COMPLETE MONOGRAPH

2015 GROUP A PROPOSED CHANGES TO THE I-CODES MEMPHIS COMMITTEE ACTION HEARINGS

April 19–28, 2015
Memphis Cook Convention Center
Memphis, Tennessee

ICC
INTERNATIONAL CODE COUNCIL®

First Printing

Publication Date: March 2015

PRINTED IN THE U.S.A.

TABLE OF CONTENTS
(2015 Group A)

INTRODUCTION

Welcome to the first full cycle of Code Development utilizing cdpACCESS™!

This 2015 Group A Cycle kicks off the first full cycle (2015 Group A, 2016 Group B and 2017 Group C) which is utilizing the new cdpACCESS system. This system allows stakeholders to collaborate on potential code changes and to submit code changes online via the system.

New to cdpACCESS and the 2015 Cycle is the way that code change modifications will be submitted and presented for committee and public viewing at the Committee Action Hearing. See page viii for details on the new modification submittal process.

The proposed changes published herein have been submitted in accordance with established procedures [Council Policy 28 Code Development (CP 28)] (see page xviii) and are posted for review. The publication of these changes constitutes neither endorsement nor question of them but is in accordance with established procedures so that any interested individuals may make their views known to the relevant code committee and others similarly interested. In furtherance of this purpose, the committee will hold an open public hearing at the date and place shown below for the purpose of receiving comments and arguments for or against such proposed changes. Those who are interested in testifying on any of the published changes are expected to be represented at these hearings.

This compilation of code change proposals is available in electronic form only. ICC no longer prints and distributes this document. The compilation of code change proposals is posted on two locations on the ICC website: the customary posting which is the linked from the Code Development webpage and from the cdpACCESS webpage.

2015 – 2017 CODE GROUPINGS

The code groupings for the 2015 – 2017 Cycle have been revised from the 2012 – 2014 Cycle as follows.

Codes moved to 2015 Group A, to be considered in this Cycle:

- IEBC non-structural provisions
- IPMC
- IRC – Mechanical
- IRC – Plumbing
- ISPSC
- IZC

The following code was moved to Group B, to be considered in the 2016 Cycle:

- IBC – Structural has been moved to Group B. This includes the structural provisions of the IEBC.

See page xiii for the 2015 – 2017 ICC Code Development Schedule

2015 ICC COMMITTEE ACTION HEARINGS

These proposed changes will be discussed in public hearings to be held on April 19 – 28, 2015 at the Memphis Cook Convention Center, Memphis, TN. The code committees will conduct their public hearings in accordance with the schedule shown on page xlii.

MEMBERSHIP COUNCILS TO MEET PRIOR TO THE HEARINGS

Prior to the hearings, some of the Membership Councils will be holding meetings during the Saturday, April 18th /Sunday morning, April 19th time period. This has been identified on the hearing schedule that was posted February 20th. Be sure to consult the Membership Councils webpage for details as they become available.

ADVANCED REGISTRATION AND VOTING

In 2014, the assembly floor motion process was changed. This is continued in the 2015 Cycle where assembly floor motions will be allowed following the committee action, however, the motion will be voted online following the hearings. All ICC members will be allowed to vote online on assembly floor motions. ICC members in attendance will still be allowed to vote on procedural "points of order" in accordance with Section 5.4.7 of CP 28 (see page xxv) **For identification purposes, all hearing participants must register. There is no cost to register or participate in the hearings.**

You are encouraged to advance register. Click here to register online.

The registration desk will be open in the lobby of the convention center according to the following schedule:

Sunday, April 19th	11:00 am to 5:00 pm
Monday, April 20th through Monday, April 27th	7:30 am to 5:00 pm
Tuesday, April 28th	7:30 am to 12:00 pm

CP 28 requires that ICC's membership records regarding ICC members reflect the eligible voters 30 days prior to the start of the Committee Action Hearings. This process includes new members as well as changes to voting status. This applies to all ICC Members - Governmental Members and non Governmental Members. Applicable CP 28 sections noted below:

> **5.7.4 Eligible Online Assembly Motion Voters:** All members of ICC shall be eligible to vote on online assembly floor motions. Each member is entitled to one vote, except that each Governmental Member Voting Representative may vote on behalf of its Governmental Member. Individuals who represent more than one Governmental Member shall be limited to a single vote. Application, whether new or updated, for ICC membership must be received by the Code Council 30 days prior to the first day of the Committee Action Hearing. The ballot period will not be extended beyond the published period except as approved by the ICC Board.
>
> **9.2 Applications:** Applications for Governmental Membership must be received by the ICC at least 30 days prior to the Committee Action Hearing in order for its designated representatives to be eligible to vote at the Public Comment Hearing or Online Governmental Consensus Vote. Applications, whether new or updated, for Governmental Member Voting Representative status must be received by the Code Council 30 days prior to the commencement of the first day of the Public Comment Hearing in order for any designated representative to be eligible to vote. An individual designated as a Governmental Member Voting Representative shall provide sufficient information to establish eligibility as defined in the ICC Bylaws. The Executive Committee of the ICC Board, in its discretion, shall have the authority to address questions related to eligibility.

As such, new membership applications as well as renewal applications must be received by ICC's Member Services Department by March 20, 2015. These records will be used to verify eligible voter status. Members are strongly encouraged to review their membership records for accuracy well in advance of the hearings so that any necessary changes are made prior to the March 20th deadline. For information on application for new membership and membership renewal, click here or call ICC Member Services at 1-888-ICC SAFE (422-7233)

PROCEDURES

The procedures for the conduct of the public hearing are published in CP 28 ("Procedures") on page xviii. The attention of interested parties is specifically directed to Section 5.0 of the Procedures. These procedures indicate the conduct of, and opportunity to participate at the Committee Action Hearing. Please review these procedures carefully to familiarize yourself with the process.

There were many cdpACCESS related changes to the process effective with the 2014 Cycle. New to the 2015 Cycle are changes to Section 3.3.5.6 Cost Impact and the electronic submittal of modifications (Section 5.5.2.1). Included among these revisions are the following:

Section 1.3.1	**Code Correlation.** This section institutionalizes the role of the Code Correlation Committee and the development and maintenance of the Code Scoping Coordination Matrix.
Section 1.5	**Secretariat.** Staff has the authority to resolve unforeseen situations which arise in the implementation of CP 28.
Section 1.6	**Recording.** This section stipulates that ICC maintains sole ownership in the content of the hearings and has the right to control its subsequent distribution.
Section 2.4	**Emergency Procedures.** This section includes a 'metric' to aid in the determination of when an issue rises to the level of concern appropriate to an emergency amendment. Furthermore, it stipulates a process by which a proposed Emergency Amendment is reviewed by the ICC Codes and Standards Council who is responsible for the implementation and oversight of ICC's Code Development Process.
Section 2.5	**Code Development Record.** Identifies the official documents and records for a cycle.
Section 3.3.1 & Section 6.4.1	**Proponent.** An e-mail address for each code change/public comment proponent will be published in the monograph, unless the proponent requests otherwise.
Section 3.3.5.3 & Section 6.4.5	**Substantiation.** ICC evaluates whether substantiating material is germane, but the policy makes it clear that ICC does not in all circumstances evaluate substantiating material for quality or accuracy.
Section 3.3.5.6	**Cost Impact.** **<u>New in the 2015 Cycle.</u>** The proponent is required to submit information that supports their claim regarding cost impact. Such information submitted will be considered by the code development committee. This language is intended to emphasize the need to provide supporting information on how the proposed change will affect the cost of construction.
Section 3.4 & Section 6.4.6	**Online Submittal.** Code changes and public comments are required to be submitted online via the cdpACCESS system.
Section 3.6.3.1	**Standard Promulgation.** If a proposed new standard is not submitted in at least draft form, the corresponding code change proposal shall be considered incomplete and shall not be processed.
Section 4.4	**Editorial Code Change Proposals.** Institutionalizes and revises the process by which the Code Correlation Committee (CCC) considers staff identified editorial code changes. Code changes identified as editorial may be required to be considered via the entire process. (See page xliv for code change proposals deemed editorial by the CCC).
Section 4.6	**Updating Standards Referenced in the Codes.** The deadline for availability of updated referenced standards and receipt by the Secretariat is December 1st of the third year of each code cycle. For the 2015/2016/2017 cycle, the deadline is December 1, 2017.
Section 5.2.2	**Conflict of Interest.** The determination as to whether or not a committee member should recuse themselves is left to the committee member. The only exception is where the committee member is also the proponent of the code change.

Section 5.4.2	**Open Hearing.** This stipulates that participants shall not advocate a position on specific code changes with Committee Members other than through the methods provided in this policy.
Section 5.4.3 & Section 7.5.3	**Presentation of Material at the Public Hearing.** All participants are to make it clear what interests they are representing. This disclosure provides additional information upon which to evaluate the testimony.
Section 5.5.2.1	**Submission (Modifications).** **New in the 2015 Cycle**. With the development of cdpACCESS, this section was revised to reflect that modifications will be submitted electronically. This feature was under development in the 2014 Cycle and was not ready for the 2014 Committee Action Hearing, however, it is being implemented in the 2015 Cycle. (See page viii)
Sections 5.7 – 5.7.5	**Assembly consideration.** Assembly floor motions made at the Committee Action Hearing will not be voted on at the hearing. They will be voted on via an online process following the hearing (5.7.2). The process will include the ability to view the video of the hearing testimony, committee deliberations and committee action (5.7.3). Each member, including Governmental Member Voting Representatives, gets only one vote (5.7.4). A successful assembly action requires a majority of votes cast and will result in an automatic public comment to be considered at the Public Comment Hearing (PCH). The initial motion at the PCH will be the committee's action (5.7.5 & 7.4). (See page vi)
Section 5.8	**Report of the Committee Action Hearing.** This report will include all the actions taken at the hearing as well as the results of the online assembly vote, including online vote counts.
Section 6.5.3	**Deadline.** This section includes a provision where-by the Code Correlation Committee is provided the opportunity to submit public comments to be considered at the Public Comment Hearing in order to facilitate code change coordination where a public comment was not submitted. Otherwise, the code change would have been placed on the consent agenda without an opportunity to coordinate with items on the individual consideration agenda.
Sections 7.5.8	**Discussion and Voting (at the Public Comment Hearing).** Voting on main motions will occur electronically with the vote recorded and assigned to the eligible voting member (7.5.8.7). Subsequent motions for Disapproval are not in order as that is addressed where a majority vote is not achieved (7.5.8.8, 7.5.8.9). The posted results will include the vote counts. (7.5.8.10)
Section 8.0	**Online Governmental Consensus Vote.** This is a new process following the Public Comment Hearing (PCH) where eligible voters can vote online. It successfully debuted in the 2014 Cycle.
Section 9.0	**Eligible Final Action Voters.** This section requires that all Governmental Member applications must be received by 30 days prior to the Committee Action Hearings. For the 2015 Cycle, this date is March 20th (see page iii). All eligible voters must be confirmed via ICC's Electronic Voter Validation System.
Section 10.0	**Tabulation, Certification and Posting of Results.** With the new Online Governmental Consensus Vote, security and validation of results is of paramount importance. This section outlines the steps to ensure fairness within the process. The final action results will be posted for each code change and include the tabulated vote counts from both the Public Comment Hearing and the Online Governmental Consensus Vote.
Section 11.0	**Code Publication.** This section identifies the role and authority of the Code Correlation Committee to resolve coordination issues between successful actions taken on code changes.

Section 12.0 **Appeals.** With the new cdpACCESS process, this section defines actions or inactions that are not appealable.

Section 13.0 **Violations.** This section notes the authority of the ICC Board to take whatever action necessary to maintain the integrity of the code development process.

ASSEMBLY ACTION PROCESS

In the 2014 Cycle, the procedures regarding assembly consideration at the Committee Action Hearing were revised (see Section 5.7 of CP 28 on page xxvi). Some important items to note regarding assembly consideration are:

- After the committee decision on a code change proposal is announced by the moderator, anyone in the assembly may make a floor motion for assembly action (5.7.1).
- After a floor motion for assembly action is made and seconded, the moderator will accept the motion and notify the attendees that the motion will be considered via an online voting process by all ICC members (5.7.2 and 5.7.4). No additional testimony will be permitted.
- Assembly floor motions will be voted on via an online process following the hearing (5.7.2).
- The online voting process will include the ability to view the video of the hearing testimony, committee deliberations and committee action (5.7.3). Each member, including Governmental Member Voting Representatives, gets only one vote (5.7.4). A successful assembly action requires a majority of votes cast and will result in an automatic public comment (5.7.5).
- A code change proposal that receives a successful assembly action will be placed on the Public Comment Agenda for individual consideration. The initial motion at the Public Comment Hearing will be the committee's action (7.4).

2015 GROUP A CODE DEVELOPMENT COMMITTEE RESPONSIBILITIES

Some sections of the International Codes have a letter designation in brackets in front of them. Code change proposals submitted for such code sections that have a bracketed letter designation in front of them will be heard by the respective committee responsible for such code sections. Because different committees will meet in different years, some proposals for a given code will be heard by a committee in a different year than the year in which the primary committee for this code meets.

For instance, Section 1505.10 of the IBC has a [BF] in front of it, meaning that this section is the responsibility of the IBC – Fire Safety Code Development Committee. However, the technical content of Chapter 15 is generally structural and as such, code change proposals are designated with the structural designation: IBC – S. In this current 2015 Group A Cycle, there are 10 such IBC – S proposals, to be heard by either the IBC – Fire Safety or IBC – General Code Development Committee. Be sure to consult the Cross Index of Proposed Code Changes on page xxxv and the respective Tentative Order of Discussion for the individual committees.

A complete summary of the 2015 – 2017 Group A, Group B and Group C Code Development Committees' responsibilities can be viewed at the ICC Website.

ANALYSIS STATEMENTS

Various proposed changes published herein contain an "analysis" that appears after the proponent's reason. These comments do not advocate action by the code committees or the voting membership for or against a proposal. The purpose of such comments is to identify pertinent information that is relevant to the consideration of the proposed change by all interested parties, including those testifying, the code committees and the voting membership. Staff analyses customarily identify such things as: conflicts and duplication within a proposed change and with other proposed changes and/or current code text; deficiencies in proposed text and/or substantiation; text problems such as wording defects and vagueness; background information on the development of current text; and staff's review of proposed reference standards for compliance with the Procedures. Lack of an analysis indicates neither support for, nor opposition to a proposal.

NEW REFERENCE STANDARDS

Proposed changes that include the addition of a reference to a new standard (a standard that is not currently referenced in the current edition of the I-Codes) will include in the proposal the number, title and edition of the proposed standard. This identifies to all interested parties the precise document that is being proposed and which would be included in the referenced standards chapter of the code if the proposed change is approved. Section 3.6.3.1 of CP 28 requires that a code change proposal will not be processed unless a consensus draft of the standard has been provided. Proponents of code changes which propose a new standard have been directed to forward copies of the standard to the code development committee. An analysis statement will be posted on the ICC website providing information regarding standard content, such as enforceable language, references to proprietary products or services, and references to consensus procedure. The analysis statements for referenced standards will be posted on or before April 2, 2015. This information will also be published and made available at the hearings.

Proposed new reference standards must be completed and readily available prior to the 2015 Public Comment Hearing in accordance with Section 3.6.3.1 of CP28.

REFERENCED STANDARDS UPDATES

Updates to currently referenced standards in any of the 2015 Codes will be considered by the Administrative Code Development Committee in the 2016 Group B Cycle.

It should be noted that, in accordance with Section 4.6 of CP 28, standards promulgators will have until December 1, 2017 to finalize and publish any updates to standards in the administrative update. If the standard update is not finalized and published by December 1, 2017, the respective I-Codes will be revised to reference the previously listed year edition of the standard.

ICC WEBSITE

This document is posted on the ICC Website. While great care has been exercised in the publication of this document, errata to proposed changes may occur. Errata, if any, will be identified in updates posted prior to the Committee Action Hearing. Users are encouraged to periodically review the ICC Website. Additionally, analysis statements for code changes which propose a new referenced standard will be updated and posted to reflect the staff review of the standard for compliance with Section 3.6 of the Procedures.

PROPONENT CONTACT INFORMATION

For most of the code change proposals, an e-mail address for the proponent has been provided.

FLOOR MODIFICATIONS (NEW SUBMITTAL PROCESS)

With the implementation of the new cdpACCESS online system, CP 28 was revised to reflect that floor modifications would be submitted electronically at the Committee Action Hearing (CAH). This 2015 Cycle will be the first cycle to utilize the new submittal process.

The only aspect of the modification process that is changing is the way the modification is submitted and viewed. It is required to be submitted electronically via cdpACCESS. All other aspects of the modification process are unchanged. As in the past, the proponent of the modification must be in attendance at the CAH to present the modification as part of his/her testimony.

Those who are submitting a modification for consideration by the respective Code Development Committee are required to sign a Copyright Release in order to have their modification(s) considered (Section 3.3.5.5 of CP 28). This feature is built into cdpACCESS similar to the way the release is executed for code change and public comment submittals.

The Chair rules the modification in or out of order. Note that this is a procedural ruling to determine if the modification is to be permitted to be considered at the hearing. It is not a technical ruling. The ruling is final, with no challenge allowed.

The modification proponent is required to identify the specific text of the code change proposal that is being revised and the revision itself. In this way, it is very similar to the public comment process and that is the way cdpACCESS was developed to process modifications.

Example:
Original code change proposal.
The original code change proposal requested the following change to Section 305.3 of the IPMC: (Note that the example is fictional.)

PM10-15
305.13

Proponent: John West representing self

Revise as follows:

305.3 Interior surfaces. All interior surfaces, including windows and doors, shall be maintained in good and clean condition. Peeling, chipping, flaking or abraded paint shall be repaired, removed or covered. Cracked or loose plaster~~, decayed wood~~ and other defective surface conditions shall be corrected. Surfaces of porous materials made of or containing organic materials, such as but not limited to wood, textiles, paint, cellulose insulation, and paper, including paper-faced gypsum board, that have visible signs of mold or mildew shall be removed and replaced or remediated in an approved manner.

> **Exception:** Porous materials that do not contain organic materials, such as clean unpainted bricks and concrete.

Proposed modification:

A modification to the code change proposal is proposed:

1. To add “and sanitary” after “clean” in the first sentence.
2. To add “or water permeable” after “porous” in the third sentence.
3. Delete “in an approved manner.” in the last sentence.
4. Delete the proposed new exception.

The cdpACCESS system will provide the text of the original code change proposal in legislative format. Using the cdpACCESS system, the proponent of the modification locates the original change in the system. To delete text, use the "delete" or "backspace" button on the keyboard. To insert new text, the proponent keys in the text in the location desired.

The cdpACCESS system will automatically take the original text and "modify" it. The modification to the original proposal will be shown with ~~cross out,~~ <u>underline</u> formatting as it has been done manually in the past.

cdpACCESS will show the modification as follows:

> **PM10-13**
> **305.13**
>
> **Modification Proponent:** Sam Sumter representing self
>
> **Modify the proposal as follows:**
>
> **305.3 Interior surfaces.** All interior surfaces, including windows and doors, shall be maintained in good<u>,</u> ~~and~~ clean <u>and sanitary</u> condition. Peeling, chipping, flaking or abraded paint shall be repaired, removed or covered. Cracked or loose plaster and other defective surface conditions shall be corrected. Surfaces of porous <u>or water permeable</u> materials made of or containing organic materials, such as but not limited to wood, textiles, paint, cellulose insulation, and paper, including paper-faced gypsum board, that have visible signs of mold or mildew shall be removed and replaced or remediated ~~in an approved manner~~.
>
> > ~~**Exception:** Porous materials that do not contain organic materials, such as clean unpainted bricks and concrete.~~

Among the benefits of using cdpACCESS to submit modifications are:

- Modification proponents will be able to access the system in advance of the hearings to develop their modification (see "Detailed Steps of the Modification Submission Process via cdpACCESS" on the following pages).
- The collaboration features will allow modification proponents to collaborate before submitting.
- The system automatically processes the modification in legislative format such that it is easy to determine how the modification differs from the original proposal.
- 20 hard copies of the modification for distribution to the committee are no longer required.
- You can preview your modification at any time by downloading a pdf via cdpACCESS.

<u>OVERVIEW OF THE MODIFICATION PROCESS (see CP28 Section 5.5.2 on page xxv)</u>

1. **NEW**. Modification submitted electronically via cdpACCESS. As in the past, this submittal is required well in advance of the code change proposal being brought to the floor.

2. The code change proposal is brought to the floor by the Moderator.
   IMPORTANT NOTE: ONCE A CODE CHANGE PROPOSAL IS BROUGHT TO THE FLOOR, ALL MODIFICATIONS MUST BE IN THE cdpACCESS SYSTEM. SEE NOTE 1.

3. Modification proponent suggests the modification from the floor at the hearing.

4. **NEW**. Modification posted to cdpACCESS for public viewing (including the hearing room via WiFi) and committee viewing.

5. Modification displayed on the screen in the hearing room.

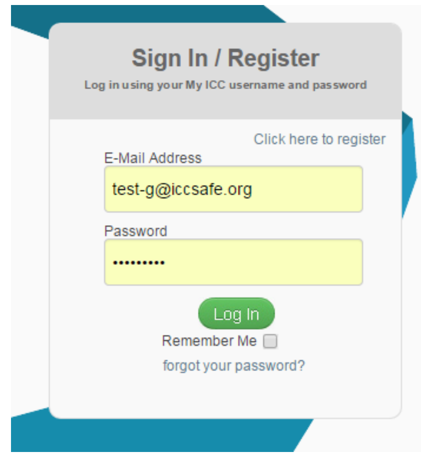
6. Chair rules the modification in or out of order.

7. If ruled in order, testimony on the modification is initiated.

DETAILED STEPS OF THE MODIFICATION SUBMISSION PROCESS via cdpACCESS

cdpACCESS will be live on April 1ST for the development of floor modifications. In order to submit a floor modification you must have a My ICC account. See below.

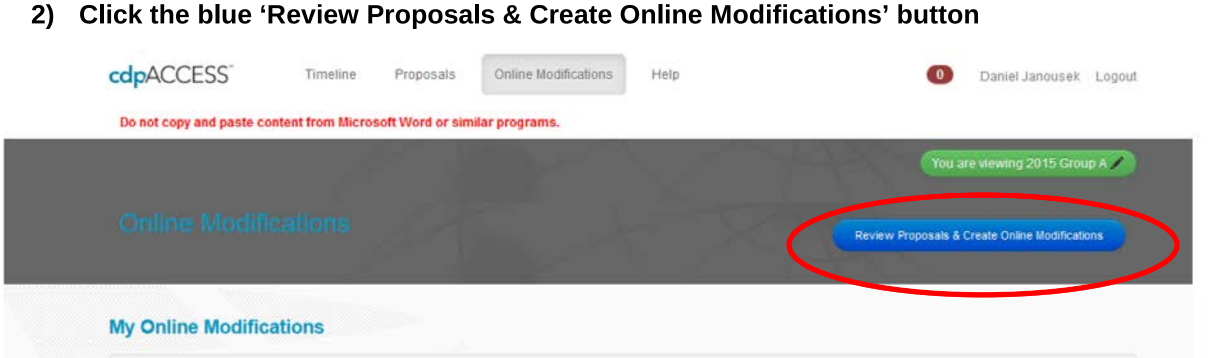
Visit http://cdpaccess.com and log in with your My ICC email address and password.



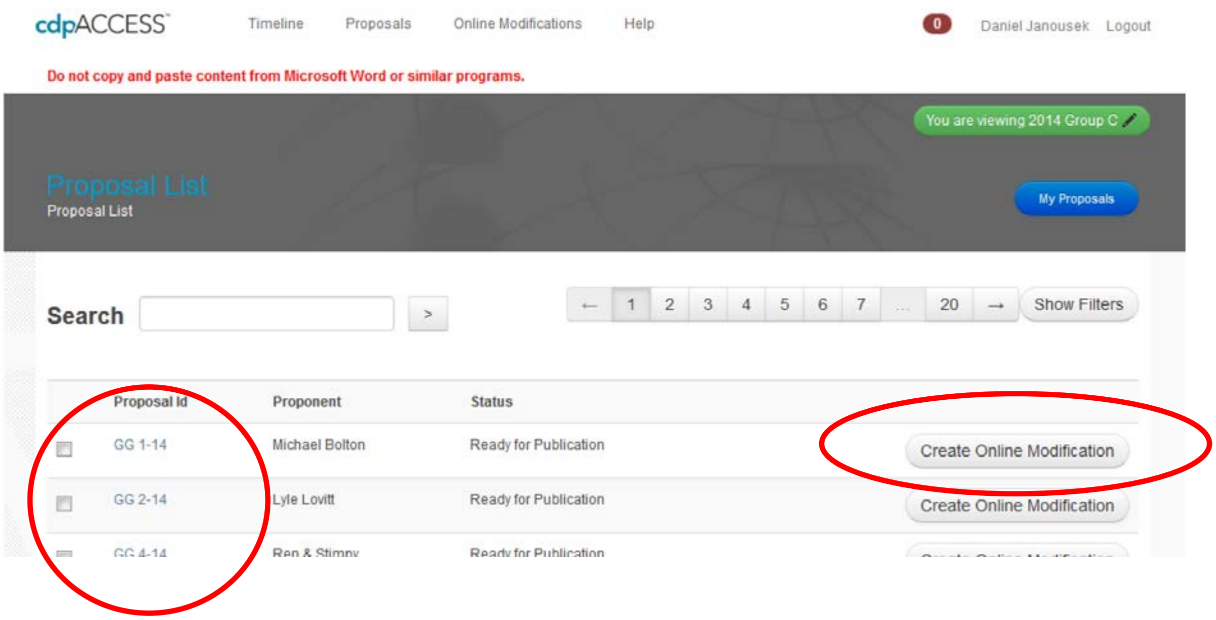
- If you have forgotten your password you can reset it online by clicking the 'forgot your password?' link at the bottom of the sign in box.
- You may also create a new account by clicking on the 'Click here to register' link at the top right of the sign in box. For Governmental Member Voting Representatives, register with the same email address that was used to validate your membership.

To create a floor modification

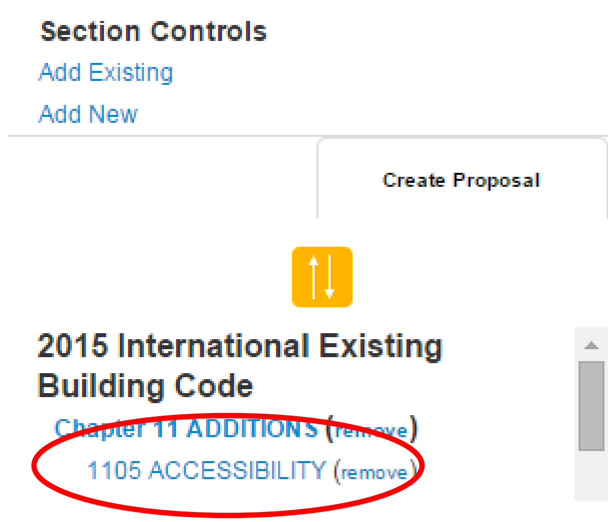
1) **Click 'Online Modifications'** at the top of the site to access the system.
2) **Click the blue 'Review Proposals & Create Online Modifications' button**



3.) Search for a proposal by Proposal ID (Code change number). Click on the number to review the proposal, or simply click the 'Create Online Modification' button. Click OK to confirm that you will be present at the hearings to present the modification.



4.) To modify a code section already in the proposal: Click on the code section in the left-hand column. The code section content will load in the center column.

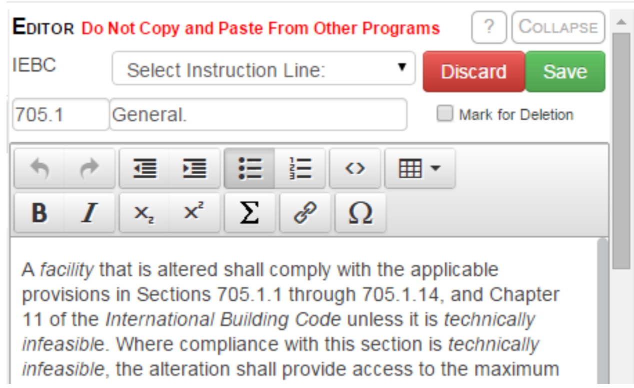


To add a code section from an I-Code: Click 'Add Existing'. You will be able to select a Code, a chapter, and a section. Click the check-box next to the appropriate section and then click 'Add Selected Sections to Proposal'. Proceed as if modifying a code section already in the proposal.

To create a new code section that does not exist in an I-Code: Click 'Add New'. You must choose a Code and chapter, then click 'Create New Code Section' to add it to the modification.

Proceed as if modifying a code section already in the proposal.

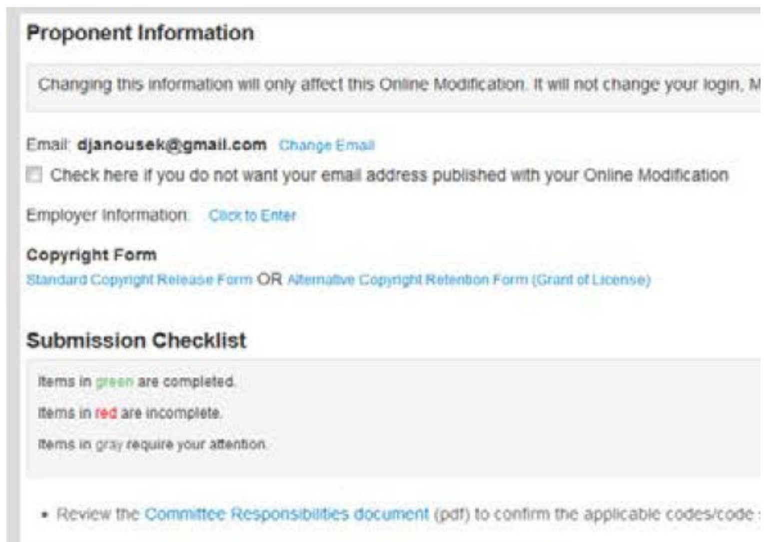
5.) To modify the content of a selected code section: Make your edits in the center column. You do not need to strike through/underline text you are deleting or adding. All you need to do is to key in the text to insert at the applicable locations and use the 'delete' or 'backspace' key to delete text -- the system will automatically create and preview legislative formatting in the right-hand column.



Make sure to click the green 'Save' button when you have completed your edits.

- You can preview your modification at any time by clicking the Download Link (PDF) at the top of the editing window.

6.) To submit your modification: Click 'Finalize and Submit' in the right-hand column of your screen.



- Email address: you may optionally change your email.

- Employer information: do not use acronyms or shorthand.

- Copyright Form: Includes information about who you represent. This must be digitally signed before submission.

- Click the 'Submit Online Modification to ICC' button.

More detailed instructions will be posted on cdpACCESS.com on April 1st.

For further help with Online Modifications, please email cdpACCESS@iccsafe.org, or if you are at the hearings please visit the cdpACCESS table outside the hearing rooms.

2015/2016/2017 ICC CODE DEVELOPMENT SCHEDULE
(Updated September 12, 2014)

STEP IN CODE DEVELOPMENT CYCLE	DATE		
	2015 – Group A Codes IBC- E, IBC - FS, IBC -G, IEBC, IFGC, IMC, IPC, IPMC, IPSDC, IRC – M, IRC- P, ISPSC, IZC	**2016 – Group B Codes Admin, IBC-S, IECC-C, IECC/IRC-R, IFC, IRC - B, IWUIC**	**2017 – Group C Code IgCC**
2015 EDITION OF I-CODES PUBLISHED	June 2, 2014		March 31, 2015 (approx.)
DEADLINE FOR RECEIPT OF APPLICATIONS FOR ALL CODE COMMITTEES	June 2, 2014 for the 2015/2016/2017 Cycle. Call for committee posted January 31, 2014 June 1, 2017 for the 2018/2019/2020 Cycle. Call for committee to be posted in January/2017.		
DEADLINE FOR cdpACCESS ONLINE RECEIPT OF CODE CHANGE PROPOSALS	January 12, 2015	January 11, 2016	January 9, 2017
WEB POSTING OF "PROPOSED CHANGES TO THE I-CODES"	March 13, 2015	March 8, 2016	March 10, 2017
COMMITTEE ACTION HEARING (CAH)	April 19 – 30, 2015 Memphis Cook Convention Center Memphis, TN	April 17 – 27, 2016 Kentucky International Convention Center Louisville, KY	April 23 – 30, 2017 Kentucky International Convention Center Louisville, KY
ONLINE CAH ASSEMBLY FLOOR MOTION VOTING PERIOD	Starts approx. one week after last day of CAH. Open for 2 weeks.	Starts approx. one week after last day of CAH. Open for 2 weeks.	Starts approx. one week after last day of CAH. Open for 2 weeks.
WEB POSTING OF "REPORT OF THE COMMITTEE ACTION HEARING"	June 5, 2015	June 1, 2016	June 2, 2017
DEADLINE FOR cdpACCESS ONLINE RECEIPT OF PUBLIC COMMENTS	July 17, 2015	July 22, 2016	July 28, 2017
WEB POSTING OF "PUBLIC COMMENT AGENDA"	August 28, 2015	September 9, 2016	September 15, 2017
PUBLIC COMMENT HEARING (PCH) ANNUAL CONFERENCE DATES NOTED BY AC	September 30 – October 7, 2015 Long Beach Convention Center Long Beach, CA AC: September 27 - 29	October 19 – 25, 2016 Kansas City Convention Center Kansas City, MO AC: October 16 – 18	October 25 – 31, 2017 Greater Columbus Convention Center Columbus, OH AC: October 22 – 24

STEP IN CODE DEVELOPMENT CYCLE	DATE		
	2015 – Group A Codes IBC- E, IBC - FS, IBC -G, IEBC, IFGC, IMC, IPC, IPMC, IPSDC, IRC – M, IRC- P, ISPSC, IZC	**2016 – Group B Codes Admin, IBC-S, IECC-C, IECC/IRC-R, IFC, IRC - B, IWUIC**	**2017 – Group C Code IgCC**
ONLINE GOVERNMENTAL CONSENUS VOTING PERIOD	Starts approx. one week after last day of PCH. Open for 2 weeks.	Starts approx. one week after last day of PCH. Open for 2 weeks.	Starts approx. one week after last day of PCH. Open for 2 weeks.

Group A Codes/Code committees:

- IBC-E: IBC Egress provisions. Chapters 10 and 11
- IBC-FS: IBC Fire Safety provisions. Chapters 7, 8, 9 (partial), 14 and 26. Majority of IBC Chapter 9 is maintained by the IFC in Group B. See notes
- IBC-G: IBC General provisions. Chapters 3 – 6, 12, 13, 27 – 33
- IEBC: IEBC non structural provisions. See notes
- IFGC
- IMC
- IPC
- IPMC (code changes heard by the IPMZC code committee)
- IPSDC (code changes heard by the IPC code committee)
- IRC-M: IRC Mechanical provisions. Chapters 12 – 23 (code changes heard by the IRC - MP code committee)
- IRC-P: IRC Plumbing provisions. Chapters 25 – 33 (code changes heard by the IRC - MP code committee)
- ISPSC
- IZC (code changes heard by the IPMZC code committee)

Group B Codes/Code committees:

- Admin: Chapter 1 of all the I-Codes except the IECC and IRC. Also includes the update of currently referenced standards in all of the 2015 Codes
- IBC-S: IBC Structural provisions. IBC Chapters 15 – 25 and IEBC structural provisions. See notes
- IECC-C: IECC Commercial energy provisions
- IECC/IRC-R: IECC Residential energy provisions and IRC Energy provisions in Chapter 11
- IFC: The majority of IFC Chapter 10 is maintained by IBC-E in Group A. See notes
- IRC-B: IRC Building provisions. Chapters 1 – 10
- IWUIC (code changes heard by the IFC code committee)

Group C Codes/Code committees:

- IgCC
    - IgCC – General: Chapters 1 – 5, 8 – 11 and Appendices
    - IgCC – Energy/Water: Chapters 6 and 7

Notes:

- Be sure to review the document entitled “2015/2016/2017 Code Committee Responsibilities” which will be posted. This identifies responsibilities which are different than Group A, B and C codes and committees which may impact the applicable code change cycle and resulting code change deadline. As an example, throughout Chapter 9 of the IBC (IBC- Fire Safety, a Group A code committee), there are numerous sections which include the designation “[F]” which indicates that the provisions of the section are maintained by the IFC code committee (a Group B code committee). Similarly, there are numerous sections in the IEBC which include the designation “[BS]”. These are structural provisions which will be heard in Group B by the IBC – Structural committee while the non structural provisions will be maintained in the 2015 Group A Cycle by the IEBC code committee. The designations in the code are identified in the Code Committee Responsibilities document.
- Proposed changes to the ICC Performance Code will be heard by the code committee noted in brackets ([ ]) in the section of the code and in the Code Committee Responsibilities document.
- Definitions. Be sure to review the brackets ([ ]) in Chapter 2 of the applicable code and the Code Committee Responsibilities document to determine which code committee will consider proposed changes to the definitions.

cdpACCESS™ Update

In response to the feedback received from the inaugural use of cdpACCESS for the 2014 Cycle, the system has been updated with the following improvements:

- "Bugs" are common with the introduction of any new software products. The system has been updated for the following:
  - Ease of adding collaborators
  - Adding co-proponents/changing ownership of the code change submittal
  - Maintaining a unique name for the submittal as given by the proponent
  - Ability to add attachments to the submittal
  - Downloading a pdf of the submitted code change
- The database has been loaded with all 2015 I-Codes which allows the proponent to "pull in" the respective text, including tables and figures
- Proposed new sections are easily created
- Editing tools have been added to propose revisions to tables
- A new "drag and drop" feature has been added for organizing sections within a proposal
- The system now automatically produces the code change submittal in legislative format by comparing the proponent inserted and deleted text with the original code text in the database. The proponent simply types in additional text or deletes existing text and cdpACCESS applies the necessary legislative format with strike-outs and underlines.

As noted on page ii, for the first time ever, ICC will be using a new online floor modification submittal process via cdpACCESS for the upcoming 2015 Committee Action Hearing. Be sure to consult page viii for the details on the process.

CP #28-05 CODE DEVELOPMENT

Approved: 9/24/05
Revised: 9/27/14

1.0 Introduction

1.1 Purpose: The purpose of this Council Policy is to prescribe the Rules of Procedure utilized in the continued development and maintenance of the International Codes (Codes).

1.2 Objectives: The ICC Code Development Process has the following objectives:

1.2.1 The timely evaluation and recognition of technological developments pertaining to construction regulations.
1.2.2 The open discussion of code change proposals by all parties desiring to participate.
1.2.3 The final determination of Code text by public officials actively engaged in the administration, formulation or enforcement of laws, ordinances, rules or regulations relating to the public health, safety and welfare and by honorary members.
1.2.4 The increased participation of all parties desiring to participate through an online submittal and voting process that includes opportunities for online collaboration.

1.3 Code Publication: The ICC Board of Directors (ICC Board) shall determine the title and the general purpose and scope of each Code published by the ICC.

1.3.1 Code Correlation: The provisions of all Codes shall be consistent with one another so that conflicts between the Codes do not occur. A Code Scoping Coordination Matrix shall determine which Code shall be the primary document, and therefore which code development committee shall be responsible for maintenance of the code text where a given subject matter or code text could appear in more than one Code. The Code Scoping Coordination Matrix shall be administered by the Code Correlation Committee as approved by the ICC Board. Duplication of content or text between Codes shall be limited to the minimum extent necessary for practical usability of the Codes, as determined in accordance with Section 4.5.

1.4 Process Maintenance: The review and maintenance of the Code Development Process and these Rules of Procedure shall be by the ICC Board. The manner in which Codes are developed embodies core principles of the organization. One of those principles is that the final content of the Codes is determined by a majority vote of the governmental and honorary members. It is the policy of the ICC Board that there shall be no change to this principle without the affirmation of two-thirds of the governmental and honorary members responding.

1.5 Secretariat: The Chief Executive Officer shall assign a Secretariat for each of the Codes. All correspondence relating to code change proposals and public comments shall be addressed to the Secretariat. The Secretariat shall have the authority to facilitate unforeseen situations which arise in the implementation of this council policy. Staff shall maintain a record of such actions.

1.6 Recording: Individuals requesting permission to record any meeting or hearing, or portion thereof, shall be required to provide the ICC with a release of responsibility disclaimer and shall acknowledge that ICC shall retain sole ownership of the recording, and that they have insurance coverage for liability and misuse of recording materials. Equipment and the process used to record shall, in the judgment of the ICC Secretariat, be conducted in a manner that is not disruptive to the meeting. The ICC shall not be responsible for equipment, personnel or any other provision necessary to accomplish the recording. An unedited copy of the recording shall be forwarded to ICC within 30 days of the meeting. Recordings shall not otherwise be copied, reproduced or distributed in any manner. Recordings shall be returned to ICC or destroyed upon the request of ICC.

2.0 Code Development Cycle

2.1 Intent: The code development cycle shall consist of the complete consideration of code change proposals in accordance with the procedures herein specified, commencing with the deadline for submission of code change proposals (see Section 3.5) and ending with publication of the Final Action on the code change proposals (see Section 10.4).

2.2 New Editions: The ICC Board shall determine the schedule for publishing new editions of the Codes. Each new edition shall incorporate the results of the code development activity since the previous edition.

2.3 Supplements: The results of code development activity between editions may be published.

2.4 Emergency Action Procedures:

2.4.1 Scope: Emergency actions are limited to those issues representing an immediate threat to health and safety that warrant a more timely response than allowed by the Code Development Process schedule.

2.4.2 Initial Request: A request for an emergency action shall be based upon perceived threats to health and safety and shall be reviewed by the Codes and Standards Council for referral to the ICC Board for action with their analysis and recommendation.

2.4.3 Board and Member Action: In the event that the ICC Board determines that an emergency amendment to any Code or supplement thereto is warranted, the same may be adopted by the ICC Board. Such action shall require an affirmative vote of at least two-thirds of the ICC Board.

The ICC membership shall be notified within ten days after the ICC Boards' official action of any emergency amendment. At the next Annual Business Meeting, any emergency amendment shall be presented to the members for ratification by a majority of the Governmental Member Voting Representatives and Honorary Members present and voting.

All code revisions pursuant to these emergency procedures and the reasons for such corrective action shall be published as soon as practicable after ICC Board action. Such revisions shall be identified as an emergency amendment.

Emergency amendments to any Code shall not be considered as a retro-active requirement to the Code. Incorporation of the emergency amendment into the adopted Code shall be subjected to the process established by the adopting authority.

2.5 Code Development Record. The code development record shall include the official documents and records developed in support of the given code development cycle. This includes the following:

1. Code Change Agenda (Section 4.8)
2. Audio and video recording of the Committee Action Hearing (Section 5.1)
3. The Online Assembly Floor Motion Ballot (Section 5.7.3)
4. Report of the Committee Action Hearing (Section 5.8)
5. Public Comment Agenda (Section 6.6)
6. Public Comment Hearing results (Section 7.5.8.10)
7. Audio and video recording of the Public Comment Hearing (Section 7.1)

8. The Online Governmental Consensus Ballot (Section 8.2)
9. Final Action results (Section 10.4)
10. Errata to the documents noted above

The information resulting from online collaboration between interested parties shall not be part of the code development record.

3.0 Submittal of Code Change Proposals

3.1 **Intent:** Any interested person, persons or group may submit a code change proposal which will be duly considered when in conformance to these Rules of Procedure.

3.2 **Withdrawal of Proposal:** A code change proposal may be withdrawn by the proponent (WP) at any time prior to public comment consideration of that proposal. All actions on the code change proposal shall cease immediately upon the withdrawal of the code change proposal.

3.3 **Form and Content of Code Change Submittals:** Each code change proposal shall be submitted separately and shall be complete in itself. Each submittal shall contain the following information:

3.3.1 **Proponent:** Each code change proposal shall include the name, title, mailing address, telephone number, and email address of the proponent. Email addresses shall be published with the code change proposals unless the proponent otherwise requests on the submittal form.

3.3.1.1 If a group, organization or committee submits a code change proposal, an individual with prime responsibility shall be indicated.
3.3.1.2 If a proponent submits a code change proposal on behalf of a client, group, organization or committee, the name and mailing address of the client, group, organization or committee shall be indicated.

3.3.2 **Code Reference:** Each code change proposal shall relate to the applicable code sections(s) in the latest edition of the Code.

3.3.2.1 If more than one section in the Code is affected by a code change proposal, appropriate proposals shall be included for all such affected sections.
3.3.2.2 If more than one Code is affected by a code change proposal, appropriate proposals shall be included for all such affected Codes and appropriate cross referencing shall be included in the supporting information.

3.3.3 **Multiple Code Change Proposals to a Code Section.** A proponent shall not submit multiple code change proposals to the same code section. When a proponent submits multiple code change proposals to the same section, the proposals shall be considered as incomplete proposals and processed in accordance with Section 4.3. This restriction shall not apply to code change proposals that attempt to address differing subject matter within a code section.

3.3.4 **Text Presentation:** The text of the code change proposal shall be presented in the specific wording desired with deletions shown struck out with a single line and additions shown underlined with a single line.

3.3.4.1 A charging statement shall indicate the referenced code section(s) and whether the code change proposal is intended to be an addition, a deletion or a revision to existing Code text.
3.3.4.2 Whenever practical, the existing wording of the text shall be preserved with only such deletions and additions as necessary to accomplish the desired change.
3.3.4.3 Each code change proposal shall be in proper code format and terminology.
3.3.4.4 Each code change proposal shall be complete and specific in the text to eliminate unnecessary confusion or misinterpretation.
3.3.4.5 The proposed text shall be in mandatory terms.

