117.1.
8. <u>Toilet rooms or bathing rooms that serve only areas exempted by Section 1103.2 are not required to be accessible.</u>

Reason: Seciton 1103.2 has a list of areas that are exempted from accessibility requirements. Sometimes there are bathrooms provided for those spaces. For example, a toilet room in farm building (1103.2.4) or a guard tower or fire watch tower (1103.2.6). If the area or building is exempted from accessibility, then it is not logical to required these bathrooms have accessible features.

Cost Impact: Will not increase the cost of construction
There are no additional construction requirements.

E 164-15 : 1109.2-KULINA4559

E 165-15

1109.2.1.2

Proponent: Yafeng Cao, KTA Group, Peer Review Studio, representing self; Gene Boecker, representing Code Consultants, Inc. (geneb@codeconsultants.com)

2015 International Building Code

Revise as follows:

1109.2.1.2 Family or assisted-use toilet rooms. Family or assisted-use toilet rooms shall include only one water closet and only one lavatory. A family or assisted-use bathing room in accordance with Section 1109.2.1.3 shall be considered a family or assisted-use toilet room.

~~**Exception**~~**Exceptions:** Additional fixtures shall be permitted by one of the following:

1. A urinal is permitted to be provided in addition to the water closet in a family or assisted-use toilet room.
2. An additional child height water closet and child height lavatory is permittted in a family/assisted use toilet room.

Reason: CAO: ADAAG has envoled to include the building elements to cover children's dimensions. Some architects propose providing one adult water close and one children water closet in the same family or assited-use toilet room for private use but current IBC 1109.2.1.2 does not recognize it as "family or assisted-use toilet room" by limiting to only one water closet and only one lavatory.
Providing two types of water closets and lavatories, one type for adults and one type for children, in the same family/assisted-use toilet room is a higher level of accommodation and should be allowed and recognized.

In regard to the private use nature of the family or assited-use toilet rooms, the multiple water closets and lavatories should be counted as one in calculting the minimum number of plumbing fixture counting as stipulated in IBC 2902.1.

BOECKER: While the family or assisted-use toilet room is required because of the benefits to persons with disabilities and caregivers, the nature of "family" is that smaller children will also be present. The purpose of the "family" toilet room is to allow the parent the ability to use the facilty as well as the child. It is quite common to provide child sized fixtures in these rooms for mercantile and assembly occupancies as a benefit for patrons of the facility. The added langauge to the exception line makes it clear that the intent is to use only one of the two exceptions. Either a urinal can be added or the two child height fixtures can be added; but, not both.

Cost Impact: Will not increase the cost of construction
CAO: This is a design option.

BOECKER: The exception allows for an option which does not increase cost.

E 165-15 : 1109.2.1.2-CAO5431

E 166-15

1109.13

Proponent: Lawrence Lincoln, representing Utah Chapter of ICC (larry.lincoln@slcgov.com)

2015 International Building Code

Revise as follows:

1109.13 Controls, operating mechanisms and hardware. Controls, operating mechanisms and hardware intended for operation by the occupant, including switches that control lighting and ventilation and electrical convenience outlets, in *accessible* spaces, along *accessible routes* or as parts of *accessible* elements shall be *accessible*.

Exceptions:

1. Operable parts that are intended for use only by service or maintenance personnel shall not be required to be *accessible*.
2. Electrical or communication receptacles serving a dedicated use shall not be required to be *accessible*.
3. Where two or more outlets are provided in a kitchen above a length of counter top that is uninterrupted by a sink or appliance, only one outlet shall ~~not~~ be required to be *accessible*.
4. Floor electrical receptacles shall not be required to be *accessible*.
5. HVAC diffusers shall not be required to be *accessible*.
6. Except for light switches, where redundant controls are provided for a single element, one control in each space shall not be required to be *accessible*.
7. Access doors or gates in barrier walls and fences protecting pools, spas and hot tubs shall be permitted to comply with Section 1010.1.9.2.

Reason: The change is to provide clarity and positive code language.

Cost Impact: Will not increase the cost of construction
Will not increase the cost of construction.

E 166-15 : 1109.13-LINCOLN4784

E 167-15

202(New), 1109.15

Proponent: Stephen DiGiovanni, Clark County Building Department, representing Southern Nevada Chapter of ICC (sdigiovanni@clarkcountynv.gov)

2015 International Building Code

Revise as follows:

1109.15 Gaming machines and gaming tables. ~~Two~~ A minimum of two percent, but not less than one, of each gaming machine type ~~of~~and gaming table ~~provided~~type shall be *accessible* ~~and provided with a front approach.Two percent of~~. Where multiple gaming areas occur, accessible gaming machines ~~provided shall be *accessible*~~and ~~provided with a front approach. *Accessible*~~ gaming ~~machines~~tables shall be distributed throughout ~~the different types of gaming machines provided.~~.

Add new definitions as follows:

SECTION 202 DEFINITIONS

GAMING To deal, operate, carry on, conduct, maintain or expose for play any game played with cards, dice, equipment or any mechanical, electromechanical or electronic device or machine for money, property, checks, credit or any representative of value except wherein occurring at private home or as operated by a charitable or educational organization.

GAMING AREA. Single or multiple areas of a building or facility where gaming machines or tables are present and gaming occurs, including but not limited to: primary casino gaming areas, VIP gaming areas, high-roller gaming areas, bar-tops, lobbies, dedicated rooms or spaces such as in retail or restaurant establishments, sports books, tournament areas.

GAMING MACHINE TYPE. Categorization of gaming machines per type of game played on them, including, but not limited to; slot machines, video poker, video keno.

GAMING TABLE TYPE. Categorization of gaming tables per the type of gamw played on them, including, but are not limited to; baccarat, bingo, blackjack/21, craps, pai-gow, poker, roulette.

Reason: Similar language, having the effect of requiring a number of gaming machines and tables to be made accessible, was added to the 2015 IBC. That language is somewhat vague, and does not take into consideration the various gaming locations, designations, and needs of the local gaming industry. Therefore, it could be interpreted as broadly or narrowly as each plan-review agency deems necessary. The result could be a vast over-application of these provisions to every differing gaming machine type (ex: monopoly vs. wheel of fortune), which was never the original intent.
This proposed amendment is designed to narrow the requirements by noting additional factors, and not penalizing casinos having numerous styles of the same gaming machine type. Although most gaming throughout the United States occurs in larger casinos, there are some States where gaming occurs at smaller "non-casino" locations. These include, but are not limited to; bars, grocery stores, convenience stores and restaurants to name a few. This verbiage allows it to be scaled for both large and small venues, and be applied regardless of the type of venue where machines are present.

Additionally, the separation of a single large casino into multiple special use/access gaming areas is also considered. This proposed amendment takes into consideration these factors and requires distribution among gaming types and gaming areas to assure a reasonable level of access to a significant variety of gaming activities for all people.

The proposed amendment also considers the unique anthropometric design of most existing gaming machines, and provides a reasonable level of access that does not require a wholesale re-design of the machine itself. Essentially, by removing the requirement for "Front Approach" at these machines, the proposed considerations allow nearly all "upright-type" gaming machines to be considered accessible so long as they do not have a fixed chair or other obstruction in front of them. Conversely, gaming tables are pretty much standard throughout the country. Thus, no special consideration was needed with respect to their approach and clearance requirements.

As a practical matter, side approach access for the disabled is neither a dignified nor comfortable way to operate gaming machines for any length of playing time. By providing a front approach or front reach requirement to them, the player is now given the same integration as given all other players. This should allow for equal play time and comfort for a wider array of gaming patrons. When gaming tables are provided (i.e., black-jack, roulette, craps, poker), at least one of each type should be accessible to allow disable players access to each unique game type. This too should increase play time and provide increased comfort for all patrons.

The proposed definitions are added to better define & clarify the terms used within Section 1109.15. They are primarily taken from Nevada Revised Statutes Chapter 463 (Sections NRS 463.0152 through NRS 463.01595) which are viewed to be the pre-eminent model for gaming control and management systems used throughout the world.

Cost Impact: Will not increase the cost of construction
This proposal will make the accessibility requirements of gaming machines and tables easier to achieve, and therefore will not increase construction costs.

E 167-15 : 1109.15-DIGIOVANNI3850

E 168-15

1110.4.13 (New)

Proponent: Edward Kulik, Chair, representing Building Code Action Committee (bcac@iccsafe.org)

2015 International Building Code

Add new text as follows:

1110.4.13 Play Areas. Play areas containing play components designed and constructed for children shall be located on an accessible route.

Reason: This proposal only requires an accessible route to play areas. A similar proposal (E251-12) was submitted last cycle as part of the coordination between the ADA recreational requirements and the IBC. Part of the reason that this proposal was disapproved last cycle was that the code officials felt that they did not want to review the requirements for play components, thus this revised proposal addresses that issue by only requiring an accessible route to the play area.
In July/2014 the ICC Board decided to sunset the activities of the Code Technology Committee (CTC). This is being accomplished by re-assigning many of the CTC Areas of Study to the applicable Code Action Committee (CAC). This proposal falls under the CTC Area of Study entitled IBC Coordination with the New ADAAG. Information on the CTC, including: the sunset plan; meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the CTC website.http://www.iccsafe.org/cs/CTC/Pages/default.aspx

This public proposal is submitted by the ICC Building Code Action Committee (BCAC). The BCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the BCAC has held 13 open meetings and numerous workgroup calls which included members of the BCAC as well as any interested party to discuss and debate the proposed changes and the public comments. Related documentation and reports are posted on the BCAC website at: http://www.iccsafe.org/cs/BCAC/Pages/default.aspx.

Cost Impact: Will not increase the cost of construction
Playgrounds are recreational facilities; therefore an accessible route to a playground is already required by code. An accessible route to playgrounds is a federal requirement under ADA. Therefore, there is no impact on the cost of construction.

E 168-15 : 1110.4.13 (New)-KULIK3341

E 169-15

1111.1

Proponent: Gene Boecker, representing Code Consultants, Inc. (geneb@codeconsultants.com)

2015 International Building Code

Revise as follows:

1111.1 Signs. Required *accessible* elements shall be identified by the International Symbol of Accessibility at the following locations.

1. *Accessible* parking spaces required by Section 1106.1.
   Exception: Where the total number of parking spaces provided is four or less, identification of *accessible* parking spaces is not required.
2. *Accessible* parking spaces required by Section 1106.2.
   Exception: In Group I-1, R-2, R-3 and R-4 facilities, where parking spaces are assigned to specific *dwelling units* or *sleeping units*, identification of *accessible* parking spaces is not required.
3. *Accessible* passenger loading zones.
4. *Accessible* rooms where multiple single-user toilet or bathing rooms are clustered at a single location.
5. *Accessible* entrances where not all entrances are *accessible*.
6. *Accessible* check-out aisles where not all aisles are *accessible*. The sign, where provided, shall be above the check-out aisle in the same location as the checkout aisle number or type of check-out identification.
7. Family or assisted-use toilet and bathing rooms.
8. *Accessible* dressing, fitting and locker rooms where not all such rooms are *accessible*.
9. *Accessible* areas of refuge in accordance with Section 1009.9.
10. Exterior areas for assisted rescue in accordance with Section 1009.9.
11. In recreational facilities, lockers that are required to be *accessible* in accordance with Section 1109.9.
12. <u>Accessible lavatories and sinks where lavatories or sinks are provided in clusters and not all are accessible.</u>

Reason: The code only requires a single lavatory in a group toilet room to be accessible and only five percent (5%) of sinks to be acessible. This means that one lavatory could be mounted at the proper height with proper toe and knee clearances and compliant pipe protection while the rest might be mounted at the proper height but without toe and knee clearances; or, more critically, without pipe protection. In some cases, due to the nature of the design, it may not be possible to know which of these are fully accessible without crawling under the counter to look; an action which is not likely for individuals who use wheelchairs. This could pose a risk to the unaware individual using the lavatory that does not fully comply. The proposal would provide adeqaute notification for those who need to know which lavatories and/or sinks are fully compliant.

Cost Impact: Will increase the cost of construction
The additional cost is the minimal cost of a sticker or sign with the International Symbol of Accessibility.

E 169-15 : 1111.1-BOECKER5536

IBC Structural Code Change Proposals

The following code change proposals are labeled as structural code change proposals because they are proposals for changes to sections in chapters of the International Building Code that are designated as the responsibility of the IBC-Structural Code Development Committee (see page xvi of the Introductory pages of this monograph), which meets in the Group B cycle in 2016. However the changes included in this Group A code development cycle are to sections of the code that have been prefaced with a [BF] or [BG], meaning that they are the responsibility of a different IBC Code Development Committee—either the IBC-Fire Safety Committee [BF] or the IBC-General Committee [BG].

The committee assigned for each code change proposal is indicated in a banner statement near the beginning of the proposal. Both the IBC-Fire Safety and the IBC-General hearing orders are include here for your reference.

TENTATIVE ORDER OF DISCUSSION
2015 PROPOSED CHANGES TO THE INTERNATIONAL BUILDING CODE (FIRE SAFETY)

The following is the tentative order in which the proposed changes to the code will be discussed at the public hearings. Proposed changes which impact the same subject have been grouped to permit consideration in consecutive changes.

Proposed change numbers that are indented are those which are being heard out of numerical order. Indentation does not necessarily indicate that one change is related to another. Proposed changes may be grouped for purposes of discussion at the hearing at the discretion of the chair. Note that some FS code change proposals may not be included on this list, as they are being heard by another committee.

S 1-15

[BF] 1505.10

Proponent: Jason Wilen, National Roofing Contractors Association (NRCA), representing National Roofing Contractors Association (NRCA) (jwilen@nrca.net)

THIS CODE CHANGE WILL BE HEARD BY THE IBC-FIRE SAFETY COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THIS COMMITTEE.

2015 International Building Code

Revise as follows:

[BF] 1505.10 Roof gardens and landscaped roofs. Roof gardens and landscaped roofs shall comply with Section 1505.1, Section 1507.16 and shall be installed in accordance with ANSI/SPRI VF-1.

Reason: The purpose of this code change is to clarify the intent of the code. As written, Section 1505.10 could be interpreted as an exception to the other parts of Section 1505. The proposed change clarifies the fire classification requirements in Section 1505 apply to roof gardens and landscaped roofs.

Cost Impact: Will not increase the cost of construction
The proposed change is a clarification and does not change the stringency of existing code requirements so the cost of construction will be unchanged.

S 1-15 : [BF] 1505.10-WILEN4791

S 2-15

[BF] 1505.9, Chapter 35

Proponent: Jonathan Roberts, UL LLC, representing UL LLC (jonathan.roberts@ul.com)

THIS CODE CHANGE WILL BE HEARD BY THE IBC-FIRE SAFETY COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THIS COMMITTEE.

2015 International Building Code

Revise as follows:

[BF] 1505.9 **~~Photovoltaic panels and modules.~~**<u>**Rooftop mounted photovoltaic panel systems**</u> Rooftop-mounted *photovoltaic panel systems* shall be tested, *listed* and identified with a fire classification in accordance with UL 1703 <u>or UL 2703</u>. The fire classification shall comply with Table 1505.1 based on the type of construction of the building.

Add new standard(s) as follows:

<u>UL 2703-14, Mounting Systems, Mounting Devices, Clamping/Retention Devices, and Ground Lugs for Use with Flat-Plate Photovoltaic Modules and Panels</u>

Reason: The position of the photovoltaic panels, as well as the slope of the roof, are critical factors in determining the fire classification of a photovoltaic panel system. The position of the photovoltaic panels is established by the racking system. Thus, the testing for photovoltaic panel systems are covered in both UL 1703 and UL 2703. The new UL 2703 standard, which is an ANSI consensus standard, provides the test method for testing multiple panels for each racking system. Either standard can be used to establish a fire classification of the photovoltaic panel system.

Cost Impact: Will not increase the cost of construction
This will provide another method to test photovoltaic systems for fire classification.

Analysis: A review of the standard proposed for inclusion in the code, UL 2703, with regard to the ICC criteria for refrenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2015.

S 2-15 : [BF] 1505.9-ROBERTS4109

S 3-15

[BF] 1508.1.1, Table [BF] 1508.2

Proponent: Jason Wilen, National Roofing Contractors Association (NRCA), representing National Roofing Contractors Association (NRCA) (jwilen@nrca.net)

THIS CODE CHANGE WILL BE HEARD BY THE IBC-FIRE SAFETY COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THIS COMMITTEE.

2015 International Building Code

Delete without substitution:

~~**[BF] 1508.1.1 Cellulosic fiberboard.** Cellulosic fiberboard roof insulation shall conform to the material and installation requirements of Chapter 23.~~

Revise as follows:

TABLE [BF] 1508.2
MATERIAL STANDARDS FOR ROOF INSULATION

Cellular glass board	ASTM C 552
Composite boards	ASTM C 1289, Type III, IV, V or VI
Expanded polystyrene	ASTM C 578
Extruded polystyrene	ASTM C 578
Fiber-reinforced gypsum board	ASTM C 1278
Glass-faced gypsum board	ASTM C 1177
Mineral fiber insulation board	ASTM C 726
Perlite board	ASTM C 728
Polyisocyanurate board	ASTM C 1289, Type I or II
Wood fiberboard	ASTM C 208, Type II

Reason: The purpose of this code change is to clarify the intent of the code and to remove redundancy. As written, Section 1508.1.1 is a pointer to Chapter 23. Information in Chapter 23 related to wood fiberboard roof insulation is redundant to information already in Chapter 15 so the pointer does not serve a useful purpose.
Further, the title of section 1508.1.1 is potentially confusing because the term "cellulosic fiberboard" is used while the term "wood fiberboard" is used in Table 1508.2. This change eliminates the lesser used of the two terms to describe the same material.

Lastly, "Type II" is added to the ASTM C208 reference for wood fiberboard in Table 1508.2. Of the six types of wood fiberboard addressed in ASTM C208, only Type II is used for roof insulation.

Cost Impact: Will not increase the cost of construction
The proposed change is a clarification and does not change the stringency of existing code requirements so the cost of construction will be unchanged.

S 3-15 : [BF] 1508.1.1-WILEN4862

S 4-15

Table [BF] 1508.2

Proponent: Jason Wilen, National Roofing Contractors Association (NRCA), representing National Roofing Contractors Association (NRCA) (jwilen@nrca.net)

THIS CODE CHANGE WILL BE HEARD BY THE IBC-FIRE SAFETY COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THIS COMMITTEE.

2015 International Building Code

Revise as follows:

TABLE [BF] 1508.2
MATERIAL STANDARDS FOR ROOF INSULATION

Cellular glass board	ASTM C 552
Composite boards	ASTM C 1289, Type III, IV, V or ~~VI~~VII
Expanded polystyrene	ASTM C 578
Extruded polystyrene	ASTM C 578
Fiber-reinforced gypsum board	ASTM C 1278
Glass-faced gypsum board	ASTM C 1177
Mineral fiber insulation board	ASTM C 726
Perlite board	ASTM C 728
Polyisocyanurate board	ASTM C 1289, Type I or II
Wood fiberboard	ASTM C 208

Reason: The purpose of this change is to update the type designations listed for the ASTM standard currently referenced in the code for composite board roof insulation. ASTM C1289-13E1 is referenced. As part of the 13E1 edition, Type VI was removed and Type VII was added. The proposed change strikes the outdated "Type VI" and adds the new "Type VII".

Cost Impact: Will not increase the cost of construction
The proposed change is a clarification and does not change the stringency of existing code requirements so the cost of construction will be unchanged.

S 4-15 : TABLE [BF] 1508.2-WILEN4793

S 5-15

Table [BF] 1508.2

Proponent: Jason Wilen, National Roofing Contractors Association (NRCA), representing National Roofing Contractors Association (NRCA) (jwilen@nrca.net)

THIS CODE CHANGE WILL BE HEARD BY THE IBC-FIRE SAFETY COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THIS COMMITTEE.

2015 International Building Code

Revise as follows:

TABLE [BF] 1508.2
MATERIAL STANDARDS FOR ROOF INSULATION

Cellular glass board	ASTM C 552
Composite boards	ASTM C 1289, Type III, IV, V or VI
Expanded polystyrene	ASTM C 578
Extruded polystyrene	ASTM C 578
Fiber-reinforced gypsum board	ASTM C 1278
Glass-faced gypsum board	ASTM C 1177
Mineral fiber insulation board	ASTM C 726
Perlite board	ASTM C 728
Polyisocyanurate board	ASTM C 1289, Type ~~I or~~ II
Wood fiberboard	ASTM C 208

Reason: The purpose of this change is to update the type designations listed for the ASTM standard currently referenced in the code for polyisocyanurate board roof insulation. ASTM C1289 is referenced and Types I and II are currently listed in Table 1508.2. The proposal removes the Type I (aluminum foil-faced) reference from Table 1508.2 because Type I is not used for roofing applications.

Cost Impact: Will not increase the cost of construction
The proposed change is a clarification and does not change the stringency of existing code requirements so the cost of construction will be unchanged.

S 5-15 : TABLE [BF] 1508.2-WILEN4870

S 6-15

Table [BF] 1508.2

Proponent: Jason Wilen, National Roofing Contractors Association (NRCA), representing National Roofing Contractors Association (NRCA) (jwilen@nrca.net)

THIS CODE CHANGE WILL BE HEARD BY THE IBC-FIRE SAFETY COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THIS COMMITTEE.

2015 International Building Code

Revise as follows:

TABLE [BF] 1508.2
MATERIAL STANDARDS FOR ROOF INSULATION

Cellular glass board	ASTM C 552
Composite boards	ASTM C 1289, Type III, IV, V or VI
Expanded polystyrene	ASTM C 578
Extruded polystyrene	ASTM C 578
Fiber-reinforced gypsum board	ASTM C 1278
Glass-faced gypsum board	ASTM C 1177
<u>High-density polyisocyanurate board</u>	<u>ASTM C1289, Type II, Class 4</u>
Mineral fiber insulation board	ASTM C 726
Perlite board	ASTM C 728
Polyisocyanurate board	ASTM C 1289, Type I or II
Wood fiberboard	ASTM C 208

Reason: The purpose of this change is to add a listing for high-density polyisocyanurate board roof insulation in Table 1508.2. As part of the 13E1 edition of ASTM C1289 (already included in IBC), Type II, Class 4 was added to the standard to address high-density polyisocyanurate board roof insulation.

Cost Impact: Will not increase the cost of construction
The proposed change is a clarification and does not change the stringency of existing code requirements so the cost of construction will be unchanged.

S 6-15 : TABLE [BF] 1508.2-WILEN4874

S 7-15

1510.1.1 (New), [BG] 1510.2.1, [BG] 1510.2.2, [BG] 1510.2.3

Proponent: Maureen Traxler, representing Washington Association of Building Officials Technical Code Development Committee (maureen.traxler@seattle.gov)

THIS CODE CHANGE WILL BE HEARD BY THE IBC-GENERAL COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THIS COMMITTEE.

2015 International Building Code

Add new text as follows:

1510.1.1 Area limitation. The aggregate area of penthouses and other enclosed rooftop structures shall not exceed one-third the area of the supporting roof deck. Such penthouses and other enclosed rooftop structures shall not be required to be included in determining the building area or number of stories as regulated by Section 503.1. The area of such penthouses shall not be included in determining the fire area specified in Section 901.7.

Revise as follows:

[BG] 1510.2.1 Height above roof deck. Penthouses constructed on buildings of other than Type I construction shall not exceed 18 feet (5486 mm) in height above the roof deck as measured to the average height of the roof of the penthouse. Penthouses located on the roof of buildings of Type I construction shall not be limited in height.

~~Exceptions~~Exception:

1. Where used to enclose tanks or elevators that travel to the roof level, penthouses shall be permitted to have a maximum height of 28 feet (8534 mm) above the roof deck.

~~2. Penthouses located on the roof of buildings of Type I construction shall not be limited in height.~~

Delete without substitution:

~~**[BG] 1510.2.2 Area limitation.** The aggregate area of penthouses and other enclosed rooftop structures shall not exceed one-third the area of the supporting roof deck. Such penthouses and other enclosed rooftop structures shall not be required to be included in determining the building area or number of stories as regulated by Section 503.1. The area of such penthouses shall not be included in determining the fire area specified in Section 901.7.~~

Revise as follows:

[BG] 1510.2.3 Use limitations. Penthouses shall not be used for purposes other than the shelter of mechanical or electrical equipment, tanks, elevators and related machinery, or vertical shaft openings in the roof assembly.

Reason: This proposal reorganizes the provisions for penthouses. Section 1510.2.2 is relocated to 1510.1 because it applies to all enclosed rooftop structures, and shouldn't be located in the subsection that applies only to penthouses. In Section 1510.2.1, exception 2 is relocated to the charging paragraph because it is actually a separate technical requirement and not an exception to the charging paragraph. The phrase "elevators and related machinery" is added in Section 1510.2.3 because it is part of the definition of "penthouse." Penthouses are commonly used to shelter rooftop elevator equipment and shouldn't be prohibited by Section 1510.

Cost Impact: Will not increase the cost of construction
This proposal will not increase the cost of construction.

S 7-15 : [BG] 1510.1-TRAXLER4259

S 8-15

[BG] 1510.6.2

Proponent: Christopher Born, Clark Nexsen, Inc., representing Self (cborn@clarknexsen.com)

THIS CODE CHANGE WILL BE HEARD BY THE IBC-GENERAL COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THIS COMMITTEE.

2015 International Building Code

Revise as follows:

[BG] 1510.6.2 Type I, II, III and IV construction. Regardless of the requirements in Section 1510.6, *mechanical equipment screens* that are located on the roof decks of buildings of Type I, II, III or IV construction shall be permitted to be constructed of combustible materials in accordance with any one of the following limitations:

1. The fire separation distance shall be not less than 20 feet (6096 mm) and the height of the *mechanical equipment screen* above the roof deck shall not exceed 4 feet (1219 mm) as measured to the highest point on the *mechanical equipment screen*.
2. The fire separation distance shall be not less than 20 feet (6096 mm) and the *mechanical equipment screen* is used for concealment of telecommunications equipment above the building roofline.
3. The fire separation distance shall be not less than 20 feet (6096 mm) and the *mechanical equipment screen* shall be constructed of fire-retardant-treated wood complying with Section 2303.2 for exterior installation.
4. Where exterior wall covering panels are used, the panels shall have a flame spread index of 25 or less when tested in the minimum and maximum thicknesses intended for use, with each face tested independently in accordance with ASTM E 84 or UL 723. The panels shall be tested in the minimum and maximum thicknesses intended for use in accordance with, and shall comply with the acceptance criteria of, NFPA 285 and shall be installed as tested. Where the panels are tested as part of an exterior wall assembly in accordance with NFPA 285, the panels shall be installed on the face of the *mechanical equipment screen* supporting structure in the same manner as they were installed on the tested exterior wall assembly.

Reason: Screen walls have been used in numerous instances in recent years to conceal telecommunications equipment such as antennas. In order to allow transmission of the appropriate frequencies, currently available concealments or screens are of combustible material. Typically these screens consist of a foam plastic core such as polystyrene with a hard plastic skin surrounding the core. These are also often of a custom graphic design to mimic the appearance of the building they are installed on, e.g., replicate brick patterns, colors, etc.
No known noncombustible material exists that provides sufficient transmissibility of an acceptable signal strength. Although some manufacturers offer a "fire resistive" product, these materials have not been tested to NFPA 285 as indicated by the current item 3 under this section. Additionally these products do not meet the "letter" of the requirements of Chapter 26 for installation of plastic materials, even if considered to be light transmittiung plastics (these panels are specifically designed to transmission a portion of the electromagnetic spectrum) because they have not been tested as an assembly.

The author is aware of no documented loss history from these products. As these products are above the roof of the building, even if they do ignite they pose minimal risk to the structure or occupants. Additionally, by requiring a minimum fire separation distance identical to that called for under several related provisions, protection from radiant fire exposure is afforded to adjacent properties.

Cost Impact: Will not increase the cost of construction
Installation of these products is generally of a voluntary nature, although some zoning boards or similar bodies may not allow telecommunications installations without some means of visually screening the equipment. Note that this provision is not intended to mandate the installation of these screens, but rather to create a code option that allows their use.

S 8-15 : [BG] 1510.6.2-BORN4795

S 9-15

[BG] 1510.7.3

Proponent: Maureen Traxler, City of Seattle, representing Seattle Dept of Planning & Development (maureen.traxler@seattle.gov)

THIS CODE CHANGE WILL BE HEARD BY THE IBC-GENERAL COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THIS COMMITTEE.

2015 International Building Code

Delete without substitution:

~~**[BG] 1510.7.3 Installation.** Rooftop-mounted *photovoltaic panels* and *modules* shall be installed in accordance with the manufacturer's instructions.~~

Reason: Section 1510.7.3 is redundant with Section 1510.7.4.

Cost Impact: Will not increase the cost of construction
Deleting redundant text will have no impact on the cost of construction.

S 9-15 : [BG] 1510.7.3-TRAXLER3414

S 10-15

[BF] 1705.17

Proponent: Anthony Apfelbeck, City of Altamonte Springs, representing City of Altamonte Springs (ACApfelbeck@altamonte.org)

THIS CODE CHANGE WILL BE HEARD BY THE IBC-FIRE SAFETY COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THIS COMMITTEE.

2015 International Building Code

Revise as follows:

[BF] 1705.17 Fire-resistant penetrations and joints. In *high-rise buildings*, buildings greater than 2 stories that are not protected by an automatic sprinkler system or in buildings assigned to *Risk Category* III or IV, *special inspections* for *through-penetrations*, membrane penetration firestops, *fire-resistant joint systems* and perimeter fire barrier systems that are tested and *listed* in accordance with Sections 714.3.1.2, 714.4.2, 715.3_ and 715.4 shall be in accordance with Section 1705.17.1 or 1705.17.2.

Reason: In buildings that are not protected by an automatic fire sprinkler system, there is 100% reliance on the passive fire protection elements to contain a fire to the compartment of origin and to ensure it does not impede the means of egress. Penetration and joint systems are critical elements in order to maintain the fire resistive integrity of a building. They take on an even greater importance when balanced fire protection is not provided and sole reliance is placed on the passive systems. The code already recognizes high-rise buildings as high risk which mandates this level of special inspection. On a risk basic, a low rise (3-7 story) non-fire sprinkler protected building poses a much greater risk to the occupants, firefighters and contents than a high-rise building which is mandated to be protected with fire sprinklers.

Cost Impact: Will increase the cost of construction
This proposal will increase the cost of construction for low-rise non-fire sprinkler protected buildings due to the application 1705.16 requiring special inspections of penetrations and joints.

TENTATIVE ORDER OF DISCUSSION 2015 PROPOSED CHANGES TO THE INTERNATIONAL EXISTING BUILDING CODE

The following is the tentative order in which the proposed changes to the code will be discussed at the public hearings. Proposed changes which impact the same subject have been grouped to permit consideration in consecutive changes.

Proposed change numbers that are indented are those which are being heard out of numerical order. Indentation does not necessarily indicate that one change is related to another. Proposed changes may be grouped for purposes of discussion at the hearing at the discretion of the chair. Note that some EB code change proposals may not be included on this list, as they are being heard by another committee.

[A] 101.4.2, 301.1.1, 301.1.3, 301.1.2, 1301.2, 1401.3.2

Proponent: Edward Kulik, Chair, representing Building Code Action Committee (bcac@iccsafe.org)

2015 International Existing Building Code

Revise as follows:

[A] 101.4.2 Buildings previously occupied. The legal occupancy of any building existing on the date of adoption of this code shall be permitted to continue without change, except as is specifically covered in this code, the retroactive and maintenance provisions of the *International Fire Code*, or the *International Property Maintenance Code*, or as is deemed necessary by the *code official* for the general safety and welfare of the occupants and the public.

301.1.1 Prescriptive compliance method. *Repairs*, *alterations*, *additions* and *changes of occupancy* complying with Chapter 4 of this code ~~in buildings~~, and complying with the retroactive and maintenance provisions of the *International Fire Code* shall be considered in compliance with the provisions of this code.

301.1.3 Performance compliance method. *Repairs*, *alterations*, *additions*, changes in occupancy and relocated buildings complying with Chapter 14 of this code, and complying with the retroactive and maintenance provisions of the *International Fire Code* shall be considered in compliance with the provisions of this code.

301.1.2 Work area compliance method. *Repairs*, *alterations, additions*, changes in occupancy and relocated buildings complying with the applicable requirements of Chapters 5 through 13 of this code, and complying with the retroactive and maintenance provisions of the *International Fire Code* shall be considered in compliance with the provisions of this code.

1301.2 Conformance. The building shall be safe for human occupancy as determined by the retroactive and maintenance provisions of the *International Fire Code* and the *International Property Maintenance Code*. Any *repair*, *alteration*, or *change of occupancy* undertaken within the moved structure shall comply with the requirements of this code applicable to the work being performed. Any field-fabricated elements shall comply with the requirements of the *International Building Code* or the *International Residential Code* as applicable.

1401.3.2 Compliance with other codes. Buildings that are evaluated in accordance with this section shall comply with the retroactive and maintenance provisions of the *International Fire Code* and *International Property Maintenance Code*.

Reason: This proposal is intended to clarify the intended scope of the reference to the IFC. The IFC has many roles that address new construction, retroactive construction requirements, maintenance and operational requirements. The sections addressed in this proposal are believed to focus primarily on provisions related to maintenance and retroactive provisions minimally. The IEBC itself will address what is intended to be addressed as far as further construction provisions. This is really meant as a clarification. A reference to the IFC in general should lead users to Chapter 1 which would, in Section 102 should explain how the reference is intended to be applied but this is sometimes misinterpreted.
Currently, the general reference to the IFC as in Section 1401.3.2 is sometimes interpreted as meaning the entire fire code thus negating the scoring methods benefits. Compliance in full with the new construction requirements of IFC Chapters 9 and 10 would require most aspects of fire protection and egress to be upgraded regardless of the score the current building would obtain. This was not the intent of the reference to the IFC.

This public proposal is submitted by the ICC Building Code Action Committee (BCAC). The BCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the BCAC has held 13 open meetings and numerous workgroup calls which included members of the BCAC as well as any interested party to discuss and debate the proposed changes and the public comments. Related documentation and reports are posted on the BCAC website at: http://www.iccsafe.org/cs/BCAC/Pages/default.aspx.

Cost Impact: Will not increase the cost of construction
This proposal will not increase the cost of construction as these revisions will simply clarify that the IEBC was only intended to reference the IFC for retroactive and maintenance provisions. Therefore the level of applicability of the IFC will not change.

Proponent: Maureen Traxler, City of Seattle, representing City of Seattle Dept of Planning & Development (maureen.traxler@seattle.gov)

2015 International Existing Building Code

Revise as follows:

[A] 104.2.1 Determination of substantially improved or substantially damaged existing buildings and structures in flood hazard areas. For applications for reconstruction, rehabilitation, repair, alteration, addition or other improvement of existing buildings or structures located in flood hazard areas, the building official shall determine where the proposed work constitutes substantial improvement or repair of substantial damage. Where the building official determines that the proposed work constitutes substantial improvement or repair of substantial damage, and where required by this code, the ~~building~~code official shall require the building to meet the requirements of Section 1612 of the *International Building Code*.

302.3 Existing materials. Materials already in use in a building in compliance with requirements or approvals in effect at the time of their erection or installation shall be permitted to remain in use unless determined by the ~~building~~code official to be unsafe.

401.2.1 Existing materials. Materials already in use in a building in compliance with requirements or approvals in effect at the time of their erection or installation shall be permitted to remain in use unless determined by the ~~building~~code official to be unsafe per Section 115.

401.3 Dangerous conditions. The ~~building~~code official shall have the authority to require the elimination of conditions deemed *dangerous*.

[BS] 404.2.1 Evaluation. The building shall be evaluated by a *registered design professional*, and the evaluation findings shall be submitted to the ~~*building official*~~code *official*. The evaluation shall establish whether the damaged building, if repaired to its predamage state, would comply with the provisions of the *International Building Code* for wind and earthquake loads.

Wind loads for this evaluation shall be those prescribed in Section 1609 of the *International Building Code*. Earthquake loads for this evaluation, if required, shall be permitted to be 75 percent of those prescribed in Section 1613 of the *International Building Code*. Alternatively, compliance with ASCE 41, using the performance objective in Table 301.1.4.2 for the applicable risk category, shall be deemed to meet the earthquake evaluation requirement.

407.1 Conformance. No change shall be made in the use or occupancy of any building unless such building is made to comply with the requirements of the *International Building Code* for the use or occupancy. Changes in use or occupancy in a building or portion thereof shall be such that the existing building is no less complying with the provisions of this code than the existing building or structure was prior to the change. Subject to the approval of the ~~building~~code official, the use or occupancy of *existing buildings* shall be permitted to be changed and the building is allowed to be occupied for purposes in other groups without conforming to all of the requirements of this code for those groups, provided the new or proposed use is less hazardous, based on life and fire risk, than the existing use.

Exception: The building need not be made to comply with the seismic requirements for a new structure unless required by Section 407.4.

407.1.1 Change in the character of use. A change in occupancy with no change of occupancy classification shall not be made to any structure that will subject the structure to any special provisions of the applicable *International Codes*, without approval of the ~~*building official*~~code *official*. Compliance shall be only as necessary to meet the specific provisions and is not intended to require the entire building be brought into compliance.

408.2 Life safety hazards. The provisions of this code shall apply to historic buildings judged by the ~~building~~code official to constitute a distinct life safety hazard.

[BS] A106.2 Existing materials. Existing materials used as part of the required vertical load-carrying or lateral forceresisting system shall be in sound condition, or shall be repaired or removed and replaced with new materials. All other unreinforced masonry materials shall comply with the following requirements:

1. The lay-up of the masonry units shall comply with Section A106.3.2, and the quality of bond between the units has been verified to the satisfaction of the building official;
2. Concrete masonry units are verified to be load-bearing units complying with ASTM C 90 or such other standard as is acceptable to the ~~building~~ code official; and
3. The compressive strength of plain concrete walls shall be determined based on cores taken from each class of concrete wall. The location and number of tests shall be the same as those prescribed for tensile-splitting strength tests in Sections A106.3.3.3 and A106.3.3.4, or in Section A108.1.

The use of materials not specified herein or in Section A108.1 shall be based on substantiating research data or engineering judgment, with the approval of the ~~building~~ code official.

[BS] A107.1 Pointing. Preparation and mortar pointing shall be performed with special inspection.

Exception: At the discretion of the ~~building~~ code official, incidental pointing may be performed without special inspection.

[BS] A108.1 Values.

1. Strength values for existing materials are given in Table A1-D and for new materials in Table A1-E.
2. Capacity reduction factors need not be used.
3. The use of new materials not specified herein shall be based on substantiating research data or engineering judgment, with the approval of the ~~building~~ code official.

[BS] A113.7 Veneer.

1. Veneer shall be anchored with approved anchor ties conforming to the required design capacity specified in the building code and shall be placed at a maximum spacing of 24 inches (610 mm) with a maximum supported area of 4 square feet (0.372 m^2).

   Exception: Existing anchor ties for attaching brick veneer to brick backing may be acceptable, provided the ties are in good condition and conform to the following minimum size and material requirements.

   Existing veneer anchor ties may be considered adequate if they are of corrugated galvanized iron strips not less than 1 inch (25 mm) in width, 8 inches (203 mm) in length and $^1/_{16}$ inch (1.6 mm) in thickness, or the equivalent.
2. The location and condition of existing veneer anchor ties shall be verified as follows:
   2.1. An approved testing laboratory shall verify the location and spacing of the ties and shall submit a report to the ~~building~~ code official for approval as part of the structural analysis.
   2.2. The veneer in a selected area shall be removed to expose a representative sample of ties (not less than four) for inspection by the ~~building~~ code official.

[BS] A206.2 Special requirements for wall anchorage systems. The steel elements of the wall anchorage system shall be designed in accordance with the building code without the use of the 1.33 short duration allowable stress increase when using allowable stress design.

Wall anchors shall be provided to resist out-of-plane forces, independent of existing shear anchors.

Exception: Existing cast-in-place shear anchors are allowed to be used as wall anchors if the tie element can be readily attached to the anchors, and if the engineer or architect can establish tension values for the existing anchors through the use of approved as-built plans or testing and through analysis showing that the bolts are capable of resisting the total shear load (including dead load) while being acted upon by the maximum tension force due to an earthquake. Criteria for analysis and testing shall be determined by the ~~building~~ code official.

Expansion anchors are only allowed with special inspection and approved testing for seismic loading.

Attaching the edge of plywood sheathing to steel ledgers is not considered compliant with the positive anchoring requirements of this chapter. Attaching the edge of steel decks to steel ledgers is not considered as providing the positive anchorage of this chapter unless testing and/or analysis are performed to establish shear values for the attachment perpendicular to the edge of the deck. Where steel decking is used as a wall anchor system, the existing connections shall be subject to field verification and the new connections shall be subject to special inspection.

[BS] A505.1 General. Structures conforming to the requirements of the ASCE 41 Chapter 4, Screening Phase, are permitted to be shown to be in conformance to this chapter by submission of a report to the ~~building~~ code official, as described in this section.

Reason: The IEBC defines the term "code official" but it then uses both "building official" and "code official." Both terms are used in other International codes, but none of the codes uses both. "Code official" is more appropriate for the IEBC because the IEBC addresses more than Building Code issues. It includes mechanical sections—the IMC uses the term "code official." It includes plumbing sections—the IPC uses the term "code official." The term "code official" is defined in Chapter 2, and is the more general term.
Note that Figure A3-1 and A3-2 also contain the term "building official" and should also be revised to "code official." The figures could not be added to the proposal.

Cost Impact: Will not increase the cost of construction
This is an editorial change that will not affect the cost of construction.

Staff Note: Figures A3-1 and A3-2 will be revised to use the term "code official" in place of "building official" if this code change is approved based upon the intent of this proposal as noted in the proponents reason statement.

EB 2-15 : 302.3-TRAXLER3299

EB 3-15

202 (New), 501.2.1 (New)

Proponent: Aaron Wilson, representing Associated Design Partners (awilson@adpengineering.com)

2015 International Existing Building Code

Add new definition as follows:

SECTION 202 DEFINITIONS

DAMAGE. Physical distortion or deterioration to any building element, component, or system due to sudden and accidental events or progressive wear and tear, such that the element, component, or system requires either removal and replacement or repair.

Add new text as follows:

501.2.1 Reconfiguration of space. Where determining what portions of the building are part of the work area, the reconfigured space shall include the rearrangement or relocation of interior and exterior; walls, floors, ceilings, and roofs, where the spacial volume of any habitable spaces is changed by more the 5%.

Exceptions:

1. The alteration or expansion of electrical and mechanical systems incidental to, and within the renovation work scope, required for compliance to this code, provided that the expansion serves the same purpose as the previous system without inclusion of new equipment and fixtures not required for compliance to this code.
2. Changing the size of existing windows and doors for purposes of improving means of egress and compliance with this code.

Reason: For improved clarity of what is considered damage and what is considered a reconfiguration of space.

Cost Impact: Will not increase the cost of construction
This proposed code change (added definition) will not increase the cost of construction. It will add clarity, avoid confusion and not make incidental code upgrades push a repair project into an alteration Level 2 classification. The 5% volume alteration clause will allow minor code mandated alterations without triggering a reconfiguration of space. Example, replacing 1/2" GWB with one or even two layers of 5/8" fire rated GWB over a 1" layer of rigid foam insulation needed for improved fire rating and improved insulation performance, should be allowed without being construed by some Architects and CEO as a reconfiguration and thus an alteration level 2 or 3.

EB 3-15 : 202-DAMAGE (New)-WILSON5704

EB 4-15

202 (New)

Proponent: Maureen Traxler, representing Seattle Dept of Planning & Development (maureen.traxler@seattle.gov)

2015 International Existing Building Code

Revise as follows:

SECTION 202 DEFINITIONS

[A] EXISTING BUILDING. A building erected prior to the date of adoption of the appropriate code, or one for which a legal building permit has been issued.

Add new text as follows:

[A] EXISTING STRUCTURE A structure erected prior to the date of adoption of the appropriate code, or one for which a legal building permit has been issued. For application of provisions in flood hazard areas, an existing structure is any building or structure for which the start of construction commenced before the effective date of the community's first flood plain management code, ordinance or standard.

Reason: Reason: The IEBC uses both the terms "existing building" and "existing structure" but only defines "existing building." Some code sections use "existing building"; some use "existing structure"; other sections use "existing building or structure." Section 501.1 is an example. "501.1 Scope. The provisions of this chapter shall ... apply to the alteration, repair, addition and change of occupancy of existing structures.... The work performed on an existing building shall be classified in accordance with this chapter."
After reviewing the use of the terms "existing building" and "existing structure" in the IBC and IEBC, we concluded that the terms are used interchangeably, and that including both definitions is the most reasonable way to coordinate the use of these terms. This proposal adds the IBC definition of "existing structure" to the IEBC. The definition for "existing building" will be modified to include a sentence about flood hazard areas that is copied from the definition of "existing structure" in Group B. The definition for "existing building" is controlled by the Admin committee.

The IBC defines "existing structure" but not "existing building." This proposal is the first step in correlating the two definitions in the IEBC and IBC. Changes to the IBC will be considered in Group B; if this proposal is successful, we will propose similar changes to the IBC.

Cost Impact: Will not increase the cost of construction
This will not increase the cost of construction.

Staff note: The term existing building is maintained by the Administrative Committee. This is an errata to the IEBC.

EB 4-15 : 202-EXISTING BUILDING-TRAXLER4261

EB 5-15

301.1

Proponent: David Bonowitz, David Bonowitz, S.E., representing Existing Buildings Subcommittee, National Council of Structural Engineers Associations (dbonowitz@att.net)

2015 International Existing Building Code

Revise as follows:

301.1 General. The *repair*, *alteration*, *change of occupancy*, *addition* or relocation of all *existing buildings* shall comply with one of the methods listed in Sections 301.1.1 through 301.1.3 as selected by the applicant. Sections 301.1.1 through 301.1.3 shall not be applied in combination with each other. Where this code requires consideration of the seismic forceresisting system of an *existing building* subject to *repair*, *alteration*, *change of occupancy*, *addition* or relocation of *existing buildings,* the seismic evaluation and design shall be based on Section 301.1.4 regardless of which compliance method is used.

> **Exception:**Other than in flood hazard areas or regarding structural provisions, and Subject to the approval of the *code official*, *alterations* complying with the laws in existence at the time the building or the affected portion of the building was built shall be considered in compliance with the provisions of this code ~~unless the building is undergoing more than a limited structural *alteration* as defined in Section 907.4.4. New structural members added as part of the *alteration* shall comply with the *International BuildingCode. Alteration*s of *existing buildings* in *flood hazardareas* shall comply with Section 701.3~~.

Reason: This proposal retains the exception that allows the code official to waive certain architectural and other requirements that the IEBC would normally trigger in alteration projects. It removes that exception, however, regarding structural provisions that would have been triggered by alterations.
The current exception already does not apply to alterations in flood hazard areas (which sometimes trigger structural improvements) or to substantial structural alterations. So the proposal does not change those cases at all.

The proposal eliminates the potential that the IEBC's basic structural requirements might be undermined by a code official's discretion, or, more likely, by a permit applicant who reads this exception as a way to demand a discretionary waiver. Since very few code officials would be comfortable waiving these structural safety provisions, the proposal actually helps them enforce the code as intended.

Further, the existing exception is unclear. It refers to "laws in existence at the time the building ... was built." But if the intent is to waive requirements triggered by alterations, this language ignores, or forgets, the fact that older codes for a long time had alteration provisions that triggered structural upgrade -- often with requirements more onerous than those in the current IEBC. So does a permit applicant claiming compliance with the "laws in existence" a generation ago also intend to comply with those outdated triggers? Thie proposal removes that potential confusion.

Since the existing structural provisions for alterations are already measured, already allow reduced loads and alternative criteria in many cases, and already trigger structural improvements only in rare and severe cases, the proposed change to this exception should have little impact except to affirm that structural safety is fundamental to the code's intent.

.

Cost Impact: Will not increase the cost of construction
This proposal will not increase the cost of construction, but it could, hypothetically, limit the cases in which the code official could effectively reduce the cost of construction by waiving structural safety requirements. In practice, no increase in the cost of construction should be expected, however, since the proposal does not change any of the code's provisions, but only changes what was a discretionary waiver.

EB 5-15 : 301.1 -BONOWITZ5196

EB 6-15

301.1

Proponent: Maureen Traxler, Seattle Dept of Planning & Development, representing Seattle Dept of Planning & Development (maureen.traxler@seattle.gov)

2015 International Existing Building Code

Revise as follows:

301.1 General. The *repair*, *alteration*, *change of occupancy*, *addition* or relocation of all *existing buildings* shall comply with one of the methods listed in Sections 301.1.1 through 301.1.3 as selected by the applicant. Sections 301.1.1 through 301.1.3 shall not be applied in combination with each other. Where this code requires consideration of the seismic forceresisting system of an *existing building* subject to *repair*, *alteration*, *change of occupancy*, *addition* or relocation of *existing buildings,* the seismic evaluation and design shall be based on Section 301.1.4 regardless of which compliance method is used.

> **Exception:** Subject to the approval of the *code official*, *alterations* complying with the laws in existence at the time the building or the affected portion of the building was built shall be considered in compliance with the provisions of this code unless the building is undergoing more than a limited structural *alteration* as defined in Section 907.4.4. New structural members added as part of the *alteration* shall comply with the *International BuildingCode*. *Alteration*s of *existing buildings* in *flood hazardareas* shall comply with Section <u>403.2,</u> 701.3<u> or 1401.3.3</u>.

Reason: This exception refers only the work area method for alterations in flood hazard areas. The prescriptive and performance methods have provisions similar to Section 701.3, so this exception should also refer to them.

Cost Impact: Will not increase the cost of construction
This proposal will not increase the cost of construction.

EB 6-15 : 301.1-TRAXLER3457

EB 7-15

301.1, 301.2 (New)

Proponent: David Bonowitz, David Bonowitz, S.E., representing Existing Buildings Subcommittee, National Council of Structural Engineers Associations (dbonowitz@att.net)

2015 International Existing Building Code

Revise as follows:

301.1 General. The *repair*, *alteration*, *change of occupancy*, *addition* or relocation of all *existing buildings* shall comply with one of the methods listed in Sections 301.1.1 through 301.1.3 as selected by the applicant. Sections 301.1.1 through 301.1.3 shall not be applied in combination with each other. ~~Where this code requires consideration of the seismic forceresisting system of an *existing building* subject to *repair*, *alteration*, *change of occupancy*, *addition* or relocation of *existing buildings*, the seismic evaluation and design shall be based on Section 301.1.4 regardless of which compliance method is used.~~

> **Exception:** Subject to the approval of the *code official*, *alterations* complying with the laws in existence at the time the building or the affected portion of the building was built shall be considered in compliance with the provisions of this code unless the building is undergoing more than a limited structural *alteration* as defined in Section 907.4.4. New structural members added as part of the *alteration* shall comply with the *International BuildingCode*. *Alteration*s of *existing buildings* in *flood hazardareas* shall comply with Section 701.3.

Add new text as follows:

<u>**301.2** **Seismic evaluation and design criteria** Where required, seismic evaluation or design shall be based on the criteria given in this section, regardless of which compliance method is used.</u>

Renumber as follows:

[BS] ~~301.1.4.1~~<u>301.2.1</u> Compliance with International Building Code-level seismic forces. *(No change to text)*

TABLE [BS] ~~301.1.4.1~~<u>301.2.1</u>
PERFORMANCE OBJECTIVES FOR USE IN ASCE 41 FOR COMPLIANCE WITH INTERNATIONAL BUILDING CODE-LEVEL SEISMIC FORCES

(No change to table)

[BS] ~~301.1.4~~<u>301.2.1</u> Seismic evaluation and design procedures. *(No change to text)*

[BS] ~~301.1.4.2~~<u>301.2.2</u> Compliance with reduced International Building Code-level seismic forces. *(No change to text)*

TABLE [BS] ~~301.1.4.2~~<u>301.2.2</u>
PERFORMANCE OBJECTIVES FOR USE IN ASCE 41 FOR COMPLIANCE WITH REDUCED INTERNATIONAL BUILDING CODE-LEVEL SEISMIC FORCES

(No change to table)

Reason: The last sentence of Section 301.1 does not belong with the first two. In fact, its presence makes the Exception to Section 301.1 confusing -- does the exception apply to the first two sentences or to the third?
The easy solution is to pull out this sentence and put it with the seismic criteria currently in Section 301.1.4. Ideally, all the seismic provisions here should be in their own section within Chapter 3 -- either new section 301.2, or better still, new section 303 -- but the rest of 301.1.4 cannot be touched in Group A. If this proposal is approved, a coordinating proposal will be submitted in Group B (or, this entirely editorial reorganization can be left to staff).

Cost Impact: Will not increase the cost of construction
The proposal is entirely editorial.

301.1, [BS] 301.1.4, [BS] 301.1.4.1, [BS] Table 301.1.1.4.1, [BS] 301.1.4.2, [BS] Table 301.1.1.4.2, 303 (New)

Proponent: Edward Kulik, Chair, representing Building Code Action Committee(bcac@iccsafe.org)

2015 International Existing Building Code

Revise as follows:

SECTION 301 ADMINISTRATION

301.1 General. The *repair*, *alteration*, *change of occupancy*, *addition* or relocation of all *existing buildings* shall comply with one of the methods listed in Sections 301.1.1 through 301.1.3 as selected by the applicant. Sections 301.1.1 through 301.1.3 shall not be applied in combination with each other. Where this code requires consideration of the seismic forceresisting system of an *existing building* subject to *repair*, *alteration*, *change of occupancy*, *addition* or relocation of *existing buildings,* the seismic evaluation and design shall be based on Section ~~301.1.4~~303.1 regardless of which compliance method is used.

> **Exception:** Subject to the approval of the *code official*, *alterations* complying with the laws in existence at the time the building or the affected portion of the building was built shall be considered in compliance with the provisions of this code unless the building is undergoing more than a limited structural *alteration* as defined in Section 907.4.4. New structural members added as part of the *alteration* shall comply with the *International BuildingCode*. *Alteration*s of *existing buildings* in *flood hazardareas* shall comply with Section 701.3.

301.1.1 Prescriptive compliance method. *Repairs*, *alterations*, *additions* and *changes of occupancy* complying with Chapter 4 of this code in buildings complying with the *International Fire Code* shall be considered in compliance with the provisions of this code.

301.1.2 Work area compliance method. *Repairs*, *alterations, additions, changes in occupancy and relocated buildings complying with the applicable requirements of Chapters 5 through 13 of this code shall be considered in compliance with the provisions of this code.*

301.1.3 Performance compliance method. *Repairs*, *alterations*, *additions*, changes in occupancy and relocated buildings complying with Chapter 14 of this code shall be considered in compliance with the provisions of this code.

Add new section as follows:

SECTION303 SEISMIC EVALUATION AND DESIGN PROCEDURES

Renumber subsequent sections:

[BS] ~~301.1.4~~ 303.1 ~~Seismic evaluation and design procedures~~ General. *(No change to text)*

[BS] ~~301.1.4.1~~ 303.1.1 Compliance with International Building Code-level seismic forces. *(No change to text)*

TABLE [BS] 3~~301.1.4.1~~303.1.1
PERFORMANCE OBJECTIVES FOR USE IN ASCE 41 FOR COMPLIANCE WITH INTERNATIONAL BUILDING CODE-LEVEL SEISMIC FORCES
(No change to Table)

[BS] ~~301.1.4.2~~ 303.1.2 Compliance with reduced International Building Code-level seismic forces. *(No change to text)*

TABLE [BS] ~~301.1.4.2~~303.1.2
PERFORMANCE OBJECTIVES FOR USE IN ASCE 41 FOR COMPLIANCE WITH REDUCED INTERNATIONAL BUILDING CODE-LEVEL SEISMIC FORCES
(No change to Table)

Reason: The code change proposal is to move the seismic evaluation and design procedures out of the same section and code hierarchy as the three compliance methods and places it in its own section. With the location of the seismic evaluation and design procedure reference in 301.1, it can potentially confuse the code user since two items need to happen in the current 301; choose a method and do a seismic evaluation.
Since the topic is separate and distinct, the proposal moves it to a separate section to ensure it is independent of the compliance method choice by the applicant.

This public proposal is submitted by the ICC Building Code Action Committee (BCAC). The BCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the BCAC has held 13 open meetings and numerous workgroup calls which included members of the BCAC as well as any interested party to discuss and debate the proposed changes and the public comments. Related documentation and reports are posted on the BCAC website at: http://www.iccsafe.org/cs/BCAC/Pages/default.aspx.

Cost Impact: Will not increase the cost of construction
Cost impact: Code proposal is only to clarify the existing code requirements through a relocation (reorganization) of code sections, so there is no intended increase or decrease expected by approving this proposal.

~~**CHAPTER 4 PRESCRIPTIVE COMPLIANCE METHOD**~~

(Delete entire chapter)
(Renumber subsequent chapters)

Revise as follows:

301.1 General. The *repair*, *alteration*, *change of occupancy*, *addition* or relocation of all *existing buildings* shall comply with one of the methods listed in Sections 301.1.1~~ through 301.1.3~~ or 301.1.2 as selected by the applicant. Sections 301.1.1 ~~through 301.1.3~~ and 301.1.2 shall not be applied in combination with each other. Where this code requires consideration of the seismic forceresisting system of an *existing building* subject to *repair*, *alteration*, *change of occupancy*, *addition* or relocation of *existing buildings,* the seismic evaluation and design shall be based on Section 301.1.4 regardless of which compliance method is used.

> **Exception:** Subject to the approval of the *code official*, *alterations* complying with the laws in existence at the time the building or the affected portion of the building was built shall be considered in compliance with the provisions of this code unless the building is undergoing more than a limited structural *alteration* as defined in Section 907.4.4. New structural members added as part of the *alteration* shall comply with the *International BuildingCode*. *Alteration*s of *existing buildings* in *flood hazardareas* shall comply with Section 701.3.

Delete without substitution:

~~**301.1.1 Prescriptive compliance method.** *Repairs*, *alterations*, *additions* and *changes of occupancy* complying with Chapter 4 of this code in buildings complying with the *International Fire Code* shall be considered in compliance with the provisions of this code.~~

Revise as follows:

~~301.1.2~~301.1.1 Work area compliance method. *Repairs*, *alterations, additions, changes in occupancy and relocated buildings complying with the applicable requirements of Chapters 5 through 13 of this code shall be considered in compliance with the provisions of this code.*

~~301.1.3~~301.1.2 Performance compliance method. *Repairs*, *alterations*, *additions*, changes in occupancy and relocated buildings complying with Chapter 14 of this code shall be considered in compliance with the provisions of this code.

(Renumber subsequent sections)

1401.2.5 Accessibility requirements. Accessibility shall be provided in accordance with Section ~~410 or 605~~705.

[BS] B101.3 Qualified historic buildings and facilities subject to Section 106 of the National Historic Preservation Act. Where an *alteration* or *change of occupancy* is undertaken to a qualified *historic building* or facility that is subject to Section 106 of the National Historic Preservation Act, the federal agency with jurisdiction over the undertaking shall follow the Section 106 process. Where the state historic preservation officer or Advisory Council on Historic Preservation determines that compliance with the requirements for accessible routes, ramps, entrances, or toilet facilities would threaten or destroy the historic significance of the building or facility, the alternative requirements of Section ~~410.9~~ 1204.1 for that element are permitted.

[BS] B101.4 Qualified historic buildings and facilities not subject to Section 106 of the National Historic Preservation Act. Where an *alteration* or *change of occupancy* is undertaken to a qualified *historic building* or facility that is not subject to Section 106 of the National Historic Preservation Act, and the entity undertaking the alterations believes that compliance with the requirements for accessible routes, ramps, entrances, or toilet facilities would threaten or destroy the historic significance of the building or facility, the entity shall consult with the state historic preservation officer. Where the state historic preservation officer determines that compliance with the accessibility requirements for accessible routes, ramps, entrances, or toilet facilities would threaten or destroy the historical significance of the building or facility, the alternative requirements of Section ~~410.9~~ 1204.1 for that element are permitted.

Reason: The intent of this proposal is to consider removing the Prescriptive compliance method from the IEBC, leaving the Work Area compliance method and the Performance compliance method in place.
Note: For purposes of brevity, the balance of Chapter 4 is not shown, but the intent is that Chapter 4 would be removed in its entirety, with corresponding changes to chapter and section numbers and related cross-referencing throughout the code.

The IEBC was created to implement the Work Area method. For continuity purposes, the two methods already in IBC Chapter 34 -- the Prescriptive and Performance methods -- were added to the IEBC upon its initial publication over a decade ago. The idea was that having three broad options would aid transition to the new code. Since then, the IEBC has enjoyed wide adoption, the Work Area method has become known and used, and revisions have been made to all three methods to reconcile many of the differences among them. Indeed, over the last three cycles, the structural provisions of the Prescriptive and Work Area methods have been made nearly identical.

Meanwhile, and especially because the IBC now refers to the IEBC in lieu of its own Chapter 34, many are questioning why the IEBC still needs multiple methods. It makes implementation confusing, and it puts a burden on jurisdiction adoption committees, code officials, design professionals, and permit applicants to weigh the advantages and disadvantages of each method. In some cases it leads to gaming. Some jurisdictions have simply not adopted one or another method, to facilitate consistent enforcement. Unfortunately, some proposals to solve the problem of multiple methods would link or cross-reference them, just to minimize duplication of text. While well-intentioned, this will only make using the IEBC more confusing and difficult (and will violate the intent of Section 301.1 that the methods should remain distinct and not used in a mix-and-match fashion). The better approach is to reconcile differences between the methods, and then eliminate the older, less accommodating Prescriptive method.

Perhaps the time for that is now. Perhaps it is time, after four code cycles, to reconsider the initial intent of the IEBC: To regulate work on existing buildings by project type, with nuances and considerations that require more than a single code chapter.

If the code's users, writers, and stakeholders agree that the Prescriptive and Work Area methods are by now sufficiently similar, we can eliminate the older Prescriptive method with little or no impact, using the public comment period and the time between now and 2018 to iron out the necessary editorial, administrative and coordination changes. If not -- that is, if there is even a significant minority in rational opposition -- then we can approve the proposal at the hearings, use the public comment period to identify irreconcilable differences, disapprove or withdraw the proposal if necessary as a final action, and work on reconciliation for the 2021 IEBC. At the very least, however, this proposal represents an opportunity to hear from the IEBC committee and the code's users about whether and when the Prescriptive method ought to be retired.

Cost Impact: Will not increase the cost of construction
If the Prescriptive Method and the Work Area Method are similar enough to justify approval of this proposal, then removal of the Prescriptive method cannot result in a significant cost increase.

2015 International Existing Building Code

Relocate Chapter 6 as follows:

~~6~~4 REPAIRS
(Runumber Subsequent sections in this Chapter)
(Renumber Chapters 4 and 5)

Revise as follows:

SECTION 301 ADMINISTRATION

301.1 General. The *repair, alteration, change of occupancy, addition* or relocation of all *existing buildings* shall comply with Section 301.2 or 301.3, as applicable.

301.2 Repairs Repairs shall comply with the requirements of Chapter 4.

~~301.1~~301.3 ~~General.~~Alteration, change of occupancy, addition or relocation The~~*repair*, ~~ *alteration*, *change of occupancy*, *addition* or relocation of all *existing buildings* shall comply with one of the methods listed in Sections ~~301.1.1~~301.3.1 through ~~301.1.3~~301.3.3 as selected by the applicant. Sections ~~301.1.1~~301.3.1 through ~~301.1.3~~301.3.3 shall not be applied in combination with each other. Where this code requires consideration of the seismic forceresisting system of an *existing building* subject to~~*repair*, ~~ *alteration*, *change of occupancy*, *addition* or relocation of *existing buildings,* the seismic evaluation and design shall be based on Section ~~301.1.4~~301.3.4 regardless of which compliance method is used.

> **Exception:** Subject to the approval of the *code official*, *alterations* complying with the laws in existence at the time the building or the affected portion of the building was built shall be considered in compliance with the provisions of this code unless the building is undergoing more than a limited structural *alteration* as defined in Section 907.4.4. New structural members added as part of the *alteration* shall comply with the *International BuildingCode*. *Alteration*s of *existing buildings* in *flood hazardareas* shall comply with Section 701.3.

~~301.1.1~~301.3.1 Prescriptive compliance method. ~~*Repairs*, *alterations*~~*Alterations*, *additions* and *changes of occupancy* complying with Chapter ~~4~~5 of this code in buildings complying with the *International Fire Code* shall be considered in compliance with the provisions of this code.

~~301.1.2~~301.3.2 Work area compliance method. ~~*Repairs, alterations*~~*Alterations, additions, changes in occupancy and relocated buildings complying with the applicable requirements of Chapters ~~5~~ 6 through 13 of this code shall be considered in compliance with the provisions of this code.*

~~301.1.3~~301.3.3 Performance compliance method. ~~*Repairs, alterations*~~*Alterations*, *additions*, changes in occupancy and relocated buildings complying with Chapter 14 of this code shall be considered in compliance with the provisions of this code.

(Renumber subsequent sections)

401.1 Scope. The provisions of this chapter shall control the *alteration~~, repair~~, addition* and *change of occupancy* or relocation of *existing buildings* and structures, including *historic buildings* and structures as referenced in Section ~~301.1.1~~301.3.1.

> **Exception:** Existing bleachers, grandstands and folding and telescopic seating shall comply with ICC 300.

401.1.1 Compliance with other methods. *Alterations*~~, repairs~~, *additions* and *changes of occupancy* to or relocation of, *existing buildings* and structures shall comply with the provisions of this chapter or with one of the methods provided in Section ~~301.1~~301.3.

401.2.2 New and replacement materials. Except as otherwise required or permitted by this code, materials permitted by the applicable code for new construction shall be used. Like materials shall be permitted for~~*repairs* and~~*alterations*, provided no hazard to life, health or property is created. Hazardous materials shall not be used where the code for new construction would not permit their use in buildings of similar occupancy, purpose and location.

Delete without substitution:

~~SECTION 404 REPAIRS~~

~~**404.1 General.** Buildings and structures, and parts thereof, shall be repaired in compliance with Sections 401.2 and 404. Work on nondamaged components that is necessary for the required *repair* of damaged components shall be considered part of the *repair* and shall not be subject to the requirements for *alterations* in this chapter. Routine maintenance required by Section 401.2, ordinary repairs exempt from permit in accordance with Section 105.2, and abatement of wear due to normal service conditions shall not be subject to the requirements for repairs in this section.~~

~~**[BS] 404.2 Substantial structural damage to vertical elements of the lateral force-resisting system.** A building that has sustained *substantial structural damage* to the vertical elements of its lateral force-resisting system shall be evaluated and repaired in accordance with the applicable provisions of Sections 404.2.1 through 404.2.3.~~

> ~~**Exceptions:**~~
> 1. ~~Buildings assigned to Seismic Design Category A, B or C whose substantial structural damage was not caused by earthquake need not be evaluated or rehabilitated for load combinations that include earthquake effects.~~
> 2. ~~One- and two-family dwellings need not be evaluated or rehabilitated for load combinations that include earthquake effects.~~

~~**[BS] 404.2.1 Evaluation.** The building shall be evaluated by a *registered design professional*, and the evaluation findings shall be submitted to the *building official.* The evaluation shall establish whether the damaged building, if repaired to its predamage state, would comply with the provisions of the *International Building Code* for wind and earthquake loads.~~

~~Wind loads for this evaluation shall be those prescribed in Section 1609 of the *International Building Code.* Earthquake loads for this evaluation, if required, shall be permitted to be 75 percent of those prescribed in Section 1613 of the *International Building Code.* Alternatively, compliance with ASCE 41, using the performance objective in Table 301.1.4.2 for the applicable risk category, shall be deemed to meet the earthquake evaluation requirement.~~

~~**[BS] 404.2.2 Extent of repair for compliant buildings.** If the evaluation establishes compliance of the predamage building in accordance with Section 404.2.1, then repairs shall be permitted that restore the building to its predamage state.~~

~~**[BS] 404.2.3 Extent of repair for noncompliant buildings.** If the evaluation does not establish compliance of the predamage building in accordance with Section 404.2.1, then the building shall be rehabilitated to comply with applicable provisions of the *International Building Code* for load combinations that include wind or seismic loads. The wind loads for the repair shall be as required by the building code in effect at the time of original construction, unless the damage was caused by wind, in which case the wind loads shall be as required by the *International Building Code.* Earthquake loads for this rehabilitation design shall be those required for the design of the predamage building, but not less than 75 percent of those prescribed in Section 1613 of the *International Building Code.* New structural members and connections required by this rehabilitation design shall comply with the detailing provisions of the *International Building Code* for new buildings of similar~~

~~structure, purpose and location. Alternatively, compliance with ASCE 41, using the performance objective in Table 301.1.4.2 for the applicable risk category, shall be deemed to meet the earthquake rehabilitation requirement.~~

~~**[BS] 404.3 Substantial structural damage to gravity loadcarrying components.** Gravity load-carrying components that have sustained *substantial structural damage* shall be rehabilitated to comply with the applicable provisions of the *International Building Code* for dead and live loads. Snow loads shall be considered if the substantial structural damage was caused by or related to snow load effects. Existing gravity load-carrying structural elements shall be permitted to be designed for live loads approved prior to the damage. If the approved live load is less than that required by Section 1607 of the *International Building Code*, the area designed for the nonconforming live load shall be posted with placards of *approved* design indicating the *approved* live load. Nondamaged gravity load-carrying components that receive dead, live or snow loads from rehabilitated components shall also be rehabilitated or shown to have the capacity to carry the design loads of the *rehabilitation* design. New structural members and connections required by this rehabilitation design shall comply with the detailing provisions of the *International Building Code* for new buildings of similar structure, purpose and location.~~

~~**[BS] 404.3.1 Lateral force-resisting elements.** Regardless of the level of damage to vertical elements of the lateral force-resisting system, if *substantial structural damage* to gravity load-carrying components was caused primarily by wind or earthquake effects, then the building shall be evaluated in accordance with Section 404.2.1 and, if noncompliant, rehabilitated in accordance with Section 404.2.3.~~

~~**Exceptions:**~~

1. ~~One- and two-family dwellings need not be evaluated or rehabilitated for load combinations that include earthquake effects.~~
2. ~~Buildings assigned to Seismic Design Category A, B or C whose substantial structural damage was not caused by earthquake need not be evaluated or rehabilitated for load combinations that include earthquake effects.~~

~~**[BS] 404.4 Less than substantial structural damage.** For damage less than *substantial structural damage*, repairs shall be allowed that restore the building to its predamage state. New structural members and connections used for this *repair* shall comply with the detailing provisions of the *International Building Code* for new buildings of similar structure, purpose and location.~~

~~**[BS] 404.5 Flood hazard areas.** For buildings and structures in *flood hazard areas* established in Section 1612.3 of the *International Building Code*, or Section R322 of the *International Residential Code*, as applicable, any repair that constitutes *substantial improvement* or repair of *substantial damage* of the existing structure shall comply with the flood design requirements for new construction, and all aspects of the existing structure shall be brought into compliance with the requirements for new construction for flood design.~~

~~For buildings and structures in flood hazard areas established in Section 1612.3 of the *International Building Code*, or Section R322 of the *International Residential Code*, as applicable, any repairs that do not constitute *substantial improvement or* repair of *substantial damage* of the existing structure are not required to comply with the flood design requirements for new construction.~~

Revise as follows:

501.1 Scope. The provisions of this chapter shall be used in conjunction with Chapters ~~6~~ 7 through 13 and shall apply to the *alteration*~~, *repair*~~, *addition* and *change of occupancy* of existing structures, including historic and moved structures, as referenced in Section 301.1.2. The work performed on an *existing building* shall be classified in accordance with this chapter.

501.1.1 Compliance with other alternatives. *Alterations*~~, *repairs*~~, *additions* and *changes of occupancy* to existing structures shall comply with the provisions of Chapters ~~6~~ 7 through 13 or with one of the alternatives provided in Section 301.1.

Delete without substitution:

~~**SECTION 502 REPAIRS**~~

~~**502.1 Scope.** *Repairs,* as defined in Chapter 2, include the patching or restoration or replacement of damaged materials, elements, *equipment or fixtures* for the purpose of maintaining such components in good or sound condition with respect to existing loads or performance requirements.~~

~~**502.2 Application.** *Repairs* shall comply with the provisions of Chapter 6.~~

~~**502.3 Related work.** Work on nondamaged components that is necessary for the required *repair* of damaged components shall be considered part of the *repair* and shall not be subject to the provisions of Chapter 7, 8, 9, 10 or 11.~~

Revise as follows:

1401.1 Scope. The provisions of this chapter shall apply to the *alteration*~~, *repair*~~, *addition* and *change of occupancy* of existing structures, including historic and moved structures, as referenced in Section ~~301.1.3~~ 301.3.3. The provisions of this chapter are intended to maintain or increase the current degree of public safety, health and general welfare in *existing buildings* while permitting ~~*repair*~~, *alteration*, *addition* and *change of occupancy* without requiring full compliance with Chapters ~~5~~ 6 through 13, except where compliance with other provisions of this code is specifically required in this chapter.

1401.1.1 Compliance with other methods. *Alterations*~~, *repairs*~~, *additions* and *changes of occupancy* to existing structures shall comply with the provisions of this chapter or with one of the methods provided in Section ~~301.1~~ 301.3.

1401.2.4 Alterations and repairs. An *existing building* or portion thereof that does not comply with the requirements of this code for new construction shall not be altered or repaired in such a manner that results in the building being less safe or sanitary than such building is currently. If, in the *alteration* or *repair*, the current level of safety or sanitation is to be reduced, the portion altered or ~~repaired~~ shall conform to the requirements of Chapters 2 through 12 and Chapters 14 through 33 of the *International Building Code*.

Reason: The purpose of this code change is to remove the topic of repair from the three compliance methods and to move repair into one standalone chapter.
The topic of repairs is fairly simple but the way the three methods handle the topic very differently:

• Prescriptive method- Specific requirements on structural repairs only, general statement on other topics with code official discretion on 'dangerous' situations

• Work area method- Specific requirements for structural (identical to prescriptive method), building materials, fire protection, accessibility, mechanical, plumbing, and electrical.

• Performance method- General requirements only and reference to the IBC for thresholds.

The IEBC has three different methods to give choices in the design of existing buildings. The reason for the choice to the applicant is to give options since every existing building is different, using legacy materials and having legacy code requirements. This is not the case for repairs.

As an example, the prescriptive method would allow items like glazing in hazardous locations non-NEMA electrical receptacles in hospitals to be replaced in kind whereas the work area method sets a baseline on these items. Since repair items don't usually get a permit or inspection, there is really little need for options in replacing something for the sole purpose of it's maintenance.

The proposal moves this topic to right before the prescriptive method and the chapters would be:

1-Admin
2-Definitions
3-General Requirements for all compliance methods
4-Repairs
5-Prescriptive
6-Work Area Classification of Work
7-Alt. 1
8- Alt. 2
9- Alt. 3
10- Change of Occupancy
11-Additions

12- Historic Buildings
13- Relocated Buildings
14- Performance Method
15- Safeguards
16- Referenced Standards

One item that would generally require a building permit would be damaged buildings. However, damaged buildings only specifically address structural items of which are currently identical in the prescriptive and work area methods. Therefore, no technical change is created by this change.

The alternative to this change would be to correlate repairs in the three methods and copy them into the three applicable chapters. However, a single chapter does not remove any options currently available, is correlated for the code user, and will minimize different requirements on the same topic in future code cycles.

This public proposal is submitted by the ICC Building Code Action Committee (BCAC). The BCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the BCAC has held 13 open meetings and numerous workgroup calls which included members of the BCAC as well as any interested party to discuss and debate the proposed changes and the public comments. Related documentation and reports are posted on the BCAC website at: http://www.iccsafe.org/cs/BCAC/Pages/default.aspx.

Cost Impact: Will not increase the cost of construction
Cost impact: Code proposal is only to clarify the existing code requirements through a relocation (reorganization) of code sections, so there is no intended increase or decrease expected by approving this proposal.

EB 10-15 : 301.1 (New)-KULIK4786

EB 11-15

301.1, 301.2 (New), 301.1.2, 301.1.3, 301.3 (New), 401.1, 401.1.1, 409, Chapter 13, 1401.1

Proponent: Edward Kulik, Chair, representing Building Code Action Committee (bcac@iccsafe.org)

2015 International Existing Building Code

Relocate Chapter 13 as follows:

~~13~~14 RELOCATED OR MOVED BUILDINGS
(Renumber all subsequent sections in this chapter)
(Renumber Chapter 14 Prescriptive Method to be Chapter 13)

SECTION 301 ADMINISTRATION

301.1 General. The *repair*, *alteration*, *change of occupancy*, *addition* or relocation of all *existing buildings* shall comply with ~~one~~301.2 or 301.3 of ~~the methods listed in Sections 301.1.1 through 301.1.3 as selected by the applicant. Sections 301.1.1 through 301.1.3 shall not be applied in combination with each other~~this section. Where this code requires consideration of the seismic ~~forceresisting~~force resisting system of an *existing building* subject to *repair*, *alteration*, *change of occupancy*, *addition* or relocation of *existing buildings,* the seismic evaluation and design shall be based on Section ~~301.1.4~~301.2.4 regardless of which compliance method is used.

> **Exception:** Subject to the approval of the *code official*, *alterations* complying with the laws in existence at the time the building or the affected portion of the building was built shall be considered in compliance with the provisions of this code unless the building is undergoing more than a limited structural *alteration* as defined in Section 907.4.4. New structural members added as part of the *alteration* shall comply with the *International BuildingCode*. *Alteration*s of *existing buildings* in *flood hazardareas* shall comply with Section 701.3.

Add new text as follows:

301.2 Repairs, alterations, change of occupancy, and additions. The *repair*, *alteration*, *change of occupancy*, or *addition* of all *existing buildings* shall comply with one of the methods listed in Sections 301.1.1 through 301.1.3 as selected by the applicant. Sections 301.2.1 through 301.2.3 shall not be applied in combination with each other.

Revise as follows:

~~301.1.1~~301.2.1 Prescriptive compliance method. *Repairs*, *alterations*, *additions* and *changes of occupancy* complying with Chapter 4 of this code in buildings complying with the *International Fire Code* shall be considered in compliance with the provisions of this code.

~~301.1.2~~301.2.2 Work area compliance method. *Repairs*, *alterations, additions,* and *changes in occupancy* ~~and relocated buildings~~ *complying with the applicable requirements of Chapters 5 through ~~13~~12 of this code shall be considered in compliance with the provisions of this code.*

~~301.1.3~~301.2.3 Performance compliance method. *Repairs*, *alterations*, *additions*, and changes in occupancy and ~~relocated buildings~~ complying with Chapter ~~14~~13 of this code shall be considered in compliance with the provisions of this code.

(Renumber subsequent sections)

Add new text as follows:

301.3 Relocated Buildings Relocated buildings shall comply with the requirements of Chapter 14.

Revise as follows:

401.1 Scope. The provisions of this chapter shall control the *alteration, repair, addition* and *change of occupancy* ~~or relocation~~ of *existing buildings* and structures, including *historic buildings* and structures as referenced in Section ~~301.1.1~~ 301.2.1.

> **Exception:** Existing bleachers, grandstands and folding and telescopic seating shall comply with ICC 300.

401.1.1 Compliance with other methods. *Alterations*, repairs, *additions* and *changes of occupancy* to ~~or relocation of,~~ *existing buildings* and structures shall comply with the provisions of this chapter or with one of the methods provided in Section ~~301.1~~301.2.

~~SECTION409 MOVED STRUCTURES~~

~~**409.1 Conformance.** Structures moved into or within the jurisdiction shall comply with the provisions of this code for new structures.~~

(Renumber subsequent sections)

1401.1 Scope. The provisions of this chapter shall apply to the *alteration*, *repair*, *addition* and *change of occupancy* of existing structures, including historic ~~and moved~~ structures, as referenced in Section ~~301.1.3~~301.2.3. The provisions of this chapter are intended to maintain or increase the current degree of public safety, health and general welfare in *existing buildings* while permitting *repair*, *alteration*, *addition* and *change of occupancy* without requiring full compliance with Chapters 5 through ~~13~~12, except where compliance with other provisions of this code is specifically required in this chapter.

(Renumber subsequent sections)

Reason: The purpose of this code change is to adequately address relocated or moved buildings in the IEBC. Currently, the three compliance methods address relocated/moved buildings in their respective scopes. This change will relocate Chapter 13, Relocated or Moved Buildings, and make it generally applicable for all three methods.
The topic is currently handled the following way:

Prescriptive Method- "Meet this code for new structures" [IEBC doesn't deal with new structures]
Work Area Method- Specific chapter that is not based upon the hierarchy of the work area method
Performance Method- No requirements provided

In short, the only method that has technical requirements is Chapter 13. Since the IBC covers relocated buildings in its scope, the use of new structure requirements for relocated or moved buildings is always an option anyway.

The IEBC has three different methods to give choices in the design of existing buildings. The reason for the choice to the applicant is to give options since every existing building is different, using legacy materials and having legacy code requirements. This is not the case for relocated buildings as the intent is to reuse an existing building in a different location rather than complete other rehabilitation work.

The Chapter layout would look like this:

1-Admin
2-Definitions
3-Prescriptive

4-General Requirements for all compliance methods

5-Work Area Classification of Work
6-Repairs
7-Alt. 1
8- Alt. 2
9- Alt. 3
10- Change of Occupancy
11-Additions
12- Historic Buildings
13- Performance Method
14- Relocated Buildings
15- Safeguards
16- Referenced Standards

In the alternative, a code change could be to modify the prescriptive method to have an appropriate reference to the IBC as well as the performance method to have some direction on the issue within it.

As a correlation note; if this proposal is denied by either the BCAC or the code development committee, a proposal has to go forward to repair IEBC 409.1 to reference the IBC.

This public proposal is submitted by the ICC Building Code Action Committee (BCAC). The BCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the BCAC has held 13 open meetings and numerous workgroup calls which included members of the BCAC as well as any interested party to discuss and debate the proposed changes and the public comments. Related documentation and reports are posted on the BCAC website at: http://www.iccsafe.org/cs/BCAC/Pages/default.aspx.

Cost Impact: Will not increase the cost of construction
Code proposal is only to clarify the existing code requirements through a relocation (reorganization) of code sections, so there is no intended increase or decrease expected by approving this proposal.

EB 11-15 : 301.1-KULIK4755

EB 12-15

301.1.1, 301.1.2, 301.1.3

Proponent: Homer Maiel, PE, CBO, representing ICC Tri-Chapter (Peninsula, East Bay, Monterey Bay) (hmaiel@gmail.com)

2015 International Existing Building Code

Revise as follows:

301.1.1 Prescriptive compliance method. *Repairs*, *alterations*, *additions*, ~~and~~ *changes of occupancy* and relocation of *existing buildings* and structures, including historical buildings complying with Chapter 4 of this code in buildings complying with the *International Fire Code* shall be considered in compliance with the provisions of this code.

301.1.2 Work area compliance method. *Repairs*, *alterations, additions, changes* ~~in~~*of occupancy* of existing structures, including historic and ~~relocated buildings~~moved structures complying with the applicable requirements of Chapters 5 through 13 of this code shall be considered in compliance with the provisions of this code.

301.1.3 Performance compliance method. *Repairs*, *alterations*, *additions*, changes ~~in~~ of occupancy of existing structures, including historic and ~~relocated buildings~~moved structures complying with Chapter 14 of this code shall be considered in compliance with the provisions of this code.

Reason: This change brings these sections in line with Sections 401.1, 501.1 and 1401.1, respectively.

Cost Impact: Will not increase the cost of construction
This proposal is editorial.

EB 12-15 : 301.1.1-MAIEL4689

EB 13-15

301.1.5 (New)

Proponent: David Collins, representing The American Institute of Architects (dcollins@preview-group.com); Ronald Nickson (rnickson@nmhc.org), representing National Multi-housing Council; Kevin Fry, BOMA International (Kfry@BOMA.org), representing BOMA International; Dan Buuck (dbuuck@nahb.org), representing NAHB

2015 International Existing Building Code

Add new text as follows:

301.1.5 Compliance with accessibility Accessible requirements for existing buildings shall comply with the 2009 edition of ICC A117.1.

Reason: Dramatic changes are being proposed in the next edition of the ICC A117.1 standard that will accommodate a higher number of individuals. For example, the turning radius is being changed from 60" diameter to a 67" diameter, and clear floor space from 30"x48" to 30"x52" and related access to features. While these changes are able to be incorporated into new construction relatively easily, existing buildings that have been designed to conform with earlier standards or were modified to meet those earlier standards are likely to find that full compliance will create problems. Even using provisions based on the technical infeasibility for compliance will still require compliance in some circumstances that aren't justifiable financially and physically.
The Department of Justice in development of the 2010 ADA Standard allows for "grandfathering" of elements in an existing building that have already been made to conform and are found to comply with the earlier ADA standard. The 2009 edition of A117.1 provides the most comprehensively structured provisions for compliance with the original ADA and HUD standard, which is why a specific reference to that edition of the Standard for determining whether areas outside the specific alterations or change of occupancy must be modified.

Cost Impact: Will not increase the cost of construction
This change will reduce the cost of construction where changes have already been made to features of a building to conform to older accessibility standards. Under the proposed changes to A117.1 significant cost would be required to conform to these requirements often in areas where upgrades have already been performed in areas such as toilet rooms to meet the barrier removal requirements of the ADA or because of alterations and change of occupancy under the I-Codes when that work had been done prior to the adoption of this new standard.

Staff Note: If this code change is successful, the edition referenced for ICC A117.1 in Chapter 16 will remain the 2009 edition.

EB 13-15 : 301.1.5 (New)-COLLINS4462

EB 14-15

401.2, 401.2.1, 401.2.2, 401.2.3, 403.1, 404.1, 602.1, 602.2

Proponent: David Bonowitz, representing Existing Buildings Subcommittee, National Counci of Structural Engineers Associations (dbonowitz@att.net)

2015 International Existing Building Code

Delete without substitution:

~~**401.2 Building materials and systems.** Building materials and systems shall comply with the requirements of this section.~~

~~**401.2.1 Existing materials.** Materials already in use in a building in compliance with requirements or approvals in effect at the time of their erection or installation shall be permitted to remain in use unless determined by the building official to be unsafe per Section 115.~~

~~**401.2.2 New and replacement materials.** Except as otherwise required or permitted by this code, materials permitted by the applicable code for new construction shall be used. Like materials shall be permitted for *repairs* and *alterations*, provided no hazard to life, health or property is created. Hazardous materials shall not be used where the code for new construction would not permit their use in buildings of similar occupancy, purpose and location.~~

~~**401.2.3 Existing seismic force-resisting systems.** Where the existing seismic force-resisting system is a type that can be designated ordinary, values of R, Ω_0 and C_d for the existing seismic force-resisting system shall be those specified by the *International Building Code* for an ordinary system unless it is demonstrated that the existing system will provide performance equivalent to that of a detailed, intermediate or special system.~~

Revise as follows:

403.1 General. Except as provided by ~~Section 401.2~~Sections 302.3, 302.4, or this section, *alterations* to any building or structure shall comply with the requirements of the *International Building Code* for new construction. *Alterations* shall be such that the *existing building* or structure is no less conforming to the provisions of the *International Building Code* than the *existing building* or structure was prior to the *alteration*.

Exceptions:

1. An existing stairway shall not be required to comply with the requirements of Section 1011 of the *International Building Code* where the existing space and construction does not allow a reduction in pitch or slope.
2. Handrails otherwise required to comply with Section 1011.11 of the *International Building Code* shall not be required to comply with the requirements of Section 1014.6 of the *International Building Code* regarding full extension of the handrails where such extensions would be hazardous due to plan configuration.

404.1 General. Buildings and structures, and parts thereof, shall be repaired in compliance with ~~Sections 401.2 and 404~~this section. Work on nondamaged components that is necessary for the required *repair* of damaged components shall be considered part of the *repair* and shall not be subject to the requirements for *alterations* in this chapter. ~~Routine maintenance required by Section 401.2~~Maintenance, ordinary repairs exempt from permit in accordance with Section 105.2, and abatement of wear due to normal service conditions shall not be subject to the requirements for repairs in this section.

Delete without substitution:

~~**602.1 Existing building materials.** Materials already in use in a building in compliance with requirements or approvals in effect at the time of their erection or installation shall be permitted to remain in use unless determined by the *code official* to render the building or structure unsafe or *dangerous* as defined in Chapter 2.~~

~~**602.2 New and replacement materials.** Except as otherwise required or permitted by this code, materials permitted by the applicable code for new construction shall be used. Like materials shall be permitted for *repairs* and *alterations*, provided no *dangerous* or *unsafe* condition, as defined in Chapter 2, is created. Hazardous materials, such as asbestos and lead-based paint, shall not be used where the code for new construction would not permit their use in buildings of similar occupancy, purpose and location.~~

Reason: The proposal removes provisions that were already moved to Chapter 3 in the last cycle. When they were moved, however, the remaining duplicate provisions addressed by this proposal could not be deleted because of Group assignments.
Sections 401.2.1, 401.2.2, 602.1, and 602.2 are now in Sections 302.3 and 302.4. Section 401.2.3 is now in Sections 301.1.4.1 and 301.1.4.2.

If 401.2.1 - 401.2.3 are deleted as proposed, the balance of 401.2 can be deleted as well.

Section 403.1 is revised accordingly to cite the existing sections that cover new and existing materials.

In Section 404.1, the two references to Section 401.2 are removed and not replaced because they are actually erroneous references that should have been removed in a previous cycle. Their removal here is at most editorial, but could even be construed as errata. The reference to 401.2 used to match a provision in IBC Chapter 34 that referred to Section 3401.2 Maintenance, but that section no longer exists in the IEBC in any of its compliance methods. The first instance could be revised to refer instead to 302.4, but it is frankly not needed, as 302.4 applies even without a direct reference. The second instance is clearly a mistaken reference to the old maintenance provision, not a reference to the current provisions about new and existing materials.

Cost Impact: Will not increase the cost of construction
The proposal is entirely editorial.

EB 14-15 : 401.2-BONOWITZ5169

EB 15-15

401.2.1, 401.2.2, 602.1, 602.2

Proponent: Kathleen Petrie, representing City of Seattle, Department of Planning and Development (kathleen.petrie@seattle.gov)

2015 International Existing Building Code

Delete without substitution:

~~**401.2.1 Existing materials.** Materials already in use in a building in compliance with requirements or approvals in effect at the time of their erection or installation shall be permitted to remain in use unless determined by the building official to be unsafe per Section 115.~~

~~**401.2.2 New and replacement materials.** Except as otherwise required or permitted by this code, materials permitted by the applicable code for new construction shall be used. Like materials shall be permitted for *repairs* and *alterations*, provided no hazard to life, health or property is created. Hazardous materials shall not be used where the code for new construction would not permit their use in buildings of similar occupancy, purpose and location.~~

~~**602.1 Existing building materials.** Materials already in use in a building in compliance with requirements or approvals in effect at the time of their erection or installation shall be permitted to remain in use unless determined by the *code official* to render the building or structure unsafe or *dangerous* as defined in Chapter 2.~~

~~**602.2 New and replacement materials.** Except as otherwise required or permitted by this code, materials permitted by the applicable code for new construction shall be used. Like materials shall be permitted for *repairs* and *alterations*, provided no *dangerous* or *unsafe* condition, as defined in Chapter 2, is created. Hazardous materials, such as asbestos and lead-based paint, shall not be used where the code for new construction would not permit their use in buildings of similar occupancy, purpose and location.~~

Reason: This proposal deletes the "Existing [Building] Materials" and "New and Replacement Materials" sections from Chapters 4 and 6 because they are already inserted in chapter 3. The content in Chapter 3 applies to all methods in the IEBC so deleting these sections in the other method chapters reduces redundancy.

Cost Impact: Will not increase the cost of construction
This modification does not change the requirement. It removes unnecessary redundancy from other chapters, so costs are not increased or decreased

EB 15-15 : 401.2.1-PETRIE3587

EB 16-15

401.2.4 (New)

Proponent: Maureen Traxler, Seattle Dept of Planning & Development, representing Seattle Dept of Planning & Development (maureen.traxler@seattle.gov)

2015 International Existing Building Code

Add new text as follows:

401.2.4 Fire resistance ratings Where approved by the code official, buildings where an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2 of the International Building Code has been added, and the building is now sprinklered throughout, the required fire-resistance ratings of building elements and materials shall be permitted to meet the requirements of the current building code. The building is required to meet the other applicable requirements of the International Building Code.

Plans, investigation and evaluation reports, and other data shall be submitted indicating which building elements and materials the applicant is requesting the code official to review and approve for determination of applying the current building code fire-resistance ratings. Any special construction features, including fire-resistance-rated assemblies and smoke-resistive assemblies, conditions of occupancy, means-of-egress conditions, fire code deficiencies, approved modifications or approved alternative materials, design and methods of construction, and equipment applying to the building that impact required fire-resistance ratings shall be identified in the evaluation reports submitted.

Reason: The proposed language is identical to Section 803.6. The language was added to the 2015 IEBC by EB 26-13. The reason offered for EB26-13 was:

> "The topic of allowing the ability to apply sprinkler protection trade-offs that exist in the current code has been a matter of discussion in the code development arena for some time. How to apply the allowance for a potential reduction in fire-resistance ratings and in what code they belong have been discussed without a consensus.
>
> "The concept is that once a building without sprinkler protection has been sprinklered throughout, whether due to renovations or retroactive code application, the designer should be permitted to allow the same fire resistance rating provisions for new construction in an existing sprinklered building. The issue is how to provide for that application of code and ensure a proper review by the building code official is performed to ensure there are no impediments to granting an approval that may result in the reduction of existing levels of protection.
>
> "This proposal attempts to provide for that process by adding a new section to the IEBC under Section 806 Building Elements and Materials. The suggested language provides that once an existing building is sprinklered throughout and meets the other fire protection requirements of Chapter 9 of the IBC, plans, investigation and evaluation reports, and other data can be submitted seeking approval of the code official for the assignment of the new fire-resistance ratings which might me a reduction, or potentially an increase.
>
> "The suggested language also requires that any special construction features, conditions of occupancy, approved modifications or approved alternative materials, design and methods of construction, and equipment applying to the building that impact required fire-resistance ratings shall be identified in the evaluation reports submitted. This is to ensure special conditions are identified that may prevent a reduction in fire-resistance ratings."

In the 2015 IEBC, the new section applies only to the work area method of compliance, but the reasoning applies equally well to the prescriptive method. The proposed language doesn't work well with the performance method because that method relies heavily on consideration of individual building features.

Cost Impact: Will not increase the cost of construction
This proposal will not increase the cost of construction.

EB 16-15 : 401.2.4 (New)-TRAXLER3416

EB 17-15

401.3, 1401.3.1

Proponent: Maureen Traxler, representing Seattle Dept of Planning & Development (maureen.traxler@seattle.gov)

2015 International Existing Building Code

Delete without substitution:

~~**401.3 Dangerous conditions.** The building official shall have the authority to require the elimination of conditions deemed *dangerous*.~~

~~**1401.3.1 Hazards.** Where the *code official* determines that an unsafe condition exists as provided for in Section 115, such unsafe condition shall be abated in accordance with Section 115.~~

Reason: These two sections are unnecessary. Section 115 covers unsafe buildings more comprehensively than Section 401 and Section 1401.3. The subject of unsafe buildings is also addressed in two other sections, but those sections serve different purposes. Section 1202.2 states that historic buildings are not required to have more work than is necessary to correct the unsafe condition. Section 1008.2 serves a similar purpose with regard to electrical systems and change of occupancy.

Cost Impact: Will not increase the cost of construction
This proposal will not increase the cost of construction.

EB 17-15 : 401.3-TRAXLER3300

EB 18-15

401.4 (New), 804.2.4.1 (New)

Proponent: Richard Wood, University of Massachusetts-Lowell, representing University of Massachusetts-Lowell (richard_wood@uml.edu)

2015 International Existing Building Code

Add new text as follows:

401.4 Pyrophoric materials. Pyrophoric materials shall be permitted to be stored or used in existing buildings in accordance with any one of the following conditions.

1. One hundred percent of the maximum allowable quantity in accordance with IBC Table 307.1(1) in buildings equipped throughout with an approved automatic sprinkler system.
2. Fifty percent of the maximum allowable quantity in accordance with IBC Table 307.1(1) for storage or use in buildings on floors equipped throughout with an approved automatic sprinkler system.
3. Twenty five percent of the maximum allowable quantity in accordance with IBC Table 307.1(1) in buildings where all locations of storage and use are protected with an approved special hazards point suppression system.

804.2.4.1 Pyrophoric materials. Pyrophoric materials shall be permitted to be stored or used in existing buildings in accordance with any one of the following conditions.

1. One hundred percent of the maximum allowable quantity in accordance with IBC Table 307.1(1) in buildings equipped throughout with an approved automatic sprinkler system, or
2. Fifty percent of the maximum allowable quantity in accordance with IBC Table 307.1(1) for storage or use in buildings on floors equipped throughout with an approved automatic sprinkler system, or
3. Twenty five percent of the maximum allowable quantity in accordance with IBC Table 307.1(1)in buildings where all locations of storage and use are protected with an approved special hazards point suppression system.

Reason: The stated intent of the IEBC is to provide alternative approaches for remodel, repair, and alterations in existing buildings. This proposal recognizes the challenges associated with renovations in existing buildings and offers reasonable levels of safety as indicated in the "Effective Use of the International Existing Building Code" section of the IEBC.

Pyrophoric product usage in laboratories, located in other than the high hazard use groups, are generally in very small quantities, usually measured in grams. The presences of these quantities do not significantly elevate the risk.
Currently, compliance with the requirement for an automatic sprinkler system throughout an entire building may be implicated once a building permittable activity is sought. Full compliance would in some cases be so cost prohibitive, the owner might choose to make no improvements to the existing building. This decision may reduce the overall level of safety as time goes on. This proposal would allow for an alternate, more focused approach to risk mitigation for a specific hazard.

Cost Impact: Will not increase the cost of construction
This proposal will not increase, but rather decrease cost by allowing alernative, less costly, compliance methods in existing buildings utilizing these materials.

EB 18-15 : 401.2.4 (New)-WOOD5068

EB 19-15

402.1, 403.1, [BS] 403.9, 407.1, 601.2, 608.1, 805.2, [BS] 807.6

Proponent: David Bonowitz, David Bonowitz, S.E., representing Existing Buildings Subcommittee, National Council of Structural Engineers Associations (dbonowitz@att.net)

2015 International Existing Building Code

Revise as follows:

402.1 General. *Additions* to any building or structure shall comply with the requirements of the *International Building Code* for new construction. Alterations to the *existing building* or structure shall be made to ensure that the *existing building* or structure together with the *addition* are no less ~~conforming to~~complying with the provisions of the *International BuildingCode* than the *existing building* or structure was prior to the *addition*. An *existing building* together with its *additions* shall comply with the height and area provisions of Chapter 5 of the *International Building Code*.

403.1 General. Except as provided by Section 401.2 or this section, *alterations* to any building or structure shall comply with the requirements of the *International Building Code* for new construction. *Alterations* shall be such that the *existing building* or structure is no less ~~conforming to~~complying with the provisions of the *International Building Code* than the *existing building* or structure was prior to the *alteration*.

Exceptions:

1. An existing stairway shall not be required to comply with the requirements of Section 1011 of the *International Building Code* where the existing space and construction does not allow a reduction in pitch or slope.
2. Handrails otherwise required to comply with Section 1011.11 of the *International Building Code* shall not be required to comply with the requirements of Section 1014.6 of the *International Building Code* regarding full extension of the handrails where such extensions would be hazardous due to plan configuration.

[BS] 403.9 Voluntary seismic improvements. *Alterations* to existing structural elements or *additions* of new structural elements that are not otherwise required by this chapter and are initiated for the purpose of improving the performance of the seismic force-resisting system of an existing structure or the performance of seismic bracing or anchorage of existing nonstructural elements shall be permitted, provided that an engineering analysis is submitted demonstrating the following:

1. The altered structure and the altered nonstructural elements are no less ~~conforming to~~complying with the provisions of the *International Building Code* with respect to earthquake design than they were prior to the *alteration*.
2. New structural elements are detailed as required for new construction.
3. New or relocated nonstructural elements are detailed and connected to existing or new structural elements as required for new construction.
4. The *alterations* do not create a structural irregularity as defined in ASCE 7 or make an existing structural irregularity more severe.

407.1 ~~Conformance~~Compliance. No change shall be made in the use or occupancy of any building unless such building is made to comply with the requirements of the *International Building Code* for the use or occupancy. Changes in use or occupancy in a building or portion thereof shall be such that the existing building is no less complying with the provisions of this code than the existing building or structure was prior to the change. Subject to the approval of the building official, the use or occupancy of *existing buildings* shall be permitted to be changed and the building is allowed to be occupied for purposes in other groups without ~~conforming to~~complying with all of the requirements of this code for those groups, provided the new or proposed use is less hazardous, based on life and fire risk, than the existing use.

Exception: The building need not be made to comply with the seismic requirements for a new structure unless required by Section 407.4.

601.2 ~~Conformance~~Compliance. The work shall not make the building less ~~conforming~~complying than it was before the *repair* was undertaken.

608.1 General. Existing mechanical systems undergoing *repair* shall not make the building less ~~conforming~~complying than it was before the *repair* was undertaken.

805.2 General. The means of egress shall comply with the requirements of this section.

Exceptions:

1. Where the *work area* and the means of egress serving it complies with NFPA 101.
2. Means of egress ~~conforming to~~complying with the requirements of the building code under which the building was constructed shall be considered compliant means of egress if, in the opinion of the *code official*, they do not constitute a distinct hazard to life.

[BS] 807.6 Voluntary lateral force-resisting system alterations. *Alterations* of existing structural elements and additions of new structural elements that are initiated for the purpose of increasing the lateral force-resisting strength or stiffness of an existing structure and that are not required by other sections of this code shall not be required to be designed for forces ~~conforming to~~complying with the *International Building Code*, provided that an engineering analysis is submitted to show that:

1. The capacity of existing structural elements required to resist forces is not reduced;
2. The lateral loading to existing structural elements is not increased either beyond its capacity or more than 10 percent;
3. New structural elements are detailed and connected to the existing structural elements as required by the *International Building Code*;
4. New or relocated nonstructural elements are detailed and connected to existing or new structural elements as required by the *International Building Code*; and
5. A *dangerous* condition as defined in this code is not created. Voluntary *alterations* to lateral force-resisting systems conducted in accordance with Appendix A and the referenced standards of this code shall be permitted.

Reason: This is an editorial proposal that adds clarity and consistency. The appropriate phrase is "no less complying," not "no less conforming." "Complying" is also the term with greater precedent and preference, as seen in sections 301.1, 406.2, 407.1, 410, 702, 705, 803, 805, 903, 1012, 1203, and 1204.

Cost Impact: Will not increase the cost of construction
The proposal is entirely editorial.

EB 19-15 : 402.1-BONOWITZ5181

EB 20-15

402.1.1 (New), 410.6, 705.1, 1105.2 (New)

Proponent: Gene Boecker, representing Code Consultants, Inc. (geneb@codeconsultants.com)

2015 International Existing Building Code

Add new text as follows:

402.1.1 Accessible Means of Egress Additions shall provide accessible means of egress in accordance with Section 1009 of the *International BuildingCode.* Where the accessible means of egress from the addition leads through the existing building, the associated accessible means of egress path in the existing building shall be altered to be in accordance with Section 1009 of the *International Building Code.* Means of egress in the addition and existing building that are not accessible shall be provided with directional signage in accordance with Section 1009 of the *International Building Code* at the non-accessible portion of the means of egress.

Revise as follows:

410.6 Alterations. A *facility* that is altered shall comply with the applicable provisions in Chapter 11 of the *International Building Code*, unless *technically infeasible*. Where compliance with this section is *technically infeasible*, the *alteration* shall provide access to the maximum extent technically feasible.

Exceptions:

1. The altered element or space is not required to be on an accessible route, unless required by Section 410.7.
2. Accessible means of egress required by Chapter 10 of the *International Building Code* are not required to be provided in existing facilities except as required by Section 402.1.1.
3. The alteration to Type A individually owned dwelling units within a Group R-2 occupancy shall be permitted to meet the provision for a Type B dwelling unit.
4. Type B dwelling or sleeping units required by Section 1107 of the *International Building Code* are not required to be provided in *existing buildings* and facilities undergoing a *change of occupancy* in conjunction with *alterations* where the *work area* is 50 percent or less of the aggregate area of the building.

705.1 General. A *facility* that is altered shall comply with the applicable provisions in Sections 705.1.1 through 705.1.14, and Chapter 11 of the *International Building Code* unless it is *technically infeasible*. Where compliance with this section is *technically infeasible*, the alteration shall provide access to the maximum extent that is technically feasible.

A *facility* that is constructed or altered to be accessible shall be maintained accessible during occupancy.

Exceptions:

1. The altered element or space is not required to be on an accessible route unless required by Section 705.2.
2. Accessible means of egress required by Chapter 10 of the *International Building Code* are not required to be provided in existing *facilities* except as required by Section 1101.1.1.
3. Type B dwelling or sleeping units required by Section 1107 of the *International Building Code* are not required to be provided in existing *facilities* undergoing less than a Level 3 *alteration*.
4. The alteration to Type A individually owned dwelling units within a Group R-2 occupancy shall meet the provisions for Type B dwelling units.

Add new text as follows:

1105.2 Accessible means of egress Additions shall provide accessible means of egress in accordance with Section 1009 of the International Building Code. Where the accessible means of egress from the addition leads through the existing building, the associated accessible means of egress path in the existing building shall be altered to be in accordance with Section 1009 of the International Building Code. Means of egress in the addition and existing building that are not accessible shall be provided with directional signage in accordance with Section 1009 of the International Building Code at the non-accessible portion of the means of egress.

Reason: The proposal clarifies the application of the requirement for accessible means of egress (AMOE) in additions. The concept is the same for both the Prescriptive Compliance Method and Work Area Compliance Method. No proposal is made for Chapter 14 because Section 1401.2.5 already refers back to Sections 410 and 705 for accessibility complaince when using the Performance Compliance Method.

402.1.1 and 1101.1.1 - Because Section 410.6 of the IEBC (and Section 1009.1 of the IBC) contains an exception that states that the AMOE is not requried in existing buidlings, it creates confusion regarding what needs to be done when the AMOE from the addition leads through the existing buidling; whether it must continue through the existing buidling and require modification to the existing buidling as is implied in Section 402.1 or whether it can stop at the existing building due the explicit language in exception 2 of Section 410.6.

The proposed langage makes it clear that if the path of egress within the existing building cannot be made to comply with the requirements for an accessible means of egress, then the addition will need to provide all the AMOE requirements for the addition. This is the only option.

Finally, signage is required at the means of egress for both the addition and the existing buidling where those egress elements do not comply with the AMOE provisions of the IBC. If the means of egress in either the addition or existing building cannot meet the requirements as an AMOE then the directinoal signage must be provided so that the occupants can find the AMOE.

410.6 and 705.1 - It is clear that the blanket exception that the existing buidling is not required to have any acessible means of egress is not completely true. The requriements for the addition may force that upon the existing buidling. The text of these two sections should recognize and reflect that.

Cost Impact: Will not increase the cost of construction
The text is a clarification of the current interpretation.

EB 21-15

402.6 (New), 403.11 (New), 804.4.4 (New), 1105 (New), 1105.1 (New)

Proponent: Adolf Zubia, representing IAFC Fire & Life Safety Section

2015 International Existing Building Code

Add new text as follows:

402.6 Carbon monoxide alarms in existing portions of a building. Where an addition is made to a building or structure of a Group I-1, I-2, I-4 or R occupancy, the existing building shall be provided with carbon monoxide alarms in accordance with Section 1103.9 of the *International Fire Code* or Section R315of the *International Residential Code*, as applicable.

403.11 Carbon monoxide alarms. Carbon monoxide alarms shall be provided to protect sleeping units and dwelling units in Group I-1, I-2, I-4 and R occupancies in accordance with Section 1103.9 of the *International Fire Code.*

804.4.4 Carbon monoxide alarms. Sleeping units and dwelling units in any work area in Group I-1, I-2, I-4 and R occupancies shall be equipped with carbon monoxide alarms in accordance with Section 1103.9 of the International Fire Code.

SECTION1105 CARBON MONOXIDE ALARMS IN GROUPS I-1, I-2, I-4 AND R

1105.1 Carbon monoxide alarms in existing portions of a building Where an addition is made to a building or structure of a Group I-1, I-2, I-4 or R occupancy, the existing building shall be equipped with carbon monoxide alarms in accordance with Section 1103.9 of the *International Fire Code* or Section R315 of the *International Residential Code*, as applicable.

Reason: This proposal is submitted by the Fire and Life Safety Section of the International Association of Fire Chiefs.
IFC Section 1103.8 contains requirements for installing smoke alarms in existing occupancies. Those requirements are reflected in the IEBC Sections 402.5. 403.10, 804.4.3 and 1104.1. IFC Section 1103.9 contains requirements for installing carbon monoxide alarms in existing occupancies; however, those requirements are currently not reflected in the IEBC.

This proposal corrects this oversight with the new proposed code sections.

This proposal will provide consistency between the IFC, IRC and the IEBC with regard to the installation and requirements of carbon monoxide alarms.

Cost Impact: Will not increase the cost of construction
The cost of construction will not increase since the existing buildings should already be in compliance with the requirements in IFC Section 1103.9. This proposal simply provides correlation between the I-Codes.

EB 21-15 : 402.6 (New)-ZUBIA4683

EB 22-15

403.1, 801.3, 1401.2.6 (New)

Proponent: David Collins, representing The American Institute of Architects (dcollins@preview-group.com)

2015 International Existing Building Code

Revise as follows:

403.1 General. Except as provided by Section 401.2 or this section, *alterations* to any building or structure shall comply with the requirements of the *International Building Code* for new construction. *Alterations* shall be such that the *existing building* or structure is no less conforming to the provisions of the *International Building Code* than the *existing building* or structure was prior to the *alteration*.

Exceptions:

1. An existing stairway shall not be required to comply with the requirements of Section 1011 of the *International Building Code* where the existing space and construction does not allow a reduction in pitch or slope.
2. Handrails otherwise required to comply with Section 1011.11 of the *International Building Code* shall not be required to comply with the requirements of Section 1014.6 of the *International Building Code* regarding full extension of the handrails where such extensions would be hazardous due to plan configuration.
3. Where provided in below grade transportation stations, existing and new escalators shall be permitted to have a clear width of less than 32 inches (815 mm).

801.3 Compliance. All new construction elements, components, systems, and spaces shall comply with the requirements of the *International Building Code*.

Exceptions:

1. Windows may be added without requiring compliance with the light and ventilation requirements of the *International Building Code*.
2. Newly installed electrical equipment shall comply with the requirements of Section 808.
3. The length of dead-end corridors in newly constructed spaces shall only be required to comply with the provisions of Section 805.6.
4. The minimum ceiling height of the newly created habitable and occupiable spaces and corridors shall be 7 feet (2134 mm).
5. Where provided in below grade transportation stations, existing and new escalators shall be permitted to have a clear withd of less than 32 inches (815 mm).

Add new text as follows:

1401.2.6 Escalators Where escalators are provided in below grade transportation stations, existing and new escalators shall be permitted to have a clear width of less than 32 inches (815 mm).

Reason: Section 3004.2.2 of the IBC includes an exception for escalators serving below-grade transportation systems allowing their minimum width to be less than 32". Since the criteria for existing buildings is in the IEBC this change is to bring that exception into the appropriate code.

Cost Impact: Will not increase the cost of construction
This is simply putting the provisions found in the IBC into the IEBC for work involving an alteration and will not increase the cost of construction.

EB 22-15 : 403.1-COLLINS5113

EB 23-15

403.2 (New), 704.1, 704.2 (New)

Proponent: Adolf Zubia, representing IAFC Fire & Life Safety Section

2015 International Existing Building Code

Add new text as follows:

403.2 Locking arrangements in Group E occupancies. Where approved by the code official, egress doors from classrooms, offices and other occupied rooms in Group E occupancies shall be allowed to be provided with locking arrangements designed to keep intruders from entering the room that require a key, special knowledge or effort when all of the following conditions are met:

1. The door shall be capable of being unlocked from outside the room with a key or other approved means.
2. Modifications shall not be made to existing listed panic hardware, fire door hardware or door closers.
3. Modifications to fire door assemblies shall be in accordance with NFPA 80.
4. The unlatching of the door or leaf shall be allowed to require two operations.

Revise as follows:

704.1 General. *Alterations* shall be done in a manner that maintains the level of protection provided for the means of egress, except as allowed in Section 704.2.

Add new text as follows:

704.2 Locking arrangements in Group E occupancies. Where approved by the code official, egress doors from classrooms, offices and other occupied rooms in Group E occupancies shall be allowed to be provided with locking arrangements designed to keep intruders from entering the room that require a key, special knowledge or effort when all of the following conditions are met:

1. The door shall be capable of being unlocked from outside the room with a key or other approved means.
2. Modifications shall not be made to existing listed panic hardware, fire door hardware or door closers.
3. Modifications to fire door assemblies shall be in accordance with NFPA 80.
4. The unlatching of the door or leaf shall be allowed to require two operations.

Reason: This proposal is submitted by Fire and Life Safety Section of the International Association of Fire Chiefs.
Unfortunately active shooter incidents in schools are a threat in modern society that have resulted in the need to quickly secure classrooms and other occupied areas to keep unwanted intruders from entering.

Many unlisted devices are being used to secure the doors from being opened. Many of these devices have not been evaluated to insure they operate properly and do not impair door operation. These devices are being deployed in periodic lockdown drills, and present the potential to for students or unauthorized personnel to secure the doors so the rooms cannot be entered.

This proposal allows key actuated deadbolts or other locks to be provided on classroom doors, where the teacher can choose to lock the door and provide shelter-in-place in the classroom. The proposed change also requires the door to be able to be unlocked from the opposite side in cases where the school administrator or responders wish to enter the room without having to make a forcible entry.

Door hardware is currently available that allows classroom to be provided with lockdown capabilities that comply with applicable IBC Chapter 10 requirements. However the costs of retrofitting doors with that hardware far exceed the cost of retrofitting with a simple deadbolt lock. This is a significant issue for school systems who are continually facing budget restrictions.

This code change limits this optional locking method only when the building is undergoing alternations. This allowance is intentionally not provided for buildings undergoing additions or a change of occupancy.

It is not necessary to add new language to the Chapter 9 alteration provisions since Section 905.1 references Section 805 means of egress requirements.

Cost Impact: Will not increase the cost of construction
This proposal allows an option that may result in lower costs than retrofitting egress doors with locking hardware that complies with IBC Chapter 10 requirements.

EB 23-15 : 704.1-ZUBIA4731

EB 24-15

403.10

Proponent: Anthony Apfelbeck, City of Altamonte Springs, representing City of Altamonte Springs (ACApfelbeck@altamonte.org)

2015 International Existing Building Code

Revise as follows:

403.10 Smoke alarms. ~~Individual sleeping units and individual dwelling units in~~
Where an *alteration* is made to a building or structure of a Group R ~~and~~or I-1 ~~occupancies~~ occupancy, the *existing building* shall be provided with smoke alarms in accordance with Section 1103.8 of the *International Fire Code*.

Reason: This proposal makes the language in 403.10 consistent with the reading of 402.5. The commentary indicates that both of these sections are intended to be consistent as to application. The current different language appears to infer a differing intent of the two sections. If the two sections have the same intent as to application, they should read the same.

Cost Impact: Will not increase the cost of construction
Editorial revision to impove consistency between similar code language.

EB 24-15 : 403.10-APFELBECK4258

EB 25-15

403.11 (New), 703.2 (New)

Proponent: Jonathan Wilson, National Center for Healthy Housing, representing National Center for Healthy Housing (jwilson@nchh.org)

2015 International Existing Building Code

Add new text as follows:

403.11 Carbon monoxide alarms. Carbon monoxide alarms shall be installed in accordance with Section 1103.9 of the *International Fire Code* in Groups I-1, I-2, I-4 and R occupancies.

703.2 Carbon monoxide alarms Carbon monoxide alarms shall be installed in accordance with Section 1103.9 of the *International Fire Code* in Groups I-1, I-2, I-4 and R occupancies.

Reason: In 2011, 49 million homes had carbon monoxide alarms.[1] Almost 4.5 million more homes had an alarm in 2011, compared to 2009.[2] These alarms protect residents and their guests from carbon monoxide poisoning which kills more than 300 people annually and hurts thousands more.[3] The carbon monoxide typically results from incomplete combustion of a fuel, usually when a vehicle, furnace, water heater, or fireplace is either functioning poorly or is warming up and has not yet reached optimum performance.[4] The risk is greatest where there are older appliances or where the garage is not properly isolated from the occupied area.
When carbon monoxide exposes residents to dangerous levels of this odorless, tasteless, invisible gas, the alarm warns them to get to safety before their brains are so starved of oxygen that they become sleepy or disoriented and unable to escape.[3] The alarm complements the many educational and code-related efforts to reduce carbon monoxide generation and exposure and serves to prevent death and serious harm much as a smoke alarm does.

According to health and safety experts at the Centers for Disease Control and Prevention (CDC),[3] the Consumer Product Safety Commission (CDC)[5] and the National Fire Protection Association (NFPA),[6] all dwellings with either an attached garage or a fuel-burning appliance should have a functioning carbon monoxide alarm. Recognizing the gaps in the existing codes, elected officials in the many states have adopted laws requiring the alarms, often in response to a tragedy.[7] The National Electric Manufacturers Association (NEMA)[8] also agrees. A decade ago, a five-year Underwriters Laboratory study confirmed the reliability of the alarms and concluded the alarms are not susceptible to nuisance activations.[9]

The ICC's International Fire Code (IFC) section 1103.9 and International Residential Code (IRC) section R315.3 now require carbon monoxide alarms in almost all dwellings with an attached garage or fuel-burning appliance. The IRC requirement is triggered by new construction or work requiring any permit without regard to whether the work affected a fuel-burning appliance. The IFC requirement applies to Group I and R occupancies (with a limited exception) and, therefore, not to homes covered by the IRC. Because the IFC alarm requirement is in a maintenance provision in Chapter 11, it applies to existing conditions and operations pursuant to section 102.2 and not only construction. While the maintenance provisions of section 1103 may result in the need for a permit pursuant to section 1103.1 to correct deficiencies, they are not triggered solely by a permit.

This proposal adds two new sections to the IEBC. New section 403.11 would require alarms in homes in accordance with the IFC as part of the prescriptive compliance methods covered by Chapter 4. New section 703.2 would do the same as part of work area compliance methods for Level 1 alterations.

In those jurisdictions that have both the IFC and the IEBC, this proposal is designed to improve compliance in those communities. In those jurisdictions with the IEBC but not the IFC, a more protective state law may apply. If no state law applies, this proposal would require an installation of a carbon monoxide alarm when a permit is triggered by the IEBC. Owners of these units will incur costs of about $42 each, but these costs will be far outweighed by the many millions saved on emergency hospitalizations and victim rehabilitation. See the cost-benefit analysis below for details.

Cost Impact: Will increase the cost of construction
COSTS
Carbon monoxide (CO) alarms listed as complying with ANSI/UL 2034 typically costs approximately $25 per unit and are relatively simple to install. We estimate the total installed cost to be $42 per dwelling.

According to the 2011 American Housing Survey (AHS),[1] an estimated 49 of 115 million occupied homes (41.6% of all homes) had working carbon monoxide detectors. About half of these detectors were powered only by batteries. Overall, 46% of owner-occupied homes and 33% of renters had detectors. The rates varied by region of the country with the Northeast at 65%, the Midwest at 54%, the West at 30%, and the South at 27%. The AHS does not track garages that are attached separately from those that are not attached.

The IFC has been adopted statewide in 28 states and locally in 11 more.[10] Unless the state or locality opted not to adopt Section 1103.9 of the IFC or a limited exception applies, a CO alarm is required all dwelling units in Group I or R occupancies containing a fuel-burning appliance or that has an attached garage (other than an open parking garage or ventilated enclosed parking garage). The units must be equipped with a single station CO alarm list as complying with UL 2034 installed and maintained in accordance with NFPA 720 and the manufacturer's instructions. In these jurisdictions, the proposal will only improve compliance with IFC and not increase construction cost.

In states without a statewide IFC, 17 have adopted the IEBC statewide or locally.[10]

- For the seven with no state or local IFC, Illinois and Massachusetts have state laws requiring CO alarms in all dwellings, West Virginia requires it in most dwellings covered by the IEBC, and Maine requires alarms when the property is sold.[7] Therefore, only Florida, Michigan, and Maryland would be impacted by the proposal. Michigan legislature has already given the Code Commission authority to require CO alarms.[7]
- Of the remaining ten with local IFCs, Colorado requires CO alarms in all dwellings, Montana requires alarms in rental property, Wisconsin requires them in multifamily housing, and New Hampshire on substantial rehabilitation.[7] Therefore, Louisiana, Nevada, Delaware, Missouri, Nebraska, North Dakota, and Texas would be impacted by the proposal in Group I and R occupancies.

BENEFITS:
The benefits of a CO alarm in fewer deaths, emergency room visits, hospitalizations, treatment, and rehabilitation far outweigh the $42 per home cost. The U.S. Consumer Product Safety Commission (CPSC) estimated the societal costs of unintentional non-fire CO poisoning deaths associated with consumer products at $705 million annually from 1999 to 2002.[9]

A 2012 study[10] estimated that the hospitalization cost for confirmed carbon monoxide poisonings was more than $26 million in 2007, based on 21,304 emergency room visits and 2,302 hospitalizations. This estimate only includes the cost of confirmed hospitalizations and not (1) the rehabilitation and long-term treatment costs, and (2) the thousands of cases where the poisoning occurred but was not confirmed, usually because the person was unaware of the exposure. In 2007, for every confirmed case there were an estimated five probable or suspected cases.[11] More recent numbers are not available though they should have decreased due to the actions by state and local legislatures, as well as implementation of the 2012 editions of the IRC and IFC.

Beyond victim hospitalization and treatment costs, carbon monoxide costs communities whose emergency responders respond to non-fire-related incidents. In 2012, the National Fire Protection Association estimated that municipal fire departments responded to an annual average of 72,000 of these incidents between 2006 and 2010, with 94% of the incidents occurring in residential properties and 73% in one- or two-family homes.[12] The alarms are likely to increase the number of responses, but, based on the UL study, few will be the result of nuisance alarms.[9]

EB 25-15 : 403.11 (New)-WILSON5120

EB 26-15

404.1, 502.1

Proponent: David Bonowitz, David Bonowitz, S.E., representing Existing Buildings Subcommittee, National Council of Structural Engineers Associations (dbonowitz@att.net)

2015 International Existing Building Code

Revise as follows:

404.1 General. Buildings and structures, and parts thereof, shall be repaired in compliance with ~~Sections 401.2 and 404~~this section. Work on nondamaged components that is necessary for the required *repair* of damaged components shall be considered part of the *repair* and shall not be subject to the requirements for *alterations* in this chapter. ~~Routine maintenance required by Section 401.2~~Maintenance, ~~ordinary repairs~~ work exempt from permit in accordance with Section 105.2, and abatement of wear due to normal service conditions shall not be subject to the requirements for repairs in this section.

502.1 Scope. *Repairs,* as defined in Chapter 2, include the patching or restoration or replacement of damaged materials, elements, *equipment or fixtures* for the purpose of ~~maintaining such components in good or sound~~restoring the predamage condition with respect to existing loads or performance requirements.

Reason: This proposal clarifies a distinction between the scopes of the IEBC and the IPMC. The distinction between maintenance and repair is already implied by the two codes, but some of the codes' wording has led to confusion. In particular, use of the words "maintenance" or "maintain" in various provisions for repairs has led some users and code officials to think that repair provisions either apply to maintenance work or may be used in lieu of maintenance provisions (in the IPMC or elsewhere).
The key conceptual distinction, as the current IEBC infers, is that "maintenance" preserves an acceptable condition, while "repair" corrects an unacceptable condition. Thus, maintenance applies even to an element in good condition and working order, while repair applies only after some damage has occurred.

The evidence is clear that the IEBC and IPMC intend to distinguish maintenance from repair: Maintenance is not defined in the IEBC. The IEBC makes an explicit distinction between the two types of work in Sections 404.1, 1301.2, and 1501.6.6. Sections 410.1, 410.2, and 1505.2 use the term "maintenance" to refer to preservation of an acceptable condition, not remedy of an unacceptable one. Section 105 makes the same distinction indirectly by acknowledging that some repairs, even though they correct damage, are as "ordinary" and commonplace as maintenance and thus also do not require a permit.

IPMC Section 101.3 distinguishes maintenance from repair, and Section 102.3 says repair is to be done in accordance with the IEBC. IEBC Section 101.7 acknowledges the same thing, namely that the IPMC may mandate repairs to correct violations and may refer to the IEBC as the basis for compliance.

The evidence is also clear that the IEBC intends its repair provisions to correct damage: Chapters 4 and 6 refer repeatedly to the "predamage" condition. Section 502.1, though it uses the verb "maintain" in its plain English sense, is explicit that repair means "restoration or replacement of damaged materials, elements, equipment or fixtures." Section 502.3 addresses the "repair of damaged components" and specifically distinguishes them from the undamaged components that do not need repair but might be affected by a repair procedure. Section 1302.7 speaks of repair specifically in the context of damage to a relocated building.

To clarify these distinctions, this proposal makes the following revisions:

In Section 404.1, it makes three edits:

- It deletes the unnecessary word "routine." There are not multiple types of maintenance, routine and non-routine.
- It replaces"ordinary repairs" with a more proper and generic term. The important point is to refer to Section 105.2 for work that does not require permits.
- It removes the incorrect reference to Section 401.2 in two places. The first instance could refer instead to Section 302.4 but is not needed. The second instance is clearly a mistake, as Section 401.2 is not about maintenance at all. This used to be a matching reference to IBC Section 3401.2, which addressed maintenance, but that provision no longer exists anywhere in the IEBC.

In Section 502.1, it makes two edits:

- It replaces the word "maintaining" with "restoring," to avoid confusion between maintenance and repair.
- It replaces the phrase "good or sound" (removed elsewhere in past cycles) with "predamage," as used elsewhere in Chapters 4 and 6.

If approved, coordinating proposals will be made in Group B as follows:

- Revise the definition of Repair to remove the confusing word "maintenance" and to clarify that repair addresses damage.
- Revise the definition of Roof Repair similarly.
- Revise Section 105.2 as needed for consistency

Cost Impact: Will not increase the cost of construction
The proposal is editorial, for purposes of clarifying an existing distinction in scope between the IEBC and IPMC.

EB 26-15 : 404.1-BONOWITZ5251

EB 27-15

405.1.3, 805.3.1.2.1

Proponent: John Coleman, representing JOMY Fire Escape Ladder and Fire Escape Systems

2015 International Existing Building Code

Revise as follows:

405.1.3 New fire escapes. New fire escapes for *existing buildings* shall be permitted only where exterior stairways cannot be utilized due to lot lines limiting stairway size or due to the sidewalks, alleys or roads at grade level. ~~New~~

Exception: Where approved by the code official fire ~~escapes~~escape ladders shall ~~not incorporate ladders or access by windows.~~be permitted.

805.3.1.2.1 Fire escape access and details. Fire escapes shall comply with all of the following requirements:

1. Occupants shall have unobstructed access to the fire escape without having to pass through a room subject to locking.
2. Access to a new fire escape shall be through a door, except that windows shall be permitted to provide access from single dwelling units or sleeping units in Group R-1, R-2 and I-1 occupancies or to provide access from spaces having a maximum occupant load of 10 in other occupancy classifications.
   - 2.1. The window shall have a minimum net clear opening of 5.7 square feet (0.53 m^2) or 5 square feet (0.46 m^2) where located at grade.
   - 2.2. The minimum net clear opening height shall be 24 inches (610 mm) and net clear opening width shall be 20 inches (508 mm).
   - 2.3. The bottom of the clear opening shall not be greater than 44 inches (1118 mm) above the floor.
   - 2.4. The operation of the window shall comply with the operational constraints of the *International Building Code*.
3. Newly constructed fire escapes shall be permitted only where exterior stairways cannot be utilized because of lot lines limiting the stairway size or because of the sidewalks, alleys, or roads at grade level.
   Exception: Where approved by the code official fire escape ladders shall be permitted.
4. Openings within 10 feet (3048 mm) of fire escape stairways shall be protected by fire assemblies having minimum $^3/_4$ -hour fire-resistance ratings.
   Exception: Opening protection shall not be required in buildings equipped throughout with an approved automatic sprinkler system.
5. In all buildings of Group E occupancy, up to and including the 12th grade, buildings of Group I occupancy, rooming houses and childcare centers, ladders of any type are prohibited on fire escapes used as a required means of egress.

Reason: Permenently affixed retractable fire escape ladders and counterbalanced ladders now exist and are avaiable. These are used in major cities in Europe. They serve where individuals or companies want alternate means of egress in the event of fire that are not currently in the existing building.
In major cities, some existing buildings have limited space for new fire escapes due to lot lines which limit stairs or due to sidewalks, alleys and or roads. These permenently affixed retractable fire escape ladders and counterbalanced ladders now allow a building owner a safe means of secondary egress in the event of fire.

Systems are approved currently in NFPA 101. NFPA 101 2015 edition p.75 section 101.7.2.9 Fire Escape Ladders (5)

http://www.nfpa.org/codes-and-standards/document-information-pages?mode=code&code=101

Images of fire escape ladders.

Below are two examples. The first is a "permanently affixed collapsible fire escape system" and the second is a "permanently affixed counter-balanced fire escape system."

FIXED-ESCAPE™

Previous System Next Systen

Permanent Collapsible Fire Escape Ladder! by Jomy.
The escape ladder that's always there!

The Fixed-Escape™ permanent collapsible fire escape ladder is mounted to the outside of any structure and provides a ready method of emergency escape. It folds up to look like a drainpipe when not in use. It is constructed of durable extruded anodized aluminum alloy and will support 650 pounds per rung and a total weight of 5,500 pounds. This system offers the maximum degree of confidence before and during an emergency situation. The perfect solution, for homes with first or second story roof over hangs underneath windows.

- Extruded 6063-T6 Aluminum Alloy and 18/8 Stainless Steel Construction.
- 22 inch rungs each have 650 pound load capacity per rung-5,500 pound load per ladder.
- Collapses into an architecturally discreet 3 ¼" by 3 ¾" aluminum case.
- Latch and spring operation makes use extremely easy-can be security locked at top of ladder.
- Meets all OSHA and local code specifications.
- Underwriters Laboratory listed.

COUNTER-BALANCED FIXED-ESCAPE™

Previous System Next System

Counter Balanced Fixed-Escape™ by JOMY ladders are all aluminum construction and have nylon bushings and stainless steel cables and fasteners to provide a life-time of rust-free and maintenance free service. Counter-balanced lead weights are concealed inside the patented side rails of the ladder to provide trouble-free use regardless of weather conditions.

The ladder can be released from top or bottom (you select). When from the top, it provides safe egress from roof, window or door. When from the bottom, it provides lockable access to mezzanines and roofs. Caged ladders for lengths over 20 feet to be OSHA compliant.Also can be equipped with Fixed Escape Fall Restraint Systems. **Available in stock standard lengths and custom lengths for special situations. Fixed ladders with and without cage and security door are also available- contact us for details.**

Bibliography: 2015 NFPA 101

Cost Impact: Will not increase the cost of construction
This will not increase the cost of construction. Systems are not mandated, however if wanted and approved by the Authority Having Jurisdiction, prices range from $2000.00 up depending on type and size.

EB 27-15 : 405.1.3-COLEMAN5368

EB 28-15

405.5

Proponent: Jeff Hugo, National Fire Sprinkler Association, representing National Fire Sprinkler Association (hugo@nfsa.org)

2015 International Existing Building Code

Revise as follows:

405.5 Opening protectives. Doors and windows ~~along the~~within 10 feet of fire escape stairways shall be protected with $^3/_4$ -hour opening protectives.

Exception: Opening protection shall not be required in buildings equipped throughout with an automatic sprinkler system.

Reason: Section 805.3.1.2.1 permits this exception for Level 2 Alterations. This proposal would provide the same exception for fire doors and windows along the fire escape when using the prescriptive compliance method.

Cost Impact: Will not increase the cost of construction
When fire sprinkler systems are installed there would be no need to install new opening protectives.

EB 28-15 : 405.5-HUGO4696

EB 29-15

406.2, 406.3, 702.4, 702.5

Proponent: Edward Kulik, Chair, representing Building Code Action Committee (bcac@iccsafe.org)

Revise as follows:

406.2 Replacement window opening control devices. In Group R-2 or R-3 buildings containing dwelling units and one- and two-family dwellings and townhouses regulated by the *International Residential Code*, window opening control devices complying with ASTM F 2090 shall be installed where an existing window is replaced and where all of the following apply to the replacement window:

1. The window is operable;
2. The window replacement includes replacement of the sash and the frame;
3. ~~The~~One of the following applies:
    1. In Group R-2 or R-3 building containing dwelling units, the top of the sill of the window opening is at a height less than 36 inches (915 mm) above the finished floor; or
    2. In one- and two-family dwellings and townhouses regulated by the International Residential Code, the top sill of the window opening is at a height less than 24 inches (610 mm) above the finished floor;
4. The window will permit openings that will allow passage of a 4-inch-diameter (102 mm) sphere when the window is in its largest opened position; and
5. The vertical distance from the top of the sill of the window opening to the finished grade or other surface below, on the exterior of the building, is greater than 72 inches (1829 mm).

The window opening control device, after operation to release the control device allowing the window to fully open, shall not reduce the minimum net clear opening area of the window unit to less than the area required by Section 1029.2 of the *International Building Code*.

Exceptions:

1. Operable windows where the top of the sill of the window opening is located more than 75 feet (22860 mm) above the finished grade or other surface below, on the exterior of the room, space or building, and that are provided with window fall prevention devices that comply with ASTM F 2006.
2. Operable windows with openings that are provided with window fall prevention devices that comply with ASTM F 2090.

406.3 Replacement window emergency escape and rescue openings. Where windows are required to provide *emergency escape* and *rescue openings* in Group R-2 and R-3 occupancies and one- and two-family dwellings and townhouses regulated by the *International Residential Code*, replacement windows shall be exempt from the requirements of Sections 1030.2, 1030.3 and 1030.5 of the *International Building Code* and Sections R310.2.1 and R310.2.3 of the *International Residential Code* accordingly provided the replacement window meets the following conditions:

1. The replacement window is the manufacturer's largest standard size window that will fit within the existing frame or existing rough opening. The replacement window shall be permitted to be of the same operating style as the existing window or a style that provides for an equal or greater window opening area than the existing window.
2. The replacement of the window is not part of a change of occupancy.

Window opening control devices complying with ASTM F 2090 shall be permitted for use on windows required to provide emergency escape and rescue openings.

702.4 Window opening control devices on replacement windows. In Group R-2 or R-3 buildings containing dwelling units and one- and two-family dwellings and townhouses regulated by the *International Residential Code*, window opening control devices complying with ASTM F 2090 shall be installed where an existing window is replaced and where all of the following apply to the replacement window:

1. The window is operable;
2. The window replacement includes replacement of the sash and the frame;
3. One of the following applies:
    - 3.1. In Group R-2 or R-3 buildings containing dwelling units, the top of the sill of the window opening is at a height less than 36 inches (915 mm) above the finished floor; or
    - 3.2. In one- and two-family dwellings and town-houses regulated by the *International Residential Code*, the top sill of the window opening is at a height less than 24 inches (610 mm) above the finished floor;
4. The window will permit openings that will allow passage of a 4-inch-diameter (102 mm) sphere when the window is in its largest opened position; and
5. The vertical distance from the top of the sill of the window opening to the finished grade or other surface below, on the exterior of the building, is greater than 72 inches (1829 mm).

The window opening control device, after operation to release the control device allowing the window to fully open, shall not reduce the minimum net clear opening area of the window unit to less than the area required by Section 1029.2 of the *International Building Code*.

Exceptions:

1. Operable windows where the top of the sill of the window opening is located more than 75 feet (22 860 mm) above the finished grade or other surface below, on the exterior of the room, space or building, and that are provided with window fall prevention devices that comply with ASTM F 2006.
2. Operable windows with openings that are provided with window fall prevention devices that comply with ASTM F 2090.

702.5 ~~Emergency~~Replacement window emergency escape and rescue openings. Where windows are required to provide emergency escape and rescue openings in Group R-2 and R-3 occupancies and one- and two-family dwellings and townhouses regulated by the *International Residential Code*, replacement windows shall be exempt from the requirements of Sections 1030.2, 1030.3 and 1030.5 of the *International Building Code* and Sections R310.21 and R310.2.3 of the *International Residential Code* accordingly, provided the replacement window meets the following conditions:

1. The replacement window is the manufacturer's largest standard size window that will fit within the existing frame or existing rough opening. The replacement window shall be permitted to be of the same operating style as the existing window or a style that provides for an equal or greater window opening area than the existing window.
2. The replacement of the window is not part of a change of occupancy.

Window opening control devices complying with ASTM F 2090 shall be permitted for use on windows required to provide *emergency escape* and *rescue openings*.

Reason: This public proposal is submitted by the ICC Building Code Action Committee (BCAC). The BCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the BCAC has held 13 open meetings and numerous workgroup calls which included members of the BCAC as well as any interested party to discuss and debate the proposed changes and the public comments. Related documentation and reports are posted on the BCAC website at: http://www.iccsafe.org/cs/BCAC/Pages/default.aspx.
The intent of this proposal is for consistent terminology in the IEBC between Chapter 4 and 7 when dealing with replacement windows. The added language also clarifies that this applies to windows in IRC dwellings.

Cost Impact: Will not increase the cost of construction
Will not increase the cost of construction.

Staff note: An errata was addressed in Section 406.3 where reference to Sections 1030.2, 1030.3 and 1030.5 should have referenced "of the International Building Code." Therefore the phrase did not need to be underlined.

EB 29-15 : 406.2-KULIK3685

EB 30-15

407.1, 410.4

Proponent: Maureen Traxler, representing Seattle Dept of Planning & Development (maureen.traxler@seattle.gov)

2015 International Existing Building Code

Revise as follows:

407.1 Conformance. No change of occupancy shall be made in ~~the use or occupancy of~~ any building unless ~~such~~the building is made to comply with the requirements of the *International Building Code* for the use or occupancy. Changes ~~in use or~~of occupancy in a building or portion thereof shall be such that the existing building is no less complying with the provisions of this code than the existing building or structure was prior to the change. Subject to the approval of the building official, ~~the use or~~changes of occupancy ~~of *existing buildings*~~ shall be permitted ~~to be changed and the building is allowed to be occupied for purposes in other groups~~ without conforming to all of the requirements of this code for ~~those groups~~the new occupancy, provided the new ~~or proposed use~~occupancy is less hazardous, based on life and fire risk, than the existing ~~use~~occupancy.

> **Exception:** The building need not be made to comply with the seismic requirements for a new structure unless required by Section 407.4.

410.4 Change of occupancy. *Existing buildings* that undergo a change of ~~group or~~ occupancy shall comply with this section.

> **Exception:** Type B dwelling or sleeping units required by Section 1107 of the *International Building Code* are not required to be provided in *existing buildings* and facilities undergoing a *change of occupancy* in conjunction with *alterations* where the *work area* is 50 percent or less of the aggregate area of the building.

Reason: These changes are proposed for consistency with EB52-12 from the last code cycle. EB52 modified the definition of "change of occupancy" and made other changes consistent with the revised definition. EB52, however, only modified Chapter 10 for the work area method of compliance. This proposal makes changes that make the prescriptive compliance method consistent with EB52 and the work area method.
EB52-12 modified the definition of "change of occupancy" to make clear distinctions between changing occupancy classifications (e.g., B to R), changing occupancy group (e.g., R-1 to R-2), and changing use within a group (e.g., R-2 dormitory to R-2 boarding house). However, any of those changes are still under the umbrella "change of occupancy" definition, which is why this proposal changes the terms "group" and "use" to "occupancy."

Cost Impact: Will not increase the cost of construction
This proposal makes editorial changes for consistency within the code.

EB 30-15 : 407.1-TRAXLER5575

EB 31-15

408.3 (New), 1203.2 (New)

Proponent: Anthony Apfelbeck, City of Altamonte Springs, representing City of Altamonte Springs (ACApfelbeck@altamonte.org)

2015 International Existing Building Code

Add new text as follows:

408.3 Fire protection plan. *Additions, alterations, changes in occupancy* or *repairs* to historic buildings shall be in compliance with the *approved* fire protection plan developed in accordance with Section 1103.1.1 of the *International Fire Code.*

1203.2 Fire protection plan. Additions, alterations, changes in occupancy or repairs to historic buildings shall be in compliance with the approved fire protection plan developed in accordance with Section 1103.1.1 of the International Fire Code.

Reason: Section 1103.1.1 of the IFC requires that each historic building have an approved fire protection plan in accordance with NFPA 914. Any repairs, alterations, additions or changes of occupancy should only occur in accordance with the approved fire protection plan. The fire protection plan is a key component for the life safety and property preservation of historic buildings. Referencing the fire protection plan in Section 408 and Section 1203 of the IEBC will ensure the building official, design professional, owner and contractor all understand the fire protection plan under the IFC is applicable and need to be consulted.

Cost Impact: Will not increase the cost of construction
This code change does not change an existing technical provision but does provide a more obvious pointer to the important provision of IFC applicable to historic buildings.

EB 31-15 : 408.3 (New)-APFELBECK4260

EB 32-15

409

Proponent: Edward Kulik, Chair, representing Building Code Action Committee (bcac@iccsafe.org)

2015 International Existing Building Code

Delete without substitution:

~~**SECTION 409 MOVED STRUCTURES**~~

~~**409.1 Conformance.** Structures moved into or within the jurisdiction shall comply with the provisions of this code for new structures.~~

Reason: The purpose of this proposal is to remove Section 409 altogether since the IEBC does not contain requirements for new construction. That requirement as written presents an unresolvable conflict within the IEBC, and also between the IBC with the IEBC.
Previous editions of the IBC contained requirements for both new and existing buildings. This specific language appeared in the 2012 IBC as Section 3410. All of the requirements for existing buildings that were previously located in IBC Chapter 34 were moved from the IBC to the IEBC in the 2015 Edition.

In the context of the 2015 IEBC, this section is a technically inaccurate statement since existing structures that are moved are no longer required by the IEBC to comply with the requirements for new buildings.

Although there is nothing in any code that would preclude an owner from bringing an existing building or a moved structure up to the new building code requirements, the IEBC code permits an owner other, more practical options.

This public proposal is submitted by the ICC Building Code Action Committee (BCAC). The BCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the BCAC has held 13 open meetings and numerous workgroup calls which included members of the BCAC as well as any interested party to discuss and debate the proposed changes and the public comments. Related documentation and reports are posted on the BCAC website at: http://www.iccsafe.org/cs/BCAC/Pages/default.aspx.

Cost Impact: Will not increase the cost of construction
This code change proposal will not increase the cost of construction because it simply eliminates a conflict that exists in the IEBC and between the IBC and IEBC which only helps to clarify the requirements already in place.

2015 International Existing Building Code

Revise as follows:

~~410.1~~303.1 Scope. The provisions of Sections ~~410.1~~303.1 through ~~410.9~~303.9 apply to maintenance, *change of occupancy*, *additions* and *alterations* to *existing buildings*, including those identified as *historic buildings*.

~~410.2~~303.2 Maintenance of facilities. *No change to text.*

~~410.3~~303.3 Extent of application. *No change to text.*

~~410.4~~303.4 Change of occupancy. *No change to text.*

~~410.4.1~~303.4.1 Partial change in occupancy. Where a portion of the building is changed to a new occupancy classification, any *alterations* shall comply with Sections ~~410.6~~303.6, ~~410.7~~303.7 and ~~410.8~~303.8.

~~410.4.2~~303.4.2 Complete change of occupancy. Where an entire building undergoes a *change of occupancy*, it shall comply with Section ~~410.4.1~~303.4.1 and shall have all of the following accessible features:

1. At least one accessible building entrance.
2. At least one accessible route from an accessible building entrance to *primary function* areas.
3. Signage complying with Section 1111 of the *International Building Code*.
4. Accessible parking, where parking is being provided.
5. At least one accessible passenger loading zone, when loading zones are provided.
6. At least one accessible route connecting accessible parking and accessible passenger loading zones to an accessible entrance.

Where it is *technically infeasible* to comply with the new construction standards for any of these requirements for a change of group or occupancy, the above items shall conform to the requirements to the maximum extent technically feasible.

Exception: The accessible features listed in Items 1 through 6 are not required for an accessible route to Type B units.

~~410.5~~303.5 Additions. Provisions for new construction shall apply to *additions*. An *addition* that affects the accessibility to, or contains an area of, a *primary function* shall comply with the requirements in Section ~~410.7~~303.7.

~~410.6~~303.6 Alterations. A *facility* that is altered shall comply with the applicable provisions in Chapter 11 of the *International Building Code*, unless *technically infeasible*. Where compliance with this section is *technically infeasible*, the *alteration* shall provide access to the maximum extent technically feasible.

Exceptions:

1. The altered element or space is not required to be on an accessible route, unless required by Section ~~410.7~~303.7.
2. Accessible means of egress required by Chapter 10 of the *International Building Code* are not required to be provided in existing facilities.
3. The alteration to Type A individually owned dwelling units within a Group R-2 occupancy shall be permitted to meet the provision for a Type B dwelling unit.
4. Type B dwelling or sleeping units required by Section 1107 of the *International Building Code* are not required to be provided in *existing buildings* and facilities undergoing a *change of occupancy* in conjunction with *alterations* where the *work area* is 50 percent or less of the aggregate area of the building.

~~410.7~~303.7 Alterations affecting an area containing a primary function. *No change to text.*

~~410.8~~303.8 Scoping for alterations. The provisions of Sections ~~410.8.1~~303.8.1 through ~~410.8.14~~303.8.15 shall apply to *alterations* to *existing buildings* and *facilities*.

~~410.8.1~~303.8.1 Entrances. *No change to text.*

~~410.8.2~~303.8.2 Elevators. *No change to text.*

~~410.8.3~~303.8.3 Platform lifts. *No change to text.*

~~410.8.4~~303.8.4 Stairways and escalators in existing buildings. *No change to text.*

~~410.8.5~~303.8.5 Ramps. Where slopes steeper than allowed by Section 1012.2 of the *International Building Code* are necessitated by space limitations, the slope of ramps in or providing access to existing facilities shall comply with Table ~~410.8.5~~303.8.5.

TABLE 303.8.5
RAMPS

SLOPE	MAXIMUM RISE
Steeper than 1:10 but not steeper than 1:8	3 inches
Steeper than 1:12 but not steeper than 1:10	6 inches

For SI: 1 inch = 25.4 mm.

~~410.8.6~~303.8.6 Accessible dwelling or sleeping units. *No change to text.*

~~410.8.7~~303.8.7 Type A dwelling or sleeping units. *No change to text.*

~~410.8.8~~303.8.8 Type B dwelling or sleeping units. *No change to text.*

303.8.9 Dining areas An accessible route to raised or sunken dining areas or to outdoor seating areas is not required provided that the same services and decor are provided in an accessible space usable by any occupant and not restricted to use by people with a disability.

~~410.8.9~~303.8.10 **Jury boxes and witness stands.** *No change to text.*

~~410.8.10~~303.8.11 **Toilet rooms.** *No change to text.*

~~410.8.11~~303.8.12 **Dressing, fitting and locker rooms.** *No change to text.*

~~410.8.12~~303.8.13 **Fuel dispensers.** *No change to text.*

~~410.8.13~~303.8.14 **Thresholds.** *No change to text.*

~~410.8.14~~303.8.15 **Amusement rides.** *No change to text.*

~~410.9~~303.9 **Historic buildings.** These provisions shall apply to *facilities* designated as historic structures that undergo *alterations* or a *change of occupancy*, unless *technically infeasible*. Where compliance with the requirements for accessible routes, entrances or toilet rooms would threaten or destroy the historic significance of the *facility*, as determined by the applicable governing authority, the alternative requirements of Sections ~~410.9.1~~303.9.1 through ~~410.9.4~~303.9.4 for that element shall be permitted.

> **Exception:** Type B dwelling or sleeping units required by Section 1107 of the *International Building Code* are not required to be provided in historical buildings.

~~410.9.1~~303.9.1 **Site arrival points.** *No change to text.*

~~410.9.2~~303.9.2 **Multilevel buildings and facilities.** *No change to text.*

~~410.9.3~~303.9.3 **Entrances.** *No change to text.*

~~410.9.4~~303.9.4 **Toilet and bathing facilities.** *No change to text.*

801.1 Scope. Level 2 *alterations* as described in Section 504 shall comply with the requirements of this chapter.

> **Exception:** Buildings in which the reconfiguration is exclusively the result of compliance with the accessibility requirements of Section ~~705.2~~ 303.7 shall be permitted to comply with Chapter 7.

901.2 Compliance. In addition to the provisions of this chapter, work shall comply with all of the requirements of Chapters 7 and 8. The requirements of Sections 803, 804 and 805 shall apply within all *work areas* whether or not they include exits and corridors shared by more than one tenant and regardless of the occupant load.

> **Exception:** Buildings in which the reconfiguration of space affecting exits or shared egress access is exclusively the result of compliance with the accessibility requirements of Section ~~705.2~~ 303.7 shall not be required to comply with this chapter.

~~[BS]~~ B101.3 Qualified historic buildings and facilities subject to Section 106 of the National Historic Preservation Act. Where an *alteration* or *change of occupancy* is undertaken to a qualified *historic building* or facility that is subject to Section 106 of the National Historic Preservation Act, the federal agency with jurisdiction over the undertaking shall follow the Section 106 process. Where the state historic preservation officer or Advisory Council on Historic Preservation determines that compliance with the requirements for accessible routes, ramps, entrances, or toilet facilities would threaten or destroy the historic significance of the building or facility, the alternative requirements of Section ~~410.9~~303.9 for that element are permitted.

~~[BS]~~ B101.4 Qualified historic buildings and facilities not subject to Section 106 of the National Historic Preservation Act. Where an *alteration* or *change of occupancy* is undertaken to a qualified *historic building* or facility that is not subject to Section 106 of the National Historic Preservation Act, and the entity undertaking the alterations believes that compliance with the requirements for accessible routes, ramps, entrances, or toilet facilities would threaten or destroy the historic significance of the building or facility, the entity shall consult with the state historic preservation officer. Where the state historic preservation officer determines that compliance with the accessibility requirements for accessible routes, ramps, entrances, or toilet facilities would threaten or destroy the historical significance of the building or facility, the alternative requirements of Section ~~410.9~~303.9 for that element are permitted.

~~[BS]~~ B102.2.3 Direct connections. New direct connections to commercial, retail, or residential facilities shall, to the maximum extent feasible, have an accessible route complying with Section ~~705.2~~ 303.7 from the point of connection to boarding platforms and transportation system elements used by the public. Any elements provided to facilitate future direct connections shall be on an accessible route connecting boarding platforms and transportation system elements used by the public.

Delete without substitution:

~~SECTION705 ACCESSIBILITY~~

~~**705.1 General.** A *facility* that is altered shall comply with the applicable provisions in Sections 705.1.1 through 705.1.14, and Chapter 11 of the *International Building Code* unless it is *technically infeasible*. Where compliance with this section is *technically infeasible*, the alteration shall provide access to the maximum extent that is technically feasible.~~

~~A *facility* that is constructed or altered to be accessible shall be maintained accessible during occupancy.~~

> ~~**Exceptions:**~~
>
> ~~1. The altered element or space is not required to be on an accessible route unless required by Section 705.2.~~
> ~~2. Accessible means of egress required by Chapter 10 of the *International Building Code* are not required to be provided in existing *facilities*.~~
> ~~3. Type B dwelling or sleeping units required by Section 1107 of the *International Building Code* are not required to be provided in existing *facilities* undergoing less than a Level 3 *alteration*.~~
> ~~4. The alteration to Type A individually owned dwelling units within a Group R-2 occupancy shall meet the provisions for Type B dwelling units.~~

~~**705.1.1 Entrances.** Where an *alteration* includes alterations to an entrance, and the *facility* has an accessible entrance on an accessible route, the altered entrance is not required to be accessible unless required by Section 705.2. Signs complying with Section 1111 of the *International Building Code* shall be provided.~~

~~**705.1.2 Elevators.** Altered elements of existing elevators shall comply with ASME A17.1/CSA B44 and ICC A117.1. Such elements shall also be altered in elevators programmed to respond to the same hall call control as the altered elevator.~~

~~**705.1.3 Platform lifts.** Platform (wheelchair) lifts complying with ICC A117.1 and installed in accordance with ASME A18.1 shall be permitted as a component of an accessible route.~~

~~**705.1.4 Ramps.** Where steeper slopes than allowed by Section 1012.2 of the *International Building Code* are necessitated by space limitations, the slope of ramps in or providing access to existing facilities shall comply with Table 705.1.4.~~

~~RAMPS~~

~~SLOPE~~	~~MAXIMUM RISE~~

~~Steeper than 1:10 but not steeper than 1:8~~	~~3 inches~~
~~Steeper than 1:12 but not steeper than 1:10~~	~~6 inches~~

~~For SI: 1 inch = 25.4 mm.~~

~~**705.1.5 Dining areas.** An accessible route to raised or sunken dining areas or to outdoor seating areas is not required provided that the same services and decor are provided in an accessible space usable by any occupant and not restricted to use by people with a disability.~~

~~**705.1.6 Jury boxes and witness stands.** In *alterations*, accessible wheelchair spaces are not required to be located within the defined area of raised jury boxes or witness stands and shall be permitted to be located outside these spaces where ramp or lift access poses a hazard by restricting or projecting into a required means of egress.~~

~~**705.1.7 Accessible dwelling or sleeping units.** Where Group I-1, I-2, I-3, R-1, R-2 or R-4 dwelling or sleeping units are being altered, the requirements of Section 1107 of the *International Building Code* for Accessible units apply only to the quantity of the spaces being altered.~~

~~**705.1.8 Type A dwelling or sleeping units.** Where more than 20 Group R-2 dwelling or sleeping units are being altered, the requirements of Section 1107 of the *International Building Code* for Type A units and Chapter 9 of the *International Building Code* for visible alarms apply only to the quantity of the spaces being altered.~~

~~**705.1.9 Toilet rooms.** Where it is technically infeasible to alter existing toilet and bathing rooms to be accessible, an accessible family or assisted-use toilet or bathing room constructed in accordance with Section 1109.2.1 of the *International Building Code* is permitted. The family or assisted-use toilet or bathing room shall be located on the same floor and in the same area as the existing toilet or bathing rooms. At the inaccessible toilet and bathing rooms, directional signs indicating the location of the nearest family or assisted-use toilet room or bathing room shall be provided. These directional signs shall include the International Symbol of Accessibility and sign characters shall meet the visual character requirements in accordance with ICC A117.1.~~

~~**705.1.10 Dressing, fitting and locker rooms.** Where it is *technically infeasible* to provide accessible dressing, fitting, or locker rooms at the same location as similar types of rooms, one accessible room on the same level shall be provided. Where separate sex facilities are provided, accessible rooms for each sex shall be provided. Separate sex facilities are not required where only unisex rooms are provided.~~

~~**705.1.11 Fuel dispensers.** Operable parts of replacement fuel dispensers shall be permitted to be 54 inches (1370 mm) maximum measured from the surface of the vehicular way where fuel dispensers are installed on existing curbs.~~

~~**705.1.12 Thresholds.** The maximum height of thresholds at doorways shall be $^3/_4$ inch (19.1 mm). Such thresholds shall have beveled edges on each side.~~

~~**705.1.13 Extent of application.** An *alteration* of an existing element, space, or area of a *facility* shall not impose a requirement for greater accessibility than that which would be required for new construction. *Alterations* shall not reduce or have the effect of reducing accessibility of a *facility* or portion of a *facility*.~~

~~**705.1.14 Amusement rides.** Where the structural or operational characteristics of an amusement ride are altered to the extent that the amusement ride's performance differs from that specified by the manufacturer or the original design, the amusement ride shall comply with requirements for new construction in accordance with Section 1110.4.8 of the *International Building Code*.~~

~~**705.2 Alterations affecting an area containing a primary function.** Where an *alteration* affects the accessibility to a, or contains an area of, *primary function*, the route to the primary function area shall be accessible. The accessible route to the *primary function* area shall include toilet facilities and drinking fountains serving the area of *primary function*.~~

~~**Exceptions:**~~

1. ~~The costs of providing the accessible route are not required to exceed 20 percent of the costs of the alterations affecting the area of *primary function*.~~
2. ~~This provision does not apply to *alterations* limited solely to windows, hardware, operating controls, electrical outlets and signs.~~
3. ~~This provision does not apply to *alterations* limited solely to mechanical systems, electrical systems, installation or *alteration* of fire protection systems and abatement of hazardous materials.~~
4. ~~This provision does not apply to *alterations* undertaken for the primary purpose of increasing the accessibility of a *facility*.~~
5. ~~This provision does not apply to altered areas limited to Type B dwelling and sleeping units.~~

~~SECTION806 ACCESSIBILITY~~

~~**806.1 General.** A building, *facility*, or element that is altered shall comply with this section and Section 705.~~

~~**806.2 Stairways and escalators in existing buildings.** In *alterations* where an escalator or stairway is added where none existed previously, an accessible route shall be provided in accordance with Sections 1104.4 and 1104.5 of the *International Building Code*.~~

~~SECTION906 ACCESSIBILITY~~

~~**906.1 General.** A building, *facility* or element that is altered shall comply with this section and Sections 705 and 806.~~

~~**906.2 Type B dwelling or sleeping units.** Where four or more Group I-1, I-2, R-1, R-2, R-3 or R-4 dwelling or sleeping units are being altered, the requirements of Section 1107 of the *International Building Code* for Type B units and Chapter 9 of the *International Building Code* for visible alarms apply only to the quantity of the spaces being altered.~~

~~**Exception:** Group I-1, I-2, R-2, R-3 and R-4 dwelling or sleeping units where the first certificate of occupancy was issued before March 15, 1991 are not required to provide Type B dwelling or sleeping units.~~

~~SECTION1006 ACCESSIBILITY~~

~~**1006.1 General.** Accessibility in portions of buildings undergoing a *change of occupancy* classification shall comply with Section 1012.8.~~

~~**1012.1.4 Accessibility.** All buildings undergoing a change of occupancy classification shall comply with Section 1012.8.~~

~~**1012.8 Accessibility.** *Existing buildings* that undergo a change of group or occupancy classification shall comply with this section.~~

~~**Exception:** Type B dwelling or sleeping units required by Section 1107 of the *International Building Code* are not required to be provided in existing buildings and facilities undergoing a *change of occupancy* in conjunction with less than a Level 3 *alteration*.~~

~~**1012.8.1 Partial change in occupancy.** Where a portion of the building is changed to a new occupancy classification, any *alteration* shall comply with Sections 705, 806 and 906, as applicable.~~

~~**1012.8.2 Complete change of occupancy.** Where an entire building undergoes a *change of occupancy*, it shall comply with Section 1012.8.1 and shall have all of the following accessible features:~~

1. ~~At least one accessible building entrance.~~

2. ~~At least one accessible route from an accessible building entrance to *primary function* areas.~~
3. ~~Signage complying with Section 1111 of the *International Building Code.*~~
4. ~~Accessible parking, where parking is provided.~~
5. ~~At least one accessible passenger loading zone, where loading zones are provided.~~
6. ~~At least one accessible route connecting accessible parking and accessible passenger loading zones to an accessible entrance.~~

~~Where it is *technically infeasible* to comply with the new construction standards for any of these requirements for a change of group or occupancy, the above items shall conform to the requirements to the maximum extent technically feasible.~~

~~**Exception:** The accessible features listed in Items 1 through 6 are not required for an accessible route to Type B units.~~

~~SECTION1105 ACCESSIBILITY~~

~~**1105.1 Minimum requirements.** Accessibility provisions for new construction shall apply to additions. An addition that affects the accessibility to, or contains an area of, *primary function* shall comply with the requirements of Sections 705, 806 and 906, as applicable.~~

~~**1105.2 Accessible dwelling units and sleeping units.** Where Group I-1, I-2, I-3, R-1, R-2 or R-4 dwelling or sleeping units are being added, the requirements of Section 1107 of the *International Building Code* for accessible units apply only to the quantity of spaces being added.~~

~~**1105.3 Type A dwelling or sleeping units.** Where more than 20 Group R-2 dwelling or sleeping units are being added, the requirements of Section 1107 of the *International Building Code* for Type A units and Chapter 9 of the *International Building Code* for visible alarms apply only to the quantity of the spaces being added.~~

~~**1105.4 Type B dwelling or sleeping units.** Where four or more Group I-1, I-2, R-1, R-2, R-3 or R-4 dwelling or sleeping units are being added, the requirements of Section 1107 of the *International Building Code* for Type B units and Chapter 9 of the *International Building Code* for visible alarms apply only to the quantity of spaces being added.~~

CHAPTER 12 HISTORIC BUILDINGS

~~SECTION1204 ALTERATIONS~~

~~**1204.1 Accessibility requirements.** The provisions of Sections 705, 806 and 906, as applicable, shall apply to facilities designated as historic structures that undergo *alterations*, unless *technically infeasible.* Where compliance with the requirements for accessible routes, entrances or toilet rooms would threaten or destroy the historic significance of the building or *facility*, as determined by the *code official*, the alternative requirements of Sections 1204.1.1 through 1204.1.4 for that element shall be permitted.~~

~~**Exception:** Type B dwelling or sleeping units required by Section 1107 of the *International Building Code* are not required to be provided in historical buildings.~~

~~**1204.1.1 Site arrival points.** At least one accessible route from a site arrival point to an *accessible* entrance shall be provided.~~

~~**1204.1.2 Multilevel buildings and facilities.** An accessible route from an accessible entrance to public spaces on the level of the accessible entrance shall be provided.~~

~~**1204.1.3 Entrances.** At least one main entrance shall be accessible.~~

~~**Exceptions:**~~

1. ~~If a main entrance cannot be made accessible, an accessible nonpublic entrance that is unlocked while the building is occupied shall be provided; or~~
2. ~~If a main entrance cannot be made accessible, a locked accessible entrance with a notification system or remote monitoring shall be provided.~~

~~**1204.1.4 Toilet and bathing facilities.** Where toilet rooms are provided, at least one accessible family or assisted-use toilet room complying with Section 1109.2.1 of the *International Building Code* shall be provided.~~

~~**1205.15 Accessibility requirements.** The provisions of Section 1012.8 shall apply to facilities designated as historic structures that undergo a *change of occupancy*, unless *technically infeasible.* Where compliance with the requirements for accessible routes, ramps, entrances, or toilet rooms would threaten or destroy the historic significance of the building or *facility*, as determined by the authority having jurisdiction, the alternative requirements of Sections 1204.1.1 through 1204.1.4 for those elements shall be permitted~~

~~**Exception:** Type B dwelling or sleeping units required by Section 1107 of the *International Building Code* are not required to be provided in historical buildings.~~

~~**1401.2.5 Accessibility requirements.** Accessibility shall be provided in accordance with Section 410 or 605.~~

SECTION 410 ACCESSIBILITY FOR EXISTING BUILDINGS

Reason: This change is written to move all of the accessibility requirements into a single section in new IEBC Section 303. New 303 is editorial with no change in criteria or requirements and simply renumbers Section 410 to Section 303. All accessibility requirements for existing buildings are placed in one section (303) allowing a focused and clear set of requirements for users to understand. In the existing IEBC, two of the three compliance methods (prescriptive and work area methods) have provisions for accessibility that are virtually identical. In addition, the existing performance method refers to the accessibility provisions of the other compliance methods.

The intent of this change is a reorganization of accessibility provisions to avoid duplication of the same requirements in multiple code sections. The text of requirements is relocated, but the content of the moved sections is not changed. There is no intent to change code requirements, only to recognize them. Note that Section 303.8.9 addressing dining areas is included only because that section has not yet been deleted from Chapter 7 as it was in current Section 410.

The identical provisions in all subsequent sections have been deleted.
We understand that there are several proposals from BCAC to coordinate the provisions between Chapter 4 and 7. Our intent is that those proposals would be incorporated into the change. This move is editorial only.

Cost Impact: Will not increase the cost of construction
This change simply consolidate the various crieria in the IEBC, and should not change the cost of construction.

Staff Note: The deletion to the committee scoping of [BS] to Sections B101.3, B101.4 and B102.2.3 is an errata and is not part of the proposal.

2015 International Existing Building Code

Add new text as follows:

410.2 Compliance with accessibility Accessible requirements for existing buildings shall comply with the 2009 edition of ICC A117.1.

Revise as follows:

410.7 Alterations affecting an area containing a primary function. Where an *alteration* affects the accessibility to, or contains an area of *primary function*, the route to the *primary function* area shall be *accessible*. The accessible route to the *primary function* area shall include toilet facilities and drinking fountains serving the area of *primary function*.

Exceptions:

1. Accessible requirements for existing buildings shall comply with the 2009 edition of ICC A117.1.
2. The costs of providing the *accessible* route are not required to exceed 20 percent of the costs of the *alterations* affecting the area of *primary function*.
3. This provision does not apply to *alterations* limited solely to windows, hardware, operating controls, electrical outlets and signs.
4. This provision does not apply to *alterations* limited solely to mechanical systems, electrical systems, installation or *alteration* of fire protection systems and abatement of hazardous materials.
5. This provision does not apply to *alterations* undertaken for the primary purpose of increasing the accessibility of a *facility*.
6. This provision does not apply to altered areas limited to Type B dwelling and sleeping units.

Add new text as follows:

705.1.1 Compliance with accessibility. Accessible requirements for existing buildings shall comply with the 2009 edition of ICC A117.1.

705.1.2 Extent of application. An *alteration* of an existing element, space, or area of a *facility* shall not impose a requirement for greater accessibility than that which would be required for new construction. *Alterations* shall not reduce or have the effect of reducing accessibility of a *facility* or portion of a *facility*..

705.2 Alterations affecting an area containing a primary function. Where an *alteration* affects the accessibility to a, or contains an area of, *primary function*, the route to the primary function area shall be accessible. The accessible route to the *primary function* area shall include toilet facilities and drinking fountains serving the area of *primary function.*

Exceptions:

1. Accessible requirements for existing buildings shall comply with the 2009 edition of ICC A117.1.
2. The costs of providing the accessible route are not required to exceed 20 percent of the costs of the alterations affecting the area of *primary function.*
3. This provision does not apply to *alterations* limited solely to windows, hardware, operating controls, electrical outlets and signs.
4. This provision does not apply to *alterations* limited solely to mechanical systems, electrical systems, installation or *alteration* of fire protection systems and abatement of hazardous materials.
5. This provision does not apply to *alterations* undertaken for the primary purpose of increasing the accessibility of a *facility*.
6. This provision does not apply to altered areas limited to Type B dwelling and sleeping units.

Revise as follows:

1012.8.2 Complete change of occupancy. Where an entire building undergoes a *change of occupancy*, it shall comply with Section 1012.8.1 and shall have all of the following accessible features:

1. At least one accessible building entrance.
2. At least one accessible route from an accessible building entrance to *primary function* areas.
3. Signage complying with Section 1111 of the *International Building Code*.
4. Accessible parking, where parking is provided.
5. At least one accessible passenger loading zone, where loading zones are provided.
6. At least one accessible route connecting accessible parking and accessible passenger loading zones to an accessible entrance.

Where it is *technically infeasible* to comply with the new construction standards for any of these requirements for a change of group or occupancy, the above items shall conform to the requirements to the maximum extent technically feasible.

~~Exception~~Exceptions:

1. The accessible features listed in Items 1 through 6 are not required for an accessible route to Type B units.
2. Accessible requirements for existing buildings shall comply with the 2009 edition of ICC A117.1.

Reason: Dramatic changes are being proposed in the next edition of the ANSI A117.1 standard that will accommodate a higher number of individuals. For example, the turning radius is being changed from 60" diameter to a 67" diameter, and clear floor space from 30"x48" to 30"x52" and related access to features. While these changes are able to be incorporated into new construction relatively easily, existing buildings that have been designed to conform with earlier standards or were modified to meet those earlier standards are likely to find that full compliance will create problems. Even using provisions based on the technical infeasibility for compliance will still require compliance in some circumstances that aren't justifiable financially and physically.
The Department of Justice in development of the 2010 ADA Standard allows for "grandfathering" of elements in an existing building that have already been made to conform and are found to comply with the earlier ADA standard. The 2009 edition of A117.1 provides the most comprehensively structured provisions for compliance with the original ADA and HUD standard, which is why a specific reference to that edition of the Standard for determining whether areas outside the specific alterations or change of occupancy must be modified.

In the other chapters (806.1, 906.1, 1012.8.1, 1105.1, 1204.1, 1401.2.5), by a reference back to Sections 410 and/or 705, this allowance would be applicable to all existing buildings.

Bibliography: None

Cost Impact: Will not increase the cost of construction
This change will reduce the cost of construction where changes have already been made to features of a building to conform to older accessibility standards. Under the proposed changes to A117.1 significant cost would be required to conform to these requirements often in areas where upgrades have already been performed in areas such as toilet rooms to meet the barrier removal requirements of the ADA or because of alterations and change of occupancy under the I-Codes when that work had been done prior to the adoption of this new standard.

Staff Note: If this code change is successful, the edition referenced for ICC A117.1 in Chapter 16 will remain the 2009 edition.

2015 International Existing Building Code

Revise as follows:

410.2 Maintenance of facilities. A *facility* that is constructed or altered to be *accessible* shall be maintained *accessible* during occupancy to the maximum extent feasible.

705.1 General. A *facility* that is altered shall comply with the applicable provisions in Sections 705.1.1 through 705.1.14, and Chapter 11 of the *International Building Code* unless it is *technically infeasibl* e. Where compliance with this section is *technically infeasible* , the alteration shall ~~provide access~~ comply with these requirements to the maximum extent that is technically feasible.
~~A *facility* that is constructed or altered to be accessible shall be maintained accessible during occupancy.~~

Exceptions:

1. The altered element or space is not required to be on an accessible route unless required by Section 705.2.
2. Accessible means of egress required by Chapter 10 of the *International Building Code* are not required to be provided in existing *facilities* .
3. Type B dwelling or sleeping units required by Section 1107 of the *International Building Code* are not required to be provided in existing *facilities* undergoing less than a Level 3 *alteration* .
4. The alteration to Type A individually owned dwelling units within a Group R-2 occupancy shall meet the provisions for Type B dwelling units.

Add new text as follows:

1508.2 During construction. A facility that is constructed or altered to be accessible shall be maintained accessible during occupancy to the maximum extent feasible.

Reason: There is a series of proposals intended to coordinate the provisions in the first and second options in the IEBC. Requirements for maintenance of facilities during construction in Sections 410.2 and 705.1 should match. However, it was also felt that maintenance of facilities during construction would be more appropriately located under Chapter 15, Construction Safeguards. Maintenance/repairs to maintain accessibility is already addressed in Section 605.1.
In July/2014 the ICC Board decided to sunset the activities of the Code Technology Committee (CTC). This is being accomplished by re-assigning many of the CTC Areas of Study to the applicable Code Action Committee (CAC). This proposal falls under the CTC Area of Study entitled IBC Coordination with the New ADAAG. Information on the CTC, including: the sunset plan; meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the CTC website.

This public proposal is submitted by the ICC Building Code Action Committee (BCAC). The BCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the BCAC has held 13 open meetings and numerous workgroup calls which included members of the BCAC as well as any interested party to discuss and debate the proposed changes and the public comments. Related documentation and reports are posted on the BCAC website at: http://www.iccsafe.org/cs/BCAC/Pages/default.aspx.

Cost Impact: Will not increase the cost of construction
The proposal is a clarification and coordination of current requirements; therefore, there is no impact on the cost.

EB 35-15 : 410.2-KULIK3344

EB 36-15

410.3, 705.1.13

Proponent: Gene Boecker, representing Code Consultants, Inc. (geneb@codeconsultants.com)

2015 International Existing Building Code

Revise as follows:

410.3 Extent of application. An *alteration* of an existing *facility* shall not impose a requirement for greater accessibility than that which would be required for new construction. *Alterations* shall not reduce or have the effect of reducing accessibility of a *facility* or portion of a *facility*, including the accessible means of egress.

705.1.13 Extent of application. An *alteration* of an existing element, space, or area of a *facility* shall not impose a requirement for greater accessibility than that which would be required for new construction. *Alterations* shall not reduce or have the effect of reducing accessibility of a *facility* or portion of a *facility*, including the accessible means of egress.

Reason: These two secions of the code already address the issue of the extent of application of accessibility to alterations. However, Sections 410.6 and 705.1 contains exceptions which state that accessible means of egress are not requried in existing buidlings. This leads to a conflict where it could be construed that it would be acceptable for the existing accessible means of egress to be reduced. The added text clarifies that this is not the case. By placing the added langauge in this section, it is also clear that the intent is not to impose any requirement greater than what would be allowed for new construction. Therefore, if the budiling was originally constructed in compliance with the 2006 IBC, with areas of refuge in a building which is protected throughout with an automatic fire sprinkler system, it would be acceptable to remove those areas of refuge since the 2015 IBC does not require areas of refuge where the building is protected throughout with an automatic fire sprinkler system. However, so as not to "reduce" the accessibility, two-way communications devices would need to be provided, consitent with the current code under which the request for removal of the areas of refuge is made.

Cost Impact: Will not increase the cost of construction
No increase in cost would be a part of this proposal since the least that would be done is to maintain the status quo. A possible cost savings can be made by allowing use of current code.

Proponent: Edward Kulik, Chair, representing Building Code Action Committee (bcac@iccsafe.org)

2015 International Existing Building Code

Revise as follows:

410.4 Change of occupancy. *Existing buildings* that undergo a change of group or occupancy shall comply with this section.

> **Exception:** Type B dwelling or sleeping units required by Section 1107 of the *International Building Code* are not required to be provided in *existing buildings* and facilities undergoing a *change of occupancy* in conjunction with *alterations* where the *work area* is 50 percent or less of the aggregate area of the building.

410.4.1 Partial change in occupancy. Where a portion of the building is changed to a new occupancy classification or the building has an aggregate area of not more than 3,000 square feet (278.7 m^2), any *alterations* shall comply with Sections 410.6, 410.7 and 410.8.

410.4.2 Complete change of occupancy. Where an entire building undergoes a *change of occupancy*and has an aggregate are of more than 3,000 square feet (278.7 m^2), it shall comply with Section 410.4.1 and shall have all of the following accessible features:

1. At least one accessible building entrance.
2. At least one accessible route from an accessible building entrance to *primary function* areas.
3. Signage complying with Section 1111 of the *International Building Code.*
4. Accessible parking, where parking is being provided.
5. At least one accessible passenger loading zone, when loading zones are provided.
6. At least one accessible route connecting accessible parking and accessible passenger loading zones to an accessible entrance.

Where it is *technically infeasible* to comply with the new construction standards for any of these requirements for a change of group or occupancy, the above items shall conform to the requirements to the maximum extent technically feasible.

> **Exception:** The accessible features listed in Items 1 through 6 are not required for an accessible route to Type B units.

1012.8 Accessibility. *Existing buildings* that undergo a change of group or occupancy classification shall comply with this section.

> **Exception:** Type B dwelling or sleeping units required by Section 1107 of the *International Building Code* are not required to be provided in existing buildings and facilities undergoing a *change of occupancy* in conjunction with less than a Level 3 *alteration*.

1012.8.1 Partial change in occupancy. Where a portion of the building is changed to a new occupancy classification or the building has an aggregate area of not more than 3,000 square feet (278.7 m^2), any *alteration* shall comply with Sections 705, 806 and 906, as applicable.

1012.8.2 Complete change of occupancy. Where an entire building undergoes a *change of occupancy* and has an aggregate area of more than 3,000 square feet (278.7 m^2), it shall comply with Section 1012.8.1 and shall have all of the following accessible features:

1. At least one accessible building entrance.
2. At least one accessible route from an accessible building entrance to *primary function* areas.
3. Signage complying with Section 1111 of the *International Building Code* .
4. Accessible parking, where parking is provided.
5. At least one accessible passenger loading zone, where loading zones are provided.
6. At least one accessible route connecting accessible parking and accessible passenger loading zones to an accessible entrance.

Where it is *technically infeasible* to comply with the new construction standards for any of these requirements for a change of group or occupancy, the above items shall conform to the requirements to the maximum extent technically feasible.

> **Exception:** The accessible features listed in Items 1 through 6 are not required for an accessible route to Type B units.

Reason: The current provisions for a complete change of occupancy is sometimes very difficult or costly for small facilities undergoing a complete change of occupancy. The 3,000 sq.ft. limit proposed is consistent with Live/work units. These small facilities will have the same accessibility requirements, regardless if the alteration is a change of occupancy or not. Changes of occupancy are probably more likely to include alterations, so a small facility would be looking at improvements to the accessible route up to the 20% cost limitation. The larger facilities will still have to provide an accessible route when the entire facility undergoes a complete change of occupancy.
The current list of 6 items can be read to require an accessible route, including an elevator, regardless of the cost of the items and how much is spent on any alterations. For the small building, this can result in an existing building being so expensive to fix that it cannot be used for anything other than its original purpose.

What is currently proposed for small buildings is similar to what is allowed for historic buildings in Section 410.9, 1204.1 and 1205.15.

In July/2014 the ICC Board decided to sunset the activities of the Code Technology Committee (CTC). This is being accomplished by re-assigning many of the CTC Areas of Study to the applicable Code Action Committee (CAC). This proposal falls under the CTC Area of Study entitled IBC Coordination with the New ADAAG. Information on the CTC, including: the sunset plan; meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the CTC website.

This public proposal is submitted by the ICC Building Code Action Committee (BCAC). The BCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the BCAC has held 13 open meetings and numerous workgroup calls which included members of the BCAC as well as any interested party to discuss and debate the proposed changes and the public comments. Related documentation and reports are posted on the BCAC website at: http://www.iccsafe.org/cs/BCAC/Pages/default.aspx.

Cost Impact: Will not increase the cost of construction
As indicated in the reason, this would be a possible reduction in cost for small buildings undergoing a complete change in occupancy.

EB 37-15 : 410.4.1-KULIK3363

EB 38-15

410.4.2, 1012.8.2

Proponent: Edward Kulik, Chair, representing Building Code Action Committee (bcac@iccsafe.org)

2015 International Existing Building Code

Revise as follows:

410.4.2 Complete change of occupancy. Where an entire building undergoes a *change of occupancy* , it shall comply with Section 410.4.1 and shall have at least one accessible route throughout the building.~~all of the following accessible features:~~

1. ~~At least one accessible building entrance.~~
2. ~~At least one accessible route from an accessible building entrance to *primary function* areas.~~
3. ~~Signage complying with Section 1111 of the *International Building Code.*~~
4. ~~Accessible parking, where parking is being provided.~~
5. ~~At least one accessible passenger loading zone, when loading zones are provided.~~
6. ~~At least one accessible route connecting accessible parking and accessible passenger loading zones to an accessible entrance.~~

Where it is *technically infeasible*to comply with the new construction standards for ~~any of these requirements for a change of group or occupancy~~ an accessible route, the ~~above items~~ accessible route shall conform to the requirements to the maximum extent technically feasible.

> **Exception:** The accessible ~~features listed in Items 1 through 6 are~~ route is not required ~~for an accessible route~~ to Type B units required by Section 410.8.8.

1012.8.2 Complete change of occupancy. Where an entire building undergoes a *change of occupancy* , it shall comply with Section 1012.8.1 and shall have at least one accessible route throughout the building.~~all of the following accessible features:~~

1. ~~At least one accessible building entrance.~~
2. ~~At least one accessible route from an accessible building entrance to primary function areas.~~
3. ~~Signage complying with Section 1111 of the International Building Code.~~
4. ~~Accessible parking, where parking is being provided.~~
5. ~~At least one accessible passenger loading zone, when loading zones are provided.~~
6. ~~At least one accessible route connecting accessible parking and accessible passenger loading zones to an accessible entrance.~~

Where it is*technically infeasible*to comply with the new construction standards for ~~any of these requirements for a change of group or occupancy~~ an accessible route, the ~~above items~~ accessible route shall conform to the requirements to the maximum extent technically feasible.

> **Exception:** The accessible ~~features listed in Items 1 through 6 are~~ route is not required ~~for an accessible route~~ to Type B units required by Section 906.2 and 1105.4.

Reason: The intent of this proposal is to clarify what is expected when a building undergoes a complete change of occupancy, regardless if it has alterations or not. The list of six items is basically describing the items on an accessible route. Stating it simply will increase understanding of the requirement. This should also eliminate the question as to if this list is intended to over ride new construction exceptions for percentages of accessible entrances or where an elevator is not required. It was never intended to ask for an existing building to exceed new construction requirements. There is a wide variety of interpretations for the list of 6 items in Section 410.4.2 and 1202.8.2. This list was originally from a draft of the new ADAAG during development. This was a list of priority items for accessible routes that ended up not being included in ADA. It was decided that designers should be able to use the money where there was the best advantage with the goal of existing buildings become as accessible as feasible over time. In addition, ADA does not address a change in occupancy; the 2010 ADA standard treats alterations the same, change of occupancy or not.

Toilet rooms and drinking fountains are not in the current list. These items would require improvements for accessibility if the complete change of occupancy also included alterations to a primary function area in accordance with Sections 410.7 and 705.2.

In July/2014 the ICC Board decided to sunset the activities of the Code Technology Committee (CTC). This is being accomplished by re-assigning many of the CTC Areas of Study to the applicable Code Action Committee (CAC). This proposal falls under the CTC Area of Study entitled IBC Coordination with the New ADAAG. Information on the CTC, including: the sunset plan; meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the CTC website.

This public proposal is submitted by the ICC Building Code Action Committee (BCAC). The BCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the BCAC has held 13 open meetings and numerous workgroup calls which included members of the BCAC as well as any interested party to discuss and debate the proposed changes and the public comments. Related documentation and reports are posted on the BCAC website at: http://www.iccsafe.org/cs/BCAC/Pages/default.aspx.

Cost Impact: Will not increase the cost of construction
The proposal is a clarification of current requirements; therefore, there is no impact on the cost.

EB 38-15 : 410.4.2-KULIK3402

EB 39-15

410.6

Proponent: Dominic Marinelli, United Spinal Association (DMarinelli@accessibility-services.com);Lee Kranz, City of Bellevue, WA, representing Washington Association of Building Officials Technical Code Development Committee

2015 International Existing Building Code

Revise as follows:

410.6 Alterations. A *facility* that is altered shall comply with the applicable provisions in Chapter 11 of the *International Building Code*, unless *technically infeasible*. Where compliance with this section is *technically infeasible*, the *alteration* shall provide access to the maximum extent technically feasible.

Exceptions:

1. The altered element or space is not required to be on an accessible route, unless required by Section 410.7.
2. Accessible means of egress required by Chapter 10 of the *International Building Code* are not required to be provided in existing facilities.
3. The alteration to Type A individually owned dwelling units within a Group R-2 occupancy shall be permitted to meet the provision for a Type B dwelling unit.
4. Type B dwelling or sleeping units required by Section 1107 of the *International Building Code* are not required to be provided in *existing buildings* and facilities undergoing ~~a *change of occupancy* in conjunction with~~ *alterations* where the *work area* is 50 percent or less of the aggregate area of the building.

Reason: Dominic Marinelli: The purpose of this code change proposal is to eliminate a conflict in the IEBC between the requirements in the Prescriptive and Work Area methods.
United Spinal Association and its partners supports requiring Type B units in existing buildings when that building is undergoing a major alteration (i.e., greater than 50% or Level 3). We do not believe that this requirement should depend on this also being a change in occupancy. We were successful in getting this requirement into the International Existing Building Code three (3) cycles ago. Previous editions exempted Type B units in any existing building.
We believe that there is a technical conflict in Section 410.6, Exception 4. The exception literally says that a minor alteration with a change of occupancy does not have to provide Type B units. The exception does not allow for minor alterations with no change in occupancy to be exempted from Type B units. That would be in conflict with the requirements in 410.8.8, 705.1 and 906.2. These three indicate Type B units are required only in major alterations.
United spinal also has a proposal in for Section 906.2 that is a different discussion.

410.8.8 Type B dwelling or sleeping units. Where four or more Group I-1, I-2, R-1, R-2, R-3 or R-4 dwelling or sleeping units are being added, the requirements of Section 1107 of the International Building Code for Type B units apply only to the quantity of the spaces being added.
Where Group I-1, I-2, R-1, R-2, R-3 or R-4 dwelling or sleeping units are being altered and where the work area is greater than 50 percent of the aggregate area of the building, the requirements of Section 1107 of the International Building Code for Type B units apply only to the quantity of the spaces being altered.

705.1 General. A facility that is altered shall comply with the applicable provisions in Sections 705.1.1 through 705.1.14, and Chapter 11 of the International Building Code unless it is technically infeasible. Where compliance with this section is technically infeasible, the alteration shall provide access to the maximum extent that is technically feasible.
A facility that is constructed or altered to be accessible shall be maintained accessible during occupancy.
Exceptions:
1. The altered element or space is not required to be on an accessible route unless required by Section 705.2.
2. Accessible means of egress required by Chapter 10 of the International Building Code are not required to be provided in existing facilities.
3. Type B dwelling or sleeping units required by Section 1107 of the International Building Code are not required to be provided in existing facilities undergoing less than a Level 3 alteration.
4. The alteration to Type A individually owned dwelling units within a Group R-2 occupancy shall meet the provisions for Type B dwelling units.
906.2 Type B dwelling or sleeping units. Where four or more Group I-1, I-2, R-1, R-2, R-3 or R-4 dwelling or sleeping units are being altered, the requirements of Section 1107 of the International Building Code for Type B units and Chapter 9 of the International Building Code for visible alarms apply only to the quantity of the spaces being altered.
Exception:
Group I-1, I-2, R-2, R-3 and R-4 dwelling or sleeping units where the first certificate of occupancy was issued before March 15, 1991 are not required to provide Type B dwelling or sleeping units.

Lee Kranz: The text in exception #4 of Section 410.6 is intended to address alternations to existing buildings but currently includes change of occupancy language. The exception in Section 410.4 deals with change of occupancy issues so the language in exception #4 of Section 410.6 is redundent and is not misplaced under the Alterations section. This proposal corrects exception #4 of Section 410.6 relating to alterations by deleting the change of occupancy text which is already covered in the exception to Section 410.4. Also, the revision creates consistency with exception #3 of Section 705.1.

Cost Impact: Will not increase the cost of construction
This is a correction to clarfiy the code and will not impact the cost of construction.

EB 39-15 : 410.6-KRANZ4115

EB 40-15

410.8.1, 705.1.1

Proponent: Edward Kulik, Chair, representing Building Code Action Committee (bcac@iccsafe.org)

2015 International Existing Building Code

Revise as follows:

410.8.1 Entrances. ~~*Accessible* entrances shall be provided in accordance with Section 1105.~~

> ~~**Exception:**~~ Where an *alteration* includes alterations to an entrance that is not accessible, and the *facility* has an *accessible* entrance, the altered entrance is not required to be *accessible*, unless required by Section 410.7. Signs complying with Section 1111 of the *International Building Code* shall be provided.

705.1.1 Entrances. Where an *alteration* includes alterations to an entrance that is not accessible, and the *facility* has an accessible entrance ~~on an accessible route~~, the altered entrance is not required to be accessible unless required by Section 705.2. Signs complying with Section 1111 of the *International Building Code* shall be provided.

Reason: There is a series of proposals intended to coordinate the provisions in the first and second options in the IEBC. Requirements for entrances in Sections 410.8.2 and 705.1.1 should match.
In July/2014 the ICC Board decided to sunset the activities of the Code Technology Committee (CTC). This is being accomplished by re-assigning many of the CTC Areas of Study to the applicable Code Action Committee (CAC). This proposal falls under the CTC Area of Study entitled IBC Coordination with the New ADAAG. Information on the CTC, including: the sunset plan; meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the CTC website.

This public proposal is submitted by the ICC Building Code Action Committee (BCAC). The BCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the BCAC has held 13 open meetings and numerous workgroup calls which included members of the BCAC as well as any interested party to discuss and debate the proposed changes and the public comments. Related documentation and reports are posted on the BCAC website at: http://www.iccsafe.org/cs/BCAC/Pages/default.aspx.

Cost Impact: Will not increase the cost of construction
The proposal is a clarification and coordination of current requirements; therefore, there is no impact on the cost.

EB 40-15 : 410.8.1-KULIK3346

EB 41-15

410.8.4, 806.2

Proponent: Edward Kulik, Chair, representing Building Code Action Committee (bcac@iccsafe.org)

2015 International Existing Building Code

Revise as follows:

410.8.4 Stairways and escalators in existing buildings. ~~In *alterations*, *change of occupancy* or *additions* where~~ Where an escalator or stairway is added where none existed previously and major structural modifications are necessary for installation, an accessible route shall be provided between the levels served by the escalator or stairways in accordance with Section 1104.4 of the *International Building Code.*

806.2 Stairways and escalators in existing buildings. ~~In *alterations* where~~Where an escalator or stairway is added where none existed previously and major structural modifications are necessary for installation, an accessible route shall be provided between the levels served by the escalator or stairways in accordance with Sections 1104.4 ~~and 1104.5~~ of the *International Building Code*.

Reason: There is a series of proposals intended to coordinate the provisions in the first and second options in the IEBC. Requirements for stairways in Sections 410.8.4 and 806.2 should match. While 806.2 is Level II alteration, change of occupancy and additions reference this section. Adding "change or occupancy or additions" under Level 2 could be confusing, so the best alternative is to remove the list from both 410.8.4 and 806.2. Where this is applicable will be handled through the references to this section.

G208-06/07 added the language in Section 410.8.4 as part of coordination with ADA 206.2.3.1. The ADA approach seems more reasonable for when and elevator or platform lift would be required. G241-12 struck the reference to 1104.5 in Section 410.8.4 so that the accessible route will be permitted to be provided in the same area as the new construction, and is not require it to be located elsewhere in the building. A reference to Section 1104.5 could be interpreted to require the accessible route to be provided in another part of the building if the new stairway was not on a general circulation route (such as a 2nd egress stairway).

In July/2014 the ICC Board decided to sunset the activities of the Code Technology Committee (CTC). This is being accomplished by re-assigning many of the CTC Areas of Study to the applicable Code Action Committee (CAC). This proposal falls under the CTC Area of Study entitled IBC Coordination with the New ADAAG. Information on the CTC, including: the sunset plan; meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the CTC website.

This public proposal is submitted by the ICC Building Code Action Committee (BCAC). The BCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the BCAC has held 13 open meetings and numerous workgroup calls which included members of the BCAC as well as any interested party to discuss and debate the proposed changes and the public comments. Related documentation and reports are posted on the BCAC website at: http://www.iccsafe.org/cs/BCAC/Pages/default.aspx.

Cost Impact: Will not increase the cost of construction
The proposal is a clarification and coordination of current requirements; therefore, there is no impact on the cost.

EB 41-15 : 410.8.4-KULIK3347

EB 42-15

410.8.6, 410.8.7, 410.8.8

Proponent: Edward Kulik, Chair, representing Building Code Action Committee (bcac@iccsafe.org)

2015 International Existing Building Code

Revise as follows:

410.8.6 Accessible dwelling or sleeping units. Where Group I-1, I-2, I-3, R-1, R-2 or R-4 dwelling or sleeping units are being altered or added, the requirements of Section 1107 of the *International Building Code* for Accessible units and Chapter 9 of the *International Building Code* for visible alarms apply only to the quantity of spaces being altered or added.

410.8.7 Type A dwelling or sleeping units. Where more than 20 Group R-2 dwelling or sleeping units are being altered or added, the requirements of Section 1107 of the *International Building Code* for Type A units and Chapter 9 of the *Internatinoal Buidling Code* for visible alarms apply only to the quantity of the spaces being altered or added.

410.8.8 Type B dwelling or sleeping units. Where four or more Group I-1, I-2, R-1, R-2, R-3 or R-4 dwelling or sleeping units are being added, the requirements of Section 1107 of the *International Building Code* for Type B units apply only to the quantity of the spaces being added. Where Group I-1, I-2, R-1, R-2, R-3 or R-4 dwelling or sleeping units are being altered and where the work area is greater than 50 percent of the aggregate area of the building, the requirements of Section 1107 of the *International Building Code* for Type B units and Chapter 9 of the *Internatinoal Buidling Code* for visible alarms apply only to the quantity of the spaces being altered.

Reason: There is a series of proposals intended to coordinate the provisions in the first and second options in the IEBC. This phrase was deleted from Sections 410.8.7, 410.8.8 and 410.8.9 by code change G215-07/08. The reason given was that when visible alarms are required to be added or altered is addressed in IBC/IFC Chapter 9. However, in Chapter 9, if a system is touched, the whole building system needs to be upgraded. This would limit the change to just the units being altered.

ALTERATIONS – LEVEL 1

705.1.8 Type A dwelling or sleeping units. Where more than 20 Group R-2 dwelling or sleeping units are being altered, the requirements of Section 1107 of the *International Building Code* for Type A units and Chapter 9 of the *International Building Code* for visible alarms apply only to the quantity of the spaces being altered.

ALTERATIONS – LEVEL 3

906.2 Type B dwelling or sleeping units. Where four or more Group I-1, I-2, R-1, R-2, R-3 or R-4 dwelling or sleeping units are being altered, the requirements of Section 1107 of the *International Building Code* for Type B units and Chapter 9 of the *International Building Code* for visible alarms apply only to the quantity of the spaces being altered.

Exception: Group I-1, I-2, R-2, R-3 and R-4 dwelling or sleeping units where the first certificate of occupancy was issued before March 15, 1991 are not required to provide Type B dwelling or sleeping units.

ADDITION

1105.3 Type A dwelling or sleeping units. Where more than 20 Group R-2 dwelling or sleeping units are being added, the requirements of Section 1107 of the *International Building Code* for Type A units and Chapter 9 of the *International Building Code* for visible alarms apply only to the quantity of the spaces being added.

1105.4 Type B dwelling or sleeping units. Where four or more Group I-1, I-2, R-1, R-2, R-3 or R-4 dwelling or sleeping units are being added, the requirements of Section 1107 of the *International Building Code* for Type B units and Chapter 9 of the *International Building Code* for visible alarms apply only to the quantity of spaces being added.

In July/2014 the ICC Board decided to sunset the activities of the Code Technology Committee (CTC). This is being accomplished by re-assigning many of the CTC Areas of Study to the applicable Code Action Committee (CAC). This proposal falls under the CTC Area of Study entitled IBC Coordination with the New ADAAG. Information on the CTC, including: the sunset plan; meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the CTC website.

This public proposal is submitted by the ICC Building Code Action Committee (BCAC). The BCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the BCAC has held 13 open meetings and numerous workgroup calls which included members of the BCAC as well as any interested party to discuss and debate the proposed changes and the public comments. Related documentation and reports are posted on the BCAC website at: http://www.iccsafe.org/cs/BCAC/Pages/default.aspx.

Cost Impact: Will not increase the cost of construction
The proposal limits the revisions to the fire alarm system. Therefore, there will be no additional costs to construction.

EB 42-15 : 410.8.6-KULIK3350

EB 43-15

410.8.8, 410.8.9 (New)

Proponent: Edward Kulik, Chair, representing Building Code Action Committee (bcac@iccsafe.org)

2015 International Existing Building Code

Revise as follows:

410.8.8 Additions with Type B dwelling or sleeping units.
Where four or more Group I-1, I-2, R-1, R-2, R-3 or R-4 dwelling or sleeping units are being added, the requirements of Section 1107 of the *International Building Code* for Type B units apply only to the quantity of the spaces being added.

410.8.9 Alterations with Type B dwelling and sleeping units. Where four or more Group I-1, I-2, R-1, R-2, R-3 or R-4 dwelling or sleeping units are being altered and where the work area is greater than 50 percent of the aggregate area of the building, the requirements of Section 1107 of the International Building Code for Type B units apply only to the quantity of the spaces being altered.

Reason: There is a series of proposals intended to coordinate the provisions in the first and second options in the IEBC. Section 410.8.8 is being split to separate additions and alterations. This is a clarification that is consistent with Sections 906.2, 1012.8 and 1105.4.
In July/2014 the ICC Board decided to sunset the activities of the Code Technology Committee (CTC). This is being accomplished by re-assigning many of the CTC Areas of Study to the applicable Code Action Committee (CAC). This proposal falls under the CTC Area of Study entitled IBC Coordination with the New ADAAG. Information on the CTC, including: the sunset plan; meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the CTC website.

The proposal is a clarification and coordination of current requirements; therefore, there is no impact on the cost.

EB 43-15 : 410.8.8-KULIK3358

EB 44-15

410.8.8

Proponent: Dan Buuck, National Association of Home Builders, representing National Association of Home Builders (dbuuck@nahb.org)

2015 International Existing Building Code

Revise as follows:

410.8.8 Additions with Type B dwelling or sleeping units. Where four or more Group I-1, I-2, R-1, R-2, R-3 or R-4 dwelling or sleeping units are being added, the requirements of Section 1107 of the *International Building Code* for Type B units apply only to the quantity of the spaces being added.

410.8.9 Alterations with Type B dwelling and sleeping units. Where four or more Group I-1, I-2, R-1, R-2, R-3 or R-4 dwelling or sleeping units are being altered and where the work area is greater than 50 percent of the aggregate area of the building, the requirements of Section 1107 of the International Building Code for Type B units apply only to the quantity of the spaces being altered.

> **Exception:** Group I-1, I-2, R-1, R-2, R-3 or R-4 dwelling or sleeping units where the first certificate of occupancy was issued before March 15, 1991 are not required to provide Type B dwelling or sleeping units.

Reason: Section 410.8.8 is being split to separate additions and alterations (similar to Section 906.2 and 1105.4). The addition of the exception to Section 410.8.9 is to coordinate with Section 906.2. The intent is to coordinate the requirements for Type B dwelling units within the options available in the IEBC.

This same exception was added to Section 906.2 during the last code cycle to bring it in line with the provisions of FHA. It was approved by the committee and had no public comments. This proposal fixes the unintended omission of the same language in Section 410.8.9. These provisions need to include similar language, because they are parallel sections.

Having this language in the IEBC allows buildings that were previously occupied to be revitalized without triggering requirements that would exceed the federal legislation. Too often existing building owners who submit plans to alter an existing residential building which was built before the FHA guidelines went into effect are told that they must comply with the accessible requirements for new buildings. This exception brings the IEBC in line with the federal guidelines.

For reference, FHA regulations state "The design requirements apply to buildings built for first occupancy after March 13, 1991, which fall under the definition of "covered multifamily dwellings." Sections 906.2 and 1105.4 are shown below for comparison:

906.2 Type B dwelling or sleeping units. Where four or more Group I-1, I-2, R-1, R-2, R-3 or R-4 dwelling or sleeping units are being altered, the requirements of Section 1107 of the International Building Code for Type B units and Chapter 9 of the International Building Code for visible alarms apply only to the quantity of the spaces being altered.

> **Exception:** Group I-1, I-2, R-2, R-3 and R-4 dwelling or sleeping units where the first certificate of occupancy was issued before March 15, 1991 are not required to provide Type B dwelling or sleeping units.

1105.4 Type B dwelling or sleeping units. Where four or more Group I-1, I-2, R-1, R-2, R-3 or R-4 dwelling or sleeping units are being added, the requirements of Section 1107 of the International Building Code for Type B units and Chapter 9 of the International Building Code for visible alarms apply only to the quantity of spaces being added.

Cost Impact: Will not increase the cost of construction
This proposal limits the Type B units requirements to only buildings that should have complied with the Fair Housing Act at the time of initial construction. Therefore, older institutional and residential buildings would not have the additional costs of upgrading for accessibility.

EB 44-15 : 410.8.8-BUUCK4900

EB 45-15

410.8.9, 705.1.6

Proponent: Edward Kulik, Chair, representing Building Code Action Committee (bcac@iccsafe.org)

2015 International Existing Building Code

Revise as follows:

410.8.9 Jury boxes and witness stands. In *alterations*, accessible wheelchair spaces are not required to be located within the defined area of raised jury boxes or witness stands and shall be permitted to be located outside these spaces where the ramp or lift access restricts or projects into the required means of egress.

705.1.6 Jury boxes and witness stands. In *alterations*, accessible wheelchair spaces are not required to be located within the defined area of raised jury boxes or witness stands and shall be permitted to be located outside these spaces where ramp or lift access ~~poses a hazard by restricting~~restricts or ~~projecting~~ projects into a required means of egress.

Reason: There is a series of proposals intended to coordinate the provisions in the first and second options in the IEBC. Requirements for courtrooms in Sections 410.8.9 and 705.1.6 should match. In July/2014 the ICC Board decided to sunset the activities of the Code Technology Committee (CTC). This is being accomplished by re-assigning many of the CTC Areas of Study to the applicable Code Action Committee (CAC). This proposal falls under the CTC Area of Study entitled IBC Coordination with the New ADAAG. Information on the CTC, including: the sunset plan; meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the CTC website.

This public proposal is submitted by the ICC Building Code Action Committee (BCAC). The BCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the BCAC has held 13 open meetings and numerous workgroup calls which included members of the BCAC as well as any interested party to discuss and debate the proposed changes and the public comments. Related documentation and reports are posted on the BCAC website at: http://www.iccsafe.org/cs/BCAC/Pages/default.aspx.

Cost Impact: Will not increase the cost of construction
The proposal is a clarification and coordination of current requirements; therefore, there is no impact on the cost.

Proponent: Gene Boecker, representing Code Consultants, Inc. (geneb@codeconsultants.com)

2015 International Existing Building Code

Revise as follows:

410.8.10 Toilet rooms. Where it is *technically infeasible* to alter existing toilet and bathing rooms to be *accessible*, a unisex toilet room or bathing room shall be provided. The unisex toilet room or bathing room shall be constructed as an *accessible* family or assisted-use toilet or bathing room ~~constructed~~ in accordance with Section ~~1109.2.1~~1109.2.1.2, 1109.2.1.3, 1109.2.1.5, 1109.2.1.6 and 1109.2.1.7 of the *International Building Code*. ~~is~~A unisex toilet room shall be permitted to contain two water closets. The ~~family or assisted-use~~unisex toilet or bathing room shall be located on the same floor and in the same area as the existing toilet or bathing rooms. At the inaccessible toilet and bathing rooms, ~~provide~~ directional signs shall be provided indicating the location of the nearest ~~family or assisted-use~~unisex toilet room or bathing room. These directional signs shall include the International Symbol of Accessibility and sign characters shall meet the visual character requirements in accordance with ICC A117.1.

410.9.4 Toilet and bathing facilities. Where toilet rooms are provided, at least one unisex toilet shall be provided. The unisex toilt room shall be constructed as an accessible family or assisted-use toilet room complying with ~~Section 1109.2.1~~Sections 1109.2.1.2, 1109.2.1.5, 1109.2.1.6 and 1109.2.1.7 of the *International Building Code*. A unisex toilet room shall be ~~provided~~permitted to contain two water closets.

705.1.9 Toilet rooms. Where it is technically infeasible to alter existing toilet and bathing rooms to be accessible, a unisex toilet room or bathing room shall be provided. The unisex toilet room or bathing room shall be constructed as an accessible family or assisted-use toilet or bathing room ~~constructed~~ in accordance with Section ~~1109.2.1~~1109.2.1.2, 1109.2.1.3, 1109.2.1.5, 1109.2.1.6 and 1109.2.1.7 of the *International Building Code*. ~~is~~A unisex toilet room shall be permitted to contain two water closets. The ~~family or assisted-use~~ unisex toilet or bathing room shall be located on the same floor and in the same area as the existing toilet or bathing rooms. At the inaccessible toilet and bathing rooms, directional signs indicating the location of the nearest ~~family or assisted-use~~ unisex toilet room or bathing room shall be provided. These directional signs shall include the International Symbol of Accessibility and sign characters shall meet the visual character requirements in accordance with ICC A117.1.

1204.1.4 Toilet and bathing facilities. Where toilet rooms are provided, at least one unises toilet shall be provided. The unisex toilet room shall be constructed as an accessible family or assisted-use toilet room complying with ~~Section 1109.2.1~~Sections 1109.2.1.2, 1109.2.1.5, 1109.2.1.6 and 1109.2.1.7 of the *International Building Code*. A unisex toilet room shall be ~~provided~~permitted to contain two water closets.

Reason: The proposals to Sections 410.9.4 and 705.1.9 are for altered buildings and are exactly the same. The proposals to Section 410.9.4 and 1204.1.4 are for historic buildings, and are the same. The code change seeks to address all in the same manner.

The concept of the alternative toilet/bathing room has been confused between the IBC's intent to provide additional access and usability in the family and assisted-use toilet and bathing rooms; and, the unisex toilet/bathing rooms intended to provide some acessibility where none would otherwise be available. The former is intended to be requried only in mercantile and assembly occupnacies where other accessible group toilet/bathing rooms are provided. The latter is intended to provide at least one accesisble set of plumbing fixtures in an existing buidling where no other accessible plumbing fixtures are provided. One is for new construction and one is for existing construction. These are different needs and should be identified as such and given different names accordingly.

It would be easy to simply have a "one size fits all" approach to both of these. However, the federal 2010 ADA Standards for Accessible Design includes different fixtures within the room than what is included in the IBC. Both sets of rules allow two options for the toilet room fixture counts and two for the bathing room fixture counts:

	IBC Family or Assisted Use Toilet and Bathing Rooms (current)				2010 Standards Unisex Toilet Room and Unisex Bathing Room			
	Toilet Room A	Toilet Room B	Bathing Room A	Bathing Room B	Toilet Room A	Toilet Room B	Bathing Room A	Bathing Room B
Lavatory	1	1	1	1	1	1	1	1
Water Closet	1	1	1	1	2	1	1	1
Urinal	0	1	0	0	0	1	0	0
Shower	n/a	n/a	1	0	n/a	n/a	1	1
Bathtub	n/a	n/a	0	1	n/a	n/a	0	1

In some cases the two sets of rules align. In others they do not. These prposed changes would place the IEBC unisex toilet/bathing rooms in line with the provisions of the 2010 Standards for unisex toilet/bathing rooms.

The 2010 ADA Standards for Accessible Design:

Section 213.2 identifies, in exceptions 1 and 2 when the unisex toilet room is required.

> **213.2 Toilet Rooms and Bathing Rooms.** Where toilet rooms are provided, each toilet room shall comply with 603. Where bathing rooms are provided, each bathing room shall comply with 603.
>
> **EXCEPTIONS:** 1. In alterations where it is technically infeasible to comply with 603, altering existing toilet or bathing rooms shall not be required where a single unisex toilet room or bathing room complying with 213.2.1 is provided and located in the same area and on the same floor as existing inaccessible toilet or bathing rooms.
>
> 2. Where exceptions for alterations to qualified historic buildings or facilities are permitted by 202.5, no fewer than one toilet room for each sex complying with 603 or one unisex toilet room complying with 213.2.1 shall be provided.

Section 213.2.1 of the 2010 Standards identifies what should be included in a unisex toilet room to meet the federal guidelines.

> **213.2.1 Unisex (Single-Use or Family) Toilet and Unisex Bathing Rooms.** Unisex toilet rooms shall contain not more than one lavatory, and two water closets without urinals or one water closet and one urinal. Unisex bathing rooms shall contain one shower or one shower and one bathtub, one lavatory, and one water closet. Doors to unisex toilet rooms and unisex bathing rooms shall have privacy latches.

Cost Impact: Will not increase the cost of construction
The revision is a clarification. It should not increase or decrease costs of construction. It may reduce administration costs because it clarifies something.

EB 46-15 : 410.8.10-BOECKER5781

EB 47-15

410.9, 1204.1, 1205.15

Proponent: Edward Kulik, Chair, representing Building Code Action Committee (bcac@iccsafe.org)

2015 International Existing Building Code

Revise as follows:

410.9 Historic buildings. These provisions shall apply to *facilities* designated as historic structures that undergo *alterations* or a *change of occupancy*, unless *technically infeasible*. Where compliance with the requirements for accessible routes, entrances or toilet rooms would threaten or destroy the historic significance of the *facility*, as determined by the ~~applicable governing authority~~authority having jurisdiction, the alternative requirements of Sections 410.9.1 through 410.9.4 for that element shall be permitted.

Exception: Type B dwelling or sleeping units required by Section 1107 of the *International Building Code* are not required to be provided in historical buildings.

1204.1 Accessibility requirements. The provisions of Sections 705, 806 and 906, as applicable, shall apply to facilities designated as historic structures that undergo *alterations*, unless *technically infeasible*. Where compliance with the requirements for accessible routes, entrances or toilet rooms would threaten or destroy the historic significance of the~~ building or~~ *facility*, as determined by the ~~*code official*~~authority having jurisdiction, the alternative requirements of Sections 1204.1.1 through 1204.1.4 for that element shall be permitted.

Exception: Type B dwelling or sleeping units required by Section 1107 of the *International Building Code* are not required to be provided in historical buildings.

1205.15 Accessibility requirements. The provisions of Section 1012.8 shall apply to facilities designated as historic structures that undergo a *change of occupancy*, unless *technically infeasible*. Where compliance with the requirements for accessible routes~~, ramps~~, entrances, or toilet rooms would threaten or destroy the historic significance of the~~ building or~~ *facility*, as determined by the authority having jurisdiction, the alternative requirements of Sections 1204.1.1 through 1204.1.4 for those elements shall be permitted

Exception: Type B dwelling or sleeping units required by Section 1107 of the *International Building Code* are not required to be provided in historical buildings.

Reason: There is a series of proposals intended to coordinate the provisions in the first and second options in the IEBC. Requirements for historic building in Sections 410.9, 1204.1 and 1205.5 should match. By changing 410.9 and 1204.1 to match 1205.15, 'the authority having jurisdiction' can include historical preservation offices and oversight. In Section 1205.15, 'ramps" are not part of the list of requirements in the following sections; therefore, they should not be in this list. The definition for the term 'facility' includes buildings, therefore you can use one descriptor.
In July/2014 the ICC Board decided to sunset the activities of the Code Technology Committee (CTC). This is being accomplished by re-assigning many of the CTC Areas of Study to the applicable Code Action Committee (CAC). This proposal falls under the CTC Area of Study entitled IBC Coordination with the New ADAAG. Information on the CTC, including: the sunset plan; meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the CTC website.

This public proposal is submitted by the ICC Building Code Action Committee (BCAC). The BCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the BCAC has held 13 open meetings and numerous workgroup calls which included members of the BCAC as well as any interested party to discuss and debate the proposed changes and the public comments. Related documentation and reports are posted on the BCAC website at: http://www.iccsafe.org/cs/BCAC/Pages/default.aspx.

Cost Impact: Will not increase the cost of construction
The proposal is a clarification and coordination of current requirements; therefore, there is no impact on the cost.

EB 47-15 : 410.9-KULIK3343

EB 48-15

410.9.3, 1204.1.3

Proponent: Edward Kulik, Chair, representing Building Code Action Committee (bcac@iccsafe.org)

2015 International Existing Building Code

Revise as follows:

410.9.3 Entrances. At least one ~~main~~ public entrance shall be accessible.

Exceptions:

1. If a ~~main~~ public entrance cannot be made accessible, an accessible ~~nonpublic~~ entrance that is unlocked while the building is occupied shall be provided; or
2. If a ~~main~~ public entrance cannot be made accessible, a locked accessible entrance with a notification system or remote monitoring shall be provided.

Signs complying with Section 1111 of the *International Building Code* shall be provided at the ~~primary~~ public entrance and the accessible entrance.

1204.1.3 Entrances. At least one ~~main~~ public entrance shall be accessible.

Exceptions:

1. If a ~~main~~ public entrance cannot be made accessible, an accessible ~~nonpublic~~ entrance that is unlocked while the building is occupied shall be provided; or
2. If a ~~main~~public entrance cannot be made accessible, a locked accessible entrance with a notification system or remote monitoring shall be provided.

Signs complying with Section 1111 of the *International Building Code* shall be provided at the public entrance and the accessible entrance.

Reason: There is a series of proposals intended to coordinate the provisions in the first and second options in the IEBC. Requirements for toilet rooms in Sections 410.9.3 and 1204.1.3 should match. The term 'public' is used in ADA instead of 'main'. The term 'nonpublic' is removed from exception 1 so that this can be any entrance to the building; also this is consistent with Exception 2. Adding the signage reference is consistent with Entrances in Sections 410.8.1 and 705.1.1.

In July/2014 the ICC Board decided to sunset the activities of the Code Technology Committee (CTC). This is being accomplished by re-assigning many of the CTC Areas of Study to the applicable Code Action Committee (CAC). This proposal falls under the CTC Area of Study entitled IBC Coordination with the New ADAAG. Information on the CTC, including: the sunset plan; meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the CTC website.

This public proposal is submitted by the ICC Building Code Action Committee (BCAC). The BCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. Since its inception in July, 2011, the BCAC has held 13 open meetings and numerous workgroup calls which included members of the BCAC as well as any interested party to discuss and debate the proposed changes and the public comments. Related documentation and reports are posted on the BCAC website at: http://www.iccsafe.org/cs/BCAC/Pages/default.aspx.

Cost Impact: Will not increase the cost of construction
The proposal is a clarification and coordination of current requirements; therefore, there is no impact on the cost.

EB 48-15 : 410.9.3-KULIK3355

EB 49-15

410.8.11 (New), 806.3 (New)

Proponent: Gene Boecker, representing Code Consultants, Inc. (geneb@codeconsultants.com)

2015 International Existing Building Code

410.8.10 Toilet rooms. Where it is *technically infeasible* to alter existing toilet and bathing rooms to be *accessible*, an *accessible* family or assisted-use toilet or bathing room constructed in accordance with Section 1109.2.1 of the *International Building Code* is permitted. The family or assisted-use toilet or bathing room shall be located on the same floor and in the same area as the existing toilet or bathing rooms. At the inaccessible toilet and bathing rooms, provide directional signs indicating the location of the nearest family or assisted-use toilet room or bathing room. These directional signs shall include the International Symbol of Accessibility and sign characters shall meet the visual character requirements in accordance with ICC A117.1.

Add new text as follows:

410.8.11 Additional toilet and bathing facilities In assembly and mercantile occupancies, where additional toilet fixtures are added, at least one accessible family or assisted-use toilet room shall be provided where required by Section 1109.2.1 of the International Building Code. In recreational facilities, where additional bathing rooms are being added, at least one family or assisted-use bathing rooms shall be provided where required by Section 1109.2.1 of the International Building Code.

705.1.9 Toilet rooms. Where it is technically infeasible to alter existing toilet and bathing rooms to be accessible, an accessible family or assisted-use toilet or bathing room constructed in accordance with Section 1109.2.1 of the *International Building Code* is permitted. The family or assisted-use toilet or bathing room shall be located on the same floor and in the same area as the existing toilet or bathing rooms. At the inaccessible toilet and bathing rooms, directional signs indicating the location of the nearest family or assisted-use toilet room or bathing room shall be provided. These directional signs shall include the International Symbol of Accessibility and sign characters shall meet the visual character requirements in accordance with ICC A117.1.

806.3 Toilet and bathing facilities In assembly and mercantile occupancies, where additional toilet fixtures are added, at least one accessible family or assisted-use toilet room shall be provided where required by Section 1109.2.1 of the International Building Code. In recreational facilities, where additional bathing rooms are being added, at least one family or assisted-use bathing rooms shall be provided where required by Section 1109.2.1 of the International Building Code.

Reason: The current text is unclear where a family or assisted use toilet room needs to be added within a facility. There is a correllative change to Section 410.8.10 and 705.1.9 to seperate this bathroom from where a unisex bathroom is permitted as an option when the men's and women's bathrooms cannot be made accessible.
410.8.11 The langauge of the requirement is changed to make it clear that the intent is to provide a family or assisted-use toilet room when it would normally be requried by Section 1109.2.1 of the IBC. The manner in which it is currently written, the text seems to imply that the family or assisted-use toilet room would be requried regardless of the occupancy classification of the facility. If so, it would impose a requirementr more strict than that for new construction.

806.3 The same langauge as shown in the revised Section 410.8.11 is being added to the Work Area method for Level 2 Alterations. It seems only appropriate that the requirement should apply to both methodologies.

Cost Impact: Will increase the cost of construction
The added requirement to the work area method will increase the cost of construction for some buidlings.
However, the clarification to the existing text will likely reduce the cost of construction. The specific balance will depend on which method is used and what type of project is involved.

Chapters 5, 6, 7, 8, 9, 10, 11, 12, 13

Proponent: Kathleen Petrie, representing Seattle Dept of Planning & Development (kathleen.petrie@seattle.gov)

2015 International Existing Building Code

Combine Chapters 5 through 12 and revise as follows:

CHAPTER 5 ~~CLASSIFICATION OF WORK~~WORK AREA METHOD

SECTION 501 ~~GENERAL~~CLASSIFICATION OF WORK

501.1 Scope. The provisions of this chapter~~ shall be used in conjunction with Chapters 6 through 13 and~~ shall apply to the *alteration*, *repair*, *addition* and *change of occupancy* of existing structures, including historic and moved structures, as referenced in Section 301.1.2. The work performed on an *existing building* shall be classified in accordance with this chapter.

501.1.1 Compliance with other alternatives. *Alterations*, *repairs*, *additions* and *changes of occupancy* to existing structures shall comply with the provisions of ~~Chapters 6 through 13~~this chapter or with one of the alternatives provided in Section 301.1.

~~501.2~~501.1.2 Work area. The *work area*, as defined in Chapter 2, shall be identified on the construction documents.

~~SECTION 502 REPAIRS~~

~~502.1~~501.2 ~~Scope~~Repairs. *Repairs,* as defined in Chapter 2, include the patching or restoration or replacement of damaged materials, elements, *equipment or fixtures* for the purpose of maintaining such components in good or sound condition with respect to existing loads or performance requirements.

~~502.2~~501.2.1 Application. *Repairs* shall comply with the provisions of ~~Chapter 6.~~Section 502.

~~502.3~~501.2.2 Related work. Work on nondamaged components that is necessary for the required *repair* of damaged components shall be considered part of the *repair* and shall not be subject to the provisions of ~~Chapter 7, 8, 9, 10 or 11~~ Sections 503, 504, 505, 506, or 507.

~~SECTION 503 ALTERATIONS- LEVEL 1~~

~~503.1~~501.3 ~~Scope~~Alteration - Level 1. *No change to text.*

~~503.2~~501.3.1 Application. Level 1 *alterations* shall comply with the provisions of ~~Chapter 7.~~Section 503.

~~SECTION 504 ALTERATIONS-LEVEL 2~~

~~504.1~~501.4 ~~Scope~~Alteration - Level 2. Level 2 *alterations* include the reconfiguration of space, the addition or elimination of any door or window, the reconfiguration or extension of any system, or the installation of any additional equipment.

~~504.2~~501.4.1 Application. Level 2 *alterations* shall comply with the provisions of~~ Chapter 7~~ Section 503 for Level 1 *alterations* as well as the provisions of~~ Chapter 8.~~ Section 504.

~~SECTION 505 ALERATIONS- LEVEL 3~~

~~505.1~~501.5 ~~Scope~~Alteration-Level 3. Level 3 *alterations* apply where the work area exceeds 50 percent of the *building area*.

~~505.2~~501.5.1 Application. Level 3 *alterations* shall comply with the provisions of~~ Chapters 7~~ Sections 503 and ~~8~~ 504 for Level 1 and 2 *alterations*, respectively, as well as the provisions of ~~Chapter 9.~~Section 505.

~~SECTION 506 CHANGE OF OCCUPANCY~~

~~506.1~~501.6 ~~Scope~~Change of occupancy. *Change of occupancy* provisions apply where the activity is classified as a *change of occupancy* as defined in Chapter 2.

~~506.2~~501.6.1 Application. *Changes of occupancy* shall comply with the provisions of ~~Chapter 10.~~Section 506.

~~SECTION 507 ADDITIONS~~

~~507.1~~501.7 ~~Scope~~Additions. Provisions for *additions* shall apply where work is classified as an *addition* as defined in Chapter 2.

~~507.2~~501.7.1 Application. *Additions* to *existing buildings* shall comply with the provisions of ~~Chapter 11.~~Section 507.

~~SECTION 508 HISTORIC BUIDLINGS~~

~~508.1~~501.8 ~~Scope~~Historic Buildings. *Historic building* provisions shall apply to buildings classified as historic as defined in Chapter 2.

~~508.2~~501.8.1 Application. Except as specifically provided for in ~~Chapter 12~~Section 508, *historic buildings* shall comply with applicable provisions of this code for the type of work being performed.

~~SECTION 509 RELOCATED BUILDINGS~~

~~509.1~~501.9 ~~Scope~~Relocated Buildings. Relocated building provisions shall apply to relocated or moved buildings. Relocated buildings shall comply with the provisions of Section 509.

~~CHAPTER 6REPAIRS~~

SECTION~~ 601~~502~~GENERAL~~REPAIRS

~~601.1~~502.1 Scope. Repairs as described in Section 502 shall comply with the requirements of this ~~chapter~~section. Repairs to *historic buildings* need only comply with ~~Chapter 12.~~Section 508.

~~601.2~~502.2 Conformance. The work shall not make the building less conforming than it was before the *repair* was undertaken.

~~[BS] 601.3~~502.3 Flood hazard areas. In flood hazard areas, repairs that constitute *substantial improvement* shall require that the building comply with Section 1612 of the *International Building Code*, or Section R322 of the *International Residential Code*, as applicable,

~~SECTION602 BUILDING ELEMENTS AND MATERIALS~~

~~602.2~~502.5 New and replacement materials. Except as otherwise required or permitted by this code, materials permitted by the applicable code for new construction shall be used. Like materials shall be permitted for *repairs* and *alterations*, provided no *dangerous* or *unsafe* condition, as defined in Chapter 2, is created. Hazardous materials, such as asbestos and lead-based paint, shall not be used where the code for new construction would not permit their use in buildings of similar occupancy, purpose and location.

~~602.3~~502.6 Glazing in hazardous locations. Replacement glazing in hazardous locations shall comply with the safety glazing requirements of the *International Building Code* or *International Residential Code* as applicable.

> **Exception:** Glass block walls, louvered windows, and jalousies repaired with like materials.

~~SECTION603 FIRE PROTECTION~~

~~603.1~~502.7 ~~General~~Fire protection. *No change to text.*

~~SECTION604 MEANS OF EGRESS~~

~~604.1~~502.8 ~~General~~Means of egress. *No change to text.*

~~SECTION605 ACCESSIBILITY~~

~~605.1~~502.9 ~~General~~Accessibility. *No change to text.*

~~SECTION606 STRUCTURAL~~

~~[BS] 606.1~~502.10 ~~General~~Structural. Structural repairs shall be in compliance with this section and Section ~~601.2~~502.10.1. Regardless of the extent of structural or nonstructural damage, *dangerous* conditions shall be eliminated. Regardless of the scope of *repair*, new structural members and connections used for *repair* or *rehabilitation* shall comply with the detailing provisions of the *International Building Code* for new buildings of similar structure, purpose and location.

~~SECTION607 ELECTRICAL~~

~~607.1~~502.11 ~~Material~~Electrical. Existing electrical wiring and equipment undergoing *repair* shall be allowed to be repaired or replaced with like material.

~~SECTION608 MECHANICAL~~

~~608.1~~502.12 ~~General~~Mechanical. Existing mechanical systems undergoing *repair* shall not make the building less conforming than it was before the *repair* was undertaken.

~~SECTION609 PLUMBING~~

~~609.1~~502.13 ~~Materials~~Plumbing. Plumbing materials and supplies shall not be used for repairs that are prohibited in the *International Plumbing Code*.

~~CHAPTER 7ALTERATIONS—LEVEL 1~~

SECTION ~~701~~503~~GENERAL~~ALTERATIONS-LEVEL 1

~~701.1~~503.1 Scope. Level 1 *alterations* as described in Section ~~503~~501.3 shall comply with the requirements of this ~~chapter~~section. Level 1 *alterations* to *historic buildings* shall comply with this ~~chapter~~section, except as modified in ~~Chapter 12.~~Section 508.

~~701.2~~503.2 Conformance. An *existing building* or portion thereof shall not be altered such that the building becomes less safe than its existing condition.

> **Exception:** Where the current level of safety or sanitation is proposed to be reduced, the portion altered shall conform to the requirements of the *International Building Code*.

~~[BS] 701.3~~503.3 Flood hazard areas. In *flood hazard areas*, *alterations* that constitute *substantial improvement* shall require that the building comply with Section 1612 of the *International Building Code*, or Section R322 of the *International Residential Code*, as applicable,

~~SECTION702 BUILDING ELEMENTS AND MATERIALS~~

~~702.1~~503.4 Interior wall and ceiling finishes. All newly installed interior wall and ceiling finishes shall comply with Chapter 8 of the *International Building Code*.

~~702.2~~503.5 Interior floor finish. New interior floor finish, including new carpeting used as an interior floor finish material, shall comply with Section 804 of the *International Building Code*.

~~702.3~~503.6 Interior trim. All newly installed interior trim materials shall comply with Section 806 of the *International Building Code*.

~~702.4~~503.7 Window opening control devices. In Group R-2 or R-3 buildings containing dwelling units and one- and two-family dwellings and townhouses regulated by the *International Residential Code*, window opening control devices complying with ASTM F 2090 shall be installed where an existing window is replaced and where all of the following apply to the replacement window:

1. The window is operable;
2. The window replacement includes replacement of the sash and the frame;
3. One of the following applies:
    3.1. In Group R-2 or R-3 buildings containing dwelling units, the top of the sill of the window opening is at a height less than 36 inches (915 mm) above the finished floor; or
    3.2. In one- and two-family dwellings and town-houses regulated by the *International Residential Code*, the top sill of the window opening is at a height less than 24 inches (610 mm) above the finished floor;
4. The window will permit openings that will allow passage of a 4-inch-diameter (102 mm) sphere when the window is in its largest opened position; and
5. The vertical distance from the top of the sill of the window opening to the finished grade or other surface below, on the exterior of the building, is greater than 72 inches (1829 mm).

The window opening control device, after operation to release the control device allowing the window to fully open, shall not reduce the minimum net clear opening area of the window unit to less than the area required by the *International Building Code.*

Exceptions:

5.1. Operable windows where the top of the sill of the window opening is located more than 75 feet (22 860 mm) above the finished grade or other surface below, on the exterior of the room, space or building, and that are provided with window fall prevention devices that comply with ASTM F 2006.

5.2. Operable windows with openings that are provided with window fall prevention devices that comply with ASTM F 2090.

~~702.5~~503.8 Emergency escape and rescue openings. Where windows are required to provide emergency escape and rescue openings in Group R-2 and R-3 occupancies and one- and two-family dwellings and townhouses regulated by the *International Residential Code*, replacement windows shall be exempt from the requirements of Sections 1030.2, 1030.3 and 1030.5 of the *International Building Code* and Sections R310.21 and R310.2.3 of the *International Residential Code* accordingly, provided the replacement window is the manufacturer's largest standard size window that will fit within the existing frame or existing rough opening. The replacement window shall be permitted to be of the same operating style as the existing window or a style that provides for an equal or greater window opening area than the existing window.

Window opening control devices complying with ASTM F 2090 shall be permitted for use on windows required to provide *emergency escape* and *rescue openings*.

~~702.6~~503.9 **Materials and methods.** All new work shall comply with the materials and methods requirements in the *International Building Code*, *International Energy Conservation Code*, *International Mechanical Code*, and *International Plumbing Code*, as applicable, that specify material standards, detail of installation and connection, joints, penetrations, and continuity of any element, component, or system in the building.

~~**SECTION703 FIRE PROTECTION**~~

~~**703.1**~~**503.10** ~~**General**~~**Fire protection.** *Alterations* shall be done in a manner that maintains the level of fire protection provided.

~~**SECTION704 MEANS OF EGRESS**~~

~~**704.1**~~**503.11** ~~**General**~~**Means of egress.** *Alterations* shall be done in a manner that maintains the level of protection provided for the means of egress.

~~**SECTION705 ACCESSIBILITY**~~

~~**705.1**~~**503.12** ~~**General**~~**Accessibility.** A *facility* that is altered shall comply with the applicable provisions in Sections ~~705.1.1~~503.12.1 through ~~705.1.14~~503.12.14, and Chapter 11 of the *International Building Code* unless it is *technically infeasible*. Where compliance with this section is *technically infeasible*, the alteration shall provide access to the maximum extent that is technically feasible.

A *facility* that is constructed or altered to be accessible shall be maintained accessible during occupancy.

Exceptions:

1. The altered element or space is not required to be on an accessible route unless required by Section 705.2.
2. Accessible means of egress required by Chapter 10 of the *International Building Code* are not required to be provided in existing *facilities*.
3. Type B dwelling or sleeping units required by Section 1107 of the *International Building Code* are not required to be provided in existing *facilities* undergoing less than a Level 3 *alteration*.
4. The alteration to Type A individually owned dwelling units within a Group R-2 occupancy shall meet the provisions for Type B dwelling units.

~~**SECTION706 REROOFING**~~

~~**[BS] 706.1**~~**503.13** ~~**General**~~**Reroofing.** Materials and methods of application used for recovering or replacing an existing roof covering shall comply with the requirements of Chapter 15 of the *International Building Code*.

Exception: Reroofing shall not be required to meet the minimum design slope requirement of one-quarter unit vertical in 12 units horizontal (2-percent slope) in Section 1507 of the *International Building Code* for roofs that provide positive roof drainage.

~~**SECTION707 STRUCTURAL**~~

~~**[BS] 707.1**~~**503.14** ~~**General**~~**Structural.** Where *alteration* work includes replacement of equipment that is supported by the building or where a reroofing permit is required, the provisions of this section shall apply.

~~**SECTION708 ENERGY CONSERVATION**~~

~~**708.1**~~**503.15** ~~**Minimum requirements.**~~**Energy Conservation.** Level 1 *alterations* to *existing buildings* or structures are permitted without requiring the entire building or structure to comply with the energy requirements of the *International Energy Conservation Code* or *International Residential Code*. The *alterations* shall conform to the energy requirements of the *International Energy Conservation Code* or *International Residential Code* as they relate to new construction only.

~~**CHAPTER 8ALTERATIONS—LEVEL 2**~~

SECTION ~~801~~504 ~~GENERAL~~ALTERATIONS-LEVEL 2

~~**801.1**~~**504.1 Scope.** Level 2 *alterations* as described in Section ~~504~~501.4 shall comply with the requirements of this ~~chapter~~section.

Exception: Buildings in which the reconfiguration is exclusively the result of compliance with the accessibility requirements of Section ~~705.2~~ 503.12.1 shall be permitted to comply with ~~Chapter 7~~Section 503.

~~**801.2**~~**504.1.1** ~~**Alteration Level 1**~~**Additional compliance.** In addition to the requirements of this ~~chapter~~section, all work shall comply with the requirements of ~~Chapter 7.~~Section 503.

~~**801.3**~~**504.1.2 Compliance with International Building Code.** All new construction elements, components, systems, and spaces shall comply with the requirements of the *International Building Code*.

Exceptions:

1. Windows may be added without requiring compliance with the light and ventilation requirements of the *International Building Code*.
2. Newly installed electrical equipment shall comply with the requirements of Section 808.
3. The length of dead-end corridors in newly constructed spaces shall only be required to comply with the provisions of Section 805.6.
4. The minimum ceiling height of the newly created habitable and occupiable spaces and corridors shall be 7 feet (2134 mm).

~~**SECTION802 SPECIAL USE AND OCCUPANCY**~~

~~**802.1**~~**504.2** ~~**General**~~**Special Use and Occupancy.** *Alteration* of buildings classified as special use and occupancy as described in the *International Building Code* shall comply with the requirements of Section 801.1 and the scoping provisions of Chapter 1 where applicable.

~~**SECTION803 BUILDING ELEMENTS AND MATERIALS**~~

~~**803.1**~~**504.3** ~~**Scope**~~**Building Elements and materials.** *No change to text.*

~~**SECTION804 FIRE PROTECTION**~~

~~**804.1**~~**504.4** ~~**Scope**~~**Fire protection.** The requirements of this section shall be limited to work areas in which Level 2 *alterations* are being performed, and where specified they shall apply throughout the floor on which the *work areas* are located or otherwise beyond the *work area*.

~~**SECTION805 MEANS OF EGRESS**~~

~~**805.1**~~**504.5** ~~**Scope**~~**Means of egress.** The requirements of this section shall be limited to work areas that include exits or corridors shared by more than one tenant within the *work area* in which Level 2 *alterations* are being performed, and where specified they shall apply throughout the floor on which the *work areas* are located or otherwise beyond the *work area*.

~~**805.2**~~**504.5.1 General.** The means of egress shall comply with the requirements of this section.

Exceptions:

1. Where the work area and the means of egress serving it complies with NFPA 101.
2. Means of egress conforming to the requirements of the building code under which the building was constructed shall be considered compliant means of egress if, in the opinion of the code official, they do not constitute a distinct hazard to life.

~~**805.3 Number of exits.** The number of exits shall be in accordance with Sections 805.3.1 through 805.3.3.~~

~~805.3.1~~504.5.2 Minimum number of exits. Every story utilized for human occupancy on which there is a *work area* that includes exits or corridors shared by more than one tenant within the *work area* shall be provided with the minimum number of exits based on the occupancy and the occupant load in accordance with the *International Building Code*. In addition, the exits shall comply with Sections 805.3.1.1 and 805.3.1.2.

~~**805.4.1 Two egress doorways required.** Work areas shall be provided with two egress doorways in accordance with the requirements of Sections 805.4.1.1 and 805.4.1.2.~~

~~805.8~~504.5.10 Exit signs. ~~Exit signs~~Means of egress in all work areas shall be provided with exit signs in accordance with ~~this section, as applicable.~~the requirements of the *International Building Code.*

~~**805.8.1 Work areas.** Means of egress in all work areas shall be provided with exit signs in accordance with the requirements of the *International Building Code.*~~

~~**805.10.1 Capacity.** The required capacity of refuge areas shall be in accordance with Sections 805.10.1.1 through 805.10.1.3.~~

~~**SECTION806 ACCESSIBILITY**~~

~~806.1~~504.6 ~~General~~Accessibility. A building, *facility*, or element that is altered shall comply with this section and Section 705.~~SECTION807 STRUCTURAL~~

~~[BS] 807.1~~504.7 ~~General~~Structural. Structural elements and systems within buildings undergoing Level 2 *alterations* shall comply with this section.

~~**SECTION808 ELECTRICAL**~~

504.8 Electrical. Electrical equipment and wiring shall comply with section 504.8.1 through 504.8.3.7.

~~808.1~~504.8.1 New installations. All newly installed electrical equipment and wiring relating to work done in any work area shall comply with all applicable requirements of NFPA 70 except as provided for in Section ~~808.3~~504.8.3.

~~808.2~~504.8.2 Existing installations. Existing wiring in all work areas in Group A-1, A-2, A-5, H and I occupancies shall be upgraded to meet the materials and methods requirements of ~~Chapter 7.~~Section 503.

~~**SECTION809 MECHANICAL**~~

504.9 Mechanical. Mechanical equipment shall comply with sections 504.9 through 504.9.3.

~~**SECTION810 PLUMBING**~~

~~810.1~~504.10 Minimum plumbing fixtures. Where the occupant load of the story is increased by more than 20 percent, plumbing fixtures for the story shall be provided in quantities specified in the *International Plumbing Code* based on the increased occupant load.

~~**SECTION811 ENERGY CONSERVATION**~~

~~811.1~~504.11 Minimum energy conservation requirements. Level 2 *alterations* to *existing buildings* or structures are permitted without requiring the entire building or structure to comply with the energy requirements of the *International Energy Conservation Code* or *International Residential Code*. The *alterations* shall conform to the energy requirements of the *International Energy Conservation Code* or *International Residential Code* as they relate to new construction only.

~~**CHAPTER 9ALTERATIONS—LEVEL 3**~~

SECTION ~~901~~ 505~~GENERAL~~ ALTERATIONS-LEVEL 3

~~901.1~~505.1 Scope. Level 3 *alterations* as described in Section ~~505~~501.5 shall comply with the requirements of this ~~chapter~~section.

~~901.2~~505.2 Compliance. In addition to the provisions of this ~~chapter~~section, work shall comply with all of the requirements of ~~Chapters 7~~Sections 503 and ~~8~~504. The requirements of Sections 803, 804 and 805 shall apply within all *work areas* whether or not they include exits and corridors shared by more than one tenant and regardless of the occupant load.

> **Exception:** Buildings in which the reconfiguration of space affecting exits or shared egress access is exclusively the result of compliance with the accessibility requirements of Section 705.2 shall not be required to comply with this ~~chapter~~section.

~~**SECTION902 SPECIAL USE AND OCCUPANCY**~~

~~902.1~~505.3 High-rise buildings. *No change to text.*

~~902.2~~505.4 Boiler and furnace equipment rooms. Boiler and furnace equipment rooms adjacent to or within Groups I-1, I-2, I-4, R-1, R-2 and R-4 occupancies shall be enclosed by 1-hour fireresistance-rated construction.

Exceptions:

1. Steam boiler equipment operating at pressures of 15 pounds per square inch gauge (psig) (103.4 KPa) or less is not required to be enclosed.
2. Hot water boilers operating at pressures of 170 psig (1171 KPa) or less are not required to be enclosed.
3. Furnace and boiler equipment with 400,000 British thermal units (Btu) (4.22 × 108 J) per hour input rating or less is not required to be enclosed.
4. Furnace rooms protected with an automatic sprinkler system are not required to be enclosed.

~~**SECTION903 BUILDING ELEMENTS AND MATERIALS**~~

~~903.1~~505.5 Existing shafts and vertical openings. Existing stairways that are part of the means of egress shall be enclosed in accordance with Section 803.2.1 from the highest *work area* floor to, and including, the level of exit discharge and all floors below.

~~903.2~~505.6 Fire partitions in Group R-3. *No change to text.*

~~903.3~~505.7 Interior finish. Interior finish in exits serving the *work area* shall comply with Section 803.4 between the highest floor on which there is a *work area* to the floor of exit discharge.

~~**SECTION904 FIRE PROTECTION**~~

~~904.1~~505.8 Automatic sprinkler systems. *No change to text.*

~~904.2~~505.9 Fire alarm and detection systems. Fire alarm and detection shall be provided in accordance with Section 907 of the *International Building Code* as required for new construction.

~~**SECTION905 MEANS OF EGRESS**~~

~~905.1~~505.10 ~~General~~Means of egress. *No change to text.*

~~**SECTION906 ACCESSIBILITY**~~

~~906.1~~505.11 ~~General~~Accessibility. A building, *facility* or element that is altered shall comply with this section and Sections 705 and 806.

~~**SECTION907 STRUCTURAL**~~

~~[BS] 907.1~~505.12 ~~General~~Structural. Where buildings are undergoing Level 3 *alterations* including structural *alterations*, the provisions of this section shall apply.

~~[BS] 907.4~~505.12.3 Existing structural elements resisting lateral loads. All existing elements of the lateral force-resisting system shall comply with this section.

Exceptions:

1. Buildings of Group R occupancy with no more than five dwelling or sleeping units used solely for residential purposes that are altered based on the conventional light-frame construction methods of the *International Building Code* or in compliance with the provisions of the *International Residential Code*.
2. Where such *alterations* involve only the lowest story of a building and the *change of occupancy* provisions of ~~Chapter 10~~Section 506 do not apply, only the lateral force-resisting components in and below that story need comply with this section.

~~**SECTION908 ENERGY CONSERVATION**~~

~~908.1~~505.13 ~~Minimum requirements.~~Energy conservation. Level 3 *alterations* to *existing buildings* or structures are permitted without requiring the entire building or structure to comply with the energy requirements of the *International Energy Conservation Code* or *International Residential Code*. The *alterations* shall conform to the energy requirements of the *International Energy Conservation Code* or *International Residential Code* as they relate to new construction only.

~~**CHAPTER 10CHANGE OF OCCUPANCY**~~

SECTION ~~1001~~ 506~~GENERAL~~CHANGE OF OCCUPANCY

~~1001.1~~506.1 Scope. The provisions of this ~~chapter~~section shall apply where a *change of occupancy* occurs, as defined in Section 202.

~~1001.2~~506.2 Certificate of occupancy. A change of occupancy or a change of occupancy within a space where there is a different fire protection system threshold requirement in Chapter 9 of the *International Building Code* shall not be made to any structure without the approval of the *code official*. A certificate of occupancy shall be issued where it has been determined that the requirements for the change of occupancy have been met**.**

~~1001.3~~506.3 Certificate of occupancy required. A certificate of occupancy shall be issued where a *change of occupancy* occurs that results in a different occupancy classification as determined by the *International Building Code*.

~~**SECTION1002 SPECIAL USE AND OCCUPANCY**~~

~~1002.1~~506.4 ~~Compliance with the building code.~~Special use and occupancy. Where the character or use of an *existing building* or part of an *existing building* is changed to one of the following special use or occupancy categories as defined in the *International Building Code*, the building shall comply with all of the applicable requirements of the *International Building Code*:

1. Covered and open mall buildings.
2. Atriums.
3. Motor vehicle-related occupancies.
4. Aircraft-related occupancies.
5. Motion picture projection rooms.
6. Stages and platforms.
7. Special amusement buildings.
8. Incidental use areas.
9. Hazardous materials.
10. Ambulatory care facilities.
11. Group I-2 occupancies.

~~**SECTION1003 BUILDING ELEMENTS AND MATERIALS**~~

~~1003.1~~506.5 ~~General~~Building elements and materials. Building elements and materials in portions of buildings undergoing a *change of occupancy* classification shall comply with Section 1012.

~~**SECTION1004 FIRE PROTECTION**~~

~~1004.1~~506.6 ~~General~~Fire protection. Fire protection requirements of Section 1012 shall apply where a building or portions thereof undergo a *change of occupancy* classification or where there is a change of occupancy within a space where there is a different fire protection system threshold requirement in Chapter 9 of the *International Building Code*.

~~**SECTION1005 MEANS OF EGRESS**~~

~~1005.1~~506.7 ~~General~~Means of egress. Means of egress in portions of buildings undergoing a *change of occupancy* classification shall comply with Section 1012.

~~**SECTION1006 ACCESSIBILITY**~~

~~1006.1~~506.8 ~~General~~Accessibility. Accessibility in portions of buildings undergoing a *change of occupancy* classification shall comply with Section 1012.8.

~~**SECTION1007 STRUCTURAL**~~

506.9 Structural. Buildings undergoing *change of occupancy* are subject to Section 506.9.

~~**SECTION1008 ELECTRICAL**~~

506.10 Electrical. Electrical equipment and wiring shall comply with Sections 506.10.1 through 506.10.4

~~**SECTION1009 MECHANICAL**~~

~~1009.1~~506.11 Mechanical requirements. Where the occupancy of an *existing building* or part of an *existing building* is changed such that the new occupancy is subject to different kitchen exhaust requirements or to increased mechanical ventilation requirements in accordance with the *International Mechanical Code*, the new occupancy shall comply with the respective *International Mechanical Code* provisions.

~~**SECTION1010 PLUMBING**~~

506.12 Plumbing. Plumbing equipment and systems shall comply with Section 506.12.

~~**SECTION1011 OTHER REQUIREMENTS**~~

~~**1011.1**~~**506.13 Light and ventilation.** Light and ventilation shall comply with the requirements of the *International Building Code* for the new occupancy.

~~**SECTION1012 CHANGE OF OCCUPANCY CLASSIFICATION**~~

~~**1012.1**~~**506.14** ~~**General**~~**Change of occupancy classification.** The provisions of this section shall apply to buildings or portions thereof undergoing a change of occupancy classification. This includes a change of occupancy classification within a group as well as a change of occupancy classification from one group to a different group or where there is a change of occupancy within a space where there is a different fire protection system threshold requirement in Chapter 9 of the *International Building Code*. Such buildings shall also comply with Sections 1002 through 1011. The application of requirements for the change of occupancy shall be as set forth in Sections 1012.1.1 through 1012.1.4. A *change of occupancy*, as defined in Section 202, without a corresponding change of occupancy classification shall comply with Section 1001.2.

~~**1012.1.1**~~**506.14.1 Compliance with** ~~**Chapter 9.**~~**Section 505.** The requirements of ~~Chapter 9~~ Section 505 shall be applicable throughout the building for the new occupancy classification based on the separation conditions set forth in Sections 1012.1.1.1 and 1012.1.1.2.

~~**1012.2 Fire protection systems.** Fire protection systems shall be provided in accordance with Sections 1012.2.1 and 1012.2.2.~~

~~**1012.2.1**~~**506.14.5 Fire sprinkler system.** Where a change in occupancy classification occurs or where there is a change of occupancy within a space where there is a different fire protection system threshold requirement in Chapter 9 of the *International Building Code* that requires an automatic fire sprinkler system to be provided based on the new occupancy in accordance with Chapter 9 of the *International Building Code*, such system shall be provided throughout the area where the *change of occupancy* occurs.

~~**1012.2.2**~~**506.14.6 Fire alarm and detection system.** Where a change in occupancy classification occurs or where there is a change of occupancy within a space where there is a different fire protection system threshold requirement in Chapter 9 of the *International Building Code* that requires a fire alarm and detection system to be provided based on the new occupancy in accordance with Chapter 9 of the *International Building Code*, such system shall be provided throughout the area where the *change of occupancy* occurs. Existing alarm notification appliances shall be automatically activated throughout the building. Where the building is not equipped with a fire alarm system, alarm notification appliances shall be provided throughout the area where the *change of occupancy* occurs in accordance with Section 907 of the *International Building Code* as required for new construction.

~~**1012.3**~~**506.14.7 Interior finish.** In areas of the building undergoing the change of occupancy classification, the interior finish of walls and ceilings shall comply with the requirements of the *International Building Code* for the new occupancy classification.

~~**1012.4**~~**506.14.8 Means of egress, general.** Hazard categories in regard to life safety and means of egress shall be in accordance with Table ~~1012.4~~506.14.8.

~~**1012.5**~~**506.14.9 Heights and areas.** Hazard categories in regard to height and area shall be in accordance with Table ~~1012.5~~506.14.9.

~~**1012.6**~~**506.14.10 Exterior wall fire-resistance ratings.** Hazard categories in regard to fire-resistance ratings of exterior walls shall be in accordance with Table ~~1012.6~~506.14.10.

~~**1012.7**~~**506.14.11 Enclosure of vertical shafts.** Enclosure of vertical shafts shall be in accordance with Sections ~~1012.7.1~~ 506.14.11.1 through ~~1012.7.4~~506.14.11.4.

~~**1012.8**~~**506.14.12 Accessibility.** *Existing buildings* that undergo a change of group or occupancy classification shall comply with this section.

> **Exception:** Type B dwelling or sleeping units required by Section 1107 of the *International Building Code* are not required to be provided in existing buildings and facilities undergoing a *change of occupancy* in conjunction with less than a Level 3 *alteration*.

~~**CHAPTER 11ADDITIONS**~~

SECTION ~~**1101**~~ **507** ~~**GENERAL**~~ **ADDITIONS**

~~**1101.1**~~**507.1 Scope.** An *addition* to a building or structure shall comply with the *International Codes* as adopted for new construction without requiring the *existing building* or structure to comply with any requirements of those codes or of these provisions, except as required by this ~~chapter~~section. Where an *addition* impacts the *existing building* or structure, that portion shall comply with this code.

~~**1101.2**~~**507.2 Creation or extension of nonconformity.** An *addition* shall not create or extend any nonconformity in the *existing building* to which the *addition* is being made with regard to accessibility, structural strength, fire safety, means of egress, or the capacity of mechanical, plumbing, or electrical systems.

~~**1101.3**~~**507.3 Other work.** Any *repair* or *alteration* work within an *existing building* to which an *addition* is being made shall comply with the applicable requirements for the work as classified in ~~Chapter 5.~~Section 501.

~~**SECTION1102 HEIGHTS AND AREAS**~~

~~**1102.1**~~**507.4 Height limitations.** No *addition* shall increase the height of an *existing building* beyond that permitted under the applicable provisions of Chapter 5 of the *International Building Code* for new buildings.

~~**1102.2**~~**507.5 Area limitations.** No *addition* shall increase the area of an *existing building* beyond that permitted under the applicable provisions of Chapter 5 of the *International Building Code* for new buildings unless fire separation as required by the *International Building Code* is provided.

> **Exception:** In-filling of floor openings and nonoccupiable appendages such as elevator and exit stairway shafts shall be permitted beyond that permitted by the *International Building Code*.

~~**1102.3**~~**507.6 Fire protection systems.** Existing fire areas increased by the *addition* shall comply with Chapter 9 of the *International Building Code*.

~~**SECTION1103 STRUCTURAL**~~

~~**[BS] 1103.1**~~**507.7** ~~**Compliance with the International Building Code**~~**Structural.** *Additions* to *existing buildings* or structures are new construction and shall comply with the *International Building Code*.

[BS] ~~**1103.2**~~**507.7.1 Additional gravity loads.** Existing structural elements supporting any additional gravity loads as a result of additions shall comply with the *International Building Code*.

Exceptions:

1. Structural elements whose stress is not increased by more than 5 percent.
2. Buildings of Group R occupancy with no more than five dwelling units or sleeping units used solely for residential purposes where the *existing building* and the *addition* comply with the conventional lightframe construction methods of the *International Building Code* or the provisions of the *International Residential Code*.

~~**SECTION1104 SMOKE ALARMS IN OCCUPANCY GROUPS R AND I-1**~~

~~**1104.1**~~**507.8 Smoke alarms in existing portions of a building.** Where an *addition* is made to a building or structure of a Group R or I-1 occupancy, the *existing* *building* shall be provided with smoke alarms as required by Section 1103.8 of the *International Fire Code* or Section R314 of the *International Residential Code* as applicable.

~~SECTION1105 ACCESSIBILITY~~

~~1105.1~~507.9 ~~Minimum requirements~~Accessibility. Accessibility provisions for new construction shall apply to additions. An addition that affects the accessibility to, or contains an area of, *primary function* shall comply with the requirements of Sections 705, 806 and 906, as applicable.

~~1105.2~~507.9.1 Accessible dwelling units and sleeping units. Where Group I-1, I-2, I-3, R-1, R-2 or R-4 dwelling or sleeping units are being added, the requirements of Section 1107 of the *International Building Code* for accessible units apply only to the quantity of spaces being added.

~~SECTION1106 ENERGY CONSERVATION~~

~~1106.1~~507.10 ~~Minimum requirements.~~Energy Conservation. *Additions* to *existing buildings* shall conform to the energy requirements of the *International Energy Conservation Code* or *International Residential Code* as they relate to new construction.

~~CHAPTER 12HISTORIC BUILDINGS~~

SECTION ~~1201~~ 508~~GENERAL~~ HISTORIC BUILDINGS

~~1201.1~~508.1 Scope. It is the intent of this ~~chapter~~section to provide means for the preservation of *historic buildings*. Historical buildings shall comply with the provisions of this ~~chapter~~section relating to their *repair*, *alteration*, relocation and *change of occupancy*.

~~[BS] 1201.2~~508.2 Report. A *historic building* undergoing *repair*, *alteration*, or *change of occupancy* shall be investigated and evaluated. If it is intended that the building meet the requirements of this ~~chapter~~section, a written report shall be prepared and filed with the *code official* by a registered design professional when such a report is necessary in the opinion of the *code official*. Such report shall be in accordance with Chapter 1 and shall identify each required safety feature that is in compliance with this ~~chapter~~section and where compliance with other chapters of these provisions would be damaging to the contributing historic features. For buildings assigned to Seismic Design Category D, E or F, a structural evaluation describing, at a minimum, the vertical and horizontal elements of the lateral force-resisting system and any strengths or weaknesses therein shall be prepared. Additionally, the report shall describe each feature that is not in compliance with these provisions and shall demonstrate how the intent of these provisions is complied with in providing an equivalent level of safety.

~~1201.3~~508.3 Special occupancy exceptions—museums. When a building in Group R-3 is also used for Group A, B, or M purposes such as museum tours, exhibits, and other public assembly activities, or for museums less than 3,000 square feet (279 m^2), the *code official* may determine that the occupancy is Group B when life-safety conditions can be demonstrated in accordance with Section 1201.2. Adequate means of egress in such buildings, which may include a means of maintaining doors in an open position to permit egress, a limit on building occupancy to an occupant load permitted by the means of egress capacity, a limit on occupancy of certain areas or floors, or supervision by a person knowledgeable in the emergency exiting procedures, shall be provided.

~~[BS] 1201.4~~508.4 Flood hazard areas. In *flood hazard areas*, if all proposed work, including repairs, work required because of a *change of occupancy*, and *alterations*, constitutes *substantial improvement*, then the *existing building* shall comply with Section 1612 of the *International Building Code*, or Section R322 of the *International Residential Code*, as applicable.

Exception: If an *historic building* will continue to be an *historic building* after the proposed work is completed, then the proposed work is not considered a *substantial improvement*. For the purposes of this exception, an *historic building* is:

1. Listed or preliminarily determined to be eligible for listing in the National Register of Historic Places;
2. Determined by the Secretary of the U.S. Department of Interior to contribute to the historical significance of a registered historic district or a district preliminarily determined to qualify as a historic district; or
3. Designated as historic under a state or local historic preservation program that is approved by the Department of Interior.

~~SECTION1202 REPAIRS~~

~~1202.1~~508.5 ~~General~~Repairs. Repairs to any portion of an *historic building* or structure shall be permitted with original or like materials and original methods of construction, subject to the provisions of this ~~chapter~~section. Hazardous materials, such as asbestos and lead-based paint, shall not be used where the code for new construction would not permit their use in buildings of similar occupancy, purpose and location.

~~1202.2~~508.5.1 Unsafe conditions. Conditions determined by the *code official* to be *unsafe* shall be remedied. No work shall be required beyond what is required to remedy the *unsafe* conditions.

~~SECTION1203 FIRE SAFETY~~

~~1203.1~~508.6 ~~Scope~~Fire safety. *Historic buildings* undergoing *alterations*, *changes of occupancy*, or that are moved shall comply with Section 1203.

~~1203.2~~508.6.1 General. Every *historic building* that does not conform to the construction requirements specified in this code for the occupancy or use and that constitutes a distinct fire hazard as defined herein shall be provided with an approved automatic fire-extinguishing system as determined appropriate by the *code official*. However, an automatic fire-extinguishing system shall not be used to substitute for, or act as an alternative to, the required number of exits from any *facility*.

~~SECTION1204 ALTERATIONS~~

~~1204.1~~508.7 Accessibility requirements. The provisions of Sections 705, 806 and 906, as applicable, shall apply to facilities designated as historic structures that undergo *alterations*, unless *technically infeasible*. Where compliance with the requirements for accessible routes, entrances or toilet rooms would threaten or destroy the historic significance of the building or *facility*, as determined by the *code official*, the alternative requirements of Sections 1204.1.1 through 1204.1.4 for that element shall be permitted.

Exception: Type B dwelling or sleeping units required by Section 1107 of the *International Building Code* are not required to be provided in historical buildings.

~~SECTION1205 CHANGE OF OCCUPANCY~~

~~1205.1~~508.8 ~~General~~Change of occupancy. *Historic buildings* undergoing a *change of occupancy* shall comply with the applicable provisions of ~~Chapter 10~~Section 506, except as specifically permitted in this ~~chapter~~section. When ~~Chapter 10~~Section 506 requires compliance with specific requirements of ~~Chapter 7~~ Section 503, ~~Chapter 8~~Section 504, or ~~Chapter 9~~ Section 505 and when those requirements are subject to the exceptions in Section 1202, the same exceptions shall apply to this section.

~~SECTION1206 STRUCTURAL~~

~~[BS] 1206.1~~508.9 ~~General~~Structural. *Historic buildings* shall comply with the applicable structural provisions for the work as classified in ~~Chapter 5.~~Section 501.

Exception: The *code official* shall be authorized to accept existing floors and approve operational controls that limit the live load on any such floor.

~~CHAPTER 13RELOCATED OR MOVED BUILDINGS~~

SECTION ~~1301~~ 509~~GENERAL~~ RELOCATED OR MOVED BUILDINGS

~~1301.1~~509.1 Scope. This ~~chapter~~section provides requirements for relocated or moved structures, including relocatable buildings as defined in Chapter 2.

~~**509.2 Application.** Relocated buildings shall comply with the provisions of Chapter 13.~~

~~1301.2~~509.2 **Conformance.** The building shall be safe for human occupancy as determined by the *International Fire Code* and the *International Property Maintenance Code*. Any *repair*, *alteration*, or *change of occupancy* undertaken within the moved structure shall comply with the requirements of this code applicable to the work being performed. Any field-fabricated elements shall comply with the requirements of the *International Building Code* or the *International Residential Code* as applicable.

~~**SECTION1302 REQUIREMENTS**~~

~~1302.1~~509.3 **Location on the lot.** The building shall be located on the lot in accordance with the requirements of the *International Building Code* or the *International Residential Code* as applicable.

~~[BS] 1302.2~~509.4 **Foundation.** The foundation system of relocated buildings shall comply with the *International Building Code* or the *International Residential Code* as applicable.

~~[BS] 1302.3~~509.5 **Wind loads.** Buildings shall comply with *International Building Code* or *International Residential Code* wind provisions as applicable.

Exceptions:

1. Detached one- and two-family dwellings and Group U occupancies where wind loads at the new location are not higher than those at the previous location.
2. Structural elements whose stress is not increased by more than 10 percent.

~~[BS] 1302.4~~509.6 **Seismic loads.** Buildings shall comply with *International Building Code* or *International Residential Code* seismic provisions at the new location as applicable.

Exceptions:

1. Structures in Seismic Design Categories A and B and detached one- and two-family dwellings in Seismic Design Categories A, B and C where the seismic loads at the new location are not higher than those at the previous location.
2. Structural elements whose stress is not increased by more than 10 percent.

~~[BS] 1302.5~~509.7 **Snow loads.** Structures shall comply with *International Building Code* or *International Residential Code* snow loads as applicable where snow loads at the new location are higher than those at the previous location.

Exception: Structural elements whose stress is not increased by more than 5 percent.

~~[BS] 1302.6~~509.8 **Flood hazard areas.** If relocated or moved into a flood hazard area, structures shall comply with Section 1612 of the *International Building Code*, or Section R322 of the *International Residential Code*, as applicable.

~~[BS] 1302.7~~509.9 **Required inspection and repairs.** *No change to text.*

Reason: This proposal reorganizes the IEBC work area method into a single chapter without making any technical changes. For a complete version of this proposal we ask that you go to: Work Area Chapter. This other document shows the intent of the proposal more clearly and accurately.
The IEBC includes 3 compliance methods--prescriptive (chapter 4), work area method (chapters 5-13), and the performance method (chapter 14). The basic premise of the IEBC is that the 3 methods are equivalent. A remodel project that uses the prescriptive method is equally as compliant as one that uses the work area method.

The format of the code doesn't reflect this equivalence. Two compliance methods are contained within a single chapter each. The work area method, however, is spread out over 9 chapters. This formatting can be misleading. It gives the appearance, for instance, that Chapter 11 applies to all additions and that Chapter 12 applies to all historic buildings, regardless of compliance method chosen for a particular project. It's misleading and confusing to designers who are trying to apply the IEBC to a building project. It's also misleading for code development. As an example, EB52-2012 was a very good code change proposal from the last code cycle that straightened out how changes of occupancy are treated in the IEBC. However, it only addressed Chapter 10 in the work area method, omitting the other 2 methods.

Each chapter of the work area method is assigned to a single section, all the sections in chapters 5-13 are renumbered, some are given different titles, and some redundant language is deleted. A few charging sections are added where the current code relies on a section title for charging. The order of the sections is not changed. The code change proposal does not show every section that would be renumbered.Sections that are not shown would be renumbered sequentially. The proposal also shows a small number of sections where we're proposing to change some language. Our intention with this proposal is that a comprehensive renumbering and correction of cross references would be done by staff and ICC's editors. An attachment to this proposal shows the details of how the renumbering could be done.

We'd like to point out that the maximum number of decimal points in section numbers is not increased in this proposal. The IEBC currently has some sections with 4 decimal points, and that is also the maximum number of decimal points in this proposal.

Cost Impact: Will not increase the cost of construction
This proposal renumbers code sections without making any technical changes.

Analysis: As stated, this proposal reorganizes several chapters of the code into a single chapter. For clarity, the code change as depicted here shows only the major sections that are moved, renumbered, or both. To view the location and renumbering of all of the sections involved, the document entitled "Work Area Chapter" can be found by clicking the link at the begining of the proponent's reason statement.

EB 50-15 : CHAPTER 5-PETRIE5516

EB 51-15

Proponent: Aaron Wilson, Associated Design Partners Inc., representing Associated Design Partners (jthibodeau@adpengineering.com)

2015 International Existing Building Code

Revise as follows:

SECTION 202 DEFINITIONS

WORK AREA. That portion or portions of a building consisting of all reconfigured spaces as indicated on the construction documents. *Work area* excludes other portions of the building where ~~incidental~~*reconfiguration of space* is not proposed, including work ~~entailed by the intended work must be performed~~incidental to *repairs*, and portions of the building where work not initially intended by the owner is specifically required by this code, including work associated with correcting dangerous conditions.

Add new text as follows:

502.4 Alteration Exclusions. Removal and replacement of incidental elements including; wall finishes, electrical and mechanical systems, insulation, and structural components within the process of completing repairs shall not be subject to the provisions of Chapters 7,8, 9, 10 and 11.

Reason: This proposal will clarify the understanding and use of the code and help reduce the extra time spent with misscommunications regarding what is considered a repair and what is an alteration. The clarifcation of the definition will better define what is considered part of the work area and what is not.

Cost Impact: Will not increase the cost of construction
The code change proposal will not increase the cost of construction. It will clarify the understanding and use of the code and help reduce the extra time spent with misscommunications.

EB 51-15 : 202-ALTERATION-WILSON5705

EB 52-15

601.2, 608.1

Proponent: David Bonowitz, David Bonowitz, S.E., representing Existing Buildings Subcommittee, National Council of Structural Engineers Associations (dbonowitz@att.net)

2015 International Existing Building Code

Revise as follows:

601.2 Conformance. The work shall not make the building less conforming than it was before the ~~*repair* was undertaken.~~damage occurred.

608.1 General. Existing mechanical systems undergoing *repair* shall not make the building less conforming than it was before the ~~*repair* was undertaken.~~damage occurred.

Reason: The current text talks about the condition "before the repair was undertaken." This means the damaged condition. What these provisions intend is to restore the condition that existed before the damage, not before the repair.

Cost Impact: Will not increase the cost of construction
The proposal is editorial.

2015 International Existing Building Code

CHAPTER 6 REPAIRS
Add new definition as follows:

SECTION 202 DEFINITIONS

SCALD HAZARD A condition where high temperature hot water discharged from a plumbing fixture can cause serious burn injuries to the user.

Revise as follows:

609.1 Materials. Plumbing materials ~~and supplies shall not be~~ used for repairs ~~that are prohibited~~be in accordance with the *International Plumbing Code.*

Add new text as follows:

609.3 Replacement water heater capacity. A replacement water heater shall be of the same output capacity, in gallons per hour, as the existing water heater that is being replaced.

Exception: Where the replacement water heater manufacturer's sizing calculations or other generally-accepted water heater sizing calculations indicate that the first hour delivery capacity of the selected replacement water heater is adequate for the installation, a replacement water heater of smaller output capacity can be installed.

609.4 Delivered hot water temperature adjustment after water heater replacement, repair or hot water system alterations. Where the water temperature in a hot water distribution system changes as the result of a water heater replacement, repair or an alteration of the hot water distribution system such as a water heater thermostat adjustment or master mixing valve adjustment or replacement, each shower or combination tub-shower supplied by the system shall be inspected for the presence of a means for reducing scald hazards to the users.

Where the means for limiting the hot water temperature is a master mixing valve complying with ASSE 1017, a mixing valve complying with ASSE 1070 or an integral limit stop on the shower or combination tub-shower valve, adjustments shall be made in accordance with Section 609.4.1. Where the means for limiting the hot water temperature discharged at the fixture is a device complying with ASSE 1062, then the operation of the device shall be verified that it significantly reduces flow when the discharge temperature approaches 120◦F (48.8◦C).

Where a shower or tub-shower combination does not have a means for scald hazard protection for a user, a means shall be installed in accordance with Section 609.4.2.

609.4.1 Adjustment procedure. Temperature limit adjustments for shall be made and set to limit the temperature of the hot water discharged to any user to not greater than 120◦F (48.8◦C). These adjustments and settings shall only be performed after both of the following are satisfied:

1. The water heater has reached the water heater temperature control setting as recommended by the water heater manufacturer and has shut off its burner or electric elements.

2. Hot water has sufficiently reached the valve such that the temperature of the discharging at the fixture does not continue to rise.

A water heater thermostat shall be prohibited as a means for limiting hot water temperature for the purposes of required scald hazard protection for a user of hot water.

609.4.2 Showers and combination tub-showers without means of protection against scalding. Where a shower or tub-shower combination valve does not have a means for scald hazard protection for a user, one or more of the following shall be performed:

1. The shower or combination tub/shower valve shall be replaced with a valve complying with ASSE 1016/ASME A112.1016/CSA B125.16. After replacement, the temperature limit stop shall be adjusted in accordance with Section 609.4.1

2. A master temperature actuated mixing valve complying with ASSE 1017 or ASSE 1070 shall be installed in the hot water outlet piping at the water heater. After installation, the temperature setting of the valve shall be adjusted in accordance with Section 609.4.1.

3. A point-of-use water temperature limiting valve complying with ASSE 1070 shall be installed at or near each shower or tub-shower combination valve After installation,the the temperature setting of the ASSE 1070 valve shall be adjusted in accordance with Section 609.4.1. ASSE 1070 valves shall be provided with access.

4. A temperature-actuated, flow reduction valve complying with ASSE 1062 shall be installed on the shower arm prior to connection of shower head and, for tub-shower combinations, on both the tub spout and the shower arm. ASSE 1062 devices shall be capable of significantly limiting the flow of water discharged as the water temperature rises towards 120◦F (48.8◦C).

Add new standard(s) as follows:
ASSE 1016-2011/ASME A112.1016-2011/CSA B125.16-11 Automatic Compensating Valves for Individual Shower & Tub/Shower Combinations
ASSE 1017-2010 Temperature Actuated Mixing Valves for Hot Water Distribution Systems
ASSE 1062-2006 Temperature Actuated, Flow Reduction (TAFR) Valves for Individual Supply Fittings
ASSE 1070-2004 Water Temperature Limiting Devices

Reason: There is currently no provisions in the code to require unsafe existing plumbing installations to where scalding is a hazard. Hundreds of people are scalded each year where non-code compliant (Two-handle) shower valves are installed. This code change is iintended to address this and other hot water scald hazards in existing installations.
What are safe hot water temperatures?
By Ron George
President, Ron George Design & Consulting Services
Plumbing Engineer Magazine Aug 2009

I am often asked, "What is a safe hot water temperature for domestic hot water?" If you read the model codes, it states the maximum hot water temperature for a shower or bathtub is 120 degrees Fahrenheit. If you read the warning labels on the side of most water heaters the maximum hot water temperature is 120 degrees Fahrenheit on some labels and 125 degrees Fahrenheit on other labels. The 125 degree limit probably allows for some temperature loss before the hot water gets to the fixtures. Most water heater literature and warning labels mention the availability of thermostatic mixing valves or automatic temperature compensating valves and they recommend their use. If you look at many of the industry standards for shower mixing valves, they state the valves must have limit stops that are adjustable to limit the maximum hot water temperature to 120 degrees Fahrenheit. The testing in the standards gives test criteria for testing the shower valves to these limits.

I have served on the working groups for several plumbing industry standards committees for temperature actuated mixing valves and shower valves and it is generally agreed that 120 degrees is the maximum, safe hot water temperature. I also have served on hot water system design standards committees where the participants had agreed that maximum domestic hot water temperature from plumbing fixtures used for bathing and washing purposes should be 120 degrees Fahrenheit. There were a few exceptions for bidets, sitz baths and whirlpool tubs that had temperatures lower than 120 degrees Fahrenheit for the recommended maximum temperatures to prevent scalding. It also should be noted that some other uses like commercial dishwashers and laundries may need temperatures higher than 120 degrees Fahrenheit. There were two temperatures discussed for each fixture during the design standard meetings. One was the "use temperature" and the other was "the maximum temperature" to prevent scalding.

It's generally agreed that 120 degrees Fahrenheit is the maximum safe hot water temperature that should be delivered from a fixture. Therefore hot water above 120 degrees Fahrenheit can be considered hazardous. Model codes address this in various plumbing code sections...

...The codes generally agree if there is a hazardous condition or a condition that is unsafe or a nuisance to life, health and property it should be corrected but in the existing building code and property maintenance code there is little guidance. It is also generally agreed that water above 120 degrees Fahrenheit at fixtures for bathing and washing with a few exceptions for lower temperatures can be considered dangerous and proper precautions should be taken to prevent the hot water from being a scalding hazard by using the proper safety devices.
When I hear about people setting their water heater to 120 degrees Fahrenheit to prevent scalding, I know they have good intentions, but most people do not know you cannot accurately control the hot water temperature leaving a water heater with the thermostat dial.
Maximum Hot Water Temperature to Prevent Scalding
I have served on many industry committees dealing with hot water system code requirements, hot water system design standards and product standards related to domestic hot water systems devices for temperature control and scald prevention. There has been consensus in all of these committees that the maximum safe hot water delivery temperature for a shower or bathtub is 120 degrees Fahrenheit to prevent scalding with a few exceptions for lower temperatures for bidets and emergency eye wash fixtures. (See the attached Figure 1 - Hot Water Scald Burns – Time vs Temperature Relationship for Second and Third Degree Burns for Adults and Children)Figure 1

There were discussions in a plumbing code ad-hoc committee on temperature limits for the hot water system where everyone agreed the maximum safe temperature was 120 F. The ASPE Hot water committee dealing with a proposed standard for temperature limits in hot water systems also agreed the maximum safe hot water temperature to prevent scalding is 120 Fahrenheit. Several ASSE working groups that I have served on dealing with hot water temperature controls have all have discussed the reaction time of bathers and they have taken into consideration that children, the elderly and people with disabilities usually take longer to get out of harm's way if the water suddenly gets hot and they agreed 120 Fahrenheit is the maximum safe hot water temperature that a valve should deliver. At 120 F it takes about 80 seconds to develop a second degree burn in a child and it takes about 8 minutes to develop a second degree burn in an adult. (See Figure 1) The 120 Degree F temperature limit gives bathers or users an adequate amount of time to get out of harm's way before an irreversible scald burn injury can occur. Each of these committees looked back to the data that was the result of burn studies done by Dr. Moritz and Dr. Henrique's at Harvard Medical College in the 1940s. The burn studies were done using baby pigs that had skin thicknesses similar to that of adult males. The studies exposed the pig's skin to various temperatures of hot water for various periods of time and the severity of the burns were studied and recorded. These were the studies used to develop the time and temperature exposure charts. There have been numerous white papers, seminars, and reports since then discussing the fact that burns can occur quicker than those recorded in the Moritz & Henrique's studies for adult males. The skin is thinner for children and the elderly and the amount of time to receive an irreversible 2nd degree burn injury is less because their skin is thinner. Many of the white papers use the Moritz and Dr. Henrique's original burn studies and they use a ratio of the skin thickness to come up with burn times for thinner skin of children and the elderly. Children, the elderly and handicapped are also slower to react because it takes them more time to realize what is happening and try to react to get out of harm's way. Someone once told me an apartment complex was not intended for children or the elderly. I said everyone grows old and children often come visit so we need to consider prevention of scalds to children, the elderly and people with disabilities more so than burns to adults because burns can occur quicker for those groups.

The PIEV Theory for Reaction Time
There is a PIEV theory relates to reaction time. The PIEV theory is most commonly used to address braking distance in automobile accidents. It addresses the amount of time it takes a driver to sense a problem and decide to react, then the reaction time is added to the braking time for the total distance that a car travels before stopping. The PIEV theory can also apply to reaction times for a bather with respect to hot water scalds.
PIEV relates to the amount of time it takes a person to react to a hazard. PIEV means - Perception, Intellection, Emotion and Volition. It is usually referred to as the PIEV theory. Before we recognize and react to a hazard, four specific areas of activity need to be processed by the brain for the muscles to react. Those processes are:
1. Perception - We need to perceive or gain a Perception of a hazard. There can be delays in the perception with limitation in sight, sound, feeling, or any other of our senses.
2. Intellection - We go through a period called, Intellection or the act or process of using the intellect by thinking or reasoning. The bather must determine if the hazard is legitimate and deciding either move out of the way of the hazard or eliminate the hazard by adjusting the controls or in some cases where the bather may be sitting out of the reach of the controls the bather may choose to pull the shower curtain in front of them. If the adjustment of the controls is the choice one must decide which control to turn and try to remember which way to turn each control to adjust the temperature or turn the water off in order to eliminate the hazard. If a wrong choice is made during this process it could compound the situation by making the water even hotter. I travel a lot and I often find that shower controls can be very confusing with respect to how to adjust the controls. I still find two handle shower controls that do not meet code requirements. This is critically important when there is no temperature limit on the shower controls. For example if the shower has a two-handle shower valve and 160 degree hot water is supplied to the system, then turning of the cold water first could lead to instant scalding injuries. Turning down the hot water to 120 F or below creates a system where it could incubate Legionella Bacteria to very high levels.
3. Emotion - There is an Emotion or evaluation factor which is defined as a conscious mental reaction (as anger or fear) subjectively experienced as strong feeling usually directed toward a specific object and typically accompanied by physiological and behavioral changes in the body with respect to deciding or assessing how we want to react. A person with reduced mental capacity or someone that is just very old will take longer to process this information and ultimately decide to react.
4. Volition - There is the physical Volition or deciding/choosing to act and acting. In the case of braking distance it is when the choice is made to move the foot from the gas pedal to the brake pedal and pressing on the brake pedal. This can be related to the time the bather chooses to adjust the control, and they move their hand to the shower control valve, plus the time to rotate or re-adjust the shower valve plus the time from the adjustment until the water temperature changes coming out of the shower head. Often it can take as much as 3-5 seconds to re-adjust the shower head and another few seconds until the water temperature changes coming out of the shower head. For ultra-low-flow (ULF) showers the delay from the time of the adjustment of the shower valve until the water temperature changes coming out of the shower head can be even longer. So burns can become more severe with ULF shower heads. This is one more area where water conservations measures can unintentionally make plumbing systems less safe.
As the temperature of the water increases this PIEV reaction time becomes more important. Using a bathtub/shower controller with a single handle would reduce the mental processing time and reduce the possibility of making an error when turning off the water. As Figure 1 shows the higher the temperatures get, the quicker the burns can occur. within seconds or less and the degree and severity of the burn can be affected by this reaction time.
As you can see by the chart in Figure 1, if the water is at 140 F it will take about 0.8 seconds for a child to receive a 2nd degree irreversible burn injury and it will take about 5.6 seconds for an adult male to receive an irreversible burn injury at 140 degrees F. Everyone else will fall somewhere in between. An adult will often find it very difficult to react to a sudden change in temperature within five (5) seconds. If the shower head is an Ultra-Low-Flow (ULF) shower head the delay can be several seconds longer before the water temperature is reduced because the mixed water temperature must evacuate or flush out the hot water in the pipe riser from the shower valve to the shower head. There is basically very little or no time to react at higher temperatures. For a typical adult that is alert and aware the PIEV theory shows it can take well over five (5) seconds to react to a sudden burst of hot water in a shower. For an elderly person or a small child that is confused it could take several minutes or more before they are able to react and adjust the controls or get out of harm's way. There has been a lot of information that suggests reducing the domestic hot water temperature to 120 F or less as it flows from the fixtures will minimize scalding and allow most people to react or get out of harm's way before a scald injury occurs.
Reducing the water temperature flowing from the fixture can be done in several ways by:
1. Reducing the hot water temperature at the fixture by adjusting the maximum temperature limit-stop on the shower valve. (The best way)
2. Using local mixing valves conforming to ASSE 1070 to reduce the hot water temperature flowing from a faucet.
3. Reducing the temperature at the source (Water Heater) with the use of a master mixing valve or temperature actuated mixing valve conforming to ASSE 1017.
4. For existing non code compliant shower or tub/shower installations, Two handle tub/shower valves without a maximum temperature limit adjustment) an ASSE 1062 valve could be used. An ASSE 1062 valve is a Temperature Actuated Flow Reduction (TAFR) valve. It looks like a chrome pipe coupling and it screws on between the shower head and the shower arm. Other models screw into a tub spout or onto a sink faucet in place of the aerator. If the water flowing from fixture exceeds about 117-120 degrees Fahrenheit the TAFR valve will shut the flow of water down to just a trickle so that scalding hot water does not spray onto the bather. It can be reset by adjusting the fixture control valve to a cold water setting and when the cold water reaches the valve it will reset and begin flowing again. This can be a bit of a nuisance in buildings where the hot water temperature is erratic, but it is an inexpensive way to provide protection against scald injuries in older buildings without code compliant shower valves.
Water Heater Thermostats Do Not Control the Water Heater Outlet Temperatures
If you adjust the water heater thermostat for the burner or heating element on a water heater down to 120 degrees, it will not prevent scalding. Water heater thermostats cannot be relied upon to control the hot water temperature leaving a water heater. Water heater manufacturers recommend that installers set thermostats at 120 - 125 F, and most of them ship the water heaters at an even lower temperature setting. It is not possible to set a water heater thermostat at a given temperature and get a relatively constant temperature of hot water from a water heater. The thermostat can not accurately control the water heater outlet temperature with a water heater thermostat.

My experience has been that not many people know that water heater thermostats cannot control the outlet temperature of a water heater. This warrants an explanation of how a water heater thermostat works so everyone understands the dial on the water heater does not have the accuracy to control the outlet temperature of storage type heater.

Water heater thermostats do not provide precise temperature controls for hot water systems. For example: the thermostat dial calibration test of ANSI Z21.10.1-1998, which is the applicable standard for gas-fired water heaters, allows the temperature to vary 10 degrees above or below the thermostat setting. I have talked to water heater manufacturers that have indicated that the controls can vary as much as 15 to 18 degrees Fahrenheit above or below the set point of the thermostat. From my experience, I have recorded the temperature leaving the top portion of a water heater over a long period of time during intermittent uses and saw temperature swings over 40 degrees Fahrenheit leaving the water heater. The shower valve standards do not have this kind of temperature fluctuation included their testing for all types of shower valves. The significant temperature swings are because the thermostat is inserted into the lower portion of a water heater tank and turns the fuel supply to the heater on and off. Most new water heater thermostat dials have no way to know what the temperature in the tank is. There is rarely a fixed temperature indicated on the dial, however some manufacturers publish temperatures associated with various marks on the thermostat dial or in their literature even though the dial cannot not control the outlet temperature of the water heater, it only controls when the energy to the heater is turned "on" and "off" by sensing the cold water coming into the bottom of the heater.

Generally, if the water heater thermostat dial is set at 120 degrees Fahrenheit, the burner would come on when the temperature at the thermostat reaches about 105 degrees Fahrenheit. The burner stays on until the water around the thermostat which is near the bottom of the heater reaches about 135 degrees Fahrenheit. (The "burner off" temperature is about 30 degrees higher than when the burner came "on" and generally about 15 degrees above the theoretical set point of the thermostat).

Most people don't realize that the maximum temperature limit test of the ANSI Z21.10.1 Gas Water Heater Standard allows the outlet water temperature of the water heater to rise significantly above the thermostat setting. This provision in the standard accounts for the phenomenon known as "stacking" or "thermal layering". The hot water is less dense and rises to the top of the hot water tank. Just like hot air rises and lifts a hot air balloon, hot water rises to the top of the tank and the cooler water drops to the bottom of the tank. Stacking or thermal layering occurs when the hot water rises to the top of the heater due to recurring short duration heating cycles caused by a frequent number of small quantity hot water uses. Frequent short draws cause cold water to enter the bottom of the water heater where the thermostatic element senses the cold water from the turbulent flow stirring in the bottom of the heater. The cold water causes the water heater to cycle on. This phenomenon can occur in any type of storage water heater and generally is more significant in vertical heaters.

I have recorded temperatures as high as 150 to 166 degrees Fahrenheit at the top of water heaters that had the thermostats set between 120 to 125 degrees Fahrenheit. Temperatures over 151 degrees Fahrenheit are extremely high temperatures and can cause serious scald burns in only a two seconds of contact with the skin. (See Table 1 - Water Temperature Effects on Adult Skin) It should be noted that the time temperature relationships in Table 1 are based upon the thickness of the skin for adult males. Children and the elderly typically have a thinner layer of the skin or epidermis and the exposure times can be shorter or the same burns can occurs in a given time at slightly lower temperatures.

EB 54-15

609.2

Proponent: Ronald George, representing Self (Ron@Plumb-TechLLC.com)

2015 International Existing Building Code

609.2 Water closet replacement. The maximum water consumption flow rates and quantities for all replaced water closets shall be 1.6 gallons (6 L) per flushing cycle.

> ~~**Exception**~~**Exceptions:**
> 1. Blowout-design water closets having a water consumption of not greater than
> [3.5 gallons (13 L) per flushing cycle].
> 2. Existing water closets that were removed and replaced, specific to each toilet facility, provided that they have been cleaned and that the flushing mechanism intended by original water closet manufacturer is installed, is in working order and is without leakage.
> 3. Where data or a report indicates that the sizes, slopes and lengths of the existing sanitary drain system and the discharge of 1.6 gallons-per-flush water closets and other plumbing fixtures into the existing drain system could negatively impact the transport of solids within the drain system, water closets having greater flush volumes or supplemental flushing devices to provide for greater water flow volumes in the drain system shall be installed where approved.

Reason: This code change allows for owners of existing buildings to maintain exoisting flow rates to prevent building drain back-ups, sewer blockages and sanitary sewer overflows. Building drain back-ups and sanitary sewer overflows cause a significant Biological hazard and health hazard.

Water Conservation Efforts Unwittingly Leading to Dry Drains

By Ron George, CPD,
President, Plumb-Tech Design & Consulting Services, LLC, Website: www.Plumb-TechLLC.com

Many experts agree there are a multitude of factors contributing to water shortages in many areas of the world. These factors include: global warming, increases in population, lack of proper water utility infrastructure, wasteful practices and underpriced water. We will never run out of water because water is constantly here in the hydrological cycle, evaporating, condensing into rain and falling to earth and flowing into the ground as groundwater. The run-off flows into streams, rivers and lakes for surface freshwater and into the ocean where it mixes with salt water. The key for us is to learn how to manage the fresh water resources we have and learn what those limits are in various arid or tropical regions of the world. The things that are occurring that are making water scarce are overdevelopment in arid regions, increases in population and lack of planning for infrastructure to keep up with population growth and shifting climate zones. With increases in population, we need to divide the fixed amount of fresh water available with each additional person and have a good understanding of that dynamic. In many cases proper pre-planning can allow additional reservoir capacity to store more fresh water, which requires acquiring land building dams, treatment facilities, pumping stations and water mains.

The United Nations conducted a study on the total amount of world water and it gave a breakdown of the freshwater resources. The study shows that 97.5 percent of the Earth's water is saltwater and 2.5 percent is fresh water. They went on to break down the 2.5 percent freshwater to show about 70 percent of the fresh water is trapped in ice and snow cover in mountainous regions and polar ice caps. About 29.7 percent or 30 percent is in groundwater and the remaining 0.3 percent is available to us in the form of fresh surface water in rivers, lakes and streams. We actually have access to a significant percentage of groundwater and all of our surface water resources. Many areas of the world remove water from the groundwater reserve through water wells. Other areas with access to rivers, lakes and streams draw water from those resources. Troubled areas of the world are the arid parts of the world that get very little rain. The small amounts of rain they get could be managed better, or desalinization plants could be used to desalinate seawater with reverse osmosis treatment systems. This is not a very good option for areas way from the coast but many coastal areas could use seawater as a freshwater source, but few are willing to invest in the technology and energy required to do so. Just down the street from my office, there are two manufacturing facilities that make desalinization equipment. Their biggest customers are in the Middle East where there has been a building boom in arid regions such as Dubai and Saudi Arabia. If large reservoirs were constructed, it would be important to make the reservoirs deep and narrow to minimize the surface area of the water. Large surface areas would contribute to evaporation when there are long dry periods. Construction of covered storage facilities or deep surface water reservoirs in arid regions would require a significant infrastructure investment for arid regions, but could help catch the few rains they get each year.

Other concerns are maintaining a minimum water flow in a stream or river to maintain the aquatic life and vegetation downstream. As more water is captured for fresh water reservoirs, it affects the economies and environment downstream. I can see this issue becoming more political as rivers that flow across international boundaries are dammed and the resources become more important and more political. It might not be too far fetched to see a war fought over water in the not too distant future.
Water uses

According to a U.S. Geological Survey conducted by the Environmental Protection Agency, 87 percent of the water use in the United States is for non-residential water use. This includes agricultural, industrial and commercial uses. Industrial water uses include water used for fabrication, processing, washing, food production, cooling, and it also includes water used by smelting facilities, petroleum refineries and industries producing chemical products and paper products.

Large water users include the industries that produce metals, wood and paper products, chemicals, gasoline and oils. Just about every manufactured product uses water during some part of the production process. Other industrial water uses include: water used for such purposes as washing, diluting, cooling or transporting a product. Some uses incorporate water into a product, or for sanitation needs large amounts of water is used to wash down equipment, rooms and floors within the manufacturing facility in food processing plants, meat packing plants and dairy processing plants. Other industries that use large amounts of water produce such commodities as paper pulp for a variety of uses like diapers, facial tissue newspapers and other paper products. Water is used in chemical plants, for condensing towers in refineries and petroleum plants, or cooling water for primary metal processing plants. Irrigation water use includes water used for growing crops, frost protection, chemical applications, weed control and other agricultural purposes, as well as water used to maintain areas such as parks and golf courses. Other uses include private water wells, livestock, aquaculture, fish hatcheries and mining activities. Electric power accounts for a significant use of water withdrawals. Most of the water is derived from surface water and used for once-through cooling at power plants. In a few cases, lakes are built specifically for cooling water for power plants. The water in these lakes cannot always be used for other fresh water uses because the lake level must be maintained at a minimum pool elevation to allow for cooling the power plants.

Figure 2 shows that only eight percent (8%) of all water use in the United States is residential, yet this is where many of the federal laws dealing with water conservation have been focused. We need to focus more on conserving water in the commercial agricultural and industrial segments discussed above; there is a huge potential for water savings in these industries.

Global warming

Global warming has been attributed to increases in greenhouse gases from a variety of sources including burning of fossil fuels from industrial applications such as coal-fired electric power plants and other industrial processes in industrialized parts of the world. The greenhouse gases are contributing to an increase in global temperatures, which are melting the polar ice caps. Some experts say that the hot and arid parts of the world will expand as global warming increases.
Population increases — Increases in population place an increased demand on freshwater resources as each person needs water for: drinking; bathing; growing the crops they consume; processing the goods they consume; and making power that they use. We need to seriously consider limiting development in arid regions of the world or, simply raise water rates to discourage development and to help pay for the more expensive infrastructure costs to support the developments in arid regions.

Water utility infrastructure

Water utilities have not kept up with the increase in population growth for construction of new reservoirs and water storage facilities. I served on the water and sewer board for my township for several years and the water and sewer boards often have their hands tied when it comes to setting water utility rates. The process of raising rates is very political and takes a lot of work to justify the slightest increase in rates because most water and sewer boards are supposed to be non-profit entities. Long-range plans are needed to identify infrastructure needs and costs. Research needs to be done to look for the ideal reservoir locations and pay for the development of the reservoirs and associated water treatment facility and water distribution piping infrastructure.

Underpriced water

The price of water charged by most water utility systems does not reflect the actual value of the water — the price that water utility purveyors typically charge reflects only the costs of collection, treatment and distribution of the water. But water also provides society with many environmental benefits and those economic costs are hidden. We have the technical ability to solve the problem, we just need to do some research and adjust the water utility rates to provide money for long-term infrastructure improvements, and educate the politicians and developers to limit development in arid regions. This can be done with pricing structures of the water utility rates. Water rates could be significantly increased in dry or arid regions to support infrastructure improvements and deter development. And water rates could be kept low in areas with surplus water supplies.

It would require a significant investment in water reservoir and utility system upgrades for many areas to increase their capacity by harvesting the rainfall, and most current water pricing structures do not support the needed construction and improvements.

Wasteful practices

There are many wasteful practices that can be attributed to water being very cheap. Since water is so cheap, there is not much of an incentive for people to conserve water. The biggest users of water are agricultural, commercial and industrial users. They account for about 87 percent of all freshwater use. Water is often used in inefficient ways in agricultural, commercial and industrial uses, but with water rates so cheap there is no financial incentive to develop more efficient water uses. In residential applications, we have reduced water flow at each fixture to flow rates that are dangerously low levels, and, in some cases, we have gone too far. Currently there are many areas where there are drainline transport problems where solids are plugging up existing drainlines when more efficient plumbing fixtures are being installed on older plumbing systems with large drains installed at the minimum slope. I have heard many stories of the significant increases in sewer cleaning costs in recent years since the advent of the 1992 Energy Policy Act and lower flow fixtures. (If you know of an example or a story related to replacement of plumbing fixtures and an increase in drain stoppages, send an e-mail. I would appreciate hearing about it. I will forward it to the appropriate people. There is a new coalition called the Plumbing Efficiency Research Coalition (PERC) that will be addressing some of these issues. I will forward any information I receive on drain line transport problems to them.)

The 'dry drains' phenomenon

Recent water conservation and green building design initiatives have focused simply on reducing water flows and seem to have ignored health safety issues related to plumbing. Some voluntary programs that give points for water conservations and some states have looked to further reduce water use in plumbing systems by 20 percent. Currently, many areas are experiencing drainline transport problems with the reductions that were mandated by the federal government in the 1992 energy policy act, which required reductions from 3.5 gallons per flush to 1.6 gallons per flush and other similar reductions for various plumbing fixtures. Proposed legislation will reduce the maximum flushing volume for water closets to 1.28 gallons per flush.

In our rush to adopt water-saving legislation and technologies in residential commercial buildings, many green industry folks, building managers and owners failed to consider the consequences of significant reductions in water flows, particularly wastewater flows through building drain pipes. Faced with water shortages from over- development in arid regions, and, in some cases, the effects of climate change and the associated challenges of regional droughts governments around the world are pushing for water use reductions and focusing mostly on residential and commercial applications. They are not putting as much pressure on the biggest offenders which are the agricultural and industrial users. The unintended consequences of these residential and commercial water use reductions have been a significant rise in blocked drains and sewage overflows in buildings.

Plumbing and appliance manufacturers have begun to design and produce a wide range of water-saving appliances and fixtures, including dual-flush toilets, waterless urinals and low-flow showerheads.
There has been no comprehensive research done to verify if these new low-flow fixtures and appliances in conjunction with waterless urinals and greywater systems are creating health and safety problems from drain blockages in the name of water conservation. Continual reductions of water flows in the plumbing systems of buildings, however, have resulted in the phenomenon known as "dry drains," where drain flows may be insufficient to effectively transport solids down the drain. I have always said, "There needs to be enough water in the river to float the boats." If we reduce the drainage flow volume and leave the drain pipes the same size then the hydraulic depth of flow will be less. In older buildings there will likely be more problems than in newer buildings. In new buildings drain sizes can be designed smaller and the minimum slopes can be designed with greater slopes. The situation is further compounded with a trend to extract greywater from plumbing systems for reuse.

Dry drains is a relatively new phenomenon as it has only started to become a problem since the advent of global water conservation efforts and it seems to be more than just a drainline transport issue. Dry drains are a result of continual efforts to conserve water in many ways. Newer technologies such as high efficiency toilets (HETs) non-water using urinals and high efficiency urinals (HEUs), lower flow rate faucets and increasingly efficient water consuming appliances, reduce the amount of water discharged into sanitary waste systems. To compound the issue, when a greywater reuse system collects discharged water from lavatory basins, clothes washers, bathtubs and shower fixtures for reuse — for flushing water closets or sub-surface irrigation purposes — it is taking water away from the sanitary drainage system. (See Figure 3 and 4) The wastewater flow needs to be maintained at a level to keep the hydraulic depth of flow sufficient for proper water velocities and drain line transport.

Recent water use reduction efforts are creating an unhealthy environment and a non-sustainable condition for drainline transport, which is a serious health and safety issue. The arbitrary reductions in fixture flow rates without any technical justification for these reductions is placing drainline transport of solids wastes in serious jeopardy. Water use reductions seem to be out of balance with reality. The arbitrary 10 and 20 percent increment reductions in water usage seem to have no scientific basis. There has been no research into the water use reductions and the minimum amount of waste required for proper drainline transport. Research is needed to address the minimum water flow required for proper drain line transport without reverting to simple math for water savings that does not reflect the multiple flushes with poor performing fixtures and actual conditions in the drains. There are unique and dangerous hazards with arbitrarily reducing water consumption in plumbing fixtures without considering the consequences.

Studies show the reduction in drainline transport will be significant when reducing a 1.6 gallon per flush water closet 20 percent to flush with 1.28 gallons per flush in order to meet water use reduction quotas. This will reduce the drainline transport from about 36 feet average transport distance to about 23 feet on average. (See Figure 5). With lower flows, it will most likely be a challenge for larger horizontal buildings and drain blockages will become more common. In high-rise vertical buildings, it should be relatively easy to load a stack and have enough additional uses of water in the stack to provide sufficient drainline transport. In a remote restroom in a large horizontal building there will be drainline transport problems and an increase in drainline blockages. The cost of cleaning the drain lines, and cleaning up the spilled sewage from drainline blockages, and the increased health risks associated with the spread of bacteria and mold from drainline blockages, needs to be weighed against the few gallons of water that will be saved. The reality is, as drains block up on a regular basis people will be trained to flush twice or three times to ensure the waste goes down the drain. (I do not know what the final outcome will be, but I do know we need to research the issues and make sound decisions instead of arbitrarily picking percentages for water reductions.)

Horizontal branch connections

There has been research done overseas that addressed the fact that when drainline branches are connected horizontally they allow waste to divert or back-up into each branch as the waste flows by each branch, which lowered the hydraulic depth of flow in the main as the waste flowed past each branch. This illustrated the need to consider code requirements to roll up branches up on a 45-degree angle to prevent the waste from entering the branches and further reducing the drainline transport capacity for drains that are already at or near minimum flow rates for proper drainline transport for ultra-low flow fixtures. The research also confirmed a drain should not drop from directly overhead into a horizontal drain. Waste usually would be directed upstream from a vertical stack dropping into a horizontal drain. This allowed solids to settle in the horizontal pipe upstream of the connection and reduced the hydraulic depth of flow because of the diversion of waste. The stack should use a 45 and a Y fitting rolled to allow a rolled up 45-degree entry into the horizontal drain.

Some of these are already required in our codes and we should be more aware of using directional drainage pattern fittings as water closet flow rates are further reduced. An interesting thing of note is the fact that the minimum slope in Australia is 1.67 percent and in the U.S. the minimum slope is 1.0104 percent (1/8 inch per foot) because they generally use smaller drain pipes.

Water Pricing.

The solution is to increase the price of water. Water needs to be priced closer to its real value. Our goal should be to find ways of calculating the true economic value of water and other resources so this can be factored into social costs at the community, national, and international levels. Increasing water rates should encourage greater water conservation.

When people recognize the true economic value of water, there is an incentive to invest in products and technology that support efficient water use without mandating flows that are unrealistically low and do not allow the plumbing system to function as intended.

According to the United Nations Food and Agriculture Organization, more than eight billion people will inhabit the earth by the year 2030, requiring 60 percent more food and a significant increase in water over today's capacities. Increased water rates will give us the funds to support the needed infrastructure improvements and provide incentives for water conservation. I also believe we should mandate research at technical data before allowing any politician to reduce water and waste flows to unrealistic levels.

Ron George is president of Ron George Design & Consulting Services. He also maintains a website dedicated to scald prevention: www.ScladPrevention.org and a website dedicated to Prevention of Legionella Bacteria in building water systems. Email Ron at info@Plumb-TechLLC.com or call 734-755-1908.

Cost Impact: Will not increase the cost of construction
This will not increase the cost of construction by allowing existing fixtures to remain in place when documentation is provided showing problems with low-flow fixtures on existing larger, minimally sloped drain lines.

EB 55-15

705.1.5

Proponent: Edward Kulik, Chair, representing Building Code Action Committee (bcac@iccsafe.org)

2015 International Existing Building Code

Delete without substitution:

~~**705.1.5 Dining areas.** An accessible route to raised or sunken dining areas or to outdoor seating areas is not required provided that the same services and decor are provided in an accessible space usable by any occupant and not restricted to use by people with a disability.~~

Reason: There is a series of proposals intended to coordinate the provisions in the first and second options in the IEBC. This section was deleted from Chapter 4 (when it was IBC Chapter 34) by E95-01. All alterations should be affected by the building code in the same manner. Providing an exception for dining areas is inconsistent with the purpose and intent of the code. An existing restaurant would be able to use technical infeasibility and the 20% maximum cost for the accessible route exceptions.
In July/2014 the ICC Board decided to sunset the activities of the Code Technology Committee (CTC). This is being accomplished by re-assigning many of the CTC Areas of Study to the applicable Code Action Committee (CAC). This proposal falls under the CTC Area of Study entitled IBC Coordination with the New ADAAG. Information on the CTC, including: the sunset plan; meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the CTC website.

This public proposal is submitted by the ICC Building Code Action Committee (BCAC). The BCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the BCAC has held 13 open meetings and numerous workgroup calls which included members of the BCAC as well as any interested party to discuss and debate the proposed changes and the public comments. Related documentation and reports are posted on the BCAC website at: http://www.iccsafe.org/cs/BCAC/Pages/default.aspx.

Cost Impact: Will not increase the cost of construction
The proposal is a clarification and coordination of current requirements; therefore, there is no impact on the cost.

EB 56-15 : 705.1.13-KULIK3405

EB 57-15

802.1

Proponent: David Bonowitz, David Bonowitz, S.E., representing Existing Buildings Subcommittee, National Council of Structural Engineers Associations (dbonowitz@att.net)

2015 International Existing Building Code

Delete without substitution:

~~**802.1 General.** *Alteration* of buildings classified as special use and occupancy as described in the *International Building Code* shall comply with the requirements of Section 801.1 and the scoping provisions of Chapter 1 where applicable.~~

Reason: This proposal improves clarity and makes application and enforcement easier.
"Special use and occupancy" buildings are addressed in IBC Chapter 4. IEBC Sections 902 and 1002 address these special occupancies in existing buildings undergoing Level 3 Alteration or Change of Occupancy. But this provision in Section 802 makes only an unnecessary reference to Section 801, and a vague reference to Chapter 1. In fact, Chapter 1 has no special "scoping provisions" for these occupancies (see Section 101.2).

If special provisions for any of these occupancies is needed in a Level 2 Alteration project, the place to make those requirements would be here in Section 802, not in Chapter 1. Currently, there are no such requirements, so Section 802 may be deleted without loss of substance.

Alternatively, Section 802 could be retained, parallel to Sections 902 and 1002, but its content would be changed to say only "Reserved."

Cost Impact: Will not increase the cost of construction
The proposal is an administrative or editorial clarification only, with no expected substantive impact.

804.2.2

Proponent: Carl Baldassarra, P.E., FSFPE, Chair, Code Technology Committee, representing Code Technology Committee (CTC@iccsafe.org)

2015 International Existing Building Code

Revise as follows:

804.2.2 Groups A, B, E, F-1, H, I, M, R-1, R-2, ~~R-4,~~ S-1 and S-2. In buildings with occupancies in Groups A, B, E, F-1, H, I, M, R-1, R-2~~, R-4~~, S-1 and S-2, work areas that have exits or corridors shared by more than one tenant or that have exits or corridors serving an occupant load greater than 30 shall be provided with automatic sprinkler protection where all of the following conditions occur:

1. The *work area* is required to be provided with automatic sprinkler protection in accordance with the *International Building Code* as applicable to new construction; and
2. The *work area* exceeds 50 percent of the floor area.

    Exception: If the building does not have sufficient municipal water supply for design of a fire sprinkler system available to the floor without installation of a new fire pump, work areas shall be protected by an automatic smoke detection system throughout all occupiable spaces other than sleeping units or individual dwelling units that activates the occupant notification system in accordance with Sections 907.4, 907.5 and 907.6 of the *International Building Code*.

Reason: This is a single exit building, and given the limit on the number of residents in Group R-4, will not ever have more than 30, therefore, Group R-4 should not be included since the requirement would never be applicable.
The ICC Code Technology Committee (CTC) has just completed its 10th year. The ICC Board has decided to sunset the CTC. The sunset plan includes re-assigning many of the CTC Areas of Study to the applicable Code Action Committee (CAC). The two remaining CTC Areas of Study are Care Facilities and Elevator Lobbies/WTC Elevator issues. This proposal falls under the Care Facilities Area of Study. Information on the CTC, including: the sunset plan; meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the CTC website at: http://www.iccsafe.org/cs/CTC/Pages/default.aspx.

Cost Impact: Will not increase the cost of construction
This eliminates a requirement that is never applicable.

EB 58-15 : 804.2.2-BALDASSARRA4284

EB 59-15

804.2.2

Proponent: Adolf Zubia, IAFC Fire & Life Safety Section, representing IAFC Fire & Life Safety Section

2015 International Existing Building Code

Revise as follows:

804.2.2 Groups A, B, E, F-1, H, I, M, R-1, R-2, R-4, S-1 and S-2. In buildings with occupancies in Groups A, B, E, F-1, H, I, M, R-1, R-2, R-4, S-1 and S-2, work areas that have exits or corridors shared by more than one tenant or that have exits or corridors serving an occupant load greater than 30 shall be provided with automatic sprinkler protection where all of the following conditions occur:

1. The *work area* is required to be provided with automatic sprinkler protection in accordance with the *International Building Code* as applicable to new construction; and
2. The *work area* exceeds 50 percent of the floor area.

    Exception: If the building does not have sufficient municipal water supply for design and installation of ~~a fire~~an automatic sprinkler system available~~ to~~ at the ~~floor without installation of a new fire pump~~site, work areas shall be protected by an automatic smoke detection system throughout all occupiable spaces other than sleeping units or individual dwelling units that activates the occupant notification system in accordance with Sections 907.4, 907.5 and 907.6 of the *International Building Code*.

Reason: This proposal is submitted by Fire and Life Safety Section of the International Association of Fire Chiefs.
The intent of this code change is to address the concern that the municipal water supply must be available at the floor level where the work area is located without the installation of a fire pump. The determining factor for an automatic fire sprinkler system should be whether there is adequate water, not whether a fire pump may be required when achieving an acceptable level of public safety.

This code change revises the text so that the adequacy of a municipal water supply at the building site is the determining factor. When the work area exceeds 50% of the floor area and a fire sprinkler system would be required. The possible installation of a fire pump to supplement the water flow and pressure is not the deciding factor when providing fire safety to the work area.

The revision to this exception will allow existing buildings to comply with this section by installing a smoke detection system in lieu of the fire sprinkler system where the volume and quantity of water at the site is not adequate to fulfill the fire sprinkler system requirements.

Cost Impact: Will increase the cost of construction
This code change will increase the cost of construction. The cost of fire pump will most likely exceed the cost of a smoke detection system. However, the same fire pump should be adequate for future fire sprinkler system installations in the building. Therefore, the fire pump will be a one-time cost for the building whereas future alterations would require the installation of additional smoke detection systems.

EB 60-15

804.2.3

Proponent: Adolf Zubia, IAFC Fire & Life Safety Section, representing IAFC Fire & Life Safety Section

2015 International Existing Building Code

Revise as follows:

804.2.3 Windowless stories. Work located in a windowless story, as determined in accordance with the *International Building Code*, shall be sprinklered where the work area is required to be sprinklered under the provisions of the *International Building Code* for newly constructed buildings and the building site has a sufficient municipal water supply ~~without~~for the design and installation of ~~a new fire pump.~~an automatic sprinkler system.

Reason: This proposal is submitted by Fire and Life Safety Section of the International Association of Fire Chiefs.
The intent of this code change is to address the concept that the minicipal water supply must be available at the floor level where the work area is located without the installation of a fire pump. The determining factor for an automatic fire sprinkler system should be whether there is adequate water, not whether a fire pump may be required when achieving an acceptable level of public safety.

This code change revises the text so that the adequacy of a municipal water supply at the building site is the determining factor. When the work area exceeds 50% of the floor area and a fire sprinkler system would be required. The possible installation of a fire pump to supplement the water flow and pressure is not the deciding factor when providing fire safety to the work area.

Cost Impact: Will increase the cost of construction
The cost of fire pump will be added to the cost of the fire sprinkler system. However, the same fire pump should be adequate for future fire sprinkler system installations in the building, therefore, the fire pump will be a one-time cost for the building and future alterations can take advantage of the fire pump supply.

EB 60-15 : 804.2.3-ZUBIA4554

EB 61-15

804.2.4

Proponent: Adolf Zubia, IAFC Fire & Life Safety Section, representing IAFC Fire & Life Safety Section

2015 International Existing Building Code

Revise as follows:

804.2.4 Other required automatic sprinkler systems. In buildings and areas listed in Table 903.2.11.6 of the *International Building Code*, *work areas* that have exits or corridors shared by more than one tenant or that have exits or corridors serving an occupant load greater than 30 shall be provided with an automatic sprinkler system under the following conditions:

1. The *work area* is required to be provided with an automatic sprinkler system in accordance with the *International Building Code* applicable to new construction; and
2. The building site has sufficient municipal water supply for design and installation of an automatic sprinkler system ~~available to the floor without installation of a new fire pump~~.

Reason: This proposal is submitted by Fire and Life Safety Section of the International Association of Fire Chiefs.
The intent of this code change is to address the concern that the minicipal water supply must be available at the floor level where the work area is located without the installation of a fire pump. The determining factor for an automatic fire sprinkler system should be whether there is adequate water at the site, not whether a fire pump may be required when achieving an acceptable level of public safety.

This code change revises the text so that the adequacy of a municipal water supply at the building site is the determining factor. When the work area exceeds 50% of the floor area and a fire sprinkler system would be required. The possible installation of a fire pump to supplement the water flow and pressure would not be the deciding factor when providing fire safety to the work area.

Cost Impact: Will not increase the cost of construction
The cost of fire pump will be added to the cost of the fire sprinkler system. However, the same fire pump should be adequate for future fire sprinkler system installations in the building, therefore, the fire pump will be a one-time cost for the building and future alterations.

EB 62-15

804.4.1.7

Proponent: Carl Baldassarra, P.E., FSFPE, Chair,Code Technology Committee, representing Code Technology Committee (CTC@iccsafe.org)

2015 International Existing Building Code

Revise as follows:

804.4.1.7 Group R-4. A manual fire alarm system shall be installed in *work areas* of Group R-4 residential care/ assisted living facilities as required by Section 1103.7.7 of the *International Fire Code* for existing Group R-4 occupancies.

Reason: This proposal is a clarification of requirements and correlation of requirements. Smoke alarms are addressed in Section 804.3.

There is a Group B proposal to remove this requirement from new Group R-4s to have fire alarm systems in IBC/IFC Section 907.2.10 and from mandatory retrofit from IFC 1103.7.7. If this is successful, this section will also be deleted. If that is not approved, this clarification is needed.

The ICC Code Technology Committee (CTC) has just completed its 10th year. The ICC Board has decided to sunset the CTC. The sunset plan includes re-assigning many of the CTC Areas of Study to the applicable Code Action Committee (CAC). The two remaining CTC Areas of Study are Care Facilities and Elevator Lobbies/WTC Elevator issues. This proposal falls under the Care Facilities Area of Study. Information on the CTC, including: the sunset plan; meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the CTC website at: http://www.iccsafe.org/cs/CTC/Pages/default.aspx.

Cost Impact: Will not increase the cost of construction
This proposal is a clarification only.

805.3, 805.3.1, 805.3.1.1, Table 805.3.1.1(1) (New), Table 805.3.1.1(2) (New)

Proponent: Edward Kulik, Chair, representing Building Code Action Committee (bcac@iccsafe.org)

2015 International Existing Building Code

Revise as follows:

805.3 Number of exits. The number of exits shall be in accordance with Sections 805.3.1 through 805.3.3.

805.3.1 Minimum number. Every story utilized for human occupancy on which there is a *work area* that includes exits or corridors shared by more than one tenant within the *work area* shall be provided with the minimum number of exits based on the occupancy and the occupant load in accordance with the *International Building Code*. In addition, the exits shall be permitted to comply with Sections 805.3.1.1 and 805.3.1.2.

805.3.1.1 Single-exit buildings. ~~Only one exit is required from spaces, of the following occupancies:~~ A single exit or access to a single exit shall be permitted from spaces, any story or any occupied roof where one of the following exist:

1. The occupant load, number of dwelling units and exit access travel distance do not exceed the values in Table 805.3.1.1(1) or 805.3.1.1(2).
~~1. In Group A, B, E, F, M, U and S occupancies, a single exit is permitted in the story at the level of exit discharge when the occupant load of the story does not exceed 50 and the exit access travel distance does not exceed 75 feet (22 860 mm).~~
~~2. Group B, F-2, and S-2 occupancies not more than two stories in height that are not greater than 3,500 square feet per floor (326 m^2), when the exit access travel distance does not exceed 75 feet (22 860 mm). The minimum fire-resistance rating of the exit enclosure and of the opening protection shall be 1 hour.~~
~~3. Open parking structures where vehicles are mechanically parked.~~
~~4. In Group R-4 occupancies, the maximum occupant load excluding staff is 16.~~
~~5. Groups R-1 and R-2 not more than two stories in height, when there are not more than four dwelling units per floor and the exit access travel distance does not exceed 50 feet (15 240 mm). The minimum fire-resistance rating of the exit enclosure and of the opening protection shall be 1 hour.~~
~~6. In multilevel dwelling units in buildings of occupancy Group R-1 or R-2, an exit shall not be required from every level of the dwelling unit provided that one of the following conditions is met:~~
~~6.1. The travel distance within the dwelling unit does not exceed 75 feet (22 860 mm); or~~
~~6.2. The building is not more than three stories in height and all third-floor space is part of one or more dwelling units located in part on the second floor; and no habitable room within any such dwelling unit shall have a travel distance that exceeds 50 feet (15 240 mm) from the outside of the habitable room entrance door to the inside of the entrance door to the dwelling unit.~~
2. In Group R-1 or R-2, non-sprinklered buildings, individual single-story or multistory dwelling or sleeping units shall be permitted to have a single exit or access to a single exit from the dwelling or sleeping unit provided one of the following criteria are met:
2.1. The occupant load is not greater than 10 and the exit access travel distance within the unit does not exceed 75 feet (22 860 mm).
2.2. The building is not more than three stories in height; all 3rd story space is part of dwelling with an exit access doorway on the 2nd story; and the portion of the exit access travel distance from the door to any habitable room within any such unit to the unit entrance doors shall not exceeds 50 feet (15 240 mm).
~~7. In Group R-2, H-4, H-5 and I occupancies and in rooming houses and child care centers, a single exit is permitted in a one-story building with a maximum occupant load of 10 and the exit access travel distance does not exceed 75 feet (22 860 mm).~~
~~8. In buildings of Group R-2 occupancy that are equipped throughout with an automatic fire sprinkler system, a single exit shall be permitted from a basement or story below grade if every dwelling unit on that floor is equipped with an approved window providing a clear opening of at least 5 square feet (0.47 m2) in area, a minimum net clear opening of 24 inches (610 mm) in height and 20 inches (508 mm) in width, and a sill height of not more than 44 inches (1118 mm) above the finished floor.~~
3.~~9.~~ In buildings of Group R-2 occupancy of any ~~height~~number of stories and with not more than four dwelling units per floor; served by an interior exit stairway with a smokeproof enclosure in accordance with Sections 909.20 and 1023.11 of the *International Building Code* or an exterior exit stairway ~~outside stairway as an exit; and with such exit located within 20 feet (6096 mm) of travel to the entrance doors to all dwelling units served thereby.~~where the portion of the exit access travel distance from the dwelling unit entrance door to the exit is a maximum of 20 feet (6096 mm).
~~10. In buildings of Group R-3 occupancy equipped throughout with an automatic fire sprinkler system, only one exit shall be required from basements or stories below grade.~~

TABLE 805.3.1.1(1)
STORIES WITH ONE EXIT OR ACCESS TO ONE EXIT FOR R-2 OCCUPANCIES

STORY	OCCUPANCY	MAXIMUM NUMBER OF DWELLING UNITS	MAXIMUM EXIT ACCESS TRAVEL DISTANCE
Basement, First or second story above grade plane	R-2[2]	4 dwelling units	50 feet
Third story above grade plane and higher	NP	NA	NA

For SI: 1 foot=3048
NP=Not Permitted.
NA=Not Applicable.
a. Group R-2, non-sprinklered and provided with emergency escape and rescue openings in accordance with Section 1030 of the *International Building Code*.

TABLE 805.3.1.1(2)
STORIES WITH ONE EXIT OR ACCESS TO ONE EXIT FOR OTHER OCCUPANCIES

STORY	OCCUPANCY	MAXIMUM OCCUPANTS LOAD PER STORY	MAXIMUM EXIT ACCESS TRAVEL DISTANCE (feet)
First story above or below grade plane	B, F-2, S-2[a]	35	75

Second story above grade plane	B, F-2, S-2[a]	35	75
Third story above grade plane and higher	NP	NA	NA

For SI: 1 foot = 304.8mm.

NP=Not Permitted

NA=Not Applicable

a. The length of exit access travel distance in a Group S-2 open parking garage shall be not more than 100 feet (30 480mm).

Reason: The current provisions are not keeping up with the allowances and changes in language for new buildings. This could be interpreted as existing buildings being more restrictive than new construction. Many items match IBC new construction allowances rather than allowing for additional options. To keep items correlated over time, the change to Section 805.3.1 is to allow for any option permitted in new construction. The reasons for the changes to Section 805.3.1.1 are found below. What can be put in tables similar to Table 1006.3.2(1) and Table 1006.3.2(2) has been made so to improve correlation and consistency over time.
Item 1 is permitted for new construction, IBC Table 1006.3.2(2); therefore, it is proposed to be deleted.

Item 2 - This is the new item 1 and the table. The area is translated to occupant load (3500 sq.ft/100 sq.ft. per occupant) and added in a table. This is consistent with the approach for new construction and should increase consistency over time. The last sentence is addressing exit stairway enclosures, which are already addressed in stairway provisions. Note a in the table is so that it is understood that this allowance will not override the allowance for 100 feet in open parking that is permitted in new construction.

Item 3 is for mechanical parking garages is permitted in IBC Section 1006.3.2 Item 3; therefore, it is proposed to be deleted.

Item 4 for Group R-4 is technically incorrect with the language using occupant load rather than number of residents; in addition a single exit is permitted in IBC Section 1006.3.2 Item 4; therefore, it is proposed to be deleted.

Item 5 is based on old travel distance allowances for single exit apartment buildings – so this limitation should be for only non-sprinklered buildings. Group R-1 does not typically have dwelling units, so this is not logical for a hotel. This item should be deleted in favor new construction allowances in Table 1006.3.2(1) for apartment buildings. The last sentence is addressing exit stairway enclosures, which are already addressed in stairway provisions; therefore, it is proposed to be deleted.

Item 6 is more restrictive than the multi-story dwelling units permitted in Section 1006.3.2, Item 5. Group R-1 does not typically have dwelling units, so terminology is not logical for a hotel. If this is needed for large sleeping unit, this allowance should be added to new construction in IBC. For sprinklered buildings this item should be deleted in favor new construction allowances in Section 1006.3.2 Item 5 for multi-story dwelling units. The revised item 2 is limited to non-sprinklered buildings and the terminology has been updated. The occupant load was added to be consistent with the previous limit on dwelling units and travel distance before sprinklers were added (2003 IBC Section 1013.3 and 1014.1). There is no intent to change to the technical criteria.

Item 7 – Rooming houses a limiting factor for Group R-2 in new construction – current text would apply this to all Group R-2. In addition, R-2 congregate residences are now 16 or more. To fit into the maximum of 10 occupants, you are a Group R-3 now. Group R-3 has always had single exit with no travel distance, so this would be more restrictive than new sprinklered or existing not sprinklered. Child care centers could be read as E and I-4. Group I-4 is part of Group I and is the same for new construction. This requirement exceeds Group E requirements for new construction and should not be applicable. The provisions for I, H-4 and H-5 match new construction in Table 1006.3.2(2). Therefore, it is proposed to be deleted.

Item 8 is addressed for new construction in Table 1006.3.2(2), including the emergency escape window requirement; therefore, it is proposed to be deleted.

Item 9 (new Item 3) allows for a different travel distance measurement and additional number of stories for apartment buildings with 4 of fewer per story. Since this is unlimited height, this would apply to sprinklered and non-sprinklered existing buildings. The change is intended to be editorial only to match new terminology.

Item 10 is addressed already permitted for new construction in Section 1006.3.2 Item 3; therefore, it is proposed to be deleted.

Cost Impact: Will not increase the cost of construction
The code change proposal will not increase the cost of construction. The intent of the proposal is coordination and an update to new terminology. It is not intended to increase requirements.

EB 63-15 : 805.3.1-KULIK4904

EB 64-15

805.3.1.1

Proponent: Carl Baldassarra, P.E., FSFPE, Chair, Code Technology Committee, representing Code Technology Committee (CTC@iccsafe.org)

2015 International Existing Building Code

Revise as follows:

805.3.1.1 Single-exit buildings. Only one exit is required from buildings and spaces of the following occupancies:

1. In Group A, B, E, F, M, U and S occupancies, a single exit is permitted in the story at the level of exit discharge when the occupant load of the story does not exceed 50 and the exit access travel distance does not exceed 75 feet (22 860 mm).
2. Group B, F-2, and S-2 occupancies not more than two stories in height that are not greater than 3,500 square feet per floor (326 m^2), when the exit access travel distance does not exceed 75 feet (22 860 mm). The minimum fire-resistance rating of the exit enclosure and of the opening protection shall be 1 hour.
3. Open parking structures where vehicles are mechanically parked.
4. ~~In Group R-4 occupancies, the maximum occupant load excluding staff is 16.~~
4. Groups R-1 and R-2 not more than two stories in height, when there are not more than four dwelling units per floor and the exit access travel distance does not exceed 50 feet (15 240 mm). The minimum fire-resistance rating of the exit enclosure and of the opening protection shall be 1 hour.
5. In multilevel dwelling units in buildings of occupancy Group R-1 or R-2, an exit shall not be required from every level of the dwelling unit provided that one of the following conditions is met:
   5.1. The travel distance within the dwelling unit does not exceed 75 feet (22 860 mm); or
   5.2. The building is not more than three stories in height and all third-floor space is part of one or more dwelling units located in part on the second floor; and no habitable room within any such dwelling unit shall have a travel distance that exceeds 50 feet (15 240 mm) from the outside of the habitable room entrance door to the inside of the entrance door to the dwelling unit.
6. In Group R-2 occupancies consisting of sleeping units, H-4, H-5 and I occupancies ~~and in rooming houses and child care centers~~, a single exit is permitted in a one-story building with a maximum occupant load of 10 and the exit access travel distance does not exceed 75 feet (22 860 mm).
7. In buildings of Group R-2 occupancy that are equipped throughout with an automatic fire sprinkler system, a single exit shall be permitted from a basement or story below grade if every dwelling unit on that floor is equipped with an approved window providing a clear opening of at least 5 square feet (0.47 m^2) in area, a minimum net clear opening of 24 inches (610 mm) in height and 20 inches (508 mm) in width, and a sill height of not more than 44 inches (1118 mm) above the finished floor.
8. In buildings of Group R-2 occupancy of any height with not more than four dwelling units per floor; with a smokeproof enclosure or outside stairway as an exit; and with such exit located within 20 feet (6096 mm) of travel to the entrance doors to all dwelling units served thereby.
9. In buildings of Group R-3 occupancy equipped throughout with an automatic fire sprinkler system, only one exit shall be required from basements or stories below grade.

Reason: The terminology is old and many in the list are addressed by new construction. IEBC Section 805.3.1. already says any single exits scenarios in IBC are permitted here. The CTC Committee scope limits them to Items 4 and 7.

- Item 4 – Group R-4 is already addressed in new, so this is not needed. In addition, Group R-4 is based on the number of care recipients, not the occupant load, so the terminology is incorrect. If it is kept it should match the text in new construction – IBC Section 1006.3.2, Item 4. " Group R-3 and R-4 occupancies shall be permitted to have one exit or access to a single exit." However, to keep consistency over time, it is preferred that this be deleted.
- Item 7 – In new provisions this limit is for Group R-2 with sleeping units. This could be read to be all Group R-2. Child care centers could be read to be both Group E and I-4. In new construction this occupant load and travel distance is Group I-4.

The ICC Code Technology Committee (CTC) has just completed its 10th year. The ICC Board has decided to sunset the CTC. The sunset plan includes re-assigning many of the CTC Areas of Study to the applicable Code Action Committee (CAC). The two remaining CTC Areas of Study are Care Facilities and Elevator Lobbies/WTC Elevator issues. This proposal falls under the Care Facilities Area of Study. Information on the CTC, including: the sunset plan; meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the CTC website at: http://www.iccsafe.org/cs/CTC/Pages/default.aspx.

Cost Impact: Will not increase the cost of construction
This correlates IEBC with IBC for this extent of an alteration.

EB 64-15 : 805.3.1.1-BALDASSARRA4286

EB 65-15

906.2

Proponent: Dominic Marinelli, representing United Spinal Association (dmarinelli@accessibility-services.com)

2015 International Existing Building Code

Revise as follows:

906.2 Type B dwelling or sleeping units. Where four or more Group I-1, I-2, R-1, R-2, R-3 or R-4 dwelling or sleeping units are being altered, the requirements of Section 1107 of the *International Building Code* for Type B units and Chapter 9 of the *International Building Code* for visible alarms apply only to the quantity of the spaces being altered.

> ~~**Exception:** Group I-1, I-2, R-2, R-3 and R-4 dwelling or sleeping units where the first certificate of occupancy was issued before March 15, 1991 are not required to provide Type B dwelling or sleeping units.~~

Reason: The purpose of this code change proposal is to eliminate a conflict in the IEBC between the requirements in the Prescriptive and Work Area methods. The deletion of the exception to Section 906.2 would coordinate with Section 410.8.8. The intent is to coordinate the requirements for Type B dwelling units within the options available in the IEBC.
In the prescriptive method, Section 906.2 requirement is found in the 2nd sentence of Section 410.8.8. (The first sentence matches IEBC Section 1105.4).

410.8.8 Type B dwelling or sleeping units. Where four or more Group I-1, I-2, R-1, R-2, R-3 or R-4 dwelling or sleeping units are being added, the requirements of Section 1107 of the International Building Code for Type B units apply only to the quantity of the spaces being added.
Where Group I-1, I-2, R-1, R-2, R-3 or R-4 dwelling or sleeping units are being altered and where the work area is greater than 50 percent of the aggregate area of the building, the requirements of Section 1107 of the International Building Code for Type B units apply only to the quantity of the spaces being altered.

United Spinal does not support the exception to Section 906.2, and believes it should be deleted for several reasons.

The current exception to Section 906.2 includes a March 15, 1991 as a trigger date. This was inserted as a coordination item with Fair Housing Act (FHA) requirements. However, this is not quite correct. It will be extremely difficult for code officials to determine as the first certificate of occupancy date is different than the date of First Occupancy as defined by the Fair Housing Accessibility Guidelines (i.e., the date that tenants first occupied their apartments). Adding a trigger date would require additional research by the architect or code official to determine if these code requirements were applicable or not. While the jurisdiction does hold records of certificate of occupancy, they do not information on actual occupancy of a space.

In addition, even if this was a match, including the trigger date of the FHA could significantly reduce the number of buildings where these basic adaptability features are required. Remember that these are already major alterations, not minor fixes. In instances where existing structure would prevent compliance with Type B features, permit applicants can take advantage of the technical infeasibility exception offered in the IEBC. It should be noted that Section 410.7 Exception 5 and 705.2 Exception 5 already exempts the building from improving the accessible route, so this requirement is only for the element being altered.

The intent of the original requirement was to require adaptable Type B features in Level III alterations. This requirement will allow for basic adaptations to be made in the Type B unit in the future (but will not require accessible turning spaces, removable base cabinets, maneuvering clearance at bedroom and bathroom doors, or the installation of grab bars).

Cost Impact: Will not increase the cost of construction
This proposal as it will match current language in Section 410.8.8.

EB 65-15 : 906.2-ROETHER5445

EB 66-15

906.3 (New)

Proponent: Gene Boecker, representing Code Consultants, Inc. (geneb@codeconsultants.com)

2015 International Existing Building Code

Add new text as follows:

906.3 **Accessible means of egress** At least one accessible means of egress shall be provided from each story of each work area to the exit discharge in accordance with the requirements of Section 1009 of the *International Building Code* unless technically infeasible.

Exceptions:

1. Historic Buildings.
2. Buildings three stories or less in height where the building does not require an automatic sprinkler system throughout in accordance with Section 903 of the *International Building Code.*

Reason: The proposal seeks to add a requirement for an accessible means of egress (AMOE) in existing buildings. Changes are being proposed only for buidlings with a Level 3 alteration. This means that at least 50 percent of the buidling is involved in an alteration, based on the descriptions in Chapter 5. The proposal also includes langauge to exempt full compliance for the AMOE where it is technically infeasible. This might be the case where the elevator would normally be required as a part of the AMOE and the hoistway shaft would need to be modified on floors beyond the work area or where such an alteration could possibly leave the building structurally unsound. Section 906.1, within the same main Section where this new code language would be located, requires the alteration to comply with Section 705. Section 705.1 already addresses the concept of technically infeasible and how it works within existing buildings.
Two exceptions are offered to this new section. The first exempts historic buildings. The complexity with which these buildings must be addressed means that it is not practical to provide an AMOE in addition to the general requirements for acessibility in an historic building. The second exception recognizes the potential costs associated with trying to create an AMOE in smaller existing buildings. If the building is small enough that automatic fire sprinklers are not required, then the creation of fire rated areas of refuge could be a considerable cost imposition. However, if the smaller buidling is requried to be protected throughout with an automatic fire sprinkler system, then areas of refuge are not required and the existing and/or new stairways can be used as part of the AMOE.

The ICC is responsible for establishing what the minimum level of safety is for new and existing buildings. The codes contain requirements for "access" for everyone, including the disabled, for both new and existing buildings. However, for existing buildings, the codes seem lacking in concern for the safety of those in the disabled community with regard to building "egress." With over 25 years of the ADA and many more years of accessibility provisions in the legacy codes, it is now time that the ICC recognize this need and include language regarding accessible means of egress for existing buildings. To do otherwise is to ignore the life safety of an entire group of the public, as well as employees, in existing buildings undergoing substantial renovation.

Cost Impact: Will increase the cost of construction
The degree of cost increase is variable. For some Level 3 alterations, the cost would be neglible if not nonexistent since a larger building will be protected throughout with an automatic fire sprinkler system, the elevator will be required to be on standby power and tactile exit signs would be required. In some instances the cost could be greater, depending on where the alteration work areas are located within the buidling. Therefore, it is not possible to offer a specific range of what the possible cost increase could be. The exceptions included in the proposal and the concept of "technically infeasible" are also options which will temper any substantial costs. Additionally, the question must be asked what the apprpriate cost for the lives that can be saved if an accessible means of egress is provided.

EB 66-15 : 906.3 (New)-BOECKER5665

EB 67-15

Table 1012.4, Table 1012.5

Proponent: Carl Baldassarra, P.E., FSFPE, Chair, Code Technology Committee, representing Code Technology Committee (CTC@iccsafe.org)

2015 International Existing Building Code

Revise as follows:

TABLE 1012.4
MEANS OF EGRESS HAZARD CATEGORIES

RELATIVE HAZARD	OCCUPANCY CLASSIFICATIONS
1 (Highest Hazard)	H
2	I-2, I-3, I-4
3	A, E, I-1, M, R-1, R-2, R-4 Condition 2
4	B, F-1, R-3, R-4 Condition 1, S-1
5 (Lowest Hazard)	F-2, S-2, U

TABLE 1012.5
HEIGHTS AND AREAS HAZARD CATEGORIES

RELATIVE HAZARD	OCCUPANCY CLASSIFICATIONS
1 (Highest Hazard)	H
2	A-1, A-2, A-3, A-4, I, R-1, R-2, R-4 Condition 2
3	E, F-1, S-1, M
4 (Lowest Hazard)	B, F-2, S-2, A-5, R-3, R-4 Condition 1, U

Reason: The change in the table is consistent with the identification of different levels of hazards for the residents in a Group R-4. The conditions are based on the egress capability of the residents. Group R-4 Condition 1 is more consistent with Group R-3. Group R-2 Condition 2 is closer to a Group I-1.
The ICC Code Technology Committee (CTC) has just completed its 10th year. The ICC Board has decided to sunset the CTC. The sunset plan includes re-assigning many of the CTC Areas of Study to the applicable Code Action Committee (CAC). The two remaining CTC Areas of Study are Care Facilities and Elevator Lobbies/WTC Elevator issues. This proposal falls under the Care Facilities Area of Study. Information on the CTC, including: the sunset plan; meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the CTC website at: http://www.iccsafe.org/cs/CTC/Pages/default.aspx.

Cost Impact: Will not increase the cost of construction
This is a reduction in requirements for Group R-4 Condition 1.

Part II:
423, 423.1.1, 423.4, 423.4.2 (New), 423.4.1 (New)

THIS IS A 2 PART CODE CHANGE PROPOSAL. BOTH PARTS WILL BE HEARD BY THE IEBC COMMITTEE. PLEASE SEE THE TENTATIVE HEARING ORDER FOR THIS COMMITTEE.

Proponent: Edward Kulik, representing Building Code Action Committee (bcac@iccsafe.org); Marc Levitan, National Institute of Standards and Technology (marc.levitan@nist.gov)

Part I

2015 International Existing Building Code

Add new text as follows:

SECTION1106 Storm Shelters

1106.1.1 Required occupant capacity The required occupant capacity of the storm shelter shall include all the buildings on the site, and shall be the greater of the following:

1. The total occupant load of the classrooms, vocational rooms and offices in the Group E occupancy.
2. The occupant load of any indoor assembly space that is associated with the Group E occupancy.

Exceptions:

1. Where an addition is being added on an existing Group E site, and where the addition is not of sufficient size to accommodate the required occupant capacity of the storm shelter for all the buildings on the site, the storm shelter shall at a minimum accommodate the required capacity for the addition.

2. Where approved by the code official, the required occupant capacity of the shelter shall be permitted to reduced by the occupant capacity of any existing storm shelters on the site.

1106.1.2 Location Storm shelters shall be located within the buildings they serve, or shall be located where the maximum distance of travel from at least one exterior door of each building to a door of the shelter serving that building does not exceed 1000 ft. (304.8 m)

1106.1 Addition to a Group E occupancy. Where an addition is added to an existing Group E Occupancy located in an area where the shelter design wind speed for tornados is 250 mph in accordance with Figure 304.2(1) of ICC500 and the occupant load in the addition is 50 or more, the addition shall have a storm shelter constructed in accordance with ICC500.

Exceptions:

1. Group E day care facilities.
2. Group E occupancies accessory to places of religious worship.
3. Additions meeting the requirements for shelter design in ICC500.

1401.2.3.1 Additions to Group E facilities. For additions to Group E occupancies, storm shelters shall be provided in accordance with Section 1106.1.

402.6 Additions to Group E facilities. For additions to Group E occupancies, storm shelters shall be provided in accordance with Section 1106.1.

Part II

2015 International Building Code

Revise as follows:

SECTION 423 STORM SHELTERS

423.1.1 Scope. This section applies to the construction of storm shelters constructed as separate detached buildings or constructed as ~~safe rooms~~ rooms or spaces within buildings for the purpose of providing ~~safe refuge~~protection from storms that produce high winds, such as tornados and hurricanes. Such structures shall be designated to be hurricane shelters, tornado shelters, or combined hurricane and tornado shelters.

423.4 Group E occupancies. In areas where the shelter design wind speed for tornados is 250 MPH in accordance with Figure 304.2(1) of ICC 500, all Group E occupancies with an aggregate occupant load of 50 or more shall have a storm shelter constructed in accordance with ICC 500. ~~The shelter shall be capable of housing the total occupant load of the Group E occupancy.~~

Exceptions:

1. Group E day care facilities.
2. Group E occupancies accessory to places of religious worship.
3. Buildings meeting the requirements for shelter design in ICC 500.

Add new text as follows:

423.4.2 Location. Storm shelters shall be located within the buildings they serve, or shall be located where the maximum distance of travel from at least one exterior door of each building to a door of the shelter serving that building does not exceed 1000 ft. (304.8 m)

423.4.1 Required occupant capacity The required occupant capacity of the storm shelter shall include all the buildings on the site, and shall be the greater of the following:

1. The total occupant load of the classrooms, vocational rooms and offices in the Group E occupancy.
2. The occupant load of any indoor assembly space that is associated with the Group E occupancy.

Exceptions:

1. Where a new building is being added on an existing Group E site, and where the new building is not of sufficient size to accommodate the required occupant capacity of the storm shelter for all the buildings on the site, the storm shelter shall at a minimum accommodate the required capacity for the new building.

2. Where approved by the code official, the required occupant capacity of the shelter shall be permitted to reduced by the occupant capacity of any existing storm shelters on the site.

Reason: This public proposal is submitted jointly by the National Institute of Standards and Technology and the ICC Building Code Action Committee (BCAC). The BCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the BCAC has held 13 open meetings and numerous workgroup calls which included members of the BCAC as well as any interested party to discuss and debate the proposed changes and the public comments. Related documentation and reports are posted on the BCAC website at: http://www.iccsafe.org/cs/BCAC/Pages/default.aspx.

As documented in the proposal that created the original requirements for installation of storm shelters in schools for the 2015 IBC, even schools built to modern building codes are susceptible to collapse during tornadoes. That proposal described a number of schools destroyed or severely damaged in several 2011 tornadoes in Missouri, Georgia, and Alabama. As documented in the National Institute of Standards and Technology's final report on its technical investigation of the Joplin, Missouri tornado of May 22, 2011, that one storm severely damaged or destroyed 10 of the 20 public schools in the City of Joplin, and several parochial schools.

In 2013, seven schoolchildren died in Oklahoma at the Plaza Towers Elementary School during the Newcastle-Moore tornado on May 20. They were taking refuge in the hallway of the New Main Classroom Building, in their designated tornado safety area, when the masonry hallway walls collapsed on them (see Figure 1). Several more students and teachers were injured in this and other buildings on the same campus. The Newcastle-Moore tornado also destroyed the Briarwood Elementary School, injuring several people, and collapsed the Gymnasium at Highland East Junior High School.

In recognition of the need to provide protection for schoolchildren from tornadoes, and that the existing school building stock is not capable of providing that protection, some states and communities have already begun to take action. Following the death of 8 students at Enterprise High School in a 2007 tornado, the State of Alabama enacted legislation in 2010 (Act 2010-746) requiring that all public schools incorporate tornado shelters built to ICC 500. Illinois recently became the second state to require ICC 500 tornado shelters in all new school building construction, when the Governor signed Public Act 098-0883 into law in August 2014.

Another positive trend in school shelter construction is that some of these facilities are also being made available as public shelters. For example, during the rebuilding following the 2011 tornado, the Joplin School District has been proactively outfitting its new and rebuilt schools with tornado shelters, and installing shelters at undamaged schools as well. These shelters, commonly in gymnasiums, are sized not only to handle the full daytime occupant load of the school but also the population of the surrounding neighborhoods within a quarter to half mile radius. The investment of public funds in these shelters is further leveraged to improve public safety by making them available whenever there is a threat from tornadoes, 24 hours a day and year-round. The shelter doors are automatically unlocked as soon as a tornado watch goes into effect. Tornado shelters at several school districts in Arkansas (Greenwood, Fort Smith, Alma, and Van Buren Public Schools) are also open to the public. At these shelters, the doors are automatically unlocked when the tornado siren sounds.

Explanation of Provisions.

• IBC Section 423.1.1 Scope. The 'safe refuge' has been revised to 'protection' so that this term will not be confused with other refuge areas already required in the code. The remainder of the change is for consistency with the revisions to the scoping language in the ICC 500-2014.

• IBC Section 423.4 Group E occupancies. The last sentence is removed and addressed in new Section 423.4.1. Section 303.1.3 states that assembly spaces associated with Group E occupancies are considered part of the Group E occupancy. However, many schools have assembly type facilities (e.g., gymnasiums with bleachers, multi-purpose rooms used for after school meetings or school registration, libraries used for school board meetings, theaters with concerts and shows open to the parents and public, gyms used for science fairs or intermural sports) that could include the public outside of normal school hours. The purpose of the storm shelter is to provide safety for the school occupants at the time of the emergency.

• IBC Section 423.4.1 Capacity. With those many uses of a school building, not all spaces will be fully occupied at the same time that all the classrooms are fully occupied. Worse case occupant load is used for all spaces for fire exiting, but total occupant load for the building is excessive for storm shelter design. The determination for the required capacity of the shelter is based on the number of staff and students that will be in the school during a typical school day or any indoor assembly space that would be fully utilized outside school hours, whichever is greater. Thus, rather than the total occupant load of the building, the capacity of the shelter is appropriately based on occupant load described in the two scenarios described in Item 1 and 2. It is not the intent of these provisions to require outdoor areas on the site (e.g., sports fields and bleachers) to be considered since that area is not a building.

In new construction, a fire wall creates a separate building. If a facility adds on with a fire wall or puts another building on an existing Group E site, this is another opportunity to provide a storm shelter for that school. The designer would be responsible for determining the required storm shelter capacity for both the new building and for the total facility on the site. Depending on what type of rooms are in the new building, what proportion of the space can be used for a shelter is information that can be calculated using the provisions in ICC 500, Chapter 5. If this is a small new building, the shelter within the building will be required to at least accommodate the students and staff within that new building. If the new building is large enough that a shelter could accommodate all the students and staff on the site, the shelter will be required to accommodate the students and staff on the site. It is not the intent of the provisions to require the new building to be made bigger just to meet the shelter provisions.

If there is an existing storm shelter on the site, that can be considered to reduce the capacity required for the new shelter. Due to travel distances and possible age of the existing shelter (perhaps built before ICC 500), the code official can have input into the decision.

The term site is currently defined in the codes:

SITE. A parcel of land bounded by a lot line or a designated portion of a public right-of-way.

• IBC Section 423.4.2 Location. The new language in IBC 423.4.2 requires the shelter to be within a building or within a distance of travel of a1000 feet or less. Where the shelter is remote, this would be approximately a 4 minute walk at 3 mph, which is an average speed that humans tend to walk. Add that to an assumed few hundred feet travel distance to first reach the exit of the building being served, and the total travel time is 5 minutes. This is consistent with current FEMA guidance for a maximum five minute walk time to reach the tornado shelter.

Figure 1. Damage to the New Main Classroom Building at Plaza Towers Elementary School. The seven schoolchildren died in the central hallway when the classroom walls collapsed on them. An additional two staff members and one student were injured in this building.

Cost Impact:

Part I: Will increase the cost of construction

This proposal will increase the cost of construction.

The most recent information on costs is available in FEMA P-361, Design and Construction Guidance for Community Safe Rooms (Second Edition, August, 2008). All of the values described below related to cost come from that publication. It should be noted that tornado shelters designed and constructed in accordance with FEMA P-361 guidelines are called safe rooms. FEMA's safe room guidelines are similar to ICC 500, but there are some differences. Where there are differences, in all cases, FEMA requirements are more stringent than ICC 500, as documented on page 1-2 of FEMA P-361, which states "All safe room criteria in this publication meet or exceed the shelter requirements of ICC 500." Shelters built to ICC 500 would therefore cost less, but there is no data available to quantify that cost reduction.

FEMA 361 describes safe room costs for new building projects as follows. "For large new building projects, however, the percent increase in the overall project cost is quite small. For example, many safe rooms protecting 200 to 300 occupants being constructed as part of a new school have added only 1 to 2 percent to the total project cost when the safe room was included in the design process at the beginning of the project."

Based on review of 36 safe room grant applications from 2008, the average safe room cost per square foot for projects considered technically feasible and effective for providing protection was $188/sf. From more expanded grant application data from years 2005 to 2008, the percent increase in building cost to harden a portion of a building to meet the safe room requirements ranged from 5-32 percent (cost increase per square foot of the safe room area being hardened). More information on safe room costs can be found in Chapter 2 of FEMA P-361.

Costs for storm shelters are anticipated to decrease as their use becomes more widespread. The adoption of requirements for storm shelters in tornado prone areas for Group E Occupancies and first responder facilities in the 2015 IBC will lead to installation of many more storm shelters than are currently being built. Subsequently, shelters will become less of a specialty item from a design and construction standpoint. As the market expands for specialty products needed in shelters, like tornado resistant doors, windows and shutters, economies of scale and new manufacturers joining the industry will also lead to cost reductions.

[5] Previous studies have shown that the premium for new-technology introduction costs disappear once the designer is satisfied with the technology's performance, the technology enters full implementation, and its application has become routine. See for example Ehlen, Mark A., and Harold E. Marshall. 1996. The Economics of New-Technology Materials: A Case Study of FRP Bridge Decking. NISTIR 5864. Gaithersburg, MD: National Institute of Standards and Technology.

Part II: Will increase the cost of construction

This proposal will increase the cost of construction.

The most recent information on costs is available in FEMA P-361, Design and Construction Guidance for Community Safe Rooms (Second Edition, August, 2008). All of the values described below related to cost come from that publication. It should be noted that tornado shelters designed and constructed in accordance with FEMA P-361 guidelines are called safe rooms. FEMA's safe room guidelines are similar to ICC 500, but there are some differences. Where there are differences, in all cases, FEMA requirements are more stringent than ICC 500, as documented on page 1-2 of FEMA P-361, which states "All safe room criteria in this publication meet or exceed the shelter requirements of ICC 500." Shelters built to ICC 500 would therefore cost less, but there is no data available to quantify that cost reduction.

FEMA 361 describes safe room costs for new building projects as follows. "For large new building projects, however, the percent increase in the overall project cost is quite small. For example, many safe rooms protecting 200 to 300 occupants being constructed as part of a new school have added only 1 to 2 percent to the total project cost when the safe room was included in the design process at the beginning of the project."

Based on review of 36 safe room grant applications from 2008, the average safe room cost per square foot for projects considered technically feasible and effective for providing protection was $188/sf. From more expanded grant application data from years 2005 to 2008, the percent increase in building cost to harden a portion of a building to meet the safe room requirements ranged from 5-32 percent (cost increase per square foot of the safe room area being hardened). More information on safe room costs can be found in Chapter 2 of FEMA P-361.

Costs for storm shelters are anticipated to decrease as their use becomes more widespread. The adoption of requirements for storm shelters in tornado prone areas for Group E Occupancies and first responder facilities in the 2015 IBC will lead to installation of many more storm shelters than are currently being built. Subsequently, shelters will become less of a specialty item from a design and construction standpoint. As the market expands for specialty products needed in shelters, like tornado resistant doors, windows and shutters, economies of scale and new manufacturers joining the industry will also lead to cost reductions.

[5] Previous studies have shown that the premium for new-technology introduction costs disappear once the designer is satisfied with the technology's performance, the technology enters full implementation, and its application has become routine. EB 68-15 : 1106 (New)-KULIK4828

EB 69-15

1202.2, 1202.3

Proponent: David Bonowitz, David Bonowitz, S.E., representing Existing Buildings Subcommittee, National Council of Structural Engineers Associations (dbonowitz@att.net)

2015 International Existing Building Code

Revise as follows:

~~1202.2~~1201.5 Unsafe conditions. *No change to text.*

~~1202.3~~1207.1 Relocated buildings. *No change to text.*

Reason: This editorial proposal reorganizes parts of Section 1202 for internal consistency within the Work Area method.
Section 1202.2, regarding unsafe conditions, does not necessarily apply only to repairs. It is a more general provision that belongs in Section 1201. (In Group B, Section 1206.2 may also be removed as redundant.)

Section 1202.3, for relocated buildings, has nothing to do with repairs. For consistency within the Work Area method, it should be in its own section, the same way Sections 1204 and 1205 are separate sections for specific project types. Ideally, 1202.3 would move to a new Section 1206: Relocated Buildings, but the proposal shows it as 1207 to clarify that the intent is NOT to make this part of the existing Section 1206: Structural.

Cost Impact: Will not increase the cost of construction
The proposal is entirely editorial.

EB 69-15 : 1202.2-BONOWITZ5192

EB 70-15

1203.5

Proponent: Daniel Nichols, New York State Division of Building Standards and Codes, representing New York State Division of Building Standards and Codes (dnichols@dos.state.ny.us)

2015 International Existing Building Code

Revise as follows:

1203.5 Interior finishes. The existing finishes ~~of walls and ceilings~~ shall be accepted when it is demonstrated that they are the historic finishes.

Reason: The definition of interior finishes includes interior floor finishes by the International Building Code. The scoping of only wall and ceiling finishes in IEBC Section 1203.5 does not allow the acceptance of historic floor finishes; such as would be found in historic homes or historic assembly occupancies. If the floor is part of the historic fabric, it should be regulated the same as the walls and ceiling interior finishes.
Just like wall and ceiling finishes, this does not provide an exception for floor finishes that are added, not back of the historic fabric of the interior, or the underlayment to removed finishes.

Cost Impact: Will not increase the cost of construction
This removes a requirement to remove or modify interior floor finishes in historic buildings.

EB 70-15 : 1203.5-NICHOLS5756

EB 71-15

1401.2

Proponent: Anthony Apfelbeck, City of Altamonte Springs Building/Fire Safety, representing City of Altamonte Springs (ACApfelbeck@altamonte.org)

2015 International Existing Building Code

Revise as follows:

1401.2 Applicability. ~~Structures existing prior to [~~~~**DATE TO BE INSERTED BY THE JURISDICTION. Note: it is recommended that this date coincide with the effective date of building codes within the jurisdiction**~~~~]~~
Existing buildings, in which there is work involving *additions*, *alterations* or *changes of occupancy* shall be made to conform to the requirements of this chapter or the provisions of Chapters 5 through 13. The provisions of Sections 1401.2.1 through 1401.2.5 shall apply to existing occupancies that will continue to be, or are proposed to be, in Groups A, B, E, F, I-2, M, R and S. These provisions shall not apply to buildings with occupancies in Group H or I-1, I-3 or I-4.

Reason: The "Structures existing prior to [**DATE TO BE INSERTED BY THE JURISDICTION. Note: it is recommended that this date coincide with the effective date of building codes within the jurisdiction**]" is language that is appropriate for Chapter 1 but is not appropriate for Chapter 14. By having this language in Chapter 14, it potentially creates a conflict with the Chapter 101.4 language and that definition of Existing Buildings. At the very least, the existing language in this section can create confusion and provides no additional value. The applicability language in Chapter 14 should focus on how the provisions of this specific chapter are applied. The issue of when the code is adopted is already covered in 101.4 and the model adoption language.
This proposal eliminates the potential conflict by defaulting to the Chapter 1 language and the definition of existing building.

Cost Impact: Will not increase the cost of construction
This is an editorial change and will not increase the cost of construction.

EB 71-15 : 1401.2-APFELBECK3718

EB 72-15

1401.2

Proponent: Kathleen Petrie, representing City of Seattle, Department of Planning and Development (kathleen.petrie@seattle.gov)

2015 International Existing Building Code

Revise as follows:

1401.2 Applicability. Structures existing prior to [**DATE TO BE INSERTED BY THE JURISDICTION. Note: it is recommended that this date coincide with the effective date of building codes within the jurisdiction**], in which there is work involving *additions*, *alterations* or *changes of occupancy* shall be made to conform to the requirements of this chapter, Chapter 4, or the provisions of Chapters 5 through 13. The provisions of Sections 1401.2.1 through 1401.2.5 shall apply to existing occupancies that will continue to be, or are proposed to be, in Groups A, B, E, F, I-2, M, R and S. These provisions shall not apply to buildings with occupancies in Group H or I-1, I-3 or I-4.

Reason:
Section 1401.1 outright allows alterations, repairs, additions and changes of occupancy to existing structures to comply with the performance method provisions of chapter 14 or with one of the other methods provided in Section 301.1, which includes the work area and prescriptive compliance methods. However, Section 1401.2 then only directs the user back to the work area code chapters 5 though 13, so this proposal adds a Chapter 4 reference to ensure that the prescriptive compliance method is included as a compliance option.

Cost Impact: Will not increase the cost of construction
This proposal does not require the use of a specific method or construction component, so the cost of construction is not increased

EB 72-15 : 1401.2-PETRIE3478

EB 73-15

1401.2.3

Proponent: Edward Kulik, Chair, representing Building Code Action Committee(bcac@iccsafe.org)

2015 International Existing Building Code

Revise as follows:

1401.2.3 Additions. *Additions* to *existing buildings* shall comply with the requirements of the *International Building Code* and the ~~,~~ *International Residential Code*~~, and this code~~ for new construction. The combined height and area of the *existing building* and the new *addition* shall not exceed the height and area allowed by Chapter 5 of the *International Building Code*. Where a fire wall that complies with Section 706 of the *International Building Code* is provided between the *addition* and the *existing building*, the *addition* shall be considered a separate building.

Reason: For additions in this context we only need to refer back to the IBC and IRC. This code does not have provisions for new construction but is focused on existing buildings. These revisions are needed to correlate with the 2015 IBC that deleted Chapter 34 on existing buildings. This is considered a clarification of the application of the IEBC as it pertains to additions and will not change anything that is now required by the I Codes.
This public proposal is submitted by the ICC Building Code Action Committee (BCAC). The BCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the BCAC has held 13 open meetings and numerous workgroup calls which included members of the BCAC as well as any interested party to discuss and debate the proposed changes and the public comments. Related documentation and reports are posted on the BCAC website at: http://www.iccsafe.org/cs/BCAC/Pages/default.aspx.

Cost Impact: Will not increase the cost of construction
This proposal will not increase the cost of construction as this revision is only a clarification of the current provisions.

EB 73-15 : 1401.2.3-KULIK4898

EB 74-15

1401.2.4

Proponent: Edward Kulik, Chair, representing Building Code Action Committee (bcac@iccsafe.org)

2015 International Existing Building Code

Revise as follows:

1401.2.4 Alterations and repairs. An *existing building* or portion thereof~~ that does not comply with the requirements of this code for new construction~~ shall not be altered or repaired in such a manner that results in the building being less safe or sanitary than such building is currently.~~ If, in the *alteration* or *repair*, the current level of safety or sanitation is to be reduced, the portion altered or repaired shall conform to the requirements of Chapters 2 through 12 and Chapters 14 through 33 of the *International Building Code.*~~

Reason: This section does not work within the IEBC as it did in the IBC. Generally we do not want an alteration or repair reducing the level of safety or sanitation. As currently written it says "this code" when in fact it was focused upon the IBC. Reference is not needed back to the IBC in this case. The last sentence is again sending the user of the code back to the IBC when we told them already that they could not reduce their level of safety or sanitation. As modified it will simply provide a baseline that the user of this chapter must meet. These revisions are needed to correlate with the 2015 IBC that deleted Chapter 34 on existing buildings. This is considered a clarification of the application of the IEBC as it applies to alterations and repairs and will not change anything that is now required by the I-Codes.
This public proposal is submitted by the ICC Building Code Action Committee (BCAC). The BCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the BCAC has held 13 open meetings and numerous workgroup calls which included members of the BCAC as well as any interested party to discuss and debate the proposed changes and the public comments. Related documentation and reports are posted on the BCAC website at: http://www.iccsafe.org/cs/BCAC/Pages/default.aspx.

Cost Impact: Will not increase the cost of construction
This proposal will not increase the cost of construction as this revision is only a clarification of the current provisions.

EB 74-15 : 1401.2.4-KULIK4903

EB 75-15

1401.2.5

Proponent: Edward Kulik, Chair, representing Building Code Action Committee (bcac@iccsafe.org)

2015 International Existing Building Code

Revise as follows:

1401.2.5 Accessibility requirements.
Accessibility shall be provided in accordance with Section 410~~,or~~ 705, 806, 906, 1105,1204 and 1205.15 as applicable.

Reason: The current reference does not pick up the accessibility provisions for Level 2 and 3, additions or allowances for historic buildings when using the performance compliance method. The performance compliance method should be required to have the same level of access as any other alteration. Technical infeasibility and the 20% maximum rule for the accessible route costs would still be applicable.
In July/2014 the ICC Board decided to sunset the activities of the Code Technology Committee (CTC). This is being accomplished by re-assigning many of the CTC Areas of Study to the applicable Code Action Committee (CAC). This proposal falls under the CTC Area of Study entitled IBC Coordination with the New ADAAG. Information on the CTC, including: the sunset plan; meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the CTC website.

This public proposal is submitted by the ICC Building Code Action Committee (BCAC). The BCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the BCAC has held 13 open meetings and numerous workgroup calls which included members of the BCAC as well as any interested party to discuss and debate the proposed changes and the public comments. Related documentation and reports are posted on the BCAC website at: http://www.iccsafe.org/cs/BCAC/Pages/default.aspx.

Cost Impact: Will not increase the cost of construction
The proposal is a clarification of current requirements; therefore, there is no impact on the cost.

Staff note: An errata was corrected to this section. The reference to Section 605 was revised to Section 705. It is shown as current code text.

EB 76-15

1401.3.2

Proponent: Anthony Apfelbeck, City of Altamonte Springs Building/Fire Safety Division, representing City of Altamonte Springs (ACApfelbeck@altamonte.org)

2015 International Existing Building Code

Revise as follows:

1401.3.2 Compliance with other codes. Buildings that are evaluated in accordance with this section shall comply with the *International Fire Code* and *International Property Maintenance Code*. Where provisions of the *International Fire Code* or *International Property Maintenance Code* conflict with the provisions of this section, the provisions of this section shall take precedence.

Reason: This section is proposed to be revised in order to be consistent with Chapter 3 General Provisions Section 302.2 Additional codes. Without the addition of the proposed language, a user could read the code to infer that even though a building complies fully with the points score evaluation of Chapter 14, the building would also have to comply with the prescriptive provisions of the IFC and the IPMC governing the same issues evaluated in Chapter 14. That is clearly not the intent of the IEBC. This proposed language clarifies how the associated codes are to apply in a manner consistent with Chapter 3 General Provisions Section 302.2 Additional codes.

Cost Impact: Will not increase the cost of construction
No cost impact or a savings as this code change does not provide for any more stringent provisions than that which are already listed.

EB 76-15 : 1401.3.2-APFELBECK3980

EB 77-15

1401.6

Proponent: Jeff Hugo, National Fire Sprinkler Association, representing National Fire Sprinkler Association (hugo@nfsa.org)

2015 International Existing Building Code

Revise as follows:

1401.6 Evaluation process. The evaluation process specified herein shall be followed in its entirety to evaluate *existing buildings* in Groups A, B, E, F, M, R, S and U. For existing buildings in Group I-2, the evaluation process specified herein shall be followed and applied to each and every individual smoke compartment. Table 1401.7 shall be utilized for tabulating the results of the evaluation. References to other sections of this code or other codes indicate that compliance with those sections is required in order to gain credit in the evaluation herein outlined. In applying this section to a building with mixed occupancies, where the separation between the mixed occupancies does not qualify for any category indicated in Section 1401.6.16, the score for each occupancy shall be determined, and the lower score determined for each section of the evaluation process shall apply to the entire building, or to each smoke compartment for Group I-2 occupancies.

Where the separation between the mixed occupancies qualifies for any category indicated in Section 1401.6.16, the score for each occupancy shall apply to each portion, or smoke compartment of the building based on the occupancy of the space.

Reason: This proposal adds "other codes" because other codes, such as the International Building Code besides the IEBC are referenced in Chapter 14.

Cost Impact: Will not increase the cost of construction
Editorial

EB 77-15 : 1401.6-HUGO4839

EB 78-15

Table 1401.6.4

Proponent: Anthony Apfelbeck, City of Altamonte Springs Building/Fire Safety, representing City of Altamonte Springs (ACApfelbeck@altamonte.org)

2015 International Existing Building Code

Revise as follows:

TABLE 1401.6.4
SEPARATION VALUES

OCCUPANCY	CATEGORIES				
	a	b	c	d	e
A-1	0	0	0	0	1
A-2	-5	-3	0	1	3
R	~~-4~~ -6	~~-2~~ -4	0	2	4
A-3, A-4, B, E, F, M, S-1	-4	-3	0	2	4
I-2	0	1	2	3	4
S-2	-5	-2	0	2	4

Reason: Occupants of a Group R are subject to the highest risks of any occupancies. Residents are subject to the careless acts of others and such residents may be incapable of self-preservation or have reduced egress times. Obviously, residents are asleep for an average of on-third of every 24 hour period and during such time they are unaware of a developing fire. Fuel loads in Group R occupancies are often quite high so fires develop quickly and become very intense with a significant probability of impacting adjacent dwelling units.
This code change revised the Group R points to more accurately reflect the hazard relative to the other occupancies in the table.

Cost Impact: Will increase the cost of construction
Existing residential properties undergoing an alteration or change of use to residential and utilizing Chapter 14 may have additional costs as a result of the modification to the table if their fire separation is deficient.

EB 78-15 : 1401.6.4-APFELBECK3722

EB 79-15

1401.6.6, 1401.6.6.1

Proponent: Anthony Apfelbeck, City of Altamonte Springs Buiding/Fire Safety, representing City of Altamonte Springs (ACApfelbeck@altamonte.org)

2015 International Existing Building Code

Revise as follows:

1401.6.6 Vertical openings. Evaluate the fire-resistance rating of interior exit stairways or ramps, hoistways, escalator openings, and other shaft enclosures within the building, and openings between two or more floors. Table 1401.6.6(1) contains the appropriate protection values. Multiply that value by the construction-type factor found in Table 1401.6.6(2). Enter the vertical opening value and its sign (positive or negative) in Table 1401.7 under Safety Parameter 1401.6.6, Vertical Openings, for fire safety, means of egress, and general safety. If the structure is a one-story building or if all the unenclosed vertical openings within the building conform to the requirements of Section 713 of the *International Building Code*, enter a value of 2. The maximum positive value for this requirement (VO) shall be 2.

1401.6.6.1 Vertical opening formula. The following formula shall be used in computing vertical opening value.

$VO = PV \times CF$ **(Equation 14-5)**

where:

VO	=	Vertical opening value. The calculated value shall not be greater than positive 2.0
PV	=	Protection value from Table 1401.6.6.(1).
CF	=	Construction-type factor from Table 1401.6.6.(2).

Reason: The last sentence of 1401.6.6 states "The maximum positive value for this requirement shall be 2." Since Table 1401.6.6(1) has a Value of 2, this application of this maximum positive value limit can create some confusion in the proper application of this section....Is the maximum positive value applicable to PV or VO? It appears that the intent of the "The maximum positive value for this requirement shall be 2" sentence is to apply to VO since the sentence above this one is discussion the VO score. This also makes senses from a scoring standpoint. If 2 was to apply to PV, then the formula would provide 14 points for a building of VB construction and 2.4 points for one of IA construction, which would make no logical sense.
This proposal clarifies the issue by providing a footnote to VO and modifies the text in 1401.6.6 to ensure that the maximum value of 2 applies to VO.

Cost Impact: Will not increase the cost of construction
Editorial change.

EB 79-15 : 1401.6.6-APFELBECK3752

EB 80-15

1401.6.8

Proponent: Anthony Apfelbeck, City of Altamonte Springs Buiding/Fire Safety, representing City of Altamonte Springs (ACApfelbeck@altamonte.org)

2015 International Existing Building Code

Revise as follows:

1401.6.8 Automatic fire detection. Evaluate the smoke detection capability based on the location and operation of automatic fire detectors in accordance with Section 907 of the *International Building Code* and the *International Mechanical Code*. Under the categories and occupancies in Table 1401.6.8, determine the appropriate value and enter that value into Table 1401.7 under Safety Parameter 1401.6.8, Automatic Fire Detection, for fire safety, means of egress, and general safety. Facilities in Group I-2 occupancies meeting Category a, b or c shall be considered to fail the evaluation. <u>Single and multiple stations smoke alarms shall be installed in accordance with Section 1103.8 of the *International Fire Code* for Group R occupancies.</u>

Reason: The current language in 1401.6.8 could leave the user with the impression that achieving an overall passing score for FS, ME and GS on Table 1401.7 would result in no requirement for single- or multi-station smoke alarms in accordance with the IFC. Clearly, not providing single- or multi-station smoke alarms would result in an unsafe environment that should not be permitted under the I-Codes. This proposal clarifies that regardless of the category scored in table 1401.6.8, single- or multi-station smoke alarms must still be provided in accordance with the IFC.
There is similar langauge already contained in 403.10 but this language is limited to alterations under the prescriptive compliance method.

Cost Impact: Will increase the cost of construction
In this proponent's opinion, this proposal is consistent with the existing intent of the ICodes/IEBC. This proposal just provides added clarity to a provision that can potentially be misapplied.

EB 80-15 : T1401.6.8-APFELBECK3755

EB 81-15

Table 1401.6.8

Proponent: Anthony Apfelbeck, representing City of Altamonte Springs (ACApfelbeck@altamonte.org)

2015 International Existing Building Code

Revise as follows:

TABLE 1401.6.8
AUTOMATIC FIRE DETECTION VALUES

OCCUPANCY	CATEGORIES					
	a	b	c	d	e	f
A-1, A-3, F, M, R, S-1	-10	-5	0	2	6	—NA
A-2	-25	-5	0	5	9	—NA
A-4, B, E, S-2	-4	-2	0	4	8	—NA
I-2	NP	NP	NP	4	5	2

NA=Not Appicable

Reason: Column f in Table 1401.6.8 is the only table in Chapter 14 that is populated with a "-" line. The dash line could be read two ways for occupancies other than an I-2: 1. As a "0", potentially conflicting with "category d" or; 2. As a Not Applicable indicator. The proponent believes that the intent of "-" is a not applicable indicator. Therefore, a new footnote has been proposed to Table 1401.6.8 to clarify that the "-" means not applicable to the other occupancies.

Cost Impact: Will not increase the cost of construction
This is an editorial change providing clarity to the code with no cost impact.

EB 81-15 : T1401.6.8-APFELBECK3756

EB 82-15

Table 1401.6.9

Proponent: Anthony Apfelbeck, City of Altamonte Springs Building/Fire Safety, representing City of Altamonte Springs (ACApfelbeck@altamonte.org)

2015 International Existing Building Code

Revise as follows:

TABLE 1401.6.9
FIRE ALARM SYSTEM VALUES

OCCUPANCY	CATEGORIES			
	a	b[a]	c	d
A-1, A-2, A-3, A-4, B, E, R	-10	-5	0	5
F, M	-5	0	10	15
~~F, M,~~ S	0	5	10	15
I-2	-4	1	2	5

a. For buildings equipped throughout with an automatic sprinkler system, add 2 points for activation by a sprinkler water-flow device.

Reason: Currently, Table 1401.6.9 provides occupancies F, M and S within the same row. However, group M and F have fire alarm system requirements in the IBC/IFC while group S does not. The lack of a fire alarm system in group M and F should have adjusted values in categories a and b that are greater than a group S but not as much as A, B, E and R. In fact, the group M and F are arguably more hazardous than a group B which is in the first column with significant negative points assigned. This proposal creates a new row for group F and M with a greater loss of points than the current S but not as significant as the A, B, E and R.

Cost Impact: Will increase the cost of construction
There is a potential for a loss of points for group M and F occupancies that do not comply with catagories a and b. This may result in the need for additional compliance actions.

EB 82-15 : T1401.6.9-APFELBECK3842

EB 83-15

1401.6.12.1

Proponent: Anthony Apfelbeck, City of Altamonte Springs Building/Fire Safety, representing City of Altamonte Springs (ACApfelbeck@altamonte.org)

2015 International Existing Building Code

Revise as follows:

1401.6.12.1 Categories. The categories for dead ends are:

1. Category a—Dead end of ≤ 35 feet (10 670 mm) but >20 feet in nonsprinklered buildings or ≤ 70 feet (21 340 mm) but > 50 feet in sprinklered buildings.
2. Category b—Dead end of ≤ 20 feet (6096 mm) in occupancies other than Group B; or ≤ 50 feet (15 240 mm) in Group B in accordance with Section 1020.4, Exception 2, of the *International Building Code*.
3. Category c—No dead ends; or ratio of length to width (l/w) is less than 2.5:1.
4. Category d—Dead ends exceeding Category a.

Reason: Categories a and b of 1401.6.12.1 currently state a fixed number such as "35 feet." The correct statement should be not a fixed number but a not to exceed number presented in ≤≥<> format. The proposal has added the less than or equal too symbols to clarify that the number is not a fixed number but is a maximum for each category and the transition from category a to b. In addition, category b has been revised to clarify that the 20 feet applies to all occupancies other than Group B.

Cost Impact: Will not increase the cost of construction
This proposal is editorial and improves readability.

EB 83-15 : 1401.6.12.1-APFELBECK3760

EB 84-15

1401.6.15.1

Proponent: Daniel Nichols, New York State Division of Building Standards and Codes, representing New York State Division of Building Standards and Codes (dnichols@dos.state.ny.us)

2015 International Existing Building Code

Revise as follows:

1401.6.15.1 Categories. The categories for means-ofegress emergency lighting are:

1. Category a—Means-of-egress emergency lighting and exit signs not provided with emergency power in accordance with Section 2702 of the *International Building Code*.
2. Category b—Means-of-egress emergency lighting and exit signs ~~provided with emergency power~~ powered by storage batteries or unit equipment in accordance with Section 2702 of the *International Building Code*.
3. Category c—~~Emergency power provided to means-of-egress~~Means of egress emergency lighting and exit signs~~, which provides protection~~ powered by an emergency generator in ~~the event~~accordance with Section 2702 of ~~power failure to~~ the ~~site or building~~International Building Code.

Reason: The difference between Category b and Category c is not well defined. According to the commentary, the intent of Category c is to give additional credit to those buildings with power systems that can provide long-term emergency power with minimal disruption to building systems. This would provide egress illumination at the regular levels rather than emergency illumination that is only required for 90 minutes.
The proposal language makes it more clear that Category c is requiring both Category b, as well as additional requirements for emergency power that mitigate building or site disruption. An example would be a 'whole-house' generator and campus-wide backup power arrangement.

The 2015 IBC revised Section 1008 to be split between general means of egress lighting under normal power, and means of egress emergency lighting provided when a building looses power. Revisions to Item 1 and 2 are coordination with that.

Cost Impact: Will not increase the cost of construction
This proposal is to provide better definition of existing code requirements.

EB 84-15 : 1401.6.15.1-NICHOLS5750

EB 85-15

1401.6.17

Proponent: Anthony Apfelbeck, City of Altamonte Springs Building/Fire Safety, representing City of Altamonte Springs (ACApfelbeck@altamonte.org)

2015 International Existing Building Code

Revise as follows:

1401.6.17 Automatic sprinklers. Evaluate the ability to ~~suppress~~ control a fire based on the installation of an automatic sprinkler system in accordance with Section 903.3.1.1 of the *International Building Code*. "Required sprinklers" shall be based on the requirements of ~~this code~~the *International Fire Code*. Under the categories and occupancies in Table 1401.6.17, determine the appropriate value and enter that value into Table 1401.7 under Safety Parameter 1401.6.17, Automatic Sprinklers, for fire safety, means of egress divided by 2, and general safety. High-rise buildings defined in Chapter 2 of the *International Building Code* that undergo a *change of occupancy* to Group R shall be equipped throughout with an automatic sprinkler system in accordance with Section 403 of the *International Building Code* and Chapter 9 of the *International Building Code*. Buildings that undergo a *change of occupancy* to Group R shall be equipped throughout with an automatic sprinkler system in accordance with Chapter 9 of the *International Fire Code*. Facilities in Group I-2 occupancies meeting Category a, b, c or f shall be considered to fail the evaluation.

Reason: Fire sprinkler protection in new Group R occupancies is basic level of protection that is expected in the IBC in order to establish a minimum level of life safety. The IEBC should continue with that expectation due to the fact that residential occupancies house occupants with a wide range of capabilities that may not be capable of self-preservation, fuel loads are high, occupants are sleeping for approximately 1/3 of their time in Group R and a fire in a adjacent tenant can easily endanger occupants in other tenant spaces.

Cost Impact: Will increase the cost of construction
This proposal will increase the cost of construction in some buildings that undergo a change of occupancy to a Group R due to the need to install a fire sprinkler system. However, value of the sprinkler system will also be reflected in additional points from Table 1401.6.17 so there is a potential for a cost savings offset.

EB 85-15 : 1401.6.17-APFELBECK3762

EB 86-15

1401.6.17, Table 1401.6.17, 1401.6.17.1

Proponent: Jeff Hugo, representing National Fire Sprinkler Association (hugo@nfsa.org)

2015 International Existing Building Code

Revise as follows:

1401.6.17 Automatic sprinklers. Evaluate the ability to suppress or control a fire based on the installation of an automatic sprinkler system in accordance with Section ~~903.3.1.1~~903.3.1 of the *International Building Code*. "Required sprinklers" shall be based on the requirements of ~~this code.~~ the *International Building Code.* Under the categories and occupancies in Table 1401.6.17, determine the appropriate value and enter that value into Table 1401.7 under Safety Parameter 1401.6.17, Automatic Sprinklers, for fire safety, means of egress divided by 2, and general safety. High-rise buildings defined in Chapter 2 of the *International Building Code* that undergo a *change of occupancy* to Group R shall be equipped throughout with an automatic sprinkler system in accordance with Section 403 of the *International Building Code* and Chapter 9 of the *International Building Code*. Facilities in Group I-2 occupancies meeting Category a, b, c or f shall be considered to fail the evaluation.

TABLE 1401.6.17
SPRINKLER SYSTEM VALUES

OCCUPANCY	CATEGORIES					
	a[a]	b[a]	c	d	e	f
A-1, A-3, F, M, R, S-1	-6	-3	0	~~2~~4	~~4~~6	6
A-2	-4	-2	0	~~1~~2	~~2~~4	4
A-4, B, E, S-2	-12	-6	0	~~3~~6	~~6~~12	12
I-2	NP	NP	NP	8	10	NP

NP = not permitted.

a. These options cannot be taken if Category a in Section 1401.6.18 is used.

1401.6.17.1 Categories. The categories for automatic sprinkler system protection are:

1. Category a—Sprinklers are required throughout the building; sprinkler protection is not provided. ~~or the sprinkler system desing is not adequate for the hazard protected in accordance with Section 903 of the *International Building Code.*~~
2. Category b—Sprinklers are required in *fire area*s or compartments ~~a portion of the building~~; sprinkler protection is not provided in *fire area*s or compartments, or the sprinkler system design is not adequate for the hazard protected in accordance with Section 903 of the *International Building Code*.
3. Category c—Sprinklers are not required; none are provided.
4. Category d—Sprinklers are required in ~~a portion of the building~~ *fire area*s or compartments; sprinklers are provided in *fire area*s or compartments~~such portion; the system is one that complied with the code at the time of installation and is maintained and supervised in accordance with Section 903 of the *International Building Code.*~~
5. Category e—Sprinklers are required throughout; sprinklers are provided throughout in accordance with Chapter 9 of the *International Building Code*.
6. Category f—Sprinklers are not required throughout; sprinklers are provided throughout in accordance with Chapter 9 of the *International Building Code*.

Reason: History and Summary

Fire sprinkler values was added to the BOCA version of Fire Safety Evaluation System (FSES) in the 1990 edition by code change number B270-89 (attached). This proposal created a table with two categories with the occupancy rows arranged the same as in the current IEBC. The first category (a) gave no credit for buildings without a sprinkler system and no credit for partial systems. The second category (b) provided values for fully sprinklered buildings according to the BOCA fire protection chapter (Article 10) which referenced NFPA 13 and NFPA 13R. Fully sprinklered buildings were given 4 points (A-2), 6 points (A-1, A-3, F, M, R, S-1) or 12 points (A-4, E, B, S-2). The values in the second category were established by other FSES processes (NFPA and NYC). These values were justified by the proponent as being equal to automatic alarm values.

In the 1996 BOCA, code change number B213-95 (attached), increased the two category value table to the current IEBC six category value table. The values in each of the six categories have been unchanged since this edition, with the exception of adding values for I-2 occupancies for the 2015 edition. The higher category values appear similar as the above version in 1990, with lower values in lower categories, however, this proposal discusses that the arrangement of the values do not do a fully sprinklered building justice as originally intended in the 1990 version.

Each proposed change is explained in detail below, however, to summarize, there was a significant and fundamental change on how these values were applied in the 1996 BOCA code. The 1990 values were for fully sprinklered buildings, but the 1996 values demoted these values for fully sprinklered buildings required to be sprinklered by the code (Category e). The full values, as intended by the 1990 text, was only given to buildings that were fully sprinklered voluntarily (Category f). The practice of constructing buildings as unsprinklered, (without any trade-offs) then adding a sprinkler system is virtually non-existent. The values in Category e and f of the 1996 BOCA to the 2015 IEBC are unjust and are not equal to the 1990 proponents' intent. This proposal adjusts the table accordingly.

Proposed Changes in Text

"...or control..."

This change correctly addresses automatic fire sprinkler systems for the majority of installations. Fire sprinkler systems designed according to NFPA 13, NFPA 13R and NFPA 13D are designed to control fires. There are a few instances in the NFPA 13 standard where the fire sprinkler is designed to suppress fires, such as in storage occupancies. It is appropriate to have "control" more than suppression in the code text, but this proposal leaves suppression in to accommodate the suppression in storage occupancies.

" ...Section 903.3.1.~~1~~..."

This change removes the limitation of the values to be used just on a NFPA 13 system. The values cannot be limited to just NFPA 13 systems. The intent of the proposal that expanded the values for 1996 BOCA did not prohibit NFPA 13R systems (B213-95), likewise, the values table has occupancies that are permitted to use NFPA 13R (R-1, R-2) and NFPA 13D (R-3, R-4) systems. When a building is sprinklered according to any of the sprinkler standards, they are considered fully sprinklered.

" ...the *International Building Code*~~this code~~...'"

When this section was located in the IBC it also stated "this code". This section wasn't revised when it moved from the IBC to the IEBC. Every other section in Chapter 14 of the IEBC that has similar language refers to the IBC. For example, IEBC Section 1401.6.18 refers the requirements back to the IBC.

" Category a - Sprinklers are required throughout the building; sprinkler protection is not provided~~. or the sprinkler system design is not adequate for the hazard protected in accordance with Section 903 of the International Building Code.~~".

This change updates and clarifies where sprinklers are throughout to make the user aware of the extent of sprinklers protection. The latter portion of the text is removed. The value assigned to this is extreme and is redundant with Category b. Having no sprinklers and an under-designed system is not equal. Both are detrimental, but one has no protection, the other has some form of protection. The penalty for an under-designed system should a Category b and keep the unsprinklered building as the highest penalty.

"Category b - Sprinklers are required in *fire area*s or compartments ~~a portion of the building~~; sprinkler protection is not provided in *fire area*s or compartments..."
This change provides a negative value when a fire area or compartment that is required to have sprinklers, but doesn't. Fire areas are defined in the IBC and "compartments" are used and qualified in Section 1401.6.3. These terms are concrete and have definite passive fire protection boundaries than the subjective term "portion". By using fire area and compartments, the code official and the user can be clear where sprinklers are supposed to be installed.

"Category d - Sprinklers are required in *fire areas* or compartments ~~a portion of the building~~; sprinklers are provided in *fire areas* or compartments.~~such porton;the system is one that complied with the code at the time of installation and is maintained and supervised in accordance with Section 903 of the *International Building Code*.~~"

This change assigns the partial system for a fire area with a value. It also removes the undefined term "portion". Fire areas are defined in the IBC and "compartments" are used and qualified in Section 1401.6.3. These terms are concrete and have definite passive fire protection boundaries than the subjective term "portion" which will have differing boundaries by every user for every building that is evaluated. By using fire area and compartments, the code official and the user can be clear where sprinklers are supposed to be installed.

There are some occupancies, such as A-1, A-2, A-3 and A-4, that are only required to have sprinklers in the fire area. Other fire areas may not need fire sprinklers. This change would provide buildings with sprinklered fire areas some credit. The value would not apply to a partial systems for incidental uses or other partial or limited-area system installation. The value would only be applied when the fire areas that are supposed to have sprinklers are installed according to the appropriate standard, or when the compartment is sprinklered.

This proposal also removes the value that is assigned for the maintenance of the system according to the edition of the standard when it was installed. The IBC and IFC along with NFPA 13 require the sprinkler system to be maintained according to NFPA 25. This may not have been clear when the proposal was drafted for the 1996 BOCA. NFPA 25 was a new standard in 1992 and while it was referenced by the BOCA Fire Prevention Code, the scope may not have been fully understood and enforcement was difficult if the BOCA Fire Prevention Code was not specifically adopted. Furthermore, a system that is currently maintained according to the NFPA 25 (as referenced by current IFC) should receive points in a higher category.

Changes to the Table

Values in Category d
The changes to Category d provide one half of the value for a (proposed) fully sprinklered building. These values would be applied when the required fire areas are sprinklered. As explained above, the term fire area is defined and have definite fire rated boundaries within the building.

Values in Category e

The changes to the values in Category e show a fully sprinklered building with the maximum value as it is in Category f. It should make no difference that a sprinkler system was required or voluntarily installed. A fully sprinklered building is installed with the same installation standards whether it was a required system or a non-required system. There are other values in Chapter 14 of the IEBC that gives "bonus" points when the code was exceeded. However, a fully sprinklered building can be "upgraded" beyond the minimum standard, but that is hard to quantify and justify when additional points are awarded. When a fire rating is increased it is easier to identify and view the upgrade.

When the sprinkler values were introduced in the 1990 BOCA they were for fully sprinklered buildings. There was no "bonus" points. The reduced values in the current IEBC Category e penalizes buildings that have required sprinkler systems.

Cost Impact: Will not increase the cost of construction
Updating values may descrease the need to upgrade other construction features to meet the FSES.

EB 86-15 : 1401.6.17-HUGO4760

EB 87-15

Table 1401.6.17

Proponent: Anthony Apfelbeck, City of Altamonte Springs Building/Fire Safety Division, representing City of Altamonte Springs (ACApfelbeck@altamonte.org)

2015 International Existing Building Code

Revise as follows:

TABLE 1401.6.17
SPRINKLER SYSTEM VALUES

OCCUPANCY	CATEGORIES					
	a[a]	b[a]	c	d	e	f
A-1, A-3, F, M, ~~R,~~ S-1	-6	-3	0	2	4	6
R	-14	-8	0	3	6	12
A-2	-4	-2	0	1	2	4
A-4, B, E, S-2	-12	-6	0	3	6	12
I-2	NP	NP	NP	8	10	NP

NP = not permitted.

a. These options cannot be taken if Category a in Section 1401.6.18 is used.

Reason: This proposal creates a new stand-alone row for group R occupancies. Currently, Group R occupancies are considered a similar hazard classification to M, F, S-1, A-3, and A-1. Group R are clearly not equivalent to these occupancies as the lack of a fire sprinkler system in a Group R will increase the risk dramatically because of occupant characteristics (elderly and very young), sleeping, fuel load and potential for impact from adjacent tenants. As Group R carries a greater risk than these other categories, a new row is created with numericals that better reflect the risk in Group R occupancies due to the presence or lack of fire sprinklers.

Cost Impact: Will increase the cost of construction
This proposal will increase the cost of construction in those Group R properties utilizing Chapter 14 that are not fire sprinkler protected. For those that are fire sprinkler protected, the greater value of sprinklers will be reflected in the potential to reduce costs.

Table 1401.6.17

Proponent: Jeff Hugo, National Fire Sprinkler Association, representing National Fire Sprinkler Association (hugo@nfsa.org)

2015 International Existing Building Code

Revise as follows:

TABLE 1401.6.17
SPRINKLER SYSTEM VALUES

OCCUPANCY	CATEGORIES					
	a[a]	b[a]	c	d	e[b]	f[b]
A-1, A-3, F, M, R, S-1	-6	-3	0	2	4	6
A-2	-4	-2	0	1	2	4
A-4, B, E, S-2	-12	-6	0	3	6	12
I-2	NP	NP	NP	8	10	NP

NP = not permitted.

a. These options cannot be taken if Category a in Section 1401.6.18 is used.

b. Increase values by 2 when fast or quick response sprinklers are used throughout or 3 when these sprinklers are used as part of an early suppression design method.

Reason: This proposal increases the values in category e and f by two when quick response or fast response sprinklers are used. This section has not been updated for almost 20 years. Since then use of quick response sprinklers has increased and is required by the IBC and NFPA 13. This technology has reduced the sprinkler response time dramatically but may not have been as widely known or used today as it was when these sections were introduced over 25 years ago in the BOCA code. Increasing the values for these type of sprinklers is common and consistent with the other FSES used, such as NFPA 101A.

Fast response sprinklers are defined in NFPA 13. Sprinklers that are considered fast have a quick response thermal element. These sprinklers are as follows: Quick Response (QR), Extended Coverage Quick Response (QREC), Residential, Early Suppression Quick Response (ESFR), and Quick Response Early Suppression (QRES) sprinklers.

This proposal also proposes to increase the value by three when quick response or fast response sprinklers are used in a early suppression design method. Many storage buildings today utilize fire sprinkler designs that use the ESFR (Early Suppression Fast Response) or QRES (Quick Response Early Suppression) sprinkler to extinguish building fires. These arrangements use large amounts of water to put out the fire rapidly.

The early suppression design method is also used in performance based designs that use fast response sprinklers to suppress fires rather than control fires. This option would be available to users who are using fire modeling and performance codes, such as ICC's Performance Code for Buildings and Facilities. In general, the area consumed by the fire is smaller in a suppression scenario than in a control mode scenario. Of course, both options apply water to a fire automatically, limiting the area of the fire.

Cost Impact: Will not increase the cost of construction
The cost of the fast or quick response sprinklers may cost more in the intial phase of construction but reduces the need for other construction features.

I-2	NP	NP	NP	8	10	NP

NP = not permitted.

a. These options cannot be taken if Category a in Section 1401.6.18 is used.

TABLE 1401.6.18
STANDPIPE SYSTEM VALUES

OCCUPANCY	CATEGORIES			
	a[a]	b	c	d
~~A-1, A-3, F, M, R, S-1~~ A, E, R	-6	0	4	6
~~A-2~~ B, F, M, S	-4	0	2	4
~~A-4, B, E, S-2~~	~~-12~~	~~0~~	~~6~~	~~12~~
I-2	-2	0	1	2

a. This option cannot be taken if Category a or Category b in Section 1401.6.17 is used.

Reason: The changes give more weight to lifesafety considerations in buildings with high occupant loads and where evacuation may be slowed by age, noise and low light, or sleeping. Also, removing the second tier simplies the table, placing all sub-classifications together. Table 1401.6.18 is modified to reflect the greater hazard mitigation impact of sprinklers versus standpipes (See Table 1401.6.17). Intuitively, a fire that can be controlled in its incipient stage by 1 or 2 sprinkler heads in a properly designed and maintained system is less hazardous than one that develops over the several minutes it will take for the hoses connected to the standpipe system to be deployed and flowing water.

Cost Impact: Will increase the cost of construction
In several of the occupancies, the value assignments will increase the penalties for lower category ratings, limiting alternatives. Several, such as S-2, will see values that will make alternatives easier to have approved.

EB 89-15 : T1401.6.17-LASAGA5334

EB 90-15

Table 1401.6.18

Proponent: Jeff Hugo, National Fire Sprinkler Association, representing National Fire Sprinkler Association (hugo@nfsa.org)

2015 International Existing Building Code

Revise as follows:

TABLE 1401.6.18
STANDPIPE SYSTEM VALUES

OCCUPANCY	CATEGORIES			
	a[a]	b	c	d
A-1, A-3, F, M, R, S-1	-6	0	~~4~~ 6	6
A-2	-4	0	~~2~~ 4	4
A-4, B, E, S-2	-12	0	~~6~~ 12	12
I-2	-2	0	~~1~~ 2	2

a. This option cannot be taken if Category a or Category b in Section 1401.6.17 is used.

Reason: This proposal adjusts the values of Category c. and with the current values in Category d. The negative "value" of not having a required standpipe in Category a. is not equal to the positive value of having the required standpipe in Category c. A building with a standpipe system has the same value whether is required or installed voluntarily. The same standard is used for the installation.

Cost Impact: Will not increase the cost of construction
Adjusted values for standpipes may decrease the need to add other measures to increase the FSES score.

EB 90-15 : T1401.6.18-HUGO4832

EB 91-15

Table 1401.6.18

Proponent: Anthony Apfelbeck, City of Altamonte Springs Building/Fire Safety Division, representing City of Altamonte Springs (ACApfelbeck@altamonte.org)

2015 International Existing Building Code

Revise as follows:

TABLE 1401.6.18
STANDPIPE SYSTEM VALUES

OCCUPANCY	CATEGORIES			
	a[a]	b	c	d
A-1, A-3, F, M, R, S-1	-6	0	2~~4~~	3~~6~~
A-2	-4	0	1~~2~~	2~~4~~
A-4, B, E, S-2	-12	0	3~~6~~	6~~12~~
I-2	-2	0	1	2

a. This option cannot be taken if Category a or Category b in Section 1401.6.17 is used.

Reason: Currently, the value of a standpipe system in Table 1401.6.18 is equivalent to the value of a sprinkler system in Table 1401.6.17 with similar points assigned across all occupancy groups with the exception of the recently added I-2. This is counter intuitive. The value of a sprinkler system in providing safe egress and fire control is significantly greater than a standpipe system in almost every fire scenario. This value should be reflected in the points within the tables. it does appear that the group I-2 changes from last cycle did take this into consideration as the value of a standpipe system in an I-2 is 12 to 20% of a sprinkler system in I-2. While this proposal does not go that far, it reduces the value of a standpipe system to 50% of the value of a sprinkler system. Arguably, it could be significantly less than the proposed number but the 50% value certainly passes the legitimacy test to a greater extent than the current equal valuations.

Cost Impact: Will increase the cost of construction
The reduced awarded points for a standpipe system will result in some buildings needing to impliment additional measures to achieve compliance with Chapter 14.

Building score—total value			

* * * *No applicable value to be inserted.

Reason: Anthony Apfelbeck:. This proposal revises Table 1401.7 to provide for "****" "No applicable value to be inserted" in the "Means of Egress" column for the "1401.6.18 Standpipes" row. It is very difficult to conceive of a fire scenario where standpipes would provide direct value to the "Mean of Egress" capability in a building. In fact, the exact opposite is the case. In fire scenarios with standpipes, there have been numerous situations where the FD operations have compromised the integrity of the stairwell or have impeded the exist capacity due to smoke intrusion into the exit stairwell or hose lines creating egress impediments. Therefore, there appears to be no or very minimum value for standpipes as a "Means of Egress" value.
Janet Washburn. I'm submitting a proposal to revised Table 1401.7 to provide **** "No applicable value to be inserted" in the Means of Egress colum for the 1401.6.18 Standpipes row. I do not believe there would be a scenario which would provide value to the Means of Egress in a building resulting from the presence of standpipes. Actually, the presence of standpipe may impede egress due the FD extending hose lines into an area from a protection exit. This could create tripping hazards and cause smoke to be permitted to enter a protected exit. Regardless, this section appears to have no value for standpipes as a "Means of Egress" value and should therefore be modified as such.

Cost Impact: Will increase the cost of construction
Anthony Apfelbeck. The eliminations of "Standpipes" as a "Means of Egress" value may cause some limited buildings to make additional improvements under the IEBC when utilizing Chapter 14.
Janet Washburn. It will increase the cost of construction. The elimination of Standpipes as a means of egress value may cause some limited buildings to make additional improvements under the IEBC when using Chapter 14.

EB 92-15 : T1401.7-APFELBECK3776

EB 93-15

[BE] 1508.1

Proponent: Edward Kulik, Chair, representing Building Code Action Committee (bcac@iccsafe.org)

THIS PROPOSAL IS ON THE AGENDA OF THE IBC MEANS OF EGRESS CODE DEVELOPMENT COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THE IBC MEANS OF EGRESS CODE DEVELOPMENT COMMITTEE.

2015 International Existing Building Code

Revise as follows:

[BE] 1508.1 Construction sites. Structures, sites, and equipment directly associated with the actual process of construction, including but not limited to scaffolding, bridging, material hoists, material storage, or construction trailers are not required to ~~be accessible.~~comply with Chapter 11 of the IBC.

Reason: The intent is to coordinate IEBC Section 1508.1 with the new language in IBC Section 1103.2.5.
IBC Section 1103.2.5 reads as follows:

1103.2.5 Construction sites. Structures, sites and equipment directly associated with the actual processes of construction including, but not limited to, scaffolding, bridging, materials hoists, materials storage or construction trailers are not required to comply with this chapter.

In July/2014 the ICC Board decided to sunset the activities of the Code Technology Committee (CTC). This is being accomplished by re-assigning many of the CTC Areas of Study to the applicable Code Action Committee (CAC). This proposal falls under the CTC Area of Study entitled IBC Coordination with the New ADAAG. Information on the CTC, including: the sunset plan; meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the CTC website.

This public proposal is submitted by the ICC Building Code Action Committee (BCAC). The BCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the BCAC has held 13 open meetings and numerous workgroup calls which included members of the BCAC as well as any interested party to discuss and debate the proposed changes and the public comments. Related documentation and reports are posted on the BCAC website at: http://www.iccsafe.org/cs/BCAC/Pages/default.aspx.

Cost Impact: Will not increase the cost of construction
The proposal is a clarification of current requirements; therefore, there is no impact on the cost.

EB 94-15

705.1.2

Proponent: andrew cid, representing Private Citizen, for : The Initiative for Emergency Elevator Communication Systems for the Deaf, Hard of Hearing and Speech Impaired (andycid99@gmail.com)

2015 International Existing Building Code

Add new text as follows:

705.1.2 Elevators. Altered elements of existing elevators shall be provided with an emergency two-way communication system in accordance with the following system criteria:

1. Is a visual text-based and a video-based live interactive system,
2. Is fully accessible by the deaf and hard of hearing and speech impaired, and
3. Is located between the elevator car and the local emergency authorities at a point outside of the hoistway.

Such elements shall also be altered in elevators programmed to respond to the same hall call control as the altered elevator.

Reason: Reason for Change to the Language of Chapter 7 - Section 705. 1.2 Elevators :
The addition of the terms "visual, text-based and video-based live interactive communication systems" is strongly recommended to emphasize the need for totally accessible communication in elevators between emergency authorities and individuals who are: Deaf, Hard of Hearing, and Speech Impaired. This type of system is recommended for installation in public elevators in existing buildings and for new construction.

Current code under Section 705.1.2 Elevators - does not permit nor provide two-way live interactive visual and total accessibility for the Deaf / Hard of Hearing community in the United States and internationally. Current code requires only one or two-way audible, auditory or telephone / push button response communication systems for the hearing community. This IEBC proposal (and previously submitted IBC proposal) aims to change the current code to enable the communication systems be accessible to all, not just to the hearing individuals.

(The following information, originally submitted as a proposal to the A117.1 Standard for the 2015 Cycle, is submitted as supporting documentation to the IEBC proposal due by January 12, 2015.

The IEBC submission is proposing to amend IEBC Chapter 7 – Section 705.1.2 Elevators, to comply with the A117.1 proposal as outlined below)

ICC A117.1 Standard Proposal
Submitted by
Andrew Cid, Amherst, NH – December 8, 2014

"Elevator Code Change to ANSI A117.1 - Elevators / Section 407.4.10"

To Implement An:
Emergency Elevator Communication System For The Deaf & Hard of Hearing
(EECSDHOH)

Reason for Change to the Language of 407.4.10:

The addition of the terms "visual, text-based and video-based live interactive communication systems" is strongly recommended to emphasize the need for totally accessible communication in elevators between emergency authorities and individuals who are: Deaf, Hard of Hearing, and Speech Impaired. This type of system is recommended for installation in public elevators in existing buildings and for new construction.

Table of Contents

The Problem with the Current Code under Building Elevators – Section 407.4.10

Current code under Section 407.4.10 does not permit nor provide two-way live interactive visual and total accessibility for the Deaf / Hard of Hearing community in the United States and internationally. Current code requires only one or two-way audible, auditory or telephone / push button response communication systems for the hearing community.

What Needs To Be Accomplished

Current code needs to be amended to reflect the needs of the Deaf / Hard of Hearing community and of the speech impaired community in the U.S. and internationally. Simply stated, the ultimate goal is to have local, state, federal laws amend current building code in accordance with ICC codes to mandate all commercial, residential and public buildings install live interactive two-way real time communication systems in passenger elevators that are fully accessible to all individuals within the Deaf / HOH community. Currently, all commercial, public and residential elevators in the world are not accessible for these particular individuals.
Rationale of Amending Current Code

The rationale behind this proposal to amend code 407.4.10 is to permit the Deaf / Hard of Hearing and the Speech Impaired to, efficiently and seamlessly, utilize an emergency communication system in the event of an emergency (e.g., regional black outs, local power outage, "a national event", brown outs, etc.). Health and safety concerns are also severely compromised in the event of an elevator mechanical breakdown of this nature. Without accessible two-way communication assistance equipment installed, an elevator can be a dangerous place for a single occupant who happens to be Deaf / HOH. This is especially perilous if the individual happens to have a heart condition or a medical condition. Without knowing what is taking place beyond those doors, an individual in this circumstance may suffer a panic attack or a heart attack. This common form of transport could cause serious harm to the health and safety of the people who ride them. Elderly and disabled passengers who happen to be Deaf / HOH suffer most when elevators malfunction. They can become entrapped for hours. Please note that an incident occurred in October 2014 in Norfolk, Virginia when two Deaf adults were trapped in a hotel elevator due to a local power outage. Hotel personnel did not know they were in there. The occupants had to text a friend via smartphone who lived nearby and ask them to alert hotel management. They were eventually rescued by the local fire department by passing handwritten notes through the cab doors .
What Is Currently Being Done

Various committees, elevator advisory groups, and a task force have already been formed to study this deficiency. The parties above include various representatives from: federal agencies, American Society of Mechanical Engineers (ASME), national Deaf / Hard of Hearing advocacy organizations, architects, state, local and federal first-responder emergency authorities, elevator industry consultants, Deaf activists, etc. It is expected that an agreement or MOU will be prepared outlining the steps that need to be taken to accomplish this goal. An unofficial general consensus is that amended code is needed to address this deficiency. The issue of communication responsibilities between emergency authorities and building owners need to be clarified. This proposal hopefully serves notice to the various telecommunications firms in the U.S. and globally to commence work on a working and competitive design and, possibly, a prototype between 2015 and 2018. The MOU will be an example of what can be accomplished when diverse groups work together to achieve a common goal. The result in this case will benefit literally millions of individuals globally.

Social Media is being utilized to create awareness of this issue and to garner global support. A public Facebook (FB) page was set up to support this endeavor. In the FB search bar, type in: Emergency Elevator Communication System for The Deaf / Hard of Hearing

The page has daily or weekly updates or posts entered by the moderator to keep the community apprised of progress.
Benefits

The Deaf / Hard of Hearing and the Speech Impaired communities will benefit greatly from increased access and an assurance of safety. Subsequent beneficiaries of code change success are the various large and small businesses that will be created and the thousands of jobs in support of these businesses.
Other beneficiaries of job creation will be the various firms within the socio-economic categories under the Small Business Administration's (SBA) definition of disadvantaged businesses, such as: Small Disadvantaged Business (SDB), Women-Owned Small Business (WOSB), Veteran-Owned Small Business (VOSB), Small Disabled Veteran-Owned (SDVO), Hub-Zone businesses, and

American Native-Owned businesses. Sourcing work out to these small firms will inevitably have a trickle effect among the communities in which they are located. By fostering competition among all of these various firms, local, state, and federal tax revenue will increase exponentially. Unemployment rates will also be reduced, as well.

New Construction / Existing Buildings

It is recommended that the amended code will need to be applied to all new construction of buildings over three floors. In addition, existing buildings will need to comply with the amended code at the next major elevator repair or alteration. Accessible communication systems for the Deaf/HOH must be installed during all Level 1 and Level 2 alterations for all existing and historic buildings because the International Existing Building Code (IEBC) will need to comply with A117.1. These communication systems will not change the SF or space configuration of existing buildings. Also, in accordance with IEBC 705.1.2 Elevators - Altered elements of existing elevators shall comply with ASME A17.1/CSA B44 and ICC A117.1.

What Type of Communication Systems are Recommended?

Some possible alternatives for sources of interactive two-way systems are, but not limited to: Pre-programmed, vandal-proof (flush into the wall) Wi-Fi tablets for emergency communication use, and / or LCD screens typed by remote contract CART or contract Captioners listening to emergency authority personnel, or through Live-interactive video-conferencing screens, etc. Placement of these systems is not considered to be a major deterrent as there is ample space in an elevator cab via the front or side panel walls. Several private firms were contacted for research purposes for this initiative. A general consensus declares that the technology is already out there but just have not been implemented into elevators as of yet because there is no market for it or demand for it, per se, for this type of device because code does not call for it. These are all high-technology driven firms and may require design and consulting input from electrical design engineers in the federal and private sectors in order to obtain a working consensus on a functional design prototype that enables all users to contact the authorities for emergency assistance. They are ready to work on a design if code requires it.

What Are The Costs To Building Owners and Operators?

The owners and operators can apply cost upgrades and retrofits to the various cost incentives and

Tax write-offs available from local, state or Federal Governments for complying with this amended code. In view of this approach, there is no need for dissent to this code proposal among the public, commercial, industrial, residential building owners/operators and the hotel / lodging industries.

Win-Win

The Deaf / HOH and Speech Impaired communities are not the only parties who will benefit from the amended code. All building owners / operators will benefit with the knowledge that their facilities are up to code and may avoid litigation stemming from potential lawsuits from said parties trapped in inaccessible elevators and who are unable to communicate with building or external emergency personnel.

Conclusion

Approval of this code amendment proposal is essential and long overdue. If the ICC adopts the code change proposal to 407.4.10 as part of the 2015 ICC Standard Code, the updated code would provide the global Deaf / Hard of Hearing and Speech impaired communities an assurance of safety, which is a higher standard than mere safety. In addition, as stated previously, this will be a win-win for both building owners and the people who visit, live and work in these buildings, and this will create thousands of new jobs.

Cost Impact: Will not increase the cost of construction

Cost Impact - The cost impact, to a recommended 70% of the existing building inventory for public and commercial buildings that are three (3) stories or higher with elevators, is expected to be negligible or minimal to the building owner / operator.

A full comprehensive version of the system is recommended for new construction and an alternative or lower cost version of the system is recommended for existing buildings.

Any costs incurred is anticipated to be alleviated wth the use of various incentives such as tax write offs for complying with new accessibility standards. In addition, for new construction, it is expected that there will be no significant additional costs involved because it will be built into the design / build. For existing buildings, the cost is built into the next alteration or major repair projects, and estimated to be approximately $2,500. For new construction, the system will cost approximately $5,000. Personal research indicates that these estimates are at the higher end of the cost range, so the actual cost may be much lower.

Note: The technology is on the market, it just has not been put into use yet for this type of requirement because code does not exist for it. This proposal aims to make this a required code and to comply with the amended A117.1 ICC Standard.

TENTATIVE ORDER OF DISCUSSION
2015 PROPOSED CHANGES TO THE
INTERNATIONAL FUEL GAS CODE

The following is the tentative order in which the proposed changes to the code will be discussed at the public hearings. Proposed changes which impact the same subject have been grouped to permit consideration in consecutive changes.

Proposed change numbers that are indented are those which are being heard out of numerical order. Indentation does not necessarily indicate that one change is related to another. Proposed changes may be grouped for purposes of discussion at the hearing at the discretion of the chair. Note that some FG code change proposals may not be included on this list, as they are being heard by another committee.

FG42-15 Part I

FG 1-15

202 (New)

Proponent: Donald Jones, None, representing Self

2015 International Fuel Gas Code

Add new definition as follows:

SECTION 202 DEFINITIONS

TOILET, GAS-FIRED An appliance, comprised of a toilet and an incinerator that is manufactured and installed as one complete unit, and is used to reduce human fecal matter to ash

Reason: Water heater, boilers, and furnaces are defined in this code. Less common appliances such as gas-fired air conditioners and log lighters are also defined in this code. Gas-fired toilets are referenced in 626.1and 626.2, but they are not defined in this code.

Cost Impact: Will not increase the cost of construction
This is a definition only. It will not increase the cost of construction.

FG 1-15 : 202-TOILET, GAS-FIRED (New)-JONES5202

FG 2-15

202

Proponent: James Ranfone, American Gas Association, representing American Gas Association (jranfone@aga.org)

2015 International Fuel Gas Code

Revise as follows:

SECTION 202 DEFINITIONS

[M] APPLIANCE. Any apparatus or device that utilizes a fuel or a raw material as a fuel to produce light, heat, power, refrigeration or air conditioning. Also, an apparatus that compresses fuel gases.

Reason: A new generation of residential CNG fueling systems are under development that would be design certifited to a new ANSI standard. These appliances would not be considered an appliance under the current definition. They will consume electricity to compress fuels. The revision will ensure that all of the IFGC's general appliance installation requirements are also applied to residential CNG equipment. The change would also correct an inconsistency in the current IFGC where Sections 413.2.3 and 413.4 currently refers to this equipment as appliances.

Cost Impact: Will not increase the cost of construction
The change does not impact appliance installation costs for those already covered by the deffintion.

FG 2-15 : 202 [M] APPLIANCE-RANFONE4933

FG 3-15

202

Proponent: Curtis Dady, Viega, LLC, representing Viega, LLC (curtis.dady@viega.us)

2015 International Fuel Gas Code

Revise as follows:

SECTION 202 DEFINITIONS

JOINT, MECHANICAL. A general form of gas-tight joints obtained by the joining of metal parts through a positiveholding mechanical construction, such as ~~press~~press-connect joint, flanged joint, threaded joint, flared joint or compression joint.

Reason: Harmonize the designation and definition of PRESS-CONNECT fittings and joints throughout the code.
Both referenced standards (ANSI LC-4/CSA 6.32 and ASME B16.51) listed in the code use the designation "press-connect" in the title and body of the standard as well as code sections IPC 605.14.5, IRC P2906.18 and IRC G2414.10.2.

Cost Impact: Will not increase the cost of construction
Change is editorial and has no affect on installation.

FG 3-15 : 202-JOINT, MECHANICAL-DADY3655

FG 4-15

202

Proponent: James Ranfone, representing American Gas Association (jranfone@aga.org)

2015 International Fuel Gas Code

Revise as follows:

SECTION 202 DEFINITIONS

FURNACE, CENTRAL

A self-contained *appliance* for heating air by transfer of heat of combustion through metal to the air, and designed to supply heated air through ducts to spaces remote from or adjacent to the *appliance* location.

~~**Downflow furnace.** A furnace designed with airflow discharge vertically downward at or near the bottom of the furnace.~~

~~**Forced air furnace with cooling unit.** A single-package unit, consisting of a gas-fired forced-air furnace of one of the types listed below combined with an electrically or fuel gas-powered summer air-conditioning system, contained in a common casing.~~

~~**Forced-air type.** A central furnace equipped with a fan or blower that provides the primary means for circulation of air.~~

~~**Gravity furnace with booster fan.** A furnace equipped with a booster fan that does not materially restrict free circulation of air by gravity flow when the fan is not in operation.~~

~~**Gravity type.** A central furnace depending primarily on circulation of air by gravity.~~

~~**Horizontal forced-air type.** A furnace with airflow through the *appliance* essentially in a horizontal path.~~

~~**Multiple-position furnace.** A furnace designed so that it can be installed with the airflow discharge in the upflow, horizontal or downflow direction.~~

~~**Upflow furnace.** A furnace designed with airflow discharge vertically upward at or near the top of the furnace. This classification includes "highboy" furnaces with the blower mounted below the heating element and "lowboy" furnaces with the blower mounted beside the heating element.~~

Reason: The IFGC code requirements do not differentiate between the various furnace types proposed to be deleted and the terms do not appear in the code. Definitions for Central Furnace and Forced-air type will remian in the code.

Cost Impact: Will not increase the cost of construction
Furnaces described by the deleted definitions are covered under the remianing two definitions and their installation are not impacted by this change.

FG 4-15 : 202-DOWNFLOW FURNACE-RANFONE4943

FG 5-15

202

Proponent: James Ranfone, American Gas Association, representing American Gas Association (jranfone@aga.org)

2015 International Fuel Gas Code

Revise as follows:

SECTION 202 DEFINITIONS

[M] PIPING. Where used in this code, "*piping*" refers to either pipe or tubing, or both.

Pipe. A rigid conduit of iron, steel, copper, ~~brass~~ copper-alloy or plastic.

Tubing. Semirigid conduit of copper, aluminum, plastic or steel.

Reason: The term brass was replaced with copper alloy througout the IFGC (S) extracted sections. The definition revision coordinates with those changes. The copper industry no longer refers to brass using the term copper alloy.

Cost Impact: Will not increase the cost of construction
Same material - different name.

FG 5-15 : 202-PIPE-RANFONE4957

FG 6-15
202

Proponent: James Ranfone, representing American Gas Association (jranfone@aga.org)

2015 International Fuel Gas Code

Revise as follows:

SECTION 202 DEFINITIONS

REGULATOR, GAS APPLIANCE.
A pressure regulator for controlling pressure to the manifold of the *appliance*. ~~Types of *appliance* regulators are as follows:~~

~~**Adjustable.**~~

1. ~~Spring type, limited adjustment. A regulator in which the regulating force acting upon the diaphragm is derived principally from a spring, the loading of which is adjustable over a range of not more than 15 percent of the outlet pressure at the midpoint of the adjustment range.~~
2. ~~Spring type, standard adjustment. A regulator in which the regulating force acting upon the diaphragm is derived principally from a spring, the loading of which is adjustable. The adjustment means shall be concealed.~~

~~**Multistage.** A regulator for use with a single gas whose adjustment means is capable of being positioned manually or automatically to two or more predetermined outlet pressure settings. Each of these settings shall be adjustable or nonadjustable. The regulator may modulate outlet pressures automatically between its maximum and minimum predetermined outlet pressure settings.~~

~~**Nonadjustable.**~~

1. ~~Spring type, nonadjustable. A regulator in which the regulating force acting upon the diaphragm is derived principally from a spring, the loading of which is not field adjustable.~~
2. ~~Weight type. A regulator in which the regulating force acting upon the diaphragm is derived from a weight or combination of weights.~~

Reason: The IFGC code requirements do not differentiate between the various appliance regulator types and the terms do not appear in the code.

Cost Impact: Will not increase the cost of construction
The regulator whose definitions are deleted are covered by the general definition without chage in installation requirements.

FG 6-15 : 202-REGULATOR, GAS APPLIANCE-RANFONE4945

FG 7-15

202 (New)

Proponent: James Ranfone, representing American Gas Association (jranfone@aga.org)

2015 International Fuel Gas Code

Add new definition as follows:

SECTION 202 DEFINITIONS

<u>**Regulator, Monitoring** A pressure regulator set in series with another pressure regulator for the purpose of automatically taking control of the pressure downstream of the monitored regulator when that pressure exceeds a set minimum.</u>

Reason: Add a definition for the term monitoring regulator that was added into Section 416.5.

Cost Impact: Will not increase the cost of construction
The term is currently undefined but code requirements exist. The new definition does not impact the cost of installation.

FG 7-15 : 202-REGULATOR, MONITORING (New)-RANFONE4950

FG 8-15

202 (New)

Proponent: James Ranfone, American Gas Association, representing American Gas Association (jranfone@aga.org)

2015 International Fuel Gas Code

Add new definition as follows:

SECTION 202 DEFINITIONS

Regulator, Series A pressure regulator in series with one or more other pressure regulators.

Reason: Add a definition for the term series regulator that was added into Section 416.5.

Cost Impact: Will not increase the cost of construction
The new definition for a term used within the code does not change the installation requirements and therefore has no impact on installation cost.

FG 8-15 : 202-REGULATOR, SERIES (New)-RANFONE4953

FG 9-15

202

Proponent: James Ranfone, representing American Gas Association (jranfone@aga.org)

2015 International Fuel Gas Code

Revise as follows:

SECTION 202 DEFINITIONS

THERMOSTAT.

Electric switch type.
A device that senses changes in temperature and controls electrically, by means of separate components, the flow of gas to the burner(s) to maintain selected temperatures.

~~**Integral gas valve type.** An automatic device, actuated by temperature changes, designed to control the gas supply to the burner(s) in order to maintain temperatures between predetermined limits, and in which the thermal actuating element is an integral part of the device.~~

1. ~~Graduating thermostat. A thermostat in which the motion of the valve is approximately in direct proportion to the effective motion of the thermal element induced by temperature change.~~
2. ~~Snap-acting thermostat. A thermostat in which the thermostatic valve travels instantly from the closed to the open position, and vice versa.~~

Reason: The term integral gas valve type thermostat does not appear in the IFGC.

Cost Impact: Will not increase the cost of construction
There are no specific code requirements for this type of thermostat.

FG 9-15 : 202-THERMOSTAT-RANFONE4947

FG 10-15

202

Proponent: James Ranfone, representing American Gas Association (jranfone@aga.org)

2015 International Fuel Gas Code

Delete and substitute as follows:

SECTION 202 DEFINITIONS

UNIT HEATER.

~~**High-static pressure type.** A self-contained, automatically controlled, vented *appliance* having integral means for circulation of air against 0.2 inch (15 mm H_2O) or greater static pressure. Such *appliance* is equipped with provisions for attaching an outlet air duct and, where the *appliance* is for indoor installation remote from the space to be heated, is also equipped with provisions for attaching an inlet air duct.~~

~~**Low-static pressure type.** A self-contained, automatically controlled, vented *appliance*, intended for installation in the space to be heated without the use of ducts, having integral means for circulation of air. Such units are allowed to be equipped with louvers or face extensions made in accordance with the manufacturer's specifications.~~

A self-contained, automatically controlled, vented, fuel-gas-burning space-heating appliance, intended for installation in the space to be heated without the use of ducts, and having integral means for circulation of air.

Reason: The IFGC code requirements do not differentiate between high- and low-static unit heaters and the terms do not appear in the code. The revised simplified definition is taken from the revised definition in the 2015 *National Fuel Gas Code*, ANSI Z223.1/NFPA 54. This proposal is offered solely for the purpose of coordinating the IFGC with ANSI Z223.1 (NFGC). This text is offered "as is" for the IFGC and it is not intended that such text be modified from a technical standpoint. The subject text was revised in the 2015 NFGC (ANSI Z223.1) and this proposal will cause the IFGC text to be consistent with such revised text in ANSI Z223.1 (NFGC).

Cost Impact: Will not increase the cost of construction
The definition does not change the installation requirements for unit heaters.

FG 10-15 : 202-UNIT HEATER (New)-RANFONE4938

FG 11-15

303.3

Proponent: Timothy Manz, representing Association of Minnesota Building Officials (tmanz@ci.blaine.mn.us)

2015 International Fuel Gas Code

Revise as follows:

303.3 Prohibited locations. Appliances shall not be located in sleeping rooms, bathrooms, toilet rooms, storage closets or surgical rooms, or in a space that opens only into such rooms or spaces, except where the installation complies with one of the following:

1. The *appliance* is a direct-vent *appliance* installed in accordance with the conditions of the listing and the manufacturer's instructions.
2. Vented room heaters, wall furnaces, vented decorative appliances, vented gas fireplaces, vented gas fireplace heaters and decorative appliances for installation in vented solid fuel-burning fireplaces are installed in rooms that meet the required volume criteria of Section 304.5.
3. A single wall-mounted unvented room heater is installed in a bathroom and such unvented room heater is equipped as specified in Section 621.6 and has an input rating not greater than 6,000 Btu/h (1.76 kW). The bathroom shall meet the required volume criteria of Section 304.5.
4. A single wall-mounted unvented room heater is installed in a bedroom and such unvented room heater is equipped as specified in Section 621.6 and has an input rating not greater than 10,000 Btu/h (2.93 kW). The bedroom shall meet the required volume criteria of Section 304.5.
5. The *appliance* is installed in a room or space that opens only into a bedroom or bathroom, and such room or space is used for no other purpose and is provided with a solid weather-stripped door equipped with an *approved* self-closing device. All *combustion air* shall be taken directly from the outdoors in accordance with Section 304.6.
6. <u>A gas clothes dryer is installed in a bathroom or toilet room and a permanent opening having an area of not less than 100 square inches is provided that allows the toilet room or bathroom to communicate with a common hallway or common space.</u>

Reason: In older homes the electrical service is not large enough for an electric dryer, so installing a gas dryer is the only option. In many homes it is desirable to have the gas dryer in an over-sized bathroom or toilet room on an upper floor. This provision provides a safe installation by requiring a minimum 100 square inch opening to a common space that ensures adequate natural ventilation is provided.

Cost Impact: Will not increase the cost of construction
This provision will not increase the cost of construction since it provides flexibility in the dryer installation.

FG 11-15 : 303.3-MANZ5820

FG 12-15

303.3.1 (New)

Proponent: John Williams, CBO, Chair, representing Adhoc Health Care Committee (AHC@iccsafe.org)

2015 International Fuel Gas Code

Add new text as follows:

303.3.1 Fireplaces and decorative appliances in Group I-2 Condition 2 occupancies. Gas fireplace appliances and decorative gas appliances shall be prohibited in Group I-2, condition 2 occupancies except in public lobby and waiting areas that are not within smoke compartments containing patient sleeping areas. Such fireplace appliances and decorative appliances shall be installed in accordance with all of the following:

1. The appliances shall be vented to the outdoors.
2. The appliances be of the direct-vent type.
3. The appliances shall automatically shut off upon activation of the fire alarm system serving the occupancy.
4. The appliance controls shall be located where they can be accessed only by facility staff.
5. A carbon monoxide detector with a local alarm shall be provided and installed in accordance with Section 915 of the *International Fire Code*.

Reason: The AHC committee is recommending limitations for the use of fuel gas-fired fireplaces and decorative equipment and the restriction of solid-fuel burning fireplaces and appliances in the Group I-2, Condition 2 occupancy. Please note: these are not new requirements for the Group I-2 Occupancy facilities but are needed in the I-Codes for coordination of the long-standing provision of the construction and operational requirements for healthcare facilities.

It is standard practice and operational procedure to control the ignition sources in healthcare occupancies that can contain combustible, flammable (and sometimes even explosive) material. Fire risks need to be limited to the maximum extent feasible and specific requirements for these facilities are not currently or are not completely addressed in the I-Codes.

The language proposed in the IFGC prescribes limitations and conditions to provide the necessary safety and limitations of hazards from within the healthcare environments to the fire and ignition sources inherent to all gas-fired fireplaces and appliances. Combustion air has been restricted from being drawn from healthcare environments extending beyond the last decade and is not a new requirement.

The physical separation of the combustion chambers of gas-fired fireplaces and equipment is required to separate and provide a barrier between the ignition sources and the environmental air within healthcare occupancies. All combustion air is required to be taken directly from the exterior of the building in accordance with an existing exception that is provided for in IFGC Section 303.3.

The placement of solid fuel burning fireplaces and appliances, both decorative and heating, creates conditions where open flames that are not otherwise able to be controlled or extinguished like the similar gas-fed and fired appliances. This is why the Adhoc Healthcare Committee is proposing their restriction instead of a limitation with operational and special control equipment.

The code sections that address the installation limitations of fuel gas-fired fireplaces and appliances will also provide alternative means for compliance for existing facilities. Given the hazards present with these appliances in the Group I-2, Condition 2 Occupancies, the proposed IFC requirements will be 'retro-active' requirements for healthcare occupancies (Group I-2);

The proposals to the IFC that are being put forth by the Adhoc Healthcare Committee have been drafted to clarify, restrict and limit the ignition source hazards in healthcare occupancies and also will reference similar requirements being proposed in the IBC, IMC AND IFGC. For instance, solid fuel heating appliances are limited by other requirements of the IMC which is why heating appliances are not needed to be referenced in this section of the *IFGC.*

There was a concern mentioned during testimony at the code hearings for the 2012 I-codes that the AHC code change proposals placing restrictions on solid fuel burning fireplaces and appliances and fuel gas-fired fireplaces and appliances might be misinterpreted to prohibit mechanical heating equipment elsewhere regulated in the IMC.

The ICC Ad Hoc Committee on Healthcare (AHC) has just completed its 4th year. The AHC was established by the ICC Board to evaluate and assess contemporary code issues relating to hospitals and ambulatory healthcare facilities. This is a joint effort between ICC and the American Society for Healthcare Engineering (ASHE), a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. Information on the AHC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the AHC effort can be downloaded from the AHC website.http://www.iccsafe.org/cs/AHC/Pages/default.aspx

Cost Impact: Will not increase the cost of construction
Wood burning fireplaces are not permitted by the federal CMS regulations, therefore, there is no change in cost of construction.

FG 12-15 : 303.3.1 (New)-WILLIAMS4239

FG 13-15

303.7

Proponent: Guy McMann, Jefferson County Colorado, representing Colorado Association of Plumbing and Mechanical Officials (CAPMO) (gmcmann@jeffco.us)

2015 International Fuel Gas Code

Revise as follows:

303.7 Pit locations. Appliances installed in pits or excavations shall not come in direct contact with the surrounding soil and shall be installed not less than 6 inches above the pit or excavation floor. The sides of the pit or excavation shall be held back a minimum of 12 inches (305 mm) from the *appliance*. Where the depth exceeds 12 inches (305 mm) below adjoining grade, the walls of the pit or excavation shall be lined with concrete or masonry, such concrete or masonry shall extend a minimum of 4 inches (102 mm) above adjoining grade and shall have sufficient lateral load-bearing capacity to resist collapse. Excavation on the control side of the appliance shall extend not less than 30 inches (762 mm) horizontally from the appliance. The *appliance* shall be protected from flooding in an *approved* manner.

Reason: This section lacks some detail in floor and control side language. This modification completes this section and has all the information necessary for a code compliant installatoin.

Cost Impact: Will not increase the cost of construction
There will be no additional cost as this is only a correlation between codes to make them consistent with each other.

FG 13-15 : 303.7-MCMANN3367

FG 14-15

304.13(IFGS) (New)

Proponent: James Ranfone, American Gas Association, representing American Gas Association (jranfone@aga.org)

2015 International Fuel Gas Code

Add new text as follows:

304.13(IFGS) Existing appliances. Where an existing appliance is located within the conditioned space of an existing building envelope and where a building envelope component, other than roofiing material, is replaced or altered, the appliance installation shall be inspected to verify compliance with the provisions of Section 304 and Chapter 5. Where an appliance installation does not comply with Section 304 and Chapter 5, it shall be altered as necessary to be in compliance with such.

Reason: AGA is proposing an extract of section 9.1.24 from ANSI Z223.1, National Fuel Gas Code.
The code requirement would address renovations to existing buildings that could impact the supply of combustion air and the performance of venting systems. AGA is aware of weatherization programs that fail to consider the importance of ensuring that existing gas appliance installations continue to meet the IFGC combustion air and venting requirements when efforts to reduce air infiltration are undertaken. This proposal is offered solely for the purpose of coordinating the IFGC with ANSI Z223.1 (NFGC). This text is offered "as is" for the IFGC and it is not intended that such text be modified from a technical standpoint. The subject text was revised in the 2015 NFGC (ANSI Z223.1) and this proposal will cause the IFGC text to be consistent with such revised text in ANSI Z223.1 (NFGC).

Cost Impact: Will increase the cost of construction
The cost to inspect appliances will be added to projects that alter exterior building components. There may be additional costs to bring the appliance installation up to compliance with the IFGC. These are necessary costs to ensure the life-safety of the building occupants.

FG 14-15 : 304.13 (IFGS) (New)-RANFONE4964

FG 16-15

401.9

Proponent: James Ranfone, American Gas Association, representing American Gas Association (jranfone@aga.org)

2015 International Fuel Gas Code

Revise as follows:

401.9 Identification. Each length of pipe and tubing and each pipe fitting, utilized in a fuel gas system, shall bear the identification of the manufacturer.

Exceptions:

1. Steel pipe fittings one inch and less in size.
2. Steel pipe sections that are: two feet and less in length, cut from longer sections of pipe in the field and threaded in the field.

Reason: The first exception would allow short lenghts of steel pipe that are cut from longer pipe stock containing the required identification markings. Is is common practice to cut short lenghts of pipe from longer pipe stock and threading them in the field. The cuts may result in the manufacturer's identification marking not appearing on the finished cut pipe. The second exception would allow small pipe fittings not to have manufacturer's markings. Small fittings used in low pressure gas piping installations represent an extremely low risk of failure and therefore manufacturer identification would serve no purpose.

Cost Impact: Will not increase the cost of construction
No new code requirements that would result in increased cost are proposed.

FG 16-15 : 401.9-RANFONE4971

FG 17-15

401.9

Proponent: James Ranfone, American Gas Association, representing American Gas Association (jranfone@aga.org)

2015 International Fuel Gas Code

Revise as follows:

401.9 Identification. Each length of pipe and tubing and each pipe fitting, utilized in a fuel gas system, shall bear the identification of the manufacturer.

Exceptions:

1. Steel pipe sections that are: two feet and less in length, cut from longer sections of pipe in the field and threaded in the field.
2. Steel pipe fittings 2 inch and less in size.
3. Where identification is provided on the product packaging or crating.
4. Where other approved documentation is provided.

Reason: The new exceptions would allow the following:

1. Short lengths of steel pipe that are cut from longer pipe stock where the stock has identification markings. It is common practice to cut short lengths of pipe from longer pipe stock. In those cases the identification marks may not appear on the cut pieces.

2. Small fittings such as bushings and couplings where markings have not been traditionally been included. These small diameter fittings are commonly used in low pressure gas piping systems rand represent an extremely low risk of failure.

3. Where the packaging or documentation for the part has the manufacturer's identification but the part does not. Very small fittings and accessories often come in packaging that have the manufacturer's identification. At least one State, Georgia, has amended the IFGC to allow such an exception. The GA text states "401.9 Identification. Each length of pipe and tubing utilized in a fuel gas system shall bear the identification of the manufacturer.   It not provided on the packaging or crating or by other approved documentations, each pipe fitting, utilized in a fuel gas system shall bear the identification of the manufacturer. "

Cost Impact: Will not increase the cost of construction
The proposal provides alternate methods to meat current code requirements.

FG 17-15 : 401.9-RANFONE5638

FG 18-15

401.9

Proponent: Bruce Swiecicki, representing National Propane Gas Association (bswiecicki@npga.org)

2015 International Fuel Gas Code

Revise as follows:

401.9 Identification. Each length of pipe and tubing~~ and each pipe fitting,~~ utilized in a fuel gas system, shall ~~bear~~ be marked with the identification of the manufacturer.

Reason: Many fittings are not capable of being marked, such as the "all-thread" nipple. To NPGA's knowledge, no fitting manufacturer currently marks every fitting produced and there is no safety benefit to doing so. This is an example of a costly requirement that appears to have no value to either the code official, the installer, the building owner or the emergency responder.

Cost Impact: Will not increase the cost of construction
This proposal will not increase the cost of construction because it is removing an onerous requirement for marking pipe fittings. Manufacturing costs will decrease as a result of not having to include an additional step by using machinery to put the manufacturer's mark on the pipe fittings it manufactures. This cost savings is expected to be passed on to the purchaser of the pipe fittings.

FG 18-15 : 401.9-SWIECICKI5660

FG 19-15

401.10

Proponent: James Ranfone, American Gas Association, representing American Gas Association (jranfone@aga.org)

2015 International Fuel Gas Code

Revise as follows:

401.10 Third-party testing and certification. Piping, tubing and fittings shall comply with the applicable referenced standards, specifications and performance criteria of this code and shall be identified in accordance with Section 401.9. ~~Piping, tubing~~ Tubing and tubing fittings shall either be tested by an approved third-party testing agency or certified by an approved third-party certification agency.

Reason: There is no evidence that third-party testing and certification of schedule 40 steel piping and fittings is necessary to help ensure safety. This material has a long history of being manufactured in accordance with long standing material standards and has been safety used for fuel gas distrubution going back over 100 years.

Cost Impact: Will not increase the cost of construction
The proposal does not create new installation requirements for schedule 40 pipe.

FG 19-15 : 401.10-RANFONE4974

FG 20-15

401.10

Proponent: Bruce Swiecicki, representing National Propane Gas Association (bswiecicki@npga.org)

2015 International Fuel Gas Code

Delete and substitute as follows:

401.10 ~~Third-party testing and certification.~~Piping materials standards. ~~Piping, tubing and fittings shall comply with the applicable referenced standards, specifications and performance criteria of this code and shall be identified in accordance with Section 401.9. Piping, tubing and fittings shall either be tested by an approved third-party testing agency or certified by an approved thirdparty certification agency.~~
Piping, tubing and fittings shall be manufactured to the applicable referenced standards, specifications and performance criteria listed in Section 403 of this code and shall be identified in accordance with Section 401.9.

Reason: This requirement in the International Fuel Gas Code has far ranging impact that wasn't anticipated at the code development hearings. In many cases, there are no certification or testing requirements to use for flare nuts, tees, pipe nipples, etc.
The current requirement in section 401.10 is extremely onerous to the fuel gas industry with very little, if any, benefit to society. Piping, tubing and fittings are fabricated to various materials standards, such as those published by the American Society for Testing and Materials (ASTM) and the American Society of Mechanical Engineers (ASME). The material standards are shown in Section 403 of the IFGC. Third party testing or certification is a needless and unjustified expense to the industry. There has been no data presented to indicate that piping and fittings have been failing in the field.

Cost Impact: Will not increase the cost of construction
This proposal will markedly decrease the cost of construction without affecting the safety of the piping installation. The reason is that manufacturers will not be required to pay for a needless excercise of obtaining a third party certification to verify that their manufactured products comply with the appropriate material standards.

FG 20-15 : 401.10-SWIECICKI5663

FG 21-15

404.6

Proponent: Guy McMann, Jefferson County, Colorado, representing Colorado Association of Plumbing and Mechanical Officials (CAPMO) (gmcmann@jeffco.us)

2015 International Fuel Gas Code

Revise as follows:

404.6 Underground penetrations prohibited. Gas *piping* shall not penetrate building foundation walls at any point ~~below grade~~<u>underground</u>. ~~Gas~~ <u>Buried gas</u> *piping* shall enter and exit a building at a point above grade and the annular space between the pipe and the wall shall be sealed.

Reason: This is a clarification that gas piping in meter vaults is not considered buried piping and does not need to rise above grade to enter a building because the vaults are not air tight.

Cost Impact: Will not increase the cost of construction
There will be no additional cost as this is a simple clarification.

FG 21-15 : 404.6-MCMANN3545

FG 22-15

404.6

Proponent: James Ranfone, American Gas Association, representing American Gas Association (jranfone@aga.org)

2015 International Fuel Gas Code

Revise as follows:

404.6 ~~Underground penetrations prohibited.~~Piping through foundation wall. ~~Gas~~ *Underground piping* ~~shall not penetrate building~~installed through the outer foundation ~~walls at any point below grade. Gas~~ ~~*piping*~~ ~~shall enter and exit~~or basement wall of a building~~ at~~, shall be encased in a ~~point above grade and the annular~~protective sleeve or protected by an approved device or method. The space between the ~~pipe~~gas pipiing and the sleeve and between the sleeve and the wall shall be sealed to prevent entry of gas and water.

Reason: A change adopted into the 2015 edition prohibits gas piping from penetrating a foundation or basement wall below grade. This change was adoped without evidence that such penetrations have resulted in a safety concern. Below grade penetrations have a long been permitted and have proven to be a safe installation method. The revised language would reinstate this allowance. At least one State, Georgia, has amendedthe IFGC to delete the prohibition and allow below grade pentration similar to the proposed text. GA test is as follows: "404.6 Piping through foundation wall. Underground piping where installed below grade through the foundation or basement wall of a building, shall be encased is a protective pipe sleeve. The annular space between the gas piping and the sleeve shall be sealed."

Cost Impact: Will not increase the cost of construction
The reinstated installation practice will decrease installation costs.

FG 23-15

404.6

Proponent: Bob Torbin, representing Omega Flex, Inc. (bob.torbin@omegaflex.net)

2015 International Fuel Gas Code

Revise as follows:

404.6 Underground penetrations prohibited. Gas *piping* shall not penetrate building foundation walls at any point below grade. Gas *piping* shall enter and exit a building at a point above grade and the annular space between the pipe and the wall shall be sealed.

> **Exception:** Penetration of the building foundation at a point below grade shall not be prohibited where the point of penetration is not less than 10 feet measured horizontally from any piping upstream of the point of delivery. Gas piping installed through the foundation wall below grade shall be sleeved and the annular space between the sleeve and wall and between the sleeve and piping shall be sealed.

Reason: The current restriction on underground penetration has little impact on single family homes and is intended to remain in effect. However, there are several disadvantages when this retriction is applied to inner city locations and multi-family buildings where difficult access and far greater distances could significantly impact both cost and safety. There can be many penetrations of the foundation wall already permitted including water line(s), sewer/water drains, and electrical service. Any fugitive gas could penetrate the foundation wall at any of these locations (if not properly sealed) whether or not the gas service is restricted to above grade penetrations. By separating the wall penetration of the gas service away from the source of any potential leakage (i.e. the plastic service line), the probability of seepage through the foundation wall at a distant penetration point is significantly reduced. The likelihood of such an event is already small, and the proposed revision to this code requirement attempts to balance the need for safety while recognizing the wide range of conditions associated with different building applications, construction style and siting issues.

Cost Impact: Will not increase the cost of construction
On single family construction, the general labor and materials will be the same whether the piping goes above or below grade and then through the foundation wall. However, on multi-family construction (such as townhouses) significant cost savings can be realized by allowing the individual unit piping (from a single meter bank) to be placed underground around the perimeter of the foundation, and then allowed to penetrate the foundation wall below grade rather than rise above grade.

FG 24-15

404.11, 404.11.1 (New), 404.11.2 (New), 404.11.2, 404.11.3 (New), 404.11.4 (New), 404.11.1

Proponent: James Ranfone, American Gas Association, representing American Gas Association (jranfone@aga.org)

2015 International Fuel Gas Code

Revise as follows:

404.11 Protection against corrosion. ~~Metallic~~ Steel pipe or tubing exposed to corrosive action, such as soil condition or moisture, shall be protected in ~~an *approved* manner. Zinc coatings (galvanizing) shall not be deemed adequate protection for gas *piping* underground. Where dissimilar metals are joined underground, an insulating coupling or fitting shall be used. *Piping* shall not be laid in contact~~accordance with ~~cinders~~Sections 404.11.1 through 404.11.5.

Add new text as follows:

404.11.1 Galvanizing Zinc coating shall not be deemed adequate protection for underground gas piping.

404.11.2 Protection methods. Underground piping shall comply with one or more of the following:

1. The piping shall be made of corrosion-resistant material that is suitable for the environment in which it will be installed.
2. Pipe shall have a factory-applied, electrically-insulating coating. Fittings and joints between sections of coated pipe shall be coated in accordance with the coating manufacturer's instructions.
3. The piping shal have a cathodic protection system installed and the system shall be monitored and maintained in accordance with an approved program.

Delete without substitution:

~~**404.11.2 Protective coatings and wrapping.** Pipe protective coatings and wrappings shall be *approved* for the application and shall be factory applied.~~

> ~~**Exception:** Where installed in accordance with the manufacturer's instructions, field application of coatings and wrappings shall be permitted for pipe nipples, fittings and locations where the factory coating or wrapping has been damaged or necessarily removed at joints.~~

Add new text as follows:

404.11.3 Dissimilar metals. Where dissimilar metals are joined underground, an insulating coupling or fitting shall be used.

404.11.4 Protection of risers. Steel risers connected to plastic piping shall be cathodically protected by means of a welded anode, except where such risers are anodeless risers.

Revise as follows:

~~**404.11.1**~~**404.11.5 Prohibited use.** *No change to text.*

Reason: The proposal replaces approved manner with additional enforceable code requirements and reorganizes the material for clarity based on new requirements adopted into the 2015 National Fuel Gas Code, ANSI Z223.1/NFPA 54. The reasons for the changes are as follows:

1. Corrosion protection will be required for steel piping. Previously, the section applied to all metallic piping. Copper is the other metallic material that can be used but it is less susceptible to corrosion. Both steel and copper are less often used for low pressure underground piping. Plastic pipe is now the preferred material for underground installations.

2. Unprotected steel piping is allowed where approved. There are some arid environments where corrosion projection may not be needed.

3.The approved projective means allows for materials that are suitable for the environment that they are installed in such as stainless steel.

4. All steel piping must be factory coated since field application often is incomplete containing holidays It is these holidays that can focus corrosive activity in one spot. Fittings and portions of steel pipe that is striped for installation would be required to be coated using manufacturer's specified materials and methods. This is similar coverage in existing 404.11.2.

5. An approved cathodic protective system is allowed. The NFGC did adopt extensive requirements for these systems but they are not proposed for the IFGC since the IFGC's focus is more on residential and light commercial.

6. New requirement that risers (other than anodeless) be projected. Failures of these risers have been reported to the NFGC committee.

Cost Impact: Will not increase the cost of construction
Most of the revisions are a reorganization of existing requirements.

FG 24-15 : 404.11.1-RANFONE5038

FG 25-15

404.14, Chapter 8

Proponent: Bob Torbin, Omega Flex, Inc., representing Omega Flex, Inc. (bob.torbin@omegaflex.net)

2015 International Fuel Gas Code

Revise as follows:

404.14 Piping underground beneath buildings. *Piping* installed underground beneath buildings is prohibited except where the *piping* is encased in a conduit of wrought iron, plastic pipe, steel pipe, a listed sleeve system or other *approved* conduit material designed to withstand the superimposed loads. The conduit shall be protected from corrosion in accordance with Section 404.11 and shall be installed in accordance with Section 404.14.1 or 404.14.2.

Reason: Reason: The ICC Evaluation Service has issued a listing criteria for polyetrhylene sleeved CSST (LC 1023) dated May 2009. The use of listed encasement systems (such as polyethylene sleeved CSST) has been included in the National Fuel Gas Code (NFPA 54) since the 2012 edition. One such product listed to LC 1023 is the Omega Flex PS-II CSST system. This product has been used underground without failure or damage for approximately ten years with thousands of installations. Use of pre-assembled encasement systems streamline the installation of gas piping beneath buildings and concrete slabs, and eliminates underground joints on both the conduit and the internal gas piping. This will improve safety when installing such systems by eliminating potential underground leakage sites while providing effective corrosion protectrion for the piping.

Bibliography: ICC LC-1023: PMG Listing Criteria for Polyethylene Sleeved Corrugated Stainless Steel Tubing: May 2009
ANSI LC-1-2014: Fuel Gas Piping Systems Using Corrugated Stainless Steel Tubing

Cost Impact: Will not increase the cost of construction
The proposed code change will not increase the cost of construction. The use of a pre-engineered encasement system will result in cost savings because the piping and conduit are installed simultaneously. This avoids the labor cost of separately installing and joining the conduit segments and the pulling the piping through the conduit. In addition, the sealing and venting methods (when required) are also integrated within the encasement system, and thus eliminating the need to separately assemble and inject non-standardized sealing/venting components and sealing materials into open-ended conduit around the existing piping.

FG 25-15 : 404.14-TORBIN4623

FG 26-15

404.17.3

Proponent: James Ranfone, American Gas Association, representing American Gas Association (jranfone@aga.org)

2015 International Fuel Gas Code

Revise as follows:

404.17.3 Tracer. A yellow insulated copper tracer wire or other *approved* conductor, or a product specifically designed for that purpose, shall be installed adjacent to underground nonmetallic *piping*. *Access* shall be provided to the tracer wire or the tracer wire shall terminate above ground at each end of the nonmetallic *piping*. The tracer wire size shall be not less than 18 AWG and the insulation type shall be suitable for direct burial.

Reason: There are products specifically designed as a tracer locator. Several gas utilities have allowed these products to be used in place of the traditional wire. The 2015 National Fuel Gas Code, ANSI Z223.1/NFPA 54, in section 7.1.7.3 was revised to allow these products.

Cost Impact: Will not increase the cost of construction
Provides an optional method, the standard method is still allowed.

FG 26-15 : 404.17.3-RANFONE5051

FG 27-15

408.4

Proponent: Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

2015 International Fuel Gas Code

Revise as follows:

408.4 Sediment trap. Where a sediment trap is not incorporated as part of the appliance, a sediment trap shall be installed downstream of the appliance shutoff valve as close to the inlet of the appliance as practical. The sediment trap shall be ~~either~~ a tee fitting having a capped nipple of any length installed vertically in the bottommost opening of the <u>run of the</u> tee as illustrated in Figure 408.4~~ or other device approved as an effective sediment trap~~. Illuminating appliances, ranges, clothes dryers, decorative vented appliances for installation in vented fireplaces, gas fireplaces and outdoor grills need not be so equipped.

Reason: The option for an "other device approved as an effective sediment trap" has been misinterpreted to allow configurations of tees that allow debris to pass over a nipple and cap installed in the branch opening of a tee. The current option was meant to address factory-built sediment trap devices, but they are not known to exist. This proposal clarifies the intent by referring to the run of tee which is consistent with the current FIGURE 408.4 of the code. The intent is not to allow the nipple cap to be connected to the branch opening of a tee because debris can simply jump over the branch opening.
This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes.

Cost Impact: Will not increase the cost of construction
This proposal will not increase the cost of construction because no additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code nor are the code requirements made more stringent.

FG 27-15 : 408.4-SNYDER3279

FG 28-15

408.4

Proponent: Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

2015 International Fuel Gas Code

Revise as follows:

408.4 Sediment trap. Where a sediment trap is not incorporated as part of the appliance, a sediment trap shall be installed downstream of the appliance shutoff valve as close to the inlet of the appliance as practical. The sediment trap shall be either a tee fitting having a capped nipple of any length installed vertically in the bottommost opening of the tee as illustrated in Figure 408.4 or other device approved as an effective sediment trap. Illuminating appliances, ranges, ~~clothes dryers,~~ decorative vented appliances for installation in vented fireplaces, gas fireplaces and outdoor grills need not be so equipped.

Reason: The list of exempt appliances in this section is supposed to address those appliances that are attended while in use. The logic is that if the appliance is attended while in use, the operator would be aware of a malfunction and would act accordingly. It is arguable that such appliances are actually attended the entire time that they are used, but, it is obvious that clothes dryers are turned on and left unattended. Occupants often turn on clothes dryers and leave their home while the dryer operates. Clothes dryers are not attended while operating. Clothes dryers should have the same protection from debris in the gas line as furnaces, boilers, water heaters, etc.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes.

Cost Impact: Will increase the cost of construction
This proposal will increase the cost of construction because a sediment trap will be required where it was not previously required.

FG 28-15 : 408.4-SNYDER3280

FG 29-15

409.5.1

Proponent: James Ranfone, American Gas Association, representing American Gas Association (jranfone@aga.org)

2015 International Fuel Gas Code

Revise as follows:

409.5.1 Located within same room. The shutoff valve shall be located in the same room as the *appliance*. The shutoff valve shall be within 6 feet (1829 mm) of the *appliance*, and shall be installed upstream of the union, connector or quick disconnect device it serves. Such shutoff valves shall be provided with *access*. <u>Shutoff valves serving movable appliances, such as cooking appliances and clothes dryers, shall be considered to be provided with access where installed behind such appliances.</u> *Appliance* shutoff valves located in the firebox of a *fireplace* shall be installed in accordance with the *appliance* manufacturer's instructions.

Reason: To clarify that an appliance shutoff valve installed behind or beside a movable appliance is allowed as long as the valve can be accessed by moving the appliance. There is some field confusion on the term "access" which is being misinterpreted as requiring the valve to be located in sight and readily accessible. At least one State, Georgia, has amended the IFGC to clarify that appliance shutoff valves can be installed in such locations. The State amendment reads: "409.5.4 Appliance valves, Shutoff valves located behind appliances such as range/ovens and clothes dryers shall be considered accessible."

Cost Impact: Will not increase the cost of construction
Clarifies the code intent.

FG 29-15 : 409.5.1-RANFONE5055

FG 30-15

409.5.3

Proponent: Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

2015 International Fuel Gas Code

Revise as follows:

409.5.3 Located at manifold. Where the *appliance* shutoff valve is installed at a manifold, such shutoff valve shall be located within 50 feet (15 240 mm) of the *appliance* served, shall be located on the same floor level as the appliance served and shall be readily accessible and permanently identified. The *piping* from the manifold to within 6 feet (1829 mm) of the *appliance* shall be designed, sized and installed in accordance with Sections 401 through 408.

Reason: Section 409.5.3 allows the appliance shutoff valve to be located up to 50 feet from the appliance served. The code does not specify how the 50 foot limit is to be measured, therefore, it could be a straight line passing through walls and floors. This allowance could mean that a furnace in an attic could have its shutoff valve on a manifold that is located in the basement in a one, two or even 3 story building. Not only is this terribly inconvenient for the service personnel, but it could also be hazardous. In such cases, the service personnel would likely have to install a second shutoff valve at the appliance to save the hassle of running back and forth between the basement and the attic. There is no justification for allowing the only service shutoff valve to be so remote. The required shutoff valve is recognized as being there for servicing the appliance, however, it is not useful for servicing an appliance if it is located where it is impractical to access.
This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes.

Cost Impact: Will not increase the cost of construction
This proposal will not increase the cost of construction because no additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code nor are the code requirements made more stringent.

FG 30-15 : 409.5.3-SNYDER3281

FG 31-15

409.7 (New)

Proponent: James Ranfone, American Gas Association, representing American Gas Association (jranfone@aga.org)

2015 International Fuel Gas Code

Add new text as follows:

<u>**409.7** **Shutoff valves in tubing systems.** Shutoff valves installed in tubing systems shall be rigidly and securely supported independently of the tubing.</u>

Reason: Shutoff valves require independent support to prevent the possible twisting of the tubing when operating the valve. CSST systems already have this requirement in their installation instructions. Valves used in copper tubing systems should also be required to be secured. A similar requirement was added to the 2015 National Fuel Gas Code, ANSI Z223.1/NFPA 54, in section 7.3.6.

Cost Impact: Will increase the cost of construction
Minimum cost increase to secure the valve using low cost brackets to building members.

FG 31-15 : 409.7 (New)-RANFONE5059

FG 32-15

410.2

Proponent: Brent Ursenbach, Salt Lake County, representing Utah Chapter ICC (bursenbach@slco.org)

2015 International Fuel Gas Code

Revise as follows:

410.2 MP regulators. MP pressure regulators shall comply with the following:

1. The MP regulator shall be *approved* and shall be suitable for the inlet and outlet gas pressures for the application.
2. The MP regulator shall maintain a reduced outlet pressure under lock-up (no-flow) conditions.
3. The capacity of the MP regulator, determined by published ratings of its manufacturer, shall be adequate to supply the *appliances* served.
4. The MP pressure regulator shall be provided with *access.* Where located indoors, the regulator shall be vented to the outdoors or shall be equipped with a leaklimiting device, in either case complying with Section 410.3.
5. A tee fitting with one opening capped or plugged shall be installed between the MP regulator and its upstream shutoff valve. Such tee fitting shall be positioned to allow connection of a pressure-measuring instrument and to serve as a sediment trap.
6. A tee fitting with one opening capped or plugged shall be installed not less than 10 pipe diameters downstream of the MP regulator outlet. Such tee fitting shall be positioned to allow connection of a pressure-measuring instrument.<u> A gas pressure test port on the inlet side of the gas control of an appliance served by the MP regulator is an alternative to the downstream tee fitting, where such appliance is located in the same room as the MP regulator.</u>
7. Where connected to rigid piping, a union shall be installed within 1 foot (304 mm) of either side of the MP regulator.

Reason: The purpose of the tee fitting in item 6 is to test the regulator outlet/applinace inlet pressure. As virtually every gas appliance has an inlet pressure test plug, integral within the appliance, it is redundent to add a tee at the regulator, when an appliance is nearby. Further, the integral appliance test ports are 1/8" pipe thread, ready to accept the identical sized fitting on testing gages.

Cost Impact: Will not increase the cost of construction
This proposal will actually reduce cost as it will eliminate the material cost and labor required to install an unneccessary tee fitting and cap, when test ports are available within nearby gas appliances.

FG 32-15 : 410.2-URSENBACH5796

FG 33-15

410.4, Chapter 8

Proponent: James Ranfone, American Gas Association, representing American Gas Association (jranfone@aga.org)

2015 International Fuel Gas Code

Revise as follows:

410.4 Excess flow valves. Where automatic *excess flow valves* are installed, they shall be listed ~~for the application~~ <u>in accordance with ANSI Z21.93/CSA 6.30,</u> and shall be sized and installed in accordance with the manufacturer's instructions.

Add new standard(s) as follows:
<u>ANSI Z21.93/CSA 6.30 - 2013 Excess Flow Valves for Natural and LP Gas with Pressures Up To 5 psig</u>

Reason: A new ANSI standard for excess flow valves has been approved and published. EFVs should be required to meet that standard to help ensure minimum performance.

Cost Impact: Will increase the cost of construction
Listed EFVs may be more expensive than unlisted units. EFV performance can be a critical life safety issue. Therefore, more expensive valves that help ensure they perform as planned is justified.

Analysis: A review of the standard proposed for inclusion in the code, ANSI Z21.93/CSA 6.30 , with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2015.

FG 33-15 : 410.4-RANFONE5065

FG 34-15

411.1, 411.4 (New)

Proponent: James Ranfone, American Gas Association, representing American Gas Association (jranfone@aga.org)

2015 International Fuel Gas Code

Revise as follows:

411.1 Connecting appliances. Except as required by Section 411.1.1, *appliances* shall be connected to the *piping* system by one of the following:

1. Rigid metallic pipe and fittings.
2. Corrugated stainless steel tubing (CSST) where installed in accordance with the manufacturer's instructions.
3. Semirigid metallic tubing and metallic fittings. Lengths shall not exceed 6 feet (1829 mm) and shall be located entirely in the same room as the *appliance*. Semirigid metallic tubing shall not enter a motor-operated *appliance* through an unprotected knockout opening.
4. *Listed* and *labeled appliance* connectors in compliance with ANSI Z21.24 and installed in accordance with the manufacturer's instructions and located entirely in the same room as the *appliance*.
5. *Listed* and *labeled* quick-disconnect devices used in conjunction with *listed* and *labeled appliance* connectors.
6. *Listed* and *labeled* convenience outlets used in conjunction with *listed* and *labeled appliance* connectors.
7. Listed and *labeled* outdoor *appliance* connectors in compliance with ANSI Z21.75/CSA 6.27 and installed in accordance with the manufacturer's instructions.
8. Listed outdoor gas hose connectors in compliance with ANSI Z21.54 used to connect portable outdoor appliances. The gas hose connection shall be made only in the outdoor area where the appliance is used, and shall be to the gas *piping* supply at an appliance shutoff valve, a listed quick-disconnect device or listed gas convenience outlet.
9. <u>Gas hose connectors for use in laboratories and educational facilities in accordance with Section 411.4</u>

Add new text as follows:

<u>**411.4** **Injection Bunsen-type burners** Injection Bunsen-type burners used in laboratories and educational facilities shall be connected to the gas supply system by either a listed or unlisted hose.</u>

Reason: The IFGC is currently silent on the use of unlisted connectors for injection burners commonly referred to as Bunsen burners. Unlisted hoses are the only readily available product for such installations and their use is common place. The new code requirement will allow the use of unlisted hoses approved by the AHJ. The revision is based on similar code requirement adopted into the 2015 National Fuel Gas Code, ANSI Z223.1/NFPA 54.

Cost Impact: Will not increase the cost of construction
Recongonizes a product that is already used.

FG 34-15 : 411.1-RANFONE5075

FG 35-15

411.2

Proponent: Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

2015 International Fuel Gas Code

Revise as follows:

411.2 Manufactured home connections. <u>The connection between the gas distribution piping system for a manufactured home and the gas service shall be located outside of the footprint of the home.</u> Manufactured homes shall be connected to the distribution *piping* system by one of the following materials:

1. Metallic pipe in accordance with Section 403.4.
2. Metallic tubing in accordance with Section 403.5.
3. *Listed* and *labeled* connectors in compliance with ANSI Z21.75/CSA 6.27 and installed in accordance with the manufacturer's instructions.

Reason: Current Section 404.6 expresses the concern for gas piping entering a building at some point below grade. Likewise there is a concern for gas service piping running underground to a point underneath a manufactured home. Such homes will have skirting that creates what is, in effect, a crawl space. Any gas leakage from an underground lateral and riser pipe will collect under the home. If there is no underground riser and connection is made directly to a meter setting, the meter and service regulator should not be under the home. Also, having the gas service riser outside of the footprint of the home will help protect it from damage when a home is moved in or out.
This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes.

Cost Impact: Will not increase the cost of construction
This proposal will not increase the cost of construction because no additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code nor are the code requirements made more stringent.

FG 35-15 : 411.2-SNYDER3282

FG 36-15

502.1

Proponent: Larry Gill, representing IPEX USA LLC (larry.gill@ipexna.com)

2015 International Fuel Gas Code

Revise as follows:

502.1 General. Vents, except as provided in Section 503.7, shall be *listed* and *labeled* . Type B and BW vents shall be tested in accordance with UL 441. Type L vents shall be tested in accordance with UL 641. Vents for Category II, III and ~~III~~IV appliances shall be tested in accordance with UL 1738.~~ Plastic vents for Category IV appliances shall not be required to be *listed* and *labeled* where such vents are as specified by the *appliance* manufacturer and are installed in accordance with the *appliance* manufacturer's instructions.~~

Reason: UL 1738 is the Standard for Safety for Venting Systems for Gas-Burning Appliances, Categories II, III, and IV and should be referenced in the IFGC for all venting materials included in scope of the standard. The current exception not requiring plastic venting to be listed and labelled should be removed as recent changes to UL 1738 now allow PP, PVC and CPVC venting to be tested and listed to the 1738 standard. Further, appliance standards do not adequately address venting and only list plumbing DWV products. Plumbing products are not adequate for venting of appliances. UL 1738 is a system standard and does not permit the mixing of different pipe, fittings or joining methods from different manufacturers. This along with a listed and labelled system specifically designed for appliance venting will provide for a safer installation and home environment.

Cost Impact: Will increase the cost of construction
The proposed change may increase the cost of construction depending on the cost of a listed and labeled venting system.

FG 36-15 : 502.1-GILL3902

FG 37-15

618.2

Proponent: Guy McMann, Jefferson County, Colorado, representing Colorado Association of Plumbing and Mechanical Officials (CAPMO) (gmcmann@jeffco.us)

2015 International Fuel Gas Code

Delete without substitution:

~~**618.2 Forced-air furnaces.** The minimum unobstructed total area of outdoor and return air ducts or openings to a forcedair warm-air furnace shall be not less than 2 square inches for each 1,000 Btu/h (4402 mm^2/W) output rating capacity of the furnace and not less than that specified in the furnace manufacturer's installation instructions. The minimum unobstructed total area of supply ducts from a forced-air warm-air furnace shall be not less than 2 square inches for each 1,000 Btu/h (4402 mm^2/W) output rating capacity of the furnace and not less than that specified in the furnace manufacturer's installation instructions.~~

> ~~**Exception:** The total area of supply air ducts and outdoor and return air ducts shall not be required to be larger than the minimum size required by the furnace manufacturer's installation instructions.~~

Reason: This is outdated legacy code language that was removed from the IMC and IRC last cycle and is not consistent with currant practice. It's up to the design professional, the requirements from Manual D or the manufacturer of the appliance to determine minimum sizes of ducts and transfer openings, not the code. If these numbers were to be applied, then the code could be condoning an undersized system. IMC 603.2 spells it out. There are too many variables and different situations for just one minimum to work for everything.

Cost Impact: Will not increase the cost of construction
This deletion is editorial in nature.

FG 38-15

618.4

Proponent: Guy McMann, Jefferson County, Colorado, representing Colorado Association of Plumbing and Mechanical Officials (CAPMO) (gmcmann@jeffco.us)

2015 International Fuel Gas Code

Revise as follows:

618.4 Prohibited sources. Outdoor or return air for forcedair heating and cooling systems shall not be taken from the following locations:

1. Closer than 10 feet (3048 mm) from an *appliance* vent outlet, a vent opening from a plumbing drainage system or the discharge outlet of an exhaust fan, unless the outlet is 3 feet (914 mm) above the outside air inlet.
2. Where there is the presence of objectionable odors, fumes or flammable vapors; or where located less than 10 feet (3048 mm) above the surface of any abutting public way or driveway; or where located at grade level by a sidewalk, street, alley or driveway.
3. A hazardous or insanitary location or a refrigeration machinery room as defined in the *International Mechanical Code*.
4. A room or space, the volume of which is less than 25 percent of the entire volume served by such system.Where connected by a permanent opening having an area sized in accordance with Section 618.2, adjoining rooms or spaces shall be considered as a single room or space for the purpose of determining the volume of such rooms or spaces.