3.3.5 Supporting Information: Each code change proposal shall include sufficient supporting information to indicate how the code change proposal is intended to affect the intent and application of the Code.

3.3.5.1 Purpose: The proponent shall clearly state the purpose of the code change proposal (e.g. clarify the Code; revise outdated material; substitute new or revised material for current provisions of the Code; add new requirements to the Code; delete current requirements, etc.)

3.3.5.2 Reasons: The proponent shall justify changing the current Code provisions, stating why the code change proposal is superior to the current provisions of the Code. Code change proposals which add or delete requirements shall be supported by a logical explanation which clearly shows why the current Code provisions are inadequate or overly restrictive, specifies the shortcomings of the current Code provisions and explains how such code change proposals will improve the Code.

3.3.5.3 Substantiation: The proponent shall substantiate the code change proposal based on technical information and substantiation. Substantiation provided which is reviewed in accordance with Section 4.2 and determined as not germane to the technical issues addressed in the code change proposal may be identified as such. The proponent shall be notified that the code change proposal is considered an incomplete proposal in accordance with Section 4.3 and the proposal shall be held until the deficiencies are corrected. The proponent shall have the right to appeal this action in accordance with the policy of the ICC Board. The burden of providing substantiating material lies with the proponent of the code change proposal. All substantiating material published by ICC is material that has been provided by the proponent and in so publishing ICC makes no representations or warranties about its quality or accuracy.

3.3.5.4 Bibliography: The proponent shall submit a bibliography of any substantiating material submitted with the code change proposal. The bibliography shall be published with the code change proposal and the proponent shall make the substantiating materials available for review at the appropriate ICC office and during the public hearing.

3.3.5.5 Copyright Release: The proponent of code change proposals, floor modifications and public comments shall sign a copyright release reading: "I hereby grant and assign to ICC all rights in copyright I may have in any authorship contributions I make to ICC in connection with any proposal and public comment, in its original form submitted or revised form, including written and verbal modifications submitted in accordance Section 5.5.2. I understand that I will have no rights in any ICC publications that use such contributions in the form submitted by me or another similar form and certify that such contributions are not protected by the copyright of any other person or entity."

3.3.5.6 Cost Impact: The proponent shall indicate one of the following regarding the cost impact of the code change proposal: 1) the code change proposal will increase the cost of construction; or 2) the code change proposal will not increase the cost of construction. The proponent shall submit information which substantiates either assertion. This information will be considered by the code development committee and will be included in the bibliography of the published code change proposal. Any proposal submitted which does not include the requisite cost information shall be considered incomplete and shall not be processed.

3.4 Online Submittal: Each code change proposal and all substantiating information shall be submitted online at the website designated by ICC. Two copies of each proposed new referenced standard in hard copy or one copy in electronic form shall be submitted. Additional copies may be requested when determined necessary by the Secretariat to allow such information to be distributed to the code development committee. Where such additional copies are requested, it shall be the responsibility of the proponent to send such copies to the respective code development committee.

3.5 **Submittal Deadline:** ICC shall establish and post the submittal deadline for each cycle. The posting of the deadline shall occur no later than 120 days prior to the code change deadline. Each code change proposal shall be submitted online at the website designated by ICC by the posted deadline. The submitter of a code change proposal is responsible for the proper and timely receipt of all pertinent materials by the Secretariat.

3.6 **Referenced Standards:** In order for a standard to be considered for reference or to continue to be referenced by the Codes, a standard shall meet the following criteria:

3.6.1 **Code References:**

3.6.1.1 The standard, including title and date, and the manner in which it is to be utilized shall be specifically referenced in the Code text.
3.6.1.2 The need for the standard to be referenced shall be established.

3.6.2 **Standard Content:**

3.6.2.1 A standard or portions of a standard intended to be enforced shall be written in mandatory language.
3.6.2.2 The standard shall be appropriate for the subject covered.
3.6.2.3 All terms shall be defined when they deviate from an ordinarily accepted meaning or a dictionary definition.
3.6.2.4 The scope or application of a standard shall be clearly described.
3.6.2.5 The standard shall not have the effect of requiring proprietary materials.
3.6.2.6 The standard shall not prescribe a proprietary agency for quality control or testing.
3.6.2.7 The test standard shall describe, in detail, preparation of the test sample, sample selection or both.
3.6.2.8 The test standard shall prescribe the reporting format for the test results. The format shall identify the key performance criteria for the element(s) tested.
3.6.2.9 The measure of performance for which the test is conducted shall be clearly defined in either the test standard or in Code text.
3.6.2.10 The standard shall not state that its provisions shall govern whenever the referenced standard is in conflict with the requirements of the referencing Code.
3.6.2.11 The preface to the standard shall announce that the standard is promulgated according to a consensus procedure.

3.6.3 **Standard Promulgation:**

3.6.3.1 Code change proposals with corresponding changes to the code text which include a reference to a proposed new standard or a proposed update of an existing referenced standard shall comply with this section. The standard shall be completed and readily available prior to the Public Comment Hearing based on the cycle of code development which includes the code change proposal. In order for a new standard to be considered for reference by the Code, such standard shall be submitted in at least a consensus draft form in accordance with Section 3.4. If a new standard is not submitted in at least draft form, the code change proposal shall be considered incomplete and shall not be processed. Updating of standards without corresponding code text changes shall be accomplished administratively in accordance with Section 4.6.

3.6.3.2 The standard shall be developed and maintained through a consensus process such as ASTM or ANSI.

4.0 Processing of Code Change Proposals

4.1 **Intent:** The processing of code change proposals is intended to ensure that each proposal complies with these Rules of Procedure and that the resulting published code change proposal accurately reflects that proponent's intent.

4.2 **Review:** Upon receipt in the Secretariat's office, the code change proposals will be checked for compliance with these Rules of Procedure as to division, separation, number of copies, form, language, terminology, supporting statements and substantiating data. Where a code change proposal consists of multiple parts which fall under the maintenance responsibilities of different code committees, the Secretariat shall determine the code committee responsible for determining the committee action in accordance with Section 5.6 and the Code Scoping Coordination Matrix (see Section 1.3.1).

4.3 **Incomplete Code Change Proposals:** When a code change proposal is submitted with incorrect format, without the required information or judged as not in compliance with these Rules of Procedure, the Secretariat shall notify the proponent of the specific deficiencies and the proposal shall be held until the deficiencies are corrected, with a final date set for receipt of a corrected submittal. If the Secretariat receives the corrected code change proposal after the final date, the proposal shall be held over until the next code development cycle. Where there are otherwise no deficiencies addressed by this section, a code change proposal that incorporates a new referenced standard shall be processed with an analysis of the referenced standard's compliance with the criteria set forth in Section 3.6.

4.4 **Editorial Code Change Proposals.** When a code change proposal is submitted that proposes an editorial or format change that, in the opinion of the Secretariat, does not affect the scope or application of the code, the proposal shall be submitted to the Code Correlation Committee who shall deem the code change proposal as editorial or send the proposal back to the Secretariat to be considered by the appropriate code development committee. To be deemed editorial, such proposal shall require a majority vote of the Code Correlation Committee. Editorial proposals shall be published in the Code Change Agenda. Such proposals shall be added to the hearing agenda for consideration by the appropriate code development committee upon written request to ICC by any individual. The deadline to submit such requests shall be 14 days prior to the first day of the Committee Action Hearing. Code Correlation Committee proposals that are not added to a code development committee hearing agenda shall be published in the next edition of the code with no further consideration.

4.5 **Copy Editing Code Text:** The Chief Executive Officer shall have the authority at all times to make editorial style and format changes to the Code text, or any approved changes, consistent with the intent, provisions and style of the Code. Such editorial style or format changes shall not affect the scope or application of the Code requirements.

4.6 **Updating Standards Referenced in the Codes:** The updating of standards referenced by the Codes shall be accomplished administratively by the Administrative Code Development Committee in accordance with these full procedures except that the deadline for availability of the updated standard and receipt by the Secretariat shall be December 1 of the third year of each code cycle. The published version of the new edition of the Code which references the standard will refer to the updated edition of the standard. If the standard is not available by the deadline, the edition of the standard as referenced by the newly published Code shall revert back to the reference contained in the previous edition and an errata to the Code issued. Multiple standards to be updated may be included in a single proposal.

4.7 **Preparation:** All code change proposals in compliance with these procedures shall be prepared in a standard manner by the Secretariat and be assigned separate, distinct and consecutive numbers. The Secretariat shall coordinate related proposals submitted in accordance with Section 3.3.2 to facilitate the hearing process.

4.8 **Code Change Agenda:** All code change proposals shall be posted on the ICC website at least 30 days prior to the Committee Action Hearing on those proposals and shall constitute the agenda for the Committee Action Hearing. Any errata to the Code Change Agenda shall be posted on the ICC website as soon as possible. Code change proposals which have not been published in the original posting or subsequent errata shall not be considered.

5.0 Committee Action Hearing

5.1 Intent: The intent of the Committee Action Hearing is to permit interested parties to present their views including the cost and benefits on the code change proposals on the published agenda. The code development committee will consider such comments as may be presented in the development of their action on the disposition of such code change proposals. At the conclusion of the code development committee deliberations, the committee action on each code change proposal shall be placed before the hearing assembly for consideration in accordance with Section 5.7.

5.2 Committee: The Codes and Standards Council shall review all applications and make committee appointment recommendations to the ICC Board. The Code Development Committees shall be appointed by the ICC Board.

5.2.1 Chairman/Moderator: The Chairman and Vice-Chairman shall be appointed by the Codes and Standards Council from the appointed members of the committee. The ICC President shall appoint one or more Moderators who shall act as presiding officer for the Committee Action Hearing.

5.2.2 Conflict of Interest: A committee member shall withdraw from and take no part in those matters with which the committee member has an undisclosed financial, business or property interest. The committee member shall not participate in any committee discussion or any committee vote on the matter in which they have an undisclosed interest. A committee member who is a proponent of a code change proposal shall not participate in any committee discussion on the matter or any committee vote. Such committee member shall be permitted to participate in the floor discussion in accordance with Section 5.5 by stepping down from the dais.

5.2.3 Representation of Interest: Committee members shall not represent themselves as official or unofficial representatives of the ICC except at regularly convened meetings of the committee.

5.2.4 Committee Composition: The committee may consist of representation from multiple interests. A minimum of thirty-three and one-third percent (33.3%) of the committee members shall be regulators.

5.3 Date and Location: The date and location of the Committee Action Hearing shall be announced not less than 60 days prior to the date of the hearing.

5.4 General Procedures: *The Robert's Rules of Order* shall be the formal procedure for the conduct of the Committee Action Hearing except as a specific provision of these Rules of Procedure may otherwise dictate. A quorum shall consist of a majority of the voting members of the committee.

5.4.1 Chair Voting: The Chairman of the committee shall vote only when the vote cast will break a tie vote of the committee.

5.4.2 Open Hearing: The Committee Action Hearing is an open hearing. Any interested person may attend and participate in the floor discussion and assembly consideration portions of the hearing. Only code development committee members may participate in the committee action portion of the hearings (see Section 5.6). Participants shall not advocate a position on specific code change proposals with committee members other than through the methods provided in this policy.

5.4.3 Presentation of Material at the Public Hearing: Information to be provided at the hearing shall be limited to verbal presentations and modifications submitted in accordance with Section 5.5.2. Each individual presenting information at the hearing shall state their name and affiliation, and shall identify any entities or individuals they are representing in connection with their testimony. Audio-visual presentations are not permitted. Substantiating material submitted in accordance with Section 3.3.5.3 and other material submitted in response to a code change proposal shall be located in a designated area in the hearing room and shall not be distributed to the code development committee at the public hearing.

5.4.4 **Agenda Order:** The Secretariat shall publish a Code Change Agenda for the Committee Action Hearing, placing individual code change proposals in a logical order to facilitate the hearing. Any public hearing attendee may move to revise the agenda order as the first order of business at the public hearing, or at any time during the hearing except while another code change proposal is being discussed. Preference shall be given to grouping like subjects together, and for moving items back to a later position on the agenda as opposed to moving items forward to an earlier position. A motion to revise the agenda order is subject to a 2/3 vote of those present and voting.

5.4.5 **Reconsideration:** There shall be no reconsideration of a code change proposal after it has been voted on by the committee in accordance with Section 5.6.

5.4.6 **Time Limits:** Time limits shall be established as part of the agenda for testimony on all code change proposals at the beginning of each hearing session. Each person requesting to testify on a code change proposal shall be given equal time. In the interest of time and fairness to all hearing participants, the Moderator shall have limited authority to modify time limitations on debate. The Moderator shall have the authority to adjust time limits as necessary in order to complete the hearing agenda.

5.4.6.1 **Time Keeping:** Keeping of time for testimony by an individual shall be by an automatic timing device. Remaining time shall be evident to the person testifying. Interruptions during testimony shall not be tolerated. The Moderator shall maintain appropriate decorum during all testimony.

5.4.6.2 **Proponent Testimony:** The Proponent is permitted to waive an initial statement. The Proponent shall be permitted to have the amount of time that would have been allocated during the initial testimony period plus the amount of time that would be allocated for rebuttal. Where the code change proposal is submitted by multiple proponents, this provision shall permit only one proponent of the joint submittal to be allotted additional time for rebuttal.

5.4.7 **Points of Order:** Any person participating in the public hearing may challenge a procedural ruling of the Moderator or the Chairman. A majority vote of ICC Members in attendance shall determine the decision.

5.5 **Floor Discussion:** The Moderator shall place each code change proposal before the hearing for discussion by identifying the proposal and by regulating discussion as follows:

5.5.1 **Discussion Order:**

1. Proponents. The Moderator shall begin by asking the proponent and then others in support of the code change proposal for their comments.
2. Opponents. After discussion by those in support of a code change proposal, those opposed hereto, if any, shall have the opportunity to present their views.
3. Rebuttal in support. Proponents shall then have the opportunity to rebut points raised by the opponents.
4. Re-rebuttal in opposition. Opponents shall then have the opportunity to respond to the proponent's rebuttal.

5.5.2 **Modifications:** Modifications to code change proposals may be suggested from the floor by any person participating in the public hearing. The person proposing the modification is deemed to be the proponent of the modification.

5.5.2.1 **Submission.** All modifications shall be submitted electronically to the ICC Secretariat in a format determined by ICC unless determined by the Chairman to be either editorial or minor in nature. The modification will be forwarded electronically to the members of the code development committee during the hearing and will be projected on the screen in the hearing room.

5.5.2.2 Criteria. The Chairman shall rule proposed modifications in or out of order before they are discussed on the floor. A proposed modification shall be ruled out of order if it:

1. is not legible, unless not required to be written in accordance with Section 5.5.2.1; or
2. changes the scope of the original code change proposal; or
3. is not readily understood to allow a proper assessment of its impact on the original code change proposal or the Code.

The ruling of the Chairman on whether or not the modification is in or out of order shall be final and is not subject to a point of order in accordance with Section 5.4.7.

5.5.2.3 Testimony. When a modification is offered from the floor and ruled in order by the Chairman, a specific floor discussion on that modification is to commence in accordance with the procedures listed in Section 5.5.1.

5.6 Committee Action: Following the floor discussion of each code change proposal, one of the following motions shall be made and seconded by members of the committee:

1. Approve the code change proposal As Submitted (AS) or
2. Approve the code change proposal As Modified with specific modifications (AM), or
3. Disapprove the code change proposal (D)

Discussion on this motion shall be limited to code development committee members. If a committee member proposes a modification which had not been proposed during floor discussion, the Chairman shall rule on the modification in accordance with Section 5.5.2.2. If a committee member raises a matter of issue, including a proposed modification, which has not been proposed or discussed during the floor discussion, the Moderator shall suspend the committee discussion and shall reopen the floor discussion for comments on the specific matter or issue. Upon receipt of all comments from the floor, the Moderator shall resume committee discussion.

The code development committee shall vote on each motion with the majority dictating the committee's action. Committee action on each code change proposal shall be completed when one of the motions noted above has been approved. Each committee vote shall be supported by a reason.

The code development committee shall maintain a record of its proceedings including the action on each code change proposal.

5.7 Assembly Consideration: At the conclusion of the committee's action on a code change proposal and before the next code change proposal is called to the floor, the Moderator shall ask for a motion from the public hearing attendees who may object to the committee's action. If a motion in accordance with Section 5.7.1 is not brought forward on the committee's action, the results of the Committee Action Hearing shall be established by the committee's action.

5.7.1 Assembly Floor Motion: Any attendee may raise an objection to the committee's action in which case the attendee will be able to make a motion to:

1. Approve the code change proposal As Submitted from the Floor (ASF), or
2. Approve the code change proposal As Modified from the Floor (AMF) with a specific modification that has been previously offered from the floor and ruled in order by the Chairman during floor discussion (see Section 5.5.2) or has been offered by a member of the Committee and ruled in order by the Chairman during committee discussion (see Section 5.6), or
3. Disapprove the code change proposal from the floor (DF).

5.7.2 Assembly Floor Motion Consideration: On receipt of a second to the floor motion, the Moderator shall accept the motion and the second and notify the attendees that the motion will be considered in an online ballot following the hearing in accordance with Section 5.7.3. No additional testimony shall be permitted.

5.7.3 Online Assembly Floor Motion Ballot: Following the Committee Action Hearing, all assembly floor motions which received a second shall be compiled into an online ballot. The ballot will include:

1. The code change proposal as published.
2. The committee action and reason from the Committee Action Hearing.
3. The floor motion, including modifications which are part of the floor motion.
4. Access to the audio and video of the Committee Action Hearing proceedings.
5. Identification of the ballot period for which the online balloting will be open.

5.7.4 Eligible Online Assembly Motion Voters: All members of ICC shall be eligible to vote on online assembly floor motions. Each member is entitled to one vote, except that each Governmental Member Voting Representative may vote on behalf of its Governmental Member. Individuals who represent more than one Governmental Member shall be limited to a single vote. Application, whether new or updated, for ICC membership must be received by the Code Council 30 days prior to the first day of the Committee Action Hearing. The ballot period will not be extended beyond the published period except as approved by the ICC Board.

5.7.5 Assembly Action: A successful assembly action shall be a majority vote of the votes cast by eligible voters (see Section 5.7.4). A successful assembly action results in an automatic public comment to be considered at the Public Comment Hearing (see Section 7.4).

5.8 Report of the Committee Action Hearing: The results of the Committee Action Hearing, including committee action and reason, online assembly floor motion vote results and the total vote count for each assembly floor motion shall be posted on the ICC website not less than 60 days prior to the Public Comment Hearing, except as approved by the ICC Board.

6.0 Public Comments

6.1 Intent: The public comment process gives attendees at the Public Comment Hearing an opportunity to consider specific objections to the results of the Committee Action Hearing and more thoughtfully prepare for the discussion for public comment consideration. The public comment process expedites the Public Comment Hearing by limiting the items discussed to the following:

1. Consideration of items for which a public comment has been submitted; and
2. Consideration of items which received a successful assembly action.

6.2 Deadline: The deadline for receipt of a public comment to the results of the Committee Action Hearing_shall be announced at the Committee Action Hearing but shall not be less than 30 days subsequent to the availability of the Report of the Committee Action Hearing (see Section 5.8).

6.3 Withdrawal of Public Comment: A public comment may be withdrawn by the public commenter at any time prior to public comment consideration of that comment. A withdrawn public comment shall not be subject to public comment consideration. If the only public comment to a code change proposal is withdrawn by the public commenter prior to the vote on the consent agenda in accordance with Section 7.5.4, the proposal shall be considered as part of the consent agenda. If the only public comment to a code change proposal is withdrawn by the public commenter after the vote on the consent agenda in accordance with Section 7.5.4, the proposal shall continue as part of the individual consideration agenda in accordance with Section 7.5.5, however the public comment shall not be subject to public comment consideration.

6.4 Form and Content of Public Comments: Any interested person, persons, or group may submit a public comment to the results of the Committee Action Hearing which will be considered when in conformance to these requirements. Each public comment to a code change proposal shall be submitted separately and shall be complete in itself. Each public comment shall contain the following information:

6.4.1 Public comment: Each public comment shall include the name, title, mailing address, telephone number and email address of the public commenter. Email addresses shall be published with the public comments unless the commenter otherwise requests on the submittal form.

If a group, organization, or committee submits a public comment, an individual with prime responsibility shall be indicated. If a public comment is submitted on behalf a client, group, organization or committee, the name and mailing address of the client, group, organization or committee shall be indicated. The scope of the public comment shall be consistent with the scope of the original code change proposal, committee action or successful assembly action. Public comments which are determined as not within the scope of the code change proposal, committee action or successful assembly action shall be identified as such. The public commenter shall be notified that the public comment is considered an incomplete public comment in accordance with Section 6.5.1 and the public comment shall be held until the deficiencies are corrected. A copyright release in accordance with Section 3.3.5.5 shall be provided with the public comment.

6.4.2 Code Reference: Each public comment shall include the code change proposal number.

6.4.3 Multiple public comments to a code change proposal. A proponent shall not submit multiple public comments to the same code change proposal. When a proponent submits multiple public comments to the same code change proposal, the public comments shall be considered as incomplete public comments and processed in accordance with Section 6.5.1. This restriction shall not apply to public comments that attempt to address differing subject matter within a code section.

6.4.4 Desired Final Action: In order for a public comment to be considered, the public comment shall indicate the desired Final Action as one of the following:

1. Approve the code change proposal As Submitted (AS), or
2. Approve the code change proposal As Modified by the committee modification published in the Report of the Committee Action Hearing (AM) or published in a public comment in the Public Comment Agenda (AMPC), or
3. Disapprove the code change proposal (D)

6.4.5 Supporting Information: The public comment shall include a statement containing a reason and justification for the desired Final Action on the code change proposal. Reasons and justification which are reviewed in accordance with Section 6.5 and determined as not germane to the technical issues addressed in the code change proposal or committee action may be identified as such. The public commenter shall be notified that the public comment is considered an incomplete public comment in accordance with Section 6.5.1 and the public comment shall be held until the deficiencies are corrected. The public commenter shall have the right to appeal this action in accordance with the policy of the ICC Board. A bibliography of any substantiating material submitted with a public comment shall be published with the public comment and the substantiating material shall be made available at the Public Comment Hearing. All substantiating material published by ICC is material that has been provided by the proponent and in so publishing ICC makes no representations or warranties about its quality or accuracy.

6.4.6 Online submittal: Each public comment and substantiating information shall be submitted online at the website designated by ICC. Additional copies may be requested when determined necessary by the Secretariat.

6.4.7 Submittal Deadline: ICC shall establish and post the submittal deadline for each cycle. The posting of the deadline shall occur no later than 120 days prior to the public comment deadline. Each public comment shall be submitted online at the website designated by ICC by the posted deadline. The submitter of a public comment is responsible for the proper and timely receipt of all pertinent materials by the Secretariat.

6.5 **Review:** The Secretariat shall be responsible for reviewing all submitted public comments from an editorial and technical viewpoint similar to the review of code change proposals (see Section 4.2).

6.5.1 **Incomplete Public Comment:** When a public comment is submitted with incorrect format, without the required information or judged as not in compliance with these Rules of Procedure, the public comment shall not be processed. The Secretariat shall notify the public commenter of the specific deficiencies and the public comment shall be held until the deficiencies are corrected, or the public comment shall be returned to the public commenter with instructions to correct the deficiencies with a final date set for receipt of the corrected public comment.

6.5.2 **Duplications**: On receipt of duplicate or parallel public comments, the Secretariat may consolidate such public comments for public comment consideration. Each public commenter shall be notified of this action when it occurs.

6.5.3 **Deadline:** Public comments received by the Secretariat after the deadline set for receipt shall not be published and shall not be considered as part of the public comment consideration. This deadline shall not apply to public comments submitted by the Code Correlation Committee. In order to correlate submitted public comments with action taken at the Committee Action Hearing on code change proposals that did receive a public comment, the Code Correlation Committee, in conjunction with staff processing of public comments, shall review the submitted public comments and submit the necessary public comments in order to facilitate the coordination of code change proposals. Such review and submittal shall not delay the posting of the Public Comment Agenda as required in Section 6.6.

6.6 **Public Comment Agenda:** The Committee Action Hearing results on code change proposals that have not received a public comment and code change proposals which received public comments or successful assembly actions shall constitute the Public Comment Agenda. The Public Comment Agenda shall be posted on the ICC website at least 30 days prior the Public Comment Hearing. Any errata to the Public Comment Agenda shall be posted on the ICC website as soon as possible. Code change proposals and public comments which have not been published in the original posting or subsequent errata shall not be considered.

7.0 Public Comment Hearing

7.1 **Intent:** The Public Comment Hearing is the first of two steps to make a final determination on all code change proposals which have been considered in a code development cycle by a vote cast by eligible voters (see Section 9.0). The second step, which follows the Public Comment Hearing, is the Online Governmental Consensus Vote that is conducted in accordance with Section 8.0.

7.2 **Date and Location:** The date and location of the Public Comment Hearing shall be announced not less than 60 days prior to the date of the hearing.

7.3 **Moderator:** The ICC President shall appoint one or more Moderators who shall act as presiding officer for the Public Comment Hearing.

7.4 **Public Comment Agenda:** The Public Comment Consent Agenda shall be comprised of code change proposals which have neither a successful assembly action nor public comment. The agenda for public testimony and individual consideration shall be comprised of proposals which have a successful assembly action or public comment (see Section 6.1).

7.5 **Procedure:** *The Robert's Rules of Order* shall be the formal procedure for the conduct of the Public Comment Hearing except as these Rules of Procedure may otherwise dictate.

7.5.1 **Open Hearing:** The Public Comment Hearing is an open hearing. Any interested person may attend and participate in the floor discussion.

7.5.2 **Agenda Order:** The Secretariat shall publish a Public Comment Agenda for the Public Comment Hearing, placing individual code change proposals and public comments in a logical order to facilitate the hearing. The proponents or opponents of any code change proposal or public comment may move to revise the agenda order as the first order of business at the public hearing, or at any time during the hearing except while another proposal is being discussed. Preference shall be given to grouping like subjects together and for moving items back to a later position on the agenda as opposed to moving items forward to an earlier position. A motion to revise the agenda order is subject to a 2/3 vote of those present and voting.

7.5.3 Presentation of Material at the Public Comment Hearing: Information to be provided at the hearing shall be limited to verbal presentations. Each individual presenting information at the hearing shall state their name and affiliation, and shall identify any entities or individuals they are representing in connection with their testimony. Audio-visual presentations are not permitted. Substantiating material submitted in accordance with Section 6.4.5 and other material submitted in response to a code change proposal or public comment shall be located in a designated area in the hearing room.

7.5.4 Public Comment Consent Agenda: The Public Comment Consent Agenda (see Section 7.4) shall be placed before the assembly with a single motion for Final Action in accordance with the results of the Committee Action Hearing. When the motion has been seconded, the vote shall be taken with no testimony being allowed. A simple majority (50% plus one) based on the number of votes cast by eligible voters shall decide the motion. This action shall not be subject to the Online Governmental Consensus Vote following the Public Comment Hearing (see Section 8.0).

7.5.5 Public Comment Individual Consideration Agenda: Upon completion of the Public Comment_Consent Agenda vote, all code change proposals not on the Public Comment Consent Agenda shall be placed before the assembly for individual consideration of each item (see Section 7.4).

7.5.6 Reconsideration: There shall be no reconsideration of a code change proposal after it has been voted on in accordance with Section 7.5.8.

7.5.7 Time Limits: Time limits shall be established as part of the agenda for testimony on all code change proposals at the beginning of each hearing session. Each person requesting to testify on a code change proposal shall be given equal time. In the interest of time and fairness to all hearing participants, the Moderator shall have limited authority to modify time limitations on debate. The Moderator shall have the authority to adjust time limits as necessary in order to complete the hearing agenda.

7.5.7.1 Time Keeping: Keeping of time for testimony by an individual shall be by an automatic timing device. Remaining time shall be evident to the person testifying. Interruptions during testimony shall not be tolerated. The Moderator shall maintain appropriate decorum during all testimony.

7.5.8 Discussion and Voting: Discussion and voting on code change proposals being individually considered shall be in accordance with the following procedures and the voting majorities in Section 7.6:

7.5.8.1 Proponent testimony: The Proponent of a public comment is permitted to waive an initial statement. The Proponent of the public comment shall be permitted to have the amount of time that would have been allocated during the initial testimony period plus the amount of time that would be allocated for rebuttal. Where a public comment is submitted by multiple proponents, this provision shall permit only one proponent of the joint submittal to waive an initial statement.

7.5.8.2 Points of Order: Any person participating in the public hearing may challenge a procedural ruling of the Moderator. A majority vote of ICC Members in attendance shall determine the decision.

7.5.8.3 Eligible voters: Voting shall be limited to eligible voters in accordance with Section 9.0.

7.5.8.4 **Allowable Final Action Motions:** The only allowable motions for Final Action are Approval as Submitted (AS), Approval as Modified by the committee (AM) or by one or more modifications published in the Public Comment Agenda (AMPC), and Disapproval (D).

7.5.8.5 **Initial Motion:** The code development committee action shall be the initial motion considered.

7.5.8.6 **Motions for Modifications:** Whenever a motion under consideration is for Approval as Submitted or Approval as Modified, a subsequent motion and second for a modification published in the Public Comment Agenda may be made (see Section 6.4.4). Each subsequent motion for modification, if any, shall be individually discussed and voted before returning to the main motion. A two-thirds majority based on the number of votes cast by eligible voters shall be required for a successful motion on all modifications.

7.5.8.7 **Voting:** After dispensing with all motions for modifications, if any, and upon completion of discussion on the main motion, the Moderator shall then ask for the vote on the main motion. The vote on the main motion shall be taken electronically with the vote recorded and each vote assigned to the eligible voting member. If the motion fails to receive the majority required in Section 7.6, the Moderator shall ask for a new motion.

7.5.8.8 **Subsequent Motion:** If the initial motion is unsuccessful, a motion for either Approval as Submitted or Approval as Modified by one or more published modifications is in order. A motion for Disapproval is not in order. The vote on the main motion shall be taken electronically with the vote recorded and each vote assigned to the eligible voting member. If a successful vote is not achieved, Section 7.5.8.9 shall apply.

7.5.8.9 **Failure to Achieve Majority Vote at the Public Comment Hearing.** In the event that a code change proposal does not receive any of the required majorities in Section 7.6, the results of the Public Comment Hearing for the code change proposal in question shall be Disapproval. The vote count that will be reported as the Public Comment Hearing result will be the vote count on the main motion in accordance with Section 7.5.8.7.

7.5.8.10 **Public Comment Hearing Results:** The result and vote count on each code change proposal considered at the Public Comment Hearing shall be announced at the hearing. The results shall be posted and included in the Online Governmental Consensus Ballot (see Section 8.2).

7.6 **Majorities for Final Action:** The required voting majority for code change proposals individually considered shall be based on the number of votes cast of eligible voters at the Public Comment Hearing shall be in accordance with the following table:

Committee Action	**Desired Final Action**		
	AS	**AM/AMPC**	**D**
AS	Simple Majority	2/3 Majority	Simple Majority
AM	2/3 Majority	Simple Majority to sustain the Committee Action or; 2/3 Majority on each additional modification and 2/3 Majority on entire code change proposal for AMPC	Simple Majority
D	2/3 Majority	2/3 Majority	Simple Majority

8.0 Online Governmental Consensus Vote

8.1 **Public Comment Hearing Results:** The results from the Individual Consideration Agenda at the Public Comment Hearing (see Sections 7.5.5 and 7.5.8.10) shall be the basis for the Online

Governmental Consensus Vote. The ballot shall include the voting options in accordance with the following table:

Committee Action	Public Comment Hearing result and Voting Majority	Online Governmental Consensus Ballot and Voting Majority	
AS	**AS:** Simple Majority	**AS:** Simple Majority	**D:** Simple Majority
	AMPC: 2/3 Majority	**AMPC:** 2/3 Majority	**D:** Simple Majority
	D: Simple Majority	**AS:** Simple Majority	**D:** Simple Majority
AM	**AS:** 2/3 Majority	**AS:** 2/3 Majority	**D:** Simple Majority
	AM: Simple Majority	**AM:** Simple Majority	**D:** Simple Majority
	AMPC: 2/3 Majority	**AMPC:** 2/3 Majority	**D:** Simple Majority
	D: Simple Majority	**AM:** Simple Majority	**D:** Simple Majority
D	**AS:** 2/3 Majority	**AS:** 2/3 Majority	**D:** Simple Majority
	AMPC: 2/3 Majority	**AMPC:** 2/3 Majority	**D:** Simple Majority
	D: Simple Majority	**AS:** 2/3 Majority	**D:** Simple Majority

8.2 **Online Governmental Consensus Ballot:** The ballot for each code change proposal considered at the Public Comment Hearing will include:

1. The Public Comment Hearing result and vote count.
2. The allowable Online Governmental Consensus Vote actions in accordance with Section 8.1.
3. Where the Public Comment Hearing result is As Submitted (AS) or Disapprove (D), the original code change proposal will be presented.
4. Where the Public Comment Hearing result is As Modified by the committee (AM) or As Modified by one or more Public Comments (AMPC), the original code change and approved modification(s) will be presented.
5. The committee action taken at the Committee Action Hearing.
6. ICC staff identification of correlation issues.
7. For those who voted at the Public Comment Hearing, the ballot will indicate how they voted.
8. An optional comment box to provide comments.
9. Access to the Public Comment Agenda which includes: the original code change, the report of the committee action and the submitted public comments.
10. Access to the audio and video of the Committee Action and Public Comment Hearing proceedings.
11. Identification of the ballot period for which the online balloting will be open.

8.3 **Voting process:** Voting shall be limited to eligible voters in accordance with Section 9.0. Eligible voters are authorized to vote during the Public Comment Hearing and during the Online Governmental Consensus Vote; however, only the last vote cast will be included in the final vote tabulation. The ballot period will not be extended beyond the published period except as approved by the ICC Board.

9.0 Eligible Final Action Voters

9.1 **Eligible Final Action Voters:** Eligible Final Action voters include ICC Governmental Member Voting Representatives and Honorary Members in good standing who have been confirmed by ICC in accordance with the Electronic Voter Validation System. Such confirmations are required to be revalidated annually. Eligible Final Action voters in attendance at the Public Comment Hearing and those participating in the Online Governmental Consensus Vote shall have one vote per eligible voter on all Codes. Individuals who represent more than one Governmental Member shall be limited to a single vote.

9.2 **Applications:** Applications for Governmental Membership must be received by the ICC at least 30 days prior to the Committee Action Hearing in order for its designated representatives to be eligible to vote at the Public Comment Hearing or Online Governmental Consensus Vote. Applications, whether new or updated, for Governmental Member Voting Representative status must be received by the Code Council 30 days prior to the commencement of the first day of the Public Comment Hearing in order for any designated representative to be eligible to vote. An individual designated as a Governmental Member Voting Representative shall provide sufficient information to establish eligibility as defined in the ICC Bylaws. The Executive Committee of the ICC Board, in its discretion, shall have the authority to address questions related to eligibility.

10.0 Tabulation, certification and posting of results

10.1 Tabulation and Validation: Following the closing of the online ballot period, the votes received will be combined with the vote tally at the Public Comment Hearing to determine the final vote on the code change proposal. ICC shall retain a record of the votes cast and the results shall be certified by a validation committee appointed by the ICC Board. The validation committee shall report the results to the ICC Board, either confirming a valid voting process and result or citing irregularities in accordance with Section 10.2.

10.2 Voting Irregularities: Where voting irregularities or other concerns with the Online Governmental Consensus Voting process which are material to the outcome or the disposition of a code change proposal(s) are identified by the validation committee, such irregularities or concerns shall be immediately brought to the attention of the ICC Board. The ICC Board shall take whatever action necessary to ensure a fair and impartial Final Action vote on all code change proposals, including but not limited to:

1. Set aside the results of the Online Governmental Consensus Vote and have the vote taken again.
2. Set aside the results of the Online Governmental Consensus Vote and declare the Final Action on all code change proposals to be in accordance with the results of the Public Comment Hearing.
3. Other actions as determined by the ICC Board.

10.3 Failure to Achieve Majority Vote: In the event a code change proposal does not receive any of the required majorities for Final Action in Section 8.0, Final Action on the code change proposal in question shall be Disapprove.

10.4 Final Action Results: The Final Action on all code change proposals shall be published as soon as practicable after certification of the results. The results shall include the Final Action taken, including the vote tallies from both the Public Comment Hearing and Online Governmental Consensus Vote, as well the required majority in accordance with Section 8.0. ICC shall maintain a record of individual votes for auditing purposes, however, the record shall not be made public. The exact wording of any resulting text modifications shall be made available to any interested party.

11.0 Code Publication

11.1 Next Edition of the Codes: The Final Action results on code change proposals shall be the basis for the subsequent edition of the respective Code.

11.2 Code Correlation: The Code Correlation Committee is authorized to resolve technical or editorial inconsistencies resulting from actions taken during the code development process by making appropriate changes to the text of the affected code. Any such changes to a Code shall require a 2/3 vote of the Code Correlation Committee. Technical or editorial inconsistencies not resolved by the Code Correlation Committee shall be forwarded to the ICC Board for resolution.

12.0 Appeals

12.1 Right to Appeal: Any person may appeal an action or inaction in accordance with Council Policy 1 Appeals. Any appeal made regarding voter eligibility, voter fraud, voter misrepresentation or breach of ethical conduct must be supported by credible evidence and must be material to the outcome of the final disposition of a code change proposal(s).

The following actions are not appealable:

1. Variations of the results of the Public Comment Hearing compared to the Final Action result in accordance with Section 10.4.

2. Denied requests to extend the voter balloting period in accordance with Sections 5.7.4 or 8.3.
3. Lack of access to the internet based online collaboration and voting platform to submit a code change proposal, to submit a public comment or to vote.
4. Code Correlation Committee changes made in accordance with Section 11.2.

13.0 Violations

13.1 ICC Board Action on Violations: Violations of the policies and procedures contained in this Council Policy shall be brought to the immediate attention of the ICC Board for response and resolution. Additionally, the ICC Board may take any actions it deems necessary to maintain the integrity of the code development process.

2015 ICC CODE DEVELOPMENT CYCLE
CROSS INDEX OF PROPOSED CODE CHANGES

Some of the proposed code changes include sections that are outside of the scope of the chapters or the code listed in the table of 2015-2017 Staff Secretaries on page xvi. This is done in order to facilitate coordination among the International Codes which is one of the fundamental principles of the International Codes.

Listed in this cross index are proposed code changes that include sections of codes or codes other than those listed on page xvi. For example, IBC Section 1004.5 is proposed for revision in code change G131-15, which is to be heard by the IBC-General Committee. This section of the IBC is typically the responsibility of the IBC-Egress. It is therefore identified in this cross index. Another example is Section 607.3.1 of the International Mechanical Code. The International Mechanical Code is normally maintained by the IMC Committee, but Section 607.3.1 will be considered for revision in proposed code change FS107-15 which will be on the IBC-Fire Safety Committee agenda. In some instances, there are other subsections that are revised by an identified code change that is not included in the cross index.

This information is provided to assist users in locating all of the proposed code changes that would affect a certain section or chapter. For example, to find all of the proposed code changes that would affect Chapter 4 of the IBC, review the proposed code changes in the portion of the monograph for the IBC-General Code Development Committee (listed with a G prefix) then review this cross reference for Chapter 4 of the IBC for proposed code changes published in other code change groups. While care has been taken to be accurate, there may be some omissions in this list.

Letter prefix: Each proposed change number has a letter prefix that will identify where the proposal is published. The letter designations for proposed changes and the corresponding publications are as follows:

PREFIX	**PROPOSED CHANGE GROUP (see monograph table of contents for location)**
E	International Building Code - Egress
EB	International Existing Building Code
FG	International Fuel Gas Code
FS	International Building Code - Fire Safety
G	International Building Code – General
M	International Mechanical Code
P	International Plumbing Code
PSD	International Private Sewage Disposal Code
PM	International Property Maintenance Code
RM	International Residential Code - Mechanical
RP	International Residential Code - Plumbing
S	International Building Code – Structural
SP	International Swimming Pool and Spa Code

2015 GROUP A COMMITTEE ACTION HEARING SCHEDULE

April 19 – 28, 2015

Memphis Cook Convention Center: Memphis, TN

The hearings will start at 1:00 pm on Sunday, April 19th. Prior to the hearings, some of the Membership Councils will be holding meetings. Be sure to consult the Membership Councils webpage for details as they become available.

In order to minimize code related subject matter conflicts between tracks, the hearings are scheduled in two tracks, as follows:

Track 1: Building related – IPMC/IZC, IEBC and IBC
Track 2: Plumbing/Mechanical/Fuel Gas (PMG) related - ISPSC, IFGC, IPC/IPSDC, IRC-P, IRC-M and IMC

Unless noted by "Start no earlier than X am," each Code Committee will begin immediately upon completion of the hearings for the prior Committee. This includes moving a Committee forward or back from the day indicated based on hearing progress. The actual start times for the various Committees are not stipulated because of uncertainties in hearing progress. The schedule anticipates that the hearings will finish by the date/time noted as "Finish" for each track.

	Sunday April 19	Monday April 20	Tuesday April 21	Wednesday April 22	Thursday April 23
TRACK 1	Start 1 pm IPMC/IZC IEBC End 7 pm	Start 8 am IEBC IBC – FS (Start no earlier than 1 pm) End 7 pm	Start 8 am IBC - FS End 7 pm	Start 8 am IBC - FS End 7 pm	Start 8 am IBC - FS IBC – G (Start no earlier than 8 am) End 7 pm
TRACK 2	Start 1 pm ISPSC IFGC End 7 pm	Start 8 am IFGC IPC/IPSDC (Start no earlier than 8 am) End 7 pm	Start 8 am IPC/IPSDC End 7 pm	Start 8 am IPC/IPSDC IRC – P (Start no earlier than 1 pm) End 7 pm	Start 8 am IRC – P IRC - M IMC (Start no earlier than 1 pm) End 7 pm

	Friday April 24	Saturday April 25	Sunday April 26	Monday April 27	Tuesday April 28
TRACK 1	Start 8 am IBC - G End 7 pm	Start 8 am IBC - G End 7 pm	Start 10 am IBC - G IBC – E (Start no earlier than 10 am) End 7 pm	Start 8 am IBC - E End 7 pm	Start 8 am IBC- E Finish 3 pm
TRACK 2	Start 8 am IMC End 7 pm	Start 8 am IMC Finish 3 pm			

Hearing schedule notes and committee designations

Notes:

- Code change agenda to be posted March 13th.
- Hearing times may be modified at the discretion of the Chairman based on hearing progress.
- Morning and afternoon breaks will be announced. A lunch break is planned for each track. A dinner break is not planned. The hearings are scheduled to adjourn for dinner and resume the next day, unless otherwise necessary to complete the agenda.
- Because of uncertainties in hearing progress, the start time indicated as “start no earlier than xx” is conservatively estimated and is not intended to be a hearing progress target.
- Consult the hearing order in the posted code change agenda for:
    - Code changes to be heard by a Committee other than the Committee under which the code change is designated (i.e. an IBC Egress code change (Exx-15) heard by the IBC – G Committee).
    - Code changes comprised of multiple parts where each part is heard by a different Committee. For example, code change Pxx- 15 Part I is heard by the IPC/IPSDC Committee as a change to the IPC and Pxx – 15 Part II is heard by the IRC – MP Committee as a change to the IRC.
    - Code changes to the definitions to determine the applicable Committee who will hear the change to the definition for the respective code.
- There are no code change proposals submitted to the IZC

Code Committees/Codes:

- IBC-E: International Building Code (IBC) Egress provisions. Chapters 10 and 11
- IBC-FS: IBC Fire Safety provisions. Chapters 7, 8, 9 (partial), 14 and 26. Majority of IBC Chapter 9 is maintained by the IFC in Group B
- IBC-G: IBC General provisions. Chapters 3 – 6, 12, 13, 27 – 33
- IEBC: International Existing Building Code non structural provisions.
- IFGC: International Fuel Gas Code
- IMC: International Mechanical Code
- IPC/IPSDC: International Plumbing and Private Sewage Disposal Codes
- IPMC/IZC: International Property Maintenance and Zoning Codes
- IRC-M: International Residential Code (IRC) Mechanical provisions. Chapters 12 – 23 (code changes heard by the IRC - MP code committee)
- IRC-P: IRC Plumbing provisions. Chapters 25 – 33 (code changes heard by the IRC - MP code committee)
- ISPSC: International Swimming Pool and Spa Code

EDITORIAL CODE CHANGES - CODE CORRELATION COMMITTEE

In a typical code change cycle, there are code change proposals that are considered strictly editorial. Section 4.4 of CP 28 (see below) establishes a process by which the Code Correlation Committee (CCC) considers such proposals.

> **4.4 Editorial Code Change Proposals.** When a code change proposal is submitted that proposes an editorial or format change that, in the opinion of the Secretariat, does not affect the scope or application of the code, the proposal shall be submitted to the Code Correlation Committee who shall deem the code change proposal as editorial or send the proposal back to the Secretariat to be considered by the appropriate code development committee. To be deemed editorial, such proposal shall require a majority vote of the Code Correlation Committee. Editorial proposals shall be published in the Code Change Agenda. Such proposals shall be added to the hearing agenda for consideration by the appropriate code development committee upon written request to ICC by any individual. The deadline to submit such requests shall be 14 days prior to the first day of the Committee Action Hearing. Code Correlation Committee proposals that are not added to a code development committee hearing agenda shall be published in the next edition of the code with no further consideration.