    Exception: The minimum volume requirement shall not apply where the amount of return air taken from a room or space is less than or equal to the amount of supply air delivered to such room or space.
5. A room or space containing an *appliance* where such a room or space serves as the sole source of return air.

    Exception: This shall not apply where:
    1. The *appliance* is a direct-vent *appliance* or an *appliance* not requiring a vent in accordance with Section 501.8.
    2. The room or space complies with the following requirements:
        - 2.1. The return air shall be taken from a room or space having a volume exceeding 1 cubic foot for each 10 Btu/h (9.6L/W) of combined input rating of all fuel-burning appliances therein.
        - 2.2. The volume of supply air discharged back into the same space shall be approximately equal to the volume of return air taken from the space.
        - 2.3. Return-air inlets shall not be located within 10 feet (3048 mm) of a draft hood in the same room or space or the combustion chamber of any atmospheric burner *appliance* in the same room or space.
    3. Rooms or spaces containing solid fuel-burning appliances, provided that return-air inlets are located not less than 10 feet (3048 mm) from the firebox of such appliances.
6. A closet, bathroom, toilet room, kitchen, garage, boiler room, furnace room or unconditioned attic.

    Exceptions:
    1. Where return air intakes are located not less than 10 feet (3048 mm) from cooking appliances and serve only the kitchen area, taking return air from a kitchen area shall not be prohibited.
    2. Dedicated forced air systems serving only a garage shall not be prohibited from obtaining return air from the garage.
7. A crawl space by means of direct connection to the return side of a forced-air system. Transfer openings in the crawl space enclosure shall not be prohibited.
8. <u>Indoor swimming pool enclosures and associated deck areas except where such spaces are dehumidified.</u>

Reason: It's not desireable to pull return air from swimming pull areas due to the negitive affects it would have on the system from humidity to chemical odors associated with such places. A dedicated system would be required, a combination of supply and exhaust or the air should be dehumidified. This senerio is consistent with the same dwelling unit built under the IMC.

Cost Impact: Will not increase the cost of construction

No cost impact provided dehumidification isnt required.

FG 38-15 : 618.4-MCMANN3560

FG 39-15

621.4

Proponent: Craig Conner, representing selff (craig.conner@mac.com)

2015 International Fuel Gas Code

Revise as follows:

621.4 Prohibited locations. Unvented room heaters shall not be installed within occupancies in Groups A, E and I. <u>Unvented room heaters shall not be installed within new dwelling units.</u> The location of unvented room heaters shall comply with Section 303.3.

Reason: Unvented heaters in the newer, more airtight homes present a serious health issue. The solution is simple. Use a vented heater. New homes are much tighter due to the increased stringency in energy codes. Between the 2009 IECC and the 2015 IECC the required air tightness roughly doubled. As homes get rapidly tighter, air quality concerns grow.

Which codes and standards already prohibit unvented room heaters? The IFGC prohibits unvented heaters in occupancy groups A, E and I in Section 621.4. Minnesota and California prohibit them. Wisconsin prohibits them in houses built after 1980. Houston Texas, New York City, and many other cities prohibit unvented heaters. The ASHRAE ventilation standard excludes unvented heaters from its scope, presumably because the ASHRAE ventilation standards are not sufficient for unvented heaters (Section 3.2 , ASHRAE 62.2-2013). Furthermore, many large builders will not install unvented heaters, in part out of concern for liability.

In the last code cycle the IFGC committee disapproved a proposal similar to this. The ICC Report of the Hearing gave three reasons. Each reason is quoted below and responded to:
Committee- "The proposal would prohibit unvented heaters in older homes that have greater air infiltration."
Response- This proposal only applies to new dwelling units, units required to be much more airtight by the new energy code.
Committee- "The nitrogen dioxide levels discussed are more stringent than recommended by the CPSC."
Response- This reason statement notes both the Consumer Products Safety Commission (CPSC) nitrogen dioxide limits and the more recent US EPA National Ambient Air Quality Standards1 limit. Both standards were exceeded in the measurements cited in the paragraph below.
Committee- "No substantiation was given to demonstrate that the current restrictions for these appliances are inadequate. "
Response- The next two paragraphs cite a study of unvented heaters in actual use.

A study by the Building Research Council (BRC study) at the University of Illinois measured the air quality in 30 homes with unvented heaters2. In the short monitoring period (3 to 4 days) several combustion products exceeded health limits in some of the houses. Of greatest concern is the nitrogen dioxide level inside the home. About 40% of the homes exceeded the Consumer Product Safety Council's nitrogen dioxide limit of 0.300 ppm. About 80% of the homes exceeded the US EPA National Ambient Air Quality Standards of 0.100 ppm. The BRC study concluded excessive nitrogen dioxide was inherently associated with unvented heaters: "Levels of NO2 that exceeded health-based guidelines occurred regardless of usage patterns, so should be considered inherent in the fireplace performance".

Unvented heaters operate like humidifiers, but without humidity controls. Combustion of methane, the main component of natural gas, produces one part carbon dioxide and two parts water. Depending on the heater size and use duration the water produced could be a fraction of a cup (small heater, limited use) to more than a gallon (large heater, 4+ hours). The BRC study shows that some use unvented heaters for 4 hours or more.

ASHRAE's position pager on unvented heaters drew these conclusions from the BRC study: "This study found that 20% of homes exceeded the EPA and WHO threshold for an 8-hour average CO level of 9 ppm, primarily when they were used for continuous, extended periods of time. This usage pattern is contrary to industry recommendations, which state that unvented heaters should be used as supplemental heaters, not primary heaters or for excessive periods of time." As the ASHRAE position paper noted, the BRC study calls into question industry assumptions of only 2-hour usage periods in their safety studies. "Of the 30 homes, one used the fireplace as the sole source of heat for the home." And "… five were used continuously at least once for longer than 4 hours." The BRC study found longer period of use were associated with pollutant levels that exceeded health standards. Industry safety analysis usage assumptions need to be revised to include longer periods of use.

Yes, the unvented heaters have an "oxygen depletion sensor" (ODS). It is perhaps stating the obvious, but an oxygen sensor monitors oxygen, but not nitrogen dioxide or carbon monoxide. This sensor does not protect against other pollutants, such as the nitrogen dioxide and carbon monoxide levels the BRC study measured as exceeding the CSPC and EPA standards1 in real homes.

In conclusion, the Consumer Product Safety Commission3 suggests removing air quality issues at the source: "Usually the most effective way to improve indoor air quality is to eliminate individual sources of pollution or to reduce their emissions." The CPSC recommends unvented heater users reduce the exposure to unvented heater combustion products in homes with unvented heaters- "While a space heater is in use, open a door from the room where the heater is located to the rest of the house and open a window slightly." This would seem antithetical to good energy efficiency practice. Building codes cannot and should not require doors or windows to be open to let in extra air to address health concerns.

Using a vented heater in a new, airtight home is a simple solution.

Cost Impact: Will increase the cost of construction
Vented heaters require a vent and are more limited in the practical locations where they can be placed. Vented heaters cost more to purchase.
Using these devices as heaters, as is sometimes recommended by the "vent-free" industry, is not an acceptable trade of health/safety for $$ savings.

FG 39-15 : 621.4-CONNER5303

FG 40-15

623.2

Proponent: James Ranfone, American Gas Association, representing American Gas Association (jranfone@aga.org)

2015 International Fuel Gas Code

Revise as follows:

623.2 Prohibited location. Cooking appliances designed, tested, *listed* and *labeled* for use in commercial occupancies shall not be installed within dwelling units or within any area where domestic cooking operations occur.

> **~~Exception~~Exceptions:**
> 1. Appliances that are also listed as domestic cooking appliances.
> 2. Where the installation is designed by a licensed Professional Engineer.

Reason: There are large residential properties that contain kitchens meant to be used for extensive entertaining purposes. These kitchens are often designed by professional engineers similar to commercial cooking installations. The IFGC currently allow such installations under 105.2 Alternate materials, methods, appliances and equipment. The proposed change would specifically permit these often requested installations. At least on State, Georgia, has amended the IFGC to permit such installation as follows: "Exception: Listed and labeled commercial cooking appliances may be installed in dwelling units and domestic kitchens when designed and accepted by a Georgia licensed Professional Engineer."

Cost Impact: Will not increase the cost of construction
These installations currently do occur under 105.2 and therefore no new code requirement is being proposed that would increase the cost of installation.

FG 40-15 : 623.2-RANFONE5077

FG 41-15

624.3 (New)

Proponent: Guy McMann, Jefferson County, Colorado, representing Colorado Associatoin of Plumbing and Mechanical Officials (CAPMO) (gmcmann@jeffco.us)

2015 International Fuel Gas Code

Add new text as follows:

624.3 Location. Water Heaters shall be located in accordance with Section 303.

Reason: This is just a user friendly pointer to direct the user to the proper section for water heater installion.

Cost Impact: Will not increase the cost of construction
There will be no additional cost as this is editorial in nature.

FG 41-15 : 624.1.2 (New)-MCMANN3546

FG 42-15

Part I:
624.2
Part II:
P2803.1, M2004.1
Part III:
1002.2

THIS IS A 3 PART CODE CHANGE. PART I WILL BE HEARD BY THE IFGC COMMITTEE. PART II WILL BE HEARD BY THE IRC-MECHANICAL COMMITTEE. PART III WILL BE HEARD BY THE IMC COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

Proponent: Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

Part I

2015 International Fuel Gas Code

Revise as follows:

624.2 Water heaters utilized for space heating. Water heaters utilized both to supply potable hot water and provide hot water for space-heating applications shall be *listed* and *labeled* for such applications by the manufacturer and shall be installed in accordance with the manufacturer's instructions and the *International Plumbing Code*. Water heaters shall not be utilized solely for space heating purposes.

Part II

2015 International Residential Code

Revise as follows:

P2803.1 Protection of potable water. Piping and components connected to a water heater for space heating applications shall be suitable for use with potable water in accordance with Chapter 29. Water heaters ~~that will be used to supply potable water~~ shall not be connected to a heating system or components previously used with nonpotable-water heating *appliances*. Chemicals for boiler treatment shall not be introduced into the water heater. Water heaters shall not be utilized solely for space heating purposes.

M2004.1 General. Water heaters used to supply both potable hot water and hot water for space heating shall be installed in accordance with this chapter, Chapter 24, Chapter 28 and the manufacturer's instructions. Water heaters shall not be utilized solely for space heating purposes.

Part III

2015 International Mechanical Code

Revise as follows:

1002.2 Water heaters utilized for space heating. Water heaters utilized both to supply potable hot water and provide hot water for space-heating applications shall be *listed* and *labeled* for such applications by the manufacturer and shall be installed in accordance with the manufacturer's instructions and the *International Plumbing Code*. Water heaters shall not be utilized solely for space heating purposes.

Reason: The current code recognizes that water heaters can have a dual role of spacing heating and domestic water heating, however, the code is silent on whether a water heater can be used only for space heating. If a water heater is used solely for space heating, it would no longer meet the definition of water heater in the code and would likely violate the listing of the water heater. If a water heater does not meet the definition of water heater, then what is it? It is certainly not a boiler. Hot water boilers are evaluated to entirely different standards than water heaters. A water heater must first be used to supply hot water to the potable water distribution system, and secondarily it can be used for space heating. By definition, a water heater always provides potable hot water.
The second sentence of Section P2803.1 of the IRC is nonsensical because it suggests that there are water heaters that are not used to supply potable water.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof.

This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes.

Cost Impact:

Part I: Will not increase the cost of construction
This proposal will not increase the cost of construction because no additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code nor are the code requirements made more stringent.

Part II: Will not increase the cost of construction
This proposal will not increase the cost of construction because no additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code nor are the code requirements made more stringent.

Part III: Will not increase the cost of construction
This proposal will not increase the cost of construction because no additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code nor are the code requirements made more stringent.

FG 42-15 : 624.2-SNYDER3283

FG 43-15

202 (New)

Proponent: Pennie L Feehan, representing Copper Development Association (penniefeehan@me.com)

2015 International Fuel Gas Code

Revise as follows:

SECTION 202 DEFINITIONS

[M] PIPING. Where used in this code, "*piping*" refers to either pipe or tubing, or both.
Pipe. A rigid conduit of iron, steel, copper, ~~brass~~copper-ally or plastic.
Tubing. Semirigid conduit of copper, copper-alloy, aluminum, plastic or steel.

Reason: The proposal removes brass because brass is a copper-alloy and copper-alloy is the term used to identify materials manufactured where copper is the base metal and includes brass and bronze.

Cost Impact: Will not increase the cost of construction
This proposal will not increase the cost of construction as this change is only to update the name of a material that is already in the code.

TENTATIVE ORDER OF DISCUSSION
2015 PROPOSED CHANGES TO THE
INTERNATIONAL MECHANICAL CODE

The following is the tentative order in which the proposed changes to the code will be discussed at the public hearings. Proposed changes which impact the same subject have been grouped to permit consideration in consecutive changes.

Proposed change numbers that are indented are those which are being heard out of numerical order. Indentation does not necessarily indicate that one change is related to another. Proposed changes may be grouped for purposes of discussion at the hearing at the discretion of the chair. Note that some M code change proposals may not be included on this list, as they are being heard by another committee.

202

Proponent: Steven Ferguson, representing ASHRAE (sferguson@ashrae.org)

2015 International Mechanical Code

Revise as follows:

SECTION 202 DEFINITIONS

OCCUPATIONAL EXPOSURE LIMIT (OEL). The ~~timeweighted~~time-weighted average (TWA) concentration for a normal ~~eighthour~~eight-hour workday and a 40-hour workweek to which nearly all workers can be repeatedly exposed without adverse effect, based on the OSHA PEL, ACGIH TLV-TWA, ~~AIHA~~ TERA OARS WEEL, or consistent value.

Reason: The WEEL values were previously issued by the American Industrial Hygiene Association. These values are now issued by the Toxicology Excellence for Risk Assessment (TERA) Occupational Alliance for Risk Science (OARS).
Please visit this website to view the WEEL database: http://www.tera.org/OARS/WEEL.html

This change is consistent with addendum d to ASHRAE Standard 34-2013 which can be found here: https://www.ashrae.org/standards-research--technology/standards-addenda

Bibliography: http://www.tera.org/OARS/WEEL.html
https://www.ashrae.org/standards-research--technology/standards-addenda

Cost Impact: Will not increase the cost of construction
This proposal simply updates a definition to indicate what organization is responsible for WEEL values, which has no impact on construction cost.

M 1-15 : 202-OCCUPATIONAL EXPOSURE LIMIT (OEL)-FERGUSON4853

M 2-15

202

Proponent: Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

2015 International Mechanical Code

Revise as follows:

SECTION 202 DEFINITIONS

ACCESS (TO). That which enables a device, *appliance* or *equipment* to be reached by ready access or by a means that first requires the removal or movement of a panel, ~~door~~ or similar obstruction [see also "Ready access (to)"].

READY ACCESS (TO). That which enables a device, *appliance* or *equipment* to be directly reached, without requiring the removal or movement of any panel, ~~door~~ or similar obstruction [see "Access (to)"].

Reason: The term "door" has caused confusion because one must pass through one or more egress doors before reaching any object inside of a building. For example, if an emergency control must be readily accessed, personnel would likely pass through one or more egress/ingress doors before reaching the emergency control, and that is the reality of the situation. The term "door" as used in the definitions was referring to "access doors" similar to panels. The term "access door" might be an alternative to the term "door" because "access door" clearly differentiates between access doors/panels and egress doors. This proposal intends to distinguish egress doors from cabinet doors, access doors and alcove doors and intends to prevent these definitions from being misinterpreted as prohibiting room and closet doors.

Cost Impact: Will not increase the cost of construction
This proposal will not increase the cost of construction because no additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code nor are the code requirements made more stringent.

M 2-15 : 202-ACCESS (TO)-SNYDER3614

M 3-15

202

Proponent: Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

2015 International Mechanical Code

Revise as follows:

SECTION 202 DEFINITIONS

COMMERCIAL COOKING APPLIANCES. Appliances used in a commercial food service establishment for heating or cooking food ~~and which produce grease vapors, steam, fumes, smoke or odors that are required to be removed through a local exhaust ventilation system. Such appliances include deep fat fryers; upright broilers; griddles; broilers; steam-jacketed kettles; hot-top ranges; under-fired broilers (charbroilers); ovens; barbecues; rotisseries; and similar appliances~~. For the purpose of this definition, a commercial food service establishment ~~shall include any building~~is where food is prepared for sale or is prepared on a ~~portion thereof used for the preparation~~scale that is by volume and ~~serving~~frequency not representative of ~~food~~domestic household cooking.

Reason: 1) The current definition is circular in that Chapter 5 uses the term and dictates where a hood is required for such appliances, yet this definition says that a commercial cooking appliance is something that requires a hood (local exhaust system). The current definition is flawed because if Chapter 5 does not require a hood for a particular cooking appliance, then this definition would say that it is no longer a commercial cooking appliance.
2) The laundry list of appliances in this definition is incomplete and is redundant with and overlaps the definitions of light-, medium- and heavy-duty cooking appliances. The overlap among the definitions creates confusion.

3) There is no accepted definition for "commercial" therefore this proposal attempts to reunite the term with its roots. "Commercial" means commerce which means money exchanging hands, buying and selling. Clearly the cooking of food for sale is commercial, however, it becomes muddy when the cooking is large scale and frequent, but food is not sold. Consider charity kitchens, some church kitchens and some institutional occupancies. If food is not being sold, then other considerations such as volume and frequency of cooking must dictate what is commercial, because as the volume and frequency increase, so too do the hazards associated with such cooking.
4) The current definition says that ANY building or portion thereof used for preparing food is a food service establishment. This is extremely broad and could include, for example, a kitchenette (lunch/break room) in an office building. Food service establishments include, but are not limited to: restaurants, cafeterias, institutional kitchens, charity kitchens, dormitory and barrack kitchens, cooking schools, church kitchens, school cafeteria kitchens, mercantile kitchens, banquet and catering facilities, bakeries, wholesale production kitchens, and similar occupancies. The volume and frequency of cooking in these occupancies is not representative of domestic household cooking.

The revised definition dumps the appliance laundry list and describes what would be considered as commercial food service establishments, which is the intent of the definition. Chapter 5 determines where hoods are required, not this definition. The revised text nails down what is commercial by tying it to sales, and attempts to categorize the non-sales cooking facilities by contrasting them with domestic cooking. This is as close as we can get to defining "commercial." If the cooking looks, smells, sounds and tastes like domestic cooking, then the code does not intend to treat it as commercial because the fire and health hazards just aren't there.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes.

Cost Impact: Will not increase the cost of construction
This proposal will not increase the cost of construction because no additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code nor are the code requirements made more stringent.

M 3-15 : 202-COMMERCIAL COOKING APPLIANCES-SNYDER3259

M 4-15

202 (New)

Proponent: Vickie Lovell, InterCode Incorporated, representing RectorSeal Corp. (vickie@intercodeinc.com)

2015 International Mechanical Code

Add new definition as follows:

SECTION 202 DEFINITIONS

LOCKING-TYPE TAMPER-RESISTANT CAP. A cap that is designed to prevent its removal by means of hand-loosening or by means of commonly available tools. Such caps can be removed only by means of a unique key that is specifically designed for the locking cap.

Reason:

Section 1101.10 was a new section in the 2009 IMC and IRC that addresses the locking access of refrigerant port caps. New code sections in both the 2015 IMC and IRC require that access ports for refrigerants be contained in a secure location or, if located outside a locked, controlled area, be secured with a tamper-resistant locking cap. This code change was approved during the 2009, 2012 and 2015 cycles to help reduce unauthorized access to refrigerants, and to help AC system efficiency from the accidental mixing of refrigerant gases.

This proposal is intended to expand on the intent and purpose of the new code section in the IMC and the IRC by defining the primary safeguard: the locking-type tamper-resistant cap.

Refrigerant gas theft has become increasingly problematic in recent years. Some of this is due to the rising costs of these gases; however, stealing refrigerant for the act of "huffing" is increasing at an alarming rate. "Sniffing" or "huffing" refrigerant gas is extremely dangerous, causing brain damage or even death. Inhalants are the fourth most abused substance. According to the Inhalant Statistics and Reports, "59% of children are aware of friends huffing at age 12." In the U.S., the 2006 National Survey on Drug Use and Health, found that 1.1 million youths aged 12 to 17 had used inhalants in the past year. "Sniffing" or "huffing" can begin at age 10 or younger. 22% of inhalant abusers who died of Sudden Sniffing Death Syndrome had no history of previous inhalant abuse--they were first-time users.

Some port caps are designed to be removed with a set bit, Allen wrench, Schrader valve tool or screwdriver. The use of such tools to remove a cap could be considered just an annoying delay to a determined thief because such port caps are not truly LOCKED. The majority of the victims of huffing are teens and pre-teens, many of whom could easily tamper with a port cap using such readily available tools. This definition clarifies that the cap should be a truly tamper-resistant lock to be effective, that is, can only be opened with a specially designed key.

This clarification of the definition of a specially designed "lock and key" will reduce theft and help to safeguard youngsters from serious injury or death resulting from the inhalation of dangerous refrigerants.

Cost Impact: Will increase the cost of construction
THIS CODE CHANGE PROPOSAL MAY HAVE A MINIMAL COST IMPACT DURING CONSTRUCTION.

M 4-15 : 202-LOCKING-TYPE TAMPER-RESISTANT CAP (New)-LOVELL3953

M 5-15

202

Proponent: Jeffrey Shapiro, International Institute of Ammonia Refrigeration, representing International Institute of Ammonia Refrigeration (jeff.shapiro@intlcodeconsultants.com)

2015 International Mechanical Code

Revise as follows:

SECTION 202 DEFINITIONS

MACHINERY ROOM. ~~A room meeting prescribed safety~~An enclosed space that, where required by Chapter 11 to contain refrigeration equipment, must comply with the requirements ~~and~~set forth in~~ which refrigeration systems or components thereof are located (see~~ Sections 1105 and 1106~~)~~.

Reason: The proposed definition is consistent with the definition in IIAR 2 and resolves a problem with the current definition. The current definition implies that any room with refrigeration equipment is a machinery room, which is incorrect. Only those rooms that are required to contain certain refrigeration machinery and refrigerant quantities are classified as machinery rooms.

Cost Impact: Will not increase the cost of construction
This proposal is a clarification that should have no impact on the cost of construction.

M 5-15 : 202-MACHINERY ROOM-SHAPIRO4843

M 6-15

202

Proponent: Pennie L Feehan, representing Copper Development Association (penniefeehan@me.com)

Part

2015 International Mechanical Code

Revise as follows:

SECTION 202 DEFINITIONS

PIPING.
Where used in this code, "piping" refers to either pipe or tubing, or both.
Pipe. A rigid conduit of iron, steel, copper, ~~brass~~copper-alloy, or plastic.
Tubing. Semirigid conduit of copper, copper-alloy, aluminum, plastic or steel.

Reason:

The proposal removes brass because brass is a copper-alloy and copper-alloy is the term used to identify materials manufactured where copper is the base metal and includes brass and bronze. Copper-alloy tubing is manufactured ASTM B135 & ASTM B251.

Cost Impact:

Will not increase the cost of construction
This proposal will not increase the cost of construction as this change is only to update the name of a material that is already in the code.

M 6-15 : 202-PIPE-FEEHAN4012

M 8-15

202

Proponent: Jay Peters, representing Cerro Flow Products (peters.jay@me.com)

2015 International Mechanical Code

Revise as follows:

SECTION 202 DEFINITIONS

~~PRESS~~PRESS-CONNECT JOINT.

No change to text.

Reason: The only change in this proposal is to replace the term "PRESS" with the industry recognized term "PRESS-CONNECT". The ASTM standard, as well as the industry, refer to this technology as ***press-connect joints*** and ***press-connect fittings***. This proposed edit to the definition was created to bring the IMC and other related standards into alignment and to prevent potential confusion in the industry. The IPC currently utilizes the term *press-connect* and this small edit would bring uniformity to the ICC Codes. A proposal to Section 1107.5 also uses the term *press-connect* and this would correlate with that proposal.

Cost Impact: Will not increase the cost of construction
This change is merely replacing a term, and is not a substantive technical change.

M 8-15 : 202-PRESS JOINT-PETERS4914

M 9-15

202

Proponent: Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

2015 International Mechanical Code

Revise as follows:

SECTION 202 DEFINITIONS

VENTILATION. The natural or mechanical process of ~~supplying~~ introducing conditioned or unconditioned outdoor air to~~, or removing such~~ a space and removing air from~~, any~~ such space at an approximately equal rate.

Reason: The current definition dates back to when ventilation involved recirculation and has caused confusion because it still implies that ventilation involves recirculated air, when in fact, it does not. In the IMC, ventilation is by means of outdoor air only. There is no recognition of ventilation by recirculated indoor air. The revised definition makes this clear and also states a fundamental principal that ventilation does not occur without a balance of supplied air and removed air. If a system supplies 1000 cfm of outdoor ventilation air to a space, then it must exhaust, relieve or otherwise remove air at an equal rate or else the space will positively or negatively pressurize and the ventilation rate will not be realized. The revised definition is open such that it will recognize any means of supplying the outdoor air, such as by supply fans with relief fans or gravity openings and by means of exhaust fans and supply fans or gravity intake openings.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes.

Cost Impact: Will not increase the cost of construction

This proposal will not increase the cost of construction because no additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code nor are the code requirements made more stringent.

M 9-15 : 202-VENTILATION-SNYDER3253

M 10-15

313 (New), Chapter 15

Proponent: Ronald George, Self, representing Self (Ron@Plumb-TechLLC.com)

2015 International Mechanical Code

Add new text as follows:

SECTION 313
SYSTEM DESIGN CONSIDERATIONS

313.1 Design of Building Water Systems The design of building water systems shall be in accordance with ASHRAE 188.

Add new standard(s) as follows:
ASHRAE 188 - DRAFT_4th Public Review_09262014 Legionellosis: Risk Management for Building Water Systems

Reason: There are many design considerations in the ASHRAE standard that will help minimize Legionella bacteria growth in building water systems which can lead to Legionnaires Disease when water droplets are aerosolized and breathed in. Following the ASHRAE Standard will minimize the risk of a person contracting Legionnaires' disease or Legionellosis by having the design team consider system maintenance proceedures to control the risk of legionellosis associated with plumbing & mechanical systems.

Bibliography: See the folowing websites for more information:
www.LegionellaPrevention.org.

http://www.cdc.gov/legionella/about/,

www.Legionella.com, www.hcinfo.com

http://www.who.int/water_sanitation_health/emerging/legionella.pdf

Cost Impact: Will increase the cost of construction
Buildings without a history of Legionella and not fitting the requirements will not need to add to the cost of construction. A water management plan will need to be done if a building meets certain minimum requirements. The cost of construction to address temperature, stagnation and water treatment will slightly increase the cost of construction and maintenance. Any building that is operating without growing Legionella should already has these processes in place, this will simply require documentation as part of a water management plan. This will provide for system design, operation and treatment that will minimize legionella bacteria growth and help prevent Leginnaires Disease.

Analysis: A review of the standard proposed for inclusion in the code, ASHRAE 188, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2015.

M 10-15 : 313 (New)-GEORGE5826

M 11-15

303.7

Proponent: Guy McMann, Jefferson County, Colorado, representing Colorado Association of Plumbing and Mechanical Officials (CAPMO) (gmcmann@jeffco.us)

2015 International Mechanical Code

Revise as follows:

303.7 Pit locations. Appliances installed in pits or excavations shall not come in direct contact with the surrounding soil and shall be installed not less than 6 inches above the pit floor. The sides of the pit or excavation shall be held back not less than 12 inches (305 mm) from the *appliance*. Where the depth exceeds 12 inches (305 mm) below adjoining grade, the walls of the pit or excavation shall be lined with concrete or masonry. Such concrete or masonry shall extend not less than 4 inches (102 mm) above adjoining grade and shall have sufficient lateral load-bearing capacity to resist collapse. Excavation on the control side of the appliance shall extend not less than 30 inches (762mm) horizontally. The *appliance* shall be protected from flooding in an *approved* manner.

Reason: This Section lacks some detail in floor and control side language found in the other codes. This modification completes this section and has all the information necessary for a complete and code compliant installation.

Cost Impact: Will not increase the cost of construction
THis proposal is just for correlation between codes for consistency.

M 11-15 : 303.7-MCMANN3565

M 12-15

303.9 (New), 901.5 (New)

Proponent: John Williams, CBO, Chair, representing Adhoc Health Care Committee

2015 International Mechanical Code

Add new text as follows:

303.9 Fireplaces in Group I-2 Condition 2 occupancies. Fuel burning appliances and fireplaces in Group I-2 condition 2 occupancies shall be in accordance with Section 901.5.

901.5 Solid fuel-burning fireplaces and appliances in Group I-2 Condition 2. In Group I-2 Condition 2 occupancies, solid fuel-burning fireplaces and appliances are prohibited.

Reason: The AHC committee is recommending limitations for the use of gas-fired fireplaces and decorative equipment and the restriction of solid-fuel burning fireplaces and appliances in the Group I-2, Condition 2 occupancy. Please note: these are not new requirements for the I-2 Occupancy facilities but are needed in the I-Codes for coordination of the long-standing provision of the construction and operational requirements for healthcare facilities.

It is standard practice and operational procedure to control the ignition sources in healthcare occupancies that can contain combustible, flammable (and sometimes even explosive) material. Fire risks need to be limited to the maximum extent feasible and specific requirements for these facilities are not currently or are not completely addressed in the I-Codes.

The language proposed in the IFGC prescribes limitations and conditions to provide the necessary safety and limitations of hazards from within the healthcare environments to the fire and ignition sources inherent to all gas-fired fireplaces and appliances. Combustion air has been restricted from being drawn from healthcare environments extending beyond the last decade and is not a new requirement.

The physical separation of the combustion chambers of gas-fired fireplaces and equipment is required to separate and provide a barrier between the ignition sources and the environmental air within healthcare occupancies. All combustion air is required to be taken directly from the exterior of the building in accordance with an existing exception that is provided for in IFGC Section 303.3.

The placement of solid fuel burning fireplaces and appliances, both decorative and heating, creates conditions where open flames that are not otherwise able to be controlled or extinguished like the similar gas-fed and fired appliances. This is why the Adhoc Healthcare Committee is proposing their restriction instead of a limitation with operational and special control equipment.

The code sections that address the installation limitations of fuel gas-fired fireplaces and appliances will also provide alternative means for compliance for existing facilities. Given the hazards present with these appliances in the Group I-2, Condition 2 Occupancies, the proposed IFC requirements will be 'retro-active' requirements for healthcare occupancies (I-2);

The proposals to the IFC that are being put forth by the Adhoc Healthcare Committee have been drafted to clarify, restrict and limit the ignition source hazards in healthcare occupancies and also will reference similar requirements being proposed in the IBC, IMC AND IFGC. For instance, solid fuel heating appliances are limited by other requirements of the IMC which is why heating appliances are not needed to be referenced in this section of the IFGC.

There was a concern mentioned during testimony at the code hearings for the 2012 I-codes that the AHC code change proposals placing restrictions on solid fuel burning fireplaces and appliances and fuel gas-fired fireplaces and appliances might be misinterpreted to prohibit mechanical heating equipment elsewhere regulated in the IMC.

The ICC Ad Hoc Committee on Healthcare (AHC) has just completed its 4th year. The AHC was established by the ICC Board to evaluate and assess contemporary code issues relating to hospitals and ambulatory healthcare facilities. This is a joint effort between ICC and the American Society for Healthcare Engineering (ASHE), a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. Information on the AHC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the AHC effort can be downloaded from the AHC website at: http://www.iccsafe.org/cs/AHC/Pages/default.aspx.

Cost Impact: Will not increase the cost of construction
Wood burning fireplaces are not permitted by the federal CMS regulations, therefore, there is no change in cost of construction.

M 12-15 : 303.9 (New)-WILLIAMS4240

M 13-15

Table 305.4

Proponent: Mike Cudahy, representing Plastic Pipe and Fittings Association (mikec@cmservnet.com)

2015 International Mechanical Code

Revise as follows:

TABLE 305.4
PIPING SUPPORT SPACING[a]

PIPING MATERIAL	MAXIMUM HORIZONTAL SPACING (feet)	MAXIMUM VERTICAL SPACING (feet)
PE-RT <u>one inch and smaller</u>	$2^{2}/3$ (32 inches)	10c
PE-RT > $1^{1}/_{4}$ inches	4	10c
PEX tubing <u>one inch and smaller</u>	$2^{2}/3$ (32 inches)	10c
<u>PEX tubing 1 1/4 inch and larger</u>	<u>4</u>	<u>10c</u>

(Portions of table not shown remain unchanged)

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm.

a. See Section 301.18.

b. The maximum horizontal spacing of cast-iron pipe hangers shall be increased to 10 feet where 10-foot lengths of pipe are installed.

c. Mid-story guide.

Reason: The 2015 code cycle for the IRC included updates to the PE-RT tubing for sizes larger than 1". The IRC-P Table P2605.1 is current and correct and should be used as the base template for all other tables within the ICC codes as identified in this amendment proposal. The horizontal support spacing for both PEX and PE-RT tubing (piping) up to and including 1" size is 32" (2-2/3Ft) and 48" (4Ft) for sizes 1- 1/4" and larger. These dimensions are consistent with all published PEX literature and manufacture's installation instructions. This would have been included in the IPC and IMC had it been in the same code cycle as the IRC for 2015.

Cost Impact: Will not increase the cost of construction
This proposal modifies the spacing for piping material support into the code and thus the code with this proposal added will not cause the cost of construction to increase, and could decrease the cost as less support is required for larger pipe.

M 13-15 : T305.4-CUDAHY4742

M 14-15

305.4

Proponent: Pennie L Feehan, representing Copper Development Association (penniefeehan@me.com)

2015 International Mechanical Code

Revise as follows:

TABLE 305.4
PIPING SUPPORT SPACING[a]

PIPING MATERIAL	MAXIMUM HORIZONTAL SPACING (feet)	MAXIMUM VERTICAL SPACING (feet)
ABS pipe	4	10[c]
Aluminum pipe and tubing	10	15
~~Brass pipe~~	~~10~~	~~10~~
~~Brass tubing, $1\frac{1}{4}$-inch diameter and smaller~~	~~6~~	~~10~~
~~Brass tubing, $1\frac{1}{2}$-inch diameter and larger~~	~~10~~	~~10~~
Cast-iron pipe[b]	5	15
Copper or copper-alloy pipe and tubing	~~12~~ 8	10
~~Copper or copper-alloy tubing, $1\frac{1}{4}$-inch diameter and smaller~~	~~6~~	~~10~~
~~Copper or copper-alloy tubing, $1\frac{1}{2}$-inch diameter and larger~~	~~10~~	~~10~~
CPVC pipe or tubing, 1 inch and smaller	3	10[c]
CPVC pipe or tubing, $1\frac{1}{4}$-inch and larger	4	10[c]
Lead pipe	Continuous	4
PB pipe or tubing	$2\frac{2}{3}$ (32 inches)	4
PE-RT	$2\frac{2}{3}$ (32 inches)	10[c]
PE-RT > $1\frac{1}{4}$ inches	4	10[c]

PEX tubing	$2^2/3$ (32 inches)	10c
Polypropylene (PP) pipe or tubing, 1 inch or smaller	$2^2/3$ (32 inches)	10c
Polypropylene (PP) pipe or tubing, $1^1/4$ inches or larger	4	10c
PVC pipe	4	10c
Steel tubing	8	10
Steel pipe	12	15

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm.

a. See Section 301.18.

b. The maximum horizontal spacing of cast-iron pipe hangers shall be increased to 10 feet where 10-foot lengths of pipe are installed.

c. Mid-story guide.

Reason: Brass is a copper alloy and the supporting requirements are covered under the Copper and Copper Alloy Pipe and Tubing line. The 6 foot requirement is to restrictive. The Copper Tubing Handbook written by Copper Development Association recommends horizontal support every 8 feet.

Cost Impact: Will not increase the cost of construction
The proposal will not impact the cost of construction as it is only changing the material terminology and combining it this the copper section of this table.

M 14-15 : T305.4-FEEHAN3723

M 15-15

Part I:
306.1.1
Part II:
M1305.1.1

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IMC COMMITTEE. PART II WILL BE HEARD BY THE IRC-MECHANICAL COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

Proponent: Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

Part I

2015 International Mechanical Code

Delete without substitution:

~~**306.1.1 Central furnaces.** Central furnaces within compartments or alcoves shall have a minimum working space *clearance* of 3 inches (76 mm) along the sides, back and top with a total width of the enclosing space being not less than 12 inches (305 mm) wider than the furnace. Furnaces having a firebox open to the atmosphere shall have not less than 6 inches (152 mm) working space along the front *combustion* chamber side. *Combustion air* openings at the rear or side of the compartment shall comply with the requirements of Chapter 7.~~

> ~~**Exception:** This section shall not apply to replacement appliances installed in existing compartments and alcoves where the working space clearances are in accordance with the *equipment* or *appliance* manufacturer's installation instructions.~~

Part II

2015 International Residential Code

Delete without substitution:

~~**M1305.1.1 Furnaces and air handlers.** Furnaces and air handlers within compartments or alcoves shall have a minimum working space clearance of 3 inches (76 mm) along the sides, back and top with a total width of the enclosing space being not less than 12 inches (305 mm) wider than the furnace or air handler. Furnaces having a firebox open to the atmosphere shall have not less than a 6-inch (152 mm) working space along the front combustion chamber side. Combustion air openings at the rear or side of the compartment shall comply with the requirements of Chapter 17.~~

> ~~**Exception:** This section shall not apply to replacement *appliances* installed in existing compartments and alcoves where the working space clearances are in accordance with the *equipment* or *appliance* manufacturer's installation instructions.~~

Reason: Part I (IMC): This section is antiquated and has apparently lost its purpose. There is no reason to single out central furnaces. Clearances for working spaces are already covered by the manufacturer's instructions and Section 306.1. The requirement for a 3 inch clearance around the sides, back and top has no apparent justification. What work could personnel perform in a 3 inch space? What is the 12 inch extra width supposed to accomplish? Section 306.1 covers this adequately. There is nothing in Chapter 7 regarding combustion air openings on the sides and rear of the furnace. If these requirements are really necessary, then why does the exception negate them for subsequent (replacement) installations?
Part II (IRC): This section is antiquated and has apparently lost its purpose. There is no reason to single out central furnaces. Clearances for working spaces are already covered by the manufacturer's instructions and Sections M1307.1, M1401.1 and M1402.2. The requirement for a 3 inch clearance around the sides, back and top has no apparent justification. What work could personnel perform in a 3 inch space? What is the 12 inch extra width supposed to accomplish? Section M1305.1 covers this adequately. There is nothing in Chapter 17 regarding combustion air openings on the sides and rear of the furnace. If these requirements are really necessary, then why does the exception negate them for subsequent (replacement) installations?

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes.

Cost Impact:

Part I: Will not increase the cost of construction
This proposal will not increase the cost of construction because no additional labor, materials, equipment, appliances or devices are mandated beyond

what is currently required by the code nor are the code requirements made more stringent.

Part II: Will not increase the cost of construction
This proposal will not increase the cost of construction because no additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code nor are the code requirements made more stringent.

M 15-15 : 306.1.1-SNYDER3276

M 17-15

307.2.2

Proponent: Pennie L Feehan, Copper Development Association, representing Copper Development Association (penniefeehan@me.com)

2015 International Mechanical Code

Revise as follows:

307.2.2 Drain pipe materials and sizes. Components of the condensate disposal system shall be cast iron, galvanized steel, copper and copper alloy, cross-linked polyethylene, polyethylene, ABS, CPVC, PVC, or polypropylene pipe or tubing. Components shall be selected for the pressure and temperature rating of the installation. Joints and connections shall be made in accordance with the applicable provisions of Chapter 7 of the *International Plumbing Code* relative to the material type. Condensate waste and drain line size shall be not less than $^{3}/_{4}$-inch (19.1 mm) internal diameter and shall not decrease in size from the drain pan connection to the place of condensate disposal. Where the drain pipes from more than one unit are manifolded together for condensate drainage, the pipe or tubing shall be sized in accordance with Table 307.2.2.

Reason: Copper alloys fittings and pipe are used regularly in condensate waste disposal systems and were missing from the list of approved materials. As an example, nipples and unions.

Cost Impact: Will not increase the cost of construction
This proposal is adding a material use in the field and will not impact the cost of construction.

M 17-15 : 307.2.2-FEEHAN3789

M 18-15

308.1

Proponent: Guy McMann, Jefferson County, Colorado, representing Colorado Associatoin of Plumbing and Mechanical Officials (CAPMO) (gmcmann@jeffco.us)

2015 International Mechanical Code

Revise as follows:

308.1 Scope. This section shall govern the reduction in required *clearances* to combustible materials, including gypsum wallboard, and combustible assemblies for *chimneys,* vents, kitchen exhaust equipment, mechanical appliances, and mechanical devices and *equipment*.

Reason: This is a similar change that was approved in theIFGC last cycle. It's important to note that the IMC considers gypsum wallboard to be combustible even when the IBC does not. Nowhere in the IMC is it stated so clearly. Even though there is a definition of non-combustible, addisng these words will clarifythe intentof the code for the user.

Cost Impact: Will not increase the cost of construction
There will be no additional cost as this is a clarification of current intent.

M 18-15 : 308.1-MCMANN3563

M 19-15

401.2

Proponent: Luis Escobar, representing Air Conditioning Contractors of America (luis.escobar@acca.org)

2015 International Mechanical Code

Revise as follows:

401.2 Ventilation required. Every occupied space shall be ventilated by natural means in accordance with Section 402 or ~~by mechanical means in accordance with Section 403. Where the air infiltration rate in a dwelling unit is less than 5 air changes per hour when tested with a blower door at a pressure of 0.2-inch water column (50 Pa) in accordance with Section R402.4.1.2 of the *International Energy Conservation Code*, the dwelling unit shall be ventilated~~ by mechanical means in accordance with Section 403. Ambulatory care facilities and Group I-2 occupancies shall be ventilated by mechanical means in accordance with Section 407.

Reason: This proposal is intended to clarify a current point of contention in the code.
Section 401.2 begins by allowing either natural or mechanical ventilation in the design. It then goes on to require mechanical ventilation if the infiltration rate is less than 5 air changes per hour (ACH) when tested per IECC section R402.4.1.2. However, IECC section R402.4.1.2 contains the procedures for verifying that the air leakage rate not exceed 5 ACH (climate zones 1 and 2) or 3 ACH (climate zones 3 - 8). This effectively allows the designer to pick natural ventilation up front only to get failed ultimately because of a catch-22 resulting from post-construction testing.

Further, it should be noted that the testing requirements ("air infiltration rate", i.e., "uncontrolled inward air leakage") does not comply with the IMC's definition of natural ventilation ("the movement of air into and out of a space through intentionally provided openings...").

The proposed change reverts back to the requirements in the 2009 IMC which simply allows for either natural or mechanical ventilation.

Cost Impact: Will not increase the cost of construction
This proposal allows the option of not installing mechanical ventilation, saving on construction costs.

M 19-15 : 401.2-ESCOBAR5800

M 20-15

202 (New), 401.2

Proponent: Mike Moore, Newport Ventures, representing Broan-NuTone, representing Newport (mmoore@newportventures.net)

2015 International Mechanical Code

Add new definition as follows:

SECTION 202 DEFINITIONS

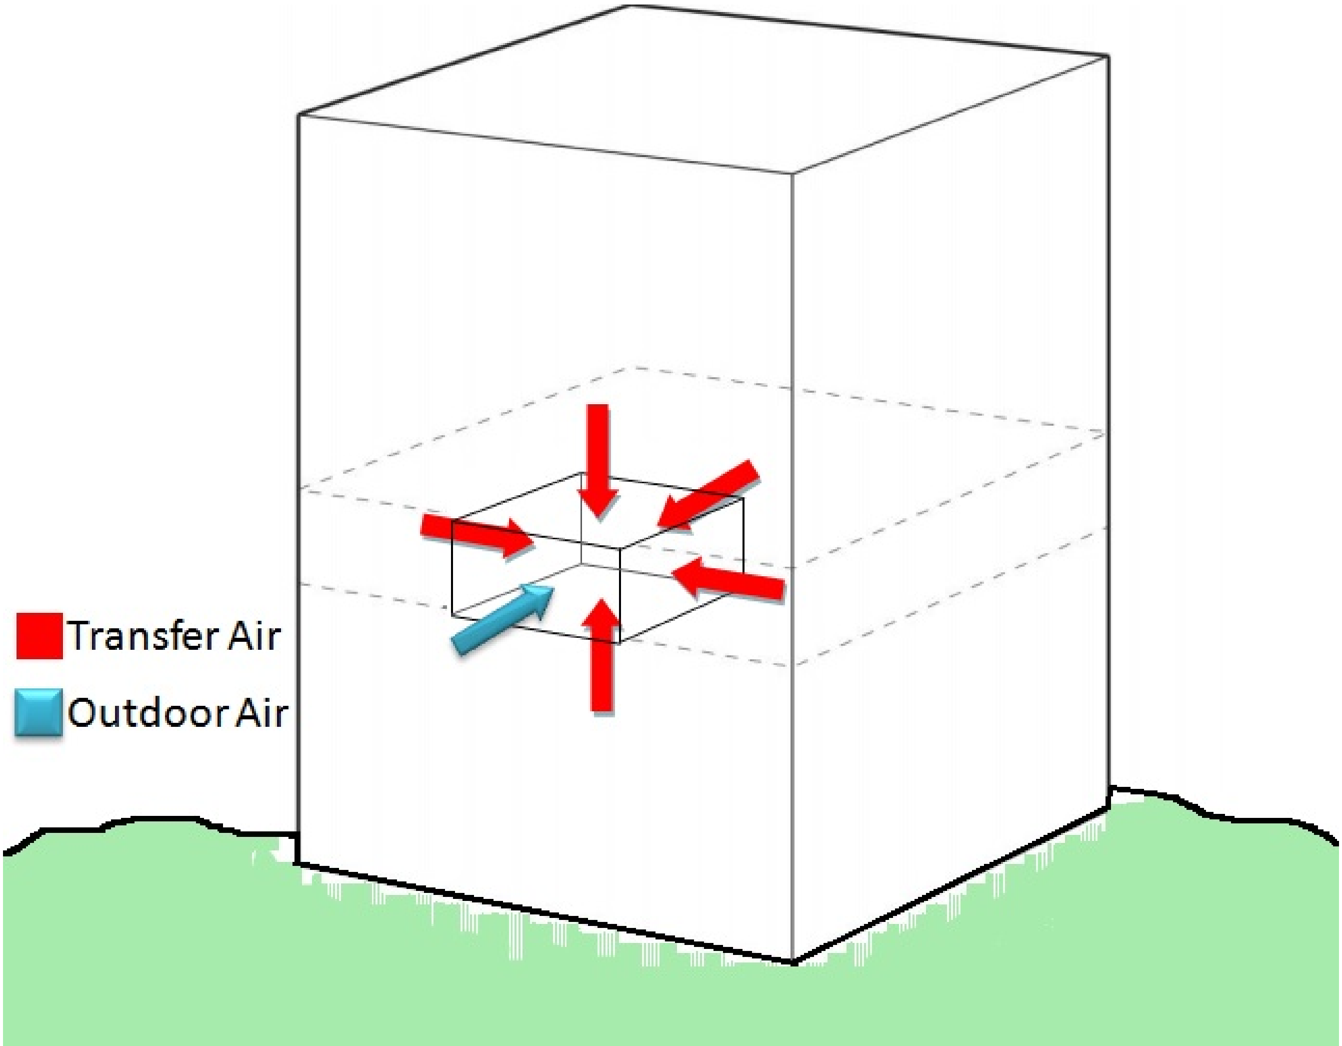
NONTRANSIENT Characterized by occupancy of a dwelling unit for greater than 30 days by occupants who are primarily permanent in nature.

Revise as follows:

401.2 Ventilation required. Every occupied space shall be ventilated by natural means in accordance with Section 402 or by mechanical means in accordance with Section 403. ~~Where the air infiltration rate~~Dwelling units in ~~a dwelling unit is less than 5 air changes per hour when tested with a blower door at a pressure of 0.2-inch water column (50 Pa) in accordance with Section R402.4.1.2 of the *International Energy Conservation Code*, the dwelling unit~~nontransient residential occupancies shall be ventilated by mechanical means in accordance with Section 403. Ambulatory care facilities and Group I-2 occupancies shall be ventilated by mechanical means in accordance with Section 407.

Reason: Compartmentalized Units are Tight and Should Require Mechanical Ventilation!
Attached dwelling units are being built tighter than ever, with increasing focus on compartmentalization of dwelling units for suppression of fire, smoke, odors, and environmental tobacco smoke; reduced energy use for heating and cooling; improved acoustics; and improved occupant comfort. Despite dwelling units being built tighter, there is no requirement for these tight units to be provided with mechanical ventilation. This proposal introduces a requirement for mechanical ventilation in today's tight and energy efficient buildings to provide occupants with minimum acceptable indoor air quality. So, how tight are these dwelling units covered by the IMC being built? Unfortunately, we don't know, because very little data are available on new, code-minimum units. We do know that in general, dwelling units are getting much tighter over time (see Figure 1), but how much, we're not sure. For argument's sake, let's say they're TWICE as leaky as ENERGY STAR multifamily high rise units. Sound reasonable? This would put them at about 12 ACH50.[12] That sounds plenty leaky to provide sufficient natural ventilation, until you consider that a significant portion of the infiltration of attached dwelling units is likely to be transfer air from neighboring units, since much less of an attached unit's surface area is adjacent to the outdoors.

For example, interior dwelling units have only 1/6 surfaces exposed to the exterior, or about 10% of the total surface area for a unit with a square floor plan. Let's assume that up to 40% of the dwelling unit leakage comes through the 10% of the surface area accounted for by the exterior wall. This number can vary widely, but is a reasonable assumption based on multiple sources and feedback from builders, developers, and energy professionals that the most difficult area to air seal in attached units is the fire rated assembly wall separating dwelling units. So, for attached dwelling units that are twice as leaky as ENERGY STAR units, the effective outdoor air leakage rate would be about 5 ACH50 (40% of 12 ACH50). This is the leakage rate that triggers mechanical ventilation requirements in both the IRC and IMC.



ENERGY STAR Tight	Typical Tightness	
Total Leakage	Total Leakage	Leakage to Outdoors
~6 ACH50 (0.3 cfm50/sqft)	~12 ACH50 (assuming twice as leaky as ENERGY STAR)	~5 ACH50 (assuming 40% of leakage comes from outdoors)

Table 1. Estimating the tightness of typical attached dwelling units.

In other words, by the IRC and IMC's own standards, typical dwelling units, regardless of whether or not they have a blower door test, should be provided with mechanical ventilation. This proposal limits the requirements for mechanical ventilation to the dwelling units that will have the highest impact on occupant health - those units whose occupants are expected to be nontransient, since these account for the lion's share of pollutant exposure over time. The definition of nontransient is adapted from the IBC definition of transient.

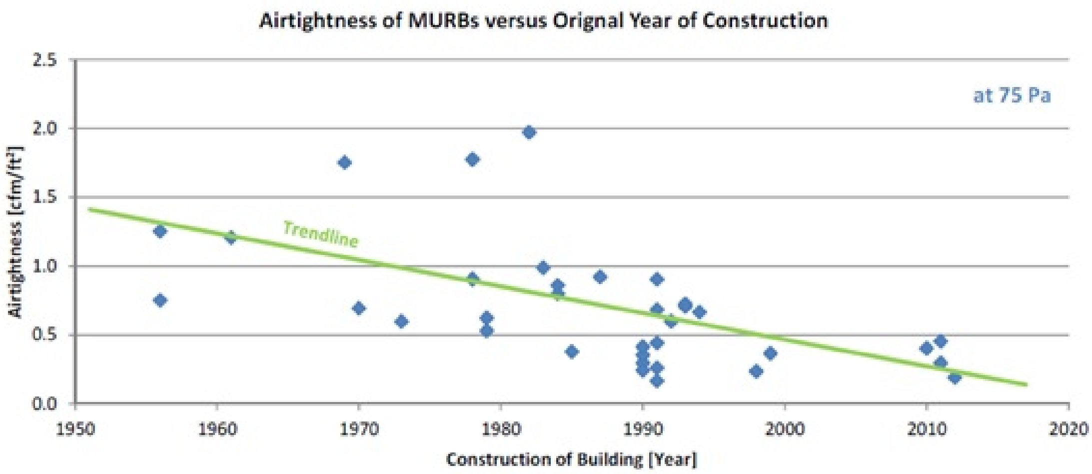


Figure 1. Airtightness of Multi-Unit Residential Buildings (MURB), by year.[14] The 0.4 cfm75/sqft metric for units built after 1995 would translate to about 0.3 cfm50/sqft. However, because this data set is limited and includes some high performance buildings across the U.S. and Canada, it should only be used to indicate a trend in tightness over time (dwelling units are getting tighter!) and should not be used to validate a specific leakage rate.

Building Tight without Mechanically Ventilating Can Have Huge Health Impacts

Building tight, compartmentalized dwelling units (5 ACH50 and below) has become the new standard practice, regardless of whether or not a developer confirms the tightness with a blower door test. Of course, the one potential problem with building tight is the negative impact it has on indoor air quality if mechanical ventilation is not provided. Without mechanical ventilation, tight dwelling units can experience elevated humidity levels; increased condensation potential on windows; higher concentrations of dust mites and allergens; and higher concentrations of pollutants such as particulate matter (which can be transmitted to the circulatory system and organs after being introduced to the lungs), radon (the second leading cause of lung cancer; has also been detected in high-rise units[13]), formaldehyde, acetaldehyde, and other VOCs that have negative health impacts.

We spend 90% of our time indoors, so it's no wonder that health impacts associated with poor indoor air quality include increased risk or exacerbation of asthma, stroke, neurotoxicity, and cancer, among others.[6,9,10] Many indoor air pollutants originate from building materials and finishes. Recent studies have shown that air pollution levels in dwelling units that are not mechanically ventilated can exceed outdoor national air quality standards for CO in 7-8% of homes and NO_2 in 55-70% of homes, during a typical week.[3] Other sources point to the increase in flame retardants in building materials and finishes driven by codes and standards as contributing to the presence of these chemicals in indoor dust and air and ultimately in the bodies of people (33 different flame retardants products have now been discovered in people's bodies; health effects of many of these are still largely unknown).[11]

Estimates for the cost of poor indoor air quality are staggering. The cost of asthma triggered by dampness and mold in U.S. residences has been estimated at $3.5 billion annually[5], and asthma now affects one in five Americans[4]. While dampness and mold should be controlled as much as possible at the source, there are other pollutants where source control is not an option for many households. Even when you exclude radon and second hand smoke from the list of indoor pollutants, poor indoor air quality in U.S. residences is estimated to account for 14% of all years of life lost and years of disability associated with "noncommunicable and nonpsychiatric diseases."[6] Based on another study, this is roughly equal to the negative health impacts of alcohol use, diabetes, and HIV/AIDS combined.[7]

Relying on Natural Ventilation Alone Doesn't Cut it In Tight Dwelling Units

A prominent study on occupant window operation in new (2002-2004 era) single family homes concluded that "a substantial percentage of homeowners never open their windows, especially in the winter" and that window operation coupled with natural infiltration does not provide the airflow rates necessary to achieve minimum indoor air quality.[8]

Nonetheless, natural ventilation through operable windows provides a useful and sometimes necessary function. Operable windows offer natural ventilation in addition to daylight and egress. Even with mechanical ventilation, a home occupant needs to be able to control their own environment, particularly in the case of an emergency such as a power failure (e.g., being able to open windows for airflow in the aftermath of a storm or blackout or in the case of equipment failure). The intention of this proposal is not to supplant natural ventilation, but to complement it. Experience shows that where mechanical ventilation is required (i.e., all ENERGY STAR homes, low-rise dwelling units built to the 2012 IECC, all new low-rise dwelling units in CA, etc.), builders are not generally using it to trade off against natural ventilation requirements. The exception for this would be toilet rooms, which for decades have often been provided with local exhaust instead of an operable window.

At this point, mechanical ventilation is needed to provide minimum acceptable air quality for code-minimum construction. This change will ensure that the comfortable, energy efficient homes that builders and developers are now building are also provided with the systems required by national consensus standards to provide for this need.

12. The ENERGY STAR requirement for maximum total air leakage in high-rise multifamily dwelling units is 0.3 cfm50/sqft of the dwelling unit's envelope surface area. For a square, 1000 sqft unit with 9 foot ceilings, this translates to 6.3 ACH50 (the ENERGY STAR requirement for low-rise and mid-rise multifamily units is even tighter, at 3-6 ACH50, depending on climate zone). Assuming typical units are twice as leaky as high rise units would place them at ~12 ACH50 total leakage. Then, assuming that these units have 40% of their leakage to outdoors means that the effective outdoor air

leakage rate would be ~5 ACH50.

Cost Impact: Will increase the cost of construction
For those dwelling units that are not already provided with outdoor air, retail incremental costs for compliant systems can be less than $70. This is based on the incremental, retail cost difference between an entry-level exhaust fan (Broan 688 at $11.56) and a quiet, higher-efficiency exhaust fan that meets the requirements of the 2012 IECC (Broan QTR080 at $79.15). Prices were sourced from zoro.com on December 19, 2014.

2015 International Mechanical Code

Revise as follows:

401.2 Ventilation required. Every occupied space shall be ventilated by natural means in accordance with Section 402 or by mechanical means in accordance with Section 403. ~~Where~~Mechanical ventilation shall be required for the following:

1. Dwelling units where the air infiltration rate~~ in a dwelling unit~~ is less than 5 air changes per hour when tested with a blower door at a pressure of 0.2-inch water column (50 Pa) in accordance with Section R402.4.1.2 of the *International Energy Conservation Code*.~~, the~~
2. Kitchens in dwelling ~~unit shall be ventilated by mechanical means in accordance with Section 403~~units.
3. Ambulatory care facilities and Group I-2 occupancies. Such ventilation shall be~~e ventilated by mechanical means~~ in accordance with Section 407.

501.3 Exhaust discharge. The air removed by every mechanical exhaust system shall be discharged outdoors at a point where it will not cause a public nuisance and not less than the distances specified in Section 501.3.1. The air shall be discharged to a location from which it cannot again be readily drawn in by a ventilating system. Air shall not be exhausted into an attic, crawl space, or be directed onto walkways.

Exceptions:

1. Whole-house ventilation-type attic fans shall be permitted to discharge into the attic space of *dwelling units* having private attics.
2. Commercial cooking recirculating systems.
3. Where installed in accordance with the manufacturer's instructions and where mechanical ~~or *natural*~~ *ventilation* is otherwise provided in accordance with Chapter 4, *listed* and *labeled* domestic ductless range hoods shall not be required to discharge to the outdoors.

Reason:

Pollutants from cooking have been identified as some of the worst in the home, in terms of health impacts. Pollution during cooking events includes NO_2, CO, HCHO (formaldehyde), acrolein (produced when cooking meats and oils; used as a nerve agent in WWI), polycyclic aromatic hydrocarbons, and particulate matter (which can become lodged in the lungs or pass through the lungs to the circulatory system.[1,2,3,4,5,6,17,18,19,20,21] Overall, indoor air pollution from residential dwelling units (excluding the impacts of radon and second hand smoke) is estimated to account for 14% of all years of life lost and years of disability associated with "noncommunicable and nonpsychiatric diseases."[7] Based on another study, this is roughly equal to the negative health impacts of alcohol use, diabetes, and HIV/AIDS combined.[8] The lion's share of the health impacts of poor indoor air quality in dwelling units has been linked to particulate matter, and indoor particulate matter is emitted when cooking on both electric and gas stoves.[3,7,9]

Overall, the primary source of particulate matter in non-smoking dwelling units is unvented cooking.[1] Natural ventilation alone is an insufficient means to provide required ventilation because it relies on pressure differentials that may or may not exist, and when they exist, the pressure differential could be equally as likely to spread the pollutant throughout the dwelling unit and neighboring units as it would be to exhaust the pollutant directly to the outdoors. Further, studies have shown that occupants often do not operate windows for ventilation.[10,11] Concerns with window operation include security and discomfort (including severe draft in winter).

To improve the health and life safety of dwelling unit occupants, this proposal would require that mechanical ventilation be provided for all kitchens in dwelling units. Some compelling facts and quotes on kitchen pollutants and ventilation follow.

- Simulations show that where a natural gas cooktop is used without a vented range hood, "62%, 9%, and 53% of occupants are routinely exposed to NO_2, CO, and HCHO (formaldehyde) levels that exceed acute health-based standards and guidelines."[12]
- "Emissions of nitrogen dioxide in homes with gas stoves exceed the EPA's definition of clean air in an estimated 55 percent to 70 percent of those homes, according to one model; a quarter of them have air quality worse than the worst recorded smog (nitrogen dioxide) event in London. Cooking represents one of the single largest contributors, generating particulate matter (formally known as PM2.5) at concentrations four times greater than major haze events in Beijing."[13]
- Increased exposure to NO_2 in dwelling units has been associated with an increased number of asthma attacks.[14,15,16]
- "People don't need to radically change their lifestyles. We need to change the building codes so that everyone gets a venting range hood."- Dr. Jennifer Logue, Research Scientist with Lawrence Berkeley National Laboratory[13]

Cost Impact: Will increase the cost of construction

For those units that do not already install kitchen exhaust, the cost of construction will increase, depending on equipment selection. Exhaust hoods start around $30 retail (e.g., Broan economy hood #403001, 2-speed, moving 160 cfm, priced on zoro.com at $33.36 with free shipping on December 19, 2014). Most dwelling units have some sort of recirculating exhaust hood at a minimum, so the actual incremental cost could probably be disregarded for the equipment itself. For units that are recirculating only, installed cost to the GC for ducting is estimated at ~$13/linear foot for 3.25x10" duct (RS Means 2013 Residential Cost Data, adjusted for inflation).

M 21-15 : 401.2-MOORE4909

M 22-15

Table 401.5

Proponent: Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

2015 International Mechanical Code

Revise as follows:

TABLE 401.5
OPENING SIZES IN LOUVERS, GRILLES AND SCREENS PROTECTING AIR INTAKE OPENINGS

OUTDOOR OPENING TYPE	MINIMUM AND MAXIMUM OPENING SIZES IN LOUVERS, GRILLES AND SCREENS[a] ~~MEASURED IN ANY DIRECTION~~
Intake openings in residential occupancies	Not < $^1/_4$ inch and not > $^1/_2$ inch
Intake openings in other than residential occupancies	> $^1/_4$ inch and not > 1 inch

For SI: 1 inch = 25.4 mm.

<u>a. For rectangular openings, the table requirements apply to the shortest side. For round openings, the table requirements apply to the diameter. For square openings, the table requirements apply to any side.</u>

Reason: The current text would not permit slotted louvers and grilles because the size limit applies to all sides "in any direction." A slot 3/8 inch wide and 12 inches long meets the intent of the code but would be prohibited by the current table. The table appears to rule out slots and instead allows only openings that are a maximum of ½ by ½ or 1 x 1 inch. What if the openings are round? If so, the measurement should apply to the diameter of the circle. "Measured in any direction" would also include the diagonal of a square or rectangle. For example, a ½ by ½ inch square mesh screen on a residential building has a diagonal of 11/16 inch, which exceeds the ½ inch maximum. As revised, note (a) clearly specifies the measurement that applies to the geometry of the opening.

Cost Impact: Will not increase the cost of construction
This proposal will not increase the cost of construction because no additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code nor are the code requirements made more stringent.

2015 International Mechanical Code

Add new definition as follows:

SECTION 202 DEFINITIONS

NONTRANSIENT Characterized by occupancy of a dwelling unit for greater than 30 days by occupants who are primarily permanent in nature.

Revise as follows:

403.1 Ventilation system. Mechanical ventilation shall be provided by a method of supply air and return or *exhaust air* except that mechanical ventilation air requirements for ~~Group R-2, R-3 and R-4 occupancies three stories and less~~dwelling units in ~~height above grade plane~~nontransient residential occupancies shall be provided by an exhaust system, supply system or combination thereof. The amount of supply air shall be approximately equal to the amount of return and *exhaust air*. The system shall not be prohibited from producing negative or positive pressure. The system to convey *ventilation air* shall be designed and installed in accordance with Chapter 6.

403.3 Outdoor air and local exhaust airflow rates. ~~Group R-2, R-3 and R-4 occupancies three stories and less~~ Dwelling units in ~~height above grade plane~~nontransient residential occupancies shall be provided with outdoor air and local exhaust in accordance with Section 403.3.2. All other buildings intended to be occupied shall be provided with outdoor air and local exhaust in accordance with Section 403.3.1.

403.3.1 Other buildings intended to be occupied. The design of local exhaust systems and ventilation systems for outdoor air for occupancies other than ~~Group R-2, R-3 and R-4 three stories and less above grade plane~~dwelling units in nontransient residential occupancies shall comply with Sections 403.3.1.1 through 403.3.1.5.

403.3.2 ~~Group R-2, R-3 and R-4~~Dwelling units in nontransient residential occupancies~~, three stories and less~~. The design of local exhaust systems and ventilation systems for outdoor air in ~~Group R-2, R-3 and R-4 occupancies three stories and less~~dwelling units in ~~height above grade plane~~nontransient residential occupancies shall comply with Sections 403.3.2.1 through 403.3.2.3.

403.3.2.1 Outdoor air for dwelling units in nontransient residential occupancies. *No change to text.*

Delete without substitution:

~~**403.3.2.2 Outdoor air for other spaces.** Corridors and other common areas within the conditioned space shall be provided with outdoor air at a rate of not less than 0.06 cfm per square foot of floor area.~~

Revise as follows:

TABLE 403.3.2.3
MINIMUM REQUIRED LOCAL EXHAUST RATES FOR ~~GROUP R-2, R-3, AND R-4~~DWELLING UNITS IN NONTRANSIENT RESIDENTIAL OCCUPANCIES

AREA TO BE EXHAUSTED	EXHAUST RATE CAPACITY
Kitchens	100 cfm intermittent or 25 cfm continuous
Bathrooms and toilet rooms	50 cfm intermittent or 20 cfm continuous

For SI: 1 cubic foot per minute = 0.0004719 m^3/s.

Reason: This proposal is intended to simplify the optional mechanical ventilation compliance path for all dwelling units in nontransient residential occupancies, regardless of building height. This change is aligned with a recent scope change in standards ASHRAE 62.2 and 62.1 that moved jurisdiction of dwelling units in nontransient residential occupancies to the scope of ASHRAE 62.2, regardless of building height.[1] This change was strongly supported by both committees, primarily for the following reason:

- Ventilation rates for dwelling units in nontransient residential occupancies should be consistent across all units, regardless of building height. Why should a dwelling unit in a 4 story building require an outdoor air ventilation rate that is up to two times greater than that in a 3 story building?

Approval of this particular proposal to the IMC would have the following benefits:

- More closely align the IMC's ventilation requirements with consensus standards without requiring the user to access or purchase those standards.
- Simplify the design, specification, and enforcement of outdoor air ventilation and exhaust requirements for dwelling units in nontransient residential occupancies, regardless of building height.
- Save significant energy: As an example, the IMC currently requires a 1000 sqft, 2 bedroom apartment with 9 foot ceilings to be provided with 53 cfm of outdoor air when located in a three story building (using equation 4-9). For the identical unit in a four story building, the IMC requires 53-105 cfm of outdoor air, depending on the type of HVAC system installed (equations 4-1 and 4-2, and tables 403.3.1.1 and 403.3.1.1.1.2). So, up to 50% of the ventilation energy currently required for high-rise dwelling units can be saved by simply transitioning all ventilation requirements for dwelling units in nontransient residential occupancies to those currently contained in Section 403.3.2.

Bibliography:

1. ASHRAE 62.2-2013 Addendum G. To access a free copy, please contact ASHRAE at (404) 636-8400.

Cost Impact: Will not increase the cost of construction
This change is not expected to increase the cost of construction because it serves to simplify the design, specification, and enforcement of outdoor air ventilation and exhaust requirements for dwelling units in nontransient residential occupancies, regardless of building height.

For SI: 1 cubic foot per minute = 0.0004719 m^3/s, 1 ton = 908 kg, 1 cubic foot per minute per square foot = 0.00508 $m^3/(s \cdot m^2)$, °C = [(°F)-32]/1.8, 1 square foot = 0.0929 m^2.

a. Based upon *net occupiable floor area*.

b. Mechanical exhaust required and the recirculation of air from such spaces is prohibited. Recirculation of air that is contained completely within such spaces shall not be prohibited (see Section 403.2.1, Item 3).

c. Spaces unheated or maintained below 50°F are not covered by these requirements unless the occupancy is continuous.

d. Ventilation systems in enclosed parking garages shall comply with Section 404.

e. Rates are per water closet or urinal. The higher rate shall be provided where the exhaust system is designed to operate intermittently. The lower rate shall be permitted only where the exhaust system is designed to operate continuously while occupied.

f. Rates are per room unless otherwise indicated. The higher rate shall be provided where the exhaust system is designed to operate intermittently. The lower rate shall be permitted only where the exhaust system is designed to operate continuously while occupied.

g. Mechanical exhaust is required and recirculation from such spaces is prohibited except that recirculation shall be permitted where the resulting supply airstream consists of not more than 10 percent air recirculated from these spaces. Recirculation of air that is contained completely within such spaces shall not be prohibited (see Section 403.2.1, Items 2 and 4).

h. For nail salons, each manicure and pedicure station shall be provided with a *source capture system* capable of exhausting not less than 50 cfm per station. Exhaust inlets shall be located in accordance with Section 502.20. Where one or more required source capture systems operate continuously during occupancy, the exhaust rate from such systems shall be permitted to be applied to the exhaust flow rate required by Table 403.3.1.1 for the nail salon.

Reason: This proposal seeks to update the existing ventilation rate table in the IMC. Standard 62.1 is the source material for this table, and this updates the table to match the ventilation rates in 62.1-2013.
Addendum s to ASHRAE Standard 62.1-2007 added a minimum outdoor airflow rate per person as well as a minimum per unit area rate in response to concerns expressing that minimum rates were needed for those spaces. Additionally, that addendum increased the outdoor airflow rate for coin operated laundry facilities based on concerns that those types of spaces were not getting enough outdoor air.

Addendum h to ASHRAE Standard 62.1-2010 modified the ventilation rates for gym/arenas/play areas because the space types had ventilation rates based on floor area only; the per-person rate was zero. Users of the standard
expressed interest in applying demand-controlled ventilation to these space types, which was effectively prohibited by the lack of a per-person component to the ventilation rate. The addendum, and this associated change replaces these space types with the new rates in this proposal. One concern about allowing CO2-based demand controlled ventilation in these spaces is that the volume per person in these spaces is typically large, which means that CO2 concentration changes will have longer than usual lag times behind occupancy changes.

Addendum L to 62.1-2010 added a new cateory for refrigerated warehouses/freezers. The current code includes ventilation spaces for warehouses, which would apply to refrigerated warehouses. Refrigerated warehouse spaces are significantly different from conventional warehouses in a number of ways. The low temperatures will slow the emission of contaminants, such as VOCs, from the materials stored in the space; the characteristics of the items being stored will be different; and the amount of time spent in the space by occupants may be shorter (particularly for spaces kept at sub-freezing temperatures).

This proposal adds a refrigerated warehouse space type to Table 6-1, providing revised ventilation rates for these spaces. These rates include a People Outdoor Air Rate which will require ventilation during periods of expected occupancy, but do not include an Area Outdoor Air Rate which will allow the ventilation rate to be zero for refrigerated warehouses with no occupants. This change was provided to ASHRAE TC 10.1, Custom Engineered Refrigeration Systems, for review. Based on comments from that Technical Committee, the Area Outdoor Air Rate was set to zero, and no distinction is made between refrigerated and freezer spaces.

Bibliography: ASHRAE Standard 62.1-2013
Addendum s to ASHRAE Standard 62.1-2007

Addendum h to ASHRAE 62.1-2010

Addendum L to ASHRAE 62.1-2010

Addenda to ASHRAE Standard 62.1 can be found here:https://www.ashrae.org/standards-research--technology/standards-addenda

Cost Impact: Will increase the cost of construction
While many of these changes may not increase the cost of construction, the cost of construction may increase in refrigerated warehouses/freezers, and warehouses as there will now need to be mechanical ventilation in those spaces, while there was no previous airflow rate requirement.

M 24-15 : T403.3.1.1-FERGUSON3836

M 25-15

403.3.2.4 (New)

Proponent: Mike Moore, Newport Ventures, representing Broan-NuTone, representing Newport (mmoore@newportventures.net)

2015 International Mechanical Code

Add new text as follows:

403.3.2.4 System controls. Control devices for outdoor air ventilation systems shall be provided with text or a symbol indicating the device's function.

Reason:
Tight dwelling units are being outfitted with code-mandated outdoor air ventilation systems. These systems are often simply a bathroom exhaust fan expected to run continuously. The problem is that without a label indicating the system's function, occupants have no idea of the purpose of these systems and are likely to turn them off – thereby increasing the rate of accumulation of harmful indoor pollutants without their knowledge. At a minimum, these systems should be labeled to indicate that they are different than a typical bath fan.

Cost Impact: Will increase the cost of construction
This proposal is expected to have minimal cost impacts, as it simply involves labeling equipment for its intended purpose. This label could either be supplied from manufacturers (incremental cost would probably be <$0.10) or field-applied.

M 25-15 : 403.3.2.4 (New)-MOORE4897

M 26-15

403.3.2.4 (New)

Proponent: Mike Moore, Newport Ventures, representing Broan-NuTone, representing Newport (mmoore@newportventures.net)

2015 International Mechanical Code

Add new text as follows:

<u>**403.3.2.4** **Ventilating Equipment.** Exhaust equipment serving single dwelling units shall be listed and labeled to provide the minimum required air flow in accordance with ANSI/AMCA 210-ANSI/ASHRAE 51.</u>

Add new standard(s) as follows:

<u>ANSI/AMCA 210 - ANSI/ASHRAE 51 -07 Laboratory Methods of Testing Fans for Aerodynamic Performance Rating</u>

Reason:

Industry experience and research have shown that "for advertised airflows that are not certified, the actual installed airflow can be a small fraction of the advertised value".[1] Without a code minimum requirement for listing and labeling flows in accordance with an ANSI standard, there is nothing in place to stop a manufacturer from reporting an airflow under whatever conditions they please (e.g., the condition with no duct work attached). Requiring listing and labeling of ventilating equipment per ANSI/AMCA 210 - ANSI/ASHRAE 51 is the first step in ensuring that fans perform to expectations. In 2015, the IRC adopted a requirement for fans to be tested per ANSI/AMCA 210 - ANSI/ASHRAE 51 when using prescriptive duct sizing Table M1506.2 (see footnote "a"), so this standard has already been referenced elsewhere in the I-codes.

Listing and labeling of products tested to this standard is maintained by the Home Ventilating Institute, which has been in operation for decades. Verification of listing and labeling to this standard can be accomplished by visually inspecting the equipment for an HVI sticker or by looking up the equipment in the on-line database.[2] Certification by HVI in accordance with ANSI/AMCA 210 - ANSI/ASHRAE 51 is already required by ASHRAE 62.2, ENERGY STAR for Homes, and the State of California, among other groups. Roughly 12,000 ventilating equipment products are listed, labeled, and can be referenced in the HVI directory.

Bibliography:

1. Singer, B. C., Delp, W. W., Apte, M., & Price, P. N. (2011). Performance of Installed Cooking Exhaust Devices. LBNL-5265E. Berkeley, CA: Lawrence Berkeley National Laboratory.
2. Home Ventilating Institute. HVI-Certified Products Directory. http://hvi.org/proddirectory/index.cfm . Accessed December 10, 2014.

Cost Impact: Will increase the cost of construction
Over 12,000 ventilating equipment products are labeled and listed in the HVI directory. These fans are tested for airflow in accordance with ANSI/AMCA 210-ANSI/ASHRAE 51. For these products, there will be no incremental cost associated with this change. For equipment that is not currently tested, listed, and labeled, the incremental costs are highly dependent upon volume of the specific products sold.

Analysis: A review of the standard proposed for inclusion in the code, ANSI/AMCA 210 - ANSI/ASHRAE 51, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2015.

M 26-15 : 403.3.2.4 (New)-MOORE4901

M 27-15

404.1

Proponent: Jonathan Roberts, representing UL LLC (jonathan.roberts@ul.com)

2015 International Mechanical Code

Revise as follows:

404.1 Enclosed parking garages. Where mechanical ventilation systems for enclosed parking garages operate intermittently, such operation shall be automatic by means of carbon monoxide detectors applied in conjunction with nitrogen dioxide detectors. Such detectors shall be listed in accordance with UL 2075 and installed in accordance with their listing and the manufacturers' ~~recommendations~~instructions.

Add new standard(s) as follows:
UL 2075-2013 Standard for Gas and Vapor Detectors and Sensors

Reason: This proposal clarifies that the detectors required by this section must be listed to UL 2075 and installed in accordance with their listing. Requiring these detectors to be listed to UL 2075 is consistent with IBC and IFC requirements.

Cost Impact: Will increase the cost of construction
Listed UL 2075 detectors might be marginally more expensive than non-listed detectors.

Analysis:
A review of the standard proposed for inclusion in the code, UL 2075, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2015.

M 27-15 : 404.1-ROBERTS4110

M 28-15

404.1, 404.2

Proponent: Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

2015 International Mechanical Code

Revise as follows:

404.1 Enclosed parking garages. ~~Where mechanical~~
Mechanical ventilation systems for enclosed parking garages shall operate ~~intermittently, such operation~~continuously or shall be ~~automatic~~automatically operated by means of carbon monoxide detectors applied in conjunction with nitrogen dioxide detectors. Such detectors shall be installed in accordance with their manufacturers~~'~~ recommendations. Automatic operation shall cycle the ventilation system between the following two modes of operation:

1. Full-on at an airflow rate of not less than 0.75 cfm per square foot of the floor area served.
2. Standby at an airflow rate of not less than 0.05 cfm per square foot of the floor area served.

Delete without substitution:

~~**404.2 Minimum ventilation.** Automatic operation of the system shall not reduce the ventilation airflow rate below 0.05 cfm per square foot (0.00025 $m^3/s \cdot m^2$) of the floor area and the system shall be capable of producing a ventilation airflow rate of 0.75 cfm per square foot (0.0038 $m^3/s \cdot m^2$) of floor area.~~

Reason: This section has been misinterpreted regarding intermittent operation. No technical changes are proposed by this revision. It is simpler to state that the exhaust system either has to run constantly or it has to run automatically. It is either on all of the time, or it is allowed to be cycled between full-on and minimum-on by the detectors. "Intermittent" operation implies that the system shuts off completely, but, Section 404.2 clearly does not allow the system to shut off completely. The current text breaks the requirements into two separate sections which adds to the confusion. Section 404.2 is being rolled into Section 404.1. Section 404.2 does not convey the simple concept that the system has to exhaust 0.75 cfm continuously or must cycle between 0.75 cfm and some rate that is not less than 0.05 cfm. The detectors determine when the system goes from standby airflow rate to full-on airflow rate.
This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes.

Cost Impact: Will not increase the cost of construction
This proposal will not increase the cost of construction because no additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code nor are the code requirements made more stringent.

M 28-15 : 404.1-SNYDER3278

M 29-15

404.2

Proponent: Kathleen Petrie, representing City of Seattle, Department of Planning and Development (kathleen.petrie@seattle.gov)

2015 International Mechanical Code

Revise as follows:

404.2 Minimum ventilation. Automatic operation of the system shall not reduce the ventilation airflow rate below 0.05 cfm per square foot (0.00025 $m^3/s \cdot m^2$) of the floor area ~~and~~when the garage is occupied. The system shall be capable of producing a ventilation airflow rate of 0.75 cfm per square foot (0.0038 $m^3/s \cdot m^2$) of floor area.

Reason: This proposal clarifies that a ventilating system for an enclosed parking garage must operate at a minimum ventialtion airflow rate only when occupants are present. This tactic conserves energy and saves the building owner money without compromizing occupant health.

Cost Impact: Will not increase the cost of construction
This proposal is only a code clarification

M 29-15 : 404.2-PETRIE4257

M 30-15

501.2, 506.1, 507.1, 507.1.2, 509.1

Proponent: Jim Tidwell, Tidwell Code Consulting, representing Fire Equipment Manufacturers' Association (jimtidwell@tccfire.com)

2015 International Mechanical Code

Revise as follows:

501.2 Independent system required. Single or combined mechanical exhaust systems for environmental air shall be independent of all other exhaust systems. Dryer exhaust shall be independent of all other systems. Type I exhaust systems shall be independent of all other exhaust systems except as provided in Section 506.3.5. Single or combined Type II exhaust systems for food-processing operations shall be independent of all other exhaust systems. Kitchen exhaust systems shall be constructed in accordance with Section 505 for domestic ~~equipment~~ cooking operations and Sections 506 through 509 for commercial ~~equipment~~cooking operations.

506.1 General. Commercial kitchen hood ventilation ducts and exhaust *equipment* shall comply with the requirements of this section. Commercial kitchen grease ducts shall be designed for the type of cooking ~~*appliance*~~ and hood served.

507.1 General. Commercial kitchen exhaust hoods shall comply with the requirements of this section. Hoods shall be Type I or II and shall be designed to capture and confine cooking vapors and residues. A Type I or Type II hood shall be installed at or above ~~all~~ ~~*commercial cooking*~~ *appliances* in accordance with Sections 507.2 and 507.3. Where any cooking *appliance* under a single hood requires a Type I hood, a Type I hood shall be installed. Where a Type II hood is required, a Type I or Type II hood shall be installed. Where a Type I hood is installed, the installation of the entire system, including the hood, ducts, exhaust equipment and makeup air system shall comply with the requirements of Sections 506, 507, 508 and 509.

Exceptions:

1. Factory-built commercial exhaust hoods that are listed and labeled in accordance with UL 710, and installed in accordance with Section 304.1, shall not be required to comply with Sections 507.1.5, 507.2.3, 507.2.5, 507.2.8, 507.3.1, 507.3.3, 507.4 and 507.5.
2. Factory-built commercial cooking recirculating systems that are listed and labeled in accordance with UL 710B, and installed in accordance with Section 304.1, shall not be required to comply with Sections 507.1.5, 507.2.3, 507.2.5, 507.2.8, 507.3.1, 507.3.3, 507.4 and 507.5. Spaces in which such systems are located shall be considered to be kitchens and shall be ventilated in accordance with Table 403.3.1.1. For the purpose of determining the floor area required to be ventilated, each individual *appliance* shall be considered as occupying not less than 100 square feet (9.3 m^2).
3. Where cooking appliances are equipped with integral down-draft exhaust systems and such appliances and exhaust systems are listed and labeled for the application in accordance with NFPA 96, a hood shall not be required at or above them.

507.1.2 Domestic cooking appliances used for commercial purposes. Domestic cooking appliances utilized for commercial purposes shall be provided with Type I or Type II hoods as required for the type of ~~appliances and~~ cooking processes in accordance with Sections 507.2 and 507.3. Domestic cooking appliances utilized for domestic ~~purposes~~ cooking shall comply with Section 505.

509.1 Where required. ~~*Commercial cooking*~~ *Cooking appliances* required by Section 507.2 to have a Type I hood shall be provided with an *approved* automatic fire suppression system complying with the *International Building Code* and the *International Fire Code*.

Reason: The existing verbiage in this section is somewhat confusing, in that it refers to the type of cooking equipment to justify the type of hood (commercial cooking equipment), then states that when domestic cooking equipment is used for commercial purposes, hoods are also required. This code change is intended to clarify that hoods and fire suppression systems are required where the hazard justifies such protection, regardless of the type of equippment being covered.
Section 501.2 addresses the construction of hoods based upon the type of appliance being used; however, other sections (505.4, 507.1.2, 507.2, 507.3) contain requirements based upon the hazard regardless of the type of equipment. The proposed change to 501.2 clarifies and correlates the requirements in the chapter.

Currently, 506.1 states that hood ventilation ducts and exhaust equipment be designed for the type of appliance; however, Section 507.1.2 requires a Type I hood where domestic appliances are used in commercial operations that produce grease or smoke (refers to 507.2). Domestic appliances are currently available that generate very similar heating hcaracteristics as commercial appliances; as a matter of fact, some of the appliances being sold to consumers for their homes are virtually indistinguishable from commercial appliances and may easily be used in commercial cooking operations. The proposed change clarifies that the hazards generated from the cooking operation dictate the required protection scheme.

Section 507.1 currently states that Type I or Type II hoods shall be installed above all commercial cooking appliances, but points to sections of the code that describe requirements for both cooking appliances and other appliances such as dishwashers. In addition, Section 507.1.2 clearly states that Type I or Type II hoods are required for domestic cooking appliances used for commercial purposes. The proposed change clarifies that hoods should be installed over appliances based upon the hazard (or lack thereof) rather than the type of appliance.

507.1.2 requires Type I or Type II hoods over domestic appliances utilized for commercial purposes. It then states that the type of hood is ddependent upon the type of appliance and the proces being used, and refers the user to sections 507.2 and 507.3. These sections clearly apply to commercial cooking and other commercial applications, so maintaining the reference to the type of appliance only confuses the user. The proposed change to this section clarifies the intent of the code.

The change to 509.1 is intended to clarify that any time a Type I hood is required, suuppression is required, regardless of the type of equipment.

Cost Impact: Will not increase the cost of construction
The code change is for purposes of clarification, and does not change the overall requirements of the section, thus will not change the cost of compliance.

M 30-15 : 501.2-TIDWELL5040

M 31-15

501.3.1

Proponent: Mike Moore, Newport Ventures, representing Broan-NuTone, representing Newport (mmoore@newportventures.net)

2015 International Mechanical Code

Revise as follows:

501.3.1 Location of exhaust outlets. The termination point of exhaust outlets and ducts discharging to the outdoors shall be located with the following minimum distances:

1. For ducts conveying explosive or flammable vapors, fumes or dusts: 30 feet (9144 mm) from property lines; 10 feet (3048 mm) from operable openings into buildings; 6 feet (1829 mm) from exterior walls and roofs; 30 feet (9144 mm) from combustible walls and operable openings into buildings which are in the direction of the exhaust discharge; 10 feet (3048 mm) above adjoining grade.
2. For other product-conveying outlets: 10 feet (3048 mm) from the property lines; 3 feet (914 mm) from exterior walls and roofs; 10 feet (3048 mm) from operable openings into buildings; 10 feet (3048 mm) above adjoining grade.
3. For all *environmental air* exhaust: 3 feet (914 mm) from property lines; 3 feet (914 mm) from operable openings into buildings for all occupancies other than Group U, and 10 feet (3048 mm) from mechanical air intakes. Such exhaust shall not be considered hazardous or noxious. Where a combined exhaust and intake terminal is used to separate intake air from exhaust air originating in living space other than kitchens, a minimum separation distance between these two openings shall not be required, provided that the exhaust air concentration within the intake air flow does not exceed 10%, as established by the manufacturer of such terminal.
4. Exhaust outlets serving structures in flood hazard areas shall be installed at or above the elevation required by Section 1612 of the *International Building Code* for utilities and attendant equipment.
5. For specific systems see the following sections:
    5.1. Clothes dryer exhaust, Section 504.4.
    5.2. Kitchen hoods and other kitchen exhaust *equipment*, Sections 506.3.13, 506.4 and 506.5.
    5.3. Dust stock and refuse conveying systems, Section 511.2.
    5.4. Subslab soil exhaust systems, Section 512.4.
    5.5. Smoke control systems, Section 513.10.3.
    5.6. Refrigerant discharge, Section 1105.7.
    5.7. Machinery room discharge, Section 1105.6.1.

Reason:
Combined exhaust/supply terminations are regularly installed with heating and energy recovery ventilators (H/ERVs) used for dwelling units. Their use reduces building penetrations, labor, and associated system costs. By reducing the number of penetrations, air leakage can also be reduced, resulting in space conditioning energy savings. Further, the durability of the structure can be improved through reducing entry pathways for bulk water. Combined terminations are regularly approved and installed in single family and multifamily dwelling units across the country, and manufacturer tests have demonstrated that minimum cross-contamination of airflow results from these terminations. There is currently no industry standard by which to test these units, so we have simply proposed that their performance be verified by the manufacturer, as is the practice in other areas of the code (IMC Sections 513.10.1, 801.14, 1002.2, 1006.3, 1006.7, 1007.2, 1102.2.2.3, 1108.1 exception 3, 1206.7, 1210.6.6.2, etc.). The 10% cross contamination metric is based on language in ASHRAE 62.1 that limits cross contamination of exhaust and supply streams to 10% for "air with moderate contaminant concentration, mild sensory-irritation intensity, or mildly offensive odors"; a similar exception exists in the IMC, Section 514.4. In both the IMC and ASHRAE 62.1, no standard is cited for determining cross-contamination, presumably because none yet exists.

Cost Impact: Will not increase the cost of construction

This proposal is expected to reduce construction costs by eliminating the need for a second wall cap and extra ducting that would otherwise be required to separate intake and exhaust airstreams.

M 31-15 : 501.3.1-MOORE4876

M 32-15

501.6 (New)

Proponent: Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

2015 International Mechanical Code

Add new text as follows:

501.6 Discharge from multiple exhaust fans. The discharge outlets of multiple exhaust fans shall not be connected to a common duct. The discharge outlets of exhaust fans serving separate dwelling units shall not be connected to a common duct.

Reason: If exhaust fans such as toilet and kitchen exhaust fans are connected together on the positive pressure (discharge) side of the fans, exhaust air will flow through any fan that is not running. The typical backdraft dampers do not prevent leakage and are not reliable unless cleaned and maintained. If the fans operate in parallel or have effective backdraft dampers, they could share a common discharge duct if such duct was properly sized and configured. Often such connections involve no engineering and consist of fans duct taped to a tee fitting without even increasing the duct size as necessary. If the fans serve different dwelling units, the exhaust air from one dwelling would discharge into another dwelling unit and this is unacceptable.
This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes.

Cost Impact: Will increase the cost of construction
This proposal will increase the cost of construction in those cases where the discharge side of exhaust fans would have been connected to a common duct, because separate exhaust terminations are required by the proposed text.

M 32-15 : 501.5-SNYDER3260

M 33-15

502.14

Proponent: Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

2015 International Mechanical Code

Revise as follows:

502.14 Motor vehicle operation. In areas where motor vehicles operate, mechanical ventilation shall be provided in accordance with Section 403. Additionally, areas in which stationary motor vehicles are operated shall be provided with a *source capture system* that connects directly to the motor vehicle exhaust systems. Such system shall be engineered by a registered design professional or shall be factory-built equipment designed and sized for the purpose. <u>Makeup air for the ventilation system shall be provided by permanent openings or mechanical makeup air supply units. Motorized dampers for such openings and makeup air supply units shall be automatically controlled to start and operate simultaneously with operation of the ventilation system.</u>

Exceptions:

1. This section shall not apply where the motor vehicles being operated or repaired are electrically powered.
2. This section shall not apply to one and two-family dwellings.
3. This section shall not apply to motor vehicle service areas where engines are operated inside the building only for the duration necessary to move the motor vehicles in and out of the building.

Reason: Overhead doors in repair garages and service garages should not be relied upon to provide makeup air for the required mechanical exhaust/ventilation system because they may or may not be open when makeup is needed. Dampered outdoor air intake openings and makeup air supply units need to be controlled so that they function when the exhaust/ventilation system functions.
This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes.

Cost Impact: Will increase the cost of construction
This proposal will increase the cost of construction in those cases where overhead doors would have been used as makeup air inlets. Alternative makeup air openings are mandated and control wiring will be required to cause simultaneous operation of ventilation systems and the makeup supply units and motorized louvers.

M 33-15 : 502.14-SNYDER3261

M 34-15

504.3

Proponent: Julius Ballanco, JB Engineering and Code Consulting, P.C., representing In-O-Vate Technologies (JBENGINEER@aol.com)

2015 International Mechanical Code

Revise as follows:

504.3 Cleanout. Each vertical riser shall be provided with a means for cleanout. Dryer duct terminations shall by design, provide access for cleaning the exhaust duct.

Reason: The routine cleaning of the dryer exhaust ducts minimizes the potential for a fire in the duct as well as increasing the efficiency of the appliance. Duct cleaning services now provide this service for dryer exhaust ducts using a wand and brush. Many duct cleaning service companies enter the dryer exhaust duct through the duct termination. This offers an easy access to the dryer exhaust duct system. If a proper dryer exhaust terminal is not provided that allows ease of access, some companies have been known to wrongly remove the termination lid or cover creating a potential leak situation.

Examples of vent caps that duct cleaners wrongly disassemble to gain access.

Examples of vent caps that duct cleaners wrongly disassemble to gain access.

Cost Impact: Will increase the cost of construction
The cost may increase for a vent terminal that allows cleaning.

M 34-15 : 504.3-BALLANCO4121

M 35-15

504.4

Proponent: Julius Ballanco, JB Engineering and Code Consulting, P.C., representing In-O-Vate Technologies (JBENGINEER@aol.com)

2015 International Mechanical Code

Revise as follows:

504.4 Exhaust installation. Dryer exhaust ducts for clothes dryers shall terminate on the outside of the building and shall be equipped with a backdraft damper. Screens shall not be installed at the duct termination. Exhaust duct penetrations of exterior wall and roof assemblies shall be sealed air-tight to prevent dryer exhaust from re-entering the building. Ducts shall not be connected or installed with sheet metal screws or other fasteners that will obstruct the exhaust flow. Clothes dryer exhaust ducts shall not be connected to a vent connector, vent or *chimney*. Clothes dryer exhaust ducts shall not extend into or through ducts or plenums.

Reason: This change clarifies that the dryer exhaust must vent to the outside without the possibility of having the dryer exhaust return to the building. In some regions, friction-fitting a ducts' end into a roof cap appears to still be acceptable. This change adds the language to require a positive leak-proof assembly that will prevent the dryer exhaust from reentering the building. The high humidity of the dryer exhaust can cause all sorts of problems within the building elements if the dryer exhaust can reenter the building. Humidity control is an important part of any building design. As such, humid lint-laden air should never be given a path to enter the building after being exhausted.

Cost Impact: Will not increase the cost of construction
This change is simply clarifying the intent of the code.

M 35-15 : 504.4-BALLANCO4118

M 36-15

504.4, 504.8.2

Proponent: Guy McMann, Jefferson County Colorado, representing Colorado Association of Plumbing and Mechanical Officials (CAPMO) (gmcmann@jeffco.us)

2015 International Mechanical Code

Revise as follows:

504.4 Exhaust installation. Dryer exhaust ducts for clothes dryers shall terminate on the outside of the building and shall be equipped with a backdraft damper. Screens shall not be installed at the duct termination. ~~Ducts shall not be connected or installed with sheet metal screws or other fasteners that will obstruct the exhaust flow.~~ Clothes dryer exhaust ducts shall not be connected to a vent connector, vent or *chimney*. Clothes dryer exhaust ducts shall not extend into or through ducts or plenums.

504.8.2 Duct installation. Exhaust ducts shall be supported at 4-foot (1219 mm) intervals and secured in place. The insert end of the duct shall extend into the adjoining duct or fitting in the direction of airflow. Ducts shall not be joined with screws or similar fasteners that protrude more than $^1/_8$ inch (3.2 mm) into the inside of the duct.

Reason: As a result of the newer language in Section 504.8.2, this language is no longer required and will only cast doubt on Section 504.8.2.

Cost Impact: Will not increase the cost of construction
.There is no cost impact as this modification is strictly editorial in nature

M 36-15 : 504.4-MCMANN4352

M 37-15

504.4

Proponent: Janine Snyder, City of Thornton, Colorado, representing Colorado Association of Plumbing & Mechanical Officials (CAPMO) (Janine.Snyder@cityofthornton.net)

2015 International Mechanical Code

Add new text as follows:

504.4 Exhaust installation. Dryer exhaust ducts for clothes dryers shall terminate on the outside of the building and shall be equipped with a backdraft damper. Screens shall not be installed at the duct termination. Ducts shall not be connected or installed with sheet metal screws or other fasteners that will obstruct the exhaust flow. Clothes dryer exhaust ducts shall not be connected to a vent connector, vent or *chimney*. Clothes dryer exhaust ducts shall not extend into or through ducts or plenums. <u>Clothes dryer exhaust ducts shall be sealed in accordance with Section 603.9</u>

Reason: Section 504 covers duct construction for dryers, however, it is unclear on the requirement to seal dryer ducts. Sealing is specified in 603.9. Because we don't have a reference directing the code official to 603.9 do we inadvertently lose the duct sealing requirements? This code change clarifies that dryer ducts must be sealed in accordance with 603.9 removing any doubt.

Cost Impact: Will not increase the cost of construction
The requirement has always been in the code to seal ducts. This code change proposal just reminds you that it is also required for dryer ducts within the section that regulates dryer ducts.

M 37-15 : 504.4-SNYDER4451

M 38-15

504.4.1 (New)

Proponent: Julius Ballanco, JB Engineering and Code Consulting, P.C., representing In-O-Vate Technologies (JBENGINEER@aol.com)

2015 International Mechanical Code

Add new text as follows:

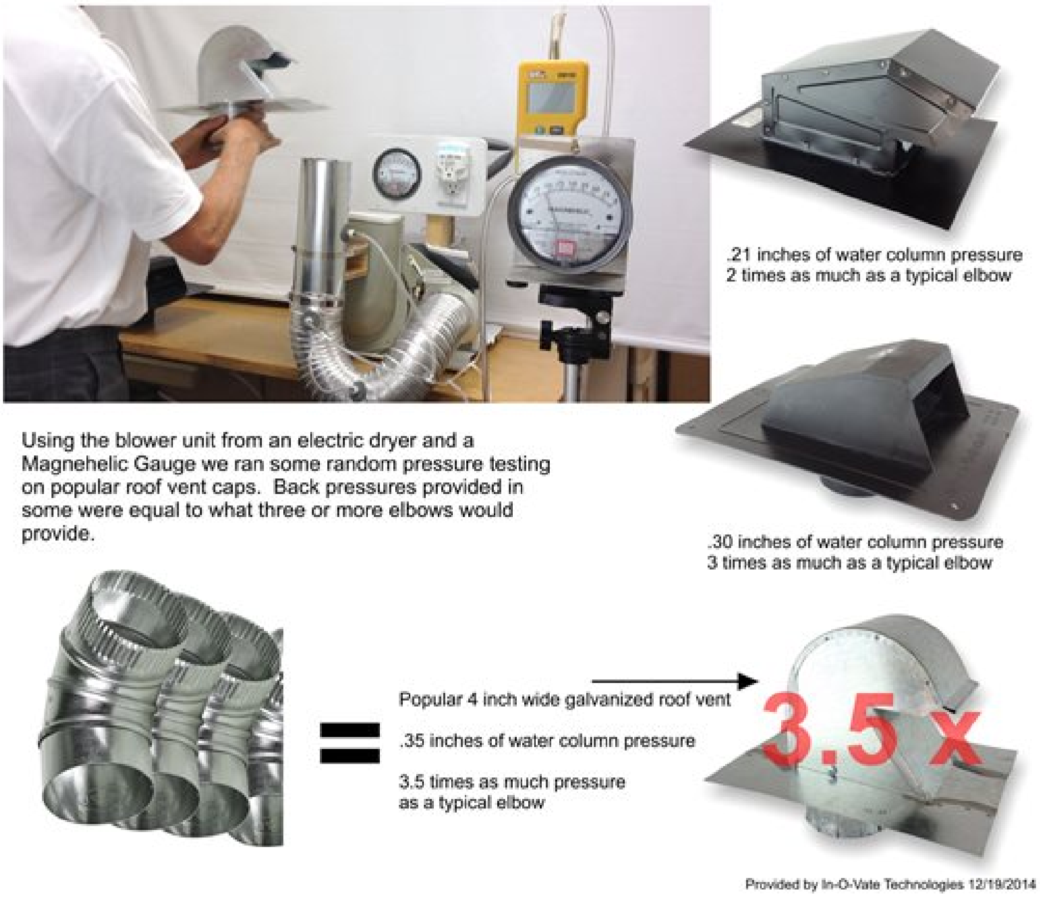
504.4.1 Exhaust termination outlet and passageway size. The passageway of dryer exhaust duct terminals shall be undiminished in size and shall provide an open area of not less than 12.5 square inches (8,065 sq mm).

Reason: The allowable (calculated) length of the dryer exhaust duct is based on an open (non-restrictive) exhaust terminal. Some exhaust terminals increase resistance due to their inherent design characteristics (path and final opening size). This results in the dryer exhaust duct having to be reduced in length. However, there is no allowance for a reduction in length for a highly resistant vent cap. Short of requiring testing standards for every vent termination, the code must require a minimum open area of 12.5 sq. inches which equates to a 4" round duct. The code is very sensitive and detailed as it relates to 90 degree elbows and their respective friction loss but does not prohibit or penalize for termination hoods that grossly create back pressure, reducing the efficiency of the dryer.
The dimension used for the opening in the interior area of the 4 inches duct is rounded to an even number (12.5"). By maintaining the same opening area throughout the vent terminal, the friction resistance in vent caps can be greatly reduced.

Video Links:

www.youtube.com/watch?v=5KnRp3eXNbk

http://youtu.be/ZL2zV1-GjdI?t=50s



Cost Impact: Will increase the cost of construction
The cost of the vent terminal may be higher.

M 38-15 : 504.4.1 (New)-BALLANCO4124

M 39-15

504.4.1 (New)

Proponent: Rick Harpenau, In-O-Vate Technologies, representing Self

2015 International Mechanical Code

Add new text as follows:

504.4.1 Exhaust termination pathways. Dryer exhaust duct terminal pathways that cause a change in direction of air flow between 45 and 90 degrees shall have an area not less than 20 percent larger that the cross sectional area of the exhaust duct served. Dryer exhaust duct terminal pathways that cause a change in direction of air flow greater than 90 degrees shall have an area not less than 30 percent larger than the cross sectional area of the exhaust duct served. Exhaust duct terminal passageways shall maintain throughout an area of not less than 12.5 square inches (8,065 sq mm).

Reason: The code is very sensitive and detailed as it relates to 90 degree elbows and their respective friction loss but does not prohibit or penalize for termination hoods that grossly create back pressure, reducing the efficiency of the dryer. There are wall vents and roof vents on the market that with minimal testing equipment show clearly they create as much back pressure as 3 and 4 elbows. Short of requiring testing standards for every vent termination, the council should consider language whereby the passageway increases in size to make up for the friction causing bends. If this addition to the codes makes sense, actual calculations can be provided. Bottom line, treat terminations the same as elbows and run lengths.
Video Links:

www.youtube.com/watch?v=5KnRp3eXNbk

http://youtu.be/ZL2zV1-GjdI?t=50s

Cost Impact: Will increase the cost of construction
A larger opening at the termination may cost more.

M 39-15 : 504.4.1 (New)-HARPENAU4551

M 40-15

504.6.1 (New)

Proponent: Julius Ballanco, JB Engineering and Code Consulting, P.C., representing In-O-Vate Technologies, Inc. (JBENGINEER@aol.com)

2015 International Mechanical Code

Add new text as follows:

504.6.1 **Make-up air for tight construction.** Make up air shall be provided for clothes dryers where the air infiltration rate is known to be less than 0.4 air changes per hour (ACH). Make-up air shall be provided by a duct that communicates with the outdoors, a ventilated crawl space, or a ventilated attic space and such duct shall have a cross sectional area not less than that of a 4 inch round duct. The make-up air duct shall open into the room in which the clothes dryer is located. Make-up air duct inlets shall be provided with a screen having a mesh size not less than ¼ inch and not greater than ½ inch. The make-up air inlet shall be equipped with an air admitting damper that opens during the operation of the clothes dryer.

Exception: Condensing dryers shall not require make-up air.

Reason: Today homes are much more tightly constructed, creating an inadequate condition for the proper operation of a clothes dryer. The exhaust rate for a residential dryer ranges from 125 to 200 cfm with newer dryers favoring 200 cfm.
When the air infiltration rate drops to less than 0.4 air changes per hour, this creates a condition of inadequate make-up for the clothes dryer. When there is inadequate ambient air to pull from, the dryer is starved and not capable of efficiently drying the clothes any longer. This extends the length of time for the dryer cycle wasting energy. It also reduce the life of the dryer since the fan is attempting to exhaust air that is not available.

Many clothes dryers are located in the basement of a home. When located in the basement, they have the available air in the basement as make-up air for exhausting the moisture. If a basement in 25 feet by 25 feet with an 8 foot ceiling, there is 5,000 cubic feet of available air. However, with an air exchange rate of 0.4, the available air for exhaust is 2000 cubic feet. That translates to 33.3 cfm of air. This means that the dryer has to draw air from other locations in order to properly operate, potentially pulling it from other unsafe sources.

Outside air is normally required by combustion air when the air infiltration rate is less than 0.4 as identified in Section G2407.5. This code change is consistent by requiring make-up air when the air exchange rate is below this value. The amount of air required for combustion air is normally less than the amount of make-up air for a dryer exhaust. An 80,000 Btu/hr furnace only requires between 16.6 and 26.6 cfm for combustion air, whereas the dryer requires between 125 and 200 cfm.

With a 4 inch duct, the make-up air can be provided at an acceptable rate. Furthermore, the fan in the clothes dryer would draw the make-up air through the make-up air duct.

A screened air admitting damper or equivalent device is necessary to prevent outside air from entering the home when the clothes dryer is not in use. The screen dimension are taken from Table 401.5 of the IMC for residential occupancies. The air admitting damper also prevents the loss of conditioned air when the dryer is not in use.

Cost Impact: Will increase the cost of construction
There is a cost to installing a make up air supply system.

M 40-15 : 504.6.1 (New)-BALLANCO3702

M 41-15

Part Part I:
504.8.1
Part Part II:
M1502.4.1

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IMC COMMITTEE. PART II WILL BE HEARD BY THE IRC-MECHANICAL COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

Proponent: Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

Part Part I

2015 International Mechanical Code

Revise as follows:

504.8.1 Material and size. Exhaust ducts shall have a smooth interior finish and shall be constructed of metal ~~a minimum~~not less than 0.016 inch (0.4 mm) ~~thick~~in thickness. The exhaust duct shall be round and the size shall be 4 inches (102 mm) nominal in diameter.

Part Part II

2015 International Residential Code

Revise as follows:

M1502.4.1 Material and size. Exhaust ducts shall have a smooth interior finish and shall be constructed of metal ~~having a minimum thickness of~~not less than 0.0157 ~~inches (0.3950~~inch(0.3950 mm) in thickness (No. 28 gage). The exhaust duct shall be round and the size shall be 4 inches (102 mm) nominal in diameter.

Reason: The code assumes that the dryer ducts are 4 inch round duct, but this not stated in the code. Square, rectangular and oval ducts all have differing flow characteristics and the exhaust system design is based on round duct. The code states 4 inch diameter which clearly indicates round duct, but it would be very clear to state that it must be round.
This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes.

Cost Impact:

Part Part I: Will not increase the cost of construction
This proposal will not increase the cost of construction because no additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code nor are the code requirements made more stringent.

Part Part II: Will not increase the cost of construction
This proposal will not increase the cost of construction because no additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code nor are the code requirements made more stringent.

M 41-15 : 504.8.1-SNYDER3262

M 42-15

504.8.2

Proponent: Julius Ballanco, JB Engineering and Code Consulting, P.C., representing In-O-Vate Technologies (JBENGINEER@aol.com)

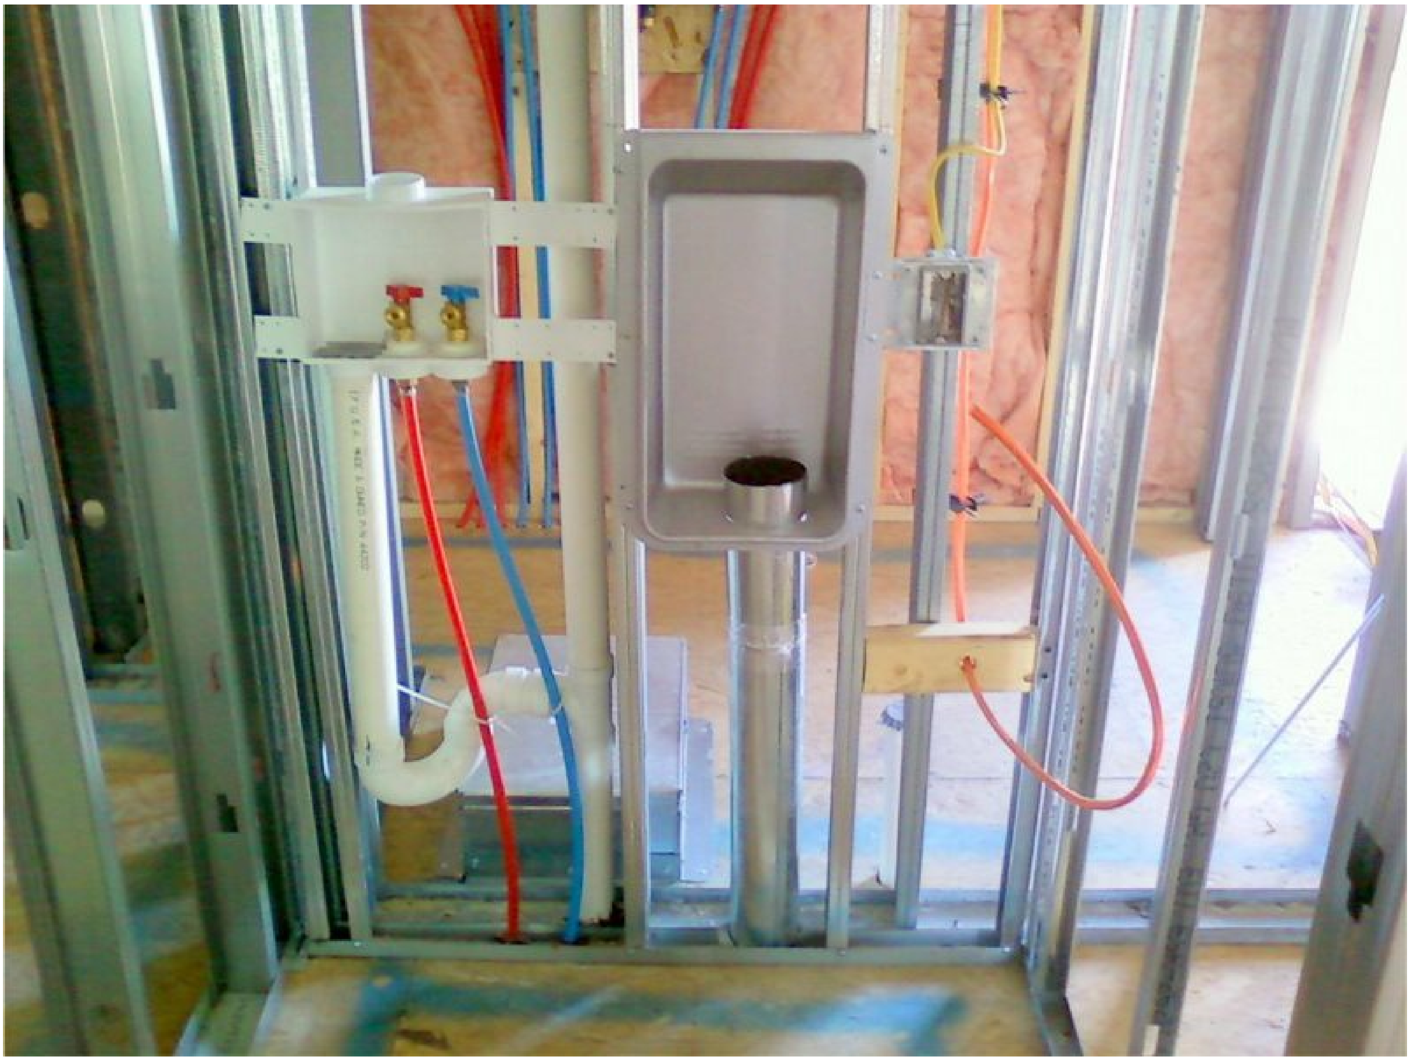
2015 International Mechanical Code

Revise as follows:

504.8.2 Duct installation. Exhaust ducts shall be supported at 4-foot (1219 mm) intervals and secured in place. The insert end of the duct shall extend into the adjoining duct or fitting in the direction of airflow. Ducts shall not be joined with screws or similar fasteners that protrude more than $^1/_8$ inch (3.2 mm) into the inside of the duct. <u>Where dryer exhaust ducts are enclosed in wall or ceiling cavities, such cavitiies shall have a least dimension of not less than 4.25 inches (108 mm). Round duct shall not be deformed.</u>

Reason: The dryer exhaust duct must remain round in shape to reduce friction loss in the duct system. The length of the duct and termination are based on friction loss for round duct, not oval duct. The length of the dryer exhaust duct would have to be reduced if the 4 inch duct was oval in shape. In addition to the reduction in efficiency, the oval pipe creates a difficult connection for the consumer to make to the dryer exhaust transition hose.

A 1 inch furring strip (1x2) can be added to a 2 x 4 stud providing the 4.25 inches of space. In most cases, this "mechanical" wall is busy with other trades (plumbing drainage and vent stacks, gas piping, electric service, laundry services and water piping). A 4.25 inch space will benefit all of the trades working within that space. The minimum space required to keep the dryer exhaust duct round is 4.125 inches. This dimension could also be referenced here, however, most contractors will simply use a furring strip on a 2 x 4 to provide the minimum spacing for the duct.



MOVIE

Examples of “mechanical walls” showing the abundance of utilities in this wall, demonstrating the need to provide more than 3.5”

Cost Impact: Will increase the cost of construction
There is an added cost of adding furring strips to a 2 x 4 wall.

M 42-15 : 504.8.2-BALLANCO4116

M 43-15

504.8.2

Proponent: Guy McMann, Jefferson County, Colorado., representing Colorado Associatoin of Plumbing and Mechanical Officials (CAPMO) (gmcmann@jeffco.us)

2015 International Mechanical Code

Revise as follows:

504.8.2 Duct installation. Exhaust ducts shall be supported at ~~4-foot~~ intervals not to exceed 12 feet (~~1219~~3657 mm) ~~intervals and~~and shall be secured in place. The insert end of the duct shall extend into the adjoining duct or fitting in the direction of airflow. Ducts shall not be joined with screws or similar fasteners that protrude more than $^{1}/_{8}$ inch (3.2 mm) into the inside of the duct.

Reason: Twelve feet is what is found in the SMACNA Manual for 4 inch duct as strapping every 4 feet is unnecessarily restrictive.

Cost Impact: Will not increase the cost of construction
This proposal will actually *decrease* costs by not having to install as many hangers and the labor to do so.

M 43-15 : 504.8.2-MCMANN3570

M 44-15

505, 505.1 (New), 505.2 (New), 505.1, 505.4

Proponent: Jonathan Roberts, UL LLC, representing UL LLC (jonathan.roberts@ul.com)

2015 International Mechanical Code

Revise as follows:

SECTION 505
DOMESTIC ~~KITCHEN~~ COOKING EXHAUST EQUIPMENT

Add new text as follows:

505.1 General. Domestic cooking exhaust equipment shall comply with the requirements of this section.

505.2 Domestic cooking exhaust. Where domestic cooking exhaust equipment is provided it shall comply with the following as applicable:

1. Overhead range hoods and downdraft exhaust equipment not integral with the cooking appliance shall be listed and labeled in accordance with UL 507.
2. Domestic cooking appliances with integral downdraft exhaust equipment shall be listed and labeled in accordance with UL 858 or ANSI Z21.1.
3. Microwave ovens with integral exhaust for installation over the cooking surface shall be listed and labeled in accordance with UL 923.

Revise as follows:

~~505.1~~505.3 ~~Domestic systems.~~Exhaust ducts. ~~Where domestic range hoods and domestic appliances equipped with downdraft~~
Domestic cooking exhaust ~~are provided, such hoods and appliances~~equipment shall discharge to the outdoors through sheet metal ducts constructed of galvanized steel, stainless steel, aluminum or copper. Such ducts shall have smooth inner walls, shall be air tight, shall be equipped with a backdraft damper, and shall be independent of all other exhaust systems.

Exceptions:

1. In other than Group I-1 and I-2, where installed in accordance with the manufacturer's instructions and where mechanical or natural ventilation is otherwise provided in accordance with Chapter 4, listed and labeled ductless range hoods shall not be required to discharge to the outdoors.
2. Ducts for domestic kitchen cooking appliances equipped with downdraft exhaust systems shall be permitted to be constructed of Schedule 40 PVC pipe and fittings provided that the installation complies with all of the following:
   - 2.1. The duct shall be installed under a concrete slab poured on grade.
   - 2.2. The underfloor trench in which the duct is installed shall be completely backfilled with sand or gravel.
   - 2.3. The PVC duct shall extend not more than 1 inch (25 mm) above the indoor concrete floor surface.
   - 2.4. The PVC duct shall extend not more than 1 inch (25 mm) above grade outside of the building.
   - 2.5. The PVC ducts shall be solvent cemented.

505.4 Other than Group R. In other than Group R occupancies, where cooktops, ranges, and open-top broilers are installed, domestic cooking ~~appliances are utilized for domestic purposes, such appliances shall be provided with domestic range hoods. Hoods and~~ exhaust systems shall be ~~in accordance with Sections 505.1 and 505.2.~~provided.

Add new standard(s) as follows:

ANSI Z21.1 - 2010 Household Cooking Gas Appliances

UL 507 - 2014 Standard for Safety Electric Fans

Reason: The IMC currently has no criteria for exhaust hoods and downdraft equipment. This proposal accomplishes the following:
1. Includes a new charging Section 505.1 that is similar to other charging sections in the IMC.
2. New section 505.2 describes the listing standards used to investigate the various types of exhaust equipment.
3. Section 505.3 (formerly Section 505.1) was retitled "Exhaust ducts" to more accurately reflect what is covered in the section. Some edits were made to clarify the wording. No substantive changes were made to the requirements for the exhaust ducts.
4. Section 505.4 was revised to clarify the types of domestic cooking appliance that requires a domestic cooking exhaust system. Without this change an exhaust system could be required for a coffee maker, wall mounted oven, rice cooker, etc.

Cost Impact: Will increase the cost of construction
In most cases there should be no increase in costs if exhaust hoods and downdraft equipment are listed to the specified standards, which appears to be common practice.

Analysis:
A review of the standard proposed for inclusion in the code, UL 507 , with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2015.

M 44-15 : 505-ROBERTS5747

M 45-15

505.1

Proponent: Guy McMann, Jefferson County Colorado, representing Colorado Association of Plumbing and Mechanical Officials (CAPMO) (gmcmann@jeffco.us)

2015 International Mechanical Code

Revise as follows:

505.1 Domestic systems. Where domestic range hoods and domestic appliances equipped with downdraft exhaust are provided, such hoods and appliances shall discharge to the outdoors through sheet metal ducts constructed of galvanized steel, stainless steel, aluminum or copper. Such ducts shall have smooth inner walls, shall be air tight, shall be equipped with a backdraft damper, and shall be independent of all other exhaust systems.

Exceptions:

1. In other than Group I-1 and I-2, where installed in accordance with the manufacturer's instructions and where mechanical or natural ventilation is otherwise provided in accordance with Chapter 4, listed and labeled ductless range hoods shall not be required to discharge to the outdoors. Installations in Group I-1 and Group I-2 occupancies shall be in accordance with Section 407.2.6 of the International Building Code and Section 904.13 of the International Fire Code.
2. Ducts for domestic kitchen cooking appliances equipped with downdraft exhaust systems shall be permitted to be constructed of Schedule 40 PVC pipe and fittings provided that the installation complies with all of the following:
   - 2.1. The duct shall be installed under a concrete slab poured on grade.
   - 2.2. The underfloor trench in which the duct is installed shall be completely backfilled with sand or gravel.
   - 2.3. The PVC duct shall extend not more than 1 inch (25 mm) above the indoor concrete floor surface.
   - 2.4. The PVC duct shall extend not more than 1 inch (25 mm) above grade outside of the building.
   - 2.5. The PVC ducts shall be solvent cemented.

Reason: These pointers are going to aid the user in finding the pertinant information regarding fire suppresion for these range hoods. It can be very time consuming trying to locate the correct language for a code compliant installation. The user would never know that fire suppresion is even required without these pointers.

Cost Impact: Will not increase the cost of construction
There is no cost impact as this proposal is strictly editorial in nature.

M 45-15 : 505.1-MCMANN4983

M 46-15

505.2, 505.2.1 (New)

Proponent: Mike Moore, Newport Ventures, representing Broan-NuTone, representing Newport (mmoore@newportventures.net)

2015 International Mechanical Code

Revise as follows:

505.2 Makeup air required. ~~Exhaust hood systems~~ Where one or more gas, liquid, or solid-fuel burning appliances that are neither direct vent nor use a mechanical draft venting system are located within a dwelling unit's air barrier, each exhaust system capable of exhausting in excess of 400 cfm (0.19 m^3/s) shall be mechanically or passively provided with *makeup air* at a rate approximately equal to the *exhaust air* rate. Such *makeup air* systems shall be equipped with ~~a means~~not less than one damper that complies with Section 505.2.1.

> **Exception:** Makeup air is not required for exhaust systems installed for the exclusive purpose of ~~closure~~space cooling and ~~shall~~intended to be ~~automatically controlled to start and operate simultaneously with the exhaust system.~~operated only when windows or other air inlets are open.

Add new text as follows:

505.2.1 Makeup air dampers. Where makeup air is required by Section 505.2, such dampers shall comply with this section. Dampers shall be gravity or barometric dampers or electrically operated dampers that automatically open when the exhaust system operates. Dampers shall be accessible for inspection, service, repair and replacement without removing permanent construction or any other ducts not connected to the damper being inspected, serviced, repaired or replaced. Gravity or barometric dampers shall not be used in passive makeup air systems except where the dampers are rated to provide the design makeup airflow at a pressure differential of 0.01 in. w.c. (3 Pa) or less.

Reason:
Backdrafting of combustion appliances typically presents the greatest danger associated with depressurizing a space. Field tests have confirmed that naturally vented combustion appliances (i.e., those that are not mechanically vented or direct-vent) are the most susceptible to depressurization, and measures should be taken to provide makeup air (MUA) for large exhaust appliances when such appliances are located within the dwelling unit's air barrier. ASHRAE 62.2, the consensus standard for Ventilation and Acceptable Indoor Air Quality in residential dwelling units, does not require MUA when combustion appliances are mechanically vented or are direct-vent. The ASHRAE 62.2 committee recently reviewed the 62.2 section requiring MUA, and the general consensus (no vote taken) was a reaffirmation that the MUA requirement should not apply to mechanically vented or direct-vent combustion appliances, due to lack of data to substantiate their susceptibility to backdrafting.

This proposal would relax the MUA requirement in the IMC for dwelling units by aligning it more closely with ASHRAE 62.2. Similar changes have been made to this section in Florida's and Virginia's adoptions of the IRC, which has a similar requirement to the IMC.

The proposal introduces a new section to address MUA dampers specifically, with the second and third sentences in Section 505.2.1 taken verbatim from the 2015 IRC. The last sentence introduces a new requirement for gravity or barometric dampers. It makes no sense to design a system to provide MUA if the damper does not open before the combustion appliance starts spilling. So, the new requirement is intended to ensure that when MUA is required, any gravity or barometric damper used to provide MUA shall engage at the pressure differential above which naturally drafted combustion appliances can be expected to backdraft (3 Pa, based on an acceptable 5%-20% failure rate across all outdoor conditions)[1]. This proposed requirement only applies to gravity or barometric dampers in "passive" MUA systems, which are those provide MUA without the assistance of a fan. Gravity or barometric dampers in "active" MUA systems are excluded from this requirement because we assume that the fan will create a sufficient pressure differential to open the damper.

Bibliography:
1. Bohac, D., et al. (2002). Ventilation and Depressurization Information for Houses Undergoing Remodeling. Accessed on Dec 5, 2014 at: http://www.mncee.org/getattachment/eedb1afc-f50e-4833-b450-d52233f58ce0/.

Cost Impact: Will not increase the cost of construction
This proposal is expected to reduce construction costs by reducing the number of scenarios requiring makeup air for kitchen exhaust.

M 46-15 : 505.2.1 (New)-MOORE4887

M 47-15

506.3.11.2

Proponent: Guy McMann, representing Colorado Association of Plumbing and Mechanical Officials (CAPMO) (gmcmann@jeffco.us)

2015 International Mechanical Code

Revise as follows:

506.3.11.2 Field-applied grease duct enclosure. Grease ducts constructed in accordance with Section 506.3.1 shall be enclosed by a *listed* and *labeled* field applied grease duct enclosure material, systems, product, or method of construction specifically evaluated for such purpose in accordance with ASTM E 2336. The surface of the duct shall be continuously covered on all sides<u> with not less than two layers of field applied grease duct enclosure material</u> from the point at which the duct originates to the outlet terminal. Duct penetrations shall be protected with a through penetration fire stop system tested and *listed* in accordance with ASTM E 814 or UL 1479 and having a "F" and "T" rating equal to the fire-resistance rating of the assembly being penetrated. The grease duct enclosure and firestop system shall be installed in accordance with the listing and the manufacturer's instructions. Partial application of a field applied grease duct enclosure shall not be installed for the sole purpose of reducing clearances to combustibles at isolated sections of grease duct. Exposed duct-wrap systems shall be protected where subject to physical damage.

Reason: ASTM E-2336 states that two layers are required to be applied to meet the Standard. All the manufacturer's instructions and the ICC evaluations also state the same. Many installers and designers are not aware that two layers are required. This was disapproved last cycle because of the possibility that a single layer system may someday be developed. Manufacturers of duct wrap material would rather sell twice as much material so there is little incentive to develop a single layer system. This is important information that the user needs to know ahead of time, not only for bidding purposes but in order to pass an inspection the first time around. Inspectors also need this information so they know what to look for. This is a simple "heads up" for code users and installers

Cost Impact: Will not increase the cost of construction
There will be no addional cost as this in only an editorial modification and clarification. Installers are already required to do do this.

M 47-15 : 506.3.11.2-MCMANN3571

M 48-15

506.3.13.2

Proponent: Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

2015 International Mechanical Code

Revise as follows:

506.3.13.2 Termination through an exterior wall.
Exhaust outlets shall be permitted to terminate through exterior walls where the smoke, grease, gases, vapors and odors in the discharge from such terminations do not create a public nuisance or a fire hazard. Such terminations shall not be located where protected openings are required by the *International Building Code*. ~~Other exterior openings~~Such terminations shall be located in accordance with Section 506.3.13.3 and shall not be located within 3 feet ~~(914 mm)~~ of ~~such terminations.~~any opening in the exterior wall.

Reason: The current last sentence implies that outdoor air intakes and windows can be within 3 feet of the exhaust terminal, however Section 506.3.13.3 requires a 10 foot separation for outdoor intakes unless there is a 3 foot vertical separation. This section has been misinterpreted to allow grease duct terminations to be within 3 feet of an operable window. The real intent of the current last sentence is fire safety related and that intent is preserved in the proposed revision. Exterior openings include all openings in the wall such as fixed (non-openable) fenestration panels. The clearance requirement of Section 506.3.13.3 must not be overlooked.
This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes.

Cost Impact: Will not increase the cost of construction
This proposal will not increase the cost of construction because no additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code nor are the code requirements made more stringent.

M 48-15 : 506.3.13.2-SNYDER3264

M 49-15

506.3.13.3.1 (New)

Proponent: Jon Marcus, representing Jon Marcus

2015 International Mechanical Code

Add new text as follows:

506.3.13.3.1 Clearance from dwelling units
Where an exhaust discharge outlet is located within 250 feet horizontally of a dwelling unit, it shall comply with one or more of the following:

1. The point of discharge for such outlet shall be located 25 feet or greater above the highest opening into the dwelling unit.
2. The exhaust system shall be served by a pollution control unit that is listed for that application and designed to effectively capture and control effluent particulates, contaminants and odors.
3. The exhaust system shall be an engineered system utilizing a utility set fan and discharge nozzle designed to eject the effluent vertically to a height not less than 25 feet above the dwelling unit.

Reason: The code currently allows commercial kitchen effluent to discharge as close as 10 feet from an adjacent building which could include single family dwellings and dwelling units in multifamily residential buildings. The occupants of dwelling units that close to the effluent discharge are subjected to the smoke, grease, particulates and odor in the effluent. This can prevent the occupants from opening their windows and enjoying their exterior spaces such as porches and balconies. In some cases, the contaminants enter the dwellings and deposit on the dwelling's interior surfaces. This scenario is all too common in urban areas where dwellings and businesses coexist next door or across a street from each other. The 250 foot horizontal distance and 25 foot vertical are reasonable and would likely allow the effluent to dissipate and be carried away such that the impact on the dwellings is minimal. The proposed text would require a 250 foot horizontal separation, but would allow any lesser horizontal separation where the discharge point is at least 25 foot above the highest window or door of any dwelling within 250 feet.

Cost Impact: Will increase the cost of construction
This proposal will increase the cost of construction because it would require vertical discharge duct extensions or pollution control equipment where it would not be required currently by the code.

M 49-15 : 506.3.13.3-MARCUS3906

M 50-15

506.3.2.5

Proponent: Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

2015 International Mechanical Code

Revise as follows:

506.3.2.5 Grease duct test.
Prior to the use or concealment of any portion of a grease duct system, a leakage test shall be performed. Ducts shall be considered to be concealed where installed in shafts or covered by coatings or wraps that prevent the ductwork from being visually inspected on all sides. The permit holder shall be responsible to provide the necessary *equipment* and perform the grease duct leakage test. A ~~light~~ water test shall be performed to determine that all welded and brazed joints are liquid tight.

A ~~light~~ water test shall be performed by passing ~~a lamp having a power rating of not less than 100 watts~~grease duct pressure washing equipment through the entire section of ductwork to be tested and visually inspecting for leakage of water. The ~~lamp~~pressure washing equipmnent shall be ~~open so as to emit light equally in all directions perpendicular to the duct walls~~of a type used for professionally cleaning commercial kitchen grease ducts. A test shall be performed for the entire duct system, including the hood-to-duct connection. ~~The~~Where the duct work ~~shall be permitted to be~~is tested in sections, ~~provided that every~~no joint ~~is tested~~shall be excluded from testing. For *listed* factory-built grease ducts, this test shall be limited to duct joints assembled in the field and shall exclude factory welds.

Reason: The light test required currently has many deficiencies. Openings in overlapped joint welds would not allow light to reach the observer. Pinhole leaks may not allow enough light through to be observed. The faults in the joints could be on sides not observed during the test and some duct sides may not be visible at all when installed. How fast can the lamp be pulled through the duct? What if the ambient light is bright or it is sunlight? What are the chances that a light test will disclose any, much less, all of the faults in joints? A test with pressurized duct cleaning equipment will expose all faults in the joints by visible water leakage.
This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes.

Cost Impact: Will increase the cost of construction
This proposal will increase the cost of construction because the proposed water test will require more labor and equipment than the currently required light test.

M 50-15 : 506.3.2.5-SNYDER3263

202 (New), 506.5.2 (New)

Proponent: Shawn Strausbaugh, Arlington County, VA representing the VA Plumbing and Mechanical Officials Association (VPMIA) and the VA Building Code Officials Association (VBCOA) Guy McMann, Jefferson County CO, representing the CO Association of Plumbing and Mechanical Officials (CA, representing Arlington County, VA representing the VA Plumbing and Mechanical Inspectors Association (VPMIA) and the VA Building Code Officials Association (VBCOA) (sstrausbaugh@arlingtonva.us)

2015 International Mechanical Code

Add new definition as follows:

SECTION 202 DEFINITIONS

POLLUTION CONTROL UNIT (PCU) Manufactured equipment that is installed in a grease exhaust duct system for the purpose of extracting smoke, grease particles, and odors from the exhaust flow by means of a series of filters.

Add new text as follows:

506.5.2 **Pollution Control Units.** Pollution control units shall be installed in accordance with the manufacturer's installation instructions and shall be in accordance with all of the following:

1. Pollution control units shall be listed and labeled in accordance with UL 1978.
2. Fans serving pollution control units shall be listed and labeled in accordance with with UL 762.
3. Pollution control units shall be mounted and secured in accordance with the manufacturer's installation instructions and the International Building Code.
4. Pollution control units located indoors shall be listed and labeled for such use. Where enclosed duct systems, as required by Section 506.3.11, are connected to a pollution control unit, such unit shall be located in a room or space having the same fire-resistance rating as the duct enclosure. Access shall be provided for servicing and cleaning of the unit. The space or enclosure shall be ventilated in accordance with the manufacturer's installation instructions.
5. A clearance of not less than 18 inches (457 mm) shall be maintained between the pollution control unit and combustible material.
6. Roof mounted pollution control units shall be listed for exterior installation and shall be mounted not less than 18 inches (457 mm) above the roof.
7. Exhaust outlets for pollution control units shall be in accordance with Section 506.3.13.
8. An airflow differential pressure control shall be provided to monitor the pressure drop across the filter sections of a pollution control unit. When the airflow is reduced below the design velocity, the airflow differential pressure control shall activate a visual alarm located in the area where cooking operations occur.
9. Pollution control units shall be provided with a factory installed fire suppression system.
10. Service space shall be provided in accordance with the manufacturer's instructions for the pollution control unit and the requirements of Section 306.
11. Wash down drains shall discharge through a grease interceptor and shall be sized for the flow. Drains, shall be sealed with a trap or other approved means to prevent air bypass. Where a trap is utilized it shall have a seal depth that accounts for the system pressurization and evaporation between cleanings.
12. Protection from freezing shall be provided for the water supply and fire suppression systems where such systems are subject to freezing.
13. Duct connections to pollution control units shall be in accordance with Section 506.3.2.3. Where water splash or carryover can occur in the transition duct as a result of a washing operation, the transition duct shall slope downward toward the cabinet drain pan for a length not less than 18 inches (457 mm). Ducts shall transition to the full size of the units inlet and outlet openings.
14. Extra heavy duty appliance exhaust systems shall not be connected to pollution control units except where such units are specifically designed and listed for use with solid fuels.
15. Pollution control units shall be maintained in accordance with the manufacturer's instructions.

Reason: Pollution Control Units have been manufactured by numerous companies for several years. The desire to limit the amount of smoke, grease, and other particulate at the exhaust outlets of commercial cooking appliances has driven the use of these units as numerous entities are requiring these types of units to be installed. These unit and there minimum construction and installation standards need to be addressed in the mechanical code.

Cost Impact: Will increase the cost of construction

The cost of construction of these specific units may be increased by manufacturers if their current unit did not meet the minimum requirements per this new section. As we do not represent manufacturers it is difficult to substantiate if this proposed change will have create such a cost increase or not

M 52-15

507.1

Proponent: Thomas Johnson, Johnson Diversified Products, Inc, representing Johnson Diversified Products, Inc. (tomj@jdpinc.com)

2015 International Mechanical Code

Revise as follows:

507.1 General. Commercial kitchen exhaust hoods shall comply with the requirements of this section. Hoods shall be Type I or II and shall be designed to capture and confine cooking vapors and residues. A Type I or Type II hood shall be installed at or above all *commercial cooking appliances* in accordance with Sections 507.2 and 507.3. Where any cooking *appliance* under a single hood requires a Type I hood, a Type I hood shall be installed. Where a Type II hood is required, a Type I or Type II hood shall be installed. Where a Type I hood is installed, the installation of the entire system, including the hood, ducts, exhaust equipment and makeup air system shall comply with the requirements of Sections 506, 507, 508 and 509.

Exceptions:

1. Factory-built commercial exhaust hoods that are listed and labeled in accordance with UL 710, and installed in accordance with Section 304.1, shall not be required to comply with Sections 507.1.1.1, 507.1.2, 507.1.3, 507.1.4, 507.1.5, 507.2, 507.2.1, 507.2.2, 507.2.3, 507.2.4, 507.2.5, 507.2.6, 507.2.7, 507.2.8, ~~507.3.1~~507.2.8.1, ~~507.3.3~~507.2.8.2. 507.2.9, ~~507.4~~507.4.1, 507.4.2, 507.5, 507.5.1, 507.4.2,507.5, 507.5.1, 507.5.2, 507.5.3, 507.5.4, 507.6.1, 508.1, 508.1.1, 508.2 and ~~507.5~~509.1.
2. Factory-built commercial cooking recirculating systems that are listed and labeled in accordance with ANSI UL 710B, and installed in accordance with Section 304.1, shall be installed in accordance with thier listings and the manufacturers' instructions. Such systems shall not be required to comply with Sections 507.1.1.1, 507.1.2, 507.1.3, 507.1.4, 507.1.5, 507.2, 507.2.1, 507.2.2, 507.2.3, 507.2.4, 507.2.5, 507.2.6, 507.2.7, 507.2.8, ~~507.3.1~~507.2.8.1, ~~507.3.3~~507.2.8.2. 507.2.9, ~~507.4~~507.4.1, 507.4.2, 507.5, 507.5.1, 507.4.2, 507.5, 507.5.1, 507.5.2, 507.5.3, 507.5.4, 507.6.1, 508.1, 508.1.1, 508.2 and ~~507.5~~509.1. Spaces in which such systems are located shall be considered to be kitchens and shall be ventilated in accordance with Table 403.3.1.1. For the purpose of determining the floor area required to be ventilated, each individual *appliance* shall be considered as occupying not less than 100 square feet (9.3 m^2).
3. Where cooking appliances are equipped with integral down-draft exhaust systems and such appliances and exhaust systems are listed and labeled for the application in accordance with NFPA 96, a hood shall not be required at or above them.

Reason: Manufacturered systems that are performance tested to an ANSI Accredideted test by an ANSI Certifying body are to be installed pursuant to thier listings and manufacturers instructions.
The prescriptive formulas of the model building and mechanical codes have always been intended to prescribe minimum safety criteria for those systems that are not preformance tested and certified by an accredited ANSI certifying body. Rather, they are field commissioned and accepted by an AHJ that that is immune from liability prosecution - if they get it wrong and the fabricated and feild installed compliant system fails. ANSI performance tested, listed and labveled products and systems installed purduant to their manufacturers instruction provide comprehensive liability protection far beyond that of one built in a fabrication shops with many different trades having a hand in thier narrow scope of work.

When the code and its interpretation by an AHJ conflicts with the products listing or the manufacturers instructions, the instructions from the manufacturer must prevail as liability for the product and its intended use is tied to its listing and manufacturers instructions. Licensing agencies do not assume liability for thier interpretations. When their code interpretations conflict with a products listing and manufacturers instrcutions, reasonable standards of care require adherance to the listing and the manufacturers instructions. Contractors, design professionals and owners that acquiese to an denying AHJ in such matters can incur significant incremental risk exposures when complainants pursue them for injury due to teh forced compliants while the AHJ's that provided the written order for the deviation quickly invoke thier discretionary immunity.

In recent State and Local licensing agencies that have denied acceptance of such products have been succesfully pursued in Boards or appeals and in courts of law for overreaching, arbitrary interpretations that in fact comprise a restraint to trade.

Accordingly, I seek to provide code language that makes it clear that ANSI performance tested, listed and labelled products must be installed pursuant to thier listings and manufacturers instructions as a preordnal requirement to the presscriptice criteria of the code.

EPA 5

Cost Impact: Will not increase the cost of construction
There will be **enormous cost savings** when the confusion the pervades regulatory agencies, desingers and the construction trade in general is clearly dienated in this code section - and all others.
To be clear, I'd have prefered to be very breif and simply state that ANSI perfomance tested listed and labelled systems installed pursuant to thier listings and manufacturers instructions are exempt from the remaining criteira of the code. This makes sense as the rest of the criteriain the code is prescriptive *and intended f*or sheet metal fabricators and the different trades that essentially sew (cobble?) thier specialties together in the field to comprise a coherent "compliant" system.

M 52-15 : 507.1-JOHNSON5473

M 53-15

507.1

Proponent: Guy McMann, representing Colorado Association of Plumbing and Mechanical Officials (CAPMO) (gmcmann@jeffco.us)

2015 International Mechanical Code

Revise as follows:

507.1 General. Commercial kitchen exhaust hoods shall comply with the requirements of this section. Hoods shall be Type I or II and shall be designed to capture and confine cooking vapors and residues. A Type I or Type II hood shall be installed at or above all *commercial cooking appliances* in accordance with Sections 507.2 and 507.3. Where any cooking *appliance* under a single hood requires a Type I hood, a Type I hood shall be installed. Where a Type II hood is required, a Type I or Type II hood shall be installed. Where a Type I hood is installed, the installation of the entire system, including the hood, ducts, exhaust equipment and makeup air system shall comply with the requirements of Sections 506, 507, 508 and 509.

Exceptions:

1. Factory-built commercial exhaust hoods that are listed and labeled in accordance with UL 710, and installed in accordance with Section 304.1, shall not be required to comply with Sections 507.1.5, 507.2.3, 507.2.5, 507.2.8, 507.3.1, 507.3.3, 507.4 and 507.5.
2. Factory-built commercial cooking recirculating systems that are listed and labeled in accordance with UL 710B, and installed in accordance with Section 304.1, shall not be required to comply with Sections 507.1.5, 507.2.3, 507.2.5, 507.2.8, 507.3.1, 507.3.3, 507.4 and 507.5. Spaces in which such systems are located shall be considered to be kitchens and shall be ventilated in accordance with Table 403.3.1.1. For the purpose of determining the floor area required to be ventilated, each individual *appliance* shall be considered as occupying not less than 100 square feet (9.3 m^2).
3. Where cooking appliances are equipped with integral down-draft exhaust systems and such appliances and exhaust systems are listed and labeled for the application ~~in accordance with NFPA 96,~~ a hood shall not be required at or above them.

Reason: The IMC does not follow NFPA-96 strictly as pertinent textis extracted. This reference implies that the standard needs to be complied with in it's entirety when in fact this is not the case. Stadards generally speaking contain much non-mandatory language.

Cost Impact: Will not increase the cost of construction
By not having to comply entirely with the NFPA Standard there could actually be a cost savings.

M 53-15 : 507.1-MCMANN3591

M 54-15

507.2

Proponent: John Corliss, City of Corvallis Oregon, representing Oregon Mechanical Officials Association (john.corliss@corvallisoregon.gov)

2015 International Mechanical Code

Revise as follows:

507.2 Type I hoods. Type I hoods shall be installed where cooking *appliances* produce grease or smoke as a result of the cooking process. Type I hoods shall be installed over *medium-duty*, *heavy-duty* and *extra-heavy-duty cooking appliances*.

~~**Exception**~~**<u>Exceptions</u>:**

1. A Type I hood shall not be required for an electric cooking appliance where an approved testing agency provides documentation that the appliance effluent contains 5 mg/m^3 or less of grease when tested at an exhaust flow rate of 500 cfm (0.236 m^3/s) in accordance with UL 710B.
2. <u>Listed and labeled solid fuel-fired ovens that are constructed of solid masonry or reinforced portland or refractory cement concrete, that are vented by natural draft in accordance with NFPA 211 and that are installed in accordance with the manufacturer's instructions and NFPA 96.</u>

Reason: This proposal provides clarity for the installation of solid fuel ovens that are listed to be natural draft vented. The IMC recognizes listed solid fuel appliances vented per NFPA211. However, when used as an oven for foods, a solid fuel appliance is currently required to be disconnected from its flue and utilize an extra-heavy duty Type I hood to vent products of combustion.
This proposal brings forward current methods from Chapter 14 of NFPA 96 for the use of natural draft vented solid fuel ovens without a grease hood or automatic fire extinguishing equipment. NFPA 96 recognizes the safe operation of these oven types utilizing natural draft venting. Ovens listed for this use are heavy duty, solid fuel appliances (IMC Chapter 9). Most units weigh in excess of 2,000 pounds and are intended to operate in excess of 650F baking temperature.

This proposal will not reduce safety. Some ovens have dual listings to UL 737. A UL 737 appliance can be installed as a decorative stove in the middle of a restaurant seating area, burn high fuel content wood, and be direct vented thru NFPA 211 products. But current IMC language requires that once lower fuel content food product is introduced, the oven must be disconnected from its listed, code-compliant, safely-functioning vent and placed under Type I extra-heavy duty category hood.

Keeping a listed appliance connected to its listed flue system does not reduce safety relative to the current IMC requirement for locating under a Type I hood:

1. Connected to a listed vent, the products of combustion remain at high temperature and are safely removed from the building per the listing. When located under an extra-heavy duty Type I hood, the combustion gases are mixed with 5-10 times more ventilation air and the flue gases cool significantly. This cools any grease vapors below the condensation point, creating grease build-up in the Type I system. Type I systems are intended to capture grease vapors because the exhaust temperatures are always within the condensation range. When installed as a listed natural draft vent, gases, including any possible grease vapor, enter the flue above condensation point and are carried beyond the vent system.

An additional wrinkle is added using an Extra-heavy duty Type I hood over solid fuel combustion: the mixing of combustion gases cools the flow to the condensation point for of creosote (about 250F for most wood types). The high flow rate of extra heavy duty Type I hoods mixes more cool (room make-up) air with the flue gases than other hoods, which reduces the temperature of the combined air stream. Creosote build-up on the hood, hood filters, exhaust duct and fan is a less safe condition than utilizing a natural vent, NFPA 211 intended to limit and prevent creosote build-up.

a. A listed solid fuel appliance is designed to maintain flue temperatures above creosote development temperatures. Dilution of flue gases under a Type I hood almost guarantees creosote development on surfaces not intended for this material. Cleaning creosote requires different procedures from cleaning grease: removal from fan parts is more difficult.

2. A natural draft solid fuel appliance does not rely on an external fan for safe operation. When under a Type I hood, fan failure or loss of power will result in uncontrolled release of combustion products and smoke into the occupied space. The fire in the oven cannot be quickly or easily extinguished during this type event. A natural draft oven will maintain safe operation in event of a power failure.

3. Lack of clear guidance on automatic extinguishing within current IMC. An open solid fuel grille (for grilling) may experience a food product fire that exceeds the heat release of the cooking fire. See https://www.youtube.com/watch?v=lKd8XXq_ZOs video of a fire on an open grille not intended to contain a flare-up. This video shows the obvious intent for the Extra-heavy duty appliance definition in IMC Chapter 2. This proposal concerns solid fuel for cooking inside a refractory oven designed to safely contain a fire. Current IMC has no clear intent of how a fire system would put out a fire within a fireplace that is already "on fire".

a. Automatic extinguishing is required for the extra heavy duty hood. The extinguishing systems will not be triggered should food products ignite inside of the oven. Should pizza/bread catch fire, it will not create a temperature rise or differential greater than the fuel already burning in the oven. Even if the food had no water content, the food has a lower fuel-content than the burning wood. The oven is designed to maintain adequate natural draft; food that catches fire inside of the oven will not create enough flare-up leaving the oven door to trigger an automatic system. "Manual" operation may be possible; Note that NFPA 96 requires a portable extinguisher. But a code minimum automatic system has little, if any, value.

b. There is unclear guidance of where to direct the extinguishing system nozzles. Should they be pointed at the oven housing? This will not extinguish a fire inside of a refractory oven. Should they point at the oven opening?

c. There is no method to cut off fuel flow to the oven. While the operator may refrain from adding fuel, the fuel inside of the oven will continue to safely burn at full fire: that's what a solid-fuel oven (fireplace) is supposed to do. A heavy refractory enclosure will contain any fire.

4. Safer containment for accidental food combustion than a deck-type oven. Deck-type pizza ovens under current code and commentary

recognize that these deck-type appliances are light duty appliances (and can be located under a Type II hood per IMC 507.2.2). These appliances are bread finishing/cheese melting appliances. It is recognized that if a pizza catches fire, the oven door can be closed and the burning food be contained within the deck-type oven. But a conveyorized pizza ovens are currently considered medium duty appliances. Current logic is that burning food product cannot be contained within the conveyorized oven. For a solid fuel oven, should the food product catch fire in a wood oven, the oven is already listed to safely contain a fire.

5. The high temperature operation of these ovens will limit any chance for grease build-up. The temperature in the oven is well above the smoke point of animal fats (Lard = 390F; Tallow = 420F). Grease will not build up on interior surfaces of the oven. See photos of the interior of a wood oven in operation:

http://www.fornobravo.com/pizza_oven_management/oven_firing.html

There is no chance for build-up of grease inside the oven: the internal temperature of the oven is "self-cleaning" during each firing cycle. The flue requires the same cleaning required for any solid fuel chimney. Grease build-up is not of concern.

NOTE: OMOA may have video/pictures of a flue outlet.

6. OMOA and State of Oregon recognizes this as a statewide method of compliance.

Cost Impact: Will not increase the cost of construction
This proposal will not increase the cost of construction and can reduce cost of installation and operation.

M 54-15 : 507.2-CORLISS4673

M 55-15

507.2.6

Proponent: Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

2015 International Mechanical Code

Revise as follows:

507.2.6 Clearances for Type I hood. A Type I hood shall be installed with a *clearance* to combustibles of not less than 18 inches (457 mm).

Exceptions:

1. ~~**Exception:**~~ *Clearance* shall not be required from gypsum wallboard or $^{1}/_{2}$ -inch (12.7 mm) or thicker cementitious wallboard attached to noncombustible structures provided that a smooth, cleanable, nonabsorbent and noncombustible material is installed between the hood and the gypsum or cementitious wallboard over an area extending not less than 18 inches (457 mm) in all directions from the hood.
2. Type I hoods listed and labeled for clearances less than 18 inches in accordance with UL710 shall be installed with the clearances specified by such listings.

-

Reason: Type I hoods can be listed to the latest edition of UL710 which now includes testing for clearances to combustibles. There are hoods that are listed for clearances of less than 18 inches, however, the code does not currently recognize this fact and would require 18 inches minimum in all cases. Adding the new exception will allow lesser clearances without having to seek alternative approval from the AHJ.
This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes.

Cost Impact: Will not increase the cost of construction
This proposal will not increase the cost of construction because no additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code nor are the code requirements made more stringent.

M 55-15 : 507.2.6-SNYDER3272

M 56-15

507.6.1

Proponent: Guy McMann, Jefferson County, Colorado., representing Colorado Associatoin of Plumbing and Mechanical Officials (CAPMO) (gmcmann@jeffco.us)

2015 International Mechanical Code

Revise as follows:

507.6.1 Capture and containment test. The permit holder shall verify capture and containment performance of the exhaust system. This field test shall be conducted with all appliances under the hood at operating temperatures, with all sources of outdoor air providing *makeup air* for the hood operating and with all sources of recirculated air providing conditioning for the space in which the hood is located operating. Capture and containment shall be verified visually by observing smoke or steam produced by actual or simulated cooking, such as ~~with~~that provided by smoke ~~candles, smoke puffers, and similar means~~generators.

Reason: The term "smoke generators" includes all forms of smoke producing products and cleans up the sectoin a little bit.

Cost Impact: Will not increase the cost of construction
There will be no addional cost as this in only an editorial modification and clarification.

M 56-15 : 507.6.1-MCMANN3574

M 57-15

510.5

Proponent: Samuel Waymire, APPA: Leadership In Educational Facilities, representing APPA: Leadership In Educational Facilities

2015 International Mechanical Code

Revise as follows:

510.5 Incompatible materials and common shafts. Incompatible materials, as defined in the *International Fire Code*, shall not be exhausted through the same hazardous exhaust system. Hazardous exhaust systems shall not share common shafts with other duct systems, except where such systems are hazardous exhaust systems originating in the same fire area.

~~Exception~~Exceptions:
1. The provisions of this section shall not apply to laboratory exhaust systems where all of the following conditions apply:

1. All of the hazardous exhaust ductwork and other laboratory exhaust within both the occupied space and the shafts are under negative pressure while in operation.
2. The hazardous exhaust ductwork manifolded together within the occupied space must originate within the same fire area.
3. Hazardous exhaust ductwork originating in different fire areas and manifolded together in a common shaft shall meet the provisions of Section 717.5.3, Exception 1, Item 1.1 of the *International Building Code*.
4. Each control branch has a flow regulating device.
5. Perchloric acid hoods and connected exhaust shall be prohibited from manifolding.
6. Radioisotope hoods are equipped with filtration, carbon beds or both where required by the *registered design professional*.
7. Biological safety cabinets are filtered.
8. Each hazardous exhaust duct system shall be served by redundant exhaust fans that comply with either of the following:
   - 8.1. The fans shall operate simultaneously in parallel and each fan shall be individually capable of providing the required exhaust rate.
   - 8.2. Each of the redundant fans is controlled so as to operate when the other fan has failed or is shut down for servicing.

2. Hazardous exhaust ducts serving laboratories that are used solely for educational purposes shall not be prohibited from sharing common shafts with other ducts.

Reason: Laboratories within educational teaching facilities typically use less hazardous materials and chemicals in such a manner and in such low quantities that the exhaust produced by these substances does not pose significant risks to health/ safety when compared to the exhaust resulting from laboratories meant for manufacturing or commercial use. Therefore it is not justifiable to impose the same regulations and restrictions on exhaust systems from these types of facilities as if they were equivalent. Exhaust from labs in educational facilities, though technically meeting the definition of hazardous, rarely pose an actual threat. For this reason, there is no need for the exhaust systems of these facilities to be subject to such stringent regulation.

Cost Impact: Will not increase the cost of construction
Given that the second exception proposed to IMC 510.5 is designed to reduce the regulatory requirements imposed upon Group B occupancies, it follows that the proposed change will not increase the cost of construction. This proposal would limit the number of regulations with which hazardous air exhaust systems in Group B occupancies have to comply, and in doing so would actually mitigate the expense of applicable construction projects by relieving the need to spend money on certain features/ technologies (flow regulating devices, redundant fans, etc.) that would be required under the code as it currently stands.

M 57-15 : 510.5-WAYMIRE4730

M 58-15

510.8

Proponent: Peter Levitt, Sternvent, representing Sternvent (plevitt@sternvent.com)

2015 International Mechanical Code

Revise as follows:

510.8 Suppression required. Ducts shall be protected with an *approved* automatic fire suppression system installed in accordance with the *International Building Code*. Dust collection system ducts shall be protected by a spark detection and extinguishing system.

Exceptions:

1. An approved automatic fire suppression system shall not be required in ducts conveying materials, fumes, mists and vapors that are nonflammable and noncombustible under all conditions and at any concentrations.
2. Automatic fire suppression systems shall not be required in metallic and noncombustible, nonmetallic exhaust ducts in semiconductor fabrication facilities.
3. An *approved* automatic fire suppression system shall not be required in ducts where the largest cross-sectional diameter of the duct is less than 10 inches (254 mm).
4. For laboratories, as defined in Section 510.1, automatic fire protection systems shall not be required in laboratory hoods or exhaust systems

Reason: Many designers of dust collection systems are not familiar with what type of fire supression system is suitable for a dust collection system duct and the asociated dust particle convening velocity of 3000-5000 feet per minute. If a source of ignition such as a spark enters a dust collection system, burning embers will travel towards the dust collector. Due to the small mass of the embers and high transport velocity in the duct, there will not be enough heat generated to activate a thermocouple sprinkler head. A photocell spark detection and extinguishing system is typically used. This technolgy is defined and recoginzed by NFPA in #69 and recognized in #664.

Bibliography:

NFPA 69

NFPA 664

and

NFPA Guide to Combustible Dusts

Authors; Walter Frank & Samuel Rodgers

Editor; Guy Colonna

2012

Pages 171-178

Cost Impact: Will increase the cost of construction
While a thermocuple sprinkler head has a cost of aprox $100 and the cost of the spark detection system is $5,000-$8,000, the spark detection system will prevent a fire or explosion in the dust collector and as a result prevent property loss, injury & loss of life, whereas a thermocouple head will be ineffective in this application.

M 58-15 : 510.8-LEVITT5228

M 59-15

510.8.4 (New)

Proponent: Ellie Klausbruckner, representing Klausbruckner & Associates Inc. (ek@klausbruckner.com)

2015 International Mechanical Code

Add new text as follows:

510.8.4 Duct cleanout. Ducts conveying combustible dust as part of a dust collection system shall be equipped with cleanouts that are provided with access. The cleanouts shall be located at the base of each vertical duct riser and at intervals not exceeding 20 foot in horizontal sections of duct.

Reason: To avoid an accumulation of combustible dust and reduce potential dust deflagration from the accumulation of dusts inside ducts, cleanouts are needed to provide accessible points as part of the housekeeping and inspection. While this hazard is more commonly found in industries that produce heavy combustible dusts [e.g. metal dusts, etc.], the potential accumulation of dusts in ducts exist in all combustible dust producing facilities.

Cost Impact: Will increase the cost of construction
The proposed code change will increase the cost of construction since previous editions did not require cleanouts.

**M 59-15 : 510.8.4 (New)-
KLAUSBRUCKNER5285**

M 60-15

511.1.3

Proponent: Peter Levitt, Sternvent, representing Sternvent (plevitt@sternvent.com)

2015 International Mechanical Code

Revise as follows:

511.1.3 Conveying systems exhaust discharge. An exhaust system shall discharge to the outside of the building either directly by flue or indirectly through the bin or vault into which the system discharges, except where the contaminants have been removed. Exhaust system discharge shall be permitted to be recirculated provided that the solid particulate has been removed at a minimum efficiency of 99.9 percent at 10 microns (10.01 mm) and where flammable vapors are present in the exhaust flow, such vapor concentrations are less than 25 percent of the LFL, ~~and *approved equipment* is used to monitor~~as determined by a hazard analysis. Where flammable vapor concentrations are greater than 25% of the ~~vapor concentration.~~LFL, the exhaust system discharge shall not be recirculated.

Reason: The current wording of section 511.1.3 requires vapor monitoring equipment for all dust collection systems that recirculate the filtered air back to the bulding, *regardless* if vapors are *ever present*. Dust collection system air streams rarley include flamable or non-flamable vapors. Vapors are not a part of the process or created by cutting wood, grinding metals, conveying chemical or food products, etc. Vapors are more likely to be part of the air stream for refuse conveying.
The current requirement for vapor monitoring equipment for all dust collectors that recirculate the air seems to be *overly burdensome*. I beleve the current text first appeared in the 2009 edition.

Some code enforcers who are familar with section 511.1.3 have been requiring flamable vapor detection systems for woodworing shops in schools, maintenance and comercial facilities, that do not have flamable vapors, because of the IMC requirement.

Flammable vapor detection systems are typicaly used in industrial processes where there is the potential for flammable vapors to exist in the work area and there is also a potential ignition source. Some aplications include; printing, paint manufacturing, commercial painting and storage areas.

Cost Impact: Will not increase the cost of construction

A typical flammable vapor detection system cost $10,000-$15,000.

End users, who do not have flammable vapors in their air stream or have flammable vapors that have a concentration of less than 25% of the LFL and need to recirculate the filtered air from the dust collection system, will no longer need to purchase a flammable vapor detection system and therefore save $10,000-$15,000.

M 60-15 : 511.1.3-LEVITT4394

M 61-15

512.2

Proponent: Pennie L Feehan, Copper Development Association, representing Copper Development Association (penniefeehan@me.com)

2015 International Mechanical Code

Revise as follows:

512.2 Materials. Subslab soil exhaust system duct material shall be air duct material *listed* and *labeled* to the requirements of UL 181 for Class 0 air ducts, or any of the following piping materials that comply with the *International Plumbing Code* as building sanitary drainage and vent pipe: cast iron; galvanized steel; ~~brass or~~ copper <u>and copper-alloy</u> pipe~~; copper~~ <u>and</u> tube of a weight not less than ~~that of copper drainage tube, Type~~<u>type</u> DWV; and plastic piping.

Reason: The proposal removes brass because brass is a copper alloy and reworded the sentence without changing the meaning.

Cost Impact: Will not increase the cost of construction
This proposal will not impact the cost of construction as this is only changing the name of the material.

M 61-15 : 512.2-FEEHAN3725

M 62-15

601.5

Proponent: Guy McMann, Jefferson County Colorado, representing Colorado Associatoin of Plumbing and Mechanical Officials (CAPMO) (gmcmann@jeffco.us)

2015 International Mechanical Code

Revise as follows:

601.5 Return air openings. Return air openings for heating, ventilation and air-conditioning systems shall comply with all of the following:

1. Openings shall not be located less than 10 feet (3048 mm) measured in any direction from an open combustion chamber or draft hood of another appliance located in the same room or space.
2. Return air shall not be taken from a hazardous or insanitary location or a refrigeration room as defined in this code.
3. The amount of return air taken from any room or space shall be not greater than the flow rate of supply air delivered to such room or space.
4. Return and transfer openings shall be sized in accordance with the appliance or equipment manufacturer's installation instructions, ACCA Manual D or the design of the registered design professional.
5. Return air taken from one dwelling unit shall not be discharged into another dwelling unit.
6. Taking return air from a crawl space shall not be accomplished through a direct connection to the return side of a forced air furnace. Transfer openings in the crawl space enclosure shall not be prohibited.
7. Return air shall not be taken from a closet, bathroom, toilet room, kitchen, garage, boiler room, furnace room or unconditioned attic.

Exceptions:

7.1. Taking return air from a kitchen is not prohibited where such return air openings serve the kitchen and are located not less than 10 feet (3048 mm) from the cooking appliances.

7.2. Dedicated forced air systems serving only the garage shall not be prohibited from obtaining return air from the garage

<u>7.3.</u> <u>Return air shall not be taken from indoor swimming pool enclosures and associated deck areas except where such spaces are dehumidified</u>.

Reason: It is not desirable to pull return air from swimming pool areas due to the affects it would have on the system from humidity and chemical odors associated with such spaces. A dedicated system would be required or a combination of supply and exhaust or the air should be dehumidified.

Cost Impact: Will not increase the cost of construction
No cost unless the air is treated.

M 62-15 : 601.5-MCMANN3834

M 63-15

601.6 (New), 601.6.1 (New)

Proponent: Jeff Sonne, Florida Solar Energy Center, representing Florida Solar Energy Center (jeff@fsec.ucf.edu)

2015 International Mechanical Code

Add new text as follows:

601.6 Balanced return air. Provisions shall be made to prevent unbalanced air flows and pressure differentials caused by restricted return air flow. Pressure differentials caused by air distribution systems across individually closed interior doors, where return air intakes are centrally located, shall be limited to 0.01 inch WC (2.5 pascals). Pressure differentials across fire walls and other partitions within ceiling space plenums shall be limited to 0.01 inch WC (2.5 pascals) by providing air duct pathways or air transfer pathways from the high pressure zone to the low pressure zone.

601.6.1 Prescriptive alternatives. The following are alternatives to the requirements of Section 601.6 and apply only to habitable rooms.

1. Transfer ducts or other transfer pathways shall be provided and shall have an area that is not less than 1½ times the cross sectional area of the supply duct or supply ducts serving the room or space. In addition, the room entry door shall have an unrestricted 1 inch (25.4 mm) or greater undercut.
2. Transfer grilles shall be provided and shall have an area of not less than 0.50 square inches for each 1 cfm of supply air. In addition, the room entry door shall have an unrestricted 1 inch (25.4 mm) or greater undercut.

Reason: Restricted return air affects building pressures and increases air infiltration which in turn increases energy use and can cause comfort, building durability, and health and safety issues. A similar balance return air requirement is already in the Florida Building Code for these reasons. A comparison of homes built prior to the code change to those after the code change showed a 74% reduction in pressure differentials across closed interior doors, from an average of 9.1 pascals to 2.4 pascals. (See supporting publication from Cummings and Withers 2006.)
This code change has been successfully implemented in Florida with little difficulty. The prescriptive alternatives are widely used and there have been few problems in verifying compliance. Inspection of these alternatives is straightforward. Contractors readily learn what steps are required to achieve the 2.5 pascal target.

This modification is an appropriate minimum code proposal. Providing return air pathways should be a minimum code requirement and has been accepted as good practice for decades. While much of the research has been done in Florida, the unbalanced return air problem exists across the United States, wherever unequal return and supply air flows occur within an enclosed space:

i. Throughout the country, as homes get tighter, depressurization of the indoor spaces caused by unbalanced return air may in turn lead to spillage or back-drafting of vented combustion devices (hot water heaters, furnaces, boilers, and fireplaces), introducing combustion gases into the home (Cummings 2012-- see slides 6-11).

ii. In cold climates, unbalanced return air causes significant increase in air flow across the building envelope, which increases space conditioning loads, may push indoor relative humidity to unacceptably low levels, and may lead to freezing of pipes.

iii. In hot and humid climate zones, unbalanced return air also causes significant increase in air flow across the building envelope, adding to space conditioning loads and increasing latent loads and indoor relative humidity.

iv. Also in hot and humid climates, depressurization of indoor spaces caused by unbalance return air combined with factors such as low homeowner thermostat set points and vapor impermeable interior wall coverings can cause mold growth (Moyer et al. 2001).

Bibliography: Balanced Return Air, Duct Airtightness, and Combustion/Dilution Air Code Compliance in 40 Central Florida Homes, FSEC-CR-1789-06, Cummings, J. and C. Withers, 2006, http://www.fsec.ucf.edu/en/publications/pdf/FSEC-CR-1789-06.pdf.
Moisture Problems in Manufactured Housing: Probable Cause and Cures, FSEC-GP-212-01, Moyer, N., D. Beal, D. Chasar, J. McIlvaine, C. Withers, and S. Chandra, 2001, http://www.fsec.ucf.edu/en/publications/pdf/FSEC-GP-212-01.pdf.

Combustion Safety Concerns and Energy Savings in Very Airtight Residences, Cummings, J., Building America Expert Meeting Presentation, June 28, 2012 (see Attachments).

Cost Impact: Will increase the cost of construction
An HVAC contractor indicates the extra material cost for a three bedroom home is $60 and 1.5 hours of labor. While installing return air pathways adds to first cost, it reduces energy waste that results from increased air infiltration and yields a reduced life-cycle cost. Monitored energy savings finds a payback of 3 years. Health benefits not counted.

M 63-15 : 601.6 (New)-SONNE4726

M 64-15

602.1

Proponent: Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

2015 International Mechanical Code

Revise as follows:

602.1 General. Supply, return, exhaust, relief and ventilation air plenums shall be limited to uninhabited crawl spaces, areas above a ceiling or below the floor, attic spaces ~~and~~, mechanical equipment rooms and the framing cavities addressed in Section 602.3. Plenums shall be limited to one fire area. Air systems shall be ducted from the boundary of the fire area served directly to the air-handling equipment. Fuel-fired appliances shall not be installed within a plenum.

Reason: Section 602.3 is in the plenum Section 602 and covers stud and joist space plenums, however, Section 602.1 does not recognize such plenums. Section 602.1 limits plenums to a list of spaces that excludes stud and joist space plenums.
This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes.

Cost Impact: Will not increase the cost of construction
This proposal will not increase the cost of construction because no additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code nor are the code requirements made more stringent.

M 64-15 : 602.1-SNYDER3267

M 65-15

602.2

Proponent: Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

2015 International Mechanical Code

Revise as follows:

602.2 Construction. *Plenum* enclosure construction materials that are exposed to the airflow shall comply with the requirements of Section 703.5 of the *International Building Code* or such materials shall have a flame spread index of not more than 25 and a smoke-developed index of not more than 50 when tested in accordance with ASTM E 84 or UL 723.

The use of gypsum boards to form plenums shall be limited to systems where the air temperatures do not exceed 125°F (52°C) and the building and mechanical system design conditions are such that the gypsum board surface temperature will be maintained above the airstream dew-point temperature. Air plenums formed by gypsum boards shall not be incorporated in air-handling systems utilizing evaporative coolers.

> <u>**Exception:** The materials from which the stud and joist space plenums addressed in Section 602.3 are constructed shall not be required to comply with Section 703.5 of the International Building Code and shall not be required to have a maximum flame spread index of 25 and a maximum smoke-developed index of 50 when tested in accordance ASTM E 84 or UL723.</u>

Reason: The significant change to Section 602.2 did not specifically address stud and joist space plenums. It is assumed that that Section 602.2 was intended to apply to spaces such as under-floor and above-ceiling spaces utilized as plenums. If Section 602.2 does apply to stud and joist space plenums, then such plenums would not be allowed to be constructed with wood studs, wood joists, wood trusses and wood floor decking. Section 602.2 should not have the effect of banning the common variety of stud and joist space plenums.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes.

Cost Impact: Will not increase the cost of construction

This proposal will not increase the cost of construction because no additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code nor are the code requirements made more stringent.

M 65-15 : 602.2-SNYDER3268

M 66-15

602.2.1

Proponent: Janine Snyder, City of Thornton, Colorado, representing Colorado Association of Plumbing & Mechanical Officials (CAPMO) (Janine.Snyder@cityofthornton.net)

2015 International Mechanical Code

Revise as follows:

602.2.1 Materials within plenums. Except as required by Sections 602.2.1.1 through 602.2.1.7, materials within plenums shall be noncombustible or shall be listed and labeled as having a flame spread index of not more than 25 and a smoke-developed index of not more than 50 when tested in accordance with ASTM E 84 or UL 723.

Exceptions:

1. Rigid and flexible ducts and connectors shall conform to Section 603.
2. Duct coverings, linings, tape and connectors shall conform to Sections 603 and 604.
3. This section shall not apply to materials exposed within plenums in one- and two-family dwellings.
4. This section shall not apply to smoke detectors.
5. Combustible materials fully enclosed within one of the following:
   5.1. Continuous noncombustible raceways or enclosures.
   5.2. Approved gypsum board assemblies.
   5.3. Materials listed and labeled for installation within a plenum and listed for the application.
6. Materials in Group H, Division 5 fabrication areas and the areas above and below the fabrication area that share a common air recirculation path with the fabrication area.

Reason: There is a misconception that any material listed for plenum use such as ordinary insulation can be used to cover PVC pipe so it can be installed in a plenum. There are specific products which have been specifically designed and tested for specific applications. This section leaves something to be desired in terms of specificity in that although some insulations may indeed be listed for plenum use, they cannot be installed to protect pipes during a fire. They are not tested for limiting flame propagation or smoke generation.

Cost Impact: Will increase the cost of construction
This will prevent the errors in the field as the construction community will not have to spend additional time and money removing the improper insulation and replacing with the correct material.

M 66-15 : 602.2.1-SNYDER4450

M 67-15

602.2.1.1, 602.2.1.2, 602.2.1.3

Proponent: Jonathan Roberts, UL LLC, representing UL LLC (jonathan.roberts@ul.com)

2015 International Mechanical Code

Revise as follows:

602.2.1.1 Wiring. Combustible electrical wires and cables and optical fiber cables exposed within a plenum shall be listed and labeled as having a~~ maximum~~ peak optical density ~~of~~not greater than 0.50~~ or less~~, an average optical density ~~of~~not greater than 0.15~~ or less~~, and a~~ maximum~~ flame spread distance ~~of~~not greater than 5 feet (1524 mm)~~ or less~~ when tested in accordance with NFPA 262 or shall be installed in metal raceways or metal sheathed cable. Combustible optical fiber and communication raceways exposed within a plenum shall be listed and labeled as having a~~ maximum~~ peak optical density ~~of~~not greater than 0.5~~ or less~~, an average optical density ~~of~~not greater than 0.15~~ or less~~, and a~~ maximum~~ flame spread distance ~~of~~not greater than 5 feet (1524 mm) ~~or less~~ when tested in accordance with ~~ANSI/~~UL 2024. Only plenum-rated wires and cables shall be installed in plenum-rated raceways.~~ Electrical wires and cables, optical fiber cables and raceways addressed in this section shall be listed and labeled and shall be installed in accordance with NFPA 70.~~

602.2.1.2 Fire sprinkler piping. Plastic fire sprinkler piping exposed within a *plenum* shall be used only in wet pipe systems and shall ~~have~~be listed and labeled as having a peak optical density not greater than 0.50, an average optical density not greater than 0.15, and a flame spread ~~of~~distance not greater than 5 feet (1524 mm) when tested in accordance with UL 1887. ~~Piping shall be *listed* and *labeled*.~~

602.2.1.3 Pneumatic tubing. Combustible pneumatic tubing exposed within a *plenum* shall ~~have~~be listed and labeled as having a peak optical density not greater than 0.50, an average optical density not greater than 0.15, and a flame spread ~~of~~distance not greater than 5 feet (1524 mm) when tested in accordance with UL 1820.~~ Combustible pneumatic tubing shall be *listed* and *labeled*.~~

Reason: This proposal is primarily editorial and introduces no substantive changes. It provides consistency with the pass/fail criteria for the testing of these products, and the listing and labeling requirements. The last sentence of each section is not necessary because the first sentence already requires the product to be listed and labeled.
In Section 602.2.1.1 the requirement for the electrical wiring to be installed in accordance with NFPA 70 was deleted because Section 301.10 already requires electrical wiring to be installed in accordance with NFPA 70.

Cost Impact: Will not increase the cost of construction
Editorial changes only.

M 67-15 : 602.2.1.1-ROBERTS5143

M 68-15

602.2.1.2, 602.2.1.7

Proponent: Larry Gill, representing IPEX USA LLC (larry.gill@ipexna.com)

2015 International Mechanical Code

Revise as follows:

602.2.1.2 Fire sprinkler and water distribution piping. Plastic fire sprinkler piping exposed within a *plenum* shall be used only in wet pipe systems and shall have a peak optical density not greater than 0.50, an average optical density not greater than 0.15, and a flame spread of not greater than 5 feet (1524 mm) when tested in accordance with UL 1887. Plastic water distribution piping exposed within a plenum shall have a peak optical density not greater than 0.50, an average optical density not greater than 0.15, and a flame spread of not greater than 5 feet (1524mm) when tested in accordance with UL 2846. Piping shall be *listed* and *labeled*.

602.2.1.7 Plastic DWV and chemical waste plumbing pipe and tube. Plastic drain, waste and vent (DWV) and chemical waste piping and tubing used in plumbing systems shall be listed and shall exhibit a flame spread index of not more than 25 and a smoke-developed index of not more than 50 when tested in accordance with ASTM E 84 or UL 723.

Add new standard(s) as follows:
UL 2846 - 2014 Fire Test of Plastic Water Distribution Plumbing Pipe for Visible Flame and Smoke Characteristics

Reason: The proposal is to add a new standard for mounting of water distribution pipe. UL 2846 is proposed to be added to Section 602.2.1.2 Fire Sprinkler piping. This section currently lists UL 1887 for sprinkler pipe and the acceptance criteria in the new UL 2846 standard is the same as UL 1887. Both fire sprinkler pipe and water distribution pipe are water filled. Therefore it makes sense to reference UL 2846 in the same section as UL 1887.
The proposed change to 602.2.1.7 will make this section applicable to DWV and special waste where the tests standards are ASTM E84 and UL 723. These proposed changes will clearly distinguish between water distribution and DWV/Special Waste.

Cost Impact: Will not increase the cost of construction
No cost impact. The change will permit plastic water distribution piping meeting UL 2846 to be installed in a plenum. This will provide a cost effective alternative to pipe in a plenum.

Analysis: A review of the standard proposed for inclusion in the code, UL 2846, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2015.

Proponent: Marcelo Hirschler, representing GBH International (gbhint@aol.com)

Part I

2015 International Mechanical Code

Revise as follows:

602.2.1.6 Foam plastic ~~insulation.~~interior finish and interior trim in plenums Foam plastic ~~insulation used~~interior wall and ceiling finish in plenums ~~as interior wall or ceiling finish or as~~and foam plastic interior trim in plenums shall exhibit a flame spread index of 75 or less and a smoke-developed index of 450 or less when tested in accordance with ASTM E 84 or UL 723 and shall also comply with one or more of Sections 602.2.1.6.1, 602.2.1.6.2 and 602.2.1.6.3.

602.2.1.6.1 Separation required. The foam plastic ~~insulation~~ shall be separated from the plenum by a thermal barrier complying with Section 2603.4 of the *International Building Code* and shall exhibit a flame spread index of 75 or less and a smoke-developed index of 450 or less when tested in accordance with ASTM E 84 or UL 723 at the thickness and density intended for use.

602.2.1.6.2 Approval. The foam plastic ~~insulation~~ shall exhibit a flame spread index of 25 or less and a smoke-developed index of 50 or less when tested in accordance with ASTM E 84 or UL 723 at the thickness and density intended for use and shall meet the acceptance criteria of Section 803.1.2 of the *International Building Code* when tested in accordance with NFPA 286.

The foam plastic ~~insulation~~ shall be approved based on tests conducted in accordance with Section 2603.9 of the *International Building Code*.

602.2.1.6.3 Covering. The foam plastic ~~insulation~~ shall be covered by corrosion-resistant steel having a base metal thickness of not less than 0.0160 inch (0.4 mm) and shall exhibit a flame spread index of 75 or less and a smoke-developed index of 450 or less when tested in accordance with ASTM E 84 or UL 723 at the thickness and density intended for use.

Part II

2015 International Building Code

Revise as follows:

2603.7 Foam plastic ~~insulation used as~~ interior finish or interior trim in plenums. Foam plastic ~~insulation used as~~ interior wall or ceiling finish ~~or as~~and foam plastic interior trim in plenums shall exhibit a flame spread index of 75 or less and a smoke-developed index of 450 or less when tested in accordance with ASTM E 84 or UL 723 and shall comply with one or more of Sections 2603.7.1, 2603.7.2 and 2607.3.

2603.7.1 Separation required. The foam plastic ~~insulation~~ shall be separated from the plenum by a thermal barrier complying with Section 2603.4 and shall exhibit a flame spread index of 75 or less and a smoke-developed index of 450 or less when tested in accordance with ASTM E 84 or UL 723 at the thickness and density intended for use.

2603.7.2 Approval. The foam plastic ~~insulation~~ shall exhibit a flame spread index of 25 or less and a smoke-developed index of 50 or less when tested in accordance with ASTM E 84 or UL 723 at the thickness and density intended for use and shall meet the acceptance criteria of Section 803.1.2 when tested in accordance with NFPA 286. The foam plastic ~~insulation~~ shall be approved based on tests conducted in accordance with Section 2603.9.

2603.7.3 Covering. The foam plastic ~~insulation~~ shall be covered by corrosion-resistant steel having a base metal thickness of not less than 0.0160 inch (0.4 mm) and shall exhibit a flame spread index of 75 or less and a smoke-developed index of 450 or less when tested in accordance with ASTM E 84 or UL 723 at the thickness and density intended for use.

Reason:

Part I: This is simple clarification. The important issue is that the foam plastic is used as interior finish or as interior trim and not whether it additionally has an insulative function: that is immaterial. This has apparently caused confusion. This is exactly the same change that is proposed for section 2603.7 of the IBC and is simple clarification.
The IBC proposal produces the following language:

Revise as follows:

2603.7 Foam plastic interior finish or interior trim in plenums.
Foam plastic interior wall or ceiling finish or foam plastic interior trim in plenums shall exhibit a flame spread index of 75 or less and a smoke-developed index of 450 or less when
tested in accordance with ASTM E 84 or UL 723 and shall comply with one or more of Sections 2603.7.1, 2603.7.2 and 2607.3.

Revise as follows:
2603.7.1 Separation required.
The foam plastic shall be separated from the plenum by a thermal barrier complying with Section 2603.4 and shall exhibit a flame spread index of 75 or less and a smoke-developed index of 450 or less when tested in accordance with ASTM E 84 or UL 723 at the thickness and density intended for use.

Revise as follows:
2603.7.2 Approval.
The foam plastic shall exhibit a flame spread index of 25 or less and a smoke developed index of 50 or less when tested in accordance with ASTM E 84 or UL 723 at the
thickness and density intended for use and shall meet the acceptance criteria of Section 803.1.2 when tested in accordance with NFPA 286. The foam plastic shall be approved based on tests conducted in accordance with Section 2603.9.

Revise as follows:
2603.7.3 Covering.
The foam plastic shall be covered by corrosion-resistant steel having a base metal
thickness of not less than 0.0160 inch (0.4 mm) and shall exhibit a flame spread index of 75 or
less and a smoke-developed index of 450 or less when tested in accordance with ASTM E 84 or
UL 723 at the thickness and density intended for use.

Part II: This is simple clarification. The important issue is that the foam plastic is used as interior finish or as interior trim and not whether it additionally has an insulative function: that is immaterial. This has apparently caused confusion.
This is the same language that is proposed for the corresponding IMC section.

The IMC proposal would lead to the following language:

Revise as follows:
602.2.1.6 Foam plastic interior finish or interior trim in plenums
Foam plastic interior wall or ceiling finish or foam plastic interior trim in plenums shall exhibit a flame spread index of 75 or less and a smoke-developed index of 450 or less when
tested in accordance with ASTM E84 or UL 723 and shall also comply with one or more of Sections 602.2.1.6.1, 602.2.1.6.2 and 602.2.1.6.3.

Revise as follows:
602.2.1.6.1 Separation required.
The foam plastic shall be separated from the plenum by a thermal barrier complying with Section 2603.4 of the International Building Code and shall exhibit a flame spread index of
75 or less and a smoke-developed index of 450 or less when tested in accordance with ASTM E84 or UL 723 at the thickness and density intended for use.

Revise as follows:
602.2.1.6.2 Approval.
The foam plastic shall exhibit a flame spread index of 25 or less and a smoke developed index of 50 or less when tested in accordance with ASTM E84 or UL 723 at the
thickness and density intended for use and shall meet the acceptance criteria of Section 803.1.2 of the International Building Code when tested in accordance with NFPA 286.
The foam plastic shall be approved based on tests conducted in accordance with Section 2603.9 of the International Building Code.

Revise as follows:
602.2.1.6.3 Covering.
The foam plastic shall be covered by corrosion-resistant steel having a base metal thickness of not less than 0.0160 inch (0.4 mm) and shall exhibit a flame spread index of 75 or
less and a smoke-developed index of 450 or less when tested in accordance with ASTM E84 or UL 723 at the thickness and density intended for use.

Cost Impact:

Part I: Will not increase the cost of construction
Simple clarification.

Part II: Will not increase the cost of construction
Simple clarification.

M 69-15 : 602.2.1.6-HIRSCHLER4986

M 70-15

Proponent: John Woestman, Kellen Company, representing Extruded Polystyrene Foam Association (XPSA) (jwoestman@kellencompany.com)

Part I

2015 International Mechanical Code

Delete without substitution:

~~**602.2.1.6 Foam plastic insulation.** Foam plastic insulation used in plenums as interior wall or ceiling finish or as interior trim shall exhibit a flame spread index of 75 or less and a smoke-developed index of 450 or less when tested in accordance with ASTM E 84 or UL 723 and shall also comply with one or more of Sections 602.2.1.6.1, 602.2.1.6.2 and 602.2.1.6.3.~~

Add new text as follows:

<u>602.2.1.6</u> <u>**Foam plastic insulation in plenums as interior finish or interior trim.**</u> <u>Where exposed to the airflow in plenums, foam plastic insulation in plenums used as interior wall or ceiling finish or interior trim, shall exhibit a flame spread index of 25 or less and a smoke-developed index of 50 or less when tested in accordance with ASTM E84 or UL 723 at the maximum thickness and density intended for use, and shall be tested in accordance with NFPA 286 and meet the acceptance criteria of Section 803.1.2 of the *International Building Code*.</u>

<u>**Exceptions:**</u>

<u>1. Foam plastic insulation in plenums used as interior wall or ceiling finish or interior trim, shall exhibit a flame spread index of 75 or less and a smoke-developed index of 450 or less when tested in accordance with ASTM E84 or UL 723 at the maximum thickness and density intended for use, where it is separated from the airflow in the plenum by a thermal barrier complying with Section 2603.4 of the *International Building Code*.</u>

<u>2. . Foam plastic insulation in plenums used as interior wall or ceiling finish or interior trim, shall exhibit a flame spread index of 75 or less and a smoke-developed index of 450 or less when tested in accordance with ASTM E84 or UL 723 at the maximum thickness and density intended for use, where it is separated from the airflow in the plenum by corrosion-resistant steel having a base metal thickness of not less than 0.0160 inch (0.4 mm).</u>

<u>3. Foam plastic insulation in plenums used as interior wall or ceiling finish or interior trim, shall exhibit a flame spread index of 75 or less and a smoke-developed index of 450 or less when tested in accordance with ASTM E84 or UL 723 at the maximum thickness and density intended for use, where it is separated from the airflow in the plenum by not less than a 1 inch (25mm) thickness of masonry or concrete.</u>

Delete without substitution:

~~**602.2.1.6.1 Separation required.** The foam plastic insulation shall be separated from the plenum by a thermal barrier complying with Section 2603.4 of the *International Building Code* and shall exhibit a flame spread index of 75 or less and a smoke-developed index of 450 or less when tested in accordance with ASTM E 84 or UL 723 at the thickness and density intended for use.~~

~~**602.2.1.6.2 Approval.** The foam plastic insulation shall exhibit a flame spread index of 25 or less and a smoke-developed index of 50 or less when tested in accordance with ASTM E 84 or UL 723 at the thickness and density intended for use and shall meet the acceptance criteria of Section 803.1.2 of the *International Building Code* when tested in accordance with NFPA 286.~~

~~The foam plastic insulation shall be approved based on tests conducted in accordance with Section 2603.9 of the *International Building Code*.~~

~~**602.2.1.6.3 Covering.** The foam plastic insulation shall be covered by corrosion-resistant steel having a base metal thickness of not less than 0.0160 inch (0.4 mm) and shall exhibit a flame spread index of 75 or less and a smoke-developed index of 450 or less when tested in accordance with ASTM E 84 or UL 723 at the thickness and density intended for use.~~

Part II

2015 International Building Code

Add new text as follows:

2603.7 Foam plastic insulation in plenums as interior finish or interior trim. Where exposed to the airflow in plenums, foam plastic insulation in plenums used as interior wall or ceiling finish, or interior trim, shall exhibit a flame spread index of 25 or less and a smoke-developed index of 50 or less when tested in accordance with ASTM E 84 or UL 723 at the maximum thickness and density intended for use, and shall be tested in accordance with NFPA 286 and meet the acceptance criteria of Section 803.1.2.

Exceptions:

1. Foam plastic insulation in plenums used as interior wall or ceiling finish, or interior trim, shall exhibit a flame spread index of 75 or less and a smoke-developed index of 450 or less when tested in accordance with ASTM E 84 or UL 723 at the maximum thickness and density intended for use, where it is separated from the airflow in the plenum by a thermal barrier complying with Section 2603.4.
2. Foam plastic insulation in plenums used as interior wall or ceiling finish, or interior trim, shall exhibit a flame spread index of 75 or less and a smoke-developed index of 450 or less when tested in accordance with ASTM E 84 or UL 723 at the maximum thickness and density intended for use, where it is separated from the airflow in the plenum by corrosion-resistant steel having a base metal thickness of not less than 0.0160 inch (0.4 mm).
3. Foam plastic insulation in plenums used as interior wall or ceiling finish, or interior trim, shall exhibit a flame spread index of 75 or less and a smoke-developed index of 450 or less when tested in accordance with ASTM E 84 or UL 723 at the maximum thickness and density intended for use, where it is separated from the airflow in the plenum by not less than a 1 inch (25mm) thickness of masonry or concrete.

Delete without substitution:

~~**2603.7 Foam plastic insulation used as interior finish or interior trim in plenums.** Foam plastic insulation used as interior wall or ceiling finish or as interior trim in plenums shall exhibit a flame spread index of 75 or less and a smoke-developed index of 450 or less when tested in accordance with ASTM E 84 or UL 723 and shall comply with one or more of Sections 2603.7.1, 2603.7.2 and 2607.3.~~

~~**2603.7.1 Separation required.** The foam plastic insulation shall be separated from the plenum by a thermal barrier complying with Section 2603.4 and shall exhibit a flame spread index of 75 or less and a smoke-developed index of 450 or less when tested in accordance with ASTM E 84 or UL 723 at the thickness and density intended for use.~~

~~**2603.7.2 Approval.** The foam plastic insulation shall exhibit a flame spread index of 25 or less and a smoke-developed index of 50 or less when tested in accordance with ASTM E 84 or UL 723 at the thickness and density intended for use and shall meet the acceptance criteria of Section 803.1.2 when tested in accordance with NFPA 286. The foam plastic insulation shall be approved based on tests conducted in accordance with Section 2603.9.~~

~~**2603.7.3 Covering.** The foam plastic insulation shall be covered by corrosion-resistant steel having a base metal thickness of not less than 0.0160 inch (0.4 mm) and shall exhibit a flame spread index of 75 or less and a smoke-developed index of 450 or less when tested in accordance with ASTM E 84 or UL 723 at the thickness and density intended for use.~~

Add new text as follows:

2604.1.1 Plenums. Foam plastics installed in plenums as interior wall or ceiling finish shall comply with Section 2603.7. Foam plastics installed in plenums as interior trim shall comply with Sections 2604.2 and 2603.7.

Reason:

Part I: This proposal is intended to revise the requirements for foam plastic in plenums. There is a companion proposal for the International Building Code. This code change is intended to not revise technical requirements, but clarifies the code's intent for the use of foam plastic in plenums. The following revisions are proposed:
1) The term "exposed to the airflow" is added to clarify the placement of the foam relative to the plenum airflow. This term is taken from the IMC Section 602.2: "602.2 Construction. Plenum enclosure construction materials that are exposed to the airflow shall comply with . . . . "
2) The requirements for foam plastic exposed to the plenum airflow (currently 602.2.1.6.2 Approval) are moved to the charging paragraph in proposed Section 2603.7.
3) Not including the last sentence in 602.2.1.6.2 in this re-write of 602.2.1.6 clearly establishes the ASTM E84 performance limits and NFPA 286 with the identified acceptance criteria in IBC Section 803.1.2 as the qualifying tests for use of foam plastics exposed to the airflow in plenums.
4) The use of a thermal barrier (currently Section 602.2.1.6.1Separation required) separating the foam plastic from the air flow in the plenum is allowed and therefore listed as an exception.
5) The use of an alternate barrier (currently Section 602.2.1.6.3 Covering) separating the foam plastic from the air flow in the plenum is allowed and therefore listed as an exception.
6) A new exception is added to recognize the use of masonry or concrete as a means to separate the foam plastic from the air flow in the plenum. Masonry and concrete, with minimum 1 inch thickness, are approved thermal barriers for foam plastic per IBC Section 2603.4.1.
The changes bring needed clarification regarding the approved barriers and corresponding flame spread and smoke-developed requirements for foam plastic used in plenums.

Part II: This proposal is intended to revise the requirements for foam plastic in plenums. There is a companion proposal for the International Mechanical Code. This code change is intended to not revise technical requirements, but clarifies the code's intent for the use of foam plastic in plenums. The following revisions are proposed:
1) The term "exposed to the airflow" is added to clarify the placement of the foam relative to the plenum airflow. This term is taken from the IMC Section 602.2: "602.2 Construction. Plenum enclosure construction materials that are exposed to the airflow shall comply with . . . . "
2) The requirements for foam plastic exposed to the plenum airflow (currently 2603.7.2 Approval) are moved to the charging paragraph in proposed Section 2603.7.
3) Not including the last sentence in 2603.7 in this re-write of 2603.7 clearly establishes the ASTM E84 performance limits and NFPA 286 with the identified acceptance criteria in 803.1.2 as the qualifying tests for use of foam plastics exposed to the airflow in plenums.
4) The use of a thermal barrier (currently Section 2603.7.1 Separation required) separating the foam plastic from the air flow in the plenum is allowed and therefore listed as an exception.
5) The use of an alternate barrier (currently Section 2603.7.3 Covering) separating the foam plastic from the air flow in the plenum is allowed and therefore listed as an exception.
6) A new exception is added to recognize the use of masonry or concrete as a means to separate the foam plastic from the air flow in the plenum. Masonry and concrete, with minimum 1 inch thickness, are approved thermal barriers for foam plastic per Section 2603.4.1.
7) A sentence is added to the Interior Finish and Trim (Section 2604.1) pointing back to the plenum requirements in Section 2603.7.
The changes bring needed clarification regarding the approved barriers and corresponding flame spread and smoke-developed requirements for foam plastic used in plenums.

Cost Impact:

Part I: Will not increase the cost of construction
No cost increase. This code proposal revises existing requirements without technical changes.

Part II: Will not increase the cost of construction
No cost increase. This code proposal revises existing requirements without technical changes.

M 70-15 : 602.2.1.6-WOESTMAN5567

M 71-15

602.2.1.7

Proponent: Mike Cudahy, representing Plastic Pipe and Fittings Association (mikec@cmservnet.com)

2015 International Mechanical Code

Revise as follows:

602.2.1.7 Plastic plumbing pipe and tube. Plastic piping and tubing used in plumbing systems ~~shall be listed and~~ shall exhibit a flame spread index of not more than 25 and a smoke-developed index of not more than 50 when tested in accordance with ASTM E 84 or UL 723.

Reason: While some of the exceptions for products in this section of the mechanical code contain, "listed and labeled" language, some have no mention of "listing and labeling", section 602.2.1.7 oddly only says, "listed".

We propose to delete, "listed" from this section, as it is inconsistent with the other language.

Cost Impact: Will not increase the cost of construction
This proposal seeks to determine if the "listing / listing and labeling" language is correct compared with other sections, and seeks conformity in the language. Thus the code with this proposal added will not cause the cost of construction to increase.

M 71-15 : 602.2.1.7-CUDAHY4606

M 72-15

602.2.1.7

Proponent: Mike Cudahy, representing Plastic Pipe and Fittings Association (mikec@cmservnet.com)

2015 International Mechanical Code

Revise as follows:

602.2.1.7 Plastic plumbing ~~pipe~~piping and ~~tube~~tubing. Plastic plumbing system piping and tubing ~~used in plumbing systems~~exposed within a *plenum* shall be listed and shall exhibit a flame spread index of not more than 25 and a smoke-developed index of not more than 50 when tested in accordance with ASTM E 84 or UL 723. As an alternative, plastic water distribution piping and tubing exposed within a plenum, shall be listed in accordance with UL 2846, and shall have a peak optical density not greater than 0.50, an average optical density not greater than 0.15, and a flame spread of not greater than 5 feet (1524 mm).

Add new standard(s) as follows:
UL 2846-2014 Fire Test of Plastic Water Distribution Plumbing Pipe for Visible Flame and Smoke Characteristics

Reason: PPFA supports a new UL testing method for water distribution piping, UL 2846, "Fire Test of Plastic Water Distribution Plumbing Pipe for Visible Flame and Smoke Characteristics".
This proposal would allow plastic water distribution only to be tested to ASTM E84, UL 723 or UL 2846. Other (service and DWV) plumbing piping would still be tested to E84 or UL 723.

Cost Impact: Will not increase the cost of construction
This proposal simply adds another option for testing piping material for use in plenums into the code and as such, the option is not requiring that this method be chosen. Thus the code with this proposal added will not cause the cost of construction to increase

Analysis: A review of the standard proposed for inclusion in the code, UL 2846, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2015.

M 72-15 : 602.2.1.7-CUDAHY5042

M 73-15

602.2.1.7

Proponent: Forest Hampton, representing Lubrizol Advanced Material, Inc. (forest.hampton@lubrizol.com)

2015 International Mechanical Code

Revise as follows:

602.2.1.7 Plastic plumbing pipe and tube. Plastic piping and tubing used in plumbing systems shall be listed and shall exhibit a flame spread index of not more than 25 and a smoke-developed index of not more than 50 when tested in accordance with ASTM E 84~~ or~~, UL 723 or CAN/ULC S102.2.

Add new standard(s) as follows:

CAN/ULC S102.2-10 Standard Method of Test for Surface Burning Characteristics of Flooring. Floor Coverings and Miscellaneous Materials and Assemblies

Reason: There are no mounting methods for plastic pipe in ASTM E84 or UL 723. The addition of ULC-S102.2-2010 provides a relevant method for testing flame and smoke properties of actual plastic pipes, fittings and valves. This method is representative of how pipes and assemblies are used in the field. This method has been in use since the 1980's and has provided a safe determination of flame and smoke properties for use in air handling systems.

Cost Impact: Will not increase the cost of construction
The proposal adds an additional test method to show acceptance.

Analysis:
A review of the standard proposed for inclusion in the code, CAN/ULC S102.2, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2015.

M 73-15 : 602.2.1.7-HAMPTON5364

M 75-15

602.2.1.7

Proponent: Marcelo Hirschler, representing GBH International (gbhint@aol.com)

2015 International Mechanical Code

Revise as follows:

602.2.1.7 Plastic plumbing pipe and tube.
Plastic piping and tubing used in plumbing systems shall be listed and labeled and shall exhibit a flame spread index of not more than 25 and a smoke-developed index of not more than 50 when tested in accordance with ASTM E 84 or UL 723.

Reason: This section was added at the last edition. When the language was developed the section was written stating that the plastic piping and tubing needs to be "listed" instead of "listed and labeled" as other products in plenums are.

Cost Impact: Will increase the cost of construction
If jurisdictions approved plastic piping and plumbing items that were listed but not listed and labeled they will, in future, have to be both listed and labeled.

M 75-15 : 602.2.1.7-HIRSCHLER3529

M 76-15

602.2.1.7

Proponent: Jonathan Roberts, UL LLC, representing UL LLC (jonathan.roberts@ul.com)

2015 International Mechanical Code

Revise as follows:

602.2.1.7 Plastic plumbing ~~pipe~~piping and ~~tube~~tubing. Plastic piping and tubing used in plumbing systems exposed within a plenum shall be listed and ~~shall exhibit~~labeled as having a flame spread index ~~of~~ not ~~more~~ greater than 25 and a smoke-developed index ~~of~~ not ~~more~~greater than 50 when tested in accordance with ASTM E 84 or UL 723.

Exception: Plastic water distribution piping and tubing listed and labeled in accordance with UL 2846 as having a peak optical density not greater than 0.50, an average optical density not greater than 0.15, and a flame spread distance not greater than 5 feet (1524 mm), and installed in accordance with its listing.

Add new standard(s) as follows:
UL 2846-14, Fire Test of Plastic Water Distribution Plumbing Pipe for Visible Flame and Smoke Characteristics

Reason: This proposal accomplishes the following:

1. Clarifies that this section is only applicable to plastic piping and tubing exposed within a plenum, using wording similar to Section 602.2.1.3.
2. Makes grammatical revisions for consistency.
3. Allows an option for water distribution piping and tubing to be listed to the UL 2846 criteria noted.

UL 2846 is an ANSI standard that includes a test method for determining values of flame propagation distance and optical smoke density for individual pairs of plastic plumbing pipes for distribution of potable water that can be installed in ducts, plenums, and other spaces used for environmental air. The scope of this standard can be viewed at http://ulstandards.ul.com/standard/?id=2846.

The acceptance criteria specified (peak optical density not greater than 0.50, an average optical density not greater than 0.15, and a flame spread distance not greater than 5 feet) is consistent with values in Sections 602.2.1.1, 602.2.1.2 and 602.2.1.3.

Cost Impact: Will not increase the cost of construction
This proposal provides an alternative method for evaluating plastic water distribution system piping and tubing.

Analysis:
A review of the standard proposed for inclusion in the code, UL 2846, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2015.

M 76-15 : 602.2.1.7-ROBERTS4106

M 77-15

602.2.1.7

Proponent: David Seiler, Arkema Inc, representing Arkema Inc. (dave.seiler@arkema.com)

2015 International Mechanical Code

Revise as follows:

602.2.1.7 Plastic plumbing pipe and tube. Plastic piping and tubing used in plumbing systems shall be listed and shall exhibit a flame spread index of not more than 25 and a smoke-developed index of not more than 50 when tested in accordance with ASTM E 84 or UL 723 <u>without any liquid in the pipe and utilizing the full width of the test apparatus tunnel during such tests</u>.

Reason: This is a simple clarification to confirm the testing procedure of ASTM E84

Bibliography: NFPA 90A, ASTM E84, UL 723

Cost Impact: Will not increase the cost of construction
This clarification makes no change in the material types that currently meet the code, thus there is no cost impact.

M 77-15 : 602.2.1.7-SEILER4331

M 78-15

602.2.1.8 (New)

Proponent: Marcelo Hirschler, representing GBH International (gbhint@aol.com)

2015 International Mechanical Code

Add new text as follows:

602.2.1.8 Pipe insulation. Pipe insulation in plenums shall comply with the requirements of Section 604.

Reason: Section 602 contains the requirements for materials in plenums. However, pipe insulation in plenums, which is supposed to comply with the same requirements as duct insulation (shown in section 604) is not specifically included. The default requirements in section 602 are simply a flame spread index of 25 and a smoke developed index of 50, when tested in accordance with ASTM E84. However, section 604 contains further details, including the requirements to meet testing in accordance with ASTM C411, the temperature requirements and the details of the mounting method for ASTM E84 (which should be in accordance with ASTM E2231). Some people may consider this as implicit but it is always better to be explicit rather than implicit. ASTM E2231 is entitled Standard Practice for Specimen Preparation and Mounting of Pipe and Duct Insulation Materials to Assess Surface Burning Characteristics and it deals with both pipe and duct insulation and it is already referenced in section 604 of the IMC.

Cost Impact: Will increase the cost of construction
This provides a pointer to clarify a missing requirement and should not affect requirements. However, if some juridisctions now handle pipe insulation in plenums different from duct insulation then the requirements would change for those jurisdictions.

M 78-15 : 602.2.1.8 (New)-HIRSCHLER3525

M 79-15

602.2.1.8 (New)

Proponent: Marcelo Hirschler, representing GBH International (gbhint@aol.com)

2015 International Mechanical Code

Add new text as follows:

602.2.1.8 Pipe and duct insulation within plenums. Pipe and duct insulation contained within plenums, including insulation adhesives, shall have a flame spread index of not more than 25 and a smoke developed index of not more than 50 when tested in accordance with ASTM E84 or UL 723, using the specimen preparation and mounting procedures of ASTM E2231. Pipe and duct insulation shall not flame, glow, smolder or smoke when tested in accordance with ASTM C411 at the temperature at which they are exposed in service. The test temperature shall not fall below 250ºF (121ºC) . Pipe and duct insulation shall be listed and labeled.

Reason: Section 602 covers the contents of plenums and section 604 covers insulation of ducts. However, it is quite common to have insulated pipes and/or insulated ducts within plenums. Pipe insulation is not specifically covered by the IMC. Moreover, the potential exists that duct insulation contained within plenums falls through the cracks and is not properly regulated. Moreover, there is also the possibility that section 604 is amended and that would affect pipe or duct insulation contained within plenums.
Note that duct insulation could be applied outside buildings and the requirements may need to be different from duct insulation within plenums. However, the new section will ensure that the fire safety requirements areapplied to pipe and duct insulation contained within plenums irrespective of other requirements for exterior insulation of ducts not contained within plenums.

Therefore it is proposed to add the same requirements from Section 604.3 to the new section on pipe and duct insulation within plenums, and, that way, the section addressing materials contained within plenums is independent of the section on materials associated with ducts, whether the ducts are free-standing or within plenums.

Exception 2 to section 602.2.1 does not specifically mention pipe or duct insulation within plenums.

Cost Impact: Will not increase the cost of construction
This is clarification only because fire safety requirements for materials contained within plenums already exist.

M 79-15 : 602.2.1.8 (New)-HIRSCHLER4751

M 80-15

602.2.2 (New)

Proponent: Brian Helms, Charlotte Plastics, representing Charlotte Pipe and Foundry (brian.helms@charlottepipe.com)

2015 International Mechanical Code

Add new text as follows:

602.2.2 Plastic piping in plenums. Plastic piping installed in plenums shall be tested in strict accordance with the requirements of ASTM E84 and UL723 including the mounting method used and the size of the sample tested. Modified tests that use mounting methods or sample sizes different than those required by the E84 and UL723 shall not be accepted as proof of compliance.

Reason: The requirements found in STM E84 and UL723 are the requirements. Changing the sample size or mounting methods to enable a plastic pipe manufacturer to achieve a passing grade ignore the basis by which the existing requirements exist. That reason is the protection of the health and safety of the occupants of the building. Allowing the use of modified tests exposes all plastic pipe manufacturers to liability which some might not wish to accept.

Cost Impact: Will not increase the cost of construction
This change merely highlights that the requirement of the standards regarding a product's acceptability for use in a plenum be followed without alteration. The practice of modifying or altering the requirements of ASTM E84 and UL 723 has been gaining momentum in the industry and diluting results that are intended to provide safety to the industry by measuring flame spread and smoke development of material used in a plenum. This change does not add to the cost of construction.

M 80-15 : 602.2.2 (New)-HELMS5401

M 81-15

603.1, 603.6.2, 603.6.2.1

Proponent: John Hamilton, representing TABB (jhamilton@tabbcertified.org)

2015 International Mechanical Code

Revise as follows:

603.1 General. An air distribution system shall be designed and installed to supply the required distribution of air. The installation of an air distribution system shall not affect the fire protection requirements specified in the *International Building Code*. Ducts shall be constructed, braced, reinforced and installed to provide structural strength and durability. <u>Ducts shall be listed in accordance with UL 181.</u>

Delete without substitution:

~~**603.6.2 Flexible air connectors.** Flexible air connectors, both metallic and nonmetallic, shall be tested in accordance with UL 181. Such connectors shall be *listed* and *labeled* as Class 0 or Class 1 flexible air connectors and shall be installed in accordance with Section 304.1.~~

~~**603.6.2.1 Connector length.** Flexible air connectors shall be limited in length to 14 feet (4267 mm).~~

Reason: Allowing the use of air connectors breeches the ICC fire protection codes.
Air connectors do not have to pass a U.L. flame penatration test, thus allowing flames to easiely jump from floor to floor or flames to enter wall cavities.

There are several videos showing this on YouTube.

Search ASHRAE 5.2 on YouTube or use this link:

https://www.youtube.com/watch?v=l5oKO_hRoxw

Cost Impact: Will not increase the cost of construction
The cost of air connectors is within 5% or flexable air ducts.

M 81-15 : 603.1-HAMILTON4932

M 82-15

603.6, 603.6.2.1, 603.6.2.2, 603.6.3, 603.6.4

Proponent: John Hamilton, representing TABB (jhamilton@tabbcertified.org)

2015 International Mechanical Code

Revise as follows:

603.6 Flexible air ducts and flexible air connectors. Flexible air ducts, both metallic and nonmetallic, shall comply with Sections 603.6.1, 603.6.1.1, 603.6.3 and 603.6.4. ~~Flexible air connectors, both metallic and nonmetallic, shall comply with Sections 603.6.2 through 603.6.4.~~

Delete without substitution:

~~**603.6.2.1 Connector length.** Flexible air connectors shall be limited in length to 14 feet (4267 mm).~~

~~**603.6.2.2 Connector penetration limitations.** Flexible air connectors shall not pass through any wall, floor or ceiling.~~

Revise as follows:

603.6.3 Air temperature. The design temperature of air to be conveyed in flexible air ducts ~~and flexible air connectors~~ shall be less than 250°F (121°C).

603.6.4 Flexible air duct and air connector clearance. Flexible air ducts ~~and air connectors~~ shall be installed with a minimum *clearance* to an *appliance* as specified in the *appliance* manufacturer's installation instructions.

Reason: UL test air connectors, but they have to weak of a lableing requirment. Many time inspectors can not tell flex duct from air connectors. Air ducts have rectangular lables indicating it is UL approved duct.

Air connectors have a round lable indicating it is UL approved air connector.

Some manufactures put large rectangular performance lables on air connectors along with a small round UL lable saying the item is air connectors,

In my attached photo it shows the problem. The perfomance label (rectangular) is 4.3 times larger than the UL air connector lable.

ASHRAE 5.2 is going to question UL on how to lable air connectors better so inspectors can see what they are.

Until UL has a better lableing system the ICC should not recognize them.

Bibliography: UL 181

Cost Impact: Will not increase the cost of construction
Flex air duct is about the same cost

M 82-15 : 603.1-HAMILTON4962

M 83-15

Table 603.4

Proponent: John Hamilton, representing TABB (jhamilton@tabbcertified.org)

2015 International Mechanical Code

Revise as follows:

TABLE 603.4
DUCT CONSTRUCTION MINIMUM SHEET METAL THICKNESS FOR <u>OVER 14 FEET IN LENGTH FOR </u>SINGLE DWELLING UNITS[a]

(Portions of table and notes not shown remain unchanged)

603.6 Flexible air ducts and flexible air connectors. Flexible air ducts, both metallic and nonmetallic, shall comply with Sections 603.6.1, 603.6.1.1, 603.6.3 and 603.6.4. Flexible air connectors, both metallic and nonmetallic, shall comply with Sections 603.6.2 through 603.6.4.

603.6.2.1 Connector length. Flexible air connectors shall be limited in length to 14 feet (4267 mm).

603.6.2.2 Connector penetration limitations. Flexible air connectors shall not pass through any wall, floor or ceiling.

603.6.4 Flexible air duct and air connector clearance. Flexible air ducts and air connectors shall be installed with a minimum *clearance* to an *appliance* as specified in the *appliance* manufacturer's installation instructions.

Reason: Why have a minimum metal thickness if the code allows air connectors to be used. Seems odd when installing metal duct it has to be a min thickness but if a paper thin material other than metal is used there is no thickness requirment.

Cost Impact: Will not increase the cost of construction
Would help make HVAC systems cheaper

M 83-15 : T603.4-HAMILTON4654

M 84-15

603.6.5 (New)

Proponent: John Hamilton, representing TABB (jhamilton@tabbcertified.org)

2015 International Mechanical Code

Add new text as follows:

603.6.5 Flexible duct installation. Flexible duct shall be installed fully extended without compression and shall be cut to the length necessary for the installation. Flexible duct shall be supported at intervals not less than 4 feet (1219 mm) for horizontal ducts and not less than 6 feet (1829) intervals for vertical ducts. The duct sag between supports shall not exceed ½ inch per foot of duct length between the supports. Flexible duct supports shall be of rigid material and not less then 1.5 inch (38 mm) in width. Hangers shall be installed to prevent restriction of the internal diameter of the duct. Flexible air duct bends shall have a radius of not less than the duct diameter. Flexible ducts shall not be bent across objects such as pipes, wires, joists and trusses. Screws shall not penetrate the inside liner of nonmetallic flexible ducts. Flexible duct connections shall be made with rigid collars that are not less than 2 inches (51 mm) in length. Such collars shall be beaded except where metal worm-gear clamps are used to secure the duct liner. Flexible duct liners shall extend not less than 1 inch (25 mm) beyond the collar bead.

Reason: Of all the studies done on flex duct to date not one has found a situation where flex duct is installed properly. The information is already code but buried in 3rd party documents that most inspectors do not have or want to purchase.
Bring the current requirments into the code book. Ralph will even let you use pictures :-)

1. Install flex duct fully extended. Do not install in the compressed state or use excess length.
2. Install horizontal flex duct hangers at least every 4 feet (1.2 m).
3. Install vertical flex duct hangers at least every 6 feet (1.8 m)
4. Install flex duct so that sag does not exceed ½ in. per ft (42 mm per m). That means no more than 1" of sag between hangers.
5. Use flex duct supports that are ridged and at 1.5 inch (38 mm) minimum wide (no cloth hangers). Hanger shall be of sufficient width to prevent any restriction of the internal diameter of the duct when the weight of the supporting section rests on the hanger.
6. Install flex duct so that bends exceed one duct diameter radius. Do not bend ducts across sharp corners such as pipes, wires, joists or trusses.
7. Do not install non-metallic flex duct with screws penetrating the inside liner.
8. All flex duct connections shall be attached to a 2" ridged collar with a bead. The flex must be pulled over at least 1" over the bead before a fasten strap is affixed. Beads on connections are optional when using metal worm-gear clamps.

Bibliography: ADC 5th edition

Cost Impact: Will not increase the cost of construction
It is already code so no code is changing, so no increase in cost.

M 84-15 : 603.5-HAMILTON4955

M 85-15

603.6.1.1

Proponent: John Hamilton, representing TABB (jhamilton@tabbcertified.org)

2015 International Mechanical Code

Revise as follows:

603.6.1.1 Duct length. Flexible air ducts shall ~~not~~ be limited to 5 feet (1524 mm) in length.

Reason: There is no standard to which flex duct is made and tested regauding the friction loss (resistance) it creates on the HVAC system. Becasue of this no one test can show how much flex duct really cost in energy use.

Even the Air Diffusion Council test are on one specific brand of flex duct and that flex duct may not even be made anymore.

Flex duct creates more pressure resitance than metal ducts thus creating a higher energy use.

Unify the IMC with the UMC

Some examples from ASHRAE Reasearch Project 1333 or RP-1333:

- 6" metal duct = 10" flex
- 8" metal duct = 12" flex
- 10" metal duct = 14" flex duct
- Turning flex 90 degrees to use it as a elbow can create 20-40 times the resistance of a sheet metal elbow.
- Not one study to date has found flex duct to be installed properly

Limiting flex to 5 feet would help bring many codes together. Several states limit the length of flex duct. Engineering firms limit the length of flex. Target corperation world wide limits flex to 6' lengths. The UMC limits flex duct to 5 foot.

The common argument agaist this limit is where is the techincal data? There is lots of it attached in this proposal. Including ASHRAE spending over 400,000 dollars to document the restriction and energy use flex creates.

Technical reasons for limiting flex

1. Installation practices:
A. Poor installation practices can raise the total pressure loss by as much as a factor of 10.
ASHRAE Research Project RP-1333, Final Report

B. As a subject for future work, it is recommended that ASHRAE study actual installations. As part of the preparation for this project, numerous housing and industrial installations were reviewed. In this limited survey, it was found that every installation was not in compliance with Manual D and ADC (2003) requirements.

ASHRAE Research Project RP-1333, Final Report.

2. Performance:

A. Culp and Cantrill (2009), even when installed properly, i.e. adequately stretching the flexible duct, the pressure loss per unit length can be up to 120% greater than the values recorded in the ASHRAE Handbook for round metal duct of the same size when seen in their testing of 305 mm (12 in.), 356 mm (14 in.), and 406 mm (16 in.) duct diameters.
ASHRAE Transactions, 115(1):622-628.

B. Example of sizing flex using the ASHRAE Duct Fitting Database

Flex size" Flex Compression
4% 15% 30% 45%
6" 7.3" 8.4 9.2 9.8
8" 9.5 10.7 11.7 12.3
10" 11.6 12.9 13.9 14.6
12" 13.6 15 16.1 16.7
14" 15.7 17.1 18.2 18.9
ASHRAE. 2012. ASHRAE Duct Fitting Database

C. The ASHRAE Standard 120 test protocol which is conducted while the sample is supported on a flat surface, such that the duct is first stretched taut with a prescribed tensile force of 110 N (25 lbf) as measured with a pull scale, for a period of one minute.

None of the above underlined criteria is a typical field practice when installing flex duct.
ASHRAE Research Project RP-1333, Final Report.

D. Per the installation standard published by ADC (2010), accepted industry practice is to install flexible ducts fully extended, and duct compression and excessive lengths are to be avoided. Does this mean the flex is not to be allowed to compress back to 4%-15% how can an installer do this?

ADC. 2010. Flexible Duct Performance & Installation Standards, 5th edition. Air Diffusion Council, Schaumburg, Illinois.

E. Culp (2011) observed that the pressure loss measurements varied approximately ±20% to ±30%. These disparities were attributed to several factors, such as: (i) actual duct diameters can vary up to 6 mm (0.25 in.) among different manufacturers, (ii) it was difficult to obtain uniform compression in duct samples having an outer insulation and duct sleeve installed, because the insulation tended to reduce the inflation of the inner liner, (iii) various manufacturers employ different materials, wire diameters/pitches, and coil attachment methods to construct their products, and (iv) a 'hysteresis' (interior liner memory) effect was observed at high volume flow rates, such that when the duct deformed to a zigzag type of configuration and was then re-straightened, the duct pressure loss was perceived to increase ~20%. The implication is that field installations may potentially exhibit significantly different pressure losses from those predicted by the present analysis.

ASHRAE Research Project RP-1333, Final Report.

F. The cases involving flexible ducts considered in this study were limited to low pressure applications where the pressure loss per unit length did not surpass approximately 16.3 Pa/m (2 in. water/100 ft). The use of flexible ducts for applications exceeding this limit is not recommended by flexible duct manufacturers.

ASHRAE Research Project RP-1333, Final Report.

G. The 1995 ACCA data does not include compressibility factors. The 2009 ACCA Manual D discusses the effect of compression, but does not have friction charts for various degrees of flexible duct compression.

H. In field studies, observed pressure drops in flexible duct systems are often higher than expected based on design calculations. This is because the flexible ducts are not installed in a fully stretched condition; they are often found to be compressed to varying degrees. This common problem leads to excessive pressure drop in many systems with associated increases in fan power, flow reduction, and noise. For design purposes and for diagnostics of duct systems, friction charts and friction loss equations and coefficients from various references are used. For fully stretched flexible duct, in particular, ASHRAE Fundamentals (ASHRAE 2001a) and ACCA Manual D (ACCA 1995) provide pressure drop calculations using such charts, equations and coefficients.
Compression Effects on Pressure Loss in Flexible HVAC Ducts Published in ASHRAE HVAC&R Research Journal, Vol. 10, No. 3, July

3. Unknowns:

A. Nylon Straps
Sherman (2005) showed that some nonmetallic flexible duct core-to-collar clamps have unacceptable high-temperature performance. Most of the standard nylon straps failed before the two-year test period was completed.
B. Rodents
Chewing through duct work is that acceptable?
C. UV light
Has been shown and created failures in flex duct.
D. Concealed spaces?
How long should a duct last inside a concealed space?
E. Duct cleaning
The ADC and every manufacture I have researched has said not to clean flex duct you should replace it. Is it feasible to put flex duct in concealed space?

Cost Impact: Will not increase the cost of construction
People will claim this will increase building cost. Not true, if flex is installed as per the ADC it actually will decrease the instalation cost of HVAC systems. However when flex is installed improperly it will cost less to install a HVAC system. That is typical practice today do not follow the code or guidelines.
Understand the code today says how to intal flex duct and not one study has found a place where flex is installed properly.

M 85-15 : 603.5-HAMILTON4984

Fibrous duct construction shall conform to the SMACNA *Fibrous Glass Duct Construction Standards* or NAIMA *Fibrous Glass Duct Construction Standards.* The air temperature within nonmetallic ducts shall not exceed 250°F (121°C).

603.6 Flexible air ducts and flexible air connectors. Flexible air ducts, both metallic and nonmetallic, shall comply with Sections 603.6.1, 603.6.1.1, 603.6.3 and 603.6.4. Flexible air connectors, both metallic and nonmetallic, shall comply with Sections 603.6.2 through 603.6.4.

Delete without substitution:

~~**603.6.2.1 Connector length.** Flexible air connectors shall be limited in length to 14 feet (4267 mm).~~

~~**603.6.2.2 Connector penetration limitations.** Flexible air connectors shall not pass through any wall, floor or ceiling.~~

Revise as follows:

603.6.3 Air temperature. The design temperature of air to be conveyed in flexible air ducts ~~and flexible air connectors~~ shall be less than 250°F (121°C).

603.6.4 Flexible air duct and air connector clearance. Flexible air ducts ~~and air connectors~~ shall be installed with a minimum *clearance* to an *appliance* as specified in the *appliance* manufacturer's installation instructions.

Reason: Follow ASHRAE Design guide

Bibliography: ASHRAE Design guide chapter 3 page 24

Cost Impact: Will not increase the cost of construction
Air connectors and flexable air ducts have the same cost

M 87-15 : 603.5-HAMILTON5028

M 88-15

603.5, 603.8.3

Proponent: Jay Peters, Codes and Standards International, representing AQC Industries (peters.jay@me.com)

2015 International Mechanical Code

Revise as follows:

603.5 Nonmetallic ducts. Nonmetallic ducts, other than plastic ducts, shall be constructed with Class 0 or Class 1 duct material and shall comply with UL 181. Fibrous duct construction shall conform to the SMACNA *Fibrous Glass Duct Construction Standards* or NAIMA *Fibrous Glass Duct Construction Standards.* The air temperature within nonmetallic ducts, other than plastic ducts, shall not exceed 250°F (121°C). Plastic ducts shall comply with section 603.8.3.

603.8.3 Plastic ducts and fittings. Plastic ducts and fittings shall be constructed of PVC or PE having a minimum pipe stiffness of 8 psi (55 kPa) at 5-percent deflection when tested in accordance with ASTM D 2412~~. Plastic duct fittings shall be constructed of either PVC or high-density polyethylene~~. Plastic duct and fittings shall be utilized in underground installations only. The maximum design temperature for systems utilizing plastic duct and fittings shall be 150°F (66°C). Plastic duct systems for underground applications shall be listed for such use.

Reason: Plastic duct systems are currently only allowed for use in underground locations per section 603.8.3. There has been some confusion regarding the application of this section in regard to the need for plastic ducts to comply with the flame and smoke requirements of UL 181. This proposal would bring needed clarity. Recently in 2014, UL has issued an interpretation (attached) stating that ***"The scope and original intent of UL 181, Factory Made Air Ducts and Air Connectors does not specifically cover factory made air ducts intended for installation underground. The requirements within UL 181 were not developed with the intent of addressing construction, performance, or other requirements for underground duct applications".*** Within the letter, UL recognizes that there are specific requirements for underground ducts in the marketplace, namely ICC ES PMG LC1014.

Because there was not a standard specific to underground ducts, ICC ES PMG created *PMG Listing Criteria for Underground Plastic Ducts (LC1014)* to address underground ducts specifically. The LC requires testing to meet related standards, IMC code provisions as well as specific provisions of UL 181 for underground ducts and exempts the flame and smoke provisions when installed underground. Multiple manufacturers of PVC and PE have tested and are listed to meet the requirments of ICC's LC, multiple standards as well as their intended application in the IMC and UMC,

Bibliography: [PMG Listing Criteria for Underground Plastic Ducts] [LC1014 Reference EG290] [ICC] [2008 Revised 2014]

Cost Impact: Will not increase the cost of construction
By clarifying the proper criteria required to test, list and install plastic ducts underground, cost of construction could potentially be reduced.

M 90-15

603.6

Proponent: John Hamilton, TABB, representing TABB (jhamilton@tabbcertified.org)

2015 International Mechanical Code

Revise as follows:

603.6 Flexible air ducts and flexible air connectors. Flexible air ducts, both metallic and nonmetallic, shall comply with Sections 603.6.1, 603.6.1.1, 603.6.3 and 603.6.4. Flexible air connectors, both metallic and nonmetallic, shall comply with Sections 603.6.2 through 603.6.4. <u>FlexiIble air ducts shall not be installed in inaccessIble spaces or wall cavities.</u>

Reason: Allowing the use of flex duct in inaccesable areas of a building should not be allowed becasue it is not cleanable.
If any type of event happens such as high humidity, flood, hazordous product in the air. Flex duct can not be cleaned. It is a temporary duct compared to metal ducts. Future cost to replace flex in inaccessable places is a huge burden many building owners face today.

It should not be allowed in non-accesable areas because of documents rodent problems chewing holes in the flex.

When flex is installed in conceld places using nylon straps the straps are failing and allowing the HVAC air to escape into the wall cavity. This is being found with the use of infrared cameras.

Bibliography: The Air Diffusion Coucil

Flexible Duct Performance
& Installation Standards
Fifth Edition

Cost Impact: Will not increase the cost of construction
When flex is installed as per the ADC manual it is more expensive to install than sheet metal ducts.

M 90-15 : 603.6-HAMILTON4927

M 91-15

603.6.1

Proponent: John Hamilton, representing TABB (jhamilton@tabbcertified.org)

2015 International Mechanical Code

Add new text as follows:

603.6.1 Flexible air ducts. Flexible air ducts, both metallic and nonmetallic, shall be tested in accordance with UL 181. Such ducts shall be *listed* and *labeled* as Class 0 or Class 1 flexible air ducts and shall be installed in accordance with Section 304.1. Screws shall not penetrate the inside liner of flexiible air ducts.

Reason: The Air Diffusion Council (ADC) does not allow screws to penatrate the inside liner of flex duct. I can not find one manufacture who allows screws to penatrate the inside liner of flex duct.

Bibliography: From the FAQ section of the ADC:
Can screws be used to fasten Flexible Air Duct core?
ADC does not recommend the use of metal screws for making connections and splices with non-metallic flexible air ducts. Procedures and materials (tapes, mastic, fasteners) for connecting and splicing non-metallic flexible ducts are evaluated using UL181B Standard which does not address the use of metal screws. Potentially, metal screws can damage the components in some non-metallic flexible ducts.

ADC does recommend the use of sheet metal screws for making connections and splices with Metallic flexible air ducts.

http://www.flexibleduct.org/ADC_FAQs.asp

Cost Impact: Will not increase the cost of construction
Not allowing screws to penatrate the inside liner of flex duct would decrease construction cost because less labor would be used.

M 91-15 : 603.6.1-HAMILTON4667

M 92-15

603.6.1.1

Proponent: John Hamilton, representing TABB (jhamilton@tabbcertified.org)

2015 International Mechanical Code

Delete without substitution:

~~**603.6.1.1 Duct length.** Flexible air ducts shall not be limited in length.~~

Reason: Flexiable air ducts are limited in length by the ADC and manufactures. This code leads to improper instalation practices. Example: Installing contrator says I use a whole box 25' of flex to make a 5 foot connection, bucause it is cheaper to install it this way. The way this code reads the installler can do this because the code says flex duct length shall not be limited. That language makes the ADC and manufactures instalation guides useless. Operation cost will go down

Bibliography: ASHRAE RP-1333 on flex duct

Cost Impact: Will not increase the cost of construction
Operation cost will go down when less flex and proper instalation is done.

M 92-15 : 603.6.1.1-HAMILTON3425

M 93-15

603.8, 603.8.3

Proponent: Charles Stock, Spunstrand Inc., representing Spunstrand Inc.

2015 International Mechanical Code

Revise as follows:

603.8 Underground ducts. Ducts shall be *approved* for underground installation. Metallic ducts not having an *approved* protective coating shall be completely encased in not less than 2 inches (51 mm) of concrete. <u>Nonmetallic and plastic ducts shall comply with UL 181.</u>

603.8.3 Plastic ducts and fittings. Plastic ducts shall be constructed <u>only</u> of PVC having a minimum pipe stiffness of 8 psi (55 kPa) at 5-percent deflection when tested in accordance with ASTM D 2412. Plastic duct fittings shall be constructed of either PVC or high-density polyethylene. Plastic duct and fittings shall be utilized in underground installations only <u>and all exposed surfaces shall have a Class 0 or Class 1 flame and smoke rating in accordance with UL 181</u>. The maximum design temperature for systems utilizing plastic duct and fittings shall be 150°F (66°C).

Reason: The further clarification in section 603.8 and the addition of section 603.8.3 are mainly intended to insure that the use of improper materials does not slip through the code cracks. This should eliminate the use of highly flammable and excessive smoke-generating materials in an HVAC duct system regardless of its installation location above or below ground. All duct and fittings used for HVAC systems in the Uniform Mechanical Code and the International Mechanical Code call for the interior of the duct and plenums to be rated Class 0 or Class 1 per UL 181, which is a flame spread of 25 and a smoke development of 50 or less. These standards are used for ducts and plenums for both safety and liability concerns which should apply to underground duct and fittings as well. The indication that PVC or HDPE, which do not meet Class 1 or Class 0 per UL 181, can be used solely because it is buried seems to drastically contradict the other code sections. Duct systems, both above and below ground, should comply with applicable UL 181 standards. It should also be noted that the maximum temperature rating for PVC and HDPE is usually 140deg F. Limit switches on residential and commercial air handlers are normally set at 160deg F and air temperatures in the ductwork can often run up to 140deg F. If a $25 limit switch fails, the temperatures can then easily exceed 140deg F. It is inappropriate to install a material in a duct system in which the air exceeds the ducts maximum temperature rating with no safety factor.

Cost Impact: Will not increase the cost of construction
Any products that are not completely code compliant, meeting UL 181 and ASTM C-518, were not and should not be considered in determining the cost impact of these proposed changes. With that said, there would be no cost impact as there are currently three U.S. manufacturers providing code approved product with numerous others who could if they are willing to enter the market.

M 93-15 : 603.8-STOCK5654

M 94-15

603.8.2

Proponent: Jay Peters, Codes and Standards International, representing AQC Industries (peters.jay@me.com)

2015 International Mechanical Code

Revise as follows:

603.8.2 Sealing. Ducts shall be sealed and secured and then tested with air to a pressure of not less than 2-inches water column (498 Pa) for not less than 5 minutes. Testing shall be performed in the presence of the code official and prior to ~~pouring the~~ encasement in concrete ~~encasement~~or direct burial.

Reason: All duct leakage, whether in the envelope, in the attic or underground are of concern, but undergroound ducts are more likely to casue serious issues due to their location. Underground duct systems have a propensity to leak which causes air exfiltration (loss) and also duct infiltration (gain) of contaminants into the duct system and building. The leakage, in-and-out, not only causees poor air quality, duct system degradation, sick building occupants, mold, mildew and even radon contamination, but also major energy waste. Some estimate that after the combined infiltration from leaks in walls/floors/ceilings, the duct system is the next largest casue of infiltration or building leakage. Underground return ducts are of particular concern due to their intake of impurities due to the negative pressure within the system. All ducts are required to be sealed before they are encased in concrete or placed underground but the code does not designate any sort of test to prove the airtightness, and more importantly, watertightness of underground duct systems. Plastic ducts are typically not subject to concrete encasement but should also be tested for air and water tightness before buried directly into the ground.

Cost Impact: Will increase the cost of construction
This may have a minimal increase in initial cost, but could have potential savings in the long run for buildings utilizing underground duct systems.

M 94-15 : 603.8.2-PETERS5141

M 95-15

603.8.3

Proponent: Terrence Cahill, Crawford Company, representing Crawford Company (tcahill@crawford-company.com)

2015 International Mechanical Code

Revise as follows:

603.8.3 Plastic ducts and fittings. Plastic ducts shall be constructed of ~~PVC~~a Class 0 or Class 1 duct material having a flame spread index of 25 or less and a smoke developement index of 50 or less, when tested in accordance with ASTM E-84 or UL 723. Ducts shall have a minimum pipe stiffness of 8 psi (55 kPa) at 5-percent deflection when tested in accordance with ASTM D 2412. ~~Plastic duct fittings shall be constructed of either PVC or high-density polyethylene.~~ Plastic duct and fittings shall be ~~utilized in~~listed and labeled for underground installations ~~only~~. The maximum design temperature for systems utilizing plastic duct and fittings shall be 150°F (66°C).

Reason: Section 603.8.3 should be updated to include all listed and labeled plastic duct options. Of primary concern is the lack of requirement for a NFPA Class 1 duct material (less than 25 Flame spread, and less than 50 Smoke development) for underground HVAC duct. For Health and Safety reasons we feel that this should be a minimum requirement for all HVAC duct.
Throughout the IMC there is a uniformity that requires Class 0 or Class1, listed and labeled material for nonmetallic duct components. Underground nonmetallic duct, Section 603.8.3 should not be an exception. The following sections are examples of the Class 0 or Class1 requirements:

-510.8 Hazardous Exhaust - Duct construction *1 (see attachment File A)

-602.2.1 Materials within plenums *2

-603.5 Nonmetallic ducts *3

-603.6.2 Flexible air connectors *4

-604.3 Coverings and Linings *5

The Uniform Mechanical Code (UMC) -2012 is also clear on requirements for Class 0 or Class 1 Duct Materials. Reference the following sections:

- 506.1 Product Conveying Ducts - Materials *6

-602.2 Combustibles within Ducts or Plenums *7.

The current IMC code section 603.8.3 limits underground HVAC duct materials to PVC or HDPE, neither of which are a Class 0 or Class 1 duct material. When this code section was written these materials may have been the best choice for corrosion resistant underground duct. There are new duct products that are ICC-ES tested and listed with a PMG listing for underground duct. One of the principle ICC-ES requirements for underground nonmetallic duct is that it be ASTM E84 Class 0 or Class1 material. This code change will acknowledge these new approved materials and set standards that are consistent and uniform as new duct materials are introduced.

After the 9/11disaster FEMA, AWWA, NYPD and others put out independent reports on what improvements could be to the building codes in order to reduce the number of casualties in future disasters. These organizations independently concurred that in the event of catastrophic episode, all ductwork within a building should have the capability of being used for exhaust duct. By requiring Class 0 or Class 1 duct material in section 603.8.3 this recommendation is ensured as these types of duct materials will not readily melt and collapse in fire situations. Both PVC and HDPE will readily melt and HDPE specifically has been shown to easily burn, even in underground applications.

This proposed Code change will ensure reliability, safety and uniformity with all nonmetallic duct applications.

Cost Impact: Will not increase the cost of construction
The proposed code change will have little if any effect on the cost of an installed underground duct systems. Even though the raw material cost of the called out PVC and HDPE are less than the resins used for fiberglass reinforced plastic, the installation requirements tend to even out the installed finished project cost. As an example, corrosion resistant high strength filament wound fiberglass duct does not require concrete encasement as metallic and some nonmetallic duct materials do.
As HVAC design engineers are trending more and more towards designing buildings utilizing Displacement Ventilation systems, larger diameter underground ducts are required. Nonmetallic, code approved duct material options already exist that are more cost effective for large diameter duct than the section 603.8.3 mentioned PVC or HDPE. The proposed code change to Class 0 or Class1 duct material will encourage the development of even more cost effective duct materials that also incorporate this life saving requirement. The real issue is health and safety and that is hard to put a price on.

December 2014 Quoted List Pricing

M 95-15 : 603.8.3-CAHILL3564

M 96-15

603.9

Proponent: Donald Surrena, National Association of Home Builders, representing National Association of Home Builders (dsurrena@nahb.org)

2015 International Mechanical Code

Revise as follows:

603.9 Joints, seams and connections. All longitudinal and transverse joints, seams and connections in metallic and nonmetallic ducts shall be constructed as specified in SMACNA *HVAC Duct Construction Standards—Metal and Flexible* and NAIMA *Fibrous Glass Duct Construction Standards*. All joints, longitudinal and transverse seams and connections in ductwork shall be securely fastened and sealed with welds, gaskets, mastics (adhesives), mastic-plus-embedded-fabric systems, liquid sealants or tapes. Tapes and mastics used to seal fibrous glass ductwork shall be listed and labeled in accordance with UL 181A and shall be marked "181 A-P" for pressure-sensitive tape, "181 A-M" for mastic or "181 A-H" for heat-sensitive tape. Tapes and mastics used to seal metallic and flexible air ducts and flexible air connectors shall comply with UL 181B and shall be marked "181 B-FX" for pressure-sensitive tape or "181 B-M" for mastic. Duct connections to flanges of air distribution system equipment shall be sealed and mechanically fastened. Mechanical fasteners for use with flexible nonmetallic air ducts shall comply with UL 181B and shall be marked "181 B-C." Closure systems used to seal all ductwork shall be installed in accordance with the manufacturer's instructions.

> **Exception:** For ducts having a static pressure classification of less than 2 inches of water column (500 Pa), additional closure systems shall not be required for continuously welded joints and seams and locking-type joints and seams of other than the snap-lock and buttonlock types<u> for ducts that are located outside of conditioned spaces</u>.

Reason: This proposal will reduce construction cost and still reduce energy loss that would occur due to duct leakage outside conditioned space. Low pressure longitudinal seam duct leakage is very limited and the small amount of leakage within conditioned space is still useful energy.

Bibliography: Estimated Costs of the 2015 IRC Codes Changes, Home Innovation Research Labs, Upper Marlboro, MD, December 2014,Report Reference No: MAT 1, Page 33

Cost Impact: Will not increase the cost of construction
Cost decrease of up to $314 for an average house according to research conducted by Home Innovation Research Labs.

M 97-15

603.5, 603.6, 603.6.1.1, 603.6.2.1, 603.5 (New), 603.9, 603.10, 603.10.1 (New), Chapter 15

Proponent: Ralph Koerber, ATCO Rubber Products, Inc, representing Air Diffusion Council (ADC) (rkoerber@atcoflex.com)

2015 International Mechanical Code

Revise as follows:

603.5 Nonmetallic ducts. Nonmetallic ducts shall be constructed with Class 0 or Class 1 duct material and shall comply with UL 181. Fibrous duct construction shall conform to the SMACNA *Fibrous Glass Duct Construction Standards* or NAIMA *Fibrous Glass Duct Construction Standards.* Flexible air ducts and air connectors shall comply with the ADC *Flexible Duct Performance & Installation Standards.* The air temperature within nonmetallic ducts shall not exceed 250°F (121°C).

603.6 Flexible air ducts and flexible air connectors. Flexible air ducts, both metallic and nonmetallic, shall comply with Sections 603.6.1, 603.6.1.1, 603.6.3, 603.6.4 and ~~603.6.4~~603.6.5. Flexible air connectors, both metallic and nonmetallic, shall comply with Sections 603.6.2 through ~~603.6.4~~603.6.5.

603.6.1.1 Duct length. Flexible air ducts shall not be limited in length. Flexible air ducts shall be installed fully extended with minimal longitudinal compression. The provision of excess duct length for the purpose of possible future relocation of air terminal devices shall be prohibited.

603.6.2.1 Connector length. Flexible air connectors and multiple lengths of flexible air connector that have been joined together shall be limited in length to 14 feet (4267 mm). Flexible air connectors shall be installed fully extended with minimal longitudinal compression.

Add new text as follows:

603.5 Flexible air duct and air connector bends. Where flexible air ducts and air connectors are used in place of metallic elbows, the bend radius shall be greater than or equal to one duct diameter.

Revise as follows:

603.9 Joints, seams and connections. All longitudinal and transverse joints, seams and connections in metallic and nonmetallic ducts shall be constructed as specified in SMACNA *HVAC Duct Construction Standards—Metal and Flexible*, ~~and~~ NAIMA *Fibrous Glass Duct Construction Standards*, or ADC *Flexible Duct Performance & Installation Standards*. All joints, longitudinal and transverse seams and connections in ductwork shall be securely fastened and sealed with welds, gaskets, mastics (adhesives), mastic-plus-embedded-fabric systems, liquid sealants or tapes. Tapes and mastics used to seal fibrous glass ductwork shall be listed and labeled in accordance with UL 181A and shall be marked "181 A-P" for pressure-sensitive tape, "181 A-M" for mastic or "181 A-H" for heat-sensitive tape. Tapes and mastics used to seal metallic and flexible air ducts and flexible air connectors shall comply with UL 181B and shall be marked "181 B-FX" for pressure-sensitive tape or "181 B-M" for mastic. Fittings used in combination with flexible air ducts and air connectors shall have a flange length of not less than 2 inches (51 mm) for connection of the flexible duct. Flexible duct and air connector inner cores shall be installed at not less than 1 inch (25.4 mm) onto the fitting prior to taping and application of the mechanical fastener. Mastic shall be applied in accordance with the mastic manufacturer's instructions prior to pulling the inner core onto the fitting and applying the mechanical fastener. Duct connections to flanges of air distribution system equipment shall be sealed and mechanically fastened. ~~Mechanical~~Non-metallic mechanical fasteners for use with flexible ~~nonmetallic~~air ducts and air ~~ducts~~connectors shall comply with UL 181B and shall be marked "181 B-C." Where non-metallic mechanical fasteners are used, the fittings shall be beaded. Insulation and outer vapor barriers of flexible ducts shall be sealed to the fitting using 2 wraps of approved tape, a mechanical fastener or both. Closure systems used to seal ~~all~~ ductwork shall be installed in accordance with the manufacturer's instructions.

> **Exception:** For ducts having a static pressure classification of less than 2 inches of water column (500 Pa), additional closure systems shall not be required for continuously welded joints and seams and locking-type joints and seams of other than the snap-lock and buttonlock types.

603.10 Supports. Ducts shall be supported in accordance with SMACNA *HVAC Duct Construction Standards—Metal and Flexible.* ~~Flexible and other factory-made~~Factory-made ducts shall be supported in accordance with the manufacturer's instructions.

Add new text as follows:

603.10.1 Flexible Duct Supports Flexible air ducts and air connectors shall be supported at intervals not to exceed 4 feet (1219mm) where installed horizontally and at intervals not to exeed 6 feet (1829mm) where installed as vertical risers and shall be in accordance with the manufacturer's instructions and the ADC *Flexible Duct Performance & Installation Standards*. Supports shall be not less than 1.5 inch (38mm) in width. Sag between supports shall not exceed 1/2 inch (13mm) for each foot (309 mm) of duct between supports.

Add new standard(s) as follows:

Air Diffusion Council
1901 N. Roselle Road, Suite 800
Schaumburg, IL 60195

ADC *Flexible Duct Performance & Installation Standards* (5th Edition)

Reason: The changes and revisions included in this proposal seek to clarify important aspects of proper flexible duct installation.
All of the language, to my knowledge, is currently included either within the manufacturer's installation instructions supplied with flexible ducts that are listed and labeled to the Ul181 Standard, the UL181B Standard for Closure Systems, and within the Air Diffusion Council Flexible Duct Performance & Installation Standards.

Although the code language currently requires that products be installed per their listing and per the manufacturer's installation instructions, this added text within the code sections should help clarify important aspects of proper flexible duct installations.

Cost Impact: Will not increase the cost of construction
Since the intent of the proposal is to clarify existing requirements (per the manufacturer's installation instructions currently required), there should be no additional cost impact if these revisions are included.

Analysis: A review of the standard proposed for inclusion in the code, ADC Flexible Duct Performance & Installation Standards, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2015.

M 97-15 : 603.10.1 (New)-KOERBER5134

M 98-15

604.3, 604.4

Proponent: Mike Fischer, Kellen Company, representing The Center for the Polyurethanes Industry of the American Chemistry Council (mfischer@kellencompany.com)

2015 International Mechanical Code

Revise as follows:

604.3 Coverings and linings. Coverings and linings, including adhesives where used, shall have a flame spread index not more than 25 and a smoke-developed index not more than 50, when tested in accordance with ASTM E 84 or UL 723, using the specimen preparation and mounting procedures of ASTM E 2231. Duct coverings and linings shall not flame, glow, smolder or smoke when tested in accordance with ASTM C 411 at the temperature to which they are exposed in service. The test temperature shall not fall below 250°F (121°C). Coverings and linings shall be listed and labeled.

Exception: Polyurethane foam insulation that is spray applied to the exterior of ducts in attics and crawlspaces shall have a smoke-developed index not greater than 450, subject to all of the following requirements:

1. The foam plastic insulation complies with the requirements of Section 2603 of the *International Building Code.*
2. The foam plastic insulation is protected against ignition in accordance with the requirements of Section 2603.4.1.6 of the *International Building Code.*

Delete without substitution:

~~**604.4 Foam plastic insulation.** Foam plastic used as duct coverings and linings shall conform to the requirements of Section 604.~~

Reason: The proposal adds an exception allowing a greater smoke-developed index for some applications of foam plastic insulation on the exterior surfaces of ducts in attics or crawlspaces under certain specified conditions. The exception applies only to foam insulation meeting the requirements of IBC Section 2603 and the ignition barrier requirements in IBC Section 2603.4.1.6. This additional option is consistent with the options in Section M1601.3 of the IRC.
Additionally the proposal removes a circular reference in Section 604.4.

Cost Impact: Will not increase the cost of construction
the proposal clarifies existing requirements and adds an option consistent with the IRC; it adds no additional mandatory provisions.

M 98-15 : 604.3-FISCHER5593

M 99-15

604.7, 202 (New), Chapter 15

Proponent: Lamont Millspaugh, Reflectix, Inc., representing Reflective Insulation Manufacturers Association International (monty.millspaugh@reflectixinc.com)

2015 International Mechanical Code

Revise as follows:

604.7 Identification. External duct insulation, except spray polyurethane foam, and factory-insulated flexible duct shall be legibly printed or identified at intervals not greater than 36 inches (914 mm) with the name of the manufacturer, the thermal resistance *R*-value at the specified installed thickness and the flame spread and smoke-developed indexes of the composite materials. ~~Duct~~<u>For other than reflective duct insulation, duct</u> insulation product *R*-values shall be based on insulation only, excluding air films, vapor retarders or other duct components, and shall be based on tested *C*-values at 75°F (24°C) mean temperature at the installed thickness, in accordance with recognized industry procedures. The <u>R-value for external reflective duct insulation shall be determined in accordance with ASTM C1668 and the installed thickness shall include the enclosed air spaces.The </u>installed thickness of duct insulation used to determine its *R*-value shall be determined as follows:

1. For duct board, duct liner and factory-made rigid ducts not normally subjected to compression, the nominal insulation thickness shall be used.
2. For duct wrap, the installed thickness shall be assumed to be 75 percent (25 percent compression) of nominal thickness.
3. For factory-made flexible air ducts, the installed thickness shall be determined by dividing the difference between the actual outside diameter and nominal inside diameter by two.
4. For spray polyurethane foam, the aged *R*-value per inch, measured in accordance with recognized industry standards, shall be provided to the customer in writing at the time of foam application.

Add new definition as follows:

SECTION 202 DEFINITIONS

<u>**REFLECTIVE DUCT INSULATION**</u> <u>A thermal insulation assembly consisting of one or more surfaces that have an emittance of 0.1 or less and that bound an enclosed air space or spaces.</u>

Add new standard(s) as follows:
<u>ASTM C1668-12 Standard Specification for Externally Applied Reflective Insulation Systems on Rigid Duct in Heating, Ventilation, and Air Conditioning (HVAC) Systems</u>

Reason: The purpose of this proposal is to provide clear and specific requirements for reflective duct insulation. This language improves the code by providing installers and building officials with a clear path on the specifications that pertain to this product, as well as adding the appropriate definition and an ASTM standard. The same definition and similar language for reflective duct insulation was approved into the 2015 IRC Section M 1601.3. Reflective duct insulation is a well-established type of material/system and it has an ASTM standard specification, namely ASTM C 1668 Standard Specification for Externally Applied Reflective Insulation Systems on Rigid Duct in Heating, Ventilation, and Air Conditioning (HVAC) Systems. It has been in the market for over 10 years and has nationwide distribution and installation.

Cost Impact: Will not increase the cost of construction
This proposal will not increase the cost of construction. The proposal only clarifies the requirements for a type of insulation material that is currenly not properly regulated by the code. It incorporates standard industry practice not presently reflected in the code, but does not make this type of insulation mandatory.

Analysis: A review of the standard proposed for inclusion in the code, ASTM C1668, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2015.

M 99-15 : 604.7-MILLSPAUGH4868

M 100-15

604.11

Proponent: Mike Fischer, Kellen Company, representing the Center for the Polyurethanes Industry of the American Chemistry Council (mfischer@kellencompany.com)

2015 International Mechanical Code

Revise as follows:

604.11 Vapor retarders. Where ducts used for cooling are externally insulated, the insulation shall be covered with a vapor retarder having a maximum permeance of 0.05 perm [2.87 ng/(Pa • s • m^2)] or aluminum foil having a minimum thickness of 2 mils (0.051 mm). Insulations having a permeance of 0.05 perm [2.87 ng/(Pa • s • m^2)] or less shall not be required to be covered. All joints and seams shall be sealed to maintain the continuity of the vapor retarder.

> <u>**Exception:** A vapor retarder is not required for spray polyurethane foam insulation having a water vapor permeance of not greater than of 3 perm per inch [1722 ng/(s · m2 · Pa)] at the installed thickness.</u>

Reason: The proposal adds an option to the vapor retarder requirements for duct insulation of the IMC. The proposal is consistent with the vapor retarder requirements of M1601.4.6 of the 2015 IRC.

Cost Impact: Will not increase the cost of construction
The proposal adds options for the code; does not add any new mandatory requirements.

M 100-15 : 604.11-FISCHER5514

M 101-15

605.4 (New)

Proponent: Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

2015 International Mechanical Code

Add new text as follows:

605.4 Bypass pathways Air handling equipment and HVAC equipment shall be designed and installed to limit the amount of airflow that bypasses the air filters and shall comply with the following:

1. Channels, racks and other filter retaining constructions that do not seal tightly to the filter frame by means of a friction fit shall be provided with a means to seal the filter frame to the filter retaining construction.
2. Where standard size filters are installed in banks of multiple filters, gaskets shall seal the gap between the frames of adjacent filters. As an alternative to gaskets, the frames of adjacent filters shall be compressed by means of spring elements that are built into the filter retaining construction.
3. Channels, racks and other filter retaining constructions shall be sealed to the duct or housing of the HVAC equipment served by the filters.
4. Filter access doors in ducts and HVAC equipment shall be designed to limit the amount of airflow that bypasses the filters.
5. Field or shop fabricated spacers shall not be installed for the purpose of replacing the intended size filter with a smaller size filter.
6. Gaskets and seals shall be provided with access for repair, maintenance and replacement.

Reason: The proposed text is taken from the 2015 IGCC.
This important fundamental requirement to prevent airflow from bypassing air filters should be a basic requirement in the IMC, not just in a high performance green building code.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes.

Cost Impact: Will increase the cost of construction
This proposal will increase the cost of construction because sealing and/or gaskets will be required beyond that which is normally provided in air handling systems.

M 101-15 : 802.2-SNYDER3269

M 102-15

805.7 (New)

Proponent: Gregg Achman, Hearth & Home Technologies, representing Hearth & Home Technologies (achmang@hearthnhome.com)

2015 International Mechanical Code

Add new text as follows:

805.7 Insulation shield Where factory-built chimneys pass through insulated assemblies, an insulation shield constructed of steel having a thickness of not less than 0.0187 inch (0.4712 mm) (No. 26 gage) shall be installed to provide clearance between the chimney and the insulation material. The clearance shall be not less than the clearance to combustibles specified by the chimney manufacturer's installation instructions. Where chimneys pass through attic space, the shield shall terminate not less than 2 inches (51 mm) above the insulation materials and shall be secured in place to prevent displacement. Insulation shields provided as part of a *listed* chimney system shall be installed in accordance with the manufacturer's instructions.

Reason: The code currently requires an insulation shield for vents (802.8) to ensure proper clearance to insulation so as not to cause a fire hazard, the code should also require insulation shields for factory-built and metal chimneys as they also require clearance to insulation and represents a fire hazard when one is not installed.

Cost Impact: Will not increase the cost of construction
There technically is no cost impact since the insulation shield should already be installed where needed to ensure a proper and safe installation.

M 102-15 : 805.7 (New)-ACHMAN4864

M 103-15

805.7 (New)

Proponent: Tom Stroud, representing Hearth, Patio & Barbecue Association (stroud@hpba.org)

2015 International Mechanical Code

Add new text as follows:

805.7 **Insulation shield.** Where masonry and factory-built chimneys pass through insulated assemblies, an insulation shield constructed of steel having a minimum thickness of 0.0187 inch (0.4712 mm) (No. 26 gage) shall be installed to provide clearance between the chimney and the insulation material. The clearance shall not be less than the clearance to combustibles specified by the chimney manufacturer's installation instructions. Where chimneys pass through attic space, the shield shall terminate not less than 2 inches (51 mm) above the insulation materials and shall be secured in place to prevent displacement. Insulation shields provided as part of a listed chimney system shall be installed in accordance with the manufacturer's installation instructions.

Reason: Insulation is currently often exceding the lengths of protective shields and it is necessary to make sure that insulation does not contact the chmney and change the safety of the chimney by not allowing free air around the vent.

Cost Impact: Will increase the cost of construction
Cost may increase slightly for longer vent protection.

M 103-15 : 805.7 (New)-STROUD5095

M 104-15

916.1, CHAPTER 15

Proponent: Jennifer Hatfield, J. Hatfield & Associates, PL, representing Association of Pool & Spa Professionals (jhatfield@apsp.org)

2015 International Mechanical Code

Revise as follows:

916.1 General. Pool and spa heaters shall be installed in accordance with the manufacturer's instructions. Oil-fired pool and spa heaters shall be tested in accordance with UL 726. Electric pool and spa heaters shall be tested in accordance with UL 1261, UL 1563 or CSA C22.2 No. 218.1. Gas-fired pool heaters shall comply with ANSI Z21.56/CSA 4.7. Pool and spa heat pump water heaters shall comply with UL 1995, AHRI 1160, or CSA C22.2 No. 236.

Add new standard(s) as follows:

AHRI 1160 (I-P) -09 Performance rating of Heat Pump Pool Heaters

ANSI Z21.56a/CSA 4.7 -2013 Gas Fired Pool Heaters

CSA C22.2 No. 236-11 Cooling Equipment

CSA C22.2 No. 218.1-M89(R2011) Spas, Hot Tubs and Associated Equipment

UL 1563-2009 Standard for Electric Spas, Hot Tubs and Associated Equipment-with revisions through July 2012

Reason: This proposal is needed to ensure consistency with what standards are required for the various pool heaters in Section 316.2 and Table 316.2 of the International Swimming Pool & Spa Code. This same proposal has been submitted to Section M2006.1 of the IRC.

Bibliography: International Swimming Pool & Spa Code, Section 316.2 & Table 316.2

Cost Impact: Will not increase the cost of construction
This proposal will not increase the cost of construction and ensures the applicable standards for the various pool heaters are provided within all the I-codes that address pool heaters.

Analysis: A review of the standard proposed for inclusion in the code, AHRI 1160 (I-P), ANSI Z21.56a/CSA 4.7, CSA C22.2 No. 236, CSA C22.2 No. 218.1, UL 1563, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2015.

M 105-15

929 (New), 929.1 (New)

Proponent: Mark Metzner, representing Self (markmetzner@shaw.ca); Muktha Tumkur (muktha.tumkur@csagroup.org)

2015 International Mechanical Code

Add new text as follows:

SECTION 929
GROUND SOURCE HEAT PUMP SYSTEMS

929.1 Design and installation of ground source heat pump systems. The design and installation of ground source heat pump systems shall conform to ANSI/CSA C448.

Reason: The CSA C448 is an ANSI designated bi-national consensus Standard for the design and installation of ground source heat pump systems. The Standard includes performance based criteria that provide a consistent application of requirements and best practices throughout the United States and Canada. This Standard will ensure that stakeholders in the ground source heat pump systems market sector will supply and receive heating / cooling systems that perform to design efficiency expectations and deliver tru, long-term value. This Standard has been developed by a bi-national Technical Committee which comprised of the industry's leaders and it provides a strong foundation for increased market penetration of this technology into the HVAC market.
The Standard harmonizes the differences between existing resources, simplifies referencing in regulations and contracts, incorporates the latest advancements, clarifies compliance using standards language, and provides credibility through an accredited neutral standards development process.

This Standard includes performance based minimum requirements for industrial, commercial, institutional and residential applications and addresses the following items related to ground source heat pump systems:

- equipment and material selection

- site survey - geological and hydrogeological

open and closed loop ground source heat pump system design / engineering

- direct expansion (DX) systems

- installation

- testing and verification

- documentation

- commissioning and decommissioning

The Standard will apply to all ground source heat pump systems using external building heat exchangers as a thermal source or sink for heating and cooling, with or without a supplementary heating or cooling source. External building heat exchangers that will be covered by this Standard include:

- ground heat exchangers - vertical and horizontal;

- open-loop systems - drilled well and surface water;

- submerged closed loop systems - fresh water and sea water;

- standing colum wells

This Standard applies to new and retrofit installations in industrial, commercial, institutional and residential applications and includes thermal energy storage systems.

The bi-national Committee consisted of representatives from the following industry associations:

- American Society for Heating, Refrigeration and Air Conditioning Engineers (ASHRAE)

- Geothermal Exchange Organization (GEO)

- International Ground Source Heat Pump Association (IGSPHA)

- International Ground Source Heat Pump Association Canada (IGSPHA - Canada)

- National Ground Water Association (NGWA)

- Plastics Pipe Institute (PPI)

- Geothermal National & International Initiative (GEONII)

- Heating, Refrigeration and Air Conditioning Institute of Canada (HRAI)

Cost Impact: Will not increase the cost of construction
The code change proposal will not increase the cost of constructin of ground source heat pump systems.
Justification:

Currently, a US standard for the design and installation of ground source heat pump systems, similar to the C448, does not exist. The C448 is a system for the design and installation of ground source heat pump systems and it inlcudes requirements and best practices related to the installation of these systems. The systems would include pumps, pipe, grout etc., which most likely have manufacturing requirements and certification requirements within other standards, but that is not within our scope. The C448 is not a certification standard for any manufactured goods.

The C448 is generally a performance based standard which contains design requirements and best practices typically accepted and used currently by US and Canadian designers. Ground source heat pump systems that adhere to C448 will be properly designed and installed to the expectation of the owner or end user and as such will represent the minimum baseline performance of such systems. In most cases, alternate materials and installation methods are allowed. Also, in some cases, alternate innovative materials are allowed if reviewed and approved by an engineer.

M 106-15

929 (New), 929.1 (New), 929.2 (New), 929.3 (New), 929.4 (New), 929.5 (New), 929.6 (New), 929.7 (New), CHAPTER 15

Proponent: Jonathan Roberts, UL LLC, representing UL LLC (jonathan.roberts@ul.com)

2015 International Mechanical Code

Add new text as follows:

SECTION 929
UNVENTED ALCOHOL FUEL-BURNING DECORATIVE APPLIANCES

929.1 General Unvented alcohol fuel-burning decorative appliances shall be listed and labeled in accordance with UL 1370 and shall be installed in accordance Section 304.1.

929.2 Prohibited use Unvented alcohol fuel-burning decorative appliances shall not be used as the sole source of comfort heating in a dwelling unit.

929.3 Input rating Unvented alcohol fuel-burning decorative appliances shall not have an input rating in excess of 0.25 gallons of fuel per hour (0.95 liters per hour).

929.4 Prohibited locations Unvented alcohol fuel-burning decorative appliances shall not be installed within occupancies in Groups E and I. The location of unvented alcohol fuel-burning decorative appliances shall comply with Section 303.

929.5 Fuel Unvented alcohol fuel-burning decorative appliances shall be used only with the specific fuel marked on the appliance nameplate.

929.6 Ventilation Fresh air infiltration into the room in which the unvented alcohol fuel-burning decorative appliance is installed shall be provided in accordance with the markings on the appliance and the manufacturer's instructions.

929.7 Installation in fireplaces An unvented alcohol fuel-burning decorative appliance shall not be installed in a factory-built fireplace or masonry fireplace except where specifically identified for such use in accordance with the appliance manufacturer's installation instructions.

Add new standard(s) as follows:
UL 1370-11, Unvented Alcohol Fuel Burning Decorative Appliances, with revisions through January, 2014

Reason: This proposal provides requirements for the installation of unvented, self-contained alcohol-fuel-burning appliances. These appliances are intended for decorative purposes, though there may be limited radiant and convection-air comfort heating. They are not intended to be utilized as a primary heat source. They are not provided with means for duct connection nor is there electrical/mechanical assist of heated air movement, such as a fan-blower assembly. The basic standard used to test and list these products is UL 1370, "Unvented Alcohol Fuel Burning Decorative Appliances", which is an ANSI consensus standard. There are five manufacturers of these appliances.

Denatured alcohol is formulated for the application. As part of the requirements of UL 1370, the appliances are tested for use only with the specific fuel marked on the appliance nameplate. These appliances are limited to a maximum input rate of 0.25 gallons of fuel per hour (0.95 liters per hour). Installation is intended to be in accordance with local codes, the manufacturer's installation instructions and any markings on the appliance. These appliances may be floor mounted or wall mounted. They may be installed in a solid-fuel-burning fireplace adapted for the purpose and, when so marked, in a factory-built solid-fuel-burning fireplace in accordance with the manufacturer's instructions. They are not intended for use in bathrooms or bedrooms nor for institutional use.

Cost Impact: Will not increase the cost of construction
This would permit the use of a new type of equipment to be installed.

Analysis: A review of the standard proposed for inclusion in the code, UL 1370, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2015.

M 107-15

202 (New), 929 (New), 929.1 (New), CHAPTER 15

Proponent: Amanda Hickman, InterCode Incorporated, representing Air Movement and Control Association International (amanda@intercodeinc.com)

2015 International Mechanical Code

Add new definition as follows:

SECTION 202 DEFINITIONS

HIGH VOLUME LOW SPEED FAN. A ceiling fan that circulates high volumes of air at low rotational speeds. Such fans are greater than 7 feet in diameter.

Add new text as follows:

SECTION 929
HIGH VOLUME LOW SPEED FANS

929.1 General. High volume low speed fans shall be tested in accordance with AMCA 230 and installed in accordance with the manufacturer's instructions.

Add new standard(s) as follows:
AMCA 230-CD1 Laboratory Methods of Testing Air Circulating Fans for Rating and Certification

Reason: The proposed language adds the appropriate test standard, installation instructions, and a definition for high volume low speed fans to the code.
The definition is based on the Department of Energy's current rule making activity on ceiling fans efficiency requirements. The test method AMCA 230 is the most current and most widely used method for fan rating and certification.

The formatting used in this proposal is consistent with the formatting in Section 928.1.

Cost Impact: Will not increase the cost of construction
This code change will not increase the cost of construction because high volume low speed fans are not being made mandatory.

Analysis: A review of the standard proposed for inclusion in the code, AMCA 230, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2015.

M 107-15 : 929.1 (New)-HICKMAN4418

M 108-15

202 (New), 929 (New), 929.1 (New), CHAPTER 35

Proponent: Vickie Lovell, InterCode Incorporated, representing MacroAir (vickie@intercodeinc.com)

2015 International Mechanical Code

Add new definition as follows:

SECTION 202 DEFINITIONS

<u>**HIGH VOLUME LARGE DIAMETER FAN.** A low speed ceiling fan that circulates large volumes of air and that is greater than 7 feet (2134 mm) in diameter.</u>

Add new text as follows:

<u>**SECTION 929**</u>
<u>**HIGH VOLUME LARGE DIAMETER FANS**</u>

<u>**929.1 General.** High volume large diameter fans shall be tested in accordance with AMCA 230 and Installed in accordance with the manufacturer's instructions.</u>

Add new standard(s) as follows:
<u>AMCA 230-CD1 Laboratory Methods of Testing Air Circulating Fans for Rating and Certification.</u>

Reason: The proposed language adds the appropriate test standard, installation instructions, and a definition for high volume large diameter fans to the code.
The definition is based on the Department of Energy's current rule making activity on ceiling fans efficiency requirements. The test method AMCA 230 is the most current and most widely used method for fan rating and certification.

The formatting used in this proposal is consistent with the formatting in Section 928.1.

Cost Impact: Will not increase the cost of construction
The code change will not increase the cost of construction because high volume large diameter fans are not being made mandatory.

Analysis: A review of the standard proposed for inclusion in the code, AMCA 230 , with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2015.

M 108-15 : 929.1 (New)-LOVELL4960

M 109-15

Part I:

929.1 (New)

Part II:

305.13 (New)

Part III:

M1602.3 (New)

THIS IS A 3 PART CODE CHANGE. PART I WILL BE HEARD BY THE IMC COMMITTEE. PART II WILL BE HEARD BY THE IFGC COMMITTEE. PART III WILL BE HEARD BY THE IRC-MECHANICAL COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

Proponent: Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

Part I

2015 International Mechanical Code

Add new text as follows:

929.1 Air-handler enclosures. Where an air-handler, electric furnace or heat pump unit is installed in an enclosure with a fuel-fired appliance, the circulating air for the air-handler, furnace and heat pump shall be conveyed to the blower housing from outside of the enclosure by continuous air-tight ducts.

Part II

2015 International Fuel Gas Code

Add new text as follows:

305.13 Air handler enclosures. Where an air-handler, electric furnace or heat pump unit is installed in an enclosure with a fuel-fired appliance, the circulating air for the air-handler, furnace and heat pump shall be conveyed to the blower housing from outside of the enclosure by continuous air-tight ducts.

Part III

2015 International Residential Code

Add new text as follows:

M1602.3 Air-handler enclosures. Where an air-handler, electric furnace or heat pump unit is installed in an enclosure with a fuel-fired appliance, the circulating air for the air-handler, furnace and heat pump shall be conveyed to the blower housing from outside of the enclosure by continuous air-tight ducts.

Reason: Section 918.4 of the IMC, Section 618.7 of the IFGC and Section G2442.7 of the IRC all address this issue well for fuel-fired warm-air furnaces, but, are silent on other appliances such as fuel-fired water heaters and boilers that are likely to be in the same enclosure. Heat pump units, cooling air-handlers and electric furnaces would have the same effect on appliance vents if the return air was not ducted back to the blower housing. It is not just warm-air furnaces that the code should be concerned about. Any blower can create strong negative pressures in the enclosure where the return is pulled through louvered doors or grilles instead of ducts connected to the blower. A fuel-fired water heater or boiler in the enclosure should be addressed as well as the warm-air furnace in the same enclosure.
This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes.

Cost Impact:

Part I: Will increase the cost of construction
This proposal will increase the cost of construction in those cases where the return air for an air handler, heat pump or electric furnace would have been pulled through a louvered door or grille and through the enclosure, instead of through ductwork connected directly to the unit.

Part II: Will increase the cost of construction
This proposal will increase the cost of construction in those cases where the return air for an air handler, heat pump or electric furnace would have been pulled through a louvered door or grille and through the enclosure, instead of through ductwork connected directly to the unit.

Part III: Will increase the cost of construction

This proposal will increase the cost of construction in those cases where the return air for an air handler, heat pump or electric furnace would have been pulled through a louvered door or grille and through the enclosure, instead of through ductwork connected directly to the unit.

M 109-15 : 928-SNYDER3270

M 110-15

1002.1, 1401.4, 1401.4.1 (New), CHAPTER 15

Proponent: Rex Gillespie (rex.gillespie@caleffi.com)

2015 International Mechanical Code

Revise as follows:

1002.1 General. Potable water heaters and hot water storage tanks shall be listed and labeled and installed in accordance with the manufacturer's instructions, the *International Plumbing Code* and this code. All water heaters shall be capable of being removed without first removing a permanent portion of the building structure. The potable water connections and relief valves for all water heaters shall conform to the requirements of the *International Plumbing Code*. Domestic electric water heaters shall comply with UL 174 or UL 1453. Commercial electric water heaters shall comply with UL 1453. Oil-fired water heaters shall comply with UL 732. Solid-fuel-fired water heaters shall comply with UL 2523. ~~Thermal solar~~Solar thermal water ~~heaters~~heating systems shall comply with Chapter 14 and ~~UL 174 or UL 1453.~~SRCC 300.

1401.4 Solar ~~energy~~thermal equipment and appliances. Solar ~~energy~~thermal*equipment* and appliances shall conform to the requirements of this chapter. Solar thermal systems shall be listed and labeled to SRCC 300 and shall be installed ~~in~~ accordance with the ~~manufacturer's~~manufacturers' instructions and SRCC 300.

Add new text as follows:

1401.4.1 Collectors and panels Solar thermal collectors and panels shall be listed and labeled in accordance with SRCC 100 or SRCC 600, as applicable.

Add new standard(s) as follows:

SRCC Standard 100-13, Minimum Standard for Solar Thermal Collectors, January 3, 2013, Solar Rating and Certification Corporation.

SRCC Standard 300-13, Minimum Standard for Solar Thermal Water Heating Systems, January 3, 2013, Solar Rating and Certification Corporation.

SRCC Standard 600-13, Minimum Standard for Solar Thermal Concentrating Collectors, January 2, 2013, Solar Rating and Certification Corporation.

Reason: Updates standard citations for solar thermal water heaters. The UL 174 and UL 1453 are not appropriate standard references because they address electric water heaters. They are removed in favor of SRCC Standard 300 which addresses solar water heating systems and is also referenced in the 2015 IRC for the same purpose.
Additional references to SRCC 100 and 600 for solar collectors are added to ensure that collectors meet minium requirements and freeing the code official from inspecting the internal components of solar collectors. Identical references to the 100 and 600 standards also appear in the 2015 IRC. These standards are already cited in most states for incentive and rebate programs, and therefore do not create an additional burden for manufacturers.

Bibliography:
SRCC Standard 100, Minimum Standard for Solar Thermal Collectors, January 3, 2013.

SRCC Standard 600, Minimum Standard for Solar Thermal Concentrating Collectors, January 2, 2013.

SRCC Standard 300, Minimum Standard for Solar Thermal Water Heating Systems, January 3, 2013

Cost Impact: Will not increase the cost of construction
The proposed changes are not anticipated to impact the cost of installation. No new equipment or features are required, and no new requirements are placed on manufacturers impacting certification or manufacturing costs. Proposed provisions provide additional clarity and direction for installers and code officials at inspection.

Analysis:
A review of the standard proposed for inclusion in the code, SRCC-100, SRCC-300, SRCC-600, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2015.

M 110-15 : 1002.1-GILLESPIE4023

M 111-15

1006.6, CHAPTER 15

Proponent: Guy McMann, Jefferson County, Colorado, representing Colorado Associatoin of Plumbing and Mechanical Officials (CAPMO) (gmcmann@jeffco.us)

2015 International Mechanical Code

Revise as follows:

1006.6 Safety and relief valve discharge. Safety and relief valve discharge pipes shall be of rigid pipe that is *approved* for the temperature of the system. ~~The discharge pipe shall be the same diameter as the safety or relief valve outlet. Safety and relief valves shall not discharge so as to be a hazard, a potential cause of damage or otherwise a nuisance.~~ Highpressure-steam safety valves shall be vented to the outside of the structure. ~~Where a low-pressure safety valve or a~~The discharge piping serving pressure relief ~~valve discharges~~valves, temperature relief valves and combinations of such valves shall:

1. Not be directly connected to the drainage system~~,~~.
2. Discharge through an air gap located in the ~~installation~~same room as the appliance.
3. Not be smaller than the diameter of the outlet of the valve served and shall ~~conform~~discharge full size to the air gap.
4. Serve a single relief device and shall not connect to piping serving any other relief device or equipment.
5. Discharge to the floor, to the pan serving the boiler or storage tank, to a waste receptor or to the outdoors.
6. Discharge in a mannor that does not cause personal injury or structural damage.
7. Discharge to a termination point that is readily observable by the building occupants.
8. Not be trapped.
9. Be installed so as to flow by gravity.
10. Not terminate more than 6 inches (152 mm) above the floor or waste receptor.
11. Not have a threaded connection at the end of such piping.
12. Not have valves or tee fittings.
13. Be constructed of those materials listed in Section 605.4 of the*International Plumbing Code*~~.~~ or materials tested, rated and approved for such use in accordance with ASME A112.4.1

Add new standard(s) as follows:
ASME A112.4.1 Water Heater Relief Valve Drain Tubes

Reason: This section lacks the detail needed and doesn't paint a complete picture. Why must the user jump to another code to find and use these requirements? It's very helpful to find all the requirements in any given Section that will complete the picture of what needs to be done to complete an installation.

Cost Impact: Will not increase the cost of construction
There will be no addional cost as this in only an editorial modification and clarification which provides information from other codes. No new requirements.

Analysis: A review of the standard proposed for inclusion in the code, ASME A112.4.1, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2015.

M 111-15 : 1006.6-MCMANN3582

M 112-15

1006.9 (New)

Proponent: Timothy Manz, City of Blaine, representing Association of Minnesota Building Officials (tmanz@ci.blaine.mn.us)

2015 International Mechanical Code

Add new text as follows:

1006.9 **Boiler shutdown switch.** A manually operated remote shutdown switch shall be provided and located as required by ASME CSD-1.

Exception: A single hot water boiler with a rated input of less than 400,000 Btu/hr (117kW).

Reason: ASME CSD-1-2012, Controls and Safety Devices for Automatically Fired Boilers, is the defacto standard in the boiler industry for controls and safety devices for boilers and is adopted by reference in most state boiler inspection programs, so this provision should be included in the IMC for clarity and consistency.

Cost Impact: Will not increase the cost of construction
The code change proposal will not increase the cost of construction in states or jurisdictions that have adopted the ASME boiler codes, so in most installations there is not an increase in cost for this requirement.

M 112-15 : 1006.9 (New)-MANZ5806

M 113-15

202 (New), 1009.1, Chapter 15

Proponent: Rex Gillespie (rex.gillespie@caleffi.com)

2015 International Mechanical Code

Revise as follows:

1009.1 Where required. An expansion tank shall be installed in every hot water system. For multiple boiler installations, not less than one expansion tank is required. Expansion tanks shall be of the closed or open type. Tanks shall be rated for the pressure of the hot water system.

Exception: Expansion tanks shall not be required in the collector loop of *drain-back systems.*

Add new definitions as follows:

SECTION 202 DEFINITIONS

DIRECT SYSTEM. A solar thermal system in which the gas or liquid in the solar collector loop is not separated from the load.

DRAIN-BACK SYSTEM. A solar thermal system in which the fluid in the solar collector loop is gravity drained from the collector into a holding tank under prescribed circumstances.

FOOD GRADE FLUID. Potable water or a fluid containing additives listed in accordance with the Code of Federal Regulations, Title 21, Food and Drugs, Chapter 1, Food and Drug Administration, Parts 174-186,

INDIRECT SYSTEM. A solar thermal system in which the gas or liquid in the solar collector loop circulates between the solar collector and a heat exchanger and such gas or liquid is not drained from the system or supplied to the load during normal operation.

NO-FLOW CONDITION. A condition where thermal energy is not transferred from a solar thermal collector by means of flow of a heat transfer fluid.

NON-FOOD GRADE FLUID. Any fluid that is not designated as a food grade fluid.

SOLAR THERMAL SYSTEM. A system that converts solar radiation to thermal energy for use in heating or cooling.

SECTION 1401
GENERAL

Revise as follows:

1401.1 Scope. This chapter shall govern the design, construction, installation, *alteration* and repair of solar thermal systems, *equipment* and appliances intended to utilize solar energy for space heating or cooling, domestic hot water heating, swimming pool heating or process heating.

1401.4 Solar ~~energy~~thermal equipment and appliances. Solar ~~energy~~thermal*equipment* and appliances shall conform to the requirements of this chapter and SRCC 300 and shall be installed in accordance with the manufacturer's instructions.

SECTION 1402
DESIGN AND INSTALLATION

Add new text as follows:

1402.1 General The design and installation of solar thermal systems shall comply with Sections 1402.1 through 1402.8. Solar thermal systems shall be listed and labeled to SRCC 300 and shall be installed in accordance with the manufacturer's instructions and SRCC 300.

Revise as follows:

~~1402.1~~1402.2 Access. Access shall be provided to solar ~~energy~~thermal*equipment*~~and appliances~~ for maintenance. Solar thermal systems and appurtenances shall not obstruct or interfere with the operation of any doors, windows or other building components requiring operation or access. Roof-mounted solar thermal equipment shall not obstruct or interfere with the operation of roof-mounted equipment, appliances, chimneys, plumbing vents, roof hatches, smoke vents, skylights and other roof penetrations and openings.

~~**1402.5.1**~~**1402.3 Pressure and temperature.** Solar ~~energy~~thermal system components containing pressurized fluids shall be protected against pressures and temperatures exceeding design limitations with ~~a~~ pressure and temperature relief ~~valve~~valves or pressure relief valves. ~~Each section of the system in which excessive pressures are capable of developing~~System components shall have a ~~relief device located so that a section cannot be valved off or otherwise isolated from a~~working pressure rating of not less than the setting of the pressure relief device. ~~Relief valves shall comply with the requirements of Section 1006.4 and discharge in accordance with Section 1006.6.~~

Add new text as follows:

1402.3.1 Relief device Each section of the system in which excessive pressures are capable of developing shall have a relief device located so that a section cannot be valved off or otherwise isolated from a relief device. Relief valves shall comply with the requirements of Section 1006.6. For indirect systems, pressure relief valves in solar loops shall also comply with SRCC 300.

Revise as follows:

~~**1402.5.2**~~**1402.3.2 Vacuum.** ~~The solar energy system~~
System components that ~~are~~might be subjected to a vacuum while in operation or during shutdown shall be designed to withstand such vacuum or shall be protected with vacuum relief valves.

~~**1402.5.3**~~**1402.4 Protection from freezing.** System components shall be protected from damage by freezing of heat transfer liquids at the lowest ambient temperatures that will be encountered during the operation of the system. Freeze protection shall be provided in accordance with SRCC 300. Drain-back systems shall be installed in compliance with Section 1402.4.1 and systems utilizing freeze protection valves shall comply with Section 1402.4.2.

Add new text as follows:

1402.4.1 Drain-back systems. Drain-back systems shall be designed and installed to allow for manual gravity draining of fluids from areas subject to freezing to locations not subject to freezing, and air filling of the components and piping. Such piping and components shall maintain a horizontal slope in the direction of flow of not less than one-fourth unit vertical in 12 units horizontal (2-percent slope). Piping and components subject to manual gravity draining shall permit subsequent air filling upon drainage and air storage or venting upon refilling.

1402.4.2 Freeze protection valves. Freeze protection valves shall discharge in a manner that does not create a hazard or structural damage.

1402.5 Protection of potable water. Where a solar thermal system heats potable water to supply a potable *hot water* distribution or any other type of heating system, the solar thermal system shall be in accordance wtih Sections 1402.5.1 through 1402.5.3 as applicable.

1402.5.1 Indirect systems. Water supplies of any type shall not be connected to the solar heating loop of an indirect solar thermal *hot water* heating system. This requirement shall not prohibit the presence of inlets or outlets on the solar heating loop for the purposes of servicing the fluid in the solar heating loop.

1402.5.2 Direct systems for potable water distribution systems. Where a solar thermal system directly heats potable water for a potable water distribution system, the pipe, fittings, valves and other components that are in contact with the potable water in the system shall comply with the requirements of the *International Plumbing Code*.

1402.5.3 Direct systems for other than potable water distribution systems. Where a solar thermal system directly heats water for a system other than a potable water distribution system, a potable water supply connected to such system shall be protected by a backflow preventer with an intermediate atmospheric vent complying with ASSE 1012. Where solar thermal system directly heats chemically treated water for a system other than a potable water distribution system, a potable water supply connected to such system shall be protected by a reduced pressure principle backflow prevention assembly complying with ASSE 1013.

Revise as follows:

~~**1402.2**~~**1402.6 Protection of equipment.** Solar thermal *equipment* exposed to vehicular traffic shall be installed not less than 6 feet (1829 mm) above the finished floor.

> **Exception:** This section shall not apply where the *equipment* is protected from motor vehicle impact.

Add new text as follows:

1402.7 Protection of structure In the process of installing or repairing any part of a solar thermal system, the building or structure shall be left in a safe structural condition in accordance with Section 302 and Sections 1402.7.1 through 1402.7.2.

Revise as follows:

~~1402.3~~1402.7.1 **Controlling condensation.** Where attics or structural spaces are part of a passive solar system, ventilation of such spaces, as required by Section 406, is not required where other *approved* means of controlling condensation are provided.

~~1402.6~~1402.7.2 **Penetrations.** Roof and wall penetrations shall be flashed and sealed to prevent entry of water, rodents and insects in accordance with Section 302.

~~1402.5~~1402.8 **Equipment.** The solar ~~energy~~ thermal system shall be equipped in accordance with the requirements of Sections ~~1402.5.1~~1402.8.1 through ~~1402.5.4~~1402.8.5.

Add new text as follows:

1402.8.1 Collectors and panels. Solar collectors and panels shall comply with Sections 1401.2.2.1 through 1401.2.2.3.

1402.8.1.1 Design. Solar thermal collectors and panels shall be listed and labeled in accordance with SRCC 100 or SRCC 600, as applicable.

Revise as follows:

~~1402.4.1~~1402.8.1.2 ~~**Collectors mounted above the roof.**~~**Rooftop-mounted solar thermal collectors and systems** The roof shall be constructed to support the loads imposed by roof mounted solar collectors. Where mounted on or above the roof covering, the collector array and supporting construction shall be constructed of noncombustible materials or fire-retardant-treated wood conforming to the *International Building Code* to the extent required for the type of roof construction of the building to which the collectors are accessory.

> ~~**Exception:** The use of plastic solar collector covers shall be limited to those *approved* plastics meeting the requirements for plastic roof panels in the *International Building Code*.~~

~~1402.4~~1402.8.1.3 ~~**Roof-mounted collectors.**~~**Collectors as roof covering** Roof-mounted solar collectors that also serve as a roof covering shall conform to the requirements for roof coverings in accordance with the *International Building Code*.

> **Exception:** The use of plastic solar collector covers shall be limited to those *approved* plastics meeting the requirements for plastic roof panels in the *International Building Code.*

Add new text as follows:

1402.8.1.4 Collector sensors. Collector sensor installation, sensor location and the protection of exposed sensor wires from degradation shall be in accordance with SRCC 300, NFPA 70 and the collector manufacturer's instructions.

Revise as follows:

~~1401.5~~1402.8.2 **Ducts.** *No change to text.*

~~1402.7~~1402.8.2.1 **Filtering.** Air transported to occupied spaces through ~~rock or~~ dust-producing materials by means other than natural convection shall be filtered ~~at~~before entering the ~~outlet from the heat storage system.~~occupied space in accordance with Section 605.

Add new text as follows:

1402.8.3 Piping. Potable piping shall be installed in accordance with the *International Plumbing Code*. Hydronic piping shall be installed in accordance with Chapter 10 of this code. Mechanical system piping shall be supported in accordance with Section 305.

1402.8.3.1 Piping insulation. Piping shall be insulated in accordance with the requirements of the *International Energy Conservation Code*. Exterior insulation shall be protected from degradation. The entire solar loop shall be insulated. Where split-style insulation is used, the seam shall be sealed. Fittings shall be fully insulated. Insulation shall comply with Section 1204.1.

Exceptions:

1. Those portions of the piping that are used to help prevent the system from overheating shall not be required to be insulated.
2. Those portions of piping that are exposed to solar radiation, made of the same material as the solar collector absorber plate and are covered in the same manner as the solar collector absorber, or that are used to collect additional solar energy, shall not be required to be insulated.
3. Piping in solar thermal systems using unglazed solar collectors to heat a swimming pool shall not be required to be insulated.

Revise as follows:

~~1401.3~~1402.8.4 **Heat exchangers.** Heat exchangers used in domestic water-heating systems shall be *approved* for the intended use. The system shall have adequate protection to ensure that the potability of the water supply and distribution system is properly safeguarded.

Add new text as follows:

1402.8.4.1 Double-wall heat exchangers. Heat exchangers utilizing a *non-food grade fluid* shall be separated from the potable water by double-wall construction. An *air gap* open to the atmosphere shall be provided between the two walls. The discharge location from the double-wall heat exchanger shall be visible.

1402.8.4.2 Single-wall heat exchangers. Single-wall heat exchangers shall be permitted to be used where *food grade fluid* is used as the heat transfer fluid.

1402.8.5 Water heaters and hot water storage tanks. Auxiliary water heaters, boilers and water storage tanks associated with solar thermal systems shall comply with Chapter 10 of this code and SRCC 300.

1402.8.5.1 Hot water storage tank insulation. Hot water storage tanks shall be insulated and such insulation shall have an R value of not less than R-12.5.

1402.8.5.2 Outdoor locations. Storage tanks and heating equipment installed in outdoor locations shall be designed for outdoor installation.

1402.8.5.3 Storage tank sensors. Storage tank sensors shall comply with SRCC 300.

1402.8.6 Solar loop. Solar loops shall be in accordance with Sections 1402.8.6.1 and 1402.8.6.2.

1402.8.6.1 Solar loop isolation.
Valves shall be installed to allow the solar loop to be isolated from the remainder of the system.

1402.8.6.2 Drain and fill valve caps. Drain caps shall be installed on drain and fill valves.

Revise as follows:

~~1402.5.4~~1402.8.7 Expansion tanks. Liquid single-phase solar energy systems shall be equipped with expansion tanks sized in accordance with Section 1009, except that additional expansion tank acceptance volume equal to the total volume of liquid contained in the installed solar collectors and piping above the collectors shall be included.

SECTION 1403
HEAT TRANSFER FLUIDS

1403.1 Flash point. The flash point of the~~ actual~~ heat transfer fluid utilized in a solar system shall be not less than 50°F (28°C) above the design maximum nonoperating (no-flow) temperature of the fluid attained in the collector.

Add new text as follows:

1403.2 Heat transfer fluids Heat transfer gases and liquids shall be rated to withstand the system's maximum design temperature under operating conditions without degradation. Heat transfer fluids shall be in accordance with SRCC 300.

1403.3 Food grade additives. Any *food grade fluid* used as a heat transfer fluid containing additives shall be third party listed by an approved agency to the approporiate section of the *Code of Federal Regulations, Title 21, Food and Drugs, Chapter 1, Food and Drug Administration, Parts 174-186.*

1403.4 Toxicity The use of *toxic fluids* shall comply with *Title 15 of the Federal Hazardous Substances Act* and Chapter 60 of the *International Fire Code.*

SECTION 1404
~~MATERIALS~~LABELING

Revise as follows:

1404.1 Collectors. Factory-built collectors shall~~ be *listed* and *labeled*, and~~ bear a label showing the manufacturer's name and address, model number~~, collector dry weight, collector maximum allowable operating~~ and ~~nonoperating temperatures and pressures, minimum allowable temperatures and the types of heat transfer fluids that are compatible with the collector. The label shall clarify that these specifications apply only to the collector.~~serial number.

1404.2 ~~Thermal~~Water storage ~~units~~tanks. Pressurized ~~thermal~~water storage ~~units~~ tanks shall~~ be *listed* and *labeled*, and~~ bear a label showing the manufacturer's name and address, model number, serial number, storage unit maximum and minimum allowable operating temperatures, and storage unit maximum and minimum allowable operating pressures~~ and the types of heat transfer fluids compatible with the storage unit~~. The label shall clarify that these specifications apply only to the ~~thermal~~water storage ~~unit~~tanks.

Add new text as follows:

1404.3 Fluid safety labeling Drain and fill valves shall be labeled with a description and warning that identifies the fluid in that loop as "Potable Water", Food Grade Fluid", "Non-Food Grade Fluid" or "Toxic". Labeling shall also be provided that reads as follows: "Fluid could be discharged at high temperature or pressure or both. Unauthorized alterations to this system could result in a health hazard or a hazardous condition."

1404.4 Heat exchangers. Heat exchangers shall be labeled to indicate the heat exchanger type with one of the following:

1. "Single-wall without leak protection"
2. "Double-wall with no leak protection"
3. "Double-wall with leak protection"

Add new standard(s) as follows:

Solar Rating and Certification Corporation

400 High Point Drive, Suite 400

Cocoa, FL 32926

SRCC Standard 100-13, Minimum Standard for Solar Thermal Collectors, January 3, 2013.

SRCC Standard 300-13, Minimum Standard for Solar Thermal Water Heating Systems, January 3, 2013.

SRCC Standard 600-13, Minimum Standard for Solar Thermal Concentrating Collectors, January 3, 2013.

Code of Federal Regulations, Title 21, Food and Drugs, Chapter 1, Food and Drug Administration, Parts 174-186.

Title 15 of the Federal Hazardous Substances Act.

Reason: The solar thermal provisions in the 2015 IRC were signficantly revised by proposals submitted by a Solar Task Group working under the SEPHCAC. These same changes were not submitted for the IMC, however, due to time constraints. This proposal seeks to extend these updates to the solar thermal provisions in the IMC to align with the language that appears in the 2015. As the language currently stands there are conflicts and key differences for freeze protection, labeling, expansion tanks, pressure and temperature control and many other items. The changes add a citation to three standards from the Solar Rating and Certification Corporation (SRCC) as was done in the 2015 IRC. These standards are already cited in most states for incentive and rebate programs.
Several other improvements that do not currently appear in the IRC Chapter 23 were also proposed. Identical language was also proposed for the 2018 IRC during this cycle to ensure that they align in the next version, if approved. They include:

- Access provisions were revised to clarify that roof-mounted solar collectors and equipment should not interfere with the operation of key safety components and features from other systems. While this can reasonably assumed, providing this provisions will provide code officials more clear language to reference when inspecting installations.
- New language has been added to the freeze protection section to address specific issues with two of the most common freeze protection approachs: drainback systems and freeze protection valves. Drainback systems allow the liquid to drain from the external collector to conditioned space when flow is not occuring. As a result proper slope is critical to ensure operation. Inspection of the installation and workmanship is necessary to ensure that the slope is consistent and the freeze protection is fully functional. Freeze protection valves discharge a small amount of water in freezing conditions and therefore should be addressed in a way similar to T&P valves to ensure that the discharge does not damage the roof or create a hazard (e.g. freezing on a pedestrian walkway). Identical language has also been proposed for Chapter 14 of the IMC.
- The provisions relating to collector and hot water storage tank labeling were simplified since this information and more can be found in manuals and specifications. The language for storage units (tanks) was also revised to clarify that they are only to apply to hot water storage tanks.

Bibliography: SRCC Standard 100-13, Minimum Standard for Solar Thermal Collectors, January 3, 2013.
SRCC Standard 300-13, Minimum Standard for Solar Thermal Water Heating Systems, January 3, 2013.

SRCC Standard 600-13, Minimum Standard for Solar Thermal Concentrating Collectors, January 2, 2013.

Cost Impact: Will not increase the cost of construction
The proposed changes are not anticipated to raise the cost of construction. Most solar thermal systems and collectors are already certified to these standards in order to meet state requirements, those of the Internal Revenue Service for federal rebates, or to comply with the requiements of the 2015 IRC. Therefore, no additional product certifications are required. It is possible that costs reductions will result from the correlation of requirements between codes and these standards.

Analysis: A review of the standard proposed for inclusion in the code, SRCC Standard 100, SRCC Standard 300-13, SRCC Standard 600-13, Code of Federal Regulations, Title 21, Food and Drugs, Chapter 1, Food and Drug Administration, Parts 174-186. Title 15 of the Federal Hazardous Substances Act , with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2015.

M 113-15 : 1009.1-GILLESPIE3858

M 114-15

1101.6

Proponent: Jeffrey Shapiro, International Institute of Ammonia Refrigeration, representing International Institute of Ammonia Refrigeration (jeff.shapiro@intlcodeconsultants.com)

2015 International Mechanical Code

Revise as follows:

1101.6 General. Refrigeration systems shall comply with the requirements of this code and, except as modified by this code, ASHRAE 15. Ammonia-refrigerating systems shall comply with this code and, except as modified by this code, ~~ASHRAE 15 and~~ IIAR 2.

Reason: IIAR 2-2014 was entirely rewritten, and the standard is now a stand-alone document that no longer relies on ASHRAE 15. During the rewrite process, ASHRAE 15 was reviewed, and provisions deemed appropriate for regulating ammonia were incorporated into the IIAR 2. Therefore, the reference to ASHRAE 15 for ammonia refrigeration is no longer necessary.

Cost Impact: Will not increase the cost of construction
This proposal may reduce the cost of construction by simplifying the design/review process to only involve a single standard for ammonia refrigeration system installations.

M 114-15 : 1101.6-SHAPIRO4849

M 115-15

1101.6, CHAPTER 15

Proponent: Jeffrey Shapiro, International Institute of Ammonia Refrigeration, representing International Institute of Ammonia Refrigeration

2015 International Mechanical Code

Revise as follows:

1101.6 General. Refrigeration systems shall comply with the requirements of this code and, except as modified by this code, ASHRAE 15. Ammonia-refrigerating systems shall comply with this code and, except as modified by this code, ASHRAE 15 and IIAR 2<u>, IIAR 3, IIAR 4 and IIAR 5</u>.

Add new standard(s) as follows:

<u>IIAR 3-2012 Ammonia Refrigeration Valves</u>

<u>IIAR 4-2015 (pending completion) Installation of Closed-Circuit Ammonia Mechanical Refrigerating Systems</u>

<u>IIAR 5-2013 Start up and Commissioning of Ammonia Refrigeration Systems</u>

Reason: These are ANSI standards that are already applicable for ammonia refrigeration facilities. Including references in the IMC will ensure that the standards can be enforced by the mechanical code official so that proper valves are used on ammonia refrigeration systems and that these systems are properly installed and commissioned.

Cost Impact: Will not increase the cost of construction
The IMC reference will correlate with what should already be industry practice.

Analysis:
A review of the standard proposed for inclusion in the code, IAR 3 , IIAR 4 and IIAR 5, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2015.

(Portions of table not shown remain unchanged)

For SI: 1 pound = 0.454 kg, 1 cubic foot = 0.0283 m ^{3}.

a. Degrees of hazard are for health, fire, and reactivity, respectively, in accordance with NFPA 704.

b. Reduction to 1-0-0 is allowed if analysis satisfactory to the code official shows that the maximum concentration for a rupture or full loss of refrigerant charge would not exceed the IDLH, considering both the refrigerant quantity and room volume .

c. For installations that are entirely outdoors, use 3-1-0.

d. Class I ozone depleting substance; prohibited for new installations.

e. Occupational Exposure Limit based on the OSHA PEL, ACGIH TLV-TWA, the ~~AIHA~~TERA WEEL or consistent value on a time-weighted average (TWA) basis (unless noted C for ceiling) for an 8 hr/d and 40 hr/wk.

f. The ASHRAE Standard 34 flammability classification for this refrigerant is 2L, which is a subclass of Class 2.

Reason: The Refrigerant Classifications (except Degrees of Hazard) are determined by ASHRAE SSPC 34 and published in ASHRAE Standard 34 . This proposal seeks to update the refrigerant table with the new refrigerants added to Standard 34 since the last code cycle. The reasons for the additions of new refrigerants can be found at https://www.ashrae.org/standards-research--technology/standards-addenda . The following four addenda may not be published by the time this monograph is published, so here is the information related to those refrigerants. No review comments were received during the public comment period and expected to be reviewed for publication approval at the end of January 2015.
R-451A: The recommended flammability classification 2 (2L in Standard 34 per footnote f of this table) is based on an LFL of 7.0 vol. %, a heat of combustion of 9790 kJ/kg (4209 Btu/lb), and a burning velocity less than 4 cm/s. The recommended toxicity classification A is based on an adopted OEL of 520 ppm v/v. The recommended ATEL is 100,000 ppm v/v.

R-451B: The recommended flammability classification 2 (2L in Standard 34 per footnote f of this table) is based on an LFL of 7.0 vol. %, a heat of combustion of 9790 kJ/kg (4209 Btu/lb), and a burning velocity less than 4 cm/s. The recommended toxicity classification A is based on an adopted OEL of 530 ppm v/v. The recommended ATEL is 100,000 ppm v/v.

R-513A: The recommended flammability classification is 1. The recommended toxicity classification A is based on an adopted OEL of 650 ppm v/v.

The recommended ATEL is 72,000 ppm v/v.

R-452A: The recommended flammability classification is 1. The recommended toxicity classification A is based on an adopted OEL of 780 ppm v/v. The recommended ATEL is 100,000 ppm v/v.

Additionally, three small/significant figure edits or corrections have been made to R-436B (8.1 g/m3 should be 8.2 g/m3 for consistency), R-1270 (the lbs/1000 cf changes from 0.1 to 0.11 due to significant digits in the analysis by SSPC 34), and the WEELs (workplace environmental exposure levels) which were previously issued by the American Industrial Hygiene Association (AIHA) are now set by The Toxicology Excellense for Risk Assessment (TERA) Occupational Alliance for Risk Science (see addendum d to ASHRAE Standard 34-2013 for more information).

If approved, the intent is for the refrigerants in this table to be re-organized in numerical order.

Bibliography: ASHRAE Standard 24-2013

Cost Impact: Will not increase the cost of construction
This proposal only classifies refrigerants. How a refrigerant is classified has no impact on the cost of construction.

M 116-15 : T1103.1-FERGUSON3779

M 117-15

Table 1103.1

Proponent: Mike Fischer, Kellen Company, representing the Responsible Refrigerants Codes Council (mfischer@kellencompany.com)

2015 International Mechanical Code

Revise as follows:

TABLE 1103.1
REFRIGERANT CLASSIFICATION, AMOUNT AND OEL

CHEMICAL REFRIGERANT	FORMULA	CHEMICAL NAME OF BLEND	REFRIGERANT CLASSIFICATION	AMOUNT OF REFRIGERANT PER OCCUPIED SPACE				[F] DEGREES OF HAZARD [a]
				Pounds per 1,000 cubic feet	ppm	g/m^3	OEL [e]	
R-1234yf	$CF_3CF=CH_2$	2,3,3,3-tetrafluoro-1 propene	A2 [f,g]	4.7	16,000	75	500	—
R-1234ze(E)	$CF_3CH=CHF$	trans-1,3,3,3-tetrafluoro-1-propene	A2 [f,g]	4.7	16,000	75	800	—

(Portions of table not shown remain unchanged)

For SI: 1 pound = 0.454 kg, 1 cubic foot = 0.0283 m^3.

a. Degrees of hazard are for health, fire, and reactivity, respectively, in accordance with NFPA 704.

b. Reduction to 1-0-0 is allowed if analysis satisfactory to the code official shows that the maximum concentration for a rupture or full loss of refrigerant charge would not exceed the IDLH, considering both the refrigerant quantity and room volume .

c. For installations that are entirely outdoors, use 3-1-0.

d. Class I ozone depleting substance; prohibited for new installations.

e. Occupational Exposure Limit based on the OSHA PEL, ACGIH TLV-TWA, the AIHA WEEL or consistent value on a time-weighted average (TWA) basis (unless noted C for ceiling) for an 8 hr/d and 40 hr/wk.

f. The ASHRAE Standard 34 flammability classification for this refrigerant is 2L, which is a subclass of Class 2.

g. The ASHRAE Standard 34 flammability classification for this refrigerant is 2L, which is a subclass of Class 2, and the refrigerant shall be treated as a Refrigerant Class A1.

Reason: The proposal revises the Classification requirements for two refrigerants, R1234YF and R1234ZE to indicate that Class A1 refrigerent requirements are applicable. This change is consistent with current referenced standards discussions at ASHRAE 34; it is important to get this change in place in case the ASHRAE standard update is not ready in time for the 2018 IMC. These refrigerants may be used in air conditioning products for all applications, provided the burning velocity is below 5 cm/sec and the end use product is listed by UL or other approved agency. All other provisions for A1 refrigerants shall apply.

Cost Impact: Will not increase the cost of construction
The proposal increases available product options.

Proponent: Jeffrey Shapiro, International Institute of Ammonia Refrigeration, representing International Institute of Ammonia Refrigeration

2015 International Mechanical Code

Revise as follows:

1104.2.2 Industrial occupancies and refrigerated rooms. This section applies only to industrial occupancies and refrigerated rooms for manufacturing, food and beverage preparation, meat cutting, other processes and storage. ~~Machinery rooms are~~Where a machinery room would otherwise be required by Section 1104.2, a machinery room shall not be required where all of the following conditions are met:

1. The space containing the machinery is separated from other occupancies by tight construction with tight-fitting doors.
2. Access is restricted to authorized personnel.
3. The floor area per occupant is not less than 100 square feet (9.3 m^2) where machinery is located on floor levels with exits more than 6.6 feet (2012 mm) above the ground. Where provided with egress directly to the outdoors or into *approved* building exits, the minimum floor area shall not apply.
4. Refrigerant detectors are installed as required for machinery rooms in accordance with Section 1105.3.
5. Surfaces having temperatures exceeding 800°F (427°C) and open flames are not present where any Group A2, B2, A3 or B3 refrigerant is used (see Section 1104.3.4).
6. All electrical *equipment* and appliances conform to Class 1, Division 2, *hazardous location* classification requirements of NFPA 70 where the quantity of any Group A2, B2, A3 or B3 refrigerant, other than ammonia, in a single independent circuit would exceed 25 percent of the lower flammability limit (LFL) upon release to the space.
7. All refrigerant-containing parts in systems exceeding 100 horsepower (hp) (74.6 kW) drive power, except evaporators used for refrigeration or dehumidification; condensers used for heating; control and pressure relief valves for either; and connecting piping, shall be located either outdoors or in a *machinery room*.

Reason: The proposal clarifies that Section 1104.2.2 only applies when a machinery room is otherwise required. As currently written, the code could be interpreted such that the special regulations in 1104.2.2 are applicable even if a machinery room weren't otherwise required, such as a case where the primary refrigerant is a brine solution. This revision will make it clear that this is not a proper application of the IMC.

Cost Impact: Will not increase the cost of construction
The proposal only clarifies the intended application of the current provisions.

M 118-15 : 1104.2.2-SHAPIRO4711

M 119-15

202 (New), 1104.2.2

Proponent: Jeffrey Shapiro, International Institute of Ammonia Refrigeration, representing International Institute of Ammonia Refrigeration (jeff.shapiro@intlcodeconsultants.com)

2015 International Mechanical Code

Add new definition as follows:

SECTION 202 DEFINITIONS

LOW-PROBABILITY PUMP. A pump that does not rely on a dynamic shaft seal as a singular means of containment to prevent atmospheric release of the pumped fluid.

Revise as follows:

1104.2.2 Industrial occupancies and refrigerated rooms. This section applies only to industrial occupancies and refrigerated rooms for manufacturing, food and beverage preparation, meat cutting, other processes and storage. Machinery rooms are not required where all of the following conditions are met:

1. The space containing the machinery is separated from other occupancies by tight construction with tight-fitting doors.
2. Access is restricted to authorized personnel.
3. The floor area per occupant is not less than 100 square feet (9.3 m^2) where machinery is located on floor levels with exits more than 6.6 feet (2012 mm) above the ground. Where provided with egress directly to the outdoors or into *approved* building exits, the minimum floor area shall not apply.
4. Refrigerant detectors are installed as required for machinery rooms in accordance with Section 1105.3.
5. Surfaces having temperatures exceeding 800°F (427°C) and open flames are not present where any Group A2, B2, A3 or B3 refrigerant is used (see Section 1104.3.4).
6. All electrical *equipment* and appliances conform to Class 1, Division 2, *hazardous location* classification requirements of NFPA 70 where the quantity of any Group A2, B2, A3 or B3 refrigerant, other than ammonia, in a single independent circuit would exceed 25 percent of the lower flammability limit (LFL) upon release to the space.
7. All refrigerant-containing parts in systems with a total connected compressor power exceeding 100 horsepower (hp) (74.6 kW) ~~drive power~~, except evaporators used for refrigeration or dehumidification; condensers used for heating; control and pressure relief valves for either; low-probability pumps; and connecting piping, shall be located either outdoors or in a *machinery room*.

Reason: The modification of the 100 HP power threshold in Item 7 clarifies that this is compressor drive power, which is the terminology used in IIAR 2 Section 4.2.3 and ASHRAE 15 Section 7.2.2(g). The change ensures that the drive power for liquid pumps and other motorized equipment attached to the system is not improperly added.
Recognition of low-probability pumps acknowledges the superior leak resistance of these pumps and encourages their use to increase safety. The approach is modeled after the current IMC approach for low-probability systems, as defined in Chapter 2. Because low-probability systems are inherently more resistant to atmospheric releases than high-probability systems, the IMC permits more widespread use of low-probability systems. With respect to pumps, experience has shown that pump leaks are typically associated with failed seals on rotating (dynamic) parts, which can result in events ranging from a simple nuisance release to a hazardous condition requiring an emergency response. This proposal will encourage the use of pumps that are hermetically sealed or similar in lieu of pumps that rely on dynamic seals to contain refrigerant.

Cost Impact: Will not increase the cost of construction
The proposal will not increase the cost of construction because the first portion of the change is a clarification of current provisions, and the second portion of the change is an optional path to compliance. Standard pumps will continue to be permitted when they are located in refrigerant machinery rooms.

M 119-15 : 1104.2.2-SHAPIRO4766

M 120-15

1104.2.2

Proponent: Jeffrey Shapiro, International Institute of Ammonia Refrigeration, representing International Institute of Ammonia Refrigeration (jeff.shapiro@intlcodeconsultants.com)

2015 International Mechanical Code

Revise as follows:

1104.2.2 Industrial occupancies and refrigerated rooms. This section applies only to industrial occupancies and refrigerated rooms for manufacturing, food and beverage preparation, meat cutting, other processes and storage. Machinery rooms are not required where all of the following conditions are met:

1. The space containing the machinery is separated from other occupancies by tight construction with tight-fitting doors.
2. Access is restricted to authorized personnel.
3. ~~The floor area per occupant is not less than 100 square feet (9.3 m²) where machinery is located on floor levels with exits more than 6.6 feet (2012 mm) above the ground. Where provided with egress directly to the outdoors or into *approved* building exits, the minimum floor area shall not apply.~~
3. Refrigerant detectors are installed as required for machinery rooms in accordance with Section 1105.3.
4. Surfaces having temperatures exceeding 800°F (427°C) and open flames are not present where any Group A2, B2, A3 or B3 refrigerant is used (see Section 1104.3.4).
5. All electrical *equipment* and appliances conform to Class 1, Division 2, *hazardous location* classification requirements of NFPA 70 where the quantity of any Group A2, B2, A3 or B3 refrigerant, other than ammonia, in a single independent circuit would exceed 25 percent of the lower flammability limit (LFL) upon release to the space.
6. All refrigerant-containing parts in systems exceeding 100 horsepower (hp) (74.6 kW) drive power, except evaporators used for refrigeration or dehumidification; condensers used for heating; control and pressure relief valves for either; and connecting piping, shall be located either outdoors or in a *machinery room*.

Reason: The section proposed for deletion is archaic, makes no sense, and doesn't typically apply because the second sentence largely negates the first. Simply by having a direct outside exit or an "approved" building exit (why would an exit not be approved, and how is a building exit different than an exit?), the occupant density limit is waived. Nevertheless, there is no logical reason for this section to establish an maximum occupancy limit based on providing a minimum floor area per occupant simply because someone is in a refrigerated area. Note that fixing a hard limit on the number of people permitted in an industrial space is very different than a typical occupant load calculation that is only for the purpose of designing the required means of egress.

Cost Impact: Will not increase the cost of construction
The proposal is unlikely to impact the cost of construction because the deleted text is probably never applied anyway.

M 120-15 : 1104.2.2-SHAPIRO4847

M 121-15

1104.2.2

Proponent: Jeffrey Shapiro, International Institute of Ammonia Refrigeration, representing International Institute of Ammonia Refrigeration (jeff.shapiro@intlcodeconsultants.com)

2015 International Mechanical Code

Revise as follows:

1104.2.2 Industrial occupancies and refrigerated rooms. This section applies only to industrial occupancies and refrigerated rooms for manufacturing, food and beverage preparation, meat cutting, other processes and storage. Machinery rooms are not required where all of the following conditions are met:

1. The space containing the machinery is separated from other occupancies by tight construction with tight-fitting doors.
2. Access is restricted to authorized personnel.
3. The floor area per occupant is not less than 100 square feet (9.3 m^2) where machinery is located on floor levels with exits more than 6.6 feet (2012 mm) above the ground. Where provided with egress directly to the outdoors or into *approved* building exits, the minimum floor area shall not apply.
4. Refrigerant detectors are installed as required for machinery rooms in accordance with Section 1105.3.
   <u>**Exceptions:**</u>
   <u>1. Refrigerant detectors are not required in unoccupied areas that contain only continuous piping that does not include valves, valve assemblies, equipment, or equipment connections.</u>
   <u>2. Where approved alternatives are provided, refrigerant detectors are not required for rooms or areas that are always occupied, and for rooms or areas that have high humidity or other harsh environmental conditions that are incompatible with detection devices.</u>
5. Surfaces having temperatures exceeding 800°F (427°C) and open flames are not present where any Group A2, B2, A3 or B3 refrigerant is used (see Section 1104.3.4).
6. All electrical *equipment* and appliances conform to Class 1, Division 2, *hazardous location* classification requirements of NFPA 70 where the quantity of any Group A2, B2, A3 or B3 refrigerant, other than ammonia, in a single independent circuit would exceed 25 percent of the lower flammability limit (LFL) upon release to the space.
7. All refrigerant-containing parts in systems exceeding 100 horsepower (hp) (74.6 kW) drive power, except evaporators used for refrigeration or dehumidification; condensers used for heating; control and pressure relief valves for either; and connecting piping, shall be located either outdoors or in a *machinery room*.

Reason: The proposed exceptions are derived from IIAR 2. In areas that only contain fixed piping, there are no expected leak sources, so detection is unnecessary regardless of the refrigerant type. This is not unlike how the IFC and IBC don't count quantities of some materials in piping systems towards MAQ amounts. The proposed exception recognizing alternative detection protocols for ammonia in areas that are continuously occupied and areas where the environmental conditions would damage or diminish the reliability of fixed detectors provides flexibility for the mechanical code official and the designer to accommodate conditions that sometimes arise for specific applications and facilities. Because of ammonia's strong self-alarming odor, it is common for facilities to have emergency plans in place that respond to an ammonia odor, which is detectable at a fraction of the thresholds at which a health or fire hazard may occur.

Cost Impact: Will not increase the cost of construction
The proposed exceptions are optional. Therefore the will never increase the cost of construction. The cost of construction may decrease depending on whether the exceptions provide a more cost effective option for leak detection.

M 121-15 : 1104.2.2-SHAPIRO4848

M 122-15

202, 1104.2.2

Proponent: Jeffrey Shapiro, International Institute of Ammonia Refrigeration, representing International Institute of Ammonia Refrigeration (jeff.shapiro@intlcodeconsultants.com)

2015 International Mechanical Code

Delete without substitution:

SECTION 202 DEFINITIONS

~~**REFRIGERATED ROOM OR SPACE.**~~

~~A room or space in which an evaporator or brine coil is located for the purpose of reducing or controlling the temperature within the room or space to below 68°F (20°C).~~

Revise as follows:

1104.2.2 Industrial occupancies and refrigerated rooms. This section applies only to rooms and spaces that are within industrial occupancies, that contain a refrigerant evaporator, that are maintained at temperatures below 68°F (20°C) and ~~refrigerated rooms~~that are used for manufacturing, food and beverage preparation, meat cutting, other processes and storage.

Machinery rooms are not required where all of the following conditions are met:

1. The space containing the machinery is separated from other occupancies by tight construction with tight-fitting doors.
2. Access is restricted to authorized personnel.
3. The floor area per occupant is not less than 100 square feet (9.3 m^2) where machinery is located on floor levels with exits more than 6.6 feet (2012 mm) above the ground. Where provided with egress directly to the outdoors or into *approved* building exits, the minimum floor area shall not apply.
4. Refrigerant detectors are installed as required for machinery rooms in accordance with Section 1105.3.
5. Surfaces having temperatures exceeding 800°F (427°C) and open flames are not present where any Group A2, B2, A3 or B3 refrigerant is used (see Section 1104.3.4).
6. All electrical *equipment* and appliances conform to Class 1, Division 2, *hazardous location* classification requirements of NFPA 70 where the quantity of any Group A2, B2, A3 or B3 refrigerant, other than ammonia, in a single independent circuit would exceed 25 percent of the lower flammability limit (LFL) upon release to the space.
7. All refrigerant-containing parts in systems exceeding 100 horsepower (hp) (74.6 kW) drive power, except evaporators used for refrigeration or dehumidification; condensers used for heating; control and pressure relief valves for either; and connecting piping, shall be located either outdoors or in a *machinery room*.

Reason: The definition that is proposed for deletion only applies to Section 1104.2.2, and it makes more sense to incorporate the criteria of the definition into the section than to have them remotely located in Chapter 2. There is a related requirement in IBC Section 1006.2.3, and the IBC approach of incorporating the criteria into the code text vs. using a definition is the approach modeled by this proposal. From a technical perspective, this change eliminates the mentioning of brine solution as being the source of temperature control for application of IMC 1104.2.2. UBC 1006.2.3 mentions only evaporators as a source for temperature control, not brine, and this makes sense given that brine is simply a salt water solution and doesn't present a hazard that warrants any special controls from a code/safety perspective.

Cost Impact: Will not increase the cost of construction
The proposal is simply a clean up of code text and a correlation of the IMC to the IBC. It will not increase the cost of construction.

M 122-15 : 1104.2.2-SHAPIRO4941

M 123-15

1105.6.1.1 (New)

Proponent: Guy McMann, Jefferson County, Colorado., representing Colorado Associatoin of Plumbing and Mechanical Officials (CAPMO) (gmcmann@jeffco.us)

2015 International Mechanical Code

Add new text as follows:

1105.6.1.1 Indoor exhaust opening location. Indoor mechanical exhaust intake openings shall be located where refrigerant leakage is likely to concentrate based on the refrigerant's relative density to air. Air current paths and machinery location shall be accounted for in locating such intake openings.

Reason: Although the code addresses openings when equipment is located outdoors, it is silent where dealing with exhaust duct opening locatoins inside the machinery room. This will be very helpful to inspectors providing guidance when they examine openings in the machinery room. Similar language can be found in ASHRAE-15.

Cost Impact: Will not increase the cost of construction
There will be no addional cost as this in only an editorial modification and clarification. This proposal contains no new requirements.

M 123-15 : 1105.6.1.1 (New)-MCMANN3583

M 124-15

1105.6.3

Proponent: Jeffrey Shapiro, International Institute of Ammonia Refrigeration, representing International Institute of Ammonia Refrigeration (jeff.shapiro@intlcodeconsultants.com)

2015 International Mechanical Code

Revise as follows:

1105.6.3 Ventilation rate. For other than ammonia systems, the mechanical ventilation systems shall be capable of exhausting the minimum quantity of air both at normal operating and emergency conditions, as required by Sections 1105.6.3.1 and 1105.6.3.2. The minimum required emergency ventilation rate for ammonia shall be 30 air changes per hour in accordance with IIAR2. Multiple fans or multispeed fans shall be allowed to produce the emergency ventilation rate and to obtain a reduced airflow for normal ventilation.

Reason: Clarifies that the 30 air change per hour ventilation rate for ammonia is the emergency ventilation rate.

Cost Impact: Will not increase the cost of construction
The proposal is a clarification of the current requirements and will not affect the cost of construction.

M 124-15 : 1105.6.3-SHAPIRO4850

M 125-15

1105.8

Proponent: Jeffrey Shapiro, International Institute of Ammonia Refrigeration, representing International Institute of Ammonia Refrigeration (jeff.shapiro@intlcodeconsultants.com)

2015 International Mechanical Code

Revise as follows:

1105.8 Ammonia discharge. Pressure relief valves for ammonia systems shall discharge in accordance with ~~ASHRAE 15.~~ <u>IIAR 2.</u>

Reason: IIAR 2-2014 was entirely rewritten, and the standard is now a stand-alone document that no longer relies on ASHRAE 15. During the rewrite process, ASHRAE 15 was reviewed, and provisions deemed appropriate for regulating ammonia were incorporated into the IIAR 2. That includes provisions for ammonia discharge. Therefore, the reference to ASHRAE 15 for ammonia refrigeration is no longer necessary.

Cost Impact: Will not increase the cost of construction
This proposal may reduce the cost of construction by simplifying the design/review process to only involve a single standard for ammonia refrigeration system installations.

M 125-15 : 1105.8-SHAPIRO4851

M 126-15

1107.9 (New)

Proponent: Howard Ahern, representing myself (howard@plumberex.com)

2015 International Mechanical Code

Add new text as follows:

1107.9 Vibration Refrigerant piping and joints shall be designed and installed so as to prevent damaging vibration and stress.

Reason: This code change addresses an important element of the design and installation and needs to be part of the code. The code change is needed to address design and installation of refrigerant piping to avoid refrigerant piping vibration & stress problems. It is a requirement in the adopted standard of ASME B31.5
Section 501.5.4 "Piping shall be arranged and supported with consideration to vibration." The Standard is lengthy the practice of isolating the refrigerant line for vibration is often overlooked.

The majority of Equipment Manufactureres Installation Instructions have for the last 4 years already required isolation of the refrigerant piping in their installation instructions to prevent vibration damage and for noise reduction.

Structural and acoustical resonances as well as forced vibration like Gas pulsation-driven vibration can cause various vibration problems that can result fatigue and broken refrigerant lines. Leaking refrigerant is not only a safety and health issue but an environment issue as well. The expense of leaked refrigerant is costly and an economic reason as well..

In a study by the Institute of Refrigeration in 2009, it listed Vibration as one of the most common causes associated with Refrigeration leakage.

*"Causes of vibration in discharge lines can be separated primarily into the following categories: one,

Structural resonances; two, forced vibration; and three, acoustical resonances. Of the causes of vibration, structural resonances are the most common, followed by forced vibration and acoustical resonances. Multiple combinations of the three also can cause vibration."

"*Gas pulsation-driven vibration is the most common cause of forced vibration. Pulsation-driven vibration does not mean that the compressor is emitting such high pulsations that it forces the line to vibrate regardless of the piping geometry. All reciprocating compressors emit discharge gas pulsations (a reciprocating compressor generates a constant stream of pulsating flow). When discharge gas pulsations react with the piping system geometry in such a way as to set up an oscillating force, discharge pipe vibration may occur. Condensations and refractions are clusters of various lengths of sound waves that catch up with each other within the piping system. This causes the amplitude of the sound level to increase, causing loud disturbing pulsating harmonic sounds. An example of this is when the discharge line comes off the compressor service valve and enters one, two, three or more elbows. Picture the pulsating discharge gas flowing from the compressor through the first straight section of discharge pipe. The discharge gas then hits the first elbow and bounces into the next section of straight pipe.

An oscillation in the gas already has started and each elbow may increase the oscillation, creating a significant amount of line vibration. Designing the discharge piping as straight as possible will reduce the chances of pulsation- driven vibration occurring."

*April 2006 ~ RSES Journal Wes Taylor,

Cost Impact: Will not increase the cost of construction
This will not increase cost as it has been part of the adopted standard for design and instalation.

M 126-15 : 1107.1.1 (New)-AHERN4771

M 127-15

1107.2

Proponent: Jeffrey Shapiro, International Institute of Ammonia Refrigeration, representing international institute of ammonia refrigeration (jeff.shapiro@intlcodeconsultants.com)

2015 International Mechanical Code

Revise as follows:

1107.2 Piping location. Refrigerant piping that crosses an open space that affords passageway in any building shall be not less than 7 feet 3 inches (2210 mm) above the floor unless the piping is located against the ceiling of such space. Refrigerant piping shall not be placed in any elevator, dumbwaiter or other shaft containing a moving object or in any shaft that has openings to living quarters or to means of egress. Refrigerant piping shall not be installed in an ~~enclosed public stairway,~~exit stairway ~~landing~~ or ~~means of egress.~~ramp or an exit passageway.

Reason: The current text prohibiting refrigerant piping from the means of egress essentially prohibits refrigerant piping from anywhere in a building because the means of egress, by definition, includes the exit access. It seems that the intent of this section is to prohibit the installation of refrigerant piping in a required exit enclosure, and the proposed text, which applies the text to exit stairs and ramps and exit passageways accomplishes that intent with clarity.

Cost Impact: Will not increase the cost of construction
The proposal should not impact the cost of construction, but might reduce the cost in cases where the location of refrigerant piping is overly restricted based on the existing text.

M 127-15 : 1107.2-SHAPIRO4705

M 128-15

1107.2

Proponent: Maureen Traxler, Seattle Dept of Planning & Development, representing Washington Association of Building Officials Technical Code Development Committee (maureen.traxler@seattle.gov)

2015 International Mechanical Code

Revise as follows:

1107.2 Piping location. Refrigerant piping that crosses an open space that affords passageway in any building shall be not less than 7 feet 3 inches (2210 mm) above the floor unless the piping is located against the ceiling of such space. Refrigerant piping shall not be placed in any of the following:

1. a fire-resistance-rated exit access corridor.
2. an interior exit stairway.
3. an interior exit ramp.
4. an exit passageway.
5. an elevator, dumbwaiter or other shaft containing a moving object~~ or in any~~.
6. a shaft that has ~~openings to living quarters~~one or ~~to means of egress. Refrigerant piping shall not be installed in an enclosed public stairway,~~more openings into a dwelling unit or sleeping unit.
7. a shaft that has one or more openings into a fire-resistance-rated exit access corridor, interior exit stairway ~~landing~~or ramp, or ~~means of egress.~~exit passageway.

Reason: The current code prohibits refrigerant piping in "means of egress" and in shafts with openings into "means of egress." The IBC definition is "A continuous and unobstructed path of vertical and horizontal egress travel from any occupied portion of a building or structure to a public way…." In other words, the means of egress includes all occupied spaces in a building, so prohibiting refrigerant piping in the means of egress means it's prohibited almost everywhere. Section 1107.2 is copied from ASHRAE 15 but this proposal gives it a reasonable interpretation that identifies specific locations where refrigerant piping is prohibited, and allows it to be installed in occupied buildings. This proposal is meant as an interpretation of the term "means of egress" as used in the ASHRAE language, without changing the intended meaning of the term.

Cost Impact: Will not increase the cost of construction
This proposal does not increase the cost of construction because it merely interprets an ambiguous term that is in the current code.

M 128-15 : 1107.2-TRAXLER4752

M 129-15

1107.9.1 (New)

Proponent: Howard Ahern, representing Airex Mfg. (howard@plumberex.com)

2015 International Mechanical Code

Add new text as follows:

1107.9.1 **Exterior wall penetrations** Refrigerant piping penerating an exterior wall shall be isolated and supported to prevent damaging vibration.

Reason: This code change is needed to create consistency for installation with this code and equipment manufactureres installation instructions for isolation of refrigerant piping to prevent vibration damage. Refrigerant piping must be isolated and supported to eliminate vibration transfer to the exterior wall specifically from the penetration of refrigerant piping. The majority of Equipment manufactureres installation instructions already require isolation of the refrigerant piping in their installation instructions to prevent vibration damage. Isolation of the piping is also need to prevent damage to the piping from contact with hard surfaces and to eliminate stress from vibration which can cause piping and joint fatigue that could lead to leaking refrigerant.
This code change also address the problem with refrigerant piping wall penetrations that are often are overlooked as a vibration path. Significant acoustic energy can pass through a small opening in a wall. The Exterior wall is most critical for its close proximity to the equipment and is the first wall of the building that is penetrated.

The code has already recognizes the problems associated with piping vibration as required in The IMC Section 1107.2.1 for concrete floors. The Exterior wall is often the closest to the equipment and the first wall of the building that is penetrated.

*"The only sure way to cut off the path of objectionable vibration is with an isolation system. Vibration will take the path of least resistance." If the connected pipe is not isolated, then uwanted vibration may bleed through to the structure."

Complaints by building occupants are usually of either of a high level of vibration that is disturbing or unacceptable noise from the piping or transmitted to the building. Depending on the sensitivity to vibration or vibration noise some building such as hospital, office building, and concert halls etc. noise reduction is critical. Classroom acoustics are very important (especially in early primary education) as studies show a link between learning and good room acoustics. Hotels, Dormitories, and Apartments all need to minimize unacceptable and disturbing noises due to Vibration.

* "An isolation system is the best inexpensive insurance against unwanted vibration."

* "Vibration isolator is defined as a resilient material placed between the equipment and the structure to create a low natural frequency support system for the equipment. Some common

materials are elastomeric pads or mounts, helical steel springs, wire rope springs, and air springs". Retrofitting after complaints develop is often far more expensive than an original installation."

*Vibration Isolation By Robert Simmons, P.E., ASHRAE Journal 2009

Cost Impact: Will not increase the cost of construction
This will not increase cost as design and installation of piping to account for vibration has been part of the adopted standard for design and installation.

M 129-15 : 1107.2.2.1 (New)-AHERN5658

M 130-15

1107.5.2

Proponent: Pennie L Feehan, Copper Development Association, representing Copper Development Association (penniefeehan@me.com)

2015 International Mechanical Code

Revise as follows:

1107.5.2 Copper and ~~brass~~copper-alloy pipe. Standard iron-pipe size, copper and ~~red brass (~~copper-alloy (not less than 80-percent copper) pipe shall conform to ASTM B 42 and ASTM B 43.

Reason: The proposal removes brass because brass is a copper alloy.

Cost Impact: Will not increase the cost of construction
This proposal is updating the name of the materials used in the field and will not impact the cost of construction.

M 130-15 : 1107.5.2-FEEHAN3728

M 131-15

1107.5.3, CHAPTER 15

Proponent: Pennie L Feehan, Copper Development Association, representing Copper Development Association (penniefeehan@me.com)

2015 International Mechanical Code

Revise as follows:

1107.5.3 Copper tube. Copper tube used for refrigerant piping erected on the premises shall be seamless copper tube of Type ACR (hard or annealed) complying with ASTM B 280 and ASTM B819. Where *approved*, copper tube for refrigerant piping erected on the premises shall be seamless copper tube of Type K, L or M (drawn or annealed) in accordance with ASTM B 88. Annealed temper copper tube shall not be used in sizes larger than a 2-inch (51 mm) nominal size. Mechanical joints shall not be used on annealed temper copper tube in sizes larger than $^7/_8$-inch (22.2 mm) OD size.

Add new standard(s) as follows:
ASTM B819−00 (R2011) Standard Specification for Seamless Copper Tube for Medical Gas Systems

Reason: Registered design professionals would like to be able to specify ASTM B819 tube in type K wall thickness for use in systems utilizing 410A refrigerant. The pressure/temperature rating of ASTM B280 tube is not high enough in some cases and sizes to accommodate the increased pressures exhibited by the saturation pressure of 410A refrigerant at some of the temperatures.

With respect to material, the internal cleanliness requirements ASTM B280 and B819 are fundamentally equal. They both are required to meet strict internal cleanliness and allowable particulate requirements as part of their respective ASTM standards. The difference between the two is that ASTM B280 tube is manufactured in one size ACR (type L) measured by actual outside diameter and ASTM B819 tubes types K and L tube are measured by actual outside diameter plus 1/8-inch, making it larger than the standard size designation. Type K and L, are only available in hard temper. And ASTM B819 tube is identified as OXY/ACR, ACR/MED with either green or blue ink stripes to identify type K or type L wall thickness.

Cost Impact: Will not increase the cost of construction
The proposed change will not increase the cost of construction, as it is adding a standard that is used in refrigeration systems..

Analysis: A review of the standard proposed for inclusion in the code, ASTM B819, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2015.

M 131-15 : 1107.5.3-FEEHAN3716

M 132-15

1107.5.3, CHAPTER 15

2015 International Mechanical Code

Revise as follows:

1107.5.3 Copper tube. Copper tube used for refrigerant piping erected on the premises shall be seamless copper tube of Type ACR (hard or annealed) complying with ASTM B 280~~. Where *approved*, copper tube for refrigerant piping erected on the premises shall be seamless copper tube of Type K, L~~ or ~~M (drawn or annealed) in accordance with~~ ASTM ~~B 88~~B819. Annealed temper copper tube shall not be used in sizes larger than a 2-inch (51 mm) nominal size. Mechanical joints shall not be used on annealed temper copper tube in sizes larger than $^{7}/_{8}$-inch (22.2 mm) OD size.

Add new standard(s) as follows:
ASTM B819-00 (R2011) Standard Specification for Seamless Copper Tube for Medical Gas Systems

Reason: I am deleting the where approved sentence, because it is confusing and may cause issues for the refrigeration system. ASTM B88 tube is not cleaned or capped by the manufacture and it would not be specified by a registered design professional. It would only be used as a repair or quick fix and not inspected.

Cost Impact: Will not increase the cost of construction
This proposal is adding a standard that is used in the field and will have no impact on the cost of construction.

Analysis: A review of the standard proposed for inclusion in the code, ASTM B819, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2015.

M 132-15 : 1107.5.3-FEEHAN3719

M 133-15

1107.5.3

Proponent: Jay Peters, representing Cerro Flow Products (peters.jay@me.com)

2015 International Mechanical Code

Revise as follows:

1107.5.3 Copper tube. Copper tube used for refrigerant piping erected on the premises shall be seamless copper tube of Type ACR (hard or annealed) complying with ASTM B 280. Where *approved*, copper tube for refrigerant piping erected on the premises shall be seamless copper tube of Type K, L or M (drawn or annealed) in accordance with ASTM B 88. Annealed temper copper tube shall not be used in sizes larger than a 2-inch (51 mm) nominal size. Mechanical joints<u>, other than press-connect joints,</u> shall not be used on annealed temper copper tube in sizes larger than $^{7}/_{8}$-inch (22.2 mm) OD size.

Reason: Press-connect joints and fitings specifically manufacturerd for refrigerant pipe and tube connections (including soft annealed copper) have been tested by Underwriters Laboratories (UL) on sizes larger than 7/8" to meet UL 207, already referenced in the IMC. This technology is ***listed*** by both ICC ES PMG and UL to meet the requirements of the International Mechanical Code and the Uniform Mechanical Code. The term was changed to match the terminology used in the industry and the ASTM standard from ***press joint*** to ***press-connect joint***. A proposal to edit the definition to match this term has also been proposed to the IMC.

Cost Impact: Will not increase the cost of construction
This new technology has great potential to save construction costs by drastically reducing labor costs as well as potential damage caused by typical brazing and soldering flames.

M 133-15 : 1107.5.3-PETERS4916

M 134-15

1201.4 (New), CHAPTER 15

Proponent: William Chapin, representing Professional Code Consulting, LLC (bill@profcc.us)

2015 International Mechanical Code

Add new text as follows:

1201.4 Installation. Hydronic heating systems shall comply with the requirements of CSA B214.

Add new standard(s) as follows:
CSA B214-12 Installation Code for Hydronic Heating Systems

Reason: CSA B214-12 contains additional requirements and information regarding the installation of the systems that are not covered within the IMC such as Oxygen Permeation for closed systems, additives added to the water, labels and tags for identifying those additives, and prevention of stagnation which can lead to Legionella bacteria exposure.

Cost Impact: Will not increase the cost of construction
Will not increase the cost of construction since this document is only for additional installation guidance not currently covered under Chapter 12 of the IMC.

Analysis: A review of the standard proposed for inclusion in the code, CSA B214 , with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2015.

M 134-15 : 1201.4 (New)-CHAPIN5256

M 135-15

Table 1202.4, Table 1210.4

Proponent: Mike Cudahy, representing Plastic Pipe and Fittings Association (mikec@cmservnet.com)

2015 International Mechanical Code

Revise as follows:

TABLE 1202.4
HYDRONIC PIPE

MATERIAL	STANDARD (see Chapter 15)
Cross-linked polyethylene (PEX) tubing	ASTM F 876; ~~ASTM F 877~~

(Portions of table not shown remain unchanged)

TABLE 1210.4
GROUND-SOURCE LOOP PIPE

MATERIAL	STANDARD (see Chapter 15)
Cross-linked polyethylene (PEX)	ASTM F 876; ~~ASTM F 877;~~ CSA B137.5

(Portions of table not shown remain unchanged)

Reason: ASTM F877 has been revised a few years ago to remove the redundant pipe/tubing dimensional and performance specifications which are otherwise specified in ASTM F876. F877 remains a PEX fitting and PEX system materials and performance standard exclusive for use with ASTM F876 piping/tubing.

Cost Impact: Will not increase the cost of construction
This proposal simply deletes a standard that is no longer pipe or tubing related from the code. The piping material is now covered by a different standard, and as such, the option is not deleting or adding a material. Thus the code with this proposal added will not cause the cost of construction to increase. ASTM F877 is already in the code.

M 135-15 : T1202.4-CUDAHY4737

M 136-15

Table 1202.4, Table 1210.4, Chapter 15

Proponent: Larry Gill, representing IPEX USA LLC (larry.gill@ipexna.com)

2015 International Mechanical Code

Revise as follows:

TABLE 1202.4
HYDRONIC PIPE

MATERIAL	STANDARD (see Chapter 15)
Raised temperature polyethylene (PE-RT)	ASTM F 2623; ASTM F 2769; <u>CSA B137.18</u>

(Portions of table not shown remain unchanged)

TABLE 1210.4
GROUND-SOURCE LOOP PIPE

MATERIAL	STANDARD (see Chapter 15)
Raised temperature polyethylene (PE-RT)	ASTM F 2623; <u>ASTM F2769; CSA B137.18</u>

(Portions of table not shown remain unchanged)

Add new standard(s) as follows:

<u>CSA B137.18 - 13 Polyethylene of raised temperature resistance (PE-RT) tubing systems for pressure applications.</u>

Reason: CSA B137.18 - Polyethylene of raised temperature resistance (PE-RT) tubing systems for pressure applications is a new consensus standard for tubing and fittings. The scope of the standard includes ground source geothermal systems and hydronic heating systems. ASTM F2769 is a standard for PE-RT systems which is currently referenced in the IMC for other applications and can be used for ground source loop pipe and hydronic pipe.

Cost Impact: Will not increase the cost of construction
This change is to simply add reference to a new standard to the Code. There is no cost impact in adding the new standard. This change just permits an option to meet a different standard then the current reference standards.

Analysis: A review of the standard proposed for inclusion in the code, CSA B137.18, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2015.

M 136-15 : T1202.4-GILL4436

M 137-15

Table1202.5, CHAPTER 15

Proponent: William Chapin, Professional Code Consulting, LLC, representing Professional Code Consulting, LLC (bill@profcc.us)

2015 International Mechanical Code

Revise as follows:

TABLE 1202.5
HYDRONIC PIPE FITTINGS

MATERIAL	STANDARD (see Chapter 15)
Copper and copper alloys	ASME B16.15; ASME B16.18; ASME B16.22; ASME B16.26; ASTM F 1974; ASTM B16.24; ASME B16.51; ASSE 1061
Ductile iron and gray iron	ANSI/AWWA C110/A21.10; AWWA C153/A21.53; ASTM A 395; ASTM A 536; ASTM F 1476; ASTM F 1548
Ductile iron	ANSI/AWWA C153/A21.53
Gray iron	ASTM A 126
Malleable iron	ASME B16.3
PE-RT fittings	ASTM F 1807; ASTM F 2098; ASTM F 2159; ASTM F 2735; ASTM F 2769; ASSE 1061
PEX fittings	ASTM F 877; ASTM F 1807; ASTM F 2159; ASSE 1061
Plastic	ASTM D 2466; ASTM D 2467; ASTM F 438; ASTM F 439; ASTM F 877; ASTM F 2389; ASTM F 2735
Steel	ASME B16.5; ASME B16.9; ASME B16.11; ASME B16.28; ASTM A 53; ASTM A 106; ASTM A 234; ASTM A 420; ASTM A 536; ASTM A 395; ASTM F 1476; ASTM F 1548

Add new standard(s) as follows:
ASSE 1061-2011 Performance Requirements for Push Fit Fittings.

Reason: ASSE 1061 Performance Requirements for Push Fit Fittings was originally published in 2006 and referenced in the 2009 IPC. These fittings have been used in the industry for over 15 years.

Cost Impact: Will not increase the cost of construction
Proposal addresses fittings and methods already used in the industry.

Analysis: A review of the standard proposed for inclusion in the code, ASSE-1061, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2015.

M 137-15 : T1202.5-CHAPIN5250

M 138-15

Table 1202.5, Table 1210.5, Chapter 15

Proponent: Larry Gill, representing IPEX USA LLC (larry.gill@ipexna.com)

2015 International Mechanical Code

Revise as follows:

TABLE 1202.5
HYDRONIC PIPE FITTINGS

MATERIAL	STANDARD (see Chapter 15)
PE-RT fittings	ASTM F 1807; ASTM F 2098; ASTM F 2159; ASTM F 2735; ASTM F 2769; ASTM D3261; CSA B137.18; CSA B137.1

(Portions of table not shown remain unchanged)

TABLE 1210.5
GROUND-SOURCE LOOP PIPE FITTINGS

PIPE MATERIAL	STANDARD (see Chapter 15)
Raised temperature polyethylene (PE-RT)	ASTM D 3261; ASTM F 1807; ASTM F 2159; CSA B137.1; ASTM F2098; ASTM F2735; ASTM F2769; CSA B137.18

(Portions of table not shown remain unchanged)

Add new standard(s) as follows:

CSA B137.18 - 13 Polyethylene of raised temperature resistance (PE-RT) tubing systems for pressure applications.

Reason: CSA B137.18 - Polyethylene of raised temperature resistance (PE-RT) tubing systems for pressure applications is a new consensus standard for tubing and fittings is being added to Tables 1202.5 and 1210.5. The scope includes fittings for these applications. CSA B137.1 and ASTM D3261 are being added to Table 1202.5 and are already included in other tables in the IMC and can be used for this application as well. . ASTM F2098, ASTM F2735, and ASTM F2769 are being added to Table 1210.5 and are already referenced in the IMC for PERT fittings for other applications and can be used for this application as well.

Cost Impact: Will not increase the cost of construction
This proposal simply adds an alternative standard for fittings. The actual fittings are similar or the same as the current standards for fittings. No impact on cost.

Analysis: A review of the standard proposed for inclusion in the code, CSA B137.18, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2015.

M 138-15 : T1202.5-GILL4439

M 139-15

Table 1202.5

Proponent: Gary Morgan, Viega LLC, representing Viega LLC (gary.morgan@viega.us)

2015 International Mechanical Code

Revise as follows:

TABLE 1202.5
HYDRONIC PIPE FITTINGS

MATERIAL	STANDARD (see Chapter 15)
PEX fittings	ASTM F 877; ASTM F 1807; ASTM F 2159; ASTM F1960; ASTM F2080

(Portions of table not shown remain unchanged)

Reason: Added two additional commonly used PEX fitting standards, F1960 and F2080, to the Table 1202.5. This has clearly been a long-standing oversight.

Cost Impact: Will not increase the cost of construction
Addition of two more fitting standards to this table has absolutely no impact on the cost of construction.

M 139-15 : T1202.5-MORGAN4998

M 140-15

1203.3.3

Proponent: Tim Earl, GBH International, representing The Oatey Company (tearl@gbhinternational.com)

2015 International Mechanical Code

Revise as follows:

1203.3.3 Soldered joints. Joint surfaces shall be cleaned. A flux conforming to ASTM B 813 shall be applied. The joint shall be soldered with a solder conforming to ASTM B 32. The base material for tinning fluxes, excluding the tinning powder, shall meet the criteria of ASTM B 813.

Reason: Tinning fluxes have been shown in several studies to create a stronger and more consistently water-tight connection when using low-lead fittings. This means less rework on the job site and less likelihood of joint failure. With the federal mandate of low-lead in 2014, this has become a significant issue and the codes need to reflect this need. We are pursuing changes to the referenced ASTM standard as well, however these will not be completed in time for this code cycle and we feel that it is important to make this change as it has the potential to save money related to rework and repair. Once the standard is altered, we would support removing the language being proposed.

Cost Impact: Will not increase the cost of construction
Will not increase cost, as it simply adds another option.

M 140-15 : 1203.3.3-EARL4638

M 141-15

1203.3.3, Chapter 15

Proponent: Marcelo Hirschler, representing The Oatey Corporation (gbhint@aol.com)

2015 International Mechanical Code

Revise as follows:

1203.3.3 Soldered joints. ~~Joint surfaces~~Solder joints shall be ~~cleaned~~made in accordance with ASTM B828. Cut tube ends shall be reamed to the full inside diameter of the tube end. A flux conforming to ASTM ~~B 813~~B813 shall be applied. The joint shall be soldered with a solder conforming to ASTM ~~B 32~~B32.

Add new standard(s) as follows:
ASTM B828 Practice for Making Capillary Joints by Soldering of Copper and Copper Alloy Tube and Fittings.

Reason: This change creates consistency between the IMC and the IPC. The proposed language is identical to that in IPC 605.13.3. As often mechanical and plumbing contractors can be one and the same, this creates uniform practice in the industry.

Cost Impact: Will not increase the cost of construction
This propsal simply clarifies surface preparation, which will not increase cost.

Analysis: A review of the standard proposed for inclusion in the code, ASTM B828, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2015.

M 141-15 : 1203.3.3-HIRSCHLER4804

M 142-15

1203.3.4

Proponent: Tim Earl, GBH International, representing The Oatey Company (tearl@gbhinternational.com)

2015 International Mechanical Code

Revise as follows:

1203.3.4 Solvent-cemented joints. Joint surfaces shall be clean and free of moisture. An *approved* primer shall be applied to CPVC and PVC pipe-joint surfaces. Joints shall be made while the cement is wet. Solvent cement conforming to the following standards shall be applied to all joint surfaces:

1. ASTM D 2235 for ABS joints.
2. ASTM F 493 for CPVC joints.
3. ASTM D 2564 for PVC joints.

CPVC joints shall be made in accordance with ASTM D 2846.

~~Exception~~Exceptions:

1. For CPVC pipe joint connections, a primer is not required where all of the following conditions apply:
   - 1.1. The solvent cement used is third-party certified as conforming to ASTM F 493.
   - 1.2. The solvent cement is yellow in color.
   - 1.3. The solvent cement is used only for joining $^1/_2$-inch (12.7 mm) through 2-inch (51 mm) diameter CPVC pipe and fittings.
   - 1.4. The CPVC pipe and fittings are manufactured in accordance with ASTM D 2846.
2. A primer is not required where the manufacturer's instructions for the solvent cement do not require the application of a primer for that application.

Reason: The market place has already begun using these fast setting orange CPVC cements as a one-step application where local inspectors allow. This simply meets a market condition and gives broader authority for these applications to occur. A work item is being created in ASTM to create a standard practice for this, but is at least this code cycle away from being completed. Once that is complete we would support removing this from the code should it be allowed. However, in the interim we again ask that the practice be allowed to help meet market demand. This would also be consistent with language in the IRC (P2906.9.1.2) and a similar proposal as this in the IPC.

Cost Impact: Will not increase the cost of construction
Will not impact cost as this proposal would simply allow another option for CPVC cement.

M 142-15 : 1203.3.4-EARL4595

M 143-15

1203.8.1 (New)

Proponent: Donald Jones, None, representing Self (donaldmjones@att.net)

2015 International Mechanical Code

Add new text as follows:

<u>**1203.8.1** **Pre-heat treatment.** The area of the tube that will receive the formed tee branch opening shall be annealed prior to forming the tee branch opening where any of the following apply:</u>

1. <u>The tube size is greater than 2 inches.</u>
2. <u>The tee branch opening size is the same size as the tube in which such opening is formed.</u>
3. <u>The manufacturer of the tee branch forming equipment specifies that the tube be annealed.</u>

Reason: Full size outlets and large bore tubing must be annealed before it undergoes extrusion. Annealing copper tubing prior to forming a tee outlet is standard procedure in the field, but like any good practice, it is not always followed. Annealing the tubing increases ductility and formability. The process of annealing allows the tube to undergo deformation without fracture. The result is a sound joint.

Bibliography: http://www.copper.org/applications/plumbing/cth/extruded-outlets/cth_14mech_install.html
http://www.t-drill.com/prodthe area of the tube to be utilized for forming a tee oulet shall be annealed prior to forming the tee outlet uct.asp?sua=2⟨=9&s=5&nav=5002006

See page 61

http://www.t-drill.com

Cost Impact: Will increase the cost of construction
The practice of annealing tubing prior to forming a tee outlet is supposed to be standard procedure in the field, but like many requirements, it is not always followed. Annealing the tubing increases ductility and workability, and the result is a better joint. Since annealing of full size branches and tubing larger than 2" are manufacturer's requirements, it will not impact cost. By adding the language to the code, it will, however, help to ensure that the joints are properly made. Short cuts will be avoided.

M 143-15 : 1203.3.8-JONES4837

M 144-15

1203.5, 1203.6

Proponent: Pennie L Feehan, Copper Development Association, representing Copper Development Association (penniefeehan@me.com)

2015 International Mechanical Code

Delete without substitution:

~~**1203.5 Brass pipe.** Joints between brass pipe or fittings shall be brazed, mechanical, threaded or welded joints conforming to Section 1203.3.~~

~~**1203.6 Brass tubing.** Joints between brass tubing or fittings shall be brazed, mechanical or soldered joints conforming to Section 1203.3.~~

Reason: Brass is a copper alloy and is covered by section 1203.7 & 1203.8

Cost Impact: Will not increase the cost of construction
This proposal will not increase the cost of construction as this change is to remove language covered in section 1203.7 & 1203.8.

M 144-15 : 1203.5-FEEHAN3720

M 145-15

202, 1203.8, 1203.8.3

Proponent: Curtis Dady, Viega, LLC, representing Viega, LLC (curtis.dady@viega.us)

2015 International Mechanical Code

Revise as follows:

SECTION 202 DEFINITIONS

~~PRESS~~PRESS-CONNECT JOINT. *No change to text.*

1203.8 Copper or copper-alloy tubing. Joints between copper or copper-alloy tubing or fittings shall be brazed, mechanical or soldered joints conforming to Section 1203.3, flared joints conforming to Section 1203.8.1, push-fit joints conforming to Section 1203.8.2 or ~~press-type~~press-connect type joints conforming to Section 1203.8.3.

1203.8.3 ~~Press~~Press-connect joints. *~~Press~~Press-connect joints* shall be installed in accordance with the manufacturer's instructions.

Reason: Harmonize the designation and definition of PRESS-CONNECT fittings and joints throughout the code.
Both referenced standards (ANSI LC-4/CSA 6.32 and ASME B16.51) listed in the code use the designation "press-connect" in the title and body of the standard as well as code sections IPC 605.14.5, IRC P2906.18 and IRC G2414.10.2.

Cost Impact: Will not increase the cost of construction
Change is simply for clarity of what is already included.

M 145-15 : 1203.8-DADY3581

M 146-15

1206.12 (New)

Proponent: Timothy Manz, representing Association of Minnesota Building Officials (tmanz@ci.blaine.mn.us)

2015 International Mechanical Code

Add new text as follows:

<u>**1206.12** **Prohibited tee applications.** Fluid in the supply side of a hydronic system shall not enter a tee fitting through the branch opening. Fluid from two returns shall not enter on the run of the same tee.</u>

Reason: This language prohibits bullhead tees, which should not be used in hyrdonic systems as they create noise and turbulence and also waste circulator head.

Cost Impact: Will not increase the cost of construction
This new provision will not increase the cost of construction because it is a basic design consideration that can be easily incorporated into the layout of the piping system.

M 146-15 : 1206.1.1 (New)-MANZ5809

M 147-15

1206.12 (New)

Proponent: Timothy Manz, representing Association of Minnesota Building Officials (tmanz@ci.blaine.mn.us)

2015 International Mechanical Code

Add new text as follows:

1206.12 **Mixing of radiation.** Except where part of an engineered design, radiation elements having different rates of heat transfer shall not be intermixed in the same heating zone.

Reason: Using different types of radiation in the same heating zone results in poorly operating systems and wastes energy.

Cost Impact: Will not increase the cost of construction
This provision will not increase the cost of the installation if the appropriate types of radiation are used in each heating zone in accordance with commonly-accepted design practices.

M 147-15 : 1206.12 (New)-MANZ5811

M 148-15

1206.13 (New)

Proponent: Timothy Manz, representing Association of Minnesota Building Officials (tmanz@ci.blaine.mn.us)

2015 International Mechanical Code

Add new text as follows:

1206.13 Draining and venting. Hydronic piping shall be installed so that the pipes can be drained and so that air can be completely removed from the system during filling.

Reason: It is a basic fundamental of piping design to provide for draining and venting of hydronic systems, so it should be a minimum code requirement.

Cost Impact: Will increase the cost of construction
This provision will slightly increase the cost of installation, but it is well worth the minimal cost to have a system that can be drained and allow for the air to be completely removed during filling.

M 148-15 : 1206.13 (New)-MANZ5812

M 149-15

1207.3 (New)

Proponent: Timothy Manz, representing Association of Minnesota Building Officials (tmanz@ci.blaine.mn.us)

2015 International Mechanical Code

Add new text as follows:

1207.3 Freeze protection.
Where hydronic piping systems are subject to freezing temperatures, the transfer fluid in such systems shall be protected from freezing by means of antifreeze solutions.

Reason: This requirement is a necessity in a cold climate like Minnesota to prevent damage that can occur as a result of freezing piping and components of the hydronic system when not adequately protected.

Cost Impact: Will increase the cost of construction
Even though this provision will increase the cost of construction in northern climates, the cost to incorporate antifreeze into the design of the hydronic system is minimal compared to the damage that can occur if not protected in freezing conditions.

M 149-15 : 1207.3 (New)-MANZ5814

M 150-15

1208.1

Proponent: Mike Cudahy, representing Plastic Pipe and Fittings Association (mikec@cmservnet.com)

2015 International Mechanical Code

Revise as follows:

1208.1 General. Hydronic piping systems shall be tested hydrostatically at one and one-half times the maximum system design pressure, but not less than 100 psi (689 kPa). The duration of each test shall be not less than 15 minutes.

> **Exception:** For plastic piping systems, testing with a compressed gas shall be an alternative to hydrostatic testing where compressed air or other gas pressure testing is specifically authorized by all of the manufacturer's instructions for the plastic pipe and fitting products installed at the time the system is being tested, and compressed air or other gas testing is not otherwise prohibited by applicable codes, laws or regulations outside of this code.

Reason: PPFA has a new air testing policy, which allows for some limited air testing of plastic piping systems, if a number of conditions are met.

Bibliography: PLASTIC PIPE AND FITTINGS ASSOCIATION POLICY ON TESTING PLASTIC PIPE AND FITTINGS INSTALLATIONS WITH COMPRESSED GAS, PPFA, 2014, http://www.ppfahome.org/ub4.aspx

Compressed air or any other compressed gases should not be used for pressure testing plastic plumbing systems.

EXCEPTIONS:

1.) With trap seal pull testing, where a completed DWV system is vacuum tested with all of its traps filled with water, and the trap seals are tested with a vacuum typically between one and two inches of water column.

2.) For plastic piping systems specifically designed for use with compressed air or gasses;

• Manufacturers' instructions must be strictly followed for installation, visual inspection, testing and use of the systems,

(and)

• Compressed air or other gas testing is not prohibited by the authority having jurisdiction (AHJ).

3.) When compressed air or other gas pressure testing is specifically authorized by the applicable written instructions of the manufacturers of all plastic pipe and plastic pipe fittings products installed at the time the system is being tested and compressed air or other gas testing is not prohibited by the authority having jurisdiction (AHJ).

The manufacturer should be contacted if there is any doubt as to how a specific system should be tested.

Cost Impact: Will not increase the cost of construction

This proposal simply adds another option for air testing some specific piping materials into the code and as such, the option is not requiring that this method be chosen. Thus the code with this proposal added will not cause the cost of construction to increase.

M 150-15 : 1208.1-CUDAHY4680

M 151-15

1208.1

Proponent: Gary Morgan, Viega LLC, representing Viega LLC (gary.morgan@viega.us)

2015 International Mechanical Code

Revise as follows:

1208.1 General. Hydronic system piping ~~systems~~ shall be tested ~~hydrostatically~~with either water or, for piping systems other than plastic, by air at one and one-half times the maximum system design pressure, but not less than 100 psi (689 kPa). The duration of each test shall be not less than 15 minutes.

> **Exception:** For plastic piping systems, testing with a compressed gas shall be an alternative to hydrostatic testing where compressed air or other gas pressure testing is specifically authorized by all of the manufacturer's instructions for the plastic pipe and fittings products installed at the time the system is being tested, and compressed air or other gas testing is not otherwise prohibited by applicable codes, laws, or regulations outside of this code.

Reason: PPFA (Plastic Pipe and Fittings Association) has a new air testing policy which allows for some limited air testing of plastic piping systems if certain conditions are met. The vast majority of plastic pipe used in hydronic applications pose no more of a safety concern than does air testing of metallic piping systems. The proposed language is also consistant with new language being proposed by PPFA in the IPC and IRC-P.

Cost Impact: Will not increase the cost of construction
If anything, allowance of air testing vs. hydrostatic testing will save time and expense typically.

M 151-15 : 1208.1-MORGAN4993

M 152-15

1209.3, 1209.3.5 (New)

Proponent: Gary Morgan, Viega LLC, representing Viega LLC (gary.morgan@viega.us)

2015 International Mechanical Code

Revise as follows:

SECTION 1209
EMBEDDED PIPING

1209.1 Materials. *No change to text.*

1209.2 Pressurizing during installation. *No change to text.*

1209.3 Embedded joints. Joints of pipe or tubing that are embedded in a portion of the building, such as concrete or plaster, shall be in accordance with the requirements of Sections 1209.3.1 through ~~1209.3.4~~1209.3.5

1209.3.1 Steel pipe joints. *No change to text.*

1209.3.2 Copper tubing joints. *No change to text.*

1209.3.3 Polybutylene joints. *No change to text.*

1209.3.4 Polyethylene of raised temperature (PE-RT) joints. PE-RT tubing shall be installed in continuous lengths or shall be joined by hydronic fittings listed in Table 1202.5.

1209.3.5 Cross-linked polyethylene (PEX) joints. PEX tubing shall be installed in continuous lengths or shall be joined by hydronic fittings listed in Table 1202.5.

Reason: Addition of the PEX joints section is necessary to be consistant with the previous sections and to be consistent with the allowances given in the PE-RT joints section, 1209.3.4.

Cost Impact: Will not increase the cost of construction
This addition has no impact whatsoever on the cost of construction.

M 152-15 : 1209.3-MORGAN4995

M 153-15

1209.5, 1209.5.1, 1209.5.2

Proponent: Brent Ursenbach, Salt Lake County, representing Utah Chapter ICC (bursenbach@slco.org)

2015 International Mechanical Code

Revise as follows:

1209.5 Thermal barrier required. Radiant floor heating systems shall be provided with a thermal barrier in accordance with Sections 1209.5.1 ~~through 1209.5.4.~~and 1209.5.2. Insulation R-values for slab-on-grade and suspended floor installation shall be in accordance with the International Energy Conservation Code.

> **Exception:** Insulation shall not be required in engineered systems where it can be demonstrated that the insulation will decrease the efficiency or have a negative effect on the installation.

Delete without substitution:

~~**1209.5.1 Slab-on-grade installation.** Radiant piping utilized in slab-on-grade applications shall be provided with insulating materials installed beneath the piping having a minimum *R*-value of 5.~~

~~**1209.5.2 Suspended floor installation.** In suspended floor applications, insulation shall be installed in the joist bay cavity serving the heating space above and shall consist of materials having a minimum *R*-value of 11.~~

Reason: Insulation R-values should be located in the IECC, not the IMC. A search shows these are the only R-values specified in the IMC. Design professionals, code officials, contractors, developers, virtually all involved in the building process look to the IECC for specific thermal performance values. Locating these two sub-sections in the IMC has created considerable confusion. A similiar proposal will be submitted in Group B, to add these sub-sections into the IECC where they belong.

Cost Impact: Will not increase the cost of construction
This proposal will not increase the cost of construction as it is the first step in re-locating an *existing* insulation requirement from the IMC to the IECC. There is no increase in the R-value of the insulation or the installation labor.

M 153-15 : 1209.5.1-URSENBACH5799

M 154-15

Table 1210.4, Table 1210.5, CHAPTER 15

Proponent: Jeremy Brown, representing NSF International

2015 International Mechanical Code

Revise as follows:

TABLE 1210.4
GROUND-SOURCE LOOP PIPE

MATERIAL	STANDARD (see Chapter 15)
Chlorinated polyvinyl chloride (CPVC)	ASTM D 2846; ASTM F 441; ASTM F 442
Cross-linked polyethylene (PEX)	ASTM F 876; ASTM F 877; CSA B137.5
Polyethylene/aluminum/polyethylene (PE-AL-PE) pressure pipe	ASTM F 1282; CSA B137.9
High-density polyethylene (HDPE)	ASTM D 2737; ASTM D 3035; ASTM F 714; AWWA C901; CSA B137.1; CSA C448; NSF 358-1
Polypropylene (PP-R)	ASTM F 2389; CSA B137.11; NSF 358-2
Polyvinyl chloride (PVC)	ASTM D 1785; ASTM D 2241
Raised temperature polyethylene (PE-RT)	ASTM F 2623

TABLE 1210.5
GROUND-SOURCE LOOP PIPE FITTINGS

PIPE MATERIAL	STANDARD (see Chapter 15)
Chlorinated polyvinyl chloride (CPVC)	ASTM D 2846; ASTM F 437; ASTM F 438; ASTM F 439; CSA B137.6
Cross-linked polyethylene (PEX)	ASTM F 877; ASTM F 1807; ASTM F 1960; ASTM F 2080; ASTM F 2159; ASTM F 2434; CSA B137.5
Polyethylene/aluminum/polyethylene (PE-AL-PE)	ASTM F 1282; ASTM F 2434; CSA B137.9
High Density Polyethylene (HDPE)	ASTM D 2683; ASTM D 3261; ASTM F 1055; CSA B137.1; CSA C448; NSF 358-1
Polypropylene (PP-R)	ASTM F 2389; CSA B137.11; NSF 358-2
Polyvinyl chloride (PVC)	ASTM D 2464; ASTM D 2466; ASTM D 2467; CSA B137.2; CSA B137.3
Raised temperature polyethylene (PE-RT)	ASTM D 3261; ASTM F 1807; ASTM F 2159; CSA B137.1

Add new standard(s) as follows:

NSF 358-2-2012 Polypropylene Pipe & fittings for water-based ground-source "geothermal" heat pump systems

Reason: NSF 358-2 Polypropylene Pipe & fittings for water-based ground-source "geothermal" heat pump systems is the American National standard and should be included in these tables. This standard has requirements for material suitability, performance, chemical resistance long term strength and quality assurance requirements related to geothermal products. A copy of this standard will be provided to the commitee and may be obtained by anyone else by emailing brown@nsf.org.

Cost Impact: Will not increase the cost of construction
Providing an additional option will not increase the cost of construction.

Analysis: A review of the standard proposed for inclusion in the code, NSF 358-2 , with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2015.

M 154-15 : T1210.4-BROWN5437

M 155-15

High Density Polyethylene (HDPE)	ASTM D 2683; ASTM D 3261; ASTM F 1055; CSA B137.1; CSA C448; NSF 358-1
Polypropylene (PP-R)	ASTM F 2389; CSA B137.11
Polyvinyl chloride (PVC)	ASTM D 2464; ASTM D 2466; ASTM D 2467; CSA B137.2; CSA B137.3
Raised temperature polyethylene (PE-RT)	ASTM D 3261; ASTM F 1807; ASTM F 2159; CSA B137.1

Add new standard(s) as follows:

NSF 358-3 Cross-linked Polyethylene (PEX) Pipe and Fittings for Water-Based Ground-Source (Geothermal) Heat Pump

Systems

Reason: NSF 358-3 Cross-linked Polyethylene (PEX) Pipe and Fittings for Water-Based Ground-Source (Geothermal) Heat Pump Systems is currently under development as of the submittal deadline. This will be the American National Standard for PEX system components used in geothermal systems and when completed should be referenced in this table. This standard will have geothermal specific requirements above and beyond the ASTM standards for PEX. This standard is expected to be completed in 2015. A draft may be obtained from Jeremy Brown at brown@nsf.org.

Cost Impact: Will not increase the cost of construction
Adding another option for standards will not increase the cost of construction.

Analysis: A review of the standard proposed for inclusion in the code, NSF 358-3, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2015.

M 155-15 : T1210.4-BROWN5455

M 156-15

1302.7, CHAPTER 15

Proponent: Jeanne Murck, Core Engineered Solutions, Inc., representing Core Engineered Solutions, Inc. (jmurck@core-es.com)

2015 International Mechanical Code

Delete and substitute as follows:

~~**1302.7 Pumps.** Pumps that are not part of an *appliance* shall be of a positive-displacement type. The pump shall automatically shut off the supply when not in operation. Pumps shall be *listed* and *labeled* in accordance with UL 343.~~

1302.7 **Pumps** Pumps that are not part of an appliance shall automatically shut off the supply when not in operation. Pumps shall be listed and labeled for use with combustible liquids in accordance with UL 343 or UL 79.

Add new standard(s) as follows:
UL 79-2005 Standard for Safety for Power-Operated Pumps for Petroleum Dispensing Products

Reason: UL 79 is titled Power-Operated Pumps for Petroleum Dispensing Products and is more often used for fuel oil applications due to the increased use of aboveground fuel storage tanks and tanks installed in locations remote for the fuel oil generator. UL 79 pumps are approved for use with flammable and combustible liquids and is a safety listing that meets and exceeds the UL 343 currently in the text. UL 79 pumps are also not necessarily postiive displacement (they can be submerged /centrifual pumps) that is why positive displacement pump requirement needs to be removed from that section.
UL 343 pumps are generally small and may not have the pumping capacity required for applications requiring greater flow and tank locations. UL 79 and the ability of the AHJ to accept an alternate listing in the last section of the sentence allows for greater flexibility and fuel flow capabilities.

Cost Impact: Will not increase the cost of construction
There is no cost impact for this change. UL 79 pumps and UL 343 pumps are very similar in cost.

Analysis: A review of the standard proposed for inclusion in the code, UL 79, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2015.

M 156-15 : 1302.7-MURCK5714

M 157-15

1303.1.1

Proponent: Pennie L Feehan, Copper Development Association, representing Copper Development Association (penniefeehan@me.com)

2015 International Mechanical Code

Revise as follows:

1303.1.1 Joints between different piping materials. Joints between different piping materials shall be made with *approved* adapter fittings. Joints between different metallic piping materials shall be made with *approved* dielectric fittings or ~~brass~~ copper-alloy converter fittings.

Reason: The proposal removes brass because brass is a copper-alloy and copper-alloy is the term used to identify materials manufactured where copper is the base metal and includes brass and bronze.

Cost Impact: Will not increase the cost of construction
This proposal will not impact the cost of construction, as the change is only to update the name of the material.

M 157-15 : 1303.1.1-FEEHAN3734

M 158-15

1303.4, 1303.5

Proponent: Pennie L Feehan, Copper Development Association, representing Copper Development Association (penniefeehan@me.com)

2015 International Mechanical Code

Delete without substitution:

~~**1303.4 Brass pipe.** Joints between brass pipe or fittings shall be brazed, mechanical, threaded or welded joints complying with Section 1303.3.~~

~~**1303.5 Brass tubing.** Joints between brass tubing or fittings shall be brazed or mechanical joints complying with Section 1303.3.~~

Reason: The proposal removes brass section because brass is a copper-alloy and copper-alloy is used to identify materials manufactured where copper is the base metal incliding brass and bronze. The brass sections are not necessary because the joing types are the same in the copper and copper-alloy pipe and tubing sections.

Cost Impact: Will not increase the cost of construction
This proposal will not impact the cost of construction as it is updating the name of the material.

M 158-15 : 1303.4-FEEHAN3732

M 159-15

1402.4, 1402.4.1

Proponent: Marcelo Hirschler, representing GBH International (gbhint@aol.com)

2015 International Mechanical Code

Revise as follows:

1402.4 Roof-mounted collectors. Roof-mounted solar collectors that also serve as a roof covering shall conform to the requirements for roof coverings in accordance with the *International Building Code*.

> **Exception:** The use of plastic solar collector covers shall be limited to those *approved* light transmitting plastics meeting the requirements for plastic roof panels in Section 2609 of the *International Building Code.*

1402.4.1 Collectors mounted above the roof.
Where mounted on or above the roof covering, the collector array and supporting construction shall be constructed of noncombustible materials or fire-retardant-treated wood conforming to the *International Building Code* to the extent required for the type of roof construction of the building to which the collectors are accessory.

> **Exception:** The use of plastic solar collector covers shall be limited to those *approved* light transmitting plastics meeting the requirements for plastic roof panels in Section 2609 of the *International Building Code*.

Reason: Plastic roof panels are regulated by section 2609 of the IBC and that section addresses "light transmitting plastic" roof panels. As light transmitting materials the plastics need to meet section 2606 of the IBC and the fire properties need to comply with Class CC1 or CC2 of section 2606.4. This proposal ties in with the change to the definition of "plastic, approved" to "light transmitting plastic, approved" in the IBC.

Cost Impact: Will not increase the cost of construction
Clarification

2603.7 (New), 2603.7, 2603.7.1 (New), 2603.7.1, 2603.7.2, 2603.7.2 (New), 2603.7.3 (New), 2604.1

THIS IS A 2 PART PROPOSAL. BOTH PARTS WILL BE HEARD BY THE IMC COMMITTEE. PLEASE SEE THE TENTATIVE HEARING ORDER FOR THE IBC FIRE SAFETY COMMITTEE.

Proponent: Rob Brooks, Rob Brooks & Associates, LLC representing The Dow Chemical Company, representing The Dow Chemical Company (rob.brooks.mail@gmail.com)

Part I

2015 International Mechanical Code

Add new text as follows:

602.2.1.6 Foam plastic in plenums as interior finish, interior trim, or duct insulation. Where foam plastic insulation or foam plastic *interior finish* is a component of a plenum enclosure, or is located in a plenum, the foam plastic shall comply with Section 602.2.1.6.1 or 602.2.1.6.2, as applicable. Where foam plastic interior *trim* is located in a plenum, the foam plastic shall comply with Sections 602.2.1.6.1, 602.2.1.6.2 and Section 2604.2 of the *International Building Code*. Where foam plastic is used as duct insulation and is located in a plenum, the foam plastic shall comply with Section 602.2.1.6.3.

Delete without substitution:

~~**602.2.1.6 Foam plastic insulation.** Foam plastic insulation used in plenums as interior wall or ceiling finish or as interior trim shall exhibit a flame spread index of 75 or less and a smoke-developed index of 450 or less when tested in accordance with ASTM E 84 or UL 723 and shall also comply with one or more of Sections 602.2.1.6.1, 602.2.1.6.2 and 602.2.1.6.3.~~

Add new text as follows:

602.2.1.6.1 Exposed to airflow. Where the foam plastic is exposed to the airflow in a plenum, the foam plastic shall comply with both of the following:

1. The foam plastic shall exhibit a flame spread index of 25 or less and a smoke-developed index of 50 or less when tested in accordance with ASTM E 84 or UL 723 at the maximum thickness and density intended for use.
2. The foam plastic shall be tested in accordance with NFPA 286 and shall comply with the acceptance criteria of Section 803.1.2.1 of the *International Building Code.*

Delete without substitution:

~~**602.2.1.6.1 Separation required.** The foam plastic insulation shall be separated from the plenum by a thermal barrier complying with Section 2603.4 of the *International Building Code* and shall exhibit a flame spread index of 75 or less and a smoke-developed index of 450 or less when tested in accordance with ASTM E 84 or UL 723 at the thickness and density intended for use.~~

~~**602.2.1.6.2 Approval.** The foam plastic insulation shall exhibit a flame spread index of 25 or less and a smoke-developed index of 50 or less when tested in accordance with ASTM E 84 or UL 723 at the thickness and density intended for use and shall meet the acceptance criteria of Section 803.1.2 of the *International Building Code* when tested in accordance with NFPA 286.~~

~~The foam plastic insulation shall be approved based on tests conducted in accordance with Section 2603.9 of the *International Building Code.*~~

Add new text as follows:

602.2.1.6.2 Not exposed to airflow. Where foam plastic located in the plenum is not exposed to the airflow, the foam plastic shall exhibit a flame spread index of 75 or less and a smoke-developed index of 450 or less when tested in accordance with ASTM E 84 or UL 723 at the maximum thickness and density intended for use and shall comply with one of the following:

1. The foam plastic shall be separated from the airflow in the plenum by a thermal barrier complying with Section 2603.4 of the *International Building Code.*
2. The foam plastic shall be separated from the airflow in the plenum by corrosion-resistant steel having a base metal thickness of not less than 0.0160 inch (0.4 mm).

3. The foam plastic shall be separated from the airflow in the plenum by not less than a 1-inch (25 mm) thickness of masonry or concrete.

Delete without substitution:

~~**602.2.1.6.3 Covering.** The foam plastic insulation shall be covered by corrosion-resistant steel having a base metal thickness of not less than 0.0160 inch (0.4 mm) and shall exhibit a flame spread index of 75 or less and a smoke-developed index of 450 or less when tested in accordance with ASTM E 84 or UL 723 at the thickness and density intended for use.~~

Add new text as follows:

602.2.1.6.3 Foam plastic insulation on exterior of ducts in plenums. Duct insulation and any associated coverings, linings and adhesives, that are located in a plenum and are exposed to the plenum airflow shall have a flame spread index of 25 or less and a smoke-developed index of 50 or less when tested in accordance with ASTM E 84 or UL 723, using the specimen preparation and mounting procedures of ASTM E 2231. Duct insulation, coverings and lining shall not flame, glow, smolder or smoke when tested in accordance with ASTM C 411 at the temperature to which they are exposed in service. The test temperature shall not fall below 250 F (121 C). Duct insulation, coverings and linings shall be *listed* and *labeled.*

Part II

2015 International Building Code

Add new text as follows:

2603.7 Foam plastic in plenums as interior finish, interior trim, or duct insulation. Where foam plastic insulation or foam plastic *interior finish* is a component of a plenum enclosure, or is located in a plenum, the foam plastic shall comply with Section 2603.7.1 or 2603.7.2, as applicable. Where foam plastic interior *trim* is located in a plenum, the foam plastic shall comply with Sections 2603.7.1, 2603.7.2 and 2604.2. Where foam plastic is used as duct insulation in a plenum, the foam plastic shall comply with Section 2603.7.3.

Delete without substitution:

~~**2603.7 Foam plastic insulation used as interior finish or interior trim in plenums.** Foam plastic insulation used as interior wall or ceiling finish or as interior trim in plenums shall exhibit a flame spread index of 75 or less and a smoke-developed index of 450 or less when tested in accordance with ASTM E 84 or UL 723 and shall comply with one or more of Sections 2603.7.1, 2603.7.2 and 2607.3.~~

Add new text as follows:

2603.7.1 Exposed to airflow. Where the foam plastic is exposed to the airflow in a plenum, the foam plastic shall comply with both of the following:

1. The foam plastic shall exhibit a flame spread index of 25 or less and a smoke-developed index of 50 or less when tested in accordance with ASTM E 84 or UL 723 at the maximum thickness and density intended for use.
2. The foam plastic shall be tested in accordance with NFPA 286 and shall comply with the acceptance criteria of Section 803.1.2.1.

Delete without substitution:

~~**2603.7.1 Separation required.** The foam plastic insulation shall be separated from the plenum by a thermal barrier complying with Section 2603.4 and shall exhibit a flame spread index of 75 or less and a smoke-developed index of 450 or less when tested in accordance with ASTM E 84 or UL 723 at the thickness and density intended for use.~~

~~**2603.7.2 Approval.** The foam plastic insulation shall exhibit a flame spread index of 25 or less and a smoke-developed index of 50 or less when tested in accordance with ASTM E 84 or UL 723 at the thickness and density intended for use and shall meet the acceptance criteria of Section 803.1.2 when tested in accordance with NFPA 286. The foam plastic insulation shall be approved based on tests conducted in accordance with Section 2603.9.~~

Add new text as follows:

2603.7.2 Not exposed to airflow. Where foam plastic located in a plenum is not exposed to the airflow, the foam plastic shall exhibit a flame spread index of 75 or less and a smoke-developed index of 450 or less when tested in accordance with ASTM E 84 or UL 723 at the maximum thickness and density intended for use and shall comply with one of the following:

1. The foam plastic shall be separated from the airflow in the plenum by a thermal barrier complying with Section 2603.4.
2. The foam plastic shall be separated from the airflow in the plenum by corrosion-resistant steel having a base metal thickness of not less than 0.0160 inch (0.4 mm).
3. The foam plastic shall be separated from the airflow in the plenum by a minimum 1-inch (25 mm) thickness of masonry or concrete.

2603.7.3 Foam plastic insulation on exterior of ducts in plenums. Duct insulation and any associated coverings, linings and adhesives that are located in a plenum and are exposed to the plenum airflow shall have a flame spread index of 25 or less and a smoke-developed index of 50 or less when tested in accordance with ASTM E84 or UL 723, using the specimen preparation and mounting procedures of ASTM E2231. Duct insulation, coverings and lining shall not flame, glow, smolder or smoke when tested in accordance with ASTM C411 at the temperature at which they are exposed in service. The test temperature shall not fall below 250 F (121 C). Duct insulation, coverings and linings shall be *listed* and *labeled*.

Revise as follows:

2604.1 General. Plastic materials installed as interior finish or *trim* shall comply with Chapter 8. Foam plastics shall only be installed as interior finish where approved in accordance with the special provisions of Section 2603.9. Foam plastics that are used as interior finish shall also meet the flame spread and smoke-developed index requirements for interior finish in accordance with Chapter 8. Foam plastics installed as interior *trim* shall comply with Section 2604.2. Foam plastic installed in plenums shall comply with Section 2603.7.

Add new standard(s) as follows:

ASTM C411-11 Test Method for Hot-surface Performance of High-temperature Thermal Insulation

ASTM E2231-09 Standard Practice for Specimen Preparation and Mounting of Pipe and Duct Insulation Materials to Assess Surface Burning Characteristices

Reason:

Part I:(IMC) This is a companion proposal with Section 2603.7 of the International Building Code. This code change proposal reorganizes Section 602.2.1.6 without modifying technical requirements. The need for reorganization came from confusion in the marketplace regarding foam plastic qualification testing requirements and approved barriers, when used in one or more of the following applications:

1) Foam plastic insulation or interior finish installed as part of a wall that forms the plenum enclosure, where the foam plastic *is exposed to the airflow* (602.2.1.6.1). Requires flame spread of 25, smoke developed index of 50 and a NFPA 286 test.

2) Foam plastic insulation or interior finish installed as part of a wall that is inside the plenum, when the foam plastic *is not exposed to the airflow* due to a protective barrier. (602.2.1.6.2). Requires flame spread of 75, smoke-developed index of 450 and a barrier - either a thermal barrier, corrosion-resistant steel or masonry or concrete (per IBC 2603.4.1.1 of the International Building Code).

3) Foam plastic used as interior trim within a plenum and exposed to the airflow. Requires compliance to Sections 602.2.1.6.1 and 602.2.1.6.2 (same as above) but also requires compliance to Section 2604.2 of the International Building Code.

4) Foam plastic used as duct insulation, where the duct insulation is exposed to the plenum airflow shall meet the requirements of 602.2.1.6.3 (which is based on Section 604.3 in the Mechanical Code).

Where applicable, the words "within plenum" have been changed to "in plenum" to be consistent with the wording in Section 602.2 of the Mechanical Code.

The use of the term "exposed to airflow" is consistent with existing language in Section 602 of the Mechanical Code.

The above changes bring needed clarification regarding the approved barriers and corresponding fire test requirements for foam plastic used at various locations within plenums. The section titles "Exposed to airflow" and "Not exposed to airflow" state the intent of the code and are designed to simplify enforcement of this section.

Part II:(IBC) This is a companion proposal with Section 602.2.1.6 of the Mechanical Code. This code change proposal reorganizes Section 2603.7 without modifying technical requirements. The need for reorganization came from confusion in the marketplace regarding foam plastic qualification testing requirements and approved barriers, when used in one or more of the following applications:

1) Foam plastic insulation or interior finish installed as part of a wall that forms the plenum enclosure, where the foam plastic is exposed to the airflow (2603.7.1). Requires flame spread of 25, smoke developed index of 50 and a NFPA 286 test.

2) Foam plastic insulation or interior finish installed as part of a wall that is inside the plenum, when the foam plastic is not exposed to the airflow due to a protective barrier. (2603.7.2). Requires flame spread of 75, smoke developed index of 450 and a barrier - either a thermal barrier, corrosion-resistant steel or masonry or concrete (per IBC 2603.4.1.1).

3) Foam plastic used as interior trim within a plenum and exposed to the airflow. Requires compliance to Sections 2603.7.1 and 2603.7.2 (same as above) but also requires compliance to Section 2604.2.

4) Foam plastic used as duct insulation, where the duct insulation is exposed to the plenum airflow shall meet the requirements of Section 2603.7.3 (which is a replication of Section 604.3 in the Mechanical Code).

Where applicable, the words "within plenum" have been changed to "in plenum" to be consistent with the wording in Section 602.2 of the Mechanical Code.

The use of the term "exposed to airflow" is consistent with existing language in Section 602 of the Mechanical Code.

A Section 2603.7 reference is added to Section 2604.1 to clarify plenum requirements as needed.

The above changes bring needed clarification regarding the approved barriers and corresponding test requirements for foam plastic used at various locations within plenums. The section titles "Exposed to airflow" and "Not exposed to airflow" state the intent of the code and are designed to simplify enforcement of this section.

Cost Impact:

Part I: Will not increase the cost of construction
There are no proposed changes in technical requirements, and this is simply a reorganization of existing requirements.

Part II: Will not increase the cost of construction
There are no proposed changes in technical requirements, and this is simply a reorganization of the existing requirements.

Analysis:

Part II: A review of the standards proposed for inclusion in the code, ASTM C411 & ASTM E2231, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2015.

1101.6

Proponent: Henry BonarII, Bonar Engineering, Inc., representing Bonar Engineering, Inc. (hank@bonarengineering.com)

2015 International Mechanical Code

Revise as follows:

1101.6 General. Refrigeration systems shall comply with the requirements of this code and, except as modified by this code, ASHRAE 15. Ammonia-refrigerating systems shall comply with this code and, except as modified by this code, ASHRAE 15 ~~and~~or IIAR 2.

Reason: While the IIAR 2 is well intended, several recent changes, including the way machinery room ventilation is calculated, by volume, are encouraging designers to lower the roofs and ceilings of machinery rooms. The use of square feet of machinery room, as ASHRAE 15 has used for 50+ years, encourages higher machinery room ceilings, which is the most effective way of venting lighter-than-air ammonia. The higher ceilings also encourage the use of vertical refrigeration vessels in lieu of horizontal vessels. Vertical vessels have proven to be far more reliable in enhancing the safety of ammonia refrigeration systems. As a practicing professional engineer specializing in ammonia system refrigeration design for 40+ years and registered in 33 states, we strongly recommend the continued use of ASHRAE 15 for safety reasons.

Cost Impact: Will not increase the cost of construction
This will decrease the cost of OSHA and EPA fines for the many machinery rooms which conform to ASHRAE 15 but not to IIAR 2.

TENTATIVE ORDER OF DISCUSSION
2015 PROPOSED CHANGES TO THE
INTERNATIONAL PLUMBING CODE

The following is the tentative order in which the proposed changes to the code will be discussed at the public hearings. Proposed changes which impact the same subject have been grouped to permit consideration in consecutive changes.

Proposed change numbers that are indented are those which are being heard out of numerical order. Indentation does not necessarily indicate that one change is related to another. Proposed changes may be grouped for purposes of discussion at the hearing at the discretion of the chair. Note that some P code change proposals may not be included on this list, as they are being heard by another committee.

2015 International Plumbing Code

Revise as follows:

SECTION 202 DEFINITIONS

BUILDING DRAIN. That part of the lowest piping of a drainage system that receives the discharge from soil, waste and other drainage pipes ~~inside and that extends 30 inches (762 mm) in *developed length* of pipe beyond the exterior walls of the building~~ and conveys the drainage to the *building sewer*.

Combined. A *building drain* that conveys both sewage and storm water or other drainage.

Sanitary. A *building drain* that conveys sewage only.

Storm. A *building drain* that conveys storm water or other drainage, but not sewage.

Reason: Most building sewer laterals are terminated 5 to 10 feet away from the building foundation prior to the foundation construction. This has caused some issues for contractors with regard to making the connection to the building sewer since the building sewer is inspected by the local sewer purveyor and typically requires an additional permit or additional inspections paid for when the piping could be extended from the building by the plumbing contractor. Additionally, this also creates some issues with regard to grease and oil interceptors.

Cost Impact: Will not increase the cost of construction
This is simply a change about where the building drainage pipe ends and other conenctions begin. Overall, there is not a change in the cost of construction as a pipe has to be run from A to B anyhow.

P 1-15 : 202-BUILDING DRAIN-RICHARDSON6018

P 2-15

202 (New)

Proponent: Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

2015 International Plumbing Code

Add new definition as follows:

SECTION 202 DEFINITIONS

CLEAR-WATER WASTE. A water discharge from equipment that is translucent and devoid of solids.

Reason: There are frequent arguments within the plumbing industry about what constitutes clear-water waste. Some believe that such waste water must be as clear as potable water while others believe that is much too severe of definition. The existing code sections that use the term clear-water waste are provided below. From the context of where the term is used in the code, it should be obvious that clear-water might not necessarily be transparent (like looking through window glass) but on the other hand, the water might be a little murky because of suspended solids. In other words, translucent. The intent of including "devoid of solids" is to identify applications where large particles floated along by the water will immediately drop out of the water. How big of solids are of concern? The allowance in Section 802.3 for not having to provide a strainer for clear-water wastes give a hint about the solids size that doesn't seem to be an issue.

Sections in the IPC that use the term "clear water waste:

709.4.1 Clear-water waste receptors. Where waste receptors such as floor drains, floor sinks and hub drains receive only clear-water waste from display cases, refrigerated display cases, ice bins, coolers and freezers, such receptors shall have a drainage fixture unit value of one-half.

801.1 Scope. This chapter shall govern matters concerning indirect waste piping and special wastes. This chapter shall further control matters concerning food-handling establishments, sterilizers, clear-water wastes, swimming pools, methods of providing air breaks or air gaps, and neutralizing devices for corrosive wastes.

802.1.3 Potable clear-water waste. Where devices and equipment, such as sterilizers and relief valves, discharge potable water to the building drainage system, the discharge shall be through an indirect waste pipe by means of an air gap.

802.1.5 Nonpotable clear-water waste. Where devices and equipment such as process tanks, filters, drips and boilers discharge nonpotable water to the building drainage system, the discharge shall be through an indirect waste pipe by means of an air break or an air gap.

802.2 Installation. Indirect waste piping shall discharge through an air gap or air break into a waste receptor. Waste receptors shall be trapped and vented and shall connect to the building drainage system. All indirect waste piping that exceeds 30 inches (762 mm) in developed length measured horizontally, or 54 inches (1372 mm) in total developed length, shall be trapped.

Exception: Where a waste receptor receives only clear-water waste and does not directly connect to a sanitary drainage system, the receptor shall not require a trap.

802.3 Waste receptors. For other than hub drains that receive only clear-water waste and standpipes, a removable strainer or basket shall cover the waste outlet of waste receptors. Waste receptors shall not be installed in concealed spaces. Waste receptors shall not be installed in plenums, crawl spaces, attics, interstitial spaces above ceilings and below floors. Ready access shall be provided to waste receptors.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes. This is PMGCAC Item 19.

Cost Impact: Will not increase the cost of construction
This proposal will not increase the cost of construction because no additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code.

202 (New)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IPC COMMITTEE. PART II WILL BE HEARD BY THE IRC-PLUMBING COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

Proponent: Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

Part I

2015 International Plumbing Code

Add new definition as follows:

SECTION 202 DEFINITIONS

<u>**FULL-OPEN VALVE** A water control or shut off component in the water supply system piping that, where adjusted for maximum flow, the flow path through the component's closure member is not a restriction in the component's through-flow area.</u>

Part II

2015 International Residential Code

Add new definition as follows:

SECTION 202 DEFINITIONS

<u>**FULL-OPEN VALVE.** A water control or shut off component in the water supply system piping that, where adjusted for maximum flow, the flow path through the component's closure member is not a restriction in the component's through-flow area.</u>

Reason: PART I: This phrase is used in various places in the code. In Section 606.1, there are a list of 7 locations where full-open valves are required. Many assumptions have been made as to what type of valve is intended. Many years ago before plastic water piping was installed, gate valves and ball valves were the only type that were available that were not globe valves. But many other types of valves for plastic piping are available that do not present a restriction when the valve is in the full-open position. This definition encompasses all type of valves that do not appreciably restrict the flow of water.
PART II: This phrase is used in several places in the code. In Sections P2903.9.1 and P2903.9.2, full-open valves are required. Many assumptions have been made as to what type of valve is intended. Many years ago before plastic water piping was installed, gate valves and ball valves were the only type that were available that were not globe valves. But many other types of valves for plastic piping are available that do not present a restriction when the valve is in the full-open position. This definition encompasses all type of valves that do not appreciably restrict the flow of water.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes. This is PMGCAC 196.

Cost Impact:

Part I: Will not increase the cost of construction
This proposal will not increase the cost of construction because no additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code.

Part II: Will not increase the cost of construction
This proposal will not increase the cost of construction because no additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code.

P 4-15

202

Proponent: James Richardson, Jr (jarichardson@columbus.gov)

2015 International Plumbing Code

Revise as follows:

SECTION 202 DEFINITIONS

HOT WATER. Water at a temperature greater than or equal to ~~110~~135°F (~~43~~57.2°C).

Reason: As pointed out in October 2013 vol.19 num.10 of PME magazine, Legionella bacteria has become and increased concern in the potable water distribution system, specifically hot water systems. The temperature typically maintained in a residential water heater is insufficient to kill the bacteria, even at long intervals (we typically see a temperature setting of 120 °F on residential and some small commercial occupancies). This temperature leaves the hot water tank at an optimum range for the bacteria to grow. As documented in This Week Community News August 8, 2013, Ohio experienced the largest outbreak in history, 39 confirmed cases including 6 deaths. Disinfection is achieved at 158 °F and above, however, I could not personally recommend setting temperatures at that level as it would present a very serious scald hazard and place the temperature at a level which would require a tempering device to be installed at any fixture which discharges water to the sanitary drainage system in order to comply with 803.1 of the 2011 OPC ("water above 140 degrees Fahrenheit shall not be discharged into any part of a drainage system"). Changing the definition of "hot water" to "Water at a temperature greater than or equal to 131°F (I recommend at least 135 °F.)" would at least place the temperature in a range that would be able to kill the bacteria in less than 6 hours of sustained temperature.
The current definition of "hot water" in the 2011 OPC is "Water at a temperature greater than or equal to 110°F (43°C)."

Additional benefits of changing the definition would require the installer to set the high limit stop on the ASSE 1016 devices to limit the hot water temperature to 120 degrees Fahrenheit as required by Ohio Plumbing Code section 423.3. Since the definition of "hot water" is 110 degrees and above, there is no requirement to set the high limit stop if they are setting the temperature between 110 – 120 degrees Fahrenheit at the water heater thermostat.

See also section 501.8 from the 2009 ICC International Plumbing Code & Commentary.

Also, in speaking with several water heater manufacturers' reps, storage type water heaters should be kept at 140 degrees Fahrenheit in order to provide an adequate supply of hot water to the building. They have indicated their sizing charts are based off of the 140 degree temperature, not 110 to 120

Bibliography: October 2013 vol.19 num.10 of PME magazine
This Week Community News August 8, 2013

Cost Impact: Will not increase the cost of construction
A change in a definition does not require more mateiral or labor to be expended.

P 5-15

202

Proponent: James Richardson, Jr (jarichardson@columbus.gov)

2015 International Plumbing Code

Revise as follows:

SECTION 202 DEFINITIONS

LOCAL VENT STACK. A vertical pipe to which connections are made from the fixture side of traps and through which vapor or foul air is removed from the fixture or device ~~utilized on bedpan washers~~.

Reason: Specifically mentioning bedpan washers leads people to think this section only applies to bed pan washer. There are other situations which typically would require the installation of a local vent stack such as interceptors and separators.

Cost Impact: Will not increase the cost of construction
This proposal just clarifies what a local vent stack is. No additional materials or labor is needed for a clarification.

P 5-15 : 202-LOCAL VENT STACK-RICHARDSON6019

P 6-15

202 (New)

Proponent: Curtis Dady, representing Viega, LLC (curtis.dady@viega.us)

2015 International Plumbing Code

Add new definition as follows:

SECTION 202 DEFINITIONS

PRESS-CONNECT JOINT. A permanent mechanical joint incorporating an elastomeric seal or an elastomeric seal and corrosion-resistant grip ring. The joint is made with a pressing tool and jaw or ring approved by the fitting manufacturer.

Reason: The IMC includes this definition but the IPC does not.

Cost Impact: Will not increase the cost of construction
It is simply the addition of a definition and has nothing to do with cost.

P 6-15 : 202-PRESS-CONNECT JOINT (New)-DADY3628

P 7-15

202

Proponent: Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

2015 International Plumbing Code

Delete without substitution:

~~SECTION 202 DEFINITIONS~~

~~**SWIMMING POOL**. Any structure, basin, chamber or tank containing an artificial body of water for swimming, diving or recreational bathing having a depth of 2 feet (610 mm) or more at any point.~~

Reason: There is no need for such a specific definition for a swimming pool within the context of how the term is used in the few places in the IPC. Water from a swimming pool is handled in the same manner no matter how a swimming pool is actually defined. And this definition conflicts with the definition of a swimming pool according to the International Swimming Pool and Spa Code.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes. This is PMGCAC Item 85.

Cost Impact: Will not increase the cost of construction
This proposal will not increase the cost of construction because no additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code.

P 7-15 : 202-SWIMMING POOL-SNYDER3914

P 8-15

303.4

Proponent: Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

2015 International Plumbing Code

Revise as follows:

303.4 Third-party certification. All plumbing products and materials required by the code to be in compliance with a referenced standard shall be listed by a third-party certification agency as complying with the referenced standards. Products and materials shall be identified in accordance with Section 303.1.

Reason: For the 2015 IRC, a proposal was submitted and approved that changed the IRC to clarify that only those materials that are required to comply with a reference standard in the code, are to be third party certified. When the change for required listing of components came about for the 2012 code code cycle for both the IRC and the IPC, it was not discovered that there was a potential for misinterpretation of this section until after the proposals for Group A codes (the IPC) were underway. The issue could only be addressed in the IRC.

The need for the rewording is this: Some interpreted this section that all plumbing products and materials had to be listed. That is, a third party agency had to evaluate every item used in the installation of a plumbing system. The problem is that a number of common items such as steel shield plates, thread seal tape, hanger strap, brackets for supporting pipes and many other similar items are not made to a standard that is referenced in the code. Listing such plumbing products to unknown criteria that is not indicated in the code is unnecessary and would only serve to increase the cost of construction without an improvement in the quality of construction. Where the code does find a need for materials to be of controlled quality, standards are brought into the code for those items and are thus required to be third party listed to prove that the manufacturer has complied with the standard.

This proposal is needed for consistency with the IRC.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes. This is PMCAC 144.

Cost Impact: Will not increase the cost of construction
This proposal will not increase the cost of construction because no additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code.

P 8-15 : 303.4-SNYDER3915

P 9-15

303.5 (New)

Proponent: Bill LeVan, Cast iron Soil Pipe Institute, representing Cast Iron Soil Pipe Institute (blevan@mindspring.com)

2015 International Plumbing Code

Add new text as follows:

303.5 Cast iron soil pipe, fittings and components Cast iron soil pipes and fittings, and the couplings used to join these products together, shall be third party listed and labeled. Third party certifiers or inspectors shall comply wih the minimum inspection requirements of Annex A or Annex A1 of the ASTM and CISPI product standards indicated in the code for such products.

Reason: Third Party inspections of manufacturers of cast iron soil pipes and fittings and the couplings used to join theses products together are required however not all third party inspectors are familair with these essential items which must be inspected to asure complaince. The ASTM and CISPI standards were modified adding the minimum requirements which are reasonable and to minimize manufacturing defects. The ASTM and CISPI committees worked closely wih third party certifiers to develop these inspection schemes.

Cost Impact: Will not increase the cost of construction
Improved inspection prodcedures at the manufacturing locations will reduce the amount of defects on jobsites before the instalaltion is begun and reduce the amount of time needed for instalaltion.

P 9-15 : 303.5 (New)-LEVAN4523

P 10-15

304.4, 304.5 (New), 504.6, 504.7.2

Proponent: Richard Avery, Self, representing Self (ravery59@gmail.com); Stephen Avery (smavery77@yahoo.com)

2015 International Plumbing Code

Revise as follows:

304.4 Openings <u>in structures</u> for pipes. *No change to text.*

<u>**304.5** **Opening in terminal end of pipes.** The terminal end of piping exiting a structure to the outside where the terminal end remains open as a vent or drain shall be rodent proofed to prevent crawling or flying insects, termites, birds, or other creatures from gaining unrestricted access to the interior of the structure and thereby weaken the structural integrity of the building, or disable pipes, fittings, components or equipment from their designed purpose. Likewise, the end of piping that terminates on the interior of the structure, but remains vulnerable to insects, termites, and other creatures that gain access to the inside of the structure through other means shall be rodent proofed in the same manner as above.</u>

504.6 Requirements for discharge piping. The discharge piping serving a pressure relief valve, temperature relief valve or combination thereof shall:

1. Not be directly connected to the drainage system.
2. Discharge through an *air gap* located in the same room as the water heater.
3. Not be smaller than the diameter of the outlet of the valve served and shall discharge full size to the *air gap*.
4. Serve a single relief device and shall not connect to piping serving any other relief device or equipment.
5. Discharge to the floor, to the pan serving the water heater or storage tank, to a waste receptor or to the outdoors.
6. Discharge in a manner that does not cause personal injury or structural damage.
7. Discharge to a termination point that is readily observable by the building occupants.
8. Not be trapped.
9. Be installed so as to flow by gravity.
10. Terminate not more than 6 inches (152 mm) above and not less than two times the discharge pipe diameter above the floor or *flood level rim* of the waste receptor.
11. Not have a threaded connection at the end of such piping.
12. Not have valves or tee fittings.
13. Be constructed of those materials listed in Section 605.4 or materials tested, rated and *approved* for such use in accordance with ASME A112.4.1.
14. <u>Be fitted with a nylon mesh sock or other suitable material that will allow water to drain from the line while preventing insects, termites, mud daubers, or other creatures from entering and clogging the discharge pipe and/or from disabling the temperature and pressure relief valve. Each opening in the mesh shall be no larger than 0.0165 inches (0.4191 mm or 419.1 microns, commonly reported as 420 microns), which corresponds to U.S. sieve size number 40.</u>

504.7.2 Pan drain termination. The pan drain shall extend full size and terminate over a suitably located indirect waste receptor or floor drain or extend to the exterior of the building and terminate not less than 6 inches (152 mm) and not more than 24 inches (610 mm) above the adjacent ground surface. <u>The terminal end of the pipe shall be covered with a nylon mesh sock or other suitable material that will allow water to drain from the line while preventing insects, termites, mud daubers, or other creatures from entering and clogging the discharge pipe and/or from gaining access to the interior frameworks and thereby weaken the structural integrity of the building, or further damage other pipes, fittings, components or equipment from their designed purpose. Each opening in the mesh shall be no larger than 0.0165 inches (0.4191 mm or 419.1 microns, commonly reported as 420 microns), which corresponds to U.S. sieve size number 40.</u> Where a pan drain was not previously installed, a pan drain shall not be required for a replacement water heater installation.

Reason: Hot water heaters and their associated components and drain lines present three areas of concern that are addressed in this proposal. All three areas are summarized below and further explained following the summaries:
This proposal seeks to prevent crawling and flying insects, termites, mud daubers, roaches, ants, rodents, and other creatures from:

1. disabling the water heater's temperature and pressure relief valve thus rendering the valve a danger to the occupants of the home or building and to the structure itself.

2. clogging the discharge pipes exiting from both the temperature and pressure relief valve and water heater pan drain.

3. gaining access to the interior of homes and buildings and thereby compromise the structural integrity of the home or building's internal frameworks.

Justification for each item above follows:

1. Watts Water Technologies, Inc., formerly known as Watts Regulator Company demonstrated the dangers inherent in overheated water tanks in 1939 by raising the water temperature inside the tank to excessive levels. In each case, the water tanks exploded with violent force and likewise destroyed the structures in which the tanks were housed. In one instance, a 30 gallon water tank heated to 297 degrees with 50 pounds of pressure exploded with 2 million foot pounds of energy. Watt's engineers calculated that the destructive force was equal to two pounds of dynamite. Watts concluded that "it is very essential that safety measures be adopted to require proper temperature and pressure relief protection for public safety" (Watts, 13:35). Later tests such as those conducted in 2007 by Adam Savage and Jamie Hyneman confirm the deadly combination of temperature and pressure buildup inside of a 52 gallon tank, which, upon exploding, sent out lethal shock waves at over one-hundred G forces. Both examples support the hypothesis that water heated to excessive temperature and subjected to pressure within a storage tank is a ticking time bomb with potentially deadly consequences to humans and devastating destruction to property. The lesson from experiments like those discussed here were accounted for in the inaugural edition of the International Plumbing Code (IPC) in that since its inception, the IPC requires that all water heaters be supplied with an approved temperature and pressure relief valve that complies with ANSI Z21.22, but the code does not further protect the valve from potential damage by insects, termites, and other creatures that can gain access to the T&P relief valve through the open end of the discharge pipe that, in many cases, terminates outside the home or structure. Care must be taken to prevent damage to or disabling of the temperature and pressure relief valve to avoid fatalities to people in homes and buildings and catastrophic consequences to ceilings, walls, and floors of structures.

2. Insects seeking shelter from the elements can clog the discharge line from the water heater pan drain or from the temperature and pressure relief valve by nest building activity. Of particular interest are those insects whose nest will not be washed away by exiting water through the discharge pipe when the line is in use. Dirt daubers are notorious creatures for building nests in unlikely places like in the air flow indictor of airplanes known as a pitot tube, which registers air speed as air passes through the tube. In one instance on a flight from the Dominican Republic to Frankfurt, Germany in February 1996, Birgenair Flight 301 crashed just minutes after takeoff when a blocked pitot tube indicated contradictory and incorrect airspeeds on the pilot and co-pilot's airspeed indicators, respectively. Attempts to reduce an erroneously high airspeed resulted in a stall that rolled the Boeing 757 upside down and into the Atlantic Ocean, killing 189 people on board: 176 passengers and 13 crew members. According to the Flight Safety Foundation report, a contributory cause of the crash was dirt from an insect that clogged the pitot tube while the aircraft was on the ground. An inspection of the pitot tube was not performed in the preflight procedures; therefore, the problem was not corrected prior to takeoff.

Researchers from the Coweeta Long Term Ecological Research Network in Otto, North Carolina, studied mud daubers and their preferences for substrate material. It seems that organ pipe mud daubers gravitate toward woody, rocky, or concrete substrates as the preferred material upon which to build a nest; however, 2.67% of nests were built on other types of substrates, including a light bulb, a chain, and electrical wire. The common link between pitot tubes, light bulbs, chains, and electrical wire is that all of these material environments include smooth substrates that, at first, might not appear to have the optimal texture to hold mud together, yet these persistent insects will build whenever and wherever opportunity and resources are available, including inside plastic or copper drain pipes. To date, the International Plumbing Code makes no provision for preventing insects and other creatures from inhabiting the discharge pipes from the water heater pan drain or from the temperature and pressure relief valve.

3. Dr. Ron Harrison, Entomologist and Technical Director for Orkin, Inc., states that "Termites are considered the top threat to wood-based structures, ahead of fire, flood and wind." According to Dan Suiter from the Entomology Department of the University of Georgia, "Termites are found in every state in the U.S., except Alaska." Further, the National Pest Management Association estimates that termites alone account for over $5 billion dollars in damages to homes and buildings. Termites are not just an American problem. Dr. Suiter goes on to say, "Out of the more than 2,000 termite species worldwide, only about 50 species can be found in the United States." The problem extends far beyond the boundaries of America into every major continent on the planet. Experts for the United Nations Environment Programme meeting at the Stockholm Convention indicate that termites are indigenous to Europe, mostly in the southern regions with warmer climates; most of Africa due to its diversity of warm, dry, and wet climates; ideal for different species of termites; Asia, and generally in China. The report adds that, "Termite distribution in China is restricted to the tropical, subtropical, and milder habitats south of the Yangtze River." Termites are also found on the Australian continent where "All termite ecological groups (subterranean, drywood, harvester, and mound builders) are represented . . ."

Whether entering through the discharge pipe leading to the temperature and pressure relief valve, or through the discharge pipe from the water heater pan drain, flying or crawling insects and other creatures must be stopped from gaining access to and damaging components, fittings, or equipment installed in the home or business, and, more importantly, from causing harm to people by disabling said components, fittings, and/or equipment. Likewise, the structural integrity of a home or business must be protected from damage by restricting access to the terminal end of pipes whether inside or outside the home or building. A nylon mesh sock of the type proposed here will allow water to drain from the discharge pipe while keeping out insects and other creatures that bring undesirable consequences to people, equipment, and structures. In the event of a small trickle of water, the pop-off sock will let water pass while protecting the terminal opening in the pipe. On the other hand, if the temperature and pressure relief valve opened, the sudden rush of water would cause the nylon mesh sock to pop-off the end of the pipe thus allowing an unrestricted flow of water to exit the full diameter of the discharge pipe. The attached images provide an illustration of the pop-off sock on and off a standard 3/4" CPVC elbow

. The sock in the attached images was hand sewn and offers a conceptual example of the form and function of the proposed idea

A professionally sewn sock by a textile manufacturer would be seamless and likely include a small amount of spandex material woven into the final product.

Cost Impact: Will increase the cost of construction

Estimates for the cost of using the pop-off sock have been calculated based upon a typical installation of a water heater with a 3/4" CPVC discharge pipe from the temperature and pressure relief valve, and a 1" PVC discharge pipe from the water heater pan drain. In both cases, it is assumed that the discharge piping terminates with a 90 degree elbow where the terminal end faces downward.

For the 3/4" CPVC discharge pipe, the terminal end of the elbow will require approximately 3 square inches of nylon mesh to cover the outside diameter of the opening up to the bend in the elbow nearest to the structure. {{3}} {{4}}

For the 1" PVC discharge pipe, the terminal end of the elbow will require approximately 7 square inches of nylon mesh to cover the outside diameter of the opening up to the bend in the elbow nearest to the structure.

Estimates for material costs vary by supplier; however, Industrial Netting in Minneapolis, MN quoted $5.00 for 864 square inches of woven nylon mesh (12" x 72").

Two-hundred eighty-eight (288) socks can be manufactured from 864 square inches of nylon mesh for the 3/4" CPVC elbow. {{1}}

One-hundred twenty-three (123) socks can be manufactured from 864 square inches of nylon mesh for the 1" PVC elbow.

The material to make one sock to cover the terminal end of a 3/4" CPVC elbow will cost approximately two cents. {{3}}

The material to make one sock to cover the terminal end of a 1" PVC elbow will cost approximately four cents.

Labor and other expenses to manufacture each sock will increase the end price; however, it seems reasonable that mass production on today's computerized machines will keep the retail cost of each sock at or below one dollar each; therefore, requiring the use of a pop-off sock on the terminal end of discharge pipes from the temperature and pressure relief valve and from the pan drain discharge line will increase the cost of construction by no more than two dollars.

P 10-15 : 304.4-AVERY3763

P 11-15

305.1

Proponent: Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

2015 International Plumbing Code

Revise as follows:

305.1 ~~Corrosion~~Protection against corrosion. ~~Pipes passing through~~Metallic piping, except for cast iron, ductile iron and galvanized steel, shall not be placed in direct contact with steel framing members, concrete or ~~cinder walls and floors or other~~masonry. Metallic piping shall not be placed in direct contact with corrosive ~~material~~soil. Where sheathing is used to prevent direct contact, the sheathing shall ~~be protected against external corrosion by~~have a ~~protective sheathing or wrapping or other means that will withstand any reaction from the lime and acid of concrete, cinder or other corrosive~~ material. ~~Sheathing or wrapping shall allow for movement including expansion and contraction of piping. The wall~~ thickness of ~~the material shall be~~ not less than ~~0.025~~0.008 inch (~~0.64~~8 mil) (0.203 mm) and the sheathing shall be made of plastic. Where sheathing protects piping that penetrates concrete or masonry walls or floors, the sheathing shall be installed in a manner that allows movement of the piping within the sheathing.

Reason: The 2015 IRC has this new language for this section. The IPC should be coordinated that confusion does not occur. There are no new requirements being proposed.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes. This is PMGCAC Item 152.

Cost Impact: Will not increase the cost of construction
This proposal will not increase the cost of construction because no additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code.

P 11-15 : 305.1-SNYDER3916

P 12-15

305.6

Proponent: Gary Kozan, CPD, Ridgeway Plumbing, representing Florida Association of Plumbing Heating Cooling Contractors (garyk@ridgewayplumbing.com)

2015 International Plumbing Code

Revise as follows:

305.6 Protection against physical damage. In concealed locations where piping, other than cast-iron or galvanized steel, is installed through holes or notches in studs, joists, rafters or similar members less than 1^{1} /~~2~~4 inches (~~38~~31.8 mm) from the nearest edge of the member, the pipe shall be protected by steel shield plates. Such shield plates shall have a thickness of not less than 0.0575 inch (1.463 mm) (No. 16 gage). Such plates shall cover the area of the pipe where the member is notched or bored, and shall extend not less than 2 inches (51 mm) above sole plates and below top plates.

Reason: The safest place to install water piping is in the middle of the wall. But in a typical 3-1/2 inch stud wall, even a 1/2-inch pipe (5/8-inch o.d.) ends up slightly nearer than the requisite 1-1/2 inch setback from either edge. Depending on enforcement, installers are often required to put stud guards on *both* sides of the stud. This makes no sense. By simply reducing the setback from 1-1/2 inches to 1-1/4 inches, both 1/2-inch and 3/4-inch water lines can be safely installed in the center of the wall without triggering the need for strike plates on both sides. This encourages quality workmanship instead of penalizing it. The pipes are still safely out of range of drywall screws up to 1-1/2 inches long.
This proposal is consistent with the National Electrical Code, which specifies a 1-1/4 inch setback from the edge of a stud. It is also consistent with the IRC, which also specifies a 1-1/4 inch setback. The Uniform Plumbing Code requires only a 1-inch setback. This proposal will bring consistency to the I-Codes.

Cost Impact: Will not increase the cost of construction
A typical 3" x 6" metal stud guard costs about 20 cents. This proposal would reduce the quantity of stud guards on any given project by about 15-20%, depending on local enforcement.

P 12-15 : 305.6-KOZAN3474

P 13-15

306.2.4 (New)

Proponent: Brian Conner, Charlotte Pipe and Foundry, representing Charlotte Pipe and Foundry (bconner@charlottepipe.com)

2015 International Plumbing Code

Add new text as follows:

306.2.4 **Plastic sewer and DWV piping installation.** Plastic sewer piping and DWV piping installed underground shall be installed in accordance with the manufacturer's instructions. Trench width shall be controlled to not exceed either the pipe outside diameter plus 16 inches (406 mm) or the pipe outside diameter multiplied by 1.25 plus 12 inches (305 mm), whichever is greater. The piping shall be bedded in 4 inches of granular fill and then backfilled compacting the side fill in 6 inch layers on each side of the piping. The compaction shall be to a minimum of 85 percent standard Proctor density and extend to a minimum of 6 inches above the top of the pipe.

Reason: Plastic sewer and DWV piping manufacturers require that the plastic pipe be installed in accordance with ASTM D2321 but installers and inspectors in the field seldom have the standard readily available and might not be aware of the requirement. The minimum requirements are contained in this code change and provide guidance to the installer and the inspector. Improperly installing plastic piping can result in over deflection of the piping and result in leaks allowing the waste water to contaminate the soil and allowing groundwater to enter the piping causing the waste water treatment plants to treat rainwater.

Cost Impact: Will not increase the cost of construction
No additional cost of this code change is expected. Savings in treatment costs by waste water plants is likely.

P 13-15 : 306.2.4 (New)-CONNER5392

P 14-15

307.1, 307.2, 307.2.1 (New), 307.2.2 (New), 307.2.3 (New), 307.2.4 (New), 307.5 (New), 307.5.1 (New), 307.5.2 (New), 307.5.3 (New)

Proponent: James Richardson, Jr (jarichardson@columbus.gov)

2015 International Plumbing Code

Revise as follows:

307.1 General. ~~In~~The building or structure shall not be weakened by the installation of mechanical systems. Where floors, walls, ceilings or any other portion of the building or structure are required to be altered or replaced in the process of installing or repairing any ~~part of a plumbing and drainage installation~~system, ~~the finished floors, walls, ceilings, tile work or any other part of~~ the building or ~~premises that must be changed or replaced~~structure shall be left in a safe structural condition in accordance with the ~~requirements of the *International Building Code.*~~building code.

307.2 Cutting, notching or bored holes. ~~A~~The cutting, notching and boring of wood framing ~~member~~members shall ~~not be cut, notched or bored in excess of limitations specified in the *International Building Code.*~~comply with Sections 307.2.1 through 307.2.4.

Add new text as follows:

307.2.1 Joist notching. Notches on the ends of joists shall not exceed one-fourth the joist depth. Holes bored in joists shall not be within 2 inches (51 mm) of the top or bottom of the joist, and the diameter of any such hole shall not exceed one third the depth of the joist. Notches in the top or bottom of joists shall not exceed one-sixth the depth and shall not be located in the middle third of the span.

307.2.2 Stud cutting and notching. In exterior walls and bearing partitions, a wood stud shall not be cut or notched in exesss of 25 percent of its depth. In nonbearing partitions that do not support loads other than the weight of the partition, a stud shall not be cut or notched in excess of 40 percent of its depth.

307.2.3 Bored holes. The diameter of bored holes in wood studs shall not exceed 40 percent of the stud depth. The diameter of bored holes in wood studs shall not exceed 60 percent of the stud depth in nonbearing partitions. The diameter of bored holes in wood studs shall not exceed 60 percent of the stud depth in any wall where each stud is doubled, provided that not more than two such successive doubled studs are so bored. The edge of the bored hole shall be not closer than 5 /8 inch (15.9 mm) to the edge of the stud. Bored holes shall be not located at the same section of stud as a cut or notch.

307.2.4 Engineered wood products. Cuts, notches and holes bored in trusses, structural composite veneer lumber, structural glue-laminated members and I-joists are prohibited except where permitted by the manufacturer's recommendations or where the effects of such alterations are specifically considered in the design of the member.

307.5 Cutting, notching and boring in steel framing. The cutting, notching and boring of steel framing members shall comply with Sections 307.5.1 through 307.5.3.

307.5.1 Cutting, notching and boring holes in structural steel framing. The cutting, notching and boring of holes in structural steel framing members shall be as prescribed by the registered design professional.

307.5.2 Cutting, notching and boring holes in cold-formed steel framing. Flanges and lips of load-bearing cold-formed steel framing members shall not be cut or notched. Holes in webs of load-bearing cold-formed steel framing members shall be permitted along the centerline of the web of the framing member and shall not exceed the dimensional limitations, penetration spacing or minimum hole edge distance as prescribed by the registered design professional. Cutting, notching and boring holes of steel floor/roof decking shall be as prescribed by the registered design professional.

307.5.3 Cutting, notching and boring holes in nonstructural cold-formed steel Flanges and lips of nonstructural cold-formed steel wall studs shall not be cut or notched. Holes in webs of nonstructural cold-formed steel wall studs shall be permitted along the centerline of the web of the framing member, shall not exceed 11/2 inches (38 mm) in width or 4 inches (102 mm) in length, and shall not be spaced less than 24 inches (610 mm) center to center from another hole or less than 10 inches (254 mm) from the bearing end.

Reason: Many States only adopt the ICC plumbing code and have their own building code or within States there are areas which are inspected by Health Departments not Building Departments. In these cases, the contractors and/or inspectors may or may not have the appropriate building code for reference concerning structural safety. The mechanical code includes the references and keeping it in the plumbing code would keep them more in line with each other.

Cost Impact: Will not increase the cost of construction
The International Building Code already has these limitations and requirements. Putting the information in the IPC is a necessity for those jurisdictions that do not adopt the IBC but never the less, should have been already following these requirements.

P 14-15 : 307.1-RICHARDSON6021

P 15-15

Part I:
308.10 (New)
Part II:
P2605.2 (New)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IPC COMMITTEE. PART II WILL BE HEARD BY THE IRC-PLUMBING COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

Proponent: Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

Part I

2015 International Plumbing Code

Add new text as follows:

308.10 Thermal expansion tanks. A thermal expansion tank shall not be supported by the piping that connects to the thermal expansion tank.

Part II

2015 International Residential Code

Add new text as follows:

P2605.2 Thermal expansion tanks. A thermal expansion tank shall not be supported by the piping that connects to the thermal expansion tank.

Reason: Too often, inspectors see thermal expansion tanks hanging on the piping that the tank connects to. Even the smallest size of tank could weigh up to 16 pounds when full of water. where these tanks are installed at the end of a horizontal rigid pipe from the side outlet of a tee, there is significant moment being applied to the piping. Larger tanks or longer pipes result in bigger moments. And perhaps a significant "moment" when the pipe cracks or breaks off. Although the this proposed section started off trying to identify where it was OK to support the tank from the piping, the realization was made that it would be easiest to just not have the piping support the tank. Strap the tank to the building structure or the water heater tank, or place the tank on top of the water heater where it will not be disturbed (and hopefully not exposed to heat from a nearby flue of a gas water heater.)
This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes. This is PMGCAC Item 36.

Cost Impact:

Part I: Will not increase the cost of construction
This proposal will not increase the cost of construction because no additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code.

Part II: Will not increase the cost of construction
This proposal will not increase the cost of construction because no additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code.

P 15-15 : 308.10 (New)-SNYDER3925

P 16-15

Table 308.5

Proponent: Mike Cudahy, representing Plastic Pipe and Fittings Association (mikec@cmservnet.com)

2015 International Plumbing Code

Revise as follows:

TABLE 308.5
HANGER SPACING

PIPING MATERIAL	MAXIMUM HORIZONTAL SPACING (feet)	MAXIMUM VERTICAL SPACING (feet)
Cross-linked polyethylene (PEX) pipe 1 inch and smaller	2.67 (32 inches)	10[b]
Cross-linked polyethylene (PEX) pipe 1 1/4 inch and larger	4	10b
Polyethylene of raised temperature (PE-RT) pipe 1 inch and smaller	2.67 (32 inches)	10[b]
Polyethylene of raised temperature (PE-RT) pipe 1 1/4 inch and larger	4	10b

(Portions of table not shown remain unchanged)

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm.

a. The maximum horizontal spacing of cast-iron pipe hangers shall be increased to 10 feet where 10-foot lengths of pipe are installed.

b. For sizes 2 inches and smaller, a guide shall be installed midway between required vertical supports. Such guides shall prevent pipe movement in a direction perpendicular to the axis of the pipe

Reason: The 2015 code cycle for the IRC included updates to the support spacing for both PEX and PE-RT tubing for sizes larger than 1". The IRC-P Table P2605.1 is current and correct and should be used as the base template for all other tables within the ICC codes as identified in this amendment proposal. The horizontal support spacing for both PEX and PE-RT tubing (piping) up to and including 1" size is 32" (2-2/3Ft) and 48" (4Ft) for sizes 1- 1/4" and larger. These dimensions are consistent with all published PEX literature and manufacture's installation instructions.

Cost Impact: Will not increase the cost of construction
This proposal modifies the spacing for piping material support into the code and thus the code with this proposal added will not cause the cost of construction to increase, and could decrease the cost as less support is required for larger pipe.

P 16-15 : T308.5-CUDAHY4741

P 17-15

Proponent: Pennie L Feehan, representing Copper Development Association (penniefeehan@me.com)

2015 International Plumbing Code

Revise as follows:

TABLE 308.5
HANGER SPACING

PIPING MATERIAL	MAXIMUM HORIZONTAL SPACING (feet)	MAXIMUM VERTICAL SPACING (feet)
~~Brass pipe~~	~~10~~	~~10~~
Copper or copper-alloy pipe and tubing	~~12~~ 8	10
~~Copper or copper-alloy tubing, 1 1/4-inch diameter and smaller~~	~~6~~	~~10~~
~~Copper or copper-alloy tubing, 1 1/2-inch diameter and larger~~	~~10~~	~~10~~

(Portions of table not shown remain unchanged)

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm.

a. The maximum horizontal spacing of cast-iron pipe hangers shall be increased to 10 feet where 10-foot lengths of pipe are installed.

b. For sizes 2 inches and smaller, a guide shall be installed midway between required vertical supports. Such guides shall prevent pipe movement in a direction perpendicular to the axis of the pipe

Reason: Brass is a copper alloy and the supporting requirements are covered under the Copper and Copper Alloy Pipe and Tubing line. The 6 foot requirement is to restrictive. The Copper Tubing Handbook written by Copper Development Association recommends horizontal support every 8 feet.

Cost Impact: Will not increase the cost of construction
This proposal wil not increase the cost of construction as this is only a clarification in the name of a product

P 17-15 : T308.5-FEEHAN3788

P 18-15

Table 308.5

Proponent: Larry Gill, representing IPEX USA LLC (larry.gill@ipexna.com)

2015 International Plumbing Code

Revise as follows:

TABLE 308.5
HANGER SPACING

PIPING MATERIAL	MAXIMUM HORIZONTAL SPACING (feet)	MAXIMUM VERTICAL SPACING (feet)
Polyethylene of raised temperature (PE-RT) pipe 1" and less	2.67 (32 inches)	10[b]
Polyethylene of raised temperature (PE-RT) pipe 1 1/4" and greater	4 (48 inches)	10[b]

(Portions of table not shown remain unchanged)

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm.

a. The maximum horizontal spacing of cast-iron pipe hangers shall be increased to 10 feet where 10-foot lengths of pipe are installed.

b. For sizes 2 inches and smaller, a guide shall be installed midway between required vertical supports. Such guides shall prevent pipe movement in a direction perpendicular to the axis of the pipe

Reason: PE-RT 1-1/4 inches and greater can be supported at 48 inches. The 48 inch support spacing is already in the 2015 IMC.

Cost Impact: Will not increase the cost of construction
This is a simple change to add support spacing requirements of 4 feet for larger PE-RT sizes and the change will result in less supports and a cost savings without compromising the integrity of the installation.

P2605.1

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IPC COMMITTEE. PART II WILL BE HEARD BY THE IRC-PLUMBING COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

Proponent: Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

Part I

2015 International Plumbing Code

Revise as follows:

308.6 Sway bracing. ~~Rigid support sway bracing shall be provided at~~Where horizontal pipes 4 inches (102 mm) and larger convey drainage or waste, and where a pipe fitting changes ~~in~~the flow direction greater than 45 degrees (0.79 rad) ~~for~~, rigid bracing or other rigid support arrangements shall be installed to resist movement of the upstream pipe ~~sizes 4 inches (102 mm) and larger.~~in a direction opposite the pipe flow. A change of flow direction into a vertical pipe shall not require the upstream pipe to be braced.

Part II

2015 International Residential Code

Revise as follows:

P2605.1 General. Piping shall be supported in accordance with the following:

1. Piping shall be supported to ensure alignment and prevent sagging, and allow movement associated with the expansion and contraction of the piping system.
2. Piping in the ground shall be laid on a firm bed for its entire length, except where support is otherwise provided.
3. Hangers and anchors shall be of sufficient strength to maintain their proportional share of the weight of pipe and contents and of sufficient width to prevent distortion to the pipe. Hangers and strapping shall be of *approved* material that will not promote galvanic action. ~~Rigid support sway bracing shall be provided at~~
4. Where horizontal pipes 4 inches (102 mm) and larger convey drainage or waste, and where a pipe fitting changes ~~in~~the flow direction greater than 45 degrees (0.79 rad) ~~for~~, rigid bracing or other rigid support arrangements shall be installed to resist movement of the upstream pipe ~~sizes 4 inches (102 mm) and larger~~in a direction opposite the pipe flow. A change of flow direction into a vertical pipe shall not require the upstream pipe to be braced.
5. Piping shall be supported at distances not to exceed those indicated in Table P2605.1.

Reason: PART I: The requirements of this section are vague enough such that several contractors working large projects have been "caught" mid-project not knowing exactly what the code was requiring. This section is about preventing undue stress on the joints in a drainage piping system. It is known that drainage piping systems can be moved about by "slugs" of waste hitting 90 degree bends in the piping where the pipe downstream is "horizontal". Where the pipe downstream of the elbow is no longer "horizontal", that is, 45 degrees or greater from the horizontal plane, the waste is falling and is less likely to impact the inside of the elbow and therefore, not impart significant forces that would cause the piping system to move.

PART II: The requirements of this section are vague enough such that several contractors working large projects (under the IPC) have been "caught" mid-project not knowing exactly what the code was requiring. Certainly, the same situation could occur for contractors working on large IRC buildings. The same clarification proposal has been proposed for the IPC so for coordination, it is proposed to this code.

This section is about preventing undue stress on the joints in a drainage piping system. It is known that drainage piping systems can be moved about by "slugs" of waste hitting 90 degree bends in the piping where the pipe downstream is "horizontal". Where the pipe downstream of the elbow is no longer "horizontal", that is, 45 degrees or greater from the horizontal plane, the waste is falling and is less likely to impact the inside of the elbow and therefore, not impart significant forces that would cause the piping system to move.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes. This is PMGCAC Item 120.

Cost Impact:

Part I: Will not increase the cost of construction
This proposal will not increase the cost of construction because no additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code.

Part II: Will not increase the cost of construction
This proposal will not increase the cost of construction because no additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code.

P 19-15 : 308.6-SNYDER3918

P 20-15

Part I:
312.1

P2503.7

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IPC COMMITTEE. PART II WILL BE HEARD BY THE IRC PLUMBING COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

Proponent: Mike Cudahy, representing Plastic Pipe and Fittings Association (mikec@cmservnet.com)

Part I

2015 International Plumbing Code

Revise as follows:

312.1 Required tests. The permit holder shall make the applicable tests prescribed in Sections 312.2 through 312.10 to determine compliance with the provisions of this code. The permit holder shall give reasonable advance notice to the code official when the plumbing work is ready for tests. The equipment, material, power and labor necessary for the inspection and test shall be furnished by the permit holder and he or she shall be responsible for determining that the work will withstand the test pressure prescribed in the following tests. All plumbing system piping shall be tested with either water or, for piping systems other than plastic, by air. After the plumbing fixtures have been set and their traps filled with water, the entire drainage system shall be submitted to final tests. The code official shall require the removal of any cleanouts if necessary to ascertain whether the pressure has reached all parts of the system.

> **Exception:** For plastic piping systems, testing with a compressed gas shall be an alternative to hydrostatic testing where compressed air or other gas pressure testing is specifically authorized by all of the manufacturer's instructions for the plastic pipe and fittings products installed at the time the system is being tested, and compressed air or other gas testing is not otherwise prohibited by applicable codes, laws, or regulations outside of this code.

Part II

2015 International Residential Code

Revise as follows:

P2503.7 Water-supply system testing. Upon completion of the water-supply system or a section of it, the system or portion completed shall be tested and proved tight under a water pressure of not less than the working pressure of the system or, for piping systems other than plastic, by an air test of not less than 50 psi (345 kPa). This pressure shall be held for not less than 15 minutes. The water used for tests shall be obtained from a potable water source.

> **Exception:** For plastic piping systems, testing with a compressed gas shall be an alternative to hydrostatic testing where compressed air or other gas pressure testing is specifically authorized by all of the manufacturer's instructions for the plastic pipe and fittings products installed at the time the system is being tested, and compressed air or other gas testing is not otherwise prohibited by applicable codes, laws, or regulations outside of this code.

Reason: PPFA has a new air testing policy, which allows for some limited air testing of plastic piping systems, if a number of conditions are met.

Bibliography:

Part II: PLASTIC PIPE AND FITTINGS ASSOCIATION POLICY ON TESTING PLASTIC PIPE AND FITTINGS INSTALLATIONS WITH COMPRESSED GAS, PPFA, 2014, http://www.ppfahome.org/ub4.aspx

Compressed air or any other compressed gases should not be used for pressure testing plastic plumbing systems.

EXCEPTIONS:

1.) With trap seal pull testing, where a completed DWV system is vacuum tested with all of its traps filled with water, and the trap seals are tested with a vacuum typically between one and two inches of water column.

2.) For plastic piping systems specifically designed for use with compressed air or gasses;

• Manufacturers' instructions must be strictly followed for installation, visual inspection, testing and use of the systems,

(and)

• Compressed air or other gas testing is not prohibited by the authority having jurisdiction (AHJ).

3.) When compressed air or other gas pressure testing is specifically authorized by the applicable written instructions of the manufacturers of all plastic pipe and plastic pipe fittings products installed at the time the system is being tested and compressed air or other gas testing is not prohibited by the authority having jurisdiction (AHJ).

The manufacturer should be contacted if there is any doubt as to how a specific system should be tested.

Cost Impact:

Part II: Will not increase the cost of construction
This proposal simply adds another option for air testing some specific piping materials into the code and as such, the option is not requiring that this method be chosen. Thus the code with this proposal added will not cause the cost of construction to increase.

P 20-15 : 312.1-CUDAHY4674

P 21-15

312.1.1, 312.1.2 (New), 312.5.1 (New), 107.4.1.1 (New)

Proponent: Ronald George, Self; www.ScaldPrevention.org, representing Self; www.ScaldPrevention.org (Ron@Plumb-TechLLC.com)

2015 International Plumbing Code

Revise as follows:

312.1.1 ~~Test~~Pressure test gauges. Gauges used for pressure testing shall be as follows:

1. Tests requiring a pressure of 10 pounds per square inch (psi) (69 kPa) or less shall utilize a testing gauge having increments of 0.10 psi (0.69 kPa) or less.
2. Tests requiring a pressure of greater than 10 psi (69 kPa) but less than or equal to 100 psi (689 kPa) shall utilize a testing gauge having increments of 1 psi (6.9 kPa) or less.
3. Tests requiring a pressure of greater than 100 psi (689 kPa) shall utilize a testing gauge having increments of 2 psi (14 kPa) or less.

Add new text as follows:

312.1.2 Temperature test gauges. Temperature gauges shall have a range of 32°F to 220°F (0°C to 104.4°C). The accuracy of gauges shall be ±2°F (1.1°C).

312.5.1 Maximum hot water temperature tests. Upon completion of the hot water system and installation of the water heater, the water heater shall be turned on and set to the design operating temperature. The water heater shall be allowed to heat up until the water heater burner or heating elements shut off. The hot or tempered water temperature discharged at each plumbing fixture required by Chapter 4 to have a limit on the maximum water temperature, shall be verified that the temperature does not exceed the limits.

107.4.1.1 Hot or tempered water temperature testing. Altered, extended or repaired systems that affect the hot or tempered water temperatures at plumbing fixtures shall have the water temperature tested as prescribed herein to disclose excessive water temperatures.

Reason: This code change is intended to address testing of the maximum temperature limiting ddevices on fixtures like showers and tub/shower combination valves, whirlpool bathtubs and other fixtures with temperature limits to prevent scalding when water heaters are originally installed or replaced. Checking the temperature and readjustment of the limit stops should also be done after a master thermostatic mixing valve has been adjusted to a new temperature.

P 22-15

312.2

Proponent: Gary Kozan, CPD, Ridgeway Plumbing, representing Florida Association of Plumbing Heating Cooling Contractors (garyk@ridgewayplumbing.com)

2015 International Plumbing Code

Revise as follows:

312.2 Drainage and vent water test. A water test shall be applied to the drainage system either in its entirety or in sections. If applied to the entire system, all openings in the piping shall be tightly closed, except the highest opening, and the system shall be filled with water to the point of overflow. If the system is tested in sections, each opening shall be tightly plugged except the highest openings of the section under test, and each section shall be filled with water, but no section shall be tested with less than a ~~10-foot~~5-foot (3048 mm) head of water. In testing successive sections, at least the upper ~~10~~5 feet (~~3048~~1524 mm) of the next preceding section shall be tested so that no joint or pipe in the building, except the uppermost ~~10~~5 feet (~~3048~~1524 mm) of the system, shall have been submitted to a test of less than a ~~10-foot~~5-foot (~~3048~~1524 mm) head of water. This pressure shall be held for not less than 15 minutes. The system shall then be tight at all points.

Reason: When testing a DWV system, the actual head pressure applied is not nearly as important as the ability to see the water in the stack. 10-foot head tests are typically verified by the inspector just "shaking the stack." If water splashes out, the system is considered to be watertight , even though it may not be. Mirrors and ladders are seldom used in the real world. By lowering the fill stack to 5 feet, both the installer and the inspector can visually verify the water level, and see if the system is holding tight.
There is nothing magical about a 10-foot head. The plain truth is that a 10-foot head (4.34 psi) is unilkely to reveal any leaks or defects that would not be detected with a 5-foot head (2.17 psi). Many jurisdictions throughout the country regard the 5-foot head test as equal or better because you can actually see if the water level drops. Florida, for example, offically adopted the 5-foot head test statewide in 2000. It was likewise approved in the 2015 IRC. It is time for the IPC also to recognize this proven common sense practice, and bring consistency to the I-Codes.

Cost Impact: Will not increase the cost of construction
Reducing the fill stack from 10 feet to 5 feet will have no cost impact whatsover.

P 22-15 : 312.2-KOZAN3479

P 23-15

312.2

Proponent: Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

2015 International Plumbing Code

Revise as follows:

312.2 Drainage and vent water test. A water test shall be applied to the drainage system either in its entirety or in sections. If applied to the entire system, all openings in the piping shall be tightly closed, except the highest opening, and the system shall be filled with water to the point of overflow. If the system is tested in sections, each opening shall be tightly plugged except the highest openings of the section under test, and each section shall be filled with water, but no section shall be tested with less than a ~~10-foot~~5-foot (~~3048~~1524 mm) head of water. In testing successive sections, at least the upper ~~10 feet~~5-foot (~~3048~~1524 mm) of the next preceding section shall be tested so that no joint or pipe in the building, except the uppermost ~~10 feet~~5-foot (~~3048~~1524 mm) of the system, shall have been submitted to a test of less than a ~~10-foot~~5-foot (~~3048~~1524 mm) head of water. This pressure shall be held for not less than 15 minutes. The system shall then be tight at all points.

Reason: In the last cycle, the IRC was changed to reduce the DWV water test pressure from 10 feet of head to 5 feet of head. This change to the IPC is to coordinate the IPC with the IRC. There was not a companion proposal in the last cycle for changing the IPC. This is the first time that this is being proposed for the IPC.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes. This is PMGCAC Item 16.

Cost Impact: Will not increase the cost of construction
This proposal will not increase the cost of construction because no additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code.

P 23-15 : 312.2-SNYDER3928

P 24-15

312.6

Proponent: Gary Kozan, CPD, Ridgeway Plumbing, representing Florida Association of Plumbing Heating Cooling Contractors (garyk@ridgewayplumbing.com)

2015 International Plumbing Code

Revise as follows:

312.6 Gravity sewer test. Gravity *sewer* tests shall consist of plugging the end of the *building sewer* at the point of connection with the public sewer, completely filling the *building sewer* with water from the lowest to the highest point thereof, ~~testing with not less than a 10-foot (3048 mm) head of water~~ and maintaining such pressure for 15 minutes. The building sewer shall be watertight at all points.

Reason: Subjecting a gravity sewer to a 10-foot head test is outdated and impractical. By the time the building sewer is connected, fixtures have usually been installed, so both ends have to be plugged off before testing in order to protect the building from flooding. Leaks on gravity sewers are rare, considering that most today are constructed with plastic pipe and contain few fittings and joints. Simply filling the sewer with water is sufficient to identify any leaks. It should be noted that public sewer mains and branch laterals downstream of the building sewer are not water tested at all.

This testing method is identical to that found in the other model code (UPC), used in many states. Florida adopted similar requirements in 2000. It is time that the IPC recognizes this proven practice and bring the codes closer together.

Bibliography: 2012 Uniform Plumbing Code:
723.0 Building Sewer Test

723.1 General. Building sewers shall be tested by plugging the end of the building sewer at its points of connection with the public sewer or private sewage disposal system and ***completely filling the building sewer with water from the lowest to the highest point thereof*** (emphasis added), or by approved equivalent low-pressure air test. Plastic DWV piping systems shall not be tested by the air test method. The building sewer shall be watertight.

2010 Florida Building Code - Plumbing:

312.6 Gravity sewer test. Gravity sewer tests shall consist of plugging the end of the building sewer with water at the point of connection with the public sewer, ***completely filling the building sewer with water from the lowest to the highest point thereof*** (emphasis added), and maintaining such pressure for 15 minutes. The building sewer shall be watertight at all points.

Cost Impact: Will not increase the cost of construction
Reducing the head test for gravity sewers will shorten the length of the fill stack, and eliminate the need for additional test fittings, test balls, and labor to plug off the upper end of the sewer. This should translate to a modest reduction in cost of approx. $20 - $40 per sewer test.

P 24-15 : 312.6-KOZAN3452

P 25-15

312.10.1

Proponent: Michael Anthony, University of Michigan, representing University of Michigan (maanthon@umich.edu)

2015 International Plumbing Code

Revise as follows:

312.10.1 Inspections. ~~Annual~~Periodic inspections shall be made of all backflow prevention assemblies and *air gaps* to determine whether ~~they~~the assemblies are operable and the air gaps exist. The inspection intervals shall be determined by an approved reliability-centered inspection, testing and maintenance program or, in absence of such a program, inspections shall occur annually.

Reason:

We are over-testing on annual fixed interval testing in some installations and under-testing in others. Reliability centered maintenance is a method used by the airline industry and the military to use resources wisely. Large research universities such as ours prioritize our testing according to hazard and sometimes exceed minimum levels set by the host municipality. In other installations our testing records show that testing intervals should be relaxed in order to reduce maintenance-induced failures.

Utilizing Reliability Centered Maintenance - RCM- principles makes it possible for the process to be data-driven, rather than utilizing an arbitrary prescriptive testing interval, which may result in over-testing. RCM analyzes the failure modes and the mean time between failures. This improvement to the code allows us to present the results of this analysis, along with proposed optimized testing intervals to the ASJ.

Bibliography: Reliability Centered Maintenance:
https://en.wikipedia.org/wiki/Reliability_centered_maintenance

It is generally used to achieve improvements in fields such as the establishment of safe minimum levels of maintenance, changes to operating procedures and strategies and the establishment of capital maintenance regimes and plans. Successful implementation of RCM will lead to increase in cost effectiveness, machine uptime, and a greater understanding of the level of risk that the organization is managing.

The late John Moubray, in his industry leading book RCM2, characterized Reliability-centered Maintenance as a process to establish the safe minimum levels of maintenance. This description echoed statements in the Nowlan and Heap report from United Airlines.

It is defined by the technical standard SAE JA1011, Evaluation Criteria for RCM Processes, which sets out the minimum criteria that any process should meet before it can be called RCM. This starts with the 7 questions below, worked through in the order that they are listed:

1. What is the item supposed to do and its associated performance standards?
2. In what ways can it fail to provide the required functions?
3. What are the events that cause each failure?
4. What happens when each failure occurs?
5. In what way does each failure matter?
6. What systematic task can be performed proactively to prevent, or to diminish to a satisfactory degree, the consequences of the failure?
7. What must be done if a suitable preventive task cannot be found?

Reliability centered maintenance is an engineering framework that enables the definition of a complete maintenance regime. It regards maintenance as the means to maintain the functions a user may require of machinery in a defined operating context. As a discipline it enables machinery stakeholders to monitor, assess, predict and generally understand the working of their physical assets. This is embodied in the initial part of the RCM process which is to identify the operating context of the machinery, and write a Failure Mode Effects and Criticality Analysis (FMECA). The second part of the analysis is to apply the "RCM logic", which helps determine the appropriate maintenance tasks for the identified failure modes in the FMECA. Once the logic is complete for all elements in the FMECA, the resulting list of maintenance is "packaged", so that the periodicities of the tasks are rationalised to be called up in work packages; it is important not to destroy the applicability of maintenance in this phase. Lastly, RCM is kept live throughout the "in-service" life of machinery, where the effectiveness of the maintenance is kept under constant review and adjusted in light of the experience gained.

RCM can be used to create a cost-effective maintenance strategy to address dominant causes of equipment failure. It is a systematic approach to defining a routine maintenance program composed of cost-effective tasks that preserve important functions.

The important functions (of a piece of equipment) to preserve with routine maintenance are identified, their dominant failure modes and causes determined and the consequences of failure ascertained. Levels of criticality are assigned to the consequences of failure. Some functions are not critical and are left to "run to failure" while other functions must be preserved at all cost. Maintenance tasks are selected that address the dominant failure causes. This process directly addresses maintenance preventable failures. Failures caused by unlikely events, non-predictable acts of nature, etc. will usually receive no action provided their risk (combination of severity and frequency) is trivial (or at least tolerable). When the risk of such failures is very high, RCM encourages (and sometimes mandates) the user to consider changing something which will reduce the risk to a tolerable level.

The result is a maintenance program that focuses scarce economic resources on those items that would cause the most disruption if they were to fail.

RCM emphasizes the use of Predictive Maintenance (PdM) techniques in addition to traditional preventive measures.

Cost Impact: Will not increase the cost of construction
Likely less, because IT&M costs will be rationalized so that our testing costs are applied proportionate to the risk. Large research universities such as ours prioritize our testing according to hazard and sometimes exceed minimum levels set by the host municipality. In other installations our testing records show that testing intervals should be relaxed in order to reduce maintenance-induced failures.

Reason: When Chapter 4 was originally laid out, the concept was to have the fixture categories in alphabetical order after the section on Installation of Fixtures. This was simply to make the code easier to use. Someone not as familiar with the code could find the section on a particular fixture. Over the years, newer section were added and placed at the end of the chapter. This change merely reorganizes the chapter into a listing of fixtures in alphabetical order.

The only substantial change to the listing is the striking of the word "other" before fixture fittings. The section addresses faucets and fixture fittings. There is no "other" fixture fittings.

Cost Impact: Will not increase the cost of construction
There is no cost impact by renumbering code sections for clarity.

Table 403.1 (IBC Table 2902.1)

Proponent: David Kulina, representing Engel Architects (david@engelarch.com)

2015 International Plumbing Code

Revise as follows:

TABLE 403.1
MINIMUM NUMBER OF REQUIRED PLUMBING FIXTURES[a] (See Sections 403.1.1 and 403.2)

NO.	CLASSIFICATION	OCCUPANCY	DESCRIPTION	WATER CLOSETS (URINALS: SEE SECTION 419.2) MALE	WATER CLOSETS (URINALS: SEE SECTION 419.2) FEMALE	LAVATORIES MALE	LAVATORIES FEMALE	BATHTUBS/ SHOWERS	DRINKING FOUNTAIN (SEE SECTION 410)	OTHER
1	Assembly	A-1[d]								
		A-2[d]								
		A-3[d]								
			Places of worship and other religious services[f]	1 per 150	1 per 75	1 per 200		—	1 per 1,000	1 service sink

(Portions of table not shown remain unchanged)

a. The fixtures shown are based on one fixture being the minimum required for the number of persons indicated or any fraction of the number of persons indicated. The number of occupants shall be determined by the *International Building Code*.

b. Toilet facilities for employees shall be separate from facilities for inmates or care recipients.

c. A single-occupant toilet room with one water closet and one lavatory serving not more than two adjacent patient sleeping units shall be permitted provided that each patient sleeping unit has direct access to the toilet room and provision for privacy for the toilet room user is provided.

d. The occupant load for seasonal outdoor seating and entertainment areas shall be included when determining the minimum number of facilities required.

e. For business and mercantile occupancies with an occupant load of 15 or fewer, service sinks shall not be required.

f. The overall occupant load for places of religious worship shall be based on the occupant load of the assembly spaces only, excluding classrooms and offices.

Reason: Places of worship do not use all spaces at once. People typically occupy, at most, two of the three types of spaces at once: the sanctuary/worship space, the fellowship/social space, or the classrooms.

Cost Impact: Will not increase the cost of construction
Costs will actually be lessened by not requiring worship facilities to provide more restrooms than necessary.

(Portions of table and notes not shown remain unchanged)

Reason: When IBC was created, the occupant load for dormitories was taken from the UBC at 1/50 and the plumbing fixture ratios were taken from BOCA.
Under BOCA, dormitory occupant load fell under general residential occupant load of 1/200 - which is too low and unrealistic, especially for exiting purposes.

By adopting pieces from the different codes, the IBC requires 4 times the number of fixtures required under BOCA and approximately twice as many as UBC.

A majority of dormitories constructed at this time utilize suites with semi-private bathrooms and do not contain gang type bath room facilities. A typical suite with 2 double bedrooms and a bath usually does not satisfy the fixture count under IBC, since the occupant load is based on the gross area of the residential occupancy.

The IBC allows the building official to to reduce the occupant load as indicated in Exception to IBC Section 1004.1.2; however, some jurisdictions strike this provision and require a higher level of scrunity or variance be granted by a higher level agency to reduce occupant load - even for plumbing fixture counts.

The revision would still increase the fixture counts from those found in the legacy codes.

TABLE 4-1
Minimum Plumbing Facilities[1]

Each building shall be provided with sanitary facilities, including provisions for the physically handicapped as prescribed by the Department having jurisdiction. For requirements for the handicapped, ANSI A117.1-1992, Accessible and Usable Buildings and Facilities, may be used.

The total occupant load shall be determined by minimum exiting requirements. The minimum number of fixtures shall be calculated at fifty (50) percent male and fifty (50) percent female based on the total occupant load.

Type of Building or Occupancy[2]	Water Closets[14] (Fixtures per Person)		Urinals[5, 10] (Fixtures per Person)	Lavatories (Fixtures per Person)		Bathtubs or Showers (Fixtures per Person)	Drinking Fountains[3, 13] (Fixtures per Person)
Assembly Places – Theatres, Auditoriums, Convention Halls, etc. – for permanent employee use	Male 1: 1-15 2: 16-35 3: 36-55 Over 55, add 1 fixture for each additional 40 persons.	Female 1: 1-15 3: 16-35 4: 36-55	Male 0: 1-9 1: 10-50 Add one fixture for each additional 50 males.	Male 1 per 40	Female 1 per 40		
Assembly Places – Theatres, Auditoriums, Convention Halls, etc. – for public use	Male 1: 1-100 2: 101-200 3: 201-400 Over 400, add one fixture for each additional 500 males and 1 for each additional 125 females.	Female 3: 1-50 4: 51-100 8: 101-200 11: 201-400	Male 1: 1-100 2: 101-200 3: 201-400 4: 401-600 Over 600 add 1 fixture for each additional 300 males.	Male 1: 1-200 2: 201-400 3: 401-750 Over 750, add one fixture for each additional 500 persons.	Female 1: 1-200 2: 201-400 3: 401-750		1: 1-150 2: 151-400 3: 401-750 Over 750, add one fixture for each additional 500 persons.
Dormitories[9] School or Labor	Male 1 per 10 Add 1 fixture for each additional 25 males (over 10) and 1 for each additional 20 females (over 8).	Female 1 per 8	Male 1 per 25 Over 150, add 1 fixture for each additional 50 males.	Male 1 per 12 Over 12 add one fixture for each additional 20 males and 1 for each 15 additional females.	Female 1 per 12	1 per 8 For females, add 1 bathtub per 30. Over 150, add 1 per 20.	1 per 150[12]

TABLE 404.1—continued
MINIMUM NUMBER OF PLUMBING FACILITIES[a]
(see Sections 404.2 and 404.3)

	OCCUPANCY	WATER CLOSETS (Urinals see Section 420.2)		LAVATORIES	BATHTUBS/ SHOWERS	DRINKING FOUNTAINS (see Section 411.1)	OTHERS
		Male	Female				
INSTITUTIONAL	Residential care	1 per 10		1 per 10	1 per 8	1 per 100	1 service sink
INSTITUTIONAL	Hospitals, ambulatory nursing home patients[c]	1 per room[e]		1 per room[e]	1 per 15	1 per 100	1 service sink per floor
INSTITUTIONAL	Day nurseries, sanitariums, nonambulatory nursing home patients, etc.[c]	1 per 15		1 per 15	1 per 15[f]	1 per 100	1 service sink
INSTITUTIONAL	Employees, other than residential care[c]	1 per 25		1 per 35	—	1 per 100	—
INSTITUTIONAL	Visitors, other than residential care	1 per 75		1 per 100	—	1 per 500	—
INSTITUTIONAL	Prisons[c]	1 per cell		1 per cell	1 per 15	1 per 100	1 service sink
INSTITUTIONAL	Asylums, reformatories, etc.[c]	1 per 15		1 per 15	1 per 15	1 per 100	1 service sink
	Mercantile (see Sections 404.2, 404.4 and 404.5)	1 per 500		1 per 750	—	1 per 1,000	1 service sink
RESIDENTIAL	Hotels, motels	1 per guestroom		1 per guestroom	1 per guestroom	—	1 service sink
RESIDENTIAL	Lodges	1 per 10		1 per 10	1 per 8	1 per 100	1 service sink
RESIDENTIAL	Multiple family	1 per dwelling unit		1 per dwelling unit	1 per dwelling unit	—	1 kitchen sink per dwelling unit; 1 automatic clothes washer connection per 20 dwelling ~~units~~
RESIDENTIAL	Dormitories	1 per 10		1 per 10	1 per 8	1 per 100	1 service sink
RESIDENTIAL	One- and two-family dwellings	1 per dwelling unit		1 per dwelling unit	1 per dwelling unit	—	~~1 kitchen sink per~~ dwelling unit; 1 automatic clothes washer connection per dwelling unit[d]
	Storage (see Sections 404.2 and 404.4)	1 per 100		1 per 100	(see Section 412)	1 per 1,000	1 service sink

a The fixtures shown are based on one fixture being the minimum required for the number of persons indicated or any fraction of the number of persons indicated. The number of occupants shall be determined by the building code.
b Fixtures located in adjacent buildings under the ownership or control of the church shall be made available during periods the church is occupied.
c Toilet facilities for employees shall be separate from facilities for inmates or patients.
d For attached one- and two-family dwellings, one automatic clothes washer connection shall be required per 20 dwelling units.
e A single-occupant toilet room with one water closet and one lavatory serving not more than two adjacent patient rooms shall be permitted where such room is provided with direct access from each patient room and with provisions for privacy.
f For day nurseries, a maximum of one bathtub shall be required.

Cost Impact: Will not increase the cost of construction
The proposal will not increase costs.

2015 International Plumbing Code

Revise as follows:

TABLE 403.1
MINIMUM NUMBER OF REQUIRED PLUMBING FIXTURES[a] (See Sections 403.1.1 and 403.2)

NO.	CLASSIFICATION	OCCUPANCY	DESCRIPTION	WATER CLOSETS (URINALS: SEE SECTION 419.2)		LAVATORIES		BATHTUBS/ SHOWERS	DRINKING FOUNTAIN (SEE SECTION 410)	OTHER
				MALE	FEMALE	MALE	FEMALE			
1	Assembly	A-1[d]	Theaters and other buildings for the performing arts and motion pictures	1 per 125	1 per 65	1 per 200		—	1 per 500	1 service sink
		A-2[d]	Nightclubs, bars, taverns, dance halls and buildings for similar purposes	1 per 40	1 per 40	1 per 75		—	1 per 500	1 service sink
			Restaurants, banquet halls and food courts	1 per 75	1 per 75	1 per 200		—	1 per 500	1 service sink
			Casinos	1 per 50 for the first 400 and 1 per 150 for the remainder exceeding 400	1 per 100 for the first 400 and 1 per 250 for the remainder exceeding 400	1 per 250 for the first 750 and 1 per 500 for the remainder exceeding 750		—	1 per 1,000	1 service sink
		A-3[d]	Auditoriums without permanent seating, art galleries, exhibition halls, museums, lecture halls, libraries, arcades and gymnasiums	1 per 125	1 per 65	1 per 200		—	1 per 500	1 service sink
			Passenger terminals and transportation facilities	1 per 500	1 per 500	1 per 750		—	1 per 1,000	1 service sink
			Places of worship and other religious services	1 per 150	1 per 75	1 per 200		—	1 per 1,000	1 service sink

(Portions of table not shown remain unchanged)

a. The fixtures shown are based on one fixture being the minimum required for the number of persons indicated or any fraction of the number of persons indicated. The number of occupants shall be determined by the *International Building Code*.

b. Toilet facilities for employees shall be separate from facilities for inmates or care recipients.

c. A single-occupant toilet room with one water closet and one lavatory serving not more than two adjacent patient sleeping units shall be permitted provided that each patient sleeping unit has direct access to the toilet room and provision for privacy for the toilet room user is provided.

d. The occupant load for seasonal outdoor seating and entertainment areas shall be included when determining the minimum number of facilities required.

e. For business and mercantile occupancies with an occupant load of 15 or fewer, service sinks shall not be required.

Reason: The Plumbing Fixture Count Table 403.1 (IBC [P] 2902.1) does not address casinos as a specific use. The building codes are beginning to recognize the unique nature of the use and occupancy for these structures; as an example the code recognizes an occupant load factor of 1:11 for gaming areas. Casinos have been constructed outside of Las Vegas for years and it appears that this trend is continuing nationally. A fixture count for this use is a necessary addition to the code.

As an A-2 occupancy, the code user is currently required to select either the Restaurants/Banquet Halls or Nightclubs/Bars uses under the A-2 occupancy in Table 403.1 (IBC [P] 2902.1) to set fixture counts, 1:75 and 1:40, respectively. The fixture counts provided in this amendment closely resemble the fixture count table used in the Southern Nevada, including the Las Vegas strip. There has been no history in Las Vegas of long lines at Casino restrooms. Casinos represent a unique place where restaurants, gaming, retail and shows are combined into one expansive building. However, even with large crowds on gaming floors, restroom facilities are not so overcrowded as to produce long lines.

Specifically, for a 30,000-ft^2 Casino,Table 403.1 (IBC [P] 2902.1)would require 152% of the number of fixtures that are currently required *if* Casinos are tabulated as large assembly space (nightclub/bar). As a restaurant or banquet hall, Table 403.1 (IBC [P] 2902.1) would require 238% of the number of fixtures required by Table 403.1 (IBC [P] 2902.1).

This amendment also accounts for increase usage and need for female restroom similar to A-4 and A-5 occupancies.

Cost Impact: Will not increase the cost of construction
This proposal provides a more lenient fixture count for casinos, so the cost of construction would presumably decrease.

P 30-15 : T403.1 (IBC [P] 2901.1)-DIGIOVANNI3854

		I-2	Hospitals, ambulatory nursing home care recipient							1 service sink per floor[e]
			Employees, other than residential care[b]							—
			Visitors, other than residential care							—
		I-3	Prisons[b]							1 service sink[e]
			Reformitories, detention centers, and correctional centers[b]							1 service sink[e]
			Employees[b]							—
		I-4	Adult day care and child day care							1 service sink[e]

NO.	CLASSIFICATION	OCCUPANCY	DESCRIPTION	WATER CLOSETS (URINALS: SEE SECTION 419.2) MALE	FEMALE	LAVATORIES MALE	FEMALE	BATHTUBS/ SHOWERS	DRINKING FOUNTAIN (SEE SECTION 410)	OTHER
6	Mercantile	M	Retail stores, service stations, shops, salesrooms, markets and shopping centers							1 service sink[e]
7	Residential	R-1	Hotels, motels, boarding houses (transient)							1 service sink[e]
		R-2	Dormitories, fraternities, sororities and boarding houses (not transient)							1 service sink[e]
		R-2	Apartment house							1 kitchen sink per dwelling unit; 1 auto-matic clothes washer con-nection per 20 dwelling units
		R-3	Congregate living facilities with 16 or fewer persons							1 service sink[e]
		R-3	One- and two-family dwellings and lodging houses with five or fewer guestrooms							1 kitchen sink per dwelling unit; 1 auto-matic clothes washer con-nection per dwelling unit
		R-4	Congregate living facilities with 16 or fewer persons							1 service sink[e]

8	Storage	S-1 S-2	Structures for the storage of goods, warehouses, store- house and freight depots. Low and Moderate Hazard.					1 service sink[e]

(Portions of table not shown remain unchanged)

a. The fixtures shown are based on one fixture being the minimum required for the number of persons indicated or any fraction of the number of persons indicated. The number of occupants shall be determined by the *International Building Code*.

b. Toilet facilities for employees shall be separate from facilities for inmates or care recipients.

c. A single-occupant toilet room with one water closet and one lavatory serving not more than two adjacent patient sleeping units shall be permitted provided that each patient sleeping unit has direct access to the toilet room and provision for privacy for the toilet room user is provided.

d. The occupant load for seasonal outdoor seating and entertainment areas shall be included when determining the minimum number of facilities required.

e. ~~For business and mercantile occupancies with an occupant load of 15 or fewer, s~~Service sinks shall not be required~~.~~ where the occupant load is 30 or fewer.

Reason: This proposal revises note e and applies note "e" to each of the service sink entries in the table, so that it addresses all occupancies required to have service sinks, not just B and M occupancies. Note "e" is revised to trigger the service sink at an occupant load of over 30, rather than the current trigger of 15 found in the note.

Cost Impact: Will not increase the cost of construction
This proposal provides a more lenient approach for fixture requirements, so the cost of construction is not increased.

P 31-15 : T403.1-DIGIOVANNI3856

P 33-15

Table 403.1 (IBC Table 2902.1)

Proponent: Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

2015 International Plumbing Code

Revise as follows:

TABLE 403.1
MINIMUM NUMBER OF REQUIRED PLUMBING FIXTURES[a] (See Sections 403.1.1 and 403.2)

NO.	CLASSIFICATION	OCCUPANCY	DESCRIPTION	WATER CLOSETS (URINALS: SEE SECTION 419.2)		LAVATORIES		BATHTUBS/ SHOWERS	DRINKING FOUNTAIN (SEE SECTION 410)	OTHER

4	Factory and industrial	F-1 and F-2	Structures in which occupants are engaged in work fabricating, assembly or processingof products or materials					~~(see Section 411)~~		

NO.	CLASSIFICATION	OCCUPANCY	DESCRIPTION	WATER CLOSETS (URINALS: SEE SECTION 419.2)		LAVATORIES		BATHTUBS/ SHOWERS	DRINKING FOUNTAIN (SEE SECTION 410)	OTHER
				MALE	FEMALE	MALE	FEMALE			
8	Storage	S-1 S-2	Structures for the storage of goods, warehouses, store- house and freight depots. Low and Moderate Hazard.					~~See Section 411~~ —		

(Portions of table and notes not shown remain unchanged)

Reason: This proposal resolves long standing confusion about what Table 403.1 requires for Showers in Factory and Storage facilities. The Table never intended to require showers but was only directing readers to the safety shower section (Section 411) in case the building designer was going to use safety showers in the design of the building. The note has no purpose in this table. Such notes could be put in the table for every other type of fixture that doesn't indicate a ratio or quantity. The note needs removed.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes. This is PMGCAC Item 87.

Cost Impact: Will not increase the cost of construction
This proposal will not increase the cost of construction because no additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code.