There are 2 such proposals in the current 2015 Cycle. They are both proposals to the IEBC and are posted as the first code changes in the IEBC's agenda. They are identified by code change numbers CCC-1 and CCC-2.

As noted in Section 4.4, anyone may request that either of these proposals be added to the hearing agenda. The deadline to make such a request is 11: 59 pm Pacific on Sunday, April 5th via email. Be sure to identify the code change number noted above. Such requests must be sent to:

TENTATIVE ORDER OF DISCUSSION
2015 PROPOSED CHANGES TO THE INTERNATIONAL BUILDING CODE (FIRE SAFETY)

The following is the tentative order in which the proposed changes to the code will be discussed at the public hearings. Proposed changes which impact the same subject have been grouped to permit consideration in consecutive changes.

Proposed change numbers that are indented are those which are being heard out of numerical order. Indentation does not necessarily indicate that one change is related to another. Proposed changes may be grouped for purposes of discussion at the hearing at the discretion of the chair. Note that some FS code change proposals may not be included on this list, as they are being heard by another committee.

703.4, 703.4 (New)

Proponent: Jeffrey Shapiro, Tyco Fire Protection Products, representing Tyco Fire Protection Products

2015 International Building Code

Delete and substitute as follows:

~~**703.4 Automatic sprinklers.** Under the prescriptive fire-resistance requirements of this code, the *fire-resistance rating* of a building element, component or assembly shall be established without the use of *automatic sprinklers* or any other fire suppression system being incorporated as part of the assembly tested in accordance with the fire exposure, procedures and acceptance criteria specified in ASTM E 119 or UL 263. However, this section shall not prohibit or limit the duties and powers of the *building official* allowed by Sections 104.10 and 104.11.~~

703.4 Automatic Sprinklers Assemblies utilizing fire sprinklers as an alternative to complying with a required fire resistance rating for a building element, component or assembly shall only be permitted where approved by the Building Official in accordance with Sections 104.10 and 104.11.

Reason: This proposal is based on text that was agreed to by major parties on both sides of the sprinklered-protected assembly issue during the last NFPA code cycle. At the second revision meeting of the NFPA Technical Committee on Fire Protection Features, a great deal of effort went into gaining this agreement, and it was supported by a majority of the committee members in attendance. Following the meeting, NFPA distributed the recommendation to the full committee for balloting, and it fell short of the required majority to advance in the process.
Nevertheless, the proposed text provides a cleaner way of conveying the intent of this section, and it warrants consideration by ICC, recognizing that previous efforts to delete the section or argue that it is not needed have not been successful.

This text will make it clear that a sprinkler-protected assembly is an alternative to a fire-resistive assembly that requires approval of the building official, as opposed to being a fire-resistive assembly. This "alternative to" approach is consistent with terminology approved by ICC-ES for inclusion AC385 as a basis for evaluating assemblies that use window sprinklers.

Cost Impact: Will not increase the cost of construction
The proposal simply clarifies current provisions.

FS 1-15 : 703.4-SHAPIRO5682

FS 2-15

703.4

Proponent: Daniel Nichols, New York State Division of Building Standards and Codes, representing New York State Division of Building Standards and Codes (dnichols@dos.state.ny.us)

2015 International Building Code

Delete without substitution:

~~**703.4 Automatic sprinklers.** Under the prescriptive fire-resistance requirements of this code, the *fire-resistance rating* of a building element, component or assembly shall be established without the use of *automatic sprinklers* or any other fire suppression system being incorporated as part of the assembly tested in accordance with the fire exposure, procedures and acceptance criteria specified in ASTM E 119 or UL 263. However, this section shall not prohibit or limit the duties and powers of the *building official* allowed by Sections 104.10 and 104.11.~~

Reason: This proposal deletes language that prohibits the use of automatic sprinklers or other fire suppression systems from being considered in a fire resistance rating of a building material.
The use of fire protection systems, including sprinklers, are used to activate or provide passive fire protection features in several locations in the code, reference standards, and evaluation reports. Examples include:

Dropping magnet power on door hold-open devices when sprinkler flow activates the building notification system

Initiating the activation of fire-resistance rated power dividers to create separate fire areas within a building

Smoke and heat vent activation due to fire detection and/or sprinkler flow

Alternative elevator lobby products that activate due to automatic detector activiation

Water curtains around open escalator openings that are otherwise required to be enclosed

Water curtains on gasketed glass for atrium separation

The activation of all of these products makes each one of them go from no protection to full expected protection because of a fire protection system. Based on a review of the information regarding the inclusion of this code section, the potential failure of a sprinkler system was a main concern in the debate. I submit that the failure rate of sprinklers is the same whether it is part of a passive fire protection system or part of the activation sequence to get a passive fire protection system in place.

In regards to the specific language, it appears the goal was to prohibit the use of any system that utilized automatic sprinklers or fire suppression systems from the prescriptive requirements of this code. This is confusing language as it could be interpreted to only apply to IBC Section 721 (since the direct reference is not provided) or does it apply to all prescriptive designs, such as the UL directories? The language does not make it clear for the building official and, in turn, can potentially confuse the issue on the reference to 104.11.

From an application perspective, the use of automatic sprinkler water curtains has been permitted for many years as a method to increase the allowable openings in buildings (along with all of the above mentioned applications). Allowing sprinkler heads that are part of fire ratings met a need in several applications we have dealt with in New York (based on ES report approved products), including the protection of required openings for light in existing buildings undergoing change of occupancy, and glazing needed for security purposes (both for the visual needs and to address the needs of high-impact glazing).

Thank you for your consideration. I understand that this topic has been fully vetted in previous code development cycles and thorugh the ICC-ES process. However, I believe that the I-Codes should be coordinated to the point that the interaction and reliance between passive and active fire protection systems should be consistent.

Cost Impact: Will not increase the cost of construction
The passage of the proposal will allow more choice in compliance methods for fire rated products.

FS 2-15 : 703.4-NICHOLS5725

FS 3-15

703.5.1, Chapter 35

Proponent: Tony Crimi, representing North American Insulation Manufacturers Association (tcrimi@sympatico.ca)

2015 International Building Code

Revise as follows:

703.5.1 Elementary materials. Materials required to be noncombustible shall be tested in accordance with ASTM E 136 or ASTM E2652, using the acceptance criteria in ASTM E136.

Add new standard(s) as follows:

ASTM E2652 - Standard Test Method for Behavior of Materials in a Tube Furnace with a Cone- shaped Airflow Stabilizer, at 750°C.

Reason: Several of the I-Codes have varying definitions of the term "non-combustible material", each based upon the way in which the concept of "non-combustible" is used within that Code. Throughout the ICC code system, the concept of "noncombustible material" is based on the idea that the material should not ignite or burn when subjected to fire or heat

The concept of "noncombustible materials" and "noncombustibility" in terms of types of construction is widely used throughout the International Codes. The IBC, IFC, IEBC and IFGC do not contain a separate definition of "noncombustible", even though they use the terminology "non-combustible materials".

In common usage, the term "noncombustible" is used to denote materials which do not ignite or are not capable of sustaining combustion. The common Dictionary definitions for "noncombustible" are typically as follows:

> *Noncombustible, adj – incapable of being burned (Merriam -Webster's International Dictionary of the English Language, Unabridged, 2013)*

In the traditional use of the terminology and concept of "non-combustible" in the Codes has been based on acceptable performance when tested in accordance with ASTM E136, Test Method for Behavior of Materials in a Vertical Tube Furnace at 750 Degrees C. Materials passing the test are permitted limited flaming and other indications of combustion. However, these have traditional been acceptable. Understandably, ASTM E136 does not replicate the full spectrum of actual building fire exposure conditions. However, this test method does provide an assessment indicating those materials which do not act to aid combustion or add appreciable heat to an ambient fire.

ASTM has recently published another standard ASTM E2652-09, entitled Standard Test Method for Behavior of Materials in a Tube Furnace with a Cone-shaped Airflow Stabilizer, at 750°C. This test method is similar to ASTM E136, but based on the international standard for Noncombustibility. The key difference between the two standards is in the equipment. The apparatuses in this test method and in Test Method E 136 is that the furnace tube in this test method has a conical air-flow stabilizer section attached at its bottom. Both test methods use cylindrical furnace tubes. Unlike ASTM E136, the test ASTM E2652 Standard does not include mandatory pass/fail criterion. It allows those criteria to be determined by the Codes or other users. Appendix X3 also contains a comparison of results obtained from this apparatus versus ASTM E136. ASTM E136 has already been revised to include ASTM E2652 as an alternate methodology.

Cost Impact: Will not increase the cost of construction
This proposal provides an alternative methodology for use.

Analysis: A review of the standard proposed for inclusion in the code, ASTM E2652, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2015.

FS 4-15

703.7

Proponent: Albert Wege, representing Wege & Company (albertwege@yahoo.com)

2015 International Building Code

Revise as follows:

703.7 Marking and identification. ~~Where there is an accessible concealed floor~~
Fire walls, ~~floor-ceiling or *attic* space, *fire walls,*~~ *fire barriers*, *fire partitions*, *smoke barriers* and smoke partitions or any other wall required to have protected openings or penetrations shall be effectively and permanently identified with signs or stenciling ~~in the concealed space~~. Such identification shall be located in accessible concealed floor, floor-ceiling or attic spaces; and either:

1. ~~Be~~Include lettering not less than 3 inches (76 mm) in height with a minimum 3/8 inch (9.5 mm) stroke in a contrasting color incorporating the suggested wording. "FIRE AND/OR SMOKE BARRIER-PROTECT ALL OPENINGS" or other wording, located within 15 feet (4572 mm) of the end of each wall and at intervals not exceeding 30 feet (9144 mm) measured horizontally along the wall or partition~~.~~; or
2. Include ~~lettering~~a contrasting color band of not less than 3 inches (~~76~~76mm) in height and lettering not less than 1/2 inch (12.7 mm) in height ~~with a minimum 3/8-inch (9.5 mm) stroke in a contrasting color~~ incorporating the suggested wording~~, "~~: "FIRE AND/OR SMOKE BARRIER—PROTECT ALL OPENINGS,~~"~~" or other wording, repeating at intervals not more than 24 inches (610 mm) measured horizontally and continuously along the entire length of the fire wall, fire barrier, fire partition, smoke barrier or smoke partition.

Exception: Walls in Group R-2 occupancies that do not have a removable decorative ceiling allowing access to the concealed space.

Reason: In the 2009 IBC, the marking and identification of fire rated wall assemblies was introduced, to identify critical wall assemblies that protect occupants from fire and smoke spread as a result of breaches within said wall assemblies. Often, maintenance and operation crews, in addition to contractors, breach these wall assemblies to install ductwork, cabling, etc, without knowing that these walls are critical to the protection of the occupants in the event of a fire.
The 2009 IBC allow marking and identification lettering at a minimum of one- half inch (½") (12.7mm) incorporating the suggested wording: "FIRE AND/OR SMOKE BARRIER—PROTECT ALL OPENINGS," to be repeated every thirty feet (30'-0") (9144 mm).

The 2012 IBC increased the marking and identification lettering to a minimum of 3" (76 mm) with a 3/8" (9.5mm) stroke incorporating the suggested wording: "FIRE AND/OR SMOKE BARRIER—PROTECT ALL OPENINGS," to be repeated every thirty feet (30'-0") (9144 mm) and within fifteen feet (15'-0") (4572 mm) of the end of each wall.

The challenge that has been encountered is that while the code section may be followed, placed at every thirty feet (30'-0) (9144 mm), the potential is still present that the lettering may still not be visible if placed behind above ceiling equipment, on other side of a duct, or if a maintenance worker happens to pop a ceiling tile mid-span and not see the text. Despite the three inch (3") (76 mm) lettering heights, these above ceiling spaces are not typically well- illuminated.

The proposal being brought forth in the code change request is to also allow marking and identification lettering at a minimum of one- half inch (½") (12.7mm) incorporating the suggested wording: "FIRE AND/OR SMOKE BARRIER—PROTECT ALL OPENINGS, but that the marking and identification is continuous along the entire length of the wall assembly; that is, end- to – end. The suggested wording shall repeat at intervals of every 24" (610 mm) horizontally within a contrasting color ban no less than 3" (76 mm) in height.

Cost Impact: Will not increase the cost of construction
Alternative format.

FS 4-15 : 703.7-WEGE3325

FS 5-15

703.7.1 (New)

Proponent: William Koffel, representing Firestop Contractors International Association (wkoffel@koffel.com)

2015 International Building Code

Add new text as follows:

703.7.1 Penetrations and Joints Tested through penetration firestop sytems and fire-resistant joint systems in walls requiring marking by Section 703.7 shall be permanently identified with a marking system. The marking system shall be located within 2 inches (50 mm) of the through penetration firestop system. For fire-resistant joint systems, the marking system shall be located within 15 feet (4570 mm) of the end of each wall or floor and at intervals not exceeding 30 feet (9144 mm) measured horizontally along the wall or partition.

The marking system shall be legible and contain, at a minimum, the following information:

Do Not Disturb - Firestop System or Fire-Resistant Joint System as appropriate
System Design Number:
Engineering Judgement Number:

Exception: Where an electronic marking and identification system is used, the identifier shall be legible to the reader equipment.

Reason: The purpose for the proposal is to require that firestop systems and joint systems be marked or identified so that code officials, special inspectors, building managers, contractors, and others can understand what system was used. This will reduce the need for expensive research time by special inspectors and code officials to find the appropriate system diagram that is needed to verify that the system used is appropriate for the application.
Secondly, should a repair be needed, knowing the system design number may allow the repair to occur without removing and replacing the entire system. The manufacturer, materials used, and all other pertinent system details will be available to those that need to inspect, maintain, or repair such systems.

Cost Impact: Will not increase the cost of construction
Most contractors will install the marking systems at no additional cost when required to do so. Over the useful life of the building, costs for repairs and maintenance should be reduced. Also, the cost to properly inspect and verify the systems during construction should also be reduced.

FS 5-15 : 703.7.1 (New)-KOFFEL5752

FS 6-15

Part I:
704.2
Part II:
704.3

THIS IS A 2 PART CODE CHANGE. BOTH PARTS WILL BE HEARD BY THE IBC-FIRE SAFETY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THIS COMMITTEE.

Proponent: Jerry Tepe, JRT-AIA Architect, representing American Institute of Architects (JRTAIA@aol.com)

Part I

2015 International Building Code

Revise as follows:

704.2 Column protection. Where columns are required to have protection to achieve a *fire-resistance rating*, the entire column shall be provided individual encasement protection by protecting it on all sides for the full column height, including connections to other structural members, with materials having the required *fire-resistance rating*._ Where the column extends through a ceiling, the encasement protection shall be continuous from the top of the foundation or floor/ceiling assembly below through the ceiling space to the top of the column.

> **Exception:** Individual encasement protection is not required on unexposed sides provided the extent of protection on unexposed sides is in accordance with the required *fire-resistance rating*, as determined in Section 703.

Part II

2015 International Building Code

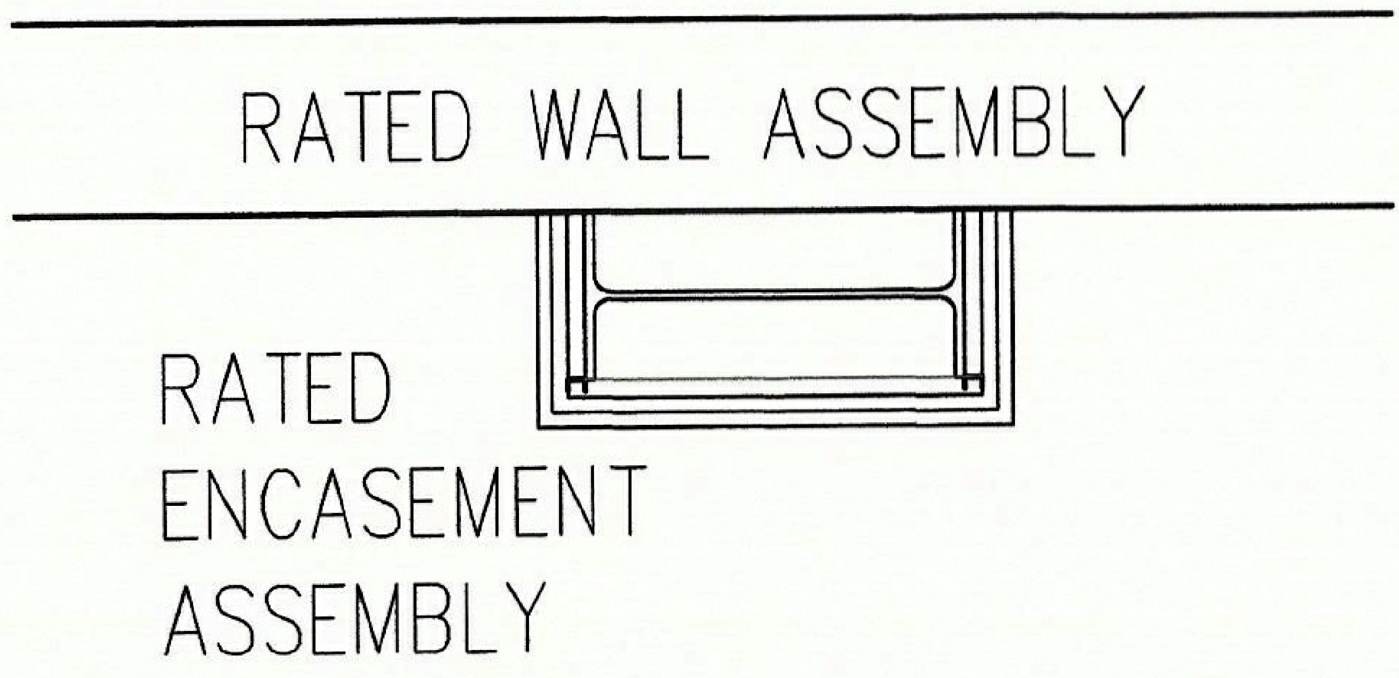
Revise as follows:

704.3 Protection of the primary structural frame other than columns. Members of the primary structural frame other than columns that are required to have protection to achieve a *fire-resistance rating* and support more than two floors or one floor and roof, or support a load-bearing wall or a nonload-bearing wall more than two stories high, shall be provided individual encasement protection by protecting them on all sides for the full length, including connections to other structural members, with materials having the required *fire-resistance rating*.

> **Exception:** Individual encasement protection ~~on all sides shall be permitted~~is not required on ~~all exposed~~unexposed sides provided the extent of protection on unexposed sides is in accordance with the required *fire-resistance rating*, as determined in Section 703.

Reason: If the face of the primary structural frame is unexposed, in all likelihood, the same face of the column is also unexposed, therefore a similar exception is proposed for columns in Section 704.2.
Examples might include the following:

- A column adjacent to a masonry wall, where the wall assembly has a different and individual fire resistance tested design equal to the hourly rating of the individual encasement requirements of the column.

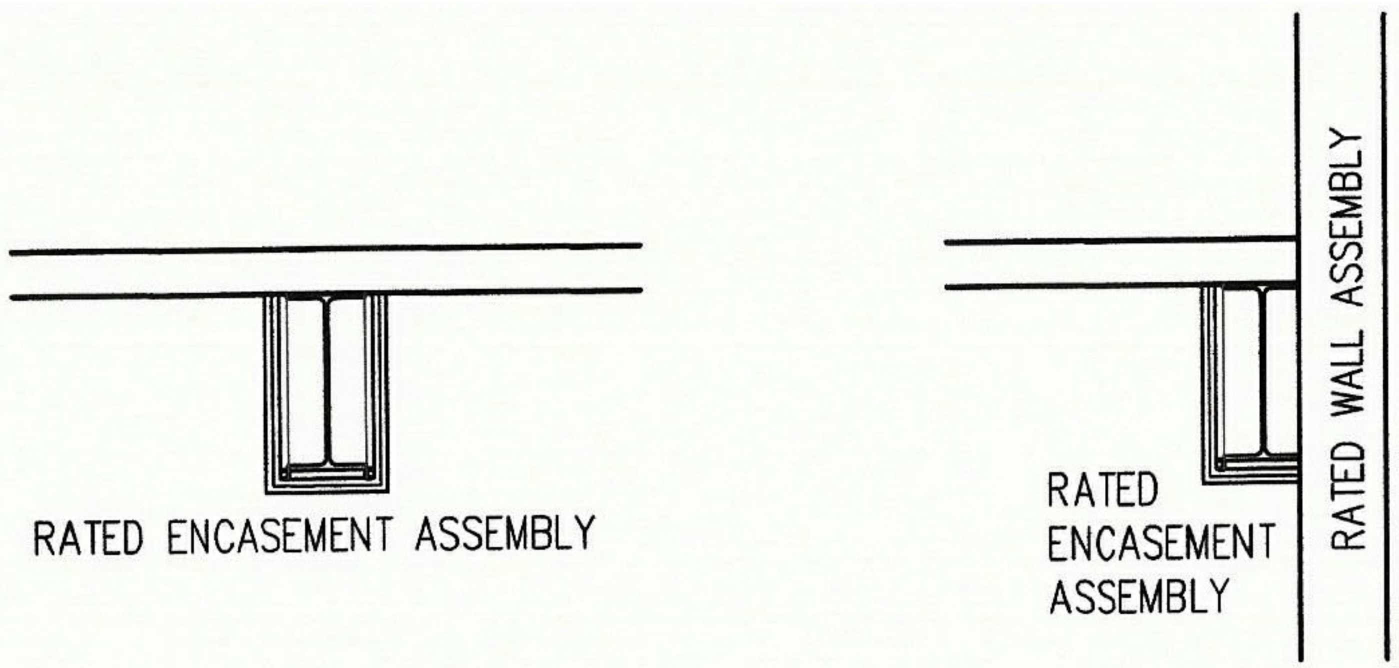


The issue is with the current language which is confusing at best, stating that "individual encasement protection shall be permitted" when that is what the main section requires. This and other ambiguities lead to multiple interpretations as to what is required when an unexposed side is covered by other construction. Some jurisdictions require individual encasement regardless of other construction, while others permit non-fire-resistance-rated adjacent construction.

The proposed changes to Section 704.3 is to address the ambiguities by more clearly stating the intent and goal of the application of the exception. The intent is to recognize that other fire resistant tested assemblies can be employed on the unexposed sides of the primary structural frame, other than columns, as long as those assemblies are equivalent to the minimum fire resistance rating of the individual encasement protection as required by the code.

Examples might include the following:

- A beam fire resistance tested design with a concrete/metal deck construction floor above (likely the original intent of the exception); or
- A beam adjacent to a masonry wall, where the wall assembly has a different and individual fire resistance tested design equal to the hourly rating of the individual encasement requirements of the beam.



An ICC Committee interpretation substantiated the intent of the exception as follows:

IBC COMMITTEE INTERPRETATION 41-14

Issued 1-6-2015

Q: Does the exception apply to all sides of the beam, i.e. top, bottom, and sides?

A: Yes.

This section is only applicable to the protection of the primary structural frame members that meet the parameters of the section and does not include columns. Even though the text states that the encasement must be on all four sides of the beam, the exception will allow tested assemblies that have the encasement on only the "exposed" sides of the beam. The assumption would be that the "exposed" side is the fire side.

Even though the usual application is a steel floor beam under a metal deck with a concrete slab, the exception does not limit its application to this scenario.

Therefore, regardless of whether it is the top, the bottom, or the side; and regardless of what type of building system is on the "unexposed" side, the "unexposed" side is not required to be encased.

Cost Impact:

Part I: Will not increase the cost of construction
The proposal may reduce the cost of construction by not requiring the owner, developer or design professional to submit for consideration a variance to the code provisions in accordance with 104.10 (Modifications) or 104.11 (Alternative materials, design and methods of construction and equipment) when other fire resistance tested designs will perform the same function as the intent of 704.2.

Part II: Will not increase the cost of construction
The proposal intends only to clarify the code, but does not make any technical changes to code requirements.

FS 6-15 : 704.3-TEPE4496

FS 7-15

704.2, 704.4.1

Proponent: David Tyree, American Wood Council, representing American Wood Council (dtyree@awc.org)

2015 International Building Code

Revise as follows:

704.2 Column protection. Where columns are required to have protection to achieve a *fire-resistance rating*, the entire column shall be provided individual encasement protection by protecting it on all sides for the full column height, including connections to other structural members, with materials having the required *fire-resistance rating*. Where the column extends through a ceiling, the encasement protection shall be continuous from the top of the foundation or floor/ceiling assembly below through the ceiling space to the top of the column.

> **Exception:** Columns located in a wall of light frame construction and located entirely between the top and bottom plates shall be permitted to have the fire resistance ratings provided by the membrane protection provided by the fire-resistance rated wall.

704.4.1 Light-frame construction. Studs, columns, and boundary elements that are integral elements in ~~*load-bearing*~~ *walls* of light-frame construction, and are located entirely between the top and bottom plates shall be permitted to have required *fire-resistance ratings* provided by the membrane protection provided for the ~~*load-bearing*~~ *wall*.

Reason: Reason: This proposal is to provide further clarification to a code change proposal that was approved last cycle and is included in the 2015 IBC in Section 704.4. Elements within fire-resistance rated walls of light-frame construction are addressed directly in Section 704.4.1 (Light-frame construction) and can be a part of a fire-resistance rated wall assembly without additional fire protection. Many buildings are built out of typical light frame construction; the concentrated loads from trusses or beams must have a continuous load path to the foundation. Some jurisdictions are interpreting that those construction boundary elements, such as, built-up and solid structural elements, are columns and are requiring them to be provided with individual fire protection. It is the intent of this provision, which has been verified by ICC staff, that it was never the intent to require individual fire protection of these elements, as they are not considered a portion of the primary structural frame.
This proposal was discussed and revised based on comments from the Colorado Chapter ICC Code Changes Committee and clarifies this provision is not intended to address continuous columns, does not have any connections to any elements of a structural frame, and is within a rated wall assembly.
For a complete list of AWC code change proposals and additional information please go to http://www.awc.org/Code-Officials/2015-IBC-Code-Changes.

Cost Impact: Will not increase the cost of construction
By revising this section, there is no additional cost as it clarifies the intent of this code provision. If anything, this proposal will actually save money as some building officials and designers have interpreted this section to require stud packs or built-up columns within a rated wall assembly to be individually fire protected which increases construction cost.

FS 7-15 : 704.4.1-TYREE4610

FS 8-15

704.2

Proponent: Timothy Saari, Colorado Code Consulting, LLC, representing Colorado Chapter ICC

2015 International Building Code

Revise as follows:

704.2 Column protection. Where columns are required to have protection to achieve a *fire-resistance rating*, the entire column shall be provided individual encasement protection by protecting it on all sides for the full column height, including connections to other structural members, with materials having the required *fire-resistance rating*._ Where the column extends through a ceiling, the encasement protection shall be continuous from the top of the foundation or floor/ceiling assembly below through the ceiling space to the top of the column.

Exception: Columns that meet the limitations of Section 704.4.1

Reason: We anticipate that the American Wood Council will be proposing a related change to Section 704.4.1, Light-frame consrtuction, that will better define when column elements that are part of, and integral to, a wall assembly, may be protected by fire-resistive wall materials. (Membrane protection) This code change proposal will link the later AWC concept to the charging language of this previoius section, and give clear direction to the code user when membrane protection is sufficient to meet the intent of the code.

This proposal is also clarifying for the structural elements that exceed the limits of Section 2308, and specifically 2308.8.1 and 2308. 8 2, and keep the code user in this section of code for all primary structural frame elements.

Cost Impact: Will not increase the cost of construction
If approved, this code clarification will lower the cost of construction by removing a perceived higher standard than the code intended, will simplify design and installation, and streamline construction.

FS 8-15 : 704.2-SAARI3985

FS 9-15

Part I:

704.2

Part II:

704.3

THIS IS A 2 PART CODE CHANGE. BOTH PARTS WILL BE HEARD BY THE IBC-FIRE SAFETY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THIS COMMITTEE.

Proponent: Timothy Pate, City and County of Broomfield representing Colorado Chapter Code Change Committee, representing City and County of Broomfield (tpate@broomfield.org)

Part I

2015 International Building Code

Revise as follows:

704.2 Column protection. Where columns are required to have protection to achieve a *fire-resistance rating*, the entire column shall be provided individual encasement protection by protecting it on all sides for the full column height, including connections to other structural members, with materials having the required *fire-resistance rating*._ Where the column extends through a ceiling, the encasement protection shall be continuous from the top of the foundation or floor/ceiling assembly below through the ceiling space to the top of the column.

<u>**Exception:** Columns located in unusable space as designated in section 711.2.6 and in Type VA, IIA, or IIIA construction.</u>

Part II

2015 International Building Code

Revise as follows:

704.3 Protection of the primary structural frame other than columns. Members of the primary structural frame other than columns that are required to have protection to achieve a *fire-resistance rating* and support more than two floors or one floor and roof, or support a load-bearing wall or a nonload-bearing wall more than two stories high, shall be provided individual encasement protection by protecting them on all sides for the full length, including connections to other structural members, with materials having the required *fire-resistance rating*.

~~Exception~~<u>Exceptions</u>:

<u>1.</u> Individual encasement protection on all sides shall be permitted on all exposed sides provided the extent of protection is in accordance with the required *fire-resistance rating*, as determined in Section 703.

<u>2.Structural members located within unsuable space areas as designated in section 711.2.6 and in Type IIIA, IIA, or VA construction.</u>

Reason: Section 711.2.6 allows the deletion of installing the ceiling membrane of a 1 hour fire resistance rated floor/ceiling assembly over unusable spaces. These spaces are typically crawl spaces or under structural floor areas where the area is not being used for any building use such as mechanical equipment or storage. The concept is that there would not be anything that would start on fire so it does not make sense to delete the membrane of the floor/ceiling assembly but to still require the rating of any structural columns located within the unusable space.

There is not a definition of unusable space in the IBC but the IBC commentary gives the opinion that it is up to the Building Official to verify that there are no combustible materials other than construction elements which would allow effectively allow piping, conduits, and ductwork - nothing that would start a fire.

FOR REFERENCE PURPOSES ONLY:

711.2.6 Unusable space. In 1-hour fire-resistance-rated floor/ceiling aseemblies, the ceiling membrane is not required to be installed over unusable crawl spaces. In 1-hour fire resistance-rated roof assemblies, the floor membrane is not required to be installed where unusable attic space occurs above.

Cost Impact:

Part I: Will not increase the cost of construction
This change could potentially lower the cost of construction in jurisdictions that have required these primary structural columns in crawl spaces to be individually protected.

Part II: Will not increase the cost of construction

This change could potentially lower the cost of construction in jurisdictions that have required these primary structural members other than columns in crawl spaces to be individually protected.

FS 9-15 : 704.2-PATE3865

FS 10-15

704.3, Table 704.3 (New)

Proponent: Jonathan Humble, American Iron and Steel Institute, representing American Iron and Steel Institute (jhumble@steel.org)

2015 International Building Code

Revise as follows:

704.3 Protection of the primary structural frame other than columns. Members of the primary structural frame other than columns that are required to have protection to achieve a *fire-resistance rating* ~~and support more than two floors or one floor and roof, or support a load-bearing wall or a nonload-bearing wall more than two stories high,~~ shall be provided individual encasement protection by protecting them on all sides for the full length, including connections to other structural members, with materials having the required *fire-resistance rating*, or membrane protection, in accordance with Table 704.3.~~.~~

> **Exception:** Individual encasement protection on all sides shall be permitted on all exposed sides provided the extent of protection is in accordance with the required *fire-resistance rating*, as determined in Section 703.

Add new text as follows:

TABLE 704.3
PRIMARY STRUCTURAL FRAME PROTECTION

PRIMARY STRUCTURAL FRAME SUPPORTING	FIRE RESISTANCE PROTECTION
Supporting one (1) floor and roof.	Encasement protection, or membrane protection as determined in Section 711, or by a combination of both.
Supporting up to two (2) floors.	Encasement protection, or membrane protection as determined in Section 711, or by a combination of both.
Supporting a load bearing wall or non-load bearing wall up to two (2) stories.	Encasement protection, or membrane protection as determined in Section 711, or by a combination of both.
Supporting three (3) floors or more.	Encasement protection.
Supporting a load bearing wall or non-load bearing wall three (3) stories or more.	Encasement protection.

Reason: This proposal was generated as a result assessing that the language, and not the technical intent, was not as clear. Section 704.3 is a run on sentence which combines too many subjects to be understood clearly. Further, Section 704.3 fails to recognize Section 711 (Horizontal Separation) for those constructions which are less than what is required for encasement protection only.
We propose to reduce the charging statement to a discussion about fire-resistance only. This is achieved by removing the construction requirements.

The construction requirements are relocated into a new table. Next to each support category is the fire-resistance requirements for that category. This will make the enforcement of the provision clearer. Further, we have suggested that the original intent (e.g. Pre-2009 IBC) be reinstated where it clearly articulates the three options available for fire resistance of the primary structural frame which are below the encasement only requirements. In this case, recognition of Section 704.3, Section 711 (Horizontal Separation), or a combination of both.

Use of the term "membrane protection" is a recognized term in the code that refers to a ceiling consisting of gypsum board or a lay-in ceiling used as part of the overall fire-resistance of a fire-resistant rated assembly.

We do not propose any modifications to the exception in this proposal.

Cost Impact: Will not increase the cost of construction
This is a format change to an existing section of the code. There is no attempt to modify the technical content. Therefore, there is no cost increase.

FS 10-15 : 704.3-HUMBLE4662

FS 11-15

202 (New), 705.2

Proponent: Stephen Thomas, representing Colorado Chapter ICC (sthomas@coloradocode.net)

2015 International Building Code

Add new definition as follows:

SECTION 202 DEFINITIONS

PROJECTION A floor, roof or appendage extending beyond any exterior wall of a building; such as cornices, eave overhangs, exterior decks or balconies, canopies, porte cocheres and similar protrusions.

Revise as follows:

705.2 Projections. ~~Cornices, eave overhangs, exterior balconies and similar projections extending beyond the exterior wall~~ Projections shall conform to the requirements of this section and Section 1406. Exterior egress balconies and exterior exit stairways and ramps shall comply with Sections 1021 and 1027, respectively. Projections shall not extend any closer to the line used to determine the fire separation distance than shown in Table 705.2.

> **Exception:** Buildings on the same lot and considered as portions of one building in accordance with Section 705.3 are not required to comply with this section for projections between the buildings.

Reason: There appears to be some confusion as to what a projection is or isn't. We have provided a new definition to clarify what they may be. By defining what a projection is, the code user will be able to enforce the code more consistently. We have also revised Section 705.2 to remove the list of projections and replace it with the defined term. The term "projection" appears in many locations throughout the IBC. This definition will provided more guidance for the user.

Cost Impact: Will not increase the cost of construction
This change is a clarification of the code. If anything, the change will reduce the cost of construction because a projection will not be required to fire-resistant rated in some cases.

FS 11-15 : 705.2-THOMAS4442

FS 12-15

705.2

Proponent: Stephen Thomas, Colorado Code Consulting, LLC, representing Colorado Chapter ICC (sthomas@coloradocode.net)

2015 International Building Code

Revise as follows:

705.2 Projections. Cornices, eave overhangs, exterior balconies and similar projections extending beyond the exterior wall shall conform to the requirements of this section and Section 1406. Exterior egress balconies and exterior exit stairways and ramps shall comply with Sections 1021 and 1027, respectively. Projections shall not extend any closer to the line used to determine the fire separation distance than shown in Table 705.2. Projections extending past the limits in Table 705.2 shall be provided with an exterior wall extending the full width of the projection. Such exterior wall shall comply with Section 705

> **Exception:** Buildings on the same lot and considered as portions of one building in accordance with Section 705.3 are not required to comply with this section for projections between the buildings.

Reason: Section 705.2 limits the distance that a projection needs to be from the line used to determine the fire separation distance. However, the code doesn't tell you what to do if the design professional wants to take the projection closer to the line. This proposal provides that direction by requiring an exterior wall to extend the full width of the projection. The exterior wall would provide protection from fire to and from adjacent properties. The areas on either side would not be required to be protected similar to exterior walls of a building that are perpendicular to the line. The reference to Section 705 is to ensure that the wall is fire-resistant rated and has the openings in accordance with Section 705.8.

Cost Impact: Will not increase the cost of construction
This change is a clarification of the code. Therefore, there is no impact on the cost of construction.

FS 12-15 : 705.2-THOMAS4449

FS 13-15

Table 705.2

Proponent: Stephen Thomas, Colorado Code Consulting, LLC, representing Colorado Chapter ICC (sthomas@coloradocode.net)

2015 International Building Code

Revise as follows:

TABLE 705.2
MINIMUM DISTANCE OF PROJECTION

FIRE SEPARATION DISTANCE - FSD (~~FSD~~ feet)	MINIMUM DISTANCE FROM LINE USED TO DETERMINE FSD
0 ~~feet~~ to less than 2 ~~feet~~	Projections not permitted
~~Greater than~~ 2 ~~feet~~ to less than 3 ~~feet~~	24 inches
~~Greater than~~ 3 ~~feet~~ to less than ~~30~~ 5 ~~feet~~	24 inches plus 8 inches for every foot of FSD beyond 3 feet or fraction thereof
~~30 feet~~5 or greater	~~20 feet~~ 40 inches

For SI: 1 foot = 304.8 mm; 1 inch = 25.4 mm.

Reason: This table was changed over the last two code cycles. We were the proponent of the original change. Our intent was to simplify the projection distance requirements by putting the requirements in a table. The change in the 2015 edition attempted to address an anomoly within the table. However, that change created a much more restrictive requirement than what was in the 2012 IBC and earlier editions. There was no technical justification for this more restrictive requirement. In previous codes, the maximum distance that a projection would be required was 40 inches. In the current edition, a building that has a fire separation distance of 30 feet would be required to hold the projection back from the lot line by a minimum of 20 feet. We feel that this is over-restrictive. This change puts the requirement back to what was permitted in previous codes and eliminates the anomoly that was present in the 2012 edition.

Cost Impact: Will not increase the cost of construction
This change will most likely reduce the cost of construction by providing clarity to the code.

FS 13-15 : T705.2-THOMAS4448

FS 14-15

Table 705.2

Proponent: Victor Cuevas, representing City of Los Angeles

2015 International Building Code

Revise as follows:

TABLE 705.2
MINIMUM DISTANCE OF PROJECTION

FIRE SEPARATION DISTANCE (FSD)	MINIMUM DISTANCE FROM LINE USED TO DETERMINE FSD
0 feet to 2 feet	Projections not permitted
Greater than 2 feet to 3 feet	24 inches
Greater than 3 feet to less than 30 feet	~~24 inches plus 8 inches for every foot of FSD beyond 3 feet or fraction thereof~~ 2' + 2/3(FSD - 3')
30 feet or greater	20 feet

For SI: 1 foot = 304.8 mm; 1 inch = 25.4 mm.

Reason: Add formula 2' + 2/3(FSF - 3') to replace text "24 inches plus 8 inches for every foot of FSD beyond 3 feet or fraction thereof" to simplify use.

Cost Impact: Will not increase the cost of construction
The code change proposal will not increase the cost of construction. Revisions to Table 705.2 will simplify the existing requirements and will not affect the current costs of construction.

FS 14-15 : T705.2-CUEVAS4802

FS 15-15

705.2.3, 705.2.3.1 (New), 705.2.4 (New), 1406.1, 1406.3, 1406.4

Proponent: Jonathan Siu, representing City of Seattle Department of Planning & Development (jon.siu@seattle.gov)

2015 International Building Code

Revise as follows:

705.2.3 Combustible projections. Combustible projections extending to within 5 feet (1524 mm) of the line used to determine the *fire separation distance* shall be of not less than 1-hour fire-resistance-rated construction, Type IV construction, fire-retardant-treated wood or as ~~required~~ permitted by Section ~~1406.3~~705.2.3.1.

> **Exception:** Type VB construction shall be allowed for combustible projections in Group R-3 and U occupancies with a fire separation distance greater than or equal to 5 feet (1524 mm).

Add new text as follows:

705.2.3.1 Balconies and similar projections. Balconies and similar projections of combustible construction other than fire-retardant-treated wood shall be fire-resistance rated where required by Table 601 for floor construction or shall be of Type IV construction in accordance with Section 602.4. The aggregate length of the projections shall not exceed 50 percent of the building's perimeter on each floor.

Exceptions:

1. On buildings of Type I and II construction, three stories or less above grade plane, fire-retardant-treated wood shall be permitted for balconies, porches, decks and exterior stairways not used as required exits.
2. Untreated wood is permitted for pickets and rails or similar guardrail devices that are limited to 42 inches (1067 mm) in height.
3. Balconies and similar projections on buildings of Type III, IV and V construction shall be permitted to be of Type V construction, and shall not be required to have a fire-resistance rating where sprinkler protection is extended to these areas.
4. Where sprinkler protection is extended to the balcony areas, the aggregate length of the balcony on each floor shall not be limited.

705.2.4 Bay and oriel windows. Bay and oriel windows shall conform to the type of construction required for the building to which they are attached.

Exception: Fire-retardant-treated wood shall be permitted on buildings three stories or less above grade plane of Type I, II, III or IV construction.

Delete without substitution:

~~**1406.1 General.** Section 1406 shall apply to *exterior wall coverings*; balconies and similar projections; and bay and oriel windows constructed of combustible materials.~~

~~**1406.3 Balconies and similar projections.** Balconies and similar projections of combustible construction other than fire-retardant-treated wood shall be fire-resistance rated where required by Table 601 for floor construction or shall be of Type IV construction in accordance with Section 602.4. The aggregate length of the projections shall not exceed 50 percent of the building's perimeter on each floor.~~

~~**Exceptions:**~~

1. ~~On buildings of Type I and II construction, three stories or less above *grade plane*, *fire-retardant-treated wood* shall be permitted for balconies, porches, decks and exterior stairways not used as required exits.~~
2. ~~Untreated wood is permitted for pickets and rails or similar guardrail devices that are limited to 42 inches (1067 mm) in height.~~
3. ~~Balconies and similar projections on buildings of Type III, IV and V construction shall be permitted to be of Type V construction, and shall not be required to have a *fire-resistance rating* where sprinkler protection is extended to these areas.~~
4. ~~Where sprinkler protection is extended to the balcony areas, the aggregate length of the balcony on each floor shall not be limited.~~

~~**1406.4 Bay and oriel windows.** Bay and oriel windows shall conform to the type of construction required for the building to which they are attached.~~

~~**Exception:** *Fire-retardant-treated wood* shall be permitted on buildings three stories or less above grade plane of Type I, II, III or IV construction.~~

Reason: This proposal is editorial in nature, making no technical changes. It simply relocates the provisions that state the protection and type of construction requirements for combustible decks and balconies, and bay and oriel windows from Chapter 14 to Chapter 7. Chapter 14 is mostly about exterior finishes, and these provisions are likely to be missed there. Chapter 7 is a more appropriate location for these provisions, since Section 705.2 already deals with type of construction and fire-resistance rated protection for projections.
Section 1406.1 is deleted since it only contained general charging language, which is not necessary now that only one section remains in Section 1406 (currently 1406.2, to be renumbered to 1406.1).

Cost Impact: Will not increase the cost of construction
Because this is an editorial relocation of existing provisions, there is no change in the regulations and therefore, no change in the cost of construction.

FS 15-15 : 705.2.3-SIU4694

FS 16-15

705.8

Proponent: Ali Fattah, City of San Diego Development Services Department, representing City of San Diego (afattah@sandiego.gov)

2015 International Building Code

Revise as follows:

705.8 Openings. Openings in *exterior walls* shall comply with Sections 705.8.1 through 705.8.6. <u>For structures or portions of structures not provided with surrounding exterior walls and with usable area under the horizontal projection of the roof or floor above, exterior wall shall mean the primary structural frame supporting the roof or floor above.</u>

Reason: The proposed code change addresses exterior opening protection for structures and buildings, and portions thereof that do not include surrounding exterior walls.

The IBC does not address the protection of covered exterior portions of a building that cannot be classified as projections and that provide shelter for useable space. The useable space is included in building area and fire area where applicable however the code does not seem to regulate the proximity of the useable space relative to the lot line.

- Projections appear to be elements attached to exterior walls that do not include useable space below.
- Exterior balconies are not defined and appear to be the exception and seem to be regulated similar to eaves and cornices and it is implied that they cantilever from the wall of the building.

Table 601 footnote (f) referenced under primary structural frame requires that the fire resistance of the structural frame to comply with Section 704.10 in addition to Table 601. As a consequence the structural frame on the outside of a building or structure without a surrounding exterior wall is required to comply with Table 602 as if it were a wall. However since the primary structural frame does not comply with the definition for wall it is necessary to modify Section 705.8 to make clear that openings within the primary structural frame are regulated.

Some structures addressed by this code change may include canopies over gasoline pump islands; canopies over play grounds or picnic areas; useable areas under portions of buildings where the upper stories are larger than portions below and closer to a lot line, etc.

Most Building Officials will consider that the face of the building to be the structural frame and would regulate the percentage of exterior openings within, however the IBC as written does not support this interpretation.

Currently as written the IBC implies that if an exterior wall is not provided then the openings on the exterior perimeter are not regulated since they are not openings in an exterior wall. A written interpretation from ICC confirms this.

Cost Impact: Will increase the cost of construction
The proposed code change is necessary for public safety and to provide more consistent application of the exterior wall opening protection requirements. The increased of construction will result is safer communities that are more resilient when faced with natural disasters that interrupt water supplies and power for extended periods of time since it ensures a protected building perimeter that can limit conflagration hazards.

FS 17-15

705.8.1

Proponent: Stephen Thomas, representing Colorado Chapter (sthomas@coloradocode.net)

2015 International Building Code

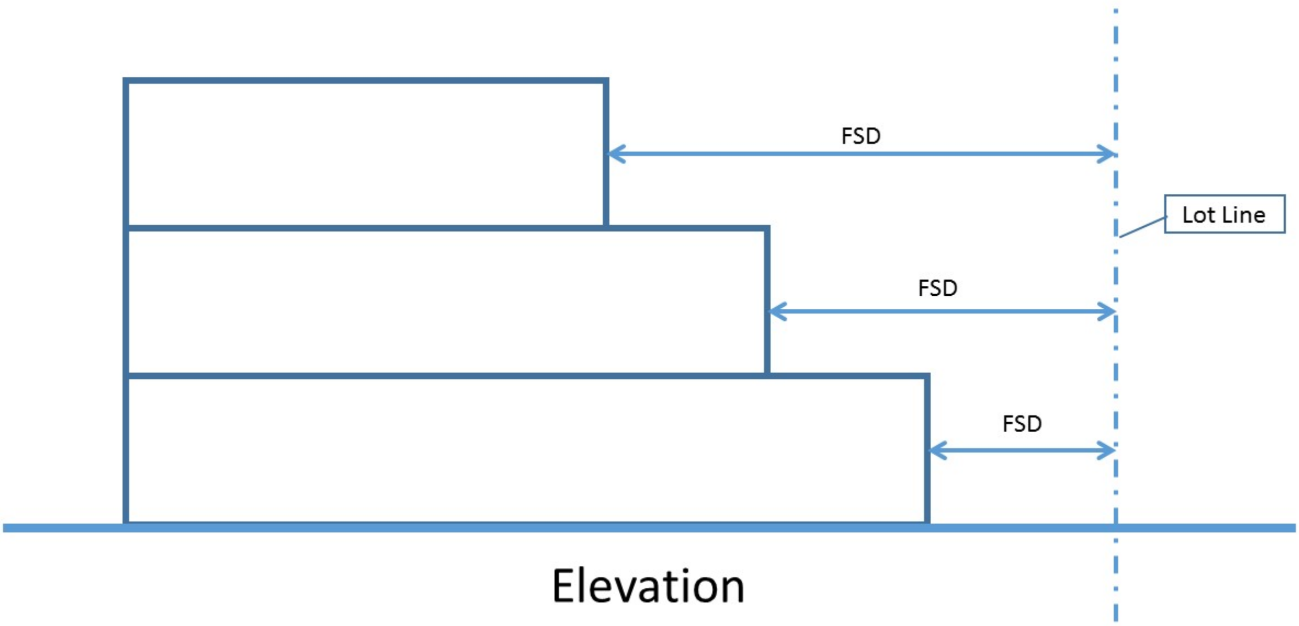
Revise as follows:

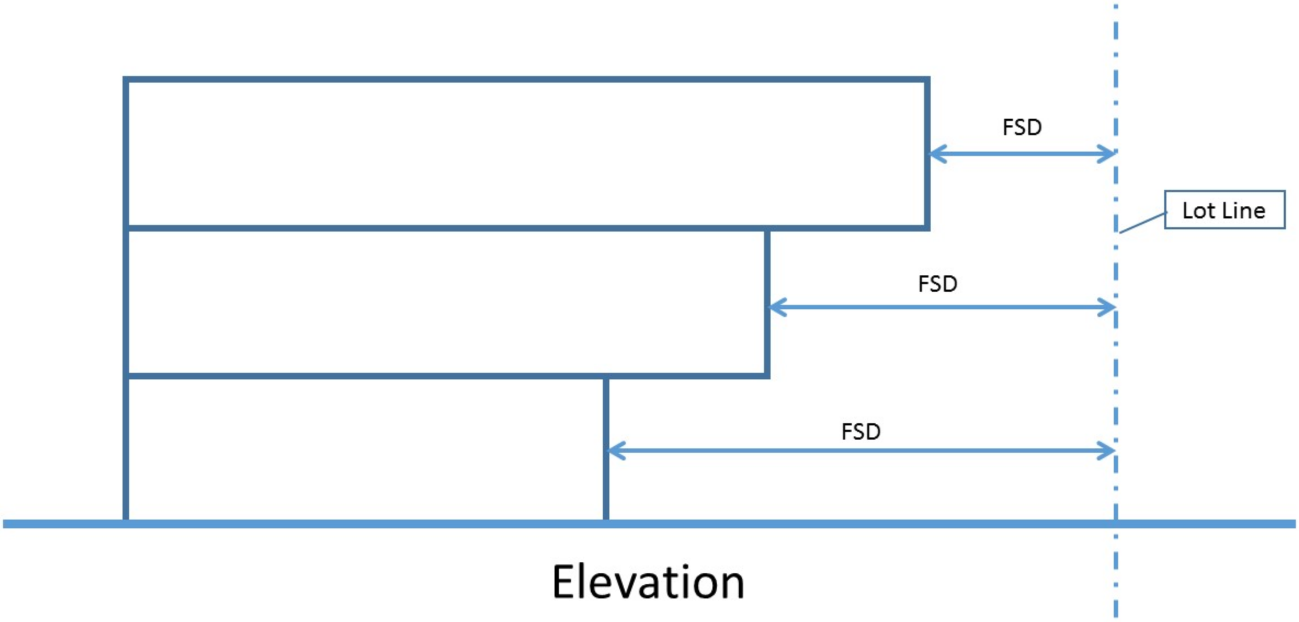
705.8.1 Allowable area of openings. The maximum area of unprotected and protected openings permitted in an *exterior wall* in any *story* of a building shall not exceed the percentages specified in Table 705.8 <u>based on the fire separation distance of each individual story</u>.

Exceptions:

1. In other than Group H occupancies, unlimited unprotected openings are permitted in the first *story* above grade plane either:
   1.1. Where the wall faces a street and has a *fire separation distance* of more than 15 feet (4572 mm); or
   1.2. Where the wall faces an unoccupied space. The unoccupied space shall be on the same lot or dedicated for public use, shall be not less than 30 feet (9144 mm) in width and shall have access from a street by a posted fire lane in accordance with the *International Fire Code*.
2. Buildings whose exterior bearing walls, exterior nonbearing walls and exterior primary structural frame are not required to be fire-resistance rated shall be permitted to have unlimited unprotected openings.

Reason: The intent of this change is to clarify that the limitation of openings in exterior walls is based on the fire separation distance of each individual story. There appears to be confusion on how to evaluate openings in exterior walls when an upper floor extends out over a lower floor. We believe that the opening protection is determined at the exterior wall of the story, not the wall plane of the story above. Just the opposite would be true if the building was a pyramid style building where the upper floors step back from the floor below. The opening protection would depend on the distance to the lot line at each story, not the first story. Please see attached diagrams.





Cost Impact: Will not increase the cost of construction
The change clarifies the intent of the code. There is no affect on the construction cost.

FS 17-15 : 705.8.1-THOMAS4446

FS 18-15

705.8.1

Proponent: Ali Fattah, City of San Diego Development Services Department, representing City of San Diego (afattah@sandiego.gov)

2015 International Building Code

Revise as follows:

705.8.1 Allowable area of openings. The maximum area of unprotected and protected openings permitted in an *exterior wall* in any *story* of a building shall not exceed the percentages specified in Table 705.8.

Exceptions:

1. In other than Group H occupancies, unlimited unprotected openings are permitted in the first *story* above grade plane either:
   1.1. Where the wall faces a street and has a *fire separation distance* of more than 15 feet (4572 mm); or
   1.2. Where the wall faces an unoccupied space. The unoccupied space shall be on the same lot or dedicated for public use, shall be not less than 30 feet (9144 mm) in width and shall have access from a street by a posted fire lane in accordance with the *International Fire Code*.
2. Buildings whose exterior bearing walls, exterior nonbearing walls and exterior primary structural frame are not required to be fire-resistance rated shall be permitted to have unlimited unprotected openings.
3. <u>In other than Group R-3 occupancies, or Group R-2 occupancies constructed of Type VB construction, unlimited unprotected openings are permitted for useable areas located under portions of a building above when the roof or floor above is located at a fire separation distance is 10 feet or greater.</u>

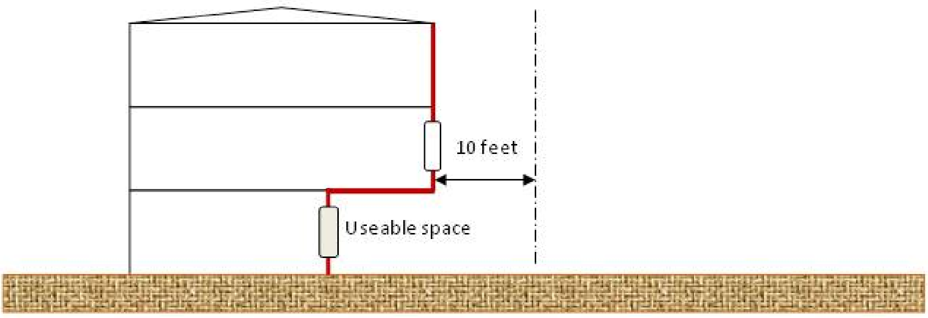
Reason: The IBC does not clearly regulate exterior opening protection when buildings include vertical offsets under which useable space occurs. The useable spaces below pose a hazard to structures and buildings on adjoining properties and no exterior walls exist under the projection of the building above.
Proposed exception # 3 addresses buildings with occupancies other than R-3, and Group R-2 constructed of Type VB construction, since they have been historically separated 5 ft from a lot line. Additionally these buildings will always be protected with sprinklers. The degree of openness provides fire protection benefits and the area will most likely include sprinkler protection unless the space is very tall.

The proposed code change treats outdoor areas under a building, for example outdoor dining in a restaurant part of which is indoors and part of which is under a larger second floor, similarly to parking garages and requires a fire separation distance of 10 ft for openings to not be limited when the structure has no surrounding wall adjacent to a lot line or imaginary line.

The IBC exempts exterior openings on open parking garages, that typically have a very limited or no surrounding exterior walls, from exterior wall opening limits in Table 705.8 when located at a fire separation distance of 10 feet or more.

No size limitation (area, depth) has been added to exempt attached structures with small depths to allow the Building Official flexibility in determining when such structures can be considered as projections if the area below is small enough to not be useable or pose a risk to buildings and structures on adjoining properties.

Most buildings of Type VB and IIB are exempt from exterior opening protection and wall protection when located at a fire separation distance of 10 ft per Table 602 footnote (g) and Section 705.8.1 exception 2. 10 ft appears to be a reasonable fire separation distance to address this issue.



Cost Impact: Will increase the cost of construction
The cost of construction may increase due to the need to enclose the attached structures. Fire resistance of the primary structural frame is required by Section 704.10 so increased fire resistance will not result. The code change will result in more uniform code application.

FS 18-15 : 705.8.1-FATTAH5675

FS 19-15

705.8.2

Proponent: Ronald Geren, RLGA Technical Services, LLC, representing Self (ron@specsandcodes.com)

2015 International Building Code

Revise as follows:

705.8.2 Protected openings. Where openings are required to be protected, *fire doors* and fire shutters shall comply with Section 716.5 and *fire window assemblies* shall comply with Section 716.6.

~~Exception~~Exceptions:

1. Opening protectives are not required where the building is equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1 and the exterior openings are protected by a water curtain using automatic sprinklers *approved* for that use.
2. Fire-resistance-rated glazing tested as part of a fire-resistance-rated wall in accordance with ASTM E 119 or UL 263 and labeled in accordance with Section 703.6 shall not be required to comply with Section 716.6 and shall not be included in the aggregate area permitted for protected openings.

Reason: Since this section directly references the sections indicated for compliance (i.e. Sections 716.5 aand 716.6), it bypasses the exception to these requirements afforded in Section 716.2. Without a definition in Chapter 2 for what entails an "opening," as written, it can be construed from this section that assemblies tested per ASTM E 119 or UL 263 are considered openings for the purpose of applying the opening requirements to exterior walls. This proposal allows the same assemblies that are exempt from the interior fire window requirements of Section 716.6 to also be exempt from opening requirements for exterior walls.

Cost Impact: Will not increase the cost of construction
This proposal provides an design alternative to the minimum exterior wall opening requirements. The basic requirement is unaltered; thus there is no increase in cost.

FS 19-15 : 705.8.2-GEREN5151

FS 20-15

705.8.5

Proponent: Tony Crimi, representing International Firestop Council (tcrimi@sympatico.ca)

2015 International Building Code

Revise as follows:

705.8.5 Vertical separation of openings. Openings in *exterior walls* in adjacent *stories* shall be separated vertically to protect against fire spread on the exterior of the buildings where the openings are within 5 feet (1524 mm) of each other horizontally and the opening in the lower *story* is not a protected opening with a *fire protection rating* of not less than $^{3}/_{4}$ hour. Such openings shall be separated vertically not less than 3 feet (914 mm) by spandrel girders, *exterior walls* or other similar assemblies that have a *fire-resistance rating* of not less than 1 hour, rated for exposure to fire from both sides, or by flame barriers that extend horizontally not less than 30 inches (762 mm) beyond the *exterior wall*. Flame barriers shall have a *fire-resistance rating* of not less than 1 hour. The unexposed surface temperature limitations specified in ASTM E 119 or UL 263 shall not apply to the flame barriers ~~or vertical separation~~ unless otherwise required by the provisions of this code.

Exceptions:

1. This section shall not apply to buildings that are three *stories* or less above *grade plane*.
2. This section shall not apply to buildings equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1 or 903.3.1.2.
3. Open parking garages.

Reason: The existing provision indicates that openings in exterior walls shall be separated vertically not less than 3 feet (914 mm) by spandrel girders, exterior walls or other similar assemblies that have a fire-resistance rating of not less than 1 hour, rated for exposure to fire from both sides. However, the last sentence of 705.8.5 then waives the unexposed surface temperature limitations specified in ASTM E 119 or UL 263. While this may be reasonable for the flame barriers because they extend horizontally beyond the build face, it is not justified for spandrel panels, exterior walls, or other similar assemblies that are mounted vertically above openings in the fire compartment.That vertical portion of the curtain wall is often immediately adjacent to cumbustible materials such as window coverings, drapes and carpets.

Our understanding of exterior fires and their mechanism of spread in buildings has been researched and reported. Building geometry and exterior projections of the curtain wall or building structural elements can have a beneficial or negative effect on flame length extension and heat flux exposure to curtain wall elements above the fire compartment. Such condition can allow the unrestricted passage of flames and hot gases from a fire on a floor below into the floor above. The position and geometry of the opening relative to the expected flame extension is important in assessing the risk of a leap frog event. The requirement to provide a fire-resistance-rating should not be waived for the vertical separation between openings.

Fire spread in high rise buildings from floor to floor occurs if flames emerge and extend on the façade of the building to cause ignition in the floor above fire floor. Even though considerable effort has been exerted to address this issue, the relevant physics is still under study and has been poorly clarified. Key factors that impact a curtain wall's fire performance are being addressed by the new Draft ASTM Test Method for Determining the Fire Resistance of Building Perimeter Containment Systems Due to External Spread of Fire. Such a test Standard could eventually be useful to provide enhanced protection or evaluate a curtain wall assembly's potential performance when subject to uncontrolled heat/flame exposure.

Cost Impact: Will increase the cost of construction
The current Code text is contradictory. It requires an ASTM E119 or UL 723 fire resistance rating from both sides, but then waives one of the most critical aspects. This proposals creates the intended level of safety. There may be some impact on cost where spandrel panels do not meet the existing ASTM E119 temperature rise conditions. In many cases, where one or more layers of gypsum board is used on the interior surface, there may be no additional cost depending on the type of spandrel construction.

FS 20-15 : 705.8.5-CRIMI4307

FS 21-15

705.8.6

Proponent: Gary Lampella, City of Redmond, Oregon, representing Oregon Building Officials Association (gary.lampella@ci.redmond.or.us)

2015 International Building Code

Revise as follows:

705.8.6 Vertical exposure. For buildings on the same lot, opening protectives having a *fire protection rating* of not less than $^3/_4$ hour shall be provided in every opening that is less than 15 feet (4572 mm) vertically above the roof of an adjacent building or structure based on assuming an imaginary line between them. The opening protectives are required where the *fire separation ~~distance~~distances* between the imaginary line~~ and the adjacent~~ to each building or structure is less than 15 feet (4572 mm).

Exceptions:

1. Opening protectives are not required where the roof assembly of the adjacent building or structure has a *fire-resistance rating* of not less than 1 hour for a minimum distance of 10 feet (3048 mm) from the *exterior wall* facing the imaginary line and the entire length and span of the supporting elements for the fire-resistance-rated roof assembly has a *fire-resistance rating* of not less than 1 hour.
2. Buildings on the same lot and considered as portions of one building in accordance with Section 705.3 are not required to comply with Section 705.8.6.

Reason: This proposal would clear up the confusion and uncertainty of when to apply the provisions of Section 705.8.6. Currently this section only addresses the the fire separation distance of one of the buildings, presumably the lower building. What this proposal will do is make it clear that in order to apply the fire-resistive provisions of this section, both buildings would have to have a fire separation distance of less than 15 feet to the imaginary line. This would also line up with the ICC interpretation that assumes the imaginary line to be equidistant between the two buildings.

Cost Impact: Will not increase the cost of construction
This is just a clarification of how to measure fire separation distance for 2 buildings on the same lot and should have no financial impact

FS 21-15 : 705.8.6-LAMPELLA5416

FS 22-15

705.8.6

Proponent: Gary Lampella, representing Oregon Builing Officials Association (gary.lampella@ci.redmond.or.us)

2015 International Building Code

Delete without substitution:

~~**705.8.6 Vertical exposure.** For buildings on the same lot, opening protectives having a *fire protection rating* of not less than $^3/_4$ hour shall be provided in every opening that is less than 15 feet (4572 mm) vertically above the roof of an adjacent building or structure based on assuming an imaginary line between them. The opening protectives are required where the *fire separation distance* between the imaginary line and the adjacent building or structure is less than 15 feet (4572 mm).~~

~~**Exceptions:**~~

1. ~~Opening protectives are not required where the roof assembly of the adjacent building or structure has a *fire-resistance rating* of not less than 1 hour for a minimum distance of 10 feet (3048 mm) from the *exterior wall* facing the imaginary line and the entire length and span of the supporting elements for the fire-resistance-rated roof assembly has a *fire-resistance rating* of not less than 1 hour.~~
2. ~~Buildings on the same lot and considered as portions of one building in accordance with Section 705.3 are not required to comply with Section 705.8.6.~~

Reason: When applying this section to buildings on the same lot with an imaginary line designed to determine fire separation distance, it adds additional requirements that are not required in an identical situation with a real property line between buildings and with the same identical physical arrangement. It makes absolutely no sense to apply different and more stringent requirements to two identical scenarios.

Both scenarios, an imaginary line and a real property line, have identical requirements of Table 602 for fire resistance based on fire separation distance, Table 705.2 for projections, Section 705.5 for exterior walls based on fire separation distance, Section 705.8 for exterior wall openings, Section 705.8.4 for mixed openings and Table 705.8 for exterior wall openings based on fire separation distance. Then we arrive at Section 705.8.6, for vertical exposure. This is the section that creates the conflict between imaginary lines and real property lines.

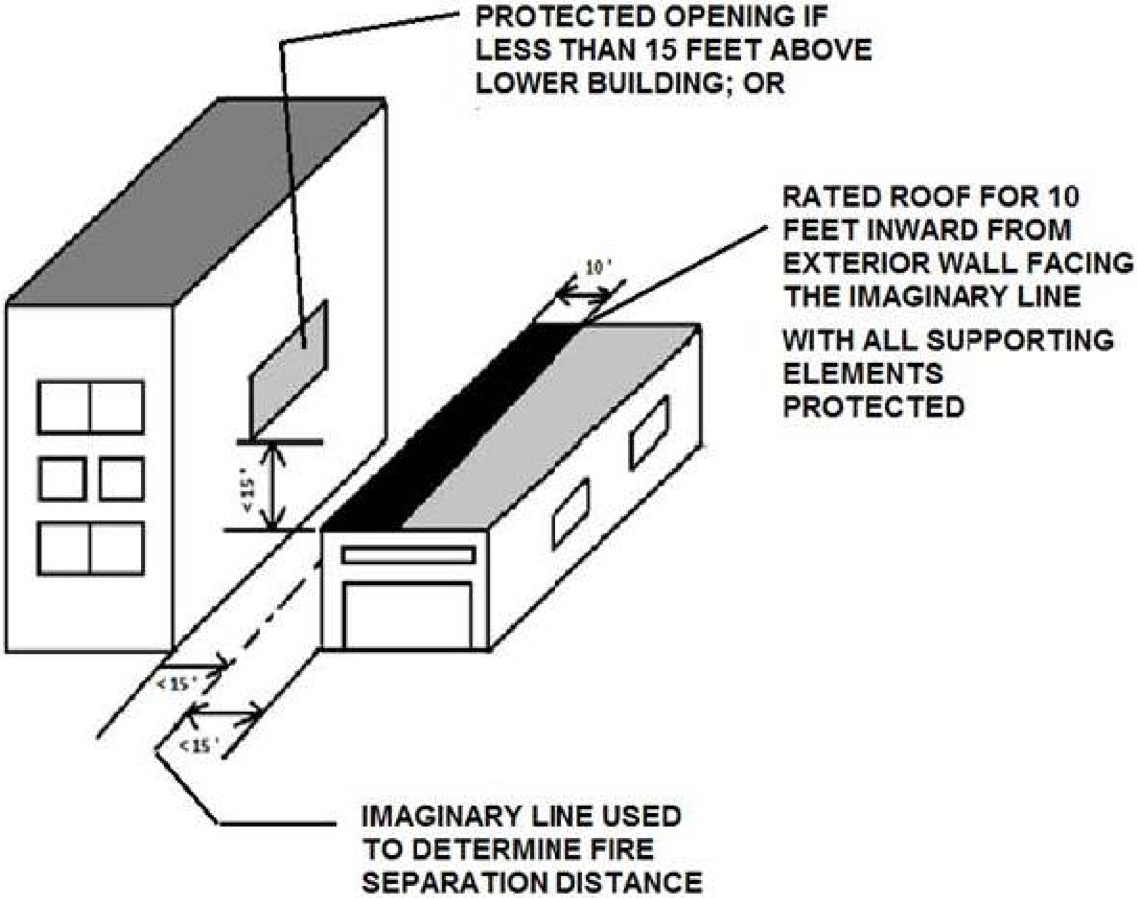


FIGURE 1

Section 705.8.6 currently requires either opening protectives or a rated roof only when you have two buildings on the same lot with an imaginary line between them. This is based on the ICC interpretation of this provision in the 2012 IBC.

Two additional and very substantial requirements are placed on two buildings on the same lot with an imaginary line to determine fire separation distance that are not applied to identical physical arrangements with real property lines. The code as written only addresses the fire separation distance of the lower building and has no verbiage for the building with the openings. Although there is an ICC interpretation propriate for both fire-resistance-rated and nonfire-resistance-rated walls.

705.8.6 Vertical exposure. For buildings on the same lot, opening protectives having a *fire protection rating* of not less than 3/4 hour shall be provided in every opening that is less than 15 feet (4572 mm) vertically above the roof of an adjacent building or structure based on assuming an imaginary line between them. The opening protectives are required where the *fire separation distance* between the imaginary line and the adjacent building or structure is less than 15 feet (4572 mm).

Exceptions:

1. Opening protectives are not required where the roof assembly of the adjacent building or structure has a *fire-resistance rating* of not less than 1 hour for a minimum distance of 10 feet (3048 mm) from the *exterior wall* facing the imaginary line and the entire length and span of the supporting elements for the fire-resistance-rated roof assembly has a *fire-resistance rating* of not less than 1 hour.
2. Buildings on the same lot and considered as portions of one building in accordance with Section 705.3 are not required to comply with Section 705.8.6.

Q: A covered mall building constructed in accordance with Section 402 is attached to a multistory anchor store. Is it the intent of Section 705.8.6 to require exterior opening protectives for the windows in the anchor store that are adjacent to and located above the roof of the covered mall building?

A: No. Although the anchor store is not considered part of the covered mall building, it is the intent of Section 402.4.2.2.1 to permit unprotected openings between the anchor store and the pedestrian area of the mall. It would be inconsistent to allow unprotected openings between the mall area and the anchor store and, at the same time, require exterior opening protectives in windows located in the anchor store above the roof of the covered mall building.

Q: Where Table 705.8 prohibits any openings in an exterior wall due to fire separation distance, is it the intent of Section 705.8.6 to permit openings in the exterior wall that is located above the roof of an adjacent building?

A: No. Section 705.8 regulates the maximum area of openings (protected and unprotected) in exterior walls. These limitations are applicable to each and every story of all exterior walls. The conditions addressed in Section 705.8.6 are also subject to the requirements of Section 705.8. Thus, the exterior wall of a building is required to comply with Section 705.8 for determining the maximum amount of openings permitted whether or not there is an adjoining building or adjacent structure with a lower roof height. Note b to Table 705.8 provides the cross-reference to Section 706.6.1 for exterior opening requirements above fire walls.

Q: When evaluating the opening protective requirements of Section 705.8.6, must the fire separation distances of both buildings be considered?

A: Yes. The hazard addressed in Section 705.8.6 is due to the fire exposure from an adjacent lower roof which is in close proximity to the exterior wall of the higher building. The requirements of this section are based on a 15-foot fire separation distance as defined in Section 702, whereas the requirements of previous editions of model codes were based on a 30-foot horizontal distance between adjacent buildings. The current requirements presume that the imaginary line or lot line is drawn equidistant between two adjacent buildings located no more than 30 feet apart.

The provisions of Section 705.8.6 are intended to be applied where the adjacent exterior walls of both buildings are required by Table 602 to be fire-resistance rated. This typically occurs where both buildings have a fire separation distance of 15 feet or less. The hazard addressed in Section 705.8.6 does not exist where one building is located at a fire separation distance of 15 feet or less and the adjoining building or adjacent structure is located at a fire separation distance of greater than 15 feet.

SECTION 706 FIRE WALLS

706.2 Structural stability. Fire walls shall have sufficient structural stability under fire conditions to allow collapse of construction on either side without collapse of the wall for the duration of time indicated by the required *fire-resistance rating* or shall be constructed as double fire walls in accordance with NFPA 221.

Q: Are building elements, such as plumbing piping, HVAC ducts and fire sprinkler piping, that are permitted to penetrate a fire wall required to be designed for compliance with the provisions of Section 706.2 for structural stability?

A: Yes. A fire wall must remain wholly intact for the time duration specified. Building elements that are permitted to penetrate a fire wall must be designed and installed such that failure of any building element on either side of a fire wall will not cause premature failure of the fire wall, neither in its entirety or in part.

Q: Can a fire-resistance-rated floor/ceiling assembly be classified as a horizontal fire wall for the purpose of subdividing a multistory structure into separate buildings?

EXIBIT 1

The ICC interpretation determined that both buildings had to have a fire separation distance that required both buildings to have fire resistive walls due to fire separation distance. Although a published interpretation, the code still does not say that. It only addresses the fire separation of the lower building.

that "the current requirements presume that the imaginary line is equidistant between the two buildings" the code does not say that. It only refers to the adjacent (shorter building) having a fire separation distance if less then 15 feet. It also says "the provsisions of Section 705.8.6 are intended to be applied where the adjacent exterior walls of both buildings are required by Table 602 to be fire-resistive rated." Again, the code does not say that it only applies if the lower building has a fire separation distance of less than 15 feet. One could have an existing building that had up to 75% of openings in the exterior wall,

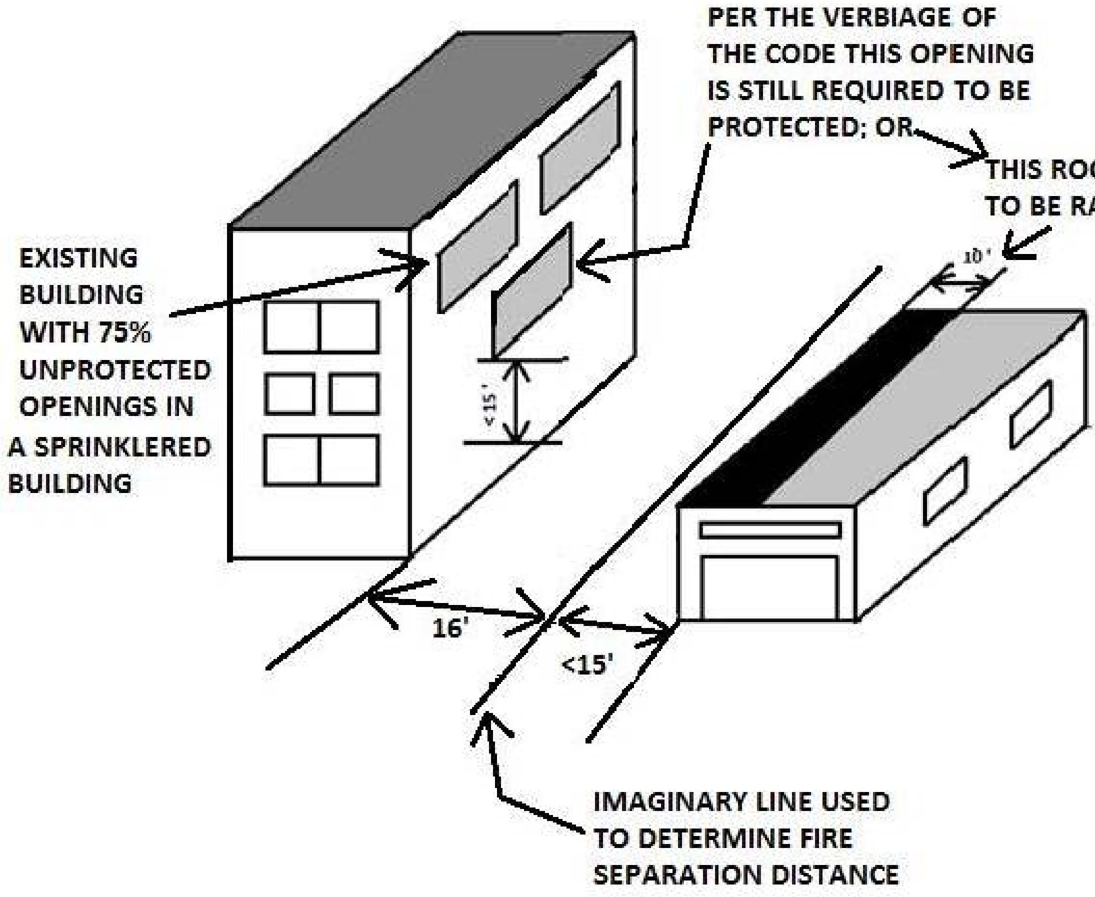

FIGURE 2

This imaginary line is placed such that the existing building can still have the 75% unprotected openings and not have to replace any glazing. Fifteen to less than 20 feet allows 75% of unprotected openings in a sprinklered building per Table 705.8.

The way the code reads in the last sentence of 705.8.6 only the shorter building has to have less than 15 feet to the imaginary line. So there is no code verbiage that regulates the fire separation distance of the taller building with the openings. Thus, the openings within 15 feet of the lower roof would still have to be protected although the building with the opening has a fire separation distance of more than 15 feet.

and another building was proposed to be constructed on the same lot 30 feet from it, one could place the imaginary line so the proposed building had a 14 foot fire separation distance and the taller one with the openings had a 16 foot fire sepration distance the openings could reamain unprotected in a non sprinklered building. But because of the code language, any opening that was less than 15 feet vertically above the adjacent roof would still be required to be protected because of the provision of measuring the fire separation distance for the lower building. Infact, you could have a much larger fire separation distance for the taller building but if the lower one was less than 15 feeet, you would still have to protect to openings within the 15 foot range due to the absence of any fire separation distance for the building with the openings. Replacing the imaginary line with an actual property line,

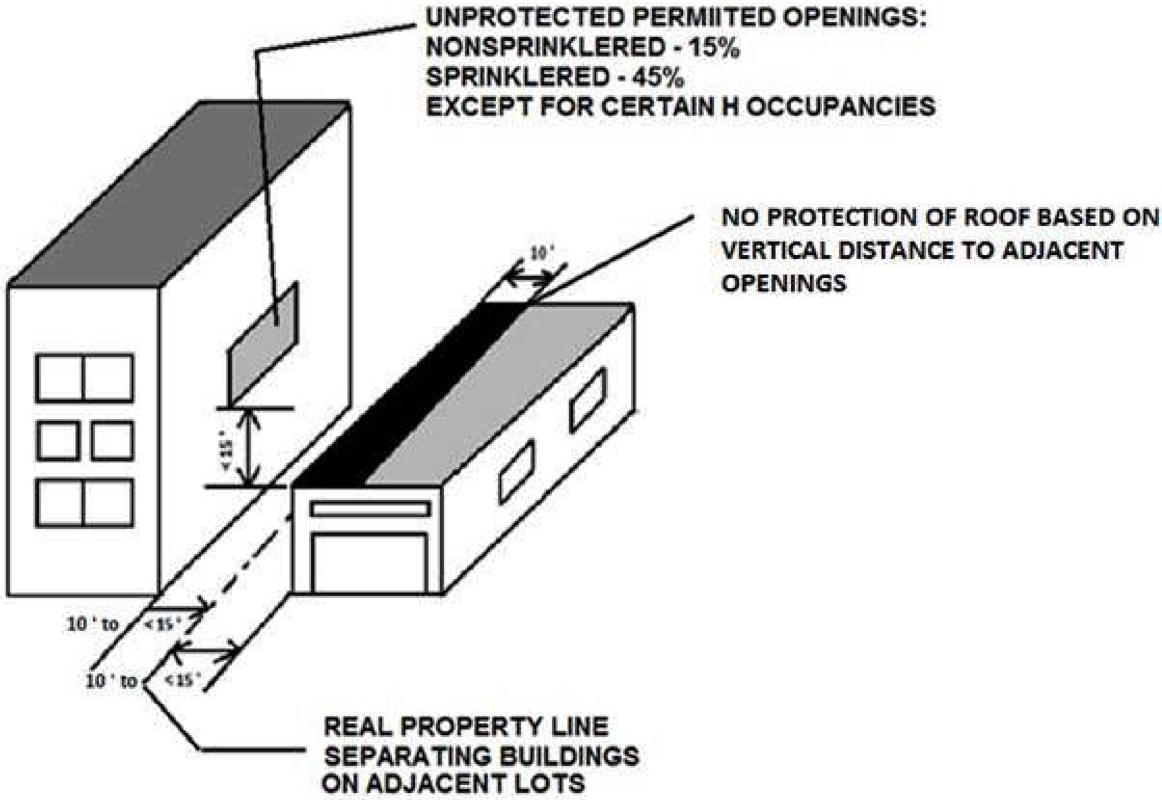

FIGURE 3

Now applying the same exact scenario to buildings with a real property line and you get virtually no requirements from Section 705.8.6 that are applicable to two buildings on the same lot with an imaginary line. You now can have a number of openings within the 15 foot vertical measurement without having to protect them or protecting the roof.

This is utilizing the 10 feet to < 15 feet in Table 705.8 as illustrating the difference in requirements between imaginary lnes and real property lines.

the buildings are now not subjected to the requirements of 705.8.6. With the two buildings with a real property line scenario you could have up to 15% of unprotected openings in a non sprinklered building and up to 45% in a sprinklered building without having to rate any of the openings in relation to the height above an adjacent roof. Furthermore, two adjacent building, each with a 5 to less than 10 foot fire separation distance to a real property line configured exactly like Figures 1 and 3 could have a wall with 10% unprotected openings without sprinklers and 25% unprotected openings when provided with sprinklers. We cannot find a similar provisions such as this anywhere in the code that regulates this type of arrangement. It is only applied when you have two buildings on the same lot with an imaginary line.

Statements from the Fire Safety committee in previous code hearings on this section were that you couldn't compare the two scenarios simply because with a property line you would have different owners and the buildings would not be constructed at the same time and how could you make two owners agree on which one does what, or how could you make an owner of an existing building retroactively modify a once code conforming building? I contend that you can relate them quite simply. If an existing building has less than a 15 foot fire separation distance to a property line, and another building is proposed on an adjacent lot with less than a 15 foot fire separation distance to the same property line, and there were one or more openings in one of the buildings that were less than 15 feet above the roof of the other building then Section 705.8.6 could be theoretically applied. The newer proposed building would have to have either a fire-rated roof or protected openings dependent upon whether it was the higher building or the lower building.

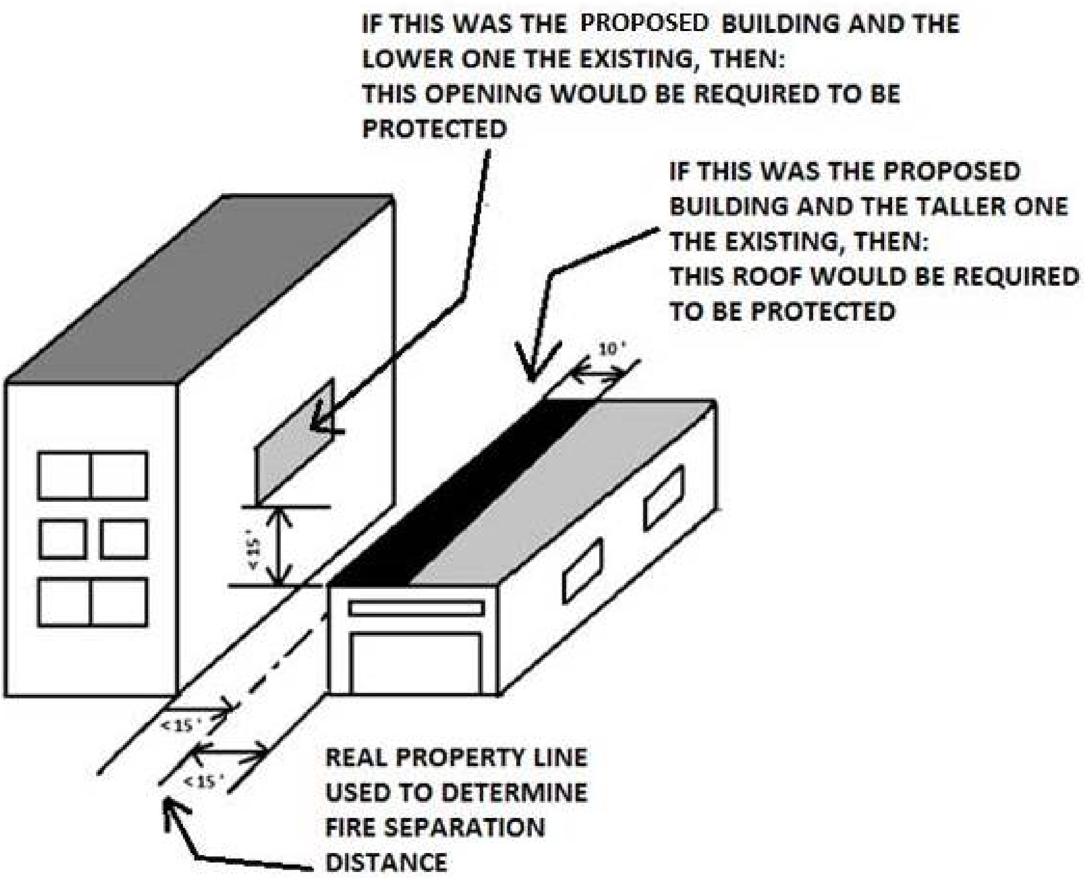

FIGURE 4

If a building was proposed to be constructed adjacent to another building on an adjacent lot, and the configuration of the two building met the provisions of Section 705.8.6, then you would apply the appropriate provision to the proposed building.

This puts no financial burden or threat of upgrading the existing building on the owner of that building. The newer building owner would be responsible to comply with 705.8.6. Of course this is merely conjecture and the code does not currently require that. But it is the exact same configuration and scenario Section 705.8.6 is addressing and is simply a way to show that you can compare the two scenarios – one with an imaginary line and one with a real property line.

So after analysis of situations with imaginary lines and real property lines, we can only presume that an imaginary line drastically changes physics and fire science to a degree that causes fire and smoke to behave very badly and function outside the realm of science – creating a hazard more severe than normal hazards associated with other structures located 30 feet from each other with a real property line between them.

Or maybe the surveying and platting of a legal and real property line also causes fire and smoke to work outside the physical realm of science and physics much like a black hole. Sucking oxygen, friction and fuel out of this magical 30 foot strip of soil and air, eradicating every known hazard and sending it millions of light years away for some unsuspecting unknown life form in a distance galaxy to deal with this very unpleasant array of toxic and harmful conditions created by an imaginary line.

It defies logic that fire and smoke would react differently with identical building locations, building shapes, and roof and opening locations due to having and imaginary line or a real property line. So why do we have different requirements for each?

If we want predictive and consistent codes, than this code section needs to be eliminated.

Cost Impact: Will not increase the cost of construction
This will not incerase to cost if approved. It is a deletion of a section that will no longer require fire-resistive assemblies.

FS 22-15 : 705.8.6-LAMPELLA3376

FS 23-15

705.8.6.1 (New)

Proponent: Gary Lampella, City of Redmond, Oregon, representing Oregon Building Officials Association (gary.lampella@ci.redmond.or.us)

2015 International Building Code

Add new text as follows:

705.8.6.1 Vertical exposure for buildings on adjacent lots Where a building is proposed adjacent to an existing building on an adjacent lot and the resulting fire separation distance for both buildings is less than 15 feet (4572 mm), and one of the buildings has openings less than 15 feet (4572 mm) above the roof of the adjacent building, one of the following provisions shall apply.

1. If the proposed building has openings less than 15 feet (4572 mm) vertically above the roof of the existing adjacent building, opening protectives having a fire protection rating of not less than 3/4 hour shall be provided for those openings; or

2. If the existing building has openings less than 15 feet vertically above the roof of the proposed adjacent building, the proposed building shall be provided with a roof assembly having a fire-resistive rating of not less than 1 hour for a distance of 10 feet (3048 mm) from the exterior face of the wall facing the property line and the entire length and span of the supporting elements for the fire-resistive-rated roof assembly shall have a fire-resistive-rating of not less than 1 hour.

Reason: The purpose of this proposal is to eliminate a conflict and align it with Section 705.8.6. Having a requirement for roof and opening protection for two buildings on the same lot with an imaginary line between them and ignoring the same exact scenario for two building on seprate lots is not logical. We can only assume that placing an imaginary line between two buildings on the same lot creates a more severe hazard than two buildings on separate lots separated by a real property line but with identical configurations. This seems to us that smoke and fire behave differently with an imaginary line than it does with a real property line. Either the imaginary line defies normal physics, fire science and behaves badly because of the imaginary line, or maybe a real property line contains some magical characteristic that removes all potential hazards and negates the need for fire-resistve protection that is required with an imaginary line. Fire and smoke behave the same between two buildings regardless if they have a real or imaginary line between them. It only changes by outside agencies such as wind, additional accelerants or by human intervension - which can happen with any building configuration. Having code provisions to control vertical fire spread for only buildings on the same lot with a fire separations distance of less than 15 feet for each building and ignoring the same exact scenario with a real property line perplexes us.
I have submiitted different variations of this proposal before the Fire Safety Committee numerous times without sucess. Feedback from this committee in previous code cycles on this section were that you couldn't compare the two scenarios simply because with a property line you would most likely have separate owners and the buildings would not be constructed at the same time, how could you make separate owners agree on which one does what, or how could you make an owner of an existing building retroactively modify a once code conforming building? I think we have addressed those concerns with this new section to clearly define the proposed building owner as the responsible party. This would be consistent with opening protection due to fire separation distance measured to a property line. If the fire separation distance of the two buildings results in both buildings having a fire separation distance of less the 15 feet by placement of the new building, and the proposed building meets either of the two provisions, openings in the wall facing the property line less than 15 feet above the existing building on the adjacent lot, or the roof of the proposed building is at an elevation that reults in existing openings in the existing building being less than 15 feet above the new roof, only the proposed building would be subject to the fire-resistive requirements. The existing building would not be required to be retrofitted or upgraded in any manner and could remain as is. See Figure 1.

If our goal is to have predictable and consistent codes that don't conflict, then this code proposal is needed and necessary to meet that goal.

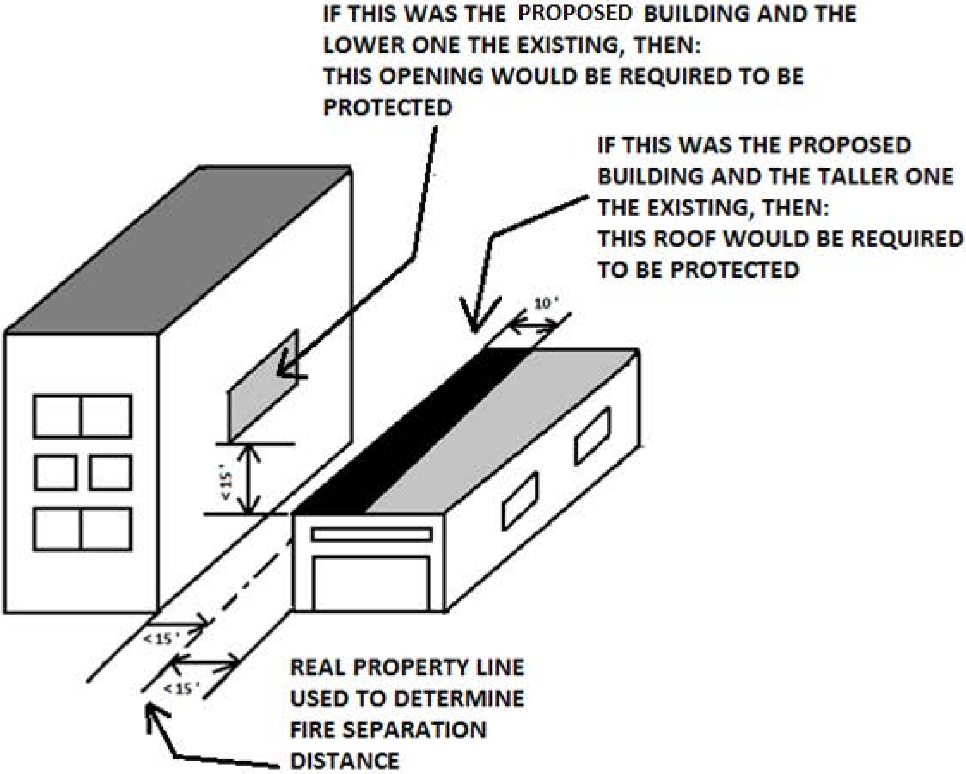

FIGURE 1

When the taller building is the proposed structure and the shorter the existing one, the opening depicted in the drawing would be required to have a fire-protection-rating of not less than ¾ hour. The existing lower building would require no fire-resistive construction for the roof.