8	Storage	~~S-1 S-2~~	Structures for the storage of goods, warehouses, store- house and freight depots. Low and Moderate Hazard.					

(Portions of table not shown remain unchanged)

a. The fixtures shown are based on one fixture being the minimum required for the number of persons indicated or any fraction of the number of persons indicated. The number of occupants shall be determined by the *International Building Code*.

b. Toilet facilities for employees shall be separate from facilities for inmates or care recipients.

c. A single-occupant toilet room with one water closet and one lavatory serving not more than two adjacent patient sleeping units shall be permitted provided that each patient sleeping unit has direct access to the toilet room and provision for privacy for the toilet room user is provided.

d. The occupant load for seasonal outdoor seating and entertainment areas shall be included when determining the minimum number of facilities required.

e. For business and mercantile ~~occupancies~~classifications with an occupant load of 15 or fewer, service sinks shall not be required.

Reason: Section 403.1 was revised for the 2015 IPC to direct the reader to the use of a building rather than its IBC occupancy classification (Group) for determining the number of plumbing fixtures. The occupancy column is Table 403.1 is now really confusing as Section 403.1 says to use the Description column but this Occupancy column implies that the IBC classification is to be used. This proposal removes the occupancy column for clarity and coordination with what Section 403.1 states.

Table 403.1 will still retain the classification column, although that column doesn't seem to add any clarification to the table as the IPC doesn't speak of "classifications" for various uses. However, as Table 403.1 is reprinted in the IBC (as Table [P] 2902.1), the classification column might incorrectly lead IBC readers to assume that the IBC occupancy classification (Group) has something to do with selection of an appropriate row for plumbing fixture requirements. IBC Section [P] 2902.1 is identical to Section 403.1 in the IPC but if the reader neglects reading the IBC section and jumps directly to the table, the existence of classification column could cause a misunderstanding.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes. This is PMGCAC Item 191.

Cost Impact: Will not increase the cost of construction
This proposal will not increase the cost of construction because no additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code.

2015 International Plumbing Code

Revise as follows:

TABLE 403.1
MINIMUM NUMBER OF REQUIRED PLUMBING FIXTURES[a] (See Sections 403.1.1 and 403.2)

NO.	CLASSIFICATION	OCCUPANCY	DESCRIPTION	WATER CLOSETS (URINALS: SEE SECTION 419.2)		LAVATORIES		BATHTUBS/ SHOWERS	DRINKING FOUNTAIN (SEE SECTION 410)	OTHER
				MALE	FEMALE	MALE	FEMALE			
1	Assembly	A-1[d]	Theaters and other buildings for the performing arts and motion pictures	1 per 125	1 per 65	1 per 200		—	1 per 500	1 service sink
		A-2[d]	Nightclubs, bars, taverns, dance halls and buildings for similar purposes	1 per 40	1 per ~~40~~ 20	1 per 75		—	1 per 500	1 service sink
			Restaurants, banquet halls and food courts	1 per 75	1 per ~~75~~38	1 per 200		—	1 per 500	1 service sink
		A-3[d]	Auditoriums without perma-nent seating, art galleries, exhibition halls, museums, lecture halls, libraries, arcades and gymnasiums	1 per 125	1 per 65	1 per 200		—	1 per 500	1 service sink
			Passenger terminals and transportation facilities	1 per 500	1 per ~~500~~250	1 per 750		—	1 per 1,000	1 service sink
			Places of worship and other religious services	1 per 150	1 per 75	1 per 200		—	1 per 1,000	1 service sink

(Portions of table not shown remain unchanged)

a. The fixtures shown are based on one fixture being the minimum required for the number of persons indicated or any fraction of the number of persons indicated. The number of occupants shall be determined by the *International Building Code*.

b. Toilet facilities for employees shall be separate from facilities for inmates or care recipients.

c. A single-occupant toilet room with one water closet and one lavatory serving not more than two adjacent patient sleeping units shall be permitted provided that each patient sleeping unit has direct access to the toilet room and provision for privacy for the toilet room user is provided.

d. The occupant load for seasonal outdoor seating and entertainment areas shall be included when determining the minimum number of facilities required.

e. For business and mercantile occupancies with an occupant load of 15 or fewer, service sinks shall not be required.

403.1.1 Fixture calculations. To determine the occupant load of each sex, the total occupant load shall be divided in half. To determine the required number of fixtures, the fixture ratio or ratios for each fixture type shall be applied to the occupant load of each sex in accordance with Table 403.1. Fractional numbers resulting from applying the fixture ratios of Table 403.1 shall be rounded up to the next whole number. For calculations involving multiple *occupancies*, such fractional numbers for each *occupancy* shall first be summed and then rounded up to the next whole number.

Exception: The total occupant load shall not be required to be divided in half where *approved* statistical data indicates a distribution of the sexes of other than 50 percent of each sex.

Reason: A disparity exists among the ratios of restroom elimination plumbing fixtures (i.e. water closets/urinals) in the various Assembly occupancies in Table 403.1 of the 2012 IPC (Table 2902.1 in the 2012 IBC). For example: for theatre goers the fixture ratio is 1:2 for male to female whereas, for 'transportation facilities' etc., the ratio is 1:1. Some of these ratios represent a one to one distribution of fixtures while others represent a distribution more closely related to what Queuing Theory (Reference # 1.) would have us recognize. This distribution is based on the differences in building use type and on the intermittent or 'bulk arrival' flows of people. It is apparent that Queuing Theory is not uniformly applied to the Assembly occupancies in Table 403.1. To correct the disparities, this proposal recommends treating A-2 and A-3 with the same assumptions of 'bulk arrival' flows as apply to the other Assembly occupancies.
Further to the above: in Table 403.1 of the 2012 IPC the ratio of restroom elimination fixtures in the A-1 and the 1st and 3rd occupancies of A-3 is 1:2 for male to female. The ratio of elimination fixtures in the A-2 and the 2nd A-3 occupancies (e.g. 'Passenger terminals and transportation facilities') is 1:1. Research into elimination duration differences between males and females has been completed by P.J. Davidson and R.G. Courtney of the Building Research Establishment [Reference # 1. under 'Activities']. Their results show that: 'males spend an average of 39 seconds at the urinal' and that the 'average time spent in the water closet for females...80 seconds'. In light of this result it would appear that 1:2 is the preferable ratio for all Assembly occupancy restrooms.

Women using A-2 and the 2nd A-3 occupancy restrooms face the same time constraints and ambulatory circulation issues as women using A-1 and the 1st and 3rd A-3 restrooms. Long lines can result in inconvenience and exposure to stress and health issues [Reference # 1. under 'The Problem']. The present ratios seem to discriminate against the former group of users. Using the same logic of flows, and times, to get through a line in theatres, auditoriums, sporting arenas and places of worship, leads to an obvious conclusion. The correction of ratio disparities among the A-1, A-2 and A-3 occupancy restrooms is needed.

We propose that the A-2 and the 2nd A-3 restroom elimination plumbing fixture ratios be brought into line with those of the A-1, A-4 and A-5 fixture ratios - that is 1:2 for male to female. We appreciate the support of all ICC members.

Note: Reference # 1. refers to the document available on-line titled: 'Queuing Theory in the Analysis of Public Restroom Use and Behavior: Implications for Research, Design, Management and Public Policy' pages 286 thru 292 by Sandra K. Rawls et al.

The Bathroom, Kira, A. 1976

Cost Impact: Will increase the cost of construction
Restroom facilities typically constitute about 10 percent of new construction costs. The proposal calls for a change in the ratio of restroom elimination plumbing fixtures (wc's/urinals) only, from a 1:1 ratio to a 1:2 ratio in the A-2 and the 2nd A-3 Assembly occupancies. The change would be for the benefit of female users of these occupancies. The change would involve doubling the number of cubicles/WC's and an increased cost of approximately 60 percent for a women's restroom. Total restroom construction costs would increase by approximately 30%. Total construction costs for these Assembly occupancies would therefore increase by approximately 3%.

Proponent: Cornelia M Orzescu, Town of Parker, representing Colorado Chapter of the ICC, Code Change Committee, representing Town of Parker (corzescu@parkeronline.org)

Part I

2015 International Plumbing Code

Add new text as follows:

403.1.1 Outdoor public swimming pool fixtures Outdoor public swimming pools used for aquatic recreation and having a water area of less than 7500 ft^2 (697 m^2) shall have not less than one water closet, one urinal, one lavatory and one shower for males and not less than two water closets, one lavatory and one shower for females.

Outdoor public swimming pools used for aquatic recreation having a water area of 7500 ft^2 (697 m2) or more shall have, for every 7500 ft^2 (697 m^2) or portion thereof, not less than 0.7 water closets, one urinal, 0.85 lavatory and one shower for males and not less than two water closets, one lavatory and one shower for females. Where the result of a fixture calculation is a portion of a whole number, the result shall be rounded up to the nearest whole number.

Section 403.1.1 (Fixture calculations) shall not apply where complying with this section.

Add new definition as follows:

SECTION 202
DEFINITIONS

PUBLIC SWIMMING POOL A pool, other than a residential pool, that is intended to be used for swimming or bathing and is operated by an owner, lessee, operator, licensee or concessionaire, regardless of whether a fee is charged for use.

Revise as follows:

TABLE 403.1
MINIMUM NUMBER OF REQUIRED PLUMBING FIXTURES[a] (See Sections 403.1.1 and 403.2)

NO.	CLASSIFICATION	OCCUPANCY	DESCRIPTION	WATER CLOSETS (URINALS: SEE SECTION 419.2)		LAVATORIES		BATHTUBS/ SHOWERS	DRINKING FOUNTAIN (SEE SECTION 410)	OTHER
				MALE	FEMALE	MALE	FEMALE			
1 (cont.)	Assembly	A-4	Coliseums, arenas, skating rinks, pools and tennis courts for indoor sporting events and activities	1 per 75 for the first 1,500 and 1 per 120 for the remainder exceeding 1,500	1 per 40 for the first 1,520 and 1 per 60 for the remainder exceeding 1,520	1 per 200	1 per 150	—	1 per 1,000	1 service sink
		A-5	Stadiums, amusement parks, bleachers and grandstands for outdoor sporting events and activities[f]	1 per 75 for the first1,500 and 1 per 120 for the remainder exceeding 1,500	1 per 40 for the first 1,520 and 1 per 60 for the remainder exceeding 1,520	1 per 200	1 per 150	—	1 per 1,000	1 service sink

(Portions of table not shown remain unchanged)

a. The fixtures shown are based on one fixture being the minimum required for the number of persons indicated or any fraction of the number of persons indicated. The number of occupants shall be determined by the *International Building Code*.

b. Toilet facilities for employees shall be separate from facilities for inmates or care recipients.

c. A single-occupant toilet room with one water closet and one lavatory serving not more than two adjacent patient sleeping units shall be permitted provided that each patient sleeping unit has direct access to the toilet room and provision for privacy for the toilet room user is provided.

d. The occupant load for seasonal outdoor seating and entertainment areas shall be included when determining the minimum number of facilities required.

e. For business and mercantile occupancies with an occupant load of 15 or fewer, service sinks shall not be required.

f. For outdoor public swimming pools used for aquatic recreation, see Section 403.1.1

Part II

2015 International Building Code

Add new text as follows:

2902.1.1 Outdoor public swimming pool fixtures Outdoor public swimming pools used for aquatic recreation and having a water area of less than 7500 ft^2 (697 m^2) shall be provided with not less than one water closet, one urinal, one lavatory and one shower for males and not less than two water closets, one lavatory and one shower for females.

Outdoor public swimming pools used for aquatic recreation having a water area of 7500 ft^2 (697 m^2) or more shall be provided with, for every 7500 ft^2 (697 m^2) or portion thereof, not less than 0.7 water closets, one urinal, 0.85 lavatory and one shower for males and not less than two water closets, one lavatory and one shower for females. Where the result of a fixture calculation is a portion of a whole number, the result shall be rounded up to the nearest whole number.

Section 2902.1.1 (Fixture calculations) shall not apply where complying with this section.

Reason: Trying to figure out a plumbing fixture count associated with outdoor public swimming pools when there is not a "building occupant load" is a doubting task. The proposed fixture count is based on the 2015 International Swimming Pool and Spa Code provisions Section 609 for Toilet rooms and bathrooms.
Note f is added to Table 403.1 to point the code user to this new section and to not attempt to use "building occupant load" numbers, Table 403.1 fixture ratios for A-5 and the calculation method of existing 403.1.1. That will result in far too many fixtures for an outdoor public swimming pool application.

This new section would not apply to buildings that might be associated with a public pool such as a club house.

Instead of just referencing the 2015 ISPSC for the number of required plumbing fixtures, the verbage is included in the IPC for jurisdictions that otherwise will not adopt or have not adopted the 2015 ISPSC.

This proposed langauge for the IBC will hopefully be carried into Chapter 29 the 2018 IBC as it is integral to the information that is normally in IBC Chapter 29.

Bibliography:

Part I: Title of book- 2015 International Swimming Pool and Spa Code
Year published-2014

Page #35

Cost Impact:

Part I: Will not increase the cost of construction
Because this proposal is not based on an occupant load, this will result in a cost decrease as compared to the cost of the number of required fixtures based on IPC Table 403.1.

Part II: Will not increase the cost of construction
Because this proposal is not based on an occupant load, this will result in a cost decrease as compared to the cost of the number of required fixtures based on IPC Table 403.1.

Analysis:

Part II: Changes to IPC Table 403.1 made by PART I will automatically change IBC Table 2902.1.

P 36-15 : 403.1.1.1 (New)-ORZESCU3686

P 37-15

403.1.2 (New) (IBC 2902.1.2 (New))

Proponent: Julius Ballanco, JB Engineering and Code Consulting, P.C., representing Self (JBENGINEER@aol.com)

2015 International Plumbing Code

Add new text as follows:

403.1.2 Excess number of elimination fixtures for males. Where the combined number of water closets and urinals for males exceeds the number of male water closets required by Section 403.1, the total number of water closets for females shall be increased by the number of combined fixtures for males that exceeds the required number of water closets for males, adjusted as necessary by the statistical requirements of Section 403.1.1.

Reason: Potty parity was a part of the Plumbing Code from its inception. The goal of the code requirements on number of fixtures between the sexes is to provide the same waiting time for men and women using the facilities.
Because of space differentials, the combined number of water closets and urinals in the men's room often exceeds the number required by code. However, the women's room may have the required number of water closets. This results in an unequal waiting time for use of the plumbing fixtures. As a result, potty parity is not achieved.

This code requirement will mandate that the number of water closets in the women's room must be increased by the same percentage as the number of water closets and urinals in the men's room. The result will be potty parity with the same waiting time between the men and women.

Cost Impact: Will increase the cost of construction
This will add cost when additional water closets are required to be installed in the women's room.

P 37-15 : 403.1.2 (New)-BALLANCO3813

P 38-15

403.1.2 (IBC 2902.1.2), 403.2.1 (IBC 2902.2.1), 403.4 (IBC 2902.4)

Proponent: Bob Kief, University of Puget Sound, representing University of Puget Sound (bkief@pugetsound.edu)

2015 International Plumbing Code

Revise as follows:

403.1.2 Family or assisted-use or gender-neutral toilet facilities and ~~bath~~bathroom fixtures. Fixtures located within family or assisted-use toilet and bathing rooms required by Section 1109.2.1 of the *International Building Code*are permitted to be included in the number of required fixtures for either the male or female, or gender-neutral occupants in assembly and mercantile *occupancies*.

403.2.1 Family or assisted-use or gender-neutral toilet facilities serving as separate facilities. Where a building or tenant space requires a separate toilet facility for each sex or gender-neutral and each toilet facility is required to have only one water closet, two family or assisted-use or gender-neutral toilet facilities shall be permitted to serve as the required separate facilities. Family or assisteduse or gender-neutral toilet facilities shall not be required to be identified for exclusive use by either sex as required by Section 403.4.

403.4 Signage. Required *public* facilities shall be provided with signs that designate the sex~~,~~ or gender-neutral as required by Section 403.2. Signs shall be readily visible and located near the entrance to each toilet facility. Signs for accessible toilet facilities shall comply with Section 1111 of the *International Building Code*.

Reason: As you may be aware, providing gender neutral bathrooms is becoming an important issue at many colleges and universities. A rapidly growing number of colleges and universities are creating gender neutral bathrooms, either through renovations or by simply changing the signs on single-stall male/female restrooms. Gender neutral bathrooms are a place where students, faculty and staff of any gender can go in and use the bathroom and feel safe regardless of gender expression or gender identity. (see attached supporting letter)
The 2015 International Plumbing Code (IPC) and 2015 International Building Code (IBC) do not recognize gender neutral individuals. Fixture calculations are based on only male and female. The code recognizes "Family or assisted-use toilet and bath fixtures" and requires signage "required public facilities shall be provided with signs that designate the sex". The code is not preventing any university or college from having gender neutral single-stall bathrooms, however, it does prevent converting multi-stall "Men's" and "Women's" bathrooms to gender neutral bathrooms in public buildings.

IBC 1109.2.1 Family or assisted-use toilet or bathing rooms.

403.2.1 (IBC [P] 2902.1.2) Family or assisted-use toilet and bath fixture count.

403.2.1 (IBC [P] 2902.2.1) Family or assisted-use toilet facilites serviing aa separate facilities.

The family or assisted-use requirements will not be effected in terms of accessibility and fixture counts but will allow a 3rd individual type to gain access to such facilities. Signage indicating the bathroom is *gender neutral* would be required.

We respectfully request that the IBC and IPC codes recognize and require a gender neutral single-stall bathroom, with the same equality as family and/or assisted-use bathrooms, to be available in every building when constructing new and/or renovating existing buildings.

I am submitting the appropriate code section change request along with a supporting letter from The Associated Students of Puget Sound (ASUPS) student government with the endorsement of our University President as well as various groups and members of our campus community.

Cost Impact: Will not increase the cost of construction
The gender neutral bathrooms should not increase the cost of construction, because single stall accessible bathrooms are already required by code, and existing single stall accessible bathrooms can easily be converted to gender neutral bathrooms by changing their signage. Shifting from gender-specific single-stall bathrooms to gender-neutral single-stall bathrooms ones is a simple no cost or low-cost way to help ensure that facilities are welcoming and open to all people, regardless of the way one presents or identifies their gender identity.

P 38-15 : 403.1.2-KIEF3626

P 39-15

403.1.2 (New) (IBC 2902.1.2 (New))

Proponent: Billy Smith, American Society of Plumbing Engineers Legislative Committee, representing American Society of Plumbing Engineers Legislative Committee (bsmith@aspe.org)

2015 International Plumbing Code

Add new text as follows:

403.1.2 Excess number of male fixtures. Where the sum of the numbers of installed water closets and urinals for males will be in excess of the required number of male water closets, and the sum is greater than the required number of female water closets, the number of installed female water closets shall be the total of the number of required female water closets and the excess number of male fixtures.

Reason: ASPE has long been a proponent of potty parity. The original values found in the International Plumbing Code were based on a paper published by ASPE. The goal of the code is to provide the same waiting time for men and women using the facilities.
Because of space differentials, the combined number of water closets and urinals in the men's room exceeds the number required by code. However, the women's room has the required number of water closets. This results in an unequal waiting time for use of the plumbing fixtures. As a result, potty parity is not achieved.

This code requirement will mandate that the number of water closets in the women's room must be increased by the same percentage as the number of water closets and urinals in the men's room. The result will be potty parity with the same waiting time between the men and women.

Cost Impact: Will not increase the cost of construction
This does not increase the cost since the change merely provides options for the installer or designer.

P 39-15 : 403.1.2 (New)-SMITH5374

P 40-15

403.1.2 (IBC 2902.1.2)

Proponent: David Collins, representing The American Institute of Architects (dcollins@preview-group.com)

2015 International Plumbing Code

Revise as follows:

403.1.2 ~~Family or assisted-use~~Single-user toilet facility and ~~bath~~bathing room fixtures. ~~Fixtures~~
The plumbing fixtures located ~~within~~in single-user toilet facilities and bathing rooms, including family or assisted-use toilet and bathing rooms that are required by Section 1109.2.1 of the *International Building Code*~~are permitted to be included in~~, shall contribute towards the total number of required plumbing fixtures for ~~either the male~~a building or ~~female occupants in assembly~~tenant space. Single-user toilet facilities and ~~mercantile *occupancies*.~~bathing rooms, and family or assisted-use toilet and bathing rooms shall not be required to be identified for exclusive use by either sex.

Reason: The use of single-user toilets has become increasingly beneficial system of providing not only better facilities, but more user friendly facilities. A higher level of privacy is achieved, the facilities are typically better maintained by the users, and the efficiencies of having unisex facilities where the users are of a dominate sex are significantly increased.
Similarly, this code change removes the limitation of use for family or assisted-use facilities to mercantile and assembly occupancies. Families or persons requiring assisted-use can be found in various occupancies and should be allowed as providing required toilets. Currently, when there are multiple single-user toilets 50% of them are required to be accessible. If this is compared with the standard ganged toilet rooms where there are multiple toilet fixtures, the number of accessible toilets and thus a greater number of useful toilets by everyone will be increased by this change.

Cost Impact: Will not increase the cost of construction
The single-user toilet room will reduce the cost of construction. Based on the minimum number of toilets, the larger general area required for circulation for multi-fixtured toilet rooms can be eliminated in large part because areas such as sight-blocking and the multiplier for urinals for credit will be eliminated in multiple single-user toilet designs.

P 40-15 : 403.1.2-COLLINS4506

P 41-15

403.2 (IBC 2902.2)

Proponent: Stephen DiGiovanni, Clark County Building Department, representing Southern Nevada Chapter of ICC (sdigiovanni@clarkcountynv.gov)

2015 International Plumbing Code

Revise as follows:

403.2 Separate facilities. Where plumbing fixtures are required, separate facilities shall be provided for each sex.

Exceptions:

1. Separate facilities shall not be required for dwelling units and sleeping units.
2. Separate facilities shall not be required in structures or tenant spaces with a total occupant load, including both employees and customers, of ~~15~~30 or fewer.
3. Separate facilities shall not be required in mercantile *occupancies* in which the maximum occupant load is 100 or ~~fewer~~less.
4. Separate facilities shall not be required in Group B occupancies in which the maximum occupany load is 50 or less provided a single toilet facility is designed for use by no more than one person at a time.

Reason: Section 403.2 (IBC Section 2902.2) requires that separate facilities be provided for males and females when plumbing fixtures are required by Table 403.1 (IBC Table 2902.1). Exception No. 2 to Section 403.2 (IBC Section 2902.2) allows shared facilities for spaces with a maximum occupant load of 15, while Exception No. 3 allows shared facilities for mercantile (Group M) occupancies with a maximum occupant load of 100. The proposed amendment is to modify Exception No. 2 to raise the minimum occupant load that requires separate facilities for males and females from 15 to 30.

With respect to the proposal for Exception #2, the following table identifies the occupant load factors for various occupancies based on IBC Table 1004.1.2 and shows the maximum area that would be allowed for each occupancy in order to avoid providing separate facilities. The table also shows the maximum area that the proposed amendment would allow for each occupancy in order to avoid providing separate facilities.

Occupancy	Occupant Load Factor (OLF) (ft^2/person)	2015 IBC Max. Area Permitted without Separate Facilities (OLF x 15) (ft^2)	*Proposed Amended* Max. Area Permitted without Separate Facilities (OLF x 30) (ft^2)
Assembly (unconcentrated use)	15	225	450
Educational	20	300	600
Factory/Industrial	100	1500	3000
Institutional areas:			
Inpatient treatment areas	240	3600	7200
Outpatient areas	100	1500	3000
Sleeping areas	120	1800	3600
Residential	200	3000	6000
Storage	300	4500	9000

An additional modification in this proposal is to use terminology and the occupancy description used throughout the code in exception #3 to be consistent with typical code language.

Further, this proposal adds an exception to address Group B occupancies. This proposal is to allowGroup B (business) occupancies, with a total occupant load of 50 or less, including customers and employees, to have a single toilet facility provided that it is designed for use by no more than one person at a time. This appears to be a reasonable standard for small business spaces of 5,000 square feet or less. Current code requires separate facilities for business occupancies that exceed 1,500 square feet.

A single accessible toilet facility occupies approximately 50 ft^2. Therefore, requiring separate facilities for males and females in small businesses requires the loss of approximately an additional 50 ft^2 of floor area along with the cost of the additional plumbing fixtures and enclosure. Fifty square feet represents a significant percentage of the floor area for the minimum size of spaces that require separate facilities per the base IPC Section 403.2 (IBC Section 2902.2). This change is intended to benefit storefront/strip mall business tenants that individually provide facilities within their space. This proposal will have little impact to standard office buildings that typically share restroom facilities.

Cost Impact: Will not increase the cost of construction
This proposal will provide a more lenient approach for facilities in Group B occupancies, so construction costs are not increased with this proposal.

P 41-15 : 403.2-DIGIOVANNI3855

P 42-15

403.2 (IBC 2902.2)

Proponent: Bryan Hampson, representing Washington Association of Building Officials Technical Code Development Committee (bhampson@kenmorewa.gov)

2015 International Plumbing Code

Revise as follows:

403.2 Separate facilities. Where plumbing fixtures are required, separate facilities shall be provided for each sex.

Exceptions:

1. Separate facilities shall not be required for dwelling units and sleeping units.
2. Separate facilities shall not be required in structures or tenant spaces with a total occupant load, including both employees and customers, of 15 or fewer.
3. Separate facilities shall not be required in mercantile *occupancies* in which the maximum occupant load is 100 or fewer.
4. <u>Separate facilities shall not be required in spaces primarily used for drinking and dining in which the maximum occupant load is 30 or less.</u>

Reason: Currently smaller drinking or dining establishments, e.g. sandwich shops, coffee shops, wineries and breweries with tasting rooms, etc., would be required to provide separate men's and women's restroom facilities when the occupant load exceeds 15, including both employees and customers. Typically there is one existing restroom and a kitchen or service area that may have one or two employees. This means that, if the dining area is greater than 195 square feet, separate restroom facilities are required (based on an assembly, unconcentrated occupant load factor of 15 people per square foot for 13 people). If a new restroom is constructed, it is required to be accessible. A small accessible restroom needs approximately 60 square feet of space. This may require leasing or purchasing additional space to accommodate a second restroom or reducing the size of the dining area. The additional restroom is unnecessary to serve the sanitary needs of the occupants of a small establishment. By requiring a separate restroom at 30 persons, there could be 420 sq. ft. (with two employees) non-fixed seating.

Cost Impact: Will not increase the cost of construction
The proposed code amendment will reduce the cost for small businesses. Because in some instances the business may need to lease or purchase added space to accomodate a second restroom and in addition to leasing or purchasing the added space is the cost of physical construction of the facility.
In addition, the restaurant industry assumes a maximum rent or lease of 8% based on gross sales. The separate restroom adds 25% (approximately) in floor space but adds nothing to the gross revenues. Small businesses would have a much better chance of survival by lowering the cost of lease and/or construction when they can spread that cost over a larger customer base.

403.2 (IBC 2902.2) , 403.2.1 (IBC 2902.1), 403.2.2 (New) (IBC 2902.2.2 New)) , 403.4 (IBC 2902.4)

Proponent: Shawn Meerkamper, Transgender Law Center, representing Transgender Law Center

2015 International Plumbing Code

Revise as follows:

403.2 Separate facilities. Where plumbing fixtures are required, separate facilities shall be provided for each sex.

Exceptions:

1. Separate facilities shall not be required for dwelling units and sleeping units.
2. Separate facilities shall not be required in structures or tenant spaces with a total occupant load, including both employees and customers, of 15 or fewer.
3. Separate facilities shall not be required in mercantile *occupancies* in which the maximum occupant load is 100 or fewer.
4. Toilet facilities that have only one water closet shall not be identified for exclusive use by either sex, as provided in Sections 403.2.1 and 403.2.2 and shall be deemed to meet the requirements of this section.

403.2.1 Family or assisted-use toilet facilities serving as separate facilities. Where a building or tenant space requires a separate toilet facility for each sex and each toilet facility is required to have only one water closet, two family or assisted-use toilet facilities shall be permitted to serve as the required separate facilities. Family or ~~assisteduse~~assisted-use toilet facilities shall not~~ be required to~~ be identified for exclusive use by either sex as required by Section 403.4.

Add new text as follows:

403.2.2 Single-stall facilities Where toilet facilities have only one water closet, those facilities shall not be identified for exclusive use by either sex.

Revise as follows:

403.4 Signage. Required *public* facilities shall be provided with signs that ~~designate~~indicate the sex or designated use, as required by ~~Section~~Sections 403.2, 403.2.1, and 403.2.2. Signs shall be readily visible and located near the entrance to each toilet facility. Signs for accessible toilet facilities shall comply with Section 1111 of the *International Building Code*.

Reason: This proposal is jointly submitted by Transgender Law Center, National Center for Lesbian Rights, and National Center for Transgender Equality.
Many people have been in the frustrating position of waiting in line for a single-stall restroom while the restroom designated for the other gender sits empty. This proposal simply provides that single-stall restrooms must be available to people of all genders, and clarifies that such single-user facilities do not violate existing laws requiring equal facilities to be available for men and for women. Amending the Plumbing Code as set forth above would increase the number of restrooms available to all people while especially benefitting parents with children of a different gender; senior citizens or people with disabilities who may require an attendant; people with bladder conditions; and people who don't fit narrow gender stereotypes, including some lesbian, gay, bisexual, and transgender people, for whom public restrooms can be sources of anxiety and sites of harassment or even violence. The consequences for public health can be serious: individuals who are unable to safely access public restrooms can develop medical problems from delaying or avoiding restroom usage.

This proposal mirrors policies already in effect in a number of major U.S. cities, including New York City, Philadelphia, San Francisco, Washington, D.C., West Hollywood, and Austin, Texas. Designating single-stall restrooms for use by all genders is also a growing trend at universities (including the University of California, which recently adopted this policy system-wide) and private businesses. Unfortunately, some institutions and government bodies find their options limited by codes such as the IPC that require single-stall restrooms to be limited to one gender. Adopting these amendments to the Plumbing Code would give guidance to local and state policymakers seeking to ensure that public restrooms are accessible and inclusive.

Cost Impact: Will not increase the cost of construction
Costs associated with our proposed amendments are limited to signage and would have no effect on construction costs. Restroom signs that do not specify gender are available for comparable costs to those that do specify gender. To the extent that there are price reductions for buying in bulk, some establishments will actually save money if they only need to purchase many of one sign.

P 43-15 : 403.2-MEERKAMPER5718

P 44-15

403.2 (IBC 2902.2)

Proponent: Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

2015 International Plumbing Code

Revise as follows:

403.2 Separate facilities. Where plumbing fixtures are required, separate facilities shall be provided for each sex.

Exceptions:

1. Separate facilities shall not be required for dwelling units and sleeping units.
2. Separate facilities shall not be required in structures or tenant spaces with a total occupant load, including both employees and customers, of 15 or fewer.
3. Separate facilities shall not be required in mercantile <u>and business</u> *occupancies* in which the maximum occupant load is ~~100~~<u>50</u> or fewer.

Reason: It has been long standing practice in the codes to group business and mercantile occupancies in regards to plumbing fixtures. It was not clear why the number was changed from 50 to 100 in the 2012 IPC for mercantile with the IBC occupant load remaining the same. These revisions are made to allow for small business occupancies to provide a single toilet facility for up to 50 occupants and reduce the number to the previous value of 50 for mercantile occupancies.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes. This is PMGCAC Item 98.

Cost Impact: Will increase the cost of construction
This proposal will increase the cost of construction because additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code. Specifically, for mercantile occupancies having an occupant load of greater than 50 and less than 101, separate toilet facilities (for male and female) will be required whereas in the current code that range does not require separate facilities. Extra space and duplicate fixtures, piping and associated materials and labor will increase the cost of construction for those mercantile establishments in that range.

P 44-15 : 403.2-SNYDER3937

P 45-15

403.3 (IBC 2902.3)

Proponent: Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

2015 International Plumbing Code

Revise as follows:

403.3 Required public toilet facilities. ~~Customers~~For structures and tenant spaces intended for *public* utilization, customers, patrons and visitors shall be provided with *public* toilet facilities ~~in~~.
Employees associated with structures and tenant spaces ~~intended for public utilization~~shall be provided with toilet facilities. The number of plumbing fixtures located within the required toilet facilities shall be provided in accordance with Section 403 for all users. ~~Employees shall be provided with toilet facilities in all *occupancies*.~~ Employee toilet facilities shall be either separate or combined employee and *public* toilet facilities.

> **Exception:** *Public* toilet facilities shall not be required ~~in~~for:
>
> 1. Open or enclosed parking garages where there are no parking attendants.
> 2. Structures and tenant spaces intended for quick transactions, including takeout, pickup and dropoff, having a public access area less than or equal to 300 square feet (28 m^2).

Reason: This section is being reorganized for clarity of the intent of the section which simply is to require public and employee toilet facilities, as applicable, for buildings and tenant spaces. The location of the required toilet facilities is covered by Sections 403.3.1 through 403.3.4. This reorganization eliminates the word "in" in the first sentence of the existing language and in the Exceptions lead-in sentence because this simple term has frequently been interpreted to mean that toilet facilities had to be within the building or tenant space that created the plumbing fixture demand. However, this interpretation is contrary to many past and current practices of toilet facilities being located in buildings other than the building generating the requirement for plumbing fixtures. Examples are:

- An amusement park with numerous buildings served by several centralized toilet facility buildings.
- An open mall building having multiple tenant spaces, served by one central toilet facility.
- A covered mall building having numerous tenant spaces, served by several centralized toilet facilities.
- A factory outlet "mall" area with several strip buildings where the toilet facilities to serve all of the buildings are located in only one of the strip buildings.

Note that Section 403.3.1 states "Access to the required facilities shall be from within the building or from the exterior of the building."

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes. This is PMGCAC Item 90.

Cost Impact: Will not increase the cost of construction
This proposal will not increase the cost of construction because no additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code.

P 45-15 : 403.3-SNYDER3934

P 46-15

Part I:
403.6 (New)
Part II:
2902.3.7 (New)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IPC COMMITTEE. PART II WILL BE HEARD BY THE IBC-GENERAL COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

Proponent: Ronald Geren, RLGA Technical Services, LLC, representing Self (ron@specsandcodes.com)

Part I

2015 International Plumbing Code

Add new text as follows:

403.6 Fixture distribution. Where two or more toilet rooms are provided for each sex, the required number of lavatories shall be distributed proportionately to the required number of water closets.

Part II

THE IBC-G COMMITTEE IS ONLY TO DECIDE WHETHER THIS SECTION SHOULD BE PLACED CHAPTER 29. THE TECHNICAL PART OF THE NEW SECTION WILL BE DECIDED BY THE IPC COMMITTEE.

2015 International Building Code

Add new text as follows:

2902.3.7 Fixture distribution. Where two or more toilet rooms are provided for each sex, the required number of lavatories shall be distributed proportionately to the required number of water closets.

Reason: The proposed addition is intended to prevent the uneven distribution of plumbing fixtures for each sex within two or more toilet facilities. For example, if 6 water closets and 3 lavatories are required for males, they cannot be distributed as follows:

- Male Toilet Facility 1: 4 water closets and 1 lavatory
- Male Toilet Facility 2: 2 water closets and 2 lavatories

The correct distribution shall be as follows:

- Male Toilet Facility 1: 4 water closets and 2 lavatories
- Male Toilet Facility 2: 2 water closets and 1 lavatory

Cost Impact:

Part I: Will not increase the cost of construction
The same number of fixtures is required, so there is not an increase in cost.

Part II: Will not increase the cost of construction
The same number of fixtures is required, so there is not an increase in cost.

P 46-15 : 403.6 (New)-GEREN5708

P 47-15

404.1.1 (New)

Proponent: Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

2015 International Plumbing Code

Add new text as follows:

404.1.1 Clustered family-or-assisted-use toilet facilities. Where multiple family-or-assisted-use toilet facilities are clustered at a single location, not less than 50 percent of the cluster of toilet facilities shall be required to be accessible.

Reason: IBC Section 1109.2 Exception 2 allow for single occupant toilet rooms that are clustered and of the same type to only have 50% constructed accessible. Since the family or assisted-use toilet room requirements basically describe an accessible single occupant bathroom, the intent of the exception is to allow for the same exception to be applicable when someone uses the allowance in IPC Section 404.2.2. This would be consistent with the 2010 ADA Standard for Accessible Design.
This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes. This is CTC/PMG Proposal Item 1.

In July/2014 the ICC Board decided to sunset the activities of the Code Technology Committee (CTC). This is being accomplished by re-assigning many of the CTC Areas of Study to the applicable Code Action Committee (CAC). This proposal falls under the CTC Area of Study entitled Acccessiblity. Information on the CTC, including: the sunset plan; meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the CTC website.

Cost Impact: Will not increase the cost of construction
This proposal will not increase the cost of construction because no additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code.

P 47-15 : 404.1.1 (New)-SNYDER3938

P 48-15

405.3.1

Proponent: David Beahm, Building Official, Warren County, representing Virginia Plumbing and Mechanical Inspectors Association, Virginia Building Code Officials Association and Warren County Virginia (dbeahm@warrencountyva.net)

2015 International Plumbing Code

Revise as follows:

405.3.1 Water closets, urinals, lavatories and bidets. A water closet, urinal, lavatory or bidet shall not be set closer than 15 inches (381 mm) from its center to any side wall, partition, vanity or other obstruction, or closer than 30 inches (762 mm) center to center between adjacent fixtures. There shall be not less than a 21-inch (533 mm) clearance in front of the water closet, urinal, lavatory or bidet to any wall, fixture or door. Water closet compartments shall be not less than 30 inches (762 mm) in width and not less than 60 inches (1524 mm) in depth for floormounted water closets and not less than 30 inches (762 mm) in width and 56 inches (1422 mm) in depth for wallhung water closets.

<u>**Exception:** An accessible children's water closet shall be set not closer than 12 inches from its center to the required partition or to the wall on one side.</u>

Reason: Both the 2003 and the 2009 ICC ANSI A117.1 indicate this reduced measurement and this exception allows the user to realize this allowance without having to go out of the IPC.

Cost Impact: Will not increase the cost of construction
This is a reference statement only and is already allowed within the associated referenced standard.

P 48-15 : 405.3.1-BEAHM3629

P 49-15

405.3.1, 405.3.5

Proponent: Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

2015 International Plumbing Code

Revise as follows:

405.3.1 Water closets, urinals, lavatories and bidets. A water closet, urinal, lavatory or bidet shall not be set closer than 15 inches (381 mm) from its center to any side wall, partition, vanity or other obstruction. Where partitions or other obstuctions do not separate adjacent fixtures, ~~or~~fixtures shall not be set closer than 30 inches (762 mm) center to center between adjacent fixtures. There shall be not less than a 21-inch (533 mm) clearance in front of ~~the~~a water closet, urinal, lavatory or bidet to any wall, fixture or door. Water closet compartments shall be not less than 30 inches (762 mm) in width and not less than 60 inches (1524 mm) in depth for floormounted water closets and not less than 30 inches (762 mm) in width and 56 inches (1422 mm) in depth for wallhung water closets.

405.3.5 Urinal partitions. Each urinal utilized by the *public* or employees shall occupy a separate area with walls or partitions to provide privacy. The width between walls or partitions at each urinal shall be not less than 30 inches (762 mm).The walls or partitions shall begin at a height not greater than 12 inches (305 mm) from and extend not less than 60 inches (1524 mm) above the finished floor surface. The walls or partitions shall extend from the wall surface at each side of the urinal not less than 18 inches (457 mm) or to a point not less than 6 inches (152 mm) beyond the outermost front lip of the urinal measured from the finished backwall surface, whichever is greater.

Exceptions:

1. Urinal partitions shall not be required in a single-occupant or family/assisted-use toilet room with a lockable door.
2. Toilet rooms located in child day care facilities and containing two or more urinals shall be permitted to have one urinal without partitions.

Reason: Where partitions are required between adjacent fixtures, the spacing cannot be 30 inches center-to-center between fixtures. We have heard about contractors who have been caught off guard by this, not knowing about the thickness of a partition (because those items are typical not there "in the rough"), only to find out at final inspection that they have a violation because someone later came in and installed the required partitions. This happens frequently with multiple urinal layouts. The added text clarifies that the width between partitions must be 30 inches and the spacing between adjacent fixtures is only applicable where partitions will not be installed.
This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes. This is PMGCAC Item 140.

Cost Impact: Will not increase the cost of construction
This proposal will not increase the cost of construction because no additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code.

P 49-15 : 405.3.1-SNYDER3939

P 50-15

405.4.1

Proponent: Pennie L Feehan, Copper Development Association, representing Copper Development Association (penniefeehan@me.com)

2015 International Plumbing Code

Revise as follows:

405.4.1 Floor flanges. Floor flanges for water closets or similar fixtures shall be not less than 0.125 inch (3.2 mm) thick for ~~brass~~copper alloy, 0.25 inch (6.4 mm) thick for plastic and 0.25 inch (6.4 mm) thick and not less than a 2-inch (51 mm) caulking depth for cast iron or galvanized malleable iron.

Floor flanges of hard lead shall weigh not less than 1 pound, 9 ounces (0.7 kg) and shall be composed of lead alloy with not less than 7.75-percent antimony by weight. Closet screws and bolts shall be of ~~brass~~copper alloy. Flanges shall be secured to the building structure with corrosion-resistant screws or bolts.

Reason: There are many different copper and copper-alloy compositions. Copper alloy is the term used to identify materials manufactured where copper is the base metal and it includes brass and bronze.

Cost Impact: Will not increase the cost of construction
This proposal will not impact the cost of construction as this change is only a clarification of the name of a product.

P 50-15 : 405.4.1-FEEHAN3790

P 51-15

Part I:
405.4.3
Part II:
Table P2701.1, P2702.4

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IPC COMMITTEE. PART II WILL BE HEARD BY THE IRC PLUMBING COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

Proponent: Angel Guzman Rodriguez, representing American Society of Mechanical Engineers

Part I

2015 International Plumbing Code

Revise as follows:

405.4.3 Securing wall-hung water closet bowls. Wallhung water closet bowls shall be supported by a concealed metal carrier that is attached to the building structural members so that strain is not transmitted to the closet connector or any other part of the plumbing system. The carrier shall conform to ~~ASME A112.6.1M or~~ ASME A112.6.2.

Part II

2015 International Residential Code

Revise as follows:

TABLE P2701.1
PLUMBING FIXTURES, FAUCETS AND FIXTURE FITTINGS

MATERIAL	STANDARD
~~Floor-affixed supports for off-the-floor plumbing fixtures for public use~~	~~ASME A 112.6.1M~~
Framing-affixed supports for off-the-floor water closets with concealed tanks	ASME A 112.6.2

P2702.4 Carriers for wall-hung water closets. Carriers for wall-hung water closets shall conform to ~~ASME A112.6.1 or~~ ASME A112.6.2.

Reason: Update Section 405.4.3 by removing the reference to ASME A112.6.1M since the requirements from standard are now covered in A112.6.2. The A112.6.1M standard is longer published by ASME.
Standard ASME A112.6.1M–1997(R2008) Floor affixed Supports for Off-the-floor Plumbing Fixtures for Public Use will be automatically removed from Chapter 15 during processing of the 2018 IPC.

Cost Impact:

Part I: Will not increase the cost of construction
This will not increase the cost of construction since the proposal is editorial/updating in nature.

Part II: Will not increase the cost of construction
This will not increase the cost of construction since the proposal is editorial/updating in nature.

P 52-15

405.5 (New)

Proponent: Julius Ballanco, JB Engineering and Code Consulting, P.C., representing Self (JBENGINEER@aol.com)

2015 International Plumbing Code

Add new text as follows:

405.5 Plumbing fixtures with a pumped waste Plumbing fixtures with a pumped waste shall comply with ASME A112.3.4/CSA B45.9. The plumbing fixture with a pumped waste shall be installed in accordance with the manufacturer's instructions.

Reason: ASME A112.3.4/CSA B45.9 was added to the code during the last revision. This standard covers macerating toilet systems and fixtures with a pumped waste. The requirements for pumped waste systems were added during the latest revision of the standard.
The fixtures with a pumped waste are typically installed during renovation or where pipe pitch cannot be achieved. Often times, plumbing fixtures with pumped waste are accessible fixture add for the physically challenged of for the aging in place. These fixtures must be installed in accordance with the manufacturer's instructions. There are limitation on the length of the pumped waste drain. There can also limitation on the location of the fixture.

This section will compliment Section 712.4.1.

Cost Impact: Will not increase the cost of construction
Since a fixture with a pumped waste is optional, there is no cost impact.

Proponent: Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

Part I

2015 International Plumbing Code

Revise as follows:

405.8 Slip joint connections. Slip joints connections shall be installed only for tubular waste piping and only between the outlet of a fixture and the connection to the drainage piping. Slip joint connections shall be made with an *approved*~~elastomeric~~ sealing gasket ~~and shall only be installed on the trap outlet, trap inlet and within the trap seal~~. ~~Fixtures with concealed slip-joint~~Slip joint connections shall be provided with access. Such access shall provide an ~~*access* panel or utility space~~opening that is not less than 12 inches (~~305 mm~~305mm) in its smallest dimension ~~or other *approved* arrangement so as to provide *access* to the slip joint connections for inspection and repair~~.

1002.2 Design of traps. Fixture traps shall be self-scouring. Fixture traps shall not have interior partitions, except where such traps are integral with the fixture or where such traps are constructed of an *approved* material that is resistant to corrosion and degradation. ~~Slip joints~~Traps having slip joint connections shall ~~be made~~comply with ~~an *approved* elastomeric gasket and shall be installed only on the trap inlet, trap outlet and within the trap seal.~~Section 405.8.

Part II

2015 International Residential Code

Revise as follows:

SECTION P2704
~~ACCESS TO~~SLIP JOINT CONNECTIONS

P2704.1 ~~General~~Slip joints. Slip joints connections shall be installed only for tubular waste piping and only between the trap outlet of a fixture and the connection to the drainage piping. Slip joint connections shall be made with an *approved* ~~elastomeric~~ sealing gasket ~~and shall be installed only on the trap outlet, trap inlet and within the trap seal~~. ~~Fixtures with concealed slip-joint~~Slip joint connections shall be ~~provided with~~accessible. Such access shall provide an ~~access panel or utility space~~opening that is not less than 12 inches (~~305 mm~~305mm) in its smallest dimension ~~or other *approved* arrangement so as to provide access to the slip connections for inspection and repair~~.

P3201.1 Design of traps. Traps shall be of standard design, shall have smooth uniform internal waterways, shall be self-cleaning and shall not have interior partitions except where integral with the fixture. Traps shall be constructed of lead, cast iron, copper or copper alloy or *approved* plastic. Copper or copper alloy traps shall be not less than No. 20 gage (0.8 mm) thickness. Solid connections, slip joints and couplings shall be permitted to be used on the trap inlet, trap outlet, or within the trap seal. ~~Slip joints~~Trap having slip joint connections shall ~~be accessible.~~comply with Section P2704.1.

Reason: From the existing wording of this section, some inspectors have the misconception that the code doesn't allow slip joints to be installed upstream of a trap inlet nor at the connection of the trap "arm" to the drainage piping. For example, consider a typical lavatory where the drainage piping in the wall was roughed in at a fairly low elevation and the tailpiece from the fixture outlet is not very long. Normally, a slip joint end, tubular waste extension piece is installed to make the connection to the end of the fixture tailpiece to the inlet of the trap. However, if the existing wording is read literally, the code doesn't allow a slip joint above the trap inlet: *only at the trap inlet, outlet and within the trap seal.* Although it would be ideal to have the rough-in elevation of the drain in the wall "coordinate" with the elevation of the fixture outlet tailpiece piece, it is not realistic to make this happen every time. Sometimes the rough-in installer doesn't know the height of the cabinetry for the lavatory or the model of the drain assembly because neither have been chosen yet by the builder designer.
The revised wording allows for what is a common practice for fixture installation in the plumbing industry.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes. This is PMGCAC Item 1.

Cost Impact:

Part I: Will not increase the cost of construction
This proposal will not increase the cost of construction because no additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code.

Part II: Will not increase the cost of construction
This proposal will not increase the cost of construction because no additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code.

P 53-15 : 405.8-SNYDER3940

P 54-15

Part I:
412.4 (New)
Part II:
IBC 1211 (New), IBC 1211.1 (New)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IPC COMMITTEE. PART II WILL BE HEARD BY THE IBC-GENERAL COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

Proponent: Tim Earl, GBH International, representing The Oatey Company (tearl@gbhinternational.com)

Part I

2015 International Plumbing Code

Add new text as follows:

412.4 Upper floors laundry room floor drain required. Where a room has plumbing provisions for the installation of a stationary automatic clothes washer, and that room is located above a finished space, the floor in the room shall have a floor drain. The floor finish shall be in accordance with Section 1211.1 of the *International Building Code.*

Part II

2015 International Building Code

Add new text as follows:

SECTION1211
ROOMS HAVING FLOORS DRAINS

1211.1 Laundry rooms with floor drains. A laundry room having a floor drain shall have an installed floor finish system that is nonabsorbent. Concrete floors shall not be required to have a nonabsorbent floor finish system.

Reason: The average claim for damages related to a ruptured washing machine connection in second floor laundries and first floor laundries over finished basement areas is over $8,000. Materials that are wetted and not replaced can promote mold growth, resulting in potential health hazards and additional repair costs. The costs associated with this water damage are much higher than the estimated cost of installing a floor drain.

Cost Impact:

Part I: Will increase the cost of construction
Estimated cost would be less than $200 per laundry room, including materials and labor, when part of new construction.

Part II: Will increase the cost of construction
Estimated cost would be less than $200 per laundry room, including materials and labor, when part of new construction.

Part II:
P2713.1

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IPC COMMITTEE. PART II WILL BE HEARD BY THE IRC-PLUMBING COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

Proponent: Julius Ballanco, representing Self (JBENGINEER@aol.com)

Part I

2015 International Plumbing Code

Revise as follows:

407.2 Bathtub waste outlets and overflows. Bathtubs shall be equipped with a waste outlet ~~and an overflow outlet. The outlets shall be connected to waste tubing or piping~~ not less than $1^1/_2$ inches (38 mm) in diameter. The waste outlet shall be equipped with a water-tight stopper. Where an overflow is installed on a bathtub, the overflow shall be not less than 1-1/2 inches (38 mm) in diameter.

Part II

2015 International Residential Code

Revise as follows:

P2713.1 Bathtub waste outlets and overflows. Bathtubs shall be equipped with a waste outlet ~~and an overflow outlet. The outlets shall be connected to waste tubing or piping~~that is not less than $1^1/_2$ inches (38 mm) in diameter. The waste outlet shall be equipped with a water-tight stopper. Where an overflow is installed, the overflow shall be not less than $1^1/_2$ inches (38 mm) in diameter.

Reason: The Code is currently not coordinated with the referenced standards. The standards listed in Table 2701.1 do not require an overflow. An overflow is an optional connection for a bathtub. The reason the standard removed the mandate for overflows is because they cannot be properly cleaned. Furthermore, they are rarely if ever used, which is the only way to clean the overflow. Without proper cleaning, there is a build-up of contaminants in the overflow.
As the code currently reads, it prohibits certain tubs because they do not have an overflow. However, Table 2701.1 allows these tubs.

The national consensus product standard should be the document that regulates the construction requirements of a bathtub.

Cost Impact:

Part I: Will not increase the cost of construction
This will decrease the cost of construction by not requiring an overflow for every bathtub.

Part II: Will not increase the cost of construction
This will decrease the cost of construction by not requiring an overflow for every bathtub.

P 55-15 : P2713.1-BALLANCO3381

P 56-15

409.1, Chapter 14

Proponent: Julius Ballanco, representing Self (JBENGINEER@aol.com)

2015 International Plumbing Code

Revise as follows:

409.1 Approval. Commercial dishwashing machines shall conform to ASSE 1004 and NSF 3. Residential dishwashers shall conform to NSF 184.

Add new standard(s) as follows:

NSF 184-2014 Residential Dishwashers

Reason: NSF 184 is the standard that regulates the performance of a residential dishwasher. Some of the requirements in this standard include achieving a minimum 99.999 percent or 5-log reduction of bacteria and reaching a final rinse temperature of 150º F. The sanitization performance is verified when the unit is operated on the sanitizing cycle

There are hundreds of residential dishwashers that have been certified to this standard.

Cost Impact: Will not increase the cost of construction

This simply adds the correct reference standard for residential dishwashers.

Analysis: A review of the standard proposed for inclusion in the code, NSF 184-10 , with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2015.

P 56-15 : 409.1-BALLANCO3382

P 57-15

409.3, 409.4 (New), 802.1.6

Proponent: Julius Ballanco, JB Engineering and Code Consulting, P.C., representing Self (JBENGINEER@aol.com)

2015 International Plumbing Code

Revise as follows:

409.3 Waste connection. The waste connection of a commercial dishwashing machine shall comply with Section ~~802.1.6 or~~ 802.1.7~~, as applicable~~.

Add new text as follows:

409.4 Residential dishwasher waste connection. The waste connection of a residential dishwasher shall connect directly to a wye branch fitting on the tailpiece of the kitchen sink, directly to the dishwasher connection of a food waste disposer, or through an air break to a standpipe. The waste line of a residential dishwasher shall rise and be securely fastened to the underside of the sink rim or counter top.

Delete without substitution:

~~**802.1.6 Domestic dishwashing machines.** Domestic dishwashing machines shall discharge indirectly through an *air gap* or *air break* into a waste receptor in accordance with Section 802.2, or discharge into a wye branch fitting on the tailpiece of the kitchen sink or the dishwasher connection of a food waste disposer. The waste line of a domestic dishwashing machine discharging into a kitchen sink tailpiece or food waste disposer shall connect to a deck-mounted air gap or the waste line shall rise and be securely fastened to the underside of the sink rim or counter.~~

Reason: The dishwaser waste connection requirements must be separated between a residential unit and a commercial unit. Commercial dishwashing machines are required to discharge through an indirect connection. The change to 409.3 will identify the indirect waste connections as only applying to commercial units. There is no change to the discharge requirements of a commercial dishwashing machine.
Residential units are technically identified as "residential dishwashers" not "domestic dishwashing machines." The standard regulating residential dishwashers is entitled, "Residential Dishwashers." There, the change is made in the terminology.

The connection of a residential dishwasher has always been permitted to be a direct connection to a kitchen sink tailpiece or a dishwasher connection of a food waste disposer. The indirect connection has always been optional. Therefore, the waste connection requirements belong in Section 409.4, not Chapter 8. Chapter 8 is reserved for indirect connections that are required. Section 802.1.6 does not belong under indrect waste. The section specifically allows a direct connection for dishwashers. This is the common type of connection, not an indrect connection.

The indirect connection is a hold-over from when dishwashers were first introduced. It was incorrectly assumed that an indirect connection was necessary. However, the plumbing profession recognized that an indirect connection is not necessary.

Cost Impact: Will not increase the cost of construction
This has no impact on the cost of construction since the connections permitted for a residential dishwasher remain the same.

P 57-15 : 409.3-BALLANCO3383

P 58-15

410.1, Chapter 14

Proponent: John Watson, Elkay, representing Elkay (john.watson@elkay.com)

2015 International Plumbing Code

Revise as follows:

410.1 Approval. Drinking fountains shall conform to ASME A112.19.1/CSA B45.2 or ASME A112.19.2/CSA B45.1 and water coolers shall conform to ~~AHRI 1010~~ASHRAE 18. Drinking fountains ~~and~~ , *water coolers* and water dispensers shall conform to NSF 61, Section 9. Electrically operated, refrigerated drinking *water coolers* and water dispensers shall be listed and labeled in accordance with UL 399.

Add new standard(s) as follows:

ASHRAE 18-2008 (RA 2013) Methods of Testing for Rating Drinking-Water Coolers with Self Contained Mechanical Refrigeration

Reason: Products/Devices that are installed to meet the requirements of drinking fountains need to comply to the same approval requirements as drinking fountains and water coolers. With the addition of water dispensers during the 2015 code cycle, we inadvertently failed to outline such requirements.

Cost Impact: Will not increase the cost of construction
This is a product certification issue which should not impact the product itself; therefore, there should be no cost increase.

Analysis: A review of the standard proposed for inclusion in the code, ASHRAE 18-2008 (RA 2013), with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2015.

P 58-15 : 410.1-WATSON5458

P 59-15

410.2 (IBC 2902.6)

Proponent: Stephen DiGiovanni, representing Southern Nevada Chapter of ICC (sdigiovanni@clarkcountynv.gov)

2015 International Plumbing Code

Revise as follows:

410.2 Small occupancies. Drinking fountains shall not be required for an occupant load of ~~15~~30 or fewer.

Reason: IPC Section 410.2 (IBC Section 2902.6) is revised to increase the occupant load up to 30 for those small occupancies where drinking fountains are not required. The increase in the occupant load for both drinking fountains and service sinks would provide a favorable code limitation to very small occupancies and a decrease in cost to small business owners. Real occupancy of spaces and the calculated occupant loads may differ to the point where the requirements of the current code may be too stringent.

Cost Impact: Will not increase the cost of construction
This proposal will result in a less stringent code requirement, and therefore would presumably lower the cost of construction.

P 59-15 : 410.2-DIGIOVANNI4738

P 60-15

410.2 (IBC 2902.6)

Proponent: Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

2015 International Plumbing Code

Revise as follows:

410.2 Small occupancies. Drinking fountains shall not be required for an occupant load of ~~15~~50 or fewer.

Reason: The following is provided as support that drinking fountains for smaller occupancies are just not needed as evidenced by the experience (two code cycles) in one of the hottest and driest areas of the country.
As many should know, the climate in Phoenix, Arizona is HOT and DRY. The following Wikipedia quote sums up the general facts:

Phoenix has a subtropical desert climate, typical of the Sonoran Desert in which it lies. Phoenix has extremely hot summers and warm winters. The average summer high temperatures are some of the hottest of any major city in the United States, and approach those of cities such as Riyadh and Baghdad.[60] On average (1981–2010), there are 107 days annually with a high of at least 100 °F (38 °C),[61] including most days from late May through early October. Highs top 110 °F (43 °C) an average of 18 days during the year[62] Every day from June 10 through August 24, 1993, the temperature in Phoenix reached 100 °F or more, the longest continuous number of days (76) in the city's history. Officially, the number of days with a high of at least 100 °F has historically ranged from 48 in 1913 to 143 in 1989. For comparison, since 1870, New York City has seen a temperature of 100 degrees or more a total of only 59 days.[63] On June 26, 1990, the temperature reached an all-time recorded high of 122 °F (50 °C).[64]

60. "Collier Center". Collier Center of Phoenix. RetrievedSeptember 12, 2012.

61. "NowData - NOAA Online Weather Data". National Oceanic and Atmospheric Administration.
Retrieved 2011-12-18.

62. "Climatology of heat in the southwest". National Weather Service. Retrieved January 6, 2009.

63. NWS Upton, NY. Retrieved 2014-05-24

64. Dorish, Joe. "10 All-Time Hottest Weather Temperature Days in Phoenix". Knoji. Retrieved February 5, 2014.

Another source indicates the average relative humidity is second to the lowest in the nation with Las Vegas having the lowest. Here's a typical year for Morning (M) and Afternoon (A) Relative Humidities in Phoenix:

JAN		FEB		MAR		APR		MAY		JUN		JUL		AUG		SEP		OCT		NOV		DEC	
M	A	M	A	M	A	M	A	M	A	M	A	M	A	M	A	M	A	M	A	M	A	M	A
67	33	60	27	57	24	43	16	35	13	31	12	44	20	51	23	49	23	50	22	57	27	67	34

Our mouths are parched just thinking about those afternoon conditions!

The City of Phoenix has always believed that the threshold of 15 occupants for not requiring drinking fountains was far too low such that it created a significant waste of building space for smaller buildings and tenant spaces. Phoenix made the decision two code cycles ago to raise the threshold to 50. In the 8 plus years of this new threshold in place for new and renovated buildings in Phoenix, there have not been any complaints about not having drinking fountains in smaller establishments. Not one.

It is believed that the low threshold is unwarranted for the remainder of the United States as those areas are not nearly as hot or dry as Phoenix.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes. This PMGCAC Item 97.

Cost Impact: Will not increase the cost of construction
This proposal will not increase the cost of construction because no additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code.

P 60-15 : 410.2-SNYDER3947

P 61-15

411.3 (New), Chapter 14

Proponent: Julius Ballanco, JB Engineering and Code Consulting, P.C., representing Self (JBENGINEER@aol.com)

2015 International Plumbing Code

Add new text as follows:

411.3 Water supply The temperature of the water supply to an emergency shower or eyewash station shall be controlled only by a temperature actuated mixing valve complying with ASSE 1071.

Add new standard(s) as follows:

ASSE 1071-2012 Performance Requirements for Temperature Actuated Mixing Valves for Plumbed Emergency Equipment

Reason: The temperature of the water to emergency fixtures is regulated by ASSE 1071 devices. These devices raise the temperature of the cold water by the introduction of hot water. The cold water flows freely through the device. This feature is imperative to prevent the water supply to an emergency fixture from shutting off.
The most important requirement of an emergency fixture is the constant flow of high volumes of water.

Without this code requirement, the water supply could be regulated with an ASSE 1070 device. This would be dangerous in that such a device could shut off the flow of water if there is a loss of either hot or cold water. By listing that the "only" means of protection is an ASSE 1071 device, no other mixing valve can be used.

The use of these devices is also consistent with the OSHA requirements for emergency fixtures.

Cost Impact: Will increase the cost of construction
There is a cost for an ASSE 1071 mixing valve.

Analysis: A review of the standard proposed for inclusion in the code, ASSE 1071-2012, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2015.

P 61-15 : 411.3 (New)-BALLANCO3810

P 62-15

411.3 (New), Chapter 14

Proponent: Ronald George, representing Self (Ron@Plumb-TechLLC.com)

2015 International Plumbing Code

Add new text as follows:

411.3 Delivery of tepid water for emergency fixtures. Water for emergency shower and eyewash flushing water shall be delivered through a properly sized, cold water by-pass equipped mixing valve conforming to ASSE 1071 Flushing fluid temperatures for eyewashes shall not exceed 100°F (37.8°C) Final adjustment of emergency shower and eyewash flushing water temperatures shall be determined by safety personnel at the site to assure a temperature that is adequate to encourage a full 15 minute flush of hazardous chemicals.

Add new standard(s) as follows:

ASSE 1071-2012 Temperature Actuated Mixing Valves for Plumbed Emergency Equipment

Reason: There was currently no requirement for emergency fixtures to use mixing valves that are listed to ASSE 1071. The aSSE 1071 standard has tight temperature control tolerences to address low flows associated with emergency eyewashes and hoigh flows associated with emergency showers. This industry standard was not referenced in the code.

Bibliography: www.ASSE-Plumbing.org
www.Plumb-Tech Design & Consulting Services LLC
www.ScaldPrevention.org

Cost Impact: Will not increase the cost of construction
Currently mixing valves were required in orger to meet the tepid water temperature range identified in the ANSI/ISEA Z358.1 standard. Installations havve been using products listed to this standard without reference in the codes.
This is simply catching up with waht is happening in the industry.

Analysis: A review of the standard proposed for inclusion in the code, ASSE 1071, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2015.

P 62-15 : 411.3 (New)-GEORGE5591

P 63-15

411.3 (New), Chapter 14

Proponent: Billy Smith, American Society of Plumbing Engineers Legislative Committee, representing American Society of Plumbing Engineers Legislative Committee (bsmith@aspe.org)

2015 International Plumbing Code

Add new text as follows:

411.3 **Water supply.** The temperature of the water supply to an emergency shower or eyewash station shall only be controlled by a temperature actuated mixing valve complying with ASSE 1071.

Add new standard(s) as follows:
ASSE 1071 - 2012 Performance Requirements for Temperature Actuated Mixing Valves for Plumbed Emergency Equipment

Reason: The temperature of the water to emergency fixtures is regulated by ASSE 1071 devices. These devices raise the temperature of the cold water by the introduction of hot water. The cold water flows freely through the device. This feature is imperative to prevent the water supply to an emergency fixture from shutting off. The most important requirement of an emergency fixture is the constant flow of high volumes of water.
Without this code requirement, the water supply could be regulated with an ASSE 1070 device. This would be dangerous in that such a device could shut off the flow of water if there is a loss of either hot or cold water. By listing that the "only" means of protection is an ASSE 1071 device, no other mixing valve can be used.

The use of these devices is also consistent with the OSHA requirements for emergency fixtures.

Cost Impact: Will not increase the cost of construction
This merely adds the proper reference to the thermostatic mixing valve required for an emergency shower.
This is already a requirement of OSHA.

Analysis: A review of the standard proposed for inclusion in the code, ASSE 1071, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2015.

P 63-15 : 411.3 (New)-SMITH5398

P 64-15

416.5, 416.6 (New)

Proponent: Ronald George, Self, Plumb-Tech Design & Consulting Services LLC; www.Plumb-TechLLC.com; www.ScaldPrevention.org, representing Self; Plumb-Tech Design & Consulting Services LLC (Ron@Plumb-TechLLC.com)

2015 International Plumbing Code

Revise as follows:

416.5 Tempered water for public hand-washing facilities. *Tempered water* shall be delivered from lavatories and group wash fixtures located in public toilet facilities provided for customers, patrons and visitors. *Tempered water* shall be delivered through an *approved* water-temperature limiting device that conforms to ASSE 1070 or CSA B125.3, or through a faucet having an integral limit stop that is field-adjusted and set.

Add new text as follows:

416.6 Hot or tempered water delivery from private lavatories *Hot water* or t*empered water* shall be delivered from lavatories and group wash fixtures located in private toilet facilities through an *approved* water-temperature limiting device conforming to ASSE 1070 or CSA B125.3, or through a faucet having an integral limit-stop that can be field-adjusted and set. Limiting devices and limit-stops shall be adjustable from 85°F (29.4°C) to 120°F (48.8°C). The setting of the device or limit-stop shall not allow a discharge water temperature exceeding 120°F (48.8°C).

Reason: This code change is intended to provide controls at a lavatory (either a limit stop on the lavatory handle or a point-of use temperature limiting valve under the sink to allow users to limit the maximum temperature flowing from a faucet to prevent scald injuries to children, elderly or handicapped persons when they are present in a facility.

Bibliography: www.ScaldPrevention.org
American Society of Sanitary Engineers standard: ASSE1070-2004 Water Temperature Limiting Devices

Cost Impact: Will increase the cost of construction
The cost for a faucet with a limit stop is minimal for the ability to limit the hot water in a home, apartment or hotel room where children, the elderly or handicapped persons may be injured using the fixture. This code change gives an option of a limit stop on the faucet or a temperature limiting valve conforming to ASSE 1070.

P 64-15 : 416.5-GEORGE5422

P 65-15

417.3.1 (New), 424.3.1 (New), 305.4

Proponent: James Richardson, Jr, City of Columbus Ohio, representing City of Columbus Ohio (jarichardson@columbus.gov)

2015 International Plumbing Code

Add new text as follows:

417.3.1 Rinsing showers on pool decks. Rinsing showers provided for outdoor swimming pools shall be located on the pool deck. The drains for the showers shall be directly connected to the building storm drain, the building storm sewer or, where a storm sewer does not exist, in accordance with storm water runoff requirements of the jurisdiction.

Rinsing showers provided for indoor swimming pools shall be located on the pool deck. The drains for such indoor showers shall be connected to a pool deck drain system that is installed in accordance with Section 802.1.4.

424.3.1 Pool deck rinsing shower controls. Shower heads for rinsing showers on outdoor swimming pool decks shall be supplied with water through an automatic temperature control mixing valve complying with ASSE 1069 or CSA B125.3. The valve shall be set to limit the water temperature to not greater than 120°F (48.9°C). Each valve shall be rated for the total flow of all shower heads served by the valve. Valves shall be located in a space that is maintained at a temperature of not less than 40°F (4.4°C).

Shower heads for rinsing showers on indoor swimming pool decks shall be contolled by valves in accordance with Section 425.3.

Revise as follows:

305.4 Freezing. Water, soil and waste pipes shall not be installed outside of a building, in attics or crawl spaces, concealed in outside walls, or in any other place subjected to freezing temperatures unless adequate provision is made to protect such pipes from freezing by insulation or heat or both. Exterior water supply system piping shall be installed not less than 6 inches (152 mm) below the frost line and not less than 12 inches (305 mm) below grade.

> **Exception:** Water, soil and waste piping in seasonal-use buildings and structures, or for outdoor seasonal-use plumbing fixtures such as pool deck rinsing showers, shall not be required to be protected as indicated this section provided that the water in the piping is evacuated by draining, by blowing out with air or by vacuuming. Evacuated traps shall be plugged or shall be refilled with a piping-compatible, environmentally-safe liquid that is freeze-resistant at the lowest expected outdoor temperature.

Reason: Rinsing showers are often provided for public pools with no real direction in the plumbing code as to how to address water and waste connections
Changing the wording for freeze protections would allow for owners who have seasonal out buildings or fixtures to winterize rather than providing "heat, insulation or both" when in many cases the only way to prevent freezing is actually evacuating water from the water lines.

Cost Impact: Will not increase the cost of construction
Rinsing showers are already provided with some form of temperature limiting valve, but in most cases are unable to be protected from freezing.

P 65-15 : 417.3.1 (New)-RICHARDSON5734

P 66-15

202 (New), 418.4 (New)

Proponent: Ronald George, Self; Plumb-Tech Design & Consulting Services LLC; www.Plumb-TechLLC.com; www.ScaldPrevention.org, representing Self; Plumb-Tech Design & Consulting Services LLC (Ron@Plumb-TechLLC.com)

2015 International Plumbing Code

Add new definition as follows:

SECTION 202 DEFINITIONS

SCALD HAZARD A condition where the discharge of high temperature hot water from a plumbing fixture can cause serious burn injuries.

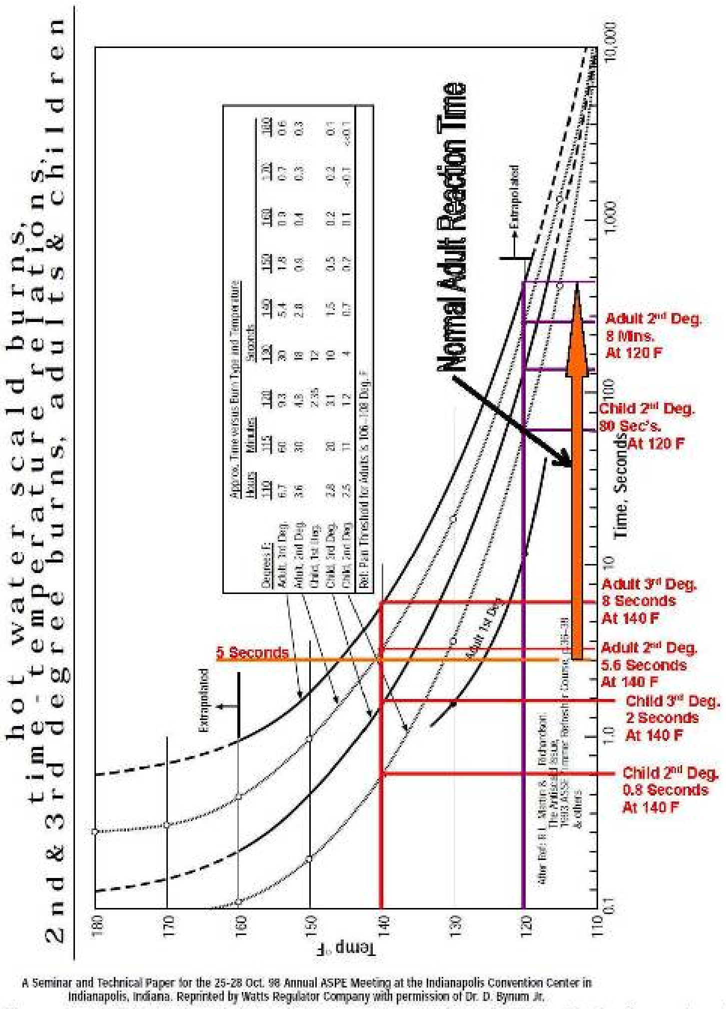
Add new text as follows:

418.4 Hot water temperature limits at sinks. To provide for the reduction of scald hazards for people, including the elderly, persons with physical disabilities and children, using public or private sinks where *hot water* is supplied to sink faucets, the water discharged to the sink shall flow through one or more of the following:

1. A device conforming to ASSE 1017.
2. A device conforming to ASSE 1070.
3. A device conforming to ASSE 1062.
4. A faucet having an integral, field-adjustable limit-stop that can be adjusted from 110°F (43.3°C) to 135°F (57.2°C).

Adjustable devices and limit-stop-equipped faucets shall be set at a faucet discharge water temperature, as determined by the building owner, that protects the intended users provided that the setting does not result in a water temperature exceeding 135°F (57.2°C). Non-adjustable devices complying with ASSE 1062 shall significantly reduce flow from the faucet when discharge water temperatures exceed 115°F (46.1°C).

Reason: This code change is intended to provide scald protection at sinks and it offers several options for controls. The code change is intended to allow limitation and adjustment of the hot water temperature to prevent scald injuries to children, elderly or handicapped persons when they are present in a facility.



A Seminar and Technical Paper for the 25-28 Oct. 98 Annual ASPE Meeting at the Indianapolis Convention Center in Indianapolis, Indiana. Reprinted by Watts Regulator Company with permission of Dr. D. Bynum Jr.

Figure 1 – Hot Water Scald Burns – Time vs Temperature Relationship for Second and Third Degree Burns for Adults and Children.
(Notes By: Ron George, CPD, See: www.ScaldPrevention.org)

Bibliography: www.ScaldPrevention.org

Cost Impact: Will increase the cost of construction
The cost for a faucet with a limit stop or an ASSE 1062 device (TAFR) is minimal for the ability to limit the hot water in a home, apartment or hotel room where children, the elderly or handicapped persons may be injured using the fixture. This code change gives several options to comply without spending too much for safety.

P 66-15 : 418.4 (New)-GEORGE5436

P 67-15

[BG] 419.3

Proponent: Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

2015 International Plumbing Code

Delete without substitution:

~~**[BG] 419.3 Surrounding material.** Wall and floor space to a point 2 feet (610 mm) in front of a urinal lip and 4 feet (1219 mm) above the floor and at least 2 feet (610 mm) to each side of the urinal shall be waterproofed with a smooth, readily cleanable, nonabsorbent material.~~

Reason: IBC Section 1210 already covers wall and floor materials in toilet facilities. There is no longer a need for this information to be in the IPC as the IPC does not have control of the section (as indicated by the [B] prior to the section number). Many code editions ago, this section was only in the IPC. However, it was later placed in the IBC as the IBC is concerned with the construction of interior spaces, toilet facilities being an interior space.
This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes. This is PMGCAC Item 134.

Cost Impact: Will not increase the cost of construction
This proposal will not increase the cost of construction because no additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code.

P 67-15 : [BG] 419.3-SNYDER3948

P 68-15

420.2, Table 604.4

Proponent: Julius Ballanco, JB Engineering and Code Consulting, P.C., representing Self (JBENGINEER@aol.com)

2015 International Plumbing Code

Revise as follows:

420.2 Water closets for public or employee toilet facilities. Water closet bowls for *public* or employee toilet facilities shall be of the elongated type. The full flush cycle water consumption of water closets for public use shall not exceed that indicated in Table 604.4 for public use water closets.

TABLE 604.4
MAXIMUM FLOW RATES AND CONSUMPTION FOR PLUMBING FIXTURES AND FIXTURE FITTINGS

PLUMBING FIXTURE OR FIXTURE FITTING	MAXIMUM FLOW RATE OR QUANTITY [b]
Water closet, private use	1.6 gallons per flushing cycle
Water closet, public use	1.28 gallons per full flush cycle or, where equipped with a dual flushing device, 1.6 gallons per full flush cycle

(Portions of table not shown remain unchanged)

For SI: 1 gallon = 3.785 L, 1 gallon per minute = 3.785 L/m, 1 pound per square inch = 6.895 kPa.

a. A hand-held shower spray is a shower head.

b. Consumption tolerances shall be determined from referenced standards.

Reason: This will increase the water conservation requirements for public use water closets. Every manufacturer of water closets has a 1.28 gallon per flush public water closet. Similarly, every manufacturer of water closets has a bowl for public use that can be equipped with a dual flush device.
If you consider a standard commercial building with 100 water closets. The water savings amounts to more than 33,000 gallons per year. This savings is accomplished without any loss in performance of the plumbing system.

Cost Impact: Will increase the cost of construction
If a dual flush water closet is installed, the cost for the water closet is higher than a 1.6 gpf water closet. The added cost is for the fixture. The labor remains the same.

P 68-15 : 420.2-BALLANCO3815

P 69-15

422.1, 609.1, 713.1

Proponent: John Williams, CBO, Chair, representing Adhoc Health Care Committee (AHC@iccsafe.org)

2015 International Plumbing Code

Revise as follows:

422.1 Scope. This section shall govern those aspects of health care plumbing systems that differ from plumbing systems in other structures. Health care plumbing systems shall conform to the requirements of this section in addition to the other requirements of this code. The provisions of this section shall apply to the special devices and equipment installed and maintained in the following *occupancies*: ~~nursing homes~~Group I-1, ~~homes for the aged~~Group I-2, ~~orphanages, infirmaries, first aid stations, psychiatric~~Group B ambulatory care facilities, ~~clinics, professional~~medical offices ~~of dentists~~ and ~~doctors, mortuaries, educational facilities, surgery, dentistry,~~ research and testing laboratories, ~~establishments~~and Group F facilities manufacturing pharmaceutical drugs and medicines~~ and other structures with similar apparatus and equipment classified as plumbing~~.

609.1 Scope. This section shall govern those aspects of health care plumbing systems that differ from plumbing systems in other structures. Health care plumbing systems shall conform to the requirements of this section in addition to the other requirements of this code. The provisions of this section shall apply to the special devices and equipment installed and maintained in the following occupancies: ~~nursing homes~~Group I-1, ~~homes for the aged~~Group I-2, ~~orphanages, infirmaries, first aid stations, psychiatric~~Group B ambulatory care facilities, ~~clinics, professional~~medical offices ~~of dentists~~ and ~~doctors, mortuaries, educational facilities, surgery, dentistry,~~ research and testing laboratories, ~~establishments~~and Group F facilities manufacturing pharmaceutical drugs and medicines~~ and other structures with similar apparatus and equipment classified as plumbing~~.

713.1 Scope. This section shall govern those aspects of health care plumbing systems that differ from plumbing systems in other structures. Health care plumbing systems shall conform to this section in addition to the other requirements of this code. The provisions of this section shall apply to the special devices and equipment installed and maintained in the following occupancies: ~~nursing homes; homes for the aged; orphanages; infirmaries; first aid stations; psychiatric~~Group I-1, Group I-2, Group B ambulatory care facilities~~; clinics; professional~~, medical offices ~~of dentists~~ and ~~doctors; mortuaries; educational facilities; surgery, dentistry,~~ research and testing laboratories~~; establishments~~, and Group F facilities manufacturing pharmaceutical drugs and medicines~~; and other structures with similar apparatus and equipment classified as plumbing~~.

Reason: This proposal replaces a laundry list of healthcare related facilities with the corresponding occupancy groups. These occupancy groups are the ones most likely to have healthcare related activity that might have an impact on the supply and waste systems.

The ICC Ad Hoc Committee on Healthcare (AHC) has just completed its 4th year. The AHC was established by the ICC Board to evaluate and assess contemporary code issues relating to hospitals and ambulatory healthcare facilities. This is a joint effort between ICC and the American Society for Healthcare Engineering (ASHE), a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. Information on the AHC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the AHC effort can be downloaded from the AHC website at: http://www.iccsafe.org/cs/AHC/Pages/default.aspx.

Cost Impact: Will not increase the cost of construction
This proposal is clarification only, therefore, the cost of construction will not change.

~~**422.10 Special elevations.** Control valves, vacuum outlets and devices protruding from a wall of an operating, emergency, recovery, examining or delivery room, or in a corridor or other location where patients are transported on a wheeled stretcher, shall be located at an elevation that prevents bumping the patient or stretcher against the device.~~

Reason: Clinical needs must determine the location of control valves, vacuum outlets and other plumbing control devices. The chance that a patient or stretcher could accidentally bump them is too broad for consistent interpretation. Given the need for ready access to some of these devices this could cause conflicts with other codes and standards, such as NFPA 99. In addition, the language cannot be consistently interpreted and enforced.

The ICC Ad Hoc Committee on Healthcare (AHC) has just completed its 4th year. The AHC was established by the ICC Board to evaluate and assess contemporary code issues relating to hospitals and ambulatory healthcare facilities. This is a joint effort between ICC and the American Society for Healthcare Engineering (ASHE), a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. Cost Impact: Will not increase the cost of construction
This section is a duplication, therefore, there is no change in construction costs.

P 71-15 : 422.3-WILLIAMS4247

P 72-15

422.4

Proponent: John Williams, CBO, Chair, representing Adhoc Health Care Committee (AHC@iccsafe.org)

2015 International Plumbing Code

Revise as follows:

422.4 Materials. Fixtures designed for therapy, special cleansing or disposal of waste materials~~, combinations of such purposes, or any other special purpose,~~ shall be of smooth, impervious, corrosion-resistant materials~~ and, where subjected to temperatures in excess of 180°F (82°C), shall be capable of withstanding, without damage, higher temperatures~~.

Reason: The phrase "combination of such purposes" is already addressed in the list and not needed. The phrase "or any other special purpose" is too broad. There are hundreds of specialty sinks throughout health care facilities. The phrase "and, where subjected to temperatures in excess of 180°F (82°C), shall be capable of withstanding, without damage, higher temperatures" is also proposed to be deleted. It does not provide any limits on how high of a temperature the fixture has to be designed for. In addition, water in excess of 180 degrees would not be found in a fixture as described in the list of what this section is applicable to. Temperatures in excess of 180 degrees would burn skin, so this is only within sealed systems.

The ICC Ad Hoc Committee on Healthcare (AHC) has just completed its 4th year. The AHC was established by the ICC Board to evaluate and assess contemporary code issues relating to hospitals and ambulatory healthcare facilities. This is a joint effort between ICC and the American Society for Healthcare Engineering (ASHE), a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. 422.5, 422.9.1

Proponent: John Williams, CBO, Chair, representing Adhoc Health Care Committee (AHC@iccsafe.org)

2015 International Plumbing Code

Delete without substitution:

~~**422.5 Access.** *Access* shall be provided to concealed piping in connection with special fixtures where such piping contains steam traps, valves, relief valves, check valves, vacuum breakers or other similar items that require periodic inspection, servicing, maintenance or repair. *Access* shall be provided to concealed piping that requires periodic inspection, maintenance or repair.~~

~~**422.9.1 Sterilizer piping.** *Access* for the purposes of inspection and maintenance shall be provided to all sterilizer piping and devices necessary for the operation of sterilizers.~~

Reason: This proposal deletes language that is too broad to be practically enforceable. All plumbing is required to have access for inspections, maintenance and repairs, therefore, it does not need to be repeated here. The term "all sterilizer piping" could be construed to mean all supply and waste piping. Current language could be read to require the entire length of the supply and waste pipes to be exposed.

The ICC Ad Hoc Committee on Healthcare (AHC) has just completed its 4th year. The AHC was established by the ICC Board to evaluate and assess contemporary code issues relating to hospitals and ambulatory healthcare facilities. This is a joint effort between ICC and the American Society for Healthcare Engineering (ASHE), a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. Cost Impact: Will not increase the cost of construction
This proposal is clarification, therefore, the cost of construction will not change.

P 73-15 : 422.5-WILLIAMS4249

P 74-15

422.6, 422.7, 713.2

Proponent: John Williams, CBO, Chair, representing Adhoc Health Care Committee (AHC@iccsafe.org)

2015 International Plumbing Code

Revise as follows:

422.6 ~~Clinical~~Flushing rim sink. A ~~clinical~~flushing rim sink shall have an integral trap in which the upper portion of a visible trap seal provides a water surface. The fixture shall be designed so as to permit complete removal of the contents by siphonic or blowout action and to reseal the trap. A flushing rim shall provide water to cleanse the interior surface. The fixture shall have the flushing and cleansing characteristics of a water closet.

422.7 Prohibited usage of ~~clinical~~flushing rim sinks and service sinks. A ~~clinical~~flushing rim sink serving a soiled utility room shall not be considered as a substitute for, or be utilized as, a service sink. A service sink shall not be utilized for the disposal of urine, fecal matter or other human waste.

713.2 ~~Bedpan washers and clinical~~Flushing rim sinks. ~~Bedpan washers and clinical~~
Flusing rim sinks shall connect to the drainage and vent system in accordance with the requirements for a water closet. ~~Bedpan washers shall also connect to a local vent.~~

Reason: This proposal attempts to clarify terms to ones that are more commonly accepted by the healthcare industry. Clinical sink or bed pan washer is too broad a term. The last sentence in 713.2 is not needed. It is covered by the 1st sentence. Section 713.2 appears to indicate that a bedpan washer and a clinical sink are different items, but Sections 422.6 and 422.7 is just clinical sinks but has requirements for bed pan washers. The hospital industry uses the term flushing rim sink for sinks used to clean bedpans. This proposals assumes that a "service sink" is some type of utility sink, quite often a mop sink.

The ICC Ad Hoc Committee on Healthcare (AHC) has just completed its 4th year. The AHC was established by the ICC Board to evaluate and assess contemporary code issues relating to hospitals and ambulatory healthcare facilities. This is a joint effort between ICC and the American Society for Healthcare Engineering (ASHE), a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. P 75-15 : 422.8-WILLIAMS4251

P 76-15

423.3, 424.10 (New)

Proponent: Ronald George, Self; www.ScaldPrevention.org, representing Self (Ron@Plumb-TechLLC.com)

2015 International Plumbing Code

Revise as follows:

423.3 Footbaths~~,~~ <u>and</u> pedicure baths ~~and head shampoo sinks~~. The water supplied to specialty plumbing fixtures, such as pedicure chairs having an integral foot bathtub~~, footbaths,~~ and ~~head shampoo sinks,~~<u>footbaths</u> shall be limited to a maximum temperature of 120°F (49°C) by a water temperature limiting device that conforms to ASSE 1070 or CSA B125.3.

Add new text as follows:

<u>**424.10** **Head shampoo sink faucets** Head shampoo sink faucets shall be supplied with hot water that is limited to a maximum temperature of 120°F (49°C) by a water temperature limiting device that conforms to ASSE 1070 or CSA B125.3. Each faucet shall have integral check valves to prevent crossover flow between the hot and cold water supply connections.</u>

Reason: The hot water temperature limit requirement for head shampoo sinks was approved for the 2015 IPC and inserted, along with footbaths and pedicure chairs, in Section 423.3. As the faucet is normally mounted on a plumbing fixture, a (shampoo) sink, the requirement for temperature limiting is better located with all of the other faucets and fixture fittings in Section 424 so the requirement doesn't go unnoticed.
This proposal leaves the footbath and pedicure bath water temperature limitation requirements in Section 423.3 (as those "baths" are not usually considered as "plumbing fixtures" but *specialty* fixtures.) This proposal moves the shampoo sink faucets requirement part of 423.3 to a new Section 424.10.

A new requirement was added for integral check valves in shampoo sink faucets to reduce the potential for thermal shock to the user. The scald hazard is abated by the tempering valve but there still could be the "thermal shock" issue (rapid change in temperature, usually going to cold). Where multiple shampoo sinks are installed but only served by one master ASSE 1070 (or CSA B125.3) tempering valve, there can be cross flow between the sink faucets such that the user-set water temperature can vary considerably, very quickly. The person getting their head shampooed is in a mostly prone position and reactively moves their head to the side (rather than up and out of the way), hitting their head hard on the side of the shampoo sink basin. In elderly persons, a bruise can easily happen, sometimes leading to a break in the skin. This is just an unecessary injury.

Most quality shampoo faucets are already equipped with integral check valves so for the most part, this proposal doesn't change anything that is commonly being installed today. The proposal simply protects the user (the person getting their head shampooed) from thermal shock should a type of faucet without integral check valves is being considered for installation at a shampoo sink.

Cost Impact: Will not increase the cost of construction
Quality shampoo sink faucets that are most commonly installed already include intergal check valves so there won't be any increase in the cost of construction. The new requirement just prevents designers and installers from choosing an inappropriate faucet type.

P 76-15 : 424.10 (New)-GEORGE5596

P 77-15

424.3

Proponent: Julius Ballanco, representing Self (JBENGINEER@aol.com)

2015 International Plumbing Code

Revise as follows:

424.3 Individual shower valves. Individual shower and ~~tubshower~~tub-shower combination valves shall be balanced-pressure, thermostatic or combination balanced-pressure/thermostatic valves that conform to the requirements of ASSE 1016/ ASME A112.1016/CSA B125.16 or ASME A112.18.1/CSA B125.1 and shall be installed at the point of use. ~~Shower and~~The maximum temperature of water discharging from an individual shower or tub-shower combination ~~valves required by this section~~valve shall be ~~equipped with a means to limit the maximum setting of the valve to~~ 120°F (49°C)~~, which~~. The maximum discharge water temperature shall be ~~field adjusted in accordance with~~limited by a temperature-actuated mixing valve conforming to ASSE 1017, ASSE 1070, or CSA B125.3, by a temperature-actuated, flow reduction device conforming to ASSE 1062 that is installed at every discharge outlet, or by the ~~manufacturer's instructions. In-line thermostatic valves shall not be utilized for compliance with this section.~~field adjustment and setting of the hot water temperature limit stop within the individual shower or tub-shower combination valve.

Reason: The plumbing engineering community has found it to be safer for large installations, such as hotels and motels, to limit the temperature of the hot water to shower valves and tub-shower combination valves. This avoids the need to adjust every shower valve.
The maximum temperature requirement is based on someone inadvertently turning the water to full hot. This was typically assumed to be a child. Hence, this limitation is not related to thermal shock. As such a thermostatic mixing valve can be used to accomplish this level of protection, including an ASSE 1017, ASSE 1070, or CSA B125.3 valve.

This change still permits the handle limit stop on the individual valve to be used to limit the temperature of the hot water.

The last sentence regarding in-line thermostatic mixing valves predates the change to ASME A112.18.1/CSA B125.1. It no longer has any meaning. Furthermore, with the allowance of a central thermostatic mixing valve to limit the temperature of the hot water, this sentence would only add confusion to the requirements.

Temperature actuated flow reduction devices are extremely effective in protecting users from high temperatures in a shower. The devices reduce the flow of water to a trickle, thus preventing water in excess of 120°F from hitting the bather. These devices meet the intent of the code requirement for limiting the maximum temperature of hot water.

Cost Impact: Will not increase the cost of construction
The change allows an option. Hence, there is no cost impact for options.

P 77-15 : 424.3-BALLANCO3386

P 78-15

424.3

Proponent: John Koeller, representing Maximum Performance (MaP) Testing (jkoeller@map-testing.com)

2015 International Plumbing Code

Revise as follows:

424.3 Individual shower valves. Individual shower and tubshower combination valves shall be balanced-pressure, thermostatic or combination balanced-pressure/thermostatic valves that conform to the requirements of ASSE 1016/ ASME A112.1016/CSA B125.16 or ASME A112.18.1/CSA B125.1 and shall be installed at the point of use. Shower and tub-shower combination valves required by this section shall be equipped with a means to limit the maximum setting of the valve to 120°F (49°C), which shall be field adjusted in accordance with the manufacturer's instructions. In-line thermostatic valves shall not be utilized for compliance with this section. <u>Shower and tub-shower combination valves shall bear the manufacturer's tag, label, or mark stating the minimum rated flow of the valve and such tag, label, or mark shall be visible by the code official and the shower end-user after installation of the valve.</u>

Reason: The marking of in-line plumbing products for the purpose of informing inspectors and others is not without precedent. IPC section 501.7 requires a visible mark of "maximum working pressure" on storage tanks as follows: "Such markings shall be in an accessible position outside of the tank so as to make inspection or reinspection readily possible." A similar situation exists with shower valves, because those valves are usually not readily visible to the inspector (nor, if they were visible, are they required to have a product marking of the minimum rated flow). Therefore, the proposed language provides for a visible indication of that rating for the inspector, similar to the provision for storage tanks cited above.

Installation of a shower valve meeting the referenced ASSE/ASME/CSA standard is not necessarily fully sufficient to ensure shower safety. The thermal protection afforded by shower valves can be compromised if the flow rate of the showerhead is less than the flow rate for which the protective components of the valve have been designed. The referenced ASME/ASSE/CSA standards for shower valves allow for acceptance and certification at a rated flow of up to 2.5 gpm. However, showerheads with maximum flow rates significantly below 2.5 gpm are widely available on the market today. For example, the current EPA WaterSense specification for showerheads sets a maximum flow rate of 2.0 gpm, and many showerheads are already available with flow rates between 2.0 and 1.5 gpm. After-market showerheads are available at flow rates as low at 1.0 gpm.

As manufacturers continue to innovate with more water- and energy-efficient showerheads, it is important to ensure that both new and retrofit installations of showerheads be accompanied by the shower valve information needed to safely protect the user.

Two significant reasons exist for adopting the proposed code change:

(1) Facilitate inspection and compliance: provides a readily visible statement of the minimum flow rate at which the shower valve is certified, such that it can be easily compared with, and its compatibility confirmed with the flow rate of the installed showerhead.

(2) Inform the homeowner/occupant: When a homeowner determines to replace an existing aging showerhead, it is important that he/she understands the limitations of the thermal protection afforded by the in-wall shower valve. As such, the homeowner must have access to the minimum flow rate at which such protection is provided by the installed valve. Without such information, safety would be compromised if the flow rate of the showerhead is less than the flow rate for which the protective components of the valve have been designed. By requiring a permanent mark, removable tag, or removable label on or attached to the faceplate or escutcheon, the homeowner/occupant is informed.

The permanent mark may be applied by the manufacturer of the valve or, in the event they are different, the manufacturer of the escutcheon or face plate, . A removable tag or label (provided by the manufacturer) must be either affixed to the valve, to the escutcheon, or to the face plate by the manufacturer of the valve.

Cost Impact: Will increase the cost of construction
Every model of shower valve meeting the referenced standard has been tested for thermal protection at at a flow rate of 2.5 gpm or a lesser flow rate designated by the manufacturer. This proposal will require manufacturers to convey the information <u>they already have</u> about the rated flow of each model of valve to the installer and the end user via a tag, removable label, or mark. There is <u>no additional testing required</u> nor is there special handling or distribution required. The cost of the proposal is de minimis, associated with affixing a tag, label or mark. If a permanent mark on the shower valve is the manufacturer's choice, the cost to the manufacturer is unknown, but certainly nominal. If a paper tag or removable adhesive label is chosen as the compliance path, the cost is similarly nominal, estimated to be less than one dollar ($1.00). In some cases, a valve body common to several models may be designed to accommodate different cartridges containing thermal protection components with differing performance characteristics. This may require additional inventory control by the manufacturer to ensure that outwardly similar valves with different cartridges (and different rated flows) are properly marked or labeled before entering the supply chain.

P 78-15 : 424.3-KOELLER5488

P 79-15

424.3, 424.4

Proponent: Ed Osann, representing Natural Resources Defense Council (eosann@nrdc.org)

2015 International Plumbing Code

Revise as follows:

424.3 Individual shower valves. Individual shower and tubshower combination valves shall be balanced-pressure, thermostatic or combination balanced-pressure/thermostatic valves that conform to the requirements of ASSE 1016/ ASME A112.1016/CSA B125.16 or ASME A112.18.1/CSA B125.1 and shall be installed at the point of use. Shower control valves shall provide thermal shock protection for the rated flow rate of the installed showerhead. Shower and tub-shower combination valves required by this section shall be equipped with a means to limit the maximum setting of the valve to 120°F (49°C), which shall be field adjusted in accordance with the manufacturer's instructions. In-line thermostatic valves shall not be utilized for compliance with this section.

424.4 Multiple (gang) showers. Multiple (gang) showers supplied with a single-tempered water supply pipe shall have the water supply for such showers controlled by an *approved* automatic temperature control mixing valve that conforms to ASSE 1069 or CSA B125.3, or each shower head shall be individually controlled by a balanced-pressure, thermostatic or combination balanced-pressure/thermostatic valve that conforms to ASSE 1016/ASME A112.1016/CSA B125.16 or ASME A112.18.1/CSA B125.1 and is installed at the point of use. Where showerheads are individually controlled, shower control valves shall provide thermal shock protection for the rated flow rate of the installed showerhead. Such valves shall be equipped with a means to limit the maximum setting of the valve to 120°F (49°C), which shall be field adjusted in accordance with the manufacturers' instructions.

Reason: Installation of a shower valve meeting the referenced ASSE/ASME/CSA standard is not sufficient to ensure shower safety. The thermal protection afforded by shower valves can be compromised if the flow rate of the showerhead is less than the flow rate for which the protective components of the valve have been designed. The referenced standard for shower valves allows for acceptance at a rated flow of up to 2.5 gpm. However, 2.5 gpm at 80 psi is the current federal *maximum* flowrate for showerheads, and showerheads with maximum flow rates well below 2.5 gpm are widely available. The current EPA *WaterSense* specification for showerheads has a maximum flow rate of 2.0 gpm, and over 3,000 qualifying models are on the market today. Many showerheads are available with flow rates between 2.0 and 1.5 gpm. As manufacturers continue to innovate with more water- and energy-efficient showerheads, the code change proposed here is needed to ensure that new buildings built to this code will safely accommodate the showerheads selected by the designer or builder.
Note that this language does not require that the showerhead itself have a flow rate of less than 2.5 gpm, but simply that the shower valve provide the thermal protection called for under the recognized standard when tested at a flow rate that matches the flow rate of the showerhead.

The 2012 Uniform Plumbing Code, Section 408.3, contains a similar requirement for 'matching' the valve and showerhead flow rates as follows:

> "Showers and tub-shower combinations shall be provided with individual control valves of the pressure balance, thermostatic, or combination pressure balance/thermostatic mixing valve type that provide scald and thermal shock protection for the rated flow of the installed showerhead."

The IRC should be no less protective of health and safety than the UPC.

Additional Technical Background

As noted above, the thermal protection afforded by shower valves can be compromised if the flow rate of the showerhead is less than the flow rate for which the protective components of the valve have been designed. As noted by Martin and Johnson (2008) (as cited in Codes and Standards Enhancement Initiative (CASE), "Multi-Head Showers and Lower-Flow Shower Heads," 2013 California Building Energy Efficiency Standards, California Utilities Statewide Codes and Standards Team, September 2011), combinations of valves and shower heads were tested to determine whether pressure-compensating valves and thermostatic valves with rated flows of 2.5 gpm would perform adequately at lower flow rates. The tests included 22 shower valves from six manufacturers, and the valves were assessed on their ability to maintain water temperature within certain bounds for a given time after a change in pressure event, as described by the ASSE 1016-2005 standard for shower valves. The results indicated that a significant share of shower valves rated for 2.5 gpm failed to provide the thermal protection specified by ASSE 1016 when tested at lower flow rates. As summarized in the CASE report (p. 15): "These results indicate that shower valve temperature maintenance is strongly affected by flow rate, and that new showers with lower-flow shower heads would have to be installed with valves that are designed for 2.0 and lower flow rates."

Cost Impact: Will not increase the cost of construction
Adoption of this proposal will have no effect on the cost of construction, since it calls for the installation of showerheads and shower mixing valves that are compatible, rather than calling for the installation of a particular showerhead or mixing valve that might carry a cost premium. Care in specification and installation is required, not a special product or special installation technique. As noted above, the proposal does not require that the showerhead itself have a flow rate of less than 2.5 gpm, and compliance can be achieved with minimally compliant valves and showerheads. If an architect or builder chooses to install a more efficient showerhead with a lower flow rate, there are valves available at moderate price points that can accomodate the builder's deision. For example, in January 2015, Moen was offering numerous models of showerhead, valve, and trim featuring a pressure-balance type valve retail priced at $102.90 that is fully compatible with showerheads rated at 1.75 gpm maximum or higher. Valves of the temperature-balancing type are more expensive, but are not required by this proposal.

The temperature of water discharging from such valves shall ~~be installed at the point of use. Shower and tub-shower combination valves required by this section shall be equipped with a means to limit the maximum setting of the valve to~~not exceed 120°F (49°C)~~, which~~. The temperature shall be ~~field adjusted in accordance with~~limited either by a temperature-actuated master mixing valve conforming to ASSE 1017, ASSE 1070, or CSA B125.3, or by the ~~manufacturer's instructions~~limit stop integral to each point-of-use-controlled shower or tub-shower combination valve. ~~In-line thermostatic~~Master mixing valves or integral limit stops, whichever serves as the temperature limiting means, shall~~ not~~ be ~~utilized for compliance with this section.~~field-adjusted and set after the hot water distribution system is operational.

Reason: This change will recognize a common means of limiting the maximum temperature from a shower valve, which is a central thermostatic mixing valve. Plumbing engineers have used this method of design in many large installations, including high rise residential buildings, hotels, and motels. It is an effective means of preventing the temperature from rising above of 120°F. This also removes the possible problem with improperly adjusted individual shower valves.
Since the maximum temperature requirement is not a means of protecting against thermal shock, any thermostatic mixing valve can be used. There is no need for end point protection of shutting off the flow of water. This is still accomplished by the shower valve. Therefore, a thermostatic mixing valve can conform to ASSE 1017, ASSE 1070, or CSA B125.3 valve.

The individual valve handle limit stop can still be used to limit the maximum temperature of hot water. This is the common means of providing this level of protection in individual dwelling units.

The existing last sentence has been deleted since it adds confusion regarding the use of central thermostatic mixing valves for limiting the temperature of the hot water. The code requirements are complete without having this confusing last sentence.

Cost Impact: Will not increase the cost of construction
This does not increase the cost since the change merely provides options for the installer or designer.

P 80-15 : 424.3-SMITH5386

P 81-15

424.5

Proponent: James Richardson, Jr (jarichardson@columbus.gov)

2015 International Plumbing Code

Delete without substitution:

~~**424.5 Bathtub and whirlpool bathtub valves.** The *hot water* supplied to bathtubs and whirlpool bathtubs shall be limited to a maximum temperature of 120°F (49°C) by a water-temperature limiting device that conforms to ASSE 1070 or CSA B125.3, except where such protection is otherwise provided by a combination tub/shower valve in accordance with Section 424.3.~~

Reason: Bathtub and whirlpool bathtub valves - Generally, individuals using these type of fixtures will check the temperature of the water prior to entering into the fixture. These fixtures are also typically hold large volumes and limiting the temperature to 120 gegrees Fahrenheit will cause long fill times and most like cause the user to end up with an other than desired entry temperature due to the excessive fill times. These are not cases where someone has been incapacitated and is unable to remove themselves from harms way.

Cost Impact: Will not increase the cost of construction
This proposal will result in less material and labor costs as temperature limiting devices don't have to be installed.

P 81-15 : 424.5-RICHARDSON6020

P 82-15

Part I:
424.5
Part II:
P2713.3

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IPC COMMITTEE. PART II WILL BE HEARD BY THE IRC-PLUMBING COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

Proponent: Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

Part I

2015 International Plumbing Code

Revise as follows:

424.5 Bathtub and whirlpool bathtub valves. The *hot water* supplied to bathtubs and whirlpool bathtubs shall be limited to a maximum temperature of 120°F (49°C) by a water-temperature limiting device that conforms to ASSE 1070 or CSA B125.3, except where such protection is otherwise provided by a combination tub/shower valve in accordance with Section 424.3. <u>Access shall be provided to the ASSE 1070 or CSA B125.3 devices. Such access shall be large enough to enable removal of the device for replacement and for temperature adjustments.</u>

Part II

2015 International Residential Code

Revise as follows:

P2713.3 Bathtub and whirlpool bathtub valves. Hot water supplied to bathtubs and whirlpool bathtubs shall be limited to a temperature of not greater than 120°F (49°C) by a water-temperature limiting device that conforms to ASSE 1070 or CSA B125.3, except where such protection is otherwise provided by a combination tub/shower valve in accordance with Section P2708.4. <u>These ASSE 1070 or CSA B125.3 devices shall be accessible. Such access shall be large enough to enable removal of the device for replacement and for temperature adjustments.</u>

Reason: Designers and installers don't think about these devices needing periodic adjustment, cleaning or replacement. Although it should be obvious that these devices should not be covered up without any way to get to them, this happens frequently, because, "the code doesn't make me do otherwise". This is loophole that needs to be eliminated so that these safety devices can be accessed.
This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes. This is PMGCAC Item 51.

Cost Impact:

Part I: Will increase the cost of construction
This proposal will increase the cost of construction because additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code. Specifically, these valves might have to be located elsewhere where access can be made to the valve. This might involve a little more piping and labor. Or, at a minimum, an access panel might have to be installed in a wall or ceiling. As access wasn't required before, this extra work to provide access might increase the cost of construction in some situations.

Part II: Will increase the cost of construction
This proposal will increase the cost of construction because additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code. Specifically, these valves might have to be located elsewhere where access can be made to the valve. This might involve a little more piping and labor. Or, at a minimum, an access panel might have to be installed in a wall or ceiling. As access wasn't required before, this extra work to provide access might increase the cost of construction in some situations.

P 83-15

424.7

Proponent: Julius Ballanco, JB Engineering and Code Consulting, P.C., representing Self (JBENGINEER@aol.com)

2015 International Plumbing Code

Revise as follows:

424.7 Temperature-actuated, flow reduction ~~valves~~devices for individual fixture fittings. Temperature-actuated, flow reduction devices, where installed for individual fixture fittings, shall conform to ASSE 1062. A temperature-actuated, flow reduction device shall be an *approved* method for limiting the water temperature to not greater than 120º F (49º C) at the outlet of a faucet or fixture fitting. Such ~~valves~~devices shall not be used alone as a substitute for the balanced-pressure, thermostatic or combination shower valves required in Section 424.3 or as a substitute for bathtub or whirlpool tub water-temperature limiting valves required in Section 424.5.

Reason: Temperature actuated flow reduction (TAFR) devices are extremely effective in protecting users from high temperatures, especially in a shower. The devices reduce the flow of water to a trickle, thus preventing water in excess of 120°F from hitting the user. When the code limits the maximum temperature of hot water, TAFR devices can provide this level of protection.
The reason for not permitting these devices on a bathtub or whirlpool tub are because of the operation of the TAFR device. When the maximum temperature is met, these devices reduce the flow to a trickle. In a bathtub, this would still allow scalding water to accumulate in the bathtub. If a small child is placed in the bathtub, or falls into the bathtub, TAFR devices do not provide any protection from scalding.

Cost Impact: Will not increase the cost of construction
Options do not increase the cost of construction.

Proponent: Janine Snyder (PMGCAC@iccsafe.org)

2015 International Plumbing Code

Add new definition as follows:

SECTION 202 DEFINITIONS

ACCESSIBLE. Describes a site, building, facility of portion thereof that complies with Chapter 11 of the *International Building Code.*

Revise as follows:

SECTION 202 DEFINITIONS

Supply fitting. A fitting that controls the volume, direction of flow or both, of water and is either attached to or ~~accessible~~is accessed from a fixture, or is used with an open or atmospheric discharge.

425.3.4 Access required. All parts in a flush tank shall be ~~accessible~~provided with access for repair and replacement.

501.7 Pressure marking of storage tanks. Storage tanks and water heaters installed for domestic hot water shall have the maximum allowable working pressure clearly and indelibly stamped in the metal or marked on a plate welded thereto or otherwise permanently attached. Such markings shall be in ~~an accessible~~a position with access on the outside of the tank so as to make inspection or reinspection readily possible.

712.3.2 Sump pit. The sump pit shall be not less than 18 inches (457 mm) in diameter and not less than 24 inches (610 mm) in depth, unless otherwise *approved*. The pit shall be ~~accessible~~provided with access and shall be located such that all drainage flows into the pit by gravity. The sump pit shall be constructed of tile, concrete, steel, plastic or other *approved* materials. The pit bottom shall be solid and provide permanent support for the pump. The sump pit shall be fitted with a gastight removable cover that is installed flush with grade or floor level, or above grade or floor level. The cover shall be adequate to support anticipated loads in the area of use. The sump pit shall be vented in accordance with Chapter 9.

1103.4 Cleanout. ~~An accessible~~ A cleanout shall be installed on the building side of the trap and shall be provided with access.

1113.1.2 Sump pit. The sump pit shall be not less than 18 inches (457 mm) in diameter and not less than 24 inches (610 mm) in depth, unless otherwise *approved*. The pit shall be ~~accessible~~provided with access and shall be located such that all drainage flows into the pit by gravity. The sump pit shall be constructed of tile, steel, plastic, cast iron, concrete or other *approved* material, with a removable cover adequate to support anticipated loads in the area of use. The pit floor shall be solid and provide permanent support for the pump.

1302.5 Filtration. Untreated water collected for reuse shall be filtered as required for the intended end use. Filters shall be ~~accessible~~provided with access for inspection and maintenance. Filters shall utilize a pressure gauge or other *approved* method to provide indication when a filter requires servicing or replacement. Filters shall be installed with shutoff valves immediately upstream and downstream to allow for isolation during maintenance.

1302.8.1 Bypass valve. One three-way diverter valve listed and labeled to NSF 50 or other approved device shall be installed on collection piping upstream of each storage tank, or drainfield, as applicable, to divert untreated on-site reuse sources to the sanitary *sewer* to allow servicing and inspection of the system. Bypass valves shall be installed downstream of fixture traps and vent connections. Bypass valves shall be marked to indicate the direction of flow, connection and storage tank or drainfield connection. Bypass valves shall be installed in ~~accessible locations~~locations that are provided with access. Two shutoff valves shall not be installed to serve as a bypass valve.

1302.9 Pumping and control system. Mechanical equipment including pumps, valves and filters shall be ~~easily accessible and removable~~provided with access that allows for removal in order to perform repair, maintenance and cleaning. The minimum flow rate and flow pressure delivered by the pumping system shall be appropriate for the application and in accordance with Section 604.

1303.8 Filtration. Collected rainwater shall be filtered as required for the intended end use. Filters shall be ~~accessible~~provided with access for inspection and maintenance. Filters shall utilize a pressure gauge or other *approved* method to provide indication when a filter requires servicing or replacement. Filters shall be installed with shutoff valves installed immediately upstream and downstream to allow for isolation during maintenance.

1303.12 Pumping and control system. Mechanical equipment including pumps, valves and filters shall be ~~easily accessible and removable~~provided with access that allows for removal in order to perform repair, maintenance and cleaning. The minimum flow rate and flow pressure delivered by the pumping system shall be appropriate for the application and in accordance with Section 604.

604.11 Individual pressure balancing in-line valves for individual fixture fittings. Where individual pressure balancing in-line valves for individual fixture fittings are installed, such valves shall comply with ASSE 1066. Such valves shall be installed in ~~an accessible location~~location with access and shall not be utilized alone as a substitute for the balanced pressure, thermostatic or combination shower valves required in Section 424.3.

Reason: The purpose of this proposal is consistency between terminologies in the codes.
The term 'accessible' is defined in the IBC. This same definition should appear in the IPC . It is used as defined in Sections 110.2, 403.3.1, 403.4, 403.5, 404.1, 404.2, 404.3, 417.4.2 and 1002.4. This proposal had revised language for other locations.

The term 'Access (to)' is already defined in the IPC as follows:

> **[M] ACCESS (TO).** That which enables a fixture, appliance or equipment to be reached by ready access or by a means that first requires the removal or movement of a panel, door or similar obstruction (see "Ready access").

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes. This is CTC/PMG Proposal Item 2.

In July/2014 the ICC Board decided to sunset the activities of the Code Technology Committee (CTC). This is being accomplished by re-assigning many of the CTC Areas of Study to the applicable Code Action Committee (CAC). This proposal falls under the CTC Area of Study entitled Accessibily. Information on the CTC, including: the sunset plan; meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the CTC website.

Cost Impact: Will not increase the cost of construction
This proposal will not increase the cost of construction because no additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code.

P 84-15 : 425.3.4-SNYDER5912

P 86-15

202 (New), Section 428 (New), 428.1 (New)

Proponent: Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

2015 International Plumbing Code

Add new text as follows:

SECTION 428
SERVICE SINKS

428.1 General. A service sink shall be a wall-mounted or floor-mounted mop sink. The sink drain shall have an outlet that is not less than 3-inches (76 mm) in diameter. Laundry trays and laundry sinks shall be prohibited to serve as a service sink. Where a service sink is required by Table 403.1, there shall be one service sink available for each tenant space or where public and employee toilet facilities are located in a central core of a building, there shall be one service sink on each floor of a building. Service sinks shall not be located within a toilet facility except where such sinks are located in a locked janitor closet of the toilet facility.

> **Exception:** Where tenant spaces will not have access to a centrally-located service sink and the tenant spaces have limited areas of hard-surface floors, a service sink shall not be required provided that not less than one toilet facility in the tenant space is equipped with a floor drain, hose bibbs for hot and cold water are provided in that toilet facility and such sink omission is approved.

SECTION 202 DEFINITIONS

SERVICE SINK. A general purpose utlity sink intended to be used for facilitating the cleaning of a building or tenant space.

Reason: The code has always lacked information on service sinks, other than to require them in certain building uses. This section provides the necessary information. It is a plumbing fixture and deserve to be included in Chapter 4. Similar requirements have been added (to the model code) at code adoption for some State codes such as New York.
This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes. This is PMGCAC 172.

Cost Impact: Will not increase the cost of construction
This proposal will not increase the cost of construction because no additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code. This proposal does not require any more service sinks than required by the 2015 IPC. In fact, the proposed language offers a reasonable exception to not have a service sink. Therefore, as service sinks were always required for specific applications, the cost impact of this proposal should be negligible, in the big picture.

P 86-15 : 428.1 (New)-SNYDER3951

P 87-15

501.4

Proponent: Ronald George, Self; Plumb-Tech Design & Consulting Services LLC; www.Plumb-TechLLC.com; www.ScaldPrevention.org, , representing Self; Plumb-Tech Design & Consulting Services LLC (Ron@Plumb-TechLLC.com)

2015 International Plumbing Code

Revise as follows:

501.4 Location. Water heaters and storage tanks shall be located in close proximity to the pressure zone of the distribution system served so that the water pressure at the water heater is not greater than 35 psi (241.3 kPa) less than the water heater pressure relief valve setting. Water heaters and storage tanks shall be located and connected so as to provide *access* for observation, maintenance, servicing and replacement.

Reason: Over the years I have investigated may plumbing system failures where improper designs located all of the water heaters in the basement of a high rise building. In many of these cases the system pressure exceeded the pressure relief valve discharge pressure or came close enough to where intermitteent pressure spikes from water hammer or pressure chanfges in the system caused intermittent discharges of the relief valve. I have seen system designs using plate and frame heat exchangers on high rise buildings that did not have relief valves, integrated temperature controls or thermal expansion tanks on extremely tall buildings. Because of this design, the system pressure exceeded the relief valve pressure and thermal expansion tank working pressure rating. The relief valved were completely removed creating a bomb. In other installations, the relief valves were hanged out to much higher relief valve pressure settings, well above the pressure rating of the equipment. These fabricated and unlisted and unlabeled (built on site) Hot water generator systems were bombs waiting for the right moment to go off. There is no third party listing for the fabricated system and they are controled by piping system applied controls that are not listed for use with the heat exchanger. Adding the language to locate the water heaters within the pressure zone prevents this from occuring. Improper location of the water heaters has been occuring because there is no limitation on where the water heater is located with respect to elevation or pressure zone limitations and often owners/engineers/contractors may unknowingly force the issue of placing the water heater in a basement and creating pressure problems and not providing mechanical rooms up in or near the pressure zones in the building. This code change will help to address these issues. This is a health and safety issue in high rise buildings.

Cost Impact: Will increase the cost of construction
This is a health and safety issue that will require additional material and some additonal labor costs to locate water heaters in the appropriate locations to be within the pressure zones of the water distribution system.

P 88-15

501.8, 501.9 (New)

Proponent: Ronald George, Plumb-Tech Design & Consulting Services LLC; www.ScaldPrevention.org; www.LegionellaPrevention.org, representing Self; Plumb-Tech Design & Consulting Services LLC (Ron@Plumb-TechLLC.com)

2015 International Plumbing Code

Revise as follows:

501.8 ~~Temperature~~Water heater temperature controls. ~~Hot water supply systems~~Water heaters shall be equipped with automatic temperature controls capable of adjustments from the lowest to the highest acceptable temperature settings for the intended temperature operating range.

501.9 Hot water distribution system temperature controls. The temperature of the hot water discharging from all water heaters shall be controlled by a tempering valve conforming to ASSE 1017. The minimum hot water temperature in the hot water distribution system shall be 124 degrees F to prevent Legionella bacteria growth. This provision shall not supersede the requirements for temperature limiting devices for scald protection at fixtures.

Reason: The existing language was always confusing as it was not clear if the temperature controls were for the water heater or the plumbing system. This code change clears up this language.
Water Heater Thermostats Do Not Control the Water Heater Outlet Temperatures
If you adjust the water heater thermostat for the burner or heating element on a water heater down to 120 degrees, it will not prevent scalding. Water heater thermostats cannot be relied upon to control the hot water temperature leaving a water heater. Water heater manufacturers recommend that installers set thermostats at 120 - 125 F, and most of them ship the water heaters at an even lower temperature setting. It is not possible to set a water heater thermostat at a given temperature and get a relatively constant temperature of hot water from a water heater. The thermostat can not accurately control the water heater outlet temperature with a water heater thermostat.

My experience has been that not many people know that water heater thermostats cannot control the outlet temperature of a water heater. This warrants an explanation of how a water heater thermostat works so everyone understands the dial on the water heater does not have the accuracy to control the outlet temperature of storage type heater.

Water heater thermostats do not provide precise temperature controls for hot water systems. For example: the thermostat dial calibration test of ANSI Z21.10.1-1998, which is the applicable standard for gas-fired water heaters, allows the temperature to vary 10 degrees above or below the thermostat setting. I have talked to water heater manufacturers that have indicated that the controls can vary as much as 15 to 18 degrees Fahrenheit above or below the set point of the thermostat. From my experience, I have recorded the temperature leaving the top portion of a water heater over a long period of time during intermittent uses and saw temperature swings over 40 degrees Fahrenheit leaving the water heater. The shower valve standards do not have this kind of temperature fluctuation included their testing for all types of shower valves. The significant temperature swings are because the thermostat is inserted into the lower portion of a water heater tank and turns the fuel supply to the heater on and off. Most new water heater thermostat dials have no way to know what the temperature in the tank is. There is rarely a fixed temperature indicated on the dial, however some manufacturers publish temperatures associated with various marks on the thermostat dial or in their literature even though the dial cannot not control the outlet temperature of the water heater, it only controls when the energy to the heater is turned "on" and "off" by sensing the cold water coming into the bottom of the heater.

Generally, if the water heater thermostat dial is set at 120 degrees Fahrenheit, the burner would come on when the temperature at the thermostat reaches about 105 degrees Fahrenheit. The burner stays on until the water around the thermostat which is near the bottom of the heater reaches about 135 degrees Fahrenheit. (The "burner off" temperature is about 30 degrees higher than when the burner came "on" and generally about 15 degrees above the theoretical set point of the thermostat).

Most people don't realize that the maximum temperature limit test of the ANSI Z21.10.1 Gas Water Heater Standard allows the outlet water temperature of the water heater to rise significantly above the thermostat setting. This provision in the standard accounts for the phenomenon known as "stacking" or "thermal layering". The hot water is less dense and rises to the top of the hot water tank. Just like hot air rises and lifts a hot air balloon, hot water rises to the top of the tank and the cooler water drops to the bottom of the tank. Stacking or thermal layering occurs when the hot water rises to the top of the heater due to recurring short duration heating cycles caused by a frequent number of small quantity hot water uses. Frequent short draws cause cold water to enter the bottom of the water heater where the thermostatic element senses the cold water from the turbulent flow stirring in the bottom of the heater. The cold water causes the water heater to cycle on. This phenomenon can occur in any type of storage water heater and generally is more significant in vertical heaters.

I have recorded temperatures as high as 150 to 166 degrees Fahrenheit at the top of water heaters that had the thermostats set between 120 to 125 degrees Fahrenheit. Temperatures over 151 degrees Fahrenheit are extremely high temperatures and can cause serious scald burns in only a two seconds of contact with the skin. (See Table 1 - Water Temperature Effects on Adult Skin) It should be noted that the time temperature relationships in Table 1 are based upon the thickness of the skin for adult males. Children and the elderly typically have a thinner layer of the skin or epidermis and the exposure times can be shorter or the same burns can occurs in a given time at slightly lower temperatures.

Cost Impact: Will increase the cost of construction
This code change will require a tempering valve on the outlet of all water heaters. This is because the controls on water heaters are not acurate and when controls are set to lower temperatures, it promotes Legionella bacteria growth. This code change will require temperatures that do not promote Legionell bacteria growth and it will provide for scald protection.

P 88-15 : 501.8-GEORGE5840

P 89-15

502.1, Chapter 14

Proponent: Rex Gillespie (rex.gillespie@caleffi.com)

2015 International Plumbing Code

Revise as follows:

502.1 General. Water heaters shall be installed in accordance with the manufacturer's instructions. Oil-fired water heaters shall conform to the requirements of this code and the *International Mechanical Code*. Electric water heaters shall conform to the requirements of this code and provisions of NFPA 70. Gas-fired water heaters shall conform to the requirements of the *International Fuel Gas Code*. Solar thermal water heating systems shall conform to the requirements of the *International Mechanical Code* and SRCC 300.

Add new standard(s) as follows:
SRCC Standard 300, Minimum Standard for Solar Thermal Water Heating Systems, January 3, 2013, Solar Rating and Certification Corporation.

Reason: This section of the IPC establishes the appropriate reference for the requierments for various types of water heaters, but omits solar thermal water heaters. These water heaters are covered in both the IRC and the IMC in Chapter 23 and Chapter 14, respectively. Additionally, the 2015 IRC references the SRCC 300 standard for these systems. This new language directs the user to the appropriate code and reference standard for this increasingly common type of water heater.

Bibliography:
SRCC Standard 300, Minimum Standard for Solar Thermal Water Heating Systems, January 3, 2013.

Cost Impact: Will not increase the cost of construction
The proposed changes are not anticipated to raise the cost of construction. Most solar thermal systems and collectors are already certified to this standard in order to meet state requirements, those of the Internal Revenue Service for federal rebates, or to comply with the requiements of the 2015 IRC. Therefore, no additional product certifications are required.

Analysis: A review of the standard proposed for inclusion in the code, SRCC Standard 300, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2015.

202 (New), 502.6 (New), 502.6.1 (New), 502.6.2 (New)

Proponent: Ronald George, Self; Plumb-Tech Design & Consulting Services LLC; www.Plumb-TechLLC.com; www.ScaldPrevention.org, representing Self; Plumb-Tech Design & Consulting Services LLC; www.Plumb-TechLLC.com (Ron@Plumb-TechLLC.com)

2015 International Plumbing Code

Add new definition as follows:

SECTION 202 DEFINITIONS

SCALD HAZARD A condition where high temperature hot water discharged from a plumbing fixture can cause serious burn injuries to the user.

Add new text as follows:

502.6 Water heater replacement and scald protection Where the water temperature in a hot water distribution system changes as the result of a water heater replacement, repair or an alteration of the hot water distribution system such as a water heater thermostat adjustment or master mixing valve adjustment or replacement, each shower or combination tub-shower supplied by the system shall be inspected for the presence of a means for reducing scald hazards to the users.

Where the means for limiting the hot water temperature is a master mixing valve complying with ASSE 1017, a mixing valve complying with ASSE 1070 or an integral limit stop on the shower or combination tub-shower valve, adjustments shall be made in accordance with Section 609.4.1. Where the means for limiting the hot water temperature discharged at the fixture is a device complying with ASSE 1062, then the operation of the device shall be verified that it significantly reduces flow when the discharge temperature approaches 120◦F (48.8◦C).

Where a shower or tub-shower combination does not have a means for scald protection for a user, a means shall be installed in accordance with Section 609.4.2.

502.6.1 Adjustment procedure Temperature limit adjustments for shall be made and set to limit the temperature of the hot water discharged to any user to not greater than 120◦F (48.8◦C). These adjustments and settings shall only be performed after both of the following are satisfied:

1. The water heater has reached the water heater temperature control setting as recommended by the water heater manufacturer and has shut off its burner or electric elements.

2. Hot water has sufficiently reached the valve such that the temperature of the discharging at the fixture does not continue to rise.

A water heater thermostat shall be prohibited as a means for limiting hot water temperature for the purposes of required scald protection for a user of hot water.

502.6.2 Showers and combination tub-showers without means of protection against scalding.
Where a shower or tub-shower combination valve does not have a means for scald protection for a user, one or more of the following shall be performed:

1. The shower or combination tub/shower valve shall be replaced with a valve complying with ASSE 1016/ASME A112.1016/CSA B125.16. After replacement, the temperature limit stop shall be adjusted in accordance with Section 502.6.1

2. A master temperature actuated mixing valve complying with ASSE 1017 or ASSE 1070 shall be installed in the hot water outlet piping at the water heater. After installation, the temperature setting of the valve shall be adjusted in accordance with Section 502.6.1.

3. A point-of-use water temperature limiting valve complying with ASSE 1070 shall be installed at or near each shower or tub-shower combination valve After installation,the the temperature setting of the ASSE 1070 valve shall be adjusted in accordance with Section 502.6.1. ASSE 1070 valves shall be provided with access.

4. A temperature-actuated, flow reduction valve complying with ASSE 1062 shall be installed on the shower arm prior to connection of shower head and, for tub-shower combinations, on both the tub spout and the shower arm. ASSE 1062 devices shall be capable of significantly limiting the flow of water discharged as the water temperature rises towards 120◦F (48.8◦C).

Reason: Reason: There are currently no provisions in the code to require protection for unsafe existing plumbing installations where scalding is a hazard. Hundreds of people are scalded each year where non-code compliant (Two-handle) shower valves are installed and a wateer heater is replaced causing a hotter temperature than was present prior to the water heater replacement. This code change is iintended to address this and other hot water scald hazards in existing installations.

What are safe hot water temperatures?

By Ron George
President, Ron George Design & Consulting Services
Plumbing Engineer Magazine Aug 2009

I am often asked, "What is a safe hot water temperature for domestic hot water?" If you read the model codes, it states the maximum hot water temperature for a shower or bathtub is 120 degrees Fahrenheit. If you read the warning labels on the side of most water heaters the maximum hot water temperature is 120 degrees Fahrenheit on some labels and 125 degrees Fahrenheit on other labels. The 125 degree limit probably allows for some temperature loss before the hot water gets to the fixtures. Most water heater literature and warning labels mention the availability of thermostatic mixing valves or automatic temperature compensating valves and they recommend their use. If you look at many of the industry standards for shower mixing valves, they state the valves must have limit stops that are adjustable to limit the maximum hot water temperature to 120 degrees Fahrenheit. The testing in the standards gives test criteria for testing the shower valves to these limits.

I have served on the working groups for several plumbing industry standards committees for temperature actuated mixing valves and shower valves and it is generally agreed that 120 degrees is the maximum, safe hot water temperature. I also have served on hot water system design standards committees where the participants had agreed that maximum domestic hot water temperature from plumbing fixtures used for bathing and washing purposes should be 120 degrees Fahrenheit. There were a few exceptions for bidets, sitz baths and whirlpool tubs that had temperatures lower than 120 degrees Fahrenheit for the recommended maximum temperatures to prevent scalding. It also should be noted that some other uses like commercial dishwashers and laundries may need temperatures higher than 120 degrees Fahrenheit. There were two temperatures discussed for each fixture during the design standard meetings. One was the "use temperature" and the other was "the maximum temperature" to prevent scalding.

It's generally agreed that 120 degrees Fahrenheit is the maximum safe hot water temperature that should be delivered from a fixture. Therefore hot water above 120 degrees Fahrenheit can be considered hazardous. Model codes address this in various plumbing code sections...

...The codes generally agree if there is a hazardous condition or a condition that is unsafe or a nuisance to life, health and property it should be corrected but in the existing building code and property maintenance code there is little guidance. It is also generally agreed that water above 120 degrees Fahrenheit at fixtures for bathing and washing with a few exceptions for lower temperatures can be considered dangerous and proper precautions should be taken to prevent the hot water from being a scalding hazard by using the proper safety devices.
When I hear about people setting their water heater to 120 degrees Fahrenheit to prevent scalding, I know they have good intentions, but most people do not know you cannot accurately control the hot water temperature leaving a water heater with the thermostat dial.
Maximum Hot Water Temperature to Prevent Scalding
I have served on many industry committees dealing with hot water system code requirements, hot water system design standards and product standards related to domestic hot water systems devices for temperature control and scald prevention. There has been consensus in all of these committees that the maximum safe hot water delivery temperature for a shower or bathtub is 120

degrees Fahrenheit to prevent scalding with a few exceptions for lower temperatures for bidets and emergency eye wash fixtures. (See the attached Figure 1 - Hot Water Scald Burns – Time vs Temperature Relationship for Second and Third Degree Burns for Adults and Children)

There were discussions in a plumbing code ad-hoc committee on temperature limits for the hot water system where everyone agreed the maximum safe temperature was 120 F. The ASPE Hot water committee dealing with a proposed standard for temperature limits in hot water systems also agreed the maximum safe hot water temperature to prevent scalding is 120 Fahrenheit. Several ASSE working groups that I have served on dealing with hot water temperature controls have all have discussed the reaction time of bathers and they have taken into consideration that children, the elderly and people with disabilities usually take longer to get out of harm's way if the water suddenly gets hot and they agreed 120 Fahrenheit is the maximum safe hot water temperature that a valve should deliver. At 120 F it takes about 80 seconds to develop a second degree burn in a child and it takes about 8 minutes to develop a second degree burn in an adult. (See Figure 1) The 120 Degree F temperature limit gives bathers or users an adequate amount of time to get out of harm's way before an irreversible scald burn injury can occur. Each of these committees looked back to the data that was the result of burn studies done by Dr. Moritz and Dr. Henrique's at Harvard Medical College in the 1940s. The burn studies were done using baby pigs that had skin thicknesses similar to that of adult males. The studies exposed the pig's skin to various temperatures of hot water for various periods of time and the severity of the burns were studied and recorded. These were the studies used to develop the time and temperature exposure charts. There have been numerous white papers, seminars, and reports since then discussing the fact that burns can occur quicker than those recorded in the Moritz & Henrique's studies for adult males. The skin is thinner for children and the elderly and the amount of time to receive an irreversible 2nd degree burn injury is less because their skin is thinner. Many of the white papers use the Moritz and Dr. Henrique's original burn studies and they use a ratio of the skin thickness to come up with burn times for thinner skin of children and the elderly. Children, the elderly and handicapped are also slower to react because it takes them more time to realize what is happening and try to react to get out of harm's way. Someone once told me an apartment complex was not intended for children or the elderly. I said everyone grows old and children often come visit so we need to consider prevention of scalds to children, the elderly and people with disabilities more so than burns to adults because burns can occur quicker for those groups.

The PIEV Theory for Reaction Time

There is a PIEV theory relates to reaction time. The PIEV theory is most commonly used to address braking distance in automobile accidents. It addresses the amount of time it takes a driver to sense a problem and decide to react, then the reaction time is added to the braking time for the total distance that a car travels before stopping. The PIEV theory can also apply to reaction times for a bather with respect to hot water scalds.

PIEV relates to the amount of time it takes a person to react to a hazard. PIEV means - Perception, Intellection, Emotion and Volition. It is usually referred to as the PIEV theory. Before we recognize and react to a hazard, four specific areas of activity need to be processed by the brain for the muscles to react. Those processes are:

1. **Perception** - We need to perceive or gain a Perception of a hazard. There can be delays in the perception with limitation in sight, sound, feeling, or any other of our senses.
2. **Intellection** - We go through a period called, Intellection or the act or process of using the intellect by thinking or reasoning. The bather must determine if the hazard is legitimate and deciding either move out of the way of the hazard or eliminate the hazard by adjusting the controls or in some cases where the bather may be sitting out of the reach of the controls the bather may choose to pull the shower curtain in front of them. If the adjustment of the controls is the choice one must decide which control to turn and try to remember which way to turn each control to adjust the temperature or turn the water off in order to eliminate the hazard. If a wrong choice is made during this process it could compound the situation by making the water even hotter. I travel a lot and I often find that shower controls can be very confusing with respect to how to adjust the controls. I still find two handle shower controls that do not meet code requirements. This is critically important when there is no temperature limit on the shower controls. For example if the shower has a two-handle shower valve and 160 degree hot water is supplied to the system, then turning of the cold water first could lead to instant scalding injuries. Turning down the hot water to 120 F or below creates a system where it could incubate Legionella Bacteria to very high levels.
3. **Emotion** - There is an Emotion or evaluation factor which is defined as a conscious mental reaction (as anger or fear) subjectively experienced as strong feeling usually directed toward a specific object and typically accompanied by physiological and behavioral changes in the body with respect to deciding or assessing how we want to react. A person with reduced mental capacity or someone that is just very old will take longer to process this information and ultimately decide to react.
4. **Volition** - There is the physical Volition or deciding/choosing to act and acting. In the case of braking distance it is when the choice is made to move the foot from the gas pedal to the brake pedal and pressing on the brake pedal. This can be related to the time the bather chooses to adjust the control, and they move their hand to the shower control valve, plus the time to rotate or re-adjust the shower valve plus the time from the adjustment until the water temperature changes coming out of the shower head. Often it can take as much as 3-5 seconds to re-adjust the shower head and another few seconds until the water temperature changes coming out of the shower head. For ultra-low-flow (ULF) showers the delay from the time of the adjustment of the shower valve until the water temperature changes coming out of the shower head can be even longer. So burns can become more severe with ULF shower heads. This is one more area where water conservations measures can unintentionally make plumbing systems less safe.

As the temperature of the water increases this PIEV reaction time becomes more important. Using a bathtub/shower controller with a single handle and a rotational limit-stop adjustment allow for adjustment to a safe temperature and it would reduce the mental processing time and reduce the possibility of making an error when turning off the water. As Figure 1 shows the higher the temperatures get, the quicker the burns can occur. within seconds or less and the degree and severity of the burn can be affected by this reaction time.

As you can see by the chart in Figure 1, if the water is at 140 F it will take about 0.8 seconds for a child to receive a 2nd degree irreversible burn injury and it will take about 5.6 seconds for an adult male to receive an irreversible burn injury at 140 degrees F. Everyone else will fall somewhere in between. An adult will often find it very difficult to react to a sudden change in temperature within five (5) seconds. If the shower head is an Ultra-Low-Flow (ULF) shower head the delay can be several seconds longer before the water temperature is reduced because the mixed water temperature must evacuate or flush out the hot water in the pipe riser from the shower valve to the shower head. There is basically very little or no time to react at higher temperatures. For a typical adult that is alert and aware the PIEV theory shows it can take well over five (5) seconds to react to a sudden burst of hot water in a shower. For an elderly person or a small child that is confused it could take several minutes or more before they are able to react and adjust the controls or get out of harm's way. There has been a lot of information that suggests reducing the domestic hot water temperature to 120 F or less as it flows from the fixtures will minimize scalding and allow most people to react or get out of harm's way before a scald injury occurs.

Reducing the water temperature flowing from the fixture can be done in several ways by:

1. Reducing the hot water temperature at the fixture by adjusting the maximum temperature limit-stop on the shower valve. (The best way)
2. Using local mixing valves conforming to ASSE 1070 to reduce the hot water temperature flowing from a faucet.
3. Reducing the temperature at the source (Water Heater) with the use of a master mixing valve or temperature actuated mixing valve conforming to ASSE 1017.
4. For existing non code compliant shower or tub/shower installations, Two handle tub/shower valves without a maximum temperature limit adjustment) an ASSE 1062 valve could be used. An ASSE 1062 valve is a Temperature Actuated Flow Reduction (TAFR) valve. It looks like a chrome pipe coupling and it screws on between the shower head and the shower arm. Other models screw into a tub spout or onto a sink faucet in place of the aerator. If the water flowing from fixture exceeds about 117-120 degrees Fahrenheit the TAFR valve will shut the flow of water down to just a trickle so that scalding hot water does not spray onto the bather. It can be reset by adjusting the fixture control valve to a cold water setting and when the cold water reaches the valve it will reset and begin flowing again. This can be a bit of a nuisance in buildings where the hot water temperature is erratic, but it is an inexpensive way to provide protection against scald injuries in older buildings without code compliant shower valves.

Water Heater Thermostats Do Not Control the Water Heater Outlet Temperatures

If you adjust the water heater thermostat for the burner or heating element on a water heater down to 120 degrees, it will not prevent scalding. Water heater thermostats cannot be relied upon to control the hot water temperature leaving a water heater. Water heater manufacturers recommend that installers set thermostats at 120 - 125 F, and most of them ship the water heaters at an even lower temperature setting. It is not possible to set a water heater thermostat at a given temperature and get a relatively constant temperature of hot water from a water heater. The thermostat can not accurately control the water heater outlet temperature with a water heater thermostat.

My experience has been that not many people know that water heater thermostats cannot control the outlet temperature of a water heater. This warrants an explanation of how a water heater thermostat works so everyone understands the dial on the water heater does not have the accuracy to control the outlet temperature of storage type heater.

Water heater thermostats do not provide precise temperature controls for hot water systems. For example: the thermostat dial calibration test of ANSI Z21.10.1-1998, which is the applicable standard for gas-fired water heaters, allows the temperature to vary 10 degrees above or below the thermostat setting. I have talked to water heater manufacturers that have indicated that the controls can vary as much as 15 to 18 degrees Fahrenheit above or below the set point of the thermostat. From my experience, I have recorded the temperature leaving the top portion of a water heater over a long period of time during intermittent uses and saw temperature swings over 40 degrees Fahrenheit leaving the water heater. The shower valve standards do not have this kind of temperature fluctuation included their testing for all types of shower valves. The significant temperature swings are because the thermostat is inserted into the lower portion of a water heater tank and turns the fuel supply to the heater on and off. Most new water heater thermostat dials have no way to know what the temperature in the tank is. There is rarely a fixed temperature indicated on the dial, however some manufacturers publish temperatures associated with various marks on the thermostat dial or in their literature even though the dial cannot not control the outlet temperature of the water heater, it only controls when the energy to the heater is turned "on" and "off" by sensing the cold water coming into the bottom of the heater.

Generally, if the water heater thermostat dial is set at 120 degrees Fahrenheit, the burner would come on when the temperature at the thermostat reaches about 105 degrees Fahrenheit. The burner stays on until the water around the thermostat which is near the bottom of the heater reaches about 135 degrees Fahrenheit. (The "burner off" temperature is about 30 degrees higher than when the burner came "on" and generally about 15 degrees above the theoretical set point of the thermostat).

Most people don't realize that the maximum temperature limit test of the ANSI Z21.10.1 Gas Water Heater Standard allows the outlet water temperature of the water heater to rise significantly above the thermostat setting. This provision in the standard accounts for the phenomenon known as "stacking" or "thermal layering". The hot water is less dense and rises to the top of the hot water tank. Just like hot air rises and lifts a hot air balloon, hot water rises to the top of the tank and the cooler water drops to the bottom of the tank. Stacking or thermal layering occurs when the hot water rises to the top of the heater due to recurring short duration heating cycles caused by a frequent number of small quantity hot water uses. Frequent short draws cause cold water to enter the bottom of the water heater where the thermostatic element senses the cold water from the turbulent flow stirring in the bottom of the heater. The cold water causes the water heater to cycle on. This phenomenon can occur in any type of storage water heater and generally is more significant in vertical heaters.

I have recorded temperatures as high as 150 to 166 degrees Fahrenheit at the top of water heaters that had the thermostats set between 120 to 125 degrees Fahrenheit. Temperatures over 151 degrees Fahrenheit are extremely high temperatures and can cause serious scald burns in only a two seconds of contact with the skin. (See Table 1 - Water Temperature Effects on Adult Skin) It should be noted that the time temperature relationships in Table 1 are based upon the thickness of the skin for adult males. Children and the elderly typically have a thinner layer of the skin or epidermis and the exposure times can be shorter or the same burns can occurs in a given time at slightly lower temperatures.

ASSE 1016-2011/ASME A112.1016-2011/CSA B125.16-11 Automatic Compensating Valves for Individual Shower & Tub/Shower Combinations

ASSE 1017-2009: Temperature Actuated Mixing Valves for Hot Water Distribution Systems

ASSE 1070-2004: Water Temperature Limiting Devices

ASSE 1062-2006: Temperature Actuated, Flow Reduction (TAFR) Valves for Individual Supply Fittings

Cost Impact: Will increase the cost of construction
The cost impact is minimal. TAFR devices sell for less than $10. Other options cost more and provide a better level of safety. The health and safety impact of this code change is very significant when dealing with older non-code compliant showers and bathtubs. This code change will save countless lives and prevent countless life altering, very painful scald injuries.

P 90-15 : 502.6 (New)-GEORGE5558

P 91-15

504.6

Proponent: William Chapin, representing Professional Code Consulting, LLC (bill@profcc.us)

2015 International Plumbing Code

Revise as follows:

504.6 Requirements for discharge piping. The discharge piping serving a pressure relief valve, temperature relief valve or combination thereof shall:

1. Not be directly connected to the drainage system.
2. Discharge through an *air gap* located in the same room as the water heater.
3. Not be smaller than the diameter of the outlet of the valve served and shall discharge full size to the *air gap*.
4. Serve a single relief device and shall not connect to piping serving any other relief device or equipment.
5. Discharge to the floor~~, to the pan serving the water heater~~ or storage tank, to a waste receptor or to the outdoors.
6. Discharge in a manner that does not cause personal injury or structural damage.
7. Discharge to a termination point that is readily observable by the building occupants.
8. Not be trapped.
9. Be installed so as to flow by gravity.
10. Terminate not more than 6 inches (152 mm) above and not less than two times the discharge pipe diameter above the floor or *flood level rim* of the waste receptor.
11. Not have a threaded connection at the end of such piping.
12. Not have valves or tee fittings.
13. Be constructed of those materials listed in Section 605.4 or materials tested, rated and *approved* for such use in accordance with ASME A112.4.1.

Reason: A water heater pan does not have sufficient volume or drain size to adequately drain the volume of water that is delivered when the relief valve opens due to an over temperature event.

Cost Impact: Will not increase the cost of construction
This will not increase the cost of construction as there is already a drain in place if there is a water heater pan.

P 91-15 : 504.6-CHAPIN5707

P 92-15

504.6

Proponent: James Richardson, Jr (jarichardson@columbus.gov)

2015 International Plumbing Code

Revise as follows:

504.6 Requirements for discharge piping. The discharge piping serving a pressure relief valve, temperature relief valve or combination thereof shall:

1. Not be directly connected to the drainage system.
2. Discharge through an *air gap* located in the same room as the water heater.
3. Not be smaller than the diameter of the outlet of the valve served and shall discharge full size to the *air gap*.
4. Serve a single relief device and shall not connect to piping serving any other relief device or equipment.
5. Discharge to the floor~~, to the pan serving the water heater or storage tank~~, to a waste receptor or to the outdoors.
6. Discharge in a manner that does not cause personal injury or structural damage.
7. Discharge to a termination point that is readily observable by the building occupants.
8. Not be trapped.
9. Be installed so as to flow by gravity.
10. Terminate not more than 6 inches (152 mm) above and not less than two times the discharge pipe diameter above the floor or *flood level rim* of the waste receptor.
11. Not have a threaded connection at the end of such piping.
12. Not have valves or tee fittings.
13. Be constructed of those materials listed in Section 605.4 or materials tested, rated and *approved* for such use in accordance with ASME A112.4.1.

Reason: It is easy to forget that some water heaters are not installed on a floor. Some are installed above ceilings, on walls well above the floor or at the edge of a storeroom mezzanine above a lower floor. Having a rare "full trip" discharge of a relief valve into a water heater pan located on a floor simply makes a mess because the pan is not shaped to contain the blast of water nor is it (and its drain) sized to handle the flow rate. But where these water heaters in pans are suspended above a ceiling or well above the floor, a splash-out or overflow of hot water from the pan will cascade down onto people who might be below. This is a recipe for scald burns. It just isn't smart design or a safe construction practice.

Cost Impact: Will not increase the cost of construction
The water heater drip pan drain has to be run to a point of disposal so running the T&P valve discharge pipe to the same point of disposal isn't a big deal especially where plastic piping is used. An installer is not going to charge the builder any more for doing it this way.

Proponent: Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

Part I

2015 International Plumbing Code

Revise as follows:

504.6 Requirements for discharge piping. The discharge piping serving a pressure relief valve, temperature relief valve or combination thereof shall:

1. Not be directly connected to the drainage system.
2. Discharge through an *air gap* located in the same room as the water heater.
3. Not be smaller than the diameter of the outlet of the valve served and shall discharge full size to the *air gap*.
4. Serve a single relief device and shall not connect to piping serving any other relief device or equipment.
5. Discharge to the floor, to the pan serving the water heater or storage tank, to a waste receptor or to the outdoors.
6. Discharge in a manner that does not cause personal injury or structural damage.
7. Discharge to a termination point that is readily observable by the building occupants.
8. Not be trapped.
9. Be installed so as to flow by gravity.
10. Terminate not more than 6 inches (152 mm) above and not less than two times the discharge pipe diameter above the floor or *flood level rim* of the waste receptor.
11. Not have a threaded connection at the end of such piping.
12. Not have valves or tee fittings.
13. Be constructed of those materials listed in Section 605.4 or materials tested, rated and *approved* for such use in accordance with ASME A112.4.1.
14. <u>Be one nominal size larger than the size of the relief valve outlet, where the relief valve discharge piping is constructed of PEX or PE-RT tubing installed with insert fittings. The outlet end of such tubing shall be fastened in place.</u>

Part II

2015 International Residential Code

Revise as follows:

P2804.6.1 Requirements for discharge pipe. The discharge piping serving a pressure-relief valve, temperature-relief valve or combination valve shall:

1. Not be directly connected to the drainage system.
2. Discharge through an air gap located in the same room as the water heater.
3. Not be smaller than the diameter of the outlet of the valve served and shall discharge full size to the air gap.
4. Serve a single relief device and shall not connect to piping serving any other relief device or equipment.
5. Discharge to the floor, to the pan serving the water heater or storage tank, to a waste receptor or to the outdoors.
6. Discharge in a manner that does not cause personal injury or structural damage.
7. Discharge to a termination point that is readily observable by the building occupants.
8. Not be trapped.
9. Be installed to flow by gravity.
10. Terminate not more than 6 inches (152 mm) and not less than two times the discharge pipe diameter above the floor or waste receptor flood level rim.
11. Not have a threaded connection at the end of the piping.
12. Not have valves or tee fittings.
13. Be constructed of those materials indicated in Section P2906.5 or materials tested, rated and *approved* for such use in accordance with ASME A112.4.1.
14. Be one nominal size larger than the size of the relief-valve outlet, where the relief-valve discharge piping is constructed of PEX or PE-RT tubing <u>installed with insert fittings</u>. The outlet end of such tubing shall be fastened in place.

Reason: PART I: This revision was accepted to the IRC in the last cycle. The issue is simply this: In some cases (perhaps the majority of cases), PEX and PE-RT tubing is connected using insert fittings. Where an insert fitting is used to connect to a relief valve, the ID of the insert fitting is significantly smaller than the ID of PEX or PE-RT tubing of the same nominal size of the relief valve outlet. This smaller opening might create excessive restriction where the relief valve had a full trip event. Therefore, increasing the size of the tubing increases the size of the insert fitting to allow for less restriction.
Fastening the end of the tubing is a safety measure to keep the discharge of water at the intended location. PEX and PE-RT tubing can be "springy" and could easy dislodge from the intended discharge point.

PART II: Item 14 was added to this section in the last cycle. The issue is simply this: In some cases (perhaps the majority of cases), PEX and PE-RT tubing is connected using insert fittings. Where an insert fitting is used to connect to a relief valve, the ID of the insert fitting is significantly smaller than the ID of PEX or PE-RT tubing of the same nominal size of the relief valve outlet. This smaller opening might create excessive restriction where the relief valve had a full trip event. Therefore, increasing the size of the tubing increases the size of the insert fitting to allow for less restriction. What was forgotten is that there are fittings that fit on the outside diameter of this type of tubing such that the inside area would not be restricted. This added phrase allows for same size (as the relief valve outlet) tubing to be used where these "outside connect fittings" are used.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes. This is PMGCAC 147.

Cost Impact:

Part I: Will not increase the cost of construction
This proposal will increase the cost of construction because additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code.

Part II: Will not increase the cost of construction
This proposal will increase the cost of construction because additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code.

P 94-15

504.6.1 (New)

Proponent: Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

2015 International Plumbing Code

Add new text as follows:

504.6.1 Relief valve indirect waste piping. Indirect waste piping that receives the discharge from not more than two ¾ inch (19 mm) relief valves shall be not less than ¾ inch (19 mm)nominal pipe size. Where indirect waste piping receives the discharge from more than two ¾ inch (19 mm) relief valves, the piping shall be not less than 1 ½ inch (38.1 mm) nominal pipe size. Indirect waste piping receiving only the discharge from relief valves shall not require liquid-seal traps.

Reason: Multi-story buildings having water heaters on each floor (water heaters "stacked") sometimes have an indirect waste pipe "stack" to catch each of the T&P discharge pipes. There is currently no sizing criteria in the code. The proposed language is what the State of New York has used successfully for many years. The 3+ relief valve indirect waste pipe size doesn't have to be any bigger for more water heaters as all of the T&P valves would never be leaking all at once. The 1 ½ inch pipe size is easy to work with in walls, is resistant to accidental damage during rough-in and is economical.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes. This is PMGCAC Item 29.

Cost Impact: Will not increase the cost of construction

This proposal will not increase the cost of construction because no additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code.

P 94-15 : 504.6.1 (New)-SNYDER3955

P 95-15

504.7

Proponent: Ronald George, Self, representing Self

2015 International Plumbing Code

Revise as follows:

504.7 Required pan. Where a storage ~~tank-type~~tank type water heater~~ or~~, a hot water storage tank, or a tankless water heater is installed in a location where water leakage from the tank or heater will cause damage, the water heater and tank shall be installed in a galvanized steel pan having a material thickness of not less than 0.0236 inch (0.6010 mm) (No. 24 gage), or other pans *approved* for such use.

Reason: During the last code cycle, there was a push to remove requirements for drain pans for tankless water heaters. There have been many failures of tankless heaters that have led to serious water damage to buildings. Tankless heaters fail too and the comment made about there was only a few ounces of water in them is incorrect and misleading. Tankless water heaters are connected to the water distribution piping and can leak hundreds of thousands of gallons of water. Drain pans should be required for tankless heaters too.

Cost Impact: Will increase the cost of construction
Cost appearrs to be the primary reason the pans weere removed during the last code cycle at the expensee of the homeowner and common sense. The cost for a home builder is a few bucks, the cost for the home owners when there is a leak with no pan can be hundreds of thousands of dollars. This will actually save money for the homeowner.

P 96-15

504.7

Proponent: James Richardson, Jr (jarichardson@columbus.gov); Dynice Broadnax (dbroadnax@iccsafe.org)

2015 International Plumbing Code

Revise as follows:

504.7 ~~Required pan.~~Water Heater Pan. Where a storage tank-type water heater or a hot water storage tank is installed in ~~a~~an elevated location ~~where~~above the finished floor of a space, a water heater pan shall be provided to collect leakage from the tank ~~will cause damage,~~and the tank connections. A pan required by this section or required by the design professional shall be ~~installed in~~ a galvanized steel pan having a material thickness of not less than 0.0236 inch (0.6010 mm) (No. 24 gage), or other pans *approved* for such use. Water heater pans shall be optional for all other installations.

Reason: There is not one documented case of a leaking water heater causing a structure to fail. There are places where they should be installed, such as elevated locations where leakage could cause injury to someone who may not know the water heater is above them in a ceiling, or where they are elevated above a fixture and the leakage or blow-off from the T&P valve could injure a person using the fixture.

Cost Impact: Will not increase the cost of construction
Not putting in pans in locations where there are not needed will save significant labor and material costs in the long run.

P 96-15 : 504.7-RICHARDSON6027

P 97-15

504.7

Proponent: Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

2015 International Plumbing Code

Revise as follows:

504.7 Required pan. Where a storage tank-type water heater or a hot water storage tank is installed in a location where water leakage from the tank will cause damage, the tank shall be installed in a ~~galvanized~~pan constructed of one of the following:

1. Galvanized steel ~~pan having a material thickness~~or aluminum of not less than 0.0236 inch (0.6010 mm) in thickness.
2. Plastic not less than 0.036 inch (0.9 mm) in thickness.
3. Other approved materials.

A plastic pan shall not be installed beneath a gas-fired water heater. ~~(No. 24 gage), or other pans *approved* for such use.~~

Reason: It would be very rare for a large commercial water heater installation to be requiring a pan. Those installations are well thought out and provisions are made for floor drains in the area of the water heater or the location of such large units are in areas where leakage will not cause damage. Thus, the existing section never comes into play for those installations.
Where this section is primarily used is in multi-family residential construction where each unit has its own water heater. Because the proposed language was approved for the 2015 IRC, there should be any reason to allow this revision for the IPC. Factory-made pans are widely available and have been used for decades. Use of such pans keeps the installed costs low as compared to what a sheet metal shop would charge to make custom, galvanized sheet steel pan. It is just not necessary.

As stated in the IRC proposal, another reason for allowing these factory-made aluminum and plastic pans is that they have smooth edges. In a residential environment, some water heaters are in a laundry room where people, including children, move about. A slip or fall against the top edge or corner of a galvanized steel pan would be unpleasant. Galvanized steel can also begin to look unsightly after many years.

This proposal is needed for consistency with the IRC.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes. This is PMGCAC Item 146.

Cost Impact: Will not increase the cost of construction
This proposal will not increase the cost of construction because no additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code.

Proponent: Janine Snyder, Chair, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

Part I

2015 International Plumbing Code

602.3.1 Sources. Dependent on geological and soil conditions and the amount of rainfall, individual water supplies are of the following types: drilled well, driven well, dug well, bored well, spring, stream or cistern. Surface bodies of water and land cisterns shall not be sources of individual water supply unless properly treated by *approved* means to prevent contamination. Individual water supplies shall be constructed and installed in accordance with the applicable state and local laws. Where such laws do not address all of the requirements set forth in NGWA-01, individual water supplies shall comply with NGWA-01 for those requirements not addressed by state and local laws.

Add new standard(s) as follows:
ANSI/NGWA-01-14 Water Well Construction Standard

Part II

2015 International Residential Code

Revise as follows:

P2602.1 General. The water-distribution and drainage system of any building or premises where plumbing fixtures are installed shall be connected to a public water supply or sewer system, respectively, if available. Where either a public water-supply or sewer system, or both, are not available, or connection to them is not feasible, an individual water supply or individual (private) sewage-disposal system, or both, shall be provided. Individual water supplies shall be constructed and installed in accordance with the applicable state and local laws. Where such laws do not address all of the requirements set forth in NGWA-01, individual water supplies shall comply with NGWA-01 for those requirements not addressed by state and local laws.

Add new standard(s) as follows:
ANSI/NGWA-01-14 Water Well Construction Standard

Reason: Many locations where wells will be constructed are covered by state and local laws for well construction. However, some areas in a jurisdiction might not be covered by those laws (or possibly, state or local laws don't exist). Adding this standard to the code is an important backstop to make sure that wells in those areas are safely constructed to be able to provide a reliable water supply for the building(s).
This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC). The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes. This is PMGCAC Item 29.

Cost Impact:

Part I: Will increase the cost of construction
This proposal will increase the cost of construction because additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code. Specifically, in situations where state or local laws don't exist for the construction of wells, these requirements could add additional costs over those cost for a well that would be constructed to a quality level less than what this standard requires. Where a standard for construction does not exist, there could be ways to "cut corners" to lessen costs of construction such as not installing a well casing, not performing tests and generally, expending less labor to construct a well that might not be safe or provide a reliable supply of water.

Part II: Will increase the cost of construction
This proposal will increase the cost of construction because additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code. Specifically, in situations where state or local laws don't exist for the construction of wells, these requirements could add additional costs over those cost for a well that would be constructed to a quality level less than what this standard requires. Where a standard for construction does not exist, there could be ways to "cut corners" to lessen costs of construction such as not installing a well casing, not performing tests and generally, expending less labor to construct a well that might not be safe or provide a reliable supply of water.

Analysis:

Part I: A review of the standard proposed for inclusion in the code, ANSI/NGWA-01, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2015.

Part II: A review of the standard proposed for inclusion in the code, ANSI/NGWA-01, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2015.

Proponent: Donald Surrena, National Association of Home Builders, representing National Association of Home Builders (dsurrena@nahb.org)

Part I

2015 International Plumbing Code

Revise as follows:

602.3.1 Sources. Dependent on geological and soil conditions and the amount of rainfall, individual water supplies are of the following types: drilled well, driven well, dug well, bored well, spring, stream or cistern. Surface bodies of water and land cisterns shall not be sources of individual water supply unless properly treated by *approved* means to prevent contamination. Individual water supplies shall be constructed in accordance with the applicable state and local laws. Where the construction of individual water supplies is not regulated by state or local laws, such individual water supplies shall be constructed in accordance with ANSI/NGWA-01.

Add new standard(s) as follows:
ANSI/NGWA-01-14 Water Well Construction Standard

Part II

2015 International Residential Code

Revise as follows:

P2602.1 General. The water-distribution and drainage system of any building or premises where plumbing fixtures are installed shall be connected to a public water supply or sewer system, respectively, if available. Where either a public water-supply or sewer system, or both, are not available, or connection to them is not feasible, an individual water supply or individual (private) sewage-disposal system, or both, shall be provided. Individual water supplies shall be constructed in accordance with the applicable state and local laws. Where the construction of individual water supplies is not regulated by state of local laws, such individual water supplies shall be constructed in accordance with ANSI/NGWA-01.

Add new standard(s) as follows:
ANSI/NGWA-01-14 Water Well Construction Standard

Reason: The IRC currently refers the user to the IPC for requirements regarding well construction, as it does for all plumbing not addressed in the IRC (P2601.1). Often locations where wells will be constructed are covered by state and local laws for well construction. The provisions for wells in the IPC are also incomplete and spreadout through several sections of the code, making tracking difficult. This proposal is a simple change that clarifies where to go for well construction requirements—either state/local regulations or an ANSI standard.
This proposal is the same as what passed in the 2013 Group B hearing for the IRC. The change, however, was not included in the 2015 IRC because the referenced standard was not published by the ICC deadline. The standard was published in 2014.

Cost Impact:

Part I: Will increase the cost of construction
This proposal will increase the cost of construction because additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code. Specifically, in situations where state or local laws don't exist for the construction of wells, these requirements will add additional costs over those costs for a well that would be constructed to a quality level less than what this standard requires. Where a standard for construction does not exist, there could be ways to "cut corners" to lessen costs of construction such as not installing a well casing, not performing tests and generally, expending less labor to construct a well that may adversely affect the safety or reliability of the supply of water. Where local/state regulations are already in place, there may be no cost impact depending on the level of local/state regulation in place.

Part II: Will increase the cost of construction
This proposal will increase the cost of construction because additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code. Specifically, in situations where state or local laws don't exist for the construction of wells, these requirements will add additional costs over those costs for a well that would be constructed to a quality level less than what this standard requires. Where a standard for construction does not exist, there could be ways to "cut corners" to lessen costs of construction such as not installing a well casing, not performing tests and generally, expending less labor to construct a well that may adversely affect the safety or reliability of the supply of water. Where local/state regulations are already in place, there may be no cost impact depending on the level of local/state regulation in place.

Analysis:

Part II: A review of the standard proposed for inclusion in the code, ANSI/NGWA-01-14, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2015.

P 99-15 : 602.3.1-SURRENA5013

P 100-15

603.1 (New), 608.16.1 (New), 608.16.2 (New)

Proponent: Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

2015 International Plumbing Code

Add new text as follows:

603.1 Protection for public water main. Public water mains shall be protected from backflow from connected water service lines in accordance with Section 608.16.1 and 608.16.2.

608.16.1 Backflow preventer required for water service lines. A backflow prevention assembly in accordance with Section 608.13.2 shall be installed in the water service lines serving the following:

1. Hospitals
2. Surgical clinics
3. Laboratories
4. Morgues
5. Mortuaries
6. Veterinary hospitals
7. Industrial occupancies
8. Packing plants
9. Slaughter houses
10. Chemical plants
11. Municipal waste treatment facilities
12. Construction sites

The location of the required backflow prevention assembly shall be on the building site. The backflow prevention assembly shall be installed in the water service line at a point that is upstream of any site connections to the water service line.

608.16.2 Protection of site water service loop system. Where a building site such as a campus has a water service loop system that serves two or more water service connections to buildings on the building site, a backflow prevention assembly in accordance with Section 608.13.2 or 608.13.7 shall be installed in the water service line for each building connecting to the loop.

Reason: New Section 608.16.1:
The code is lacking requirements for backflow protection of public water supplies that connect to buildings or building sites known to have High Risk, High Hazard activities occurring. The building and site applications identified in this new Section 608.16.1 are according to the University of Southern California's Cross Connection Control Manual. The USC Cross Connection Control Manual is a highly regarded publication produced and periodically updated by the Foundation for Cross-Connection Control and Hydraulic Research at USC. The Foundation has been involved in backflow issues for over 100 years. Many jurisdictions and water utilities operate cross-connection control programs using this Manual and their tenants concerning backflow protection.

Section 101.3 states that the intent of the International Plumbing Code is "…to establish minimum standards to provide a reasonable level of safety, health, protection of property and public welfare….." Section 101.2 states that scope of the code applies to "….plumbing systems within the jurisdiction."

The plumbing code assumes that the code-required backflow protection at each of the potable water outlets in a building (or on a building site) protects the water distribution system of the building (or site). And that this "primary protection" is adequate protection for the public water supply that the water service line serving those buildings (and sites) connects to. The problem with this assumption for the indicated buildings and building sites is that building owners and system operators have difficulty controlling every possible situation that might lead to a backflow event. Many of these operations are large complexes with miles and miles of potable water piping with thousands of potable water outlets. Some of these complexes undergo constant construction for upgrades and repair of industrial systems where potable water piping may or may not be involved. There is great potential for a cross-connection to be made.

Adding to this great potential for a cross-connection is the nature of the substances involved with these operations. The code doesn't distinguish between various hazard levels of contaminates but in practice, there is obviously a significantly higher risk for a contaminate that can make thousands of people very ill with only a small amount of material introduced into the public water supply. The organizations and companies who have administered backflow protection programs for large public water supplies have realized this for decades. The USEPA has also realized this for a long time. For public water suppliers who do have a backflow protection program, the suppliers will not allow these buildings and building sites to connect to the public water main without a Reduced Pressure Zone backflow protection assembly (reference Section 608.13.2) in the water service line.

The following question might be asked: "Why not continue to let the public water suppliers deal with this issue?" There are several issues surrounding this question:

1. Where the public water supplier does require this RPZ, it is installed on the building owner's property and in the water service line that is regulated by the IPC. Should not the plumbing code have this requirement in the code as this involves piping that the code regulates?
2. The IPC has the regulations for backflow preventers such as the appropriate standards and details about their installation. The building owner is buying this equipment (through the plumbing contractor) so the code provides the requisite information. There has been many situations where the plumbing contractor has said, "Why do I have to provide this equipment? I have complied with the IPC. Show me the IPC code section that it where it requires that I am responsible to provide this.
3. What about jurisdictions where there is not a backflow protection program in place for the public water supply? Should the public connected to that water system be any less protected than anyone else? Keep in mind what Section 101.3 says. With everyone in the backflow protection field knowing that these buildings and building sites have significant contamination risks involved, should not the IPC be a leader in protecting the public water supply for all those connected to that supply for these High Risk, High Hazard situations?

New Section 608.16.2:

This new section has nothing to do with the necessity for new Section 608.16.1. There can be building sites having multiple buildings that are served by a "loop" water service line arrangement. In other words, there is one "tap" on the public water main but once the water service line on the building site, it splits to run in different directions to service multiple buildings on the site. The two different "split" water service lines eventually meet up and connect to each other somewhere on the building site. The reasons for this "loop" design are germane to this proposal.

The problem is that this "loop" water service line design can create conditions for a backflow event to occur between buildings connected to the loop. For example, consider a campus with several high rise buildings and several low rise buildings. Where the water demand in a low rise building becomes significant, the pressure decreases in the high rise building and because the elevation of the water is so much higher than it the low rise building, the water in the high rise building moves into the "loop" towards the low rise building. *Remember that a backflow event occurs because of a change in pressurebetween two points.* Now imagine many buildings on a campus with water moving back and forth in the "loop" many times a day. It only takes one failed "primary" backflow preventer in one building on the campus to end up contaminating the water supply for all the buildings connected to the loop.

A double check valve backflow protection assembly for each building is sufficient to protect against this situation. It is field testable to be able to verify its proper operation. An RPZ backflow protection assembly can also provide the same protection, however, because of the higher cost, such a device would only need to be used for applications where higher hazards (such as those in new Section 608.16.1) might exist on a campus loop system.

The PMGCAC urges approval of this important proposal.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes. This is PMGCAC Item 165.

Cost Impact: Will increase the cost of construction
This proposal will increase the cost of construction because additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code.

Specifically, the code doesn't require these backflow protection assemblies so yes, because the code will require them, the change in the code *appears* to make the cost of construction higher. However, knowing that many public water suppliers already mandate these backflow protection assemblies (and the building and site owners already are having to install them), there won't be an increase in construction cost. And, many owners of these buildings or sites are already smart enough to know that they don't want to be responsible for a public water supply contamination event because they failed to correctly do something correctly somewhere in the depths of their operations. They already had voluntarily complied. Where the cost impact will show up is where the building or site owner doesn't care to incur the cost, there is no backflow protection program in place in the jurisdiction, the code official recognizes the issue but can't require the RPZ because it is not in the code. In those situations there will be the added cost of RPZ backflow protection assembly, the labor to install it and, where located inside of a building, the labor and material for a drain to capture a backflow event from the RPZ.

P 100-15 : 603.1 (New)-SNYDER3959

P 101-15

Part I:
603.1
Part II:
P2903.7

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IPC COMMITTEE. PART II WILL BE HEARD BY THE IRC PLUMBING COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

Proponent: Julius Ballanco, representing Self (JBENGINEER@aol.com)

Part I

2015 International Plumbing Code

Revise as follows:

603.1 Size of water service pipe. The water service pipe shall be sized to supply water to the structure in the quantities and at the pressures required in this code. The water service pipe shall be not less than ~~3/4~~ 1 inch (~~19.1~~25.4 mm) in diameter.

Part II

2015 International Residential Code

Revise as follows:

P2903.7 Size of water-service mains, branch mains and risers. The size of the water service pipe shall be not less than ~~3/4~~ 1 inch (19 mm) diameter. The size of water service mains, branch mains and risers shall be determined from the water supply demand [gpm (L/m)], available water pressure [psi (kPa)] and friction loss caused by the water meter and *developed length* of pipe [feet (m)], including *equivalent length* of fittings. The size of each water distribution system shall be determined according to design methods conforming to acceptable engineering practice, such as those methods in Appendix P and shall be *approved* by the code official.

Reason: The minimum pipe size of ¾ inch dates back to the Hoover Code days, whereby it was understood that the minimum pipe size for a single family dwelling could be ½ inch galvanized steel pipe. This sizing was based on one bathroom and a kitchen sink. That was the original indoor plumbing required for a single family dwelling. The code predated the use of copper tube or plastic pipe. However, in case additional fixtures were added to the home, it was mandated that the water service be a minimum of ¾ inch. Most water services during this period of time were lead pipe. The inside diameter of ¾ inch lead pipe was ¾ inch.
Today's modern home has minimum plumbing requirements that dictate a pipe size of at least ¾ inch. Following the concept of the earlier codes, this would result in upsizing the water service to a minimum of 1 inch pipe. Additionally, both the International Building Code and International Plumbing Code require residential sprinklers for all single family dwellings. With a typical demand of two residential sprinklers, the minimum flow rate for the system becomes 16 gpm. The residential sprinkler flow rate can be as high as 40 gpm or more. This would result in the need for a 1 inch water service.

The most popular pipe used today for residential water service is polyethylene. It has been estimated that 90 percent of the water services for single family dwellings in the United States is polyethylene.

A ¾ inch polyethylene tube has an inside diameter that range from 0.625 inches to 0.715 inches depending on the SDR. A 1 inch polyethylene tube would be more in line with the older ¾ inch lead water service regarding size. Furthermore, the inside diameter of 1 inch polyethylene is very similar to 3/4 inch galvanized steel pipe. The inside diameter of ¾ inch galvanized steel pipe is 0.824 inches. The inside diameter of 1 inch polyethylene pipe, SDR 9 is 0.875 inches.

Based on the additional fixtures required for a single family dwelling and the requirement for residential sprinklers, the minimum water service must be increased to 1 inch.

Cost Impact:

Part I: Will increase the cost of construction
The increase in cost is minimal based on the cost of the piping material. The labor and installation costs remain the same.

Part II: Will increase the cost of construction
The cost of the piping material will be higher.

P 101-15 : 603.1-BALLANCO3697

P 102-15

604.2

Proponent: Ronald George, Self; Plumb-Tech Design & Consulting Services LLC, representing Self; Plumb-Tech Design & Consulting Services LLC (Ron@Plumb-TechLLC.com)

2015 International Plumbing Code

Revise as follows:

604.2 System interconnection. At the points of interconnection between the hot and cold water supply piping systems and the individual fixtures, appliances or devices, provisions shall be made to prevent flow between such piping systems. Hot water circulation systems shall not utilize cold water distribution piping for the return of water to the water heater.

Reason: This is a health hazard routing hot water return through the cold water distribution system. Routing hot water return through the cold water supply pipes creates a condition where it will not be possible to get cold water in some cases. It also creates a condition where LEgionell bacteria can grow.

Cost Impact: Will not increase the cost of construction
Cross connections are already prohibited. Returning hot water through the cold water pipe is a cross-connection where hot water can be routed to other fixtures.

P 102-15 : 604.2-GEORGE5205

P 103-15

Table 604.3

Proponent: Michael Anthony, University of Michigan, representing University of Michigan (maanthon@umich.edu)

2015 International Plumbing Code

Revise as follows:

TABLE 604.3
WATER DISTRIBUTION SYSTEM DESIGN CRITERIA REQUIRED CAPACITY AT FIXTURE SUPPLY PIPE OUTLETS

FIXTURE SUPPLY OUTLET SERVING	FLOW RATE[a] (gpm)	FLOW PRESSURE (psi)
Bathtub, balanced-pressure, thermostatic or combination balanced-pressure/thermostatic mixing valve	4	20
Bidet, thermostatic mixing valve	2	20
Combination fixture	4	8
Dishwasher, residential	2.75	8
Drinking fountain	0.75	8
Laundry tray	4	8
Lavatory, private	0.8	8
Lavatory, private, mixing valve	0.8	8
Lavatory, public	0.4	8
Shower	2.5	8
Shower, balanced-pressure, thermostatic or combination balanced-pressure/thermostatic mixing valve	2.5[b]	20
<u>Shower room, athletic center or student housing</u>	<u>2.0</u>	<u>8</u>
Sillcock, hose bibb	5	8
Sink, residential	1.75	8
Sink, service	3	8
Urinal, valve	12	25
Water closet, blow out, flushometer valve	25	45
Water closet, flushometer tank	1.6	20
Water closet, siphonic, flushometer valve	25	35
Water closet, tank, close coupled	3	20
Water closet, tank, one piece	6	20

For SI: 1 pound per square inch = 6.895 kPa, 1 gallon per minute = 3.785 L/m.

a. For additional requirements for flow rates and quantities, see Section 604.4.

b. Where the shower mixing valve manufacturer indicates a lower flow rating for the mixing valve, the lower value shall be applied.

Reason: Multiple showers in the same room are common in athletic and recreation facilities and student housing (residences, living centers). Diversity of use permits lower flow rates.

Bibliography:
We have provided background information at this web site:
https://sites.google.com/a/umich.edu/14-39-international-plumbing-code-2018-revision/home

Cost Impact: Will not increase the cost of construction
Piping systems may be smaller thereby reducing the cost.

P 104-15

603.1 (New)

Proponent: Michael Anthony, University of Michigan, representing University of Michigan (maanthon@umich.edu)

2015 International Plumbing Code

Add new text as follows:

<u>**603.1** **Water service meter sizing** Water service meters shall be sized based upon 1-year historical demand measurements of identical occupancy or use classes.</u>

Reason: Water service meters are generally too large; and they are getting more oversized as water consumption is reduced. To use historical demand patterns for the specification of the water meter borrows from a concept that has worked in the National Electrical Code for many years. It permits a designer to size a power system capacity if he has the data to substantiate it. For the committee's information, that passage is reproduced in part below:

> 220.87 Determining Existing Loads. The calculation of a feeder or service load for existing installations shall be permitted to use actual maximum demand to determine the existing load under all of the following conditions:
> (1) The maximum demand data is available for a 1-year period.
> Exception: If the maximum demand data for a 1-year period is not available, the calculated load shall be permitted to be based on the maximum demand (measure of average power demand over a 15-minute period) continuously recorded over a minimum 30-day period using a recording ammeter or power meter connected to the highest loaded phase of the feeder or service, based on the initial loading at the start of the recording. The recording shall reflect the maximum demand of the feeder or service by being taken when the building or space is occupied and shall include by measurement or calculation the larger of the heating or cooling equipment load, and other loads that may be periodic in nature due to seasonal or similar conditions.
> (2) The maximum demand at 125 percent plus the new load does not exceed the ampacity of the feeder or rating of the service.
> (3) The feeder has overcurrent protection in accordance with 240.4, and the service has overload protection in accordance with 230.90.

While the system is an electrical system, much of it -- conceptually -- can be brought to bear upon the specification of the water meter -- i.e. data driven.

Bibliography:
Background and reference information about this proposal will be available at this web site:

https://sites.google.com/a/umich.edu/14-39-international-plumbing-code-2018-revision/

Cost Impact: Will not increase the cost of construction
Smaller meters generally should cost less; though local jurisdictions may change their connection fees to secure lost revenue.

P 105-15

Table 604.4

Proponent: John Addario, New York State Department of State - Building Standards and Codes, representing New York State Department of State - Building Standards and Codes (john.addario@dos.state.ny.us)

2015 International Plumbing Code

Revise as follows:

TABLE 604.4
MAXIMUM FLOW RATES AND CONSUMPTION FOR PLUMBING FIXTURES AND FIXTURE FITTINGS

PLUMBING FIXTURE OR FIXTURE FITTING	MAXIMUM FLOW RATE OR QUANTITY [b]
Water closet - public and private	~~1.6~~1.28 gallons per flushing cycle[c]
Water closet—public and remote[d]	1.6 gpf

(Portions of table not shown remain unchanged)

For SI: 1 gallon = 3.785 L, 1 gallon per minute = 3.785 L/m, 1 pound per square inch = 6.895 kPa.

a. A hand-held shower spray is a shower head.

b. Consumption tolerances shall be determined from referenced standard.

c. The effective flush volume for dual-flush water closet is defined as the composite, average flush volume of two reduced flushes and one full flush.In public settings, the maximum water use of a dual flush water closet is based solely on its full flush operation; not an average of full and reduced volume flushes.

d. A water closet is remote where its discharge is combined with less than 1.5 DFU discharge from other fixtures and such discharge must flow horizontally for 30 feet or more.

Reason: This proposal reflects the current requirements in the IGCC for high efficiency water closets. The last cycle the committee was concerned that there was a need for further study in the use of high effeciency water closets. The proposed change addresses these concerns by exempting them in a public setting when they are installed in a remote location. This proposal is in line with the IGCC and addresses the concerns from the committee from the last cycle.

Cost Impact: Will not increase the cost of construction
The price of plumbing fixtures and fittings vary due to style, trim, and material. The attached documents demonstrate that esssentially there will be no cost impact in response to adopting these requirements. The attached only reflects the bare cost comparision of the fixtures and does not include the cost saving realized from water conservation.

P 105-15 : T604.4 -ADDARIO4773

P 106-15

Table 604.4

Proponent: John Addario, New York State Department of State - Building Standards and Codes, representing New York State Department of State Building Standards and Codes (john.addario@dos.state.ny.us)

2015 International Plumbing Code

Revise as follows:

TABLE 604.4
MAXIMUM FLOW RATES AND CONSUMPTION FOR PLUMBING FIXTURES AND FIXTURE FITTINGS

PLUMBING FIXTURE OR FIXTURE FITTING	MAXIMUM FLOW RATE OR QUANTITY [b]
Lavatory, private	~~2.2~~1.5 gpm at 60 psi
Lavatory, public (metering)	0.25 gallon per metering cycle
Lavatory, public (other than metering)	0.5 gpm at 60 psi
Shower head [a]	~~2.5~~ 2.0 gpm at 80 psi
Sink faucet	2.2 gpm at 60 psi
Urinal	~~1.0~~0.5 gallon per flushing cycle
Water closet	1.6 gallons per flushing cycle

For SI: 1 gallon = 3.785 L, 1 gallon per minute = 3.785 L/m, 1 pound per square inch = 6.895 kPa.

a. A hand-held shower spray is a shower head.

b. Consumption tolerances shall be determined from referenced standards.

Reason: This proposal reflects the current WaterSense rates for lavatories, shower heads and urinals. WaterSense fixtures have been available and in use since 2006. These products are now widely available, accepted and proven to perform as well as less water effecient products. Additionally they are now available at the same price point as less efficient fixtures.

Cost Impact: Will not increase the cost of construction
The price of plumbing fixtures and fittings vary due to style, trim, and material. The attached documents demonstrate that esssentially there will be cost impact in response to adopting these requirements. The attached only reflects the bare cost comparision of the fixtures and does not include the cost saving realized from water conservation.

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IPC COMMITTEE. PART II WILL BE HEARD BY THE IRC-PLUMBING COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

Proponent: Anthony Floyd, City of Scottsdale, representing City of Scottsdale (afloyd@scottsdaleaz.gov)

Part I

2015 International Plumbing Code

Revise as follows:

TABLE 604.4
MAXIMUM FLOW RATES AND CONSUMPTION FOR PLUMBING FIXTURES AND FIXTURE FITTINGS

PLUMBING FIXTURE OR FIXTURE FITTING	MAXIMUM FLOW RATE OR QUANTITY [b]
Lavatory, private	~~2.2~~ 1.5 gpm at 60 psi
Lavatory, public (metering)	0.25 gallon per metering cycle
Lavatory, public (other than metering)	0.5 gpm at 60 psi
Shower head (s) discharge[a,c]	2.5 gpm at 80 psi
Sink faucet	2.2 gpm at 60 psi
Urinal	1.0 gallon per flushing cycle
Water closet - remote[d]	1.6 gallons per flushing cycle
Water closet - nonremote[d]	1.28 gallons per flushing cycle average[e,f]

For SI: 1 gallon = 3.785 L, 1 gallon per minute = 3.785 L/m, 1 pound per square inch = 6.895 kPa.

a. A hand-held shower spray is a shower head.

b. Consumption tolerances shall be determined from referenced standards.

c. The combined flow rate from shower heads that are capable of operating simultaneoulsy including rain systems, waterfalls, body sprays and jets shall not exceed 2.5 gpm for every 2600 square inches or portion thereof. In shower compartments required to comply with the requirements of Chapter 11 of the International Bulding Code, the combined flow rate shall not exceed 4.0 gpm for every 2600 square inches or portion thereof.

d. A water closet is remote where its discharge is combined with less than 1.5 DFU discharge from other fixtures and such discharge flows horizontally for 30 feet or more.

e. The effective flush volume for a dual-flush water closet is defined as the composite, average flush volume of two reduced flushes and one full flush.

f. In public settings, the maximum water use of a dual flush water closet is based solely on its full flush operation; not an average of full and reduced volume flushes.

Part II

2015 International Residential Code

Revise as follows:

TABLE P2903.2
MAXIMUM FLOW RATES AND CONSUMPTION FOR PLUMBING FIXTURES AND FIXTURE FITTINGS[b]

PLUMBING FIXTURE OR FIXTURE FITTING	MAXIMUM FLOW RATE OR QUANTITY [b]
Lavatory faucet	~~2.2~~ 1.5 gpm at 60 psi
Shower head(s) discharge[ac]	2.5 gpm at 80 psi
Sink faucet	2.2 gpm at 60 psi
Water closet	~~1.6~~ 1.28 gallons per flushing cycle

For SI: 1 gallon per minute = 3.785 L/m,

1 pound per square inch = 6.895 kPa.

a. A handheld shower spray shall be considered a shower head.

b. Consumption tolerances shall be determined from referenced standards.

c. The combined flow rate from shower heads that are capable of operating simultaneously including rainfall shower systems, waterfalls, body sprays and jets shall not exceed 2.5 gpm for every 2600 square inches or portion thereof of shower compartment floor area.

Reason: Recent advancements have allowed water closets to use 1.28 gallons per flush (gpf) or less while still providing equal or superior performance. This is 20 percent less water than the current federal standard of 1.6 gpf. Toilets are by far the main source of water use in the home, accounting for nearly 30 percent of an average home's indoor water consumption. Water-efficient toilets significantly reduce water use and help preserve the nation's water resources. Unlike some first-generation, "low-flow" toilets, high-efficiency toilets combine efficiency with high performance. Design advances enable high-efficiency toilets to save water with no trade-off in flushing power. In fact, many perform better than standard toilets in consumer testing. Faucets account for more than 15 percent of indoor household water use - more than 1 trillion gallons of water across the United States each year. High efficiency lavatory faucets that use a maximum of 1.5 gallons per minute (gpm) can reduce a sink's water flow by 30 percent or more from the current standard flow of 2.2 gpm without sacrificing performance.
The maximum flush volumes in the current IRC are based upon a nationwide standard enacted 20 years ago. In December 2010, the US Department of Energy determined that states were no longer preempted from adopting more stringent efficiency standards for water closets, among other products. Federal Regisister, Vol. 75, No. 245, December 22, 2010, p. 80289. This document may be assess here: http://www.regulations.gov/#!documentDetail;D=EERE-2010-BT-WAV-0045-0001

Water closets operating at 1.28 gpf or better are commonly available and perform as well as those with higher flush volumes. Since 2006, the establishment of the WaterSense labeling program for water efficient products and services by the Environmental Protection Agency has provided a framework for the recognition of products that are substantially more efficient than minimum federal requirements while maintaining functionality and customer satisfaction. WaterSense criteria for tank-type water closets were established in 2007. Manufacturers have responded by bringing large numbers of models to market that meet or exceed WaterSense specifications. Based on the most recent reports by WaterSense partners, more than 1,621 models of tank-type toilets from nearly 100 brands currently meet WaterSense specifications, showing the widespread availability and commercial viability of these more efficienct plumbing fixtures. With the pace of introduction of new models that meet WaterSense specifications, it is reasonable to expect that these figures will be substantially larger by 2015.

Cost Impact:

Part I: Will not increase the cost of construction
Based on manufacturer's mass production and market-wide availability, high-efficiency water closets and lavatory faucets dominate the market and are cost neutral with the current standard low-flow fixtures. The National Resources Defense Council (NRDC) estimates that if the flush volumes specified in this proposal were applied to new construction nationwide effective 2016, the following savings would be realized in the residential sector alone: 41.6 million gallons of water per day by 2030 with a cumulative savings for consumers of more that $138 million through 2030.

Part II: Will not increase the cost of construction
Based on manufacturer's mass production and market-wide availability, high-efficiency water closets and lavatory faucets dominate the market and are cost neutral with the current standard low-flow fixtures. The National Resources Defense Council (NRDC) estimates that if the flush volumes specified in this proposal were applied to new construction nationwide effective 2016, the following savings would be realized in the residential sector alone: 41.6 million gallons of water per day by 2030 with a cumulative savings for consumers of more that $138 million through 2030.

Analysis:

Part II: The heading of the second column of Table P2903.2 was published incorrectly for 2015 as PLUMBING FIXTURE OR FIXTURE FITTING. This has been identified as errata. The header has been corrected in this proposal to read MAXIMUM FLOW RATE OR QUANTITY [b]. This will be corrected for publication of the 2018 IRC.

P 107-15 : T604.4-FLOYD3394

P 108-15

Table 604.4

Proponent: Karen Hobbs, Natural Resources Defense Council, representing Natural Resources Defense Council (khobbs@nrdc.org); Ed Osann (eosann@nrdc.org)

2015 International Plumbing Code

Revise as follows:

TABLE 604.4
MAXIMUM FLOW RATES AND CONSUMPTION FOR PLUMBING FIXTURES AND FIXTURE FITTINGS

PLUMBING FIXTURE OR FIXTURE FITTING	MAXIMUM FLOW RATE OR QUANTITY [b]
Urinal	~~1.0~~ 0.5 gallon per flushing cycle
Water closet[c,d,e]	~~1.6~~ 1.28 gallons per flushing cycle

(Portions of table not shown remain unchanged)

For SI: 1 gallon = 3.785 L, 1 gallon per minute = 3.785 L/m, 1 pound per square inch = 6.895 kPa.

a. A hand-held shower spray is a shower head.

b. Consumption tolerances shall be determined from referenced standards.

c. 1.6 gallons per flushing cycle for a water closet connected to the sanitary drainage system of an existing building.

d. The effective flush volume for a dual-flush water closet is defined as the composite, average flush volume of two reduced flushes and one full flush.

e. In public settings, the maximum water use of a dual flush water closet is based solely on its full flush operation; not the average of full and reduced volume flushes.

Reason: Recent advancements have allowed toilets to use 1.28 gallons per flush or less while providing equal or superior performance. This is 20 percent less water than the current federal standard of 1.6 gallons per flush. Toilets are by far the main source of water use in the home, accounting for nearly 30 percent of an average home's indoor water consumption. Water-efficient toilets can reduce water use in the home and help preserve the nation's water resources. Unlike some first-generation, "low-flow" toilets, high-efficiency toilets combine efficiency with high performance. Design advances enable high-efficiency toilets to save water with no trade-off in flushing performance or drainline function. In fact, many perform better than standard toilets in consumer testing (Source: EPA *WaterSense*:http://www.epa.gov/WaterSense/products/toilets.html).
WaterSense criteria for tank-type water closets were established in 2007. Based on the most recent reports by *WaterSense* partners, more than 2,305 models of tank-type toilets from more than 115 brands currently meet the *WaterSense* specification, showing the widespread availability and commercial viability of these more efficient water closets.

Like toilets, urinals operating at 0.5 gpf or better are commonly availabile today and perform as well as those with higher flush volume. WaterSense criteria for flushing urinals were established in 2009. Manufacturers have reponded by bringing large numbers of models to market that meet or exceed WaterSense specifications. Based on the most recent reports by WaterSense partners, 151 models of urinal fixtures from 15 brands and 91 models of urinal valves from 7 brands currently meet the WaterSense specification of 0.5 gpf, demonstrating the widespread availability and commercial viability of more efficient urinals. With the pace of introduction of new models that meet WaterSense specifications, it is reasonable to expect that these figures will be even larger by 2018.

The Natural Resources Defense Council (NRDC) estimates that significant water savings could be realized if these standards were applied nationwide effective in 2018:

- **For toilets**, approximately 36 million gallons of water per day could be saved in the residential sector by 2030 (this value represents savings from residential toilets; it does not exclude flushometer valve toilets in the residential secctor and tank-type toilets in the Commercial and Industrial sectors). NRDC estimates savings in the commercial sector of 8 million gallons of water per day by 2030.
- **For urinals**, water savings would reach 2 million gallons per day by 2030.

Reducing water use is an integral part of the stated purpose of the International Plumbing Code. As noted in Chapter 1 of the 2015 edition: "**101.3 Intent**. The purpose of the code is to establish minimum standards to provide a reasonable level of safety, health, property protection and public welfare by regulating the controlling the design, construction, installation, quality of materials, location, operation and maintenance or use of plumbing equipment and systems."

Nothing is more fundamental to public "health, safety, property protection and public welfare" than the maintenance of adequate water supplies. Water-saving technologies, such as high-efficiency toilets and urinals, reduce water use, helping to ensure that water supplies are maintained at safe and reliable levels, maintaining human health and firefighting capability, as well as environmental resources.

Maximum Performance (MaP) of Toilet Fixtures

December 3, 2014

The following list of toilet fixtures was screened from the current MaP database of 3,084 tank-type models. All models on this list include these characteristics: WaterSense compliant, single-flush, 1.28 gallons per flush maximum, gravity-fed, elongated ADA height bowl, floor-mounted, 12-inch rough-in, minimum 3-inch flush valve, and a MaP score of 1,000 grams. Except for the 3 models highlighted below, all feature a trapway in excess of 2 inches. Current retail prices for the models were obtained where possible from retailer websites.

MaP Report No.	Brand Name	Model Name	Model Number	MaP Flush Performance Score (grams of waste removed in a single flush)	1- or 2-piece	Flush Valve-Flapper size (in.) December 3, 2014

Bibliography: Koeller, John, "Single-flush toilet matrix-2014-12-03.pdf"; December, 2014.

Cost Impact: Will not increase the cost of construction
Adoption of this code change proposal will not increase the cost of construction. As noted above, more than 2,305 models of tank-type toilets from more than 115 brands currently meet the 1.28 gpf standard in this proposal; for urinals, 151 models of urinal fixtures from 15 brands and 91 models of urinal valves from 7 brands currently meet the *WaterSense* specification of 0.5 gpf

(Source: MaP Testing: http://www.map-testing.com/high-efficiency-toilets.html). *Consumer Reports* identifies top-performing toilets at 1.28 gpf, ranging in cost from $100 to $380 (Source: *Consumer Reports*, "Water-saving toilets from Consumer Reports' tests: Stop flushing water and money down the drain," July 14, 2014: http://www.consumerreports.org/cro/news/2014/07/water-saving-toilets-from-consumer-reports-tests/index.htm.

In addition, attached is a list of toilet fixtures that was screened from the current MaP database; all models on the list are 1.28 gpf. Current retail prices for the models were obtained where possible from retailer websites (file name: "Single-flush toilet matrix-2014-12-03.pdf."

According to EPA's *WaterSense*, "Our product research has found that high-efficiency urinal fixtures and flushing devices are no more expensive than their standard (1.0 gpf) counterparts. The average price of a new high-efficiency or standard urinal fixture is about $350 and the average cost for a high-efficiency or standard pressurized flushing device (flushometer valve) is approximately $200. Because there is very little to no cost difference between high-efficiency flushing urinals and standard flushing urinals, installing high-efficiency models in new construction or as part of the natural replacement process is cost-effective with immediate payback in water cost savings" (Source: EPA *WaterSense*: http://www.epa.gov/WaterSense/pubs/faq_lfu.html).

The City of Tucson has found that "Prices [for urinals] are comparable to those for regular urinals and toilets" (Source: City of Tucson, "Commercial-Industrial High Efficiency Urinal Rebate Program," http://water.tucsonaz.gov/files/water/docs/Urinal_Brochure_2-13.pdf).

P 108-15 : T604.4-HOBBS5110

P 109-15

Part I:
Table 604.4
Part II:
Table P2903.2

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IPC COMMITTEE. PART II WILL BE HEARD BY THE IRC-PLUMBING COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

Proponent: Karen Hobbs, Natural Resources Defense Council, representing Natural Resources Defense Council (khobbs@nrdc.org)

Part I

2015 International Plumbing Code

Revise as follows:

TABLE 604.4
MAXIMUM FLOW RATES AND CONSUMPTION FOR PLUMBING FIXTURES AND FIXTURE FITTINGS

PLUMBING FIXTURE OR FIXTURE FITTING	MAXIMUM FLOW RATE OR QUANTITY [b]
Lavatory, private	~~2.2~~1.5 gpm at 60 psi
Shower head [a]	~~2.5~~2.0 gpm at 80 psi

(Portions of table not shown remain unchanged)

For SI: 1 gallon = 3.785 L, 1 gallon per minute = 3.785 L/m, 1 pound per square inch = 6.895 kPa.

a. A hand-held shower spray is a shower head.

b. Consumption tolerances shall be determined from referenced standards.

Part II

2015 International Residential Code

Revise as follows:

TABLE P2903.2
MAXIMUM FLOW RATES AND CONSUMPTION FOR PLUMBING FIXTURES AND FIXTURE FITTINGS

PLUMBING FIXTURE OR FIXTURE FITTING	MAXIMUM FLOW RATE OR QUANTITY[b]
Lavatory faucet	~~2.2~~1.5 gpm at 60 psi
Water closet[c]	~~1.6~~1.28 gallons per flushing cycle

(Portions of table not shown remain unchanged)

For SI: 1 gallon per minute = 3.785 L/m,

1 pound per square inch = 6.895 kPa.

a. A handheld shower spray shall be considered a shower head.

b. Consumption tolerances shall be determined from referenced standards.

c. 1.6 gallons per flushing cycle for a water closet connected to the sanitary drainage system of an existing building.

Reason: Showerheads operating at 2.0 gpm at 80 psi are commonly available and perform as well as showerheads operating at 2.5 gpm. The *WaterSense* specification for showerheads was adopted in 2010, including a maximum flow rate of 2.0 gpm at 80 psi. Based on the most recent reports by *WaterSense* partners, more than 800 models from 45 brands currently meet the proposed standard, demonstrating the widespread availability and commercial viability of these types of showerheads (Source: MaP Testing: http://www.map-testing.com/).
Residential lavatory faucets rated at 1.5 gpm or less are also commonly available and perform as well as those with higher flow rates. WaterSense established criteria for residential lavatory faucets and faucet accessories such as aerators in 2007. Based on the most recent reports by WaterSense partners, over 5,200 models from 134 brands currently meet the WaterSense specification, showing the widespread availability and commercial viability of more efficient lavatory faucets (Source: MaP Testing: http://www.map-testing.com/).

The Natural Resources Defense Council (NRDC) estimates that significant water and energy savings could accrue nationwide if these revised flow rates for showerheads and faucets became effective in 2018 (savings estimates apply only to the residential sector):

- **Water and energy savings potential for showerheads**:
- 86 million gallons of water per day by 2030;
- 1,553 MWh (Megawatt hours) of electricity per year by 2030; and;
- 112 million therms of natural gas per year by 2030.

- **Water and energy savings potential for faucets**:
- 122 million gallons of water per day by 2030;
- 2,199 MWh (Megawatt hours) of electricity per year by 2030; and

- 158 million therms of natural gas per year by 2030.

Reducing water use is an integral part of the stated purpose of the International Plumbing Code. As noted in Chapter 1 of the 2015 edition: "**101.3 Intent.** The purpose of the code is to establish minimum standards to provide a reasonable level of safety, health, property protection and public welfare by regulating the controlling the design, construction, installation, quality of materials, location, operation and maintenance or use of plumbing equipment and systems."

Nothing is more fundamental to public "health, safety, property protection and public welfare" than the maintenance of adequate water supplies. Water-saving technologies, such as high-efficiency faucets and showerheads, reduce water use, helping to ensure that water supplies are maintained at safe and reliable levels, protecting human health and firefighting capability, as well as environmental resources.

Bibliography:

Part II: Koeller, John, "Single-flush toilet matrix-2014-12-03.pdf"; December, 2014.

Cost Impact:

Part I: Will not increase the cost of construction
As noted above, both showerheads and faucets operating at the flow rates proposed are commonly available and perform as well as less efficient fixtures. For showerheads, more than 800 models from 45 brands currently meet the proposed standard; for faucets, over 5,200 models from 134 brands currently meet the proposed standard (Source: MaP Testing; http://www.map-testing.com/). According to EPA WaterSense, "Showerheads are available at a variety of price points and ranges in cost may be due to a number of factors including style or functional design" (Source: EPA WaterSense: http://www.epa.gov/WaterSense/pubs/faq_showerheads.html).
Consumer Reports found that, "If you think you have to spend top dollar to get a strong performer, think again. Our top-rated multisetting showerhead costs a quarter of the price of the model that finished second" (Source: *Consumer Reports*: http://www.consumerreports.org/cro/showerheads/buying-guide.htm).

Regarding faucets, EPA WaterSense also found that, "Most high-efficiency faucet accessories that restrict flow are no more expensive that their conventional counterparts. However, pressure compensating faucet accessories that are designed to provide and maintain a constant flow rate despite fluctuations in water pressure typically cost a few dollars more." http://www.epa.gov/WaterSense/faucets.html. Lowe's Home Improvement Store features more than 1,759 residential bathroom faucets that meet the proposed standard of 1.5 gpm from 19 brands, ranging in cost from $15 to $2000 (Source: Lowe's Home Improvement Store website: http://www.lowes.com/Bathroom/Bathroom-Faucets/Bathroom-Sink-Faucets/_/N-1z0wz0vZ1z0z4i4/pl#!). For showerheads, Lowe's lists 185 products from 15 brands, ranging in cost from $5 to $400 (Source: Lowe's Home Improvement Store website: http://www.lowes.com/Bathroom/Showers-Shower-Accessories/Showerheads/_/N-1z0wz0vZ1z0z4gq/pl#!).

Part II: Will not increase the cost of construction
Adoption of this code change proposal will not increase the cost of construction. As noted above, more than 2,305 models of tank-type toilets from more than 115 brands currently meet the 1.28 gpf standard in this proposal. (Source: MaP Testing; http://www.map-testing.com/). *Consumer Report*s identifies top-performing high-efficiency toilets at 1.28 gpf, ranging in cost from $100 to $380. (Source: *Consumer Reports*, "Water-saving toilets from *Consumer Reports*' tests: Stop flushing water and money down the drain," July 14, 2014: http://www.consumerreports.org/cro/news/2014/07/water-saving-toilets-from-consumer-reports-tests/index.htm).
In addition, attached is a list of toilet fixtures screened from the current MaP database; all models on the list are 1.28 gpf. Current retail prices for the models were obtained where possible from retailer websites (file name: "Single-flush toilet matrix-2014-12-03.pdf").

Consumer Reports tested 16 brands of faucets ranging in price from $80 to $600 and found little difference in performance or durability (Source: "Water Conservation with Shower and Faucet Tips", http://www.scgh.com/go-green/water-fixtures-and-plumbing/water-wise-showers-and-faucets/).

Regarding faucets, EPA WaterSense also found that, "Most high-efficiency faucet accessories that restrict flow are no more expensive that their conventional counterparts. However, pressure compensating faucet accessories that are designed to provide and maintain a constant flow rate despite fluctuations in water pressure typically cost a few dollars more" (Source: EPA WaterSense: http://www.epa.gov/WaterSense/faucets.html). Lowe's Home Improvement Store features more than 1,759 residential bathroom faucets that meet the proposed standard of 1.5 gpm from 19 brands, ranging in cost from $15 to $2000 (Source: Lowe's Home Improvement Store website: http://www.lowes.com/Bathroom/Bathroom-Faucets/Bathroom-Sink-Faucets/_/N-1z0wz0vZ1z0z4i4/pl#!).

P 109-15 : T604.4-HOBBS5292

P 110-15

Table 604.4

Proponent: Billy Smith, American Society of Plumbing Engineers Legislative Committee, representing American Society of Plumbing Engineers Legislative Committee (bsmith@aspe.org)

2015 International Plumbing Code

Revise as follows:

TABLE 604.4
MAXIMUM FLOW RATES AND CONSUMPTION FOR PLUMBING FIXTURES AND FIXTURE FITTINGS

PLUMBING FIXTURE OR FIXTURE FITTING	MAXIMUM FLOW RATE OR QUANTITY [b]
Water closet, private use application	1.6 gallons per flushing cycle
Water closet, public use application	1.28 gallons per full flushing cycle or, where equipped with dual flush device, 1.6 gallons per full flush cycle

For SI: 1 gallon = 3.785 L, 1 gallon per minute = 3.785 L/m, 1 pound per square inch = 6.895 kPa.

a. A hand-held shower spray is a shower head.

b. Consumption tolerances shall be determined from referenced standards.

Reason: This will increase the water conservation requirements for public use water closets. Every manufacturer of water closets has a 1.28 gallon per flush public water closet. Similarly, every manufacturer of water closets has a bowl for public use that can be equipped with a dual flush device.
If you consider a standard commercial building with 100 water closets. The water savings amounts to more than 33,000 gallons per year. This savings is accomplished without any loss in performance of the plumbing system.

Cost Impact: Will increase the cost of construction
This may increase the cost depending on which fixture is selected to install. The cost of the fixture may be higher. The installation is the same cost.

P 110-15 : T604.4-SMITH5395

P 111-15

604.4 (New)

Proponent: Ronald George, Self; Plumb-Tech Design & Consulting Services LLC; www.LegionellaPrevention.org, representing Self; Plumb-Tech Design & Consulting Services LLC (Ron@Plumb-TechLLC.com)

2015 International Plumbing Code

Add new text as follows:

604.4 **Maximum length of dead leg piping** The length of dead legs in the hot or cold water distribution piping systems shall not exceed four branch pipe diameters.

Reason: The length of the dead leg was determined from examining several glass piping installations with colored water in order to illustrate how stagnant water reacts in piping branches[1]. In the testing that I witnessed, the clear water flowing past a branch illustrated that the colored water remained beyond 4 to 5 pipe diameters from the tee. Based on this observation, water treatment chemicals would be able to reach about 4 pipe diameters into a branch pipe to control Legionella bacteria but not beyond about 4 pipe diameters. For this reason, 4 pipe diameters is an appropriate maximum distance for dead legs. Longer dead legs would be possible with some form of parralel piping flow or circulation to maintain water treatment chemical levels in branches. Dead legs are a significant source of Legionella bacteria and other pathogen growth in biofilms in the plumbing system. Dead legs are sections of pipe where water does not normally flow. Stagnant water in dead legs allows the water treatment chemicals to dissipate, rendering them ineffective for controling Legionella.

1. Video of colored water flowing by a tee: http://mechanical-hub.com/minimizing-legionella-bacteria-in-building-water-systems

Bibliography: www.LegionellaPrevention.org
ASHRAE - Guideline 12-2000 - Minimizing the Risk of Legionellosis Associated with Building Water Systems

http://mechanical-hub.com/minimizing-legionella-bacteria-in-building-water-systems

www.Plumb-TechLLC.com

ASHRAE Standard 188 - Legionellosis: Risk Management for Building Water Systems (not finalized as of this submission)

Cost Impact: Will increase the cost of construction
The cost increase will be minimal. In some installations, there may be the addition of one pipe fitting. In more elaborate installations, the cost could be as much as 10-15 percent more for the water distribution pipe and fittings.

P 111-15 : 604.12 (New)-GEORGE5462

P 112-15

Table 605.3, Table 605.4

Proponent: Larry Gill, representing IPEX USA LLC (larry.gill@ipexna.com)

2015 International Plumbing Code

Revise as follows:

TABLE 605.3
WATER SERVICE PIPE

MATERIAL	STANDARD
Polyethylene of raised temperature (PE-RT) plastic tubing	ASTM F 2769; CSA B137.18

(Portions of table not shown remain unchanged)

TABLE 605.4
WATER DISTRIBUTION PIPE

MATERIAL	STANDARD
Polyethylene of raised temperature (PE-RT) plastic tubing	ASTM F 2769; CSA B137.18

(Portions of table not shown remain unchanged)

Add new standard(s) as follows:
CSA B137.18-13 Polyethylene of raised temperature resistance (PE-RT) tubing systems for pressure applications.

Reason: CSA B137.18 - Polyethylene of raised temperature resistance (PE-RT) tubing systems for pressure applications is a new consensus system standard (tubing and fittings). The scope includes the following: potable water distribution systems or other applications including, municipal water service lines,reclaimed water distribution, radiant panel heating and cooling systems, hydronic baseboard heating systems, snow and ice melting heating systems, building services piping, compressed air distribution, and ground source geothermal systems.

Cost Impact: Will not increase the cost of construction
Adding an alternate standard for a piping material will not affect the cost of an installation.

Analysis: A review of the standard proposed for inclusion in the code, CSA B137.18-13, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2015.

P 112-15 : 605.3-GILL4429

P 113-15

Part I:
Table 605.3, Table 605.4
Part II:
Table P2906.4, Table P2906.5

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IPC COMMITTEE. PART II WILL BE HEARD BY THE IRC-PLUMBING COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

Proponent: Mike Cudahy, representing Plastic Pipe and Fittings Association (mikec@cmservnet.com)

Part I

2015 International Plumbing Code

Revise as follows:

TABLE 605.3
WATER SERVICE PIPE

MATERIAL	STANDARD
Cross-linked polyethylene (PEX) plastic pipe and tubing	ASTM F 876; ~~ASTM F 877;~~ AWWA C904; CSA B137.5

(Portions of table not shown remain unchanged)

TABLE 605.4
WATER DISTRIBUTION PIPE

MATERIAL	STANDARD
Cross-linked polyethylene (PEX) plastic tubing	ASTM F 876~~; ASTM F 877;~~ CSA B137.5

(Portions of table not shown remain unchanged)

Part II

2015 International Residential Code

Revise as follows:

TABLE P2906.4
WATER SERVICE PIPE

MATERIAL	STANDARD
Cross-linked polyethylene (PEX) plastic tubing	ASTM F 876; ~~ASTM F 877;~~ CSA B137.5

(Portions of table not shown remain unchanged)

TABLE P2906.5
WATER DISTRIBUTION PIPE

MATERIAL	STANDARD
Cross-linked polyethylene (PEX) plastic tubing	ASTM F 876; ~~ASTM F 877;~~ CSA B137.5

(Portions of table not shown remain unchanged)

Reason: ASTM F877 has been revised a few years ago to remove redundant pipe/tubing dimensional and performance specifications which are otherwise specified in ASTM F876. F877 remains a PEX fitting and PEX system materials and performance standard exclusive for use with ASTM F876 piping/tubing.
ASTM F877 is already in the code.

Cost Impact:

Part I: Will not increase the cost of construction
This proposal simply deletes a standard that is no longer pipe or tubing related from the code. The piping material is now covered by a different standard, and as such, the option is not deleting or adding a material. Thus the code with this proposal added will not cause the cost of construction to increase.

Part II: Will not increase the cost of construction
This proposal simply deletes a standard that is no longer pipe or tubing related from the code. The piping material is now covered by a different standard, and as such, the option is not deleting or adding a material. Thus the code with this proposal added will not cause the cost of construction to increase.

P 114-15

Table 605.3

Proponent: Pennie L Feehan, Copper Development Association, representing Copper Development Association (penniefeehan@me.com)

2015 International Plumbing Code

Revise as follows:

TABLE 605.3
WATER SERVICE PIPE

MATERIAL	STANDARD
~~Brass pipe~~	~~ASTM B 43~~

(Portions of table not shown remain unchanged)

Reason: The proposal removes brass because brass is a copper-alloy and copper-alloy is the term used to identify materials manufactured where copper is the base metal and includes brass and bronze.

Cost Impact: Will not increase the cost of construction
This proposal will not impact the cost of construction as this is only a clarification of a product name.

P 114-15 : T605.3-FEEHAN3791

P 115-15

Part I:
605.4
Part II:
P2906.5

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IPC COMMITTEE. PART II WILL BE HEARD BY THE IRC-PLUMBING COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

Proponent: Gary Morgan, Viega LLC, representing Viega LLC (gary.morgan@viega.us)

Part I

2015 International Plumbing Code

Revise as follows:

605.4 Water distribution pipe. Water distribution pipe shall conform to NSF 61 and shall conform to one of the standards listed in Table 605.4. Hot and cold water distribution pipe and tubing shall have a pressure rating of not less than 100 psi (690 kPa) at 180ºF (82ºC).

Part II

2015 International Residential Code

Revise as follows:

P2906.5 Water-distribution pipe. Water-distribution piping within *dwelling units* shall conform to NSF 61 and shall conform to one of the standards indicated in Table P2906.5. ~~Hot-water-distribution~~Hot and cold water-distribution pipe and tubing shall have a pressure rating of not less than 100 psi at 180°F (689 kPa at 82°C).

Reason: This code proposal is really only an attempt to address a subtle technicality that has existed for a very long time. The addition of "and cold" to this sentence makes it 100% clear that even cold water distribution piping needs to be temperature/pressure rated at 180F. Another possible way to address the issue is to simply remove "hot" from the same sentence. All of the piping standards listed in Table 605.4 for water distribution piping already meet this mandatory elevated temperature/pressure rating. The existing code language stating specifically "hot water distribution pipe and tubing" implies that pipes used for cold water distribution piping may not need to carry elevated temperature/pressure rating.
Your support of this proposal would be most appreciated!

Cost Impact:

Part I: Will not increase the cost of construction
This proposal has absolutely no impact on the cost of construction and only attempts to address a technicality which has existed for many years.

Part II: Will not increase the cost of construction
This proposal has absolutely no impact on the cost of construction and only attempts to address a technicality which has existed for many years.

P 115-15 : 605.4-MORGAN5099

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IPC COMMITTEE. PART II WILL BE HEARD BY THE IRC-PLUMBING COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

Proponent: Gary Morgan, Viega LLC, representing Viega LLC (gary.morgan@viega.us)

Part I

2015 International Plumbing Code

Revise as follows:

605.17 PEX plastic. Joints between cross-linked polyethylene plastic tubing and fittings shall comply with Sections 605.17.1 and 605.17.2. PEX tubing shall comply with Section 605.17.3.

Add new text as follows:

605.17.3 PEX tubing. The manufacturer of PEX tubing shall have marked the outside of the tubing with the thermoplastic material designation code in accordance with ASTM F876. The designation code shall consist of the abbreviation "PEX" followed by four digits. The first digit shall represent a chlorine resistance rating as established by testing in accordance with ASTM F876.

605.17.3.1 Chlorine resistance rating digits. The first digit of the designation code shall have the following meanings:

1. Digit "0" indicates that the tubing has not been tested for chlorine resistance or that tubing does not comply with the minimum requirements for chlorine resistance.

2. Digit "1" indicates that the tubing complies with the minimum requirements for chlorine resistance for the conditions of 25% of the time at 140°F (60°C) and 75% of the time at 73°F (23°C).

3. Digit "3" indicates that the tubing complies with the minimum requirements for chlorine resistance for the conditions of 50% of the time at 140°F (60°C) and 50% of the time at 73°F (23°C).

4. Digit "5" indicates that the tubing complies with the minimum requirements for chlorine resistance for the conditions of 100% of the time at 140°F (60°C).

Part II

2015 International Residential Code

Revise as follows:

P2906.9.1.5 Cross-linked polyethylene plastic (PEX). Joints between cross-linked polyethylene plastic tubing or fittings shall comply with Section P2906.9.1.5.1 or Section P2906.9.1.5.2. PEX tubing shall comply with Section P2906.9.1.5.3.

Add new text as follows:

P2906.9.1.5.3 PEX tubing. The manufacturer of PEX tubing shall have marked the outside of the tubing with the thermoplastic material designation code in accordance with ASTM F876. The designation code shall consist of the abbreviation "PEX" followed by four digits. The first digit shall represent a chlorine resistance rating as established by testing in accordance with ASTM F876.

P2906.9.1.5.3.1 Chlorine resistance rating digits. The first digit of the designation code shall have the following meanings:

1. Digit "0" indicates that the tubing has not been tested for chlorine resistance or that tubing does not comply with the minimum requirements for chlorine resistance.

2. Digit "1" indicates that the tubing complies with the minimum requirements for chlorine resistance for the conditions of 25% of the time at 140°F (60°C) and 75% of the time at 73°F (23°C).

3. Digit "3" indicates that the tubing complies with the minimum requirements for chlorine resistance for the conditions of 50% of the time at 140°F (60°C) and 50% of the time at 73°F (23°C).

4. Digit "5" indicates that the tubing complies with the minimum requirements for chlorine resistance for the conditions of 100% of the time at 140°F (60°C).

Reason: Disinfection of potable water using free chlorine as a disinfectant is the most common practice used today and has been over the last many decades. Not all plastic pipes have equal long-term performance when operating in a hot-chlorinated water enviroment therefore it is important for the user of this code to understand how plastic pipes are rated so pipes can be properly specified for their expected end use operating conditions.
The PEX standard ASTM F876 includes mandatory chlorine resistance designation code information needed by field personnel so that the PEX selected meets the expected end use conditions of the installation. This information is normally included on the print line of the tubing in accordance with the listing of that specific tubing. Building inspectors not having ready access to the ASTM standard need code guidance so they will know if the tubing is correctly applied for the end use and environmental conditions of the installation. If the tubing will be used for a hot water recirculation system, the inspector needs to know how to determine if properly rated PEX has been used. Also, if the tubing will be installed in an environment that normally exceeds 73°F (23°C) (such as an attic in very warm climates), the inspector needs to know what designation code is required.

This proposal would require that all PEX tubing be marked with its material designation code according to ASTM F876. Currently the other PEX standard listed in the table of water distribution pipe, CSA B137.5, does not currently mandate a PEX material designation code marking requirement therefore it would be impossible for the specifier, installer, or code inspector to know if the tubing is suitable for the expected end use conditions.

Chlorine testing of all ASTM F876 and CSA B137.5 PEX tubing materials are required today for certification and listing which attempts to replicate the end-use conditions (time at elevated temperature) under which the tubing can operate and still reach an extrapolated test lifetime of 50 years.

Cost Impact:

Part I: Will not increase the cost of construction

This proposal has absolutely no impact on the cost of construction and only seeks to clarify requirements within the code.

Part II: Will not increase the cost of construction
This proposal has absolutely no impact on the cost of construction and only seeks to clarify requirements within the code.

P 117-15 : 605.4-MORGAN6013

P 118-15

Table 605.4

Proponent: Pennie L Feehan, Copper Development Association, representing Copper Development Association (penniefeehan@me.com)

2015 International Plumbing Code

Revise as follows:

TABLE 605.4
WATER DISTRIBUTION PIPE

MATERIAL	STANDARD
~~Brass pipe~~	~~ASTM B 43~~
Copper or copper-alloy pipe	ASTM B 42; ASTM B 43; ASTM B 302

(Portions of table not shown remain unchanged)

Reason: There are many different copper and copper-alloy compositions. Copper alloy is the term used to identify materials manufactured where copper is the base metal and it includes brass and bronze.

Cost Impact: Will not increase the cost of construction
This proposal will not increast the cost of construction as this change is only to update the name of a material that is already in the code.

P 118-15 : T605.4-FEEHAN3792

P 119-15

Table 605.5, Chapter 14

Proponent: William Chapin, representing Professional Code Consulting, LLC (bill@profcc.us)

2015 International Plumbing Code

Revise table as follows:

TABLE 605.5
PIPE FITTINGS

MATERIAL	STANDARD
Fittings for polyethylene of raised temperature (PE-RT) plastic tubing	ASSE 1061; ASTM F 1807; ASTM F 2098; ASTM F 2159; ASTM F 2735; ASTM F 2769

(Portions of table not shown remain unchanged)

Add new standard(s) as follows:
ASSE 1061-2011 Peformance Requirements for Push-Fit Fittings (UPDATE of edition level only)

Reason: ASSE 1061-2011 added PE-RT to the list of tubings in this edition of the standard so that those fittings can be used for PE-RT tubing.

Cost Impact: Will not increase the cost of construction
This will not increase the cost of construction as it only adds another option for the installer.

Analysis: Successful action on this proposal will result in the update of Reference Standard ASSE 1061 to the 2011 edition level for only the change indicated in the table. A coordinating proposal for updating the standard for the entire code will be submitted to Group B for inclusion in the Reference Standards administrative update proposal.

PIPE FITTINGS

MATERIAL	STANDARD
Fittings for polyethylene of raised temperature (PE-RT) plastic tubing	ASTM F 1807; ASTM F 2098; ASTM F 2159; ASTM F 2735; ASTM F 2769; ASTM D3261; CSA B137.18

(Portions of table not shown remain unchanged)

Add new standard(s) as follows:
CSA B137.18-13 Polyethylene of raised temperature resistance (PE-RT) tubing systems

Reason: CSA B137.18 - Polyethylene of raised temperature resistance (PE-RT) tubing systems for pressure applications is a new consensus system standard for tubing and fittings. ASTM D3261 is a consensus standard for PE fusion and is also applicable for PE-RT.

Cost Impact: Will not increase the cost of construction
Adding another pipe material standard as an option does not impact the cost of construction.

Analysis: A review of the standard proposed for inclusion in the code, CSA B137.18-13, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2015.

P 120-15 : T605.5-GILL4432

P 121-15

605.5.1.1 (New)

Proponent: Donald Jones, Self, representing Self (donaldmjones@att.net)

2015 International Plumbing Code

Add new text as follows:

605.5.1.1 Pre-heat treatment. The area of a copper tube to be utilized for forming a tee outlet shall be annealed prior to forming the outlet where the run of the tee is greater than 2 inches (50.8 mm), the run and branch of the tee are the same size or required by the manufacturer of the tee outlet-forming equipment.

Reason: Full size outlets and large bore tubing must be annealed before they undergo extrusion. Annealing copper tubing prior to forming a tee outlet is standard procedure in the field, but like any good practice and requirement of the manufacturer, it is not always followed. Annealing the area of the tubing increases its ductility and formability. The process of annealing allows the tube to undergo deformation without fracture. The result is a sound joint.

Bibliography: http://www.copper.org/applications/plumbing/cth/extruded-outlets/cth_14mech_install.html

http://www.copper.org/publications/pub_list/pdf/copper_tube_handbook.pdf
See page 61

Cost Impact: Will not increase the cost of construction
Since annealing is already a manufacturer's requirement, it will not impact cost. By adding the language to the code, it will, however, help to ensure that the joints are properly made. Short cuts will be avoided.

P 121-15 : 605.5.1-JONES3390

P 122-15

605.6, 605.9

Proponent: Ronald George, self, representing self (Ron@Plumb-TechLLC.com)

2015 International Plumbing Code

Revise as follows:

605.6 Flexible water connectors. Flexible water connectors exposed to continuous pressure shall conform to ASME A112.18.6/CSA B125.6. *Access* shall be provided to all flexible water connectors. Compression couplings shall not be used for flexible water connector joints.

605.9 Prohibited joints and connections. The following types of joints and connections shall be prohibited:

1. Cement or concrete joints.
2. Joints made with fittings not *approved* for the specific installation.
3. Solvent-cement joints between different types of plastic pipe.
4. Saddle-type fittings.
5. Compression joints on plastic water distribution piping or flexible connectors.

Reason: Plastic piping with compression couplings have failed on many occasions when there is a seasonal change in the water temperature or domestic hot water application that allows the plastic pipe to soften. During water hammer events from booster pumps cycling on, valves closing or well pumps cycling, the plastic piping can work loose and cause a flood. Plastic pipe and compressin couplings do not make a safe pipe joint.

Cost Impact: Will not increase the cost of construction
This is not a cost issue it is a material issue. Flexible water connectors and plastic piping should not be joined with compression couplings. I have served as an expert witness recently for a significnt number of compression joint failures especially on hot water piping systems.

P 122-15 : 605.6-GEORGE5606

P 123-15

Table 605.7, Chapter 14

Proponent: Julius Ballanco, representing Self (JBENGINEER@aol.com)

2015 International Plumbing Code

Revise as follows:

TABLE 605.7
VALVES

MATERIAL	STANDARD
Chlorinated polyvinyl chloride (CPVC) plastic	ASME A112.4.14; ASME A112.18.1/CSA B125.1; ASTM F 1970; CSA B125.3, IAPMO Z1157
Copper or copper alloy	ASME A112.4.14; ASME A112.18.1/CSA B125.1; ASME B16.34; CSA B125.3; MSS SP-67; MSS SP-80; MSS SP-110, IAPMO Z1157
Cross-linked polyethylene (PEX) plastic	ASME A112.4.14; ASME A112.18.1/CSA B125.1; CSA B125.3; NSF 359, IAPMO Z1157
Gray iron and ductile iron	AWWA C500; AWWA C504; AWWA C507; MSS SP-67; MSS SP-70; MSS SP-71; MSS SP-72; MSS SP-78, IAPMO Z1157
Polypropylene (PP) plastic	ASME A112.4.14; ASTM F 2389, IAPMO Z1157
Polyvinyl chloride (PVC) plastic	ASME A112.4.14; ASTM F 1970, IAPMO Z1157

Add new standard(s) as follows:
IAPMO/ANSI Z1157-2014 Ball Valves

Reason: This change will add the new national concensus standard for ball valves. The standard covers ball valves 1/8 through 4 NPS in size. It regulates both full port and reduced port ball valves.
This Standard was developed by the IAPMO Z1157 Technical Subcommittee and approved by the IAPMO Plumbing Standards Committee in accordance with the *ANSI Essential Requirements: Due process requirements for American National Standards and the IAPMO Policies and Procedures for Consensus Development of American National Standards*. This Standard was approved as an American National Standard on November 24, 2014.

Cost Impact: Will not increase the cost of construction
There is no cost impact since the use of ball valves meeting this standard is optional.

Analysis: A review of the standard proposed for inclusion in the code, IAPMO/ANSI Z1157-2014, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2015.

2015 International Plumbing Code

Revise as follows:

TABLE 605.8
MANUFACTURED PIPE NIPPLES

MATERIAL	STANDARD
~~Brass ,~~ Copper or copper alloy, and chromium-plated	ASTM B 687
Steel	ASTM A 733

Reason: This standard establishes the requirements for copper and copper alloy pipe nipples within a specified size range. Chromium-plated pipe are copper and copper alloys nipples used in decorative applications.

Cost Impact: Will not increase the cost of construction
This proposal will not increast the cost of construction as this change is only to update the name of a material that is already in the code.

P 126-15 : T605.8-FEEHAN3793

P 127-15

Table 608.1

Proponent: Michael Moss, representing American Backflow Prevention Association (msmoss@utah.gov)

2015 International Plumbing Code

Revise as follows:

TABLE 608.1
APPLICATION OF BACKFLOW PREVENTERS

DEVICE	DEGREE OF HAZARD[a]	APPLICATION[b]	APPLICABLE STANDARDS
Backflow prevention assemblies:			
Spill-resistant vacuum breaker assembly	High or low hazard	Backsiphonage only Sizes $^{1}/_{4}$ ″–2″	ASSE 1056, CSA B64.1.3

(Portions of table not shown remain unchanged)
For SI: 1 inch = 25.4 mm
a. Low hazard—See Pollution (Section 202).
High hazard—See Contamination (Section 202).
b. See Backpressure, low head (Section 202).
See Backsiphonage (Section 202).

Reason: The table did not contain the CSA standard reference for Spill-resistant vacuum breaker. The standard reference is already in Section 608.13.8. It simply needs to be added to the table for clarity and consistency.

Cost Impact: Will not increase the cost of construction
There is no cost impact with the existing cross reference standard between the section and the table.

Proponent: Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

Part I

2015 International Plumbing Code

Revise as follows:

605.10.2 Solvent cementing. Joint surfaces to be solvent cemented shall be clean and free from moisture. Solvent cement that conforms to ASTM D 2235 shall be applied to all joint surfaces. The joint shall be made while the cement is wet. Joints shall be made in accordance with ASTM D 2235. ~~Solvent-cement~~Solvent-cemented joints shall not be ~~permitted~~limited to only above ~~or below ground.~~ground applications.

605.10.3 Threaded joints. ~~Threads~~Threaded connections shall ~~conform to ASME B1.20.1.~~be made using Schedule 80 or ~~heavier~~greater wall thickness pipe. Pipe threads shall be ~~permitted to be threaded~~cut with dies specifically designed for plastic pipe. ~~*Approved* thread lubricant or tape~~Threads shall confom to ASME B1.20.1. Threaded connections shall be ~~applied on the~~assembled by first applying to male threads only, a thread lubricant that is chemically compatible with the pipe and fitting, or thread sealing tape.

605.19.1 Flared joints. ~~Flared~~The use of flared joints connections and the type of flared joint fittings shall be ~~permitted where so indicated~~as specified by the pipe manufacturer. Flared joints shall be made by a tool designed for that operation.

605.22.4 Threaded joints. ~~Threads~~The usable perssure rating of threeaded pipe shall ~~conform to ASME B1.20.1.~~be 50 percent of the manufacturer's pressure rating for unthreaded pipe. Threaded connections shall be made using Schedule 80 or ~~heavier~~greater wall thickness pipe. Pipe threads shall be ~~permitted to be threaded~~cut with dies specifically designed for plastic pipe~~, but the pressure rating~~. The use of ~~the pipe shall be reduced by 50 percent. Thread by socket~~thread-by-socket molded fittings shall be ~~permitted~~prohibited. ~~*Approved*~~ A thread lubricant ~~or tape shall be applied on~~that is chemically compatible with the ~~male threads only.~~pipe and fitting, or thread sealing tape.

608.13.2 Reduced pressure principle backflow prevention assemblies. Reduced pressure principle backflow prevention assemblies shall conform to ASSE 1013, AWWA C511, CSA B64.4 or CSA B64.4.1. Reduced pressure detector assembly backflow preventers shall conform to ASSE 1047. These devices shall be ~~permitted~~considered to be ~~installed where subject to~~capable of functioning under any downstream pressure condition whether continuous ~~pressure conditions~~or intermittent. The relief opening shall discharge by *air gap* and shall be prevented from being submerged.

608.13.3 Backflow preventer with intermediate atmospheric vent. Backflow preventers with intermediate atmospheric vents shall conform to ASSE 1012 or CSA B64.3. These devices shall be ~~permitted~~considered to be ~~installed where subject to~~capable of functioning under any downstream pressure condition whether continuous ~~pressure conditions~~or intermittent. The relief opening shall discharge by *air gap* and shall be prevented from being submerged.

608.16.3 Heat exchangers. Heat exchangers utilizing an essentially toxic transfer fluid shall be separated from the potable water by double-wall construction. An *air gap* open to the atmosphere shall be provided between the two walls. Heat exchangers utilizing an essentially nontoxic transfer fluid shall be ~~permitted to be~~ of single-wall or double wall construction.

608.16.4.1 Additives or nonpotable source. Where systems under continuous pressure contain chemical additives or antifreeze, or where systems are connected to a nonpotable secondary water supply, the potable water supply shall be protected against backflow by a reduced pressure principle backflow prevention assembly or a reduced pressure principle fire protection backflow prevention assembly. Where ~~chemical additives or antifreeze are added to~~ only a portion of an automatic fire sprinkler system or standpipe system will contain chemical additives or antifreeze, only that portion of the system shall be required to be served through a reduced pressure principle backflow prevention assembly or ~~the~~a reduced pressure principle fire protection backflow prevention assembly ~~shall be permitted to be located so as to isolate that portion of the system~~. Where these systems are not under continuous pressure, the potable water supply shall be protected against backflow by an air gap or an atmospheric vacuum breaker conforming to ASSE 1001 or CSA B64.1.1.