When the shorter building is the proposed and the taller the existing building, then the roof would be required to be fire-resistive rated for 10 feet inward from the exterior wall and all supporting members rated. The taller existing building would be permitted to have unprotected openings.

Cost Impact: Will increase the cost of construction

The cost of costruction will increase only for projects that opt to construct buildings closer than 15 feet to a property line with another building on the adjacent lot also less than 15 feet from the propety line. We don't belive that this is common pratice so the cost in overall construction should be minimal

FS 23-15 : 705.8.6.1 (New)-LAMPELLA3558

FS 24-15

705.9 (New), 714.3, 1403.4

Proponent: Lee Kranz, City of Bellevue, WA, representing Lee Kranz

2015 International Building Code

Add new text as follows:

<u>**705.9** **Penetrations** Penetrations into or through fire-resistance rated *exterior walls* shall comply with Sections 714.3.1 through 714.3.3.</u>

Revise as follows:

714.3 Fire-resistance-rated walls. Penetrations into or through *fire walls*, *fire barriers*, *smoke barrier* walls ~~and~~<u>,</u> *fire partitions* <u>and fire-resistance rated *exterior walls*</u>shall comply with Sections 714.3.1 through 714.3.3. Penetrations in *smoke barrier* walls shall also comply with Section 714.4.4.

1403.4 Fire resistance. *Exterior walls* shall be fire-resistance rated as required by other sections of this code with opening protection <u>and penetration protection</u> as required by Chapter 7.

Reason: Section 714.3 conspicuously does not include fire-resistance rated exterior walls in the list of assemblies required to have protected penetrations. Listed fire-resistance rated exterior wall assemblies are not typically tested with unprotected penetrations and therefor do not address the multitude of possibilities for membrane and through-penetrations made at the job site. If approved this code change will require all fire-resistance rated exterior walls to have penetrations protected in accordance with Sections 714.3.1 through 714.3.3. This is consistent with the intent of the listed assembly requirements and maintains the type of construction fire-resistance rating requirements of Tables 601, 602 and other provisions requiring exterior walls to be of fire-resistance rated construction.

Cost Impact: Will increase the cost of construction
The cost will go up because more fire-resistance rated exterior wall penetrations will be protected from the effects of fire.

FS 24-15 : 705.9 (New)-KRANZ5084

FS 25-15

705.11

Proponent: Joseph Holland, representing Hoover Treated Wood Products (jholland@frtw.com)

2015 International Building Code

Revise as follows:

705.11 Parapets. Parapets shall be provided on *exterior walls* of buildings.

Exceptions: A parapet need not be provided on an *exterior wall* where any of the following conditions exist:

1. The wall is not required to be fire-resistance rated in accordance with Table 602 because of *fire separation distance*.
2. The building has an area of not more than 1,000 square feet (93 m^2) on any floor.
3. Walls that terminate at roofs of not less than 2-hour fire-resistance-rated construction or where the roof, including the deck or slab and supporting construction, is constructed entirely of noncombustible materials.
4. One-hour fire-resistance-rated *exterior walls* that terminate at the underside of the roof sheathing, deck or slab, provided:
    - 4.1. Where the roof/ceiling framing elements are parallel to the walls, such framing and elements supporting such framing shall not be of less than 1-hour fire-resistance-rated construction for a width of 4 feet (1220 mm) for Groups R and U and 10 feet (3048 mm) for other occupancies, measured from the interior side of the wall.
    - 4.2. Where roof/ceiling framing elements are not parallel to the wall, the entire span of such framing and elements supporting such framing shall not be of less than 1-hour fire-resistance-rated construction.
    - 4.3. Openings in the roof shall not be located within 5 feet (1524 mm) of the 1-hour fire-resistance-rated *exterior wall* for Groups R and U and 10 feet (3048 mm) for other occupancies, measured from the interior side of the wall.
    - 4.4. The entire building shall be provided with not less than a Class B roof covering.
5. ~~In Groups R-2 and R-3 where~~Where the entire building is provided with a Class ~~C~~ B roof covering, the *exterior wall* shall be permitted to terminate at the underside of the roof sheathing or deck in Type III, IV and V construction, provided one or both of the following criteria is met:

    Exception: Group R-2 and R-3 shall be permitted a Class C roof covering.

    - 5.1. The roof sheathing or deck is constructed of *approved* noncombustible materials or of *fire-retardant-treated wood* for a distance of 4 feet (1220 mm).
    - 5.2. The roof is protected with 0.625-inch (16 mm) Type X gypsum board directly beneath the underside of the roof sheathing or deck, supported by not less than nominal 2-inch (51 mm) ledgers attached to the sides of the roof framing members for a minimum distance of 4 feet (1220 mm).
6. Where the wall is permitted to have not less than 25 percent of the *exterior wall* areas containing unprotected openings based on *fire separation distance* as determined in accordance with Section 705.8.

Reason: The provision in Section 5.1 and 5.2 have for many years demonstrated they work as well as a parapet for residential construction. Change will allow the provision in other occupancies when the roof covering classification is a least a Class B. The R-2 and R-3 occupancies would still be permitted a Class C roof covering.

Cost Impact: Will not increase the cost of construction
Could save construction costs.Parapets require additional attention during construction. Parapets require additional attention during construction. They are an extension above the roof. Using FRTW for the sheathing in lieu of untreated wood and eliminating the labor and materials for the parapet will reduce construction costs.

FS 25-15 : 705.11-HOLLAND4428

FS 26-15

705.11.1

Proponent: Galen Taylor, County of Los Angeles Fire Department, representing self (galentaylor@me.com); Adria Reinertson, Riverside County Fire Department, representing California Fire Chiefs Association (adriar@moval.org)

2015 International Building Code

Revise as follows:

705.11.1 Parapet construction. Parapets shall have the same *fire-resistance rating* as that required for the supporting wall, and on any side adjacent to a roof surface, shall have noncombustible faces for the uppermost 18 inches (457 mm), including counterflashing and coping materials. The height of the parapet shall be not less than 30 inches (762 mm) and not more than 48 inches (1219 mm) above the point where the roof surface and the wall intersect. Where the roof slopes toward a parapet at a slope greater than two units vertical in 12 units horizontal (16.7-percent slope), the parapet shall extend to the same height as any portion of the roof within a *fire separation distance* where protection of wall openings is required, ~~but~~ in no case shall the height of the parapet be less than 30 inches (762 mm).

Exception: Parapets shall not be limited to 48 inches (1219 mm) in height where approved by the fire ode official.

Reason: Firefighting operations typically require accessing the roof, from the exterior, to perform critical ventilation operations. Firefighters performing such operations may also need to rapidly retreat from their roof-top positions. Excessively high parapets present an immovable obstacle to firefighters when sudden changes in roof-top firefighting operations require an immediate evacuation. Excessively high parapets also prevent firefighters from shouting or signally for help should their hand-held radio stop working.

This proponent has seen building projects involving parapets up to nine feet high on all four sides. Planning Departments also are prone to imposing view-screen requirements at the edge of building roofs which present an equivalent barrier to roof-top access and egress. With the advent of roof-top gardens, the use of parapets as a screening tool will likely increase. However, since the building code is silent regarding maximum parapet heights, jurisdictional authorities are hard pressed to impose a maximum height limit. This proposal would impose a limit on parapets heights while still allowing a reasonable degree of flexability on a case by case basis.

Cost Impact: Will not increase the cost of construction

Since no additional construction materials are involved in limiting maximum parapet height there should be no additional costs imposed by this code amendment.

FS 26-15 : 705.11.1-TAYLOR5108

FS 27-15

706.1.1.1 (New)

Proponent: Adolf Zubia, representing Fire Code Action Committee (fcac@iccsafe.org)

2015 International Building Code

Add new text as follows:

706.1.1.1 Fire walls not required Fire walls are not required on lot lines dividing a building for ownership purposes where the aggregate height and area of the portions of the building located on both sides of the lot line do not exceed the maximum height and area requirements of this code. The code official shall be provided with copies of dedicated access easements and contractual agreements that permit the owner of the portion of the building located on either side of the lot line access to the other side for purposes of maintaining fire and life safety systems necessary for the operation of the building.

Reason: This proposal is submitted by the ICC Fire Code Action Committee (FCAC). This ICC committee was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the Fire-CAC has held 10 open meetings and numerous Regional Work Group and Task Group meetings and conference calls which included members of the committees as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the FAC website at:
http://www.iccsafe.org/cs/CAC/Pages/default.aspx?usertoken={token}&Site=icc
Currently the only requirement for constructing a fire wall within the IBC is when a building exceeds the maximum height and area requirements of the code. This is reflected in Section 503.1 of the IBC and the user is pointed to Section 706 for the technical requirements applying to fire walls. At Section 706.1.1 the language states that if a wall is constructed on a lot line with the wall intended for use between two buildings it must be constructed as a fire wall. Two key issues are that the construction of a party wall is not mandated based upon the existence of a lot line; and, often a wall is built adjacent to a lot line, not on it, making this section moot in most cases.

This proposal is intended to recognize that it is increasingly common to have property subdivided with a lot line dividing a building for ownership purposes. this issue is addressed in Chapter 4 for malls where anchor stores have lot lines specific to the anchor store established for financial purposes along the wall that separates the mall from the anchor store. But this issue is not addressed for other types of buildings and as a result, designers, building owners and code officials are left to wrestle with the issue on a case by case basis.

The proposed language specifies that where a property line divides a building for ownership purposes, and the building portions on both sides of the line do not exceed the maximum height and area requirements of the code, a fire wall is not required to be constructed on the property line. This allowance is only permitted where copies of dedicated access easements and contractual agreements allowing for maintenance of required fire and life safety systems that straddle the separation wall be provided to the code official. This new section is intended to provide guidance to ensure consistency in application of the code to buildings divided by ownership lot lines.

Cost Impact: Will not increase the cost of construction
There will be a decrease in cost by providing for a systematic method of handling buildings that have a lot line bisecting them for ownership purposes, eliminating unnecessary alternative method applications, appeal processes and/or construction of walls not necessary for fire or life safety.

FS 27-15 : 706.1.1.1 (New)-ZUBIA4764

FS 28-15

706.2

Proponent: Edwin Huston, representing NCSEA Code Advisory Committee (huston@smithhustoninc.com)

2015 International Building Code

Revise as follows:

706.2 Structural stability. Fire walls shall be designed and constructed to allow collapse of the structure on either side without collapse of the wall under fire conditions. Fire walls designed and constructed in accordance with NFPA 221 shall be deemed to comply with this section.

> **Exception:** Modify NFPA 221, Section 4.2 to read as follows:
>
> 4.2 Design Loads. All walls and their support shall be designed for loads in accordance with IBC Chapter 16, and to withstand a minimum uniform load, Ak, of 8 lbs/ft2 (0.38 kPa) from either direction applied perpendicular to the face of the wall utilizing the load combinations for extraordinary events ASCE 7, Section 2.5.

Reason: The loading requirements for firewalls in NFPA 221 – 15 are based on Allowable Stress Design level loads. They need to be revised to coordinate with the current strength level loading of ASCE 7 and to clarify how to combine them with other loads. The 8 psf is the existing 5 psf load from 1607.14 multiplied by a load factor of 1.6 to increase it to a Strength Design load in accordance with ASCE 7 Section 2.5.

Cost Impact: Will not increase the cost of construction
This change clarifies the design loads for structural stability of the fire wall and does not add new requirements which would increase the cost of construction.

FS 28-15 : 706.2-HUSTON5246

FS 29-15

706.2

Proponent: Homer Maiel, PE, CBO, representing ICC Tri-Chapter (Peninsula, East Bay, Monterey Bay) (hmaiel@gmail.com)

2015 International Building Code

Revise as follows:

706.2 Structural stability. Fire walls shall be designed and constructed to allow collapse of the structure on either side without collapse of the wall under fire conditions. Fire walls designed and constructed in accordance with NFPA 221 shall be deemed to comply with this section.

> **Exception:** Where double fire walls are used in accordance with NFPA 221, floor and roof sheathing not exceeding 3/4 inch (19.05 mm) thickness shall be permitted to be continuous through the wall assemblies of light frame construction.

Reason: There is widely accepted interpretation by many building departments and structural engineers that the roof and floor diaphragms must be continuous to properly perform its function. The sheathing which comprises these diaphragms in light frame construction is generally wood structural panels between 7/16 inches to 23/32 inches thickness. These panels represent a very small risk of causing failure of the wall on the unaffected side of a double fire wall assembly. The benefit of performing the seismic function as a diaphragm is generally regarded as well worth any very small risk caused by fire exposure from one side of a double fire wall.
The following link is to a Structural Engineers of Southern California recommendation to carry the floor sheathing through these fire walls.

http://www.icclabc.org/uploads/Opinion_from_SEAOSC_on_Firewall_Final.pdf

Cost Impact: Will not increase the cost of construction
This code change does not create a new requirement. It allows an additional option for compliance that is not required.

FS 29-15 : 706.2-MAIEL5795

FS 30-15

706.3

Proponent: Sam Francis, American Wood Council, representing American Wood Council (sfrancis@awc.org)

2015 International Building Code

Revise as follows:

706.3 Materials. *Fire walls* shall be constructed of any of the following materials*:*

1. Fire walls in buildings of Type I or Type II construction shall be of any approved noncombustible materials.

   ~~**Exception:** Buildings~~

2. Fire walls in buildings of Type III or Type IV construction shall be of any approved noncombustible materials or of cross-laminated timber protected by a layer of 5/8 inch Type X gypsum wallboard
3. Fire walls in buildings of Type V construction shall be of any approved material.

Reason: This proposal would permit cross-laminated timber fire walls to be used in Types III and IV construction in lieu of noncombustible materials. CLT is a prefabricated engineered wood product consisting of not less than three layers of solid-sawn lumber or structural composite lumber where the adjacent layers are cross oriented and bonded with structural adhesive toform a solid wood element. These solid wood elements can easily achieve a high fire resistance rating and have inherent structural advantages in fire conditions, when protected and rated appropriately. CLT has been shown by fire testing to perform well and will offer flexibility and practicality of design.

Cost Impact: Will not increase the cost of construction
there would be a decrease in construction costs with this proposal. Fire Walls could be constructed of the same material as the exterior walls utilizing methods and materials less expensive than noncombustible walls and with savings on labor as well. Fire tests conducted on this material has shown it to perform very well under fire conditions.

FS 30-15 : 706.3-FRANCIS5269

FS 31-15

706.3

Proponent: Homer Maiel, PE, CBO, representing ICC Tri-Chapter (Peninsula, East Bay, Monterey Bay) (hmaiel@gmail.com)

2015 International Building Code

Revise as follows:

706.3 Materials. *Fire walls* shall be of any *approved* noncombustible materials.

~~Exception~~Exceptions:

1. Buildings of Type V construction.
2. Two 2-hour fire walls of wood or steel light frame construction, with structural wood panel sheathing, shall be permitted to be substituted for a 3-hour non-combustible fire wall in building of Type III construction.

Reason: Substituting two 2-hour light frame walls for a single required 3-hour wall provides flexibilty in design and construction while improving fire resistance, which outweighs material considerations. Some current fire walls designs in Type III construction call for the construction of three separate walls in order to accomplish the required rating with a noncombustible assembly in the center and a light frame assembly on each side with plywood sheathing providing vertical support and serving as a shear wall for the building on each side of the fire wall. Each of these walls could be utilized as a 2-hour fire wall with the floor sheathing continuous through at the floor and roof levels as proposed in a separate code change for Section 706.2. This proposed arangement provides a better structural solution and also is an opportunity to minimize air infiltration or loss through the space between walls. This allows improved effeciency of materials and design while also improving structural and energy performance. From a fire standpoint, it is felt two 2-hour walls walls are better or equivalent to one 3-hour wall.
The following link is to a Structural Engineers of Southern California recommendation to carry the floor sheathing through fire walls.

http://www.icclabc.org/uploads/opinion_from_SEAOSC_on_Firewall_Final.pdf

Cost Impact: Will not increase the cost of construction
This code change does not create a new requirement. It allows an additional option for compliance that is not required.

FS 31-15 : 706.3-MAIEL5792

FS 32-15

706.5.1

Proponent: Stephen Thomas, representing Colorado Chapter (sthomas@coloradocode.net)

2015 International Building Code

Revise as follows:

706.5.1 Exterior walls. Where ~~the~~ a *fire wall* intersects an *exterior* ~~walls~~*wall*, the *fire-resistance rating* and opening protection of the *exterior walls* shall comply with one of the following:

1. The *exterior walls* on both sides of the *fire wall* shall have a 1-hour *fire-resistance rating* with $^3/_4$-hour ~~protection where~~ opening ~~protection is required by Section 705.8~~protectives. The *fire-resistance rating* of the *exterior wall* shall extend not less than 4 feet (1220 mm) on each side of the intersection of the *fire wall* to *exterior wall*. The maximum area of protected openings located in the 4-foot (1220 mm) exterior wall segments shall not exceed 15 percent of the wall segment in any story. *Exterior wall* intersections at *fire walls* that form an angle equal to or greater than 180 degrees (3.14 rad) do not need *exterior wall* protection.
2. Buildings or spaces on both sides of the intersecting *fire wall* shall assume to have an imaginary *lot line* at the *fire wall* and extending beyond the exterior of the *fire wall*. The location of the assumed line in relation to the *exterior walls* and the *fire wall* shall be such that the *exterior wall* and opening protection meet the requirements set forth in Sections 705.5 and 705.8. Such protection is not required for *exterior walls* terminating at *fire walls* that form an angle equal to or greater than 180 degrees (3.14 rad).

Reason: The current language in the code is confusing regarding the exterior openings on each side of a fire wall terminating at the exterior wall. It references required protected openings in Section 705.8. Table 705.8 limits the area of unprotected and protected openings based on fire separation distance. It does not "require" protected openings anywhere. We have set a limitation of 15% of the area of the protected wall to limit the amount of openings. The 15% is based on the amount of protected openings permitted in Table 705.8 for a fire separation distance of 3-5 feet. We have also done some minor editorial revisions to make the section read better.

Cost Impact: Will not increase the cost of construction
This change is a clarification of the code language. It will not affect the cost of construction.

FS 32-15 : 706.5.1-THOMAS4434

FS 33-15

706.8

Proponent: David Kulina, representing Engel Architects (david@engelarch.com)

2015 International Building Code

Revise as follows:

706.8 Openings. Each opening through a *fire wall* shall be protected in accordance with Section 716.5 and shall not exceed 156 square feet (15 m^2). The aggregate width of openings <u>in a wall over 24 feet long</u> at any floor level shall not exceed 25 percent of the length of the wall.

Exceptions:

1. Openings are not permitted in party walls constructed in accordance with Section 706.1.1.
2. Openings shall not be limited to 156 square feet (15 m^2) where both buildings are equipped throughout with an *automatic sprinkler system* installed in accordance with Section 903.3.1.1.

Reason: Occassionally, a limited fire wall is needed to separate two buildings that are connected with a narrow corridor. For example, two 100,000 s.f. warehouses may be connected by a 12' access tunnel. The 25% rule limits the opening to 36". Assuming the firewall would be 48" outside each wall of the corridor, the proposed change would allow that opening to be 12' wide. The 24' limit proposed would allow for loads up to 16" wide, which would accomodate most wide industrial loads.

Cost Impact: Will not increase the cost of construction
Cost will not be increased.There's not a definite impact on cost. For example, a coiling fire door costs $1.50 / s.f., which is more than the cost of block. So, allowing a larger coiling fire door in a wall would mean additional cost. However, in some circumstances, it will allow two buildings to have a smaller link between the structures, thus saving money.

FS 33-15 : 706.8-KULINA4548

Part III:

715.7 (New), Chapter 35

THIS IS A 3 PART CODE CHANGE. ALL PARTS WILL BE HEARD BY THE IBC-FIRE SAFETY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THIS COMMITTEE.

Proponent: Tony Crimi, representing International Firestop Council (tcrimi@sympatico.ca)

Part I

2015 International Building Code

706.10 Joints. Joints made in or between *fire walls* shall comply with Section 715.

Add new text as follows:

706.10.1 Joints at floors. Where a fire wall is permitted to terminate at the underside of the roof sheathing, deck or slab in accordance with 706.6, joints at the intersection of a fire wall and the underside of a fire-resistance-rated roof assembly, slab or deck above shall comply with Section 715.

706.10.2 Joints at nonfire-resistance rated roof intersections in lieu of parapets. Where vertical continuity in accordance with section 706.6 is not provided by a parapet, joints at the intersection of a fire wall and a nonfire-resistance-rated roof assembly, roof slab, or roof deck shall be protected by an approved continuity head of wall joint system installed as tested in accordance with ASTM E2837. The system shall have an F rating/T rating of not less than that of the firewall.

Add new standard(s) as follows:
Add new Referenced Standard to Chapter 35 as follows:

ASTM E2837, Standard Test Method for Determining the Fire Resistance of Continuity Head-of-Wall Joint Systems Installed between Rated Wall Assemblies and Nonrated Horizontal Assemblies.

Part II

2015 International Building Code

Revise as follows:

707.9 ~~Voids~~Joints at intersections. The ~~voids created~~joints at the intersection of a *fire barrier* and ~~a nonfire-resistance-rated roof assembly or~~the underside of a nonfire-resistance-rated ~~exterior wall assembly~~sheathing, slab or deck above shall be filled._ An approved material or system shall be used to fill the ~~void~~joint, and shall be securely installed in or on the intersection for its entire length so as not to dislodge, loosen or otherwise impair its ability to accommodate expected building movements and to retard the passage of fire and hot gases.

Add new text as follows:

707.10 Joints at intersections of fire barriers and nonfire-resistance-rated exterior walls The joints at the intersection of a fire barrier and a nonfire-resistance-rated exterior wall assembly shall be filled. An approved material or system shall be used to fill the joint, and it shall be securely installed in or on the intersection for its entire length so as not to dislodge, loosen or otherwise impair its ability to accommodate expected building movements and to retard the passage of fire and hot gases.

715.4 Joints between fire barriers and nonfire-resistance-rated roofs Where required elsewhere in this code,joints at the intersection of fire barriers and the underside of a nonfire-resistance-rated roof sheathing, slab or deck above shall be protected by an approved continuity head-of-wall joint system installed as tested in accordance with ASTM E 2837 to provide a F rating for a time period not less than the required fire-resistance rating of the wall assembly in which it is installed.

715.4.1 Installation Continuity head-of-wall joint systems shall be securely installed in or over the joint for its entire length so as not to dislodge, loosen or otherwise impair its ability to accommodate expected building movements and to retard the passage of fire and hot gases.

Add new standard(s) as follows:
ASTM E 2837-13 Standard Test Method for Determining the Fire Resistance of Continuity Head-of-Wall Joint Systems

Installed Between Rated Wall Assemblies and Nonrated Horizontal Assemblies

Part III

2015 International Building Code

Add new text as follows:

715.7 Joints at top of wall Intersections in fire barriers The voids created at the intersection of a fire barrier and a non-fire-resistance-rated floor or roof sheathing, slab or deck above shall be protected by an approved continuity head of wall joint system installed as tested in accordance with ASTM E2837. The system shall have an F rating/T rating of minimum 1 hour, but not less than that of the fire barrier.

Add new standard(s) as follows:
ASTM E 2837-13, Standard Test Method for Determining the Fire Resistance of Continuity Head-of-Wall Joint Systems Installed between Rated Wall Assemblies and Nonrated Horizontal Assemblies

Reason:

Part I: The Code allows several exceptions to the general requirement for vertical continuity of fire walls in section 706.6, and specifically to the requirement to have a parapet. However, unlike for fire barriers, the Code is silent as to how the joints created between the top of a fire wall and a fire-resistance rated and/or non-fire-resistance rated roof are to be protected from fire spread through the top-of-wall joint when any of the parapet exceptions are used.
In the case of fire barriers, which are a less critical building safety feature than fire walls, Section 707.9 was added to the 2012 IBC to clarify that voids created at the intersection of a fire barrier and a nonfire-resistance rated roof assembly must be filled with an approved material or system to prevent fire spread. One example of such an application is a fire barrier used to separate occupancies in a metal (typically pre-engineered) building that would not have a fire-rated roof. The ASTM E 2837 Standard evaluates continuity head-of-wall joint systems for this specific application. The joint systems tested and listed in accordance with ASTM E2837 provide an assurance that the installed joint detail will provide the continuity of fire resistance established by the rated wall assembly, right up to the deck above.

In the hierarchy of passive fire protection construction elements, fire walls are used in the most critical locations and applications. The code language proposed here parallels that of sections 707.8 and 707.9 for fire barriers, except that in 706.12, the ASTM E2837 standard has been referenced. Using tested joint systems at the top of the firewall where the firewall ends below the roof deck will provide an assurance that fire cannot get past the fire wall at this potential weak point. None of the joint systems listed by UL for this application require any modifications to the wall or to the roof deck. The test is focused only on the fire performance of the joint itself.

At the time Section 707.9 was proposed to address the top-of-wall joint for fire barriers intersecting a non-rated roof, no consensus test standard existed to test head-of-wall joint systems involving nonfire-resistance rated horizontal assemblies. Therefore, the 2012 code described how the void protection is to be provided. However, it is rather subjective for the designer and code official to determine. ASTM E 2837, "Standard Test Method for Determining the Fire Resistance of Continuity Head-of-Wall Joint Systems Installed Between Rated Wall Assemblies and Nonrated horizontal Assemblies" was developed precisely to address this condition. This standard allows for the objective evaluation of a joint's ability to prevent fire spread through the joint installed at the intersection of a rated wall assembly and a non-rated roof assembly.

The ASTM E 2837 F and T ratings directly address the top-of-wall joint performance requirements specified in 707.9 that the material or system will not dislodge, loosen or otherwise impair its ability to accommodate expected building movements and to retard the passage of fire and hot gases. For fire walls, the Code should specify a test method for the top-of-wall joint to ensure that this performance is achieved without any doubt.

Part II: The 2012 and later editions of the International Building Code have a provision whereby the voids created at the intersection of a fire barrier and the underside of a nonfire-resistance-rated roof sheathing, slab or deck above shall be filled with an approved material or system. While this language gives the code official the ability to accept some matching tested system, it does not acknowledge the existence of a new fire test standard and tested systems that specifically addresses the fire performance of these joints. This proposal then recognizes the existence of the new Standard ASTM E 2837, entitled "Standard Test Method for Determining the Fire Resistance of Continuity Head-of-Wall Joint Systems Installed Between Rated Wall Assemblies and Nonrated Horizontal Assemblies", along with the tested systems. Since there are a limited number of published systems at this time, the use of system is being proposed as an option to the current allowance of an approved material or system. If desired, at some later date, when more tested systems are available, the code language can be revised once again to mandated tested systems in much the same way systems tested to ASTM E 1966 or UL 2079 are mandated for rated-to-rated construction.

Part III: Chapter 7 of the IBC has numerous requirements for continuity of vertical and horizontal fire resistance rated assemblies. Wall continuity (i.e. continuity of fire resistance) is required at joint openings, which are typically linear voids, gaps, openings, or other discontinuities within an assembly, or at the intersection with other assemblies. For the intersection of a rated wall assembly and nonrated horizontal assembly above (floor or roof), the joint between the two assemblies would need to provide the same fire resistance as the rated wall assembly. A joint detail with fire resistance less than that of the wall would allow for the propagation of fire and/or smoke to the other side of the wall much earlier than the rated wall would, thus diminishing the life safety function of the rated wall, and even making the wall near useless if the fire and/or smoke are able to spread very quickly through the joint above the wall to the other side of the fire barrier.
Test methods ASTM E1966 and UL 2079, which are referenced in the IBC, are only applicable to the testing of joints between two intersecting assemblies if both of the assemblies are fire resistance rated. To allow the evaluation of the fire resistance of joint details between a fire resiatance rated wall and a non-fire rated roof or floor above, ASTM began work in 2007 on a new test method. That test standard was completed and issued in 2011, and was issued as "ASTM E2837, Standard Test Method for Determining the Fire Resistance of Continuity Head-of-Wall Joint Systems Installed between Rated Wall Assemblies and Nonrated Horizontal Assemblies". With the standard having existed for almost 4 years, both UL and Intertek now

have tested system listings in accordance with the standard.

It is important to note that none of the listed systems requires any modifications at all to the wall assembly or to the floor or roof assembly above. The listed systems simply specify the materials that are needed to fill and seal the joint in a manner that will prevent premature fire spread through that joint. As indicated by the title of the ASTM standard ("Continuity Head of Wall Joint Systems"), the test is designed to evaluate the continuity of the wall's fire resistance rating up to the underside of the floor or roof deck above. Passing the test means that the joint detail must not allow fire spread through the joint prior to the given fire resistance rating, which would normally be the fire resistance rating of the fire barrier wall.

Section 707.5 requires smoke barriers to form an effective membrane continuous from the top of the foundation or floor/ceiling assembly below to the underside of the floor or roof sheathing, deck or slab above, including continuity through concealed spaces, such as those found above suspended ceilings, and interstitial structural and mechanical spaces. Section 707.9 of the IBC requires the joint opening at the top of the rated fire barrier wall assembly below the nonrated horizontal assembly to be protected, using performance language and dictating that the chosen material or system be approved. The ASTM E 2837 Standard was created to evaluate continuity head-of-wall joint systems for this specific application, providing exactly the code-mandated performance. Using a tested joint detail, instead of allowing joint details to be improvised for each and every building and then requiring the AHJ to approve the detail, will prvide a measure of consistency, predictability, and an even level of life safety from one building to the next.

To achieve the rating, the joint system must remains in the opening during the fire resistance test and the hose stream test, and will have withstood the fire resistance test for the rating period equal to the rated wall assembly by preventing flaming on the unexposed side of the test specimen and on the underside of the nonrated horizontal assembly on the unexposed side. The Integrity test also ensures no occurrence of ignition of the cotton pad, which is related to the passage of hot gases in the current IBC 707.9 requirements.

Cost Impact:

Part I: Will not increase the cost of construction
Based on the continuity provisions, these joints are already required to be addressed.

Part II: Will not increase the cost of construction
This code change will not increase the cost of construction as it does not mandate a tested system. In cases where a tested system would be the option chosen, the cost of construction will vary. In some cases, it may be decreased, due to the time saved (and therefore expense saved) by not needing to engineer and get approval for a custom-designed solution.

Part III: Will increase the cost of construction
This proposal may increase the cost of construction if the chosen joint detail for a given installation requires more work or higher cost materials than an inferior joint detail that an AHJ might have been willing to approve. This proposal may decrease the cost of construction in cases where it allows a contractor to simply specify a tested and listed detail, thus saving on the time and costs of designing a unique joint detail and getting that detail approved.

Analysis:

Part I: A review of the standard proposed for inclusion in the code, ASTM E2837, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2015.

Part II: A review of the standard proposed for inclusion in the code, ASTM E2837, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2015.

Part III: A review of the standard proposed for inclusion in the code, ASTM E2837, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2015.

FS 34-15 : 706.10.1 (New)-CRIMI4301

FS 35-15

707.3.11 (New), 711.2.4.7 (New)

Proponent: Adolf Zubia, ICC Staff, representing Fire Code Action Committee (fcac@iccsafe.org)

2015 International Building Code

Add new text as follows:

707.3.11 Fire Pump Rooms. The *fire barriers* separating fire pump rooms from other building areas shall have a *fire-resistance rating* of not less than that is indicated in Section 913.2.1.

711.2.4.7 Fire Pump Rooms. The *horizontal assemblies* separating fire pump rooms from other building areas shall have a *fire-resistance rating* of not less than that is indicated in Section 913.2.1.

Reason: This proposal is submitted by the ICC Fire Code Action Committee (FCAC). This ICC committee was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the Fire-CAC has held 6 open meetings and numerous Regional Work Group and Task Group meetings and conference calls which included members of the committees as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the FAC website at: http://www.iccsafe.org/cs/CAC/Pages/default.aspx?usertoken={token}&Site=icc
Fire pump rooms are constructed of fire barriers and horizontal assemblies as stated in Section 913.2.1 but a pointer should be inserted in the fire barrier section for designers and code officials. F203–07/08 inserted 912.2.1, however, it was never correlated to the fire barrier or horizontal assembly section in Chapter 7.

Cost Impact: Will not increase the cost of construction
This change does not add any new requirements for fire resistance rated separation of fire pump rooms. It merely provides guidance to the designer by pointing to the existing requirements for both vertical and horizontal separation.

FS 35-15 : 707.3.11 (New)-ZUBIA4193

FS 36-15

707.6

Proponent: Joseph Hetzel, representing Door & Access Systems Manufacturers Association (Jhetzel@thomasamc.com)

2015 International Building Code

Revise as follows:

707.6 Openings. Openings in a *fire barrier* shall be protected in accordance with Section 716. Openings shall be limited to a maximum aggregate width of 25 percent of the length of the wall, and the maximum area of any single opening shall not exceed 156 square feet (15 m^2). Openings in enclosures for exit access stairways and ramps, interior exit stairways and ramps and exit passageways shall also comply with Sections 1019, 1023.4 and 1024.5, respectively.

Exceptions:

1. Openings shall not be limited to 156 square feet (15 m^2) where adjoining floor areas are equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1.
2. Openings shall not be limited to 156 square feet (15 m^2) or an aggregate width of 25 percent of the length of the wall where the opening protective is a fire door serving enclosures for exit access stairways and ramps, and interior exit stairways and ramps.
3. Openings shall not be limited to 156 square feet (15 m^2) or an aggregate width of 25 percent of the length of the wall where the opening protective has been tested in accordance with ASTM E 119 or UL 263 and has a minimum *fire-resistance rating* not less than the *fire-resistance rating* of the wall.
4. Fire window assemblies permitted in atrium separation walls shall not be limited to a maximum aggregate width of 25 percent of the length of the wall.
5. Openings shall not be limited to 156 square feet (15 m^2) or an aggregate width of 25 percent of the length of the wall where the opening protective is a fire door assembly in a *fire barrier* separating an enclosure for *exit access* stairways and ramps, and interior exit stairways and ramps from an exit passageway in accordance with Section 1023.3.1.
6. <u>Openings shall not be limited to 156 square feet (15 m2) or an aggregate width of 25 percent of the length of the wall where the opening protective is a rolling steel *fire door* tested in accordance with UL 10B or NFPA 252 and labeled in accordance with Section 716.5.7.2.</u>

Reason: The current Exceptions do not address rolling steel fire doors, the most common opening protective greater than 156 square feet (15 m^2). The proposed Exception reflects long-standing common practice where the use of rolling steel fire doors have been determined to be both necessary and practical as opening protectives. Rolling steel fire doors offer benefits and provide solutions for opening protection not available with other types of fire doors and should also qualify for exception.

Cost Impact: Will not increase the cost of construction
None.We believe the proposed change is consistent with common current practice and therefore only permits what is already being done. Since it is already being done, there is no effect on product or cost and therefore requires no further study.

FS 36-15 : 707.6-HETZEL3421

FS 37-15

707.9

Proponent: Masoud Sabounchi, representing masoud sabounchi (masoud@acecode.com)

2015 International Building Code

Revise as follows:

707.9 Voids at intersections. The voids created at the intersection of a *fire barrier* and~~ a nonfire-resistance-rated roof assembly or~~ a nonfire-resistance-rated exterior wall assembly shall be filled. An approved material or system shall be used to fill the void, and shall be securely installed in or on the intersection for its entire length so as not to dislodge, loosen or otherwise impair its ability to accommodate expected building movements and to retard the passage of fire and hot gases.

Reason: Section 707.5 requires fire barriers to be continuous through concealed spaces and be attached to the underside of the floor or roof sheathing, slab or deck. Section 707.9 creates a conflict with section 707.5 by allowing the fire barriers to terminate at the ceiling and the cavity space above the ceiling to be filled. Section 707.9 would allow fire barriers such as shafts, occupancy separations and similar to be discontinued through the cavity space of a non-fire resistance rated roof-ceiling assembly while the same fire barrier has to be continuous thru the cavity space of a fire resistance rated roof-ceiling assembly. This proposal coordinates section 707.9 with 707.5.

Cost Impact: Will not increase the cost of construction
This proposal is for coordiantion of section 707.9 with 707.5

FS 37-15 : 707.9-SABOUNCHI4361

FS 38-15

708.4, 718.4.2

Proponent: Marshall Klein, representing National Multtfamily Housing Council (makleinfpe@comcast.net)

2015 International Building Code

Revise as follows:

708.4 Continuity. Fire partitions shall extend from the top of the foundation or floor/ceiling assembly below to the underside of the floor or roof sheathing, slab or deck above or to the fire-resistance-rated floor/ceiling or roof/ceiling assembly above, and shall be securely attached thereto. In combustible construction where the *fire partitions* are not required to be continuous to the sheathing, deck or slab, the space between the ceiling and the sheathing, deck or slab above shall be fireblocked or draftstopped in accordance with Sections 718.2 and 718.3 at the partition line. The supporting construction shall be protected to afford the required *fire-resistance rating* of the wall supported, except for walls separating tenant spaces in *covered and open mall buildings*, walls separating *dwellingunits*, walls separating *sleeping units* and *corridor* walls, in buildings of Type IIB, IIIB and VB construction.

Exceptions:

1. The wall need not be extended into the crawl space below where the floor above the crawl space has a minimum 1-hour *fire-resistance rating*.
2. Where the room-side fire-resistance-rated membrane of the *corridor* is carried through to the underside of the floor or roof sheathing, deck or slab of a fire-resistance-rated floor or roof above, the ceiling of the *corridor* shall be permitted to be protected by the use of ceiling materials as required for a 1-hour fire-resistance-rated floor or roof system.
3. Where the *corridor* ceiling is constructed as required for the *corridor* walls, the walls shall be permitted to terminate at the upper membrane of such ceiling assembly.
4. The fire partitions separating tenant spaces in a *covered or open mall building*, complying with Section 402.4.2.1, are not required to extend beyond the underside of a ceiling that is not part of a fire-resistance-rated assembly. A wall is not required in *attic* or ceiling spaces above tenant separation walls.
5. Attic fireblocking or draftstopping is not required at the partition line in Group R-2 ~~buildings that do not exceed~~occupancies up to and including four *stories* in height in buildings not exceeding 60 feet in height *abovegrade plane*, provided the *attic* space is subdivided by draftstopping into areas not exceeding 3,000 square feet (279 m^2) or above every two *dwellingunits*, whichever is smaller.
6. Fireblocking or draftstopping is not required at the partition line in buildings equipped with an *automatic sprinkler system* installed throughout in accordance with Section 903.3.1.1 or 903.3.1.2, provided that automatic sprinklers are installed in combustible floor/ceiling and roof/ceiling spaces.

718.4.2 Groups R-1 and R-2. Draftstopping shall be provided in *attics*, mansards, overhangs or other concealed roof spaces of Group R-2 buildings with three or more *dwellingunits* and in all Group R-1 buildings. Draftstopping shall be installed above, and in line with, *sleeping unit* and *dwellingunit* separation walls that do not extend to the underside of the roof sheathing above.

Exceptions:

1. Where *corridor* walls provide a *sleeping unit* or *dwellingunit* separation, draftstopping shall only be required above one of the *corridor* walls.
2. Draftstopping is not required in buildings equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1.
3. In occupancies in Group R-2 ~~that do not exceed~~up to and including four *stories*in height in buildings not exceeding 60 feet in height *abovegrade plane*, the *attic* space shall be subdivided by *draftstops* into areas not exceeding 3,000 square feet (279 m^2) or above every two *dwellingunits*, whichever is smaller.
4. Draftstopping is not required in buildings equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.2, provided that automatic sprinklers are installed in the combustible concealed space where the draftstopping is being omitted.

Reason: Completing correlation between the I-Codes and NFPA 13R's scope, which was partially done last code cycle under Proposal F134-13, approved as modified. That proposal correlated Section 903.3.1.2 with NFPA 13R Section 1.1. This code proposal correlates these two exceptions with Section 903.3.1.2, recognizing that the intent of the exceptions is to cover buildings protected by NFPA 13R systems and limit the exceptions to buildings not exceeding 60-feet in height above grade plane. As currently written, the exceptions could be applied to buildings that are taller than 60 feet, which was not intended and should not be allowed.

Cost Impact: Will not increase the cost of construction
Code Proposal's intent is just to clarify the intended application of the exceptions.

FS 38-15 : 708.4-KLEIN5265

FS 39-15

708.4, 718.4.2

Proponent: Joseph Holland, representing Hoover Treated Wood Products (jholland@frtw.com)

2015 International Building Code

Revise as follows:

708.4 Continuity. Fire partitions shall extend from the top of the foundation or floor/ceiling assembly below to the underside of the floor or roof sheathing, slab or deck above or to the fire-resistance-rated floor/ceiling or roof/ceiling assembly above, and shall be securely attached thereto. In combustible construction where the *fire partitions* are not required to be continuous to the sheathing, deck or slab, the space between the ceiling and the sheathing, deck or slab above shall be fireblocked or draftstopped in accordance with Sections 718.2 and 718.3 at the partition line. The supporting construction shall be protected to afford the required *fire-resistance rating* of the wall supported, except for walls separating tenant spaces in *covered and open mall buildings*, walls separating *dwellingunits*, walls separating *sleeping units* and *corridor* walls, in buildings of Type IIB, IIIB and VB construction.

Exceptions:

1. The wall need not be extended into the crawl space below where the floor above the crawl space has a minimum 1-hour *fire-resistance rating*.
2. Where the room-side fire-resistance-rated membrane of the *corridor* is carried through to the underside of the floor or roof sheathing, deck or slab of a fire-resistance-rated floor or roof above, the ceiling of the *corridor* shall be permitted to be protected by the use of ceiling materials as required for a 1-hour fire-resistance-rated floor or roof system.
3. Where the *corridor* ceiling is constructed as required for the *corridor* walls, the walls shall be permitted to terminate at the upper membrane of such ceiling assembly.
4. The fire partitions separating tenant spaces in a *covered or open mall building*, complying with Section 402.4.2.1, are not required to extend beyond the underside of a ceiling that is not part of a fire-resistance-rated assembly. A wall is not required in *attic* or ceiling spaces above tenant separation walls.
5. Attic fireblocking or draftstopping is not required at the partition line in Group R-2 buildings that do not exceed four *storiesabovegrade plane*, provided the *attic* space is subdivided by draftstopping into areas not exceeding 3,000 square feet (279 m^2) or above every two *dwellingunits*, whichever is smaller.
6. Fireblocking or draftstopping is not required at the partition line in buildings equipped with an *automatic sprinkler system* installed throughout in accordance with Section 903.3.1.1 or 903.3.1.2, provided <u>either:</u>
   - 6.1. that automatic sprinklers are installed in combustible floor/ceiling and roof/ceiling spaces<u> or,</u>
   - 6.2. <u>that the combustible floor/ceiling and roof/ceiling spaces are constructed entirely of fire-retardant-treated-wood complying with Section 2303.2</u>.

718.4.2 Groups R-1 and R-2. Draftstopping shall be provided in *attics*, mansards, overhangs or other concealed roof spaces of Group R-2 buildings with three or more *dwellingunits* and in all Group R-1 buildings. Draftstopping shall be installed above, and in line with, *sleeping unit* and *dwellingunit* separation walls that do not extend to the underside of the roof sheathing above.

Exceptions:

1. Where *corridor* walls provide a *sleeping unit* or *dwellingunit* separation, draftstopping shall only be required above one of the *corridor* walls.
2. Draftstopping is not required in buildings equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1.
3. In occupancies in Group R-2 that do not exceed four *storiesabovegrade plane*, the *attic* space shall be subdivided by *draftstops* into areas not exceeding 3,000 square feet (279 m^2) or above every two *dwellingunits*, whichever is smaller.
4. Draftstopping is not required in buildings equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.2, provided <u>either:</u>
   - 4.1. that automatic sprinklers are installed in the combustible concealed space where the draftstopping is being omitted<u> or,</u>
   - 4.2. <u>that the combustible concealed space is constructed entirely of fire-retardant-treated-wood complying with Section 2303.2</u>.

Reason: FRTW is permitted in numerous areas of the Code in non-combustible construction because of its fire retardant properties and excellent fire data history. Even under the NFPA 13 Sprinkler Standard, combustible concealed spaces that are constructed entirely of FRTW are not required to have sprinkler protection (NFPA 13 Section 8.15.1.2.11).

Such an alternative also provides better for proper ventilation of the attic space above dwelling units. In typical multiple-family construction, with dwelling units along the front and back of the building, trusses run front to rear with soffit vents at each end. When draftstopping or firestopping are required at each dwelling unit, it usually blocks achieving proper cross ventilation, eliminating the use of ridge vents. Soffit and ridge venting allow natural air circulation that, in turn, lowers the roof sheathing temperature in the winter, relieving many of the problems associated with ice dams. Therefore, providing an alternative to drafttstopping, firestopping or sprinklering such concealed spaces would be reasonable not only from a life safety and fire protection standpoint, but also provide better ventilation and energy compliance.
In typical multiple-family construction, with dwelling units along the front to rear with soffit vents at each end. If draftstopping were required at each dwelling unit, it would block cross ventilation, eliminating the use of ridge vents. Soffit and ridge venting allow natural air circulation that, in turn, lowers the roof sheathing temperature in the winter, relieving many of the problems associated with ice dams.
.

Cost Impact: Will not increase the cost of construction
Will not increase the cost of construction. Only provides a reasonable option to improve attic ventilation and energy compliance by using FRT that is permitted in other sections of the Code as an alternative for other similar life safety and fire protection Code requirements

FS 39-15 : 708.4-HOLLAND5459

FS 40-15

708.4

Proponent: Masoud Sabounchi, Representing Colorado Chapter of ICC, representing masoud sabounchi (masoud@acecode.com)

2015 International Building Code

Revise as follows:

708.4 Continuity. Fire partitions shall extend from the top of the foundation or floor/ceiling assembly below to the underside of the floor or roof sheathing, slab or deck above or to the fire-resistance-rated floor/ceiling or roof/ceiling assembly above, and shall be securely attached thereto. In combustible construction where the *fire partitions* are not required to be continuous to the sheathing, deck or slab, the space between the ceiling and the sheathing, deck or slab above shall be fireblocked or draftstopped in accordance with Sections 718.2 and 718.3 at the partition line. The supporting construction shall be protected to afford the required *fire-resistance rating* of the wall supported, except for walls separating tenant spaces in *covered and open mall buildings*, walls separating *dwellingunits*, walls separating *sleeping units* and *corridor* walls, in buildings of Type IIB, IIIB and VB construction.

Exceptions:

1. The wall need not be extended into the crawl space below where the floor above the crawl space has a minimum 1-hour *fire-resistance rating*.
2. Where the room-side fire-resistance-rated membrane of the *corridor* is carried through to the underside of the floor or roof sheathing, deck or slab of a fire-resistance-rated floor or roof above, the ceiling of the *corridor* shall be permitted to be protected by the use of ceiling materials as required for a 1-hour fire-resistance-rated floor or roof system.
3. Where the *corridor* ceiling is constructed as required for the *corridor* walls, the walls shall be permitted to terminate at the upper membrane of such ceiling assembly.
4. The fire partitions separating tenant spaces in a *covered or open mall building*, complying with Section 402.4.2.1, are not required to extend beyond the underside of a ceiling that is not part of a fire-resistance-rated assembly. A wall is not required in *attic* or ceiling spaces above tenant separation walls.
5. Attic fireblocking or draftstopping is not required at the partition line in Group R-2 buildings that do not exceed four *storiesabovegrade plane*, provided the *attic* space is subdivided by draftstopping into areas not exceeding 3,000 square feet (279 m^2) or above every two *dwellingunits*, whichever is smaller.
6. Fireblocking or draftstopping is not required at the partition line in buildings equipped with an *automatic sprinkler system* installed throughout in accordance with Section 903.3.1.1 or 903.3.1.2, provided that automatic sprinklers are installed in combustible floor/ceiling and roof/ceiling spaces.
7. <u>Draftstopping is not required in buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1.</u>

Reason: Sections 718.3.2 exception #1, 718.3.3 exception, 718.4.2 exception #2, and 718.4.3 exception allow elimination of draft stops in concealed combustible floor or attic spaces when the building is equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 (NFPA 13). Section 708.4 exception 6 allows elimination of draftstopping when a NFPA 13 sprinkler system is installed and the combustible floor and attic spaces are sprinkler protected, Exceptions in section 718.3 and 718.4 do not require sprinkler protection of combustible floor of attic spaces to allow elimination of draft stops when building is protected by a NFPA 13 automatic sprinkler system. NFPA 13 has specific provisions that would allow elimination of sprinkler protection in combustible concealed spaces (such as filling the combustible concealed spaces with non-combustible insulation). Either exceptions to section 718.3 and 718.4 have to be revised to indicate that draftstopping can only be eliminated when concealed combustible spaces are sprinkler protected or another exception would be required in Section 708.4 to coordinate the noted exceptions with each other. The proposed exception creates this consistency. The reason exception #6 of Section 708.4 remains unchanged is because this exception allows elimination of "fire blocking" as well as draftstopping while the proposed exception #7 only addresses draftstopping.

Cost Impact: Will not increase the cost of construction
The proposed addition of exception #7 to Section 708.4 will make provisions of this section consistent with the exceptions in Section 718.3 and 718.4 and will not increase the construction cost.

FS 40-15 : 708.4-SABOUNCHI4364

FS 41-15

708.4, 718.4.2

Proponent: Jeffrey Shapiro, National Multifamily Housing Council, representing National Multifamily Housing Council (jeff.shapiro@intlcodeconsultants.com); Anthony Apfelbeck, City of Altamonte Springs Building/Fire Safety, representing City of Altamonte Springs (ACApfelbeck@altamonte.org)

2015 International Building Code

Revise as follows:

708.4 Continuity. Fire partitions shall extend from the top of the foundation or floor/ceiling assembly below to the underside of the floor or roof sheathing, slab or deck above or to the fire-resistance-rated floor/ceiling or roof/ceiling assembly above, and shall be securely attached thereto. In combustible construction where the *fire partitions* are not required to be continuous to the sheathing, deck or slab, the space between the ceiling and the sheathing, deck or slab above shall be fireblocked or draftstopped in accordance with Sections 718.2 and 718.3 at the partition line. The supporting construction shall be protected to afford the required *fire-resistance rating* of the wall supported, except for walls separating tenant spaces in *covered and open mall buildings*, walls separating *dwellingunits*, walls separating *sleeping units* and *corridor* walls, in buildings of Type IIB, IIIB and VB construction.

Exceptions:

1. The wall need not be extended into the crawl space below where the floor above the crawl space has a minimum 1-hour *fire-resistance rating*.
2. Where the room-side fire-resistance-rated membrane of the *corridor* is carried through to the underside of the floor or roof sheathing, deck or slab of a fire-resistance-rated floor or roof above, the ceiling of the *corridor* shall be permitted to be protected by the use of ceiling materials as required for a 1-hour fire-resistance-rated floor or roof system.
3. Where the *corridor* ceiling is constructed as required for the *corridor* walls, the walls shall be permitted to terminate at the upper membrane of such ceiling assembly.
4. The fire partitions separating tenant spaces in a *covered or open mall building*, complying with Section 402.4.2.1, are not required to extend beyond the underside of a ceiling that is not part of a fire-resistance-rated assembly. A wall is not required in *attic* or ceiling spaces above tenant separation walls.
5. Attic fireblocking or draftstopping is not required at the partition line in Group R-2 buildings that do not exceed four *storiesabovegrade plane*, provided the *attic* space is subdivided by draftstopping into areas not exceeding 3,000 square feet (279 m^2) or above every two *dwellingunits*, whichever is smaller.
6. Fireblocking or draftstopping is not required at the partition line in buildings equipped with an *automatic sprinkler system* installed throughout in accordance with Section 903.3.1.1 or 903.3.1.2, provided that automatic sprinklers are installed in combustible floor/ceiling and roof/ceiling spaces.
7. <u>In attics exceeding 5,000 square feet in area or covering more than four dwelling units in R-2 occupancies, attic fireblocking or draftstopping is not required at the partition line where the attic space is subdivided by multi-layered draftstops into areas not exceeding 5,000 square feet or above every four dwelling units, whichever is smaller, using one of the following for draftstopping materials. Joints of each layer shall be staggered from other layers. If roof trusses are used, draftstopping material shall be permitted to be placed with multiple layers on one side of the truss or with one or more layers on opposite sides.</u>
    - 7.1. <u>2 or more layers of ½" gypsum board</u>
    - 7.2. <u>2 or more layers of 15/32" wood structural panel,</u>
    - 7.3. <u>3 or more layers of 7/16" oriented strand board (OSB),</u>
    - 7.4. <u>Other *approved* materials adequately supported.</u>

718.4.2 Groups R-1 and R-2. Draftstopping shall be provided in *attics*, mansards, overhangs or other concealed roof spaces of Group R-2 buildings with three or more *dwellingunits* and in all Group R-1 buildings. Draftstopping shall be installed above, and in line with, *sleeping unit* and *dwellingunit* separation walls that do not extend to the underside of the roof sheathing above.

Exceptions:

1. Where *corridor* walls provide a *sleeping unit* or *dwellingunit* separation, draftstopping shall only be required above one of the *corridor* walls.
2. Draftstopping is not required in buildings equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1.
3. In occupancies in Group R-2 that do not exceed four *storiesabovegrade plane*, the *attic* space shall be subdivided by *draftstops* into areas not exceeding 3,000 square feet (279 m^2) or above every two *dwellingunits*, whichever is smaller.

4. Draftstopping is not required in buildings equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.2, provided that automatic sprinklers are installed in the combustible concealed space where the draftstopping is being omitted.
5. In attics exceeding 5,000 square feet in area or covering more than four dwelling units in R-2 occupancies, attic fireblocking or draftstopping is not required at the partition line where the attic space is subdivided by multi-layered draftstops into areas not exceeding 5,000 square feet or above every four dwelling units, whichever is smaller, using one of the following for draftstopping materials. Joints of each layer shall be staggered from other layers. If roof trusses are used, draftstopping material shall be permitted to be placed with multiple layers on one side of the truss or with one or more layers on opposite sides.
    5.1. 2 or more layers of ½" gypsum board.
    5.2. 2 or more layers of 15/32" wood structural panel.
    5.3. 3 or more layers of 7/16" oriented strand board (OSB).
    5.4. Other approved materials adequately supported.

-

Reason: Concerns have been expressed by some fire officials regarding the expected time to failure of single layer attic draftstops; albeit, it is recognized that draftstops are not intended to offer significant fire resistance. The concept offered by this proposal is to provide draftstops that have a more robust fire performance at increased intervals, recognizing that staggered joints on multiple layers and increased material thickness to approximately one inch will significantly increase time to failure of an assembly versus what is currently permitted by the code. This improves the likelihood for an assembly to still be in place when the fire department arrives on the scene of a fire that has originated in or extended to an attic.
Using IBC Table 722.6.2(1) for guidance, 2 layers of ½" gypsum board or 2 layers of 15/32" wood structural panel (such as plywood) bonded with exterior glue may provide 20 minutes of fire resistance. OSB is also a wood structural panel, but because industry standard is to use 7/16" OSB (as compared to 15/32" plywood), 3 layers was determined to be appropriate, given the performance objectives of this section. The proposed 5,000 square foot or 4-dwelling unit (whichever is smaller) threshold for applying this exception is included to ensure that someone won't argue that attics with a total area that is smaller than these thresholds don't need any draftstopping at all.
If the proposal that rewrites the entirety of Section 708.4 is approved, it is the intent of this code change that the proposed exception become Exception 4 to the revised Section 708.4.2, and there would be no need to duplicate the exception in Section 718.

Cost Impact: Will not increase the cost of construction
This proposal offers an additional option for construction that is not mandatory; therefore, it will not increase the cost of construction.

Proponent: Jeffrey Shapiro, National Multifamily Housing Council, representing National Multifamily Housing Council (jeff.shapiro@intlcodeconsultants.com)

2015 International Building Code

Revise as follows:

708.1 General. The following wall assemblies shall comply with this section.

1. Separation walls as required by Section 420.2 for ~~Groups~~Group I-1~~, R-1, R-2~~ and ~~R-3~~Group R occupancies.
2. Walls separating tenant spaces in *covered and open mall buildings* as required by Section 402.4.2.1.
3. Corridor walls as required by Section 1020.1.
4. Elevator lobby separation as required by Section 3006.2.
5. Egress balconies as required by Section 1019.2

Delete and substitute as follows:

~~**708.4 Continuity.** Fire partitions shall extend from the top of the foundation or floor/ceiling assembly below to the underside of the floor or roof sheathing, slab or deck above or to the fire-resistance-rated floor/ceiling or roof/ceiling assembly above, and shall be securely attached thereto. In combustible construction where the *fire partitions* are not required to be continuous to the sheathing, deck or slab, the space between the ceiling and the sheathing, deck or slab above shall be fireblocked or draftstopped in accordance with Sections 718.2 and 718.3 at the partition line. The supporting construction shall be protected to afford the required *fire-resistance rating* of the wall supported, except for walls separating tenant spaces in *covered and open mall buildings*, walls separating *dwellingunits*, walls separating *sleeping units* and *corridor* walls, in buildings of Type IIB, IIIB and VB construction.~~

~~**Exceptions:**~~

1. ~~The wall need not be extended into the crawl space below where the floor above the crawl space has a minimum 1-hour *fire-resistance rating*.~~
2. ~~Where the room-side fire-resistance-rated membrane of the *corridor* is carried through to the underside of the floor or roof sheathing, deck or slab of a fire-resistance-rated floor or roof above, the ceiling of the *corridor* shall be permitted to be protected by the use of ceiling materials as required for a 1-hour fire-resistance-rated floor or roof system.~~
3. ~~Where the *corridor* ceiling is constructed as required for the *corridor* walls, the walls shall be permitted to terminate at the upper membrane of such ceiling assembly.~~
4. ~~The fire partitions separating tenant spaces in a *covered or open mall building*, complying with Section 402.4.2.1, are not required to extend beyond the underside of a ceiling that is not part of a fire-resistance-rated assembly. A wall is not required in *attic* or ceiling spaces above tenant separation walls.~~
1. ~~Attic fireblocking or draftstopping is not required at the partition line in Group R-2 buildings that do not exceed four *storiesabovegrade plane*, provided the *attic* space is subdivided by draftstopping into areas not exceeding 3,000 square feet (279 m^2) or above every two *dwellingunits*, whichever is smaller.~~
2. ~~Fireblocking or draftstopping is not required at the partition line in buildings equipped with an *automatic sprinkler system* installed throughout in accordance with Section 903.3.1.1 or 903.3.1.2, provided that automatic sprinklers are installed in combustible floor/ceiling and roof/ceiling spaces.~~

708.4 Continuity Fire partitions shall extend from the top of the foundation or floor/ceiling assembly below to:

1. The underside of the floor or roof sheathing, deck or slab above, or
2. The underside of a floor/ceiling or roof/ceiling assembly having a fire-resistance rating that is not less than the fire-resistance rating of the fire partition.

Fire partitions shall be securely attached to 1 or 2 above.

Exceptions:
1. Fire partitions shall not be required to extend into a crawl space below where the floor above the crawl space has a minimum 1-hour fire-resistance rating.
2. Fire partitions serving as a corridor wall shall not be required to extend above the lower membrane of a corridor ceiling provided the corridor ceiling membrane is equivalent to corridor wall membrane, and either:
2.1. The room-side membrane of the corridor wall extends to the underside of the floor or roof sheathing, deck or slab of a fire-resistance-rated floor or roof above, or

2.2. The building is equipped with an automatic sprinkler system installed throughout in accordance with Section 903.3.1.1 or 903.3.1.2, including automatic sprinklers installed in the space between the top of the fire partition and underside of the floor or roof sheathing, deck or slab above.
3. Fire partitions serving as a corridor wall shall be permitted to terminate at the upper membrane of the corridor ceiling assembly where the corridor ceiling is constructed as required for the corridor wall.
4. Fire partitions separating tenant spaces in a covered or open mall building complying with Section 402.4.2.1 shall not be required to extend above the underside of a ceiling. Such ceiling shall not be required to be part of a fire-resistance-rated assembly, and the attic or space above the ceiling at tenant separation walls shall not be required to be subdivided by fire partitions.

Add new text as follows:

708.4.1 Supporting construction. The supporting construction for a fire partition shall have a fire-resistance rating that is equal to or greater than the required fire-resistance rating of the supported fire partition.

Exception. In buildings of Type IIB, IIIB and VB construction, the supporting construction requirement shall not apply to fire partitions separating tenant spaces in covered and open mall buildings, fire partitions separating dwelling units, fire partitions separating sleeping units, and fire partitions serving as corridor walls.

708.4.2 Fireblocks and draftstops in combustible construction In combustible construction where fire partitions do not extend to the underside of the floor or roof sheathing, deck or slab above, the space above and along the line of the fire partition shall be provided with one of the following:

1. Fire-blocking up to the underside of the floor or roof sheathing, deck or slab above using materials complying with 718.2.1, or
2. Draftstopping up to the underside of the floor or roof sheathing, deck or slab above using materials complying with Section 718.3.1 for floors or 718.4.1 for attics.

Exceptions:
1. Buildings equipped with an automatic sprinkler system installed throughout in accordance with Section 903.3.1.1, or in accordance with Section 903.3.1.2 provided that protection is provided in the space between the top of the fire partition and underside of the floor or roof sheathing, deck or slab above as required for systems complying with Section 903.3.1.1.
2. Where corridor walls provide a sleeping unit or dwelling unit separation, draftstopping shall only be required above one of the corridor walls.
3. In Group R-2 occupancies with less than 4 dwelling units, fire-blocking and draftstopping shall not be required.
4. In Group R-2 occupancies that do not exceed four stories above grade plane, the attic space shall be subdivided by draftstops into areas not exceeding 3,000 square feet (279 m2) or above every two dwelling units, whichever is smaller.
5. In Group R-3 occupancies with less than 3 dwelling units, fire-blocking and draftstopping shall not be required in floor assemblies. This exception shall not apply to Group R-4.

Revise as follows:

718.3 Draftstopping in floors. ~~In combustible construction, draftstopping~~
Draftstopping shall be installed to subdivide floor/ceiling assemblies ~~in the locations prescribed~~where required by Section 708.4.2. In other than Group R occupancies, draftstopping shall also be installed to subdivide combustible floor/ceiling assemblies so that horizontal floor areas do not exceed 1,000 square feet (93 m2).

Exception: Buildings equipped throughout with an automatic sprinkler system in ~~Sections 718.3.2 through 718.3.3.~~accordance with Section 903.3.1.1.

Delete without substitution:

~~**718.3.2 Groups R-1, R-2, R-3 and R-4.** Draftstopping shall be provided in floor/ceiling spaces in Group R-1 buildings, in Group R-2 buildings with three or more *dwellingunits*, in Group R-3 buildings with two *dwellingunits* and in Group R-4 buildings. Draftstopping shall be located above and in line with the *dwellingunit* and *sleeping unit* separations.~~

~~**Exceptions:**~~

~~1. Draftstopping is not required in buildings equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1.~~
~~2. Draftstopping is not required in buildings equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.2, provided that automatic sprinklers are installed in the combustible concealed spaces where the draftstopping is being omitted.~~

~~**718.3.3 Other groups.** In other groups, draftstopping shall be installed so that horizontal floor areas do not exceed 1,000 square feet (93 m^2).~~

~~Exception:~~ ~~Draftstopping is not required in buildings equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1.~~

Revise as follows:

718.4 Draftstopping in attics. ~~In combustible construction, draftstopping~~ Draftstopping shall be installed to subdivide *attic* spaces where required by Section 708.4.2. In other than Group R-1 and R-2 occupancies, draftstopping shall also be installed to subdivide combustible attic spaces and combustible concealed roof spaces ~~in the locations prescribed in Sections 718.4.2 and 718.4.3~~such that any horizontal area does not exceed 3,000 square feet (279 m2). Ventilation of concealed roof spaces shall be maintained in accordance with Section 1203.2.

Exceptions. Buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1.

Delete without substitution:

~~**718.4.2 Groups R-1 and R-2.** Draftstopping shall be provided in *attics*, mansards, overhangs or other concealed roof spaces of Group R-2 buildings with three or more *dwellingunits* and in all Group R-1 buildings. Draftstopping shall be installed above, and in line with, *sleeping unit* and *dwellingunit* separation walls that do not extend to the underside of the roof sheathing above.~~

~~**Exceptions:**~~

1. ~~Where *corridor* walls provide a *sleeping unit* or *dwellingunit* separation, draftstopping shall only be required above one of the *corridor* walls.~~
~~2.~~ ~~Draftstopping is not required in buildings equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1.~~
2. ~~In occupancies in Group R-2 that do not exceed four *storiesabovegrade plane*, the *attic* space shall be subdivided by *draftstops* into areas not exceeding 3,000 square feet (279 m^2) or above every two *dwellingunits*, whichever is smaller.~~
~~3.~~ ~~Draftstopping is not required in buildings equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.2, provided that automatic sprinklers are installed in the combustible concealed space where the draftstopping is being omitted.~~

~~**718.4.3 Other groups.** Draftstopping shall be installed in *attics* and concealed roof spaces, such that any horizontal area does not exceed 3,000 square feet (279 m^2).~~

~~Exception:~~ ~~Draftstopping is not required in buildings equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1.~~

Reason: 708.1 Editorial correlation with 2015 IBC Section 420.1, which added the requirement for separation walls in R-4 occupancies to be fire partitions. It is understood that Section 310.6 requires Group R-4 to meet requirements of Group R-3 unless otherwise specified by the IBC (that's also the reason that Section 708.4.2, Exception 5 for Group R-3 has to exclude R-4 to keep the exception consistent with current requirements). However, changing 708.1 to include all Group R occupancies will eliminate the appearance that R-4 has been omitted from the requirements of this section, particularly considering that R-4 is specifically listed in Section 420.1, which triggers provisions in Section 708.1.
708.4 The proposed rewrite results from an initial intent of adding another exception to this section (which I've now done in a separate proposal). I hadn't read the text of this section in quite some time because I knew what it was supposed to say. However, when I actually read the text, I found it unintelligible. The base paragraph has several different things going on...basic continuity, draftstopping/fire-blocking above, and supporting construction requirements. Then the 6 exceptions that follow aren't clear with respect to which parts of the main paragraph they apply to. Making matters worse, there is overlap and conflict between 708.4 and 718.3.2 and 718.4.2. I decided to undertake rewriting all of the provisions in an attempt to fix these issues while maintaining the current technical requirements. Although there has been no deliberate intent to change how the code applies, there were cases where interpretations were necessary to clarify conflicting provisions.

Deciphering the apparent intent of the code, pulling the sections and exceptions into pieces and reassembling them into comprehensible requirements took many hours, and I invite all "code groupies" and industry experts to closely compare the current and proposed provisions and notify me if any unintentional technical changes have occurred.

718.3.2 and 718.4.2. The existing draftstopping thresholds in 718.3.2 and 718.4.2 are specific to certain occupancies. These conflict with the draftstopping requirements in Section 708.4.2, which relate to continuity of fire partitions (recognizing that all dwelling and sleeping unit separations are fire partitions, as required by Sections 420.1 and 420.2). Based on the "specific over general" rule in Section 102.1 and the fact that there would be no reason for the current code to include the thresholds in 718.3.2 and 718.4.2 if they weren't intended to override Section 708.4.2, the existing special thresholds in 718.3.2 and 718.4.2 were moved to Section 708.4 to eliminate the conflict and consolidate all of the draftstopping requirements for Group R in a single location.

The current text related to mansards and overhangs is irrelevant because the following sentence in the current Section 718.4.2 ties this text only to continuity of fire partitions that form separations for sleeping units and dwelling units. By referencing the revised 708.4 in this proposal, any space above a fire partition (mansard, overhang, or whatever) requires the same level of protection based on the "continuity of fire partitions" requirement.

One additional change that should be considered by the Code Development Committee, but was skipped in this proposal because it is a technical change, is extending the Group R exception in Section 718.4 of this proposal (for attics) to include all Group R occupancies, as is the case for floor assemblies under 718.3.2 of the 2015 IBC. There is no apparent reason for 718.3 and 718.4 to have handled Group R occupancies differently for floors vs. attic spaces, and it makes more sense for all Group R attics to follow Section 708.4.2. Without fixing this, R-3 and R-4 will continue to have conflicting requirements in 708.4.2 and 718.4.

Cost Impact: Will not increase the cost of construction
There will be no impact on the cost of construction other than the cost savings associated with countless hours of design time that was saved by people who no longer had to study these sections for hours to figure out what the actually required.

FS 43-15

Part I:
708.6
Part II:
709.5, 716.6.7

THIS IS A 2 PART CODE CHANGE. BOTH PARTS WILL BE HEARD BY THE IBC-FIRE SAFETY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THIS COMMITTEE.

Proponent: Robert Davidson, Davidson Code Concepts, LLC, representing SAFTI FIRST (rjd@davidsoncodeconcepts.com)

Part I

2015 International Building Code

Revise as follows:

708.6 Openings. Openings in a *fire partition* shall be protected in accordance with Section 716. The total area of the fire-protection-rated glazing in fire door side lights and transoms and in fire window assemblies shall not exceed 25 percent of the area of a common wall with any room.

Part II

2015 International Building Code

Revise as follows:

709.5 Openings. Openings in a *smoke barrier* shall be protected in accordance with Section 716. The total area of the fire-protection-rated glazing in fire door side lights and transoms and in fire window assemblies shall not exceed 25 percent of the area of a common wall with any room.

Exceptions:

1. In Group I-1 Condition 2, Group I-2 and ambulatory care facilities, where a pair of opposite-swinging doors are installed across a corridor in accordance with Section 709.5.1, the doors shall not be required to be protected in accordance with Section 716. The doors shall be close fitting within operational tolerances, and shall not have a center mullion or undercuts in excess of $^3/_4$ inch (19.1 mm), louvers or grilles. The doors shall have head and jamb stops, and astragals or rabbets at meeting edges. Where permitted by the door manufacturer's listing, positive-latching devices are not required.
2. In Group I-1 Condition 2, Group I-2 and *ambulatory care facilities*, horizontal sliding doors installed in accordance with Section 1010.1.4.3 and protected in accordance with Section 716.

716.6.7 Interior fire window assemblies. Fire-protection-rated glazing used in *fire window assemblies* located in *fire partitions*, *smoke barriers* and *fire barriers* shall be limited to use in assemblies with a maximum *fire-resistance rating* of 1 hour in accordance with this section.

Reason: The intent of this proposal is to address an anomaly in the current code language. For fire barriers there is a limitation on the total amount of openings permited of any type:

> "707.6 Openings. Openings in a fire barrier shall be protected in accordance with Section 716. Openings shall be limited to a maximum aggregate width of 25 percent of the length of the wall, and the maximum area of any single opening shall not exceed 156 square feet (15 m2). Openings in enclosures for exit access stairways and ramps, interior exit stairways and ramps and exit passageways shall also comply with Sections 1019, 1023.4 and 1024.5, respectively."

In addition to that restriction the code also limits fire-protection-rated glazing to 1 hour or less fire-resistance-rated assemblies. And the amount of fire-protection-rated fire windows in a wall section is further restricted:

> "716.6.7 Interior fire window assemblies. Fire-protection-rated glazing used in fire window assemblies located in fire partitions and fire barriers shall be limited to use in assemblies with a maximum fire-resistance rating of 1 hour in accordance with this section."
>
> > " 716.6.7.2 Area limitations. The total area of the glazing in fire-protection-rated window assemblies shall not exceed 25 percent of the area of a common wall with any room."

The combination of the overall opening limitation in Section 707.6 for fire barriers, and the fire window fire-protection-rated glazing protection requirements in Section 716.6.7 limit the total amount of fire-protection-rated glazing that can be utilized for the purpose of limiting the use of a product that allows radiant heat to go through the protected opening.

However, when you get to the Fire Partition portion of the code there is no overall limitation in openings. The fire-protected-rated fire windows still must comply with the limitations of Section 716.6.7 but what is lost is control of the amount of fire-protection-rated glazing used in fire door sidelights and transoms because there is no overall restriction on the amount of openings which would include the entire fire door assembly. This allows for additional fire-protection-rated glazing and radiant heat transfer beyond the amount restricted by Section 716.6.7.2 for fire windows.

The proposed language is intended to capture fire-protection-rated glazing in fire door sidelites and transoms for appllication of the restriction found at Section 716.6.7.2.

NFPA 80, "Standard for Fire Doors and Other Opening Protectives" includes background on radiant heat concerns in Annex I; the following is an extract of that information:

NFPA 80-2013

"I.1 Background. Fire windows were originally designed for protecting openings in exterior walls. In such applications, radiant heat transfer was not a significant consideration, since the main function of fire windows was to contain the flames within the building. However, where fire windows are used in interior partitions, users of this standard might need to consider radiant heat transfer during fire. Exiting through corridors and past fire windows could be compromised, and combustible materials on the unexposed side of fire windows could be ignited. The information that follows is a guide to the evaluation of radiant heat transfer through fire windows.

Recent revisions to this standard have permitted very large areas of fire protection–rated glazing materials to be used in interior partitions, limited only by the size of the test furnace. Also, recent technological advances in the glazing industry have compounded the problem of radiant heat transfer by making it possible to provide glazing materials with fire protection ratings of 60 minutes and 90 minutes. Historically, fire windows, including glass block, have been limited to a 45-minute rating by the standard fire test, NFPA257, Standard on Fire Test for Window and Glass Block Assemblies. This time limit was predicated on the failure of wired glass at approximately 1600°F (870°C). [1] Some manufacturers also have developed fire resistance–rated glazing assemblies that meet the requirements of a fire resistance–rated wall assembly (currently up to 2 hours). These glazing materials, however, do not transmit excessive radiant heat, since they are re-quired to limit the temperature rise on the unexposed face to 250°F (121°C). "

Cost Impact:

Part I: Will increase the cost of construction
This proposal could create a minimal increase in the cost of construction by limiting the amount of fire-protection rated glazing in a given common wall in a room.

Part II: Will increase the cost of construction
This proposal could create a minimal increase in the cost of construction by limiting the amount of fire-protection rated glazing in a given common wall in a room.

FS 43-15 : 708.6-DAVIDSON5293

FS 44-15

709.5

Proponent: John Williams, CBO, CBO, Chair, Adhoc Healthcare Committee, representing Adhoc Health Care Committee (AHC@iccsafe.org); Carl Baldassarra, P.E., FSFPE, Chair, Code Technology Committee, representing Code Technology Committee (CTC@iccsafe.org)

2015 International Building Code

Revise as follows:

709.5 Openings. Openings in a *smoke barrier* shall be protected in accordance with Section 716.

Exceptions:

1. In Group I-1 Condition 2, Group I-2 and ambulatory care facilities, where a pair of opposite-swinging doors are installed across a corridor in accordance with Section 709.5.1, the doors shall not be required to be protected in accordance with Section 716. The doors shall be close fitting within operational tolerances, and shall not have a center mullion or undercuts in excess of $^3/_4$ inch (19.1 mm), louvers or grilles. The doors shall have head and jamb stops, and astragals or rabbets at meeting edges. Where permitted by the door manufacturer's listing, positive-latching devices are not required. Factory applied or field applied protective plates are not required to be labeled.
2. In Group I-1 Condition 2, Group I-2 and *ambulatory care facilities*, horizontal sliding doors installed in accordance with Section 1010.1.4.3 and protected in accordance with Section 716.

Reason:
Smoke barrier doors are typically installed across corridors and patient treatment areas. These doors see a very high volume of gurney and bed traffic, as well as carts, wheeled equipment and transport devices. As a result they are often damaged. This proposal would allow the installation of a non-labeled protective plate, usually made of steel or other resilient material, to be installed on these doors to protect them from excessive wear and damage. Due to the size of equipment being wheeled through, these protective plates need to be allowed to be greater than 48" high. Currently NFPA 80 would require that the protective plates on rated doors be limited to 48" and that they be labeled. The doors in smoke barriers do not function as true fire doors. This section contains many special directives and requirements exempting smoke barriers doors from meeting fire door requirements. This code change follows with the established intent of this section. Smoke barriers are intended to be substantial construction and providing protective plates provides additional protection to the doors keeping the original construction free from damage thus in a more substantial manner. They do not provide the same fire resistance rating as a true 1 hour fire barrier.

A correlative change is planned for the IFC Section 1105.6.3 as part of the Group B proposals.

The ICC Ad Hoc Committee on Healthcare (AHC) has just completed its 4th year. The AHC was established by the ICC Board to evaluate and assess contemporary code issues relating to hospitals and ambulatory healthcare facilities. This is a joint effort between ICC and the American Society for Healthcare Engineering (ASHE), a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. Information on the AHC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the AHC effort can be downloaded from the AHC website at: http://www.iccsafe.org/cs/AHC/Pages/default.aspx.

The ICC Code Technology Committee (CTC) has just completed its 10th year. The ICC Board has decided to sunset the CTC. The sunset plan includes re-assigning many of the CTC Areas of Study to the applicable Code Action Committee (CAC). The two remaining CTC Areas of Study are Care Facilities and Elevator Lobbies/WTC Elevator issues. This proposal falls under the Care Facilities Area of Study. Information on the CTC, including: the sunset plan; meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the CTC website at: http://www.iccsafe.org/cs/CTC/Pages/default.aspx .

Cost Impact: Will not increase the cost of construction
Allowing the use of non-labled plates will be less costly than requiring labeled plates.

FS 44-15 : 709.5-WILLIAMS4241

FS 45-15

709.5, 709.5.1

Proponent: John Woestman, Kellen Company, representing Builders Hardware Manufacturers Association (BHMA) (jwoestman@kellencompany.com)

2015 International Building Code

Revise as follows:

709.5 Openings. Openings in a *smoke barrier* shall be protected in accordance with Section 716.

Exceptions:

1. In Group I-1 Condition 2, Group I-2 and ambulatory care facilities, where a pair of opposite-swinging doors are installed across a corridor in accordance with Section 709.5.1, the doors shall ~~not~~ be required to be protected in accordance with Section 716. The doors shall be close fitting within operational tolerances, and shall not have a center mullion or undercuts in excess of $^3/_4$ inch (19.1 mm), louvers or grilles. The doors shall have head and jamb stops, and astragals or rabbets at meeting edges. Where permitted by the door manufacturer's listing, positive-latching devices are not required.
2. In Group I-1 Condition 2, Group I-2 and *ambulatory care facilities*, horizontal sliding doors installed in accordance with Section 1010.1.4.3 and protected in accordance with Section 716.

709.5.1 Group I-2 and ambulatory care facilities. In Group I-2 and ambulatory care facilities, where doors are installed across a corridor, the doors shall be automatic-closing by smoke detection in accordance with Section 716.5.9.3 and shall have a vision panel with fire-protection-rated glazing materials in fire-protection-rated frames, the area of which shall not exceed that tested in accordance with the testing requirements of Section 716 for fire-protection-rated glazing.

Reason: Exception 1 is the only application in the code where non-fire-rated and non-smoke-rated doors are allowed to "protect" openings in required smoke barriers. Elsewhere in the code, openings in smoke barriers are required to be protected with opening protectives which comply with Section 716. The occupancies and uses of Exception 1 (other than I-1) are also the only occupancies and uses identified in the code where required fire response plans may allow a defend-in-place strategy. From an objective perspective, openings in the required smoke barriers in an occupancy which may have defend-in-place fire safety procedures should be held to no less of a performance standard than required for other occupancies. Also missing in the application of Exception 1, by allowing non-fire-rated doors and non-smoke-rated doors, is the code requirement these doors be installed in accordance with NFPA 80 for fire doors, or NFPA 105 for smoke doors; and the ongoing IFC requirement these doors be maintained in accordance with NFPA 80 and / or NFPA 105. This code proposal proposes to address this discrepancy by deleting "not" from Exception 1.
In 709.5.1, the phrase "the area of which shall not exceed that tested" raises the question of "Tested to what performance requirement(s)?" This proposal attempts to answer that question.

Cost Impact: Will increase the cost of construction
Installing opening protectives (door assemblies) which comply with the requirements of IBC Section 716 Opening Protectives cost more than installing doors which do not.

FS 45-15 : 709.5-WOESTMAN5510

FS 46-15

712.1.10.1

Proponent: David Collins, representing The American Institute of Architects (dcollins@preview-group.com)

2015 International Building Code

Revise as follows:

712.1.10.1 Automobile ramps. Vertical openings for automobile ramps in ~~open and enclosed~~ parking garages shall be permitted where constructed in accordance with Sections 406.5 and 406.6~~, respectively~~.

Reason: The current language in the code is redundant and confusing. The new language allows openings that may be used for other purposes including occupant mobility.

Cost Impact: Will not increase the cost of construction
This change should reduce the cost of construction as it will clarify how openings are permitted in floors of parking garages.

FS 46-15 : 712.1.10.1-COLLINS4479

FS 47-15

713.2, Chapter 35

Proponent: Rebecca Baker, representing Colorado Association of Plumbing and Mechanical Officials (CAPMO) (bbaker@co.jefferson.co.us)

2015 International Building Code

Revise as follows:

713.2 Construction. Shaft enclosures shall be constructed as *fire barriers* in accordance with Section 707 or horizontal assemblies in accordance with Section 711, or both.

Exception: Shaft construction shall not be required for exhaust ducts where a listed and labeled field applied duct enclosure material or system specifically evaluated for such purpose in accordance with ASTM E 2336 is installed on exhaust ducts complying with the following:

1. A single or manifolded duct shall originate on the same floor, space or fire area.
2. The duct shall terminate to the outdoors from the space of origin.
3. The field applied enclosure shall serve a single duct with a minimum one-hour fire resistance rating and shall be equal to the fire resistance rating of the construction penetrated.
4. Fire dampers, smoke dampers or combination fire/smoke dampers shall not be installed in the duct.
5. Duct passing through four or more stores shall have a two-hour fire resistance rating.
6. Exposed enclosure systems shall be protected from damage.
7. Field applied duct enclosure systems installed on grease ducts shall be in accordance with the *International Mechanical Code.*
8. Enclosure systems shall be installed in accordance with the manufacturers installation instructions.

Add new standard(s) as follows:

ASTM E2336-04(2013) Standard Test Methods for Fire Resistive Grease Duct Enclosure System

Reason: It's time to recognize that this tested and listed method of replacing a shaft with a field applied duct wrap system is overdue. Just like the design for grease duct enclosure systems, other exhause ducts like hazardous or that from a Type II kitchen can benefit from this option. The enclosure system already carries a one and two hour fire resistance rating. This option can provide significant savings in cost and labor and has been proven to provide an equivalent measure of safety as that of a shaft. This does not apply to supply ducts as an entire supply system has not been tested to the fullest extent possible. This proposal only applies to exhause ducts.

Cost Impact: Will not increase the cost of construction
This proposal increases design flexibility and allows the owner/applicant to choose the method of complaince based which works best and is most economical for the situation.

Analysis: The referenced standard, ASTM E2336, is currently referenced in the International Mechanical Code.

FS 47-15 : 713.2-BAKER3348

FS 48-15

713.2, Chapter 35

Proponent: Janine Snyder, City of Thornton, representing Colorado Association of Plumbing & Mechanical Officials (CAPMO) (Janine.Snyder@cityofthornton.net)

2015 International Building Code

Revise as follows:

713.2 Construction. Shaft enclosures shall be constructed as *fire barriers* in accordance with Section 707 or horizontal assemblies in accordance with Section 711, or both.

Exception: Shaft construction shall not be required for exhaust ducts where a listed and labeled field applied duct enclosure material or system specifically evaluated for such purpose in accordance with ASTM E 2336 is installed on exhaust dusts complying with the following.

1. A single or manifolded duct shall originate on the same floor, space or fire area.
2. The duct shall terminate to the outdoors from the space of origin.
3. There shall be no interconnecting ducts beyond the space of origin.
4. The field applied enclosure shall serve a single duct with a minimum one hour fire resistance rating and shall be equal to the fire resistance rating of the construction penetrated.
5. Fire dampers, smoke dampers or combination fire/smoke dampers shall not be installed in the duct.
6. Duct passing through four or more stories shall have a two hour fire resistance rating.
7. Exposed enclosure systems shall be protected from damage.
8. Field applied duct enclosure system installed on grease ducts shall be in accordance with the International Mechanical Code.
9. Enclosure systems shall be installed in accordance with the manufacturers installation instructions.

Add new standard(s) as follows:

ASTM E2336-04 (2013) Standard Test Methods for Fire Resistive Grease Duct Enclosure System.

Reason: Its time to recognize that this tested and listed method of replacing a shaft with a field applied duct wrap system is overdue. Just like the design for grease duct enclosures systems, other exhaust ducts like hazardous or that from a Type II kitchen can benefit from this option. The enclosure system already carries a one and two hour fire resistance rating. This option can provide significant savings in cost and labor and has been provide to provide an equivalent measure of safety as that of a shaft. This does not apply to supply ducts as an entire supply system has not been tested to the fullest extent possible. This proposal only applies to exhaust ducts.

Cost Impact: Will not increase the cost of construction
This will not increase the cost of construction as technology has caught up with the codes and expensive shaft construction will not be necessary with these provisions.

Analysis: The referenced standard, ASTM E2336, is currently referenced in the International Mechanical Code.

FS 48-15 : 713.2-SNYDER4452

FS 49-15

713.8.2 (New)

Proponent: Matthew Davy, representing Arup (matt.davy@arup.com)

2015 International Building Code

713.8 Penetrations. Penetrations in a shaft enclosure shall be protected in accordance with Section 714 as required for *fire barriers*. Structural elements, such as beams or joists, where protected in accordance with Section 714 shall be permitted to penetrate a shaft enclosure.

713.8.1 Prohibited penetrations. Penetrations other than those necessary for the purpose of the shaft shall not be permitted in shaft enclosures.

Add new text as follows:

713.8.2 Membrane penetrations Membrane penetrations shall be permitted on the outside of shaft enclosures. Such penetrations shall be protected in accordance with Section 714.3.2.

Reason: The purpose of Section 713.8 and 713.8.1 is to limit through penetrations into a shaft enclosure; however, membrane penetrations should be permitted on the outside of the shaft enclosure. As currently written, an electrical box is not permitted on the outside of the shaft enclosure.
This section needs to clarify the intent of Section 713.8.

Cost Impact: Will not increase the cost of construction
The code change proposal will not increase the cost of construction since it will allow membrane penetrations in shaft enclosures without the need for additional construction/material on the outside of the shaft enclosure. Also, it increases net area for the building.

FS 49-15 : 713.8.2 (New)-DAVY5357

FS 50-15

713.13

Proponent: Ali Fattah, City of San Diego Development Services, representing SD Area Chapter ICC

2015 International Building Code

Revise as follows:

713.13 Waste and linen chutes and incinerator rooms. Waste and linen chutes shall comply with the provisions of NFPA 82, Chapter ~~5~~6 and shall meet the requirements of Sections 713.13.1 through 713.13.6. Incinerator rooms shall meet the provisions of Sections 713.13.4 through 713.13.5.

Exception: Chutes serving and contained within a single dwelling unit.

Reason: The code section as published is in error. Chapter 5 of NFPA 82 includes requirements for incinerators however Ch 6 includes requirement for waste and linen chutes. Section 713.13.5 appropriately references a section in Ch 5 of NFPA 82 for incinerator rooms. This corrected reference will result in correct code application.

Bibliography: 2014 edition of NFPA 82 "STANDARD ON INCINERATORS AND WASTE AND LINEN HANDLING SYSTEMS AND EQUIPMENT"

Cost Impact: Will not increase the cost of construction
No cost impact editorial code change.

FS 50-15 : 713.13-FATTAH3824

FS 51-15

713.13, 713.14, 3002.1

Proponent: Lee Kranz, City of Bellevue, WA, representing Lee Kranz

2015 International Building Code

Revise as follows:

713.13 Waste and linen chutes and incinerator rooms. Waste and linen chutes shall comply with the provisions of NFPA 82, Chapter 5 and shall meet the requirements of Sections 712 and 713.13.1 through 713.13.6. Incinerator rooms shall meet the provisions of Sections 713.13.4 through 713.13.5.

Exception: Chutes serving and contained within a single dwelling unit.

713.14 Elevator, dumbwaiter and other hoistways. Elevator, dumbwaiter and other hoistway enclosures shall be constructed in accordance with ~~Section~~Sections 712, 713 and Chapter 30.

3002.1 Hoistway enclosure protection. Elevator, dumbwaiter and other hoistway enclosures shall be *shaft enclosures* complying with ~~Section~~Sections 712 and 713.

Reason: The proposed references in Sections 713.13, 713.14 and 3002.1 to Section 712 are necessary to permit the use of the exceptions contained in Section 712 for shaft construction. By referencing only Section 713 from these sections it could be misunderstood that the exceptions of Section 712 are not applicable for waste and linen chutes and incinerator rooms of Section 713.13, for elevator, dumbwaiter and other hoistways of Section 713.14, or for hoistway enclosures of Section 3002.1. Section 712 is where the exceptions for shaft enclosures were relocated in the 2012 IBC and the reference to that section from Sections 713.13, 713.14 and 3002.1 were overlooked for the 2015 code.

Cost Impact: Will not increase the cost of construction
This change will have no bearing on the cost of construction for shafts because it permits the use of the exceptions contained in Section 712.

FS 51-15 : 713.13-KRANZ5122

FS 52-15

713.13.1

Proponent: Masoud Sabounchi, Representing Colorado Chapter of ICC, representing masoud sabounchi (masoud@acecode.com)

2015 International Building Code

Revise as follows:

713.13.1 Waste and linen. A shaft enclosure containing a recycling, or waste or linen chute shall not be used for any other purpose and shall be enclosed in accordance with Section 713.4. A shaft enclosure shall be permitted to contain recycling and waste chutes. Openings into the shaft, from access rooms and discharge rooms, shall be protected in accordance with this section and Section 716. Openings into chutes shall not be located in *corridors*. Doors into chutes shall be self-closing. Discharge doors shall be self- or automatic-closing upon the actuation of a smoke detector in accordance with Section 716.5.9.3, except that heat-activated closing devices shall be permitted between the shaft and the discharge room.