703.3 Sanitary drain piping and storm ~~sewers~~drain piping in the same trench. ~~Where separate systems of sanitary drainage~~Sanitary drain piping and storm ~~drainage are installed in the same property, the sanitary and storm building sewers or drains~~drain piping shall ~~be permitted to~~not be ~~laid~~prohibited from being installed side by side, without earth separation, in ~~one~~the the same trench.

705.2.2 Solvent cementing. Joint surfaces shall be clean and free from moisture. Solvent cement that conforms to ASTM D 2235 or CSA B181.1 shall be applied to all joint surfaces. The joint shall be made while the cement is wet. Joints shall be made in accordance with ASTM D 2235, ASTM D 2661, ASTM F 628 or CSA B181.1. ~~Solventcement~~Solvent cemented joints shall not be ~~permitted~~limited to only above ~~or below ground.~~ground applications.

705.2.3 Threaded joints. ~~Threads~~Threaded connections shall ~~conform to ASME B1.20.1.~~be made using Schedule 80 or ~~heavier~~greater wall thickness pipe. Pipe thread shall be ~~permitted to be threaded~~cut with dies specifically designed for plastic pipe. ~~*Approved* thread lubricant or tape~~Threads shall conform to ASME B1.20.1. Threaded connections shall be ~~applied on the~~assembled by first applying to male threads only. A thread lubricant chemically compatible with the pipe and fitting, or thread sealing tape.

705.4.1 Caulked joints. Joints for hub and spigot pipe shall be firmly packed with oakum, hemp or ~~hemp~~acid-resistant rope. Molten lead shall be poured into the joint in one operation and to a depth of not less than 1 inch (25 mm). The lead shall not recede more than $^1/_8$ inch (3.2 mm) below the rim of the hub and shall be caulked tight. ~~Paint~~The application of paint, varnish or other coatings ~~shall not be permitted~~ on the jointing material shall be prohibited until after the joint has been tested and *approved*. ~~Lead~~

Exception: The use of lead shall ~~be run in one pouring and shall~~not be ~~caulked tight. Acid-resistant rope and acidproof~~required where the use of acid-proof cement ~~shall be permitted.~~is required by the piping manufacturer.

705.8.1 Caulked joints. ~~Lead-caulked joints~~Joints for hub and spigot soil pipe shall be firmly packed with oakum, hemp or ~~hemp~~acid-resistant rope. Molten lead shall be poued into the joint in one operation and ~~filled with molten lead~~to a depth of not less than 1 inch (25 mm)~~ in depth and~~. The lead shall not to recede more than $^1/_8$ inch (3.2 mm) below the rim of the hub and shall be caulked tight. ~~Paint~~The application of paint, varnish or other coatings ~~shall not be permitted~~ on the jointing material shall be prohibited until after the joint has been tested and *approved*. ~~Lead~~

Exception: The use of lead shall ~~be run in one pouring and shall~~not be ~~caulked tight. Acid-resistant rope and acidproof~~required where the use of acid-proof cement ~~shall be permitted.~~is required by the piping manufacturer.

705.11.2 Solvent cementing. Joint surfaces shall be clean and free from moisture. A purple primer that conforms to ASTM F 656 shall be applied. Solvent cement not purple in color and conforming to ASTM D 2564, CSA B137.3, CSA B181.2 or CSA B182.1 shall be applied to all joint surfaces. The joint shall be made while the cement is wet and shall be in accordance with ASTM D 2855. ~~Solventcement~~Solvent cemented joints shall not be ~~permitted~~limited to only above ~~or below ground.~~ground applications.

Exception: A primer ~~is~~shall not be required where both of the following conditions apply:

1. The solvent cement used is third-party certified as conforming to ASTM D 2564.
2. The solvent cement is used only for joining PVC drain, waste and vent pipe and fittings in nonpressure applications in sizes up to and including 4 inches (102 mm) in diameter.

705.11.3 Threaded joints. ~~Threads~~Threaded connections shall ~~conform to ASME B1.20.1~~be made using. Schedule 80 or ~~heavier~~greater wall thickness pipe. Pipe threads shall be ~~permitted to be threaded~~cut with dies specifically designed for plastic pipe. ~~*Approved* thread lubricant or tape~~Threads shall conform to ASME B1.20.1. Threaded connections shall be ~~applied on the~~assembled by first applying to male threads only, A thread lubricant chemically compatible with the pipe and fitting, or thread sealing tape.

907.3 Lower section. The lower section of the drainage *stack*shall be vented by a yoke vent~~ connecting~~. The yoke vent connection shall be between the offset and the next lower horizontal *branch*~~. The~~ or the yoke vent connection shall~~ be permitted to~~ be a vertical extension of the lower section of drainage *stack*. The size of the yoke vent and connection shall be ~~a minimum of~~not less than the size required for the vent *stack* of the drainage *stack.*

Part II

2015 International Residential Code

Revise as follows:

P3003.3.2 Solvent cementing. Joint surfaces to be solvent cemented shall be clean and free from moisture. Solvent cement that conforms to ASTM D 2235 or CSA B181.1 shall be applied to all joint surfaces. The joint shall be made while the cement is wet. Joints shall be made in accordance with ASTM D 2235, ASTM D 2661, ASTM F 628 or CSA B181.1. ~~Solvent-cement~~Solvent-cemented joints shall not be ~~permitted~~limited to only above ~~or below ground.~~ground applications.

P3003.3.3 Threaded joints. ~~Threads~~Threaded connections shall ~~conform to ASME B1.20.1~~be made using. Schedule 80 or ~~heavier~~greater wall thickness pipe. Pipe threads shall be ~~permitted to be threaded~~cut with dies specifically designed for plastic pipe. ~~*Approved* thread lubricant or tape~~Threads shall conform to ASME B1.20.1. Threaded connections shall be ~~applied on the~~assembled by first applying to male threads only, a thread lubricant that is chemically compatible with the pipe and fitting, or thread sealing tape.

P3003.4.1 Caulked joints. Joints for hub and spigot pipe shall be firmly packed with oakum or hemp. Molten lead shall be poured into the joint in one operation and to a depth of not less than 1 inch (25 mm). The lead shall not recede more than $^{1}/_{8}$ inch (~~3~~3.2 mm) below the rim of the hub and shall be caulked tight. ~~Paint~~The application of paint, varnish or other coatings ~~shall not be permitted~~ on the jointing material shall not be prohibited until after the joint has been tested and *approved*.~~ Lead shall be run in one pouring and shall be caulked tight.~~

P3003.9.3 Threaded joints. ~~Threads~~Threaded connections shall ~~conform to ASME B1.20.1~~be made using. Schedule 80 or ~~heavier~~greater wall thickness pipe. Pipe threads shall be ~~permitted to be threaded~~cut with dies specifically designed for plastic ~~pipe~~pipe.Threads shall conform to ASME B1.20.1. ~~*Approved* thread lubricant or tape~~Threaded connections shall be ~~applied on the~~assembled by first applying to male threads only, a thread lubricant that is chemically compatible with the pipe and fitting, or thread sealing tape.

Reason: The primary purpose of this proposal is to resolve a multitude of language issues that have gone unchecked over many code cycles. Although the ICC Secretariats and ICC Publication editors can solve minor editorial language issues prior to the publication of the codes, more extensive language rework needs to be placed in front of the ICC membership for their approval. The PMGCAC is pleased to take on this task as this is a simple thing to do to improve the codes for everyone's benefit. And that is part of the reason for the formation of the CAC's: to improve the codes.

Eliminating the phrase "shall be permitted" (and "is permitted") , wherever possible:

The phrase "shall be permitted" is often incorrectly applied in code language. The incorrect phrase application is believed to come from the belief that one always has to ask for permission to do anything. Certainly, where the code does regulate something by indicating, such as, what materials to use or what dimension to not exceed, permission does need to be granted to use a different material or to exceed the dimension. However, where the code does not speak of anything regarding the materials to be used or the dimensions not to be exceeded, then the code is silent. Permission does not have to be granted for something that the code does not regulate.

For example, consider an appliance such as an icemaker. The code does not regulate the location of icemakers. Therefore, to put a statement in the code that says, "Icemakers shall be permitted to be 18 inches away from any wall." is an assumption that permission had to be granted for the location of the icemaker. But the code does not regulate icemaker location nor does it specify a dimension in the first place in order for that permission to be granted. Essentially, the "shall be permitted" statement is nonsensical because by the code's silence, icemakers can be located anywhere.

What the proponent meant to say is "Icemakers shall be located not closer than 18 inches to a wall." Now the code is making a mandatory statement about what is required. Any dimension 18 inches and greater is acceptable. No permission is necessary for 18 inches or greater. "Permission" (in accordance with Section 105.2) would have to be requested for less than 18 inches.

The use of "shall be permitted" is an unfortunate habit that tends to spiral out of control in code language because somehow, proponents think that the use of "shall be permitted" is always mandatory language. Perhaps it is the "legalese sound" of such a phrase that makes people think that a requirement is being stated. However, the words do not state a requirement, but in the example given, only a permission for something that was not regulated at all.

There is a certain type of situation where the use of "shall be permitted" is not as problematic. For example, consider the code requirement for a water closet to be set not closer than 15 inches from its center to an obstruction at the side of the water closet. A proponent wants to allow that dimension to be 12 inches under certain conditions. Essentially, the proponent is wanting to write an exception to the code limitation of 15 inches. His exception states:

Exception: A water closet shall be permitted closer than 12 inches from its center to an obstruction at its side provided that the obstruction is a bathtub having an apron height of not greater than 15 inches above the finished floor and the bathtub is not equipped with a shower door system.

Now the use of "shall be permitted" is tolerable, although still unnecessary, because the code already stated a requirement in the main section and an exception (a grant of permission) is provided where certain conditions exist. "Where certain conditions exist" is a key element in the proper use of "shall be permitted". Typically, the conditions follow the phrase "provided that". Where the code had regulations about something, then permission needs to be granted to do something different than what the code required. And that permission needs to spell out the conditions for the code official (and the user) in order to be in compliance with the code. The following is better in that it avoids the use of "shall be permitted".

Exception: A water closet shall be not closer than 12 inches from its center to an obstruction at its side provided that the obstruction is a bathtub having an apron height of not greater than 15 inches above the finished floor and the bathtub is not equipped with a shower door system.

An obscure interpretation twist in the use of "shall be permitted" is where the code official believes that whatever follows the phrase is within his or her authority to grant or reject. Using the previous example: "Icemakers shall be permitted to be 18 inches away from any wall." Mr. Code Official says on one project, "No, I am not going to give you permission to do that." But on another project, he grants the permission. The conditions for granting permission are missing, well at least they are missing in the code language.

Some uses of "shall be permitted" might seem harmless. And some uses of "shall be permitted" are appropriate where conditions are provided for an exception to what the code already regulates. It is best to not use the phrase at all but sometimes it is very difficult where statements have been put in the code that essentially say "It's OK to do this or use that." Some of these "regulations" came to be because a contractor was not allowed to do something because of a judgment call a code official had to make because the code was not clear or the manufacturer's instructions deferred to the code official. A proposal was made to the code to add text to "allow something". This type of language is very difficult to accommodate within a code that is written in a format of "do this" and "don't do that". In reviewing the proposing changes, the reader will see how some of these more difficult situations are handled so that the code language maintains a mandatory format.

Most of the sections in this proposal involve the elimination of "shall be permitted" and "permitted". It should be readily obvious which ones those are.

These sections are not the only locations in the code where "shall be permitted" and "permitted" are used "inappropriately" in the code. These are only the easy ones to correct without involving potentially significant technical changes.

Eliminating the use of the word "approved", where appropriate:

Certainly there are situations where approval by the code official is needed. The I-codes are loaded with "and approved". However, some uses of "approved" were inadvertently placed in code language or place the code official in an unnecessary (and perhaps difficult) position for making approvals.

In the proposed revised code sections, a statement similar to "An approved thread lubricant shall be used." In this case, it could be that a pipe and fitting manufacturer unknowing used the term "approved" to mean "make sure you use something that the manufacturer approves". Or, it could really mean that the code official has to approve the thread lubricant. It is uncertain, but because the term "approved" is ubiquitous in the codes, the default interpretation is always approved by the code official. If the code official is supposed to approve the thread lubricant, then on what basis does he or she grant the approval? The code provides nothing to go on.

In the revised code sections, approved was removed for the thread lubricant and a requirement for "chemical compatibility" inserted. It is believed that the code official does not want to be involved with approval of thread lubricants. The installer is already required to comply with the (pipe and fitting) manufacturers' instructions (see Section 303.2). It doesn't hurt to put the requirement for chemical compatibility in this section to remind the installer to pay attention to this. And, if the code official spots an obvious mistake in thread lubricant use (typically, a petroleum-based metal piping thread lubricant being used on plastic piping is a common violation), he or she has code language to fall back to and doesn't have to dig deeper into the pipe and fitting manufacturer's instructions.

In the same light is a statement similar to "An approved…. tape shall be used." It is uncertain whether the modifier "approved" in the sections to be revised is actually meant to apply to the term "tape". What kind of tape? Most everybody in the plumbing trade knows that the intended tape is thread sealing tape. Is it necessary to be that explicit? Probably not but someone could apply electrical tape on the threads and be in compliance. Therefore, maybe "approved" was intended to modify "tape". Again, it is believed that the code official does not want to be involved with approval of thread sealing tape. This material has such widespread availability and use that it would be difficult to misunderstand what was intended which is the thin PTFE tape provided in rolls labeled "thread seal(ing) tape". The code has not seen a need to specify a minimum thickness, a reference standard or color types so why would a code official need to approve this material? It is not necessary.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes. This is PMGCAC Item 195.

Cost Impact:

Part I: Will increase the cost of construction
This proposal will not increase the cost of construction because no additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code.

Part II: Will not increase the cost of construction
This proposal will not increase the cost of construction because no additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code.

P 128-15 : 605.10.2-SNYDER3965

P 129-15

605.11, 605.11.1, 605.11.2, 605.11.3, 605.11.4

2015 International Plumbing Code

Delete without substitution:

~~**605.11 Brass.** Joints between brass pipe and fittings shall comply with Sections 605.11.1 through 605.11.4.~~

~~**605.11.1 Brazed joints.** All joint surfaces shall be cleaned. An *approved* flux shall be applied where required. The joint shall be brazed with a filler metal conforming to AWS A5.8.~~

~~**605.11.2 Mechanical joints.** Mechanical joints shall be installed in accordance with the manufacturer's instructions.~~

~~**605.11.3 Threaded joints.** Threads shall conform to ASME B1.20.1. Pipe-joint compound or tape shall be applied on the male threads only.~~

~~**605.11.4 Welded joints.** All joint surfaces shall be cleaned. The joint shall be welded with an *approved* filler metal.~~

Reason: The proposal removes brass because brass is a copper alloy and is covered in Section 605.13.

Cost Impact: Will not increase the cost of construction
This proposal will not increast the cost of construction as this change is only to update the name of a material that is already in the code.

P 129-15 : 605.11-FEEHAN3794

P 130-15

605.14.3, 605.18.3, 605.22.2, 605.23.3

Proponent: John Stempo, Victaulic Company, representing Victaulic Company

2015 International Plumbing Code

Add new text as follows:

605.14.3 Grooved and shouldered mechanical joints. Grooved and shouldered mechanical joints shall comply with ASTM F 1476, shall be made with an *approved* elastomeric seal and other internal components, if applicable, and shall be installed in accordance with the manufacturer's instructions. Such joints shall be exposed or concealed.

605.18.3 Grooved and shouldered mechanical joints. Grooved and shouldered mechanical joints shall comply with ASTM F 1476, shall be made with an *approved* elastomeric seal and other internal components, if applicable, and shall be installed in accordance with the manufacturer's instructions. Such joints shall be exposed or concealed.

605.22.2 Grooved and shouldered mechanical joints. Grooved and shouldered mechanical joints shall comply with ASTM F 1476, shall be made with an *approved* elastomeric seal and other internal components, if applicable, and shall be installed in accordance with the manufacturer's instructions. Such joints shall be exposed or concealed.

605.23.3 Grooved and shouldered mechanical joints. Grooved and shouldered mechanical joints shall comply with ASTM F 1476, shall be made with an *approved* elastomeric seal and other internal components, if applicable, and shall be installed in accordance with the manufacturer's instructions. Such joints shall be exposed or concealed.

Reason: There are some types of grooved mechanical joints that utilize internal components other than elastomeric seals. These proposed changes are intended to clarify language in the code to specifically address the use and acceptance of these additional components within a grooved mechanical joint design, if they are *approved*.

Cost Impact: Will not increase the cost of construction
A clarification of what components could be used for sealing in this type of joint will not increase the cost of construction.

P 130-15 : 605.14.3-STEMPO3966

P 131-15

Part I:
605.14.6
Part II:
P2906.14

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IPC COMMITTEE. PART II WILL BE HEARD BY THE IRC-PLUMBING COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

Proponent: Tim Earl, GBH International, representing The Oatey Company (tearl@gbhinternational.com)

Part I

2015 International Plumbing Code

Revise as follows:

605.14.6 Solder joints. Solder joints shall be made in accordance with the methods of ASTM B 828. All cut tube ends shall be reamed to the full inside diameter of the tube end. All joint surfaces shall be cleaned. A flux conforming to ASTM B 813 shall be applied. The base material for tinning fluxes, excluding the tinning powder, shall meet the criteria of ASTM B813. The joint shall be soldered with a solder conforming to ASTM B 32. The joining of water supply piping shall be made with *lead-free solders and fluxes*. "Lead free" shall mean a chemical composition equal to or less than 0.2-percent lead.

Part II

2015 International Residential Code

Revise as follows:

P2906.14 Soldered and brazed joints. Soldered joints in copper and copper alloy tubing shall be made with fittings approved for water piping and shall conform to ASTM B 828. Surfaces to be soldered shall be cleaned bright. Fluxes for soldering shall be in accordance with ASTM B813. The base material for tinning fluxes, excluding the tinning powder, shall meet the criteria of ASTM B813. Brazing fluxes shall be in accordance with AWS A5.31M/A5.31. Solders and fluxes used in potable water-supply systems shall have a lead content of not greater than 0.2 percent.

Reason: Tinning fluxes have been shown in several studies to create a stronger and more consistently water-tight connection when using low-lead fittings. This means less rework on the job site and less likelihood of joint failure. With the federal mandate of low-lead in 2014, this has become a significant issue and the codes need to reflect this need. We are pursuing changes to the referenced ASTM standard as well, however these will not be completed in time for this code cycle and we feel that it is important to make this change as it has the potential to save money related to rework and repair. Once the standard is altered, we would support removing the language being proposed.

Cost Impact:

Part I: Will not increase the cost of construction
This proposal will not affect cost as it simply adds another solder flux option.

Part II: Will not increase the cost of construction
This proposal will not affect cost as it simply adds another solder flux option.

P 132-15

Part I:

605.14.7 (New), 605.15.4 (New), 605.17.3 (New)

Part II:

P2906.20 (New)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IPC COMMITTEE. PART II WILL BE HEARD BY THE IRC-PLUMBING COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

Proponent: Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

Part I

2015 International Plumbing Code

Add new text as follows:

605.14.7 Push-fit joints Push-fit joints shall conform to ASSE 1061 and shall be installed in accordance with the manufacturer's instructions.

605.15.4 Push-fit joints. Push-fit joints shall conform to ASSE 1061 and shall be installed in accordance with the manufacturer's instructions.

605.17.3 Push-fit joints. Push-fit joints shall conform to ASSE 1061 and shall be installed in accordance with the manufacturer's instructions.

Part II

2015 International Residential Code

Add new text as follows:

P2906.20 Push-fit joints. Push-fit joints shall be used only on copper-tube-size outside diameter dimensioned CPVC, PEX and copper tubing. Push-fit joints shall conform to ASSE 1061 and shall be installed in accordance with the manufacturer's instructions.

Reason: Push-fit fittings utilize a *type* of joining method (a connection) that is different than solvent cemented, soldered, brazed connections. And technically, this type of fitting doesn't strictly fit the Chapter 2 definition of a MECHANICAL JOINT. The use of these fittings has become very popular in recent years. These fittings are marketed with names that include such terms as "bite" or "grip" or "speed".
The standard for push-fit fittings is ASSE 1061. This standard was approved for the IPC several cycles ago for inclusion into the water pipe fitting table of the code. However, most readers of the code do not realize what this standard covers and where it is referenced in the code. Because these joints are a different connection method, they need to be indicated in the appropriate sections of the MATERIALS JOINTS AND CONNECTIONS section of the code.

This proposal is not adding this standard to the code but is only adding sections that should have been added several cycles ago when ASSE 1061 was added.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes. This is PMGCAC Item 32.

Cost Impact:

Part I: Will not increase the cost of construction
This proposal will not increase the cost of construction because no additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code.

Part II: Will not increase the cost of construction
This proposal will not increase the cost of construction because no additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code.

P 132-15 : 605.14.7 (New)-SNYDER3961

P 133-15

Part I:
605.16.2
Part II:
P2906.9.1.3

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IPC COMMITTEE. PART II WILL BE HEARD BY THE IRC-PLUMBING COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

Proponent: Tim Earl, GBH International, representing The Oatey Company (tearl@gbhinternational.com)

Part I

2015 International Plumbing Code

Revise as follows:

605.16.2 Solvent cementing. Joint surfaces shall be clean and free from moisture, and an approved primer shall be applied. Solvent cement, orange in color and conforming to ASTM F 493, shall be applied to joint surfaces. The joint shall be made while the cement is wet, and in accordance with ASTM D 2846 or ASTM F 493. Solvent cement joints shall be permitted above or below ground.

~~**Exception**~~**Exceptions:**

1. A primer is not required where all of the following conditions apply:
   - 1.1 The solvent cement used is third-party certified as conforming to ASTM F 493.
   - 1.2 The solvent cement used is yellow in color.
   - 1.3 The solvent cement is used only for joining $^1/_2$ inch (12.7 mm) through 2-inch-diameter (51 mm) CPVC/AL/CPVC pipe and CPVC fittings.
   - 1.4 The CPVC fittings are manufactured in accordance with ASTM D 2846.
2. A primer is not required where the manufacturer's instructions for the solvent cement do not require the application of a primer.

Part II

2015 International Residential Code

Revise as follows:

P2906.9.1.3 CPVC/AL/CPVC pipe. Joint surfaces shall be clean and free from moisture, and an approved primer shall be applied. Solvent cement, orange in color and conforming to ASTM F493, shall be applied to all joint surfaces. The joint shall be made while the cement is wet, and in accordance with ASTM D2846 or ASTM F493. Solvent-cement joints shall be installed above or below ground.

~~**Exception**~~**Exceptions:**

1. A primer is not required where all of the following conditions apply:
   - 1.1 The solvent cement used is third-party certified as conforming to ASTM F 493.
   - 1.2 The solvent cement used is yellow in color.
   - 1.3 The solvent cement is used only for joining $^1/_2$ inch (12.7 mm) through 2-inch-diameter (51 mm) CPVC/AL/CPVC pipe and CPVC fittings.
   - 1.4 The CPVC fittings are manufactured in accordance with ASTM D 2846.
2. A primer is not required where the manufacturer's instructions for the solvent cement do not require the application of a primer.

Reason: The market place has already begun using these fast setting orange CPVC cements as a one-step application where local inspectors allow. This simply meets a market condition and gives broader authority for these applications to occur. A work item is being created in ASTM to create a standard practice for this, but is at least this code cycle away from being completed. Once that is complete we would support removing this from the code should it be allowed. However, in the interim we again ask that the practice be allowed to help meet market demand. This would also be consistent with language in the IRC (P2906.9.1.2) and a similar proposal as this in the IMC.

Cost Impact:

Part I: Will not increase the cost of construction
Cost will not increase as this proposal would simply allow for another option for CPVC cement.

Part II: Will not increase the cost of construction
Cost will not increase as this proposal would simply allow for another option for CPVC cement.

P 133-15 : 605.16.2-EARL4555

P 134-15

605.24.1

Proponent: Pennie L Feehan, Copper Development Association, representing Copper Development Association (penniefeehan@me.com)

2015 International Plumbing Code

Revise as follows:

605.24.1 Copper pipe or ~~copper-alloy~~ tubing to galvanized steel pipe. Joints between copper pipe or ~~copper-alloy~~ tubing and galvanized steel pipe shall be made with a ~~brass fitting~~copper-alloy or dielectric fitting or a dielectric union conforming to ASSE 1079. The copper tubing shall be soldered to the fitting in an *approved* manner, and the fitting shall be screwed to the threaded pipe.

Reason: Because brass is a copper-alloy the sentence does not make sense. It's telling you to use a brass nipple when you are already using a brass nipple.

Cost Impact: Will not increase the cost of construction
This proposal will not increast the cost of construction as this change is only to update the name of a material that is already in the code.

P 134-15 : 605.24.1-FEEHAN3795

P 135-15

Part I:

605.24.3 (New), 605.9

Part II:

P2906.17.2 (New)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IPC COMMITTEE. PART II WILL BE HEARD BY THE IRC PLUMBING COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

Proponent: Mike Cudahy, representing Plastic Pipe and Fittings Association (mikec@cmservnet.com)

Part I

2015 International Plumbing Code

Add new text as follows:

605.24.3 Joint between PVC water service and CPVC water distribution. Where a PVC water service pipe connects to a CPVC pipe at the beginning of a water distribution system, the transition shall be by a mechanical fitting, an approved adapter fitting, a transition fitting or by a single solvent-cemented transition joint. A single, solvent cement transition joint shall be in compliance with ASTM F493 and the pipe, fitting, and solvent cement manufacturers' instructions. Solvent cement joint surfaces shall be clean, free from moisture and prepared with an approved primer. Solvent cement conforming to ASTM F493 shall be applied to the joint surfaces and the joint assembled while the cement is wet.

Revise as follows:

605.9 Prohibited joints and connections. The following types of joints and connections shall be prohibited:

1. Cement or concrete joints.
2. Joints made with fittings not *approved* for the specific installation.
3. Solvent-cement joints between different types of plastic pipe except as provided for in Section 605.24.3.
4. Saddle-type fittings.

Part II

2015 International Residential Code

Add new text as follows:

P2906.17.2 Joint between PVC water service and CPVC water distribution Where a PVC water service pipe connects to a CPVC pipe at the beginning of a water distribution system, the transition shall be by a mechanical fitting, an *approved* adapter fitting, a transition fitting or by a single solvent-cemented transition joint. A single, solvent cement transition joint shall be in compliance with ASTM F493 and the pipe, fitting, and solvent cement manufacturers' instructions. Solvent cement joint surfaces shall be clean, free from moisture and prepared with an approved primer. Solvent cement conforming to ASTM F493 shall be applied to the joint surfaces and the joint assembled while the cement is wet.

Reason: Transitions being made from PVC service to CPVC water distribution systems is common, and solvent cementing for this single transition application should be an option.

Cost Impact:

Part I: Will not increase the cost of construction
None.

Part II: Will not increase the cost of construction
This proposal allows for an optional method of joining not in this code. The option is not requiring that this method be chosen. Thus the code with this proposal added will not cause the cost of construction to increase.

P 135-15 : 605.24.3 (New)-CUDAHY4669

P 136-15

604.1, Chapter 14

Proponent: Ronald George, Self; Plumb-Tech Design & Consulting Service LLC; www.Plumb-TechLLC.com; www.LegionellaPrevention.org, representing Self; Plumb-Tech Design & consulting Services LLC (Ron@Plumb-TechLLC.com)

2015 International Plumbing Code

Revise as follows:

604.1 General. The design of the water distribution system shall be in accordance with ASHRAE 188 and shall conform to *accepted engineering practice*. Methods utilized to determine pipe sizes shall be *approved*.

Add new standard(s) as follows:
ASHRAE 188 - DRAFT_4th Public Review_09262014 Legionellosis: Risk Management for Building Water Systems

Reason: There are many design considerations in the ASHRAE standard that will help minimize Legionella bacteria growth in building water systems which can lead to Legionnaires Disease when water droplets are aerosolized from shower heads, and other building water systems and fixtures that aerosolize water droplets. Following the ASHRAE Standard will minimize the risk og a Person contracting Legionnaires' disease.

Bibliography: www.LegionellaPrevention.org
www.Plumb-TechLLC.com

Cost Impact: Will increase the cost of construction
The cost of construction of the plumbing system to eliminate dead legs and provide other design concepts to address temperature and stagnation is estimated to be about 10 - 15 percent more to comply with this standard, however it will provide for hygienic system designs that will minimize legionella bacteria growth and help prevent Leginnaires Disease. See www.LegionellaPrevention.org.

Analysis: A review of the standard proposed for inclusion in the code, ASHRAE 188, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2015.

P 136-15 : 606.8 (New)-GEORGE5211

P 137-15

607.6 (New)

Proponent: Ronald George, Plumb-Tech Design & Consulting Services LLC, representing Self (Ron@Plumb-TechLLC.com)

2015 International Plumbing Code

Add new text as follows:

607.6 Separation of underground hot and cold piping. Underground hot water distribution piping required to be insulated in accordance with Section 607.5 shall be separated from underground cold water distribution piping by not less than 12 inches (304 mm).

Reason: I have investigated underground piping installations where the hot and cold water pipes were bundled together. The heat will transfer from one system to the other and cause operational problems and make it difficult to get hot or cold water. This code change is intended to address this issue.

Cost Impact: Will not increase the cost of construction
Currently, the piping must be installed this way in order to work properly. This language just codifies it so the inspector can assure this is done before the concrete is poured.

P 137-15 : 606.8 (New)-GEORGE5842

P 138-15

607.2.1.1

Proponent: Ronald George, Self, representing Self (Ron@Plumb-TechLLC.com)

2015 International Plumbing Code

Delete without substitution:

~~**607.2.1.1 Pump controls for hot water storage systems.** The controls on pumps that circulate water between a water heater and a storage tank for heated water shall limit operation of the pump from heating cycle startup to not greater than 5 minutes after the end of the cycle.~~

Reason: The piping between the tank and the heater is part of the storage tank. allowing it to cycle on and offf would allow the temperature to drop to a temperature that is ideal for Legionella Bacteria growth. The pipes should be heaavily insulated, the energy savings is negligible, the wear and tear on starting and stopping a circulating pump would be signifcant. This code language is not needed.

Cost Impact: Will not increase the cost of construction
This will reduce the controls required to cycle the pump on and off.

P 138-15 : 607.2.1.1-GEORGE5571

P 139-15

607.2.1.2

Proponent: Ronald George, Self; Plumb-Tech Design & Consulting Services LLC, representing Self; Plumb-Tech Design & Consulting Services LLC. (Ron@Plumb-TechLLC.com)

2015 International Plumbing Code

Delete without substitution:

~~**607.2.1.2 Demand recirculation controls for distribution systems.** A water distribution system having one or more recirculation pumps that pump water from a heated water supply pipe back to the heated water source through a cold water supply pipe shall be a demand recirculation water system. Pumps shall have controls that comply with both of the following:~~

1. ~~The control shall start the pump upon receiving a signal from the action of a user of a fixture or appliance, sensing the presence of a user of a fixture, or sensing the flow of hot or tempered water to a fixture fitting or appliance.~~
2. ~~The control shall limit the temperature of the water entering the cold water piping to 104°F (40°C).~~

Reason: Demand recirculation systems create a cross nonnection between hot water and cold water systems.

Cost Impact: Will not increase the cost of construction
This code change will not add cost to construction.

P 139-15 : 607.2.1.2-GEORGE5210

P 140-15

607.2.1.2

Proponent: Ronald George, representing Self (Ron@Plumb-TechLLC.com)

2015 International Plumbing Code

Delete without substitution:

~~**607.2.1.2 Demand recirculation controls for distribution systems.** A water distribution system having one or more recirculation pumps that pump water from a heated water supply pipe back to the heated water source through a cold water supply pipe shall be a demand recirculation water system. Pumps shall have controls that comply with both of the following:~~

1. ~~The control shall start the pump upon receiving a signal from the action of a user of a fixture or appliance, sensing the presence of a user of a fixture, or sensing the flow of hot or tempered water to a fixture fitting or appliance.~~
2. ~~The control shall limit the temperature of the water entering the cold water piping to 104°F (40°C).~~

Reason: Demand Recirculation Systems work based on piping hot water thrrouggh the cold water piping. This is creating a cross connection. Other fixtures on the cold water branch and main piping will be fed tempered or hot water as a result of this code language. This is an intentional code violation for a lazy mans hot water recirculation system. The proper way to design and instal a hot water system is with a dedicated hot water return piping system with balancing valves and chack valves where needed. The plumbing code should not endorse a cross connection.
this sytem is available for homeowner to use in after market applications. It should not be part of an original design. A dedicated hot water return line should be used in new construction.

Cost Impact: Will not increase the cost of construction
This is not a cost issue, it is a health and safety issue. There is no cost associated with this system change. Hot or tempered water should not be intentionally piped through the cold water pipes.

P 140-15 : 607.2.1.2-GEORGE5574

P 141-15

607.3

Proponent: Gary Kozan, CPD, Ridgeway Plumbing, representing Florida Association of Plumbing Heating Cooling Contractors (garyk@ridgewayplumbing.com)

2015 International Plumbing Code

Revise as follows:

607.3 Thermal expansion control. Where a storage water heater is supplied with cold water that passes through a check valve, pressure reducing valve or backflow preventer, a thermal expansion ~~tank~~control device shall be connected to the water heater cold water supply pipe at a point that is downstream of all check valves, pressure reducing valves and backflow preventers. Thermal expansion ~~tanks~~control devices shall be sized in accordance with the~~ tank~~ manufacturer's instructions and shall be sized such that the pressure in the water distribution system shall not exceed that required by Section 604.8.

Reason: There are many different products on the market today that provide effective solutions to thermal expansion control, including pressure relief valves and special-purpose ballcocks. The IPC should recognize all proven technologies and should not limit designers and contractors solely to thermal expansion tanks. This change is consistent with the IRC, and with all prior editions of the IPC.

Bibliography:

2015 International Residential Code:

P2903.4 Thermal expansion control. A means for controlling increased pressure (emphasis added) caused by thermal expansion shall be installed where required in accordance with Sections P2903.4.1 and P2903.4.2.

P2903.4.1 Pressure-reducing valve. For water services up to and including 2 inches (51 MM), **a device for controlling thermal expansion** (emphasis added) shall be installed where, because of thermal expansion, the pressure on the downstreram side of a pressure-reducing valve exceeds the pressure-reducting valve setting.

P2903.4.2 Backflow prevention device or check valve. Where a backflow prevention device, check valve or other device is installed on a water supply system using storage water heating equipment such that thermal expansion causes an increase in pressure, **a device for controlling pressure** (emphasis added) shall be installed.

Cost Impact: Will not increase the cost of construction
By providing additional choices, the designer can select the most appropriate, cost effective solution depending on the situation.

2015 International Plumbing Code

Add new text as follows:

607.3.1 **Thermal expansion device location.** Where a thermal expansion device is installed as an *approved* alternative method for a thermal expansion tank, the thermal expansion device shall be installed on the cold water inlet piping between the water heater and shut off valve for the water heater.

Reason: This additional code section provided here within is intended to clarify where the thermal expansion device shall be installed. The code currently does not specify where thermal expansion devices shall be installed within the system. This leaves room for error and cause for a possible hazardous situation.
Many municipalities require check valves at the water supply source before it enters the structure creating a closed system. With a closed system, expanded water from the water heater has nowhere to go & will strain the system, thus is why we install expansion devises. Furthermore, if the shut off valve at the water heater was left in the closed position, the increased water pressure could reach dangerous levels. The expansion devise will not be as effective if it has been installed anywhere besides at the water heater, specifically on the cold water supply side between the water heater and the shut off valve.

Bibliography: [Internet] [Watts Installation Instructions] [Watts] [2013] [Page 1]
[media.wattswater.com/1910868.pdf]

Cost Impact: Will not increase the cost of construction
Thermal expansion tanks or devices are required to be installed on plumbing systems which have a water heater. The purposed code addition will not create any additional cost, but will just simply address the location of such devices.

2015 International Plumbing Code

Add new text as follows:

607.6 Minimum hot water temperature to control Legionnella bacteria growth. The water temperature throughout the hot water distribution system including hot water circulation system returns to the water heater shall be not less than 124°F (51.1 °C). The temperature shall be measured in the hot water return piping within 6 feet (1829 mm) of the connection of the hot water return piping to the water heater. To facilitate the measurement of water temperature at that location, a temperature gauge, thermometer or thermowell shall be installed in the hot water return piping.

Reason: Legionella Bacteria has a growth range between 68 degrees F and 122 Degrees F. Industry standards and guidelines have reccomended storing and distributing hot water at temperatures that are outside of the LEgionella growth temperature range. By storing at 124 F any Legionella bacteria that makes its way into the water distribution piping system will be kept in check and will not grow to large numbers in a stagnant water heater or low temperature hot water return piping. Scalding can be prevented by adjusting the limit stops on all code compliant shower and bathtub controls by supplying a temperature of hot water that will not promote bacteri growth and adjusting the limit-stop at each fixture to supply a safe temperature free of scalding hazards.

Legionella pneumophila bacteria are widely distributed in water systems. They tend to grow in biofilms or slime on the surfaces of lakes, rivers and streams, and they are not completely eradicated by the chlorination levels commonly used to disinfect domestic water systems especially in systems that are stagnant where Chlorine is allowed to dissipate. Low and even nondetectable levels of the organism can colonize a water source and grow to high concentrations under the right conditions.

Conditions that promote growth of the organism include heat, sediment, scale, and supporting (commensal) microflora in water. Common water organisms including algae, amoebae, and other bacteria appear to amplify Legionella growth by providing nutrients or harboring the organism. Because of its ability to remain viable in domestic water systems, it is capable of rapid multiplication under the proper conditions.

According to OSHA Water conditions that tend to promote the growth of Legionella include:

1. stagnation;
2. temperatures between 20° and 50°C (68° - 122°F) (The optimal growth range is 35° - 46°C [95° - 115°F]);
3. pH between 5.0 and 8.5;
4. sediment that tends to promote growth of commensal microflora; and
5. micro-organisms including algae, flavobacteria, and Pseudomonas, which supply essential nutrients for growth of Legionella or harbor the organism (amoebae, protozoa).

Common Sources of Contaminated Water

Water sources that frequently provide optimal conditions for growth of the organisms include:

1. cooling towers, evaporative condensers, and fluid coolers that use evaporation to reject heat. These include many industrial processes that use water to remove excess heat;
2. domestic hot-water systems with water heaters that operate below 60°C (140°F) and deliver water to taps below 50°C (122°F);
3. humidifiers and decorative fountains that create a water spray and use water at temperatures favorable to growth;
4. spas and whirlpools;
5. dental water lines, which are frequently maintained at temperature above 20°C (68°F) and sometimes as warm as 37°C (98.6°F) for patient comfort; and
6. other sources including stagnant water in fire sprinkler systems and warm water for eye washes and safety showers.
7. Water stored below 20°C (68°F) is generally not a source for amplified L. pneumophila levels. However, high levels of bacteria have been measured in the water supplying ice machines. The source of amplification in this case was thought to be heat from the condenser coil of the ice maker transferring heat to the cold water supply pipes behind the ice machines in poorly ventillated spaces.

2015 International Plumbing Code

Add new text as follows:

607.6 Master Temperature Actuated Mixing Valve. All commercial water heaters shall have the ability to heat water to a temperature of not less than 180°F (82.2°C). The water heaters shall be designed to be operated to provide for a stored water temperature of not less than 140°F (60°C) to minimize Legionella bacteria growth. A master temperature actuated mixing valve conforming to ASSE 1017 shall be installed on the hot water discharge pipe of a water heater to stabilize the hot water distribution system delivery temperature at the temperature required for hot water return temperature of not less than 124°F (51.1°C) to minimize Legionella bacteria growth.

Reason: This code change is to provide hot water system controls to minimize scalding and control Legionella bacteria growth.

A Hot Water System Balancing Act – Scald Prevention vs Legionella Prevention
By: Ron George, CPD, President, Plumb-Tech Design & Cons. Services LLC.
Web site: www.Plumb-TechLLC.com
Plumbing Engineer Magazine, Mar. 2013

Plumbing design professionals and contractors are faced with many challenges when designing, installing or maintaining domestic hot water systems. Two of the more important challenges of a domestic hot water system are providing hot water for bathing and washing that will not cause scald injuries and hot water that is at a temperature high enough to prevent Legionella bacteria growth. I call it the *hot water system balancing act*. Scalding and Legionella account for a significant percentage of the litigation cases associated with plumbing systems.

Many plumbing industry groups have addressed the scalding issue and it is documented in the plumbing codes that the maximum hot water temperature to prevent scalding is 120 degrees Fahrenheit (F). The minimum temperature to prevent Legionella bacteria growth at any point in the domestic hot water supply or return piping system should be 124 degrees F according to ASHRAE. The 124 degree temperature comes from the new ASHRAE Guideline 12 which is nearing completion for publication. (See Figure 2) These two temperatures seem conflict with each other, but they can actually work together. The plumbing system can be designed to store and distribute hot water at higher temperatures and deliver the hot water from the showers and bathtub/shower fixtures at safe temperatures of 120 F or less by simply adjusting the limit stops on the tub/shower valves to limit the hot water to 120 F or less. Many design professionals, contractors, maintenance personnel, tenants and building owners may not be aware of the temperature limit stop feature on all code compliant shower valves. The manufacturers publish information on how to set the limit stop for shower valves. If the shower valve is an older shower valve without limit stops, it should be replaced or a thermostatic mixing valve conforming to ASSE 1070 should be installed on the hot water supply branch to temper the water to a maximum of 120 F or an ASSE 1062 device could be used to prevent scalding. Code compliant shower valves conform to ASSE 1016 or CSA B125.1 which were recently harmonized with ASME in the standard titled: *ASSE 1016/ASME A112.1016/CSA B125.16, Performance requirements for automatic compensating valves for individual showers and tub/shower combinations*. The temperature flowing to the shower valves can be as high as 140 degrees F and the shower valves should have the maximum temperature limit stops adjusted to limit the temperature leaving the shower valve to a maximum of 120 F. In addition the valves must be seasonally adjusted to account for the changes in the incoming cold water temperature which can affect the mixed water temperature.

Maximum Hot Water Temperature to Prevent Scalding
I have served on many industry committees dealing with hot water system code requirements, hot water system design standards and product standards related to domestic hot water systems devices for temperature control and scald prevention. There has been consensus in all of these committees that the maximum safe hot water delivery temperature for a shower or bathtub is 120 degrees Fahrenheit to prevent scalding with a few exceptions for lower temperatures for bidets and emergency eye wash fixtures. (See Figure 1 - Hot Water Scald Burns – Time vs Temperature Relationship for Second and Third Degree Burns for Adults and Children)
There were discussions in a plumbing code ad-hoc committee on temperature limits for the hot water system where everyone agreed the maximum safe temperature was 120 F. The ASPE Hot water committee dealing with a proposed standard for temperature limits in hot water systems also agreed the maximum safe hot water temperature to prevent scalding is

120 Fahrenheit. Several ASSE working groups that I have served on dealing with hot water temperature controls have all have discussed the reaction time of bathers and they have taken into consideration that children, the elderly and people with disabilities usually take longer to get out of harm's way if the water suddenly gets hot and they agreed 120 Fahrenheit is the maximum safe hot water temperature that a valve should deliver. At 120 F it takes about 80 seconds to develop a second degree burn in a child and it takes about 8 minutes to develop a second degree burn in an adult. (See Figure 1) The 120 Degree F temperature limit gives bathers or users an adequate amount of time to get out of harm's way before an irreversible scald burn injury can occur. Each of these committees looked back to the data that was the result of burn studies done by Dr. Moritz and Dr. Henrique's at Harvard Medical College in the 1940s. The burn studies were done using baby pigs that had skin thicknesses similar to that of adult males. The studies exposed the pig's skin to various temperatures of hot water for various periods of time and the severity of the burns were studied and recorded. These were the studies used to develop the time and temperature exposure charts. There have been numerous white papers, seminars, and reports since then discussing the fact that burns can occur quicker than those recorded in the Moritz & Henrique's studies for adult males. The skin is thinner for children and the elderly and the amount of time to receive an irreversible 2nd degree burn injury is less because their skin is thinner. Many of the white papers use the Moritz and Dr. Henrique's original burn studies and they use a ratio of the skin thickness to come up with burn times for thinner skin of children and the elderly. Children, the elderly and handicapped are also slower to react because it takes them more time to realize what is happening and try to react to get out of harm's way. Someone once told me an apartment complex was not intended for children or the elderly. I said everyone grows old and children often come visit so we need to consider prevention of scalds to children, the elderly and people with disabilities more so than burns to adults because burns can occur quicker for those groups.

The PIEV Theory for Reaction Time
There is a PIEV theory relates to reaction time. The PIEV theory is most commonly used to address braking distance in automobile accidents. It addresses the amount of time it takes a driver to sense a problem and decide to react, then the reaction time is added to the braking time for the total distance that a car travels before stopping. The PIEV theory can also apply to reaction times for a bather with respect to hot water scalds.
PIEV relates to the amount of time it takes a person to react to a hazard. **PIEV** means - ***Perception***, ***Intellection***, ***Emotion*** and ***Volition***. It is usually referred to as the PIEV theory. Before we recognize and react to a hazard, four specific areas of activity need to be processed by the brain for the muscles to react. Those processes are:

1. **Perception** - We need to perceive or gain a *Perception* of a hazard. There can be delays in the perception with limitation in sight, sound, feeling, or any other of our senses.

2. **Intellection** - We go through a period called, *Intellection* or the act or process of using the intellect by thinking or reasoning. The bather must determine if the hazard is legitimate and deciding either move out of the way of the hazard or eliminate the hazard by adjusting the controls or in some cases where the bather may be sitting out of the reach of the controls the bather may choose to pull the shower curtain in front of them. If the adjustment of the controls is the choice one must decide which control to turn and try to remember which way to turn each control to adjust the temperature or turn the water off in order to eliminate the hazard. If a wrong choice is made during this process it could compound the situation by making the water even hotter. I travel a lot and I often find that shower controls can be very confusing with respect to how to adjust the controls. I still find two handle shower controls that do not meet code requirements. This is critically important when there is no temperature

limit on the shower controls. For example if the shower has a two-handle shower valve and 160 degree hot water is supplied to the system, then turning of the cold water first could lead to instant scalding injuries. Turning down the hot water to 120 F or below creates a system where it could incubate Legionella Bacteria to very high levels.

3. ***Emotion*** - There is an *Emotion* or evaluation factor which is defined as a conscious mental reaction (as anger or fear) subjectively experienced as strong feeling usually directed toward a specific object and typically accompanied by physiological and behavioral changes in the body with respect to deciding or assessing how we want to react. A person with reduced mental capacity or someone that is just very old will take longer to process this information and ultimately decide to react.

4. **Volition** - There is the physical *Volition* or deciding/choosing to act and acting. In the case of braking distance it is when the choice is made to move the foot from the gas pedal to the brake pedal and pressing on the brake pedal. This can be related to the time the bather chooses to adjust the control, and they move their hand to the shower control valve, plus the time to rotate or re-adjust the shower valve plus the time from the adjustment until the water temperature changes coming out of the shower head. Often it can take as much as 3-5 seconds to re-adjust the shower head and another few seconds until the water temperature changes coming out of the shower head. For ultra-low-flow (ULF) showers the delay from the time of the adjustment of the shower valve until the water temperature changes coming out of the shower head can be even longer. So burns can become more severe with ULF shower heads. This is one more area where water conservations measures can unintentionally make plumbing systems less safe.

As the temperature of the water increases this PIEV reaction time becomes more important. Using a bathtub/shower controller with a single handle would reduce the mental processing time and reduce the possibility of making an error when turning off the water. As Figure 1 shows the higher the temperatures get, the quicker the burns can occur. within seconds or less and the degree and severity of the burn can be affected by this reaction time.

As you can see by the chart in Figure 1, if the water is at 140 F it will take about 0.8 seconds for a child to receive a 2nd degree irreversible burn injury and it will take about 5.6 seconds for an adult male to receive an irreversible burn injury at 140 degrees F. Everyone else will fall somewhere in between. An adult will often find it very difficult to react to a sudden change in temperature within five (5) seconds. If the shower head is an Ultra-Low-Flow (ULF) shower head the delay can be several seconds longer before the water temperature is reduced because the mixed water temperature must evacuate or flush out the hot water in the pipe riser from the shower valve to the shower head. There is basically very little or no time to react at higher temperatures. For a typical adult that is alert and aware the PIEV theory shows it can take well over five (5) seconds to react to a sudden burst of hot water in a shower. For an elderly person or a small child that is confused it could take several minutes or more before they are able to react and adjust the controls or get out of harm's way. There has been a lot of information that suggests reducing the domestic hot water temperature to 120 F or less as it flows from the fixtures will minimize scalding and allow most people to react or get out of harm's way before a scald injury occurs.

Reducing the water temperature flowing from the fixture can be done in several ways by:

1. Reducing the hot water temperature at the fixture by adjusting the maximum temperature limit-stop on the shower valve. (The best way)

2. Using local mixing valves conforming to ASSE 1070 to reduce the hot water temperature flowing from a faucet.
3. Reducing the temperature at the source (Water Heater) with the use of a master mixing valve or temperature actuated mixing valve conforming to ASSE 1017.
4. For existing non code compliant shower or tub/shower installations, Two handle tub/shower valves without a maximum temperature limit adjustment) an ASSE 1062 valve could be used. An ASSE 1062 valve is a Temperature Actuated Flow Reduction (TAFR) valve. It looks like a chrome pipe coupling and it screws on between the shower head and the shower arm. Other models screw into a tub spout or onto a sink faucet in place of the aerator. If the water flowing from fixture exceeds about 117-120 degrees Fahrenheit the TAFR valve will shut the flow of water down to just a trickle so that scalding hot water does not spray onto the bather. It can be reset by adjusting the fixture control valve to a cold water setting and when the cold water reaches the valve it will reset and begin flowing again. This can be a bit of a nuisance in buildings where the hot water temperature is erratic, but it is an inexpensive way to provide protection against scald injuries in older buildings without code compliant shower valves.

Minimum Water Temperature to Prevent Legionella Bacteria Growth
Recently the members of the ASHRAE committee for *ASHRAE Guideline 12 - Prevention of Legionellosis Associated with Building Water Systems* recommended a change to the next edition of the guideline to require a minimum hot water temperature of 124 degrees Fahrenheit in the Hot Water Return (HWR) piping and a minimum hot water storage temperature of 130 F in circulated water heaters and a minimum of 140 F in uncirculated water heaters. This is because they have realized hot water temperatures in the ideal growth range have a lot to do with the Legionella bacteria levels on hot water systems. The new ASHRAE Guideline 12 will bring hot water system designs into alignment with what the ASPE Research Foundation's recommendations were in a white paper published in 1988. Many plumbing engineers have been following those recommendations for years. The ASPE research paper called for storing hot water at 135 to 140 degrees Fahrenheit and delivering it from the fixtures at no more than 120 degrees Fahrenheit. In the near future the ASHRAE standard titled ASHRAE 188 - *Prevention of Legionellosis Associated with Building Water Systems* which references the ASHRAE Guideline 12 will be published as an industry standard and it may even be adopted in the codes. In either case it set the industry standard for hot water system design and it will change how some hot water systems have been designed over the years. Hot water systems will now require storage temperatures high enough to prevent Legionella Bacteria Growth. So simply setting the thermostat to 120 F to prevent scalding will not be possible. (See: Figure 2 - Effects of Water Temperature on Legionella Bacteria and see: Legionella articles in December 2012 and Jan 2013 issues of Plumbing Engineer Magazine for more information and facts about Legionnaires Disease)

If you follow the new ASHRAE Standard 188 and the soon to be published guideline 12, you will find you should not use the thermostat on a water heater to simply adjust it to 120 degrees Fahrenheit to prevent scalding. This is already not allowed in the two model plumbing codes, however there are some local codes such as the State of North Carolina plumbing code that, as this writing, allow this dangerous practice. The minimum storage temperature required in a water heater will soon be 130 F for circulated heaters and 140 F for uncirculated heaters.

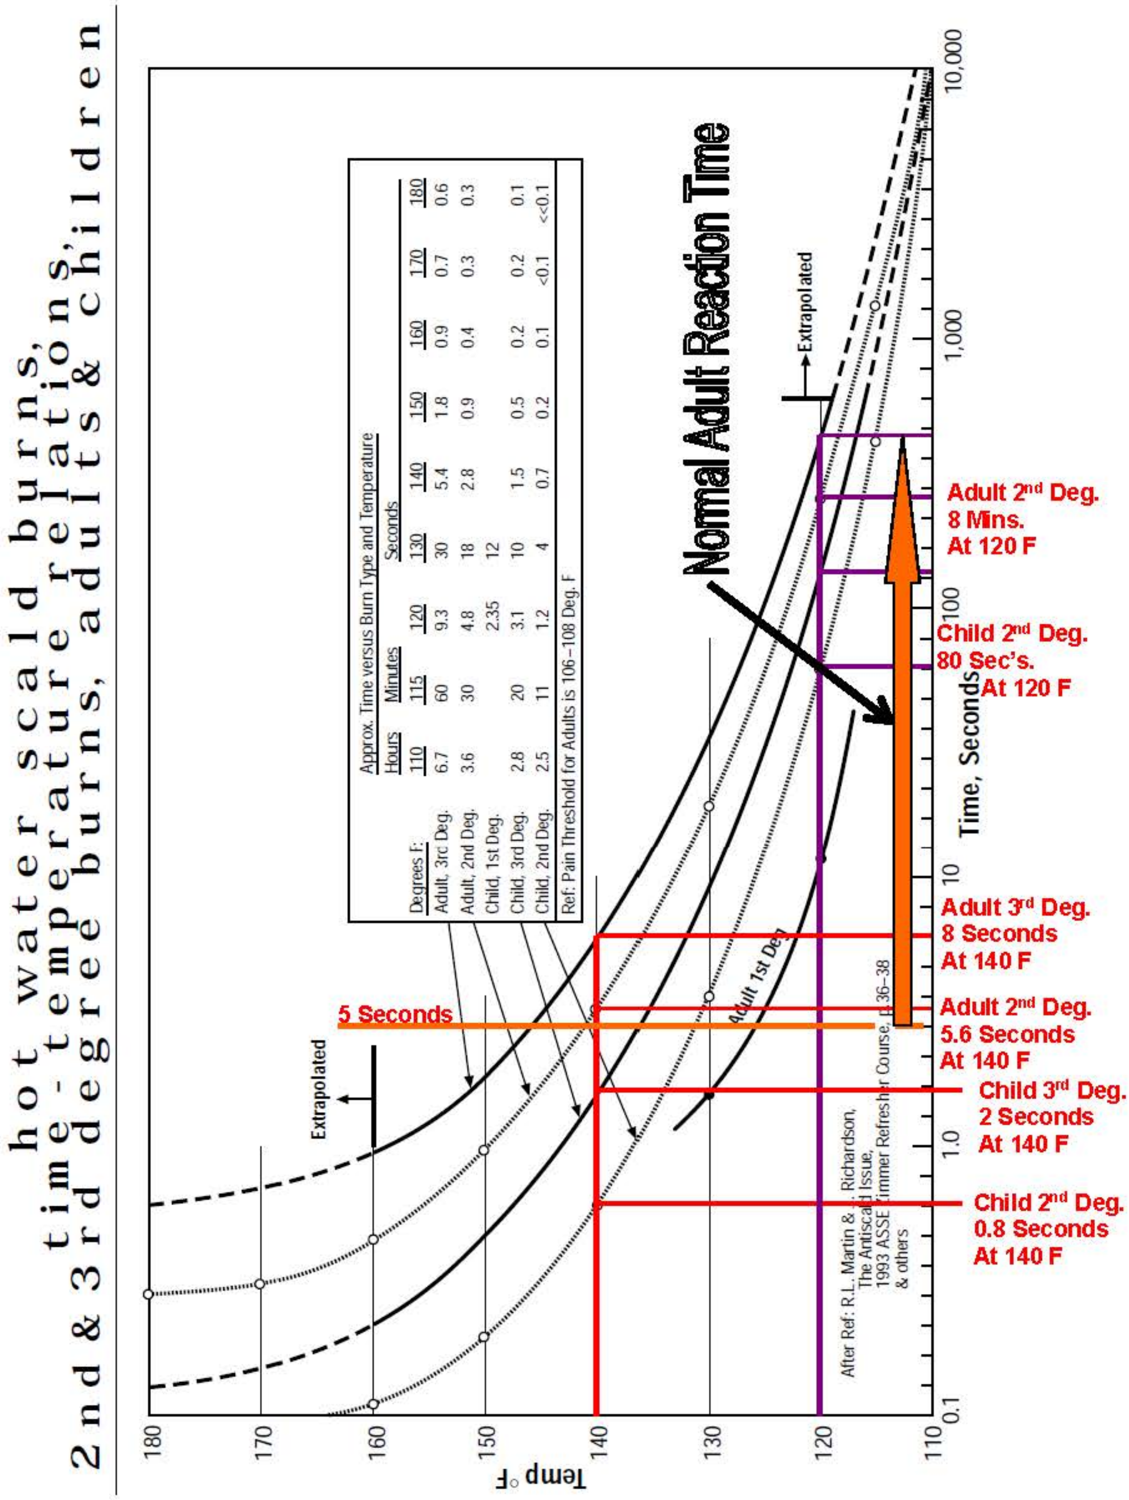
Water Heater Thermostats

The water temperature flowing from the fixtures should not be reduced to 120 degrees Fahrenheit by adjusting the water heater thermostat for scald prevention. The water heater thermostat should never be used to try and control the hot water system delivery temperature. The thermostat is located in the bottom of the water heater and is intended to only sense the incoming cold water and anticipate the need for hot water by turning the burner "ON" and "OFF". There are too many variables that can allow the hot water to exceed the water heater thermostat setting. Intermittent, short usage of hot water can cause the water heater burner to cycle on even when the hot water at the top of the water heater is hotter than the thermostat setting. This causes the water heater to overheat the hot water at the top of the water heater. In some cases the hot water can be as much as 30 degrees or more, higher than the thermostat setting on the water heater. This is why the thermostat on the water heater should not be used as a system temperature controller for scald prevention.

Energy Conservation and Bacteria Growth on Hot Water Systems.
There have been numerous web sites, radio spots, print materials and other well intentioned people that suggest turning the water heater down to 120 degrees Fahrenheit to save energy and they usually discuss the added side effect of minimizing scalding. These suggestions are wrong for many reasons because the thermostat on the water heater cannot accurately control the outlet temperature of the water heater, Low storage temperatures also create a shortage of hot water, low storage temperatures can allow condensing conditions in heaters that are not designed for condensing which can lead to heat exchanger corrosion and it creates storage temperatures that are ideal for legionella bacteria growth. This is another example of energy conservation practices making a hot water system less safe. Safety should trump efficiency! There are other ways to prevent scalding without turning down the water heater thermostat. I have also heard of many healthcare facilities eliminating hot water tanks and installing instantaneous water heaters in a misguided effort to minimize Legionella bacteria growth in hot water tanks. It's not the tank it's the storage temperature. This is reaction to a problem that often creates other problems. (See Figure 2)

Master Thermostatic Mixing Valves
The ASHRAE Guideline 12 recommendations do not mandate a master thermostatic mixing valve for a hot water system. Although one could be installed to allow water temperatures to be stored at slightly higher temperatures and the hot water could be distributed at a stable temperature that assures a minimum of 124 degrees F on the hot water return prior to the hot water tank connection. These new temperature requirements will undoubtedly mean we need to have a temperature gauge on the hot water return piping, the hot water supply piping leaving the water heater and on the piping leaving a mixing valve if one is installed. By providing the temperature gauges the maintenance personnel can monitor the entire hot water distribution system so that it can be hot enough to prevent legionella bacteria growth.

It's is a balancing act to try and keep from scalding someone or giving them Legionellosis. If the hot water system temperatures are maintained at a minimum of 124 F in the hot water return, no less than 130 F in a circulated storage tank and no less than 140 F in an uncirculated storage tank Legionella growth will be minimized. If temperature limit stops are utilized to keep shower and tub/shower water from exceeding 120 F the system will not present a scald hazard. Make sure your plumbing designs include the *hot water system balancing act.*



Approx. Time versus Burn Type and Temperature

2015 International Plumbing Code

Add new text as follows:

607.6 Balancing of multi-branch hot water circulating systems Where there is more than one hot water return branch in a hot water circulating system having one circulating pump, the circulating pump shall be sized to deliver the required flow and head for all branches. The required flow in gallons per minute (liters per second) to maintain the desired hot water temperature for each branch shall be calculated. Each branch shall have a balancing valve that is field-adjusted and set to the required calculated flow. A check valve shall be located downstream of each balancing valve to prevent crossflow between branches.

607.7 Maximum velocities for hot water return piping The water velocity in hot water return piping sytems shall be limited to prevent water hammer and errosion of piping. Where the water temperature is 140°F (60°C) or less, the water velocity shall not exceed 5 feet per second (3 meters per second). Where the water temperature exceeds 140°F (60°C), the water velocity shall not exceed 2.5 feet per second (1.5 meters per second).

Reason: No balancing requirement is in the plumbing code. Many larger buildings are experiencing problems because balancing is not required.
When balancing is not done properly the velocity in some sections of pipe can become excessive. Balancing valves have a flow adjustment that allows you to read or set the flow at each balancing valve. If the flow in GPM is known based on the balancing valve setting or the flow rate of the circulating pump can be used in smaller systems. Where the flow in GPM is known and the pipe size is known, the velocity in feet per second can easily be determined by looking at any pipe sizing chart or table.

Bibliography: http://www.copper.org/publications/pub_list/pdf/copper_tube_handbook.pdf
See Page 11 of the Copper Tube Handbook for velocity limitations. These velocity limitations should apply to PEX piping sytems with brass fittings also.

http://www.pdionline.org/storage/publications/PDI-WH-201.pdf

See the water pipe sizing chart on page 31 of the PDI WH 201 standard that is free to download. It lists the Pipe size, flow in GPM and flow Velocity in Feet Per Second.

Cost Impact: Will increase the cost of construction
balancing has always been required for the system to operate properly, but it has never been required in the code. There will be a slight cost to balance the HW system, but now they will perform better because there never has been a requirement for balancing.

P 146-15

607.6 (New)

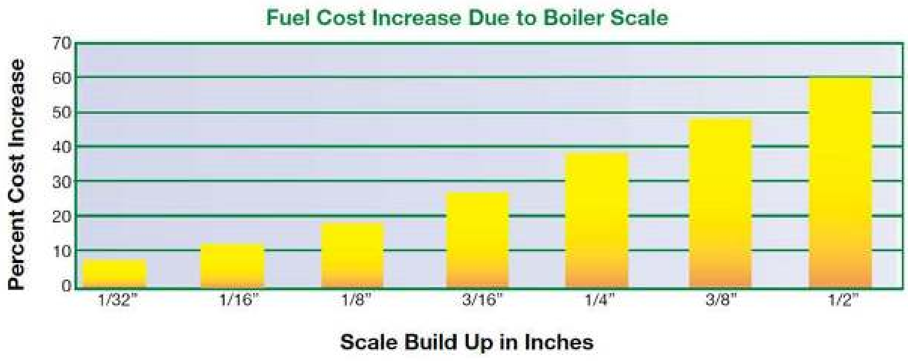
Proponent: Ronald George, Self, representing Self (Ron@Plumb-TechLLC.com)

2015 International Plumbing Code

Add new text as follows:

607.6 Flushing and de-liming tees The connecting piping for each water heater shall have tees installed for the purposes of flushing and de-liming of the heater at manufacturer's recommended maintenance intervals. The tees shall be installed in the hot and cold water piping between the water heater and the water heater isolation valves The tees shall have a 3/4 inch (19.1 mm) valve with a 3/4 inch (19.1 mm) hose thread for connection of flushing and de-liming equipment.

Reason: Delimiting tees are needed for proper maintenace of water heaters.



Cost Impact: Will increase the cost of construction
The cost of the tees and hose valves is minimal and it allows the scale to be removed from the water heater with a small pump and hose connections with a mild vinegar acidic solution. Removing scale will save millions of dollars worth of fuel that is wasted fuel each year. 1/16 inch of scale on a heating surface causes us to use 12 percent more fuel to heat a given amount of water. 1/4 inch of scale will cause about 38 percent additional fuel to be consumed to heat a given amount of water. 1/2 inch of scale on the heating surface will cause us to use 60 percent more fuel to heat a given amount of water. if your monthly heating bill is $360, then you will be spending another $216 a month to heat the same amount for a total fuel consumption of $576/month. A simple calculation shows over $2,000 dollars in fuel saving per year by maintaining a clean heating surface.

2015 International Plumbing Code

Add new text as follows:

608.1.1 Equipment location and installation planning. Backflow prevention assemblies in accordance with Sections 608.13.2, 608.13.3, 608.13.5, 608.13.7 and 608.13.8 shall be located with the center of the assembly not greater than 5 feet (1524 mm) above a floor or a permanent equipment platform. Where an assembly or portions of an assembly must be located at a greater dimension above a floor or platform, a permanent equipment platform shall be provided to access the assembly, or portion thereof, that is greater than 5 feet (1524 mm) above the floor or platform. The structural design of equipment platforms shall comply with Chapter 16 of the *International Building Code.*

Reason: To ensure safe access to backflow prevention assemblies for testing, repair and maintenance, an equipment platform is required where the assembly is located higher than 5 feet off the floor. It is very difficult to work off of a ladder when attempt to test or repair a backflow prevention assembly. Having to work off a ladder is just an another obstacle that might cause someone to not do the required testing   Where access is readily and safely provided,assemblies will be tested as they need to be.
This new section is placed at the beginning of Section 608 to alert mechanical systems designers to put some thought into where to locate these backflow prevention assemblies in the first place, rather than to have their location be an after thought such that equipment platformss are needed. No one wants to work off platform so prior planning to avoid platforms is smart design.

Cost Impact: Will not increase the cost of construction
Proper planned installation will not increase costs and will enhance safety.

P 148-15

608.1.2 (New), 608.1.2.1 (New), 608.1.2.2 (New), 608.1.2.3 (New)

Proponent: Michael Moss, representing American Backflow Prevention Association (msmoss@utah.gov)

2015 International Plumbing Code

Add new text as follows:

608.1.2 Specific installation criteria. Backflow prevention assemblies shall be installed in accordance with Sections 608.1.2.1 through 608.1.2.3, as applicable.

608.1.2.1 Reduced pressure principle backflow prevention assembly The reduced pressure principle backflow prevention assembly shall be installed as follows:

1. Assemblies shall not be installed in a pit.
2. The relief valve shall not be directly connected to any waste disposal line, including sanitary sewer, storm drains or vents.
3. Assemblies shall be in a horizontal position only unless listed or approved for vertical installation in accordance with Section 303.4.
4. The bottom of each assembly shall be installed not less than 12 inches above the floor or ground.
5. The body of each assembly shall be not less than 12 inches from any walls, ceiling, or obstacle and shall be be provided with access for testing, repair and maintenance.

608.1.2.2 Double check backflow prevention assembly. Double check backflow prevention assembly shall be installed as follows:

1. Assemblies shall be in the horizontal position except where listed or *approved* for vertical installation in accordance with Section 303.4.
2. The bottom of the assembly shall be not less than 12 inches above the floor or ground.
3. The body of each assembly shall be not less than 12 inches from any walls, ceilings or obstacle and shall be accessible for testing, repair and maintenance.
4. Where installed in a pit or vault, the body shall be not less than 12 inches from all sides, including the floor, roof or ceiling and shall be provided with access for testing, repair and maintenance.

608.1.2.3 Pressure and spill-resistant vacuum breaker assemblies. Pressure and spill-resistant vacuum breaker assemblies shall be installed as follows:

1. Not subject to a backpressure condition from downstream piping.
2. Not less than 12 inches above all downstream piping and outlets.
3. Not less than12 inches from any wall, ceiling or obstacle and shall be be provided with access for testing, repair and maintenance.
4. Not below ground, in a vault or pit.
5. In a vertical position only.

Reason: There is no adequate minimum installation criteria for the assemblies in Table 608.1 and inadequate guidance within the individual sections for the specific assemblies. For clarity and consistency this information is provided in these sections to assist in proper installation and inspection.

Cost Impact: Will not increase the cost of construction
There is no cost impact with the added criteria of proper installation.

608.3, 608.4 (New)

Proponent: Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

2015 International Plumbing Code

Revise as follows:

608.3 Devices, appurtenances, appliances and apparatus. Devices, appurtenances, appliances and apparatus intended to serve some special function, such as sterilization, distillation, processing, cooling, or storage of ice or foods, and that connect to the water supply system, shall be provided with protection against backflow and contamination of the water supply system. ~~Water pumps, filters, softeners, tanks and other appliances and devices that handle or treat potable water shall be protected against contamination.~~

Add new text as follows:

608.4 Potable water handling and treatment equipment. Water pumps, filters, softeners, tanks and other appliances and devices that handle or treat potable water to be supplied to the potable water distribution system shall be located to prevent contamination from entering the appliances and devices. Overflow, relief valve and waste discharge pipes from such appliances and devices shall terminate in accordance with the appliance or device manufacturer's installation instructions. Where such instructions do not specify the termination arrangement, the termination shall be to an air gap.

Reason: One interpretation of the existing Section 608.3 is that the potable water supply line to a water softener is required to have a backflow preventer, supposedly to protect the water in the water service line from contamination. However, the phrase "water softener" is in a group along with filters, pumps, tanks and appliances that handle or treat potable water. If water softeners are required to have a backflow preventer upstream, does this mean that pumps and filters are also required to have backflow preventers upstream? Those items are in the same sentence.

This doesn't seem to make sense because a water softener provides potable water to the building's potable water distribution system. It is understood that most water softeners have a brine tank where salt is placed and periodically replenished. If the chemical (salt) is safe enough to treat the resin bed of the softener (through which the potable water to the building flows), then is there really a problem?

Millions and millions of water softeners across this country have been installed without a backflow preventer upstream of the softener. The EPA's Cross Connection Manual and the USC Manual for Cross Connection Control do not specifically mention the presence of a water softener as needing a backflow preventer. Connection diagrams for (NSF 44) water softeners do not indicate a need for backflow protection or even mention checking with the local code official to be told that backflow protection is required.

It is believed that the existing language requirement was to make sure that that these devices were not installed in pits and the overflows and relief pipes and discharge pipes from these devices passed through an air gap to the point of discharge. Nothing more. If the code intended for these devices to have a backflow preventer upstream, the device would have had language in Section 608.13. The revised code language clarifies the original intent.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes. This is PMGCAC Item 193.

Cost Impact: Will not increase the cost of construction
This proposal will not increase the cost of construction because no additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code.

Proponent: Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

Part I

2015 International Plumbing Code

Revise as follows:

608.7 Valves and outlets prohibited below grade. Potable water outlets and combination stop-and-waste valves shall not be installed underground or below grade. ~~Freezeproof~~A freezeproof yard ~~hydrants~~hydrant that ~~drain~~drains the riser into the ground ~~are~~shall be considered ~~to be~~as having a stop-and-waste ~~valves~~valve below grade.

> **Exception:** Freezeproof yard hydrants that drain the riser into the ground shall be permitted to be installed~~,~~ provided that the potable water supply to such hydrants is protected ~~upstream of~~in accordance with Section 608.13.2 or 608.13.5 and the hydrants and the piping from the backflow preventer to the hydrant are identified in accordance with Section ~~608 and the hydrants are permanently identified as nonpotable outlets by *approved* signage that reads as follows: "Caution, Nonpotable Water~~608.8.~~ Do Not Drink."~~

Part II

2015 International Residential Code

Revise as follows:

P2903.9.5 Valves and outlets prohibited below grade. Potable water outlets and combination stop-and-waste valves shall not be installed underground or below grade. ~~Freezeproof~~A freezeproof yard ~~hydrants~~hydrant that ~~drain~~drains the riser into the ground ~~are~~shall be considered ~~to be~~as having a stop-and-waste ~~valves~~valve below grade.

> **Exception:**~~Installation of freezeproof~~Freezeproof yard hydrants that drain the riser into the ground shall be permitted ~~if~~to be installed provided that the potable water supply to such hydrants is protected ~~upstream of~~in accordance with Section P2902.3.5 or P2902.3.4 and the hydrants and the piping from the backflow preventer to the hydrants are identified in accordance with Section ~~P2902 and the hydrants are permanently identified as nonpotable outlets by *approved* signage that reads as follows: "Caution, Nonpotable Water~~P2901.2.~~ Do Not Drink."~~

Reason: There is no way to know what type of health hazard the stop and waste opening of a yard hydrant will be exposed to. The contaminants could include lawn fertilizer, animal wastes, garden fertilizer or septic tank effluent. This application is not any different than an irrigation system having at/below grade sprinkler heads. See Section 608.16.5 (IRC Section P2902.5.3). The code requires either a pressure vacuum breaker assembly or a backflow prevention assembly for that application. (For a valve downstream of the backflow preventer, an atmospheric vacuum breaker will not work). But the code currently lacks coverage for what type of backflow protection is necessary for yard hydrant applications. For the code officials who do give this yard hydrant application some thought, many simply choose a dual check valve which is only suitable for low hazard conditions. And there is no way to field verify that this type of backflow device is operational. This is a high hazard application just like an irrigation system and the potable water supply of the building should be protected accordingly. Improper backflow protection for connection of these frost proof yard hydrants to the building water distribution system is an accident waiting to happen.

Keep in mind that where a yard hydrant is needed, a sanitary type yard hydrant (one that does not drain the riser into the ground) can be provided, probably at a lower cost than requiring a backflow prevention assembly for the more inexpensive, riser drain-to-the-ground type yard hydrant. Where only one yard hydrant is installed, a sanitary yard hydrant will probably be an easier selection. Where multiple yard hydrants are on a lot, a dedicated yard hydrant line for all yard hydrants with one backflow prevention assembly to serve all hydrant might be easier.

The signage and marking requirements were removed as the indicated section was updated in the last code cycle to more adequately cover the topic. There is no need to duplicate requirements in the code.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes. This is PMGCAC Item 148.

Cost Impact:

Part I: Will increase the cost of construction
This proposal will increase the cost of construction because additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code. Specifically, where code officials were not requiring the correct backflow preventer for these applications, there will be a higher cost for the correct backflow preventer plus added labor and materials for either placing the required backflow prevention assembly in a place where leakage (when failure of the device occurs) or for providing a drain for the assembly for when leakage happens (when failure of the device occurs).

Part II: Will increase the cost of construction
This proposal will increase the cost of construction because additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code. Specifically, where code officials were not requiring the correct backflow preventer for these applications, there will be a higher cost for the correct backflow preventer plus added labor and materials for either placing the required backflow prevention assembly in a place where leakage (when failure of the device occurs) or for providing a drain for the assembly for when leakage happens (when failure of the device occurs).

P 151-15

608.9

Proponent: Ronald George, representing Self (Ron@Plumb-TechLLC.com)

2015 International Plumbing Code

Revise as follows:

608.9 Reutilization prohibited. Water utilized for the heating or cooling of equipment or other processes shall not be returned to the potable water system. Such water shall be discharged into a drainage system through an *air gap* or shall be utilized for nonpotable purposes.

Reason: Plumbing systems should use double wall heat exchangers or other approved means to prevent contamination of the potable water supply. Potable water should not be allowed to flow througgh heat exchangers either hot or cold for other process systems. There have been low-budget combined heating hot water and domestic hot water systems that utilize the domestic hot water piped through heat exchanger coils, baseboard piping, suply & return pipes and control valves for space heating. These systems often have componenets, coils, piping and valves that are not of approved materials for domestic water systems. In addition, many of these systems can remain dormant and for well over six to nine months when the heating cycle is not neeeded. Upon the first call for heat, all of the stagnant and brackish bacteria laden water in the heating system is flushed or injected into the potable hot water system in the hot water tank. This will significantly dump large quantities of bacteria laden water into the domestic hot water system. This is a serious cross-connection and contamination problem. This increases the chances of contracting Legionnaire's Disease and being exposed to a host of other Bacteria and pathogens in the domestic water system. Where the domestic water is allowed to flow through the hydronic heating circuit, the water will sit stagnant in the heating coils, valves and piping for long periods of time allowing the chlorine to dissipate after a few days. when the chlorine or other water treatment chemical is gone, bacteria will flourish. In all cases where the water sits stagnant in the piping for more than a few days conditions will be present where bacteria and other pathogens can grow to very high levels before flow resumes through the coils . These combined heating hot water and domestic hot water systems should not be allowed unless a closed loop of heat transfer fluid (propylene glycol) is flowing through the heating coils. Domestic water should not be allowed to flow through heating coils. There are many systems where heating coils are located inside a domestic hot water tank and the fluid in the heating coils is in a closed loop. That is a preffered system design for combined heating hot water and domestic hot water systems. The domestic hot water should not be allowed to flow through the heating hot water pipes because of this seasonal use and the great potential for bacteria growth. In my opinion, this is a cross connection that can be restricted by the code official, but the codde is not clear on this because it only addresses cooling coils, not heating coils. This should provide clarification for safe plumbing systems.

22 pitfalls to avoid when designing or installing a combined heating hot water and domestic hot water system

A combined heating hot water and domestic hot water system is a hybrid system that utilizes a boiler or boilers to heat water for heating the building environment, and it uses boiler water to heat domestic hot water for bathing, washing and cleaning uses. The two systems are often combined in an effort to reduce the initial cost of installation, but there are a lot of differences between the two that, if not accounted for, could result in someone getting seriously injured.

Over the years, I have investigated numerous combined systems and found that there are a lot of mistakes or pitfalls that seem to occur. Since there are many opportunities to make mistakes with combined systems, someone very familiar with how both systems are supposed to operate should design them. Heating hot water generally needs to be at a very high temperature, while domestic hot water should be at a lower temperature. If the domestic water gets too hot there are scalding dangers, so proper controls are very important.

I have been investigating scald incidents since the mid 1990s, and I have seen a significant number of these combined systems involved in scald litigation cases because they are often not designed, operated or maintained properly. There are only two plumbing code sections that address combined systems. One section calls for the piping and components in a combined system to be approved for use in potable water systems. The other code requirement calls for a thermostatic mixing valve if the system temperature exceeds 140 F.

There are many more issues than the two mentioned above that need to be addressed. Following is a list of problems or pitfalls that I have found over the years that are related to combined heating hot water and domestic hot water systems. If you can avoid these pitfalls you will have a much safer system:

Pitfall number 1: Open system vs. closed system

There are two versions of a combined heating hot water and domestic hot water system. Systems with domestic hot water flowing from the city water supply through the heating hot water system components such as pumps, control valves and heating coils are often called open systems. Open systems utilize the domestic hot water flowing through the heating coils or baseboard heaters for heating the building. The same water flows to the plumbing fixtures for bathing and washing. These systems provide a significant challenge, because the fluid in the system must be potable water. It is difficult to circulate domestic hot water through many hydronic components without having scale, corrosion, buildup of air pockets and oxidation problems. These systems often sit stagnant for long periods of time during the off-season for heating allowing bacteria and other debris to build up to high levels in the stagnant water. When heat is firrst called for in the fall, it will dose the domestic water heater with a large dose of bacteria and stagnant water. this will usually higher doses than the water treatment chemicals can handle.

Systems with a double wall heat exchanger to separate the fluid of the heating hot water system from the domestic hot water are referred to as closed systems. Closed systems use a heat exchanger to provide a closed loop for the heating hot water. The closed loop flows through the water heater tank in single or double wall heat exchanger coils to serve the heating hot water system or vice versa. The boiler will supply a coil in the domestic water tank. The heating coils and the heat exchanger serving the domestic hot water. Most hydronic systems have pumps, valves, coils and components that are not approved for drinking water service. Closed hydronic heating systems allow the heating hot water to be a glycol solution with corrosion inhibiters to prevent corrosion and other chemicals to prevent scale build-up on heating surfaces. The closed systems are preferred because they eliminate a lot of opportunities for systems problems.

Pitfall Number 2: System operating temperatures

The next challenge for combined systems is the system operating temperatures. Heating hot water systems are generally designed to operate between 180 F and 210 F. Domestic hot water systems are designed to operate between 85 F to 140 F. Heating coils sizes must be increased if the combined system temperatures are lower or scald prevention valves are needed if the system temperatures are kept higher for the heating hot water system temperatures.

Tempered water is water having a temperature range between 85 F (29 C) and 110 F (43 C). Hot water is water at a temperature greater than or equal to 110 F (43 C) Domestic hot water for bathing and showering is usually limited to a maximum of 120 F. Domestic hot water for dishwashing and laundries can be higher. Generally, domestic hot water systems operate around 140 F and heating hot water systems operate around 190 to 200 F. Scalding is often associated with combined systems when unqualified maintenace workers adjust system temperatures to address "lack of heat" calls.

Pitfall Number 3: Not including all of the required components in the combined systems

A combined system requires many components to operate properly. If all of the components are not installed in the proper location, the system will experience problems. These components include, but are not limited to the following: the boiler, storage tanks, expansion tank, isolation valves, unions, dielectric waterways, circulating pumps, air eliminators or air vents, control valves, relief valves, balancing valves, heating coils, fin tube radiators, thermostats, pressure gauges, temperature gauges, flushing connections, plumbing fixtures, etc. All of these components must work in concert and must be designed to work together as a system. If any one or several of the components are not installed, or if they are undersized or installed improperly, problems and safety issues can occur.

Pitfall Number 4: Seasonal pumping and pump sizing

During the winter heating season, all of the components in a combined system will require a simultaneous peak demand in the morning when it is showering time. The circulating pump must be sized for the simultaneous peak heating and showering loads. During this time it does not make sense to circulate a large quantity of water. I often see a smaller circulating pump that is piped around the large circulating pump so it can be used in the winter months when the large circulators are not needed for building heating.

Systems with domestic hot water flowing from the city water supply through the heating hot water system components such as pumps, control valves and heating coils are often called open systems. Systems with a double wall heat exchanger separating the fluid of the heating hot water system from the domestic hot water are often referred to as closed systems.

When a significant portion of a system is being used seasonally for heating and the remainder of the system is being used year round for domestic hot water, open systems are susceptible to bacteria growth in stagnant sections of heating coil piping. Heating coils have huge potential for bacterial amplification when hydronic systems are coupled with potable hot water systems where no physical barrier or heat exchanger exists between the two fluids.

Pitfall Number 5: Dead legs

During the summer months, the fan coil units and branches to baseboard heating units are shut off with a solenoid valve or the circulating pump on these branches does not run all summer long. It is not unusual for a heating system to sit idle for more than six months in southern climates. When the first call for heating is made, there is usually a slug of brackish and foul tasting water that is high in debris, metals and bacteria content. Combined systems are by design creating very large dead legs. This is a violation in many plumbing codes. Controls on combined systems need to incorporate a periodic flushing of the zones by operating the solenoid valves and circulators on each zone on at least a weekly basis if not more often.

Pitfall Number 6: Peak load problems

The early morning is generally the coldest time of day. It is also when guests at a hotel or residents of an apartment building or condominium take their morning showers. Equipment, piping, pumps and valves must be sized to handle this simultaneous peak load. If the equipment is not sized big enough the temperature of the space will fall and the shower water temperature will fall. Either condition is likely to result in calls and complaints.

Pitfall Number 7: Sizing

Sizing problems can arise when engineers, owners or contractors try to be thrifty and save a few bucks by rounding down on their peak load calculations and downsizing pumps, piping, valves or coils. This is when the phone starts ringing with complaints of spaces being too cold or there not being enough hot water for a shower. The maintenance men usually do what comes naturally when they receive calls of not enough heat: They go to the boiler and turn the temperature up. Turning up the temperature will not cause problems for the heating coils, but it does significantly increase the risk of scalding if the maximum temperature limit stops in the showers and tub/shower valves are not readjusted.

If the shower has an old two-handle or single handle non-compensating type shower valve that compensates for changes in incoming temperature or pressure the risk of scalding is even greater. The best solution is to have a thermostatic mixing valve on the hot water supply to limit the hot water to a safe temperature. If the hot water and heating water piping are still separated, and the system uses one boiler, then a temperature actuated master thermostatic mixing valve conforming to ASSE 1017 or the appropriate CSA B-125 mixing valve can be located at the water heater to lower the hot water to a safe delivery temperature. If the combined system utilizes the same piping for heating hot water and domestic hot water, a temperature limiting valve conforming to ASSE 1070 should be used in-line to mix cold water with hot water to provide a safe temperature of hot water for bathing or showering fixtures.

Pitfall Number 8: Maintenance

The main problem with a combined system is that the system includes components and controls for two different mechanical trade disciplines. Often, if there is a service call, the service technician may be familiar with one system or the other. If the system was designed with a specific operating temperature, it is not uncommon for a service tech familiar with only one system to set the temperature to that of the system he is accustomed to.

There are also many components in the system that one trade or the other may be unfamiliar with. For example, in one case the owner called an HVAC technician to work on his combined system. The technician was used to setting hydronic systems for building heating at 190 to 200 F. He set the temperature to 190 F, and a woman was scalded when she got into her shower. The technician did not know that he needed to reset the maximum temperature limit stop on all of the ASSE 1016 shower valves when he readjusted the boiler set point temperature.

Pitfall Number 9: Cast iron boiler on an open system

Cast iron boilers do not perform well with open systems because of the large quantities of water that introduces oxygen and minerals that cause rust stains, oxidation and fouling of the heating surfaces. This mistake does not take long to find because of the rust stains that appear in sinks, bathtubs and showers. Cast iron boilers can work well, but they must have a separate closed loop of boiler water that is treated with corrosion inhibitors and other boiler chemicals as needed. The boiler water can then be piped to a coil in a hot water tank or to a heat exchanger to provide domestic hot water.

Pitfall Number 10: No storage tank with copper fin tube boilers

I have seen installations where someone thought they could save a few bucks by eliminating the storage tank and using the heating hot water main as the storage tank. This does not work in motels, hotels, apartment buildings and condos. In facilities like these there needs to be a stored volume of water ready for use in a dump load such as a morning shower period. Copper fin tube boilers are designed to raise the temperature of the water only 20 to 40 F as the water flows through the boiler. If the water flows too slowly through the boiler, it will scale up and if it flows too fast the copper will erode away. These types of boilers need to have a storage tank for plumbing applications with a dump load. In heating applications, the Btu input is matched to the heating load calculations, and the system works fine.

Pitfall Number 11: No thermal expansion tank

All heating hot water system and domestic hot water systems must have a thermal expansion tank rated for use in a potable water system, not a hydronic expansion tank. The tank should be sized for a system start-up from ambient to hot. If the system has one boiler and two piping systems with a heat exchanger each piping system should have a thermal expansion tank.

Pitfall Number 12: Scalding injuries and deaths

Many designers, contractors and owners forget that there are lives at stake when they design and build the combined hot water systems. People have been scalded to death or seriously injured when the systems are not designed, installed or maintained properly.

Pitfall Number 13: Litigation

Kurt Vonnegut, Jr. an american writer once wrote "Another flaw in the human character is that everybody wants to build and nobody wants to do maintenance." If you are not willing to commit to properly maintaining the system for the life of the system, don't design it, don't install it or don't request that it be installed. Combined systems require an extensive amount of work and oversight to make sure someone does not get injured. You must document everything, because when someone is injured, everyone will be named in the lawsuit.

Pitfall Number 14: Code requirements for thermostatic mixing valves

The 2009 International Plumbing Code (IPC) has the following language dealing with combined systems:
501.2 Water heater as space heater. Where a combination potable water heating and space heating system requires water for space heating at temperatures higher than 140°F (60°C), a master thermostatic mixing valve complying with ASSE 1017 shall be provided to limit the water supplied to the potable hot water distribution system to a temperature of 140°F (60°C) or less. The potability of the water shall be maintained throughout the system.

The 2009 IPC also has the following language addressing maximum water temperatures for instantaneous water heaters:

501.6 Water temperature control in piping from tankless heaters. The temperature of water from tankless water heaters shall be a maximum of 140°F (60°C) when intended for domestic uses. This provision shall not supersede the requirement for protective shower valves in accordance with Section 424.3.

Pitfall Number 15: Engineered system

I have seen a value engineering option offered by a contractor to combine the domestic hot water system with the heating hot water system. This was not a value to the owner, and it was not engineered. During the evaluation process, the owner decided to allow the contractor to combine the systems without having the contractor provide engineered drawings. This decision gave the contractor the ability to use whatever he wanted to use. The owner got a system that did not work.

Pitfall Number 16: Pipe materials

I have seen a cost cutting option labeled as a value engineering option given by a contractor. The option was accepted, and the contractor simply eliminated the domestic hot water system and changed the hydronic system from black steel to galvanized steel piping. This was in a condominium building that had about 500 condos that sold in the neighborhood of one million dollars each. The galvanized pipe started to rust significantly within two years of service and rust stains were significant in all fixtures. The seasonal dead legs from the heating coils allowed rust barnacles to form until the first call for heat. When the flow in these dead leg branches resumed on the first call for heat in the fall rust, debris, iron oxide and stagnant water would be flushed into the strainers of the control valves and into the domestic water system.

Galvanized steel pipe should never be used on a domestic hot water system because domestic hot water is an open system connected to the city water main, which introduces a large quantity of oxygenated water into the system. Oxygenated water will cause significant corrosion in ferrous metals such as black steel and galvanized pipe. All components of a combined system should be copper or another code approved non-ferrous material for domestic hot water service if they are in contact with the city water supply. I often see iron valves installed in these combined systems. This is usually the result of a heating contractor installing or performing maintenance on the combined system and of the contractor not being familiar with the requirements in the code for all components to be approved for domestic water use.

Pitfall Number 17: Pumps

When sizing pumps for a combined system there should be two separate systems and one boiler. The hydronic system should be a closed loop that can use large ductile iron-bodied pumps. The problem with an open system is that, when the large pumps are shut down for six months or more, the pumps, and all hydronic circuits to heating coils and baseboard heaters, become dead legs in the piping system. This is why there should be a separate closed piping circuit for the heating system piping.

Pitfall Number 18: Corrosion and Errosion of the pipes

I have seen large cast iron and ductile iron hydronic pumps that were not approved for domestic water systems installed in combined systems. When such systems are first turned on in the fall, large slugs of iron oxide laden water are forced into the domestic hot water distribution system. This generally results in sinks and bathtubs filled with orange rusty looking water until the entire system gets flushed out significantly. The ferrous materials in the combined system typically lead to other problems with plugged strainers on control valves and other components. Another problem I see often with these systems is the flow in GPM is not totaled for the paek flow for both systems often resulting in undersized piping. If copper piping is used, the hot water velocity must be within the limitations provided in the Copper Development Association's "Copper Piping Handbook" Cold water can have a velocity up to 8 feet per second in copper pipes, hot water up to 140 F has a velocity limitation of 5 feet per second. Hot water over 140 F has a velocity limitation of 2 - 3 feet per second. I have seen many copper pipes springing leaks because of high velocities and high temperatures. High velocities and high temperatures can easily occur in combined systems.

Pitfall Number 19: Corrosion inhibitors and other boiler water treatment chemicals

I visited one building on the East Coast where the combined system consisted of eight- inch galvanized water pipes. The galvanized pipes were corroding to the point where the hot water was very cloudy and orange. The building maintenance personnel chose to add an injection pump to inject chemicals into the domestic water main entering the building to raise the PH of the water and to intentionally build up a layer of scale inside the galvanized piping to minimize the amount of corrosion. The problem was that the scale also formed on the heating surfaces and in the control valves, causing them to fail. Upon inspecting the barrel of the chemicals being injected into the water supply, I noted that there were warning labels stating that the materials were toxic to humans. I reported this to the building owner, who had to correct the situation immediately. This was another case of a heating contractor working on a plumbing system and not being familiar with plumbing code requirements. The solution he came up with would be a possible option for a hydronic system, but in a domestic water system that was a code violation.

Pitfall Number 20: Loss of both systems when there is a problem

When there is a problem with a combined system that causes the system to shut down, both the domestic hot water system and the heating hot water system are out of service. If it is a boiler problem or another major problem, the entire building could be without both systems for a long period of time.

Pitfall Number 21: Legionellae bacteria

A research report in 1988 authored by Al Steele, who was the president of the ASPE Research foundation at the time, recommended storing domestic hot water between 135 F and 140 F and utilizing a thermostatic mixing valve to mix the hot water down to a safe delivery temperature below 120 F. With a storage temperature of 140 F, Legionellae bacteria will die within 32 minutes.

The Legionellae bacteria cannot survive water temperatures above 131 F (55 C) for more than five or six hours. The bacteria die instantly at temperatures above 158 F (70 C). General protection against the bacteria can be achieved by designing an operating water temperature of at least 140 F (60 C) or higher. As temperatures increase, so does the risk of scalding. For system water temperatures below 140 F (60 C) special provisions are necessary to allow for cleaning and chemical treatment procedures for addressing the Legionellae bacteria in the domestic hot water system.

A storage temperature of 140 F should be high enough to protect the water heater from the bacteria, but in open systems with Legionellae bacteria in the municipal water supply, the potable hot water system would continually be reseeded with high dosages of water that is potentially infested with Legionellae bacteria. This is another reason why combined systems should have a closed loop for the heating hot water system.

Pitfall Number 22: Leakage of boiler water

When boiler water at a higher temperature than 140 F, (180 to 210 degrees F) leaks through a faulty zone valve or solenoid valve or is allowed to flow by gravity circulation through a circulating pump that is de-energized, there is the potential for overheating the domestic hot water. A thermostat that controls a solenoid valve or circulating pumps on the water heater should never be used to control the temperature in a domestic hot water system. Thermostats allow too great a temperature variation and there is potential for leakage and temperature creep. The best way to address this is to provide a thermostatic mixing valve that conforms to ASSE 1017 on the domestic hot water line coming from the hot water tank to provide a safe hot water distribution temperature.

If you are considering a combined system, avoiding these pitfalls should help keep your building warm and provide the occupants a safe temperature of hot water. If you don't avoid these pitfalls you could find yourself in hot water.

Another option would be to keep life simple and keep the systems separate. Then you will not have to worry about someone coming along later and messing up your system design with system modifications or poor maintenance that can create scalding issues. Steer clear of combined heating hot water and domestic hot water systems and you will also steer clear of potential litigation.

Ron George is president of Ron George Design & Consulting Services. He has served as Chairman of the International Residential Plumbing & Mechanical Code Committee. He has also served on the IPC Code committee. He is active in plumbing code and plumbing product standard development committees with ICC, IAPMO, ASSE, ASME, ISEA, ASHRAE, NFPA and ASTM. His company specializes in plumbing, piping, fire protection and HVAC system design and consulting services. He also provides plumbing and mechanical code consulting services and he provides investigations of mechanical system failures and litigation support. To contact Ron, email: Ron@Plumb-TechLLC.com.

Bibliography: Title of Magazine: Plumbing Engineer Magazine, 22 pitfalls to avoid when designing or installing a combined heating hot water and domestic hot water system, August, 2010 Part 1 & September 2010 Part 2, By Ron George, CIPE, CPD, President, Ron George Design & Consulting Services - Part 1 Website: http://plumbingengineer.com/aug_10/code.php ; Part 2 Website: http://plumbingengineer.com/sept_10/code.php
Copper Development Association's Copper Tube Handbook. website: http://www.copper.org/applications/plumbing/cth/

Cost Impact: Will not increase the cost of construction
There is no cost increase with this code change. This is simply a clarification. Combined system with open piping has not been allowed in the current code because of cross connections. This code change is just clarifying the language because the language is not clear it has allowed an unsafe condition to occur where it has been misinterpreted. Combined heating hot water and domestic hot water systems can still be used, There just needs to be a closed loops for the heating hot water to prevent contamination, stagnant water, corrosion and scald injuries.

P 151-15 : 608.9-GEORGE4656

P 152-15

608.11

Proponent: Jeremy Brown, NSF International, representing NSF International

2015 International Plumbing Code

Revise as follows:

608.11 ~~Painting of~~<u>Potable</u> water tanks. <u>Where in contact with potable water intended for drinking water, water tanks, coatings for the inside of tanks and liners for water tanks shall conform to NSF 61.</u> The interior surface of a potable water tank shall not be lined, painted or repaired with any material that changes the taste, odor, color or potability of the water supply when the tank is placed in, or returned to, service.

Reason: NSF/ANSI Standard 61 Drinking Water System Components-Health Effects addresses critical aspects of drinking water system components: whether contaminants that leach or migrate from the product/material into the drinking water are above acceptable levels in finished waters. Requiring NSF 61 will help protect the drinking water supply from the leaching of contaminants. The IPC and IRC already requires conformance to NSF 61 for pipes, fittings, faucets and valves intended to supply drinking water. (Sections 424.1, 605.3, 605.4, 605.5, 605.7 of IPC). It is logical that tanks should have to meet this same requirement to protect the drinking water. This requirement is also referenced in the Uniform Plumbing Code, and the water works regulations of 46 states.

There are adequate products on the market to fulfill this requirement as there are hundreds of products listed by NSF and other third party certifiers.

Cost Impact: Will not increase the cost of construction

Because there are many certified tanks, tank liners, and coatings on the market, this is not expected to increase the cost of construction.

P 152-15 : 608.11-BROWN5244

P 153-15

608.13.1

Proponent: Michael Moss, American Backflow Prevention Association, representing American Backflow Prevention Association (msmoss@utah.gov)

2015 International Plumbing Code

Revise as follows:

608.13.1 Air gap. The minimum required *air gap* shall be measured vertically from the lowest end of a potable water outlet to the *flood level rim* of the fixture or receptacle into which such potable water outlet discharges. *Air gaps* shall comply with ASME A112.1.2 and *air gap* fittings shall comply with ASME A112.1.3. <u>Products that are *listed* and *labeled* to ASME A112.1.2 or ASME A112.1.3 shall be considered to be in compliance with this section.</u>

Reason: Section 608.13.9 is incorrectly located with and greatly confused by the various types of backflow preventers within Section 608.13. This is specific to the types of backflow preventers, their standards and suitability for use in certain conditions. Table 608.1 aligns with that criteria. Chemical dispensers are already specified with the backflow requirements of Section 608.16.7.

Cost Impact: Will not increase the cost of construction
The installation and proper use of dispenser equipment would not increase or lower costs.

P 153-15 : 608.13.1-MOSS5815

P 154-15

608.13.4

Proponent: Michael Moss, American Backflow Prevention Association, representing American Backflow Prevention Association (msmoss@utah.gov)

2015 International Plumbing Code

Revise as follows:

608.13.4 Barometric loop. ~~Barometric loops~~A barometric loop shall ~~precede~~be designed and installed to rise vertically at an angle of 90 degrees from the ~~point of connection and shall extend vertically~~horizontal to a ~~height~~distance of 35 feet (10 668 mm) above the loop inlet and return vertically downwards through a 180 degree change in direction to the same elevation as the loop inlet. A barometric loop shall ~~only~~be considered to be ~~utilized as an atmospheric-type~~capable of preventing backsiphonage only where the pressure in the downstream piping is less than or ~~pressure-type vacuum breaker.~~equal to the pressure upstream of the loop, whether the flow in the loop is continuous or not.

Reason: The wording of the existing section poorly conveys the required design and installation of protection using a barometric loop. The downstream operating operating conditions are critical for proper use and installation

Cost Impact: Will not increase the cost of construction
This is a clarification of language for installation and inspection and no additional cost is involved.

P 154-15 : 608.13.4-MOSS5776

P 155-15

608.13.5, 608.13.8

Proponent: Michael Moss, American Backflow Prevention Association, representing American Backflow Prevention Association (msmoss@utah.gov)

2015 International Plumbing Code

Revise as follows:

608.13.5 Pressure vacuum breaker assemblies. Pressure vacuum breaker assemblies shall ~~conform to~~comply with ASSE 1020 or CSA B64.1.2. Spill-resistant vacuum breaker assemblies shall comply with ASSE 1056 or CSA B64.1.3. These assemblies ~~are designed for installation under continuous pressure conditions where~~shall be installed with the critical level ~~is installed at~~of the ~~required height~~assembly located not less than 12 inches (304.8 mm) above all downstream piping and outlets. Pressure vacuum breaker assemblies shall not be installed in locations where spillage could cause damage to the structure.

Delete without substitution:

~~**608.13.8 Spill-resistant pressure vacuum breaker assemblies.** Spill-resistant pressure vacuum breaker assemblies shall conform to ASSE 1056 or CSA B64.1.3. These assemblies are designed for installation under continuous-pressure conditions where the critical level is installed at the required height.~~

Reason: The existing section included spill-resistant vacuum breaker assemblies. Section 608.13.8 duplicated the requirements. The conditions for use of both types of backflow assemblies are the same. The deletion of the confusing language and the added language clarifies the installation requirements and inspection criteria for for applicable installations.

Cost Impact: Will not increase the cost of construction
There is no cost increase with proper planning and installation.

P 155-15 : 608.13.5-MOSS5777

P 156-15

608.13.6, 608.13.6.1 (New), 608.13.6.2 (New), 608.13.6.3 (New)

Proponent: Michael Moss, American Backflow Prevention Association, representing American Backflow Prevention Association (msmoss@utah.gov)

2015 International Plumbing Code

Revise as follows:

608.13.6 Atmospheric-type vacuum breakers. ~~Pipeapplied atmospheric-type vacuum~~Vacuum breakers shall ~~conform to ASSE 1001 or CSA B64.1.1~~be in accordance with Sections 608.13.6.1 and 608.13.6.2. ~~Hose-connection vacuum breakers~~Laboratory faucet backflow preventers shall ~~conform to ASME A112.21.3, ASSE 1011, ASSE 1019, ASSE 1035, ASSE 1052, CSA B64.2, CSA B64.2.1, CSA B64.2.1.1, CSA B64.2.2 or CSA B64.7. These devices shall operate under normal atmospheric pressure when the critical level is installed at the required height.~~be in accordance with Section 608.13.6.3.

Add new text as follows:

608.13.6.1 Pipe-applied vacuum breakers Pipe-applied atmospheric-type vacuum breakers shall conform to ASSE 1001 or CSA B64.1.1. These vaccum breakers shall be considered capable of functioning only where the downstream piping is open to the atmosphere and is located not less than 6 inches above all downstream piping and outlets.

608.13.6.2 Hose-connection vacuum breakers. Hose connection vacuum breakers shall conform to ASME A112.21.3, ASSE 1011, ASSE 1019, ASSE 1035, ASSE 1052, CSA B64.2, CSA B64.2.1, CSA B64.2.2 or CSA B64.7. These vacuum breakers shall be considered capable of functioning only where the downstream hose is open to the atmosphere and the open end of the hose is not greater than 10 feet (3048 mm) above the elevation of the vacuum breaker.

608.13.6.3 Laboratory faucet backflow preventers Laboratory faucet backflow preventers shall conform to ASSE 1035 or CSA B64.7. These backflow preventers shall be considered capable of functioning only where the downstream hose is open to the atmosphere and the open end of the hose is not greater than 10 feet (3048 mm) above the elevation of the backflow preventer.

Reason: Existing Section 608.13.6 has requirements for three (3) different vacuum breakers with multiple standards. The statement "These devices shall operate under normal atmospheric pressure when the critical level is installed at the required height." does not provide adequate and necessary guidance for installation and inspection. The section was divided to ensure proper and clear installation and inspection conditions for each device.

Cost Impact: Will not increase the cost of construction
Proper installation and identification will not increase cost.

P 156-15 : 608.13.6-MOSS5778

P 157-15

608.13.7, 608.13.10

Proponent: Michael Moss, American Backflow Prevention Association, representing American Backflow Prevention Association (msmoss@utah.gov)

2015 International Plumbing Code

Revise as follows:

608.13.7 Double check backflow prevention assemblies. Double check backflow prevention assemblies shall conform to ASSE 1015, CSA B64.5, CSA B64.5.1 or AWWA C510. Double check detector fire protection backflow prevention assemblies shall conform to ASSE 1048. These assemblies shall be considered to be capable of ~~operating~~functioning under ~~continuous~~any downstream pressure ~~conditions~~condition whether continuous or intermittent.

608.13.10 Dual check valve type backflow preventer. Dual check valve-type backflow preventers shall conform to ASSE 1024 or CSA B64.6. These backflow preventers shall be considered to be capable of functioning under any downstream pressure condition whether continuous or intermittent.

Reason: In Section 608.13.7 the deleted language is more of a device design statement than a required condition of service for proper operation of the device. The added language conveys permissable downstream operating conditions. This is much clearer langauge for installation and inspection.
Section 608.13.10 has been modified to properly identify this device in accordance with the ASSE naming convention and Table 608.1. The added language conveys the permissable downstream operating conditions. his is much clearer langauge for installation and inspection.

Cost Impact: Will not increase the cost of construction
There is not any cost involved with the clarification of this section.

P 157-15 : 608.13.7-MOSS5774

P 158-15

608.13.9, 608.16.7

Proponent: Michael Moss, American Backflow Prevention Association, representing American Backflow Prevention Association (msmoss@utah.gov)

2015 International Plumbing Code

Delete without substitution:

~~**608.13.9 Chemical dispenser backflow devices.** Backflow devices for chemical dispensers shall comply with ASSE 1055 or shall be equipped with an *air gap* fitting.~~

Revise as follows:

608.16.7 Chemical dispensers. Where chemical dispensers connect to the potable water distribution system, the water supply system shall be protected against backflow in accordance with Section 608.13.1, 608.13.2, 608.13.5, 608.13.6, ~~608.13.8~~ or ~~608.13.9~~608.13.8. The chemical dispenser unit shall connect to a dedicated water supply connection separate from any sink faucet outlet.

Exception: For chemical dispenser units *listed* to act as an air gap fitting because backflow protection is installed within the unit, an external means of protection shall not be required.

Reason: Section 608.13.9 is incorrectly located and confused with the various types of backflow preventers of Section 608.13 which is specific to the types of backflow preventers, their standards and suitability to certain conditions. Table 608.1 aligns with those. Chemical dispensers already specify the backflow requirements in Section 608.16.7

Cost Impact: Will not increase the cost of construction
There is no addition cost for the proper use and installation

P 158-15 : 608.13.9-MOSS5775

P 159-15

608.16.1 (New), 608.16.1, 608.16.1.2 (New)

Proponent: Roger Harper, representing Virginia Plumbing and Mechanical Inspectors Association (skip.harper@dhcd.virginia.gov)

2015 International Plumbing Code

Add new text as follows:

608.16.1 Beverage dispensers. The water supply connection to beverage dispensers shall be protected against backflow in accordance with Sections 608.16.1.1 and 608.16.1.2.

Revise as follows:

~~608.16.1~~608.16.1.1 ~~Beverage~~Carbonated beverage dispensers.
The water supply connection to carbonated beverage dispensers shall be protected against backflow by a backflow preventer conforming to ASSE 1022 or by an *air gap*. The portion of the backflow preventer device downstream from the second check valve of the device and the piping downstream therefrom shall not be affected by carbon dioxide gas.

Add new text as follows:

608.16.1.2 Coffee machines and non carbonated drink dispensers. The water supply connection to coffee machines and noncarbonated beverage dispensers shall be protected against backflow by a backflow preventer conforming to ASSE 1022, ASSE 1024 or by an air gap.

Reason: This section needs to be sub-divided into two catagories one for carbonated beverage dispensers and one for non carbonated dispensers.

Cost Impact: Will not increase the cost of construction
There is no cost increase but actually less cost in many cases because of the price difference between the backflow devices.

P 159-15 : 608.16.1-HARPER3516

P 160-15

608.16.1, 608.16.9, 608.16.10

Proponent: Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

2015 International Plumbing Code

Revise as follows:

608.16.1 Beverage dispensers. The water supply connection to each beverage ~~dispensers~~dispenser shall be protected against backflow by a backflow preventer conforming to ASSE 1022 or by an *air gap*. The portion of the backflow preventer device downstream from the second check valve and the piping downstream therefrom shall not be affected by carbon dioxide gas.

608.16.9 Dental ~~pump~~pumping equipment. ~~Where~~The water supply connection to each dental pumping equipment ~~connects to the water distribution system, the water supply~~ system shall be protected against backflow in accordance with Section 608.13.1, 608.13.2, 608.13.5, 608.13.6 or 608.13.8.

608.16.10 Coffee machines and noncarbonated beverage dispensers. The water supply connection to each coffee ~~machines~~machine and each noncarbonated beverage ~~dispensers~~dispenser shall be protected against backflow by a backflow preventer conforming to ASSE 1022 or by an *air gap*.

Reason: The reason for these revisions should be obvious. Each "unit" needs to be protected from backflow from the other "unit". For example, installing one backflow preventer device to serve multiple "units" leaves open the possibility that contamination in one "unit" could contaminate an adjacent "unit". In other words, cross contamination could occur. Although the backflow protection section of the code is primarily concerned with protecting the potable water supply from the "units", the code needs to also be specific about protection between units. These changes make this clear. Hopefully, many jurisdictions have already been aware of this potential problem and have already required separate backflow prevention devices for these units.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes. This is PMGCAC Item 128.

Cost Impact: Will increase the cost of construction
This proposal will increase the cost of construction because additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code. For those jurisdictions that were not enforcing the code in this manner, yes, there might need to be extra backflow prevention devices installed. In those situations there will be an increased cost of material and labor.

P 160-15 : 608.16.1-SNYDER4014

P 161-15

608.16.1, 608.16.1.1 (New), 608.16.1.2 (New), 608.16.10

Proponent: Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

2015 International Plumbing Code

Revise as follows:

608.16.1 Beverage dispensers. The water supply connection to beverage dispensers shall be protected against backflow ~~by a backflow preventer conforming to ASSE 1022 or by an *air gap*. The portion of the backflow preventer device downstream from the second check valve~~in accordance with Section 608.16.1.1 and ~~the piping downstream therefrom shall not be affected by carbon dioxide gas~~608.16.1.2.

Add new text as follows:

608.16.1.1 Carbonated beverage dispensers. The water supply connection to carbonated beverage dispensers shall be protected against backflow by a backflow prevention device conforming to ASSE 1022 or by an air gap. The portion of the backflow preventer device downstream from the second check valve of the device and the piping downstream therefrom shall not be affected by carbon dioxide gas.

608.16.1.2 Coffee machines and noncarbonated beverage dispensers. The water supply connection to coffee machines and noncarbonated beverage dispensers shall be protected against backflow by a backflow prevention device conforming to ASSE 1024 or by an air gap.

Delete without substitution:

~~**608.16.10 Coffee machines and noncarbonated beverage dispensers.** The water supply connection to coffee machines and noncarbonated beverage dispensers shall be protected against backflow by a backflow preventer conforming to ASSE 1022 or by an *air gap*.~~

Reason: There is not a need to protect the potable water supply to coffee machines and noncarbonated beverage dispensers with a backflow prevention device that is suitable for a potable water supply connection to a carbonated beverage dispenser. The ASSE 1022 device is constructed especially for exposure to carbon dioxide gas and carbonated water. An ASSE 1024 device is a dual check valve device just like the ASSE 1022 device but it does not have an intermediate atmospheric vent and thus, does not require a drain. There isn't any justification for needing to use the ASSE 1022 device (and having to provide a drain for the vent) where there will not be exposure to carbon dioxide gas or carbonated water. What comes from a coffee machine or a non-carbonated beverage dispenser is supposedly safe enough to ingest so why have so great of concern that the potable water supply might become "polluted" with something that will not make people sick if an ASSE 1024 device fails. (See the definition of POLLUTED in Chapter 2).

Also consider that, in general, ASSE 1022 devices apparently don't have a long life according to many field reports. On the other hand, ASSE 1024 devices are frequently used with great success in many other similar low hazard applications.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes. This is PMGCAC Item 95.

Cost Impact: Will not increase the cost of construction
This proposal will not increase the cost of construction because no additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code.

P 161-15 : 608.16.1-SNYDER4015

Proponent: Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

Part I

2015 International Plumbing Code

Add new text as follows:

608.16.11 Humidifiers. The water supply connection to humidifiers shall be protected against backflow by a backflow preventer conforming to ASSE 1012 or by an *air gap.*

Revise as follows:

801.1 Scope. This chapter shall govern matters concerning indirect waste piping and special wastes. This chapter shall further control matters concerning food-handling establishments, sterilizers, humidifiers, clear-water waste, swimming pools, methods of providing *air breaks* or *air gaps*, and neutralizing devices for corrosive wastes.

801.2 Protection. Devices, appurtenances, appliances and apparatus intended to serve some special function, such as sterilization, humidification, distillation, processing, cooling, or storage of ice or foods, and that discharge to the drainage system, shall be provided with protection against backflow, flooding, fouling, contamination and stoppage of the drain.

802.1 Where required. Food-handling equipment, in other than dwelling units, clear-water waste, humidifiers, dishwashing machines and utensils, pots, pans and dishwashing sinks shall discharge through an indirect waste pipe as specified in Sections 802.1.1 through 802.1.8. Health-care related fixtures, devices and equipment shall discharge to the drainage system through an indirect waste pipe by means of an *air gap* in accordance with this chapter and Section 713.3. Fixtures not required by this section to be indirectly connected shall be directly connected to the plumbing system in accordance with Chapter 7.

Part II

2015 International Residential Code

Add new text as follows:

SECTION P2725
HUMIDIFIER DISCHARGE

P2726.1 Overflow pipe from humidifier. The overflow pipe from a humidifier shall terminate at an air gap before discharging water to the point of disposal.

P2902.6 Humidifiers. The water supply connection to humidifiers shall be protected against backflow by a backflow preventer conforming to ASSE 1012 or by an air gap.

Reason: Most humidifier manufacturer installation instructions only say to make potable water connections in accordance with local codes. The codes are silent on the protection of the water supply connection to humidifiers. Humidifiers, if not regularly serviced, can be a source of contamination to the connected water supply. The inspector has no way of knowing whether such pieces of equipment have internal backflow protection. This simple addition to the codes will clarify the humidifiers need to have a backflow device just like other similar pieces of equipment in the list of items.
Humidifiers have overflows that drain excess water. Improper (direct) connection of the overflow tube could cause a contamination to occur inside of the humidifier which could result in contamination being carried into the airstream of the equipment that the humidifier is attached to. The requirement for an air gap connection at the termination of this discharge tube will prevent this possible contamination from occurring.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes. This is PMGCAC Item 177.

Cost Impact:

Part I: Will increase the cost of construction
This proposal will increase the cost of construction because additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code. Specifically, there will be the added cost of a backflow preventer and the installation labor.

Part II: Will increase the cost of construction
This proposal will increase the cost of construction because additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code. Specifically, there will be the added cost of a backflow preventer and the installation labor.

P 162-15 : 608.16.11 (New)-SNYDER3958

P 163-15

610.1

Proponent: Ronald George, Self; www.LegionellaPrevention.org, representing Self (Ron@Plumb-TechLLC.com)

2015 International Plumbing Code

Revise as follows:

610.1 General. New potable water systems shall be purged of deleterious matter and disinfected within two weeks prior to utilization and occupancy of the building. The method to be followed shall be that prescribed by the health authority or water purveyor having jurisdiction or, in the absence of a prescribed method, the procedure described in either AWWA C651 or AWWA C652, or as described in this section. This requirement shall apply to "on-site" or "inplant" fabrication of a system or to a modular portion of a system.

1. The pipe system shall be flushed with clean, potable water until dirty water does not appear at the points of outlet.
2. The system or part thereof shall be filled with a water/chlorine solution containing not less than 50 parts per million (50 mg/L) of chlorine, and the system or part thereof shall be valved off and allowed to stand for 24 hours; or the system or part thereof shall be filled with a water/chlorine solution containing not less than 200 parts per million (200 mg/L) of chlorine and allowed to stand for 3 hours.
3. Following the required standing time, the system shall be flushed with clean potable water until the chlorine is purged from the system.
4. The procedure shall be repeated where shown by a bacteriological examination that contamination remains present in the system.

Reason: Chlorine dissipates over time when it is introduced into the piping system and losses its ability to disinfect agains bacteria and other organic pathogens in the water piping. Upon initially filling the piping system, flushing can be done at that time, but final disinfection of the piping system should be completed within two weeks of occupancy the building. During the construction of a recnt project that filled severla city plocks, the plumbing system was flushed and filled with water. The piping was allowed to sit in temperatures over 100 degrees for almost twwo years before the building was completed and occupied. Immediate after occupancy there was an outbreak of Legionnaires disease from people showering in the stagnant water that had been in the pipes for a very long time. This code change is simply requiring the flushing to be performed at initial fill and construction and disinfection to occur within two weeks prior to occupancy so that the hazard of bacteria and Legionnella can be eliminated prior to occupancy.

Cost Impact: Will not increase the cost of construction
This code change is just changing the time of the disinfection to protect occupants in a new building. There is no additional cost.

P 163-15 : 610.1-GEORGE5587

P 164-15

611.2

Proponent: Jeremy Brown, NSF International, representing NSF Internaional

2015 International Plumbing Code

Revise as follows:

611.2 Reverse osmosis systems. Point-of-use reverse osmosis drinking water treatement units shall comply with NSF58 or CSA B483.1. The discharge from a reverse osmosis drinking water treatment unit shall enter the drainage system through an *air gap* or an *air gap* device that meets the requirements of NSF 58 or CSA B483.1.

Reason: Point-of-use reverse osmosis(RO) drinking water treatment units are commonly used in kitchens, day care centers, breakrooms, etc. These standards are a necessary reference to ensure the protection of public health from these units from a performance, material safety and contaminant reduction aspect. These standards are already referenced in the P2909.2 of the IRC and the reference here contains similar language.

Cost Impact: Will not increase the cost of construction
Because a majority of point of use products sold in the US already meet the requirements of NSF/ANSI 58, this code change is not expected to increase the cost of construction.

P 164-15 : 611.2-BROWN5076

P 165-15

2015 International Plumbing Code

Add new text as follows:

SECTION 614
PRESSURE GAUGES

614.1 Where required. Pressure gauges shall be installed in the following locations:

1. On the suction and discharge piping of water pressure booster pumps or booster pump package systems.
2. In buildings over 3 stories, at the top of each water riser.
3. In buildings over 3 stories, at the top of each pressure zone in a high rise building.
4. In buildings over 3 stories, at the bottom of each riser or pressure zone.
5. In buildings over 3 stories, at the bottom of each pressure zone.
6. In buildings over 3 stories, at the building water service entrance downstream of the meter and backflow preventer.

614.2 Gauge connection requirements Pressure gauges shall have snubbers and gauge cocks that can be normally closed except for when taking pressure readings to prevent physical damage to the gauge from water hammer and pump pulsations.

614.2 Gauge range selection. The range chosen for pressure gauges selection shall provide for the normal system operating pressure reading to be within the middle third of the range.

Reason: There should be requirements for pressure gauges to allow for diagnosis of sytem problems.

Cost Impact: Will increase the cost of construction
There is a slight cost associated with providing pressure gauges.

P 165-15 : 614 (New)-GEORGE5605

P 166-15

Part I:
701.2
Part II:
P2602.1

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IPC COMMITTEE. PART II WILL BE HEARD BY THE IRC-PLUMBING COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

Proponent: Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

Part I

2015 International Plumbing Code

Revise as follows:

701.2 ~~Sewer~~Connection to sewer required. ~~Buildings in which~~Sanitary drainage piping from plumbing fixtures ~~are installed~~in buildings and ~~premises having~~sanitary drainage piping systems from premises shall be connected to a public *sewer~~, where~~*. Where a public sewer is not available, ~~or an *approved*~~ the sanitary drainage piping and systems shall be connected to a private sewage disposal system in compliance with state or local requirements. Where state or local requirements do not exist for private sewage disposal systems, the sanitary drainage piping and systems shall be connected to an approved private sewage disposal system that is in accordance with the *International Private Sewage Disposal Code*.

> **Exception:** Sanitary drainage piping and systems that convey only the discharge from bathtubs, showers, lavatories, clothes washers and laundry trays shall not be required to connect to a public sewer or to a private sewage disposal system provided that the piping or systems are connected to a system in accordance with Chapter 13 or 14.

Part II

2015 International Residential Code

Revise as follows:

P2602.1 General. The water-distribution~~ and drainage~~ system of any building or premises where plumbing fixtures are installed shall be connected to a public water supply~~ or sewer system, respectively, if available~~. Where~~ either~~ a public water-supply ~~or sewer system, or both, are~~system is not available, or connection to ~~them~~the supply is not feasible, an individual water supply ~~or individual (private) sewage-disposal system, or both, ~~shall be provided. Sanitary drainage piping from plumbing fixtures in buildings and sanitary drainage piping systems from premises shall be connected to a public sewer. Where a public sewer is not available, the sanitary drainage piping and systems shall be connected to a private sewage disposal system in compliance with state or local requirements. Where state or local requirements do not exist for private sewage disposal systems, the sanitary drainage piping and systems shall be connected to an approved private sewage disposal system that is in accordance with the International Private Sewage Disposal Code.

> **Exception:** Sanitary drainage piping and systems that convey only the discharge from bathtubs, showers, lavatories, clothes washers and laundry trays shall not be required to connect to a public sewer or to a private sewage disposal system provided that the piping or systems are connected to a system in accordance with Sections P2911 or P2910.

Reason: PART I: The section is being re-written because many jurisdictions have state and local laws regulating private sewage disposal systems and do not and cannot use the IPSDC. However, there are some jurisdictions that do not have state and local laws for private sewage disposal, therefore in those cases, the IPSDC provide regulations for waste disposal.

The section language (existing or revised) presents a roadblock for utilizing gray water systems. The exception was added to allow for gray water to be diverted from the sewer or private sewage disposal system so that it can be processes by systems in accordance with Chapters 13 or 14.

PART II: Some jurisdictions do not have state and local laws for private sewage disposal systems. Therefore in those cases, the IPSDC provides regulations for waste disposal. The section language (existing or revised) presents a roadblock for utilizing gray water systems. The exception was added to allow for gray water to be diverted from the sewer or private sewage disposal system so that it can be processed by systems in accordance with Chapters P2910 or P2911.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes. This is PMGCAC Item 199.

Cost Impact:

Part I: Will not increase the cost of construction

This proposal will not increase the cost of construction because no additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code.

Part II: Will not increase the cost of construction

This proposal will increase the cost of construction because additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code. Specifically, where private sewage disposal is not regulated by state and local laws, builders could do anything with sewage. They might not provide a large enough private sewage disposal system or one made of materials having long life. In those situations, there will be the extra cost for properly sized systems and better materials. Possibly there would be some additional labor for a larger installation.

P 166-15 : 701.2-SNYDER4017

P 167-15

701.8

Proponent: Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

2015 International Plumbing Code

Delete without substitution:

~~**701.8 Drainage piping in food service areas.** Exposed soil or waste piping shall not be installed above any working, storage or eating surfaces in food service establishments.~~

Reason: Questions about this section have been coming up more frequently concerning the necessity of this requirement and the intent of the section. Does this section mean that soil and waste piping cannot be above the indicated areas regardless of whether a "ceiling" is between the piping and those areas? Or is this section requiring that a ceiling be installed and if so, what type of ceiling (lay-panel/grid work or gypsum board on framing)? Or is this section requiring custom-made "drip pans" under all soil and waste piping (whether there is a ceiling between the piping and the surfaces below or not)?

This section is vague and should be removed from the code. Here's why:

There seems to be the implication that soil and waste piping joints will always leak even though the piping is installed in accordance with the code and is pressure tested in the presence of a code official. If there really is a significant problem with joints failing, then that is an issue to be solved elsewhere. What about ductwork, sprinkler piping and even penetrations through a floor above that can leak "contaminated water" that can drop down to the surfaces below? What about condensation on the outside of cool surfaces that carry years of dirt off of surfaces. Why is there not a similar restriction against the installation of ductwork, sprinkler piping and penetrations above these areas?

If the assumption is made that a ceiling below the piping is what is required, why does a ceiling make the situation any more acceptable? Lay-in panel/grid ceiling systems can "leak" water without ever showing any damage to ceiling panels (think of the lighting troffers). Would we not be just as concerned about leakage in a space above a ceiling that served as an air plenum for a HVAC system?

A recent popular building design practice for restaurants is to not have a "ceiling" over the eating surfaces such as tables or bars. The "ceiling" in these areas is the bottom of the roof deck or the floor above. All the support structure, ductwork, sprinkler piping, other piping and associated hardware is exposed; typically all painted a uniform dark color.

Where the floor above the eating surfaces has plumbing fixtures, there will necessarily be soil and waste piping below the floor and in the open ceiling area just described. If the code intends for "drip pans" to be installed under the piping, then what should the drip pans be made of? Should those pans slope to a drain point? If so, where should the discharge of the drip pans be routed to? Is it acceptable to have the drip pans catching leaks for years and, unbeknownst to the owner, allowing a build-up of a festering mess of bacteria that is open to the moving ventilation air in the space?

A reading of the latest Food Code by the FDA, did not reveal any prohibitions for soil and waste piping above the surfaces indicated in this section. However, the Food Code does make a big deal about the "clean ability" of surfaces above food prep areas (but not above eating surfaces). Obviously, pipes and pipe hangers as well as most structural and ductwork surfaces would be difficult to clean. The local health departments enforcing their version of the Food Code will most likely demand ceilings in the food prep area even though the code (the IBC) does not have such a requirement.

Perhaps what needs to happen is that a proposal to the IBC be made to indicate that ceilings (and what type) are required above food preparation areas with the justification that the Food Code has concerns about "clean ability" of items that would be exposed if the ceiling was not there. That seems more logical than possibly what IPC Section 701.8 is trying to imply.

The PMGCAC did not feel that it was within their scope to make or suggest an IBC proposal for ceilings in restaurants. However, if such a proposal was made and was successful, it would be appropriate to make a proposal to the IPC that would prohibit the installation of any type of piping below a ceiling required by IBC Section 123.4 (whatever the IBC section number would end up being). Until then, this IPC Section 701.8 should simply be removed.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes. This is PMGCAC Item 137.

Cost Impact: Will not increase the cost of construction
This proposal will not increase the cost of construction because no additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code.

P 167-15 : 701.8-SNYDER4019

P 168-15

Table 702.1

Proponent: Pennie L Feehan, Copper Development Association, representing Copper Development Association (penniefeehan@me.com)

2015 International Plumbing Code

Revise as follows:

TABLE 702.1
ABOVE-GROUND DRAINAGE AND VENT PIPE

MATERIAL	STANDARD
~~Brass pipe~~	~~ASTM B 43~~
Copper or copper-alloy pipe	ASTM B 42; ASTM B 43; B 302

(Portions of table not shown remain unchanged)

Reason: Brass is a copper alloy and I relocated the standard to the Copper and Copper Alloy Pipe line to cleanup the table.

Cost Impact: Will not increase the cost of construction
This proposal will not increast the cost of construction as this change is only to update the name of a material that is already in the code.

P 168-15 : T702.1-FEEHAN3796

P 169-15

Table 702.1,Table 702.2, Table 702.3, 705.12 (New)

Proponent: Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

2015 International Plumbing Code

Revise as follows:

TABLE 702.1
ABOVE-GROUND DRAINAGE AND VENT PIPE

MATERIAL	STANDARD
Ductile iron	AWWA C115/A21.15, AWWA C151/A21.51

(Portions of table not shown remain unchanged)

TABLE 702.2
UNDERGROUND BUILDING DRAINAGE AND VENT PIPE

MATERIAL	STANDARD
Ductile iron	AWWA C115/A21.15, AWWA C151/A21.51

(Portions of table not shown remain unchanged)

TABLE 702.3
BUILDING SEWER PIPE

MATERIAL	STANDARD
Ductile iron	AWWA C115/A21.15, AWWA C151/A21.51

(Portions of table not shown remain unchanged)

Add new text as follows:

705.12 Ductile iron. Joints between ductile iron pipe sections, or between ductile iron pipe and ductile or gray iron fittings shall be mechanical joints installed in accordance with the manufacturer's instructions.

Reason: Tables 702.1, 702.2, 702.3 are each missing a ductile iron pipe material entry even though the pipe fitting Table 702.4 includes ductile iron fittings. That in itself is a coordination problem. Why would the pipe fittings be included in the code but not the pipe? Over the years, there have been a few designers asking about what this is because they want to use ductile iron for sanitary drainage service. Although more costly that most other drainage pipe materials, there are good reasons for that material choice for special circumstances both inside and outside of a building. This material might be used where support spacing is desired to be much wider than the code allows (Table 308.5). Or burial in expansive soils creates significant stresses for the piping that other pipe materials don't have the strength to withstand.

Ductile iron piping is frequently used by utilities for wastewater service. The standards for ductile iron piping are already in the code because the same standards apply to ductile iron water piping. However, for water service, the piping is required (by this code) to have cement mortar lining to reduce rust coloring of potable water. Ductile iron for wastewater service does not need a lining.

The new section simply covers how the joints are to be made between fittings and the piping.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes. This is PMGCAC Item 52.

Cost Impact: Will not increase the cost of construction
This proposal will not increase the cost of construction because no additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code.

P 169-15 : T702.1-SNYDER4020

P 170-15

Table 702.2
Part II:
Table P3002.1

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IPC COMMITTEE. PART II WILL BE HEARD BY THE IRC PLUMBING COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

Proponent: Mike Cudahy, representing Plastic Pipe and Fittings Association (mikec@cmservnet.com)

Part I

2015 International Plumbing Code

Revise as follows:

TABLE 702.2
UNDERGROUND BUILDING DRAINAGE AND VENT PIPE

MATERIAL	STANDARD
Polyolefin pipe	ASTM F 1412; <u>ASTM F714;</u> CSA B181.3

(Portions of table not shown remain unchanged)

Part II

2015 International Residential Code

Revise as follows:

TABLE P3002.1
UNDERGROUND BUILDING DRAINAGE AND VENT PIPE

PIPE	STANDARD
Polyolefin pipe	ASTM F 1412; <u>ASTM F714;</u> CSA B181.3

(Portions of table not shown remain unchanged)

Reason:

Part I: ASTM F714 polyethylene pipe is sometimes used to rehabilitate piping sewers under buildings. Currently the code does not list the product for that use, and we were asked to submit a change to allow the use of the product.

HDPE sewer pipe made to ASTM F714, *Standard Specification for Polyethylene (PE) Plastic Pipe (DR-PR) Based on Outside Diameter* is currently listed under TABLE 702.2, Building Sewer Pipe, allowing its installation and use outside of buildings. Section 717, which is a new section in the code, explains the use and installation of the product outside of buildings in pipe bursting methods. PPFA has had calls regarding the codes not permitting the products under buildings when repair is needed.

Part II: ASTM F714 polyethylene pipe is sometimes used to rehabilitate piping sewers under buildings. Currently the code does not list the product for that use, and we were asked to submit a change to allow the use of the product.
HDPE sewer pipe made to ASTM F714, "Standard Specification for Polyethylene (PE) Plastic Pipe (DR-PR) Based on Outside Diameter", is currently listed under TABLE P3002.1, Building Sewer Pipe, allowing its installation and use outside of buildings. PPFA has had calls regarding the codes not permitting the products under buildings when repair is needed.
ASTM F714, "Standard Specification for Polyethylene (PE) Plastic Pipe (DR-PR) Based on Outside Diameter" is already in the code.

Cost Impact:

Part I: Will increase the cost of construction
This proposal allows for an optional pipe material to be used under buildings. The option is not requiring that this method be chosen. Thus the code with this proposal added will not cause the cost of construction to increase, and the material may even cost less than other options.

Part II: Will not increase the cost of construction
This proposal allows for an optional pipe material to be used under buildings. The option is not requiring that this method be chosen. Thus the code with this proposal added will not cause the cost of construction to increase, and the material may even cost less than other options.

2015 International Plumbing Code

Revise as follows:

TABLE 702.3
BUILDING SEWER PIPE

MATERIAL	STANDARD
Acrylonitrile butadiene styrene (ABS) plastic pipe in IPS diameters, including Schedule 40, DR 22 (PS 200) and DR 24 (PS 140); with a solid, cellular core or composite wall	ASTM D 2661; ASTM F 628; ASTM F 1488; CSA B181.1
Acrylonitrile butadiene styrene (ABS) plastic pipe in sewer and drain diameters, including SDR 42 (PS 20), PS 35, SDR 35 (PS 45), PS 50, PS 100, PS 140, SDR 23.5 (PS 150) and PS 200; with a solid, cellular core or composite wall	ASTM F 1488; ASTM D 2751
Cast-iron pipe	ASTM A 74; ASTM A 888; CISPI 301
Concrete pipe	ASTM C 14; ASTM C 76; CSA A257.1M; CSA A257.2M
Copper or copper-alloy tubing (Type K or L)	ASTM B 75; ASTM B 88; ASTM B 251
Polyethylene (PE) plastic pipe (SDR-PR)	ASTM F 714
Polypropylene (PP) Plastic Pipe	ASTM F2736; ASTM F2764; CSA B182.13
Polyvinyl chloride (PVC) plastic pipe in IPS diameters, including Schedule 40, DR 22 (PS 200) and DR 24 (PS 140); with a solid, cellular core or composite wall	ASTM D 2665; ASTM F 891; ASTM F 1488
Polyvinyl chloride (PVC) plastic pipe in sewer and drain diameters, including PS 25, SDR 41 (PS 28), PS 35, SDR 35 (PS 46), PS 50, PS 100, SDR 26 (PS 115), PS 140 and PS 200; with a solid, cellular core or composite wall	ASTM F 891; ASTM F 1488; ASTM D 3034; CSA B182.2; CSA B182.4
Polyvinyl chloride (PVC) plastic pipe with a 3.25-inch O.D. and a solid, cellular core or composite wall	ASTM D 2949, ASTM F 1488
Polyvinylidene fluoride (PVDF) plastic pipe	ASTM F 1673; CSA B181.3

Stainless steel drainage systems, Types 304 and 316L	ASME A112.3.1
Vitrified clay pipe	ASTM C 4; ASTM C 700

For SI: 1 inch = 25.4 mm.

703.2 Drainage pipe in filled ground. Where a building sewer or building drain is installed on filled or unstable ground, the drainage pipe shall conform to one of the standards for ABS plastic pipe, cast-iron pipe, copper or copperalloy tubing, ~~or~~ PVC plastic pipe or PP plastic pipe listed in Table 702.3.

Add new text as follows:

705.16 Polypropylene plastic. The joint between polypropylene plastic pipe and fittings shall incorporate an elastomeric seal. The joint shall conform to ASTM D3212. Mechanical joints shall not be installed above ground.

Add new standard(s) as follows:

ASTM F2736-13e1 Standard Specification for 6 to 30 in (152 to 762 mm) Polypropylene (PP) Corrugated Single Wall Pipe And Double Wall Pipe

ASTM F2764/F2764M-11ae2 Standard Specification for 30 to 60 in (750 to 1500 mm) Polypropylene (PP) Triple Wall Pipe and Fittings for Non-Pressure Sanitary Sewer Applications

CSA B181.0-11 Definitions, general requirements, and methods of testing for thermoplastic non-pressure piping

CSA B182.13-11 Profile polypropylene (PP) sewer pipe and fittings for leak-proof sewer applications

Reason: This code change is proposed to incorporate the current ASTM and CSA standards for Polypropylene (PP) sanitary sewer pipe into the IPC code to bring it current with accepted pipe technology. PP pipe is widely used in North America for sanitary sewer trunk lines and has been used in Europe for many years for similar applications. The incorpoation of PP into the IPC will allow sewer authorities following IPC to specify PP pipe in their systems.

Cost Impact: Will not increase the cost of construction
Polypropylene has proven to be a lower cost alternative to many iother sanitary sewer pipe products.

Analysis: A review of the standard proposed for inclusion in the code,ASTM F2736-13e1, ASTM F2764/F2764M-11ae2, CSA B181.0-11 & CSA B182.13-11, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2015.

Table P3002.3

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IPC COMMITTEE. PART II WILL BE HEARD BY THE IRC-PLUMBING COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

Proponent: Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

Part I

2015 International Plumbing Code

Revise as follows:

TABLE 702.4
PIPE FITTINGS

MATERIAL	STANDARD
Polyethylene	ASTM D2683

Part II

2015 International Residential Code

Revise as follows:

TABLE P3002.3
PIPE FITTINGS

PIPE MATERIAL	FITTING STANDARD
Polyethylene	ASTM D2683

(Portions of table not shown remain unchanged)

Reason: PART I: Polyethylene pipe is already in IPC table for Building Sewer Pipe. However, a corresponding entry for pipe fittings of this material was not installed in the fittings table. This created a problem where fittings were needed for this pipe. Fittings could be required for branch piping, lateral connections and cleanouts. Section 717 for Pipe Bursting for sewer replacement was added to the code in the last cycle. That section included the fitting standard ASTM D2683. This standard just needs to be put in Table 702.4 so that fittings for polyethylene pipe included for sewer applications other than pipe bursting sewer applications.
PART II: Polyethylene pipe is already in IRC table for Building Sewer Pipe. However, a corresponding entry for pipe fittings of this material was not installed in the fittings table. This created a problem where fittings were needed for this pipe. Fittings could be required for branch piping, lateral connections and cleanouts. Section P3010 for Pipe Bursting for sewer replacement was added to the code in the last cycle. That section included the fitting standard ASTM D2683. This standard just needs to be put in Table P3002.3 so that fittings for polyethylene pipe included for sewer applications other than pipe bursting sewer applications.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes. This is PMGCAC Item 35.

Cost Impact:

Part I: Will not increase the cost of construction
This proposal will not increase the cost of construction because no additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code.

Part II: Will not increase the cost of construction
This proposal will not increase the cost of construction because no additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code.

P 174-15 : T702.4-SNYDER4060

P 175-15

702.5

Proponent: Mike Cudahy, representing Plastic Pipe and Fittings Association (mikec@cmservnet.com)

2015 International Plumbing Code

Revise as follows:

702.5 Temperature rating. Where the waste water temperature will be greater than 140°F (60°C), the sanitary drainage piping material shall be ~~rated~~ recommended for such service by the pipe and fitting manufacturers for the highest temperature of the waste water.

Reason: Non-pressure DWV piping materials are not "rated" as pressure piping is - rating is a combination temperature and pressure issue.

Cost Impact: Will not increase the cost of construction
This proposal is only modifying and correcting language and does not impact costs. Thus the code with this proposal added will not cause the cost of construction to increase.

P 175-15 : 702.5-CUDAHY4926

P 176-15

703.4

Proponent: Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

2015 International Plumbing Code

Revise as follows:

703.4 Existing building sewers and building drains. ~~Existing~~Where the entire sanitary drainage system of an existing building is replaced, existing building drains under concrete slabs and existing building sewers ~~and drains shall connect with new building sewer and drainage systems only where found by examination and test to conform to~~that will serve the new system shall be internally examined to verify that the piping is sloping in ~~quality~~the correct direction, is not broken, is not obstructed and is sized for the drainage load of ~~material. The code official shall notify~~ the ~~owner~~new plumbing drainage system to ~~make the changes necessary to conform to this code.~~be installed.

Reason: This same proposal was approved for the 2015 IRC. This proposal is to coordinate the IPC with the same allowance.

Consider a few situations that happen to buildings. 1) A slab-on grade building burns down or is wind damaged such that only the remaining slab foundation will be used to re-construct a new building. Re-use of the building drain would be desirable to avoid extensive slab rework. 2) A building is completely razed or the entire plumbing drainage system of a building needs replaced such that only the building sewer remains. Re-use of the building sewer would be desirable to avoid extensive costs and possible complications for replacing the sewer (such as crossing a public street to connect to the public sewer). Why tear out good, serviceable building drains and building sewers for the sake of replacing with new material? The only way to know if existing building drains and existing building sewers are serviceable is to internally examine the piping for problems.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes. This is PMGCAC Item 200.

Cost Impact: Will not increase the cost of construction
This proposal will not increase the cost of construction because no additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code.

P 176-15 : 703.4-SNYDER4061

P 177-15

704.1, Table 704.1

Proponent: Ronald George, Self, representing Self (Ron@Plumb-TechLLC.com)

2015 International Plumbing Code

Revise as follows:

704.1 Slope of horizontal drainage piping. Horizontal drainage piping shall be installed in uniform alignment at uniform slopes. The slope of a horizontal drainage pipe shall be not less than that indicated in Table 704.1 except that where the drainage piping is upstream of a grease interceptor, the slope of the piping shall be twice that indicated in Table 704.1.

TABLE 704.1
SLOPE OF HORIZONTAL DRAINAGE PIPE

SIZE (inches)	MINIMUM SLOPE (inch per foot)
$2^1/_2$ or less	$^1/_4$[a]
3 to 6	$^1/_8$[a]
8 or larger	$^1/_{16}$[a]

For SI: 1 inch = 25.4 mm, 1 inch per foot = 83.33 mm/m.

Notes:

a. Slopes for piping draining to a grease interceptor shall comply with Section 704.1.

Reason: Currently there is no requirement for increased slope for grease laden waste to increase the velocity of the grease laden waste to get it to the interceptor before ot cools and coagulates in the drain line. This concept of increasing the slope of grease laden waste has been discussed in many design books and industry publications and articles for years, but it has not been a code requirement.

Cost Impact: Will not increase the cost of construction
There should be no additional materials required to apply this design.

P 177-15 : 704.1-GEORGE5824

P 178-15

Part I:
704.2
Part II:
P3005.1.6

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IPC COMMITTEE. PART II WILL BE HEARD BY THE IRC-PLUMBING COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

Proponent: Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

Part I

2015 International Plumbing Code

Revise as follows:

704.2 ~~Change~~No reduction in size in the direction of flow. The size of the drainage piping shall not be reduced in ~~size in~~ the direction of the flow. The following shall not be considered a reduction in size in the direction of flow:

1. A 4-inch by 3-inch (102 mm by 76 mm) water closet ~~connection shall~~flange.
2. A water closet bend fitting having a 4-inch (102 mm) inlet and a 3-inch (76 mm) outlet provided that the 4 inch leg of the fitting is upright and below, but not ~~be considered as a reduction in size.~~necessarily directly connected to, the water closet flange.
3. An approved offset closet flange.

Part II

2015 International Residential Code

Revise as follows:

P3005.1.6 ~~Change~~No reduction in size in the direction of flow. The size of the drainage piping shall not be reduced in ~~size in~~ the direction of the flow. The following shall not be considered a reduction in size in the direction of flow:

1. A 4-inch by 3-inch (102 mm by 76 mm) water closet ~~connection shall~~flange.
2. A water closet bend fitting having a 4-inch (102 mm) inlet and a 3-inch (76 mm) outlet provided that the 4 inch leg of the fitting is upright and below, but not ~~be considered as a reduction in size.~~necessarily directly connected to, the water closet flange.
3. An approved offset closet flange.

Reason:

Part I: This section begs for clarification especially since 4 x 3 closet bends (elbows) and offset closet flanges are frequently being used in current day construction. Item 1 is not any change to what was stated before.

Item 2- Four x 3 closet bends were commonly used many decades ago when these bends were made of lead. The item is carefully worded to make the intent clear that the bend is to be installed in the upright orientation (and not horizontally). Also, the wording indicates that the bend is not required to be directly connected to closet flange – there can be a vertical section of pipe between the upright bend and the closet flange.

Item 3-Offset closet flanges have been used for decades. Some jurisdictions are reluctant to allow any offset closet flanges because the code doesn't outright discuss the use offset flanges (nor does it prohibit them). Because some offset closet flanges are especially "restrictive looking", code officials didn't want to start allowing some types and not other types. This section is often cited as the basis for disapproving the use of all offset flanges. However, that doesn't seem completely appropriate as some offset closet flanges comply with the standards indicated for pipe fittings in Table 702.4. For example, the standard ASTM D2665 (for PVC fittings) references the standard ASTM D3311 for the patterns and dimensions of DWV fittings. Table 44 in ASTM D3311 shows two types of offset closet flanges. Thus, a code official denying the use of that particular offset closet flange might not be supported by what the code is allowing by Table 702.4. Therefore, Item 3 is being added to open the door for fittings that are already approved by inclusion in a referenced standard and any other offset closet flange that the code official thinks is acceptable.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes. This is PMGCAC Item 201.

Part II: This section begs for clarification especially since 4 x 3 closet bends (elbows) and offset closet flanges are frequently being used in current day construction. Item 1 is not any change to what was stated before.

Item 2- Four x 3 closet bends were commonly used many decades ago when these bends were made of lead. The item is carefully worded to make the intent clear that the bend is to be installed in the upright orientation (and not horizontally). Also, the wording indicates that the bend is not required to be directly connected to closet flange – there can be a vertical section of pipe between the upright bend and the closet flange.

Item 3-Offset closet flanges have been used for decades. Some jurisdictions are reluctant to allow any offset closet flanges because the code doesn't outright discuss the use offset flanges (nor does it prohibit them). Because some offset closet flanges are especially "restrictive looking", code officials didn't want to start allowing some types and not other types. This section is often cited as the basis for disapproving the use of all offset flanges. However, that doesn't seem completely appropriate as some offset closet flanges comply with the standards indicated for pipe fittings in Table P3002.3. For example, the standard ASTM D2665 (for PVC fittings) references the standard ASTM D3311 for the patterns and dimensions of DWV fittings. Table 44 in ASTM D3311 shows two types of offset closet flanges. Thus, a code official denying the use of that particular offset closet flange might not be supported by what the code is allowing by Table P3002.3. Therefore, Item 3 is being added to open the door for fittings that are already approved by inclusion in a referenced standard and any other offset closet flange that the code official thinks is acceptable.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes. This is PMGCAC Item 201.

Cost Impact:

Part I: Will not increase the cost of construction
This proposal will not increase the cost of construction because no additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code.

Part II: Will not increase the cost of construction

This proposal will not increase the cost of construction because no additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code.

P 178-15 : 704.2-SNYDER4063

P 179-15

705.3, 705.3.1, 705.3.2, 705.3.3, 705.3.4

Proponent: Pennie L Feehan, Copper Development Association, representing Copper Development Association (penniefeehan@me.com)

2015 International Plumbing Code

Delete without substitution:

~~**705.3 Brass.** Joints between brass pipe or fittings shall comply with Sections 705.3.1 through 705.3.4.~~

~~**705.3.1 Brazed joints.** All joint surfaces shall be cleaned. An *approved* flux shall be applied where required. The joint shall be brazed with a filler metal conforming to AWS A5.8.~~

~~**705.3.2 Mechanical joints.** Mechanical joints shall be installed in accordance with the manufacturer's instructions.~~

~~**705.3.3 Threaded joints.** Threads shall conform to ASME B1.20.1. Pipe-joint compound or tape shall be applied on the male threads only.~~

~~**705.3.4 Welded joints.** All joint surfaces shall be cleaned.The joint shall be welded with an *approved* filler metal.~~

Reason: The proposal removes brass because brass is a copper alloy and is covered in Section 706.6 and Secton 705.7.

Cost Impact: Will not increase the cost of construction
This proposal will not increast the cost of construction as this change is only to update the name of a material that is already in the code.

P 179-15 : 705.3-FEEHAN3800

P 180-15

705.16.1, 705.16.2, 705.16.3, 705.19

Proponent: Pennie L Feehan, representing Copper Development Association (penniefeehan@me.com)

2015 International Plumbing Code

Revise as follows:

705.16.1 Copper or copper-alloy pipe or tubing to cast-iron hub pipe. Joints between copper or copper-alloy pipe or tubing and cast-iron hub pipe shall be made with a ~~brass~~ copper or copper-alloy ferrule or compression joint. The copper or copper-alloy pipe or tubing shall be soldered to the ferrule in an *approved* manner, and the ferrule shall be joined to the cast-iron hub by a caulked joint or a mechanical compression joint.

705.16.2 Copper or copper-alloy pipe or tubing to galvanized steel pipe. Joints between copper or copper-alloy pipe or tubing and galvanized steel pipe shall be made with a ~~brass converter fitting~~ copper-alloy or dielectric fitting. The copper tubing shall be soldered to the fitting in an *approved* manner, and the fitting shall be screwed to the threaded pipe.

705.16.3 Cast-iron pipe to galvanized steel ~~or brass pipe~~. Joints between cast-iron and galvanized steel ~~or brass pipe~~ shall be made by either caulked or threaded joints or with an *approved* adapter fitting.

705.19 Soldering bushings. Soldering bushings shall be of ~~red brass~~ copper or copper-alloy and shall be in accordance with Table 705.19.

Reason: This proposal cleans up the section and does not change the intent. Copper-alloy is the term used to identify materials manufactured where copper is the base metal and it includes brass and bronze. The term brass convertor fitting is typical use in fuel gas piping systems.

Cost Impact: Will not increase the cost of construction
This proposal will not increast the cost of construction as this change is only to update the name of a material that is already in the code.

P 180-15 : 705.16.1-FEEHAN3968

P 181-15

Part I:
705.16.1
Part II:
P3003.13.1, P3003.13.2, P3003.13.3

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IPC COMMITTEE. PART II WILL BE HEARD BY THE IRC-PLUMBING COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

Proponent: Pennie L Feehan, representing Copper Development Association (penniefeehan@me.com)

Part I

2015 International Plumbing Code

Revise as follows:

705.16.1 Copper pipe or ~~copper-alloy~~ tubing to cast-iron hub pipe. Joints between copper pipe or ~~copper-alloy~~ tubing and cast-iron hub pipe shall be made with a ~~brass~~ copper-alloy ferrule or compression joint. The copper pipe or ~~copper-alloy~~ tubing shall be soldered to the ferrule in an *approved* manner, and the ferrule shall be joined to the cast-iron hub by a caulked joint or a mechanical compression joint.

Part II

2015 International Residential Code

Revise as follows:

P3003.13.1 Copper pipe or ~~copper-alloy~~ tubing to cast-iron hub pipe. Joints between copper pipe or ~~copper-alloy~~ tubing and cast-iron hub pipe shall be made with a copper-alloy ferrule or compression joint. The copper pipe or ~~copper-alloy~~ tubing shall be soldered to the ferrule in an *approved* manner, and the ferrule shall be joined to the cast-iron hub by a caulked joint or a mechanical compression joint.

P3003.13.2 Copper pipe or ~~copper-alloy~~ tubing to galvanized steel pipe. Joints between copper pipe or ~~copper-alloy~~ tubing and galvanized steel pipe shall be made with a copper-alloy ~~fitting~~ or dielectric fitting. The copper tubing shall be soldered to the fitting in an *approved* manner, and the fitting shall be screwed to the threaded pipe.

P3003.13.3 Cast-iron pipe to galvanized steel or ~~brass~~copper-alloy pipe. *No change to text.*

Reason: This proposal cleans up the section and does not change the intent. Copper alloy is the term used to identify materials manufactured where copper is the base metal and it includes brass and bronze. The term brass convertor fitting is typical use in fuel gas piping systems.

Cost Impact:

Part I: Will not increase the cost of construction
This proposal will not increast the cost of construction as this change is only to update the name of a material that is already in the code.

Part II: Will not increase the cost of construction
This proposal will not increase the cost of construction as this change is only to update the name of a material that is already in the code.

P 181-15 : 705.16.1-FEEHAN3983

P 182-15

705.16.2

Proponent: Pennie L Feehan, representing Copper Development Association (penniefeehan@me.com)

2015 International Plumbing Code

Revise as follows:

705.16.2 Copper or copper-alloy tubing to galvanized steel pipe. Joints between copper pipe or ~~copper-alloy~~ tubing and galvanized steel pipe shall be made with a ~~brass converter fitting~~ copper-alloy or dielectric fitting. The copper tubing shall be soldered to the fitting in an *approved* manner, and the fitting shall be screwed to the threaded pipe.

Reason: Because brass is a copper-alloy the sentence does not make sense. It's telling you to use a brass fitting when you are already using a brass nipple.

Cost Impact: Will not increase the cost of construction
This proposal will not increast the cost of construction as this change is only to update the name of a material that is already in the code.

P 182-15 : 705.16.2-FEEHAN3954

P 183-15

705.16.3

Proponent: Pennie L Feehan, representing Copper Development Association (penniefeehan@me.com)

2015 International Plumbing Code

Revise as follows:

705.16.3 Cast-iron pipe to galvanized steel or ~~brass~~copper-alloy pipe. Joints between cast-iron and galvanized steel or ~~brass~~ copper-alloy pipe shall be made by either caulked or threaded joints or with an *approved* adapter fitting.

Reason: Copper alloy is the term used to identify materials manufactured where copper is the base metal and it includes brass and bronze.

Cost Impact: Will not increase the cost of construction
This proposal will not increase the cost of construction as this change is only to update the name of a material that is already in the code.

P 184-15

Part I:
705.16.4, 707.1, Chapter 14
Part II:
P3003.2, P3003.13.4, Chapter 44

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IPC COMMITTEE. PART II WILL BE HEARD BY THE IRC PLUMBING COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

Proponent: Mike Cudahy, representing Plastic Pipe and Fittings Association (mikec@cmservnet.com)

Part I

2015 International Plumbing Code

Revise as follows:

705.16.4 Plastic pipe or tubing to other piping material. Joints between different types of plastic pipe shall be made with an approved adapter fitting or by a solvent cement joint only where a single joint is made between ABS and PVC pipes at the end of a building drainage pipe and the beginning of a building sewer pipe using a solvent cement complying with ASTM D3138. Joints between plastic pipe and other piping material shall be made with an *approved* adapter fitting. Joints between plastic pipe and cast-iron hub pipe shall be made by a caulked joint or a mechanical compression joint.

707.1 Prohibited joints. The following types of joints and connections shall be prohibited:

1. Cement or concrete joints.
2. Mastic or hot-pour bituminous joints.
3. Joints made with fittings not *approved* for the specific installation.
4. Joints between different diameter pipes made with elastomeric rolling O-rings.
5. Solvent-cement joints between different types of plastic pipe except where provided for in Section 705.16.4.
6. Saddle-type fittings.

Add new standard(s) as follows:
ASTM D3138-04(2011) , Standard Specification for Solvent Cements for Transition Joints Between Acrylonitrile-Butadiene-Styrene (ABS) and Poly(Vinyl Chloride) (PVC) Non-Pressure Piping Component.

Part II

2015 International Residential Code

Revise as follows:

P3003.2 Prohibited joints. Running threads and bands shall not be used in the drainage system. Drainage and vent piping shall not be drilled, tapped, burned or welded.
The following types of joints and connections shall be prohibited:

1. Cement or concrete.
2. Mastic or hot-pour bituminous joints.
3. Joints made with fittings not *approved* for the specific installation.
4. Joints between different diameter pipes made with elastomeric rolling O-rings.
5. Solvent-cement joints between different types of plastic pipe except where provided for in Section P3003.13.4.
6. Saddle-type fittings.

P3003.13.4 Plastic pipe or tubing to other piping material. Joints between different types of plastic pipe shall be made with *approved* adapter fitting or by a solvent cement joint only where a single joint is made between ABS and PVC pipes at the end of a building drainage pipe and the beginning of a building sewer pipe using a solvent cement complying with ASTM D3138. Joints between plastic pipe and other piping material shall be made with an *approved* adapter fitting. Joints between plastic pipe and cast-iron hub pipe shall be made by a caulked joint or a mechanical compression joint.

Add new standard(s) as follows:
ASTM D3138-04(2011) Standard Specification for Solvent Cements for Transition Joints Between Acrylonitrile-Butadiene-Styrene (ABS) and Poly(Vinyl Chloride) (PVC) Non-Pressure Piping Components

Reason: The use of a special transition cement for this single application is widely accepted, both by local authorities having jurisdiction and other national codes when the building sewer and building drainage change from ABS to PVC. This will create a consistent practice in the industry.

Cost Impact:

Part I: Will not increase the cost of construction
This proposal allows for an optional method of joining used elsewhere, but not in this code. The option is not requiring that this method be chosen. Thus the code with this proposal added will not cause the cost of construction to increase.

Part II: Will not increase the cost of construction
This proposal allows for an optional method of joining used elsewhere, but not in this code. The option is not requiring that this method be chosen. Thus the code with this proposal added will not cause the cost of construction to increase.

Analysis:

Part I: A review of the standard proposed for inclusion in the code, ASTM D3138, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2015.

Part II: A review of the standard proposed for inclusion in the code, ASTM D3138, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2015.

Cast iron Long sweep (90 degree bend)	~~X~~Y	~~X~~Y	~~X~~Y
BRANCH FITTING PATTERNS[e]			
Sanitary tee	~~X[c]~~ L[d]	NA	NA
Wye	~~X~~Y	~~X~~Y	~~X~~Y
Combination wye and eighth bend	~~X~~Y	~~X~~Y	~~X~~Y

For SI: ~~1 inch = 25.4 mm.~~ 1 degree = 0.17 radians.

a. ~~The fittings shall only be permitted for a 2-inch or smaller fixture drain.~~ Legend: Y = Acceptable use. NA = Not allowed. L = Limited use; refer to the indicated note.

b. ~~Three inches or larger.~~ For 2-inch (50.8 mm) or smaller sizes, acceptable for piping serving only a single fixture.

c. ~~For a limitation on double sanitary tees, see Section 706.3.~~ Acceptable only for 3-inch or larger size piping.

d. Double pattern is limited in accordance with Section 706.3.

e. Double and single patterns.

706.3 Installation of fittings. Fittings shall be installed to guide sewage and waste in the direction of flow. Change in direction shall be made by fittings installed in accordance with Table 706.3. Change in direction by combination fittings, side inlets or increasers shall be installed in accordance with Table 706.3 based on the pattern of flow created by the fitting. ~~Double~~The branches of double sanitary tee patterns shall not receive the discharge of any of the following:

> ~~**Exception:** Back-to-back water closet connections to double sanitary tees shall be permitted where the horizontal developed length between the outlet of the double sanitary tee pattern is 18 inches (457 mm) or greater.~~

1. back-to-back water closetswhere either water closet is less than 18 inches horizontal developed length from the water closet outlet to the connection to the sanitary tee.
2. ~~and~~ fixtures or appliances with pumping action discharge.
3. drainage stacks discharging to both branches of the tee where the vertical portion of either stack is within 10 pipe diameters horizontally to the sanitary tee.

Reason: The existing table is is primitive, at best, and it is a wonder that more installers haven't made significant mistakes. There even isn't a legend for what X means. First off, putting an "X" in a table cell where something is allowed is just backward to how the rest of the world uses "X"s. This is the reason for changing the "X"s to "Y"s. (The new legend in the note a indicates Y=Acceptable use.)
Next, putting a dash in for where something is "not allowed" doesn't make sense either. Use of "NA" makes more sense. (The new legend in the note a indicates NA=Not Allowed)

Then, having a X with superscript note letters doesn't tell give a quick, clear warning that something (in the notes) needs to be considered. That is why I used "L" to indicate that the use is Limited and to see the specific notes in the table. (The new legend in the note a indicates L=Limited use: see notes)

The headers for BEND PATTERNS and BRANCH FITTING PATTERNS were put in to be helpful in separating the table for better reading. Also, this alloed me to a note on BRANCH FITTING PATTERNS to indicate that this part of the table applies to both single and double patterns. This has always been a hot topic in the plumber and code official worlds as some of each think that this table only applies to single patterns for some types of fittings in some applications. There have been articles written in magazines about this. The added note "e" makes it clear that the table is for both single and double. Note that I have submitted a companion proposal for the issue about double wyes and double combos being used in horizontal drains if this particular part of the proposal causes you concern. Some don't like this practice, some seem to think it is OK to do. I believe my companion proposal will resolve all concerns.

The existing notes were reworded for clarity...no changes in requirements were done.

Changes to Section 706.3 were included with this proposal as I felt that since the table made reference to that section, it should be in this proposal.

I changed how Section 706.3 was laid out for the back-to-back issue because i wanted to include item 3. There have been situations where some plumbers wanted to connect the horizontal pipes from the bases of two stacks, into a double san tee. If those stacks were really close to each other,then the flow from one could shoot across the double san tee and into the pipe coming from the other stack. I think that it is necessary to limit how close the base of a stack can be to these double san tees to avoid presssure fluctuations in the system (and perhaps clogging). The old timers "right way" to make the connection would be to use a double combo....but there could be reasons that someone would want to use the tee (probably a double san tee is cheaper!) . If they do that, they need to be limited.

Cost Impact: Will not increase the cost of construction
This is just a clarification of the table. The additional Item 3 for Section 706.3 is just a limitation that would rarely, if ever apply. There wouldn't be any hardship in labor and materials. The installer would just do the work in a slightly different way, not at any greater cost.

P 188-15 : 706.3-PERRY5791

P 189-15

706.4 (New)

Proponent: Robert Perry, representing Self (BPerry@gmail.com)

2015 International Plumbing Code

Add new text as follows:

706.4 Double pattern fittings in horizontal piping Double wye fittings and double combination-wye-and-eighth-bend fittings shall not be installed in horizontal drain piping except where the barrell of the fitting is installed at a slope of not less than 1/2 inch per foot (4-percent).

Reason: This issue is the source of great aggravation for many installers. Some code officials say NO, you cannot have a double wye or a double combo wye "in the flat". Others, including some APSE engineers say that this is allowed. Mathematically, when the barrel of the fitting is set at a minimum slope, especially slopes such as 1% or less, the slope in the branches is almost nothing. This could lead to stoppages in the lines connecting to the branches. Along with the possibility that the branches might not be set perfectly level with each other, this is precisely why some people refuse to allow this type of fitting "in the flat". But what if the barrel of the fitting is installed with a greater slope such as 8% slope (about 1 inch per foot). The branches would have plenty of slope for proper flow. The issue as to whether to allow or not allow double pattern fittings in horizontal piping has to do with the slope of the barrell of the fitting.
This proposal requires a 4 percent slope (or greater) for that barrell of the fitting. That 1/2 inch per foot slope results in slightly greater than 3/8 inch per foot slope (about 3% slope) in the branches of the fitting. That is enough slope for any size of piping connecting to the branches and has a little leeway to account fot he installer not setting the branches perfectly level. I strongly request that you approve this proposal to end the years of arguments abou this issue. And it doesn't matter to me if the committee wanted to change the slope number to something larger like 3/4 inch per foot slope (about 6% slope) to be safe about what is happening in the branches. Just choose a number and let's move forward.

Cost Impact: Will not increase the cost of construction
This proposal would solidify the allowance to use a single fitting in some applications so there would be a reduction in labor and material costs.

P 189-15 : 706.4 (New)-PERRY5790

P 190-15

Part I:
705.16.4, 707.1, Chapter 14
Part II:

Proponent: Tim Earl, GBH International, representing The Oatey Company (tearl@gbhinternational.com)

Part I

2015 International Plumbing Code

Revise as follows:

705.16.4 Plastic pipe or tubing to other piping material. Joints between different types of plastic pipe or between plastic pipe and other piping material shall be made with an *approved* adapter fitting. Joints between plastic pipe and cast-iron hub pipe shall be made by a caulked joint or a mechanical compression joint.

<u>**Exception:** Where a PVC sewer pipe connects to an ABS building drainage pipe, an adapter fitting shall not be required to be used where a single, solvent cement joint will be used. The solvent cement for the single joint shall be green in color and shall conform to ASTM D3138.</u>

707.1 Prohibited joints. The following types of joints and connections shall be prohibited:

1. Cement or concrete joints.
2. Mastic or hot-pour bituminous joints.
3. Joints made with fittings not *approved* for the specific installation.
4. Joints between different diameter pipes made with elastomeric rolling O-rings.
5. Solvent-cement joints between different types of plastic pipe<u> except where provided for in Section 705.16.4</u>.
6. Saddle-type fittings.

Add new standard(s) as follows:
<u>ASTM D3138 - ??? Standard Specification for Solvent Cements for Transition Joints Between Acrylonitrile-Butadiene-Styrene (ABS) and Poly(Vinyl Chloride) (PVC) Non-Pressure Piping Components</u>

Part II

2015 International Residential Code

Revise as follows:

P3003.13.4 Plastic pipe or tubing to other piping material. Joints between different types of plastic pipe or between plastic pipe and other piping material shall be made with an *approved* adapter fitting. Joints between plastic pipe and cast-iron hub pipe shall be made by a caulked joint or a mechanical compression joint.

<u>**Exception:** Where a PVC sewer pipe connects to an ABS building drainage pipe, an adapter fitting shall not be required to be used where a single, solvent cement joint will be used. The solvent cement for the single joint shall be green in color and shall conform to ASTM D3138.</u>

P3003.2 Prohibited joints. Running threads and bands shall not be used in the drainage system. Drainage and vent piping shall not be drilled, tapped, burned or welded.

The following types of joints and connections shall be prohibited:

1. Cement or concrete.
2. Mastic or hot-pour bituminous joints.
3. Joints made with fittings not *approved* for the specific installation.
4. Joints between different diameter pipes made with elastomeric rolling O-rings.
5. Solvent-cement joints between different types of plastic pipe<u> except as provided for in Section P3003.13.4</u>.
6. Saddle-type fittings.

Add new standard(s) as follows:
<u>ASTM D3138 - 04 (2011) Standard Specification for Solvent Cements for Transition Joints Between Acrylonitrile-Butadiene-Styrene (ABS) and Poly(Vinyl Chloride) (PVC) Non-Pressure Piping Components</u>

Cost Impact:

Part I: Will not increase the cost of construction
This may save as much as $50 per such joint, accounting for labor reduction and no longer needing mechanical joint components.

Part II: Will not increase the cost of construction
This may save as much as $50 per such joint, accounting for labor reduction and no longer needing mechanical joint components.

Analysis:

Part II: A review of the standard proposed for inclusion in the code, ASTM D3138, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2015.

P 190-15 : 707.1-EARL4640

P 191-15

Part I:
708.1.6
Part II:
P3005.2.6

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IPC COMMITTEE. PART II WILL BE HEARD BY THE IRC-PLUMBING COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

Proponent: Pennie L Feehan, representing Copper Development Association (penniefeehan@me.com)

Part I

2015 International Plumbing Code

Revise as follows:

708.1.6 Cleanout plugs. Cleanout plugs shall be of ~~brass~~copper-alloy, plastic or other *approved* materials. Cleanout plugs for borosilicate glass piping systems shall be of borosilicate glass. ~~Brass~~Copper-alloy cleanout plugs shall conform to ASTM A 74 and shall be limited for use only on metallic piping systems. Plastic cleanout plugs shall conform to the referenced standards for plastic pipe fittings, as indicated in Table 702.4. Cleanout plugs shall have a raised square head, a countersunk square head or a countersunk slot head. Where a cleanout plug will have a trim cover screw installed into the plug, the plug shall be manufactured with a blind end threaded hole for such purpose.

Part II

2015 International Residential Code

Revise as follows:

P3005.2.6 Cleanout plugs. Cleanout plugs shall be copper alloy, plastic or other *approved* materials. Cleanout plugs for borosilicate glass piping systems shall be of borosilicate glass. ~~Brass~~ Copper-alloy cleanout plugs shall conform to ASTM A74 and shall be limited for use only on metallic piping systems. Plastic cleanout plugs shall conform to the referenced standards for plastic pipe fittings as indicated in Table P3002.3. Cleanout plugs shall have a raised square head, a countersunk square head or a countersunk slot head. Where a cleanout plug will have a trim cover screw installed into the plug, the plug shall be manufactured with a blind end threaded hole for such purpose.

Reason: This proposal cleans up the section and does not change the intent. There are many different copper and copper-alloy compositions. Copper alloy is the term used to identify materials manufactured where copper is the base metal and it includes brass and bronze.

Cost Impact:

Part I: Will not increase the cost of construction
This proposal will not increast the cost of construction as this change is only to update the name of a material that is already in the code.

Part II: Will not increase the cost of construction
This proposal will not increase the cost of construction as this change is only to update the name of a material that is already in the code.

P 191-15 : 708.1.6-FEEHAN3973

P 192-15

709.3

Proponent: Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

2015 International Plumbing Code

Revise as follows:

709.3 ~~Values for continuous and semicontinuous~~Conversion of gpm flow into dfu values. Where discharges to a waste receptor or to a drainage system are only known in gallons per minute (liters per second) values, the ~~*Drainage*~~*drainage fixture unit* values for ~~continuous and semicontinuous flow into a drainage system~~those flows shall be computed on the basis that 1 gpm (0.06 L/s) of flow is equivalent to two *drainage* fixture units.

Reason: This section is often misunderstood because of the vague and undefined terms "continuous" and "semicontinuous". Also, some have interpreted that this is a conversion factor that works in both directions. It is not and was never intended to be because of the "probability of use" of a fixture that is incorporated in all dfu values. This equivalency is provided as an easy way to convert gallons per minute flows into an approximate dfu value so that the designer of the plumbing system can move forth with the design of the drainage system according to dfu sizing tables.

This wording only clarifies the intent of the existing section and does not add any new requirements.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes. This is PMGCAC Item 34.

Cost Impact: Will not increase the cost of construction
This proposal will not increase the cost of construction because no additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code.

P 192-15 : 709.3-SNYDER4064

P 193-15

709.4

Proponent: Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

2015 International Plumbing Code

Revise as follows:

709.4 Values for indirect waste receptor. The *drainage fixture unit* load of an indirect waste receptor receiving the discharge of indirectly connected fixtures shall be the sum of the *drainage fixture unit* values of the fixtures that discharge to the receptor, but not less than the *drainage fixture unit* value given for the ~~indirect~~ waste receptor in Table 709.1 or 709.2.

Reason: This is a simple cleanup of language for clarity. Although there could be an indirectly connected waste receptor, there is no such thing as an indirect waste receptor. Piping (discharging) to a waste receptor is often called indirect waste piping because the connection to the sanitary drainage system is indirect (through an air gap or air break). This section is not about the special circumstance of the outlet pipe from a waste receptor discharging to another waste receptor. For example, such as a floor drain in a refrigerated food storage room required to discharge to a waste receptor outside of the room.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes. This is PMGCAC Item 202.

Cost Impact: Will not increase the cost of construction
This proposal will not increase the cost of construction because no additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code.

P 193-15 : 709.4-SNYDER4065

P 194-15

Part I:
712.3.2
Part II:
P3007.3.2

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IPC COMMITTEE. PART II WILL BE HEARD BY THE IRC PLUMBING COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

Proponent: Donald Surrena, National Association of Home Builders, representing National Association of Home Builders (dsurrena@nahb.org)

Part I

2015 International Plumbing Code

Revise as follows:

712.3.2 Sump pit. The sump pit shall be not less than 18 inches (457 mm) in diameter and not less than 24 inches (610 mm) in depth, unless otherwise *approved*. The pit shall be accessible and located such that all drainage flows into the pit by gravity. The sump pit shall be constructed of tile, concrete, steel, plastic or other *approved* materials. The pit bottom shall be solid and provide permanent support for the pump. The sump pit shall be fitted with a gastight removable cover that is installed ~~flush with grade or floor level, or above~~<u>not more than 2 inches (51 mm) below</u> grade or floor level. The cover shall be adequate to support anticipated loads in the area of use. The sump pit shall be vented in accordance with Chapter 9.

Part II

2015 International Residential Code

Revise as follows:

P3007.3.2 Sump pit. The sump pit shall be not less than 18 inches (457 mm) in diameter and 24 inches (610 mm) deep, unless otherwise *approved*. The pit shall be accessible and located so that drainage flows into the pit by gravity. The sump pit shall be constructed of tile, concrete, steel, plastic or other *approved* materials. The pit bottom shall be solid and provide permanent support for the pump. The sump pit shall be fitted with a gas-tight removable cover that is installed ~~above grade level or floor level, or~~ not more than 2 inches (51 mm) below grade or floor level. The cover shall be adequate to support anticipated loads in the area of use. The sump pit shall be vented in accordance with Chapter 31.

Reason: The purpose of this code change is to make the IPC consistent with the IRC where the sump cover is installed not more than 2 inches below grade. Currently the cover for sump pits needs to be located at grade or higher leaving little to no flexibility for the design of the finished floor, however by allowing the cover to be not more than 2 inches below grade (as in the IRC) or higher eliminates this problem.

Cost Impact:

Part I: Will not increase the cost of construction
When unable to install cover flush with grade, or to allow for a finished surface, correcting the problem could potentially cost in excess of $200. Therefore, this code change could decrease the cost of construction in certain circumstances.

Part II: Will not increase the cost of construction
There is no change to the requirements of this section. This proposal is for correlation purposes only.

P 194-15 : 712.3.2-SURRENA5014

P 195-15

Part I:
712.3.3
Part II:
P3007.3.3

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IPC COMMITTEE. PART II WILL BE HEARD BY THE IRC-PLUMBING COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

Proponent: Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

Part I

2015 International Plumbing Code

Revise as follows:

712.3.3 Discharge pipe and fittings. Discharge pipe and fittings serving sump pumps and ejectors shall be constructed of materials in accordance with Sections 712.3.3.1 and 712.3.3.2~~ and shall be *approved*~~.

Part II

2015 International Residential Code

Revise as follows:

P3007.3.3 Discharge pipe and fittings. Discharge pipe and fittings serving sump pumps and ejectors shall be constructed of materials in accordance with Sections P3007.3.3.1 and P3007.3.3.2~~ and shall be *approved*~~.

Reason:

Part I: Subsections 712.3.3.1 and 712.3.3.1 provide enough guidance to the designer and installer for proper selection of discharge piping components such that there is not a need for the code official to further approve the selections. Besides, what other criteria would a code official use to grant approval?

> **712.3.3.1 Materials.** Pipe and fitting materials shall be constructed of brass, copper, CPVC, ductile iron, PE, or PVC.
>
> **712.3.3.2 Ratings.** Pipe and fittings shall be rated for the maximum system operating pressure and temperature. Pipe fitting materials shall be compatible with the pipe material. Where pipe and fittings are buried in the earth, they shall be suitable for burial.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes. This is PMGCAC Item 50.

Part II: Subsections P3007.3.3.1and P3007.3.3.2 provide enough guidance to the designer and installer for proper selection of discharge piping components such that there is not a need for the code official to further approve the selections. Besides, what other criteria would a code official use to grant approval?

> **P3007.3.3.1 Materials.** Pipe and fitting materials shall be constructed of copper alloy, copper, CPVC, ductile iron, PE, or PVC.
>
> **P3007.3.3.2 Ratings.** Pipe and fittings shall be rated for the maximum system operating pressure and temperature. Pipe fitting materials shall be compatible with the pipe material. Where pipe and fittings are buried in the earth, they shall be suitable for burial.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. Proponent: Robert Adkins, Prince William County, representing Virginia Plumbing and Mechanical Inspectors Association (radkins@pwcgov.org)

Part I

2015 International Plumbing Code

Revise as follows:

712.4.2 Capacity. A sewage pump or sewage ejector shall have the capacity and head for the application requirements. Pumps or ejectors that receive the discharge of water closets shall be capable of handling spherical solids with a diameter of up to and including 2 inches (51 mm). Other pumps or ejectors shall be capable of handling spherical solids with a diameter of up to and including ~~1~~ ½ inch (~~25~~13 mm). The capacity of a pump or ejector based on the diameter of the discharge pipe shall be not less than that indicated in Table 712.4.2.

Exceptions:

1. Grinder pumps or grinder ejectors that receive the discharge of water closets shall have a discharge opening of not less than 1 -1/4 inches (32 mm).
2. Macerating toilet assemblies that serve single water closets shall have a discharge opening of not less than $^3/_4$ inch (19 mm).

Part II

2015 International Residential Code

Revise as follows:

P3007.6 Capacity. Sewage pumps and sewage ejectors shall have the capacity and head for the application requirements. Pumps and ejectors that receive the discharge of water closets shall be capable of handling spherical solids with a diameter of up to and including 2 inches (51 mm). Other pumps or ejectors shall be capable of handling spherical solids with a diameter of up to and including ~~1 inch (25.4 mm)~~½ inch (13 mm). The minimum capacity of a pump or ejector based on the diameter of the discharge pipe shall be in accordance with Table 3007.6.

Exceptions:

1. Grinder pumps or grinder ejectors that receive the discharge of water closets shall have a discharge opening of not less than $1^1/_4$ inches (32 mm).
2. Macerating toilet assemblies that serve single water closets shall have a discharge opening of not less than $^3/_4$ inch (19 mm).

Reason: Many pumps do not comply with the 1 inch minimum requirement, especially smaller pump systems used for individual fixtures such as pantry sinks, etc. Numerous pumps for these purposes are available with this size discharge.

Cost Impact:

Part I: Will not increase the cost of construction
Allowing a slightly smaller pump will not increase the cost of construction.

Part II: Will not increase the cost of construction
Allowing a slightly smaller pump will not increase the cost of construction.

P 197-15 : 712.4.2-ADKINS3488

P 198-15

Part I:
712.4.2
Part II:
P3007.6

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IPC COMMITTEE. PART II WILL BE HEARD BY THE IRC-PLUMBING COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

Proponent: Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

Part I

2015 International Plumbing Code

Revise as follows:

712.4.2 Capacity. A sewage pump or sewage ejector shall have the capacity and head for the application requirements. Pumps or ejectors that receive the discharge of water closets shall be capable of handling spherical solids with a diameter of up to and including 2 inches (51 mm). Other pumps or ejectors shall be capable of handling spherical solids with a diameter of up to and including **1/2** inch (~~25~~13 mm). The capacity of a pump or ejector based on the diameter of the discharge pipe shall be not less than that indicated in Table 712.4.2.

Exceptions:

1. Grinder pumps or grinder ejectors that receive the discharge of water closets shall have a discharge opening of not less than $1^1/_4$ inches (32 mm).
2. Macerating toilet assemblies that serve single water closets shall have a discharge opening of not less than $^3/_4$ inch (19.1 mm).

Part II

2015 International Residential Code

Revise as follows:

P3007.6 Capacity. Sewage pumps and sewage ejectors shall have the capacity and head for the application requirements. Pumps and ejectors that receive the discharge of water closets shall be capable of handling spherical solids with a diameter of up to and including 2 inches (51 mm). Other pumps or ejectors shall be capable of handling spherical solids with a diameter of up to and including **1/2** inch (~~25.4~~13 mm). The minimum capacity of a pump or ejector based on the diameter of the discharge pipe shall be in accordance with Table 3007.6.

Exceptions:

1. Grinder pumps or grinder ejectors that receive the discharge of water closets shall have a discharge opening of not less than $1^1/_4$ inches (32 mm).
2. Macerating toilet assemblies that serve single water closets shall have a discharge opening of not less than $^3/_4$ inch (19 mm).

Reason: There are smaller pump systems used for individual fixtures such as pantry sinks and bar sinks that are only capable of passing ½ inch solids. These pumps have been successfully used in jurisdictions where these pumps were approved as an alternative method.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. 2015 International Plumbing Code

Add new text as follows:

SECTION 713
FOOD WASTE IN COMMERCIAL FOOD HANDLING ESTABLISHMENTS

713.1 Food waste. In commercial food handling establishments, the disposal of food waste shall be in accordance with Section 713.1.1 or Section 713.1.2.

713.1.1 Food waste disposer. Food waste shall discharge to the sanitary drainage system through a commercial food waste disposer.

713.1.2 Separation of food waste. Food waste shall be separated from sanitary drainage flow. Such food waste shall be put into a trash receptacle, a composting bin, a beneficial reuse bin or a pulper for disposal. Sink strainers and mechanical strainers shall be an *approved* means for separating food waste from drainage flow.

Reason: While this may appear to be an obvious requirement, there are still plumbing systems that have food waste discharged down the drain. The only time food waste should discharge down the drain in a food handling establishment is after it has been first ground up through a commercial food waste disposer.
If a commercial food waste disposer is not provided, the food waste must be disposed of in another manner. The most common method of disposing of food waste is to a trash receptacle. Other options are to compost the food waste, have it sent for beneficial reuse, or dispose of it to a pulper.

This code requirement will help prevent stoppages in the drainage system resulting for large food waste items that do not belong in the piping. Only pulverized food particle are intended to be discharged to the sanitary drainage system.

Cost Impact: Will not increase the cost of construction
The intent of the code is currently to prevent uncontrolled food waste from discharging down the drain. This section merely identifies the options for doing this.

P 199-15 : 713 (New)-BALLANCO3806

P 200-15

713.4

Proponent: John Williams, CBO, Chair, representing Adhoc Health Care Committee (AHC@iccsafe.org)

2015 International Plumbing Code

Revise as follows:

713.4 Vacuum system station. Ready *access* shall be provided to vacuum system station ~~receptacles~~inlets. ~~Such receptacles shall be built into cabinets or recesses and shall be visible.~~

Reason: The proper term is 'inlet', not 'receptacles'. It is a conflict to both require being built into a cabinet and visible. The inlets cannot be recessed because it would be too hard to connect with patient equipment

The ICC Ad Hoc Committee on Healthcare (AHC) has just completed its 4th year. The AHC was established by the ICC Board to evaluate and assess contemporary code issues relating to hospitals and ambulatory healthcare facilities. This is a joint effort between ICC and the American Society for Healthcare Engineering (ASHE), a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. Information on the AHC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the AHC effort can be downloaded from the AHC website at: http://www.iccsafe.org/cs/AHC/Pages/default.aspx.

Cost Impact: Will not increase the cost of construction
This proposal removes a potentially hazardous requirement. There are many more options available, therefore, the cost of construction will not change.

P 200-15 : 713.4-WILLIAMS4253

P 201-15

713.5, 713.6, 713.7, 713.7.1, 713.7.2

Proponent: John Williams, CBO, Chair, representing Adhoc Health Care Committee (AHC@iccsafe.org)

2015 International Plumbing Code

Revise as follows:

713.5 ~~Bottle~~Medical vacuum system. ~~Vacuum (fluid suction)~~ Medical vacuum systems intended for collecting, removing and disposing of blood, ~~pus~~other bodily fluids or ~~other fluids by the bottle system~~waste anesthesia gasses shall ~~provided~~comply with ~~receptacles equipped with an overflow prevention device at each vacuum outlet station.~~NFPA 99.

Delete without substitution:

~~**713.6 Central disposal system equipment.** Central vacuum (fluid suction) systems shall provide continuous service. Systems equipped with collecting or control tanks shall provide for draining and cleaning of the tanks while the system is in operation. In hospitals, the system shall be connected to the emergency power system. The exhausts from a vacuum pump serving a vacuum (fluid suction) system shall discharge separately to open air above the roof.~~

~~**713.7 Central vacuum or disposal systems.** Where the waste from a central vacuum (fluid suction) system of the barometric-lag, collection-tank or bottle-disposal type is connected to the drainage system, the waste shall be directly connected to the sanitary drainage system through a trapped waste.~~

~~**713.7.1 Piping.** The piping of a central vacuum (fluid suction) system shall be of corrosion-resistant material with a smooth interior surface. A *branch* shall be not less than $^1/_2$- inch (12.7 mm) nominal pipe size for one outlet and shall be sized in accordance with the number of vacuum outlets. A main shall be not less than 1-inch (25 mm) nominal pipe size. The pipe sizing shall be increased in accordance with the manufacturer's instructions as stations are increased.~~

~~**713.7.2 Velocity.** The velocity of airflow in a central vacuum (fluid suction) system shall be less than 5,000 feet per minute (25 m/s).~~

Reason: This proposal deletes some of the incomplete requirements in this section and references NFPA 99, which is broadly accepted as the national standard for medical gas and vacuum systems. It is much more appropriate to send the medical vacuum component of the piping system to NFPA 99 for design and installation. This system is covered more completely in 5.1.10 in that standard. As written the requirements in this section are incomplete. NFPA99 is already referenced in Section 1202.1.

The ICC Ad Hoc Committee on Healthcare (AHC) has just completed its 4th year. The AHC was established by the ICC Board to evaluate and assess contemporary code issues relating to hospitals and ambulatory healthcare facilities. This is a joint effort between ICC and the American Society for Healthcare Engineering (ASHE), a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. Information on the AHC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the AHC effort can be downloaded from the AHC website at: http://www.iccsafe.org/cs/AHC/Pages/default.aspx.

Cost Impact: Will not increase the cost of construction
NFPA 99 is referenced in Section 1202.1, therefore, there would be no increase in construction cost.

P 201-15 : 713.5-WILLIAMS4254

P 202-15

715.1, 715.2 (New)
Part II:
P3008.1, P3008.2 (New)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IPC COMMITTEE. PART II WILL BE HEARD BY THE IRC PLUMBING COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

Proponent: Julius Ballanco, JB Engineering and Code Consulting, P.C., representing Mainline Backflow Products (JBENGINEER@aol.com)

Part I

2015 International Plumbing Code

Revise as follows:

715.1 ~~**Sewage backflow.**~~**Where required.** Where plumbing fixtures are installed on a floor with a finished floor elevation below the elevation of the manhole cover of the next upstream manhole in the public *sewer*, such fixtures shall be protected by a backwater valve installed in the *building drain*, or horizontal *branch* serving such fixtures. ~~Plumbing fixtures installed on a floor with a finished floor elevation above the elevation of the manhole cover of the next upstream manhole in the public *sewer* shall not discharge through a backwater valve.~~

> ~~**Exception:** In existing buildings, fixtures above the elevation of the manhole cover of the next upstream manhole in the public *sewer* shall not be prohibited from discharging through a backwater valve.~~

Add new text as follows:

715.2 Allowable installation. Where plumbing fixtures are installed on a floor with a finished floor elevation above the elevation of the manhole cover of the next upstream manhole in the public sewer, and a backwater valve is installed in the building drain or horizontal branch serving such fixtures, the backwater valve shall be of the normally-open type.

> **Exception:** Normally-closed backwater valve installations for existing buildings shall not be prohibited.

Part II

2015 International Residential Code

Revise as follows:

P3008.1 ~~**Sewage backflow.**~~**Where required.** Where the flood level rims of plumbing fixtures are below the elevation of the manhole cover of the next upstream manhole in the public sewer, the fixtures shall be protected by a backwater valve installed in the *building drain*, branch of the *building drain* or horizontal branch serving such fixtures. ~~Plumbing fixtures having flood level rims above the elevation of the manhole cover of the next upstream manhole in the public sewer shall not discharge through a backwater valve.~~

> ~~**Exception:** In existing buildings, fixtures above the elevation of the manhole cover of the next upstream manhole in the *public sewer* shall not be prohibited from discharging through a backwater valve.~~

Add new text as follows:

P3008.2 Allowable installation. Where plumbing fixtures are installed on a floor with a finished floor elevation above the elevation of the manhole cover of the next upstream manhole in the public sewer, and a backwater valve is installed in the building drain or horizontal branch serving such fixtures, the backwater valve shall be of the normally-open type.

> **Exception:** Normally-closed backwater valve installations for existing buildings shall not be prohibited.

Reason:

Part I: This section was originally developed based on the use of what is now classified as "normally closed backwater valve." ASME A112.14.1 has two categories of backwater valves, normally closed backwater valves and normally open backwater valves. A normally open backwater valve allows the free movement of air throughout the drainage system. The connection to the public sewer is based on having a free movement of air from the public sewer through the vent terminal on the roof.
When a normally closed backwater valve is installed for the entire plumbing system, this is not accomplished. However, with a normally open backwater valve, the free movement of air occurs in the sanitary drainage and vent system.

This change merely adds a distinction between the use of a normally closed backwater valve and a normally open backwater valve. The requirements for normally closed backwater valve remain the same. The only change is to revise the title of the section to read, "Where required." Since this is the section that requires backwater valves to be installed, it is most appropriate to entitle the section, "Where required."

The second half of the original section has been split into a new section entitled, "Allowable installation." This is the part of the original code section that placed limitations on using backwater valves for fixtures that are located above the elevation of the manhole cover. The change is to allow the discharge of fixtures located above the elevation of the manhole cover provided that a normally open backwater valve is installed. This is consistent with the intended use of each style of backwater valve.

The wording of the exception was been changed to reflect the revised wording to Section 915.2. However, the requirements of the exception do not change. It still will allow a normally closed backwater valve for an existing building.

Part II: This section was originally developed based on the use of what is now classified as "normally closed backwater valve." ASME A112.14.1 has two categories of backwater valves, normally closed backwater valves and normally open backwater valves. A normally open backwater valve allows the free movement of air throughout the drainage system. The connection to the public sewer is based on having a free movement of air from the public sewer through the vent terminal on the roof.

When a normally closed backwater valve is installed for the entire plumbing system, this is not accomplished. However, with a normally open backwater valve, the free movement of air occurs in the sanitary drainage and vent system.

This change merely adds a distinction between the use of a normally closed backwater valve and a normally open backwater valve. The requirements for normally closed backwater valve remain the same. The only change is to revise the title of the section to read, "Where required." Since this is the section that requires backwater valves to be installed, it is most appropriate to entitle the section, "Where required."

The second half of the original section has been split into a new section entitled, "Allowable installation." This is the part of the original code section that placed limitations on using backwater valves for fixtures that are located above the elevation of the manhole cover. The change is to allow the discharge of fixtures located above the elevation of the manhole cover provided that a normally open backwater valve is installed. This is consistent with the intended use of each style of backwater valve.

The wording of the exception was been changed to reflect the revised wording of Section P3008.2. However, the requirements of the exception do not change. It still will allow a normally closed backwater valve for an existing building.

Cost Impact:

Part I: Will increase the cost of construction
This change provides options for the code user. There is no additional language mandating the use of backwater valves.

Part II: Will not increase the cost of construction
This change provides options for the code user. There is no additional language mandating the use of backwater valves.

P 202-15 : 715.1-BALLANCO3730

P 203-15

Part I:

715.2, 715.3, 715.4, 715.5

Part II:

P3008.2, P3008.5, P3008.3, P3008.4

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IPC COMMITTEE. PART II WILL BE HEARD BY THE IRC PLUMBING COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

Proponent: Julius Ballanco, JB Engineering and Code Consulting, P.C., representing Mainline Backflow Products (JBENGINEER@aol.com)

Part I

2015 International Plumbing Code

Revise as follows:

715.2 Material. ~~Bearing parts of backwater valves shall be of corrosion-resistant material.~~
Backwater valves shall comply with ASME A112.14.1, CSA B181.1 or CSA B181.2.

Delete without substitution:

~~**715.3 Seal.** Backwater valves shall be so constructed as to provide a mechanical seal against backflow.~~

~~**715.4 Diameter.** Backwater valves, when fully opened, shall have a capacity not less than that of the pipes in which they are installed.~~

Revise as follows:

~~**715.5**~~**715.3 Location.** Backwater valves shall be installed so that *access* is provided to the working parts~~ for service and repair~~.

Part II

2015 International Residential Code

Revise as follows:

P3008.2 Material. ~~Bearing parts of backwater valves shall be of corrosion-resistant material.~~
Backwater valves shall comply with ASME A112.14.1, CSA B181.1 or CSA B181.2.

~~**P3008.5**~~**P3008.3 Location.** Backwater valves shall be installed so that access is provided to *the working parts~~ are accessible for service and repair~~*.

Delete without substitution:

~~**P3008.3 Seal.** Backwater valves shall be constructed to provide a mechanical seal against backflow.~~

~~**P3008.4 Diameter.** Backwater valves, when fully opened, shall have a capacity not less than that of the pipes in which they are installed.~~

Reason:

Part I: This change cleans up the language in the section. Backwater valves, like all plumbing products, are required to be third party listed. The listing is to the referenced standard. The reference standard has the requirements that are proposed to be stricken in the section. Furthermore, plumbing inspectors are not checking on the dimensions or working parts of a listed backwater valve.
Paragraph 2.4 of ASME A112.14.1 goes into great detail regarding the material requirements for the backwater valve. Not only are the bearing parts corrosion resistant, the quality of the corrosion resistance is listed. Hence the first sentence in Section 712.2 is unnecessary.

Paragraph 3.2 of the ASME standard specifies water tightness requirements for the backwater valve. Hence, Section 712.3 is unnecessary.

Paragraph 2.1.1 of the ASME standard requires the backwater valve to comply with the opening dimensions of Table 1. The opening dimensions equal the pipe dimensions. Hence, Section P712.4 is unnecessary.

The last section does not require a statement that the access is for service and repair. The language is simply cleaned up to use the term defined in the code

Part II: This change cleans up the language in the section. Backwater valves, like all plumbing products, are required to be third party listed. The listing is to the referenced standard. The reference standard has the requirements that are proposed to be stricken in the section. Furthermore, plumbing inspectors are not checking on the dimensions or working parts of a listed backwater valve.
Paragraph 2.1.1 of ASME A112.14.1 requires the backwater valve to comply with the opening dimensions of Table 1. The opening dimensions equal the pipe dimensions. Hence, Section P3008.4 is unnecessary.

Paragraph 2.4 of the ASME standard goes into great detail regarding the material requirements for the backwater valve. Not only are the bearing parts corrosion resistant, the quality of the corrosion resistance is listed. Hence the first sentence in Section P3008.2 is unnecessary.

Paragraph 3.2 of the ASME standard specifies water tightness requirements for the backwater valve. Hence, Section P3008.3 is unnecessary.

The last section has been cleaned up to identify that the internal moving components are what must be accessible. The movement in the code has been to use the term, "provide access" or "access is provided," as opposed to accessible. The term "accessible" is more associated with requirements for the physically challenged. The sentence would become identical to the wording in the IPC.

Cost Impact:

Part I: Will not increase the cost of construction
There are no changes to the mandatory requirements. This cleans up the requirement with greater reliance on the standard and listing.

Part II: Will not increase the cost of construction
There is no change in the requirements. The proposal cleans up the langauge with reliance on the standard and the listing.

P 203-15 : 715.2-BALLANCO3731

P 204-15

Part I:
717.4, 717.5
Part II:
P3010.4, P3010.5

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IPC COMMITTEE. PART II WILL BE HEARD BY THE IRC PLUMBING COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

Proponent: Mike Cudahy, representing Plastic Pipe and Fittings Association (mikec@cmservnet.com)

Part I

2015 International Plumbing Code

Revise as follows:

717.4 Pipe. The replacement ~~piping~~pipe shall be ~~manufactured with~~made of a high density polyethylene (HDPE) and shall have a standard dimension ratio (SDR) of 17 ~~and~~. The pipe shall be in compliance with ASTM F 714.

717.5 Pipe fittings. Pipe fittings to be connected to the replacement ~~piping~~pipe shall be made of ~~extra-high molecular weight PE3408 material~~high-density polyethylene (HDPE) and shall be ~~manufactured with an SDR of 17 and~~ in compliance with ASTM D 2683.

Part II

2015 International Residential Code

Revise as follows:

P3010.4 Pipe. The replacement pipe shall be made of a high-density polyethylene (HDPE) ~~that conforms to cell classification number PE3608, PE4608 or PE4710 as indicated in ASTM F 714. The pipe fittings~~and shall be ~~manufactured with an SDR of 17 and~~ in compliance with ASTM F 714.

P3010.5 Pipe fittings. Pipe fittings to be connected to the replacement ~~piping~~pipe shall be made of high-density polyethylene (HDPE) ~~that conforms to cell classification number PE3608, PE4608 or PE4710 as indicated in ASTM F 714. The pipe fittings~~and shall be ~~manufactured with an SDR of 17 and~~ in compliance with ASTM D 2683.

Reason: ASTM F714, Standard Specification for Polyethylene (PE) Plastic Pipe (DR-PR) Based on Outside Diameter, only refers to pipe, not fittings. Fittings are not made in SDR's. And calling out resin designation codes is not necessary. This change has a companion change in the IRC to get the requirements to match this language.

Cost Impact:

Part I: Will not increase the cost of construction
None.

Part II: Will not increase the cost of construction
This proposal is modifying language to coordinate with each other in multiple code sections and does not impact costs. Thus the code with this proposal added will not cause the cost of construction to increase."

P 204-15 : 717.4-CUDAHY4648

P 205-15

Part I:

3011 (New), Chapter 44

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IPC COMMITTEE. PART II WILL BE HEARD BY THE IRC-PLUMBING COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

Proponent: Larry Gill, representing IPEX USA LLC (larry.gill@ipexna.com)

Part I

2015 International Plumbing Code

Add new text as follows:

SECTION 718
REPLACEMENT OF UNDERGROUND SEWERS BY PVC FOLD AND FORM METHODS

718.1 General This section shall govern the replacement of existing building sewer piping by PVC fold and form methods.

718.2 Applicability The replacement of building sewer piping by PVC fold and form methods shall be limited to gravity drainage piping of sizes 6 inches (152mm) and smaller. The replacement piping shall be of the same nominal size as the existing piping.

718.3 Pre-installation inspection The existing piping sections to be replaced shall be inspected internally by a recorded video camera survey. The survey shall include notations of the position of cleanouts and the depth of connections to the existing piping.

718.4 Pipe The replacement piping shall be manufactured in compliance with ASTM F1871 or ASTM F1504.

718.5 Installation Pipe complying with ASTM F1504 shall be installed in accordance with ASTM F1947. Pipe complying with ASTM F1871 shall be installed in accordance with ASTM F1867.

718.6 Cleanouts Where the existing building sewer did not have cleanouts meeting the requirements of this code, cleanout fittings shall be installed as required by this code.

718.7 Post-installation inspection The completed replacement piping shall be inspected internally by a recorded video camera survey. The video survey shall be reviewed and approved by the code official prior to pressure testing of the replacement piping system.

718.8 Pressure testing The replacement piping system and the connections to the replacement piping shall be tested in accordance with Section 312.

Add new standard(s) as follows:

ASTM F1871-2011 Standard Specification for Folded/Formed Poly (Vinyl Chloride) Pipe Type A for Existing Sewer and Conduit Rehabilitation

ASTM F1504-2014 Standard Specification for Folded Poly(Vinyl Chloride) (PVC) Pipe for Existing Sewer and Conduit Rehabilitation

ASTM F1947-2010 Standard Practice for Installation of Folded Poly (Vinyl Chloride) (PVC) Pipe into Existing Sewers and Conduits

ASTM F1867-2012 Standard Practice for Installation of Folded/Formed Poly (Vinyl Chloride) (PVC) Pipe Type A for Existing Sewer and Conduit Rehabilitation

Part II

2015 International Residential Code

Add new text as follows:

SECTION 3011
REPLACEMENT OF UNDERGROUND SEWERS BY PVC FOLD AND FORM METHODS

3011.1 General This section shall govern the replacement of existing building sewer piping by PVC Fold and Form methods.

3011.2 Applicability The replacement of building sewer piping by PVC Fold and Form methods shall be limited to gravity drainage piping 6 inches (152MM) and smaller. The replacement piping shall be of the same nominal size as the existing piping.

3011.3 Pre-installation inspection The existing piping sections to be replaced shall be inspected internally by a recorded video camera survey. The survey shall include notations of the position of cleanouts and the depth of connections to the existing piping.

3011.4 Pipe The replacement piping shall be manufactured in complaince with ASTM F1871 or ASTM F1504.

3011.5 Installation Piping complying with ASTM F1504 shall be installed in accordance with ASTM F1947. Piping complying with ASTM F1871 shall be installed in accordance with ASTM F1867.

3011.6 Cleanouts Where the existing building sewer did not have cleanouts meeting the requirements of this code, cleanout fittings shall be installed as required by this code.

3011.7 Post-installation inspection The completed replacement piping shall be inspected internally by a recorded video camera survey. The video survey shall be reviewed and approved by the code official prior to pressure testing of the replacement piping system.

3011.8 Pressure testing The replacement piping system as well as the connections to the replacement piping shall be tested in accordance with Section P2503.4.

Add new standard(s) as follows:

ASTM F1871 - 2011 Standard Specification for Folded/Formed Poly (Vinyl Chloride) Pipe Type A for Existing Sewer and Conduit Rehabilitation

ASTM F1504 - 2014 Standard Specification for Folded Poly(Vinyl Chloride) (PVC) Pipe for Existing Sewer and Conduit Rehabilitation

ASTM F1947 - 2010 Standard Practice for Installation of Folded Poly (Vinyl Chloride) (PVC) Pipe into Existing Sewers and Conduits

ASTM F1867 - 2012 Standard Practice for Installation of Folded/Formed Poly (Vinyl Chloride) (PVC) Pipe Type A for Existing Sewer and Conduit Rehabilitation

Reason: The current IPC includes provisions for replacement of underground sewers by pipe bursting or the installation of new pipe in an open cut trench. This proposal introduces a different method for sewer rehabilitation which is similar to pipe bursting. Fold and form is a method where a PVC pipe is manufactured in a plant to either ASTM F1504 or ASTM F1871. The pipe is heated and collapsed to form a roll for transport to the worksite. Once on site the pipe is heated and pulled into an existing sewer pipe which is in need of rehabilitation. The new pipe is then expanded and installed per ASTM F1947 or ASTM F1867. This proposal also includes sections similar to Section 717 to put the sewer line back in service. This proposal will provide for an alternative to open cut and pipe bursting methods and give owners and municipalities additional means to repair a deteriorating system.

Cost Impact:

Part I: Will not increase the cost of construction
This proposal provides another option for sewer rehabilitation/replacement. It is estimated that pipe bursting and fold and form methods are approximatley 60% of the cost of open cut installation. These methods offer significant savings as well as less impact on the surrounding area.

Part II: Will not increase the cost of construction
No cost impact. It is estimated that pipe bursting and fold and form methods are approximately 60% of the cost of open cut installations. These methods offer significant savings as well as less impact on the surrounding area.

Analysis:

Part II: A review of the standard proposed for inclusion in the code, ASTM F1871-2011, ASTM F1504-2014, ASTM F1947-2010 and ASTM F1867-2012, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2015.

P 205-15 : 718 (New)-GILL4544

P 206-15

802.1

Proponent: Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

2015 International Plumbing Code

Revise as follows:

802.1 Where required. Food-handling equipment, in other than dwelling units, clear-water waste, dishwashing machines and utensils, pots, pans and dishwashing sinks shall discharge through an indirect waste pipe as specified in Sections 802.1.1 through 802.1.8. Health-care related fixtures, devices and equipment shall discharge to the drainage system through an indirect waste pipe by means of an *air gap* in accordance with this chapter and Section 713.3. Fixtures not required ~~by this section~~ to be indirectly connected by this section and the exception of Section 301.6 shall be directly connected to the plumbing system in accordance with Chapter 7.

Reason: The revised language resolves a conflict that has existed in the code for many cycles. The existing section language seemed to require that floor drains at the base of elevator shafts had to be direct connected to the drainage system. However, the exception of Section 301.6 requires that these floor drains must be indirectly connected to the drainage system.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes. This is PMGCAC Item 17.

Cost Impact: Will not increase the cost of construction
This proposal will not increase the cost of construction because no additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code.

P 206-15 : 802.1-SNYDER4068

P 207-15

802.1

Proponent: John Williams, CBO, Chair, representing Adhoc Health Care Committee (AHC@iccsafe.org)

2015 International Plumbing Code

Revise as follows:

802.1 Where required. Food-handling equipment, in other than dwelling units, clear-water waste, dishwashing machines and utensils, pots, pans and dishwashing sinks shall discharge through an indirect waste pipe as specified in Sections 802.1.1 through 802.1.8. ~~Health-care related fixtures, devices and equipment shall discharge to the drainage system through an indirect waste pipe by means of an *air gap* in accordance with this chapter and Section 713.3.~~ Fixtures not required by this section to be indirectly connected shall be directly connected to the plumbing system in accordance with Chapter 7.

Reason: This proposal deletes the requirement that all healthcare related fixtures discharge through an air gap. Flushing rim sinks, which are used for the disposal of solid waste and bedpan cleaning, are healthcare related fixtures and should not have an indirect drain. The term "healthcare related" is too broad, and potentially creates infection control problems.

The ICC Ad Hoc Committee on Healthcare (AHC) has just completed its 4th year. The AHC was established by the ICC Board to evaluate and assess contemporary code issues relating to hospitals and ambulatory healthcare facilities. This is a joint effort between ICC and the American Society for Healthcare Engineering (ASHE), a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. Information on the AHC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the AHC effort can be downloaded from the AHC website at: http://www.iccsafe.org/cs/AHC/Pages/default.aspx.

Cost Impact: Will not increase the cost of construction
This proposal is for clarification, therefore, there will be not increase in the cost of construction.

P 207-15 : 802.1-WILLIAMS4255

P 208-15

202, 422, 713, 802.1

2015 International Plumbing Code

Delete without substitution:

SECTION 202 DEFINITIONS

~~**STERILIZER.**~~

~~**Boiling type.** A boiling-type sterilizer is a fixture of a nonpressure type utilized for boiling instruments, utensils or other equipment for disinfection. These devices are portable or are connected to the plumbing system.~~
~~**Instrument.** A device for the sterilization of various instruments.~~
~~**Pressure (autoclave).** A pressure vessel fixture designed to utilize steam under pressure for sterilizing.~~
~~**Pressure instrument washer sterilizer.** A pressure vessel fixture designed to both wash and sterilize instruments during the operating cycle of the fixture.~~
~~**Utensil.** A device for the sterilization of utensils as utilized in health care services.~~
~~**Water.** A device for sterilizing water and storing water.~~

~~**STERILIZER VENT.**~~

~~A separate pipe or *stack*, indirectly connected to the building drainage system at the lower terminal, that receives the vapors from nonpressure sterilizers, or the exhaust vapors from pressure sterilizers, and conducts the vapors directly to the open air. Also called vapor, steam, atmospheric or exhaust vent.~~

~~**SECTION422 HEALTH CARE FIXTURES AND EQUIPMENT**~~

~~**422.1 Scope.** This section shall govern those aspects of health care plumbing systems that differ from plumbing systems in other structures. Health care plumbing systems shall conform to the requirements of this section in addition to the other requirements of this code. The provisions of this section shall apply to the special devices and equipment installed and maintained in the following *occupancies*: nursing homes, homes for the aged, orphanages, infirmaries, first aid stations, psychiatric facilities, clinics, professional offices of dentists and doctors, mortuaries, educational facilities, surgery, dentistry, research and testing laboratories, establishments manufacturing pharmaceutical drugs and medicines and other structures with similar apparatus and equipment classified as plumbing.~~

~~**422.2 Approval.** All special plumbing fixtures, equipment, devices and apparatus shall be of an *approved* type.~~

~~**422.3 Protection.** All devices, appurtenances, appliances and apparatus intended to serve some special function, such as sterilization, distillation, processing, cooling, or storage of ice or foods, and that connect to either the water supply or drainage system, shall be provided with protection against backflow, flooding, fouling, contamination of the water supply system and stoppage of the drain.~~

~~**422.4 Materials.** Fixtures designed for therapy, special cleansing or disposal of waste materials, combinations of such purposes, or any other special purpose, shall be of smooth, impervious, corrosion-resistant materials and, where subjected to temperatures in excess of 180°F (82°C), shall be capable of withstanding, without damage, higher temperatures.~~

~~**422.5 Access.** *Access* shall be provided to concealed piping in connection with special fixtures where such piping contains steam traps, valves, relief valves, check valves, vacuum breakers or other similar items that require periodic inspection, servicing, maintenance or repair. *Access* shall be provided to concealed piping that requires periodic inspection, maintenance or repair.~~

~~**422.6 Clinical sink.** A clinical sink shall have an integral trap in which the upper portion of a visible trap seal provides a water surface. The fixture shall be designed so as to permit complete removal of the contents by siphonic or blowout action and to reseal the trap. A flushing rim shall provide water to cleanse the interior surface. The fixture shall have the flushing and cleansing characteristics of a water closet.~~

~~**422.7 Prohibited usage of clinical sinks and service sinks.** A clinical sink serving a soiled utility room shall not be considered as a substitute for, or be utilized as, a service sink. A service sink shall not be utilized for the disposal of urine, fecal matter or other human waste.~~

~~**422.8 Ice prohibited in soiled utility room.** Machines for manufacturing ice, or any device for the handling or storage of ice, shall not be located in a soiled utility room.~~

~~**422.9 Sterilizer equipment requirements.** The approval and installation of all sterilizers shall conform to the requirements of the *International Mechanical Code.*~~

~~**422.9.1 Sterilizer piping.** *Access* for the purposes of inspection and maintenance shall be provided to all sterilizer piping and devices necessary for the operation of sterilizers.~~

~~**422.9.2 Steam supply.** Steam supplies to sterilizers, including those connected by pipes from overhead mains or branches, shall be drained to prevent any moisture from reaching the sterilizer. The condensate drainage from the steam supply shall be discharged by gravity.~~

~~**422.9.3 Steam condensate return.** Steam condensate returns from sterilizers shall be a gravity return system.~~

~~**422.9.4 Condensers.** Pressure sterilizers shall be equipped with a means of condensing and cooling the exhaust steam vapors. Nonpressure sterilizers shall be equipped with a device that will automatically control the vapor, confining the vapors within the vessel.~~

~~**422.10 Special elevations.** Control valves, vacuum outlets and devices protruding from a wall of an operating, emergency, recovery, examining or delivery room, or in a corridor or other location where patients are transported on a wheeled stretcher, shall be located at an elevation that prevents bumping the patient or stretcher against the device.~~

~~**SECTION713 HEALTH CARE PLUMBING**~~

~~**713.1 Scope.** This section shall govern those aspects of health care plumbing systems that differ from plumbing systems in other structures. Health care plumbing systems shall conform to this section in addition to the other requirements of this code. The provisions of this section shall apply to the special devices and equipment installed and maintained in the following occupancies: nursing homes; homes for the aged; orphanages; infirmaries; first aid stations; psychiatric facilities; clinics; professional offices of dentists and doctors; mortuaries; educational facilities; surgery, dentistry, research and testing laboratories; establishments manufacturing pharmaceutical drugs and medicines; and other structures with similar apparatus and equipment classified as plumbing.~~

~~**713.2 Bedpan washers and clinical sinks.** Bedpan washers and clinical sinks shall connect to the drainage and vent system in accordance with the requirements for a water closet. Bedpan washers shall also connect to a local vent.~~

~~**713.3 Indirect waste.** Sterilizers, steamers and condensers shall discharge to the drainage through an indirect waste pipe by means of an *air gap.* Where a battery of not more than three sterilizers discharges to an individual receptor, the distance between the receptor and a sterilizer shall not exceed 8 feet (2438 mm). The indirect waste pipe on a bedpan steamer shall be trapped.~~

~~**713.4 Vacuum system station.** Ready *access* shall be provided to vacuum system station receptacles. Such receptacles shall be built into cabinets or recesses and shall be visible.~~

~~**713.5 Bottle system.** Vacuum (fluid suction) systems intended for collecting, removing and disposing of blood, pus or other fluids by the bottle system shall be provided with receptacles equipped with an overflow prevention device at each vacuum outlet station.~~

~~**713.6 Central disposal system equipment.** Central vacuum (fluid suction) systems shall provide continuous service. Systems equipped with collecting or control tanks shall provide for draining and cleaning of the tanks while the system is in operation. In hospitals, the system shall be connected to the emergency power system. The exhausts from a vacuum pump serving a vacuum (fluid suction) system shall discharge separately to open air above the roof.~~

~~**713.7 Central vacuum or disposal systems.** Where the waste from a central vacuum (fluid suction) system of the barometric-lag, collection-tank or bottle-disposal type is connected to the drainage system, the waste shall be directly connected to the sanitary drainage system through a trapped waste.~~

~~**713.7.1 Piping.** The piping of a central vacuum (fluid suction) system shall be of corrosion-resistant material with a smooth interior surface. A *branch* shall be not less than $^{1}/_{2}$- inch (12.7 mm) nominal pipe size for one outlet and shall be sized in accordance with the number of vacuum outlets. A main shall be not less than 1-inch (25 mm) nominal pipe size. The pipe sizing shall be increased in accordance with the manufacturer's instructions as stations are increased.~~

~~**713.7.2 Velocity.** The velocity of airflow in a central vacuum (fluid suction) system shall be less than 5,000 feet per minute (25 m/s).~~

~~**713.8 Vent connections prohibited.** Connections between local vents serving bedpan washers or sterilizer vents serving sterilizing apparatus and normal sanitary plumbing systems are prohibited. Only one type of apparatus shall be served by a local vent.~~

~~**713.9 Local vents and stacks for bedpan washers.** Bedpan washers shall be vented to open air above the roof by means of one or more local vents. The local vent for a bedpan washer shall be not less than a 2-inch-diameter (51 mm) pipe. A local vent serving a single bedpan washer is permitted to drain to the fixture served.~~

~~**713.9.1 Multiple installations.** Where bedpan washers are located above each other on more than one floor, a local vent *stack* is permitted to be installed to receive the local vent on the various floors. Not more than three bedpan washers shall be connected to a 2-inch (51 mm) local vent *stack*, not more than six to a 3-inch (76 mm) local vent *stack* and not more than 12 to a 4-inch (102 mm) local vent *stack*. In multiple installations, the connections between a bedpan washer local vent and a local vent *stack* shall be made with tee or tee-wye sanitary pattern drainage fittings installed in an upright position.~~

~~**713.9.2 Trap required.** The bottom of the local vent stack, except where serving only one bedpan washer, shall be drained by means of a trapped and vented waste connection to the sanitary drainage system. The trap and waste shall be the same size as the local vent *stack*.~~

~~**713.9.3 Trap seal maintenance.** A water supply pipe not less than $^{1}/_{4}$ inch (6.4 mm) in diameter shall be taken from the flush supply of each bedpan washer on the discharge or fixture side of the vacuum breaker, shall be trapped to form not less than a 3-inch (76 mm) water seal and shall be connected to the local vent stack on each floor. The water supply shall be installed so as to provide a supply of water to the local vent stack for cleansing and drain trap seal maintenance each time a bedpan washer is flushed.~~

~~**713.10 Sterilizer vents and stacks.** Multiple installations of pressure and nonpressure sterilizers shall have the vent connections to the sterilizer vent *stack* made by means of inverted wye fittings. *Access* shall be provided to vent connections for the purpose of inspection and maintenance.~~

~~**713.10.1 Drainage.** The connection between sterilizer vent or exhaust openings and the sterilizer vent *stack* shall be designed and installed to drain to the funnel or baskettype waste fitting. In multiple installations, the sterilizer vent *stack* shall be drained separately to the lowest sterilizer funnel or basket-type waste fitting or receptor.~~

~~**713.11 Sterilizer vent stack sizes.** Sterilizer vent *stack* sizes shall comply with Sections 713.11.1 through 713.11.4.~~

~~**713.11.1 Bedpan steamers.** The minimum size of a sterilizer vent serving a bedpan steamer shall be $1^{1}/_{2}$ inches (38 mm) in diameter. Multiple installations shall be sized in accordance with Table 713.11.1.~~

TABLE 713.11.1

~~**STACK SIZES FOR BEDPAN STEAMERS AND BOILING-TYPE STERILIZERS (Number of Connections of Various Sizes Permitted to Various-sized Sterilizer Vent Stacks)**~~

~~For SI: 1 inch = 25.4 mm.~~

~~a. Total of each size.~~

~~b. Combination of sizes.~~

~~**713.11.4 Pressure instrument washer sterilizer sizes.** The diameter of a sterilizer vent stack serving an instrument washer sterilizer shall be not less than 2 inches (51 mm). Not more than two sterilizers shall be installed on a 2-inch (51 mm) *stack*, and not more than four sterilizers shall be installed on a 3-inch (76 mm)~~

Revise as follows:

802.1 Where required. Food-handling equipment, in other than dwelling units, clear-water waste, dishwashing machines and utensils, pots, pans and dishwashing sinks shall discharge through an indirect waste pipe as specified in Sections 802.1.1 through 802.1.8. Health-care related fixtures, devices and equipment shall discharge to the drainage system through an indirect waste pipe by means of an *air gap* in accordance with this chapter~~ and Section 713.3~~. Fixtures not required by this section to be indirectly connected shall be directly connected to the plumbing system in accordance with Chapter 7.

Reason: This proposal deletes a section that provides no practical value to the text. The requirements in this section are too broad to be enforceable; too generic to provide any clear direction; or otherwise covered in the text of this code.

The ICC Ad Hoc Committee on Healthcare (AHC) has just completed its 4th year. The AHC was established by the ICC Board to evaluate and assess contemporary code issues relating to hospitals and ambulatory healthcare facilities. This is a joint effort between ICC and the American Society for Healthcare Engineering (ASHE), a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. Information on the AHC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the AHC effort can be downloaded from the AHC website at: http://www.iccsafe.org/cs/AHC/Pages/default.aspx.

Cost Impact: Will not increase the cost of construction
These items are already addressed in the IPC, therefore, the deletion will not increase the cost of construction.

P 208-15 : 802.1-WILLIAMS4256

P 209-15

802.1.2.1 (New)

Proponent: James Richardson, Jr (jarichardson@columbus.gov)

2015 International Plumbing Code

Add new text as follows:

802.1.2.1 **Optional indirect connections** Waste lines from dental cuspidor bowls, cuspidor fountains, drinking fountains, bar sinks, soda fountains, floor drains and shower drains shall be directly connected to the sanitary drainage system or shall discharge independently through an air break to a waste receptor, standpipe or floor drain that is directly connected to the sanitary drainage system.

Reason: Some fixtures make sense to allow for indirect drainage, especially if it eliminates the need for some type of trap primer device for the fixture receicing the discharge. Allowing these indirect connections will give business owners more flexibility in their design and help lower overall construction costs without impacting public safety.

Cost Impact: Will not increase the cost of construction
This is an option and not a requirement. But if the option is chosen, the costs to install such drains will be reduced.

P 209-15 : 802.1.2.1 (New)-RICHARDSON6022

P 210-15

802.1.2 (New), 802.1.7 (New), 802.1.8

Proponent: James Richardson, Jr (jarichardson@columbus.gov)

2015 International Plumbing Code

Add new text as follows:

802.1.2 **Hand sinks.** Hand sinks in food service areas and in food preparation establishments shall be directly connected to the drainage system or indirectly connected through an air gap to a floor sink that is connected to the drainage system.

802.1.7 **Commercial food waste disposers.** Commercial food waste disposers shall not be indirectly connected to the drainage system. Such disposer connections shall be in accordance with Section 413.3.

Revise as follows:

802.1.8 Food utensils, dishes, pots and pans sinks. Sinks, in other than dwelling units, used for the washing, rinsing or sanitizing of utensils, dishes, pots, pans or service ware used in the preparation, serving or eating of food shall discharge indirectly through an *air gap* ~~or an *air break*~~ to the drainage system.

Reason: For most fixtures in a food service kitchen, it makes sense to allow for indirect connections. This allows for maximum flexibility for kitchen layouts and future changes as floor sinks can capture multiple fixtures if the floor sink sized correctly. Hand sinks are often required by local health departments to be indirect connected so this proposal will align the code with many jurisdication's needs.
Some health departments allow (or acknowledge) that 3-compartment pots-and-pans sinks are sometimes used for thawing of frozen food. These sinks should be treated no differently than any other food prep sink (that does require an air gap at the drain). This is a simple change that will do a lot towards food safety. The code already allows either an air break or an air gap for these siks. Requiring an air gap only just means that the drain pipes will need to terminate above the floor sink and not in the floor sink. A simple change that does not affect the cost of the installation but will be safer considering all the possible uses for 3-compartment sinks. This will promote better sanitary conditions in such establishments and keep in line with requirements by health departments,

The new section for commercial food waste disposer discharge connections is simply a reminder, in an appropriate place in the code, that these discharges cannot go to a floor sink or other type waste receptor. Section 413.3 already covers this, however, many people are missing the direct connection requirement. As these disposers are commonly installed just ahead of the commercial dishwasher (at a plate and-tray scraping station), this new section is located in the code just before the code requiremnt for connection of commercial dishwashers.

Cost Impact: Will not increase the cost of construction
This proposal provides for an option for hand sinks that could save on installation costs. And certainly, future remodeling costs could be lower for kitchen layout changes.

P 210-15 : 802.1.2.2 (New)-RICHARDSON6023

P 211-15

202 (New), 428 (New), 428.1 (New)

Proponent: James Richardson, Jr, representing City of Columbus Ohio (jarichardson@columbus.gov)

2015 International Plumbing Code

Add new definition as follows:

SECTION 202 DEFINITIONS

<u>**SERVICE SINK** Any designated sink so approved for liquid discharge, surface water liquid filling, subsurface water cleaning, and similar liquid wastes, washing in a facility, and installed in a dedicated area or space.</u>

Add new text as follows:

<u>**SECTION 428**</u>
<u>**SERVICE SINKS**</u>

<u>**428.1 Location.** Service sinks shall not be installed in toilet facilities. A service sink shall be located in a space dedicated for the sink such as a janitor's closet that is equipped with a door. Employees in the building or tenant space shall have access to the dedicated space.</u>

Reason: There is no definition of a mops sink or service sink, but yet are required for occupancies for cleaning purposes. Many times designers try to locate these within toielt facilites which allows for improper usage of the fixture and also limits the availability of the fixture when the toilet facility is in use.

Cost Impact: Will not increase the cost of construction
Service sinks are already a required fixture in many occupancies. This proposal simply identifies what those sinks are and where to locate them.

P 211-15 : 802.3-RICHARDSON5695

P 212-15

802.3.3.1 (New)

Proponent: Guy McMann, Jefferson County, Colorado, representing Colorado Association of Plumbing and Mechanical Officials (CAPMO) (gmcmann@jeffco.us)

2015 International Plumbing Code

Add new text as follows:

802.3.3.1 Connection of laundry tray to standpipe. As an alternative for a laundry tray fixture connecting directly to a drainage system, a laundry tray waste line without a fixture trap shall connect to a standpipe for an automatic clothes washer drain. The standpipe shall extend not less than 30 inches (732 mm) above the weir of the standpipe trap and shall extend above the flood level rim of the laundry tray. The outlet of the laundry tray shall not be greater than 30 inches (762 mm) horizontal distance from the side of the standpipe.

Reason: This allowance language has been in the IRC for several code cycles and has been a frequent practice in many jurisdictions for much longer. It has been proven to work well for many years. There is no technical justification to not allow this method for IPC buildings.
Where this method will really be advantageous is in multi-family high-rise construction where the cost savings will be significant *and* the laundry tray providing a buffer against overflow of the ACW standpipe (if the standpipe drain clogs). The laundry tray will fill up with the washer discharge. This is a nice safety feature against water damage for multi-level buildings.

Cost Impact: Will not increase the cost of construction
This proposal will not increase costs and may actually decrease costs by permitting a practice that is recognized in the residential Code. The savings could be realized as not having to install a vent, trap and waste line for a laundry tub.

P 212-15 : 802.3.3.1 (New)-MCMANN3603

P 213-15

804.1, 804

Proponent: Julius Ballanco, JB Engineering and Code Consulting, P.C., representing Self (JBENGINEER@aol.com)

2015 International Plumbing Code

Revise as follows:

~~804.1~~802.2 ~~General~~Material, joints, and connections. The materials, joints, connections, and methods utilized for the construction and installation of indirect waste ~~pipes and~~piping systems shall comply with the applicable provisions of Chapter 7.

Delete without substitution:

~~SECTION 804~~
~~MATERIALS, JOINTS AND CONNECTIONS~~

Reason: Since this requirement only applies to indirect waste systems, it should appear in Section 802, not as a separate section. Section 803 applies to special waste. Nothing in Section 804 applies to special waste. Hence, the appropriate location is Section 802.
The text has been cleaned up to address joints and connections, as well as, materials. The current section does not coordinate with the title of the section.

Cost Impact: Will not increase the cost of construction
There is no increase in the cost of construction when the code is wordsmithed to make it easier to understand.

P 213-15 : 804-BALLANCO3384

P 214-15

804.1, 804.2 (New)

Proponent: Brian Conner, Charlotte Pipe and Foundry, representing Charlotte Pipe and Foundry (bconner@charlottepipe.com)

2015 International Plumbing Code

Revise as follows:

804.1 General. The ~~materials and~~ methods utilized for the construction and installation of indirect waste pipes and systems shall comply with the applicable provisions of Chapter 7.

Add new text as follows:

<u>**804.2** **Special waste pipe, fittings and components.** Pipes ,fittings and components receiving or intended to receive the discharge of any fixture into which acid or corrosive chemicals are placed shall be constructed of CPVC, high silicon iron, PP, PVDF, chemical resistant glass, or glazed ceramic materials.</u>

Reason: Sanitary and chemical drainage are inherently different applications. The purpose of this proposed change is to clarify the allowable materials which are specifically listed for chemical drainage applications.

Cost Impact: Will not increase the cost of construction
This change will not increase the cost of construction as special wastes have alwaus required special piping of one of those types..

Proponent: Julius Ballanco, JB Engineering and Code Consulting, P.C., representing Solar City (JBENGINEER@aol.com)

Part I

2015 International Plumbing Code

Revise as follows:

903.1 ~~Roof extension.~~Vent pipes terminating outdoors. ~~Open vent~~Vent pipes ~~that extend through a roof~~terminating outdoors shall be ~~terminated not less than [**NUMBER**] inches (mm) above~~extended to the outdoors through the roof~~. Where~~ or a ~~roof is to be used for assembly or as a promenade, observation deck, sunbathing deck or similar purposes, open vent pipes shall terminate not less than 7 feet (2134 mm) above~~side wall of the ~~roof~~building in accordance with one of the methods identified in Sections 903.1.1 through 903.1.4.

Add new text as follows:

903.1.1 Roof extension. Open vent pipes that extend through a roof and that do not meet the conditions of Section 902.1.2 or Section 903.1.3 shall terminate not less than [NUMBER] inches (mm) above the roof.

903.1.2 Roof used for recreational uses. Where a roof is to be used for assembly or as a promenade, observation deck, sunbathing deck or similar purposes, open vent pipes shall terminate not less than 7 feet (2134 mm) above the roof.

903.1.3 Roof extension covered. Where an open vent pipe terminates above a sloped roof and is covered by either a roof-mounted panel such as a solar collector or photovoltaic panel mounted over the vent opening, or by a roof element such as an architectural feature or a decorative shroud, the vent pipe shall terminate not less than 2 inches (51 mm) above the roof surface. Such roof elements shall be designed to prevent the adverse effects of snow accumulation and wind on the function of the vent. The placement of a panel over a vent pipe and the design of a roof element covering the vent pipe shall provide for an open area for the vent pipe to the outdoors that is not less than the area of the pipe, as calculated from the inside diameter of the pipe. Such vent terminals shall be protected by a method that prevents birds and rodents from entering or blocking the vent pipe opening.

903.1.4 Side wall vent terminal. Vent terminals extending through the wall shall terminate not closer than 10 feet (3048 mm) from a lot line and not less than 10 feet (3048 mm) above the highest grade elevation within 10 feet (3048 mm) in any direction horizontally of the vent terminal. Vent pipes shall not terminate under the overhang of a structure where the overhang includes soffit vents. Such vent terminals shall be protected by a method that prevents birds and rodents from entering or blocking the vent pipe opening and that does not reduce the open area of the vent pipe.

Delete without substitution:

~~**903.6 Extension through the wall.** Vent terminals extending through the wall shall terminate at a point not less than 10 feet (3048 mm) from a lot line and not less than 10 feet (3048 mm) above average ground level. Vent terminals shall not terminate under the overhang of a structure with soffit vents. Side wall vent terminals shall be protected to prevent birds or rodents from entering or blocking the vent opening.~~

Part II

2015 International Residential Code

Revise as follows:

P3103.1 ~~Roof extension.~~Vent pipes terminating outdoors. ~~Open vent~~Vent pipes ~~that extend through a roof~~terminating outdoors shall be ~~terminated not less than 6 inches (152 mm) above~~extended to the outdoors through the roof or ~~6 inches (152 mm) above~~a side wall of the ~~anticipated snow accumulation, whichever is greater. Where a roof is to be used for assembly, as a promenade, observation deck or sunbathing deck or for similar purposes, open vent pipes shall terminate not less than 7 feet (2134 mm) above~~building in accordance with one of the ~~roof~~methods identified in Sections P3103.1.1 through P3103.1.4.