Reason: Section 713.13.1 implies that a recycling chute is not permitted to be located in the same shaft with a waste chute. Hazard associated with a recycling chute is not any different than that of a waste chute. To provide two side by side shaft enclosures to enclose the recycling and the waste chute does not provide additional safety especially since chutes have specific installation requirements, sprinkler protection, ventilation and similar.

Cost Impact: Will not increase the cost of construction
This proposal does not increase the cost of construction because the proposed revision allows one shaft to contain a recycling and a waste chute where two separate shaft enclosures might be required otherwise. This proposal reduces cost of construction.

FS 52-15 : 713.13.1-SABOUNCHI4392

FS 53-15

713.13.3

Proponent: Stephen DiGiovanni, Clark County Building Department, representing Southern Nevada Chapter of ICC (sdigiovanni@clarkcountynv.gov)

2015 International Building Code

Revise as follows:

713.13.3 Chute access rooms. Access openings for waste or linen chutes shall be located in rooms or compartments enclosed by not less than 1-hour *fire barriers* constructed in accordance with Section 707 or *horizontal assemblies* constructed in accordance with Section 711, or both. Openings into the access rooms shall be protected by opening protectives having a *fire protection rating* of not less than $^{3}/_{4}$ hour. Doors shall be self- or automatic-closing upon the detection of smoke in accordance with Section 716.5.9.3. <u>The room or compartment shall be configured to allow the access door to the room or compartment to close and latch with the access panel to the refuse or laundry chute in any position.</u>

Reason: The proposed would ensure the intent of the code that the room and door provide a minimum level of protection to the shaft enclosing the chute and the chute access doors. This intended protection is made clear in Section 713.13.1. If the room design does not allow the door to close upon failure of the self-closing requirement of the chute access door the intent of the section is defeated. This proposal brings clarity to the implied intent of the code.

Cost Impact: Will increase the cost of construction
This proposal will increase construction costs by requiring that chute access rooms be configured to address an added performance feature contained within this proposal.

FS 53-15 : 713.13.3-DIGIOVANNI3827

FS 54-15

714.2 (New), Chapter 35

Proponent: William Koffel, representing Firestop Contractors International Association (wkoffel@koffel.com)

2015 International Building Code

Add new text as follows:

714.2 **Contractor Qualifications** In buildings of Group I-2 occupancy, listed through-penetration firestop systems shall be installed by contractors certified by an organization accredited to the criteria set forth ISO 17065 by a recognized accreditation body complying to ISO 17011. Documentation shall be submitted to the code official verifying certification of the contractor.

Exception: Repairs, Level 1 Alterations, and Level 2 Alterations as defined in the International Existing Building Code.

Add new standard(s) as follows:

ISO 17011-15 - Conformity assessment — General requirements for accreditation bodies accrediting conformity assessment bodies

ISO 17065-15 - Conformity assessment — Requirements for bodies certifying products, processes and services

Reason: The proposed language addresses the issues and concerns expressed in the past by the Code Development Committee

1. Availability of contractors - The application of the section has been restricted to buildings of Group I-2. Such construction projects, especially Level 3 Alternations and new construction generally attract regional general contractors and therefore firestop contractors will also be attracted from a regional basis. Presently there are contractors in every state. It is also anticipated that additional contractors will seek the necessary qualification between the time when the proposal is approved and the code is adopted and enforced.

2. References to specific qualification programs - The proposed language eliminates the references to the existing UL and FM programs and instead provides the criteria for the certification process and certifying organization. This approach is similar to what is being proposed for ICC 1000 and the text is similar to a definition being developed by the IAS for a certification agency.

3. Small projects - By exempting Repairs, Level 1 Alterations, and Level 2 Alterations, smaller construction projects will not required outside specialty contractors.

Proper design, selection, installation, and inspection of through penetration firestop systems are critical to maintaining the integrity of the fire resistance rated assembly that is being penetrated. There are existing approval or qualification programs administered by FM Approvals and UL for contractors who install materials that become firestop systems. Contracting firms are eligible to obtain the FM Approval and/or UL Qualification. The costs range from $6,000 to $10,000 for the initial audit and about $3,000 annually for ongoing audits. Currently, companies of all sizes are FM 4991 Approved or UL Qualified in areas where the I-Codes are adopted.

Cost Impact: Will increase the cost of construction

While the cost of construction may increase for certain projects, there will also be substantial cost savings on other projects in which substantial remediation activities have been necessary to correct improper or deficient installations. Most owners will be getting the job done correctly at a lower cost by eliminating the need for corrective actions immediately after the construction is completed.

Analysis: A review of the standard proposed for inclusion in the code, ISO 17011 and ISO 17065, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2015.

FS 54-15 : 714.2 (New)-KOFFEL4841

FS 55-15

714.2 (New)

Proponent: William Koffel, representing Firestop Contractors International Association (wkoffel@koffel.com)

2015 International Building Code

Add new text as follows:

<u>**714.2** **Installation** A listed through-penetration firestop system shall be securely installed in accordance with the manufacturer's installation instructions and the listing criteria.</u>

Reason: The intent of the paragraph is to require that all listed systems be installed in accordance with the listing critieria (including manufacturer's instructions). The manufacturer's instructions provide additional details that are not commonly identified in the listing criteria, including environmental conditions and tooling.

Cost Impact: Will not increase the cost of construction
Listed systems should already be installed in accordance with the manufacturer's installation instructions.

FS 55-15 : 714.2 (New)-KOFFEL5417

FS 56-15

714.3.1.1, 714.4.1.1

Proponent: Jonathan Roberts, UL LLC, representing UL LLC (jonathan.roberts@ul.com)

2015 International Building Code

Revise as follows:

714.3.1.1 Fire-resistance-rated assemblies. ~~Penetrations~~ *Through penetrations* shall be protected using materials installed as tested in ~~an~~ the *approved* fire-resistance-rated assembly.

714.4.1.1 ~~Installation~~Fire-resistance-rated assemblies. *Through penetrations* shall be protected using materials installed as tested in the *approved* fire-resistance-rated assembly.

Reason: As written, these two similar sections, covering wall assemblies and horizontal assemblies, state penetrations shall be installed as tested in the approved fire-resistance-rated assembly. By definition, a penetration is a breach in the floor, floor-ceiling or wall assembly. This proposal clarifies that it is the method of protecting the penetration, not the penetration itself, that is the subject of these sections. It also revises the title of Section 714.4.1.1 to be consistent with that of Section 714.3.1.1.

Cost Impact: Will not increase the cost of construction
This simply clarifies the existing requirements.

FS 56-15 : 714.4.1.1-ROBERTS4052

FS 57-15

714.3.2, 714.4.2, 717.6.1 (IMC 607.6.1)

Proponent: James Smith, ICC Region III Code Development Committee, representing ICC Region III Code Development Committee

2015 International Building Code

Revise as follows:

714.3.2 Membrane penetrations. Membrane penetrations shall comply with Section 714.3.1. Where walls or partitions are required to have a *fire-resistance rating*, recessed fixtures shall be installed such that the required fire resistance will not be reduced.

Exceptions:

1. Membrane penetrations of maximum 2-hour fire-resistance-rated walls and partitions by steel electrical boxes that do not exceed 16 square inches (0.0 103 m^2) in area, provided the aggregate area of the openings through the membrane, including those listed in exception 6, does not exceed 100 square inches (0.0645 m^2) in any 100 square feet (9.29 m^2) of wall area. The *annular space* between the wall membrane and the box shall not exceed $^1/_8$ inch (3.2 mm). Such boxes on opposite sides of the wall or partition shall be separated by one of the following:
   1.1. By a horizontal distance of not less than 24 inches (610 mm) where the wall or partition is constructed with individual noncommunicating stud cavities;
   1.2. By a horizontal distance of not less than the depth of the wall cavity where the wall cavity is filled with cellulose loose-fill, rockwool or slag mineral wool insulation;
   1.3. By solid fireblocking in accordance with Section 718.2.1;
   1.4. By protecting both outlet boxes with *listed* putty pads; or
   1.5. By other *listed* materials and methods.
2. Membrane penetrations by *listed* electrical boxes of any material, provided such boxes have been tested for use in fire-resistance-rated assemblies and are installed in accordance with the instructions included in the listing. The *annular space* between the wall membrane and the box shall not exceed $^1/_8$ inch (3.2 mm) unless *listed* otherwise. Such boxes on opposite sides of the wall or partition shall be separated by one of the following:
   2.1. By the horizontal distance specified in the listing of the electrical boxes;
   2.2. By solid fireblocking in accordance with Section 718.2.1;
   2.3. By protecting both boxes with *listed* putty pads; or
   2.4. By other *listed* materials and methods.
3. Membrane penetrations by electrical boxes of any size or type, that have been *listed* as part of a wall opening protective material system for use in fire-resistance-rated assemblies and are installed in accordance with the instructions included in the listing.
4. Membrane penetrations by boxes other than electrical boxes, provided such penetrating items and the *annular space* between the wall membrane and the box, are protected by an *approved membrane penetration* firestop system installed as tested in accordance with ASTM E 814 or UL 1479, with a minimum positive pressure differential of 0.01 inch (2.49 Pa) of water, and shall have an F and T rating of not less than the required *fire-resistance rating* of the wall penetrated and be installed in accordance with their listing.
5. The *annular space* created by the penetration of an automatic sprinkler, provided it is covered by a metal escutcheon plate.
6. Membrane penetrations of maximum 2-hour fire resistance-rated walls and partitions by steel electrical boxes that exceed 16 square inches (0.0 103 m^2) in area, or steel electrical boxes of any size having an aggregate area through the membrane, including those listed in exception 1, exceeding 100 square inches (0.0645 m^2) in any 100 square feet (9.29 m^2) of wall area, provided such penetrating items are protected by listed putty pads or other listed materials and methods, and installed in accordance with the listing.

714.4.2 Membrane penetrations. Penetrations of membranes that are part of a *horizontal assembly* shall comply with Section 714.4.1.1 or 714.4.1.2. Where floor/ceiling assemblies are required to have a *fire-resistance rating*, recessed fixtures shall be installed such that the required *fire resistance* will not be reduced.

Exceptions:

1. *Membrane penetrations* by steel, ferrous or copper conduits, pipes, tubes or vents, or concrete or masonry items where the *annular space* is protected either in accordance with Section 714.4.1 or to prevent the free passage of flame and the products of combustion. The aggregate area of the openings through the membrane, including those listed in exception 2, and the exception to section 717.6.1 shall not exceed 100 square inches (64 500 mm^2) in any 100 square feet (9.3 m^2) of ceiling area in assemblies tested without penetrations.
2. Ceiling *membrane penetrations* of maximum 2-hour *horizontal assemblies* by steel electrical boxes that do not exceed 16 square inches (10 323 mm^2) in area, provided the aggregate area of such penetrations, including those listed in exception 1, and the exception to section 717.6.1, does not exceed 100 square inches (44 500 mm^2) in any 100 square feet (9.29 m^2) of ceiling area, and the *annular space* between the ceiling membrane and the box does not exceed $^1/_8$ inch (3.2 mm).
3. *Membrane penetrations* by electrical boxes of any size or type, that have been *listed* as part of an opening protective material system for use in *horizontal assemblies* and are installed in accordance with the instructions included in the listing.
4. *Membrane penetrations* by *listed* electrical boxes of any material, provided such boxes have been tested for use in fire-resistance-rated assemblies and are installed in accordance with the instructions included in the listing. The *annular space* between the ceiling membrane and the box shall not exceed $^1/_8$ inch (3.2 mm) unless *listed* otherwise.
5. The *annular space* created by the penetration of a fire sprinkler, provided it is covered by a metal escutcheon plate.
6. Noncombustible items that are cast into concrete building elements and that do not penetrate both top and bottom surfaces of the element.
7. The ceiling membrane of 1- and 2-hour fire-resistance-rated horizontal assemblies is permitted to be interrupted with the double wood top plate of a wall assembly that is sheathed with Type X gypsum wallboard, provided that all penetrating items through the double top plates are protected in accordance with Section 714.4.1.1 or 714.4.1.2 and the ceiling membrane is tight to the top plates.

717.6.1 Through penetrations. In occupancies other than Groups I-2 and I-3, a duct constructed of *approved* materials in accordance with the *International Mechanical Code* that penetrates a fire-resistance-rated floor/ceiling assembly that connects not more than two *stories* is permitted without shaft enclosure protection, provided a *listed fire damper* is installed at the floor line or the duct is protected in accordance with Section 714.4. For air transfer openings, see Section 712.1.9.

Exception: A duct is permitted to penetrate three floors or less without a *fire damper* at each floor, provided such duct meets all of the following requirements:

1. The duct shall be contained and located within the cavity of a wall and shall be constructed of steel having a minimum wall thickness of 0.0187 inches (0.4712 mm) (No. 26 gage).
2. The duct shall open into only one *dwelling or sleeping unit* and the duct system shall be continuous from the unit to the exterior of the building.
3. The duct shall not exceed 4-inch (102 mm) nominal diameter and the ~~total~~ aggregate area of such ducts and other penetrating elements, including those listed in exceptions 1 and 2 of section 714.4.2, shall not exceed 100 square inches (0.065 m^2) in any 100 square feet (9.3 m^2) of floor area.
4. The *annular space* around the duct is protected with materials that prevent the passage of flame and hot gases sufficient to ignite cotton waste where subjected to ASTM E 119 or UL 263 time-temperature conditions under a minimum positive pressure differential of 0.01 inch (2.49 Pa) of water at the location of the penetration for the time period equivalent to the *fire-resistance rating* of the construction penetrated.
5. Grille openings located in a ceiling of a fire-resistance-rated floor/ceiling or roof/ceiling assembly shall be protected with a *listedceiling radiation damper* installed in accordance with Section 717.6.2.1.

Reason: There are three areas of the code that include exceptions to the requirements for the use of tested and listed firestop assemblies that are based on "total" and "aggregate" area of the penetration. Only one out of the three used the word "total" and we felt it best to be consistent and use the word "aggregate" instead of "total" in section 717.6.1 as well.
In addition, we felt the intent of these exceptions was to acknowledge that as long as there were limited penetrations (only 100 square inches in 100 square feet of surface area) of noncombustible elements there was not a need to protect them with firestop systems. We also felt there was not an intent to allow 300 square inches in 100 square feet of surface area. For that reason we referenced each of these exceptions to one another to assure the aggregate area included each of those being addressed individually. Without the cross references we feel it could be interpreted that in any given 100 square foot surface area of a horizontal assembly one could have 100 square inches of steel pipe/conduit (section 714.4.2 exception 1) + 100 square inches of steel electrical boxes (section 714.4.2 exception 2) + 100 square inches of ductwork (section 717.6.1) for a total 300 square inches of elements penetrating the membrane that provides the fire resistance integrity of the horizontal assembly. We believe the intent is to keep the integrity of the surface limited to that 100 square inches per 100 square feet in area.

We also felt it was appropriate to refer to each of the other similar exceptions for the sake of clarity and consistency. For instance we reference back and forth within each of the exceptions that refer to the penetration of walls. We use the same methodology for horizontal assemblies by refering back and forth to the similar provisions that are found in each section of the code that touches on items that penetrate horizontal assemblies. By doing so we feel both the designers and code oficials will be on the same page when applying and interpreting these code sections.

Cost Impact: Will increase the cost of construction
Although we must state that this change would have the potential to increase the cost of contruction, we also feel the number of instances when this would happen would be extremely limited. We feel that in most cases the designers and contrators will coordinate placement of penetrating items in such a manner that they will be dispersed in a way to stay below the 100 square inch per 100 square feet of surface area trigger. Accordingly, because it will only be in those rare instances where that cannot be accomplished, the cost will be minimal when compared to the overall cost of construction. We also believe many contractors already coordinate in this manner so as to minimize the probability of being surprised by the field interpretation of an inspector.

FS 57-15 : 714.3.2-SMITH4042

FS 58-15

714.3.2

Proponent: Tony Crimi, representing International Firestop Council (tcrimi@sympatico.ca)

2015 International Building Code

Revise as follows:

714.3.2 Membrane penetrations. Membrane penetrations shall comply with Section 714.3.1. Where walls or partitions are required to have a *fire-resistance rating*, recessed fixtures shall be installed such that the required fire resistance will not be reduced.

Exceptions:

1. Membrane penetrations of maximum 2-hour fire-resistance-rated walls and partitions by steel electrical boxes that do not exceed 16 square inches (0.0 103 m^2) in area, provided the aggregate area of the openings through the membrane does not exceed 100 square inches (0.0645 m^2) in any 100 square feet (9.29 m^2) of wall area. The *annular space* between the wall membrane and the box shall not exceed $^1/_8$ inch (3.2 mm). Such boxes on opposite sides of the wood or steel stud wall or partition shall be separated by one of the following:
   1.1. By a horizontal distance of not less than 24 inches (610 mm) where the wall or partition is constructed with individual ~~noncommunicating~~non-staggered stud cavities;
   1.2. By a horizontal distance of not less than the depth of the wall cavity where the wall cavity is filled with cellulose loose-fill, rockwool or slag mineral wool insulation;
   1.3. By solid fireblocking in accordance with Section 718.2.1;
   1.4. By protecting both outlet boxes with *listed* putty pads; or
   1.5. By other *listed* materials and methods.
2. Membrane penetrations by *listed* electrical boxes of any material, provided such boxes have been tested for use in fire-resistance-rated assemblies and are installed in accordance with the instructions included in the listing. The *annular space* between the wall membrane and the box shall not exceed $^1/_8$ inch (3.2 mm) unless *listed* otherwise. Such boxes on opposite sides of the wall or partition shall be separated by one of the following:
   2.1. By the horizontal distance specified in the listing of the electrical boxes;
   2.2. By solid fireblocking in accordance with Section 718.2.1;
   2.3. By protecting both boxes with *listed* putty pads; or
   2.4. By other *listed* materials and methods.
3. Membrane penetrations by electrical boxes of any size or type, that have been *listed* as part of a wall opening protective material system for use in fire-resistance-rated assemblies and are installed in accordance with the instructions included in the listing.
4. Membrane penetrations by boxes other than electrical boxes, provided such penetrating items and the *annular space* between the wall membrane and the box, are protected by an *approved membrane penetration* firestop system installed as tested in accordance with ASTM E 814 or UL 1479, with a minimum positive pressure differential of 0.01 inch (2.49 Pa) of water, and shall have an F and T rating of not less than the required *fire-resistance rating* of the wall penetrated and be installed in accordance with their listing.
5. The *annular space* created by the penetration of an automatic sprinkler, provided it is covered by a metal escutcheon plate.
6. Membrane penetrations of maximum 2-hour fire resistance-rated walls and partitions by steel electrical boxes that exceed 16 square inches (0.0 103 m^2) in area, or steel electrical boxes of any size having an aggregate area through the membrane exceeding 100 square inches (0.0645 m^2) in any 100 square feet (9.29 m^2) of wall area, provided such penetrating items are protected by listed putty pads or other listed materials and methods, and installed in accordance with the listing.

Reason: This Code proposal is intended to clearly articulate the application of this section. First, it clarifies that the requirements apply to both steel and wood stud walls. Second, it attempts to better express what is meant by "noncommunicating stud cavities".
The use of both wood and steel studs is common in fire resistance rated assemblies. The provision for separation of non-communicating stud cavities should recognise and include steel studs as well as wood studs. The term "noncommunicating" is problematic in that it is not a common construction term. Similarly, Merriam-Webster does not have a clear definition for the term The closest approximation is in their Medical Dictionary, which states:

> Communicating: to cause to pass from one to another(e.g. some diseases are easily communicated)

What was intended with this proposal was to address walls or partitions which did not use staggered studs. As written, steel studs are often interpreted as never creating non-communicating stud cavities because of the cut-outs. This unfairly penalizes steel stud assemblies. Because the existing language for membrane penetration protection does not explicitly exclude staggered studs walls, there are many questions as to which of these same methods can be applied in these assemblies. This proposed language will clarify the application.

Cost Impact: Will not increase the cost of construction
The proposal may reduce the cost of construction by providing additional exceptions. The additional clarity will reduce inspection time and cost.

FS 58-15 : 714.3.2-CRIMI4306

FS 59-15

714.3.3, 714.4.3

Proponent: Gregory Keeler, representing Self (design_tech@windstream.net)

2015 International Building Code

Revise as follows:

714.3.3 Dissimilar materials. Noncombustible penetrating items shall not connect to combustible items beyond the point of ~~firestopping~~fireblocking unless it can be demonstrated that the fire-resistance integrity of the wall is maintained.

714.4.3 Dissimilar materials. Noncombustible penetrating items shall not connect to combustible materials beyond the point of ~~firestopping~~fireblocking unless it can be demonstrated that the fire-resistance integrity of the *horizontal assembly* is maintained.

Reason: This proposal is editorial in nature in that all other uses of the word "firestopping" have been removed from the code. The term "firestopping" is also not defined in Chapter 2. This revision will make Section 714 more consistent.

Cost Impact: Will not increase the cost of construction
THis proposal is editorial in nature and will not increase the cost of construction.

FS 59-15 : 714.3.3-KEELER3441

FS 60-15

714.4.1

Proponent: William Koffel, representing Firestop Contractors International Association (wkoffel@koffel.com)

2015 International Building Code

Revise as follows:

714.4.1 Through penetrations. Through penetrations of *horizontal assemblies* shall comply with Section 714.4.1.1 or 714.4.1.2.

Exceptions:

1. Penetrations by steel, ferrous or copper conduits, pipes, tubes or vents or concrete or masonry items through a single fire-resistance-rated floor assembly where the *annular space* is protected with materials that prevent the passage of flame and hot gases sufficient to ignite cotton waste when subjected to ASTM E 119 or UL 263 time-temperature fire conditions under a minimum positive pressure differential of 0.01 inch (2.49 Pa) of water at the location of the penetration for the time period equivalent to the *fire-resistance rating* of the construction penetrated. Penetrating items with a maximum 6-inch (152 mm) nominal diameter shall not be limited to the penetration of a single fire-resistance-rated floor assembly, provided the aggregate area of the openings through the assembly does not exceed 144 square inches (92 900 mm^2) in any 100 square feet (9.3 m^2) of floor area. Such penetrations shall be contained and located within the concealed space of a horizontal assembly or within the cavity of a wall above or below the floor.
2. Penetrations in a single concrete floor by steel, ferrous or copper conduits, pipes, tubes or vents with a maximum 6-inch (152 mm) nominal diameter, provided the concrete, grout or mortar is installed the full thickness of the floor or the thickness required to maintain the *fire-resistance rating*. The penetrating items shall not be limited to the penetration of a single concrete floor, provided the area of the opening through each floor does not exceed 144 square inches (92 900 mm^2). Such penetrations shall be contained and located within the concealed space of a horizontal assembly or within the cavity of a wall above or below the floor.
3. Penetrations by *listed* electrical boxes of any material, provided such boxes have been tested for use in fire-resistance-rated assemblies and installed in accordance with the instructions included in the listing.

Reason: The purpose for this change is not to eliminate the exceptions from the Code but to provide the necessary protection from thermal conductivity as required for other protection methods. There are several areas within the Code that address a concern with regard to the potential for fire spread due to thermal conductivity. The proposed language will result in the exceptions being consistent with the overall intent of the Code by addressing thermal conductivity.
The never ending variations of the potential existence and presence of combustibles in areas where penetrations are not concealed within the protection of a wall is a liability and is currently addressed inconsistently wihtin the Code.

Cost Impact: Will increase the cost of construction
It is anticipated that the cost of construction may increase on some projects since there will be additional cost if the exceptions are to be used. However, other alternative compliance options remain in the Code unchanged.

FS 60-15 : 714.4.1-KOFFEL5746

FS 61-15

714.4.1.2

Proponent: Tony Crimi, representing International Firestop Council (tcrimi@sympatico.ca)

2015 International Building Code

Revise as follows:

714.4.1.2 Through-penetration firestop system. *Through penetrations* shall be protected by an *approvedthrough-penetration firestop system* installed and tested in accordance with ASTM E 814 or UL 1479, with a minimum positive pressure differential of 0.01 inch of water (2.49 Pa). The system shall have an F rating/T rating of not less than 1 hour but not less than the required rating of the floor penetrated.

Exceptions:

1. Floor penetrations contained and located within the cavity of a wall above the floor or below the floor do not require a T rating.
2. Floor penetrations by floor drains, tub drains or shower drains contained and located within the concealed space ~~of~~below a ~~horizontal assembly~~floor do not require a T rating.
3. Floor penetrations of maximum 4-inch (102 mm) nominal diameter penetrating directly into metal-enclosed electrical power switchgear do not require a T rating.

Reason: This proposed change clarifies and potentially expands (depending on interpretation) the existing exception for floor penetrations by floor drains, tub drains or shower drains contained and located within the concealed space of a horizontal assembly. The existing language uses the term "horizontal assembly", which is a defined term in the IBC and denotes a fire resistance-rated floor or roof assembly. If the concealed space is part of a floor/ceiling assembly, which is a horizontal assembly that includes the use of a fire-rated ceiling membrane, then the penetration would be concealed behind a fire rated material. If the concealed space referred to in exception No. 2 is simply a floor assembly, which does not incorporate the use of a fire rated membrane, then a penetration that would be concealed would be above a non-rated ceiling. In either case, the horizontal concealed space of a floor/ceiling assembly (with rated membrane) or of a floor assembly (with non-rated ceiling) is comparable in construction and protection, to that of a wall cavity in the current exception for floor penetrations contained and located within the cavity of a wall above the floor or below the floor. In the wall exception (714.4.1.2, Exception 1), the wall concealing the penetration may be either non-rated or fire rated. Thus, the level of protection that the proposed wording would make clear is comparable to that provided in the current exception for penetrations concealed within a wall, and is consistent with the proponent's intent in FS69-09/10 that added Exception No.2 to the IBC.
Floor drains, tub drains and shower drains would never be located such that the pipe penetrating the floor would be within the cavity of a wall. Thus, those drains would not be able to use the existing T-rating exception for walls (Exception No. 1). Many jurisdictions are already interpreting Eception No, 2 to apply the logic of the existing exception for walls, to include the situation of penetrating items concealed above a a non-rated ceiling, as there is some intuitive recognition that the situations really are analogous.

Cost Impact: Will not increase the cost of construction
The proposal expands the exception to include fire-resistance rated floors in which the membrane is not part of the rating.

FS 61-15 : 714.4.1.2-CRIMI4303

FS 62-15

714.4.1.2

Proponent: Ken Cornwall, representing ProVent Systems, Inc. (kcornwall@prosetsystems.com)

2015 International Building Code

714.4.1.2 Through-penetration firestop system. *Through penetrations* shall be protected by an *approvedthrough-penetration firestop system* installed and tested in accordance with ASTM E 814 or UL 1479, with a minimum positive pressure differential of 0.01 inch of water (2.49 Pa). The system shall have an F rating/T rating of not less than 1 hour but not less than the required rating of the floor penetrated.

Exceptions:

1. Floor penetrations contained and located within the cavity of a wall above the floor or below the floor do not require a T rating.
2. Floor penetrations by floor drains, tub drains or shower drains contained and located ~~within the concealed space of~~inside a ~~horizontal assembly do not require a T rating~~bathroom and connected with PVC or ABS drainage pipe shall comply with Section 714.4.1.2.
3. Floor penetrations of maximum 4-inch (102 mm) nominal diameter penetrating directly into metal-enclosed electrical power switchgear do not require a T rating.

Reason: The "T" rating requires the penetration to close off within 5 to 7 minutes from the start of the ASTM E-814 fire test. If the "T"" rating is complied with, there would be none to very litlle smoke transmission through the openings. If the "T" rating is zero and not required, the normal closure can take up to 18 minutes. Bedrooms are usually located next to bathrooms where toxic smoke can fill the entire habitable sleeping area and cause fatal smoke inhalation.

Cost Impact: Will not increase the cost of construction
There should not be any additonal cost because the ASTM E-814 or UL1479 fire tests for these penetrations now requires "F" and "T" ratings.

FS 62-15 : 714.4.1.2-CORNWALL4772

FS 63-15

714.4.1.2

Proponent: Jonathan Roberts, UL LLC, representing UL LLC (jonathan.roberts@ul.com)

2015 International Building Code

Revise as follows:

714.4.1.2 Through-penetration firestop system. *Through penetrations* shall be protected by an *approvedthrough-penetration firestop system* installed and tested in accordance with ASTM E 814 or UL 1479, with a minimum positive pressure differential of 0.01 inch of water (2.49 Pa). The system shall have an F rating/T rating of not less than 1 hour but not less than the required rating of the floor penetrated.

Exceptions:

1. Floor penetrations contained and located within the cavity of a wall above the floor or below the floor do not require a T rating.
2. Floor penetrations by floor drains, tub drains or shower drains contained and located within the concealed space of a horizontal assembly do not require a T rating.
3. Floor penetrations of cable or maximum 4-inch (102 mm) nominal diameter metal conduit or tubing penetrating directly into metal-enclosed electrical power switchgear do not require a T rating.

Reason: In its current form, Exception 3 of Section 714.4.1.2 is incomplete in that it does not specify what is penetrating the floor into the top of the switchgear. The reason statement that was submitted with FS75-12, which led to Exception 3, references "metal EMT or conduit". However, these devices are also wired with cable. As such, this proposal suggests wiring methods which reflect all these options.

Cost Impact: Will not increase the cost of construction
It simply clarifies the current requirements.

FS 63-15 : 714.4.1.2-ROBERTS4043

FS 64-15

714.4.1.2

Proponent: Homer Maiel, PE, CBO, representing ICC Tri-Chapter (Peninsula, East Bay, Monterey Bay) (hmaiel@gmail.com)

2015 International Building Code

Revise as follows:

714.4.1.2 Through-penetration firestop system. *Through penetrations* shall be protected by an *approvedthrough-penetration firestop system* installed and tested in accordance with ASTM E 814 or UL 1479, with a minimum positive pressure differential of 0.01 inch of water (2.49 Pa). The system shall have an F rating/T rating of not less than 1 hour but not less than the required rating of the floor penetrated.

Exceptions:

1. Floor penetrations contained and located within the cavity of a wall above the floor or below the floor do not require a T rating.
2. Floor penetrations by floor drains, tub drains or shower drains contained and located within the concealed space of a horizontal assembly do not require a T rating.
3. Floor penetrations of maximum 4-inch (102 mm) nominal diameter penetrating directly into metal-enclosed electrical power switchgear do not require a T rating.
4. <u>Floor penetrations in the parking garages do not require F and T ratings</u>

Reason: It makes no sense to have a large unprotected openings between floors such as vehicle ramps and then a small floor opening next to such ramp to have F and T ratings!!

Cost Impact: Will not increase the cost of construction
This code change will decrease the cost of construction. In order to effectively compartmentalize a fire, a floor must prevent the passage of smoke and flame and also prevent the temperature on the non-fire side from rising high enough to ignite materials stored on non-fire side. To achieve these requirements, certain listed/approved fire stopping assemblies need to be installed; thus the added cost. By adopting this new exception, that requirements goes away and with it the added cost of fire stopping assemblies.

FS 64-15 : 714.4.1.2-MAIEL4340

FS 65-15

714.4.1.2

Proponent: John Valiulis, Hilti, Inc., representing Hilti, Inc. (john.valiulis@hilti.com)

2015 International Building Code

Revise as follows:

714.4.1.2 Through-penetration firestop system. *Through penetrations* shall be protected by an *approvedthrough-penetration firestop system* installed and tested in accordance with ASTM E 814 or UL 1479, with a minimum positive pressure differential of 0.01 inch of water (2.49 Pa). The system shall have an F rating/T rating of not less than 1 hour but not less than the required rating of the floor penetrated.

Exceptions:

1. Floor penetrations contained and located within the cavity of a wall above the floor or below the floor do not require a T rating.
2. Floor penetrations by floor drains, tub drains or shower drains contained and located within the concealed space of a horizontal assembly do not require a T rating.
3. Floor penetrations of maximum 4-inch (102 mm) nominal diameter penetrating directly into metal-enclosed electrical power switchgear do not require a T rating.
4. <u>Floor penetrations of a concrete floor by steel, ferrous, or copper conduits, pipes, tubes or vents with a maximum 6-inch (152 mm) nominal diameter, where the area of the opening through the floor does not exceed 144 square inches (92 900 mm^2) if the penetrating item penetrates more than a single floor, do not require a T-rating.</u>

Reason: <u>Overview</u>
This code change aims to rectify the significant inconsistency in performance requirements for floor penetrations of fire rated concrete floor assemblies covered by different code sections. The proposed exception would set equal heat transfer performance expectations for the different code-permitted options for sealing some specific through-penetrations of a concrete floor.

<u>Code requirements when the penetration is firestopped</u>

The most common code-compliant way of firestopping a though-penetration of a fire resistance rated floor assembly is to protect the penetration in accordance with a tested through-penetration firestop system, as detailed in 714.4.1.2. Using a tested firestop system will require that the system have an F-rating equal to the rating of the penetrated assembly. The F-rating is a measure of the firestop system's ability to prevent fire passage. In addition, a floor penetration firestop system may also require a T-rating equal to the fire rating of the assembly, unless one of the three T-rating exceptions are met, as enumerated in 714.4.1.2, shown above. The T-rating is a measure of the firestop system's ability to limit temperature rise on the non-fire side of the penetration.

<u>Code requirements when the penetration is sealed with concrete/grout/mortar</u>

The IBC and the legacy codes have allowed an exception to the requirement for an approved, tested firestop system, under certain strict limitations, as covered in 714.4.1 Exception No. 2. Using Exception No. 2, the prescriptive code allows filling the annular space with full-depth concrete, grout, or mortar, if the penetration meets all of these conditions:
a) Is a steel, ferrous, or copper conduit, pipe, tube or vent
b) Has a maximum 6 inch nominal diameter
c) The area of the opening through the floor does not exceed 144 square inches if the penetrating item penetrates more than a single floor.

The level of fire safety provided by 714.4.1 Exception 2 is found to be lacking by some in the fire protection community, but the fact remains that it is in the 2015 IBC, was in the legacy codes, and has been used for several decades. This code change proposal acknowledges the continued existence of that exception, without commenting on its merits or lack thereof, and aims to make other sections of the code, namely 714.4.1.2, consistent with this exception, assuming that this exception remains in the Code.

<u>Measured performance of penetrations sealed with concrete/grout/mortar</u>

Using 714.4.1 Exception No.2, there is no requirement for the penetration sealing method (concrete, grout or mortar) to restrict the temperature rise of the penetrating item on the non-fire side to less than 325F (i.e. no requirement for a T-rating). A steel or copper penetrating item will in fact get hot quite fast on the non-fire side (above the floor) if sealed with the concrete/grout/mortar solution. A fire test conducted by UL in 2005 (see Reference No. 1) measured the penetrant temperature on the non-fire side (i.e. above the floor) for three separate floor penetrations, sealed with 1) hydraulic cement, 2) grout and 3) mortar. The penetrating items and hole sizes where within the parameters allowed by 714.4.1 Exception No. 2. The fire test exposure was the standard ASTM E119 time-temperature curve, which is the same time-temperature curve used for other required fire resistance ratings required within the IBC. The test demonstrated that for all three penetrations tested, the T-rating limit of 325F temperature rise was exceeded within 17 minutes. Thus, the penetrations sealed with concrete, grout or mortar would be 43 minutes short of achieving even a minimal 1-hour T-rating. This is inconsistent with 714.4.1.2, which requires an approved firestop system to have a T-rating of at least 1 hour, and not less than the required rating of the floor penetrated.

<u>Making the options more consistent in their performance demands</u>

It is this inconsistency that this present code change aims to correct. Under conditions where the Code does not require a penetrating item to maintain any specific maximum temperature rise (T-rating), that same performance requirement (or lack of requirement) should be maintained regardless of the methodology chosen to accomplish the penetration seal. It is not logical to require a tested and listed firestop system to restrict temperature rise to 325F on the non-fire side for 4 times the amount of time that this same temperature rise can be limited by the penetration sealed with concrete grout or mortar. The performance criteria required by any one of a number of code-accepted alternatives should be equivalent, not divergent by a factor of four as in this instance.

Thus, for the very specific and limited applications where the code allows the concrete, grout or mortar solution (i.e. 6 inch copper or steel penetrant, with maximum hole size 144 sq. in. where penetrating item penetrates more than one floor), the T-rating should not be required when a tested and listed firestop system is used. The proposed new exception would not diminish the tested and proven ability of the firestop system to resist the passage of fire, as expressed by the F-rating, which still must equal the fire resistance rating of the penetrated assembly.

The words used for the proposed new exception are the same words used in 714.4.1 Exception No. 2 to describe the penetrating items that fall under that exception. This provides consistency not only of intent but also of verbiage between the two methodologies.

Establishing consistent temperature transmittal (T-rating) performance requirements between the concrete/grout/mortar solution, and the firestop solution, will have the advantage of allowing design and installation professionals to make a better, objective choice between the options. This change allows non-fire performance objectives of the penetration and fire safety to be considered without any other bias. For example, firestop systems can allow for movement of the penetrating item (depending on the firestop system selected), can provide a hermetic, water-tight seal, and would prevent the corrosion issues that are known to exist (depending on pipe and concrete composition) when a metallic pipe is cemented into a floor.

Bibliography: 1. "Fact-finding investigation of through-penetrations sealed with hydraulic cement, grout , or mortar", Underwriters' Laboratories, File R22102, Project 05CA06187, 2005

Cost Impact: Will not increase the cost of construction
The proposed new exception does not add any new requirements. Rather, under the specified conditions, it makes the option of using a tested and listed solution a more practical and therefore likely less expensive option that would be consistent with the level of heat transfer (T-rating) allowed for the prescriptive solution specified in 714.4.1 Exception 2.

FS 65-15 : 714.4.1.2-VALIULIS5542

FS 66-15

714.4.2

Proponent: Tony Crimi, representing International Firestop Council (tcrimi@sympatico.ca)

2015 International Building Code

Revise as follows:

714.4.2 Membrane penetrations. Penetrations of membranes that are part of a *horizontal assembly* shall comply with Section 714.4.1.1 or 714.4.1.2. Where floor/ceiling assemblies are required to have a *fire-resistance rating*, recessed fixtures shall be installed such that the required *fire resistance* will not be reduced.

Exceptions:

1. *Membrane penetrations* by steel, ferrous or copper conduits, pipes, tubes or vents, or concrete or masonry items where the *annular space* is protected either in accordance with Section 714.4.1 or to prevent the free passage of flame and the products of combustion. The aggregate area of the openings through the membrane shall not exceed 100 square inches (64 500 mm^2) in any 100 square feet (9.3 m^2) of ceiling area in assemblies tested without penetrations.
2. Ceiling *membrane penetrations* of maximum 2-hour *horizontal assemblies* by steel electrical boxes that do not exceed 16 square inches (10 323 mm^2) in area, provided the aggregate area of such penetrations does not exceed 100 square inches (44 500 mm^2) in any 100 square feet (9.29 m^2) of ceiling area, and the *annular space* between the ceiling membrane and the box does not exceed $^1/_8$ inch (3.2 mm).
3. *Membrane penetrations* by electrical boxes of any size or type, that have been *listed* as part of an opening protective material system for use in *horizontal assemblies* and are installed in accordance with the instructions included in the listing.
4. *Membrane penetrations* by *listed* electrical boxes of any material, provided such boxes have been tested for use in fire-resistance-rated assemblies and are installed in accordance with the instructions included in the listing. The *annular space* between the ceiling membrane and the box shall not exceed $^1/_8$ inch (3.2 mm) unless *listed* otherwise.
5. The *annular space* created by the penetration of a fire sprinkler, provided it is covered by a metal escutcheon plate.
6. Noncombustible items that are cast into concrete building elements and that do not penetrate both top and bottom surfaces of the element.
7. The ceiling membrane of 1- and 2-hour fire-resistance-rated horizontal assemblies is permitted to be interrupted with th~~e double~~ wood top plate of a wall assembly that is sheathed with Type X gypsum wallboard, provided that all penetrating items through the ~~double~~ top plates are protected in accordance with Section 714.4.1.1 or 714.4.1.2 and the ceiling membrane is tight to the top plates.

Reason: This code change was originally introduced in the 2012 IBC by FS75-09/10. It provided a new exception to section 712.4.1.2 to allow the ceiling membrane of a 1 or 2 hour fire rated floor/ceiling or roof/ceiling assembly to be interrupted by a double wood top plate of a fire rated wall. All penetrations of the top plates are protected by approved through penetration firestop systems. The proposal codified a typical condition that we see with Type VA construction where the wood framed walls extend up and attach directly to the underside of wood floor joists/trusses or roof joists/trusses for structural requirements. This code change was in line with the UL testing criteria and general information section. From the standpoint of firestopping, a double top plate is not necessary in order to effectively protect the penetrations. Many penetrations complying with Section 714.4.1.1 or 714.4.1.2 can be installed in a single wood top plate.

Cost Impact: Will not increase the cost of construction
This proposal will add design flexibility and potentially reduce the cost of construction for some situations. Some existing tested and Listed systems already exist for the revised condition.

FS 66-15 : 714.4.2-CRIMI4300

FS 67-15

714.4.2

Proponent: Jonathan Roberts, UL LLC, representing UL LLC (jonathan.roberts@ul.com)

2015 International Building Code

Revise as follows:

714.4.2 Membrane penetrations. Penetrations of membranes that are part of a *horizontal assembly* shall comply with Section 714.4.1.1 or 714.4.1.2. Where floor/ceiling assemblies are required to have a *fire-resistance rating*, recessed fixtures shall be installed such that the required *fire resistance* will not be reduced.

Exceptions:

1. *Membrane penetrations* by steel, ferrous or copper conduits, pipes, tubes or vents, or concrete or masonry items where the *annular space* is protected either in accordance with Section 714.4.1 or to prevent the free passage of flame and the products of combustion. The aggregate area of the openings through the membrane shall not exceed 100 square inches (64 500 mm^2) in any 100 square feet (9.3 m^2) of ceiling area in assemblies tested without penetrations.
2. Ceiling *membrane penetrations* of maximum 2-hour *horizontal assemblies* by steel electrical boxes that do not exceed 16 square inches (10 323 mm^2) in area, provided the aggregate area of such penetrations does not exceed 100 square inches (44 500 mm^2) in any 100 square feet (9.29 m^2) of ceiling area, and the *annular space* between the ceiling membrane and the box does not exceed $^1/_8$ inch (3.2 mm).
3. *Membrane penetrations* by electrical boxes of any size or type, that have been *listed* as part of an opening protective material system for use in *horizontal assemblies* and are installed in accordance with the instructions included in the listing.
4. *Membrane penetrations* by *listed* electrical boxes of any material, provided such boxes have been tested for use in fire-resistance-rated assemblies and are installed in accordance with the instructions included in the listing. The *annular space* between the ceiling membrane and the box shall not exceed $^1/_8$ inch (3.2 mm) unless *listed* otherwise.
5. The *annular space* created by the penetration of a fire sprinkler, provided it is covered by a metal escutcheon plate.
6. Noncombustible items that are cast into concrete building elements and that do not penetrate both top and bottom surfaces of the element.
7. The ceiling membrane of 1- and 2-hour fire-resistance-rated horizontal assemblies is permitted to be interrupted with the double wood top plate of a wall assembly that is sheathed with Type X gypsum wallboard, provided that all penetrating items through the double top plates are protected in accordance with Section 714.4.1.1 or 714.4.1.2 and the ceiling membrane is tight to the top plates.
8. Ceiling membrane penetrations by listed luminaires (light fixtures) or by luminaires protected with listed materials, which have been tested for use in fire-resistance-rated assemblies and are installed in accordance with the instructions included in the listing.

Reason: This proposal recognizes the listings of recessed incandescent and fluorescent can lights, or enclosure materials which protect recessed can lights or troffer light fixtures, which have been tested as a ceiling membrane penetration of fire-resistance-rated horizontal assemblies. There are currently twenty six UL listed can lights which incorporate integral fire protection which have evaluated for use in fire-resistance-rated horizontal assemblies. Similarly there are eleven UL listed enclosure materials which have been evaluated for their ability to protect penetrations in ceiling membranes by non fire rated can lights or troffer light fixtures.

Cost Impact: Will not increase the cost of construction
These products are already in use within the construction industry.

FS 67-15 : 714.4.2-ROBERTS5081

FS 68-15

715.1

Proponent: Paul Coats, PE CBO, representing American Wood Council (pcoats@awc.org)

2015 International Building Code

Revise as follows:

715.1 General. Where *joints* are provided to accommodate openings that are created due to building tolerances, or are designed to allow independent movement of the building in any plane caused by thermal, seismic, wind, or any other loading, they shall be protected in accordance with this section. Joints installed in or between fire-resistance-rated walls, floor or floor/ceiling assemblies and roofs or roof/ceiling assemblies shall be protected by an approved *fire-resistant joint system* designed to resist the passage of fire for a time period not less than the required *fire-resistance rating* of the wall, floor or roof in or between which the system is installed. *Fire-resistant joint systems* shall be tested in accordance with Section 715.3.

Exception: *Fire-resistant joint systems* shall not be required for joints in all of the following locations:

1. Floors within a single *dwelling unit*.
2. Floors where the joint is protected by a shaft enclosure in accordance with Section 713.
3. Floors within atriums where the space adjacent to the atrium is included in the volume of the atrium for smoke control purposes.
4. Floors within malls.
5. Floors and ramps within open and enclosed parking garages or structures constructed in accordance with Sections 406.5 and 406.6, respectively.
6. Mezzanine floors.
7. Walls that are permitted to have unprotected openings.
8. Roofs where openings are permitted.
9. Control joints not exceeding a maximum width of 0.625 inch (15.9 mm) and tested in accordance with ASTM E 119 or UL 263.