Add new text as follows:

P3103.1.1 Roof extension. Open vent pipes that extend through a roof and that do not meet the conditions of Section P3101.1.2 or Section P3101.1.3 shall terminate not less than 6 inches (150 mm) above the roof or 6 inches (150 mm) above the anticipated snow accumulation, which ever is greater.

P3101.1.2 Roof used for recreational puposes. Where a roof is to be used for assembly or as a promenade, observation deck, sunbathing deck or similar purposes, open vent pipes shall terminate not less than 7 feet (2134 mm) above the roof.

P3103.1.3 Roof extension covered. Where an open vent pipe terminates above a sloped roof and is covered by either a roof-mounted panel such as a solar collector or photovoltaic panel mounted over the vent opening, or by a roof element such as an architectural feature or a decorative shroud, the vent pipe shall terminate not less than 2 inches (51 mm) above the roof surface. Such roof elements shall be designed to prevent the adverse effects of snow accumulation and wind on the function of the vent. The placement of a panel over a vent pipe and the design of a roof element covering the vent pipe shall provide for an open area for the vent pipe to the outdoors that is not less than the area of the pipe, as calculated from the inside diameter of the pipe. Such vent terminals shall be protected by a method that prevents birds and rodents from entering or blocking the vent pipe opening.

P3103.1.4 Side wall vent terminal. Vent terminals extending through the wall shall terminate not closer than 10 feet (3048 mm) from a lot line and not less than 10 feet (3048 mm) above the highest grade elevation within 10 feet (3048 mm) in any direction horizontally of the vent terminal. Vent pipes shall not terminate under the overhang of a structure where the overhang includes soffit vents. Such vent terminals shall be protected by a method that prevents birds and rodents from entering or blocking the vent pipe opening and that does not reduce the open area of the vent pipe.

Delete without substitution:

~~**P3103.6 Extension through the wall.** Vent terminals extending through the wall shall terminate not less than 10 feet (3048 mm) from the *lot line* and 10 feet (3048 mm) above the highest adjacent *grade* within 10 feet (3048 mm) horizontally of the vent terminal. Vent terminals shall not terminate under the overhang of a structure with soffit vents. Side wall vent terminals shall be protected to prevent birds or rodents from entering or blocking the vent opening.~~

Reason: This proposed change reorganizes the section regarding the vent terminal. There are currently three options for a vent terminal, extending the vent (number) inches or more above the roof, extending the vent more than 7 feet above the roof when the roof is used for entertainment, or extending the vent through the side wall. However, the three requirements are separated between multiple sections. This makes the requirement readily identifiable in a section that presents all the options in one main section.

A fourth option for terminating the vent has been included. The fourth option would allow the vent to terminate 2 inches above a sloped roof when protected by a covering. This would allow photovoltaic solar collectors to be installed over vent terminals. It would also allow other protected vent terminals, such as architectural features that hide the vent for aesthetic purposes.

The size, length, and location of vent terminals has been a subject matter that has been greatly discussed over the last century. There are many myths, innuendoes, theories, and hypothesis regarding vent terminals. One of the most complete papers on vent terminals was published by the National Bureau of Standards (NBS) in 1954, entitled, "Frost Closure of Roof Vents in Plumbing Systems," authored by Nerbert Eaton and Robert Wyly. Most of the current code requirements originate from the recommendations of this paper.

The NBS paper investigated plumbing roof vents and their termination throughout North America. Identified as a major concern is the frost closure of the vent terminal. Other concerns included snow blockage, shearing off of the vent terminal, and rainwater entrance.

Prior to this paper, it was largely alluded that the reason for a minimum size of 1-1/4 inch and a termination above the roof surface was to prevent a bird from building a nest and laying an egg to block off the vent. To this day, birds building nests in vents is a concern. However, that concern is more related to side wall venting that provides an easy opening for a bird to build a nest.

When a vent terminates lower to the roof, measures must be taken to prevent a bird from building a nest around the vent pipe and blocking it off. Increasing the size of the vent is one means used to avoid a bird's nest. Screening and vent covers also are used to prevent birds from building a nest.

The more pressing issue is how far above the roof a vent should terminate. Two issues of importance are water tightness of the flashing and preventing rainwater entrance into the plumbing vent. Modern day flashings can make the roof penetration water tight at much lower heights, including a termination 2 inches above the roof.

The NBS report suggested a minimum of 2 inch penetration above the roof to prevent rainwater from entering the plumbing vent. It is recognized that a flat roof can have a greater accumulation of water hence the need for the vent to be at a higher elevation. Typically secondary roof drains are located between 2 and 4 inches above the roof. Thus, the vent terminal would have to be located at a higher height which is the reason for maintaining a minimum of inserting the appropriate number of inches above the roof for a flat roof.

The NBS report identified a vent terminal used in Saskatoon, Canada that terminates at the sloped roof. There was no extension above the roof. This was found to be extremely effective in preventing frost closure. As the NBS report states, the closer the vent terminates to the roof, the lower the possibility of frost closure. The report also found that by making the vent a minimum of 3 inch in diameter, frost closure that impacts the performance of the venting system was avoided.

Snow accumulation has been a subject of more recent discussions regarding vent terminals. However, snow accumulation was addressed in the NBS report. The NBS report found that while snow may completely cover the vent terminal, the snow eventually melts from the heated vapors emanating out of the vent. Prior to the snow melting, the NBS report found that the snow cover did not impact the performance of the vent. This makes sense since the purpose of the vent is to balance the pressure in the drainage system with atmospheric pressure. The snow cover is not dense enough to prevent the balancing of pressure in the piping system.

The current code requires the vent to terminate at a height specified by the jurisdiction. The Residential Code requires the termination to be 6 inches above the anticipated snow cover. The requirement add the local value remains intact. However, when the vent is covered, such as by a solar panel or architectural feature, it cannot be covered by snow such that the vent doesn't perform properly. Thus, the vent could terminate at a 2 inch height above a sloped roof.

In the mountain west, shearing of the roof vent is a problem when the snow and ice melt and slide off of sloped roofs. By extending the vent higher through the roof, there is a greater force applied on the vent that can result in the pipe being sheared off. If the vent is lowered, the force on the vent during snow and ice slides is also lowered. This may reduce the shearing incidents of vent pipes. However, that is not part of the reason for lowering the vent terminal height. The vent would be protected if installed at a lower height. Hence, the snow and ice slides would have little to no impact on the vent since it is covered.

Plumbing contractors in the mountain west with heavy snow and ice accumulations have found that the more practical solution is to extend the vent through the roof closer to the peak of the roof. Thus, the force from sliding snow and ice is lowered. This has not been addressed in this code change and is more of a regional issue addressed by knowledgeable local contractors.

The remaining issue that is not often addressed for vent terminals is the impact of wind. During windy conditions, the vent terminal can create a reduced pressure zone that siphons the trap seal. This is often called a Venturi effect. The other concern is downdrafts that can increase the pressure in the drainage system. However, downdrafts have not had a major impact on the drainage system based on the termination height above the roof. While the possibility exists that a lower vent termination height could result in higher wind downdrafts, this has not proven to be the case. However, the code requirement addresses downdrafts by requiring the covering to prevent any adverse impact from wind.

What the plumbing profession must acknowledge is that solar is a viable source of energy for a building. As such, accommodations must be made to allow for the maximum area of roof coverage with solar panels. This may require the adjustment in the height of the vent terminal.

While accommodations must be made, there cannot be a sacrifice of public health. The lowering of the vent terminal to 2 inches on a sloped roof will not impact public health. This was proven by the NBS study published in 1954. Furthermore, modern building practices will result in a water tight vent terminal that will perform as intended.

P 216-15

902.3, 903.3, 305.5

Proponent: Tim Earl, GBH International , representing The Oatey Company (tearl@gbhinternational.com)

2015 International Plumbing Code

Delete without substitution:

~~**902.3 Sheet lead.** Sheet lead for vent pipe flashings shall weigh not less than 3 pounds per square foot (15 kg/m^2) for field-constructed flashings and not less than 2 $^1/_2$ pounds per square foot (12 kg/m^2) for prefabricated flashings.~~

Revise as follows:

903.3 Flashings. The juncture of each vent pipe with the roof line shall be made water tight by an *approved* flashing. <u>Flashings shall contain less than 4% lead by weight.</u>

305.5 Waterproofing of openings. Joints at the roof and around vent pipes shall be made water tight by the use of ~~lead,~~ copper, galvanized steel, aluminum, plastic or other *approved* flashings or flashing material. Exterior wall openings shall be made water tight.

Reason: Lead is a material identified as causing birth defects and reproductive harm. It also persists in the environment and is an aquatic toxicant. Now that alternatives exist, its use should be minimized. 4% maximum lead content is logical as non-potable water alloys used in plumbing have that as a limit; meaning that such alloys are commonly available for use. This would also still allow lead coated copper, which is needed in some applications.

Cost Impact: Will not increase the cost of construction
Other flashing options, such as copper or lead coated copper, are no more expensive than lead.

P 216-15 : 903.3-EARL4532

2015 International Plumbing Code

Delete and substitute as follows:

TABLE 909.1
MAXIMUM LENGTH OF FIXTURE DRAIN
FROM FIXTURE TRAP TO VENT CONNECTION[a,b]
(FEET)

Fixture drain pipe size (inches)	Vent connection at a horizontal drain pipe			Vent connection at a vertical drain pipe					
				Sanitary tee fitting fixture drain connection to the vertical drain pipe			Tee-wye fitting fixture drain connection to the vertical drain pipe[c]		
	Slope of fixture drain[d] (inches per foot)			Slope of fixture drain[d] (inches per foot)			Slope of fixture drain[d] (inches per foot)		
	1/8	1/4	1/2	1/8	1/4	1/2	1/8	1/4	1/2
1-1/4	NP	5	2.5	NP	3.5	2	NP	1.5	1
1-1/2	NP	6	3	NP	5	3	NP	4	2
2	NP	8	4	NP	6	4	NP	4.5	4
3	24	12	6	10	8	6	6	6	6
4	32	16	8	12	10	8	8	8	8

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm, 1 inch per foot = 83.3 mm/m.

a. Developed length.

b. NP = Not permitted

c. A tee-wye fitting is also known as a combination-wye-and-eight-bend fitting.

d. Fixture drain shall be at uniform slope.

Delete without substitution:

~~**909.2 Venting of fixture drains.** The total fall in a *fixture drain* due to pipe slope shall not exceed the diameter of the *fixture drain*, nor shall the vent connection to a *fixture drain*, except for water closets, be below the weir of the trap.~~

Reason: When table 909.1 was revised, it only incorporated some of the provision in the report on self siphonage, BMS 126, published in 1951. The report identified that fixture could connect to tee wye fittings. However, the distance from trap to vent is greatly reduced. This change includes the allowance of a connection to a vertical drain through a tee wye.
The other change that is necessary is to address when a pitch greater than ¼ inch per foot is used. The greater the pitch, the shorter the length between the trap and the vent.
This table has been used in the State of Wisconsin for more than 20 years. The distances are consistent with the results of the self siphonage report from the National Bureau of Standards.
Section 909.2 must be deleted to be consistent with the revised table. Otherwise, the connection to a tee wye would not be permitted.

Cost Impact: Will not increase the cost of construction
This will reduce the cost of construction when a vent distance can be extended.

Proponent: Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

Part I

2015 International Plumbing Code

Revise as follows:

911.1 Individual vent as common vent. An individual vent is shall be permitted to vent two traps or ~~trapped~~two fixtures having integral traps as a common vent provided that the installation complies with Section 911.2, 911.3 or 911.4. The traps or trapped fixtures being common vented shall be located on the same floor level.

911.2 ~~Connection at the same level.~~Horizontal common vent. Where ~~the~~two fixture drains ~~being common vented connect~~connect horizontally to a horizontal drain, their connection shall be at the same level~~, the~~ through a double pattern fitting. The vent connection shall be at the interconnection of the fixture drains being common vented or downstream of the interconnection.

~~911.3~~911.4 ~~Connection~~Vertical common vent with connection at different levels. *No change to text.*

Add new text as follows:

911.3 Vertical common vent with connection at the same level. Where the two *fixture drains* being common vented connect horizontally to a vertical drain at the same level, their vent connection shall be through a double pattern fitting. The vent connection shall be at the interconnection of the *fixture drains* being common vented.

Part II

2015 International Residential Code

Revise as follows:

P3107.1 Individual vent as common vent. An individual vent is shall be permitted to vent two traps or ~~trapped~~ two fixtures having integral traps as a common vent provided that the installation complies with Section P3107.2, P3107.2.3 or P3107.2.4. The traps or trapped fixtures being common vented shall be located on the same floor level.

P3107.2 ~~Connection at the same level.~~Horizontal common vent. Where ~~the~~ two*fixture drains* ~~being common vented~~ connect horizontally to a horizontal drain, their vent connection shall be at the same level~~, the~~ through a double pattern fitting. The vent connection shall be at the interconnection of the *fixture drains* being common vented or downstream of the interconnection.

~~P3107.3~~P3107.4 ~~Connection~~Vertical common vent with connection at different levels. Where the *fixture drains* connect at different levels, the vent shall connect as a vertical extension of the vertical drain. The vertical drain pipe connecting the two *fixture drains* shall be considered the vent for the lower *fixture drain*, and shall be sized in accordance with Table P3107.3. The upper fixture shall not be a water closet.

P3107.3 Vertical common vent with connection at the same level. Where the two *fixture drains* being common vented connect horizontally to a vertical drain at the same level, their vent connection shall be through a double pattern fitting. The vent connection shall be at the interconnection of the *fixture drain*s being common vented.

Reason: This proposal does not propose any new requirements but only provides clarification for what is already in the code (but is hard to understand).

Proposed revisions new section 911.3 and revised section 911.4 are the widely used and well known, vertical common vent arrangements that has been used for decades. Section 911.3 was extracted from the existing 911.2 in order to separate out the horizontal common vent application.

The code has allowed horizontal common venting for many decades but the language was not clear enough to be widely understood. The revised language should make the requirements clear.

A minor rewriting to Section P3107.1 provide the conditions under which the individual vent can be a common vent, ties the following sections into it and clarifies what "trapped fixtures" are.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes. This is PMGCAC Item 3.

Cost Impact:

Part I: Will not increase the cost of construction
This proposal will not increase the cost of construction because no additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code.

Part II: Will not increase the cost of construction
This proposal will not increase the cost of construction because no additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code.

Proponent: Julius Ballanco, representing Self (JBENGINEER@aol.com)

Part I

2015 International Plumbing Code

Revise as follows:

915.1 Type of fixtures. A *combination waste and vent system* shall not serve fixtures other than floor drains, sinks, lavatories and drinking fountains. *Combination waste and vent systems* shall not receive the discharge from a ~~food waste disposer or~~ clinical sink.

Part II

2015 International Residential Code

Revise as follows:

P3111.1 Type of fixtures. A combination waste and vent system shall not serve fixtures other than floor drains, sinks and lavatories. ~~A combination waste and vent system shall not receive the discharge of a food waste disposer.~~

Reason: The American Society of Plumbing Engineers Research Foundation completed a study of the impact of food waste disposer on combination waste and vent systems. The study concluded that there was no impact on the venting and that food waste disposer can readily connect to these systems. Based on the technical findings of this research, there is no technical justification for placing a limitation on the discharge of food waste disposers to combination waste and vent systems. The Research Report of the findings has been published and is available for review on the ASPE website, http://aspe.org/sites/default/files/webfm/ASPE%20RF/rf_report_food%20waste.pdf.
The code change that originally added the restriction for food waste disposers identified the pumping action of the reason for restricting food waste disposers. The concern was that the pumping action would result in the siphonic of other traps for fixtures connecting to the system. This was proven to not be the case during the testing.

A combination waste and vent system is a popular venting method for island fixtures. However, the current code language would prohibit a food waste disposer on these kitchen sinks. There is no reason for restricting the use of food waste disposers on these sink.

Cost Impact:

Part I: Will not increase the cost of construction
This will lower the cost of construction by allowing a viable venting method to be used when a kitchen sink has a food waste disposer.

Part II: Will not increase the cost of construction
This will lower the cost of construction by allowing a viable venting method to be used when a kitchen sink has a food waste disposer.

Proponent: Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

Part I

2015 International Plumbing Code

Revise as follows:

915.1 Type of fixtures. A *combination waste and vent system* shall ~~not~~ only serve ~~fixtures other than~~ floor drains, sinks, lavatories and drinking fountains. A *combination waste and vent system* shall be considered to be the vent for those fixtures.The developed length of a *fixture drain* to the *combination waste and vent system* piping shall not exceed the limitations of Table 909.1.*Combination waste and vent systems* shall not receive the discharge from a food waste disposer or clinical sink.

915.2 Installation. The only vertical pipe of a *combination waste and vent system* shall be the connection between ~~the~~a f*ixture drain* and ~~the~~a horizontal combination waste and vent pipe. The length of the vertical ~~distance~~pipe shall not exceed 8 feet (2438 mm).

915.2.1 Slope. The slope of a horizontal combination waste and vent ~~pipe~~piping shall not exceed one-half unit vertical in 12 units horizontal (4-percent slope) and shall not be less than that indicated in Table 704.1.

915.2.2 Size and length. The size of a combination waste and vent ~~pipe~~piping shall be not less than that indicated in Table 915.2.2. The horizontal length of a *combination waste and vent system* shall be unlimited.

915.2.3 ~~Connection~~Vent connection. ~~The~~ A *combination waste and vent system* shall be provided with a dry vent connected at any point within the system or the system shall connect to a horizontal drain or building drain, that serves vented fixtures located on the same floor. *Combination waste and vent systems* connecting to building drains receiving only the discharge from one or more stacks shall be provided with a dry vent. The dry vent ~~connection~~ connected to the combination waste and vent pipe shall extend vertically to a point not less than 6 inches (152 mm) above the flood level rim of the highest fixture being vented by the *combination waste and vent system* before ~~offsetting horizontally.~~ horizontal offsets in the dry vent piping are allowed.

915.2.4 Vent size. The dry vent connected to the *combination waste and vent system* shall be sized for the total *drainage fixture* unit load in accordance with Section 906.2.

Delete without substitution:

~~**915.2.5 Fixture branch or drain.** The *fixture branch* or *fixture drain* shall connect to the combination waste and vent within a distance specified in Table 909.1. The combination waste and vent pipe shall be considered the vent for the fixture.~~

Add new text as follows:

915.1.1 Single fixture systems. A horizontal *fixture drain* shall be considered to be a c*ombination waste and vent system* provided that the *fixture drain* size complies with Table 915.2.2.

Part II

2015 International Residential Code

Revise as follows:

P3111.1 Type of fixtures. A combination waste and vent system shall ~~not~~only serve ~~fixtures other than~~ floor drains, sinks, lavatories and ~~lavatories~~drinking fountains. A combination waste and vent system shall be considered to be the vent for those fixtures. The developed length of a fixture drain to the combination waste and vent system piping shall not exceed the limitations of Table P3105.1. Combination waste and vent systems shall not receive the discharge ~~of~~from a food waste disposer.

Add new text as follows:

P3111.1.1 Single fixture systems. A horizontal fixture drain shall be considered to be a combination waste and vent system provided that the fixture drain size complies with P3105.1.

Revise as follows:

P3111.2 Installation. The only vertical pipe of a combination waste and vent system shall be the connection between ~~the~~a fixture drain and ~~the~~a horizontal combination waste and vent pipe. The lenght of the vertical ~~distance~~pipe shall be not greater than 8 feet (2438 mm).

P3111.2.1 Slope. The slope of a horizontal combination waste and vent ~~pipe~~piping shall ~~have a slope of~~be not greater than $^{1}/_{2}$ unit vertical in 12 units horizontal (4-percent slope)~~. The minimum slope~~ and shall not be less than that indicated in ~~accordance with~~ Section ~~P3005.3~~P3005.2.

P3111.2.2 ~~Connection~~Vent connection. ~~The~~A combination waste and vent system shall be provided with a dry vent connected at any point within the system or the system shall connect to a horizontal drain or building drain, that serves vented fixtures located on the same floor. Combination waste and vent systems connecting to*building drains* receiving only the discharge from one or more stacks shall be provided with a dry vent. The dry vent ~~connection~~connected to the combination waste and vent pipe shall extend vertically to a point not less than 6 inches (152 mm) above the flood level rim of the highest fixture being vented by the combination waste and vent system before ~~offsetting horizontally.~~horizontal offsets in the dry vent piping are allowed.

P3111.2.3 Vent size. The dry vent connected to the combination waste and vent system shall be sized for the total drainage fixture unit load in accordance with Section ~~P3113.1~~P3111.1.

Delete without substitution:

~~**P3111.2.4 Fixture branch or drain.** The fixture branch or *fixture drain* shall connect to the combination waste and vent within a distance specified in Table P3105.1. The combination waste and vent pipe shall be considered the vent for the fixture.~~

Revise as follows:

P3111.3 Size and length. The size of a combination drain and vent ~~pipe~~piping shall be not less than that specified in Table 3111.3. The horizontal length of a combination drain and vent system shall be unlimited.

Reason: PART I: The primary reason for this proposal is to add new Section 915.1.1 to cover the very special situation of a single fixture combination waste and vent system.

Consider a 2 inch floor drain which by definition has a 2 inch trap. Where the floor drain is an emergency floor drain, Table 709.1 indicates that the dfu value is zero. Where the floor drain is not emergency floor drain, Table 709.1 indicates that the dfu value is 2. Where the floor drain is intended to receive only clear-water waste from certain types of equipment, Section 709.4.1 (through note h of Table 709.1), the dfu value is 1/2. For this example, consider that the floor drain is a 2 dfu value. Now review Table 915.2.2 and determine that a 2 inch combination waste and vent pipe can accommodate up to 3 dfu. Therefore, the 2 inch pipe from the trap of the 2 inch floor drain can be its own combination waste and vent system.

However, this is not readily apparent from existing language especially when reading existing Section 915.2.5. That section seems to indicate that the length of a fixture drain to its vent connection is always limited by the trap-to-vent distances in Table 909.1. The piping from any fixture trap to the vent connection is limited in length so that the vent connection is not below the trap weir (see Section 909.1). Table 909.1 reflects the maximum length of the fixture drain at the indicated slopes so Section 909.1 is not violated. But where the fixture drain is "oversized" according to the requirements for a combination waste and vent system, then the limit on fixture drain length for these single fixture applications is meaningless. The fixture trap cannot siphon because the pipe is oversized for the intended dfu going into the drain.

For a better flow of requirements, Section 915.2.5 was merged into Section 915.1. This was important in order to move the requirement for meeting Table 909.1 before new Section 915.1.1 to make that new section make sense.

Several minor changes were made to other sections including changing pipe to piping. Pipe implies a section of pipe without fittings. A combination waste and vent system can have horizontal bends. Some have misinterpreted that "pipe" meant that a CWV system only was allowed as a "straight run" system.

Another small but important change is in 915.2. Here, pipe really does mean pipe as in a straight run of pipe in vertical direction. Adding words to the last sentence will hopefully reinforce that it is not just the distance of 8 feet but a vertical pipe not longer than 8 feet. Note the definition for VERTICAL PIPE in chapter 2. A vertical pipe could have vertical offsets and still be considered vertical.

PART II: The primary reason for this proposal is to add new Section 915.1.1 to cover the very special situation of a single fixture combination waste and vent system.

Consider a 2 inch floor drain which by definition has a 2 inch trap. Where the floor drain is an emergency floor drain, Table P3004.1 indicates that the dfu value is zero. Where the floor drain is not emergency floor drain, note b indicates the dfu unit value is the summation of dfu discharging to the floor drain. For this example, consider that the floor drain is a 2 dfu value. Now review Table P3111.3 and determine that a 2 inch combination waste and vent pipe can accommodate up to 3 dfu. Therefore, the 2 inch pipe from the trap of the 2 inch floor drain can be its own combination waste and vent system.

However, this is not readily apparent from existing language especially when reading existing Section P3111.2.4. That section seems to indicate that the length of a fixture drain to its vent connection is always limited by the trap-to-vent distances in Table P3105.1. The piping from any fixture trap to the vent connection is limited in length so that the vent connection is not below the trap weir (see Section P3105.2). Table P3105.1reflects the maximum length of the fixture drain at the indicated slopes so Section P3105.2 is not violated. But where the fixture drain is "oversized" according to the requirements for a combination waste and vent system, then the limit on fixture drain length for these single fixture applications is meaningless. The fixture trap cannot siphon because the pipe is oversized for the intended dfu going into the drain.

For a better flow of requirements, Section P3111.2.4 was merged into Section P3111.1. This was important in order to move the requirement for meeting Table P3105.1 before new Section P3111.1 to make that new section make sense.

Several minor changes were made to other sections including changing pipe to piping. Pipe implies a section of pipe without fittings. A combination waste and vent system can have horizontal bends. Some have misinterpreted that "pipe" meant that a CWV system only was allowed as a "straight run" system.

Another small but important change is in P3111.2. Here, pipe really does mean pipe as in a straight run of pipe in vertical direction. Adding words to the last sentence will hopefully reinforce that it is not just the distance of 8 feet but a vertical pipe not longer than 8 feet. Note the definition for VERTICAL PIPE in chapter 2. A vertical pipe could have vertical offsets and still be considered vertical.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes. This is PMGCAC Item 18.

Cost Impact:

Part I: Will not increase the cost of construction
This proposal will not increase the cost of construction because no additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code.

Part II: Will not increase the cost of construction
This proposal will not increase the cost of construction because no additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code.

P 221-15 : 915.1-SNYDER4071

P 222-15

915.2.3

Proponent: James Richardson, Jr, representing City of Columbus Ohio (jarichardson@columbus.gov)

2015 International Plumbing Code

Revise as follows:

915.2.3 Connection. The *combination waste and vent system* shall be provided with a dry vent connected at any point within the system or the system shall connect to a horizontal drain that serves vented fixtures located on the same floor. *Combination waste and vent systems* connecting to building drains and branches of building drains receiving ~~only~~ the discharge from one or more stacks shall be provided with a dry vent. The vent connection to the combination waste and vent pipe shall extend vertically to a point not less than 6 inches (152 mm) above the flood level rim of the highest fixture being vented before offsetting horizontally.

Reason: Discharge from stacks causes the biggest pressure fluxuation in a plumbing system, especially for combination drain and vent systems which have no method for relieving positive pressures. In larger municipalities, many sewer systems maintain positive pressure which further compounds issues for combination drain and vent systems. Additionally, a combination drain and vent system connected to building drain (not a branch drain) currently requires no dry vent connection to the "system", in the event of a blockage in the building drain, upon the release of the blockage the traps attached to the CD&V system will lose their trap seal due to the subsequent negative pressure since there is no dry vent connection to balance the pressure within the system.

Cost Impact: Will not increase the cost of construction
This doesn't change the design of these systems but just clarifies where the systems can be installed.

P 222-15 : 915.2.3-RICHARDSON5325

P 223-15

915.2.3

Proponent: James Richardson, Jr (jarichardson@columbus.gov)

2015 International Plumbing Code

Revise as follows:

915.2.3 Connection. The *combination waste and vent system* shall be provided with a dry vent connected at any point within the system or the system shall connect to a horizontal drain that serves vented fixtures located on the same floor. *Combination waste and vent systems* connecting to building drains receiving ~~only~~ the discharge from one or more stacks shall be provided with a dry vent. The vent connection to the combination waste and vent pipe shall extend vertically to a point not less than 6 inches (152 mm) above the flood level rim of the highest fixture being vented before offsetting horizontally.

Reason: Building drains receive higher flows than other horizontal drains in a building. Depending on a single vented fixture far away from the building drain to provide venting air for a CWV system connected to a building drain that has stacks (possibly many stacks) discharging to the building drain just isn't a safe thing to do. There could be a CWV system for floor drains in a rarely occupied basement of a commercial building where numerous stacks come down into the building drain. A vent on a service sink somewhere in the corner of a large basement area is simply going to be too far away to provide sufficient venting air, through a nearly flooded building drain (at times), for connected CWV systems. These CWV systems need dedicated vents to prevent blowback of waste out of the connected floor drains. As you might imagine, blowback out of the floor drains could leave the trap seals open to allow sewer gases into the unhabited basement. These gases could be picked up air handlers or worse, become concentrated enough to explode with a spark from nearby switchgear.
The concept currently allowed by this code section might be workable for a home plumbing system but for a commerical building system, it just isn't smart design.

Cost Impact: Will not increase the cost of construction
This doesn't change the design of these systems but just clarifies where the systems can be installed.

P 223-15 : 915.2.3-RICHARDSON6025

P 224-15

Part I:
918.1
Part II:
P3114.1

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IPC COMMITTEE. PART II WILL BE HEARD BY THE IRC-PLUMBING COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

Proponent: Tim Earl, GBH International, representing The Oatey Company (tearl@gbhinternational.com)

Part I

2015 International Plumbing Code

Revise as follows:

918.1 General. Vent systems utilizing air admittance valves shall comply with this section. Stack-type air admittance valves shall conform to ASSE 1050. Individual and branchtype air admittance valves shall conform to ASSE 1051. Both types of air admittance valves shall have a membrane constructed of silicone rubber.

Part II

2015 International Residential Code

Revise as follows:

P3114.1 General. Vent systems using *air admittance valves* shall comply with this section. Individual and branch-type air admittance valves shall conform to ASSE 1051. Stack-type air admittance valves shall conform to ASSE 1050. Both types of air admittance valves shall have a membrane constructed of silicone rubber.

Reason: Silicone rubber is much more resistant to deformation and degradation from temperature change and humidity than other commonly used rubber diaphragm materials, as shown through accelerated aging and TGA analysis. This provides a higher degree of longevity and more importantly, a higher factor of safety to building occupants, as AAV diaphragm failure is less likely to occur with silicone. Diaphragm failure can lead to gas intrusion into the structure. Note that we are pursuing changes to the referenced ASSE standards as well, however these are not complete in time for this code cycle and we feel that waiting three more years is counter to ensuring a higher degree of confidence in the performance of these products. Once the standard is altered, we would support removing the code language being proposed. This is also consistent with a proposed change to the IRC.
The attached data from moisture exposure test shows that silicone demonstrates less swelling than other commonly used rubber diaphragm materials.

Moisture exposure data

The photo shows a deformed EPDM diaphragm after long-term exposure to humidity, heat, and sewer gas.

EPDM diaphragm after long-term exposure to humidity, heat, and sewer gas

Cost Impact:

Part I: Will not increase the cost of construction
This will have no impact on cost, as silicone is no more expensive than other commonly used rubber diaphragm materials.

Part II: Will not increase the cost of construction
This will have no impact on cost, as silicone is no more expensive than other commonly used rubber diaphragm materials.

P 224-15 : 918.1-EARL4546

P 225-15

918.3.1

Proponent: James Richardson, Jr, representing City of Columbus Ohio (jarichardson@columbus.gov)

2015 International Plumbing Code

Revise as follows:

918.3.1 Horizontal branches. Individual and branch-type air admittance valves shall vent only fixtures that are on the same floor level and connect to a *horizontal branch drain*. Where the horizontal *branch* is located more than four branch intervals from the top of the stack, <u>or where the AAV is connected to a single fixture drain, </u>the horizontal *branch*<u> *or horizontal fixture drain*</u>shall be provided with a relief vent that shall connect to a vent stack or stack vent, or extend outdoors to the open air. The relief vent shall connect to the *horizontal branch drain* between the stack and the most downstream *fixture drain* connected to the *horizontal branch drain*. The relief vent shall be sized in accordance with Section 906.2 and installed in accordance with Section 905. The relief vent shall be permitted to serve as the vent for other fixtures.

Reason: 918.3.1 references individual and branch type AAVs connecting to a horizontal branch drain. The definition of a horizontal branch drain is: A drainage branch pipe extending laterally from a soil or waste stack or the building drain, with or without verticle sections or branches, that receives the discharge from two or more fixture drains or branches and conducts the discharge to the soil or waste stack or to the building drain. Based off of the definitions and the previous wording in the code section, it would appear the intent is for there to be some way to relieve positive pressures since the AAV can only relieve negative pressures. Without taking into consideration positive pressure, a contractor could connect two sinks off of a building drain on the same drainage lateral, creating a horizontal branch drain, and vent the fixtures with only an AAV. In doing so, positive pressures created by stack discharge could affect the operation of the fixtures and AAVs, or positive pressures in the sewer system could affect the AAVs.

Cost Impact: Will increase the cost of construction
There will be minimal addtional cost to provide the relief vent for a single fixture or a pair of fixtures.

P 225-15 : 918.3.1-RICHARDSON5685

P 226-15

Part I:
918.8
Part II:
P3114.8

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IPC COMMITTEE. PART II WILL BE HEARD BY THE IRC-PLUMBING COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

Proponent: Guy McMann, representing Colorado Association of Plumbing and Mechanical Officials (CAPMO) (gmcmann@jeffco.us)

Part I

2015 International Plumbing Code

Revise as follows:

918.8 Prohibited installations. Air admittance valves shall not be installed in nonneutralized special waste systems as described in Chapter 8 except where such valves are in compliance with ASSE 1049, are constructed of materials *approved* in accordance with Section 702.5 and are tested for chemical resistance in accordance with ASTM F 1412. Air admittance valves shall not be located in spaces utilized as supply or return air plenums. Air admittance valves without an engineered design shall not be utilized to vent sumps or tanks of any type. Air admittance valves shall not be installed on outdoor vent terminals for the sole purpose of reducing clearances to gravity air intakes or mechanical air intakes.

Part II

2015 International Residential Code

Revise as follows:

P3114.8 Prohibited installations. *Air admittance valves* shall not be used to vent sumps or tanks except where the vent system for the sump or tank has been designed by an engineer. Air admittance valves shall not be installed on outdoor vent terminals for the sole purpose of reducing clearances to gravity or mechanical air intakes.

Reason:

Part I: This type of installation is not consistent with the intent of use of AAVs. These are still mechanical devices with a shelf life and are subject to failure even if the correct AAV for outdoor use is installed. Failures will result in sewer gas making its way into building openings. The correct remedy is to move or raise the vent.

Part II: This type of installation is not consistent with the intended use of AAVs. These are still mechanical devices with a shelf life and are subject to failure even if the correct AAV for outdoor use is installed. Failures will result in sewer gas making its way into building openings. The correct remedy is to move or raise the vent.

Cost Impact:

Part I: Will not increase the cost of construction
There is no additional cost that would normally occur to correct a non-code compliant installation. This proposal attempts to circumvent the installation of a product against its' intended use as air admittance valves are a mechanical devices that will eventually fail.

Part II: Will not increase the cost of construction
There is no additional cost that would normally occur to correct a non-code compliant installation. This proposal attempts to circumvent the installation of a product against its' intended use as air admittance valves are a mechanical devices that will eventually fail.

P 226-15 : 918.8-MCMANN3592

P 227-15

918.8

Proponent: Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

2015 International Plumbing Code

Revise as follows:

918.8 Prohibited installations. Air admittance valves shall not be installed in nonneutralized special waste systems as described in Chapter 8 except where such valves are in compliance with ASSE 1049, are constructed of materials *approved* in accordance with Section 702.5 and are tested for chemical resistance in accordance with ASTM F 1412. Air admittance valves shall not be located in spaces utilized as supply or return air plenums. Air admittance valves ~~without an engineered design~~ shall not be ~~utilized~~used to vent sumps or tanks ~~of any type.~~except where the vent system for the sump or tank has been designed by an engineer.

Reason: The IRC already has this correction/clarification made in the last cycle and this proposal is for coordination with that IRC change.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes. This is PMGCAC Item 150.

Cost Impact: Will not increase the cost of construction
This proposal will not increase the cost of construction because additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code.

P 227-15 : 918.8-SNYDER4076

P 228-15

Part I:
918.8

P3114.8

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IPC COMMITTEE. PART II WILL BE HEARD BY THE IRC-PLUMBING COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

Proponent: Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

Part I

2015 International Plumbing Code

Revise as follows:

918.8 Prohibited installations. Air admittance valves shall not be installed in nonneutralized special waste systems as described in Chapter 8 except where such valves are in compliance with ASSE 1049, are constructed of materials *approved* in accordance with Section 702.5 and are tested for chemical resistance in accordance with ASTM F 1412. Air admittance valves shall not be located in spaces utilized as supply or return air plenums. Air admittance valves without an engineered design shall not be utilized to vent sumps or tanks of any type. <u>Air admittance valves shall not be connected to waste piping where a slip joint connection is downstream of the air admittance valve connection.</u>

Part II

2015 International Residential Code

Revise as follows:

P3114.8 Prohibited installations. *Air admittance valves* shall not be used to vent sumps or tanks except where the vent system for the sump or tank has been designed by an engineer. <u>Air admittance valves shall not be connected to waste piping where a slip joint connection is downstream of the air admittance valve connection.</u>

Reason: This proposal is not an attempt to limit the use of Air Admittance Valves (AAVs) in any way. AAVs have been in the code for many code cycles and are understood to be a viable venting method where used in accordance with the provisions of the code. This proposal is attempting to prevent an "unintended consequence" of a specific arrangement of AAV installation. Consider the following (extremely common) application for an AAV: A lavatory in a toilet facility or bathroom. A quite common venting method used is the horizontal wet venting method where the vent for the lavatory serves as the venting for the water closets and bathtub/shower in the toilet facility or bathroom. An AAV can be used for the lavatory vent. There is not a problem with use of an AAV in this situation. However, where the AAV is part of a tubular waste assembly (with the AAV downstream of the trap and a slip joint downstream of the AAV connection), there is a possibility that the trap will be replaced with a non-AAV trap and no one will be the wiser. Unfortunately, this will leave the bathroom group without a vent.

It is just too easy for this type of AAV arrangement to be replaced. In a public toilet facility, vandalism can occur where trim and fixtures must be replaced. This type of AAV trap can "disappear" in the process as they are somewhat of a specialty item and certainly have a higher cost than a standard trap. Allowing AAV's into the code came with the code requirements intent that the presence of these devices would be apparent (review Sections 918.4 through 918.8). For example, where located in an attic, an AAV has to be above the insulation. Where stack type AAV's are used they have to be located 6 inches above the flood level rim of the served fixtures. Although AAV's can be concealed, the must be provided with access. In other words, you have to be able to see that there is a location for installation of the AAV. Removal of an AAV trap with a slip joint connection downstream doesn't leave any evidence that an AAV was there or was supposed to be there.

Again, this is not to say that a AAV cannot be used for venting a lavatory. To comply with the proposed limitation, the installer simply has to "hard pipe" for the AAV. In that manner, there is a fixed connection for the AAV that is not easily removable in the future

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes. This is PMGCAC Item 2.

Cost Impact:

Part I: Will increase the cost of construction
This proposal will increase the cost of construction because additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code. Specifically, there will be a few more pipe fittings and a slightly more labor required at set out (fixture installation) to facilitate the "hard piped" AAV connection. Because the AAV was already going to be used, there is no extra cost for an AAV.

Part II: Will increase the cost of construction
This proposal will increase the cost of construction because additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code. Specifically, there will be a few more pipe fittings and a slightly more labor required at set out (fixture installation) to facilitate the "hard piped" AAV connection. Because the AAV was already going to be used, there is no extra cost for an AAV.

P 228-15 : 918.8-SNYDER4077

P 229-15

1002.3 (New), 405.8, 706.2, 708.1.5, 901.2.1, 904.1, 1002.1, 1002.3, Chapter 14

Proponent: Angel Guzman Rodriguez, representing American Society of Mechanical Engineers

2015 International Plumbing Code

Add new text as follows:

1002.3 Inline sanitary waste valves Inline sanitary waste valves shall comply with ASME A112.18.8. The valves shall be installed only on fixture outlets having 1-1/4 inch (31.8mm) or 1-1/2 inch (38.1 mm) outside diameter tubular waste piping. Valves conveying the waste from a food waste disposer shall be installed only in a vertical orientation. The valves shall not be installed on the outlet of a urinal. The valves shall be installed in a vertical orientation or a horizontal orientation. Where installed in a horizontal orientation, the valve body shall be oriented with the ribs on the exterior of the valve body located on the bottom of the valve. The valves shall be provided with *access.*

Revise as follows:

405.8 Slip joint connections. Slip joints shall be made with an *approved* elastomeric gasket and shall only be installed on ~~the~~a trap outlet, a trap inlet~~ and~~, within the trap seal, and on the inlet and outlet of an inline sanitary waste valve. Fixtures with concealed slip-joint connections shall be provided with an *access* panel or utility space not less than 12 inches (305 mm) in its smallest dimension or other *approved* arrangement so as to provide *access* to the slip joint connections for inspection and repair.

706.2 Obstructions. The fittings shall not have ledges, shoulders or reductions capable of retarding or obstructing flow in the piping. Threaded drainage pipe fittings shall be of the recessed drainage type. This section shall not be applicable to tubular waste fittings used to convey vertical flow upstream of the trap seal liquid level of a fixture trap or upstream of an inline sanitary waste valve complying with Section 1002.3.

708.1.5 Cleanout size. Cleanouts shall be the same size as the piping served by the cleanout, except that cleanouts for piping larger than 4 inches (102 mm) need not be larger than 4 inches (102 mm).

Exceptions:

1. A removable P-trap with slip or ground joint connections can serve as a cleanout for drain piping that is one size larger than the P-trap size.
2. Where serving as a cleanout, a removable inline sanitary waste valve shall comply with Section 1002.3 and the drain piping served shall be not greater than one size larger than the size of such valve.
3. Cleanouts located on *stacks* can be one size smaller than the *stack* size.
4. The size of cleanouts for cast-iron piping can be in accordance with the referenced standards for cast-iron fittings as indicated in Table 702.4.

901.2.1 Venting required. Traps and trapped fixtures shall be vented in accordance with one of the venting methods specified in this chapter. Inline sanitary waste valves in accordance with Section 1002.3 shall not be required to be vented.

904.1 Required vent extension. The vent system serving each *building drain* shall have not less than one vent pipe that extends to the outdoors. Sanitary drainage systems that do not have traps and have only inline sanitary waste valves in accordance with Section 1002.3 shall be provided with at least one vent.

1002.1 ~~Fixture traps.~~Trap or inline sanitary waste valve required for each fixture. Each plumbing fixture shall be ~~separately trapped by~~independently discharge to a ~~liquid-seal trap,~~*trap* or an inline sanitary waste valve in accordance with Section 1002.3 except as otherwise permitted by this code. The vertical distance from the fixture outlet to the trap weir shall not exceed 24 inches (610 mm), and the horizontal distance shall not exceed 30 inches (610 mm) measured from the centerline of the fixture outlet to the centerline of the inlet of the trap. The height of a clothes washer standpipe above a trap shall conform to Section 802.4. A fixture shall not be double trapped.

Exceptions:

1. This section shall not apply to fixtures with integral traps.
2. A combination plumbing fixture is permitted to be installed on one trap, provided that one compartment is not more than 6 inches (152 mm) deeper than the other compartment and the waste outlets are not more than 30 inches (762 mm) apart.
3. A grease interceptor intended to serve as a fixture trap in accordance with the manufacturer's installation instructions shall be permitted to serve as the trap for a single fixture or a combination sink of not more than three compartments where the vertical distance from the fixture outlet to the inlet of the interceptor does not exceed 30 inches (762 mm) and the *developed length* of the waste pipe from the most upstream fixture outlet to the inlet of the interceptor does not exceed 60 inches (1524 mm).
4. Floor drains in multilevel parking structures that discharge to a building storm *sewer* shall not be required to be individually trapped. Where floor drains in multilevel parking structures are required to discharge to a combined *building sewer* system, the floor drains shall not be required to be individually trapped provided that they are connected to a main trap in accordance with Section 1103.1.

1002.3 Prohibited traps. The following types of traps are prohibited:

1. Traps that depend on moving parts to maintain the seal.
2. Bell traps.
3. Crown-vented traps.
4. Traps not integral with a fixture and that depend on interior partitions for the seal, except those traps constructed of an *approved* material that is resistant to corrosion and degradation.
5. "S" traps.
6. Drum traps.

   Exception: Drum traps used as solids interceptors and drum traps serving chemical waste systems shall not be prohibited.

For the purposes of this section, inline sanitary waste valves complying with ASME A112.18.8 shall not considered as a prohibited trap.

Add new standard(s) as follows:

ASME A112.18.8–2009 (R2014) In-Line Sanitary Waste Valves for Plumbing Drainage

Reason: Inline sanitary waste valves serve the same function as a liquid seal traps. The valve design has been tested and proven to maintain a gas tight seal when used in the application where a trap would be used. These valves have been mainly used in manufactured homes where the valve location is in areas that are small and there is limited space. The performance requirements for these valves are mentioned within the ASME A112.18.8 standard which includes a gas-tight seal test. This is an ANSI approved standard.
Section 1002.3 is the main section of interest of this proposal and provides the requirements and limitations for installation of the valves. All other sections of the code have been carefully revised to accomodate this type of device within the structure of the code.

A similar proposal was submitted by abother proponent to the IRC-P&M Committee in 2013 (Group B of 2012/2013/2014 code development cycle) and was approved by the Committee. However, the proposal was not approved at Final Action.

RP149-13

Committee Action: Approved as Submitted

Committee Reason: This proposal provides another option for a p-trap where conditions are not favorable for installation of a p-trap.

Assembly Action: None

Cost Impact: Will not increase the cost of construction
The use of in-line sanitary waste valves will not affect cost of construction. These waste valves are already being used and this code change will only require that the valves comply with the standard.

Analysis: A review of the standard proposed for inclusion in the code, ASME A112.18.8–2009 (R2014), with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2015.

P 230-15

1003.3

Proponent: Ken Loucks, representing Schier Products Company (ken.loucks@schierproducts.com)

2015 International Plumbing Code

Revise as follows:

1003.3 Grease interceptors. Grease interceptors shall comply with the requirements of Sections 1003.3.1 through ~~1003.3.5~~1003.3.7.

Reason: The 2015 language failed to include all of the relevent sections for grease interceptors in the requirements for grease interceptors under 1003.3 since it currently only requires interceptors to meet sections up to 1003.3.5 (leaving out 1003.3.6 and 1003.3.7). This has the effect of exempting gravity grease interceptors from requirements that should pertain to all grease interceptors without exception. Also, 1003.3.7 specifically requires grease interceptors to be directly connected to the sanitary drainage system, however this is confusing since this section is not mandated for compliance in 1003.3.

Cost Impact: Will not increase the cost of construction
There is no cost impact, since this only clarifies requirements already in the code but which are confusing as is.

P 230-15 : 1003.3-LOUCKS3822

P 231-15

413.1, 413.3, 1003.3.1

Proponent: Julius Ballanco, JB Engineering and Code Consulting, P.C., representing InSinkErator (JBENGINEER@aol.com)

2015 International Plumbing Code

Revise as follows:

413.1 Approval. Domestic food waste disposers shall conform to ASSE 1008. Domestic and commercial food waste disposers shall be listed and labeled in accordance with UL 430. Food waste disposers shall not increase the *drainage fixture unit* load on the sanitary drainage system.

413.3 Commercial food waste disposer waste outlets. Commercial food waste disposers shall be connected to a drain not less than $1^1/_2$ inches (38 mm) in diameter. Commercial food waste disposers shall be directly connected and trapped separately from any other fixtures or sink compartments.

1003.3.1 Grease interceptors and automatic grease removal devices required. A grease interceptor or automatic grease removal device shall be required to receive the drainage from fixtures and equipment with greaseladen waste located in food preparation areas, such as in restaurants, hotel kitchens, hospitals, school kitchens, bars, factory cafeterias and clubs. Fixtures and equipment shall include pot sinks, prerinse sinks; soup kettles or similar devices; wok stations; floor drains or sinks into which kettles are drained; automatic hood wash units and dishwashers without prerinse sinks. Commercial food waste disposers shall not be required to discharge to a grease interceptor or to an automatic grease removal device. Grease interceptors and automatic grease removal devices shall receive waste only from fixtures and equipment that allow fats, oils or grease to be discharged. Where lack of space or other constraints prevent the installation or replacement of a grease interceptor, one or more grease interceptors shall be permitted to be installed on or above the floor and upstream of an existing grease interceptor.

Reason: This change merely clarifies the requirements for commercial food waste disposers. Chapter 3 already requires food waste disposers to be listed and labeled. When UL 430 was added during the last code change cycle, it was only added as a reference to domestic food waste disposers. However, the standard also regulates commercial food waste disposers.
Food waste disposers are required to connect directly to the drainage system. There have been incidents whereby there was a misinterpretation of Chapter 8 and food waste disposers were required to discharge indirectly to the drainage system because they are located in a food handling establishment. By adding the word "directly" there will not be such misinterpretation.

Finally, there have been occasions where there has been a misinterpretation of Section 1003.3.1, whereby health inspectors required grease interceptors to discharge through a grease interceptor. By adding a sentence to this section, it clarifies that this is not required by this section. The added sentence could also be converted to an exception.

Cost Impact: Will not increase the cost of construction
This proposal adds clarity to the code. There is no change that impacts cost of installation.

P 231-15 : 1003.3.1-BALLANCO3808

P 232-15

1003.3.1

Proponent: Ken Loucks, Schier Products Company, representing Schier Products Company (ken.loucks@schierproducts.com)

2015 International Plumbing Code

Revise as follows:

1003.3.1 Grease interceptors and automatic grease removal devices required. ~~A~~One or more grease ~~interceptor~~interceptors or automatic grease removal ~~device~~devices shall be ~~required~~provided to receive the drainage containing fats, oils or grease from kitchen fixtures and food preparation equipment. Such fixtures and equipment ~~with greaseladen waste~~shall include pot sinks, prerinse sinks, soup kettles or similar devices, wok stations, floor drains, floor sinks, automatic hood wash units and dishwashers that are located in the food preparation areas~~,~~ of food-handling establishments such as ~~in~~ restaurants, hotel kitchens, hospitals, school kitchens, bars, factory cafeterias and clubs~~. Fixtures and equipment shall include pot sinks, prerinse sinks; soup kettles or similar devices; wok stations; floor drains or sinks into which kettles are drained; automatic hood wash units and dishwashers without prerinse sinks. Grease interceptors and automatic grease removal devices shall receive waste only from fixtures and equipment that allow fats, oils or grease to be discharged~~. Where lack of space or other constraints prevent the installation or replacement of a grease interceptor, one or more grease interceptors shall be permitted to be installed on or above the floor and upstream of an existing grease interceptor.

Reason: The current plumbing code and its interpretation does not provide adequate control of Fats, Oils, and Greases (FOG) from food service establishments (restaurants, delis, and commercial kitchens). FOG in the wastewater collection system causes blockages, increases utility costs and disrupts wastewater treatment plants[1].

The phrase, "A grease interceptor or automatic grease removal device shall be required to receive the drainagefrom fixtures and equipment with greaseladen waste..." is too ambiguous. Many people are not sure whether a fixture carries greaseladen waste and in many cases fixtures that are now know to carry at least some greaseladen waste routinely do not get routed to a grease interceptor. This leads to unanticipated bypass in violation of EPA mandates and NPDES requirements.

The presence of a prerinse sink should not preclude a dishwasher from being routed to an interceptor since the use of the prerinse sink is not a guarantee that food scraps and greasy residue will be removed from dishware prior to entering the dishwasher.

This proposal amends the 2015 IPC by mandating that all fixtures and equipment in food preparation areas be routed to an interceptor in support of federally mandated FOG abatement requirements[2].

Bibliography:
1. EPA Report to Congress, 833-R-04-001, US EPA, 2004, pages ES-1 through ES-4, 4-27 and 4-28

2. Fact Sheet National Pretreatment Program Controlling Fats, Oils, and Grease Discharges from Food Service Establishments, 40 CFR 403,US EPA, 2012, pages 1 through 5

http://www.epa.gov/npdes/pubs/pretreatment_foodservice_fs.pdf

Cost Impact: Will not increase the cost of construction
It is not possible to quantify actual costs because it is dependent on the specifics of a particular application, such as building type/size, design variables, construction methods and materials, however the associated costs for post construction changes to a grease interceptor system that fails to meet pretreatment compliance requirements can cost tens of thousands of dollars. These changes should not impact state agencies, units of local government, or the public either since building codes division's and local building departments already enforce the requirements of the plumbing code.

P 232-15 : 1003.3.1-LOUCKS3296

P 233-15

1003.3.2

Proponent: Julius Ballanco, JB Engineering and Code Consulting, P.C., representing InSinkErator (JBENGINEER@aol.com)

2015 International Plumbing Code

Revise as follows:

1003.3.2 Food waste disposers restriction. ~~Where~~A food waste ~~disposers connect to grease interceptors, a solids interceptor shall separate the discharge before connecting to the grease interceptor. Solids interceptors and grease interceptors shall be sized and rated for the discharge of the food waste disposers. Emulsifiers, chemicals, enzymes and bacteria~~disposer shall not discharge ~~into the food waste disposer.~~to a grease interceptor.

Reason: It has been well established that food waste from a disposer must not discharge through a grease interceptor. If food waste passes through a grease interceptor, it greatly reduces the efficiency of the interceptor. Food waste decomposition in a grease interceptor will dramatically increase the oxygen consumption. The food waste will also drop the pH, increase corrosion, and increase the hydrogen sulfide production. The only means of preventing this occurrence is to not have the food waste disposer discharge to the grease interceptor.
Using a solids interceptor before a grease interceptor is not a viable solution. The solids interceptor will continually fill up with food waste requiring maintenance. In a food handling establishment, this maintenance could be hourly.

A food waste disposer must discharge directly to the sanitary drainage system. This code change will result in such a requirement.

Cost Impact: Will not increase the cost of construction
This identifies a limitation on the discharge of food waste disposers through grease interceptor. By properly connecting the food waste disposer, the cost will be less because of material savings.

P 233-15 : 1003.3.2-BALLANCO3807

P 234-15

1003.3.2, 1003.3.3 (New)

Proponent: JEFFREY HUTCHER, cleanblu, representing Cleanblu (jhutcher@pacbell.net)

2015 International Plumbing Code

Revise as follows:

1003.3.2 Food waste disposers. Where food waste disposers connect to grease interceptors, a solids interceptor shall separate the discharge before connecting to the grease interceptor. Solids interceptors and grease interceptors shall be sized and rated for the discharge of the food waste disposers. ~~Emulsifiers, chemicals, enzymes and bacteria shall not discharge into the food waste disposer.~~

Add new text as follows:

<u>**1003.3.3** **Additives to grease interceptors.** Dispensing systems that dispense interceptor performance additives to grease interceptors shall not be installed except where such systems dispense microbes for the enhancement of aerobic bio remediation of grease and other organic material, or for inhibiting growth of pathogenic organisms by anaerobic methods. Such microbial dispensing systems shall be installed only where the grease interceptor manufacturer's instructions allow such systems and the systems conform to ASME A112.14.6. Systems that discharge emulsifiers, chemicals or enzymes to grease interceptors shall be prohibited.</u>

Reason: Section 1003.3.2 is outdated and ignores the advances of new technology. To include bacteria in the prohibition is not only ignoring science, it is akin to prohibiting electricity as an energy solution. bioremediation is the sole mechanism of ALL waste water treatment plants and natures way to handle waste. Enzymes and microbes are not the same. Enzymes are dead strings of protein that disperse grease and is a common additive in dish soap. Microbes are lifeforms that eat and digest waste. Microbes can be blended (not altered) to feed on grease, sulfur, while inhibiting the growth of pathogens and other harmful organisms. Waste water treatment depends on microbes and and would simply cease to function without them ; So would the human body. Yeast are microbes too. It makes our bread rise, they give us beer, wine and cheese. They are not additives. It's impossible not to have microbes in any establishment. Using Microbes in point source pollution control is enchancing already naturally occuring bacteria and introducing them to their food source. Just like yeast, the by-products are Carbon Dioxide and water. Systems designed to use aerobic Microbes are now listed and meet ASME A112.4.6, using the rigorous EPA test protocol 1664. There is no reason to exclude them in point source pollution control. Exclusion of microbial treatment would be irresponsible, unnatural and dangerous to human and animal health.

Cost Impact: Will not increase the cost of construction
The microbe dispensing systems are optional and therefore, there is no additional cost of material or labor. The new section simply allows these optional systems to be installed as long as they comply with the requirements indicated by the section.

P 234-15 : 1003.3.2-HUTCHER4455

P 235-15

1003.4.2.1

Proponent: James Richardson, Jr (jarichardson@columbus.gov)

2015 International Plumbing Code

Revise as follows:

1003.4.2.1 General design requirements. Oil separators shall have a depth of not less than 2 feet (610 mm) below the invert of the discharge drain. The outlet opening of the separator shall have not less than an ~~18inch~~18-inch (457 mm) water seal. Oil separators shall be provided with a local vent that extends, undiminished in size, to the outdoors. The local vent shall be independent from the venting system of a sanitary drainage system. Plumbing fixtures discharging to the oil separator and requiring a vent for the fixture trap, shall have the vent for the trap connected to the local vent or the vent for the trap shall extend to the outdoors, independent from the venting system of a sanitary drainage system. The termination of such vents shall be in accordance with Section 903.

Reason: General design requirements - Oil separators have always been designed with a local vent stack to allow for toxic and flammable vapors to be vented to a safe place and were always kept independent of the sanitary system. Since there is no requirement in the code for the local vent stack, many design professionals have not been designing these systems with the local vent stack. Without the requirement that it remain independent from the sanitary venting system, they are also designing systems interconnected allowing for the transfer of the toxic or flammable vapor to be transferred to the public sewer system, especially in larger systems where there can exists high positive pressures and high negative pressures.

Cost Impact: Will increase the cost of construction
As a separate vent piping system for oil separators and the fixtures connected to the oil separators must be installed, there will be a moderate cost for materials and labor for these venting systems to be installed. Knowledgable contractors have already be installing these separate venting systems so, as there will be only some contrators that will be asking for an upcharge to install these oil separator systems. The other contractors have been doing it correctly and charging appropriately all along.

P 235-15 : 1003.4.2.1-RICHARDSON6024

P 236-15

Table 1102.4, Chapter 14

Proponent: Shawn Coombs, Advanced Drainage Systems, Inc., representing Advanced Drainage Systems, Inc. (shawn.coombs@ads-pipe.com)

2015 International Plumbing Code

Revise as follows:

TABLE 1102.4
BUILDING STORM SEWER PIPE

MATERIAL	STANDARD
Polypropylene (PP) Pipe	CSA B182.13

(Portions of table not shown remain unchanged)

Add new standard(s) as follows:
CSA B182.13-2011 Profile Polypropylene (Pp) Sewer Pipe And Fittings For Leak-Proof Sewer Applications

Reason: This code change is proposed because there is currently an CSA Standard Specification for this pipe material. PP pipe has been used in gravity flow storm sewer applications (both watertight and soil tight) in Europe for over 25 years and is now being manufactured in the United States. AASHTO has approved the material under AASHTO Specification M330. The American Society Testing Materials (ASTM) has also approved PP pipe per ASTM F2881-11. The acceptance of the proposed change will enable manufacturers with products that meet the requirements of the ASTM Standard to have their products used. This change will also allow the authorities having jurisdiction to permit the use of products that meet this CSA standard.

Cost Impact: Will increase the cost of construction
Using PP will slightly increase the pipe material cost, but will fascilitate ease of installation, due to the stiffer nature of the pipe's wall.

Analysis: A review of the standard proposed for inclusion in the code, CSA B182.13-2011, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2015.

P 236-15 : 1102.4-COOMBS4183

P 237-15

Table 1102.4, Chapter 14

Proponent: Shawn Coombs, Advanced Drainage Systems, Inc., representing Advanced Drainage Systems, Inc. (shawn.coombs@ads-pipe.com)

2015 International Plumbing Code

Revise as follows:

TABLE 1102.4
BUILDING STORM SEWER PIPE

MATERIAL	STANDARD
Polyethylene (PE) plastic pipe	<u>ASTM F667</u>; ASTM F 2306/F 2306M

(Portions of table not shown remain unchanged)

Add new standard(s) as follows:
<u>ASTM F667 - 12 "Standard Specification for 3 through 24 in. Corrugated Polyethylene Pipe and Fittings"</u>

Reason: This code change is proposed because the currently listed ASTM F2306 has a size range of 12" to 60". There are applications where the designer uses smaller diameter polyethylene pipe to convey storm water or other drainage from the end of the building drain to a public sewer, private sewer, individual sewage disposal system or other point of disposal. Proposed ASTM F667-06 is needed as it covers pipe sizes 3" to 24"
The acceptance of the proposed change will allow the authorities having jurisdiction to permit the use of this product in smaller diameters where required.

Cost Impact: Will not increase the cost of construction
The addition of this standard will allow more appropriately sized diameters of PE to be used, thus optimizing cost.

Analysis: A review of the standard proposed for inclusion in the code, ASTM F667, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2015.

P 237-15 : T1102.4-COOMBS4123

P 238-15

Table 1102.4, Chapter 14

Proponent: Shawn Coombs, representing Advanced Drainage Systems, Inc. (shawn.coombs@ads-pipe.com)

2015 International Plumbing Code

Revise as follows:

TABLE 1102.4
BUILDING STORM SEWER PIPE

MATERIAL	STANDARD
Polyethylene (PE) plastic pipe	ASTM F 2306/F 2306M; <u>ASTM F2648/F2648M</u>

(Portions of table not shown remain unchanged)

Add new standard(s) as follows:
<u>ASTM F2648/F2648M-13 Standard Specification for 2 to 60 inch [50 to 1500 mm] Annular Corrugated Profile Wall Polyethylene (PE) Pipe and Fittings for Land Drainage Applications</u>

Reason: Section 503 Material Selection of the IGCC discusses the use of recyclable building materials and the use of indigenous materials on projects. This code change is proposed because ASTM F2648 allows the use of recycled materials to be used in the manufacture of High Density Polyethyene pipe. The addition of ASTM F2648 to Table 1102.4 is in support of the IGCC initiative. The acceptance of the proposed change will allow the authorities having jurisdiction to permit the use of this product on projects in direct support of the IGCC.

Cost Impact: Will not increase the cost of construction
The use of recycled materials in our products in most cases make the pipe more cost effective.

Analysis: A review of the standard proposed for inclusion in the code,ASTM F2648/F2648M, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2015.

P 238-15 : T1102.4-COOMBS4173

P 239-15

Table 1102.4, Chapter 14

2015 International Plumbing Code

Revise as follows:

TABLE 1102.4
BUILDING STORM SEWER PIPE

MATERIAL	STANDARD
Polypropylene (PP) Pipe	ASTM F2881

(Portions of table not shown remain unchanged)

Add new standard(s) as follows:
ASTM F2881-11 "Standard Specification for 12 to 60 in. [300 to 1500 mm] Polypropylene (PP) Dual Wall Pipe and Fittings for Non-Pressure Storm Sewer Applications"

Reason: This code change is proposed because there is currently an ASTM Standard Specification for this pipe material. PP pipe has been used in gravity flow storm sewer applications (both watertight and soil tight) in Europe for over 25 years and is now being manufactured in the United States. AASHTO has approved the material under AASHTO Specification M330. The Canadian Standards Association (CSA) has also approved PP pipe per CSA B182.13-11. The acceptance of the proposed change will enable manufacturers with products that meet the requirements of the ASTM Standard to have their products used. This change will also allow the authorities having jurisdiction to permit the use of products that meet this ASTM standard.

Cost Impact: Will increase the cost of construction
Using polypropylene pipe will slightly increase the pipe material cost, but will facilitate installation, due to the stiffer nature of the pipe's wall.

Analysis: A review of the standard proposed for inclusion in the code,ASTM F2881 , with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2015.

P 239-15 : T1102.4-COOMBS4180

P 240-15

Table 1102.4

2015 International Plumbing Code

Revise as follows:

TABLE 1102.4
BUILDING STORM SEWER PIPE

MATERIAL	STANDARD
Acrylonitrile butadiene styrene (ABS) plastic pipe <u>in IPS diameters, including Schedule 40, DR 22 (PS 200) and DR 24 (PS 140); with a solid, cellular core or composite wall.</u>	ASTM D 2661; ~~ASTM D 2751;~~ ASTM F 628; <u>ASTM F 1488;</u> CSA B181.1; CSA B182.1
Cast-iron pipe	ASTM A 74; ASTM A 888; CISPI 301
Concrete pipe	ASTM C 14; ASTM C 76; CSA A257.1M; CSA A257.2M
Copper or copper-alloy tubing (Type K, L, M or DWV)	ASTM B 75; ASTM B 88; ASTM B 251; ASTM B 306
Polyethylene (PE) plastic pipe	ASTM F 2306/F 2306M
Polyvinyl chloride (PVC) plastic pipe (Type DWV, SDR26, SDR35, SDR41, PS50 or PS100) <u>in IPS diameters, including Schedule 40, DR 22 (PS 200) and DR 24 (PS 140); with a solid, cellular core or composite wall.</u>	ASTM D 2665; ASTM D 3034; ASTM F 891; <u>ASTM F 1488;</u> CSA B182.4; CSA B181.2; CSA B182.2
Vitrified clay pipe	ASTM C 4; ASTM C 700
Stainless steel drainage systems, Type 316L	ASME A112.3.1

Reason: ASTM D2751 has been withdrawn in 2014.
ASTM F1488, "Standard Specification for Coextruded Composite Pipe" is found in table 702.2, but not table 1102.4

Cost Impact: Will not increase the cost of construction
This proposal simply adds another option for piping material into the code and corrects others, and as such, the option is not requiring that this material be chosen. Thus the code with this proposal added will not cause the cost of construction to increase.

P 240-15 : T1102.4-CUDAHY4621

P 241-15

Table 1102.5, Chapter 14

Proponent: Shawn Coombs, Advanced Drainage Systems, Inc., representing Advanced Drainage Systems, Inc. (shawn.coombs@ads-pipe.com)

2015 International Plumbing Code

Revise as follows:

TABLE 1102.5
SUBSOIL DRAIN PIPE

MATERIAL	STANDARD
Polyethylene (PE) plastic pipe	ASTM F 405; <u>ASTM F667</u>; CSA B182.1; CSA B182.6; CSA B182.8

(Portions of table not shown remain unchanged)

Add new standard(s) as follows:
<u>ASTM F667 - 12 Standard Specification for 3 through 24 in. Corrugated Polyethylene Pipe and Fittings</u>

Reason: This code change proposal is proposed because the currently listed ASTM F405 is limited in size to only 3" to 6" diameter pipe. There are applications where larger diameters of perforated polyethylene pipe are required to collect subsurface water or seepage water and convey such water to a place of disposal. The proposed ASTM F667-06 is needed as it covers pipe sizes 3" to 24" diameters. The acceptance of the proposed change will allow the authorities having jurisdiction to permit the use of this product in larger diameters where required.

Cost Impact: Will not increase the cost of construction
The addition of this standard will allow more appropriately sized diameters of PE to be used, thus optimizing cost.

Analysis: A review of the standard proposed for inclusion in the code, ASTM F667 - 12 , with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2015.

1102.6, Chapter 14

Proponent: Julius Ballanco, JB Engineering and Code Consulting, P.C., representing Self (JBENGINEER@aol.com)

2015 International Plumbing Code

Revise as follows:

1102.6 Roof Drains. Roof drains shall conform to ASME A112.6.4 or ASME A112.3.1. Roof drains shall be tested and rated in accordance with ASPE/IAPMO Z1034.

Add new standard(s) as follows:
ASPE/IAPMO Z1034 Test Method for Evaluating Roof Drain Performance

Reason: ASPE/IAPMO Z1034 is the new consensus standard for testing and rating roof drains for their flow rate. The current code requires the manufacturer to publish their flow rates. The flow rates are determined by testing to this standard.
The testing requirements in the standard are consistent with the results published in the ASPE Research Foundation Roof Drainage Research Report. The standard also allows flexibility in design to allow manufacturers to develop their own test rig for certifying their roof drains.

Cost Impact: Will not increase the cost of construction
While this testing will cost the manufacturers, such costs are not passed on to the construction costs. Testing and listing of products is a normal business expense for manufacturers.

Analysis: A review of the standard proposed for inclusion in the code, ASPE/IAPMO Z1034, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2015.

P 242-15 : 1102.6-BALLANCO3657

P 243-15

1102.6, Chapter 14

Proponent: Billy Smith, American Society of Plumbing Engineers Legislative Committee, representing American Society of Plumbing Engineers Legislative Committee (bsmith@aspe.org)

2015 International Plumbing Code

Revise as follows:

1102.6 Roof Drains. Roof drains shall conform to ASME A112.6.4 or ASME A112.3.1. Roof drains shall be tested and rated in accordance with ASPE/IAPMO Z1034.

Add new standard(s) as follows:
ASPE/IAPMO Z1034-2015 Test Method for Evaluating Roof Drain Performance

Reason: ASPE/IAPMO Z1034 is the new consensus standard for testing and rating roof drains for their flow rate. The current code requires the manufacturer to publish their flow rates. The flow rates are determined by testing to this standard.
The testing requirements in the standard are consistent with the results published in the ASPE Research Foundation Roof Drainage Research Report. The standard also allows flexibility in design to allow manufacturers to develop their own test rig for certifying their roof drains.

Cost Impact: Will increase the cost of construction
There are already cost associated with testing of roof drains. However, this being a new consensus standard, cost could increase.

Analysis: A review of the standard proposed for inclusion in the code, ASPE/IAPMO Z1034-2015, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2015.

P 243-15 : 1102.6-SMITH5403

P 244-15

1105.2

Proponent: MAX WEISS, Plumbing & Drainage Institute, representing Plumbing & Drainage Institute (max@weissresearch.net)

2015 International Plumbing Code

Revise as follows:

1105.2 Roof drain flow rate. The published roof drain flow rate, based on the head of water above the roof drain, shall be used to size the ~~storm drainage system in accordance with Section 1106~~roof drain. The flow rate used for sizing the storm drainage piping shall be based on the maximum anticipated ponding at the roof drain.

Reason: The effort to use the roof drain alone as a flow rate determiner ignores the ASPE data cited as support for the previous change. The ASPE data demonstrates the discharge piping configuration has a greater effect on system flow rate than either ponding depth or drain design. Therefore, while roof drain only flow rate, independent of discharge piping can be used as a flow quantifying element in the overall system design, it is not possible to use that element alone to determine the flow rate for the entire system. Piping configuration effect on flow must be calculated to obtain system flow accuracy.

Cost Impact: Will not increase the cost of construction
The proposal does not add or subtract material, elements, or method of construction. It simply amends the method of calculation.

11000	114	229	343	457	571	686
12000	125	249	374	499	623	748

Add new text as follows:

1106.2.1 Roof drainage. The stormwater drainage flow rate from a roof surface shall be in accordance with Table 1106.2.1 using a rainfall rate of a 60 minute duration storm of 100 year return period and the horizontal projected area of the roof. Stormwater drainage flow from a roof surface through secondary (emergency) roof drainage means shall not be considered when determining the flow rate for the primary storm drainage piping system.

1106.2.1.1 Roof drain. The roof drain shall have a manufacturer's published flow rate greater than or equal to the stormwater drainage flow rate determined in Section 1106.2.1. The flow rate used for sizing the roof drainage system shall be the roof drain manufacturer's published flow rate based at a head height of 4 inches (102 mm) of water ponding. Roof drainage piping shall be sized in accordance with Table 1106.2.

1106.2.1.2 Elevation of secondary roof drainage means . The bottom of the opening for secondary (emergency) roof drainage means shall be not less than 2 inches (51 mm) and not more than 3 inches (76 mm) higher than the lowest opening of the primary roof drain served by the secondary (emergency) roof drainage means.

1106.2.2 Engineered roof drain flow rate. Vertical and horizontal storm drain piping shall be sized based on the flow rate through the roof drain. The flow rate through a roof drain shall be based on the maximum anticipated height of water ponding above the roof drain that serves a roof area subjected to a rainfall rate of a 60-minute duration storm of 100-year return period and a 5-minute duration storm of 10-year return period. The flow rate through a roof drain shall be determined from the specific roof drain manufacturer's published flow rate at the maximum anticipated height of water ponding. The size of storm drainage piping from the roof drains to the termination of the storm drainage piping system shall be not less than the sizes indicated in Table 1106.2. The maximum anticipated height of water ponding above a roof drain and the stormwater drainage flow from a roof surface shall not include the effects of storm water drainage through any secondary (emergency) roof drainage means.

1106.2.2.1 Elevation of secondary roof drainage means. The bottom of the opening for secondary (emergency) roof drainage means shall be not less than 2 inches (51 mm) higher that the lowest opening of the primary roof drain served by the secondary (emergency) roof drainage means.

Reason: ASPE Research Foundation and IAPMO cosponsored research on the performance of roof drains in storm drainage system. The code change further updates the code requirements based on the recommendations in the ASPE RF report. The research report states the problem and the justification for this change. The research report is included with the submittal and can be downloaded at no cost at www.aspe.org.
The only difference between this change and the recommendation in the ASPE RF report is the first methodology for sizing a storm drainage system in proposed Section 1106.2.1. These requirements were developed to provide a cook-book method of sizing rather than conducting a proper engineering design. As a result, this sizing method takes a very conservative approach to sizing the drainage piping. The drainage piping with be equal to or larger than the pipe size when using the engineered design.

The sizing of the storm drainage system still relies on the values published by the roof drain manufacturers. This data identifies the flow rate based on head height through the roof drain.

Another addition to the engineered sizing requirement is the evaluation of the roof drainage system for a microburst. While a 100 year storm may appear to be the most drastic storm for sizing a system, a microburst can overpower the storm drainage piping resulting in failure of the piping system. The microburst will typically not have a significant impact on the roof loading compared to a 100 year storm of 60 minute duration.

Bibliography: Storm Drainage System Research Project, Flow Through Roof Drains, Ballanco, 2012, Copyright American Society of Plumbing Engineers Research Foundation

Cost Impact: Will not increase the cost of construction
This change only adds an optional design method. While the new method will increase the cost of construction, it is not a mandated design. If the engineered design is selected, the cost remains neutral.

P 246-15

1106.5, 1108.3

Proponent: Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

2015 International Plumbing Code

Revise as follows:

1106.5 Parapet wall ~~scupper location~~scuppers. ~~Parapet wall~~ Where scuppers are used for primary roof drainage ~~scupper~~or for secondary (emergency overflow) roof drainage or both, the quantity, size, location and ~~overflow scupper location shall comply with the requirements of Section 1503.4~~inlet elevation of the scuppers shall be chosen to prevent the depth of ponding water on the roof from exceeding the maximum water depth that the roof was designed for as determined by Section 1611.1 of the *International Building Code*. Scupper openings shall be not less than 4 inches (102 mm) in height and have a width that is equal to or greater than the circumference of a roof drain sized for the same roof area. The flow through the primary system shall not be considered when locating and sizing secondary scuppers.

1108.3 Sizing of secondary drains. Secondary (emergency) roof drain systems shall be sized in accordance with Section 1106 based on the rainfall rate for which the primary system is sized. Scuppers shall be sized to prevent the depth of ponding water from exceeding that for which the roof was designed as determined by Section 1101.7. Scuppers shall have an opening dimension of not less than 4 inches (102 mm) in height and have an opening width equal to the circumference of the roof drain required for the area served, sized in accordance with Table 1106.2(1). The flow through the primary system shall not be considered when sizing the secondary roof drain system.

Reason: The current language in the IPC and IBC implies that scuppers are only approved for secondary roof drainage. However, there are many areas of the country where scuppers are used for the primary roof drain system with another set of scuppers (installed at a higher elevation) used for the secondary drainage system. Where scuppers are used for primary system, there needs to be method to equate the code required drain size to a scupper opening width. A simple design criteria of the scupper width equaling the circumference of the code required primary roof drain has worked very well in such areas such as Phoenix where buildings are subject to annual monsoon thunderstorms in the summer. Statement trailing the reason:
This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes. This is PMGCAC Item 168.

Cost Impact: Will not increase the cost of construction
This proposal will not increase the cost of construction because additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code.

P 246-15 : 1106.5-SNYDER4082

P 247-15

1301.1.1 (New)

Proponent: Jeff Hugo, National Fire Sprinkler Association, representing National Fire Sprinkler Association (hugo@nfsa.org)

2015 International Plumbing Code

Add new text as follows:

1301.1.1 Fire Protection Systems The storage, treatment and distribution of nonpotable water to be used for fire protection systems shall be in accordance with the *International Fire Code.*

Reason: This proposal is to insert text to remind designers and users of the International Plumbing Code for nonpotable water systems that use of these systems in fire protection warrant further examination and design considerations. While many of these systems are used and governed by the International Plumbing Code, there are a fair amount of these systems used for fire protection systems. By referencing the International Fire Code, the user of International Plumbing Code has direct reference to the installation standards used for fire protection systems. Many of these installation standards have specific listing requirements and design considerations that must be incorporated into the nonpotable water systems of Sections 1301, 1302, 1303 and 1304.

Cost Impact: Will not increase the cost of construction
The reference to the IFC and the appropriate installation standards does not increase the cost of construction.

P 247-15 : 1301.1.1 (New)-HUGO5346

P 248-15

1301.2.1

Proponent: Troy Vassos, Golder Associates Ltd., representing self (tvassos@golder.com)

2015 International Plumbing Code

Delete without substitution:

~~**1301.2.1 Residual disinfectants.** Where chlorine is used for disinfection, the nonpotable water shall contain not more than 4 ppm (4mg/L) of chloramines or free chlorine when tested in accordance with ASTM D 1253. Where ozone is used for disinfection, the nonpotable water shall not contain gas bubbles having elevated levels of ozone at the point of use.~~

> ~~**Exception:** Reclaimed water sources shall not be required to comply with these requirements.~~

Reason:

1. The reference in the Code Section to "not more than 4 ppm (4 mg/L) of chloramines or free chlorine" is a drinking (potable) water standard intended to provide a safe margin for total body exposure over a lifetime of consuming water with this concentration and has no relevancy for a non-potable water standard - as the non-potable water will not be consumed,
2. US EPA drinking water criteria for maximum residual disinfectant level goals (MRDLG) references of 4 mg/L for chlorine and chloramine - based solely on possible health risks and exposure over a lifetime of water consumption at this concentration, with an adequate margin of safety.
3. The Code Section could be interpreted to allow a maximum total chlorine residual of 8 mg/L, as total chlorine is the sum of free chlorine (max 4 mg/L) and chloramine (max 4 mg/L) residuals - whereas the drinking water standard is based on either/or.
4. The list of disinfection residuals in the Code Section is incomplete. For example, chlorine dioxide and peracetic acid are not considered, both wastewater disinfectants that result in residual concentrations.
5. The presence of gas bubbles in an ozone application is not a measure of the ozone residual of the water.
6. The release of ozone in the air is likely a far more serious health concenr than the residual concentration of ozone in the water.
7. The Code Section does not state monitoring frequency - implying continuous monitoring and equipment cost.
8. Controlling a maximum disinfectant residual level could have significant cost (i.e chemcial neutralization or other means of residual destruction) versus.
9. Not clear whether the "intention" was health, environment or equipment protection related - but it appears the individual(s) who prepared this Code Section did not specifically reference a particular residual impact or they wouldn't have referenced the stated concentrations.
10. No consideration for environmental impacts of disinfectant residual concentrations - which also depend on the reuse application. Reuse water application for stream augmentation, or where the reuse water may flow into a surface body of water containing aquatic organisms. For example, chlorine or chloramine residual concentrations of less than 0.5 mg/L can be acutely toxic (lethal) to aquatic organisms. Canadian Federal legislation restricts maximum effluent chlorine residuals to 0.01 mg/L.

There are no alternative standards to reference, as the intention for the proposed residual concentrations has not been made clear (i.e. is it a health issue or an adverse material affect concern?)

Bibliography: http://water.epa.gov/drink/contaminants/basicinformation/disinfectants.cfm
[Disinfection of wastewater with peracetic acid: a review] [Environment International. Volume 30, Issue 1] Mehmet Kitis] [2004] [Page 47-55]

https://www.ec.gc.ca/eu-ww/default.asp?lang=En&n=71E71A86-1

Cost Impact: Will increase the cost of construction
There is no indication as to the frequency of measurement to verify the residual chlorine concentrations are less than the 4 mg/L indicated; therefore, this infers that real time measurement and controls are required to ensure the total chlorine or chloramine residual limit is not exceeded. This will result in cost to provide the instrumentation to monitor the residual chlorine levels (est. $5,000) and equipment to neutralize and limit the chlorine residual (est. $20,000 for chemical feed pumps and controls), plus an increased labour cost to carry out daily calibration checks & adjustments as well as chemical top-ups (estimated at $10 per day or about $3,500 per year).

P 248-15 : 1301.2.1-VASSOS4815

P 249-15

1301.4

Proponent: Karen Hobbs, Natural Resources Defense Council, representing Natural Resources Defense Council (khobbs@nrdc.org)

2015 International Plumbing Code

Revise as follows:

1301.4 Permits. Permits shall be required for the construction, installation, alteration and repair of nonpotable water systems. Construction documents, engineering calculations, diagrams and other such data pertaining to the nonpotable water system shall be submitted with each permit application.

Exceptions:

1. Rainwater systems that do not include storage and that supply water only for outdoor applications.
2. Nonpotable water systems collecting water only from a single clothes washer and supplying water only for outdoor applications where such outdoor discharges comply with the requirements of the jurisdication.

Reason: Permitting can be costly and time-consuming and therefore a deterrent for the reuse of onsite nonpotable water. Eliminating this requirement for simple reuse systems that pose little health risk can help to broaden the implementation of onsite reuse of nonpotable water. Additionally, states such as California (http://www.hcd.ca.gov/codes/shl/2007CPC_Graywater_Complete_2-2-10.pdf) and Arizona (http://www.harvestingrainwater.com/wp-content/uploads/Arizona_Greywater_Guidelines_in_English.pdf) have set precedents for not requiring permits for laundry to landscape graywater systems.

Cost Impact: Will not increase the cost of construction
No cost increase will result from this proposal; the proposal simply eliminates an unnecessary permit process for simple reuse sytems.

P 249-15 : 1301.4-HOBBS5298

P 250-15

1301.4

Proponent: Troy Vassos, representing self (tvassos@golder.com)

2015 International Plumbing Code

Revise as follows:

1301.4 Permits. Permits shall be required for the construction, installation, alteration, repair and ~~repair~~operation of nonpotable water systems. Construction documents, engineering calculations, diagrams and other such data pertaining to the nonpotable water system shall be submitted with each permit application.

Reason:

1. A permit or letter of authorization may also be required to operate a non-potable water treatment and distribution system or to use the non-potable water, or a water reuse system is permitted to operate subject to specific conditions. For example, the bibiography includes a reference to the province of British Columbia Municipal Wastewater Regulation that requires a letter of authorization from the local health jurisdiction to operate a water reuse system.

   http://www.bclaws.ca/civix/document/id/complete/statreg/87_2012

   Section 105 (1) .. a person must not provide reclaimed water unless the person .. receives authorization .. to provide reclaimed water for the proposed use, subject to the conditions specified by the health officer.

Bibliography: [http://www.bclaws.ca/civix/document/id/complete/statreg/87_2012]

Cost Impact: Will not increase the cost of construction
There is no cost implication to noting there may also be a jurisdiction requirement or permit to operate the reuse facility, just as there is likely to be a permit to construct or repair.

P 250-15 : 1301.4-VASSOS5801

P 251-15

1301.6

Proponent: David Cantrell, representing Joint Consensus Committee on Rainwater Collection System Design and Installation (IS-RCSDI) (dave.cantrell@kingcounty.gov)

2015 International Plumbing Code

Revise as follows:

1301.6 ~~Approved components~~Components and materials. Piping, plumbing components and materials used in collection and conveyance systems shall be ~~manufactured~~ of material approved by the manufacturer for the intended application ~~and compatible with any disinfection and treatment systems used~~.

Reason: Treatment and disinfection systems are not expected to affect permitted piping, plumbing components and materials. Since the section already specifies that materials must be "approved" this term has no value added by remaining in the section heading.

Cost Impact: Will not increase the cost of construction
This code change is for clarificaiton only and does not increase the specific provisions addressed in the code section.

P 251-15 : 1301.6-CANTRELL5178

P 252-15

1301.6

Proponent: Troy Vassos, representing self (tvassos@golder.com)

2015 International Plumbing Code

Revise as follows:

1301.6 Approved components and materials. Piping, plumbing components and materials used in collection and conveyance systems shall be manufactured of material approved for the intended application ~~and compatible with any disinfection and treatment systems used~~.

Reason:

1. The term compatible is not defined, but its use vaguely implies that treatment and disinfection systems could in some way damage commonly used plumbing components and materials used in collection and conveyance systems.
2. The nature of the "incompatibility" is unclear, so it is not possible to verify compatibility.
3. It is possible that the authors of the Code Section were referring to the effect of chemical disinfectants on plastic pipe, but as can be seen in the referenced report on this subject, the subject is far from being a well understood and defined subject. Further, the issue is addressed by many other standards that could be referenced by the code.

There are no incompatibility criteria related to disinfection and/or treatment technologies that can be referenced.

Bibliography: [http://hdpeoxidation.com/Carollo%20Study%20on%20HDPE-PVC%20Pipe%20-%20Disinfectant%20Oxidation%208-08.pdf]

Cost Impact: Will not increase the cost of construction
The requirement to ensure the plumbing conveyancing components are compatible with disinfection and/or treatment systems is not expected to have a cost impact, as it is expected that common plumbing materials used for conveying nonpotable water would be unaffected by disinfection and/or treatment systems.

P 252-15 : 1301.6-VASSOS5798

P 253-15

1301.9.1

Proponent: David Cantrell, representing Joint Consensus Committee on Rainwater Collection System Design and Installation (IS-RCSDI) (dave.cantrell@kingcounty.gov)

2015 International Plumbing Code

Delete without substitution:

~~**1301.9.1 Sizing.** The holding capacity of the storage tank shall be sized in accordance with the anticipated demand.~~

Reason: In the absence of providing more informed guidance, this section should be eliminated. For example, tank sizing for rainwater storage is based on anticipated demand patterns, rainfall characteristics, and cost, not just anticipated demand.

Cost Impact: Will not increase the cost of construction
Deleting this sizing section does not add more restrictive requirements to the installation.

P 253-15 : 1301.9.1-CANTRELL5182

P 254-15

1301.9.1

Proponent: Troy Vassos, representing self (tvassos@golder.com)

2015 International Plumbing Code

Delete without substitution:

~~**1301.9.1 Sizing.** The holding capacity of the storage tank shall be sized in accordance with the anticipated demand.~~

Reason:

1. Sizing of rainwater harvesting (non-potable) storage is done based on anticipated demand patterns, rainfall characteristics, and cost – not just anticipated demand.
2. Sizing of water reuse system storage (see bibliographic reference) may be considered in tandem with water treatment capacities and variations in demand. This is particularly true for treated wastewater which could be treated to meet the instantaneous non-potable water demands, or treated at a lower rate and stored to meet future demands.
3. In the absence of providing more comprehensive guidance on the sizing of storage, it is recommended that this section be deleted

Bibliography: [http://nepis.epa.gov/Adobe/PDF/P100FS7K.pdf]

Cost Impact: Will not increase the cost of construction
The removal of an incomplete design criteria for storage will not have an adverse economic impact.

P 254-15 : 1301.9.1-VASSOS5802

P 255-15

1301.9.2

Proponent: David Cantrell, representing Joint Consensus Committee on Rainwater Collection System Design and Installation (IS-RCSDI) (dave.cantrell@kingcounty.gov)

2015 International Plumbing Code

Revise as follows:

1301.9.2 Location. ~~Storage tanks shall be installed above~~Any storage tank or ~~below grade. Above-grade storage tanks~~ portion thereof that is above-grade shall be protected from direct exposure to sunlight ~~and shall be constructed~~by one of the following methods:

1. Tank construction using opaque, UV-resistant materials such as~~, but not limited to,~~ heavily tinted plastic, fiberglass, lined metal, concrete, wood, or painted to prevent algae growth~~, or shall have specially~~
2. Specially constructed sun barriers ~~including, but not limited to, installation~~.
3. Installation in garages, crawl spaces or sheds.

Storage tanks and their manholes shall not be located directly under soil piping, waste piping or any source of contamination.

Reason: The first sentence has no added value. The provisions of this and other sections dictate the necessary requirements for storage tanks based on their installation above or below grade. The methods used for protection from sunlight is easier in a list format as opposed to a single paragraph.

Cost Impact: Will not increase the cost of construction
This code change merely reorganizes the section without adding or deleting any existing provisions.

P 255-15 : 1301.9.2-CANTRELL5171

P 256-15

1301.9.2

Proponent: Troy Vassos, representing self (tvassos@golder.com)

2015 International Plumbing Code

Revise as follows:

1301.9.2 Location. Storage tanks shall be installed above, at or below grade. ~~Above-grade~~At or above-grade storage tanks shall be protected from direct sunlight and shall be constructed using opaque, UV-resistant materials such as, but not limited to, heavily tinted plastic, fiberglass, lined metal, concrete, wood, or painted to prevent algae growth, or shall have specially constructed sun barriers including, but not limited to, installation in garages, crawl spaces or sheds. Storage tanks and their manholes shall not be located directly under soil piping, waste piping or any source of contamination.

Reason:

1. Non-potable storage tanks could be installed fully buried, partially buried, at grade, or above grade (elevated). It is common to use elevated storage to generate water distribution pressure.

Cost Impact: Will not increase the cost of construction
The proposed change in wording does not have a cost impact.

P 256-15 : 1301.9.2-VASSOS5807

P 257-15

1301.9.6

Proponent: JEFFREY HUTCHER, Cleanblu, representing self

2015 International Plumbing Code

Revise as follows:

1301.9.6 Overflow. The storage tank shall be equipped with an overflow pipe having a diameter not less than ~~that shown in Table 606.5.4~~the tank inlet pipe diameter. The overflow pipe shall be protected from insects or vermin and shall discharge in a manner consistent with storm water runoff and sanitary drainage requirements of the jurisdiction. The overflow pipe from storm water and rainwater systems shall discharge at a sufficient distance from the tank to avoid damaging the tank foundation or the adjacent property. Drainage from overflow pipes shall be directed to prevent freezing on roof walkways. The overflow drain shall not be equipped with a shutoff valve. A cleanout shall be provided on each overflow pipe in accordance with Section 708. Overflow drains from gray water tank systems shall connect to the sanitary system downstream of the tank

Reason: The section fails to address overflow from Gray Water systems which cannot be discharged overland as Storm or Rainwater systems. Overflows from gray water tanks shall discharge to sanitary. Point source pollutant discharge is a violation of US code 33 which includes the Clean Water Act 1972. It also violates the National Pollution Discharge Elimination System (NPDES)

Cost Impact: Will increase the cost of construction
The proposal may increase the cost since it is now spelled out to allow the jurisdiction to require connections to sanitary for certain systems, but it will eliminate the confusion about Gray water and other non potable sources. Without the new wording, the possibilty exists for a jurisdiction to allow for an llicit discharge in in violation of the clean water act

P 257-15 : 1301.9.6-HUTCHER4404

P 258-15

1301.9.7

Proponent: David Cantrell, representing Joint Consensus Committee on Rainwater Collection System Design and Installation (IS-RCSDI) (dave.cantrell@kingcounty.gov)

2015 International Plumbing Code

Revise as follows:

1301.9.7 Access. Not less than one access opening shall be provided to allow inspection and cleaning of the tank interior. Access openings shall have an *approved* locking device or other approved method of securing access. Below-grade storage tanks, located outside of the building, shall be provided with a manhole either not less than 24 inches (610 mm) square or with an inside diameter not less than 24 inches (610 mm). Manholes shall extend not less than 4 inches (102 mm) above ground or shall be designed to prevent water infiltration. Finished grade shall be sloped away from the manhole to divert surface water. Manhole covers shall be secured to prevent unauthorized access. Service ports in manhole covers shall be not less than 8 inches (203 mm) in diameter and shall be not less than 4 inches (102 mm) above the finished grade level. The service port shall be secured to prevent unauthorized access.

> **Exception:** ~~Storage~~Water storage tanks for treated water that are less than 800 gallons (3028L) in volume and installed below grade shall not be required to be equipped with a manhole~~, but shall have~~ provided that the tank has a service port of not less than 8 inches (203 mm) in diameter.

Reason: Raw water storage tanks should have an easy access for cleaning (i.e. manhole access). The exception more appropriately applies to treated water storage tanks.

Cost Impact: Will not increase the cost of construction
This code change clarifies the appropriate access for treated water tanks. Such tanks are typically smaller than water storage tanks that store water prior to treatment.

P 258-15 : 1301.9.7-CANTRELL5180

P 259-15

1301.9.9

Proponent: David Cantrell, representing Joint Consensus Committee on Rainwater Collection System Design and Installation (IS-RCSDI) (dave.cantrell@kingcounty.gov)

2015 International Plumbing Code

Revise as follows:

1301.9.9 Draining of tanks. ~~Where tanks require draining for~~Tanks shall be provided with a means of emptying the contents for the purpose of service or cleaning~~, tanks~~. Tanks shall be drained by using a pump or by a drain located at the lowest point in the tank. The tank drain pipe shall discharge as required for overflow pipes and shall not be smaller in size than specified in Table 606.5.7. Not less than one cleanout shall be provided on each drain pipe in accordance with Section 708.

Reason: It is important for all water storage tanks to have a means for draining or emptying the tank for maintenance purposes and cleaning in order to protect the health and safety of users.

Cost Impact: Will not increase the cost of construction
This code change clarifies the methods for draining or emptying tanks, but does not add or increase any additional provisions for such.

P 259-15 : 1301.9.9-CANTRELL5176

P 260-15

1301.9.9

Proponent: JEFFREY HUTCHER, representing ARCSA (jhutcher@pacbell.net)

2015 International Plumbing Code

Revise as follows:

1301.9.9 Draining of tanks. ~~Where tanks require draining for service or cleaning, tanks~~
<u>Tanks</u> shall be <u>capable of being</u> drained by using a pump or by a drain located at the lowest point in the tank. The tank drain pipe shall discharge as required for overflow pipes and shall not be smaller in size than specified in Table 606.5.7. Not less than one cleanout shall be provided on each drain pipe in accordance with Section 708.

Reason: All tanks need to be cleaned and sometimes emptied for abandonment. The new language make it a requirement

Cost Impact: Will not increase the cost of construction
This should have no impact on cost. Professionals already know a provision for draining should be provided

P 260-15 : 1301.9.9-HUTCHER5154

P 261-15

1302.1, 1304.3

Proponent: Dru Meadows, theGreenTeam, Inc., representing Walmart (dmeadows@thegreenteaminc.com)

2015 International Plumbing Code

Revise as follows:

1302.1 General. The provisions of ASTM E2635 and Section 1302 shall govern the construction, installation, alteration and repair of on-site nonpotable water reuse systems for the collection, storage, treatment and distribution of on-site sources of nonpotable water as permitted by the jurisdiction.

1304.3 Reclaimed water systems. The design of the reclaimed water systems shall conform to ~~ASTM E 2635 and~~ *accepted engineering practice*.

Reason:
This proposal is intended to coordinate the scope of ASTM E2635 and its prior use in the IgCC, with the reorganization of IgCC Chapter 7 language to IPC Chapter 13.

There was some streamlining in the relocation of the language from IgCC Chapter 7 to IPC Chapter 13. That helped to clarify the difference between systems that use nonpotable water captured on-site, and systems that use nonpotable water capture off-site (i.e. nonpotable water delivered to the site, also called "reclaimed water" "municipal reclaimed water" or "recycled water").

Reference to ASTM E2635 seems to have ended up in the wrong subsection. In the IgCC, it addressed water reclaimed/reused on-site. In the IPC, it is located in a section that appears limited to water reclaimed off-site. It should be moved from Section 1304 to Section 1302.

The scope of ASTM E2635 – 14, Standard Practice for Water Conservation in Buildings Through In-Situ Water Reclamation, states:

> "This practice specifies limitations for use of reclaimed water in-situ. It is not intended for application to the use of reclaimed water delivered from an offsite municipal wastewater treatment facility."

Cost Impact: Will not increase the cost of construction
No new requirements are identified so there is not a change in the cost of construction.

P 261-15 : 1302.1-MEADOWS3620

P 262-15

1302.2

Proponent: Troy Vassos, representing self (tvassos@golder.com)

2015 International Plumbing Code

Revise as follows:

1302.2 Sources. On-site nonpotable water reuse systems shall collect waste discharge from only the following sources: bathtubs, showers, lavatories, clothes washers and laundry trays. ~~Water~~Where *approved* and as appropriate for the intended application, water from other ~~*approved*~~ nonpotable sources ~~including swimming pool backwash operations, air conditioner condensate, rainwater, cooling tower blow-down water, foundation drain water, steam system condensate, fluid cooler discharge water, food steamer discharge water, combination oven discharge water, industrial process water and fire pump test water~~ shall ~~also be permitted to~~ be collected for reuse by on-site nonpotable water reuse systems~~, as *approved* by the code official and as appropriate for the intended application~~.

Reason:

1. As approval of alternative sources of reuse water is required by the Code Section, it is unnecessary to provide an example list of alternative sources.
2. The list of alternative sources is not exhaustive, and other souces of reusable water could be considered.
3. Many of the alternative nonpotable wastewater sources have considerably different types of contaminants and levels of contamination than the greywater sources noted in the first sentence. Consequently, the type of treatment and treatment complexity is expected to be considerably different for many of the example non-potable water sources listed, than for the greywater sources noted. Non-potable water sources of particular concern in the alternative sources include cooling tower blow-down water, food steamer discharge water, and industrial process water.
4. Consequently, it is recommended that the example list of alternative non-potable water sources be deleted.

Cost Impact: Will not increase the cost of construction
The elimination of an example list of alternative non-potable water sources will not have a cost impact, and does not affect the intent of the section to recognize that jurisdictions may also consider other appropriate sources of non-potable water.

P 262-15 : 1302.2-VASSOS5808

P 263-15

1302.2.1

Proponent: Karen Hobbs, Natural Resources Defense Council, representing Natural Resources Defense Council (khobbs@nrdc.org)

2015 International Plumbing Code

Revise as follows:

1302.2.1 Prohibited sources. Waste water containing urine or fecal matter shall not be diverted to on-site nonpotable water reuse systems and shall discharge to the sanitary drainage system of the building or premises in accordance with Chapter 7. Reverse osmosis system reject water, water softener discharge water, kitchen sink waste water, dishwasher waste water and waste water discharged from wet-hood scrubbers shall not be collected for reuse in an on-site nonpotable water reuse system.

Exception: Where prohibited sources of water have been treated onsite by *approved* methods, the use of the treated water in on-site nonpotable water reuse systems shall be in accordance with the requirements of the jurisdication.

Reason: In some instances, the treatment and reuse of blackwater can be more cost-effective than dual plumbing to collect graywater sources separately from blackwater for reuse. Some cities, such as San Francisco (http://www.sfwater.org/index.aspx?page=686), have programs that not only allow the treatment and reuse of blackwater, they provide incentives. Given water scarcity in many parts of the country, as well as infrsatructure limitations, the IPC should not prohibit the use of blackwater for onsite nonpotable reuse, if local jurisdictions permit its use. The onsite reuse of blackwater can improve local reliability of water and reduce loads on sanitary sewer collection systems and treatment plants.

Cost Impact: Will not increase the cost of construction
No cost impact; this proposal would simply allow the use of blackwater if the local jurisdiction already permits its use.

P 263-15 : 1302.2.1-HOBBS5300

P 264-15

1302.2.1

Proponent: Troy Vassos, Golder Associates Ltd., representing self (tvassos@golder.com)

2015 International Plumbing Code

Revise as follows:

1302.2.1 Prohibited sources. ~~Waste water containing urine or fecal matter shall not be diverted to on-site nonpotable water reuse systems and shall discharge to the sanitary drainage system of the building or premises in accordance with Chapter 7.~~
Reverse osmosis system reject water, water softener discharg~~e water, kitchen sink waste water, dishwasher waste~~ water and waste water discharged from wet-hood scrubbers shall not be collected for reuse in an on-site nonpotable water reuse system.

Reason:

1. The treatment of mixed municipal or domestic (sanitary) wastewater containing urine and fecal matter is considered to be an acceptable practice in all jurisdictions that permit reuse water to be used to satisfy non-potable water demands.
2. There is no technical reason to exclude blackwater sources (e.g. toilet & urinal, kitchen sink and dishwasher sources, for example) for treatment and reuse. In preparing the Canadian Guidelines for Domestic Reclaimed Water for Use in Toilet and Urinal Flushing, Health Canada concluded there was no significant health risk difference associated with reuse water generated from mixed wastewater sources versus greywater sources. In fact, the type and concentration of contaminants have been shown to be very similar for the two groups of wastewater (i.e. mixed wastewater versus greywater).
3. Generating reuse water by only treating greywater sources would require the separate collection of greywater, and would incur increased costs for drainage.
4. The existing NSF/ANSI Standard 350 and 350-1, and CSA 128.3 -12 water reuse treatment system performance standards include mixed wastewater and greywater sources within the standards, as does the recent Australian EPA standard for water reuse package treatment plant performance.
5. The water reuse water quality standards for non-potable applications are based on treating mixed wastewater (e.g. US EPA, California Title 22, Florida, Washington State, etc.) and do not consider segregating or preferentially treating greywater sources to generate reuse water for non-potable use.

Bibliography: [Canadian Guidelines for Domestic Reclaimed Water for Use in Toilet and Urinal Flushing] [ISBN: 978-1-100-15665-1] [Health Canada] [2010]
[Guidelines for Water Reuse] [EPA/600/R-12/618] [US EPA] [2012]

Cost Impact: Will not increase the cost of construction
The inclusion of sanitary or blackwater sources will increase the amount of water available for reuse applications, and will decrease the associated cost of treatment as separate plumbing systems will not be required for blackwater and greywater sources and the inherent reduction in unit costs expected for increased scale treatment applications.

P 264-15 : 1302.2.1-VASSOS5810

P 265-15

1302.5

2015 International Plumbing Code

Delete without substitution:

~~**1302.5 Filtration.** Untreated water collected for reuse shall be filtered as required for the intended end use. Filters shall be accessible for inspection and maintenance. Filters shall utilize a pressure gauge or other *approved* method to provide indication when a filter requires servicing or replacement. Filters shall be installed with shutoff valves immediately upstream and downstream to allow for isolation during maintenance.~~

Reason:

1. "Untreated" wastewater sources should not be filtered. The wastewater source (mixed wastewater or greywater) contains a high concentration of soluble biodegradable organic matter and suspended solids which will rapidly clog a filter. The soluble organics will result in bacterial growth within the filter, and clogging.
2. Established reuse water quality standards, such as those stated in NSF/ANSI Standard 350 & 350-1 and CSA B 128.3-12, as well as state and federal guidelines and regulatory standards for water reuse quality have stringent turbidity requirements (typically less than 2 NTU) that inherently can only be achieved with a high degree of filtration, **BUT ONLY FOLLOWING** biological oxidation (treatment). Stating that filtration is required for reuse water (i.e. treated wastewater) is unnecessary as it is addressed by the water quality or treatment equipment requirements of the jurisdication.

The requirement to filter untreated wastewater will result in increased costs due to filter clogging and high O&M.

Bibliography: [Canadian Guidelines for Domestic Reclaimed Water for Use in Toilet and Urinal Flushing] [ISBN: 978-1-100-15665-1] [Health Canada [2010]
[Guidelines for Water Reuse] [EPA/600/R-12/618] [US EPA] [2012]

[http://www.ecy.wa.gov/PROgrams/wq/reclaim/index.html]

Cost Impact: Will not increase the cost of construction
One less piece of equipment required will lower construction costs.

P 265-15 : 1302.5-VASSOS5813

P 266-15

1302.6, 1302.6.1, 1302.7.1, 1302.7.3, 1302.12.6

Proponent: Troy Vassos, Golder Associates Ltd., representing self (tvassos@golder.com)

2015 International Plumbing Code

Revise as follows:

1302.6 ~~Disinfection and treatment.~~Untreated gray water storage. ~~Where the intended application for nonpotable water collected on site for reuse requires disinfection or other treatment or both, it shall be disinfected as needed to ensure that the required water quality is delivered at the point of use.~~
Nonpotable water collected on site containing untreated gray water shall be retained in collection reservoirs for a maximum of 24 hours.

1302.6.1 Gray water used for fixture flushing. Gray water used for flushing water closets and urinals shall be ~~disinfected and treated~~treated as required by ~~an on-site water reuse treatment system complying with NSF 350.~~the jurisdiction.

Delete without substitution:

TABLE 1302.7.1
~~LOCATION OF NONPOTABLE WATER REUSE STORAGE TANKS~~

~~ELEMENT~~	~~MINIMUM HORIZONTAL DISTANCE FROM STORAGE TANK (feet)~~
~~Critical root zone (CRZ) of protected trees~~	~~2~~
-	-
~~Seepage pits~~	~~5~~
~~Septic tanks~~	~~5~~
~~Water wells~~	~~50~~
-	-
~~Water service~~	~~5~~
~~Public water main~~	~~10~~

For SI: 1 foot = 304.8 mm.

~~**1302.7.3 Outlets.** Outlets shall be located not less than 4 inches (102 mm) above the bottom of the storage tank and shall not skim water from the surface.~~

~~**1302.12.6 Water quality test.** The quality of the water for the intended application shall be verified at the point of use in accordance with the requirements of the jurisdiction.~~

Reason:

1. The water quality requirement including the method and degree of disinfection is determined by the jurisdiction, and can vary between jurisdictions. For example, the BC Municipal Wastewater Regulation that governs water reuse in the province of British Columbia has four water reuse water quality classifications, two of which can be used for water reuse applications with direct public access (i.e. high potential for body contact).
2. By definition, water reuse means "treated wastewater" and for the non-potable applications considered in the Code also typically requires a high level of disinfection.
3. The requirement for the point of compliance for water quality should be left to the jurisdiction.
4. It is recommended the first sentence be deleted and the title modified to refer to the storage of untreated greywater - however, the storage requirement is usually specified by the jurisdiction.
5. The water quality requirement for using treated greywater as a source of reuse water for fixture flushing should be left to the jurisdiction, as it may vary between jurisdictions.
6. NSF/ANSI Standard 350 & 350-1, and CSA B 128.3 are treatment performance standards and not water quality standards.
7. CSA B 128.3 should be referenced where NSF/ANSI Standard 350 is appropriate to be referenced.
8. There is no reasonable rationale to restrict the the proximity of storage containers for reuse water (i.e. treated and disinfected water suitable for non-potable reuse applications) and property lines, or surface water bodies.
9. The setback requirements are expected to vary between jurisdictions - therefore the table should be deleted and a reference made to jurisdiction.
10. The requirement for an outlet from a storage tank containing non-potable reuse water (by definition treated, low turbidity of less than 2 NTU, and disinfected) to be located not less than 4 inches (102 mm) above the bottom is unecessary and in contradicition with Section 1301 which requires non-potable water storage tanks to drain from the lowest point in the tank.
11. The location of where the reuse water quality is to be met can vary from jurisdiction to jurisdiction and should be left to the jurisdiction, so stating this is unecessary as the Code does not address water quality anyway - but leaves that to the jurisdiction.

.

Bibliography: NSF/ANSI 350 and 350-1: Onsite Water Reuse
CSA B 128.3-12 Performance of Non-Potable Water Reuse Systems

Cost Impact: Will not increase the cost of construction
The proposed changes do not have cost implications.

P 266-15 : 1302.6-VASSOS5817

P 267-15

1302.7.2

Proponent: Richard Grace, Fairfax County, VA, representing VA Plumbing and Mechanical Inspectors Association (VPMIA) and VA Building Code Officials Association (VBCOA) (richard.grace@fairfaxcounty.gov)

2015 International Plumbing Code

Delete without substitution:

~~**1302.7.2 Design and construction.** Storage tanks shall be designed and constructed in accordance with Chapters 16 through 22 of the *International Building Code* and in accordance with the following standards, as appropriate for the material of the storage tank: AWWA D100, AWWA D115, AWWA D120, UL 58, UL 1746, UL 1316, UL 142, API 12F or API 12D.~~

Reason: Section 1301.9 as referenced under section 1302.7 already gives specific design and construction information for tanks. The references given to the specific standards under section 1302.7.2 leave out many material and methods used to store nonpotable water and is very restrictive and cost prohibitive.

Cost Impact: Will not increase the cost of construction
By removing the referenced section th requirement for tanks to comply with the specific listed standards is removed which allows other materials and methods to be used.

P 267-15 : 1302.7.2-HARPER4521

P 268-15

1303.1, Chapter 14

Proponent: JEFFREY HUTCHER, representing ARCSA (jhutcher@pacbell.net)

2015 International Plumbing Code

Revise as follows:

1303.1 General. ~~The provisions of Section 1303~~ASPE/ARCSA/ANSI 63 and accepted engineering practice shall govern rainwater harvesting systems inciuding the design, construction, installation, alteration and repair of rainwater collection and conveyance systems ~~for~~including th~~e collection,~~ storage, treatment and distribution of rainwater for nonpotable applications, as permitted by the jurisdiction.

Add new standard(s) as follows:
ASPE/ARCSA/ANSI 63-2013 Rainwater catchment systems

Reason: The American Rainwater Catchment Systems Association developed the ANSI accredited ASPE/ARCSA 63 Standard. It is the most comprehensive standard developed for the safe collection and design of Rainwater harvesting systems. The ARCSA standard is already the backbone of the industry and installers and manufacturers follow this standard which has been developed by experts in the field.

Cost Impact: Will not increase the cost of construction
Having reliable standards that can be followed always reduces the cost of construction when the application is already in the Code. Clarification of prescriptive and performance requirements and designs can be found in the standard

Analysis: A review of the standard proposed for inclusion in the code,ASPE/ARCSA/ANSI 63, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2015.

P 268-15 : 1303.1-HUTCHER4405

P 269-15

1303.2

Proponent: David Cantrell, representing Joint Consensus Committee on Rainwater Collection System Design and Installation (IS-RCSDI) (dave.cantrell@kingcounty.gov)

2015 International Plumbing Code

Revise as follows:

1303.2 Collection surface. Rainwater shall be collected only from above-ground impervious roofing surfaces constructed from approved materials and where *approved*, ~~materials. Collection of water from~~ vehicular parking or pedestrian ~~surfaces shall be prohibited except where the water is used exclusively for landscape irrigation. Overflow and bleed-off pipes from roof-mounted appliances including, but not limited to, evaporative coolers, water heaters, and solar water heaters shall not discharge onto rainwater collection~~walking surfaces.

Reason: Current rainwater harvesting practices include the collection of water from vehicular parking or pedestrian surfaces. While such restriction may be appropriate for collection of rainwater intended to be treated for potable use, this chapter address rainwater collection for nonpotable use. Rainwater harvesting technologies are able to safely accomodate collection from these surfaces. The change is required in order to allow the use of modern conservation techniques.

Cost Impact: Will not increase the cost of construction
This code section clarifies the type of collection surfaces and to a degree expands the use of such surfaces.

P 269-15 : 1303.2-CANTRELL5175

P 270-15

1303.3, 1303.4, 1303.15.2

Proponent: David Cantrell, representing Joint Consensus Committee on Rainwater Collection System Design and Installation (IS-RCSDI) (dave.cantrell@kingcounty.gov)

2015 International Plumbing Code

Revise as follows:

1303.3 Debris excluders. Downspouts and leaders shall be connected to~~ a roof washer and shall be equipped with ~~ a debris excluder or equivalent device that is designed to ~~prevent the contamination of collected rainwater with ~~remove leaves, sticks, pine needles and similar ~~material. Debris excluders and equivalent devices shall be self-cleaning.~~ debris to prevent such from entering the storage tank

1303.4 ~~Roof washer.~~First-flush diverter. ~~A sufficient amount of rainwater~~First-flush diverters shall ~~be diverted at the beginning of each rain event,~~operate automatically and~~ not allowed to enter the storage tank, to wash accumulated debris from the collection surface. The amount of rainfall to be diverted shall be field adjustable as necessary to minimize storage tank water contamination. The roof washer~~ shall not rely on ~~manually operated~~manually-operated valves or devices~~, and shall operate automatically~~. Diverted rainwater shall not be drained to the roof surface~~,~~ and shall be discharged in a manner consistent with the storm water runoff requirements of the jurisdiction. ~~Roof washers ~~First-flush diverters shall be accessible for maintenance and service.

1303.15.2 ~~Roofwasher~~First-flush diverter test. ~~Roofwashers ~~First-flush diverters shall be tested by introducing water into the ~~gutters~~collection system upstream of the diverter. Proper diversion of the first ~~quantity~~amount of water shall be in accordance with the requirements of Section 1303.4~~ shall be verified~~.

Reason: The intent of the provisions in these sections is to divert the initial runoff of water from a roof with its contaminants that may build up during a non-rain event so that it does not enter the storage tank. While the result is basically an initial washing of the roof area, the term "roof washer" is commonly mistaken for a mechanical device. Using the term "first-flush diverter" will allow for both the typical non-mechanical standpipe application or an approved manufacturered mechanical device. This code change deletes the mandate to install roof washers or first-flush diverters since such would not be necessary for a rainwater system serving outside landscape irrigation only or for the common practice of using rain barrels for irrigation purposes.

Cost Impact: Will not increase the cost of construction
This code change results in clarifying where non-mechanical diverters may be used, and would actually decrease the cost of installation for nonpotable reuse of rainwater.

P 270-15 : 1303.3-CANTRELL5183

P 271-15

1303.4

Proponent: JEFFREY HUTCHER, representing ARCSA (jhutcher@pacbell.net)

2015 International Plumbing Code

Delete without substitution:

1303.4 ~~**Roof washer.** A sufficient amount of rainwater shall be diverted at the beginning of each rain event, and not allowed to enter the storage tank, to wash accumulated debris from the collection surface. The amount of rainfall to be diverted shall be field adjustable as necessary to minimize storage tank water contamination. The roof washer shall not rely on manually operated valves or devices, and shall operate automatically. Diverted rainwater shall not be drained to the roof surface, and shall be discharged in a manner consistent with the storm water runoff requirements of the jurisdiction. Roof washers shall be accessible for maintenance and service.~~

Reason: Roof washer is an outdated term. There are numerous technologies such as vortex flitrations devices that not only capture contaminates, they also contain debris excluders that initiate the first flush. These devices are readily available and tested to achieve desired results. The roof washer term has caused confusion in the field where inspectors expect to see the entire roof washed before the rainwater. This is costly and unnecessary

Cost Impact: Will not increase the cost of construction
this will have no impact on construction costs except where confusion is avoided and money saved

P 271-15 : 1303.4 (New)-HUTCHER5125

P 272-15

1303.4

Proponent: JEFFREY HUTCHER, representing ARCSA (jhutcher@pacbell.net)

2015 International Plumbing Code

Revise as follows:

1303.4 ~~Roof washer.~~First flush. A sufficient amount of rainwater shall be diverted at the beginning of each rain event, and not allowed to enter the storage tank, to wash accumulated debris from the collection surface. The amount of rainfall to be diverted shall be field adjustable as necessary to minimize storage tank water contamination. The ~~roof washer~~ first flush device shall not rely on manually operated valves or devices, and shall operate automatically. Diverted rainwater shall not be drained to the roof surface, and shall be discharged in a manner consistent with the storm water runoff requirements of the jurisdiction. ~~Roof washers~~First flush devices shall be accessible for maintenance and service.

Reason: Roof washer is an outdated term that causes interpretation problems for inspectors and end users. the substitution with First flush Clarifies the section

Cost Impact: Will not increase the cost of construction
Adding clarity to the language to eliminate confusion always saves money

P 272-15 : 1303.4-HUTCHER5129

P 273-15

1303.5.2

Proponent: JEFFREY HUTCHER, representing ARCSA (jhutcher@pacbell.net)

2015 International Plumbing Code

Delete and substitute as follows:

1303.5.2 ~~Size~~Gutter and piping sizes. ~~Gutters and downspouts shall be installed and sized in accordance with Section 1106.6 and local rainfall rates.~~
The rainwater flow for the design of gutters and rainwater conveyance systems shall be in accordance with Section 1106.1. Where a rainwater conveyance system with gutter collection is designed for gravity flow of rainwater to the storage tank entirely by partially-full piping, the size of the roof gutters, leaders, conductors and horizontal drains shall be not less than as required by Section 1106. Where a rainwater conveyance system with gutter collection is designed for rainwater to flow to the storage tank whether partially or entirely by piping sections that are flooded with water, the size of the roof gutters, leaders, conductors and horizontal drains shall be not less than sizes determined by accepted engineering practice for preventing loss of rainwater at the gutters. The accepted engineering practice-determined sizes shall not be less than what is required by Section 1106.

Reason: Rainwater harvesting systems may be dry or wet conveyance. Wet conveyance systems typically use larger diameter piping on the downspouts to prevent flooding as the water rises from grade level to the tank inlet. Hydraulics, Head pressures and friction loss tables and formulas found in the ARCSA Manual are typically used by Rainwater Harvesting designers to calculate gutter and downspout size.

Cost Impact: Will not increase the cost of construction
Consistence and clarity always saves money and prevents costly mistakes. Piping that is too small can flood the gutters and render a collection system inefficient or useless in heavy rains. The new wording alerts the end user that chapter 11 may not be adequate for a wet conveyance system

P 273-15 : 1303.5.2-HUTCHER5153

P 274-15

1303.10.1

Proponent: Troy Vassos, Golder Associates Ltd., representing self (tvassos@golder.com)

2015 International Plumbing Code

Delete without substitution:

~~**1303.10.1 Location.** Storage tanks shall be located with a minimum horizontal distance between various elements as indicated in Table 1303.10.1.~~

Reason:

1. There is no reason to require horizontal setbacks for rainwater storage units.
2. Any setback requirements should be left to the discretion of the jurisdiction.

Cost Impact: Will not increase the cost of construction
The elimination of horizontal setbacks will not add to cost.

P 274-15 : 1303.10.1-VASSOS5819

P 275-15

1303.15.8, 1303.15.9 (New)

Proponent: David Cantrell, representing Joint Consensus Committee on Rainwater Collection System Design and Installation (IS-RCSDI) (dave.cantrell@kingcounty.gov)

2015 International Plumbing Code

Revise as follows:

1303.15.8 Water quality test. The quality of the water for the intended application shall be verified at the point of use in accordance with the requirements of the jurisdiction. ~~Except where site conditions as specified in ASTM E 2727 affect the rainwater, collected rainwater shall be considered to have the parameters indicated in Table 1303.15.8.~~

Delete without substitution:

~~TABLE 1303.15.8~~
~~RAINWATER QUALITY~~

~~PARAMETER~~	~~VALUE~~
~~pH~~	~~6.0-7.0~~
~~BOD~~	~~Not greater than 10 mg/L~~
~~NTU~~	~~Not greater than 2~~
~~Fecal coliform~~	~~No detectable fecal coli in 100 mL~~
~~Sodium~~	~~No detectable sodium in 100 mL~~
~~Chlorine~~	~~No detectable chlorine in 100 mL~~
~~Enteroviruses~~	~~No detectable enteroviruses in 100 mL~~

Add new text as follows:

1303.15.9 Collected raw rainwater quality. ASTM E2727 shall be used to determine what, if any, site conditions impact the quality of collected raw rainwater and whether those site conditions require treatment of the raw water for the intended end use or make the water unsuitable for specific end uses.

Reason: Table 1303.15.8 presents qualities that would wrongly be assumed to be typical of collected rainwater by many users of this code. The site conditions that affect collected rainwater quality vary significantly and often from one place to another. Directing the user to the ASTM standard alone without providing the table will result in a much better assesment of the collected rainwater quality and result in much better design of the required treatment and determination of suitablity for an intended use. It is currently unclear as to whether the second sentence of Section 1303.15.8 applies to the raw collected rainwater or the product (treated) water to be used for a specific purpose. Breaking Section 1303.15.8 into two separate and distinct sections will improve clarity and application.

Cost Impact: Will not increase the cost of construction
This code change merely describes what is involved in the water quality test. It does not add additional testing requirements.

P 275-15 : 1303.15.8-CANTRELL5165

P 276-15

1303.15.8

Proponent: JEFFREY HUTCHER, representing ARCSA (jhutcher@pacbell.net)

2015 International Plumbing Code

Revise as follows:

1303.15.8 Water quality test. The quality of the ~~water~~rainwater for the intended application shall be verified at the point of use in accordance with the requirements of the jurisdiction. ~~Except where site conditions as specified in ASTM E 2727 affect the rainwater, collected rainwater shall be considered to have the parameters indicated in Table 1303.15.8.~~

Reason: ASTM E 2727 does not address the differing regulations that govern water quality. Since Jurisdictions have different requirements, testing shall reflect the Jurisdictions guidelines for different intended uses. Testing to ASTM E 2727 guidelines may not be acceptable to the jurisdiction. In addition, ASTM E 2727 does not account for different intended uses, commercial or otherwise. The water quality standard for a residential subsurface irrigation system would not have the same treatment requirements as cooling tower make up water.

Cost Impact: Will not increase the cost of construction
Since jurisdictions have different protocols and requirements regarding rainwater quality, even using the data in ASTM E 2727 may not apply. It is up to the permittee to obtain the jurisdiction's requirements regardless.

P 276-15 : 1303.15.8-HUTCHER5157

P 277-15

Table 1303.15.8

Proponent: Troy Vassos, Golder Associates Ltd., representing self (tvassos@golder.com)

2015 International Plumbing Code

Delete without substitution:

TABLE 1303.15.8
~~RAINWATER QUALITY~~

~~PARAMETER~~	~~VALUE~~
~~pH~~	~~6.0-7.0~~
~~BOD~~	~~Not greater than 10 mg/L~~
~~NTU~~	~~Not greater than 2~~
~~Fecal coliform~~	~~No detectable fecal coli in 100 mL~~
~~Sodium~~	~~No detectable sodium in 100 mL~~
~~Chlorine~~	~~No detectable chlorine in 100 mL~~
~~Enteroviruses~~	~~No detectable enteroviruses in 100 mL~~

Reason:

1. Rainwater quality should be left to the jurisdiction as water quality requirments can vary from jurisdiction to jurisdiction.
2. BOD and chlorides are not apporpriate water quality parameters for rainwater.
3. pH range is too narrow and does not reflect the potential for acid rain (low pH). The range is more restrictive than wastewater effluent discharges

Cost Impact: Will not increase the cost of construction
No additional cost to eliminating WQ requirments for rainwater

P 277-15 : T1303.15.8-VASSOS5821

P 278-15

1304.3.1.3

Proponent: Troy Vassos, Golder Associates Ltd., representing self (tvassos@golder.com)

2015 International Plumbing Code

Revise as follows:

1304.3.1.3 Labeling and marking. Nonpotable ~~rainwater~~ distribution piping labeling and marking shall comply with Section 608.8.

Reason:

1. Reclaimed water is not rainwater. Reclaimed water is reuse water, or wastewater that has been treated to an acceptable water quality standard for nonpotable water applications.

Cost Impact: Will not increase the cost of construction
Rainwater should not be referenced in the section - this is a zero cost correction.

P 278-15 : 1304.3.1.3-VASSOS5818

PSD 1-15

505.13.1

Proponent: Pennie L Feehan, representing Copper Development Association (penniefeehan@me.com)

2015 International Private Sewage Disposal Code

Revise as follows:

505.13.1 Copper pipe or ~~copper-alloy~~ tubing to cast-iron hub pipe. Joints between copper pipe or ~~copper-alloy~~ tubing and cast-iron hub pipe shall be made with a ~~brass~~ copper-alloy ferrule or compression joint. The copper pipe or ~~copper-alloy~~ tubing shall be soldered to the ferrule in an approved manner, and the ferrule shall be joined to the cast-iron hub by a caulked joint or a mechanical compression joint.

Reason: This proposal cleans up the section and does not change the intent. This proposal will match IPC Section 705.16.1.

Cost Impact: Will not increase the cost of construction
This proposal will not increase the cost of construction as this change is only to update the name of a material that is already in the code.

PSD 1-15 : 505.13.1-FEEHAN3988

301.4 (New), [A] 110.1, 202 (New),

Proponent: Tom Leatherbee, Oklahoma Floodplain Managers Association, representing Oklahoma Floodplain Managers Association (tleatherbee@cityofdelcity.org); Rebecca Quinn, RCQuinn Consulting, Inc., representing on behalf of Federal Emergency Management Agency (rcquinn@earthlink.net); Gregory Wilson (gregory.wilson2@fema.dhs.gov)

2015 International Property Maintenance Code

Add new text as follows:

301.4 Structures located in flood hazard areas. For structures located in flood hazard areas as defined in the International Building Code, all costs of all repairs and improvements necessary to bring the exterior and interior of a structure, excluding exterior property, into compliance with the minimum standards of this code shall be included when determining substantial improvement, including all costs related to correcting cited violations.

Revise as follows:

[A] 110.1 General. The *code official* shall order the *owner* or owner's authorized agent of any *premises* upon which is located any structure, which in the *code official's* or owner's authorized agent judgment after review is (1) so deteriorated or dilapidated or has become so out of repair as to be dangerous, unsafe, insanitary or otherwise unfit for human habitation or occupancy, and such that it is unreasonable to repair the structure, to demolish and remove such structure; or (2) if such structure is capable of being made safe by repairs, to repair and make safe and sanitary, or to board up and hold for future repair or to demolish and remove at the *owner's* option; or (3) where there has been a cessation of normal construction of any structure for a period of more than two years, the *code official* shall order the *owner* or owner's authorized agent to demolish and remove such structure, or board up until future repair; or (4) where structures, if located in flood hazard areas established in the *International Building Code*, are determined to have incurred *substantial damage*, the *code official* shall order the owner to demolish and remove such structure, or board up until future repair. Boarding the building up for future repair shall not extend beyond one year, unless *approved* by the building official.

Add new definition as follows:

SECTION 202 DEFINITIONS

SUBSTANTIAL DAMAGE. Damage of any origin sustained by a structure whereby the cost of restoring the structure to its before-damaged condition would equal or exceed 50 percent of the market value of the structure as of the date the code official issues an order pursuant to this code.

SECTION 202 DEFINITIONS

SUBSTANTIAL IMPROVEMENT. Any repair, reconstruction, rehabilitation, alteration, addition or improvement of a building or structure, the cost of which equals or exceeds 50 percent of the market value of the structure before the improvement or repair is started. If the structure has sustained substantial damage, as defined in the International Building Code or the International Existing Building Code, any repairs are considered substantial improvement regardless of the actual repair work performed. For the purpose of this code, the term does not include any alteration of a historic structure provided that the alteration will not preclude the structure's continued designation as a historic structure.

Reason: The broad scope and intent of the IPMC can create difficulties for code officials attempting to apply the code to dilapidated structures in flood hazard areas that when those structures are determined to not comply with IPMC provisions intended to ensure public health, safety and welfare. The flood provisions of the IBC, IRC, and IEBC apply to buildings in flood hazard areas if the code official determines that proposed improvements are "substantial improvement" and if the code official determines buildings have incurred "substantial damage. Both terms are defined in the IBC and IEBC and require comparison of costs to market value of the building. Substantial damage may be triggered by damage of any cause. Most damage results from sudden events, such as fire, tornado, earthquake, or flood.
When applied to structures that have been neglected and become dilapidated and unsafe over time, the basic substantial damage and substantial improvement requirements can be undermined by an existing provision in the IBC/IEBC definition of substantial improvement that allows exclusion of costs to correct identified code violations. Once a structure has been cited under the IPMC, it's conceivable that most if not all costs to correct cited conditions could be excluded.

Another aspect of the IBC/IEBC definition for substantial damage is problematic when applied to buildings that have been neglected and become dilapidated and unsafe over time, and that is the determination of market value of the building. When a building is damaged by a sudden event, it is relatively straightforward to determine the market value "before the damage occurred." It is not straightforward when the damage has occurred over time – what date should be used to determine the market value "before the damage occurred"?

This proposal has two objectives: (1) to specify, for substantial damage, the date of the market value is the date the code official issues an order pursuant to the IPMC; and (2) to remove the provision that allows excluding costs to correct cited violations from the substantial improvement determination when an owner proposes repairing a building pursuant to an order issued pursuant to the IPMC.

Section 110.1 is modified by including structures determined to have incurred substantial damage in the list of conditions that warrant an order of demolition or boarding up until future repair. If future repair is pursued by the owner, the substantial damage determination means the repairs would have to bring the building into compliance with the flood provisions in the IBC or IRC, as applicable. One result of this change is that many more owners are likely to consider demolition, in which case replacement structures would have to comply with all requirements of the IBC/IRC, resulting in all the benefits associated with compliance (resistance to all loads, improved fire safety, energy efficiency, etc.).

Section 202 is modified by adding definitions for Substantial Damage and Substantial Improvement; however, both definitions differ from those in the IBC and IEBC. The proposed definition of Substantial Damage makes clear that the market value of the structure is the date of the code official's order pursuant to the IPMC, avoiding an ambiguity. Without this clarification, an owner may claim the market value should be the value of the building before maintenance starting being neglected, which could be many years in the past (and typically not easy to determine). The proposal to specify the market value as of the date of an order is likely be a higher market value (thus raising the 50% threshold) than the market value as of the date an application for a permit to perform repairs is received (which may be a year or more after the citation is issued), as recommended in FEMA guidance in Section 4.5 of FEMA's Substantial Improvement/ Substantial Damage Desk Reference (FEMA P-758).

The proposed definition of Substantial Improvement removes the provision that allows exclusion of certain costs, thus requiring the costs of all work to be included in the calculation.

Section 301 is modified by adding a new section with plain language that makes it clear all interior and exterior costs are included when Substantial Improvement is determined, and emphasizes that all costs of all repairs and improvements necessary to correct existing cited violations must be included.

Without these amendments, dilapidated and unsafe buildings in flood hazard areas might not trigger the substantial improvement and substantial damage requirements, and thus could be repaired and remain vulnerable to future flooding. In many communities, many buildings that are cited under the IPMC are low income housing. If allowed to remain at-risk of flooding, people who have few resources to recover loss of personal property will remain exposed to flooding.

The combined result of these amendments is to strengthen the applicability of the IPMC as it relates to structures in flood hazard areas by identifying substantial damage as a trigger for a demolition order, removing ambiguity with regard to determining market value for substantial damage determinations, and eliminating an enforcement problem created by the exclusion of some repair costs from the substantial improvement calculation.

A real-life example illustrates the difficulties that will be easier to address if this proposal is approved. A code official was faced with ordering demolition of a dilapidated apartment complex that had been damaged by flooding and left unrepaired for several years (see Figure). The code official, pursuant to the IBC and the community's floodplain management regulations, determined that the structures were substantially damaged. The code official concurrently issued a demolition order pursuant to Section 110 of the IPMC, as the structures were unsafe, insanitary, and unreasonable to repair. This demolition order cited specific exterior and interior conditions in making these determinations. Subsequent application for a remodel permit was denied because the work proposed was determined to be substantial improvement, and the applicant did not propose bringing the building into compliance with the flood requirements. On appeal, the property owner challenged the substantial damage/substantial improvement determinations because virtually all of the proposed repairs would be to correct cited violations of the IPMC, and thus the applicant claimed those costs should be excluded from the determination.

Had the code official's order to demolish or bring the building into compliance been overturned, the apartment buildings could have been repaired in a manner that left them at continued risk for flooding, contrary to the intent of IBC 1612 and local flood damage prevention regulations. These specific buildings, as a result of a somewhat unrelated proceeding, were eventually demolished and the land redeveloped with commercial buildings that incorporate significant flood mitigation measures.

Figure. Interior Condition at Kristie Manor Apartments at time of Demolition Order and Substantial Damage Declaration. The buildings had flooded multiple times, each time experiencing further deterioration. Note the high water mark and mold. Had the apartment buildings been repaired without bringing it into compliance with the flood requirements, the structures and occupants would have remained at risk for this sort of damaging and life-threatening flooding due to their location in a floodway.

Bibliography: Substantial Improvement/Substantial Damage Desk Reference, FEMA P-758. Federal Emergency Management Agency. 2010. http://www.fema.gov/library/viewRecord.do?id=4160

Cost Impact: Will not increase the cost of construction
The effect on costs will vary on a case-by-case basis. There are scenarios where demolishing and rebuilding fully compliant will likely be less expensive than retrofitting or elevating an existing building to bring it into compliance with the flood requirements. Long-term maintenance and operations cost would also be less, and the cost of NFIP flood insurance will be considerably lower. Costs may increase in other scenarios, especially when Substantial Improvement is triggered because costs to correct existing cited violations are not subtracted, although the cost of NFIP flood insurance will be considerably lower than if the building remains at risk to flooding.

2015 International Property Maintenance Code

Revise as follows:

SECTION 202 DEFINITIONS

INFESTATION. The noxious presence~~,~~ within or contiguous to~~,~~ a structure or *premises* of insects, rodents, vermin or other pests.

Add new definitions as follows:

INSECT. All species of classes of Arachnida and Insecta (Hexapoda) of the phylum Arthropoda including flies, mosquitoes, bed bugs, crickets, cockroaches, moths, bees, wasps, hornets, fleas, lice, beetles, weevils, gnats, ants, termites, mites, ticks, spiders, and scorpions.

PEST. Noxious insect, rodent, or other vermin.

RODENT. A member of the order Rodentia, including but not limited to field and wood mice, wood rats, squirrels, woodchucks, gophers, Norway rats (Rattus norvegicus), roof rats (Rattus rattus), and house mice (Mus musculus).

SANITARY. A condition that is free of infestation, pest residues, rotting material, uncontained sewage or animal waste, and accumulation of rubbish or garbage.

Revise as follows:

302.5 Rodent harborage. Structures and *exterior property* shall be kept free from rodent harborage and *infestation*. There shall be no accumulation of trash, paper, boxes, firewood, lumber, scrap metal, food, or other materials that support rodent harborage in or around any dwelling or premises. Stored materials shall be placed in boxes or stacked in stable piles elevated at least six inches (152 mm) above the ground or floor and at least six inches (152 mm) from the walls. There shall be no accumulation of stagnant water in or around any dwelling or premises. Where rodents are found, they shall be promptly ~~exterminated~~eliminated by *approved* processes that will not be injurious to human health. After pest elimination, proper precautions shall be taken to ~~eliminate rodent~~remove food and water sources or harborage ~~and~~to prevent reinfestation.

Add new text as follows:

302.5.1 Rodent prevention. There shall be no trees, shrubs, or other plantings in the soil within six inches (152 mm) of any dwelling.

302.5.2 Rodent exclusion. There shall be no holes or open joints in exterior walls, foundations, slabs, floors, or roofs that equal or exceed one-quarter inch (6 mm). The areas surrounding windows, doors, pipes, drains, wires, conduits, vents, and other openings that penetrate exterior walls shall be sealed.

Revise as follows:

309.1 Infestation. Structures shall be kept free from insect and rodent *infestation. Infestations*~~Structures in which insects or rodents are found~~ shall be promptly ~~exterminated~~eliminated by *approved* processes that will not be injurious to human health. After pest elimination, proper precautions shall be taken to prevent reinfestation.

309.2 Owner. The *owner* of any structure shall be responsible for pest elimination within the structure prior to renting or leasing the structure. The *owner* shall maintain the building and premises to keep pests from entering the building and dwelling units; inspect and monitor for pests; and investigate occupant reports of unsafe or unhealthy conditions; provide written responses to occupant reports; and make needed repairs in a timely manner

309.5 Occupant. The *occupant* of any structure shall be responsible for the continued rodent and pest-free condition of the structure. The *occupant* shall inspect and monitor for pests; report infestations to the owner; and cooperate with the owner's requests to ensure pest-free conditions.

Exception: Where the *infestations* are caused by defects in the structure, the *owner* shall be responsible for pest elimination.

Add new text as follows:

APPENDIX APPENDIX BINTEGRATED PEST MANAGEMENT

SECTION B101 General

B101.1 General. Integrated pest management (IPM) methods shall be used to maintain every dwelling free of infestation, openings that allow pest entry, conditions that harbor pests or provide them with food or water, and visible pest residue or debris.

B101.2 Integrated pest management defined. A systematic strategy for managing pests that consists of prevention, exclusion, monitoring, and suppression of pests. Where chemical pesticides are necessary, a preference is given to materials and methods that maximize safety and reduce environmental health risk. Methods to manage pests include eliminating their harborage places; removing or making inaccessible their food and water sources; routine inspection and monitoring; identification of evidence found; treatment that is scaled to and designed for the infestation; and using pesticides with the lowest toxicity in a manner with the least exposure to residents and the environment.

B101.3 Pest management professional. In multi-family housing, a pest management professional who is certified or trained in integrated pest management shall develop and manage the pest elimination program.

B101.4 Pesticide use. Only pesticides that are registered for use with the U.S. Environmental Protection Agency and the state's regulatory agencies may be used. Foggers and organic phosphates shall only be used by firms and individuals licensed by the state to apply these pesticides.

Reason: This proposal is designed to address a number of problems regarding the IPMC's existing pest-related provisions and to add an optional appendix regarding integrated pest management for jurisdictions seeking to eliminate pests more effectively and consistently. The primary objective of the proposal is to make the requirements clearer and easier to comply with for owners and operators as well as code officials who are not pest management professionals.

1. Proposed changes to terminology and definitions:

- **Extermination v. elimination:** The 2009 edition of the IPMC replaced the outdated term "extermination" with the outcome-focused term "pest elimination" and dropped descriptions of pest elimination such as "fumigation" and "poison spraying." However, sections 302.5 on rodent harborage and 309.1 on infestation retained the word "exterminated." The term is not defined. This proposal corrects that inconsistency by using "eliminated" instead.
- **Infestation and honey bees or crickets:** The term "infestation" is currently defined as "The presence, within or contiguous to, a structure or premises of insects, rats, vermin or other pests." It has a number of serious problems:
  - It is not a sentence. It essentially says, "The presence a structure or premises of pests." We propose deleting the commas before and after "within or contiguous" to make it grammatically correct.
  - It would call for the elimination of beneficial insects, such as honey bees and crickets outside, because they are insects under a common meaning of the term. We propose to add the word "noxious" to narrow the scope to those insects which are harmful to living things (the meaning of noxious[1]) and exclude beneficial or innocuous insects. We considered other terms, but, since noxious is already used in section 302.4 regarding weeds and section 403.4 regarding process ventilation, we wanted to avoid creating a new term for code officials to interpret. We put the word before "presence" to make clear that where an insect or animal is present makes a difference. A squirrel inside a home would be a noxious presence but outside it would not be one.
  - By adding the word "noxious," we think it is appropriate to replace "rats" with "rodents". Rodents such as squirrels are fine outside a structure, but if inside they are an infestation that needs to be eliminated. In addition, the term "rodents" is used 11 times in the code including in the definition of "pest elimination."
- **Define basic terms used throughout the code:** The code does not define four pest-related terms

(insect, rodent, pest, and sanitary) despite their use many places in the code. Without definitions for these terms, property owners, managers, and occupants may have very different understandings of what the code requires. As a result, their disputes may limit the effectiveness of the code and undermine its intent of protecting health and safety. It also burdens code officials who are called upon to intervene with their own interpretation.

  - "Insect" is used eight times. Sometimes the use means all insects such as for screens and doors, and other times more narrowly in conjunction with the term "infestation." The proposal defines it as the classes of Arachnida and Insecta in the phylum Arthopoda and gives common examples. While technically spiders (a member of Arachnida) are not insects, they are commonly considered insects.
  - "Rodent" is used 13 times. The proposal defines it as members of the order Rodentia and gives common examples.
  - "Pest" is used 11 times. The proposal defines it as "noxious insect, rodent, or other vermin." This definition is also important because federal law defines the term more broadly to include weeds, mold, and bacteria. In the structural setting, the common understanding of pests does not include these items. We recognize that the word "noxious" is somewhat redundant but think the clarity helps.
  - "Sanitary" is used 29 times. The proposal defines it as "a condition that is free of infestation, pest residues, rotting material, uncontained sewage or animal waste, and accumulation of rubbish or garbage." This definition captures our understanding of what the term means based on a review of the 29 uses. Each of these conditions can cause diseases or attract pests that undermine the occupant's health.

- **Harborage and exclusion:**
  - The term "harborage" is used four times in the code: in the definition of "pest elimination" and in section 302.5 regarding rodent harborage. However, the term is not defined and the section dealing with rodent harborage says the harborage must be eliminated but does not explain what it is or give any examples. Rather than create a definition, the proposal adds a description that gives examples of materials that can be harborage; explains that stored materials need to be 6" from the floor or walls to limit harborage; and says that there should not be an accumulation of stagnant water. Rodents need a ready source of water to survive, especially mice. Many experts call for 18", but we thought that was excessive.
  - The proposal adds two new sections under the rodent harborage section. Section 302.5.1 calls for plantings to be 6" from a dwelling to make it more difficult for rodents to access the dwelling since they do not want to be visible while seeking an opening to the structure. Section 302.5.2 calls for exterior openings to be less than 1/4" since mice can go through holes or cracks bigger than that amount.

2. Proposed clarification of owner and occupant responsibilities:

The proposal more clearly defines the relative responsibilities of the owner and the occupant in the rental setting. It requires the occupant to inspect and monitor for pests, report infestations to the owner, and cooperate with the owner's requests to ensure pest-free conditions. The owner would be required to maintain the exterior of the building, inspect and monitor for pests, investigate complaints, and provide feedback to occupants on the resolution of their complaints.

In a single-occupant or single-tenant structure, existing section 309.3 makes the occupant/tenant fully responsible.

By removing these ambiguities in the current code, code officials should be able to resolve disputes more easily and reduce the need to defend interpretations.

3. Proposed optional requirements in an appendix for integrated pest management:

The proposal adds an appendix that jurisdictions may elect to adopt if they want to require integrated pest management (IPM). This pest elimination has been shown to be more consistently effective, especially when someone with asthma may be in the structure. It uses a systematic strategy to prevent, exclude, monitor, and suppress pests. It also promotes the use of the least toxic pesticide in a manner with the least exposure to residents and the environment.

Proposed new section B101.2 would require that a pest management professional trained in IPM conduct the pest elimination in multi-family housing. In these situations, pest elimination is particularly difficult because of the shared control. The National Pest Management Association, which represents most of the country's firms, certifies firms who adopt and implement IPM under its GreenPro certification program.[2]

Proposed new section B101.4 would remind owners and operators that only pesticides approved by the state and federal government may be used. In addition, it would require a state-licensed firm to apply foggers and organophosphates because these pesticide applications are liable to be misused by an individual and result in dangerous exposures.

Bibliography:
[1] Noxious, Merriam-Webster Dictionary, Encyclopedia Britannica Company, accessed January 7, 2015 at http://www.merriam-webster.com/dictionary/noxious.
[2] GreenPro, National Pest Management Association, accessed January 7, 2015 at http://www.certifiedgreenpro.org/.

Cost Impact: Will not increase the cost of construction
The proposal will not increase the cost of construction. The requirement in the optional appendix to use an IPM-trained pest management professional to control pests may increase the labor rates charged by the firm, but these costs should be offset by the savings from more effective pest control.

2015 International Property Maintenance Code

SECTION 202 DEFINITIONS

Delete without substitution:

~~**DETACHED.** When a structural element is physically disconnected from another and that connection is necessary to provide a positive connection.~~

~~**EQUIPMENT SUPPORT.** Those structural members or assemblies of members or manufactured elements, including braces, frames, lugs, snuggers, hangers or saddles, that transmit gravity load, lateral load and operating load between the equipment and the structure.~~

Revise as follows:

302.7 Accessory structures. Accessory structures, including *detached* garages, fences and walls, shall be maintained ~~structurally sound and~~ in good repair.

304.1 General. The exterior of a structure shall be maintained in good repair~~, structurally sound~~ and sanitary so as not to pose a threat to the public health, safety or welfare.

304.4 Structural members. Structural members shall be maintained free from *deterioration*~~, and shall be capable of safely supporting the imposed dead and live loads~~.

304.10 Stairways, decks, porches and balconies. Every exterior stairway, deck, porch and balcony, and all appurtenances attached thereto, shall be maintained ~~structurally sound,~~ in good repair, with proper anchorage~~ and capable of supporting the imposed loads~~.

304.11 Chimneys and towers. Chimneys, cooling towers, smoke stacks, and similar appurtenances shall be maintained~~ structurally safe and sound, and~~ in good repair. Exposed surfaces of metal or wood shall be protected from the elements and against decay or rust by periodic application of weathercoating materials, such as paint or similar surface treatment.

305.1 General. The interior of a structure and equipment therein shall be maintained in good repair~~, structurally sound~~ and in a sanitary condition. *Occupants* shall keep that part of the structure that they occupy or control in a clean and sanitary condition. Every *owner* of a structure containing a *rooming house*, *housekeeping units*, a hotel, a dormitory, two or more *dwelling unit*s or two or more nonresidential occupancies, shall maintain, in a clean and sanitary condition, the shared or public areas of the structure and *exterior property*.

305.2 Structural members. Structural members shall be maintained ~~structurally sound, and be capable of supporting the imposed loads.~~free from deterioration.

306.1 General. The components of a structure and equipment therein shall be maintained in good repair~~, structurally sound~~ and in a sanitary condition.

Reason: This proposal clarifies the scope of the IPMC with respect to structural maintenance, structural assessment, and structural repair. Sections 101.2 and 102.2 establish the scope and applicability of the IPMC as related to "light, ventilation, space, heating, sanitation, protection from the elements, ... fire and other hazards," but not structural damage or capacity loss. The IPMC Chapters clarify this further, as they cover weather effects and deterioration from various causes (Chapter 3), light and ventilation (4), plumbing (5), mechanical and electrical systems (6), and fire safety (7), but not structural assessment or adequacy. Thus, identification and remedy of structural capacity loss is outside the scope of the IPMC. Rather, structural capacity loss is already addressed fully by the IEBC in terms of intentional alteration, repair of damage, and attention to dangerous conditions.

This is appropriate. Indeed, if you have a structural problem, it's actually too late for maintenance of the types covered by the IPMC. Yes, structural elements can deteriorate, and do need maintenance, but (with the possible exception of mortared masonry), that maintenance is provided indirectly through weather tightness, drainage, pest control, etc. -- that is, by providing IPMC-compliant maintenance of roofing, flashing, drains, fireproofing, and sealants. The structural elements themselves, properly built and sealed, are the most durable parts of a building. If you have a structural deterioration problem, it is not because you failed to maintain the steel, concrete, masonry, or wood, but because you deferred maintenance on other NON-structural building components. Further, repair of any such structural damage, unlike MEP or roofing maintenance, usually requires engineering and is not done by a contractor alone.

This proposal therefore clarifies and removes various references to structural elements, loads, and capacities, as follows. (Note: The IPMC uses the term "structure" to mean anything built or constructed, not necessarily just the structural load-carrying members and systems. In most cases, "structure" in the IPMC means the same thing as "building," as defined in the IBC. This proposal accepts the IPMC's use of "structure," despite the possible confusion with "structural member," and does not make any changes that would affect this usage.)

Sections 304.4 and 305.2, as modified by this proposal, provide all that is necessary in the IPMC: Protect the structure from deterioration. But once that deterioration has advanced to the point of capacity loss (because the maintenance was not provided), it becomes damage and is subject to provisions for repair through the IEBC, not maintenance through the IPMC. This is consistent with IPMC Sections 101.3 and 102.3. Section 101.3 charges that "Existing structures and premises that do not comply with these provisions shall be altered or repaired ... ." Section 102.3 then clarifies that "Repairs ... or alterations ... shall be done in accordance with [the IBC or IEBC]."

The term "detached" is unnecessary because it is defined in the IPMC only in terms of structural elements and used only in provisions for unsafe buildings or, inconsistently, as "detached garage." Unsafe structures are already covered by the IEBC, where the definition of dangerous includes consideration of detachment of both structural and nonstructural components, but without the need to define this common English word.

The term "equipment support" refers to structural members and fasteners already covered by the IBC and IEBC. Further, neither this term nor its variants are used anywhere in the IPMC apart from this definition.

The phrase "structurally sound" (or similar) is deleted because it is undefined and unenforceable and has been removed from the IBC and IEBC for that reason over the last few cycles. More important, the IPMC uses this phrase in general charging language where it is unnecessary. Where the point is just to say that certain conditions must be maintained per the IPMC, it is enough to say, as the code does, that they be maintained "in good repair," which includes whatever is intended by "structurally sound." The details of how to do that are then provided in separate provisions for roofing, sealants, pest control, etc.

The phrase "capable of supporting loads" (or similar) is deleted because this is an engineering determination, not a maintenance task. Those implementing the IPMC should not be made responsible for checking structural adequacy. (If anything, they should be responsible for ensuring that the structure is not intentionally over-loaded or cut away, but it is unclear if the IPMC intends to address such actions. In any case, the judgment of whether an over-loaded or cut structural member is still adequate is again an engineering task, not a maintenance task.)

If approved, a coordinated proposal will be made in Group B to address related issues in Chapter 1.

Cost Impact: Will not increase the cost of construction
The proposal merely clarifies the scope of the IPMC with respect to the IEBC, removing duplication and potentially confusing overlaps.

PM 3-15 : 302.7-BONOWITZ5227

304.1.1, 305.1.1, 306.1.1

Proponent: David Bonowitz, David Bonowitz, S.E., representing Existing Buildings Subcommittee, National Council of Structural Engineers Associations (dbonowitz@att.net)

2015 International Property Maintenance Code

Revise as follows:

304.1.1 Unsafe conditions. ~~The following~~
Unsafe conditions ~~shall be determined as unsafe and~~ shall be repaired or replaced ~~to comply~~in compliance with the~~*International Building Code* or the~~ *International Existing Building Code*. ~~as required for existing buildings:~~

1. ~~The nominal strength of any structural member is exceeded by nominal loads, the load effects or the required strength;~~
2. ~~The *anchorage* of the floor or roof to walls or columns, and of walls and columns to foundations is not capable of resisting all nominal loads or load effects;~~
3. ~~Structures or components thereof that have reached their limit state;~~
4. ~~Siding and masonry joints including joints between the building envelope and the perimeter of windows, doors and skylights are not maintained, weather resistant or water tight;~~
5. ~~Structural members that have evidence of *deterioration* or that are not capable of safely supporting all nominal loads and load effects;~~
6. ~~Foundation systems that are not firmly supported by footings, are not plumb and free from open cracks and breaks, are not properly *anchored* or are not capable of supporting all nominal loads and resisting all load effects;~~
7. ~~Exterior walls that are not *anchored* to supporting and supported elements or are not plumb and free of holes, cracks or breaks and loose or rotting materials, are not properly *anchored* or are not capable of supporting all nominal loads and resisting all load effects;~~
8. ~~Roofing or roofing components that have defects that admit rain, roof surfaces with inadequate drainage, or any portion of the roof framing that is not in good repair with signs of *deterioration*, fatigue or without proper anchorage and incapable of supporting all nominal loads and resisting all load effects;~~
9. ~~Flooring and flooring components with defects that affect serviceability or flooring components that show signs of *deterioration* or fatigue, are not properly *anchored* or are incapable of supporting all nominal loads and resisting all load effects;~~
10. ~~Veneer, cornices, belt courses, corbels, trim, wall facings and similar decorative features not properly anchored or that are anchored with connections not capable of supporting all nominal loads and resisting all load effects;~~
11. ~~Overhang extensions or projections including, but not limited to, trash chutes, canopies, marquees, signs, awnings, fire escapes, standpipes and exhaust ducts not properly *anchored* or that are *anchored* with connections not capable of supporting all nominal loads and resisting all load effects;~~
12. ~~Exterior stairs, decks, porches, balconies and all similar appurtenances attached thereto, including *guards* and handrails, are not structurally sound, not properly *anchored* or that are *anchored* with connections not capable of supporting all nominal loads and resisting all load effects; or~~
13. ~~Chimneys, cooling towers, smokestacks and similar appurtenances not structurally sound or not properly *anchored*, or that are anchored with connections not capable of supporting all nominal loads and resisting all load effects.~~

Exceptions:

1. Where substantiated otherwise by an *approved* method.
2. Demolition of unsafe conditions shall be permitted where *approved* by the *code official*.

305.1.1 Unsafe conditions. ~~The following~~ Unsafe conditions ~~shall be determined as unsafe and~~ shall be repaired or replaced ~~to comply~~in compliance with ~~the *International Building Code* or~~ the *International Existing Building Code*. ~~as required for existing buildings:~~

1. ~~The nominal strength of any structural member is exceeded by nominal loads, the load effects or the required strength;~~
2. ~~The anchorage of the floor or roof to walls or columns, and of walls and columns to foundations is not capable of resisting all nominal loads or load effects;~~
3. ~~Structures or components thereof that have reached their limit state;~~

4. ~~Structural members are incapable of supporting nominal loads and load effects;~~
5. ~~Stairs, landings, balconies and all similar walking surfaces, including *guards* and handrails, are not structurally sound, not properly *anchored* or are *anchored* with connections not capable of supporting all nominal loads and resisting all load effects;~~
6. ~~Foundation systems that are not firmly supported by footings are not plumb and free from open cracks and breaks, are not properly *anchored* or are not capable of supporting all nominal loads and resisting all load effects.~~

Exceptions:

1. Where substantiated otherwise by an *approved* method.
2. Demolition of unsafe conditions shall be permitted when *approved* by the *code official.*

306.1.1 Unsafe conditions. ~~Where any of the following conditions cause the component or system to be beyond its limit state, the component or system shall be determined as unsafe~~
Unsafe components and systems shall be repaired or replaced ~~to comply~~in compliance with ~~the *International Building Code* or~~ the *International Existing Building Code*. ~~as required for existing buildings:~~

1. ~~Soils that have been subjected to any of the following conditions:~~
   - 1.1. ~~Collapse of footing or foundation system;~~
   - 1.2. ~~Damage to footing, foundation, concrete or other structural element due to soil expansion;~~
   - 1.3. ~~Adverse effects to the design strength of footing, foundation, concrete or other structural element due to a chemical reaction from the soil;~~
   - 1.4. ~~Inadequate soil as determined by a geotechnical investigation;~~
   - 1.5. ~~Where the allowable bearing capacity of the soil is in doubt; or~~
   - 1.6. ~~Adverse effects to the footing, foundation, concrete or other structural element due to the ground water table.~~
2. ~~Concrete that has been subjected to any of the following conditions:~~
   - 2.1. ~~*Deterioration*;~~
   - 2.2. ~~*Ultimate deformation*;~~
   - 2.3. ~~Fractures;~~
   - 2.4. ~~Fissures;~~
   - 2.5. ~~Spalling;~~
   - 2.6. ~~Exposed reinforcement; or~~
   - 2.7. ~~*Detached*, dislodged or failing connections.~~

   - ~~6.10. Excessive cutting and notching.~~

Exceptions:

1. Where substantiated otherwise by an *approved* method.
2. Demolition of unsafe conditions shall be permitted where *approved* by the *code official.*

Reason: This proposal corrects errors and removes duplication in the IPMC of provisions already covered more appropriately in the IBC and IEBC.
Unsafe conditions are rare and represent extreme situations. As such, they are outside the general scope (see Section 101.2) and intent (101.3) of the IPMC. Rather, they are more properly addressed by the IBC and IEBC, which already define unsafe conditions to include "inadequate maintenance" and provide remedial administrative procedures (IBC Section 116, IEBC Section 115). In fact, the IPMC relies on the IEBC definitions of unsafe and dangerous, as it does not provide its own definitions in Chapter 2.

Thus, unsafe conditions need only be mentioned in the IPMC to note that they are unacceptable and must be eliminated, which is what this proposal would say. Otherwise, the current listings of specific unsafe conditions are duplicative, often unenforceable, outside the scope of a maintenance code, and in many cases just wrong.

Consider the many references in these three sections to structural elements and their resistance to "nominal loads" and "all load effects." Nominal loads include full Wind and Earthquake loads. Applying these provisions as currently writen would cause every building more than about 20 years old to be labeled dangerous and unsafe even in the absence of deterioration or damage. Further, by referencing structural loads and capacities, simple implementation of the IPMC would require regular assessment by a structural engineer, which is certainly beyond the code's intent.

Consider the many references to structural "soundness." This term is undefined and unenforceable. Provisions requiring structurally sound conditions were removed from the IBC and IEBC for this reason over the last several code cycles.

Consider the several references to a component's "limit state." These references are inappropriate because, as defined in the IBC, there are multiple possible limit states. Merely exceeding a serviceability limit state (especially as contemplated by Section 306.1.1) almost never makes a building or component unsafe.

Consider the many references to deterioration. Deterioration is indeed a sign that maintenance is needed, but it is not a reason to label a building or component unsafe. Similarly, corrosion, elastic deformation, spalling, and cracks (especially as listed in Section 306.1.1) are often normal and are not of themselves reason to label a building or component unsafe. (The IEBC definition of unsafe includes "inadequate maintenance," meaning "not enough to maintain health, safety, and welfare," not merely non-compliant or imperfect maintenance.)

Despite the deletion of these long lists, the proposal results in no loss of substance. As noted, unsafe conditions are already defined and addressed in the IEBC. More specifically, each of the items proposed for deletion is already covered elsewhere in the IPMC. Considering the list in Section 304.1.1:

-- Items 1, 2, 3, 5, 6, and 7 address structural elements and thus are already covered by the IEBC and IBC definition of dangerous.

-- Item 4 is addressed in Section 304.6.

-- Item 8 is addressed in Section 304.7.

-- Item 9 does not even belong in Section 304 but is addressed in Section 305.4

-- Item 10 is addressed in Section 304.8.

-- Item 11 is addressed in Section 304.9.

-- Item 12 is addressed in Section 304.10.

-- Item 13 is addressed in Section 304.11.

Considering the list in Section 305.1.1: Items 1 through 6 address structural elements and thus are already covered by the IBC and IEBC definition of dangerous. Item 5 is additionally addressed by Section 305.4.

Considering the list in Section 306.1.1: Items 1 through 6 address components in terms of their structural materials and properties and thus are already covered by the IBC and IEBC definition of dangerous.

Finally, in addition to removing the inappropriate lists, the proposal requires compliance only with the IEBC, not the IBC, because the IPMC by definition relates to existing buildings, and the IBC no longer has existing building provisions for repair or removal of unsafe conditions.

If approved, a coordinated proposal will be made in Group B to address further duplication and overlap in IPMC Section 108.

Cost Impact: Will not increase the cost of construction
The proposal merely removes duplicate provisions already found in other applicable codes.

PM 5-15

505.4, 505.5 (New), 505.6 (New), 505.7 (New), 505.8 (New)

Proponent: Ronald George, Plumb-Tech Design & Consulting, www.Plumb-TechLLC.com, www.ScaldPrevention.org, representing Self; Plumb-Tech Design & Consulting Services LLC; www.ScaldPrevention.org (Ron@Plumb-TechLLC.com)

2015 International Property Maintenance Code

Revise as follows:

505.4 Water heating facilities. Water heating facilities shall be properly installed, maintained and capable of providing an adequate amount of hot or tempered water to be drawn at every required sink, lavatory, bathtub, shower and laundry facility ~~at a minimum temperature of 110°F (43°C).~~. A gas-burning water heater shall not be located in any *bathroom*, *toilet room*, *bedroom* or other occupied room normally kept closed, unless adequate combustion air is provided. An *approved* combination temperature and pressure-relief valve and relief valve discharge pipe shall be properly installed and maintained on water heaters.

Add new text as follows:

505.5 Maximum Hot Water Temperatures

1. The maximum hot water temperature flowing from any kitchen sink faucet shall be 130 degrees Fahrenheit.
2. The maximum hot water temperature flowing from a lavatory faucet, shower head, bathtub filler faucet bathtub/shower combination, or whirlpool bathtub filler faucet shall be 120 degrees Fahrenheit (48.8 degreess Celcius).
3. The maximum temperature flowing from a bidet faucet shall be 110 degrees Fahrenheit (43 degrees Celcius)
4. The burner control thermostat on the water heater shall not be used to control the hot water distributiuon temperature for conformance to the above hot water temperature limit requirements.

505.6 Minimum Hot or Tempered Water Temperatures

1. The water temperature flowing from a lavatory shall be capable of reaching a minimum of at least 85 degrees Fahrenheit.
2. The water temperature flowing from a kitchen sink shall be capable off reaching a minimum of at least 120 degrees F.
3. The water temperature flowing from a shower, tub/shower, bathtub or whirlpool bathtub shall be capable of reaching a minimum of at least 110 degrees F.
4. The water temperature flowing from a shower, tub/shower, bathtub or whirlpool bathtub shall be capable of reaching a minimum of at least 110 degrees F.

505.7 Water Heater Replacement - Capacity When a water heater is replaced, it shall be replaced with a water heater of the same delivery capacity in gallons per hour. When Calculating gallons per hour the temperature rise shall be based on the same temperature rise as the prior heater. If no temperature rise is known, the temperature rise shall be based on a 100 degree rise.

Exception: Where the water heater manufacturer's sizing calculations or other published water heater sizing calculations show the first hour delivery capacity of the selected water heater is adequate for the installation.

505.8 Water Heater Replacement or system temperature changes When a water heater is added, replaced, serviced or adjusted or if a temperature actuated mixing vale serving the hot water distribution system is adjusted, the distribution system temperatures checked to verify the temperaturres do not exceed the limits prescribed in section 505.5 to minimize the risk of scalding.

The existing domestic hot water system shall be checked to verify if the existing shower valve and/or combination tub/shower valve has a code compliant pressure or temperature compensating type, anti-scald shower valve with a maximum temperature limit-stop adjuistment conforming to ASSE 1016/ASME A112.1016/CSA B125.16, Performance requirements for automatic compensating valves for individual showers and tub/shower combinations. After the water heater has been installed and the thermostat has been adjusted to the recommended temperature and allowed to heat up until the burner shuts off, or after a thermostatic mixing valve is adjusted to a new temperature, check and adjust the maximum temperature limit-stop on every shower and tub/shower combination valve to limit the hot water temperature to a maximum of 120 Fahrenheit for scald protection. Also,adjust the outlet temperature of each point-of-use, in-line temperature limiting valve serving bathtubs, whirlpool bathtubs, or lavatories in accordance with the manufacturer's installation instructions to limit the hot water temperature to a maximum of 120 Fahrenheit for scald protection.

The thermostat on the water heater shall not be used to control the hot water distribution temperature for scald protection.

If a non-code compliant shower or tub/shower valve is present, one of more of the following methods shall be provided in the domestic hot water system to minimize the risk of scalding:

1. Replace non-code compliant shower or tub/shower valves with a code compliant shower valve conforming to ASSE 1016/ASME A112.1016/CSA B125.16, Performance requirements for automatic compensating valves for individual showers and tub/shower combinations shall be installed with the temperature limit stop adjusted in accordance with the manufacturers installation instructions to limit the hot water temperature to a maximum of 120 degrees Fahrenheit to minimize the risk of scalding. or
2. Provide a Master Temperature Actuated Mixing Valve conforming to ASSE 1017 Temperature Actuated Mixing Valve for Hot Water Distribution Systems at the water heater to limit the hot water temperature to a maximum of 120 degrees Fahrenheit to minimize the risk of scalding.or
3. Provide a water temperature limiting valve at or near each fixture outlet used for bathing or showering in accordance with the requirements of ASSE 1070 Water Temperature Limiting Devices located near the non-code compliant bathtub/shower or bathtub fixtures to limit the hot water temperature to a maximum of 120 degrees Fahrenheit to minimize the risk of scalding. or
4. Provide a Temperature Actuated, Flow Reduction (TAFR) valve conforming to ASSE 1062 Temperature Actuated, Flow Reduction (TAFR) Valves for Individual Supply Fittings at the shower head and at the tub fillerspout where a combination tub/shower fixture is installed and for any other fixtures used for bathing or showering to limit the hot water temperature to a maximum of 120 degrees Fahrenheit to minimize the risk of scalding

Add new standard(s) as follows:

ASSE 1016-2011/ASME A112.1016-2011/CSA B125.16-2011 Automatic Compensating Valves for Individual Shower & Tub/Shower Combinations

ASSE 1017-2010 Temperature Actuated Mixing Valves for Hot Water Distribution Systems

ASSE 1062-2006 Temperature Actuated, Flow Reduction (TAFR) Valves for Individual Supply Fittings

ASSE 1070-2004 Water Temperature Limiting Devices

Reason: There is currently no provisions in the code to require unsafe existing plumbing installations to where scalding is a hazard. Hundreds of people are scalded each year where non-code compliant (Two-handle) shower valves are installed. This code change is iintended to address this and other hot water scald hazards in existing installations.

What are safe hot water temperatures?

By Ron George
President, Ron George Design & Consulting Services

Plumbing Engineer Magazine Aug 2009

I am often asked, "What is a safe hot water temperature for domestic hot water?" If you read the model codes, it states the maximum hot water temperature for a shower or bathtub is 120 degrees Fahrenheit. If you read the warning labels on the side of most water heaters the maximum hot water temperature is 120 degrees Fahrenheit on some labels and 125 degrees Fahrenheit on other labels. The 125 degree limit probably allows for some temperature loss before the hot water gets to the fixtures. Most water heater literature and warning labels mention the availability of thermostatic mixing valves or automatic temperature compensating valves and they recommend their use. If you look at many of the industry standards for shower mixing valves, they state the valves must have limit stops that are adjustable to limit the maximum hot water temperature to 120 degrees Fahrenheit. The testing in the standards gives test criteria for testing the shower valves to these limits.

I have served on the working groups for several plumbing industry standards committees for temperature actuated mixing valves and shower valves and it is generally agreed that 120 degrees is the maximum, safe hot water temperature. I also have served on hot water system design standards committees where the participants had agreed that maximum domestic hot water temperature from plumbing fixtures used for bathing and washing purposes should be 120 degrees Fahrenheit. There were a few exceptions for bidets, sitz baths and whirlpool tubs that had temperatures lower than 120 degrees Fahrenheit for the recommended maximum temperatures to prevent scalding. It also should be noted that some other uses like commercial dishwashers and laundries may need temperatures higher than 120 degrees Fahrenheit. There were two temperatures discussed for each fixture during the design standard meetings. One was the "use temperature" and the other was "the maximum temperature" to prevent scalding.

It's generally agreed that 120 degrees Fahrenheit is the maximum safe hot water temperature that should be delivered from a fixture. Therefore hot water above 120 degrees Fahrenheit can be considered hazardous. Model codes address this in various plumbing code sections...

...The codes generally agree if there is a hazardous condition or a condition that is unsafe or a nuisance to life, health and property it should be corrected but in the existing building code and property maintenance code there is little guidance. It is also generally agreed that water above 120 degrees Fahrenheit at fixtures for bathing and washing with a few exceptions for lower temperatures can be considered dangerous and proper precautions should be taken to prevent the hot water from being a scalding hazard by using the proper safety devices.

When I hear about people setting their water heater to 120 degrees Fahrenheit to prevent scalding, I know they have good intentions, but most people do not know you cannot accurately control the hot water temperature leaving a water heater with the thermostat dial.

Maximum Hot Water Temperature to Prevent Scalding

I have served on many industry committees dealing with hot water system code requirements, hot water system design standards and product standards related to domestic hot water systems devices for temperature control and scald prevention. There has been consensus in all of these committees that the maximum safe hot water delivery temperature for a shower or bathtub is 120 degrees Fahrenheit to prevent scalding with a few exceptions for lower temperatures for bidets and emergency eye wash fixtures. (See the attached Figure 1 - Hot Water Scald Burns – Time vs Temperature Relationship for Second and Third Degree Burns for Adults and Children)
There were discussions in a plumbing code ad-hoc committee on temperature limits for the hot water system where everyone agreed the maximum safe temperature was 120 F. The ASPE Hot water committee dealing with a proposed standard for temperature limits in hot water systems also agreed the maximum safe hot water temperature to prevent scalding is 120 Fahrenheit. Several ASSE working groups that I have served on dealing with hot water temperature controls have all have discussed the reaction time of bathers and they have taken into consideration that children, the elderly and people with disabilities usually take longer to get out of harm's way if the water suddenly gets hot and they agreed 120 Fahrenheit is the maximum safe hot water temperature that a valve should deliver. At 120 F it takes about 80 seconds to develop a second degree burn in a child and it takes about 8 minutes to develop a second degree burn in an adult. (See Figure 1) The 120 Degree F temperature limit gives bathers or users an adequate amount of time to get out of harm's way before an irreversible scald burn injury can occur. Each of these committees looked back to the data that was the result of burn studies done by Dr. Moritz and Dr. Henrique's at Harvard Medical College in the 1940s. The burn studies were done using baby pigs that had skin thicknesses similar to that of adult males. The studies exposed the pig's skin to various temperatures of hot water for various periods of time and the severity of the burns were studied and recorded. These were the studies used to develop the time and temperature exposure charts. There have been numerous white papers, seminars, and reports since then discussing the fact that burns can occur quicker than those recorded in the Moritz & Henrique's studies for adult males. The skin is thinner for children and the elderly and the amount of time to receive an irreversible 2nd degree burn injury is less because their skin is thinner. Many of the white papers use the Moritz and Dr. Henrique's original burn studies and they use a ratio of the skin thickness to come up with burn times for thinner skin of children and the elderly. Children, the elderly and handicapped are also slower to react because it takes them more time to realize what is happening and try to react to get out of harm's way. Someone once told me an apartment complex was not intended for children or the elderly. I said everyone grows old and children often come visit so we need to consider prevention of scalds to children, the elderly and people with disabilities more so than burns to adults because burns can occur quicker for those groups.

The PIEV Theory for Reaction Time

There is a PIEV theory relates to reaction time. The PIEV theory is most commonly used to address braking distance in automobile accidents. It addresses the amount of time it takes a driver to sense a problem and decide to react, then the reaction time is added to the braking time for the total distance that a car travels before stopping. The PIEV theory can also apply to reaction times for a bather with respect to hot water scalds.
PIEV relates to the amount of time it takes a person to react to a hazard. PIEV means - Perception, Intellection, Emotion and Volition. It is usually referred to as the PIEV theory. Before we recognize and react to a hazard, four specific areas of activity need to be processed by the brain for the muscles to react. Those processes are:

1. **Perception** - We need to perceive or gain a Perception of a hazard. There can be delays in the perception with limitation in sight, sound, feeling, or any other of our senses.

2. **Intellection** - We go through a period called, Intellection or the act or process of using the intellect by thinking or reasoning. The bather must determine if the hazard is legitimate and deciding either move out of the way of the hazard or eliminate the hazard by adjusting the controls or in some cases where the bather may be sitting out of the reach of the controls the bather may choose to pull the shower curtain in front of them. If the adjustment of the controls is the choice one must decide which control to turn and try to remember which way to turn each control to adjust the temperature or turn the water off in order to eliminate the hazard. If a wrong choice is made during this process it could compound the situation by making the water even hotter. I travel a lot and I often find that shower controls can be very confusing with respect to how to adjust the controls. I still find two handle shower controls that do not meet code requirements. This is critically important when there is no temperature limit on the shower controls. For example if the shower has a two-handle shower valve and 160 degree hot water is supplied to the system, then turning of the cold water first could lead to instant scalding injuries. Turning down the hot water to 120 F or below creates a system where it could incubate Legionella Bacteria to very high levels.

3. **Emotion** - There is an Emotion or evaluation factor which is defined as a conscious mental reaction (as anger or fear) subjectively experienced as strong feeling usually directed toward a specific object and typically accompanied by physiological and behavioral changes in the body with respect to deciding or assessing how we want to react. A person with reduced mental capacity or someone that is just very old will take longer to process this information and ultimately decide to react.

4. **Volition** - There is the physical Volition or deciding/choosing to act and acting. In the case of braking distance it is when the choice is made

to move the foot from the gas pedal to the brake pedal and pressing on the brake pedal. This can be related to the time the bather chooses to adjust the control, and they move their hand to the shower control valve, plus the time to rotate or re-adjust the shower valve plus the time from the adjustment until the water temperature changes coming out of the shower head. Often it can take as much as 3-5 seconds to re-adjust the shower head and another few seconds until the water temperature changes coming out of the shower head. For ultra-low-flow (ULF) showers the delay from the time of the adjustment of the shower valve until the water temperature changes coming out of the shower head can be even longer. So burns can become more severe with ULF shower heads. This is one more area where water conservations measures can unintentionally make plumbing systems less safe.

As the temperature of the water increases this PIEV reaction time becomes more important. Using a bathtub/shower controller with a single handle would reduce the mental processing time and reduce the possibility of making an error when turning off the water. As Figure 1 shows the higher the temperatures get, the quicker the burns can occur. within seconds or less and the degree and severity of the burn can be affected by this reaction time.

As you can see by the chart in Figure 1, if the water is at 140 F it will take about 0.8 seconds for a child to receive a 2nd degree irreversible burn injury and it will take about 5.6 seconds for an adult male to receive an irreversible burn injury at 140 degrees F. Everyone else will fall somewhere in between. An adult will often find it very difficult to react to a sudden change in temperature within five (5) seconds. If the shower head is an Ultra-Low-Flow (ULF) shower head the delay can be several seconds longer before the water temperature is reduced because the mixed water temperature must evacuate or flush out the hot water in the pipe riser from the shower valve to the shower head. There is basically very little or no time to react at higher temperatures. For a typical adult that is alert and aware the PIEV theory shows it can take well over five (5) seconds to react to a sudden burst of hot water in a shower. For an elderly person or a small child that is confused it could take several minutes or more before they are able to react and adjust the controls or get out of harm's way. There has been a lot of information that suggests reducing the domestic hot water temperature to 120 F or less as it flows from the fixtures will minimize scalding and allow most people to react or get out of harm's way before a scald injury occurs.

Reducing the water temperature flowing from the fixture can be done in several ways by:

1. Reducing the hot water temperature at the fixture by adjusting the maximum temperature limit-stop on the shower valve. (The best way)
2. Using local mixing valves conforming to ASSE 1070 to reduce the hot water temperature flowing from a faucet.
3. Reducing the temperature at the source (Water Heater) with the use of a master mixing valve or temperature actuated mixing valve conforming to ASSE 1017.
4. For existing non code compliant shower or tub/shower installations, Two handle tub/shower valves without a maximum temperature limit adjustment) an ASSE 1062 valve could be used. An ASSE 1062 valve is a Temperature Actuated Flow Reduction (TAFR) valve. It looks like a chrome pipe coupling and it screws on between the shower head and the shower arm. Other models screw into a tub spout or onto a sink faucet in place of the aerator. If the water flowing from fixture exceeds about 117-120 degrees Fahrenheit the TAFR valve will shut the flow of water down to just a trickle so that scalding hot water does not spray onto the bather. It can be reset by adjusting the fixture control valve to a cold water setting and when the cold water reaches the valve it will reset and begin flowing again. This can be a bit of a nuisance in buildings where the hot water temperature is erratic, but it is an inexpensive way to provide protection against scald injuries in older buildings without code compliant shower valves.

Water Heater Thermostats Do Not Control the Water Heater Outlet Temperatures

If you adjust the water heater thermostat for the burner or heating element on a water heater down to 120 degrees, it will not prevent scalding. Water heater thermostats cannot be relied upon to control the hot water temperature leaving a water heater. Water heater manufacturers recommend that installers set thermostats at 120 - 125 F, and most of them ship the water heaters at an even lower temperature setting. It is not possible to set a water heater thermostat at a given temperature and get a relatively constant temperature of hot water from a water heater. The thermostat can not accurately control the water heater outlet temperature with a water heater thermostat.

My experience has been that not many people know that water heater thermostats cannot control the outlet temperature of a water heater. This warrants an explanation of how a water heater thermostat works so everyone understands the dial on the water heater does not have the accuracy to control the outlet temperature of storage type heater.

Water heater thermostats do not provide precise temperature controls for hot water systems. For example: the thermostat dial calibration test of ANSI Z21.10.1-1998, which is the applicable standard for gas-fired water heaters, allows the temperature to vary 10 degrees above or below the thermostat setting. I have talked to water heater manufacturers that have indicated that the controls can vary as much as 15 to 18 degrees Fahrenheit above or below the set point of the thermostat. From my experience, I have recorded the temperature leaving the top portion of a water heater over a long period of time during intermittent uses and saw temperature swings over 40 degrees Fahrenheit leaving the water heater. The shower valve standards do not have this kind of temperature fluctuation included their testing for all types of shower valves. The significant temperature swings are because the thermostat is inserted into the lower portion of a water heater tank and turns the fuel supply to the heater on and off. Most new water heater thermostat dials have no way to know what the temperature in the tank is. There is rarely a fixed temperature indicated on the dial, however some manufacturers publish temperatures associated with various marks on the thermostat dial or in their literature even though the dial cannot not control the outlet temperature of the water heater, it only controls when the energy to the heater is turned "on" and "off" by sensing the cold water coming into the bottom of the heater.

Generally, if the water heater thermostat dial is set at 120 degrees Fahrenheit, the burner would come on when the temperature at the thermostat reaches about 105 degrees Fahrenheit. The burner stays on until the water around the thermostat which is near the bottom of the heater reaches about 135 degrees Fahrenheit. (The "burner off" temperature is about 30 degrees higher than when the burner came "on" and generally about 15 degrees above the theoretical set point of the thermostat).

Most people don't realize that the maximum temperature limit test of the ANSI Z21.10.1 Gas Water Heater Standard allows the outlet water temperature of the water heater to rise significantly above the thermostat setting. This provision in the standard accounts for the phenomenon known as "stacking" or "thermal layering". The hot water is less dense and rises to the top of the hot water tank. Just like hot air rises and lifts a hot air balloon, hot water rises to the top of the tank and the cooler water drops to the bottom of the tank. Stacking or thermal layering occurs when the hot water rises to the top of the heater due to recurring short duration heating cycles caused by a frequent number of small quantity hot water uses. Frequent short draws cause cold water to enter the bottom of the water heater where the thermostatic element senses the cold water from the turbulent flow stirring in the bottom of the heater. The cold water causes the water heater to cycle on. This phenomenon can occur in any type of storage water heater and generally is more significant in vertical heaters.

I have recorded temperatures as high as 150 to 166 degrees Fahrenheit at the top of water heaters that had the thermostats set between 120 to 125 degrees Fahrenheit. Temperatures over 151 degrees Fahrenheit are extremely high temperatures and can cause serious scald burns in only a two seconds of contact with the skin. (See Table 1 - Water Temperature Effects on Adult Skin) It should be noted that the time temperature relationships in Table 1 are based upon the thickness of the skin for adult males. Children and the elderly typically have a thinner layer of the skin or epidermis and the exposure times can be shorter or the same burns can occurs in a given time at slightly lower temperatures.

Cost Impact: Will increase the cost of construction
The cost impact is minimal. The health and safety impact is one of the most significant health and safety related code changes to existing buildings in years. This code change will save countless lives and prevent countless life altering, very painful scald injuries.

Analysis: A review of the standard proposed for inclusion in the code, ASSE 1016-2011/ASME A112.1016-2011/CSA B125.16-2011, ASSE 1017-2010, ASSE 1062-2006 and ASSE 1070-2004, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2015.

2015 International Property Maintenance Code

Add new text as follows:

505.5 Non-potable water reuse systems Nonpotable water reuse systems and rainwater collection and conveyance systems shall be maintained in a safe and sanitary condition. Where such systems are not properly maintained, the systems shall be repaired to provide for safe and sanitary conditions, or the system shall be abandoned in accordance with Section 505.5.1.

505.5.1 Abandonment of systems. Where a nonpotable water reuse system or a rainwater collection and distribution system is not maintained or the owner ceases use of the system, the system shall be abandoned in accordance with Section 1301.10 of the *International Plumbing Code*.

Reason: As the newly developed, approved water reclaimation systems are being added in the built environment, these systems need to be maintained so as to not cause hazards to structures or the public. The section is taken largely from chapter 13 of the 2015 IPC.

Cost Impact: Will not increase the cost of construction
This is a maintenance issue and should not have any impact on new construction.

PM 6-15 : 505.5 (New)-BRIDGES4801

PM 7-15

602.6 (New)

Proponent: Jeff Hugo, National Fire Sprinkler Associaton, representing National Fire Sprinkler Association (hugo@nfsa.org)

2015 International Property Maintenance Code

Add new text as follows:

602.6 Freeze Protection All areas and spaces of the building containing fire protection system piping with water or other agents susceptible to freezing, shall be maintained at or above 40 degrees Fahrenheit, or protected from freezing by other approved methods in accordance with Section 704.1.1.

Reason: Several fire protection installation standards, including but not limited to; NFPA 13, NFPA 13R, NFPA 14 require the water filled piping to be at, or above 40 degrees Fahrenheit. The other approved methods can be limited use of frost-proof casings, insulation and listed heat trace tape. A professional engineer is also permitted to prove through heat loss calculations that the piping will not freeze when the area or space is maintained below 40 degrees.
The IPMC already has reference to NFPA 25 (704.1.1) which requires these spaces to be maintained. However, it is a good measure to bring this out into the body of the IPMC for code officials to be aware of the temperature of the spaces that the fire protection piping is installed.

Cost Impact: Will not increase the cost of construction
Not a new technical requirement.

PM 7-15 : 602.6 (New)-HUGO4913

PM 8-15

603.1

Proponent: David Bridges, City of Martinsville, VA, representing City of Martinsville, VA

2015 International Property Maintenance Code

Revise as follows:

603.1 Mechanical equipment and appliances. Mechanical equipment, appliances, fireplaces, solid fuel-burning appliances, cooking appliances and water heating appliances shall be properly installed and maintained in a safe working condition, and shall be capable of performing the intended function.

Reason: currently section 603.1 adequately covers all mechanical appliances, but not the associated fuel conveyance piping, fuel gas systems, fuel oil storage, hangers, supports, etc.... By adding "equipment" it clarify's that items associated with mechanical equipment are also covered by the IPMC.

Cost Impact: Will not increase the cost of construction
This is a clarification of items covered by the IPMC and will not add to the cost of construction.

PM 8-15 : 603.1-BRIDGES5611

PM 9-15

Appendix B (New), Chapter 8

Proponent: Jonathan Wilson, National Center for Healthy Housing, representing National Center for Healthy Housing (jwilson@nchh.org)

2015 International Property Maintenance Code

Add new text as follows:

APPENDIX B
HEALTH STANDARDS

SECTIONB101
GENERAL

B101.1 Scope. The provisions of this chapter shall govern the minimum conditions and standards for the health of persons at residential premises.

B101.2 Approved agency. An approved agency is a government agency responsible for the health of a resident in a dwelling. In most jurisdictions, the approved agency is a health department.

B101.3 Findings. When a code official has evidence that a hazardous condition as described in section B102 is likely to exist, the code official is authorized to require the owner or occupant responsible for maintenance to remove the hazardous condition. The code official shall be permitte to rely on a report from an approved agency as evidence that the hazardous condition is likely to exist or that the condition has been removed and has been returned to compliance.

B101.4 Testing or inspection. The code official is authorized to require the property owner to conduct appropriate testing or inspection methods as evidence of compliance with this appendix. The code official may accept results from an approved agency or from an individual licensed in accordance with federal, state, or jurisdiction laws to conduct the testing or inspection. The testing or inspection results shall be deemed sufficient to establish whether a premises is in compliance with the requirements of this appendix. The property owner shall be responsible for the cost of testing or inspection.

SECTIONB102
HAZARDOUS CONDITIONS

B102.1 Lead-based paint hazards. Lead levels in dust or soil at or above federal regulatory limits pursuant to 40 CFR Section 745.65 is a hazardous condition. unless the jurisdiction has adopted more protective standards; in such a case, those more protective standards will apply.

B102.2 Friable asbestos-containing material hazards. Significantly damaged friable asbestos-containing material as defined by 40 CFR Part 763 is a hazardous condition unless the jurisdiction has adopted a more protective standard. Friable means that the material, when dry, can be crumbled, pulverized, or reduced to powder by hand pressure.

B102.3 Radon. Radon present at levels at or above the level that the jurisdiction has designated as requiring reduction is a hazardous condition. If no designation has been made, then hazardous condition is four picocuries per liter of air (pCi/L) in the lowest habitable level of the dwelling.

Add new standard(s) as follows:
U.S. Environmental Protection Agency, 40 CFR 745.65 Lead-Based Paint Poisoning Prevention in Certain Residential Structures, 2012.

U.S. Environmental Protection Agency, 40 CFR 763 Asbestos-Containing Material in Schools, 1987

Reason: Three health hazards, lead, asbestos and radon, pose significant risk to many dwellings but go unmentioned in the IPMC. As a result, residents are not adequately protected for three reasons:

1. Residents are unlikely to know they are at significant risk because the hazards are not visible or are masked in dust and debris. While many retail hardware stores carry low-cost test kits to allow residents to measure the hazard, unless they know of the danger, residents may not use them until the harm has been done.
2. They are only likely to be found in a structure that is poorly maintained, repaired, or renovated. However, once created, they are unlikely to be addressed through standard maintenance and housekeeping.
3. Many government agencies, such as health departments are capable of assessing the hazard but often lack the authority provided by a property maintenance code to efficiently address the risk.

This proposal gives the jurisdiction the language it needs to address these all-too-common hazards. The jurisdiction would elect to adopt a new optional Appendix B to the IPMC that defines these hazardous conditions and gives the code official the authority to act. As with all appendices, if the jurisdiction does not affirmatively adopt the appendix, it will have no effect.

The requirements are designed to be triggered by section 101.3 when a government agency (defined as an approved agency) responsible for the health of a resident in a dwelling provides the code official with a report showing that one of the three hazardous conditions is likely to exist. Based on the report, the code official would require the owner or occupant to eliminate the hazardous condition and conduct the necessary testing and inspection to confirm the property has returned to compliance. The testing and inspection may be conducted by the government agency making the initial finding or by an individual licensee in accordance with federal, state, or local laws to perform the work.

The code official would be entitled to rely on the analysis performed by the approved agency--most likely the state or local health department. The code official would not be expected to have any specialized knowledge of the hazard or the hazardous condition and would only be authorized and not mandated to act.

Section 102.1 describes lead-based paint hazards and refers to 40 CFR 745.65 unless the jurisdiction has adopted a more protective standard. These levels in the regulation define the amount of lead in dust or soil that is likely to poison a child in the dwelling. The dangers associated with lead poisoning are well known: serious health effects, detrimental effects on cognitive and behavioral development, with serious personal and social consequences that may persist throughout their lifetime.[1] Lead affects a child's intelligence even at very low levels of exposure.

While there is no safe level of lead exposure for children, the U.S. Environmental Protection Agency (EPA) regulation provides levels that can be measured and reasonably achieved. The agency adopted this regulation in 2001 after extensive public notice and comment including conducting a cost-benefit analysis. The levels in that regulation are:

- Lead-based paint on an existing painted surface—0.5 percent by weight or 1.0 milligrams per square centimeter;
- Dust on floors—40 micrograms of lead per square foot of settled dust (µg/ft^2);
- Dust on interior window sills—250 µg/ft^2;
- Dust on window troughs (wells)—400 µg/ft^2;
- Bare soil in children's play areas—400 parts per million (ppm) of lead; and
- Bare soil in areas of the yard that are not children's play areas—1,200 ppm.

Many states have adopted these levels into their regulations to guide health departments and environmental agencies responsible for protecting children from lead-based paint hazards.

In most situations, lead-based paint hazards are the result of paint in a pre-1978 dwelling being deteriorated or being disturbed in a manner that generates dust contaminated with lead. Repairing the paint may limit making the hazardous condition worse, but it does not clean up the problem. Only through testing and inspection can one determine if the hazardous condition has been removed.

Section 102.2 describes asbestos hazards and references EPA's regulations at 40 CFR Part 763 unless the jurisdiction has adopted more protective standards. Those regulations protect people, especially children, from lung cancer, asbestosis, and mesothelioma. These regulations were adopted in 1987 after extensive public notice and comment and apply to asbestos-containining materials in schools. Many states have adopted regulations similar to these.

Asbestos-containing material is any material or product that contains more than one percent asbestos. It would only present a hazardous condition under this proposal if it was friable and was significantly damaged. Friable means that the material, when dry, can be crumbled, pulverized, or reduced to powder by hand pressure. A material is damaged if it has deteriorated or sustained physical injury such that the internal structure of the material is inadequate or, if applicable, which has delaminated such that its bond to the substrate (adhesion) is inadequate or which for any other reason lacks fiber cohesion or adhesion qualities. The damage is significant if it is extensive and severe.

If the asbestos is not significantly damaged, the hazardous condition would not exist. However, once significantly damaged, the asbestos is likely to have been released. Only through testing and inspection can one determine if the asbestos has been appropriately cleaned.

Section 102.3 describes radon, a naturally-occurring, odorless, tasteless, invisible gas over four picocuries per liter of air as a hazardous condition unless the jurisdiction has adopted a more protective level. At this level, radon poses a significant risk of lung cancer, second only to secondhand smoke, when it seeps into the home through cracks in the foundation from the soil.

EPA adopted this level in the 1980s, and three ANSI consensus standards by the American Association of Radon Scientists and Technologists (AARST) have adopted it. These consensus standards address how the levels should be measured, how the levels should be mitigated, and what testing and inspection is needed to confirm the hazardous condition has been eliminated.

Bibliography:

[1] CDC Response to Advisory Committee on Childhood Lead Poisoning Prevention Recommendations in "Low Level Lead Exposure Harms Children: A Renewed Call of Primary Prevention, Centers for Disease Control and Prevention, 2012, www.cdc.gov/nceh/lead/acclpp/cdc_response_lead_exposure_recs.pdf.

Cost Impact: Will not increase the cost of construction
The hazardous conditions described in the new optional Appendix B should not be present in a properly constructed and maintained home.

Analysis: A review of the standard proposed for inclusion in the code, 40 CFR 746.65 and 40CFR 763, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2015.

TENTATIVE ORDER OF DISCUSSION
2015 PROPOSED CHANGES TO THE INTERNATIONAL RESIDENTIAL CODE (MECHANICAL)

The following is the tentative order in which the proposed changes to the code will be discussed at the public hearings. Proposed changes which impact the same subject have been grouped to permit consideration in consecutive changes.

Proposed change numbers that are indented are those which are being heard out of numerical order. Indentation does not necessarily indicate that one change is related to another. Proposed changes may be grouped for purposes of discussion at the hearing at the discretion of the chair. Note that some RM code change proposals may not be included on this list, as they are being heard by another committee.

M1305.1.4.2

Proponent: Guy McMann, Jefferson County Colorado, representing Colorado Association of Plumbing and Mechanical Officials (CAPMO) (gmcmann@jeffco.us)

2015 International Residential Code

Delete and substitute as follows:

M1305.1.4.2 **~~Excavations.~~** **Pit locations** ~~Excavations for *appliance* installations shall extend to a depth of 6 inches (152 mm) below the *appliance* and 12 inches (305 mm) on all sides, except that the control side shall have a clearance of 30 inches (762 mm).~~

Appliances installed in pits or excavations shall not come in direct contact with the surrounding soil and shall be installed not less than 6 inches (152 mm) above the pit floor. The sides of the pit or excavation shall be held back not less thanf 12 inches (305 mm) from the appliance. Where the depth exceeds 12 inches (305 mm) below adjoining grade, the walls of the pit or excavation shall be lined with concrete or masonry. Such concrete or masonry shall extend not less than 4 inches (102 mm) above adjoining grade and shall have sufficient lateral load-bearing capacity to resist collapse. Excavation on the control side of the appliance shall extend horizontally not less than 30 inches (762 mm). The appliance shall be protected from flooding in an *approved* manner.

Reason: The language in the IMC and IFGC is much more complete and concise. This modification completes this section and has all the information necessary for a code compliant installation and makes it consistent with the other codes

Cost Impact: Will not increase the cost of construction
This proposal is strictly editorial in nature and will not cause an increase is cost.

RM 1-15 : M1305.1.4.2-MCMANN3695

RM 2-15

M1305.1.4.2

Proponent: Guy McMann, Jefferson County Colorado, representing Colorado Association of Plumbing and Mechanical Officials (gmcmann@jeffco.us)

2015 International Residential Code

Delete without substitution:

~~**M1305.1.4.2 Excavations.** Excavations for *appliance* installations shall extend to a depth of 6 inches (152 mm) below the *appliance* and 12 inches (305 mm) on all sides, except that the control side shall have a clearance of 30 inches (762 mm).~~

Reason: This is legacy code language that appeared in 1984 and was incorporated into the 2000 edition of the Residention Code. There is no technical justification to dig a pit 6 inches below the bottom of any appliance. If there is a water issue in a pit an appliance should not be installed in it. This section mandates that a water heater be installed on a stand or be suspended above the floor of a pit. M1305.1.4.1 already takes care of the issue by requiring the appliance to be on a 3 inch pad which is perfectly acceptable provided there are no water issues. The bottom of the pit is still the ground and M1305.1.4.1 would still apply.

Cost Impact: Will not increase the cost of construction
This proposal will actully *decrease* the cost of construction by not requiring excessive digging. It will also not require the purchace or building of a stand to support the appliance. labor dollars could be saved by not being required to suspend an appliance.

RM 2-15 : M1305.1.4.2-MCMANN4827

RM 3-15

M1401.3

Proponent: Luis Escobar, representing Air Conditioning Contractors of America (luis.escobar@acca.org)

2015 International Residential Code

Revise as follows:

M1401.3 Equipment and appliance sizing. Heating and cooling *equipment* and *appliances* shall be sized in accordance with ACCA Manual S or other approved sizing methodologies based on building loads calculated in accordance with ACCA Manual J or other *approved* heating and cooling calculation methodologies.

> ~~**Exception:** Heating and cooling equipment and appliance sizing shall not be limited to the capacities determined in accordance with Manual S where either of the following conditions applies:~~
>
> ~~1. The specified equipment or appliance utilizes multistage technology or variable refrigerant flow technology and the loads calculated in accordance with the approved heating and cooling calculation methodology are within the range of the manufacturer's published capacities for that equipment or appliance.~~
> ~~2. The specified equipment or appliance manufacturer's published capacities cannot satisfy both the total and sensible heat gains calculated in accordance with the approved heating and cooling calculation methodology and the next larger standard size unit is specified.~~

Reason: The exceptions in the 2015 codes were initially introduced because it was not certain that Manual S would complete full revision prior to the 2015 code's publication. However, ACCA Manual S completed the ANSI consensus revision process in 2014 and is referenced in the 2015 code. This creates a severe contradiction between the IRC and the national consensus standard it references.
The Manual S revision committee that developed the sizing procedures and oversize limits included the manufacturers of multi-stage and variable refrigerant flow (VRF) equipment. Those limits were revised through the public review process and now allow a greater range of equipment to be installed for multi-stage and VRF applications. The published Manual S fully covers the proper procedures for multi-stage and VRF technology agreed upon by designers, manufacturers, and energy advocates.

A study published in September 2014 by the National Institute of Standards and Technology, entitled "Sensitivity Analysis of Installation Faults on Heat Pump Performance", found that the energy penalty for over-sizing HVAC equipment could lead to as much as 20% greater energy use in warm climates. Manual S-2014 however allows a new method of oversizing multi-stage and VRF equipment in cold climates to get the necessary heating performance, while still maintaining appropriate sizing limits for warm climates. BUT the current exceptions apply across the board and will lead to unjustifiable oversizing that cost energy and money.

Bibliography: [Sensitivity Analysis of Installation Faults on Heat Pump Performance][NIST Technical Note 1848][Domanski, Henderson, Payne][2014][www.acca.org/standards/quality]
[Understanding ACCA Manual S][ACCA Special Presentation][Luis Eescobar][2014][available upon request luis.escobar@acca.org]

[Residential Equipment Selection][ANSI/ACCA 3 Manual S - 2014][ACCA][2014][www.acca.org/standards/codes]

Cost Impact: Will not increase the cost of construction
See energy consumption results from NIST Study, specifically single fault: equipment sizing. Energy use can increase by up to 24% if oversizing is the only installation fault. The effects are greater with additional installation faults (duct leakage, indoor coil airflow, refrigerant under/over charging, etc.).

RM 3-15 : M1401.3-ESCOBAR5735

RM 4-15

M1411.1

Proponent: Mike Fischer, representing the Responsible Refrigerants Codes Council (mfischer@kellencompany.com)

2015 International Residential Code

Revise as follows:

M1411.1 ~~Approved refrigerants~~Refrigerants. Refrigerants used in ~~direct~~ refrigerating systems shall conform to the applicable provisions of ~~ANSI/ASHRAE 34.~~Section 1103 of the *International Mechanical Code*.

Reason: The current requirements of M1411.1 in the IRC Mechanical Chapter are not accurate and appropriate- the use of the word "approved" in the section heading is not necessary; the inclusion of the term "direct" leaves no guidance on refreigerants used in indirect systems, and the reference to ANSI/ASHRAE 34 is incomplete because ASHRAE 15 is not also referenced. the simplest solution to clean up this section of the code is to replace the existing text and refer to the IMC.

Cost Impact: Will not increase the cost of construction
The proposal is a clarification of existing requirements.

RM 4-15 : M1411.1-FISCHER5582

RM 5-15

M1411.6.1 (New)

Proponent: Howard Ahern, representing Airex Mfg. (howard@plumberex.com)

2015 International Residential Code

Add new text as follows:

<u>**M1411.6.1 Refrigerant line insulation protection** Refrigerant Piping insulation exposed to weather shall be protected from damage, including that caused by sunlight, moisture, equipment maintenance and wind. Adhesive tape shall not be considered as a means of protection.</u>

Reason: This code change clarifies that the Refrigerant vapor (suction) line insulation complying with M1411.6 needs to be protected when it is exposed outdoors. There has been confusion from Builders, inspectors and contractors that manufactures marking U.V. on the pipe insulation was all that was needed to protect outdoor Refrigerant vapor (suction) line insulation. The majority of Pipe Insulation Manufactureres for Refrigerant vapor (suction) line insulation already have stated in their technical papers or installation instructions that when using their insulation outdoors it must be protected from UV, weather and other damage such as rodents and birds and that they offer only a limited UV resistance. No elastomeric foam is truly UV resistant.
The damage can also be caused by not only U.V, moisture, wind and damage from equipment maintenance but also oxidation. All these factors will permanently damage the insulations external surface permeability and seriously impact the insulation thermal conductivity which will impact the heating or cooling systems efficiency and resulting in higher electrical cost as the compressor must work harder to compensate for the temperature difference which can lead to a shorter life span of the equipment.

Adhesives break down due to bacteria and moisture, removal of Adhesives tape would destroy the external surface permeability of the insulation required in M1411.6

Cost Impact: Will not increase the cost of construction
This code change will not increase cost of construction in jurisdictions that have adopted the 2102 or the 2015 IECC. Most jurisdictions by 2018 should have adopted one of the IECC codes. This would only be a cost increase to jurisdictions that have not adopted the 2102 or the 2015 IECC. The majority of pipe insulation manufactures already state in their technical papers or instructions that when using their insulation outdoors it must be protected from weather.

RM 5-15 : M1411.6.1 (New)-AHERN5275

RM 6-15

M1411.7.1 (New), Chapter 44

Proponent: Howard Ahern, representing Airex Mfg. (howard@plumberex.com)

2015 International Residential Code

Add new text as follows:

M1411.7.1 Exterior wall penetration. Refrigerant piping shall be isolated by a vibration isolator and supported at exterior wall penerations. Vibration isolators shall comply with ASTM E331.

Add new standard(s) as follows:

ASTM E331- 00(2009) Standard Test Method for Water Penetration of Exterior Windows, Skylights, Doors, and Curtain Walls by Uniform Static Air Pressure Difference

Reason: This code change is needed to create consistency for installation with this code and Equipment Manufactureres installation instructions for isolation of refrigerant piping to prevent vibration damage. Refrigerant piping must be isolated and supported to eliminate vibration transfer to the exterior wall specifically from the penetration of refrigerant piping. The majority of Equipment Manufactureres Installation Instructions have for the last 4 years already required isolation of the refrigerant piping in their installation instructions to prevent vibration damage and for noise reduction. Isolation of the piping is also needed to prevent damage to the piping from contact with hard surfaces and to eliminate stress from vibration which can cause piping and joint fatigue that could lead to leaking refrigerant.
The Exterior wall penetration is a critical space due to its close proximity to the equipment and that it is the first wall penetrated by refrigerant piping in the vast majority of installations.

The only sure way to cut off the path of problematic vibration and eliminate the transference of vibration to the structure is with a Vibration Isolator with the piping supported at the point of penetration to avoid any contact with wall building materials.

Vibration will take the path of least resistance. If the piping is not isolated, then unwanted vibration will transfer through to the wall. Vibration Isolators contain resilient material that absorb the vibration energy and isolate the piping. There are already many materials and products being used in construction for piping isolation.

Trying to repair or retrofitting for vibration problems after complaints arise, is often far more expensive than an original installation.

The exterior wall penetration is often overlooked as a vibration path. Substantial acoustic energy can pass through a small opening in a wall. Reciprocating compressors mainly cause this vibration energy. From a distributing rattle or asking "why is my wall buzzing" every time the equipment starts to occupants perturbed by a "humming " noise, the problems with vibration transmission to the wall from refrigerant lines can be a constant problem for occupants.

Installation of these isolators when installed must not allow water penetration into the exterior wall and must meet ASTM E331 Standard Test Method for Water Penetration ____

Reference R703.1.1 Exterior wall coverings

R703.1.1 Water resistance. The exterior wall envelope shall be designed and constructed in a manner that prevents the accumulation of water within the wall assembly by providing a water-resistant barrier behind the exterior veneer as required by Section R703.2 and a means of draining to the exterior water that enters the assembly. Protection against condensation in the exterior wall assembly shall be provided in accordance with Section R702.7 of this code.

Exceptions: A weather-resistant exterior wall envelope shall not be required over concrete or masonry walls designed in accordance with Chapter 6 and flashed in accordance with Section R703.4 or R703.8.

Compliance with the requirements for a means of drainage, and the requirements of Sections R703.2 and R703.4, shall not be required for an exterior wall envelope that has been demonstrated to resist wind-driven rain through testing of the exterior wall envelope, including joints, penetrations and intersections with dissimilar materials, in accordance with ASTM E 331 under the following conditions

Exterior wall envelope test assemblies shall include at least one opening, one control joint, one wall/eave interface and one wall sill. All tested openings and penetrations shall be representative of the intended end-use configuration.

Exterior wall envelope test assemblies shall be at least 4 feet by 8 feet (1219 mm by 2438 mm) in size.

Exterior wall assemblies shall be tested at a minimum differential pressure of 6.24 pounds per square foot (299 Pa).

Exterior wall envelope assemblies shall be subjected to the minimum test exposure for a minimum of 2 hours. The exterior wall envelope design shall be considered to resist wind-driven rain where the results of testing indicate that water did not penetrate control joints in the exterior wall envelope, joints at the perimeter of openings penetration or intersections of terminations with dissimilar materials.

____

*"An isolation system is the best inexpensive insurance against unwanted vibration."

The International Mechanical Code and Uniform Mechanical Code both recognize the problems associated with piping vibration.

*Vibration Isolation by Robert Simmons, P.E., ASHRAE Journal 2009

Cost Impact: Will increase the cost of construction
Negligible cost increase, as The International Mechanical Code and the Uniform Mechanical Code already require designing and installing refrigerant piping to address vibration. A major percentage of any increased cost has already been absorbed by this requirement. The majority of Equipment Manufactureres already require isolation of the refrigerant piping in their installation instructions to prevent vibration. Again, any increased cost has already been absorbed by the aforementioned installation requirement.
There are many products on the market that can be installed for this requirement. Many Builders have already been installing products for vibration isolation and many Contractors building with pressure testing (blower door) have been addressing this penetration area with better installation including isolation. As there are a variety of isolating materials and systems to provide isolation, it is a minor increase in construction cost but it is a significant savings to Home Owners and Builders, as trying to repair vibration problems after complaints is often very costly.

Analysis: A review of the standard proposed for inclusion in the code, ASTM E331, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2015.

RM 6-15 : M1411.7.1 (New)-AHERN4794

RM 7-15

M1416 (New), M1416.1 (New)

Proponent: Mark Metzner, representing Self (markmetzner@shaw.ca); Muktha Tumkur (muktha.tumkur@csagroup.org)

2015 International Residential Code

Add new text as follows:

SECTION M1416
GROUND SOURCE HEAT PUMP SYSTEMS

M1416.1 **Design and installation.** The design and installation of ground source heat pump systems shall conform to ANSI/CSA C448.

Reason: The CSA C448 is an ANSI designated bi-national consensus Standard for the design and installation of ground source heat pump systems. The Standard includes performance based criteria that provide a consistent application of requirements and best practices throughout the United States and Canada. This Standard will ensure that stakeholders in the ground source heat pump systems market sector will supply and receive heating / cooling systems that perform to design efficiency expectations and deliver tru, long-term value. This Standard has been developed by a bi-national Technical Committee which comprised of the industry's leaders and it provides a strong foundation for increased market penetration of this technology into the HVAC market.
The Standard harmonizes the differences between existing resources, simplifies referencing in regulations and contracts, incorporates the latest advancements, clarifies compliance using standards language, and provides credibility through an accredited neutral standards development process.

This Standard includes performance based minimum requirements for industrial, commercial, institutional and residential applications and addresses the following items related to ground source heat pump systems:

- equipment and material selection
- site survey - geological and hydrogeological

open and closed loop ground source heat pump system design / engineering

- direct expansion (DX) systems
- installation
- testing and verification
- documentation
- commissioning and decommissioning

The Standard will apply to all ground source heat pump systems using external building heat exchangers as a thermal source or sink for heating and cooling, with or without a supplementary heating or cooling source. External building heat exchangers that will be covered by this Standard include:

- ground heat exchangers - vertical and horizontal;
- open-loop systems - drilled well and surface water;
- submerged closed loop systems - fresh water and sea water;
- standing colum wells

This Standard applies to new and retrofit installations in industrial, commercial, institutional and residential applications and includes thermal energy storage systems.

The bi-national Committee consisted of representatives from the following industry associations:

- American Society for Heating, Refrigeration and Air Conditioning Engineers (ASHRAE)
- Geothermal Exchange Organization (GEO)
- International Ground Source Heat Pump Association (IGSPHA)
- International Ground Source Heat Pump Association Canada (IGSPHA - Canada)
- National Ground Water Association (NGWA)
- Plastics Pipe Institute (PPI)
- Geothermal National & International Initiative (GEONII)
- Heating, Refrigeration and Air Conditioning Institute of Canada (HRAI)

Cost Impact: Will not increase the cost of construction
The code change proposal will not increase the cost of constructin of ground source heat pump systems.

Justification:

Currently, a US standard for the design and installation of ground source heat pump systems, similar to the C448, does not exist. The C448 is a system for the design and installation of ground source heat pump systems and it inlcudes requirements and best practices related to the installation of these systems. The systems would include pumps, pipe, grout etc., which most likely have manufacturing requirements and certification requirements within other standards, but that is not within our scope. The C448 is not a certification standard for any manufactured goods.

The C448 is generally a performance based standard which contains design requirements and best practices typically accepted and used currently by US and Canadian designers. Ground source heat pump systems that adhere to C448 will be properly designed and installed to the expectation of the owner or end user and as such will represent the minimum baseline performance of such systems. In most cases, alternate materials and installation methods are allowed. Also, in some cases, alternate innovative materials are allowed if reviewed and approved by an engineer.

RM 7-15 : M1416 (New)-METZNER5517

RM 8-15

M1502.3 (New)

Proponent: Julius Ballanco, JB Engineering and Code Consulting, P.C., representing In-O-Vate Technologies, Inc (JBENGINEER@aol.com)

2015 International Residential Code

Add new text as follows:

M1502.3 Make-up air for tight construction. Make-up air shall be provided for clothes dryers where the air infiltration rate is known to be less than 0.4 air changes per hour (ACH). Make-up air shall be provided by a duct that communicates with the outdoors, a ventilated crawl space, or a ventilated attic space and such duct shall have a cross sectional area not less than that of a 4 inch round duct. The make-up air duct shall open into the room in which the clothes dryer is located. Make-up air duct inlets shall be provided with a screen having a mesh size not less than ¼ inch and not greater than ½ inch. The make-up air inlet shall be equipped with an air admitting damper that opens during the operation of the clothes dryer.

Exception: Condensing dryers shall not require make-up air.

Reason: Today homes are much more tightly constructed, creating an inadequate condition for the proper operation of a clothes dryer. The exhaust rate for a residential dryer ranges from 125 to 200 cfm with newer dryers favoring 200 cfm.
When the air infiltration rate drops to less than 0.4 air changes per hour, this creates a condition of inadequate make-up for the clothes dryer. When there is inadequate ambient air to pull from, the dryer is starved and not capable of efficiently drying the clothes any longer. This extends the length of time for the dryer cycle wasting energy. It also reduce the life of the dryer since the fan is attempting to exhaust air that is not available.

Many clothes dryers are located in the basement of a home. When located in the basement, they have the available air in the basement as make-up air for exhausting the moisture. If a basement in 25 feet by 25 feet with an 8 foot ceiling, there is 5,000 cubic feet of available air. However, with an air exchange rate of 0.4, the available air for exhaust is 2000 cubic feet. That translates to 33.3 cfm of air. This means that the dryer has to draw air from other locations in order to properly operate, potentially pulling it from other unsafe sources.

Outside air is normally required by combustion air when the air infiltration rate is less than 0.4 as identified in Section G2407.5. This code change is consistent by requiring make-up air when the air exchange rate is below this value. The amount of air required for combustion air is normally less than the amount of make-up air for a dryer exhaust. An 80,000 Btu/hr furnace only requires between 16.6 and 26.6 cfm for combustion air, whereas the dryer requires between 125 and 200 cf

With a 4 inch duct, the make-up air can be provided at an acceptable rate. Furthermore, the fan in the clothes dryer would draw the make-up air through the make-up air duct.

A screened air admitting damper or equivalent device is necessary to prevent outside air from entering the home when the clothes dryer is not in use. The screen dimension are taken from Table 401.5 of the IMC for residential occupancies. The air admitting damper also prevents the loss of conditioned air when the dryer is not in use.

Cost Impact: Will increase the cost of construction
There will be an increase cost to install a make up air duct.

RM 8-15 : M1502.3 (New)-BALLANCO3701

RM 9-15

M1502.3

Proponent: Julius Ballanco, JB Engineering and Code Consulting, P.C., representing In-O-Vate Technologies (JBENGINEER@aol.com)

2015 International Residential Code

Revise as follows:

M1502.3 Duct termination. Exhaust ducts shall terminate on the outside of the building. Exhaust duct terminations shall be in accordance with the dryer manufacturer's installation instructions. If the manufacturer's instructions do not specify a termination location, the exhaust duct shall terminate not less than 3 feet (914 mm) in any direction from openings into buildings. Exhaust duct terminations shall be equipped with a backdraft damper. Screens shall not be installed at the duct termination. <u>Exhaust duct penetrations of exterior wall and roof assemblies shall be sealed air-tight to prevent the dryer exhaust from re-entering the building.</u>

Reason: This change clarifies that the dryer exhaust must vent to the outside without the possibility of having the dryer exhaust return to the building. In some regions, friction-fitting a ducts' end into a roof cap appears to still be acceptable. This change adds the language to require a positive leak-proof assembly that will prevent the dryer exhaust from reentering the building. The high humidity of the dryer exhaust can cause all sorts of problems within the building elements if the dryer exhaust can reenter the building. Humidity control is an important part of any building design. As such, humid lint-laden air should never be given a path to enter the building after being exhausted.

Cost Impact: Will not increase the cost of construction
This change clarifies the intent of the code.

RM 9-15 : M1502.3-BALLANCO4119

2015 International Residential Code

Revise as follows:

M1502.3 Duct termination. Exhaust ducts shall terminate on the outside of the building. Exhaust duct terminations shall be in accordance with the dryer manufacturer's installation instructions. If the manufacturer's instructions do not specify a termination location, the exhaust duct shall terminate not less than 3 feet (914 mm) in any direction from openings into buildings. Exhaust duct terminations shall be equipped with a backdraft damper. Screens shall not be installed at the duct termination. <u>Dryer exhaust duct terminations shall, by design, provide access for cleaning the exhaust duct.</u>

Reason: The routine cleaning of the dryer exhaust ducts minimizes the potential for a fire in the duct as well as increasing the efficiency of the appliance. Duct cleaning services now provide this service for dryer exhaust ducts using a wand and brush. Many duct cleaning service companies enter the dryer exhaust duct through the duct termination. This offers an easy access to the dryer exhaust duct system. If a proper dryer exhaust terminal is not provided that allows ease of access, some companies have been known to wrongly remove the termination lid or cover creating a potential leak situation.

Examples of vent caps that duct cleaners wrongly disassemble to gain access.

Examples of vent caps that duct cleaners wrongly disassemble to gain access.

Cost Impact: Will increase the cost of construction
The exhaust terminal may cost more.

RM 10-15 : M1502.3-BALLANCO4122

RM 11-15

M1502.3.1 (New)

Proponent: Julius Ballanco, JB Engineering and Code Consulting, P.C., representing In-O-Vate Technologies (JBENGINEER@aol.com)

2015 International Residential Code

Add new text as follows:

M1502.3.1 Exhaust termination outlet and passageway size. The passageway of dryer exhaust duct terminals shall be undiminished in size and shall provide an open area of not less than 12.5 square inches (8,065 sq mm).

Reason: The allowable (calculated) length of the dryer exhaust duct is based on an open (non-restrictive) exhaust terminal. Some exhaust terminals increase resistance due to their inherent design characteristics (path and final opening size). This results in the dryer exhaust duct having to be reduced in length. However, there is no allowance for a reduction in length for a highly resistant vent cap. Short of requiring testing standards for every vent termination, the code must require a minimum open area of 12.5 sq. inches which equates to a 4" round duct. The code is very sensitive and detailed as it relates to 90 degree elbows and their respective friction loss but does not prohibit or penalize for termination hoods that grossly create back pressure, reducing the efficiency of the dryer.
The dimension used for the opening in the interior area of the 4 inches duct is rounded to an even number (12.5"). By maintaining the same opening area throughout the vent terminal, the friction resistance in vent caps can be greatly reduced.

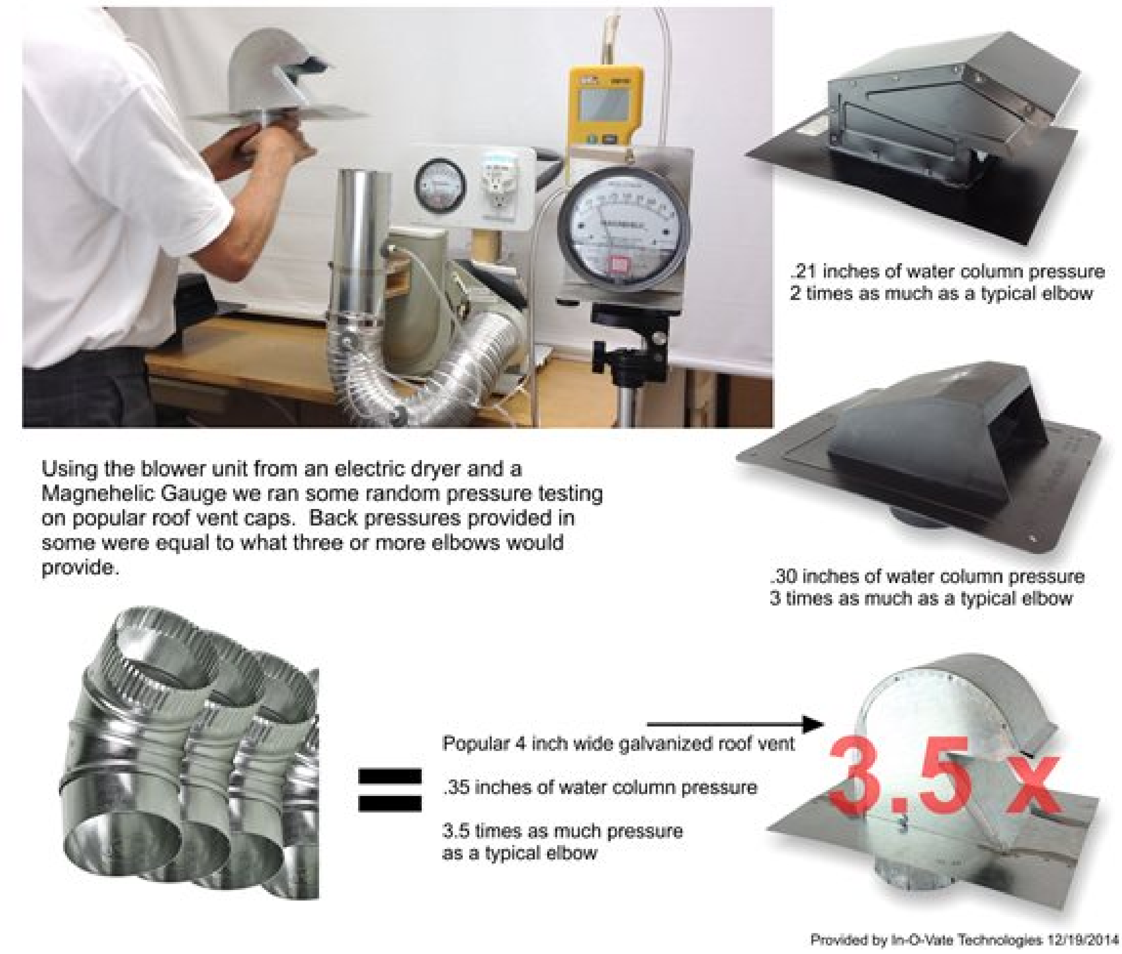
www.youtube.com/watch?v=5KnRp3eXNbk

http://youtu.be/ZL2zV1-GjdI?t=50s



Cost Impact: Will increase the cost of construction
The cost of the vent terminal may be higher.

RM 11-15 : M1502.3.1-BALLANCO4125

RM 12-15

M1502.4.2

Proponent: Julius Ballanco, JB Engineering and Code Consulting, P.C., representing In-O-Vate Technologies (JBENGINEER@aol.com)

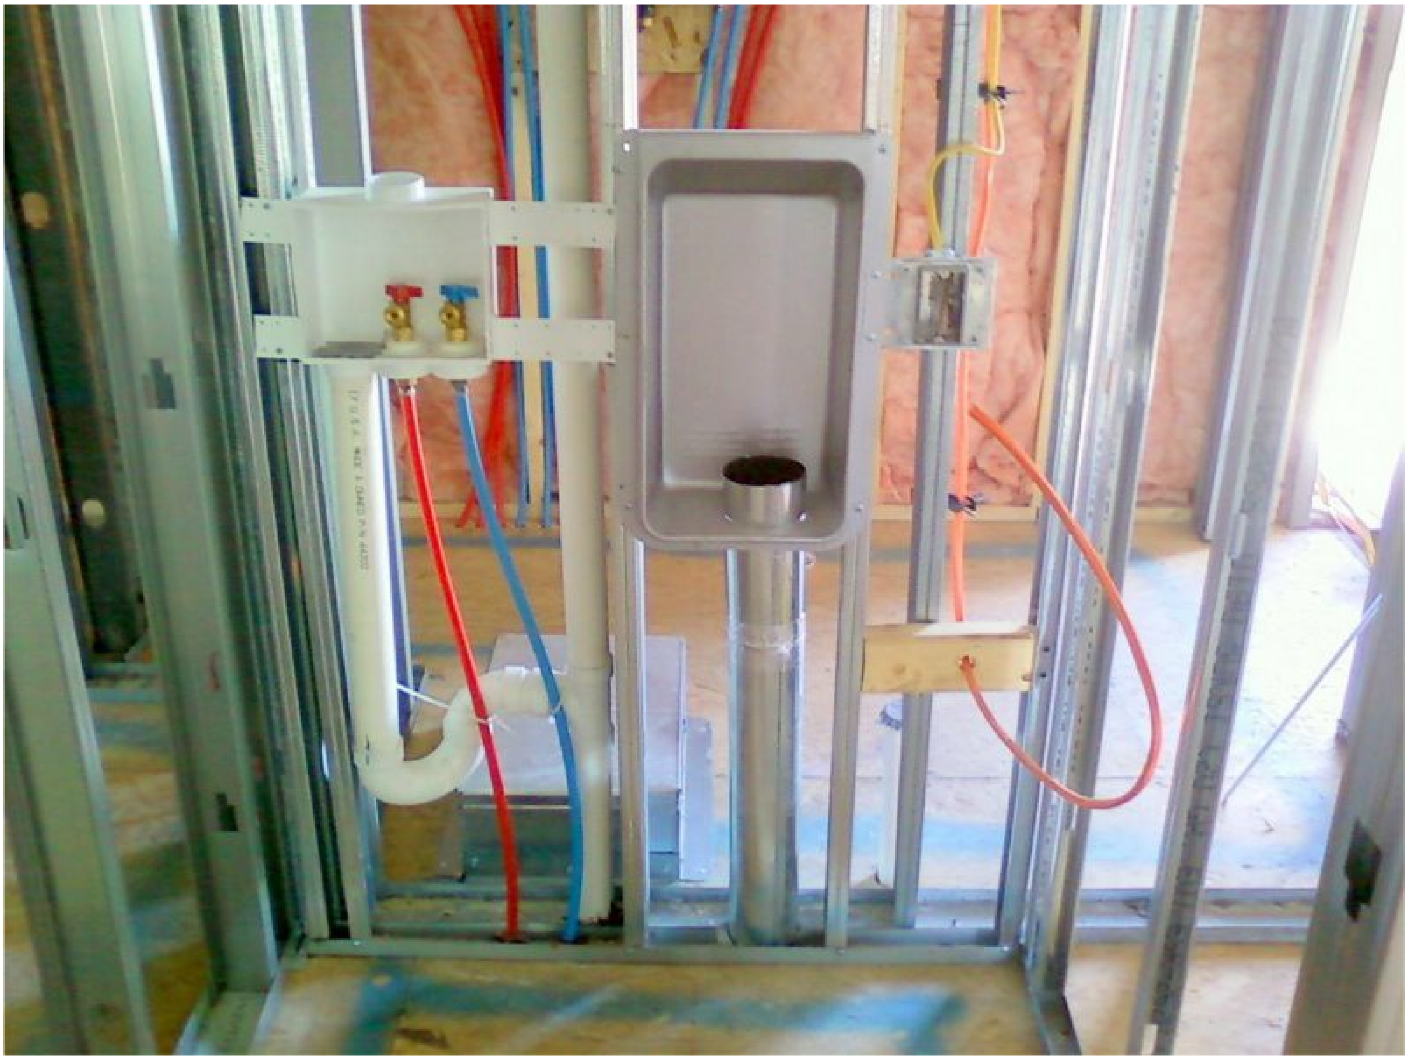
2015 International Residential Code

Revise as follows:

M1502.4.2 Duct installation. Exhaust ducts shall be supported at intervals not to exceed 12 feet (3658 mm) and shall be secured in place. The insert end of the duct shall extend into the adjoining duct or fitting in the direction of airflow. Exhaust duct joints shall be sealed in accordance with Section M1601.4.1 and shall be mechanically fastened. Ducts shall not be joined with screws or similar fasteners that protrude more than $^1/_8$ inch (3.2 mm) into the inside of the duct. <u>Where dryer exhaust ducts are enclosed in wall or ceiling cavities, such cavities shall have a least dimension of not less than 4.25 inches (108 mm). Round ducts shall not be deformed.</u>

Reason: The dryer exhaust duct must remain round in shape to reduce friction loss in the duct system. The length of the duct and termination are based on friction loss for round duct, not oval duct. The length of the dryer exhaust duct would have to be reduced if the 4 inch duct was oval in shape. In addition to the reduction in efficiency, the oval pipe creates a difficult connection for the consumer to make to the dryer exhaust transition hose.

A 1 inch furring strip (1x2) can be added to a 2 x 4 stud providing the 4.25 inches of space. In most cases, this "mechanical" wall is busy with other trades (plumbing drainage and vent stacks, gas piping, electric service, laundry services and water piping). A 4.25 inch space will benefit all of the trades working within that space. The minimum space required to keep the dryer exhaust duct round is 4.125 inches. This dimension could also be referenced here, however, most contractors



MOVIE

Examples of "mechanical walls" showing the abundance of utilities in this wall, demonstrating the need to provide more than 3.5"

Cost Impact: Will increase the cost of construction
There is an added cost for furring strips on a 2 x 4 wall.

RM 12-15 : M1502.4.2-BALLANCO4117

RM 13-15

M1502.4.2.1 (New)

Proponent: Rick Harpenau, In-O-Vate Technologies, representing In-O-Vate Technologies (rick@dryerbox.com)

2015 International Residential Code

Add new text as follows:

M1502.4.2.1 Exhaust termination pathways. . Dryer exhaust duct terminal pathways that cause a change in direction of air flow between 45 and 90 degrees shall have an area not less than 20 percent larger that the cross sectional area of the exhaust duct served. Dryer exhaust duct terminal pathways that cause a change in direction of air flow greater than 90 degrees shall have an area not less than 30 percent larger than the cross sectional area of the exhaust duct served. Exhaust duct terminal passageways shall maintain throughout an area of not less than 12.5 square inches (8,065 sq mm).

Reason: The code is very sensitive and detailed as it relates to 90 degree elbows and their respective friction loss but does not prohibit or penalize for termination hoods that grossly create back pressure, reducing the efficiency of the dryer. There are wall vents and roof vents on the market that with minimal testing equipment show clearly they create as much back pressure as 3 and 4 elbows. Short of requiring testing standards for every vent termination, the council should consider language whereby the passageway increases in size to make up for the friction causing bends. If this addition to the codes makes sense, actual calculations can be provided. Bottom line, treat terminations the same as elbows and run lengths.

Proponent: Jonathan Roberts, UL LLC, representing UL LLC (jonathan.roberts@ul.com)

2015 International Residential Code

Revise as follows:

SECTION M1503
~~RANGE HOODS~~DOMESTIC COOKING EXHAUST EQUIPMENT

Add new text as follows:

M1503.1 General. Domestic cooking exhaust equipment shall comply with the requirements of this section.

M1503.2 Domestic cooking exhaust. Where domestic cooking exhaust equipment is provided it shall comply with one of the following:

1. Overhead range hoods and downdraft exhaust equipment not integral with the cooking appliance shall be listed and labeled in accordance with UL 507.
2. Domestic cooking appliances with integral downdraft exhaust equipment shall be listed and labeled in accordance with UL 858 or ANSI Z21.1.
3. Microwave ovens with integral exhaust for installation over the cooking surface shall be listed and labeled in accordance with UL 923.

M1503.2.1 Open top broiler exhaust. Domestic open-top broiler units shall be provided with a metal exhaust hood, having a thickness of not less than 0.0157-inch (0.3950 mm) (No. 28 gage). Such hood shall be installed with a clearance of not less than 1 /4 inch (6.4 mm) between the hood and the underside of combustible material and cabinets. A clearance of not less than 24 inches (610 mm) shall be maintained between the cooking surface and combustible material and cabinets. The hood width shall be not less than the width of the broiler unit and shall extend over the entire unit.

> **Exception**: Broiler units that incorporate an integral exhaust system, and that are listed and labeled for use without an exhaust hood, shall not be required to have an exhaust hood.

Revise as follows:

~~M1503.1~~M1503.3 ~~General~~Exhaust discharge. ~~Range hoods~~ Domestic cooking exhaust equipment shall discharge to the outdoors through a duct. The duct ~~serving the hood~~ shall have a smooth interior surface, shall be air tight, shall be equipped with a back-draft damper and shall be independent of all other exhaust systems. Ducts serving range hoods shall not terminate in an attic or crawl space or areas inside the building.

> **Exception:** Where installed in accordance with the manufacturer's instructions, and where mechanical or natural *ventilation* is otherwise provided, *listed* and *labeled* ductless range hoods shall not be required to discharge to the outdoors.

~~M1503.2~~M1503.4 Duct material. Ducts serving ~~range hoods~~ domestic cooking exhaust equipment shall be constructed of galvanized steel, stainless steel or copper.

> **Exception:** Ducts for domestic kitchen cooking *appliances* equipped with down-draft exhaust systems shall be permitted to be constructed of schedule 40 PVC pipe and fittings provided that the installation complies with all of the following:
> 1. The duct is installed under a concrete slab poured on grade.
> 2. The underfloor trench in which the duct is installed is completely backfilled with sand or gravel.
> 3. The PVC duct extends not more than 1 inch (25 mm) above the indoor concrete floor surface.
> 4. The PVC duct extends not more than 1 inch (25 mm) above grade *outside of the building.*
> 5. The PVC ducts are solvent cemented.

Delete without substitution:

~~SECTIONM1505 OVERHEAD EXHAUST HOODS~~

~~**M1505.1 General.** Domestic open-top broiler units shall have a metal exhaust hood, having a minimum thickness of 0.0157-inch (0.3950 mm) (No. 28 gage) with $^{1}/_{4}$ inch (6.4 mm) clearance between the hood and the underside of combustible material or cabinets. A clearance of not less than 24 inches (610 mm) shall be maintained between the cooking surface and the combustible material or cabinet. The hood shall be not less than the width of the broiler unit, extend over the entire unit, discharge to the outdoors and be equipped with a backdraft damper or other means to control infiltration/exfiltration when not in operation. Broiler units incorporating an integral exhaust system, and *listed* and *labeled* for use without an exhaust hood, need not have an exhaust hood.~~

Reason: This proposal accomplishes the following:

1. Changes the name of Section M1503 from Range Hoods to Domestic Cooking Exhaust Equipment, which more accurately reflects the duct, makeup air, and exhaust air requirements in the section.
2. Adds a charging paragraph for the Section to M1503.1.
3. Describes the listing standards used to investigate the various types of exhaust equipment in Section M1503.2.
4. Relocates Section M1505.1 for open top broilers to section M1503.2.1.
5. Makes editorial revisions for clarity.

Cost Impact: Will not increase the cost of construction
It is primarily editorial in nature.

RM 15-15

M1503.4, M1503.4.1, M1503.4.2 (New)

Proponent: Mike Moore, Newport Ventures, representing Broan-NuTone, representing Newport Ventures (mmoore@newportventures.net)

2015 International Residential Code

Revise as follows:

M1503.4 Makeup air required. ~~Exhaust hood systems~~Where one or more gas-, liquid-, or solid-fuel- burning appliance that is neither direct -vent nor uses a mechanical draft venting system is located within a dwelling unit's air barrier, each exhaust system capable of exhausting in excess of 400 cubic feet per minute (0.19 m^3/s) shall be mechanically or ~~naturally~~ passively provided with makeup air at a rate approximately equal to the exhaust air rate. Such makeup air systems shall be equipped with not less than one damper complying with Section M1503.4.2. ~~Each damper shall~~

> **Exception:** Makeup air is not required for exhaust systems installed for the exclusive purpose of space cooling and intended to be ~~a gravity damper~~operated only when windows or ~~an electrically operated damper that automatically opens when the exhaust system operates. Dampers shall be accessible for inspection, service, repair and replacement without removing permanent construction or any~~ other ~~ducts not connected to the damper being inspected, serviced, repaired or replaced.~~air inlets are open.

M1503.4.1 Location. Kitchen exhaust makeup air shall be discharged into the same room in which the exhaust system is located or into rooms or *duct systems* that communicate through one or more permanent openings with the room in which such exhaust system is located. Such permanent openings shall have a net cross-sectional area not less than the required area of the makeup air supply openings.

Add new text as follows:

M1503.4.2 Makeup air dampers Where makeup air is required by Section M1503.4, makeup air dampers shall comply with this section. Each damper shall be a gravity damper or an electrically operated damper that automatically opens when the exhaust system operates. Dampers shall be accessible for inspection, service, repair and replacement without removing permanent construction or any other ducts not connected to the damper being inspected, serviced, repaired or replaced. Gravity or barometric dampers shall not be used in passive makeup air systems except where the dampers are rated to provide the design makeup airflow at a pressure differential of 0.01 in. w.c. (3 Pa) or less.

Reason:

Backdrafting of combustion appliances typically presents the greatest danger associated with depressurizing a space. Field tests have confirmed that naturally vented combustion appliances (i.e., those that are not mechanically vented or direct-vent) are the most susceptible to depressurization, and measures should be taken to provide makeup air (MUA) for large exhaust appliances when such appliances are located within the dwelling unit's air barrier. ASHRAE 62.2, the consensus standard for Ventilation and Acceptable Indoor Air Quality in residential dwelling units, does not require MUA when combustion appliances are mechanically vented or are direct-vent. The ASHRAE 62.2 committee recently reviewed the 62.2 section requiring MUA, and the general consensus (no vote taken) was a reaffirmation that the MUA requirement should not apply to mechanically vented or direct-vent combustion appliances, due to lack of data to substantiate their susceptibility to backdrafting.

This proposal would relax the MUA requirement in the IRC by aligning it more closely with ASHRAE 62.2. Similar changes have been made to this section in Florida's and Virginia's adoptions of the IRC.

The proposal introduces a new section to address MUA dampers specifically, moving the text from M1503.4 to M1503.4.2 and introducing one new requirement for gravity or barometric dampers. It makes no sense to design a system to provide MUA if the damper does not open before the combustion appliance starts spilling. So, the new requirement is intended to ensure that when MUA is required, any gravity or barometric damper used to provide MUA shall engage at the pressure differential above which naturally drafted combustion appliances can be expected to backdraft (3 Pa, based on an acceptable 5%-20% failure rate across all outdoor conditions)[1]. This proposed requirement only applies to gravity or barometric dampers in "passive" MUA systems, which are those that provide MUA without the assistance of a fan. Gravity or barometric dampers in "active" MUA systems are excluded from this requirement because we assume that the fan will create a sufficient pressure differential to open the damper.

A companion proposal has been submitted to the IMC.

Cost Impact: Will not increase the cost of construction
This proposal is expected to reduce construction costs by reducing the number of scenarios requiring makeup air for kitchen exhaust.

RM 15-15 : M1503.4-MOORE4878

RM 16-15

M1503.4

Proponent: Janine Snyder, City of Thornton, Colorado, representing Colorado Association of Plumbing & Mechanical Officials (CAPMO) (Janine.Snyder@cityofthornton.net)

2015 International Residential Code

Revise as follows:

M1503.4 Makeup air required. Exhaust ~~hood~~ systems capable of exhausting in excess of 400 cubic feet per minute (0.19 m^3/s) shall be mechanically or naturally provided with makeup air at a rate approximately equal to the exhaust air rate. Such makeup air systems shall be equipped with not less than one damper. Each damper shall be a gravity damper or an electrically operated damper that automatically opens when the exhaust system operates. Dampers shall be accessible for inspection, service, repair and replacement without removing permanent construction or any other ducts not connected to the damper being inspected, serviced, repaired or replaced.

Reason: The proposed change allows the code to capture down draft systems as well and not just apply to hoods.

Cost Impact: Will not increase the cost of construction
This will allow consistency with all exhaust systems.

RM 16-15 : M1503.4-SNYDER4454

RM 17-15

M1503.4

Proponent: Janine Snyder, City of Thornton, Colorado, representing Colorado Association of Plumbing & Mechanical Officials (CAPMO) (Janine.Snyder@cityofthornton.net)

2015 International Residential Code

Delete and substitute as follows:

M1503.4 Makeup air required. ~~Exhaust hood systems capable of exhausting in excess of 400 cubic feet per minute (0.19 m^3/s) shall be mechanically or naturally provided with makeup air at a rate approximately equal to the exhaust air rate. Such makeup air systems shall be equipped with not less than one damper. Each damper shall be a gravity damper or an electrically operated damper that automatically opens when the exhaust system operates. Dampers shall be accessible for inspection, service, repair and replacement without removing permanent construction or any other ducts not connected to the damper being inspected, serviced, repaired or replaced.~~

<u>Exhaust hood systems capable of exhausting in excess of 400 cubic feet per minute (0.19 m^3/s) shall be mechanically or naturally provided with makeup air at a rate approximately equal to the exhaust air rate. Such makeup air systems shall be equipped with not less than one damper. Each damper shall be an electrically operated damper that automatically opens when the exhaust system operates. Dampers shall be accessible for inspection, service, repair and replacement without removing permanent construction or any other ducts not connected to the damper being inspected, serviced, repaired or replaced.</u>

Reason: By practice they just don't work unless installed running downhill in the duct which can create a faulty seal within the duct allowing additional leakage. The whole intent is to have the electronic connection between the hood and damper. Volume dampers are subject to not fully closing when installed in the horizontal run due to wind and interior vs exterior pressure diffentials. Additionally, they can create an unintended opening in the building envelope which is a prohibition in the energy code.

Cost Impact: Will increase the cost of construction
This will slightly increase the cost of construction by returning to practices. However, the energy cost impact of having an opening into a conditioned structure from the exterior mitigates the increased construction cost.

RM 17-15 : M1503.4-SNYDER5667

RM 18-15

M1503.4

Proponent: Donald Surrena, National Association of Home Builders, representing National Association of Home Builders (dsurrena@nahb.org)

2015 International Residential Code

Revise as follows:

M1503.4 Makeup air required. Exhaust hood systems capable of exhausting in excess of 400 cubic feet per minute (0.19 m^3/s) shall be mechanically or naturally provided with makeup air at a rate approximately equal to the exhaust air rate that is in excess of 400 cubic feet per minute. Such makeup air systems shall be equipped with not less than one damper. Each damper shall be a gravity damper or an electrically operated damper that automatically opens when the exhaust system operates. Dampers shall be accessible for inspection, service, repair and replacement without removing permanent construction or any other ducts not connected to the damper being inspected, serviced, repaired or replaced.

Exception:

1. Makeup air provisions are not required for dwellings that do not contain naturally vented appliances or solid fuel- burning appliances.
2. Makeup air provisions are not required for kitchen exhaust systems that are capable of exhausting not greater than 600 cubic feet per minute (0.28 m3/s) provided that one or more of the following conditions is met.
3. The floor area within the air barrier of a dwelling unit is not less than 1500 square feet (139 m2), and natural draft type and mechanical draft type space-heating or water-heating appliances are not located within the air barrier.
4. The floor area within the air barrier of a dwelling unit is not less than 3000 square feet (279 m2), and natural draft type space-heating or water-heating appliances are not located within the air barrier.

Reason: This proposal makes two functional changes to the makeup air requirements. First, it reduces the makup air requirement to only be the amount in excess of 400 cfm rather than the entire amount of ehxaust. Second, the change includes exceptions to allow higher exhaust rates for larger homes.
As orginially written in the 2015 IRC, section M1503.4 allows range hoods up to 400 cfm to be installed without makup air. It would be consistent to require makeup air equaling the excess of 400 cfm for larger capacity fans. Essentially, there would be no difference between the effect a 400 cfm fan has on a hous and a 600 cfm fan with 200 cfm of makup air. This would also improve the feasibility and acceptance of this code section as well as reduce wasted energy and potential occupant discomfort caused by needlessly introducing excessive amounts of unconditioned air.

This will ultimately improve the feasibility and acceptance of this code section as well as cut down on the amount of wasted energy and potential occupant discomfort caused by needlessly introducing excessive amounts of unconditioned air.

Cost Impact: Will not increase the cost of construction
Houses meeting the exception will reduce construction cost by at least $150. This savings include not installing an outdoor air supply duct and a gravity damper in addition to the ongoing energy savings to the home owner.

RM 18-15 : M1503.4-SURRENA5020

RM 19-15

M1504.1, M1901.1, M1901.2

Proponent: Jonathan Roberts, UL LLC, representing UL LLC (jonathan.roberts@ul.com)

2015 International Residential Code

Delete without substitution:

~~**M1504.1 Installation of a microwave oven over a cooking appliance.** The installation of a *listed* and *labeled* cooking *appliance* or microwave oven over a *listed* and *labeled* cooking *appliance* shall conform to the terms of the upper *appliance'slisting* and *label* and the manufacturer's installation instructions. The microwave oven shall conform to UL 923.~~

Revise as follows:

M1901.1 Clearances. Freestanding or built-in ranges shall have a vertical clearance above the cooking top of not less than 30 inches (762 mm) to unprotected combustible material. Reduced clearances are permitted in accordance with the *listing* and *labeling* of the range hoods or ~~*appliances*. The installation of a listed and labeled cooking appliance or~~ microwave ~~oven over a listed and labeled cooking appliance shall be in accordance~~ovens with ~~Section M1504.1. The clearances for a domestic open-top broiler unit shall be in accordance with Section M1505.1.~~integral exhaust.

M1901.2 Cooking appliances. Cooking *appliances* shall be *listed* and *labeled* for household use and shall be installed in accordance with the manufacturer's instructions. The installation shall not interfere with *combustion air* or access for operation and servicing. Electric cooking appliances shall comply with UL 1026 or UL 858. Solid-fuel-fired fireplace stoves shall comply with UL 737. Microwave ovens shall comply with UL 923.

Reason: This proposal clarifies installation criteria for microwave ovens with integral exhaust fans that are installed above cooking surfaces. It does this as follows:

1. Deletes Section M1504.1. Those requirements primarily deal with clearances, which is covered by Section M1901.1.
2. Section M1901.1 was revised to clarify that reduced clearances to combustible material can be done in accordance with the listing and labeling of the microwave oven with integral exhaust.
3. The reference to microwave ovens complying with UL 923 was moved from deleted Section M1504.1 to Section M1901.2.

Cost Impact: Will not increase the cost of construction
Editorial changes only.

RM 20-15

M1506.3, R303.5, R303.5.1, R303.5.2

Proponent: Mike Moore, Newport Ventures, representing Broan-NuTone, representing Newport (mmoore@newportventures.net)

2015 International Residential Code

Revise as follows:

M1506.3 Exhaust openings. ~~Air exhaust openings shall terminate not less than 3 feet (914 mm) from property lines; 3 feet (914 mm) from operable and nonoperable openings into the building and 10 feet (3048 mm) from mechanical air intakes except where the opening is located 3 feet (914 mm) above the air intake.~~
Openings shall comply with Sections R303.5.2 and R303.6.

R303.5 Opening location. Outdoor intake and exhaust openings shall be located in accordance with Sections R303.5.1 and R303.5.2.

R303.5.1 Intake openings. Mechanical and gravity outdoor air intake openings shall be located not less than 10 feet (3048 mm) from any hazardous or noxious contaminant source, such as vents, chimneys, plumbing vents, streets, alleys, parking lots and loading docks.

For the purpose of this section, the exhaust from *dwelling* unit toilet rooms, bathrooms, kitchens, and ~~kitchens~~other living space shall not be considered as hazardous or noxious.

~~**Exceptions:**~~

1. ~~The 10-foot (3048 mm) separation is not required where the intake opening is located 3 feet (914 mm) or greater below the contaminant source.~~
2. ~~Vents and chimneys serving fuel-burning appliances shall be terminated in accordance with the applicable provisions of Chapters 18 and 24.~~
3. ~~Clothes dryer exhaust ducts shall be terminated in accordance with Section M1502.3.~~

R303.5.2 Exhaust openings. Exhaust air shall not be directed onto walkways. Air exhaust openings shall terminate not less than 3 feet (914 mm) from property lines; 3 feet (914 mm) from operable and nonoperable openings into the building; and 10 feet (3048 mm) from mechanical air intakes.

Exceptions:

1. The 10-foot (3048 mm) separation between intake and exhaust openings is not required where the intake opening is located 3 feet (914 mm) or greater below the contaminant source.
2. Vents and chimneys serving fuel-burning appliances shall be terminated in accordance with the applicable provisions of Chapters 18 and 24.
3. Clothes dryer exhaust ducts shall be terminated in accordance with Section M1502.3.
4. Where a combined exhaust and intake terminal is used to separate intake air from exhaust air originating in living space other than kitchens, a minimum separation distance between these two openings is not required provided that the exhaust air concentration within the intake air flow does not exceed 10%, as established by the manufacturer of such terminal.

Reason:
Combined exhaust/supply terminations are regularly installed with heating and energy recovery ventilators (H/ERVs). Their use reduces building penetrations, labor, and associated system costs. By reducing the number of penetrations, air leakage can also be reduced, resulting in space conditioning energy savings. Further, the durability of the structure can be improved through reducing entry pathways for bulk water. Combined terminations are regularly approved and installed in single family and multifamily dwelling units across the country, and manufacturer tests have demonstrated that minimum cross-contamination of airflow results from these terminations. There is currently no industry standard by which to test these units, so we have simply proposed that their performance be verified by the manufacturer, as is the practice in other areas of the code (M2002.5, R502.7, R502.8.2, R703.11.1.1, R802.7.2, R905.2.6, R1003.15.1, R1003.15.2, G2405.3, etc.). The 10% cross contamination metric is based on language in ASHRAE 62.1 that limits cross contamination of exhaust and supply streams to 10% for "air with moderate contaminant concentration, mild sensory-irritation intensity, or mildly offensive odors"; a similar exception exists in the IMC, Section 514.4. In both the IMC and ASHRAE 62.1, no standard is cited for determining cross-contamination, presumably because none yet exists. All exceptions were moved to the exhaust openings section because two of the four exceptions address only exhaust openings; the other two exceptions apply to both intake and exhaust openings, so could feasibly be located in either section.

Cost Impact: Will not increase the cost of construction

This proposal is expected to reduce construction costs by eliminating the need for a second wall cap and extra ducting that would otherwise be required to separate intake and exhaust airstreams.

RM 21-15

M1506.3

Proponent: Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

2015 International Residential Code

Delete and substitute as follows:

M1506.3 Exhaust openings. ~~Air exhaust openings shall terminate not less than 3 feet (914 mm) from property lines; 3 feet (914 mm) from operable and nonoperable openings into the building and 10 feet (3048 mm) from mechanical air intakes except where the opening is located 3 feet (914 mm) above the air intake. Openings shall comply with Sections R303.5.2 and R303.6.~~
Air exhaust openings shall terminate as follows:

1. Not less than 3 feet (914 mm) from property lines.
2. Not less than 3 feet (914 mm) from gravity air intake openings, operable windows and doors..
3. Not less than 10 feet (3048 mm) from mechanical air intakes openings except where the exhaust opening is located not less than 3 feet (914 mm) above the air intake opening. Openings shall comply with Sections R303.5.2 and R303.6.

Reason: This section has been misinterpreted because of its poor language and structure. It reads much better in a list format and the necessary clarifiers "not less than" were added where the code appeared to be requiring an exact distance of 3 or 10 feet. The terms "operable and nonoperable openings" are ambiguous because they could be referring to windows that don't open (inoperable) or grilles and louvers that have no means of closure. The intent, of course, is simply to regulate the distance to air intake openings, doors and operable windows. A fixed glass panel can be viewed as an opening, but there is no reason to limit the distance to an exhaust opening from a fixed glass panel. The last requirement relative to mechanical air intakes confused the words "opening" and "intakes," both of which are openings. The revised text cleans up this section with no change in intent.
This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes.

Cost Impact: Will not increase the cost of construction
This proposal will not increase the cost of construction because no additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code nor are the code requirements made more stringent.

RM 21-15 : M1506.3-SNYDER3285

RM 22-15

M1507.2

Proponent: Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

2015 International Residential Code

Revise as follows:

M1507.2 Recirculation of air. Exhaust air from bathrooms and toilet rooms shall not be recirculated within a residence or circulated to another *dwelling unit* and shall be exhausted directly to the outdoors. Exhaust air from bathrooms ~~and~~, toilet rooms and kitchens shall not discharge into an *attic*, crawl space or other areas inside the building. This section shall not prohibit the installation of ductless range hoods in accordance with the exception to Section M1503.1.

Reason: This section fails to include kitchen exhaust. The code should not allow kitchen exhaust to discharge to another dwelling unit or to an attic, crawl space, etc. any more than it should allow the same for toilet and bathroom exhaust. The new added last sentence makes sure that ductless range hoods are not prohibited because such simulated exhaust devices are allowed by Section M1503.1 as long as other ventilation is provided for the kitchen.
This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes.

Cost Impact: Will increase the cost of construction
This proposal will increase the cost of construction in those cases where the kitchen exhaust would have been recirculated or discharged to a location other than outdoors.

RM 22-15 : M1507.2-SNYDER3286

RM 23-15

M1507.3 (New)

Proponent: Mike Moore, Newport Ventures, representing Broan-NuTone, representing Newport (mmoore@newportventures.net)

2015 International Residential Code

Add new text as follows:

M1507.3 Ventilating equipment. Exhaust equipment serving single dwelling units shall be listed and labeled as providing the minimum required air flow in accordance with ANSI/AMCA 210-ANSI/ASHRAE 51.

Reason:
Industry experience and research have shown that "for advertised airflows that are not certified, the actual installed airflow can be a small fraction of the advertised value".[1] Without a code minimum requirement for listing and labeling flows in accordance with an ANSI standard, there is nothing in place to stop a manufacturer from reporting an airflow under whatever conditions they please (e.g., the condition with no duct work attached). Requiring listing and labeling of ventilating equipment per ANSI/AMCA 210 - ANSI/ASHRAE 51 is the first step in ensuring that fans perform to expectations. In 2015, the IRC adopted a requirement for fans to be tested per ANSI/AMCA 210 - ANSI/ASHRAE 51 when using prescriptive duct sizing Table M1506.2 (see footnote "a"). This proposal would simply elevate that requirement from a footnote to a place where it can actually be seen within the code.

Listing and labeling of products tested to this standard is maintained by the Home Ventilating Institute, which has been in operation for decades. Verification of listing and labeling to this standard can be accomplished by visually inspecting the equipment for an HVI sticker or by looking up the equipment in the on-line database.[2] Certification by HVI in accordance with ANSI/AMCA 210 - ANSI/ASHRAE 51 is already required by ASHRAE 62.2, ENERGY STAR for Homes, and the State of California, among other groups. Roughly 12,000 ventilating equipment products are listed, labeled, and can be referenced in the HVI directory.

Bibliography:
1. Singer, B. C., Delp, W. W., Apte, M., & Price, P. N. (2011). Performance of Installed Cooking Exhaust Devices. LBNL-5265E. Berkeley, CA: Lawrence Berkeley National Laboratory.
2. Home Ventilating Institute. HVI-Certified Products Directory. http://hvi.org/proddirectory/index.cfm . Accessed December 10, 2014.

Cost Impact: Will increase the cost of construction
Over 12,000 ventilating equipment products are labeled and listed in the HVI directory. These fans are tested for airflow in accordance with ANSI/AMCA 210-ANSI/ASHRAE 51. For these products, there will be no incremental cost associated with this change. For equipment that is not currently tested, listed, and labeled, the incremental costs are highly dependent upon volume of the specific products sold.

Analysis: A review of the standard proposed for inclusion in the code, ANSI/AMCA 210- ANSI/ASHRAE 51 , with regard to the ICC criteria for referenced
standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2015.

Proponent: Craig Conner, representing self (craig.conner@mac.com); Joseph Lstiburek, representing self (joe@buildingscience.com)

2015 International Residential Code

Revise as follows:

M1507.3 Whole-house mechanical ventilation system. Whole-house mechanical ventilation systems shall be designed in accordance with Sections M1507.3.1 through ~~M1507.3.3~~ M1507.3.6.

M1507.3.1 System design. *No change to text.*

M1507.3.2 System controls. *No change to text.*

M1507.3.3 Mechanical ventilation rate. The whole-house mechanical ventilation system shall provide outdoor air at ~~a continuous~~ an average rate of not less than that determined ~~in accordance with~~ by Equation 15-1 or ~~TableM1507.3.3(1)~~ Table M1507.3.3.

$$Q_r = (0.01 \times A_{floor}) + [7.5 \times (N_{br} + 1)] \qquad \textbf{(Equation 15-1)}$$

where:

Q_r =ventilation flow rate, cubic feet per minute (cfm)

A_{floor} = floor area in square feet (ft^2)

N_{br} = number of bedrooms, not less than one

~~Exception: The whole-house mechanical system is permitted to operate intermittently where the system has controls that enable operation for 25-percent of each 4-hour segment and the ventilation rate prescribed in Table M1507.3.3(1) is multiplied by the factor determined in accordance with Table M1507.3.3(2).~~

TABLE M1507.3.3 ~~(1)~~
~~CONTINUOUS~~ WHOLE-HOUSE MECHANICAL VENTILATION ~~SYSTEM~~ AIRFLOW RATE ~~REQUIREMENTS~~

DWELLING UNIT FLOOR AREA (square feet)	NUMBER OF BEDROOMS				
	0 – 1	2 – 3	4 – 5	6 – 7	> 7
	Airflow in CFM				
<1,500	30	45	60	75	90
1,501 – 3,000	45	60	75	90	105
3,001 – 4,500	60	75	90	105	120
4,501 – 6,000	75	90	105	120	135
6,001 – 7,500	90	105	120	135	150
> 7,500	105	120	135	150	165

For SI: 1 square foot = 0.0929 m^2, 1 cubic foot per minute = 0.0004719 m^3/s.

Delete without substitution:

~~TABLE M1507.3.3(2)~~

~~INTERMITTENT WHOLE-HOUSE MECHANICAL VENTILATION RATE FACTORS~~~~[a, b]~~

Portions of table not shown for clarity

~~a. For ventilation system run time values between those given, the factors are permitted to be determined by interpolation.~~

~~b. Extrapolation beyond the table is prohibited.~~

Add new text as follows:

M1507.3.4 Ventilation quality adjustment The required whole house ventilation rate from Section M1507.3 shall be adjusted by the system coefficient in Table 1507.3.4 based on the system type using Equation 15-2.

$Q_v = Q_r \times C_{system}$ **(Equation 15-2)**

where:

Q_r = ventilation rate in cubic feet per minute from Equation 15-1

C_{system} = system coefficient from Table M1507.3.4

TABLE M1507.3.4
SYSTEM COEFFICIENT

SYSTEM TYPE	**DISTRIBUTED**[a]		**NOT DISTRIBUTED**[a]	
	MIXED[b]	**NOT MIXED**[b]	**MIXED**[b]	**NOT MIXED**[b]
Balanced[c]	0.75	1.0	1.0	1.25
Not Balanced[c]	1.0	1.25	1.25	1.5

a. "Distributed" shall apply where outdoor ventilation air is supplied directly to each bedroom and the largest common area; otherwise "not distributed" shall apply.

b. " Mixed" shall apply where not less than 70% of the whole building air volume is recirculated each hour by one or more mechanical systems, otherwise "not mixed" shall apply. Where a central heating or cooling air handler fan is used to provide the mixing, the design heating or cooling airflow rate shall be used to determine the operation time setting required.

c. "Balanced" shall apply where two or more fans simultaneously supply outdoor air and exhaust air at approximately the same rate; otherwise "not balanced" shall apply. Where outdoor air is supplied by a central forced air system, "balanced" shall apply only where the fan for such system operates simultaneously with the exhaust fan(s) .

M1507.3.5 Intermittent operation Systems controlled to operate intermittently shall operate for not less thant one hour in each four hour period. The ventilation rate provided by systems controlled to operate intermittently shall be computed as the average ventilaton provided including both times of operation and non-operation.

Revise as follows:

~~M1507.4~~M1507.3.6 Local exhaust rates. Local exhaust systems shall ~~be designed to~~ have the capacity to exhaust the minimum air flow rate ~~determined~~ in accordance with Table ~~M1507.4~~M1507.3.6. Fans required by this section shall be provided with controls that enable manual override, such as an on and off switch. Fan controls shall be provided with ready access from the room served by the fan.

~~TABLE M1507.4~~ TABLE M1507.3.6
MINIMUM ~~REQUIRED~~ LOCAL EXHAUST RATES ~~FOR ONE- AND TWO-FAMILY DWELLINGS~~

AREA TO BE EXHAUSTED	EXHAUST RATES
Kitchens	100 cfm ~~intermittent or 25 cfm continuous~~
Bathrooms-Toilet Rooms	~~Mechanical exhaust capacity of~~ 50 cfm ~~intermittent or 20 cfm continuous~~

Reason: This proposed change adds the equation to compute minimum ventilation rates, adjusts airflow rates based on the effectiveness of the ventilation system type, more clearly states that the occupants shall have controls to adjust the ventilation, and makes several changes to clarify the ventilation section.
The equation on which Table M1507.3.3 is based is added explicitly as Equation 15-1. The equation is an alternative to the ventilation rates in Table M1507.3.3. The rate computed by Equation 15-1 is often lower than the table because the rates in the table have been rounded up to the largest floor area and highest number of bedrooms for each cell in the table.

Some types of ventilation work better than others. The proposal adds a ventilation quality adjustment (new M1507.3.4) based on the type of ventilation system.

This change improves on the code language; for example, although Section M1507.3.3 says the requirement is for a continuous rate, it is clear the section also allows intermittent ventilation. Unneeded words are eliminated. For example the existing Table M1507.3.3(2) and the discussion on "intermittent" in the exception is a long-winded ways of saying rates that are averaged over 4 hour periods also work.

This change makes it clear that occupants can control kitchen and bath fans, allowing them to increase the ventilation when needed. For example, increasing the ventilation if food is burned in the kitchen, or odors in the bathroom suggest higher levels of ventilation.

Some argue ventilation rates need to be substantially increased, but they do not provide evidence that existing rates are inadequate. The existing ventilation rates in the IRC have been used in many programs over the past two decades: Environments for Living program, Engineered for Life program, Energy and Environmental Building Association (EEBA) building recommendations, DOE Building America program experience, Canada's R-2000 program and Canada's Energy Star program.

Excess ventilation causes problems. Excess ventilation causes part load humidity problems in humid climates, which can lead to mold. Excess ventilation causes buildings to get overly dry during the winter leading to problems with wood finishes and furniture. Excess ventilation can cause discomfort to occupants leading to the installation of humidifiers which can be sources of indoor pollutants, leading the occupants to turn off the ventilation system which defeats the purpose of providing ventilation. Finally excessive ventilation leads to big energy costs.

Cost Impact: Will not increase the cost of construction
Overall costs should not increase. The required ventilation airflow rates are based on the same equation as the existing code. Ventilation rates required by the Equation 15-1 option are the same or slightly less than in the existing Table M1507.3.3(1). There will be some increases or decreases in cost depending on the system type, with the code change encouraging the use of the more effective systems. Some options, such as providing ventilation air through a central forced air system, are an inexpensive way to provide ventilation that is both "distributed" and "mixed". Most builders are already using the larger fans in Table M1507.3.6. Operating costs should go down due to encouraging the use of more effective ventilation system types and letting the occupant control ventilation to use it when most needed.

RM 24-15 : M1507.3-CONNER5337

RM 25-15

M1507.3.2

Proponent: Mike Moore, Newport Ventures, representing Broan-NuTone, representing Newport (mmoore@newportventures.net)

2015 International Residential Code

Revise as follows:

M1507.3.2 System controls. The whole-house mechanical ventilation system shall be provided with controls that enable manual override. Such controls shall be provided with text or a symbol that indicates the control's function.

Reason:
Tight homes are being outfitted with code-mandated whole-house mechanical ventilation systems. These systems are often simply a bathroom exhaust fan expected to run continuously. The problem is that without a label indicating the system's function, homeowners have no idea of the purpose of these systems and are likely to turn them off – thereby increasing the rate of accumulation of harmful indoor pollutants without their knowledge. At a minimum, these systems should be labeled to indicate that they are different than a typical bath fan.

Cost Impact: Will increase the cost of construction
This proposal is expected to have minimal cost impacts, as it simply involves labeling equipment for its intended purpose. This label could either be supplied from manufacturers (incremental cost would probably be <$0.10) or field-applied.

RM 25-15 : M1507.3.2-MOORE4894

RM 26-15

M1507.3.3, Chapter 44

Proponent: Robby Schwarz, EnergyLogic, Inc., representing EnergyLogic, Inc. (robby@nrglogic.com)

2015 International Residential Code

Revise as follows:

M1507.3.3 Mechanical ventilation rate. The whole-house mechanical ventilation system shall provide outdoor air at a continuous rate ~~of not less than that~~ as determined in accordance with Table M1507.3.3(1) or in accordance with Equation 15-1.

Equation 15-1
Ventilation rate =(0.01 CFM x total square foot area of house) + [(number of bedrooms +1) x 7.5 CFM]

> **Exception:** The whole-house mechanical ventilation system is permitted to operate intermittently where the system has controls that enable operation for not less than 25-percent of each 4-hour segment and the ventilation rate prescribed in Table M1507.3.3(1) is multiplied by the factor determined in accordance with Table M1507.3.3(2).

Add new standard(s) as follows:
ASHRAE 62.2 - 2010 Ventilation and Acceptable Indoor Air Quaility in Low-Rise Residential Buildings

Reason: Many Builders and Designers would like to be more precise in the specification of the air that is utilized to ventilate a home. The table is good to ensure that ventilation is occurring in a home and for a quick guide for the quantity of air that is needed for whole house mechanical ventilation, but the formula is more precise especially for homes that are on the small side in the floor area chart.

M1507.3.3 Mechanical ventilation rate. The whole-house mechanical ventilation system shall provide outdoor air at a continuous rate of not less than that determined in accordance with Table M1507.3.3(1).

Exception: The whole-house mechanical ventilation system is permitted to operate intermittently where the system has controls that enable operation for not less than 25-percent of each 4-hour segment and the ventilation rate prescribed in Table M1507.3.3(1) is multiplied by the factor determined in accordance with Table M1507.3.3(2).

TABLE M1507.3.3(1)
CONTINUOUS WHOLE-HOUSE MECHANICAL VENTILATION SYSTEM AIRFLOW RATE REQUIREMENTS

DWELLING UNIT FLOOR AREA (square feet)	NUMBER OF BEDROOMS				
	0 – 1	2 – 3	4 – 5	6 – 7	> 7
	Airflow in CFM				
< 1,500	30	45	60	75	90
1,501 - 3,000	45	60	75	90	105
3,001 - 4,500	60	75	90	105	120
4,501 - 6,000	75	90	105	120	135
6,001 - 7,500	90	105	120	135	150
> 7,500	105	120	135	150	165

For SI: 1 square foot = 0.0929 m^2, 1 cubic foot per minute = 0.0004719 m^3/s.

TABLE M1507.3.3(2)
INTERMITTENT WHOLE-HOUSE MECHANICAL VENTILATION RATE FACTORS[a, b]

RUN-TIME PERCENTAGE IN EACH 4-HOUR SEGMENT	25%	33%	50%	66%	75%	100%
Factor[a]	4	3	2	1.5	1.3	1.0

a. For ventilation system run time values between those given, the factors are permitted to be determined by interpolation.
b. Extrapolation beyond the table is prohibited.

M1507.3.3 Mechanical ventilation rate. The whole house mechanical ventilation system shall provide outdoor air at a continuous ~~rate of not less than that~~as determined in accordance with Table M1507.3.3(1) or the ASHRAE 62.2 formula (0.01 CFM x total sqft of house) + ((number of bedrooms +1) x 7.5CFM) .

Rational Statement:

Many Builders and Designers would like to be more precise in the specification of the air that is utilized to ventilate a home. The table is good to ensure that ventilation is occurring in a home and for a quick guide for the quantity of air that is needed for whole house mechanical ventilation, but the formula is more precise especially for homes that are on the small side in the floor area chart.

TABLE M1507.3.3(1)

CONTINUOUS WHOLE-HOUSE MECHANICAL VENTILATION SYSTEM AIRFLOW RATE REQUIREMENTS

DWELLING UNIT FLOOR AREA (square feet)	NUMBER OF BEDROOMS				
	0 – 1	2 – 3	4 – 5	6 – 7	> 7
	Airflow in CFM				
< 1,500	30	45	60	75	90
1,501 – 3,000	45	60	75	90	105
3,001 – 4,500	60	75	90	105	120
4,501 – 6,000	75	90	105	120	135
6,001 – 7,500	90	105	120	135	150
> 7,500	105	120	135	150	165

- Ventilation can't be greater than what is calculated by formula

Fan flow (CFM) = 0.01 CFM x your floor area + 7.5 x (your number of bedrooms + 1)

- For a 1,510 square foot 4-bedroom home,

(0.01 X 1510) + (7.5 times 5)

(15.1) + (37.5)

Formula Result: 52.6 CFM

Chart Result: 75 CFM

Cost Impact: Will not increase the cost of construction
No cost increase. Possible cost reductions by using more accurate ventilation requirements

Analysis: A review of the standard proposed for inclusion in the code, ASHRAE 62.2, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2015.

RM 26-15 : M1507.3.3-SCHWARZ4944

RM 27-15

M1507.4 (New)

Proponent: Craig Conner, representing self (craig.conner@mac.com); Craig Drumheller (CDrumheller@nahb.org); Shaunna Mozingo (smozingo@coloradocode.net)

2015 International Residential Code

Add new text as follows:

M1507.4 Venting and depressurization. Each fuel-fired furnace, boiler and water heater shall comply one or more of the following:

1. It shall be a direct-vent, fan-assisted or power-vented type.
2. Where of the natural draft type, it shall be located in a dwelling unit that has only supply or balanced ventilation systems.
3. It shall be located outside of the dwelling unit's air barrier.
4. It shall be located in a mechanical room and provided with combustion air that is supplied entirely from ducts to the outdoors or from direct openings to the outdoors.

Exceptions:

1. This section shall not apply to dwelling units having a tested air tightness of greater than 3 ACH50.
2. This section shall not apply to dwelling units having depressurization test results that are within the limits specified by an approved depressurization standard.

Reason: This proposal provides clear and practical requirements which limit the types of whole house mechanical ventilation systems which can be installed with naturally vented appliances in order to minimize the potential for back drafting. This proposal addresses the most likely scenarios where back drafting could occur and allows the whole house mechanical ventilation to assist in preventing back drafting rather than becoming a contributing factor. The requirements are consistent with Table RA301.1(1) in informative Appendix RA in the 2015 IECC where recommended depressurization limits in houses are defined. All configurations in the table with depressurization limits less than -5 Pa will no longer be able to use exhaust only whole house ventilation.

Bibliography: (1) Russell, Marion, Max Sherman and Armin Rudd (2005). "Review of Residential Ventilation Technologies." LBNL Report 57730, Ernest Orlando Lawrence Berkeley National Laboratory, Berkeley. California. http://www.buildingscience.com/documents/guides-and-manuals/gm-review-residential-ventilation-technologies

Cost Impact: Will increase the cost of construction
This code change proposal will increase the cost of construction for certain construction configurations. In a house with a naturally vented combustion appliances where exhaust-only ventilation was the preferred method of whole house ventilation, there will be an increase in cost to change to a supply type system. According to a 2005 study(1) the additional cost to go from a single-point exhaust system to a central-fan integrated supply system (without exhaust) will be roughly $155.

RM 27-15 : M1507.4 (New)-CONNER5309

RM 28-15

M1507.4

Proponent: Anthony Floyd, City of Scottsdale, representing City of Scottsdale (afloyd@scottsdaleaz.gov)

2015 International Residential Code

Revise as follows:

M1507.4 Local exhaust ~~rates~~system. Local exhaust systems shall be designed to have the capacity to exhaust the minimum air flow rate determined in accordance with Table M1507.4. Except where functioning as a component of a whole house ventilation system, exhaust fans shall be controlled by a humidity control. Humidity controls shall be capable of adjustment between a relative humidity range of 50 to 80 percent. A humidity control shall utilize manual or automatic means of adjustment and shall be a separate component or an integral component of the exhaust fan.

Reason: Bathroom exhaust fans are often underutilized by occupants. Properly operated exhaust fans removes moisture and odors thereby improving the functionality of the space and contributing to a healthy and sanitary environment. Unless functioning as a component of a whole house ventilation system, effective moisture and odor removal is achieved by humidity sensor controls. Humidity controls ensure the exhaust system operates when the bathroom is in use and for a period of time after the occupant has left the room.
During a bath or shower, the humidity level in a bathroom can be a perfect breeding ground for mold, mildew and microorganisms that can impact your health. Excess moisture has tremendous potential for damaging a home. It cracks and peels paint, ruins gypsum wallboard, causes exterior paint failure, warps doors and rusts cabinets and fixtures. Without control, it can even cause deterioration of joists and framing. As it condenses on windows, walls, ceilings and cabinets, it attracts dirt. It encourages mildew on tile grout and generally provides an environment for increased bacterial growth.

Depending on the size of the bathroom, an intermittent exhaust fan needs to run at least 20 minutes after each shower to ensure that moisture levels are reduced. Both intermittent and continuous bathroom exhaust systems reduce the risk of mold growth which is a significant health concern in homes. Moisture sensor controlled exhaust fans are far more effective than a timed or manually operated fan or an operable window that is usually left closed during the winter and summer months of the year.

Bibliography: Home Ventilating Institute - http://www.hvi.org/publications/HowMuchVent.cfm
GreenCodePro/CALGreen - http://greencodepro.com/code-summaries/california-green-building-standards-code/4-506-1-bathroom-exhaust-fans

LEED for Homes Reference Guide, 2008. p. 301-302.

Cost Impact: Will increase the cost of construction
Exhaust fan costs range from $106 for an 80 cfm with humidity sensor control to $251 for an 80 cfm with humidity sensor control, motion sensor, and quiet sound rating. The minimum cost for a roof vent kit with flex duct is $23. Moisture controlled bathroom exhaust fans minimizes the potential for building damage, saving the cost of making repairs to correct problems that could have been easily avoided.

RM 29-15

M1601.1.1

Proponent: Julius Ballanco, JB Engineering and Code Consulting, P.C., representing Self (JBENGINEER@aol.com)

2015 International Residential Code

Revise as follows:

M1601.1.1 Above-ground duct systems. Above-ground *duct systems* shall conform to the following:

1. *Equipment* connected to *duct systems* shall be designed to limit discharge air temperature to not greater than 250°F (121°C).
2. ~~Factory-made~~Listed factory-made ducts shall ~~be listed and labeled in accordance~~comply with UL 181~~ and installed in accordance with the manufacturer's instructions~~.
3. Fibrous glass duct construction shall conform to the SMACNA *Fibrous Glass Duct Construction Standards* or NAIMA *Fibrous Glass Duct Construction Standards*.
4. Field-fabricated and shop-fabricated metal and flexible duct constructions shall conform to the SMACNA HVAC *Duct Construction Standards—Metal and Flexible* except as allowed by Table M1601.1.1. Galvanized steel shall conform to ASTM A 653.
5. The use of gypsum products to construct return air ducts or plenums is permitted, provided that the air temperature does not exceed 125°F (52°C) and exposed surfaces are not subject to condensation.
6. *Duct systems* shall be constructed of materials having a flame spread index of not greater than 200.
7. Stud wall cavities and the spaces between solid floor joists to be used as air plenums shall comply with the following conditions:
    7.1. These cavities or spaces shall not be used as a plenum for supply air.
8. These cavities or spaces shall not be part of a required fire-resistance-rated assembly.
9. Stud wall cavities shall not convey air from more than one floor level.
10. Stud wall cavities and joist-space plenums shall be isolated from adjacent concealed spaces by tight-fitting fireblocking in accordance with Section R602.8.
11. Stud wall cavities in the outside walls of building envelope assemblies shall not be utilized as air plenums.

Reason: As currently written, Item 2 mandated UL 181. However, many sheet metal manufacturers make duct in their shop. A contractors shop would in essence qualify as a factory. However, contractors do not have listing and labeling of their duct. This section is also in conflict with other items, spectifically Item 3, 4, and 6. This section should simply allow the use of UL 181 duct as opposed to appearing to require compliance.

Cost Impact: Will not increase the cost of construction
This will lower the cost of construction by allowing any viable duct to be used in a dwelling unit.

RM 29-15 : M1601.1.1-BALLANCO3972

RM 30-15

M1601.1.1

Proponent: Julius Ballanco, JB Engineering and Code Consulting, P.C., representing General Plastics (JBENGINEER@aol.com)

2015 International Residential Code

Revise as follows:

M1601.1.1 Above-ground duct systems. Above-ground *duct systems* shall conform to the following:

1. *Equipment* connected to *duct systems* shall be designed to limit discharge air temperature to not greater than 250°F (121°C).
2. Factory-made ducts shall be listed and labeled in accordance with UL 181 and installed in accordance with the manufacturer's instructions.
3. Fibrous glass duct construction shall conform to the SMACNA *Fibrous Glass Duct Construction Standards* or NAIMA *Fibrous Glass Duct Construction Standards*.
4. Field-fabricated and shop-fabricated metal and flexible duct constructions shall conform to the SMACNA HVAC *Duct Construction Standards—Metal and Flexible* except as allowed by Table M1601.1.1. Galvanized steel shall conform to ASTM A 653.
5. The use of gypsum products to construct return air ducts or plenums is permitted, provided that the air temperature does not exceed 125°F (52°C) and exposed surfaces are not subject to condensation.
6. *Duct systems* shall be constructed of materials having a flame spread index of not greater than 200.
7. Stud wall cavities and the spaces between solid floor joists to be used as air plenums shall comply with the following conditions:
    - 7.1. These cavities or spaces shall not be used as a plenum for supply air.
    - 7.2. These cavities or spaces shall not be part of a required fire-resistance-rated assembly.
    - 7.3. Stud wall cavities shall not convey air from more than one floor level.
    - 7.4. Stud wall cavities and joist-space plenums shall be isolated from adjacent concealed spaces by tight-fitting fireblocking in accordance with Section R602.8.
    - 7.5. Stud wall cavities in the outside walls of building envelope assemblies shall not be utilized as air plenums.
8. PVC plastic duct and fitting material shall conform to cell classification 12454-B of ASTM D1248 or ASTM D1784 and the external loading properties of ASTM D2412. The duct temperature for plastic ducts shall not exceed 150° F (66° C).

Reason: The PMGCAC raised a concern last cycle regarding the requirements for plastic duct above ground. The plastic duct being used above ground is the same duct that is used for underground installations. This change will add the plastic duct requirements to the list of above ground duct systems using the language in Section M1601.1.2 to regulate the material requirement.
Item 6 in this section was originally added to the code during the initial hearings for the IRC when I proposed the inclusion of plastic ducts above ground. The Committee, at that time, thought the text would be more clear by referencing a flame spread of 200 rather than the language proposed for plastic duct. As such, plastic ducts have always been permitted by the IRC for above ground installations. This will simply add more specific requirements for the duct material.

Cost Impact: Will not increase the cost of construction
This change clarifies the requirement for PVC plastic duct and fittings. These are optional materials that may be used for duct construction.

RM 30-15 : M1601.1.1-BALLANCO5109

RM 31-15

M1601.1.1

Proponent: Guy McMann, Jefferson County Colorado, representing Colorado Associatoin of Plumbing and Mechanical Officials (CAPMO) (gmcmann@jeffco.us)

2015 International Residential Code

Revise as follows:

M1601.1.1 Above-ground duct systems. Above-ground *duct systems* shall conform to the following:

1. *Equipment* connected to *duct systems* shall be designed to limit discharge air temperature to not greater than 250°F (121°C).
2. Factory-made ducts shall be listed and labeled in accordance with UL 181 and installed in accordance with the manufacturer's instructions.
3. Fibrous glass duct construction shall conform to the SMACNA *Fibrous Glass Duct Construction Standards* or NAIMA *Fibrous Glass Duct Construction Standards*.
4. Field-fabricated and shop-fabricated metal and flexible duct constructions shall conform to the SMACNA HVAC *Duct Construction Standards—Metal and Flexible* except as allowed by Table M1601.1.1. Galvanized steel shall conform to ASTM A 653.
5. The use of gypsum products to construct return air ducts or plenums is permitted, provided that the air temperature does not exceed 125°F (52°C) and exposed surfaces are not subject to condensation.
6. *Duct systems* shall be constructed of materials having a flame spread index of not greater than 200.
7. Stud wall cavities and the spaces between solid floor joists to be used as air plenums shall comply with the following conditions:
    - 7.1. These cavities or spaces shall not be used as a plenum for supply air.
    - 7.2. These cavities or spaces shall not be part of a required fire-resistance-rated assembly.
    - 7.3. Stud wall cavities shall not convey air from more than one floor level.
    - 7.4. Stud wall cavities and joist-space plenums shall be isolated from adjacent concealed spaces by tight-fitting fireblocking in accordance with Section R602.8.
    - 7.5. Stud wall cavities in the outside walls of building envelope assemblies shall not be utilized as air plenums
8. <u>Volume dampers, equipment and other means of supply, return and exhaust air adjustment used in system balancing shall be provided with access</u>.

Reason: This language is absent in the IRC and is critical that access be provided for these devices in order to properly balance a system..

Cost Impact: Will increase the cost of construction
It is possible that an increase in cost might occur if access doors need to be purchased. Otherwise not.

RM 31-15 : M1601.1.1-MCMANN3699

RM 32-15

M1601.1.1

Proponent: Robby Schwarz, representing EnergyLogic, Inc. (robby@nrglogic.com)

2015 International Residential Code

Revise as follows:

M1601.1.1 Above-ground duct systems. Above-ground *duct systems* shall conform to the following:

1. *Equipment* connected to *duct systems* shall be designed to limit discharge air temperature to not greater than 250°F (121°C).
2. Factory-made ducts shall be listed and labeled in accordance with UL 181 and installed in accordance with the manufacturer's instructions.
3. Fibrous glass duct construction shall conform to the SMACNA *Fibrous Glass Duct Construction Standards* or NAIMA *Fibrous Glass Duct Construction Standards*.
4. Field-fabricated and shop-fabricated metal and flexible duct constructions shall conform to the SMACNA HVAC *Duct Construction Standards—Metal and Flexible* except as allowed by Table M1601.1.1. Galvanized steel shall conform to ASTM A 653.

~~5. The use of gypsum products to construct return air ducts or plenums is permitted, provided that the air temperature does not exceed 125°F (52°C) and exposed surfaces are not subject to condensation.~~

5. *Duct systems* shall be constructed of materials having a flame spread index of not greater than 200.
6. Stud wall cavities and the spaces between solid floor joists to be used as air plenums shall comply with the following conditions:
   6.1. These cavities or spaces shall not be used as a plenum for supply or return air.
   6.2. These cavities or spaces shall not be part of a required fire-resistance-rated assembly.
   6.3. Stud wall cavities shall not convey air from more than one floor level.
   6.4. Stud wall cavities and joist-space plenums shall be isolated from adjacent concealed spaces by tight-fitting fireblocking in accordance with Section R602.8.
   6.5. Stud wall cavities in the outside walls of building envelope assemblies and the spaces between solid floor joists in any portion of the building shall not be utilized as supply or return air plenums.

Reason: Rational Statement:
Air is a fluid like water is a fluid. Code will not stand for a plumbing system that leaks but allows a minimum level of duct leakage even though the air that is carried through the duct system carries heat, moisture, and pollutants that can be detrimental to the building occupant and the structure. Many have read the language in the last two cycles of the code to mean that both the supply side and the return side of an HVAC system need to be fully ducted. However the commentary has left a window of opportunity for contractors to continue to utilize building cavities for return air plenums. To be crystal clear, this code change proposal is largely in response to that and is designed to ensure that all HVAC duct systems are fully ducted to ensure life safety, long term durability, cost effectiveness, comfort and efficiency as they are all impacted by air under pressure being forced through un-ducted building cavities. A number of papers have been written about the decrease in efficiency and comfort as well as the increase in building durability issues and cost of ownership associated with air traveling through and out of un-ducted building cavities. Much of this air also is pulled into and out of the building due to the connection of the cavity to the outside. Negative pressure are a significant issue for combustion safety is a home and are more likely to impact atmospherically vented appliances through the leakage associated with building cavities used as returns. For all of these reasons and more all air pushed our pulled by an HVAC blower motor should be contained inside a duct system.

Cost Impact: Will increase the cost of construction
Cost implications are small with this proposal as building cavities need to be enclosed any way so air can flow through them. However this proposal is requiring that return air be enclosed in duct work and there will be a cost associated with that. However, this requirement, as well and the enhanced duct sealing requirements of the IECC, leads builders to the utilization of centralized returns which diminishes the amount of return duct work in the house drastically, maintains comfort and performance of the HVAC system, and is very cost affective.

RM 33-15

M1601.1.1

Proponent: Donald Surrena, National Association of Home Bulilders, representing National Association of Home Builders (dsurrena@nahb.org); Jay Peters, representing AQC Industries (peters.jay@me.com)

2015 International Residential Code

Revise as follows:

M1601.1.1 Above-ground duct systems. Above-ground *duct systems* shall conform to the following:

1. *Equipment* connected to *duct systems* shall be designed to limit discharge air temperature to not greater than 250°F (121°C).
2. Factory-made ducts shall be listed and labeled in accordance with UL 181 and installed in accordance with the manufacturer's instructions.
3. Fibrous glass duct construction shall conform to the SMACNA *Fibrous Glass Duct Construction Standards* or NAIMA *Fibrous Glass Duct Construction Standards*.
4. Field-fabricated and shop-fabricated metal and flexible duct constructions shall conform to the SMACNA HVAC *Duct Construction Standards—Metal and Flexible* except as allowed by Table M1601.1.1. Galvanized steel shall conform to ASTM A 653.
5. The use of gypsum products to construct return air ducts or plenums is permitted, provided that the air temperature does not exceed 125°F (52°C) and exposed surfaces are not subject to condensation.
6. Polyethylene~~*Duct*~~ duct *systems* shall be constructed of materials having a flame spread index of not greater than 200.
7. Stud wall cavities and the spaces between solid floor joists to be used as air plenums shall comply with the following conditions:
   7.1. These cavities or spaces shall not be used as a plenum for supply air.
   7.2. These cavities or spaces shall not be part of a required fire-resistance-rated assembly.
   7.3. Stud wall cavities shall not convey air from more than one floor level.
   7.4. Stud wall cavities and joist-space plenums shall be isolated from adjacent concealed spaces by tight-fitting fireblocking in accordance with Section R602.8.
   7.5. Stud wall cavities in the outside walls of building envelope assemblies shall not be utilized as air plenums.
8. PVC and CPVC ducts and fittings not covered by external duct insulation shall be constructed of material having a flame spread index not greater than 25 and a smoke development index not greater than 50 when tested in accordance with ASTM E 84 or UL 723. PVC and CPVC ducts and fittings shall be constructed of material having a flame spread index not greater than 25 and a smoke development index not greater than 500 when tested in accordance with ASTM E 84 or UL 723 where such ducts and fittings are covered by external duct insulation material conforming to Section M1601.3. The design air temperature within PVC and CPVC duct systems shall not exceed 140°F (60°C).

Reason: There is a need to more clearly support the use of above-ground plastic ducts in the International Residential Code (IRC) Section M1601.1.1. Plastic ducts appear to be "technically" allowed under this IRC Section but often receive rejection at the local jurisdiction level due to lack of specificity, clarity, and coherence, particularly in regards to the language of IRC Section M1601.2[1] and the International Mechanical Code (IMC) Section 603.8.3[2]. Unclear and incomplete duct material requirements make using lower-cost, higher-performing duct systems unnecessarily difficult or impossible depending on interpretation at the local jurisdiction level.
Solvent welded assembly of plastic ducts inherently results in low air leakage and low airflow resistance. These relatively lower-cost materials are commonly available in appropriate small sizes for space conditioning airflow in low-load houses.

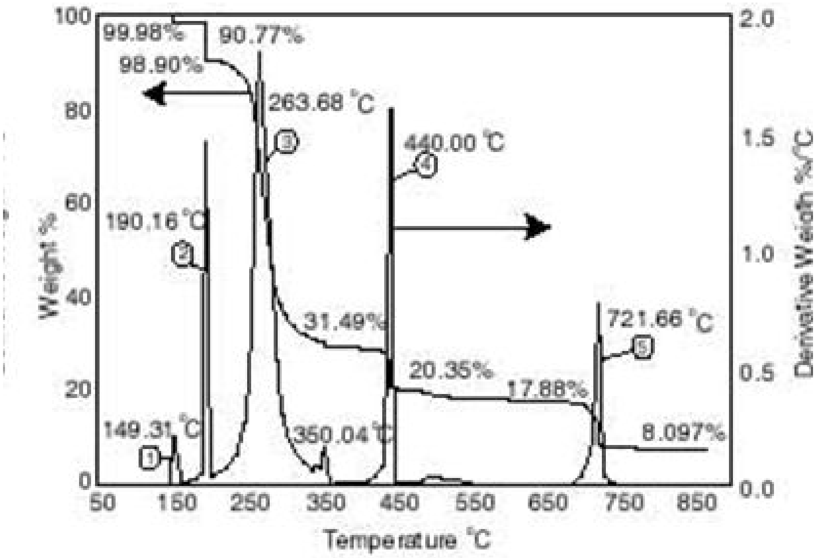
After researching the history, it was found that item 6 under Section M1601.1.1 was established specifically to allow polyethylene ducts, fittings and transitions (often blow-molded) to be used in above-ground duct systems. Based on feedback from industry stakeholders, building officials and ICC staff, the lack of clarity in this section regarding the intended material has been an ongoing problem. Calling out the intended polyethylene material will make this section clear and enforceable, clarifying that not only polyethylene fitings are allowed, but the duct system constructed of the same material.

Some available CPVC products made with fire retardant already meet the 25/50 flame spread and smoke development limitation, without being water filled. While the ignition temperature of PVC is up to 850°F (455°C), PVC and CPVC are self-extinguishing materials, meaning that they will stop burning when the heat source is removed. Typical PVC has a flame spread index in the range of 15, far less than the Class 1 duct limit of 25. The smoke development index for PVC is in the range of 500, but testing of available duct wrap products has been shown to reduce the smoke development index to less than 50.

In prior proposals related to this Section, questions have been raised about PVC brittleness and PVC off-gassing. Regarding PVC brittleness:

- PVC becomes brittle in extreme cold, but if it were installed as an air duct in an extreme cold location it would be insulated, protecting it from cold and potentially damaging impact.
- PVC will soften and lose strength with excessive heat, but that condition is well above the 140° F design air temperature limitation imposed in this proposal. (As a further note about the 140° F limit, that is not a technical limit to be confused with the 150° F limit given for plastic ducts in Section M1601.1.2, rather, 140° F is a reasonable practical limit since there is no practical need to supply heated air in dwellings above 140° F in dwellings. Modern condensing furnaces typically deliver heated air in the range of 110° F to 115° F. Air delivered much hotter than that can cause comfort and air distribution/stratification problems, as remembered by the old "scorched air" complaints.)
- PVC will break down and get brittle if left exposed to UV light, but once again it would be covered with insulation and protected in that case.
- PVC will degrade with age as plasticizers added in manufacturing are lost. After an estimated 50 years, its effective pressure capability may drop but not in the range of air duct pressures. In addition, PVC is already approved for use with pressurized water.

Regarding VOC off-gassing, the chart below obtained from http://www.madisongroup.com/case-studies-pvc-pipe.html shows test results from a thermogravimetric analyzer (TGA) where the PVC sample was gradually heated. Decomposition of different compounds can be seen along with the percent weight loss. The decomposition peaks can be matched with known materials that decompose at the same exact temperature. Referring to the curve marked (1), there was no recorded weigh loss until about 150° C (302° F).



TGA Analysis of a PVC sample. (1) Volatiles: humidity, monomers, solvents (2) DOP plasticizer (3) HCL formation (4) carbon-carbon scission (5) CO_2 formation

---

[1] IRC Chapter 16 Duct Systems, Section 1601.2 states that, "Each portion of a factory-made air duct shall bear a listing and label indicating compliance with UL 181 and UL 181A or UL 181B."

[2] IMC Chapter 6 Duct Systems, Section 603.8.3 states that, "Plastic duct and fittings shall be utilized in underground installations only."

Cost Impact: Will not increase the cost of construction
Since the added text clarifies that PVC, CPVC and polyethylene may be used–as an option–in duct construction, there is no added cost associated with this proposal. In fact, it may reduce construction costs by allowing contractors more options. Where PVC or CPVC ducts are required to have an external insulation covering material conforming to Section M1601.3, the comparison would only be where the ducts are inside conditioned space which is the only case where they can be uninsulated. Flexible duct and fibrous duct board are pre-insulated factory ducts. Therefore, the cost comparison is only between uninsulated metal ducts and insulated plastic ducts. In that case, it is estimated that the cost of minimally insulated plastic duct is roughly equivalent to the cost of uninsulated metal duct.

RM 33-15 : M1601.1.1-SURRENA5025

RM 34-15

M1601.1.2

Proponent: Jay Peters, Codes and Standards International, representing AQC Industries (peters.jay@me.com)

2015 International Residential Code

Revise as follows:

M1601.1.2 Underground duct systems. Underground *duct systems* shall be constructed of *approved* concrete, clay, metal or plastic. The maximum ~~duct~~design temperature for systems utilizing plastic ~~ducts~~duct and fittings shall ~~not~~ be ~~greater than~~ 150°F (66°C). Metal ducts shall be protected from corrosion in an *approved* manner or shall be completely encased in concrete not less than 2 inches (51 mm) thick. Nonmetallic ducts shall be installed in accordance with the manufacturer's instructions. Plastic pipe and fitting materials shall conform to cell classification 12454-B of ASTM D 1248 or ASTM D 1784 and external loading properties of ASTM D 2412. Ducts shall slope to an accessible point for drainage. ~~Where encased in concrete, ducts~~Ducts shall be sealed, secured and ~~secured~~tested with air at a pressure of not less than 2 inches of W.C. for not less than 5 minutes in the presence of the code official prior to ~~any~~encasing the ducts in concrete ~~being poured~~or direct burial. Metallic ducts having an *approved* protective coating and nonmetallic ducts shall be installed in accordance with the manufacturer's instructions.

Reason: This air temperature language does not change the substantive technical content of the provision but uses the exact same language as the IMC to bring uniformity to the codes.
All duct leakage, whether in the envelope, in the attic, or underground is undesireable but underground ducts are more likely to cause serious issues due to their location. Underground ducts systems have a propensity to leak which causes air exfiltration (loss) and also duct infiltration (gain) of contaminants into the duct system and residence. The leakage, in-and-out, not only causes poor indoor air quality, duct system degradation, sick building occupants, mold, mildew and even radon contamination, but also wastes energy. Some estimate that after the combined infiltration from walls/ceilings/floors, the duct system is the next largest cause of air leakage in the residence. Underground return air ducts are of particular concern due to the negative pressure within the duct system, causing intake of impurities. All ducts are to be sealed before burial, whether in concrete or directly buried in the ground but the code does not require any verification or test to prove the system is airtight, or more importantly, watertight. Metallic ducts encased in concrete, as well as those approved for direct burial should be tested to find leaks before burial, not afterwards, or never at all.

Cost Impact: Will increase the cost of construction
Although I have checked the box for additional cost, underground duct systems, when installed by quality contractors and installed correctly should already be performing this test. The proposal for air test may add a minimal cost to initial installation but has potential to save money in the long run through greater energy savings, indoor air quality and future repairs.

2015 International Residential Code

Add new text as follows:

M1601.1.3 **Nonmetallic Ducts** Nonmetallic ducts shall be constructed with Class 0 or Class 1 duct material and shall comply with UL181. Fibrous duct construction shall conform to the SMACNA Fibrous Glass Duct Construction Standards or NAIMA Fibrous Glass Duct Construction Standards. Flexible air ducts and air connectors shall comply with the ADC Flexible Duct Performance & Installation Standards. The air temperature within nonmetallic ducts shall not exceed 250ºF (121ºC).

M1601.1.3.1 **Flexible Air Ducts and Air Connectors** Flexible air ducts, both metallic and non-metallic, shall comply with Sections M1601.1.3.2, M1601.1.3.3, M1601.1.2.7, and M1601.1.3.8. Flexible air connectors, both metallic and nonmetallic, shall comply with Sections M1601.1.3.4 through M1601.1.3.8.

M1601.1.3.2 **Flexible air ducts** Flexible air ducts, both metallic and nonmetallic, shall be tested in accordance with UL181. Such ducts shall be *listed* and *labeled* as Class 0 or Class 1 flexible air ducts and shall be installed in accordance with their listing.

M1601.1.3.3 **Duct length.** Flexible air ducts shall not be limited in length. Flexible air ducts shall be installed fully extended. The provision of excess duct length for the purpose of possible future relocation of air terminal devices is prohibited.

M1601.1.3.4 **Flexible air connectors** Flexible air connectors, both metallic and nonmetallic, shall be tested in accordance with UL181. Such connectors shall be *listed* and *labeled* as Class 0 or Class 1 flexible air connectors and shall be installed in accordance with their listing.

M1601.1.3.5 **Connector length.** Flexible air connectors shall be limited in length to 14 feet (4267 mm). . Flexible air connectors and multiple lengths of flexible air connector that have been joined together shall be limited in length to 14 feet (4267 mm). Flexible air connectors shall be installed fully extended. .

M1601.1.3.6 **Connector penetration limitations.** Flexible air connectors shall not pass through any wall, floor, or ceiling.

M1601.1.3.7 **Flexible air duct and air connector clearance.** Flexible air ducts and air connectors shall be installed with *clearances* to *appliances* as specified in the *appliance* manufacturer's installation instructions.

M1601.1.3.8 **Flexible air duct and air connector bends.** Where flexible air ducts and air connectors are used in place of metallic elbows, the bend radius shall be greater than or equal to one (1) duct diameter measured to the outer surface of the duct on the inside of the bend.

Revise as follows:

M1601.4.1 Joints, seams and connections. Longitudinal and transverse joints, seams and connections in metallic and nonmetallic ducts shall be constructed as specified in SMACNA HVAC *Duct Construction Standards—Metal and Flexible* and NAIMA *Fibrous Glass Duct Construction Standards*. Joints, longitudinal and transverse seams, and connections in ductwork shall be securely fastened and sealed with welds, gaskets, mastics (adhesives), mastic-plus-embedded-fabric systems, liquid sealants or tapes. Tapes and mastics used to seal fibrous glass ductwork shall be *listed* and *labeled* in accordance with UL 181A and shall be marked "181A-P" for pressure-sensitive tape, "181 A-M" for mastic or "181 A-H" for heat-sensitive tape.
~~Tapes and mastics used to seal metallic and flexible air ducts and flexible air connectors shall comply with UL 181B and shall be marked "181 B-FX" for pressure-sensitive tape or "181 BM" for mastic.~~

Duct connections to flanges of air distribution system equipment shall be sealed and mechanically fastened~~.~~ ~~Mechanical fasteners for use with flexible nonmetallic air ducts shall comply with UL 181B and shall be marked 181B-~~

~~C~~. Crimp joints for round metallic ducts shall have a contact lap of not less than 1 inch (25 mm) and shall be mechanically fastened by means of not less than three sheet-metal screws or rivets equally spaced around the joint.

Tapes and mastics used to seal metallic and nonmetallic flexible air ducts and flexible air connectors shall comply with UL 181B and shall be marked "181 B-FX" for pressure-sensitive tape or "181 BM" for mastic. Fittings used in combination with flexible air ducts and air connectors shall have a flange length of not less than 2 inches (51 mm) for connection of the flexible duct. Flexible duct inner cores shall be installed not less than 1" (25mm) onto the fitting prior to taping and application of the mechanical fastener. Mastic shall be applied in accordance with the mastic manufacturer's installation instructions prior to pulling the inner core onto the fitting and applying the mechanical fastener. Nonmetallic mechanical fasteners for use with flexible nonmetallic air ducts shall comply with UL 181B and shall be marked 181B-C. Where nonmetallic mechanical fasteners are used, the fittings shall be beaded. The insulation and outer vapor barrier of flexible ducts shall be sealed to the fitting using 2 wraps of approved duct tape or a mechanical fastener in place of, or in conjunction with, the tape.

Closure systems used to seal all ductwork shall be installed in accordance with the manufacturers' instructions.

Exceptions:

1. Spray polyurethane foam shall be permitted to be applied without additional joint seals.
2. Where a duct connection is made that is partially inaccessible, three screws or rivets shall be equally spaced on the exposed portion of the joint so as to prevent a hinge effect.
3. For ducts having a static pressure classification of less than 2 inches of water column (500 Pa), additional closure systems shall not be required for continuously welded joints and seams and locking-type joints and seams of other than the snap-lock and button-lock types.

Add new text as follows:

M1601.4.3.1 **Support** Flexible air ducts and air connectors shall be supported at intervals not to exceed 4 feet (1219mm) where installed horizontally and 6 feet (1829mm) where installed as vertical risers and shall be installed in accordance with the manufacturer's installation instructions and the *ADC Flexible Duct Performance & Installation Standards.* Supports shall be not less than 1.5 inches (38mm) in width and the sag between supports shall not exceed 1/2" (13mm) per foot of duct length between supports.

Add new standard(s) as follows:

Air Diffusion Council

1901 N. Roselle Road, Suite 800

Schaumburg, IL 60195

ADC *Flexible Duct Performance & Installation Standards*, 5th Edition

Reason: The proposed revised and added text is companion to similar proposals made to the IMC Chapter 6.
The changes and revisions included seek to clarify important aspects of proper flexible duct installation.

All of the language, to my knowledge, is currently included either within the manufacturer's installation instructions supplied with flexible ducts that are listed and labeled to the UL181 Standard, the UL181B Standard for Closure Systems, and within the Air Diffusion Council Flexible Duct Performance & Installation Standards.

Although the code language currently requires that products be installed per the listing and per the manufacturer's installation instructions, this added or revised text within the code sections should help clarify important aspects of proper flexible duct installations.

Some revisions are only movement of text within the sections to facilitate flow of information and relavence.

Cost Impact: Will not increase the cost of construction
Since the intent of the proposal is to clarify existing requirements (per the manufacturer's installation instructions already required), there should be no additional cost impact if these revisions are included.

Analysis:
A review of the standard proposed for inclusion in the code, ADC Fle*xible Duct Performance & Installation Standards*, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2015.

RM 35-15 : M1601.1.3 (New)-KOERBER5138

RM 36-15

M1601.4.1

Proponent: Donald Surrena, National Association of Home Builders, representing National Association of Home Builders (dsurrena@nahb.org)

2015 International Residential Code

Revise as follows:

M1601.4.1 Joints, seams and connections. Longitudinal and transverse joints, seams and connections in metallic and nonmetallic ducts shall be constructed as specified in SMACNA HVAC *Duct Construction Standards—Metal and Flexible* and NAIMA *Fibrous Glass Duct Construction Standards*. Joints, longitudinal and transverse seams, and connections in ductwork shall be securely fastened and sealed with welds, gaskets, mastics (adhesives), mastic-plus-embedded-fabric systems, liquid sealants or tapes. Tapes and mastics used to seal fibrous glass ductwork shall be *listed* and *labeled* in accordance with UL 181A and shall be marked "181A-P" for pressure-sensitive tape, "181 A-M" for mastic or "181 A-H" for heat-sensitive tape.

Tapes and mastics used to seal metallic and flexible air ducts and flexible air connectors shall comply with UL 181B and shall be marked "181 B-FX" for pressure-sensitive tape or "181 BM" for mastic. Duct connections to flanges of air distribution system equipment shall be sealed and mechanically fastened. Mechanical fasteners for use with flexible nonmetallic air ducts shall comply with UL 181B and shall be marked 181B-C. Crimp joints for round metallic ducts shall have a contact lap of not less than 1 inch (25 mm) and shall be mechanically fastened by means of not less than three sheet-metal screws or rivets equally spaced around the joint.

Closure systems used to seal all ductwork shall be installed in accordance with the manufacturers' instructions.

Exceptions:

1. Spray polyurethane foam shall be permitted to be applied without additional joint seals.
2. Where a duct connection is made that is partially inaccessible, three screws or rivets shall be equally spaced on the exposed portion of the joint so as to prevent a hinge effect.
3. For ducts having a static pressure classification of less than 2 inches of water column (500 Pa), additional closure systems shall not be required for continuously welded joints and seams and locking-type joints and seams of other than the snap-lock and button-lock types that are located outside of conditioned spaces.

Reason: This proposal will reduce construction cost and still reduce energy loss that would occur due to duct leakage outside conditioned space. Low pressure longitudinal seam duct leakage is very limited and the small amount of leakage within conditioned space is still useful energy.

Cost Impact: Will not increase the cost of construction
Cost decrease of up to $314 for an average house according to research conducted by Home Innovation Research Labs.

RM 36-15 : M1601.4.1-SURRENA5018

RM 37-15

M1602.2

Proponent: Guy McMann, Jefferson County Colorado, representing Colorado Association of Plumbing and Mechanical Officials (CAPMO) (gmcmann@jeffco.us)

2015 International Residential Code

Revise as follows:

M1602.2 Return air openings. Return air openings for heating, ventilation and air conditioning systems shall comply with all of the following:

1. Openings shall not be located less than 10 feet (3048 mm) measured in any direction from an open combustion chamber or draft hood of another appliance located in the same room or space.
2. The amount of return air taken from any room or space shall be not greater than the flow rate of supply air delivered to such room or space.
3. Return and transfer openings shall be sized in accordance with the appliance or equipment manufacturers' installation instructions, Manual D or the design of the registered design professional.
4. Return air shall not be taken from a closet, bathroom, toilet room, kitchen, garage, mechanical room, boiler room, furnace room or unconditioned attic.

    Exceptions:

    1. Taking return air from a kitchen is not prohibited where such return air openings serve the kitchen only, and are located not less than 10 feet (3048 mm) from the cooking appliances.
    2. Dedicated forced-air systems serving only the garage shall not be prohibited from obtaining return air from the garage.
5. Taking return air from an unconditioned crawl space shall not be accomplished through a direct connection to the return side of a forced-air furnace. Transfer openings in the crawl space enclosure shall not be prohibited.
6. Return air from one dwelling unit shall not be discharged into another dwelling unit.
7. <u>Return air shall not be taken from indoor swimming pool enclosures and associated deck areas except where such space is dehumidified.</u>

Reason: It is not desirable to pull return air from swimming pool areas due to the affects it would have on the system from humidity and chemical odors associated with such spaces. A dedicated system would be required or a combination of supply and exhaust. This scenario is consistent with the same dwelling built under the IMC.

Cost Impact: Will not increase the cost of construction
Generally speaking this proposal is will not cause an increase is cost. If dehumidificaton is chosen then there could be an increase in cost.

RM 37-15 : M1602.2-MCMANN3700

RM 38-15

M2005.1, M2005.2, M2005.2.1

Proponent: Guy McMann, Jefferson County, Colorado, representing Colorado Associatoin of Plumbing and Mechanical Officials (CAPMO) (gmcmann@jeffco.us)

2015 International Residential Code

Revise as follows:

M2005.1 General. Water heaters shall be installed in accordance with Chapter 28, the manufacturer's instructions and the requirements of this code. ~~Water heaters installed in an attic shall comply with the requirements of Section M1305.1.3.~~ Gas-fired water heaters shall comply with the requirements in Chapter 24. Domestic electric water heaters shall comply with UL 174. Oiled-fired water heaters shall comply with UL 732. Thermal solar water heaters shall comply with Chapter 23 and UL 174. Solid fuel-fired water heaters shall comply with UL 2523.

M2005.2 Prohibited locations. Fuel-fired water heaters shall not be located in sleeping rooms, bathrooms, toilet rooms, storage closets or a space that opens only to such room or spaces.

Exceptions:

1. The water heater is a direct- vent appliance installed in accordance with the terms of its listing and the manufacturer's installation instructions.
2. Where the water heater is installed in a room ~~used as a storage closet. Water heaters located in~~or space that opens only into a bedroom or bathroom, the room or space shall be ~~installed in~~provided with a ~~sealed enclosure so that~~ *solid weather stripped door equipped with an approved self-closing device. All combustion air* ~~will not~~ shall be taken directly from the ~~living space~~outdoors. ~~Installation of direct-vent water heaters within an enclosure is not required.~~

M2005.2.1 Water heater access. Access to water heaters that are located in an *attic* or underfloor crawl space ~~is permitted to~~shall be ~~through a closet located in a sleeping room or bathroom where *ventilation* of those spaces is~~ in accordance with ~~this code.~~Section M1305.

Reason: This section lacks some general informatoin and is incomplete. It is also in need of a little cleanup. There are no new requirements.

Cost Impact: Will not increase the cost of construction
This proposal is strictly editorial in nature and will not cause an increase is cost.

RM 38-15 : M2005.1-MCMANN3692

RM 39-15

M2006.1, M2006.3, Chapter 44

Proponent: Jennifer Hatfield, J. Hatfield & Associates, PL, representing Association of Pool & Spa Professionals (jhatfield@apsp.org)

2015 International Residential Code

Revise as follows:

M2006.1 General. Pool and spa heaters shall be installed in accordance with the manufacturer's installation instructions. Oil-fired pool heaters shall comply with UL 726. Electric pool and spa heaters shall comply with UL 1261, UL 1563 or CSA C22.2 No. 218.1. Gas-fired pool heaters shall comply with ANSI Z21.56/CSA 4.7. Pool and spa heat pump water heaters shall comply with UL 1995, AHRI 1160, or CSA C22.2 No. 236.

Delete without substitution:

~~**M2006.3 Temperature-limiting devices.** Pool heaters shall have temperature-relief valves.~~

Add new standard(s) as follows:

AHRI 1160 (I-P) -09 Performance rating of Heat Pump Pool Heaters

ANSI Z21.56a/CSA 4.7 -2013 Gas Fired Pool Heaters

CSA C22.2 No. 236-11 Cooling Equipment

CSA C22.2 No. 218.1-M89(R2011) Spas, Hot Tubs and Associated Equipment

UL 1563-2009 Standard for Electric Spas, Hot Tubs and Associated Equipment-with revisions through July 2012

Reason: This proposal is needed to ensure consistency with what standards are required for the various pool heaters in Section 316.2 and Table 316.2 of the International Swimming Pool & Spa Code.
Further, section M2006.3 needs to be removed because it is out of date and not compatible with the current heaters on the market. For example, UL Standard 1995 does not require a temperature relief valve for two reasons: (1) If a condition exists whereby the thermostat fails to turn off the heat pump, the outlet water temperature is effectively controlled by the compressor high pressure control and/or internal pressure control. Long before the outlet water reaches an unacceptably high temperature, the refridgeration system high pressure control and/or the compressor internal pressure control will trip and shut off the compressor. (2) A pool, spa or hot tub is an open system, unlike a water heater tank that can allow pressure to build. Excess pressure developed as a result of excessive temperatures in the heat pump are relieved through the pool, spa or hot tub.

Bibliography: International Swimming Pool & Spa Code, Section 316.2 and Table 316.2

Cost Impact: Will not increase the cost of construction
This proposal will prevent an increase in cost because without it, a jurisdiction may requrie a temperature relief valve in products that are not currently listed to have one.

Analysis:
A review of the standard proposed for inclusion in the code, AHRI 1160, ANSI Z21.56/CSA 4.7, CSA C22.2 No 218.1, CSA C22.2 No. 236 and UL 1563, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2015.

RM 39-15 : M2006.1-HATFIELD5744

RM 40-15

Table M2101.1, M2103.3

Proponent: Curtis Dady, Viega, LLC, representing Viega, LLC (curtis.dady@viega.us)

2015 International Residential Code

Revise as follows:

TABLE M2101.1
HYDRONIC PIPING MATERIALS

MATERIAL	USE CODE[a]	STANDARD[b]	JOINTS	NOTES
Copper tubing (type K, L or M)	1, 2	ASTM B 75, B 88, B 251, B 306, ASME B16.51	Brazed, soldered, press-connected and flared mechanical fittings	Joints embedded in concrete

(Portions of table not shown remain unchanged)

For SI: °C = [(°F)-32]/1.8.

a. Use code:
1. Above ground.
2. Embedded in radiant systems.
3. Temperatures below 180°F only.
4. Low temperature (below 130°F) applications only.
5. Temperatures below 160°F only.

b. Standards as listed in Chapter 44.

M2103.3 Piping joints. Copper and copper alloy systems shall be soldered, brazed, or press-connected. Soldering shall be in accordance with ASTM B 828. Fluxes for soldering shall be in accordance with ASTM B 813. Brazing fluxes shall be in accordance with AWS A5.31. Press-connect shall be in accordance with ASME B16.51. Piping joints that are embedded shall be installed in accordance with the following requirements:

1. Steel pipe joints shall be welded.
2. Copper tubing shall be joined by brazing complying with Section P3003.6.1.
3. Polybutylene pipe and tubing joints shall be installed with socket-type heat-fused polybutylene fittings.
4. CPVC tubing shall be joined using solvent cement joints.
5. Polypropylene pipe and tubing joints shall be installed with socket-type heat-fused polypropylene fittings.
6. Cross-linked polyethylene (PEX) tubing shall be joined using cold expansion, insert or compression fittings.
7. Raised temperature polyethylene (PE-RT) tubing shall be joined using insert or compression fittings.

Reason: ASME B16.51 "Copper and Copper Alloy Press-Connect Pressure Fittings" is included in IMC table 1202.5 HYDRONIC PIPE FITTINGS and these joints are included in sections 1203.8 and 1203.8.3.

Cost Impact: Will not increase the cost of construction
Addition of option, not requirement.

RM 40-15 : M2101.1-DADY3675

RM 41-15

Table M2101.1, Table M2105.4

Proponent: Mike Cudahy, representing Plastic Pipe and Fittings Association (mikec@cmservnet.com)

2015 International Residential Code

Revise as follows:

TABLE M2101.1
HYDRONIC PIPING MATERIALS

MATERIAL	USE CODE[a]	STANDARD[b]	JOINTS	NOTES
Cross-linked polyethylene (PEX)	1, 2, 3	ASTM F 876, ~~F 877~~	(See PEX fittings)	Install in accordance with manufacturer's instructions

(Portions of table and notes not shown remain unchanged)

TABLE M2105.4
GROUND-SOURCE LOOP PIPE

MATERIAL	STANDARD
Cross-linked polyethylene (PEX)	ASTM F 876; ~~ASTM F 877~~ CSA B137.5

(Portions of table not shown remain unchanged)

Reason: ASTM F877 has been revised a few years ago to remove redundant pipe/tubing dimensional and performance specifications which are otherwise specified in ASTM F876. F877 remains a PEX fitting and PEX system materials and performance standard exclusive for use with ASTM F876 piping/tubing.

Cost Impact: Will not increase the cost of construction
This proposal simply deletes a standard that is no longer pipe or tubing related from the code. The piping material is now covered by a different standard, and as such, the option is not deleting or adding a material. Thus the code with this proposal added will not cause the cost of construction to increase..

RM 41-15 : Table M2101.1-CUDAHY4732

RM 42-15

Table M2101.1

Proponent: Pennie L Feehan, representing Copper Development Association (penniefeehan@me.com)

2015 International Residential Code

Revise as follows:

TABLE M2101.1
HYDRONIC PIPING MATERIALS

MATERIAL	USE CODE[a]	STANDARD[b]	JOINTS	NOTES
~~Brass pipe~~	~~1~~	~~ASTM B 43~~	~~Brazed, welded, threaded, mechanical and flanged fittings~~	
~~Brass tubing~~	~~1~~	~~ASTM B 135~~	~~Brazed, soldered and mechanical fittings~~	
Copper <u>and copper-alloy</u> pipe	1	ASTM B42, <u>B43,</u> B302	Brazed, soldered and mechanical fittings threaded, welded and flanged	
Copper and copper-alloy tubing (type K, L or M)	1, 2	ASTM B75, B88, <u>B135,</u> B251, B306	Brazed, soldered and flared mechanical fittings	Joints embedded in concrete <u>shall be brazed</u>

(Portions of table not shown remain unchanged)

For SI: °C = [(°F)-32]/1.8.

a. Use code:

1. Above ground.
2. Embedded in radiant systems.
3. Temperatures below 180°F only.
4. Low temperature (below 130°F) applications only.
5. Temperatures below 160°F only.

b. Standards as listed in Chapter 44.

Reason: The proposal removes brass because brass is a copper alloy and the standards and requirements are covered in the copper & copper-alloy lines. The requirement under note was incomplete comment and did not make sence.

Cost Impact: Will not increase the cost of construction
This proposal will not increase the cost of construction as it is editorial in nature.

RM 42-15 : Table M2101.1-FEEHAN4026

RM 43-15

Table M2101.1, Table M2105.4, Table M2105.5, M2105.13, M2105.13.3 (New), M2105.13.4 (New), Chapter 44

Proponent: Larry Gill, representing IPEX USA LLC (larry.gill@ipexna.com)

2015 International Residential Code

Revise as follows:

TABLE M2101.1
HYDRONIC PIPING MATERIALS

MATERIAL	USE CODE[a]	STANDARD[b]	JOINTS	NOTES
Raised temperature polyethylene (PE-RT)	1, 2, 3	ASTM F 2623 ASTM F 2769 <u>CSA B137.18</u>	Copper crimp/insert fitting stainless steel clamp, insert fittings	
Raised Temperature Polyethylene (PE-RT) fittings	1, 2,3	ASTM F 1807 ASTM F 2159 ASTM F 2735 ASTM F 2769 ASTM F 2098 <u>ASTM D3261</u> <u>CSA B137.18</u>	Copper crimp/insert fitting stainless steel clamp, insert fittings	

(Portions of table not shown remain unchanged)

TABLE M2105.4
GROUND-SOURCE LOOP PIPE

MATERIAL	STANDARD
Raised temperature polyethylene (PE-RT)	ASTM F 2623; ASTM F 2769; <u>CSA B137.18</u>

(Portions of table not shown remain unchanged)

TABLE M2105.5
GROUND-SOURCE LOOP PIPE FITTINGS

PIPE MATERIAL	STANDARD

Raised temperature polyethylene (PE-RT)	ASTM D 3261; ASTM F 1807; ASTM F 2159; ASTM F 2769; CSA B137.1; ASTM F1055, ASTM F2098, ASTM F2735, ASTM D2683, ASTM D3261, CSA B137.18

(Portions of table not shown remain unchanged)

M2105.13 Raised temperature polyethylene (PE-RT) plastic tubing. Joints between raised temperature polyethylene tubing and fittings shall comply with Sections M2105.13.1, M2105.13.2, M2105.13.3, and ~~M2105.13.2~~M2105.13.4. Mechanical joints shall comply with Section M2105.8.1.

Add new text as follows:

M2105.13.3 Heat fusion joints. Heat fusion joints shall be of the socket-fusion, saddle-fusion or butt-fusion type, and shall be joined in accordance with ASTM D2657. Joint surfaces shall be clean and free of moisture. Joint surfaces shall be heated to melt temperatures and joined. The joint shall remain undisturbed until cool. Fittings shall be manufactured in accordance with ASTM D2683 or ASTM D3261.

M2105.13.4 Electrofusion joints Joints shall be of the electrofusion type. Joint surfaces shall be clean and free of moisture and scoured to expose virgin resin. Joint surfaces shall be heated to melt temperatures to a time specified by the manufacturer and joined. The joint shall remain undisturbed until cool. Fittings shall be manufactured in accordance with ASTM F1055.

Add new standard(s) as follows: CSA B137.18 - 2013 - Polyethylene of raised temperature (PE-RT) tubing systems for pressure applications.

Reason: Add new CSA B137.18 - Polyethylene of raised temperature resistance (PE-RT) tubing systems for pressure applications to Tables M2101.1, M2105.4, and M2105.5 (scope includes hydronic heating and ground source loop pipe and fittings).
Add reference to ASTM D3261which is a consensus standard for PE fusion to Table M2101.1 and Table M2105.5

Add references to ASTM F1055, ASTM F2098, ASTM F2735, and ASTM D2683 to Table M2105.5. ASTM F2098 and ASTM F2735 are already referenced in the IMC for PE-RT fittings. ASTM F1055 and ASTM D2683 are being added for fused PE joints.

Add new sections M2105.13.3 and M2105.13.4 to permit fusion of PE-RT joints.

The addition of these PE-RT standards will provide alternatives to the standards already in the Code.

Cost Impact: Will not increase the cost of construction
No cost impact. These changes provide alternatives to PERT pipe and fittings standards only. No changes in cost to the current Code provisions.

Analysis: A review of the standard proposed for inclusion in the code, CSA B137.18, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2015.

RM 43-15 : Table M2101.1-GILL4497

RM 44-15

Table M2101.9

Proponent: Mike Cudahy, representing Plastic Pipe and Fittings Association (mikec@cmservnet.com)

2015 International Residential Code

Revise as follows:

TABLE M2101.9
HANGER SPACING INTERVALS

PIPING MATERIAL	MAXIMUM HORIZONTAL SPACING (feet)	MAXIMUM VERTICAL SPACING (feet)
PEX tubing ≤ 1 inch	2.67	4
PEX tubing ≥ 1 1/4 inches	4	10a

(Portions of table not shown remain unchanged)

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm.

a. For sizes 2 inches and smaller, a guide shall be installed midway between required vertical supports. Such guides shall prevent pipe movement in a direction perpendicular to the axis of the pipe.

Reason: The 2015 code cycle for the IRC included updates to the support spacing for both PEX and PE-RT tubing for sizes larger than 1". The IRC-P Table P2605.1 is current and correct and should be used as the base template for all other tables within the ICC codes as identified in this amendment proposal. The horizontal support spacing for both PEX and PE-RT tubing (piping) up to and including 1" size is 32" (2-2/3Ft) and 48" (4Ft) for sizes 1- 1/4" and larger. These dimensions are consistent with all published PEX literature and manufacture's installation instructions.

Cost Impact: Will not increase the cost of construction
This proposal modifies the spacing for piping material support into the code and thus the code with this proposal added will not cause the cost of construction to increase, and could decrease the cost as less support is required for larger pipe.

RM 44-15 : Table M2101.9-CUDAHY4739

RM 45-15

M2101.10

Proponent: Mike Cudahy, representing Plastic Pipe and Fittings Association (mikec@cmservnet.com)

2015 International Residential Code

Revise as follows:

M2101.10 Tests. Hydronic piping systems shall be tested hydrostatically at a pressure of one and one-half times the maximum system design pressure, but not less than 100 pounds per square inch (689 kPa). The duration of each test shall be not less than 15 minutes and not more than 20 minutes.

> **Exception:** For plastic piping systems, testing with a compressed gas shall be an alternative to hydrostatic testing where compressed air or other gas pressure testing is specifically authorized by all of the manufacturer's instructions for the plastic pipe and fittings products installed at the time the system is being tested, and compressed air or other gas testing is not otherwise prohibited by applicable codes, laws, or regulations outside of this code.

Reason: PPFA has a new air testing policy, which allows for some limited air testing of plastic piping systems, if a number of conditions are met.

Bibliography: PLASTIC PIPE AND FITTINGS ASSOCIATION POLICY ON TESTING PLASTIC PIPE AND FITTINGS INSTALLATIONS WITH COMPRESSED GAS, PPFA, 2014, http://www.ppfahome.org/ub4.aspx

Compressed air or any other compressed gases should not be used for pressure testing plastic plumbing systems.

EXCEPTIONS:

1.) With trap seal pull testing, where a completed DWV system is vacuum tested with all of its traps filled with water, and the trap seals are tested with a vacuum typically between one and two inches of water column.

2.) For plastic piping systems specifically designed for use with compressed air or gasses;

• Manufacturers' instructions must be strictly followed for installation, visual inspection, testing and use of the systems,

(and)

• Compressed air or other gas testing is not prohibited by the authority having jurisdiction (AHJ).

3.) When compressed air or other gas pressure testing is specifically authorized by the applicable written instructions of the manufacturers of all plastic pipe and plastic pipe fittings products installed at the time the system is being tested and compressed air or other gas testing is not prohibited by the authority having jurisdiction (AHJ).

The manufacturer should be contacted if there is any doubt as to how a specific system should be tested.

Cost Impact: Will not increase the cost of construction
This proposal simply adds another option for air testing some specific piping materials into the code and as such, the option is not requiring that this method be chosen. Thus the code with this proposal added will not cause the cost of construction to increase.

RM 45-15 : M2101.10-CUDAHY4681

RM 46-15

M2101.10

Proponent: Gary Morgan, Viega LLC, representing Viega LLC (gary.morgan@viega.us)

2015 International Residential Code

Revise as follows:

M2101.10 Tests. Hydronic system piping ~~systems~~ shall be tested ~~hydrostatically~~ with either water or, for piping systems other than plastic, by air at a pressure of one and one-half times the maximum system design pressure, but not less than 100 pounds per square inch (689 kPa). The duration of each test shall be not less than 15 minutes and not more than 20 minutes.

> **Exception:** For plastic piping systems, testing with a compressed gas shall be an alternative to hydrostatic testing where compressed air or other gas pressure testing is specifically authorized by all of the manufacturer's instructions for the plastic pipe and fittings products installed at the time the system is being tested, and compressed air or other gas testing is not otherwise prohibited by applicable codes, laws, or regulations outside of this code.

Reason: PPFA (Plastic Pipe and Fittings Association) has a new air testing policy, which allows for some limited air testing of plastic piping systems if certain conditions are met. The vast majority of plastic pipe used in hydronic applications pose no more of a safety concern than does air testing of metallic piping systems. The proposed language is also consistant with new language being proposed by PPFA in the IPC and IRC-P.

Cost Impact: Will not increase the cost of construction
If anything, allowance of air testing vs. hydrostatic testing will save time and expense typically.

RM 46-15 : M2101.10-MORGAN4930

RM 47-15

M2101.10

Proponent: Gary Morgan, Viega LLC, representing Viega LLC (gary.morgan@viega.us)

2015 International Residential Code

Revise as follows:

M2101.10 Tests. Hydronic piping systems shall be tested hydrostatically at a pressure of one and one-half times the maximum system design pressure, but not less than 100 pounds per square inch (689 kPa). The duration of each test shall be not less than 15 minutes~~ and not more than 20 minutes~~.

Reason: To limit the maximum time of pressure testing to 20 minutes (when the minimum time is already only 15 minutes) is not consistant with industry practice nor is it consistant with the IMC 1208.1 for testing of hydronic systems where no such maximum time even exists.

Cost Impact: Will not increase the cost of construction
Eliminating the maximum time of testing requirement has absolutely no bearing on the cost of construction.

RM 47-15 : M2101.10-MORGAN4994

RM 48-15

M2103.2, M2103.2.1, M2103.2.2

2015 International Residential Code

Revise as follows:

M2103.2 Thermal barrier required. Radiant floor heating systems shall have a thermal barrier in accordance with Sections M2103.2.1 through M2103.2.4. Insulation R-values for slab-on-grade and suspended floor installations shall be in accordance with the *International Energy Conservation Code*.

> **Exception:** Insulation shall not be required in engineered systems where it can be demonstrated that the insulation will decrease the efficiency or have a negative effect on the installation.

Delete without substitution:

~~**M2103.2.1 Slab-on-grade installation.** Radiant piping used in slab-on-grade applications shall have insulating materials having a minimum *R*-value of 5 installed beneath the piping.~~

~~**M2103.2.2 Suspended floor installation.** In suspended floor applications, insulation shall be installed in the joist bay cavity serving the heating space above and shall consist of materials having a minimum *R*-value of 11.~~

Reason: Insulation R-values should be located in the IECC/Chapter 11, not Chapter 21- Hydronic Piping. Design professionals, code officials, contractors, developers, virtually all involved in the building process look to the IECC/Chapter 11 for specfic thermal performance values. Locating these two sub-sections in the IMC has created considerable confusion. A similiar proposal will be submitted in Grouip B, to add these sub-sections into the IECC where they belong.

Cost Impact: Will not increase the cost of construction
This proposal will not increase the cost of construction as it is the first step in re-locating an existing insulation requirement from the IRC mechanical section to the IECC/Chapter 11 IRC. There is no increase in the R-value of the insulation or the installation labor.

RM 48-15 : M2103.2-URSENBACH5803

RM 49-15

M2103.3

Proponent: Tim Earl, GBH International, representing The Oatey Company (tearl@gbhinternational.com)

2015 International Residential Code

Revise as follows:

M2103.3 Piping joints. Copper and copper alloy systems shall be soldered in accordance with ASTM B 828. Fluxes for soldering shall be in accordance with ASTM B 813. The base material for tinning fluxes, excluding the tinning powder, shall meet the criteria of ASTM B813. Brazing fluxes shall be in accordance with AWS A5.31. Piping joints that are embedded shall be installed in accordance with the following requirements:

1. Steel pipe joints shall be welded.
2. Copper tubing shall be joined by brazing complying with Section P3003.6.1.
3. Polybutylene pipe and tubing joints shall be installed with socket-type heat-fused polybutylene fittings.
4. CPVC tubing shall be joined using solvent cement joints.
5. Polypropylene pipe and tubing joints shall be installed with socket-type heat-fused polypropylene fittings.
6. Cross-linked polyethylene (PEX) tubing shall be joined using cold expansion, insert or compression fittings.
7. Raised temperature polyethylene (PE-RT) tubing shall be joined using insert or compression fittings.

Reason: Tinning fluxes have been shown in several studies to create a stronger and more consistently water-tight connection when using low-lead fittings. This means less rework on the job site and less likelihood of joint failure. With the federal mandate of low-lead in 2014, this has become a significant issue and the codes need to reflect this need. We are pursuing changes to the referenced ASTM standard as well, however these will not be completed in time for this code cycle and we feel that it is important to make this change as it has the potential to save money related to rework and repair. Once the standard is altered, we would support removing the language being proposed.

Cost Impact: Will not increase the cost of construction
This proposal will not affect cost as it simply adds another solder flux option.

RM 49-15 : M2103.3-EARL4643

RM 50-15

Table M2105.4, Table M2105.5, Chapter 44

Proponent: Jeremy Brown, representing NSF International (brown@nsf.org)

2015 International Residential Code

Revise as follows:

TABLE M2105.4
GROUND-SOURCE LOOP PIPE

MATERIAL	STANDARD
Chlorinated polyvinyl chloride (CPVC)	ASTM D 2846; ASTM F 437; ASTM F 438; ASTM F 439; ASTM F 441; ASTM F 442; CSA B137.6
Cross-linked polyethylene (PEX)	ASTM F 876; ASTM F 877 CSA B137.5; NSF 358-3
Polyethylene/aluminum/polyethylene (PE-AL-PE) pressure pipe	ASTM F 1282; CSA B137.9; AWWA C 903
High-density Polyethylene (HDPE)	ASTM D 2737; ASTM D 3035; ASTM F 714; AWWA C901; CSA B137.1; CSA C448; NSF 358-1
Polypropylene (PP-R)	ASTM F 2389; CSA B137.11
Polyvinyl chloride (PVC)	ASTM D 1785; ASTM D 2241; CSA 137.3
Raised temperature polyethylene (PE-RT)	ASTM F 2623; ASTM F 2769

TABLE M2105.5
GROUND-SOURCE LOOP PIPE FITTINGS

PIPE MATERIAL	STANDARD
Chlorinated polyvinyl chloride (CPVC)	ASTM D 2846; ASTM F 437; ASTM F 438; ASTM F 439; ASTM F 1970; CSA B137.6
Cross-linked polyethylene (PEX)	ASTM F 877; ASTM F 1807; ASTM F 1960; ASTM F 2080; ASTM F 2159; ASTM F 2434; CSA B137.5; NSF 358-3
Polyethylene/aluminum/polyethylene PE-AL-PE)	ASTM F 2434; ASTM F 1282; CSA B137.9
High-density Polyethylene (HDPE)	ASTM D 2683; ASTM D 3261; ASTM F 1055; CSA B137.1; CSA C448; NSF 358-1

Polyvinyl chloride (PVC)	ASTM D 2464; ASTM D 2466; ASTM D 2467; ASTM F 1970, CSA B137.2; CSA B137.3
Raised temperature polyethylene (PE-RT)	ASTM D 3261; ASTM F 1807; ASTM F 2159; F 2769; B137.1

Add new standard(s) as follows:

NSF 358-3 (DRAFT 10-7-2014) Cross-linked Polyethylene (PEX) Pipe and Fittings for Water-Based Ground-Source (Geothermal) Heat Pump Systems

Reason: NSF 358-3 Cross-linked Polyethylene (PEX) Pipe and Fittings for Water-Based Ground-Source (Geothermal) Heat Pump Systems is currently under development as of the submittal deadline. This will be the American National Standard for PEX system components used in geothermal systems and when completed should be referenced in this table. This standard will have geothermal specific requirements above and beyond the ASTM standards for PEX. This standard is expected to be completed in 2015. A draft may be obtained from Jeremy Brown at brown@nsf.org.

Cost Impact: Will not increase the cost of construction
Adding another option for standards will not increase the cost of construction.

Analysis: A review of the standard proposed for inclusion in the code,NSF 358-3 , with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2015.

RM 50-15 : Table M2105.4-BROWN5479

RM 51-15

Table M2105.4, Table M2105.5

Proponent: Jeremy Brown, representing NSF International

2015 International Residential Code

Revise as follows:

TABLE M2105.4
GROUND-SOURCE LOOP PIPE

MATERIAL	STANDARD
Polypropylene (PP-R)	ASTM F 2389; CSA B137.11; NSF 358-2

(Portions of table not shown remain unchanged)

TABLE M2105.5
GROUND-SOURCE LOOP PIPE FITTINGS

PIPE MATERIAL	STANDARD
Polypropylene (PP-R)	ASTM F 2389; CSA B137.11; NSF 358-2

(Portions of table not shown remain unchanged)

Add new standard(s) as follows:
NSF 358-2-2012 Polypropylene Pipe & fittings for water-based ground-source "geothermal" heat pump systems

Reason: NSF 358-2 Polypropylene Pipe & fittings for water-based ground-source "geothermal" heat pump systems is the American National standard and should be included in these tables. This standard has requirements for material suitability, performance, chemical resistance long term strength and quality assurance requirements related to geothermal products. A copy of this standard will be provided to the commitee and may be obtained by anyone else by emailing brown@nsf.org.

Cost Impact: Will not increase the cost of construction
Providing an additional option will not increase the cost of construction.

Analysis: A review of the standard proposed for inclusion in the code, NSF 358-2, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2015.

RM 51-15 : Table M2105.4-BROWN5477

RM 52-15

M2005.1, M2301.2.1, M2301.2.2.2, M2301.2.4, M2301.2.6, M2301.2.8, M2301.2.11.1, M2301.3, M2301.3.1, M2301.3.2, M2301.2.6.1 (New), M2301.2.6.2 (New)

Proponent: Rex Gillespie (rex.gillespie@caleffi.com)

2015 International Residential Code

Revise as follows:

M2005.1 General. Water heaters shall be installed in accordance with Chapter 28, the manufacturer's instructions and the requirements of this code. Water heaters installed in an attic shall comply with the requirements of Section M1305.1.3. Gas-fired water heaters shall comply with the requirements in Chapter 24. Domestic electric water heaters shall comply with UL 174. Oiled-fired water heaters shall comply with UL 732. ~~Thermal solar~~Solar thermal water ~~heaters~~heating systems shall comply with Chapter 23 and ~~UL 174~~SRCC 300. Solid fuel-fired water heaters shall comply with UL 2523.

M2301.2.1 Access. ~~Solar energy collectors, controls, dampers, fans, blowers and pumps~~ Access shall be ~~accessible~~ provided to solar energy *equipment* for ~~inspection, maintenance, repair~~maintenance. Solar systems and ~~replacement~~appurtenances shall not obstruct or interfere with the operation of any doors, windows or other building components requiring operation or access. Roof-mounted solar thermal equipment shall not obstruct or interfere with the operation of roof-mounted equipment, appliances, chimneys, plumbing vents, roof hatches, smoke vents, skylights and other roof penetrations and openings.

M2301.2.2.2 Collector sensors. Collector sensor installation, sensor location and the protection of exposed sensor wires from ~~ultraviolet light~~ degradation shall be in accordance with SRCC 300.

M2301.2.4 Vacuum relief. System components that might be subjected to ~~pressure drops below atmospheric pressure~~ a vacuum during operation or shutdown shall be designed to withstand such vacuum or shall be protected ~~by a vacuum-relief valve.~~ with vacuum relief valves.

M2301.2.6 Protection from freezing. System components shall be protected from damage resulting from freezing of heat-transfer liquids at the winter design temperature provided in Table R301.2(1). Freeze protection shall be provided ~~by heating, insulation, thermal mass and heat transfer fluids~~in accordance with SRCC 300. Drain-back systems shall be installed in compliance with Section M2301.2.6.1 and systems utilizing freeze ~~points lower than the winter design temperature, heat tape or other *approved* methods, or combinations thereof.~~protection valves shall comply with Section M2301.2.6.2.

> **Exception:** Where the 97.5-percent winter design temperature is greater than ~~32~~or equal to 48°F (~~0~~9°C).

M2301.2.8 Expansion tanks. Expansion tanks in solar energy systems shall be installed in accordance with Section M2003 in solar collector loops that contain pressurized heat transfer fluid. Where expansion tanks are used, the system shall be designed in accordance with SRCC 300 to provide an expansion tank that is sized to withstand the maximum operating pressure of the system.

> **Exception:** Expansion tanks shall not be required in the collector loop of *drain-back systems*.

M2301.2.11.1 Solar loop isolation. Valves shall be installed to allow the solar ~~collectors~~ loop to be isolated from the remainder of the system

M2301.3 Labeling. *Labeling* shall comply with Sections M2301.3.1 and M2301.3.2.

M2301.3.1 Collectors and panels. Solar thermal collectors and panels shall be listed and labeled in accordance with SRCC 100 or SRCC 600. ~~Collectors and panels~~Factory-built collectors shall ~~be *listed* and *labeled* to show~~bear a label showing the manufacturer's name, model number~~,~~ and serial number~~, collector weight, collector maximum allowable temperatures and pressures, and the type of heat transfer fluids that are compatible with the collector or panel~~. ~~The *label* shall clarify that these specifications apply only to the collector or panel.~~

M2301.3.2 Thermal storage units. Pressurized ~~thermal~~ water storage ~~units~~ tanks shall ~~be *listed* and *labeled* to show~~ bear a label showing the manufacturer's name and address, model number, serial number, storage unit maximum and minimum allowable operating temperatures and ~~pressures,~~storage unit maximum and ~~the type of heat transfer fluids that are compatible with the storage unit~~minimum allowable operating pressures. The *label* shall clarify that these specifications apply only to the ~~thermal~~ water storage ~~unit~~tanks.

Add new text as follows:

M2301.2.6.1 Drain-back systems Drain-back systems shall be designed and installed to allow for manual gravity draining of fluids from areas subject to freezing to locations not subject to freezing, and air filling of the components and piping. Such piping and components shall maintain a horizontal slope in the direction of flow of not less than one-fourth unit vertical in 12 units horizontal (2-percent slope). Piping and components subject to manual gravity draining shall permit subsequent air filling upon drainage and air venting upon refilling.

M2301.2.6.2 Freeze protection valves. Freeze protection valves shall discharge in a manner that does not create a hazard or structural damage.

Reason: A reference to the SRCC 300 standard was added to the IRC in Chapter 23 during the 2015 cycle. This change in Chapter 20 changes to language to correspond to SRCC 300. Requirements for hot water storage tanks, which UL 174 intended to address are covered in SRCC 300, therefore, UL 174 is no longer necessary.
Access provisions were revised to clarify that roof-mounted solar collectors and equipment should not interfere with the operation of key safety components and features from other systems. While this can reasonably assumed, providing this provisions will provide code officials more clear language to reference when inspecting installations.

New language has been added to the freeze protection section to address specific issues with two of the most common freeze protection approachs: drainback systems and freeze protection valves. Drainback systems allow the liquid to drain from the external collector to conditioned space when flow is not occuring. As a result proper slope is critical to ensure operation. Inspection of the installation and workmanship is necessary to ensure that the slope is consistent and the freeze protection is fully functional. Freeze protection valves discharge a small amount of water in freezing conditions and therefore should be addressed in a way similar to T&P valves to ensure that the discharge does not damage the roof or create a hazard (e.g. freezing on a pedestrian walkway). Identical language has also been proposed for Chapter 14 of the IMC. The winter design temperature was revised to utilize the 97.5% winter design temperature, which can be found in Appendix D of the IPC. The threshold value was adjusted to accomodate this change. This will provide greater clarity and allow the Appendix D tables to be used.

The provisions relating to collector and hot water storage tank labeling were simplified since this information and more can be found in manuals and specifications. The language for storage units (tanks) was also revised to clarify that they are only to apply to hot water storage tanks.

Bibliography: SRCC 300, Minimum Standards for Solar Water Heating Systems, Jan. 2, 2013.

Cost Impact: Will not increase the cost of construction
The proposed changes are not anticipated to impact the cost of installation. No new equipment or features are required, and no new requirements are placed on manufacturers impacting certification or manufacturing costs. Proposed provisions provide additional clarity and direction for installers and code officials at inspection.

RM 52-15 : M2301.2.1-GILLESPIE4041

RM 53-15

M2301.3.3 (New)

Proponent: Robby Schwarz, EnergyLogic, Inc., representing EnergyLogic, Inc. (robby@nrglogic.com)

2015 International Residential Code

Add new text as follows:

M2301.3.3 Labeling of solar energy systems The solar energy installer shall provide a certificate or label that lists the following information relative to the installed solar system: Such certificate or label shall be posted near the inverter, electrical distribution panel, or other conspicuous location.

1. The date that the system was installed.
2. The name of the installation company.
3. The system type.
4. The orientation of the arrays and collectors.
5. The tilt in degrees of the arrays and collectors.
6. The square foot area of the arrays and collectors.
7. The number of panels in the arrays.
8. The peak power production of the arrays and collectors stated in watts.
9. The inverter efficiency of the arrays and collectors.
10. The loop type of the arrays and collectors.
11. The type of the arrays and collectors.
12. The storage volume of the system in cubic feet or gallons.

Reason: Rational Statement:
Just like the requirement to provide an insulation certificate to fully document the R-values of the insulation in each assembly of the home ensures that the code official and home owner knows and understand what has been installed in the home, this proposal ensures that everyone involved knows and understands the PV or solar thermal system that has been installed. In addition, since the requirement is in label form it is hoped that this Permanente label will live with the house and will provide meaning full information that can be used for repairs and upgrades, as well as, appraisals and sales transactions when the house is turned over.

Cost Impact: Will not increase the cost of construction
The cost of a label is so minimal that it should not be considered increasing the cost of construction.

RM 53-15 : M2301.3.3 (New)-SCHWARZ4982

RM 54-15

R202 (New), M2301.4.1.1 (New), M2301.4.1.2 (New)

Proponent: Rex Gillespie (rex.gillespie@caleffi.com)

2015 International Residential Code

Add new definition as follows:

SECTION 202 DEFINITIONS

FOOD GRADE FLUID. Potable water or a fluid containing additives listed in accordance with the Code of Federal Regulations, Title 21, Food and Drugs, Chapter 1, Food and Drug Administration, Parts 174-186

SECTION 202 DEFINITIONS

NON-FOOD GRADE FLUID. Any fluid that is not designated as a food grade fluid.

Add new text as follows:

M2301.4.1.1 Double-wall heat exchangers. Heat exchangers utilizing a *non-food grade fluid* shall separate the non-food grade fluid from the potable water by means of double-wall construction. An air gap open to the atmosphere shall be provided between the two walls. The point of discharge from the air gap between the two walls of the double-wall heat exchanger shall be visible.

M2301.4.1.2 Single-wall heat exchangers. Where single-wall heat exchangers are used, the heat transfer fluid shall be food grade fluid..

Reason: This proposal seeks to align with the language that appears in the IMC Chapter 1402.8 regarding heat exchangers and add definitions of FOOD GRADE and NON-FOOD GRADE heat transfer fluids as stated in SRCC Standard 300

Bibliography: SRCC Standard 300, Minimum Standard for Solar Thermal Water Heating Systems, January 3, 2013.

Cost Impact: Will not increase the cost of construction
The proposed changes are not anticipated to impact the cost of installation. No new equipment or features are required, and no new requirements are placed on manufacturers impacting certification or manufacturing costs. Proposed provisions provide additional clarity and direction for installers and code officials at inspection.

Analysis: A review of the standard proposed for inclusion in the code, CFR Title 21, Chapter 1, Parts 174-186, with regard to the ICC criteria for referenced
standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2015.

TENTATIVE ORDER OF DISCUSSION
2015 PROPOSED CHANGES TO THE
INTERNATIONAL RESIDENTIAL CODE
(PLUMBING)

The following is the tentative order in which the proposed changes to the code will be discussed at the public hearings. Proposed changes which impact the same subject have been grouped to permit consideration in consecutive changes.

Proposed change numbers that are indented are those which are being heard out of numerical order. Indentation does not necessarily indicate that one change is related to another. Proposed changes may be grouped for purposes of discussion at the hearing at the discretion of the chair. Note that some RP code change proposals may not be included on this list, as they are being heard by another committee.

P2503.4

Proponent: Gary Kozan, CPD, representing Florida Association of Plumbing Heating Cooling Contractors (garyk@ridgewayplumbing.com)

2015 International Residential Code

Revise as follows:

P2503.4 Building sewer testing. The *building sewer* shall be tested by insertion of a test plug at the point of connection with the public sewer~~,~~ and completely filling the *building sewer* with water ~~and pressurizing~~from the lowest to the ~~sewer to not less than 10-foot (3048 mm) head of water~~highest point thereof. The test pressure shall not decrease during a period of not less than 15 minutes. The *building sewer* shall be watertight at all points.

A forced sewer test shall consist of pressurizing the piping to a pressure of not less than 5 psi (34.5 kPa) greater than the pump rating and maintaining such pressure for not less than 15 minutes. The forced sewer shall be water tight at all points.

Reason: Subjecting a gravity house sewer to a 10-foot head test is outdated and impractical. By the time the building sewer is connected, fixtures have usually been installed, so both ends have to be plugged off before testing in order to protect the building from flooding. Leaks on gravity house sewers are rare, considering that most today are constructed with plastic pipe and contain few fittings and joints. Simply filling the sewer with water is sufficient to identify any leaks. It should be noted that public sewer mains and branch laterals downstream of the building sewer are not water tested at all.
This testing method is identical to that found in the other model plumbing code (UPC), used in many states. Florida adopted similar testing requirements in 2000. It is time that the IPC recognizes this proven practice and bring the codes closer together.

Bibliography:
2012 Uniform Plumbing Code:

723.0 Building Sewer Test

723.1 General. Building sewers shall be tested by plugging the end of the building sewer at its points of connection with the public sewer or private sewage disposal system and ***completely filling the building sewer with water from the lowest to the highest point thereof***(emphasis added), or approved equivalent low-pressure air test. Plastic DWV piping systems shall not be tested by the air test method. The building sewer shall be watertight.

2010 Florida Building Code - Plumbing

312.6 Gravity sewer test. Gravity sewer tests shall consist of plugging the end of the building sewer with water at the point of connection with the public sewer, ***completely filling the building sewer with water from the lowest to the highest point thereof***(emphasis added), and maintaining such pressure for 15 minutes. The building sewer shall be watertight at all points.

2010 Florida Building Code - Residential:

2503.4 Gravity sewer test. Gravity sewer tests shall consist of plugging the end of the building sewer with water at the point of connection with the public sewer, ***completely filling the building sewer with water from the lowest to the highest point thereof***(emphasis added), and maintaining such pressure for 15 minutes. The building sewer shall be watertight at all points.

Cost Impact: Will not increase the cost of construction
Reducing the head test for gravity sewers will shorten the length of the fill stack, and eliminate the need for additional test fittings, test balls, and labor to plug off the upper end of the sewer. This should translate to a modest reduction in cost of approx. $20 - $40 per sewer test.

RP 1-15 : P2503.4-KOZAN3454

RP 2-15

P2503.5.1

Proponent: Janine Snyder, City of Thornton, Colorado, representing Colorado Association of Plumbing & Mechanical Officials (CAPMO) (Janine.Snyder@cityofthornton.net)

2015 International Residential Code

Revise as follows:

P2503.5.1 Rough plumbing. DWV systems shall be tested on completion of the rough piping installation by water or, for piping systems other than plastic, by air, without evidence of leakage. Either test shall be applied to the drainage system in its entirety or in sections after rough-in piping has been installed, as follows:

1. Water test. Each section shall be filled with water to a point not less than ~~5~~ 10 feet (~~1524~~3048 mm) above the highest fitting connection in that section, or to the highest point in the completed system. Water shall be held in the section under test for a period of 15 minutes. The system shall prove leak free by visual inspection.
2. Air test. The portion under test shall be maintained at a gauge pressure of 5 pounds per square inch (psi) (34 kPa) or 10 inches of mercury column (34 kPa). This pressure shall be held without introduction of additional air for a period of 15 minutes.

Reason: Historically the codes required a 10 foot head on DWV systems. With the change in the 2015 to only 5 feet head the DWV system can have leaks that are undetectable therefore placing the property owner at risk for damage over the life of the structure. The 10 foot head not only elliminates that risk it ensures that the system is in fact water tight which is the purpose of the test in the first place.

Cost Impact: Will increase the cost of construction
The 10 foot head requirement has been in place and is the standard for testing. The cost of replacing or repairing portions of the DWV system that have leaks that have gone undetected due to the relaxed testing pressures overrules the cost of the additional 5 foot head of water.

RP 2-15 : P2503.5.1-SNYDER4419

RP 3-15

P2603.2.1

Proponent: Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

2015 International Residential Code

Revise as follows:

P2603.2.1 Protection against physical damage. In concealed locations, where piping, other than cast-iron or galvanized steel, is installed through holes or notches in studs, joists, rafters or similar members less than ~~1 $^1/_4$~~ 1 ½ inches (~~31.8~~38.1 mm) from the nearest edge of the member, the pipe shall be protected by steel shield plates. Such shield plates shall have a thickness of not less than 0.0575 inch (1.463 mm) (No. 16 Gage). Such plates shall cover the area of the pipe where the member is notched or bored, and shall extend not less than 2 inches (51 mm) above sole plates and below top plates.

Reason: For the 2015 IRC, a proposal was approved that reduced the dimension to 1 ¼ inches to match what the National Electrical Code has for wiring protection. Such a reason has no technical basis as wiring is not piping. Drywall nails or screws penetrating wires could cause a short such that a circuit breaker would trip and the circuit becomes dead. Yes, finding such an electrical fault is sometimes difficult but it does not lead to structure damage. A screw or nail penetration of a pipe leads to water damage of a structure. Sometimes the water damage does not immediately occur or the leak is so small that it takes months or even years for the leak to be discovered. Water, or worse, sewage leaks over a long period of time cause mold damage in walls and ceilings and bacteria contamination of living spaces.
The plumbing codes have maintained this 1 ½ inch dimension for many decades with great success in limiting widespread issues with pipe penetrations. Consider that a 2 inch long drywall screw attaching ½ inch gypsum board to framing will penetrate the framing member 1 ½ inches.

This should have not been allowed to change in the IRC in the 2015 edition. This proposal is needed for consistency between the IRC and the IPC.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes. This is PMGCAC Item 143.

Cost Impact: Will not increase the cost of construction
This proposal will not increase the cost of construction because no additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code.

RP 3-15 : P2603.2.1-SNYDER4137

RP 4-15

P2708.4

Proponent: Ed Osann, representing Natural Resources Defense Council (eosann@nrdc.org)

2015 International Residential Code

Revise as follows:

P2708.4 Shower control valves. Individual shower and tub/shower combination valves shall be equipped with control valves of the pressure-balance, thermostatic-mixing or combination pressure-balance/thermostatic-mixing valve types with a high limit stop in accordance with ASSE 1016/ASME A112.1016/CSA B125.16. <u>Shower control valves shall provide thermal shock protection for the rated flow rate of the installed showerhead.</u> The high limit stop shall be set to limit the water temperature to not greater than 120°F (49°C). In-line thermostatic valves shall not be used for compliance with this section.

Reason: Installation of a shower valve meeting the referenced ASSE/ASME/CSA standard is not sufficient to ensure shower safety. The thermal protection afforded by shower valves can be compromised if the flow rate of the showerhead is less than the flow rate for which the protective components of the valve have been designed. The referenced standard for shower valves allows for acceptance at a rated flow of up to 2.5 gpm. However, 2.5 gpm at 80 psi is the current federal *maximum* flowrate for showerheads, and showerheads with maximum flow rates well below 2.5 gpm are widely available. The current EPA *WaterSense* specification for showerheads has a maximum flow rate of 2.0 gpm, and over 3,000 qualifying models are on the market today. Many showerheads are available with flow rates between 2.0 and 1.5 gpm. As manufacturers continue to innovate with more water- and energy-efficient showerheads, the code change proposed here is needed to ensure that new buildings built to this code will safely accommodate the showerheads selected by the designer or builder.
Note that this language does not require that the showerhead itself have a flow rate of less than 2.5 gpm, but simply that the shower valve provide the thermal protection called for under the recognized standard when tested at a flow rate that matches the flow rate of the showerhead.

The 2012 Uniform Plumbing Code, Section 408.3, contains a similar requirement for 'matching' the valve and showerhead flow rates as follows:

> "Showers and tub-shower combinations shall be provided with individual control valves of the pressure balance, thermostatic, or combination pressure balance/thermostatic mixing valve type that provide scald and thermal shock protection for the rated flow of the installed showerhead."

The IRC should be no less protective of health and safety than the UPC.

Additional Technical Background

As noted above, the thermal protection afforded by shower valves can be compromised if the flow rate of the showerhead is less than the flow rate for which the protective components of the valve have been designed. As noted by Martin and Johnson (2008) (as cited in Codes and Standards Enhancement Initiative (CASE), "Multi-Head Showers and Lower-Flow Shower Heads," 2013 California Building Energy Efficiency Standards, California Utilities Statewide Codes and Standards Team, September 2011), combinations of valves and shower heads were tested to determine whether pressure-compensating valves and thermostatic valves with rated flows of 2.5 gpm would perform adequately at lower flow rates. The tests included 22 shower valves from six manufacturers, and the valves were assessed on their ability to maintain water temperature within certain bounds for a given time after a change in pressure event, as described by the ASSE 1016-2005 standard for shower valves. The results indicated that a significant share of shower valves rated for 2.5 gpm failed to provide the thermal protection specified by ASSE 1016 when tested at lower flow rates. As summarized in the CASE report (p. 15): "These results indicate that shower valve temperature maintenance is strongly affected by flow rate, and that new showers with lower-flow shower heads would have to be installed with valves that are designed for 2.0 and lower flow rates."

Cost Impact: Will not increase the cost of construction
Adoption of this proposal will have no effect on the cost of construction, since it calls for the installation of showerheads and shower mixing valves that are compatible, rather than calling for the installation of a particular showerhead or mixing valve that might carry a cost premium. Care in specification and installation is required, not a special product or special installation technique. As noted above, the proposal does not require that the showerhead itself have a flow rate of less than 2.5 gpm, and compliance can be achieved with minimally compliant valves and showerheads. If an architect or builder chooses to install a more efficient showerhead with a lower flow rate, there are valves available at moderate price points that can accomodate the builder's deision. For example, in January 2015, Moen was offering numerous models of showerhead, valve, and trim featuring a pressure-balance type valve retail priced at $102.90 that is fully compatible with showerheads rated at 1.75 gpm maximum or higher. Valves of the temperature-balancing type are more expensive, but are not required by this proposal.

RP 4-15 : P2708.4-OSANN5184

RP 5-15

P2801.6

Proponent: Kari Hebrank, Wilson & Associates, representing VizCO-US (khebrank@wilsonmgmt.com); Howard Guard (howard@vizco.com)

2015 International Residential Code

Revise as follows:

P2801.6 Required pan. Where a storage tank-type water heater or a hot water storage tank is installed in a location where water leakage from the tank will cause damage, the tank shall be installed in a pan constructed of one of the following:

1. Galvanized steel or aluminum of not less than 0.0236 inch (0.6010 mm) in thickness.
2. Plastic not less than 0.036 inch (0.9 mm) in thickness.
3. Other approved materials.

A plastic pan ~~shall not be installed~~ beneath a gas-fired water heater shall be constructed of material having a flame spread index of 25 or less and a smoke-developed index of 450 or less when tested in accordance with ASTM E 84 or UL 723.

Reason: The reason for this code proposal is that there should not be a restriction against the installation of all plastic pans beneath gas-fired hot water heaters and storage tanks as there are some plastic pans that have been developed and successfully tested against tough industry standards and ratings for flammability and smoke, specifically ASTM E84 Class A standards, thus making these type of pans perfectly suitable for water leakage protection for gas-fired hot water heaters.
One such product is manufactured by VizCO-US, Inc., and their proprietary SECUREFLX material, which was tested and met both UL94 V2 flammability rating and ASTM E84 Class A standards for flame spread and smoke development, has been used and approved in furnace drain pans for years. The heat and distortion thresholds of this material and the accompanying proven test and rating standards make VizCO-US pans an extremely safe product for use with either gas or electric water heaters. The VizCO-US product test reports are included in an attachment to this code proposal {510} {509} and it is important to note that the UL94 flammability rating for plastic materials --to which the VizCO-US plastic pan adheres--states that specimens may not burn with flaming combustion for more than 30 seconds after either application of the test flame.

Another reason for this code change is that without it, there would be a restriction of trade for manufacturers who produce plastic drip pans that meet the mandated UL and ASTM standards for flammability and smoke. Furthermore, the building code is intended to accommodate new products and new technology as innovative ideas and products emerge, rather than discriminate against products that meet current industry building standards. Without this code change, there will be discrimination against one segment of the building product manufacturing industry.

Moreover, with ZERO CLEARANCE gas water heater models, the manufacturers have approved a zero clearance between the bottom of the tank and any flammable surface, so a plastic pan that meets flammability ratings should be allowed upon the manufacturers approval.

Without this code change, only metal pans would be allowed to be installed beneath a gas-fired water heater, thus limiting choice for both the contractor and the consumer, and ultimately increasing costs. VizCO-US plastic pans meet or exceed ASTM E-84 and UL 94 testing and performance standards and contain the following characteristics: self-extinguishing, low smoke, flexible, extreme strength, affordability and perform without failure at a higher temperature range than any other non-metallic solution. (See sales sheet attachment for product characteristics.) {511} {512}

The standards UL 723 and ASTM 84 are standards that characterize the relative rate at which flame will spread as the subject material burns. Testing reports for the VizCO-US plastic pans are attached to this code proposal.

Bibliography: The referenced testing standards and ratings are included in the attachments. {509} {510}

Cost Impact: Will not increase the cost of construction
This code proposal has cost-savings implications to the construction industry and consumers. VizCO-US plastic pans will save distributors, contractors and homeowners anywhere from 10%-30% when installed beneath gas-fired water heaters, rather than installation of the higher-priced metal pans. Additionally, oftentimes there are replacement costs with the metal pans, especially the flimsier aluminum pans, that are easily dented and crushed during transportation from the manufacturer to the distributor, from the distributor to the contractor and from the contractor to the jobsite.
Unlike metal pans which are dented and crushed during installation of the water tanks that roll over the sides of the pan, VizCO-US plastic pans are designed not to break, crack, split or crush. You can actually roll a tank over the side of a VizCO-US pan which is designed to aide in the installation process and keep the contractor from having to lift a tank up and over a sidewall of the pan. (See sales sheet attachment for

product description.) {511} {512}

VizCO-US pans offer cost-savings to everyone in the supply chain from the time it is released from the manufacturing plant unitl the time the tank is set in place. Due to the extreme strength of the product, there are cost-savings in shipping/delivery costs and financial cost-savings by not having to worry about replacement costs, or credits and returns for damaged products like there are with metal pans.

RP 6-15

P2802 (New), P2802.1 (New), P2802.2 (New), Table P2802.2 (New), P2802.3 (New)

Proponent: Ed Osann, representing Natural Resources Defense Council (eosann@nrdc.org)

2015 International Residential Code

Add new text as follows:

SECTION P2802
RADIAL DISTANCE TO CERTAIN PLUMBING FIXTURES

P2802.1 Scope. The distance limitation in Section P2802.2 shall apply to the following plumbing fixtures:

1. lavatories.
2. kitchen sinks.
3. showers.
4. tub-shower combinations.

Exception: Plumbing fixtures connected to a hot water recirculation system.

P2802.2 Maximum distance to certain plumbing fixtures For hot water distribution systems serving individual dwelling units, the maximum radial distance in plan view between the location of a water heater and a plumbing fixture receiving hot water from it shall be no more than the length shown in Table P2802.2. For purposes of this determination, the location of a water heater shall be translated vertically to each floor on which a fixture served by such water heater is located.

TABLE P2802.2
MAXIMUM RADIAL DISTANCE BETWEEN A WATER HEATER AND CERTAIN PLUMBING FIXTURES

Dwelling Unit Floor Area (ft^2)	Maximum Plan View distance (ft)	
	Two or More Story Structures	One-Story Structures
≤1000	20 ft.	30 ft.
>1000 to ≤1600	30 ft.	40 ft.
>1600 to ≤2200	40 ft.	50 ft.
>2200 to ≤2800	45 ft.	55.ft.
>2800	50 ft.	65 ft.

P2802.3 Points of Measurement Radial distance shall be measured in plan view betwee the center point of the water heater and the hot water outlet serving a plumbing fixture indicated in Section P2802.1.

Reason: Cold or tepid water in the initial draw from a hot water outlet is often unusable for its intended purpose and is frequently purged, resulting in a waste of water, energy, and time for residents. Pipe insulation significantly reduces heat loss and helps to ensure that hot water gets to users sooner. However, a complementary strategy is to reduce the volume of water contained in the hot water distribution system subject to cool-down. This proposal seeks to reduce entrained hot water volume by setting generous but clear limits on the distance between a hot water heater and the furthest bathroom or kitchen fixture it serves.

Providing greater proximity between the hot water source and the fixtures using hot water will reduce the need for purging. This proposal is similar in intent and effect to Section 607.2 of the International Plumbing Code, which sets a maximum developed length of 50 feet for hot water supply piping between a heat source and any hot water fixture. While not a limitation on pipe length or internal volume *per se*, this proposal will have similar results and has the avantage of requiring no special drawings nor any measurements or calculations at the job site. Rather, its simple provisions can be easily applied during project design and confirmed at plan check, and its graduated distance limits meet the need for a flexible approach that respects the diversity of types and sizes of single-family homes covered by the IRC.

Plans for most two-story production homes should comply with this provision with little or no adjustment. Most home designs where the principal length-to-width ratio of the building footprint is 2 to 1 or less should face few compliance isues. The concept may be more challenging for single-story homes, and for that reason an additinal distance allowance is provided for single-story buildings. Plans for homes with long and narrow configuration may require adjustment, largely to avoid positioning the hot water heater and its furthest fixture outlet at diagonally opposite corners of the building. Avoiding such inherently inefficient designs is the primary intent of this proposal.

The specific limitations in this proposal have their origin in a review of data collected from a diverse group of 55 single-family homes under construction in California in 2010-11. A plot of house floor area and maximum length of pipe between the hot water heater and the furthest hot water fixture was developed. Based upon these plotted data, in 2011 the California Utilities Statewide Codes and Standards team devloped a draft proposal setting a grauated limit on the maximum length of hot water pipe between a water heater and the furthest fixture. The proposal was estimated to save over 2500 gallons of water and over 24 therms of natural gas annually when applied to prototype homes. However, these initial pipe length criteria would have been met by just 10 out of the 55 homes surveyed. Subsequent workshops raised concerns about the challenges of field verification of pipe length subject to the limit. As a result, the concept was modified to measure radial distance in plan view, in lieu of field verification of pipe length. In its second iteration, limits were expressed as radial distances instead of pipe length, but the proposal was intended to be equally stringent. In this proposal for the IRC 2018 model code, these stringent distant limits have been increased by 50%; we estimate that over 75% of the surveyed homes in the 2010-11 data set would meet these proposed limits.

Plans not meeting the radial length limitation can come into compliance using several strategies, including fixture repositioning or hot water repositioning. The latter can often be accomplished by repositioning the proposed water heater location from an exterior garage wall to an interior garage wall; moving a basement water heater from a corner toward a more central location; or rearranging fixture locations in a bathroom to move hot water outlets closer to the water heater. Installation of a second water heater is also an option, as is a recirculation loop. Design flexibility is maintained, and architects and builders can easily identify any compliance issues at an early stage.

The IRC, as a minimum code, has a crucial role to play in curbing excessive waste of water and energy in future years by means of improved design and construction of new homes. An inefficient hot water distribution system is likely to remain in place for the life of the building, leaving owners without access to options that would have only been practical at the time of construction.

Reducing the waste of energy and water is an integral part of the stated purpose of the IRC:

> R101.3 Intent.
>
> The purpose of this code is to establish minimum requirements to safeguard the public safety, health and general welfare through affodability, structural strength, means of egress facilities, stability, sanitation, light and ventilation, energy conservation and safety to life and property from fire and other hazards attributed to the built environment and to provide safety to fire fighters and emergency responders during emergency operations.

This proposal, by reducing demands on energy and water systems in new homes, clarly advances the "public safety, health and general welfare" through cost-effective designs and energy conservation. Water-saving building designs reduce unnecessary water use, helping to ensure that water supplies are maintained at safe and reliable levels, protecting human health and firefighting capability as well as environmental resources. Energy- and water-saving designs, such as those meeting the criteria of this proposal, also enhance housing affordability and general welfare through reduced energy, water and sewer bills of building owners and occupants.

Additional Technical Background

A 2009 paper by Robert Hendron of the National Renewable Energy Laboratory and others quantified the waste of hot water in initial draws waiting for water to reach 105ºF. Modeling the plumbing typical of a 3-bedroom, 2-bath, single-story home with a hot water distrubutiuon simulation tool found that an estimated 12% of all hot water used on an annual basis is wasted. When viewed by fixture, the results are as follows:

- Showers -- over 10% wastage.
- Kitchen sinks -- 18% wastage.
- Lavatories -- over 30% wastage.

Purging at these fixtures is responsible for 95% of the estimated total of nearly 3,000 gallons of hot water wastage annually. Of course, many new homes are built with more hot water outlets than this model's base case and with hot water distribution systems that are far less efficient. Nevertheless, this proposal will direct the attention of designers and code officials to the proximity between water heaters and those fixtures that are responsible for the great majority of hot water waste.

Single Family Water Heating Distribution System Improvements, Codes and Standards Enhancement Initiative (CASE), California Utilities Statewide Codes and Standards Team, draft May 2011.

Single Family Water Heating Distribution System Improvements, Codes and Standards Enhancement Initiative (CASE), California Utilities Statewide Codes and Standards Team, final September 2011.

Cost Impact: Will not increase the cost of construction
This proposal is a design requirement that can be met without increasing the cost of construction. Plans that may be initially out of conformance can most commonly be adjusted with strategies that need not carry a cost penalty, such as repositioning the proposed hot water heater location from an exterior garage wall to an interior garage wall, or by rearranging fixture locations in a bathroom to move hot water outlets closer to the water heater. Such changes typically result in shorter lengths of both cold and hot water piping, thereby reducing costs. The CASE report referenced in the bibliography evaluated the cost-effectiveness of radial distance limits that were significantly more stringent than proposed here, and found them to be cost-effective in all cases. (See final report, pp. 20-21.) The report's estimate even assumed an initial cost of $390 for additional lengths of natural gas piping and water heater vent piping, even though repositioning a water heater from an outer garage wall to an inner garage wall need not increase gas service line length. Cost savings averageing $73 from reduced length of PEX hot water piping were estimated. Natural gas savings of 24 therms per year more than ofset these costs on a life-cycle basis. What's more, no savings were calculated or credited for reduced water and sewer charges over the life of the building, which would further improve the cost-effctiveness of this measure.

RP 6-15 : P2802 (New)-OSANN5261

RP 7-15

P2804.6.1

Proponent: William Chapin, representing Professional Code Consulting, LLC (bill@profcc.us)

2015 International Residential Code

Revise as follows:

P2804.6.1 Requirements for discharge pipe. The discharge piping serving a pressure-relief valve, temperature-relief valve or combination valve shall:

1. Not be directly connected to the drainage system.
2. Discharge through an air gap located in the same room as the water heater.
3. Not be smaller than the diameter of the outlet of the valve served and shall discharge full size to the air gap.
4. Serve a single relief device and shall not connect to piping serving any other relief device or equipment.
5. Discharge to the floor, ~~to the pan serving the water heater or~~ storage tank, to a waste receptor or to the outdoors.
6. Discharge in a manner that does not cause personal injury or structural damage.
7. Discharge to a termination point that is readily observable by the building occupants.
8. Not be trapped.
9. Be installed to flow by gravity.
10. Terminate not more than 6 inches (152 mm) and not less than two times the discharge pipe diameter above the floor or waste receptor flood level rim.
11. Not have a threaded connection at the end of the piping.
12. Not have valves or tee fittings.
13. Be constructed of those materials indicated in Section P2906.5 or materials tested, rated and *approved* for such use in accordance with ASME A112.4.1.
14. Be one nominal size larger than the size of the relief-valve outlet, where the relief-valve discharge piping is constructed of PEX or PE-RT tubing. The outlet end of such tubing shall be fastened in place.

Reason: A water heater pan does not have sufficient volume or drain size to adequately drain the volume of water that is delivered when the relief valve opens due to an over temperature event.

Cost Impact: Will not increase the cost of construction
This will not increase the cost of construction as there is already a drain in place if there is a water heater pan.

RP 7-15 : P2804.6.1-CHAPIN5710

RP 8-15

P2902.5.4, P2904.1

Proponent: Jeffrey Shapiro, representing International Residential Code Fire Sprinkler Coalition (jshapiro@ircfiresprinkler.org)

2015 International Residential Code

Revise as follows:

P2902.5.4 Connections to automatic fire sprinkler systems. The potable water supply to automatic fire sprinkler systems shall be protected against backflow by a double check backflow prevention assembly, a double check fire protection backflow prevention assembly, a reduced pressure principle backflow prevention assembly or a reduced pressure principle fire protection backflow prevention assembly.

> **Exception:**~~Where~~ Where sprinkler systems are installed ~~as a portion of the water distribution system~~ in accordance with ~~the requirements of this code and are not provided with a fire department connection~~Section P2904.1, backflow protection for the water supply system shall not be required.

P2904.1 General. The design and installation of residential fire sprinkler systems shall be in accordance with NFPA 13D or Section P2904, which shall be considered equivalent to NFPA 13D. Partial residential sprinkler systems shall be permitted to be installed only in buildings not required to be equipped with a residential sprinkler system. Section P2904 shall apply to stand-alone and multipurpose wet-pipe sprinkler systems that do not include the use of antifreeze. A multipurpose fire sprinkler system shall provide domestic water to both fire sprinklers and plumbing fixtures. A stand-alone sprinkler system shall be separate and independent from the water distribution system.

A backflow preventer shall not be required to separate a ~~stand-alone~~ sprinkler system from the water distribution system, provided that the sprinkler system complies with all of the following:

1. The system complies with NFPA 13D or Section P2904.
2. The piping material complies with Section P2905.
3. The system does not contain antifreeze.
4. The system does not have a fire department connection.

Reason: The proposed revision clarifies the code by coordinating the requirements in Sections P2902.5.4 with P2904.1. The allowance to omit backflow protection for certain stand-alone systems currently permitted by Section P2904.1 was not previously correlated with Section P2902.5.4, which has caused confusion in applying the code. The proposed text further improves usability of the code by placing a complete backflow preventer exception in Section P2904.1 rather than the current approach, which covers multipurpose systems in Section P2902.5.4 and standalone systems in Section P2904.1.

The proposed revision also makes it clear that the permissible exception to backflow protection applies to systems installed to either Section P2904 or NFPA 13D, and it corrects an oversight in the current code text related to fire department connections, making it clear that backflow protection may not be omitted on any system, stand-alone or multipurpose, that is provided with a fire department connection. Although fire department connections aren't required by Section P2904 and aren't ordinarily installed on home fire sprinkler systems, the possibility that such a connection might be voluntarily provided must be addressed.

Cost Impact: Will not increase the cost of construction

The proposal will reduce the cost of construction in cases where a backflow preventer would otherwise have been provided because of a misunderstanding of the current code provisions.

RP 8-15 : P2902.5.4-SHAPIRO4703

RP 9-15

P2903.4, P2903.4.1, P2903.4.2

Proponent: Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

2015 International Residential Code

Revise as follows:

P2903.4 Thermal expansion control. ~~A means for controlling increased~~ Where a storage water heater is supplied with cold water that passes through a check valve, pressure ~~caused by~~reducing valve or backflow preventer, a thermal expansion tank shall be ~~installed where required~~connected to the water heater cold water supply pipe at a point that is downstream of all check valves, pressure reducing valves and backflow preventers. Thermal expansion tanks shall be sized in accordance with ~~Sections P2903.4.1~~the tank manufacturer's instructions and ~~P2903.4.2~~shall be sized such that the pressure in the water distribution system shall not exceed that required by Section P2903.3.1.

Delete without substitution:

~~**P2903.4.1 Pressure-reducing valve.** For water service system sizes up to and including 2 inches (51 mm), a device for controlling pressure shall be installed where, because of thermal expansion, the pressure on the downstream side of a pressure-reducing valve exceeds the pressure-reducing valve setting.~~

~~**P2903.4.2 Backflow prevention device or check valve.** Where a backflow prevention device, check valve or other device is installed on a water supply system using storage water heating equipment such that thermal expansion causes an increase in pressure, a device for controlling pressure shall be installed.~~

Reason: Any location there is a pressure reducing device, a check valve or a backflow preventer in the cold water piping to a storage-type water heater, a means to compensate for thermal expansion must be installed. This is typically accomplished with an expansion tank. Other methods for relieving thermal expansion pressure, such additional relief valves, waste water for the life of the system. Thermal expansion tanks are required by most storage water heater manufacturers to protect the water heater. Expansion tank manufacturers typically size their tanks so that the water distribution system pressure will remain just shy of the pressure required to open a 150 psi water heater relief valve. This will allow the system pressure to exceed the maximum pressure intended by Section P2903.3.1, which is unacceptable. A similar proposal for the 2015 IPC was Approved as Submitted.
This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes. This is PMGCAC Item 149.

Cost Impact: Will increase the cost of construction
This proposal will increase the cost of construction because additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code. Specifically, there will be the added cost for a thermal expansion tank and the labor to connect it to the piping versus the cost and labor to install a relief valve that discharges a small amount of water to relieve thermal expansion caused pressure. Where specialized water closet tank fill valves were used for the relief, the change might result in no cost impact at all. Where use of a relief valve (before) required a drain to be installed for capturing the discharge, installing a thermal expansion tank might cost less than the drain installation.

RP 9-15 : P2903.4-SNYDER4139

RP 10-15

P2903.5

Proponent: Michael Meagher, representing Sioux Chief Mfg (michael.meagher@siouxchief.com)

2015 International Residential Code

Revise as follows:

P2903.5 Water hammer. The flow velocity of the water distribution system shall be controlled to reduce the possibility of water hammer. A water hammer arrestor shall be installed where quick-closing valves are utilized. Water-hammer arrestors shall be installed in accordance with the manufacturer's instructions. Water-hammer arrestors shall conform to ASSE 1010.

Reason: This proposal re-aligns both the IRC P2903.5 with the IPC 604.9 Water Hammer paragraphs as they were when they were first created, eliminating confusion and clearly spelling out the necessary requirement for water hammer control on all plumbing systems. Originally, these two code paragraphs on water hammer control were identical. Then, the 2009 IRC P2903.5 was edited, striking a single sentence that contained the mandatory language. This same edit proposal did not make it through to the 2009 IPC 604.9. It was voted down, keeping the mandatory language as is. Confusion amongst code officials throughout the country has ensued over this discrepency in the two codes ever since.

Water hammer control has been a part of our plumbing codes and practices ever since plain air chambers were introduced over a hundred years ago. Today, modern plumbing systems require water hammer control even more so than in the past. In regards to the science of water hammer, the laws of physics do not change when comparing the pressure surge in a 1-or-2 family dwelling to the surge in a multi-family system. They are the same. In addition, the advent of plastic piping systems, with various designs of metal and hard-plastic mechanical fitting systems, do not eliminate this need for water hammer control, as some may have assumed. Rather, the need to protect these systems from damaging pressure surges is even greater due to their lower pressure ratings compared to traditional metal piping systems.

Over the years, the plumbing industry has developed a wide variety of ASSE 1010 certified AA size arresters, even laundry boxes with certified integral arresters, which have become very popular throughout the country, making water hammer control very easy and affordable. Other model codes requiring arresters have been successfully welcomed and easily enforced throughout much of the United States, Canada, and in many parts of the world, for many years now. The installation of AA arresters is now common practice for well over half the residential construction in North America, in both single-family and multi-family.

Bibliography: [Link to website for additional information] This link to the ASSE website verifies the many arrester manufacturers and the wide variety of ASSE certified AA arrester options available in the plumbing industry.
http://www.asse-plumbing.org/prodlist_new.asp

Cost Impact: Will increase the cost of construction
For fhe tens of thousands of new homes that are already being installed with AA arresters, there is NO cost impact.
For the tens of thousands of new homes that are still being installed with old-fashioned plain air chambers, there is NO cost impact, and more likely a cost savings, due to the elimination of the cost of labor and material of installing 12-16 air chambers versus the cost of 3 to 5 AA arresters per home.

Where the current IRC is being used and interpreted as requiring NO water hammer control, the initial installation cost impact of this code change will be roughly $18 to $30 per home, depending on local interpretation of required quick-closing valves. This cost impact is calculated using the most common practice of arrester installation, which is installing outlet boxes (such as laundry boxes) with integral arresters. Since the arresters are already factory-installed, the cost impact is simply the cost difference in boxes with and without arresters, roughly $6 per single valve/arrester box ($12 per laundry box since it includes two arresters per box). The second most popular AA arrester installaion is the swivel compression tee arrester which easily and quickly hooks up to the compression supply stop that serves the quick-closing valve. The cost impact of this is roughly $8. Depending on local enforcement, the total cost impact per home could be $18-$30, or an average of about $24 per home.

The LONG TERM cost impact of water hammer control, however, is immeasurable. yet very obvious. Just like many other required devices in a plumbing system, such as pressure reducing valves limiting static pressures to 80 psi, water hammer arresters will help protect the entire plumbing system and all of its necessary appurtenances and appliances from premature failure, saving the homeowner thousands of dollars in repairs and damage over the life of the home.

RP 10-15 : P2903.5-MEAGHER5179

RP 11-15

P2902.5.4, P2904.1, 2904.1.1 (New)

Proponent: Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

2015 International Residential Code

Revise as follows:

P2902.5.4 Connections to automatic fire sprinkler systems. The potable water supply to automatic fire sprinkler systems shall be protected against backflow by a double check backflow prevention assembly, a double check fire protection backflow prevention assembly, a reduced pressure principle backflow prevention assembly or a reduced pressure principle fire protection backflow prevention assembly.

> **Exception:** Where sprinkler systems are installed~~ as a portion of the water distribution system~~ in accordance with ~~the requirements of this code and are not provided with a fire department connection~~Section P2904.1.1, backflow protection for the water supply system shall not be required.

P2904.1 General. The design and installation of residential fire sprinkler systems shall be in accordance with NFPA 13D or Section P2904, which shall be considered equivalent to NFPA 13D. Partial residential sprinkler systems shall be permitted to be installed only in buildings not required to be equipped with a residential sprinkler system. Section P2904 shall apply to stand-alone and multipurpose wet-pipe sprinkler systems that do not include the use of antifreeze. A multipurpose fire sprinkler system shall provide domestic water to both fire sprinklers and plumbing fixtures. A stand-alone sprinkler system shall be separate and independent from the water distribution system.~~ A backflow preventer shall not be required to separate a stand-alone sprinkler system from the water distribution system.~~

Add new text as follows:

2904.1.1 Backflow protection.
A backflow preventer shall not be required to separate a stand-alone sprinkler system from the water distribution system, provided that the sprinkler system complies with all of the following:

1. The system complies with NFPA 13D or Section P2904.
2. The piping material complies with Section P2905.
3. The system does not contain antifreeze.
4. The system does not have a fire department connection.

Reason: The proposed revision clarifies the code by coordinating the requirements in Sections P2902.5.4 with P2904.1. The allowance to omit backflow protection for certain stand-alone systems currently permitted by Section P2904.1 was not previously correlated with Section P2902.5.4, which has caused confusion in applying the code. The proposed text further improves usability of the code by placing a complete backflow preventer exception in the proposed Section P2904.1.1 rather than the current approach, which covers multipurpose systems in Section P2902.5.4 and standalone systems in Section P2904.1.
The proposed revision also makes it clear that the permissible exception to backflow protection applies to systems installed to either Section P2904 or NFPA 13D, and it corrects an oversight in the current code text related to fire department connections, making it clear that backflow protection may not be omitted on any system, stand-alone or multipurpose, that is provided with a fire department connection. Although fire department connections aren't required by Section P2904 and aren't ordinarily installed on home fire sprinkler systems, the possibility that such a connection might be voluntarily provided must be addressed.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes. This is PMGCAC Item 145.

Cost Impact: Will not increase the cost of construction
This proposal will not increase the cost of construction because no additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code.

RP 11-15 : P2904.1-SNYDER4138

RP 12-15

Table P2906.6, Chapter 44

Proponent: William Chapin, representing Professional Code Consulting, LLC (bill@profcc.us)

2015 International Residential Code

Revise as follows:

TABLE P2906.6
PIPE FITTINGS

MATERIAL	STANDARD
Fittings for polyethylene of raised temperature (PE-RT) plastic tubing	ASSE 1061; ASTM F 1807; ASTM F2098; ASTM F 2159; ASTM F 2735; ASTM F 2769

(Portions of table not shown remain unchanged)

Add new standard(s) as follows:
ASSE 1061-2011 Peformance Requirements for Push-Fit Fittings (UPDATE of edition year).

Reason: ASSE 1061-2011 added PE-RT to the list of tubing that can be used with the fittings.

Cost Impact: Will not increase the cost of construction
This will not increase the cost of construction as it only adds another option for the installer.

Analysis: Successful action on this proposal will result in the update of Reference Standard ASSE 1061 to the 2011 edition level for only the change indicated in the table. A coordinating proposal for updating the standard for the entire code will be submitted to Group B for inclusion in the Reference Standards administrative update proposal.

RP 12-15 : Table P2906.6-CHAPIN5711

RP 13-15

P2906.6.1 (New)

Proponent: Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

2015 International Residential Code

Add new text as follows:

P2906.6.1 Saddle tap fittings. The use of saddle tap fittings and combination saddle tap and valve fittings shall be prohibited.

Reason: As PEX, PE-RT and CPVC tubings are becoming even more popular than ever for water distribution systems in residential buildings, there are more reports of saddle tap fittings being installed on these types of tubing. This just doesn't work out very well. The IRC does not require that refrigerator ice maker water supply connection boxes be installed at rough-in. And the installation of reverse osmosis drinking water systems is becoming quite popular. Where can someone tap into the water distribution system for the supply of water? A saddle tap is quick and easy but is subject to being bumped and twisted. Where the tap is a combination tap and valve, operation of the valve makes the potential for leakage problems greater.
This connection method should be prohibited just like it has been prohibited in the IPC for some time.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes. This is PMGCAC Item 130.

Cost Impact: Will increase the cost of construction
This proposal will increase the cost of construction because additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code. For those plumbing contractors that were trying to legally cut corners in every way possible, there will be the minor added cost for a tee installation. Can they convince the builder or developer that they should be paid more for their work because of this change? It would be very, very doubtful that the builder or developer will be impacted with this minor cost addition.

RP 13-15 : P2906.6.1 (New)-SNYDER4140

RP 14-15

P2906.9.1.5, P2906.9.1.5.1, P2906.9.1.5.2

Proponent: Gary Morgan, Viega.LLC, representing Viega LLC (gary.morgan@viega.us)

2015 International Residential Code

Revise as follows:

~~P2906.9.1.5~~P2906.10 Cross-linked polyethylene plastic (PEX). Joints between cross-linked polyethylene plastic tubing or fittings shall comply with Section ~~P2906.9.1.5.1~~P2906.10.1 or Section ~~P2906.9.1.5.2~~P2906.10.2.

~~P2906.9.1.5.1~~P2906.10.1 Flared joints. *No change to text.*

~~P2906.9.1.5.2~~P2906.10.2 Mechanical joints. Mechanical joints shall be installed in accordance with the manufacturer's instructions. Fittings for cross-linked polyethylene (PEX) plastic tubing shall comply with the applicable standards indicated in Table P2906.6 and shall be installed in accordance with the manufacturer's instructions. PEX tubing shall be factory marked with the applicable standards for the fittings that the PEX manufacturer specifies for use with the tubing.

Reason: This proposal fixes an oversight that has existed for several years in this code in that the Section for "PEX Plastic" (P2906.9.1.5) should never have been subcategorized under "Solvent cementing" Section P2906.9.1. Like other specific piping material types, "PEX plastic" should have had it's own section like that of Polypropylene (PP), PEX/AL/PEX, Stainless Steel, Press-connect,and PE-RT to name a few.
This proposal also brings the IRC in consistant alignment with how the IPC is now organized by renumbering the sections for PEX.

Cost Impact: Will not increase the cost of construction
This proposal will have no effect on the cost of construction and only seeks to correct an oversight of organizational numbering.

RP 14-15 : P2906.9.1-MORGAN5492

RP 15-15

P2906.9.1.4

Proponent: Tim Earl, GBH International, representing The Oatey Company, representing The Oatey Company (tearl@gbhinternational.com)

2015 International Residential Code

Revise as follows:

P2906.9.1.4 PVC plastic pipe. A purple primer , or other *approved* primer, that conforms to ASTM F 656 shall be applied to PVC solvent-cemented joints. Solvent cement for PVC plastic pipe conforming to ASTM D 2564 shall be applied to all joint surfaces.

Reason: The market place has already begun using clear as well as UV-light visible primers where local inspectors allow. Many users prefer this as spilled purple primers can permanently stain surfaces and cause added expenses in repair/replacement of stained items. This simply meets a market condition and gives broader authority for these applications to occur. This would also be consistent with language in the IPC and other proposals in the IRC.

Cost Impact: Will not increase the cost of construction
This proposal will not impact cost as it simply adds another primer option.

RP 15-15 : P2906.9.1.4-EARL4723

RP 16-15

Table P2906.4, Table P2906.5, Table P2906.6, P2906.19, P2906.19.2 (New), P2906.19.3 (New)

Proponent: Larry Gill, representing IPEX USA LLC (larry.gill@ipexna.com)

2015 International Residential Code

Revise as follows:

TABLE P2906.4
WATER SERVICE PIPE

MATERIAL	STANDARD
Polyethylene of raised temperature (PE-RT) plastic tubing	ASTM F 2769; CSA B137.18

(Portions of table not shown remain unchanged)

TABLE P2906.5
WATER DISTRIBUTION PIPE

MATERIAL	STANDARD
Polyethylene of raised temperature (PE-RT) plastic tubing	ASTM F 2769; CSA B137.18

(Portions of table not shown remain unchanged)

TABLE P2906.6
PIPE FITTINGS

MATERIAL	STANDARD
Fittings for polyethylene of raised temperature (PE-RT) plastic tubing	ASTM F 1807; ASTM F2098; ASTM F 2159; ASTM F 2735; ASTM F 2769; ASTM F1055; ASTM D2683; ASTM D3261; CSA B137.18

(Portions of table not shown remain unchanged)

P2906.19 Polyethylene of raised temperature plastic. Joints between polyethylene of raised temperature plastic tubing and fittings shall be in accordance with ~~Section~~Sections P2906.19.1, P2906.19.2 and P2906.19.3.

Add new text as follows:

P2906.19.2 Heat fusion Joints Joints shall be of the socket-fusion, saddle-fusion, or butt-fusion type, and shall be joined in accordance with ASTM D2657. Joint surfaces shall be clean and free of moisture. Joint surfaces shall be heated to melt temperatures and joined. The joint shall remain undisturbed until cool. Fittings shall be manufactured in accordance with ASTM D2683 or ASTM D3261.

P2906.19.3 Electrofusion Joints Joints shall be of the electrofusion type. Joint surfaces shall be clean and free of moisture and scoured to expose virgin resin. Joint surfaces shall be heated to melt temperatures for a period of time specified my the manufacturer and joined. The joint shall remain undisturbed until cool. Fittings shall be manufactured in accordance with ASTM F1055.

Add new standard(s) as follows:
CSA B137.18 - 2013 - Polyethylene of raised temperature resistance (PE-RT) tubing systems for pressure applications.

Reason: Add new CSA B137.18 Polyethylene of raised temperature resistance (PE-RT) tubing systems for pressure applications to tables

P2906.4, P2906.5 and P2906.6. This standard includes both pipe and fittings for water service and water distribution. This change will permit pipe and fittings meeting CSA B137.18 to be used in accordance with the Code.
Add new sections P2906.19.2 and P2906.19.3 for PE-RT fusion joints. Also add corresponding reference standards for PE-RT fusion - ASTM F1055, ASTM D2683 and ASTM D3261. This change will permit PE-RT pipe to be joined by fusing methods.

Cost Impact: Will not increase the cost of construction
This proposal adds additional standards for use with PERT pipe and fittings. These new standards are similar to existing referenced standards and product are similar so there is no increase in the cost of the PERT system by referenciing these standards and adding standards to permit fusion of PERT.

Analysis: A review of the standard proposed for inclusion in the code, CSA B137.18 - 2013, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2015.

RP 16-15 : P2906.19-GILL4509

RP 17-15

P3003.9.2

Proponent: Tim Earl, GBH International, representing The Oatey Company (tearl@gbhinternational.com)

2015 International Residential Code

Revise as follows:

P3003.9.2 Solvent cementing. Joint surfaces shall be clean and free from moisture. A purple primer, or other *approved* primer, that conforms to ASTM F 656 shall be applied. Solvent cement not purple in color and conforming to ASTM D 2564, CSA B137.3 or CSA B181.2 shall be applied to all joint surfaces. The joint shall be made while the cement is wet, and shall be in accordance with ASTM D 2855. Solvent-cement joints shall be installed above or below ground.

> **Exception:** A primer shall not be required where all of the following conditions apply:
> 1. The solvent cement used is third-party certified as conforming to ASTM D 2564.
> 2. The solvent cement is used only for joining PVC drain, waste and vent pipe and fittings in non-pressure applications in sizes up to and including 4 inches (102 mm) in diameter

Reason: The market place has already begun using clear as well as UV-light visible primers where local inspectors allow. Many users prefer this as spilled purple primers can permanently stain surfaces and cause added expenses in repair/replacement of stained items. Also, there are some installations (under sinks, basements) where the PVC will be exposed and the primer visible after installation. This simply meets a market condition and gives broader authority for these applications to occur. This would also be consistent with language in the IPC and other proposals in the IRC.
Visible primer stains on pipe installation:

Typical installation with visible primer

UV-visible primer:

UV visible primer

Staining to floor from purple primer (after being wiped off, with less than one minute of exposure):

Stained floor

Stained tile

Cost Impact: Will not increase the cost of construction
This proposal will not impact cost as it simply allows another primer option.

RP 18-15

P3010.4, P3010.5

Proponent: Larry Gill, representing IPEX USA LLC (larry.gill@ipexna.com)

2015 International Residential Code

Revise as follows:

P3010.4 Pipe. The replacement pipe shall be made of a high-density polyethylene (HDPE) that conforms to ~~cell classification number~~ material designation code PE3608, PE4608 or PE4710 as indicated in ASTM F 714. The pipe fittings shall be manufactured with an SDR of 17 and in compliance with ASTM F 714.

P3010.5 Pipe fittings. Pipe fittings to be connected to the replacement piping shall be made of high-density polyethylene (HDPE) that conforms to ~~cell classification number~~ material designation code PE3608, PE4608 or PE4710 as indicated in ASTM F 714. The pipe fittings shall be manufactured with an SDR of 17 and in compliance with ASTM D 2683.

Reason: The listed designations PE 3608, 4608 and 4710 are not cell classiciations per the referecned standard ASTM F714. They are material designation codes. Minor correction to terminology.

Cost Impact: Will not increase the cost of construction
Change to correct terminology with no impact on cost. The proposal does not change the cost of the product it only corrects how the product is referenced.

2015 International Residential Code

Revise as follows:

P3201.1 Design of traps. Traps shall be of standard design, shall have smooth uniform internal waterways, shall be self-cleaning and shall not have interior partitions except where integral with the fixture. Traps shall be constructed of lead, cast iron, copper or copper alloy or *approved* plastic. Copper or copper alloy traps shall be not less than No. 20 gage (0.8 mm) thickness. Solid connections, slip joints and couplings shall be permitted to be used on the trap inlet, trap outlet, or within the trap seal. Slip joints shall be accessible.

> **Exception:** Sanitary waste valve devices complying with ASME A112.18.8 shall be an alternative to the traps required by this section where such devices are installed in accordance with the manufacturer's instructions.

P3201.2 Trap seals. Each fixture trap shall have a liquid seal of not less than 2 inches (51 mm) and not more than 4 inches (102 mm).

> **Exception:** Sanitary waste valve devices complying with ASME A112.18.8 shall not be required to have a liquid seal.

P3201.2.1.1 Potable water-supplied trap seal primer valve. A potable water-supplied trap seal primer valve shall supply water to the trap. Water-supplied trap seal primer valves shall conform to ASSE 1018. The devices shall be installed in accordance with the manufacturer's instructions. The discharge pipe from the trap seal primer valve shall connect to the trap above the trap seal on the inlet side of the trap.

P3201.2.1.2 Reclaimed or gray-water-supplied trap seal primer valve. A reclaimed or gray-water-supplied trap seal primer valve shall supply water to the trap. Water-supplied trap seal primer valves shall conform to ASSE 1018. The devices shall be installed in accordance with the manufacturer's instructions. The quality of reclaimed or gray water supplied to trap seal primer valves shall be in accordance with the requirements of the manufacturer of the trap seal primer valve. The discharge pipe from the trap seal primer valve shall connect to the trap above the trap seal on the inlet side of the trap.

P3201.2.1.3 Waste-water-supplied trap primer device. A waste-water-supplied trap primer device shall supply water to the trap. Waste-water-supplied trap primer devices shall conform to ASSE 1044. The devices shall be installed in accordance with the manufacturer's instructions. The discharge pipe from the trap seal primer device shall connect to the trap above the trap seal on the inlet side of the trap.

P3201.2.1.4 Barrier-type trap seal protection device. A barrier-type trap seal protection device ~~shall protect the floor drain trap seal from evaporation. Barrier-type floor drain trap seal protection devices~~ shall conform to ASSE 1072. The devices shall be installed in accordance with the manufacturer's instructions.

P3201.3 Trap setting and protection. Traps shall be set level with respect to their water seals and shall be protected from freezing. Trap seals shall be protected from siphonage, aspiration or back pressure by an *approved* system of venting (see Section P3101). The devices shall be installed in accordance with the manufacturer's instructions.

P3201.5 Prohibited trap designs. The following types of traps are prohibited:

1. Bell traps.
2. Separate fixture traps with interior partitions, except those lavatory traps made of plastic, stainless steel or other corrosion-resistant material.
3. "S" traps.
4. Drum traps.
5. Trap designs with moving parts.

> **Exception:** Sanitary waste valve devices complying with ASME A112.18.8 shall be permitted provided that the devices are installed in accordance with the manufacturer's instructions.

P3201.6 Number of fixtures per trap. Each plumbing fixture shall be separately trapped by a water seal trap. The vertical distance from the fixture outlet to the trap weir shall not exceed 24 inches (610 mm) and the horizontal distance shall not exceed 30 inches (762 mm) measured from the center line of the fixture outlet to the centerline of the inlet of the trap. The height of a clothes washer standpipe above a trap shall conform to Section P2706.1.2. Fixtures shall not be double trapped.

Exceptions:

1. Fixtures that have integral traps.
2. A single trap shall be permitted to serve two or three like fixtures limited to kitchen sinks, laundry tubs and lavatories. Such fixtures shall be adjacent to each other and located in the same room with a continuous waste arrangement. The trap shall be installed at the center fixture where three fixtures are installed. Common trapped fixture outlets shall be not more than 30 inches (762 mm) apart.
3. Connection of a laundry tray waste line into a standpipe for the automatic clothes-washer drain shall be permitted in accordance with Section P2706.1.2.1.
4. <u>A water seal trap shall not be required where a sanitary waste valve device complying with ASME A112.18.8 is installed in accordance with the manufacturer's instructions.</u>

Add new standard(s) as follows:

<u>ASME A112.18.8 -2009 (Reaffirmed 2014) In-Line Sanitary Waste Valves for Plumbing Drainage Systems</u>

Reason: This code change proposal is for a new plumbing product that outperforms a p-trap, but it is not a p-trap. A p-trap is based on trapping water in the drain to provide a seal between the interior of a building and the sewer gasses and odors in the public sewer. This product is called an In-Line Sanitary Waste valve. It is designed to prevent sewer odors from the building drain and public sewers from entering the building but it does not "Trap water" it uses a flexible membrane and therefore it needs to be identified separately with an exception. In-line sanitary waste valves perform better than a P-trap. P-traps will often plug when solids are put into the drain, where in-line waste valve easily pass solids. P-traps often crack and leak when exposed to freezing temperatures and P-traps will dry up an allow sewer odors to escape into the building when the fixture has not been used for a period of time. (A couple of weeks) In-line sanitary waste valves perform very well in freezing conditions and they still prevent sewer gasses from entering a building when the fixture has not been used for an extended period. Long periods of non-use is common for many seasonal type hotel, school and state park types of buildings. Sanitary waste valves have been used extensively in many other parts of the world very successfully. (Europe, South Africa, and Asia) (See attached testimonial letters)

This proposal is seeking to allow the use of in-line sanitary waste valves that conform to the requirements of the attached standard to be used in lieu of p-traps, but not replace p-traps. These devices cost more than a p-trap, so they will not take over the market. They are intended to only be used on sinks, lavatories, and bathtubs where freezing conditions may exist (in overhangs) or in seasonal buildings like cabins, vacation homes or large hotels where some wings or building may not be used for long periods, They may also be used in State Park facilities, National Park Facilities, seasonal resorts, schools, and stadiums during off-seasons or in buildings where traps can freeze or dry up. This option is currently not available and this code change is intended to give consumers a choice for a better product if they choose to purchase it.

The manufacturer went to the American Society of Mechanical Engineers to develop a Standard for this product. The standard is ASME A112.18.8, the standard was titled: "In-Line Sanitary Waste Valves for Plumbing Drainage Systems". This standard includes a "Scope" that states these devices are intended "for use as an alternate to tubular p-traps" (1-1/4 inch and 1-1/2 inch at sinks, lavatories and bathtubs only) The standard also covers the material and performance requirements for the product. It also states that these devices are not intended for use with water closets and urinals.

The Standard includes Material Requirements for the device to comply with the Seal material requirements in ASTM F409 Standard Specification for Thermoplastic Accessible and Replaceable Plastic Tube and Tubular Fittings. It also addresses the Seal material to comply with or exceed the following material requirements from ASTM D2000: M3BA507, A14, B13, C12 and F17 or M2BG714, B14, EO14, and EO34. The ASTM D2000 standard is an industry standard for rubber and polymer products. The material requirements have been confirmed with a 3rd party laboratory test report. (Attached)

The Standard also has material requirements for the bladder/checking member material to comply with or exceed the following material requirements from ASTM D2000: M3FC607, EA14, EO16 and G11. The bladder/checking member material requirements have been confirmed with a 3rd party laboratory test report. (Attached)

Other material requirements address valve inlet dimensions, valve outlet dimensions and threaded connections.

The Standard includes performance testing requirements which includes the following tests: 1. Waterway Flow test; 2. One-Way Sealing Performance Test; 3. Airway Flow Rate; 4. Recovery from an Excess Back Pressure Test; 5. Leak Tightness Test; 6. Thermal Cycling; 7. Resistance to Household Substances: rice, diced vegetables, resistance to cleaning product, soaps, solids, kiln dried sand, and the lard test from the grease interceptor and trap seal protection device standards; 9. Resistance to Chemicals and Solvents; 10. Drop Test; and 11. Life Cycle Operation Test.

The Standard also has requirements for marking, Identification and installation Instructions.

In-Line sanitary waste valves are an innovative, hygienic, Self Sealing, Waste Valve.

In-Line sanitary waste valves can be installed vertically or horizontally (with an adaptor) and are available in 1-1/4 inch (32mm) and 1-1/2 inch (40mm) sizes.

The Recreational Vehicle industry in North America has embraced this technology because it out performs P-traps in freezing conditions and when there are periods of non-use. Another advantagee over p-traps is it prevents sewage from backing up into bathtubs when there is movement and it could help prevent backflow of sewage.

Bibliography: Link to website for additional information: http://overseas.wavin.com/overseas/HepVo_waste_valve.html

Cost Impact: Will not increase the cost of construction
There will be no addditional cost associated with this code change, because it is not mandating the use of products meeting this Standard, it is simply listing it as an alternate to a p-trap as an alternate method for a better performing installation. It is not a mandatory code change, If someone chooses to install an in-line Sanitary Waste Valve, Then it must conform to the industry Standard.

Analysis: A review of the standard proposed for inclusion in the code, ASME A112.18.8 -2009 (Reaffirmed 2014), with regard to the ICC criteria for referenced
standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2015.

TENTATIVE ORDER OF DISCUSSION
2015 PROPOSED CHANGES TO THE
INTERNATIONAL SWIMMING POOL AND SPA CODE

The following is the tentative order in which the proposed changes to the code will be discussed at the public hearings. Proposed changes which impact the same subject have been grouped to permit consideration in consecutive changes.

Proposed change numbers that are indented are those which are being heard out of numerical order. Indentation does not necessarily indicate that one change is related to another. Proposed changes may be grouped for purposes of discussion at the hearing at the discretion of the chair. Note that some SP code change proposals may not be included on this list, as they are being heard by another committee.

101.3.1 (New)

Proponent: Jennifer Hatfield, J. Hatfield & Associates, PL, representing Association of Pool & Spa Professionals (jhatfield@apsp.org)

2015 International Swimming Pool and Spa Code

Add new text as follows:

101.3.1 Flotation tanks. Flotation tank systems intended for sensory deprivation therapy shall not be considered to be included in the scope of this code.

Reason: Per the scope of the ISPSC, the provisions of this code are intended to address aquatic recreation facilities, pools and spas...that are intended for swimming, bathing or wading. A flotation tank system is not intended for swimming, bathing or wading; rather, it is intended for sensory deprivation therapy and should not be included under the ISPSC. This proposal attempts to clarify this by providing intent that they are not under the scope of this code.

Cost Impact: Will increase the cost of construction
This proposal attempt to clarifty that a product is not under the scope of the ISPSC and therefore will not increase the cost of construction.

SP 1-15 : [A] 101.3-HATFIELD5742

SP 2-15

202 (New),

Proponent: Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

2015 International Swimming Pool and Spa Code

Add new definition as follows:

SECTION 202 DEFINITIONS

ACCESS (TO). That which enables a fixture, appliance or equipment to be reached by ready access or by a means that first requires the removal or movement of a panel, door similar obstruction (see "Ready access").

SECTION 202 DEFINITIONS

READY ACCESS. That which enables a fixture, appliance or equipment to be directly reached without requiring the removal or movement of any panel, door or similar obstruction and without the use of a portable ladder, step stool or similar device.

Reason: There are several locations where these terms are used in the ISPSC however, without these definitions, the true meaning of the terms are not clear. These definitions are identical to the IMC definitions for these terms. The IMC has scoping control of these defined terms where they are used in all codes except for the IRC.
This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes. This is PMGCAC Item 108.

Cost Impact: Will not increase the cost of construction
This proposal will not increase the cost of construction because additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code.

SP 2-15 : 202-ACCESS (TO) (New)-SNYDER4141

SP 3-15

202

Proponent: Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

2015 International Swimming Pool and Spa Code

Revise as follows:

SECTION 202 DEFINITIONS

SHALLOW AREAS. Portions of a pool or spa with water depths less than ~~5~~4 feet (~~1524 mm~~1219mm).

Reason: This proposal resolves a conflict between the definition of SHALLOW AREA and what is stated as a shallow area in Section 807.2. The change was made in the conservative direction.
This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes. This is PMGCAC Item 12.

Cost Impact: Will not increase the cost of construction
This proposal will not increase the cost of construction because no additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code.

SP 3-15 : 202-SHALLOW AREAS-SNYDER4142

SP 4-15

202

Proponent: Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

2015 International Swimming Pool and Spa Code

Revise as follows:

SECTION 202 DEFINITIONS

SWIMOUT. An underwater seat area that is placed completely outside of the ~~perimeter shape~~diving envelope of ~~the~~a pool. ~~Where located at the deep end, swimouts are permitted to be used as the deep-end means of entry or exit to the pool.~~

Reason: A swimout is not required to be outside of the perimeter shape of a pool. Many times they are located on those areas but they are not required to be. This revised wording agrees with Figure 322.2.
The second sentence is a requirement and requirements should not be in code defintions. Requirments belong in the code text (Chapters 3 though 10). There was no need to add this requirement to the code as it is already in Sections 411.1.3 and 809.2

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes. This is PMGCAC Item 13.

Cost Impact: Will not increase the cost of construction
This proposal will not increase the cost of construction because no additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code.

SP 4-15 : 202-SWIMOUT-SNYDER4143

SP 5-15
202

Proponent: Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

2015 International Swimming Pool and Spa Code

SECTION 202 DEFINITIONS

~~**UNDERWATER LEDGE.** A narrow shelf projecting from the side of a vertical structure whose dimensions are defined in the appropriate standard.~~

Reason: The phrase UNDERWATER LEDGE is only used in the definition of UNDERWATER SEAT and nowhere else in the code. There is no a need for this definition as it is clear by the description of UNDERWATER SEAT. This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes. This is PMGCAC Item 40.

Cost Impact: Will not increase the cost of construction
This proposal will not increase the cost of construction because no additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code.

SP 5-15 : 202-UNDERWATER LEDGE-SNYDER4144

SP 6-15

302.6

Proponent: Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

2015 International Swimming Pool and Spa Code

Revise as follows:

302.6 Waste-water discharge. Where ~~waste water~~ wastewater from pools ~~and~~or spas, such as backwash water from filters and water from deck drains~~discharge~~ discharge to ~~the~~ a building drainage system, ~~such installation~~ the connection shall be through an air gap in accordance with the *International Plumbing Code* or the *International Residential Code~~,~~ as applicable in accordance with Section 102.7.1*.

Reason: This simple rewording clarifies the intent that water being discharged to a building drainage system must do so through an air gap. It is paramount that sewage not come in contact with water systems around a pool or spa.
This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes. This is PMGCAC Item 105.

Cost Impact: Will not increase the cost of construction
This proposal will not increase the cost of construction because additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code.

SP 6-15 : 302.6-SNYDER4145

SP 7-15

303.1.3

Proponent: Jennifer Hatfield, J. Hatfield & Associates, PL, representing Association of Pool & Spa Professionals (jhatfield@apsp.org)

2015 International Swimming Pool and Spa Code

Revise as follows:

303.1.3 Covers. Outdoor heated pools and outdoor permanent spas shall be provided with a vapor-retardant cover or other *approved* vapor-retardant means in accordance with Section 104.11.

> **Exception:** Where more than 70 percent of the energy for heating, computed over an operating season, is from ~~site-recovered energy such as from~~ a heat pump or solar energy source, covers or other vapor-retardant means shall not be required.

Reason: The original intent of this exception was that when an air-source swimming pool heat pump was installed on a pool or spa, it would not require a vapor retardant cover. Because an air-source swimming pool heat pump transfers heat from the air to the pool, it is a more energy efficient way to heat a pool over other types of heaters. The language included the term site-recovered energy without the knowlege that this term is defined in ASHRAE 90.1 and as defined would not include air-source swimming pool heat pumps. If this exception were to be interpretted to require a heat pump that uses site-recovered energy, as defined in ASHRAE 90.1, then one would find that such a product does not exist in the swimming pool industry.
Therefore, this proposal eliminates that terminology to clarify that the intent here is if a pool or permanent spa utilizes a heat pump or solar energy source for more than 70% of the energy used in heating the pool or permanent spa, than one is exempt from the vapor retardant cover requirement.

Cost Impact: Will not increase the cost of construction
This change will not increase the cost of construction; rather, it will clarify the original intent of this section.

SP 7-15 : 303.1.3-HATFIELD5787

SP 8-15

305.1

Proponent: Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

2015 International Swimming Pool and Spa Code

Revise as follows:

305.1 General. The provisions of this section shall apply to the design of barriers for restricting entry into areas having for pools and spas. ~~These design controls are intended to provide protection against the potential drowning and near drowning by restricting access to such pools spas. These requirements provide an integrated level of protection against potential drowning through the use of physical barriers and warning devices.~~ Where spas or hot tubs are equipped with a lockable safety cover complying with ASTM F 1346 and swimming pools are equipped with a powered safety cover that complies with ASTM F 1346, the areas where those spas, hot tubs or pools are located shall not be required to comply with Sections 305.2 through 305.7.

~~**Exceptions:**~~

1. ~~Spas and hot tubs with a lockable *safety cover* that complies with ASTM F 1346.~~
2. ~~Swimming pools with a powered *safety cover* that complieswith ASTM F 1346.~~

Reason: The last two sentences in the existing section appear to be commentary so they should be removed. The exceptions really don't fit correctly because the main paragraph does not have requirements that the exceptions work with.

The proposed revised language better identifies what Section 305 is about which is the design of barriers for restricting entry into areas having pools and spas. The new last sentence simply says, where a pool or spa has a safety cover, compliance with the remainder of the section is not required. No new requirements are being presented by this proposal.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC). The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes. This is PMGCAC Item 41.

Cost Impact: Will not increase the cost of construction

This proposal will not increase the cost of construction because additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code.

SP 8-15 : 305.1-SNYDER4146

SP 9-15

305.2.4.1 (New), 305.2.10

Proponent: Jennifer Hatfield, J. Hatfield & Associates, PL, representing Association of Pool & Spa Professionals (jhatfield@apsp.org)

2015 International Swimming Pool and Spa Code

Add new text as follows:

305.2.4.1 **Setback for mesh fences** The location of a mesh fence from the inside of the fence to the nearest edge of the water of a pool or spa shall be not less than 20 inches (508 mm).

Delete without substitution:

~~**305.2.10 Poolside barrier setbacks.** The pool or spa side of the required barrier shall be not less than 20 inches (508 mm) from the water's edge.~~

Reason: This proposal clarifies the original intent of Section 305.2.10, which was to apply only to mesh fences, which are removable child barriers otherwise known as baby barriers. The setback requirement was never intended to apply to walls, screen enclosures, other types of fencing, etc. The way the code is currently written it could be construed as applying to all types of barriers and not just the mesh fencing as intended. Therefore, this proposal simply deletes Section 305.2.10 and instead places the setback requirement as a subsection of the mesh fencing section, so it is applied to only that type of barrier fence.

Bibliography: See 2007 Florida Building Code, Code Commentary for Section R4101.17.1.13 which clearly provides that the intent of the setback is only for mesh fencing.

Cost Impact: Will not increase the cost of construction
This will not increase the cost of construction, as it simply clarifies the original intent of a code provision.

SP 9-15 : 305.2.4.1 (New)-HATFIELD5780

SP 10-15

305.2.10 (New)

Proponent: Jennifer Hatfield, J. Hatfield & Associates, PL, representing Association of Pool & Spa Professionals (jhatfield@apsp.org)

2015 International Swimming Pool and Spa Code

Add new text as follows:

305.2.10 Flexible plastic netting Flexible plastic mesh fencing and netting shall not be used for a required barrier. This section shall not apply to factory-manufactured mesh fence assemblies made and installed in accordance with Section 305.2.4.

Reason: This new section is being proposed to clarfiy that certain plastic fencing is not intended for use as a pool barrier. For example, the plastic fencing one uses at construction sites to warn people to stay out of the area could possibly be argued as meeting the barrier provisions if this new section is not added. This is possible due to the fact the vertical post spacing could be 15 to 20 feet, the "holes" could meet the width maximum and the top edge is supported by a tension wire. However, the "holes" could be widened by a foot being inserted and weight on the top could pull it down to less than 48 inches above grade. Further, the bottom of this type of fence rarely is supported by a tension wire; therefore, it could be possible for someone to push under it and get into the pool. All of these factors represent a safety concern if this type of product were used to meet the barrier requirements, which is why this new section is needed to prevent that from happening. However, the second sentence is needed to clarfiy this is NOT intended to eliminate the mesh fencing that is manufactured specifically as a "baby barrier" around a pool, under Section 305.2.4.

Cost Impact: Will not increase the cost of construction
This will not increase the cost of construction, as it just clarifies that a certain type of plastic netting that was never intended to be a pool barrier iand s not, in fact, a pool barrier.

SP 10-15 : 305.2.10 (New)-HATFIELD5487

SP 11-15

305.3

Proponent: Timothy Pate, , City and County of Broomfield, representing the Colorado Chapter of ICC Code Change Committee, representing City and County of Broomfield (tpate@broomfield.org)

2015 International Swimming Pool and Spa Code

Revise as follows:

305.3 Gates. Access gates shall comply with the requirements of Sections 305.3.1 through 305.3.3 and shall be equipped to accommodate a locking device. Pedestrian access gates shall open outward away from the pool or spa, shall be self-closing and shall have a self-latching device.

<u>Where the combined occupant load of the pool deck area and the pool water area is calculated to be 50 persons or more based on the swimming pool occupant load factors in Table 1004.1.2 of the International Building Code, not less than two pedestrian access gates shall serve as the means of egress gates for the combined area. The means of egress gates shall be separated in accordance with Section 1007.1.1 of the IBC. Where more than one means of egress gate from the area is required, all means of egress gates from the area shall have panic hardware installed in accordance with Section 1010.1.10 of the IBC.</u>

Reason: This proposed change is to add language that would require checking the occupant load using IBC Table 1004.1.2 which has pool and pool deck listed as a function of space. Once the space exceeds the 49 it would need exits which would match what is done for a building or space within a building. There has been confusion as to how exterior pools are treated in regards to means of egress since they are not technically an occupancy. I do not believe the best way to solve this is to change language to call these spaces occupancies since you would then have to also use Chapter 29 to determine required numbers of plumbing fixtures. I believe some building departments use IBC section 1004.5 for these outdoor areas but this section says you need means of egress but the definition of means of egress only talks to occupied portions of buildings or structures.
This leads to a lot of confusion for building departments and designers. I feel that adding this specific language to the swimming pool barrier section will help clear up this confusion.

Cost Impact: Will increase the cost of construction
This would increase the cost in the jurisdictions that have not interpretated this section to require the panic hardware already.

SP 11-15 : 305.3-PATE3935

SP 12-15

305.3, 305.3.3, 305.4

Proponent: Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

2015 International Swimming Pool and Spa Code

Revise as follows:

305.3 Gates. Access gates shall comply with the requirements of Sections 305.3.1 through 305.3.3 and shall be equipped to accommodate a locking device. Pedestrian access gates shall open outward away from the pool or spa, shall be self-closing and shall have a self-latching device.

305.3.3 Latches. For *residential* pools, the operable parts of the latch release for the self-latching device shall be located at 54 inches (1372 mm) maximum above the finished floor or ground. Where the latch release~~ mechanism~~ of the self-latching device is located less than 54 inches (1372~~ mm~~) ~~from grade~~above the finished floor or ground, the latch release~~ mechanism~~ shall be located on the pool or spa side of the gate not less than 3 inches (76 mm) below the top of the gate, and the gate and barrier shall not have openings greater than 1~~/2~~/2 inch (12.7 mm) within 18 inches (457 mm) of the release mechanism. For *public pools*, for latches on gates along the accessible route, the operable parts of the self-latching devices shall comply with Section 1010.1.9.2 of the *International Building Code.*

305.4 Structure wall as a barrier. Where a wall of a dwelling or structure serves as part of the barrier and where doors or windows provide direct access to the pool or spa through that wall, one of the following shall be required:

1. Operable windows having a sill height of less than 48 inches (1219 mm) above the indoor finished floor and doors shall have an alarm that produces an audible warning when the window, door or their screens are opened. The alarm shall be *listed* and *labeled* as a water hazard entrance alarm in accordance with UL 2017. In ~~dwellings or structures~~dwelling units not required to be Accessible units, Type A units or Type B units, the operable parts of the alarm deactivation switches shall be located 54 inches (1372 mm) or more above the finished floor. In ~~dwellings or structures~~dwelling units required to be Accessible units, Type A units or Type B units, or in structures where the swimming pool is required to be accessible, the operable parts of the alarm deactivation switches shall be located not greater than 54 inches (1372 mm) and not less than 48 inches (1219 mm) above the finished floor.
2. A *safety cover* that is *listed* and *labeled* in accordance with ASTM F 1346 is installed for the pools and spas.
3. An *approved* means of protection, such as self-closing doors with self-latching devices, is provided. Such means of protection shall provide a degree of protection that is not less than the protection afforded by Item 1 or 2.

Reason: The intent of the changes is to coordinate the locking arrangements on gates and doors for public pools with the allowances worked out in the IBC as part of the coordination with ADA. The definition for public pool and residential pool would determine where accessibility is appropriate.

The 2015 IBC reads as follows:
IBC 1010.1.9.2 Hardware height. Door handles, pulls, latches, locks and other operating devices shall be installed 34 inches (864 mm) minimum and 48 inches (1219 mm) maximum above the finished floor. Locks used only for security purposes and not used for normal operation are permitted at any height.
Exception: Access doors or gates in barrier walls and fences protecting pools, spas and hot tubs shall be permitted to have operable parts of the release of latch on self-latching devices at 54 inches (1370 mm) maximum above the finished floor or ground, provided the self-latching devices are not also self-locking devices operated by means of a key, electronic opener or integral combination lock.

IBC 1109.13 Controls, operating mechanisms and hardware. Controls, operating mechanisms and hardware intended for operation by the occupant, including switches that control lighting and ventilation and electrical convenience outlets, in accessible spaces, along accessible routes or as parts of accessible elements shall be accessible.

Exceptions:

1. Operable parts that are intended for use only by service or maintenance personnel shall not be required to be accessible.
2. Electrical or communication receptacles serving a dedicated use shall not be required to be accessible.
3. Where two or more outlets are provided in a kitchen above a length of counter top that is uninterrupted by a sink or appliance, one outlet shall not be required to be accessible.
4. Floor electrical receptacles shall not be required to be accessible.
5. HVAC diffusers shall not be required to be accessible.
6. Except for light switches, where redundant controls are provided for a single element, one control in each space shall not be required to be accessible.
7. Access doors or gates in barrier walls and fences protecting pools, spas and hot tubs shall be permitted to comply with Section 1010.1.9.2.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes. This is CTC/PMG Proposal Item 4.

Cost Impact: Will not increase the cost of construction
This proposal will not increase the cost of construction because no additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code.

SP 12-15 : 305.3.3-SNYDER4147

SP 13-15

306.1

Proponent: Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

2015 International Swimming Pool and Spa Code

Revise as follows:

306.1 General. ~~**Decks**~~ The structural design and installation of decks around pools and spas shall be ~~designed and installed~~ in accordance with the *International Residential Code* or the *International Building Code,* as applicable in accordance with Section ~~102.7.1~~ 102.7, ~~except as provided in~~ and this section.

Reason: The arrangement of the first part of the existing code section can be read "Decks shall be…. installed….". In other words, one interpretation of this section might conclude that decks are required for every pool and spa. This is not what was intended by the section. This section is only requiring that the design and installation of decks be in accordance with the applicable codes. The revise language clarifies the intent.
This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes. This PMGCAC Item 42.

Cost Impact: Will not increase the cost of construction
This proposal will not increase the cost of construction because no additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code.

2015 International Swimming Pool and Spa Code

Revise as follows:

307.1 General design requirements. ~~The provisions of this section~~ Sections 307.1.1 through 307.1.4 shall apply to all pools and spas.

> ~~**Exception:** The provisions of Sections 307.3 through 307.6 do not apply to *listed* and *labeled* portable *residential* spas and *listed* and *labeled* portable *residential* exercise spas.~~

~~**307.2**~~**307.1.1 Glazing in hazardous locations.** *No change to text.*

~~**307.7**~~**307.1.2 Colors and finishes.** ~~The~~For other than residential pools and residential spas, the colors, patterns, or finishes of the pool ~~or~~and spa ~~interior~~interiors shall not obscure objects or surfaces within the pool or spa.

> ~~**Exception:** *Residential* pools and spas.~~

~~**307.8**~~**307.1.3 Roofs or canopies.** *No change to text.*

~~**307.9**~~**307.1.4 Accessibility.** *No change to text.*

307.2 Specific design and material requirements. Sections 307.2.1 through 307.2.4 shall apply to all pools and spas except for listed and labeled portable residential spas and listed and labeled portable residential exercise spas.

~~**307.3**~~**307.2.1 Materials.** *No change to text.*

~~**307.3.1**~~**307.2.1.1 Beach pools.** *No change to text.*

~~**307.3.2**~~**307.2.1.2 Compatibility.** *No change to text.*

~~**307.4**~~**307.2.2 Materials and structural design.** Pools and spas shall conform to one or more of the standards indicated in Table ~~307.4~~307.2.2. The structural design of pools and spas shall be in accordance with the *International Building Code* or the *International Residential Code*, as applicable in accordance with Section 102.7.1 of this code.

TABLE 307.2.2
RESERVOIRS AND SHELLS

MATERIAL	STANDARD
Fiberglass reinforced plastic	IAPMO Z124.7
Plastic	IAPMO Z124.7
Stainless steel (Types 316, 316L, 304, 304L)	ASTM A 240
Tile	ANSI A108/A118/A136.1
Vinyl	ASTM D 1593

~~**307.4.1**~~**307.2.2.1 Installation.** *No change to text.*

~~**307.5**~~**307.2.3 Freeze protection.** *No change to text.*

~~**307.6**~~**307.2.4 Surface condition.** *No change to text.*

Reason: The existing layout of Section 307 does work very well when attempting apply the Exception in Section 307.1 to only a portion of the sections in Section 307. Generally, good format for an exception is to have the exception "attached" to every section that the exception applies to. This makes the code difficult to read whereas a reorganization is often a better way to accomplish the goal which in this case, is to exempt portable spas from complying with some (but not all) of the requirements in Section 307. Although there is a significant moving around of language and some new sections to accommodate the reorganization, no new requirements are being introduced.
Section 307.1 (and its subsections) are general requirements that apply for all pools and spas.

Section 307.2 (and its subsections) are more specific requirements except those requirements do not apply to *listed and labeled* spas. Remember that specific requirements for *listed and labeled* spas are covered by Chapter 9.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC). The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes. This is PMGCAC Item 43.

Cost Impact: Will not increase the cost of construction
This proposal will not increase the cost of construction because additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code.

SP 14-15 : 307.1-SNYDER4149

SP 15-15

307.6 (New), Chapter 11

Proponent: Jennifer Hatfield, J. Hatfield & Associates, PL, representing Association of Pool & Spa Professionals (jhatfield@apsp.org)

2015 International Swimming Pool and Spa Code

Add new text as follows:

307.6 Plastering of pools and spas The plastering of the interior of concrete pools and permanently-installed concrete spas shall be in accordance with APSP 12.

Add new standard(s) as follows:
ANSI/APSP/NPC/ICC - 12 2015 American National Standard for the Plastering of Swimming Pools

Reason: The Association of Pool & Spa Professionals, in conjunction with the National Plasters Council and ICC are currently developing the ANSI/APSP/NPC/ICC-12 American National Standard for the Plastering of Swimming Pools. This Standard will provide clear requirements when plastering a swimming pool or a permanently installed concrete spa, in both residential and commercial settings.
Plastering is the final coating applied to the shell of a concrete pool or spa. White is the most common, but it can be tinted to other colors by using pigmented aggregate. Pool plaster adds a watertight seal and makes the surface of the pool smoother for contact with swimmers than the underlying rough concrete shell. The pool plaster is a key element for the athestics and overall enjoyment of the pool or spa and this standard will ensure that it is applied properly.

Cost Impact: Will not increase the cost of construction
This proposal will not increase the cost of construction, rather it will help ensure a proper plaster was put on the pool, decreasing the costs associated with having to redo a bad plaster job.

Analysis: A review of the standard proposed for inclusion in the code, ANSI/APSP/NPC/ICC - 12 , with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2015.

SP 15-15 : 307.6 (New)-HATFIELD5495

SP 16-15

307.9

Proponent: Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

2015 International Swimming Pool and Spa Code

Revise as follows:

307.9 Accessibility. An accessible route to public pools and spas shall be provided in accordance with the *International Building Code.* Accessibility within public pools and spas shall be provided as required by the accessible recreational facilities provisions of the *International Building Code.* ~~Accessibility for pools and spas accessory to detached oneand two-family dwellings and townhouses not more than three stories in height shall be provided where required by the *International Residential Code.*~~

Reason: In Section 307.9, the last sentence not only adds confusion, and should be deleted. There is nothing in the IRC that addresses accessibility in pools and spas. Recreational facilities that serve multiple townhouses would be addressed in the IBC.This is CTC/PMG Proposal Item 5
This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes.

Cost Impact: Will not increase the cost of construction
This proposal will not increase the cost of construction because no additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code.

SP 16-15 : 307.9-SNYDER4151

SP 17-15

308.3

Proponent: Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

2015 International Swimming Pool and Spa Code

Revise as follows:

308.3 ~~Shape~~Dimensions and shape. ~~This code is not intended to regulate the~~The dimensions and shape of a pool or spa ~~other than~~shall not be limited provided that water circulation is provided for every water area, underwater areas are designed to ~~take into account the effect that a given shape will have on the safety~~avoid entrapment of bathers and, where regulated by other sections of the ~~occupants and to maintain~~code, perimeter access is provided for the ~~minimum required level of circulation to ensure sanitation.~~pool or spa.

Reason: The existing language seemed to be more of a commentary statement than a requirement. However, there was an underlying intent to the words that needed to be brought out about the general design (dimension and shape) that is critical for the safety of users. Simply stated, you can make a pool or spa any shape or size provided that water circulation, perimeter access and avoidance of bather entrapment is provided for.
This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC). The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes. This is PMGCAC Item 44.

Cost Impact: Will not increase the cost of construction
This proposal will not increase the cost of construction because additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code.

SP 17-15 : 308.3-SNYDER4152

SP 18-15

311.3, 311.3.1 (New), 311.3.2 (New)

Proponent: Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

2015 International Swimming Pool and Spa Code

Revise as follows:

311.3 Water velocity. The water velocity in suction and return ~~lines~~piping shall comply with either Section 311.3.1 or 311.3.2. Pool piping sizes shall be chosen so that at the rated flows for the filtering and cleaning equipment, the operating head of the pump is not ~~exceed 8 feet (2.4 m) per second~~exceeded. The water velocity in ~~suction~~copper and copper alloy piping shall ~~be as required by Section 310.~~not exceed 8 fps (2.4 mps).

311.3.1 **Public pool and spas.** For *public* pools and spas, suction piping water velocity shall not exceed 6 fps (1.8 mps), return piping water velocity shall not exceed 10 fps (3.0 mps) and water velocity through grates shall not exceed 1.5 fps (0.5 mps) except where compliance with Section 310 further limits the water velocities in piping and through grates.

311.3.2 **Residential pool and spas.** For *residential* pools and spas, the water velocity in suction piping and return piping shall not exceed 8 fps (2.4 mps) except where compliance with Section 310 further limits the water velocities in suction and return piping.

Reason: APSP 7-2013 (which is referenced by the 2015 ISPSC) has some different requirements (than the previous edition) with respect to sizing of circulation piping. The ISPSC needs to be updated and clarified so that there is not confusion when comparing the requirements of APSP and the code.
This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC). The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes. This is PMGCAC Item 8.

Cost Impact: Will increase the cost of construction
This proposal will increase the cost of construction because additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code. Specifically, in some cases, the suction piping might have to be larger in order to control the velocity through the suction outlet grate. The requirement for larger piping will have additional cost in both material and labor.

SP 18-15 : 311.3-SNYDER4154

SP 19-15

313.7, 202 (New)

Proponent: Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

2015 International Swimming Pool and Spa Code

Revise as follows:

313.7 Emergency shutoff switch. An emergency shutoff switch shall be provided to disconnect all power to recirculation and jet system pumps and air blowers. Emergency shutoff switches shall be~~:~~ provided with ready access~~;~~, be located within sight of the pool or spa~~;~~, and be located not less than 5 feet (~~1524 mm~~1524mm) horizontally from ~~the~~an inside wall~~s~~ of the pool or spa~~.~~ that is served by the pumps and blowers controlled by the switch.

> ~~**Exception:** *Onground storable pools*, permanent inground *residential* swimming pools, *residential* spasand *residential* water features.~~

Add new definition as follows:

SECTION 202 DEFINITIONS

READY ACCESS. That which enables a fixture, appliance or equipment to be directly reached without requiring the removal or movement of any panel, door or similar obstruction and without the use of a portable ladder, step stool or similar device.

Reason: The emergency shutoff switch should be out in the open and not behind a panel so it is obvious where the switch is for fast access. Using the term "ready access" along with the IMC definition, will make this clear. The definition is identical to the IMC definition for this term. The IMC has scoping control of this defined term where it is used in all codes except for the IRC.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes. This is PMGCAC Item 107.

Cost Impact: Will not increase the cost of construction
This proposal will not increase the cost of construction because additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code.

SP 19-15 : 313.7-SNYDER4155

SP 20-15

316.2, Table 316.2, 316.4, 316.6 (New), 316.6.1 (New), 316.6.2 (New), Chapter 11

Proponent: Jennifer Hatfield, J. Hatfield & Associates, PL, representing Association of Pool & Spa Professionals (jhatfield@apsp.org)

2015 International Swimming Pool and Spa Code

Revise as follows:

316.2 Listed and labeled. Heaters and hot water storage tanks shall be *listed* and *labeled* in accordance with the applicable standard listed in Table 316.2.

TABLE 316.2
WATER HEATERS

DEVICE	STANDARD
Electric water heater	UL 1261, UL 1563 or CSA C22.2 No. 218.1
Gas-fired water heater	ANSI Z21.56/CSA 4.7a
Heat exchanger	~~NSF 50~~AHRI 400
Heat pump water heater	UL 1995, AHRI 1160, CSA C22.2 No. 236
~~Photovoltaic solar water heaters~~	~~NSF 50~~
~~Thermal radiant solar water heater~~	~~NSF 50~~

316.4 Installation. Heaters shall be installed in accordance with the manufacturer's specifications and the *International Fuel Gas Code*, *International Mechanical Code*, *International Energy Conservation Code*, NFPA 70 or *International Residential Code*, as applicable in accordance with Section 102.7.1. Solar thermal water heaters shall be installed in accordance with Section 316.6.

Add new text as follows:

316.6 Solar thermal water heaters. Solar thermal heaters utilized for pools and spas shall comply with Sections 316.6.1 through 316.6.2.

316.6.1 Installation. Solar thermal water heaters shall be installed in accordance with the International Mechanical Code or International Residential Code, as applicable in accordance with Section 102.7.1.

316.6.2 Collectors and panels. Solar thermal collectors and panels shall be listed and labeled in accordance with SRCC 100 or SRCC 600. Collectors and panels shall be permanently marked with the manufacturer's name, model number, and serial number. Such markings shall be located on each collector in a position that is readily viewable after installation of the collector or panel.

Add new standard(s) as follows:

AHRI 400-01 Liquid to Liquid Heat Exchangers with Addenda 1 and 2

SRCC 100 - 13 Standard 100 for Solar Collectors

SRCC 300 - 13 Standard 100 for Solar Water Heating Systems

Reason: This proposal add requirements for solar thermal water heater collectors that appears in the IRC to ensure safety and performance of these devices. It also removes references to NSF 50 for solar thermal and PV water heaters since they are outside the scope of NSF 50. Further, it adds reference to AHRI 400 for heat exchangers to align with an existing requirement in the IECC.

Cost Impact: Will not increase the cost of construction
This proposal will not increase the cost of construction, rather it aligns requirements with what already exists in other codes.

Analysis: A review of the standard proposed for inclusion in the code,AHRI 400-01, SRCC 100 - 13, SRCC 300 - 13, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2015.

SP 20-15 : 316.2-HATFIELD5761

SP 21-15

318.2

Proponent: Jerry Kerney, self, representing self (JKerney60@gmail.com)

2015 International Swimming Pool and Spa Code

Revise as follows:

318.2 Protection of potable water supply. Potable water supply systems shall be designed, installed and maintained so as to prevent contamination from nonpotable liquids, solids or gases being introduced into the potable water supply through cross-connections or other piping connections to the system. Means of protection against backflow in the potable water supply shall be ~~provided through~~by an air gap complying with ASME A112.1.2 ~~and~~or by a backflow prevention assembly in accordance with the *International Residential Code* or the *International Plumbing Code*, as applicable in accordance with Section 102.7.1.

Reason: It is not always possible to use an air gap to make the connection of potable water to pool or spa systems. Mechanical backflow prevention assemblies, as outlined in the plumbing codes, is another acceptable method for making potable water connections to non-potable systems such as pools and spas. This is done often. The code yexy doesn't reflect what is common practice. This needs changed.

Cost Impact: Will not increase the cost of construction
Where use of an air gap is impossible, a backflow prevention assembly is the only way to make the connection. This change doesn't cost more than what the existing code was requiring to be impossible.

SP 21-15 : 318.2-KERNEY5783

SP 22-15

401.1

Proponent: Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

2015 International Swimming Pool and Spa Code

Revise as follows:

401.1 ~~Public swimming pools~~ Scope. The provisions of this chapter shall apply only to ~~public swimming pools. Public swimming pools covered in this chapter include~~ Class A, Class B, Class C, Class E and Class F public swimming pools.

Reason: This is partially a clean up to make the sentence read in mandatory language. Also, Class F was added to the list of pols because in the last cycle, Class F (wading pools) was added to the language in Section 405 on wading pools and a definition was added to Chapter 2 for Class F. This section was overlooked in those revisions/addtions.
This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC). The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes. This is PMGCAC Item 62.

Cost Impact: Will not increase the cost of construction
This proposal will not increase the cost of construction because additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code.

N	MAXIMUM SLOPE TO REDUCE DIMENSION BEYOND FULL REQUIREMENTS FOR POOL DEPTH and CEILING HEIGHT					30 DEGREES										

	* Note: The minimum distance between adjacent platforms must be at least 0.25 metres. Note: Dimensions B (plummet to pool wall at side) and C (plummet to adjacent plummet) apply to Platforms with widths as detailed. If Platform widths are increased then B and C are to be increased by half the additional width(s). Note: The 10 Metre Platform must project 0.25 metres beyond any adjacent platform. Note: All platforms Note: The leading edge of the concrete platforms for springboards must be at least constructed to be directly above the pool wall or beyond.

N	MAXIMUM SLOPE TO REDUCE DIMENSION BEYOND MINIMUM REQUIREMENTS FOR POOL DEPTH and CEILING HEIGHT IS 30 DEGREES.														

Note 1:The leading edge of the concrete platforms for springboards must be at least constructed to be directly above the pool wall or beyond.

Note 2: All platforms must project 2'-5.53" (0.75 meters) beyond any plaform directly below.

Note 3: Dimensions B (plummet to pool wall at side) and C (plummet to adjacent plummet) apply to Platforms with widths as detailed. If Platform widths are increased then B and C are to be increased by half the additional width(s).

* Note 4: The minimum distance between adjacent platforms must be at least 0'-9.84" (0.25 meters).

Note 5: The 10 Metre Platform must project at least 0'-9.84" (0.25 meters) beyond any adjacent platform.

Note 6: In dimension H 'Dept of Water at Plummet', USA DIVING has approved 11' for 1m springboard and 12' for 3m springboard and 5m platform as the minimum depth.

N	MAXIMUM SLOPE TO REDUCE DIMENSION BEYOND MINIMUM REQUIREMENTS FOR POOL DEPTH and CEILING HEIGHT IS 30 DEGREES.														
-															

Note 1:The leading edge of the concrete platforms for springboards must be at least constructed to be directly above the pool wall or beyond.

Note 2: All platforms must project 2'-5 9/16" (0.75 meters) beyond any plaform directly below.

Note 3: Dimensions B (plummet to pool wall at side) and C (plummet to adjacent plummet) apply to Platforms with widths as detailed. If Platform widths are increased then B and C are to be increased by half the additional width(s).

* Note 4: The minimum distance between adjacent platforms must be at least 0'-9 7/8" (0.25 meters).

Note 5: The 10 Metre Platform must project at least 0'-9.84" (0.25 meters) beyond any adjacent platform.
Note 6: In dimension H 'Dept of Water at Plummet', USA DIVING has approved 11' for 1m springboard and 12' for 3m springboard and 5m platform as the minimum depth.

TABLE 402.12(6)
MINIMUM DIVING WATER ENVELOPES FOR CLASS A POOLS FOR NFHS-SANCTIONED DIVING EVENTS
(SEE FIGURE 402.12(6))

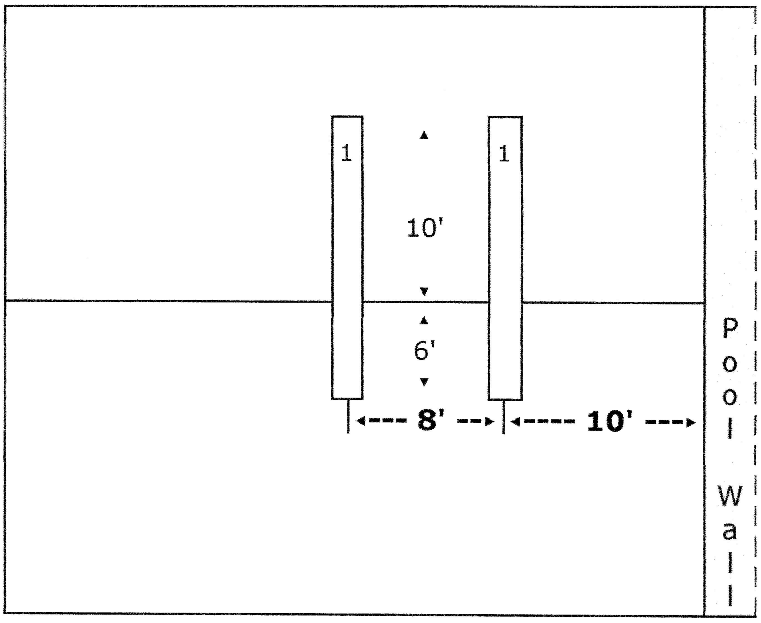
Matrix of Springboard Dimensions for High School Competitive Diving

NATIONAL FEDERATION OF STATE HIGH SCHOOL ASSOCIATIONS (NFHS)				
	Rule 9, Section 1, Article 1	**Board Height**	**U.S Dimensions**	**Metric Dimensions**
	Length of Board	1m	16'	4.877m
	Width of Board	1m	20"	.508m
a.	End of springboard Back to Pool Wall	1m	6'	1.829m
b.	Center of board to center of another board	1m	8'	2.438m
c.	Center of board to pool side wall	1m	10'	3.048m
d.	End of springboard to forward pool wall	1m	29'	8.839m
e.	Top of springboard to ceiling overhead	1m	16'	4.877m

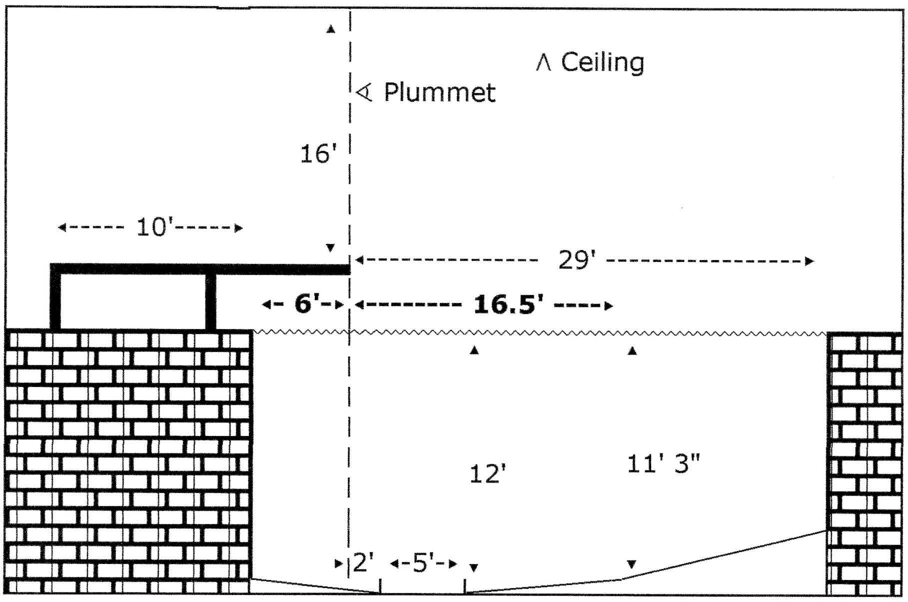
f.	Water depth at any point 2' to 5' in front of the end of the board, must be 12' (3.658m) or more, except for pools constructed prior to January 1987, where water depth 2 to 5 feet in front of the end of the board must be a minimum of 10 feet (3.045m).	1m	12'/10'	3.658 / 3.048m
g.	Maximum depth reduction rate of diving pools which do not exceed minimum depth requirement shall be 6 1/4% for a distance of 16.5' (5.0m) forward (6.096m) from the end of the board and 6' (1.829m) back and to the sides. Deeper pools may have proportionally steeper depth reduction rates.	1m	**	**

FIGURE 402.12(6)([Add # Here])
FIGURE FOR TABLE 402.12(6)

MINIMUM DIVING WATER ENVELOPE FOR HIGH SCHOOL POOLS WITH TWO 1 METER SPRINGBOARDS



Overhead View



Side View

Reason: Architects, contractors, and zoning officers have often asked for a conversion table of the FINA dimensions to U. S. dimensions. The three national governing bodies have different diemnsional conversion standards. This information needs to be in this publication so that there is not misinterpretation of what is required in USA Diving, NCAA, and high school diving facilities to guard against a facility not being able to a sanction for competition.

Cost Impact: Will not increase the cost of construction
These dimensions are already a requirement for competition pools and therefore, there is no change in the cost of construction. Having this information all in one place might eliminate rework costs and lower the cost of installing these pools.

SP 25-15 : 402.1-LEAS5115

SP 26-15

402.3

Proponent: Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

2015 International Swimming Pool and Spa Code

Revise as follows:

402.3 Installation. The installation of manufactured diving equipment shall be in accordance with Sections 402.3 through 402.12. Manufactured diving equipment shall be located in the deep area of the pool so as to provide the minimum dimensions shown in Table 402.12 and shall be installed in accordance with the manufacturer's instructions. Installation and use instructions for manufactured diving equipment shall be provided by the manufacturer and shall specify the minimum diving water envelope dimensions required for each diving board and diving stand combination. The manufacturer's instructions shall refer to the water envelope type by dimensionally relating their products to Point A on the diving water envelopes shown in Table 402.12. The diving board manufacturer shall specify which boards fit on the design pool geometry types as indicated in Table 402.12.

Reason: This is strictly an editorial clean up to correctly use the phrase "diving water envelope" where talking about diving features for a pool.
This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes. This is PMGCAC Item 73.

Cost Impact: Will not increase the cost of construction
This proposal will not increase the cost of construction because additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code.

SP 26-15 : 402.3-SNYDER4160

SP 27-15

402.6

Proponent: Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

2015 International Swimming Pool and Spa Code

Revise as follows:

402.6 Location of pool features in a diving pool. Where a pool is designed for use with diving equipment, the location of steps, pool stairs, ladders, underwater benches, underwater ledges, special features and other accessory items shall be outside of the minimum diving water envelope~~. See~~ shape at the design waterline as depicted in Figure 322.2.

Reason: This is partially an editorial change in that the "See Figure 322.2" was dangling at the end of this section without a real connection to the other words. The words "shape at the design waterline" is an especially important addition to made clear that underwater elements such as benches and ledges cannot encroach on the *straight downward projection* of the shape of the diving water envelope at the waterline. It is one thing to make sure that the sloped side walls of a pool are outside of the 3-D shape of the diving water envelope indicated in Figure 804.1 but to allow a horizontal flat surface under the water to be close to the outside of the 3-D shape could be an unnecessarily risky interpretation. Therefore, this improved wording clarifies that those underwater features are to be kept outside of the diving water envelope shape at the design waterline.
This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes. This is PMGCAC Item 82.

Cost Impact: Will not increase the cost of construction
This proposal will not increase the cost of construction because additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code.

SP 27-15 : 402.6-SNYDER4161

SP 28-15

410.1

Proponent: Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

2015 International Swimming Pool and Spa Code

Revise as follows:

410.1 ~~Dressing and sanitary~~<u>Toilet</u> facilities. ~~Dressing and sanitary facilities shall be provided for~~
Class A and B pools ~~as~~<u>shall be provided with toilet facilities having the</u> required ~~by~~<u>number of plumbing fixtures in accordance with</u> the *International Building Code*~~and~~<u> or the</u>*International Plumbing Code*.

Reason: As there is not a requirement for providing dressing rooms or bathing facilities in the IPC or IBC, it doesn't make sense to send the reader on a hunt for something that doesn't exist. Only plumbing fixtures are required by IPC/IBC so this section just needs to say that.
This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes. This is PMGCAC Item 110.

Cost Impact: Will not increase the cost of construction
This proposal will not increase the cost of construction because additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code.

SP 28-15 : 410.1-SNYDER4162

SP 29-15

609.3.1

Proponent: Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

2015 International Swimming Pool and Spa Code

Revise as follows:

609.3.1 Deck shower. Not less than one ~~shower~~ and not greater than half of the total number of showers required by Section 609.2 shall be located on the deck of or at the entrance of each pool.

Reason: This proposal is a clarification of existing code and does not add new requirements.
This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes. This is PMGCAC Item 109.

Cost Impact: Will not increase the cost of construction
This proposal will not increase the cost of construction because no additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code.

SP 29-15 : 609.3.1-SNYDER4163

SP 30-15

SECTION 612 (New)

Proponent: Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

2015 International Swimming Pool and Spa Code

Add new text as follows:

SECTION 612
SPRAY PADS

612.1 General. Spray pads shall comply with this section.

612.2 Safety hazards. Parts of the spray pad that can be accessed by the users of the spray pad shall be designed and constructed to not present safety hazards to the users.

612.3 Walking surface at perimeter. A walking surface of not less than 4 foot (1296 mm) in width shall be provided around the perimeter of the splash zone. The walking surface shall be sloped away from the splash zone. The drainage from the perimeter walking surface shall be directed to deck drains or other surface water disposal systems. Walking surfaces shall not drain to the surge basin for the spray pad.

612.4 Splash zone. The splash zone shall comply with Sections 612.4.2 through 612.4.5.

612.4.1 Absence of standing water. Surfaces in the splash zone shall be designed to not have standing water.

612.4.2 Slope to drain. The surfaces of the splash zone shall slope to drain water to the surge basin of the circulation system for the spray pad.

612.4.3 Nozzles on walking surfaces. Water nozzles that spray from walking surfaces shall be flush with those surfaces. Openings in such nozzles shall not exceed ½ inch (12.7 mm).

612.4.4 Other nozzles. Nozzles, other than those on walking surfaces, shall be designed to be clearly visible.

612.4.5 Potable water for foggers and misters. Foggers and misters that produce finely atomized water mists shall be supplied only with potable water. Foggers and misters shall not be supplied with water from the surge basin.

612.5 Circulation system. The circulation system shall consist of the equipment covered in Sections 612.5.1 through 612.5.3

612.5.1 Catch screen. A catch screen or basket shall be provided for splash zone drainage piping connections to the surge basin. The screen or basket shall be designed to prevent larger debris from entering the surge basin.

612.5.2 Surge basin.
A surge basin shall be provided having a capacity of not less than 4000 gallons or the number of gallons that can be pumped in one minute by the combination of all spray pad and recirculation pumps, whichever is greater.

612.5.2.1 Basin materials and design. The basin shall be constructed of materials which are inert, corrosion resistant and non toxic. Basins shall be constructed of concrete, fiberglass, high density polyethylene, stainless steel or other approved materials. The design of basins shall anticipate all anticipated loadings under full and empty conditions. Such loading conditions shall be determined by a design professional who has experience with the design of public pools.

612.5.2.2 Basin access. The basin shall be designed for access for cleaning and inspection. Not less than one access of opening of not less than 3 foot by 3 foot (914mm by 914 mm) shall be provided for placement of a ladder into the basin. All access opening covers shall be locked or shall require tools to open.

612.5.2.3 Circulation pump.
The circulation pump shall be sized to turnover the surge basin capacity in ½ hour or less. The intake for the pump shall be located at the lowest elevation of the surge basin Where separate pumps are installed for the circulation system and the spray nozzles system, the suction intakes for those pumps shall be located on opposite ends of the basin.

612.5.2.4 Spray nozzles and water feature pumps. Spray nozzles and water feature systems shall be be supplied water from the discharge of the recirculation pump or from separate pumps. Where separate pumps are installed for the recirculation system and a spray nozzles or water feature system, the suction intakes for spray nozzles and water feature pump systems shall be located adjacent to the recirculation pump discharge point in the basin.

612.5.2.5 Pump control. The controls for spray nozzles and water feature pump systems shall prevent operation of those pumps when the recirculation pump is not operating.

612.5.2.6 Disinfection system. In addition to filtration and sanitizing equipment required by Chapter 3 and this chapter, the recirculation system shall be equipped with an ultraviolet light disinfection unit. The unit shall listed and labeled to NSF 50. Where a method other than ultraviolet disinfection is being considered as an alternative method in accordance with Section 104.9, such method shall provide a reduction in the level of cryptosporidium that is equal to or greater than the ultraviolet light method. The alternative method's cryptosporidium reduction capability shall be determined by a nationally recognized testing laboratory.

612.5.2.6.1 UV unit location.
The ultraviolet light disinfection unit shall be located on the recirculation system and upstream of any water connection for, or separate pump intake for, supplying spray nozzles or water features.

612.5.2.6.2 UV intensity meter. The chamber of the ultraviolet light disinfection unit shall be equipped with a ultraviolet light intensity meter that is located opposite and at the greatest water depth from the ultraviolet light source. The meter shall be filtered to restrict its sensitivity to the disinfection spectrum.

612.5.2.7 Control of pumps by UV meter.
The ultraviolet light intensity meter shall interlock with the controls for pumps that supply water for the spray nozzles and water features systems. Where the ultraviolet light intensity meter senses an ultraviolet dosage rate of less than 40 mJ/cm^2, the interlock shall lock out those pumps from operation.

612.5.2.8 Make-up water system.
The surge basin shall be provided with a make-up water system that is supplied with potable water. The portable water supply shall be protected against backflow in accordance with the *International Plumbing Code.*

612.5.3 Diverter valve. The drainage piping for the splash zone shall have a diverter valve to divert splash zone drainage away from the surge basin when the spray pad is not in operation. The diverted drainage shall be to an approved place of disposal.

612.6 Operating instructions. Operating instructions for spray pads shall require that the cicrculation system be operated continuously for not less than 4 turnovers prior to the pumps for the spray nozzles and water features systems being turned on for use of the spray pad.

612.7 Lighting. Where a spray pad will be in operation at night or during periods of inadequate natural lighting, artificial lighting shall be provided. Such lighting shall be installed in accordance with the manufacturer's instructions and NFPA 70.

Reason: In the last cycle, the APSP organization proposed similar language for these highly popular water play areas that are rapidly becoming an alternative for some public swimming pools in many jurisdictions across the country. The technical committee disapproved the proposal because the term that was used in the proposed language for naming these attractions was a trademarked term. (The proposed SPRAY PADS is not, to our knowledge, a trademarked term.) There was no disagreement by the committee that this information was needed for the code but the trademarked term just had to be changed. Unfortunately, the proposal was disapproved by the membership at final action hearing.
Waterparks have included these attractions in their array of fun things to do at the park for many years. As large waterparks are highly focused on the safety and cleanliness of all water used at the park, regulations didn't seem to be necessary for these attractions – the waterparks knew what to do, how to do it and have an excellent track record. However, as these types of attractions move into the public sector, many people who are responsible for choosing and operating this equipment might be lacking the (waterparks') knowledge about what is critical for a safe installation. Those involved in the pool and spa industry and those involved in operating public pools in jurisdictions across the country are well aware of a water contamination occurrence in one of these attractions at a Traverse City, MI city park not so long ago.

The ISPSC is the best place to install these requirements within the I-code family of codes as these attractions involve circulated and filtered water (similar to what a pool or spa uses) for recreational use even though such attractions do not involve users "bathing" (immersing themselves) in bodies of water.

The most recent edition of the California Building Code is reflective of many of the proposed concepts and details of the language of this proposal.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC). The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes. This is PMGCAC Item 10.

Cost Impact: Will increase the cost of construction
This proposal will increase the cost of construction because additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code. Specifically, the code is currently silent about

these types of attractions which means that any supplier of these attractions could provide any kind of equipment (of safe design or not). In some cases, having these regulations in code will make the cost of some suppliers' attraction packages be more than if they did not have to comply with these minimum safety requirements. For other suppliers, these requirements are already included in their standard packages.

SP 30-15 : 612 (New)-SNYDER4164

SP 31-15

809.3

Proponent: Jennifer Hatfield, J. Hatfield & Associates, PL, representing Association of Pool & Spa Professionals (jhatfield@apsp.org)

2015 International Swimming Pool and Spa Code

Revise as follows:

809.3 Secondary entries and exits. Where water depth in the deep area of a pool exceeds 5 feet (1524 mm), a means of entry and exit shall be provided in the deep area of the pool.
Exception: In pools where a deep end egress presents a potential hazard, handholds are permitted to be substituted for a means of egress.

Reason: The language being proposed is due to what was adopted on June 28, 2012 as ANSI approved errata to the 2011 edition of the ANSI/APSP/ICC - 5 American National Standard for Residential Inground Swimming Pools, which provides in Section 6.1.1 the following exception: "In pools where a deep end egress may present a potential hazard, handholds may be subsituted for a means of egress."
This code proposal attempts to take that errata and put it into code langauge that will ensure consistency between the ISPSC and what is in the APSP-5 Standard. The reason this change occured in the APSP-5 standard was due to concerns from pool builders and fiberglass manufacturers that the language in Section 6.1 of the standard, which correlates with Section 809.2 of the ISPSC, would create problems in both construction and fiberglass manufacturering with existing molds - if an exception were not added existing molds would no longer be able to be used.

"Vanishing edge pools that extend over the side of a mountain (recent issue of Aqua Magazine that provides an extreme example but an example nonetheless) or where the vanishing edge is in a backyard elevated 10 feet above the surrounding property line is a more common example. In these cases if you were to exit the deep end, you'd fall and get injured or in the case of the mountain you'd most likely die…so we do not want to have an egress in these type of situations. The reason handholds would be allowed is that the edge of the wall itself may serve as a handhold, if it slopes away from the pool interior toward the exterior."

The exception added to the APSP-5 standard and being proposed here for inclusion in the ISPSC will help clarify and remedy the concern by eliminating the problems encountered by builders and manufacturers, while at the same time, eliminate the misperception of a shallow end being the deep end basd on the assumption that a ladder signifies the deep end.

Bibliography: Refer to ANSI/APSP/ICC-5 2011 Residential Inground Swimming Pool Standard with June 28, 2012 Errata

Cost Impact: Will not increase the cost of construction
This proposal will not increase the cost of construction, rather, if it is not adopted there is a good chance the cost of construction would increase if it were determined that the existing molds builders and manufacturers use are no longer allowed to meet this requirement.

Proponent: Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

2015 International Swimming Pool and Spa Code

Revise as follows:

809.3 Secondary entries and exits. Where water depth in the deep area of a pool exceeds 5 feet (1524 mm), a means of entry and exit shall be provided in the deep area of the pool.

Exception: Where a means of exit from the deep end of a pool would present a potential hazard, handholds shall be provided for the means of exit.

Reason: Since the APSP-5 2011 standard was published, several calls have been received from builders and fiberglass pool manufacturers expressing concern that the language in Section 6.1 of APSP-5 is creating problems both in construction and for fiberglass pool manufacturers with existing molds. According to the language in the 2011 edition of APSP-5, these existing molds can no longer be used.

The existing language has been modified to help clarify and remedy this section. Hopefully, it will eliminate the problems encountered by builders and manufacturers, while at the same time, eliminate the misperception of a shallow end being the deep end based on the assumption that a ladder signifies the deep end.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC). The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes. This is PMGCAC Item 9.

Cost Impact: Will not increase the cost of construction

This proposal will not increase the cost of construction because additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code.

SP 32-15 : 809.3-SNYDER4171

SP 33-15

809.5.1, 809.5.2

Proponent: Jennifer Hatfield, J. Hatfield & Associates, PL, representing Association of Pool & Spa Professionals (jhatfield@apsp.org)

2015 International Swimming Pool and Spa Code

Revise as follows:

809.5.1 Tread dimension and area. Treads shall have a minimum unobstructed horizontal depth of 10 inches (254 mm) and a minimum unobstructed walking surface area of 240 square inches (0.15 m^2).

809.5.2 Riser heights. Risers, other than the top and bottom riser, shall have a uniform height of not greater than 12 inches (305 mm). The top riser height shall be any dimension not exceeding 12 inches (305 mm) for the width of the walking surface. The bottom riser height shall be any dimension not exceeding 12 inches (305 mm). The top and bottom riser heights shall not be required to be equal to each other or equal to the uniform riser height. Riser heights shall be measured at the horizontal centerline of the ~~stairs~~walking surface area.

Reason: The rationale for the changes being proposed is that when entry steps are installed on the side of a pool, they may extend in width to a point where the walking surface area may not be the "center" of the tread width. This proposal is consistent with the requirements found in the ANSI/APSP/ICC -5 American National Standard for Residential Inground Swimming Pools, specifically this can be found within the subsections to 6.2 of APSP-5.

Bibliography: Refer to ANSI/APSP/ICC - 5 Residential Inground Swimming Pool Standard

Cost Impact: Will not increase the cost of construction
This proposal clarifies current practice and will not increase the cost of construction.