Reason: This proposal is editorial in nature and makes no change to the current requirements. The proposed wording comes directly from the current definition of Joint in Chapter 2: "Joint. The opening in or between adjacent assemblies that is created due to building tolerances, or is designed to allow independent movement of the building in any plan caused by thermal, seismic, wind or any other loading."
Inserting the definition of "joint" here will preclude confusion with other common uses of the term. The purpose of Section 715 is to maintain fire resistance in and between assemblies where spaces are intentionally provided to allow movement of building elements. Where such space is not needed nor provided, such as in platform frame construction, there is no requirement for a fire resistance rated joint system between fire resistance rated assemblies. The proposed wording will clarify the application.

Additional information about this proposal may be posted at http://www.awc.org/Code-Officials/2015-IBC-Code-Changes/

Cost Impact: Will not increase the cost of construction
This will have no impact on the cost of construction.The cost impact of this proposal will be zero since it is a clarification of current requirements and is editorial in nature.

FS 68-15 : 715.1-COATS4011

FS 69-15

715.1

Proponent: Tony Crimi, representing International Firestop Council (tcrimi@sympatico.ca)

2015 International Building Code

Revise as follows:

715.1 General. Joints installed in or between fire-resistance-rated walls, floor or floor/ceiling assemblies and roofs or roof/ceiling assemblies shall be protected by an approved *fire-resistant joint system* designed to resist the passage of fire for a time period not less than the required *fire-resistance rating* of the wall, floor or roof in or between which the system is installed. *Fire-resistant joint systems* shall be tested in accordance with Section 715.3.

Exception: *Fire-resistant joint systems* shall not be required for joints in all of the following locations:

1. Floors within a single *dwelling unit*.
2. Floors where the joint is protected by a shaft enclosure in accordance with Section 713.
3. Floors within atriums where the space adjacent to the atrium is included in the volume of the atrium for smoke control purposes.
4. Floors within malls.
5. Floors and ramps within open and enclosed parking garages or structures constructed in accordance with Sections 406.5 and 406.6, respectively.
6. Mezzanine floors.
7. Walls that are permitted to have unprotected openings.
8. Roofs where openings are permitted.
9. Control joints not exceeding a maximum width of 0.625 inch (15.9 mm) and tested in accordance with ASTM E 119 or UL 263.
10. The intersection of exterior curtain wall assemblies and the roof slab or roof deck.

Reason: The purpose of this code proposal is to clarify that a fire-resistant joint system is not required for the joint between an exterior curtain wall and a rated, or unrated, roof slab or deck.. The IBC has never had any requirement for that joint to be protected. However, given that the code does not say that you do or don't have to provide some protection at that joint, it is occasionally assumed and misinterpreted that some protection is required. Adding this joint to the list of joints that do not require a fire-resistant joint system will prevent such mis-application of the code.
There are currently no systems available to protect these joints, and no test methods available for this condition. So even if a request was made for a fire-resistant joint system at this location, it would be impossible to comply with that request. In addition, Section 711.4 already exempts penetrations of roof assemblies from needing protection. However, that should not be confused with continued need to protect penetrations through membranes of fire-resistance rated roof/ceiling assemblies.

In this case, it is specifically the joint between the roof slab or roof deck and the exterior curtain wall that would be exempted in a manner similar to through penetrations of a roof slab or roof deck.

Cost Impact: Will not increase the cost of construction
The proposals clarifies/adds an additional exemption to the need for a fire-resistant joint system.

FS 69-15 : 715.1-CRIMI4302

FS 70-15

715.2

Proponent: William Koffel, representing Firestop Contractors International Association (wkoffel@koffel.com)

2015 International Building Code

Revise as follows:

715.2 Installation. A *fire-resistant joint system* shall be securely installed in accordance with the manufacturer's installation instructions and the listing criteria in or on the joint for its entire length so as not to ~~dislodge, loosen or otherwise~~ impair its ability to accommodate expected building movements and to resist the passage of fire and hot gases.

Reason: It is appropriate to install the fire-resistant joint system in accordance with the listing (including manufacturer's instructions) and in a manner to accommodate building movement. The text proposed to be deleted is subjective and does not provide enforceable Code text.
The manufacturer's installation instructions provide additional details that are not commonly identified in the listing criteria. This includes environmental conditions, tooling, and additional details regarding how the fire-resistant joint system is to be installed.

Cost Impact: Will not increase the cost of construction
The proposed text will not result in an increase in the cost of construction. Listed systems should already be installed in accordance with the manufacturer's installation instructions.

FS 70-15 : 715.2-KOFFEL4845

FS 71-15

715.2, 715.4

Proponent: Vickie Lovell, InterCode Incorporated, representing 3M (vickie@intercodeinc.com)

2015 International Building Code

Revise as follows:

715.2 Installation. ~~A~~ ~~*fire-resistant*~~*Fire-resistant* *joint* ~~*system*~~*systems* and other approved materials used to protect the void created at the intersection of a floor/ceiling assembly and the exterior wall assembly shall be securely installed~~ in accordance with the listing criteria in or on the joint~~ for its entire length so as not to dislodge, loosen or otherwise impair its ability to accommodate expected building movements and to resist the passage of fire and hot gases. *Fire-resistant joint systems* required by this section to be tested and listed shall be installed in accordance with their listing criteria.

715.4 Exterior curtain wall/floor intersection. Where ~~fire resistance-rated~~fire-resistance rated floor or floor/ceiling assemblies are required, voids created at the intersection of the exterior curtain wall assemblies and such floor assemblies shall be sealed with an *approved* system to prevent the interior spread of fire. Such systems shall be securely installed and tested in accordance with ASTM E 2307 to provide an *F rating* for a time period not less than the *fire-resistance rating* of the floor assembly. Height and fire-resistance requirements for curtain wall spandrels shall comply with Section 705.8.5.

> **Exception:** Voids created at the intersection of the exterior curtain wall assemblies and such floor assemblies where the vision glass extends to the finished floor level shall be permitted to be sealed with an approved material to prevent the interior spread of fire. Such material shall be securely installed for its entire length so as not to dislodge, loosen or otherwise impair its ability to accommodate expected building movement, and be capable of preventing the passage of flame and hot gases sufficient to ignite cotton waste where subjected to ASTM E 119 time-temperature fire conditions under a minimum positive pressure differential of 0.01 inch (0.254 mm) of water column (2.5 Pa) for the time period not less than the *fire-resistance rating* of the floor assembly.

Reason: The intent of this section of the code is to ensure that one of the largest joints in a multi-story building, the perimeter joint at the intersection of the exterior wall and the floor, is adequately protected. The text describes the appropriate systems and materials for use in such joints. The section states that fire-resistant joint systems and other approved materials used to protect the void created at the intersection of a floor/ceiling assembly and the exterior wall assembly systems and materials shall perform two functions: 1) to prevent or retard the passage of fire and hot gases; and 2) to be securely installed so as to accommodate building movement.
The code text identifies two different approaches to fire testing. One is a fire-resistance rated perimeter joint system tested to ASTM E 2307; the other is an assemblage of approved materials that has been deemed to provide adequate fire resistance based on historical testint to ASTM E 119 and anecdotal field experience. The shortfall in both approaches is that there is no requirement in this section of the code that requires the perimeter joint system nor the generic fire resistive materials to accommodate the expected movement of the joint. The code only states that both shall be "securely installed," presumably at the time of construction, but does not require that the material REMAIN securely installed throughout the life of the building. Throughout a building's life cycle, joints experience rotational, vertical and/or horizontal movement and would possibly dislodge the systems and materials over time. This proposal conveys that the systems and materials have to anticipate the expected movement of the building and make the code more consistent.

Cost Impact: Will not increase the cost of construction
This proposal should not increase the cost of construciton since joints are already required to be tested for cyclic movement within the standard ASTM E 2307. This proposal requires that the method of protecting the perimeter joint system be appropriate for the expected movement of the joint, which is implied but not currently required by the code.

FS 71-15 : 715.2-LOVELL4867

FS 72-15

715.3

Proponent: Jonathan Roberts, UL LLC, representing UL LLC (jonathan.roberts@ul.com)

2015 International Building Code

Revise as follows:

715.3 Fire test criteria. *Fire-resistant joint systems* shall be tested in accordance with the requirements of either ASTM E 1966 or UL 2079. Nonsymmetrical wall joint systems shall be tested with both faces exposed to the furnace, and the assigned *fire-resistance rating* shall be the shortest duration obtained from the two tests. Where evidence is furnished to show that the wall was tested with the least fire-resistant side exposed to the furnace, subject to acceptance of the *building official*, the wall need not be subjected to tests from the opposite side.

> **Exception:** For *exterior walls* with a horizontal *fire separation distance* greater than ~~5~~ 10 feet (~~1524~~3048 mm), the joint system shall be required to be tested for interior fire exposure only.

Reason: Section 705.5 of the 2015 International Building Code (IBC) states the required fire-resistance rating of exterior walls with a fire separation distance of greater than 10 feet shall be rated for exposure to fire from the inside only. This distance was increased from 5 feet to 10 feet with the 2009 edition of the IBC. This proposed change to the Exception of Section 715.3 is intended to bring consistency between the requirements for exterior walls and fire-resistant joint systems installed within exterior walls.

Cost Impact: Will increase the cost of construction
Any tested system previously acceptable will still be acceptable. This may provide a negligible increase cost.

FS 72-15 : 715.3-ROBERTS4050

FS 73-15

707.5, 711.4 (New), 711.5 (New), 712.1.5, 715, 715.1 (New), 715.1, 715.2, 715.3, 715.6, 715.2 (New), 715.2.1 (New), 715.4, 715.2.3 (New), 715.5, 715.4.1, 715.3 (New), 715.3.1 (New), 715.3.2 (New), 715.4.2, 715.1.1

Proponent: Tony Crimi, representing International Firestop Council (tcrimi@sympatico.ca)

2015 International Building Code

CHAPTER 7 FIRE AND SMOKE PROTECTION FEATURES
Revise as follows:

707.5 Continuity. *Fire barriers* shall extend from the top of the foundation or floor/ceiling assembly below to the underside of the floor or roof sheathing, slab or deck above and shall be securely attached thereto. Such *fire barriers* shall be continuous through concealed space, such as the space above a suspended ceiling. Joints and voids at intersections shall comply with Sections 707.8~~ and 707.9~~.

Exceptions:

1. Shaft enclosures shall be permitted to terminate at a top enclosure complying with Section 713.12.
2. Interior exit stairway and ramp enclosures required by Section 1023 and exit access stairway and ramp enclosures required by Section 1019 shall be permitted to terminate at a top enclosure complying with Section 713.12.

Add new text as follows:

711.4 Penetrations Penetrations of *horizontal assemblies*, whether concealed or unconcealed, shall comply with Section 714.

711.5 Joints Joints made in or between horizontal assemblies shall comply with Section 715.1.Joints or voids at the intersection of horizontal assemblies and fire resistance rated walls, curtain walls, and exterior vertical walls shall comply with Section 715.2.

Revise as follows:

712.1.5 Joints. Joints shall be permitted where complying with Section ~~712.1.5.1 or 712.1.5.2~~715, as applicable.

SECTION 715 ~~FIRE-RESISTANT JOINT SYSTEMS~~PROTECTION OF JOINTS

Add new text as follows:

715.1 Joints in or between fire-resistance-rated assemblies Joints in or between fire-resistance-rated assemblies shall comply with Sections 715.1.1 through 715.1.4.

Revise as follows:

~~715.1~~715.1.1 General. Joints installed in or between fire-resistance-rated walls, floor or floor/ceiling assemblies and roofs or roof/ceiling assemblies shall be protected by an approved *fire-resistant joint system* designed to resist the passage of fire for a time period not less than the required *fire-resistance rating* of the wall, floor or roof in or between which the system is installed. *Fire-resistant joint systems* shall be tested in accordance with Section ~~715.3~~715.1.3.

Exception: *Fire-resistant joint systems* shall not be required for joints in all of the following locations:

1. Floors within a single *dwelling unit*.
2. Floors where the joint is protected by a shaft enclosure in accordance with Section 713.
3. Floors within atriums where the space adjacent to the atrium is included in the volume of the atrium for smoke control purposes.
4. Floors within malls.
5. Floors and ramps within open and enclosed parking garages or structures constructed in accordance with Sections 406.5 and 406.6, respectively.
6. Mezzanine floors.
7. Walls that are permitted to have unprotected openings.
8. Roofs where openings are permitted.
9. Control joints not exceeding a maximum width of 0.625 inch (15.9 mm) and tested in accordance with ASTM E 119 or UL 263.

~~715.2~~715.1.2 Installation. A *fire-resistant joint system* shall be securely installed in accordance with the listing criteria in or on the joint for its entire length so as not to dislodge, loosen or otherwise impair its ability to accommodate expected building movements and to resist the passage of fire and hot gases.

~~715.3~~<u>715.1.3</u> **Fire test criteria.** *Fire-resistant joint systems* shall be <u>installed as</u> tested in accordance with the requirements of either ASTM E 1966 or UL 2079. Nonsymmetrical wall joint systems shall be tested with both faces exposed to the furnace, and the assigned *fire-resistance rating* shall be the shortest duration obtained from the two tests. Where evidence is furnished to show that the wall was tested with the least fire-resistant side exposed to the furnace, subject to acceptance of the *building official*, the wall need not be subjected to tests from the opposite side.

> **Exception:** For *exterior walls* with a horizontal *fire separation distance* greater than 5 feet (1524 mm), the joint system shall be required to be tested for interior fire exposure only.

~~715.6~~<u>715.1.4</u> **Fire-resistant joint systems in smoke barriers.** *Fire-resistant joint systems* in *smoke barriers*, and joints at the intersection of a horizontal *smoke barrier* and an exterior curtain wall, shall be tested in accordance with the requirements of UL 2079 for air leakage. The *L rating* of the joint system shall not exceed 5 cfm per linear foot (0.00775 m^3/s m) of joint at 0.30 inch (7.47 Pa) of water for both the ambient temperature and elevated temperature tests.

Add new text as follows:

<u>**715.2** **Joints between floor assemblies and curtain walls.** Joints between curtain walls and floor or floor/ceiling assemblies that are required to be fire resistance rated shall comply with Sections 715.2.1 through 715.2.4. Joints between curtain walls and nonfire-resistance-rated floor or floor/ceiling assemblies shall comply with Section 715.2.5.</u>

<u>**715.2.1** **Installation** Joints shall be securely installed for its entire length so as not to dislodge, loosen or otherwise impair its ability to accommodate expected building movements and to resist the passage of fire and hot gases.</u>

Revise as follows:

~~715.4~~<u>715.2.2</u> **Exterior curtain wall/<u>Fire resistance-rated</u> floor<u> or floor/ceiling</u> intersection.** Where fire resistance-rated floor or floor/ceiling assemblies are required, voids created at the intersection of the exterior curtain wall assemblies and such floor assemblies shall be sealed with an *approved* system to prevent the interior spread of fire. Such systems shall be securely installed and tested in accordance with ASTM E 2307 to provide an *F rating* for a time period not less than the *fire-resistance rating* of the floor assembly. Height and fire-resistance requirements for curtain wall spandrels shall comply with Section 705.8.5.

> **Exception:** Voids created at the intersection of the exterior curtain wall assemblies and such floor assemblies where the vision glass extends to the finished floor level shall be permitted to be sealed with an approved material to prevent the interior spread of fire. Such material shall be securely installed and capable of preventing the passage of flame and hot gases sufficient to ignite cotton waste where subjected to ASTM E 119 time-temperature fire conditions under a minimum positive pressure differential of 0.01 inch (0.254 mm) of water column (2.5 Pa) for the time period not less than the *fire-resistance rating* of the floor assembly.

Add new text as follows:

<u>**715.2.3** **Fire-resistant joint systems in smoke barriers.** Joints at the intersection of a horizontal *smoke barrier* and an exterior curtain wall shall be tested in accordance with the requirements of UL 2079 for air leakage. The *L rating* of the joint system shall not exceed 5 cfm per linear foot (0.00775 m3/s m) of joint at 0.30 inch (7.47 Pa) of water for both the ambient temperature and elevated temperature tests.</u>

Revise as follows:

~~715.5~~<u>715.2.4</u> **Spandrel wall.** *No change to text.*

~~715.4.1~~<u>715.2.5</u> **Exterior curtain wall/nonfire-resistance-rated floor assembly intersections.** Voids created at the intersection of exterior curtain wall assemblies and nonfire-resistance-rated floor or floor/ceiling assemblies shall be sealed with an *approved* material or system to retard the interior spread of fire and hot gases between *stories*.

Add new text as follows:

<u>**715.3** **Joints between fire resistance rated walls and non-fire resistance rated floors or roofs.** Joints between fire barriers and floors or roofs shall comply with Sections 715.3.1 and 715.3.2.</u>

<u>**715.3.1** **Installation** Joints shall be securely installed so as not to dislodge, loosen or otherwise impair its ability to accommodate expected building movements and to retard the passage of fire and hot gases.</u>

<u>**715.3.2** **Joints between fire barriers and nonfire-resistance-rated roof assemblies.** The voids created at the intersection of a *fire barrier* and a nonfire-resistance-rated roof assembly shall be filled with an approved material or system to retard the interior spread of fire and hot gases.</u>

Revise as follows:

~~715.4.2~~<u>715.4</u> **Exterior curtain wall/vertical fire barrier intersections.** *No change to text.*

~~715.1.1~~<u>715.2.6</u> **Curtain wall assembly.** *No change to text.*

Reason: Section 715 organization is revised as follows, to group the rules for any given application together, and to draw clear distinctions between each one of them.
715.1 JOINTS IN OR BETWEEN FIRE RESISTANCE RATED ASSEMBLIES

715.2 JOINTS BETWEEN FLOOR ASSEMBLIES AND CURTAIN WALLS

715.3 JOINTS BETWEEN FIRE RESISTANCE RATED WALLS AND NON-FIRE RESISTANCE RATED FLOORS OR ROOFS

715.4 JOINTS BETWEEN FIRE RESISTANCE RATED WALLS AND NON-FIRE RESISTANCE RATED CURTAIN WALLS

All of the code requirements are exactly as in the 2015 IBC, except moved to the appropriate new sub-section of 715. The charging statements in the earlier parts of Chapter 7 that have pointed to sections or articles within 715 are modified to correct the articles to which they need to reference in the proposed, reorganized section 715. Similarly, new charging paragraphs are created to provide consistency in the format of each section.

Cost Impact: Will not increase the cost of construction
This proposal is a reorganization of existing requirements.

FS 73-15 : CHAPTER 7-CRIMI4413

FS 74-15

402.8.6.1, 405.4.2, 405.4.3, 407.3.1, 408.3.8, 410.3.5, 510.2, 705.8.2, 706.8, 722.2.4.4, 909.20.3.1, 909.20.3.2, 1023.3.1, 3008.6.3, 3008.6.3.1, 3007.6.3, 3104.10

Proponent: John Woestman, Kellen Company, representing Builders Hardware Manufacturers Association (BHMA) (jwoestman@kellencompany.com)

2015 International Building Code

Revise as follows:

402.8.6.1 Exit passageways. Where *exit passageways* provide a secondary *means of egress* from a tenant space, doorways to the *exit passageway* shall be protected by 1-hour *fire door assemblies* that comply with Section 716 and are self- or automatic-closing by smoke detection in accordance with Section 716.5.9.3.

405.4.2 Smoke barrier penetration. The compartments shall be separated from each other by a *smoke barrier* in accordance with Section 709. Penetrations between the two compartments shall be limited to plumbing and electrical piping and conduit that are firestopped in accordance with Section 714. Doorways shall be protected by *fire door assemblies* *that comply with Section 716 and shall be* ~~that are~~ automatic-closing by smoke detection in accordance with Section 716.5.9.3 and are installed in accordance with NFPA 105 and Section 716.5.3. Where provided, each compartment shall have an air supply and an exhaust system independent of the other compartments.

405.4.3 Elevators. Where elevators are provided, each compartment shall have direct access to an elevator. Where an elevator serves more than one compartment, an elevator lobby shall be provided and shall be separated from each compartment by a s*moke barrier* in accordance with Section 709. ~~Doors~~Doorways in the smoke barrier shall be ~~gasketed~~protected by fire door assemblies that comply with Section 716, ~~have a drop sill~~shall comply with the smoke and draft control assembly requirements of Section 716.5.3 with the UL 1784 test conducted without an artificial bottom seal, and shall be automatic-closing by smoke detection in accordance with Section 716.5.9.3.

407.3.1 Corridor doors. *Corridor* doors, other than those in a wall required to be rated by Section 509.4 or for the enclosure of a vertical opening or an *exit*, shall not have a required *fire protection rating* and shall not be required to be equipped with *self-closing* or automatic-closing devices, but shall provide an effective barrier to limit the transfer of smoke and shall be equipped with positive latching. Roller latches are not permitted. Other doors shall conform to Section ~~716.5~~716.

408.3.8 Interior exit stairway and ramp construction. One *interior exit stairway* or *ramp* in each building shall be permitted to have glazing installed in doors and interior walls at each landing level providing access to the *interior exit stairway or ramp*, provided that the following conditions are met:

1. The *interior exit stairway or ramp* shall not serve more than four floor levels.
2. *Exit* doors shall be not less than $^3/_4$ -hour *fire door assemblies* complying with Section ~~716.5~~716
3. The total area of glazing at each floor level shall not exceed 5,000 square inches (3.2 m^2) and individual panels of glazing shall not exceed 1,296 square inches (0.84 m^2).
4. The glazing shall be protected on both sides by an *automatic sprinkler system*. The sprinkler system shall be designed to wet completely the entire surface of any glazing affected by fire when actuated.
5. The glazing shall be in a gasketed frame and installed in such a manner that the framing system will deflect without breaking (loading) the glass before the sprinkler system operates.
6. Obstructions, such as curtain rods, drapery traverse rods, curtains, drapes or similar materials shall not be installed between the automatic sprinklers and the glazing.

410.3.5 Proscenium curtain. Where a proscenium wall is required to have a *fire-resistance rating*, the *stage* opening shall be provided with a fire curtain complying with NFPA 80, horizontal sliding doors complying with Section ~~716.5.2~~716 having a fire protection rating of at least 1 hour, or an *approved* water curtain complying with Section 903.3.1.1 or, in facilities not utilizing the provisions of smoke-protected assembly seating in accordance with Section 1029.6.2, a smoke control system complying with Section 909 or natural *ventilation* designed to maintain the smoke level not less than 6 feet (1829 mm) above the floor of the *means of egress*.

510.2 Horizontal building separation allowance. A building shall be considered as separate and distinct buildings for the purpose of determining area limitations, continuity of *fire walls*, limitation of number of *stories* and type of construction where all of the following conditions are met:

1. The buildings are separated with a *horizontal assembly* having a *fire-resistance rating* of not less than 3 hours.
2. The building below the *horizontal assembly* is of Type IA construction.

3. *Shaft*, *stairway*, *ramp* and escalator enclosures through the *horizontal assembly* shall have not less than a 2-hour *fire-resistance rating* with opening protectives in accordance with Section ~~716.5~~716.

   Exception: Where the enclosure walls below the *horizontal assembly* have not less than a 3-hour *fire-resistance rating* with opening protectives in accordance with Section ~~716.5~~716, the enclosure walls extending above the *horizontal assembly* shall be permitted to have a 1-hour *fire-resistance rating*, provided:

   1. The building above the *horizontal assembly* is not required to be of Type I construction;
   2. The enclosure connects fewer than four *stories*; and
   3. The enclosure opening protectives above the *horizontal assembly* have a *fire protection rating* of not less than 1 hour.

4. The building or buildings above the *horizontal assembly* shall be permitted to have multiple Group A occupancy uses, each with an *occupant load* of less 300, or Group B, M, R or S occupancies.
5. The building below the *horizontal assembly* shall be protected throughout by an *approved automatic sprinkler system* in accordance with Section 903.3.1.1, and shall be permitted to be any occupancy allowed by this code except Group H.
6. The maximum *building height* in feet (mm) shall not exceed the limits set forth in Section 504.3 for the building having the smaller allowable height as measured from the *grade plane*.

705.8.2 Protected openings. Where openings are required to be protected, ~~*fire doors* and fire shutters~~opening protectives shall comply with Section ~~716.5 and *fire window assemblies* shall comply with Section 716.6~~716.

Exception: Opening protectives are not required where the building is equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1 and the exterior openings are protected by a water curtain using automatic sprinklers *approved* for that use.

706.8 Openings. Each opening through a *fire wall* shall be protected in accordance with Section ~~716.5~~716 and shall not exceed 156 square feet (15 m^2). The aggregate width of openings at any floor level shall not exceed 25 percent of the length of the wall.

Exceptions:

1. Openings are not permitted in party walls constructed in accordance with Section 706.1.1.
2. Openings shall not be limited to 156 square feet (15 m^2) where both buildings are equipped throughout with an *automatic sprinkler system* installed in accordance with Section 903.3.1.1.

722.2.4.4 Columns built into walls. The minimum dimensions of Table 722.2.4 do not apply to a reinforced concrete column that is built into a concrete or masonry wall provided all of the following are met:

1. The *fire-resistance rating* for the wall is equal to or greater than the required rating of the column;
2. The main longitudinal reinforcing in the column has cover not less than that required by Section 722.2.4.2; and
3. Openings in the wall are protected in accordance with ~~Table 716.5~~Section 716.

Where openings in the wall are not protected as required by Section ~~716.5~~716, the minimum dimension of columns required to have a *fire-resistance rating* of 3 hours or less shall be 8 inches (203 mm), and 10 inches (254 mm) for columns required to have a *fire-resistance rating* of 4 hours, regardless of the type of aggregate used in the concrete.

909.20.3.1 Balcony doors. Where access to the *stairway* or *ramp* is by way of an open exterior balcony, the door assembly into the enclosure shall be a *fire door assembly* in accordance with Section ~~716.5~~716.

909.20.3.2 Vestibule doors. Where access to the *stairway* or *ramp* is by way of a vestibule, the door assembly into the vestibule shall be a *fire doorassembly* complying with Section ~~716.5~~716. The door assembly from the vestibule to the *stairway* shall have not less than a 20-minute *fire protection rating* complying with Section ~~716.5~~716.

Add new text as follows:

1023.3.1 Extension. Where *interior exit stairways* and *ramps* are extended to an *exit discharge* or a *public way* by an *exit passageway*, the *interior exit stairway* and *ramp* shall be separated from the *exit passageway* by a *fire barrier* constructed in accordance with Section 707 or a *horizontal assembly* constructed in accordance with Section 711, or both. The *fire-resistance rating* shall be not less than that required for the *interior exit stairway* and *ramp*. A *fire door* assembly complying with Section 716 shall be installed in the *fire barrier* to provide a *means of egress* from the *interior exit stairway* and *ramp* to the *exit passageway*. Openings in the *fire barrier* other than the *fire door* assembly are prohibited. Penetrations of the *fire barrier* are prohibited.

Exceptions:

1. Penetrations of the *fire barrier* in accordance with Section 1023.5 shall be permitted.

2. Separation between an *interior exit stairway* or *ramp* and the *exit passageway* extension shall not be required where there are no openings into the *exit passageway* extension.

Revise as follows:

3008.6.3 Lobby doorways. Other than the doors to the hoistway, elevator machine rooms, machinery spaces, control rooms and control spaces within the lobby enclosure smoke barrier, each doorway to an occupant evacuation elevator lobby shall be provided with a $^3/_4$-hour *fire door assembly* complying with Section ~~716.5~~716. The *fire door assembly* shall comply with the smoke and draft control assembly requirements of Section 716.5.3.1, and tested in accordance with ~~the~~ UL 1784 ~~test conducted~~ without ~~the~~ an artificial bottom seal.

3008.6.3.1 Vision panel. A vision panel shall be installed in each *fire door assembly* protecting the lobby doorway. The vision panel shall consist of fire-protection-rated glazing and shall comply with the requirements of Section 716 and shall be located to furnish clear vision of the occupant evacuation elevator lobby.

3007.6.3 Lobby doorways. Other than doors to the hoistway, elevator control room or elevator control space, each doorway to a fire service access elevator lobby shall be provided with a $^3/_4$-hour *fire door assembly* complying with Section ~~716.5~~716. The *fire door assembly* shall comply with the smoke and draft control door assembly requirements of Section 716.5.3.1, and tested in accordance with ~~the~~ UL 1784 ~~test conducted~~ without ~~the~~an artificial bottom seal.

3104.10 Tunneled walkway. Separation between the tunneled walkway and the building to which it is connected shall be not less than 2-hour fire-resistant construction and openings therein shall be protected in accordance with ~~Table 716.5.~~Section 716.

Reason: This proposal is an effort to review all I-Code references that "point" IBC Section 716 and its subsections.
In many locations, the references to a subsection of IBC 716 many need only an editorial update to the new location of the references requirements based on the reorganized text.

In other locations, it seems appropriate to clarify and / slightly revise the text and the reference.

These proposed revisions may, in some cases, be considered technical revisions. But, the goal of the proposed revisions is to be consistent with what is understood to be the intent of the code.

Cost Impact: Will not increase the cost of construction
There should be no cost increase, if the proposed revisions are consistent with the intent of the code.

FS 74-15 : 705.8.2-WOESTMAN5793

FS 75-15

716.1, 716.5

Proponent: Adolf Zubia, representing Fire Code Action Committee (fcac@iccsafe.org)

2015 International Building Code

Revise as follows:

716.1 General. Opening protectives required by other sections of this code shall comply with the provisions of this section and shall be installed in accordance with NFPA 80.

716.5 Fire door and shutter assemblies. Approved *fire door* and fire shutter assemblies shall be constructed of any material or assembly of component materials that conforms to the test requirements of Section 716.5.1, 716.5.2 or 716.5.3 and the *fire protection rating* indicated in Table 716.5. *Fire door* frames with transom lights, sidelights or both shall be permitted in accordance with Section 716.5.6.~~*Fire door* assemblies and shutters shall be installed in accordance with the provisions of this section and NFPA 80.~~

Exceptions:

1. Labeled protective assemblies that conform to the requirements of this section or UL 10A, UL 14B and UL 14C for tin-clad *fire door* assemblies.
2. Floor *fire door* assemblies in accordance with Section 712.1.13.1.

Reason: This proposal is submitted by the ICC Fire Code Action Committee (FCAC). This ICC committee was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. The Fire-CAC has held 10 open meetings and numerous Regional Work Group and Task Group meetings and conference calls for the current code development cycle which included members of the committees as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the FAC website at: http://www.iccsafe.org/cs/CAC/Pages/default.aspx?usertoken={token}&Site=icc
This proposal relocates the requirement for installation in accordance with NFPA 80 to Section 716.1 because this is applicable to all opening protectives covered in Section 716, including fire door assemblies, fire shutter assemblies, fire window assemblies and glass unit masonry.

The FCAC opening protective work group included interested industry and testing lab representatives working together to make this section more user friendly. The work group unanimously agreed on a number of proposed changes to IBC Section 716, including this one.

Cost Impact: Will not increase the cost of construction
This code change is primarily editorial but clarifies that all opening protectives shall be installed to NFPA 80.

FS 75-15 : 716.1-ZUBIA4214

FS 76-15

Table 716.3, 2409.1

Proponent: Adolf Zubia, ICC Staff, representing Fire Code Action Committee (fcac@iccsafe.org)

2015 International Building Code

Revise as follows:

TABLE 716.3
MARKING FIRE-RATED GLAZING ASSEMBLIES

FIRE TEST STANDARD	MARKING	DEFINITION OF MARKING
ASTM E 119 or UL 263	W	Meets wall assembly criteria.
ASTM E 119 or UL 263	FC	Meets floor/ceiling criteria[a]
NFA 257 or UL 9	OH	Meets fire window assembly criteria including the hose stream test.
NFPA 252 or UL 10B or UL 10C	D H T	Meets fire door assembly criteria. Meets fire door assembly hose stream test. Meets 450ºF temperature rise criteria for 30 minutes
	XXX	The time in minutes of the fire resistance or fire protection rating of the glazing assembly.

For SI: ºC = [(ºF) - 32]/1.8.
a. See Section 2409.1

2409.1 Glass walkways. Glass installed as a part of a floor/ceiling assembly as a walking surface and constructed with laminated glass shall comply with ASTM E 2751 or with the load requirements specified in Chapter 16. Such assemblies shall comply with the *fire-resistance rating and marking* requirements of this code where applicable.

Reason: In July/2014 the ICC Board decided to sunset the activities of the Code Technology Committee (CTC). This is being accomplished by re-assigning many of the CTC Areas of Study to the applicable Code Action Committee (CAC). This proposal falls under the CTC Area of Study entitled Unenclosed stairways and ADA/IBC coordination. Information on the CTC, including: the sunset plan; meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the CTC website.
This proposal is submitted by the ICC Fire Code Action Committee (FCAC). This ICC committee was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the Fire-CAC has held 10 open meetings and numerous Regional Work Group and Task Group meetings and conference calls which included members of the committees as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the FAC website at: http://www.iccsafe.org/cs/CAC/Pages/default.aspx?usertoken={token}&Site=icc

To assist designers, builders and code officials in determining the correct product has been supplied/installed when fire protection or fire-resistance-rated glazing is called for in a construction project, the code requires markings linked to the rating/appropriate use of the product. As new products and uses are introduced to the market, the marking requirements require updating. This proposal recognizes the use of ASTM E 119 or UL 263 tested and listed products for rated floor/ceiling assemblies by designating the marking as FC. The proposal adds the criteria and the marking letters to Table 716.3 and it modifies Section 2409.1 to include the requirement for the marking. This proposal maintains consistency in the code when dealing with fire-rated glazing products.

Cost Impact: Will not increase the cost of construction
The changes to the Table better reflect existing code requirements.

FS 76-15 : T2409.1-ZUBIA4198

FS 77-15

716.3.1

Proponent: Jonathan Roberts, representing UL LLC (jonathan.roberts@ul.com)

2015 International Building Code

Revise as follows:

716.3.1 Fire-rated glazing identification. For fire-rated glazing, the *label* shall bear the identification required in Tables 716.3 and 716.5. "D" indicates that the glazing is permitted to be used in *fire door* assemblies and that the glazing meets the fire protection requirements of NFPA 252, UL 10B or UL 10C. "H" shall indicate that the glazing meets the hose stream requirements of NFPA 252, UL 10B or UL 10C. "T" shall indicate that the glazing meets the temperature requirements of Section 716.5.5.1. The placeholder "XXX" represents the fire-rating period, in minutes.

Reason: UL 10B and 10C have been included as comparable standards to NFPA 252 since the 2009 edition of the International Building Code. All other sections of the Section 716 which reference NFPA 252 also include UL 10B and 10C. This proposal revises Section 716.4 to also reference UL 10B and 10C in conjunction with NFPA 252 for consistency.

Cost Impact: Will not increase the cost of construction
This simply provides code users more flexibility by allowing the use of the comparable UL standard.

FS 77-15 : 716.3.1-ROBERTS4053

FS 78-15

716.4

Proponent: Adolf Zubia, representing Fire Code Action Committee (fcac@iccsafe.org)

2015 International Building Code

Revise as follows:

716.4 Alternative methods for determining fire protection ratings. The application of any of the alternative methods *listed* in this section shall be based on the fire exposure and acceptance criteria specified in NFPA 252, UL 10B, UL 10C, NFPA 257 or UL 9. The required *fire resistance* of an opening protective shall be permitted to be established by any of the following methods or procedures:

1. Designs documented in *approved* sources.
2. Calculations performed in an *approved* manner.
3. Engineering analysis based on a comparison of opening protective designs having *fire protection ratings* as determined by the test procedures set forth in NFPA 252, UL 10B, UL 10C, NFPA 257 or UL 9.
4. Alternative protection methods as allowed by Section 104.11.

Reason: This proposal is submitted by the ICC Fire Code Action Committee (FCAC). This ICC committee was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. The Fire-CAC has held 10 open meetings and numerous Regional Work Group and Task Group meetings and conference calls for the current code development cycle which included members of the committees as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the FAC website at: http://www.iccsafe.org/cs/CAC/Pages/default.aspx?usertoken={token}&Site=icc
UL 10B and 10C have been included as comparable standards to NFPA 252 since the 2009 edition of the International Building Code. All other sections of the Section 716 which reference NFPA 252 also include UL 10B and 10C. This proposal revises Section 716.4 to also reference UL 10B and 10C in conjunction with NFPA 252 for consistency.

The FCAC opening protective work group included interested industry and testing lab representatives working together to make this section more user friendly. The work group unanimously agreed on a number of proposed changes to IBC Section 716, including this one

Cost Impact: Will not increase the cost of construction
This code change proposal allows options for engineering analysis based on two UL standards.

FS 78-15 : 716.4-ZUBIA4203

FS 79-15

Table 716.5

For SI: 1 square inch = 645.2 mm.

a. Two doors, each with a fire protection rating of $1^{1}/_{2}$ hours, installed on opposite sides of the same opening in a fire wall, shall be deemed equivalent in fire protection rating to one 3-hour fire door.

b. Fire-resistance-rated glazing tested to ASTM E 119 in accordance with Section 716.2 shall be permitted, in the maximum size tested.

c. Except where the building is equipped throughout with an automatic sprinkler and the fire-rated glazing meets the criteria established in Section 716.5.5.

d. Under the column heading "Fire-rated glazing marking door vision panel," W refers to the fire-resistance rating of the glazing, not the frame.

e. See Section 716.5.8.1.2.1.

f. See also Section 716.3.1 and Table 716.3 for additional permitted markings.

Reason: In July/2014 the ICC Board decided to sunset the activities of the Code Technology Committee (CTC). This is being accomplished by re-assigning many of the CTC Areas of Study to the applicable Code Action Committee (CAC). This proposal falls under the CTC Area of Study entitled labeling of fire-rated glazing Information on the CTC, including: the sunset plan; meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the CTC website.
This proposal is submitted by the ICC Fire Code Action Committee (FCAC). This ICC committee was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. The Fire-CAC has held 10 open meetings and numerous Regional Work Group and Task Group meetings and conference calls for the current code development cycle which included members of the committees as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the FAC website at: http://www.iccsafe.org/cs/CAC/Pages/default.aspx?usertoken={token}&Site=icc

Section 716.3 and 716.3.1 allow for fire rated glazing products to have product performance markings greater than the minimum requirement of the code. The language was added to the 2012 code. Table 716.5 is a graphic representation of the codes requirements for the rating opening assemblies, the allowable use of fire rated glazing and the minimum marking criteria when fire rated glazing is permitted. The table is not the actual technical requirements, those technical requirements exist within the written sections of Chapter 7. The table serves as an application aid for quick reference on what is required depending on the assembly an opening is in. Sections 716.3 and 716.3.1 are intended to be enhancements to the required markings of glazing products and the footnote proposed to be added is to enhance the application of Table 716.5 and clarify the table as a quick reference guide.

Cost Impact: Will not increase the cost of construction
This change merely clarifies the marking requirements for a specific type of glazing.

FS 79-15 : T716.5-ZUBIA4199

	2	$1^{1}/_{2}$	100 sq. in.[b]	≤100 sq. in. = D-H-90 >100 sq. in.= D-H-W-90	Not Permitted	2	Not Permitted	W-120
					Fire protection			
	1	$^{3}/_{4}$	Maximum size tested	D-H-45	$^{3}/_{4}$		D-H-45	
Smoke barriers					**Fire protection**			
	1	$^{1}/_{3}$	Maximum size tested	D-20	$^{3}/_{4}$		D-H-OH-45	

For SI: 1 square inch = 645.2 mm.

a. Two doors, each with a fire protection rating of $1^{1}/_{2}$ hours, installed on opposite sides of the same opening in a fire wall, shall be deemed equivalent in fire protection rating to one 3-hour fire door.

b. Fire-resistance-rated glazing tested to ASTM E 119 in accordance with Section 716.2 shall be permitted, in the maximum size tested.

~~c. Except where the building is equipped throughout with an automatic sprinkler and the fire-rated glazing meets the criteria established in Section 716.5.5.~~

d. Under the column heading "Fire-rated glazing marking door vision panel," W refers to the fire-resistance rating of the glazing, not the frame.

e. See Section 716.5.8.1.2.1.

Reason: This proposal is to delete "note c" from Table 716.5 since the note does not make any changes to the current code requirements indicated in the Table. Note c is attached to the "100 sq. in." limitation in the "Door Vision Panel Size" column at the "Fire barriers having a required fire resistance rating of 1 hour: Enclosures for shafts, exit access stairways, exit access ramps, interior exit stairways and interior exit ramps; and exit passageway walls" line.

It directs the user to Section 716.5.5 of the code. However, current Section 716.5.5 does not provide for any modification of the 100 sq. in. limitation for fire protection rated glazing. (Note B at the top of the column provides for increased fire-resistance rated glazing size).

716.5.5 Doors in interior exit stairways and ramps and exit passageways. Fire door assemblies in interior exit stairways and ramps and exit passageways shall have a maximum transmitted temperature rise of not more than 450°F (250°C) above ambient at the end of 30 minutes of standard fire test exposure.

Exception: The maximum transmitted temperature rise is not required in buildings equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2.

716.5.5.1 Glazing in doors. Fire-protection-rated glazing in excess of 100 square inches (0.065 m2) is not permitted. Fire-resistance-rated glazing in excess of 100 square inches (0.065 m2) shall be permitted in door fire doors. Listed fire-resistance-rated glazing in a fire door shall have a maximum transmitted temperature rise in accordance with Section 716.5.5 when the fire door is tested in accordance with NFPA 252, UL 10B or UL 10C.

The note traces back to a previous edition of the IBC where the maximum transmitted temperature rise exception was repeated under Section 716.5.5.1 in error. That was corrected with the exception being deleted in the 2012 edition of the IBC and as a result Note c needs to be deleted as it currently creates misdirection to a user of the table.

Cost Impact: Will not increase the cost of construction
The cost of construction would be reduced by clarification of the code language through deletion of the misleading note.

For SI: 1 square inch = 645.2 mm.

a. Two doors, each with a fire protection rating of $1^{1}/_{2}$ hours, installed on opposite sides of the same opening in a fire wall, shall be deemed equivalent in fire protection rating to one 3-hour fire door.

b. Fire-resistance-rated glazing tested to ASTM E 119 in accordance with Section 716.2 shall be permitted, in the maximum size tested.

c. Except where the building is equipped throughout with an automatic sprinkler and the fire-rated glazing meets the criteria established in Section 716.5.5.

d. Under the column heading "Fire-rated glazing marking door vision panel," W refers to the fire-resistance rating of the glazing, not the frame.

e. See Section 716.5.8.1.2.1.

716.5.5 Doors in interior exit stairways and ramps and exit passageways. *Fire door* assemblies in interior exit stairways and ramps and exit passageways shall have a maximum transmitted temperature rise of not more than 450°F (250°C) above ambient at the end of 30 minutes of standard fire test exposure.

> ~~**Exception:** The maximum transmitted temperature rise is not required in buildings equipped throughout with an *automatic sprinkler system* installed in accordance with Section 903.3.1.1 or 903.3.1.2.~~

716.5.5.1 Glazing in doors. ~~Fire-protection-rated~~

Fire rated glazing ~~in excess of 100 square inches (0.065 m^2) is not permitted. Fire-resistance-rated glazing in excess of 100 square inches (0.065 m^2)~~ shall be permitted in ~~door~~ *fire doors in accordance with Table 716.5*. Listed ~~fire-resistance-rated~~fire rated glazing in a fire door shall have a maximum transmitted temperature rise in accordance with Section 716.5.5 when the fire door is tested in accordance with NFPA 252, UL 10B or UL 10C.

Exception: The maximum transmitted temperature rise is not required in buildings equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2.

716.5.8.1.2 Fire-protection-rated glazing in door assemblies in fire walls and fire barriers rated greater than 1 hour. Fire-protection-rated glazing shall be prohibited in *fire walls* and *fire barriers* except in temperature rise doors in fire walls and fire barriers rated 2 hours or less that comply with Section 716.5.5.1, or as provided in Sections 716.5.8.1.2.1 and 716.5.8.1.2.2.

Reason: The code currently imposes unwarranted barriers to the use of fire-protection rated glazings in sizes greater than 100 sq.in. that, while not fire-resistance rated, are capable of blocking the passage of heat to enable a fire door tested to NFPA 252 (or UL 10B or UL 10C) to meet the 450º F temperature rise limitation found in Section 716.5.5 ("temperature rise doors").
The modifications proposed here are intended to permit the use of fire-protection rated glazing in sizes larger than 100 sq.in. if, and only if, the fire doors in which it is installed meets the 450º F temperature rise limitation found in Section 716.5.5.

The term "fire-rated glazing" is defined in Ch. 2 of the IBC to include both fire-protection rated and fire-resistance rated glazing. The proposed modification to Section 716.5.5.1, takes advantage of that definition to, simply, allow any "fire-rated glazing," whether fire-protection rated or fire-resistance rated, in temperature rise doors so long as it complies with the temperature rise restrictions of Section 716.5.5.

Consistent with this proposed change to Section 716.5.5.1, Table 716.5 is modified to permit complying fire-protection rated glazings found in temperature rise doors to be marked "D-H-T-xxx" (along with fire-resistance rated glazings found in temperature rise doors that are already being marked "D-H-W-xxx"). Likewise, Section 716.5.8.1.2 is also modified to accomodate the use of fire-protection rated glazings in temperature rise doors found in fire walls and fire barriers rated 2 hours or less.

Finally, the sprinklered building "exception" to Section 716.5.5 is moved to the end of the section, simply, to clarify that it applies to all of Section 716.5.5, including Section 716.5.5.1.

Cost Impact: Will not increase the cost of construction
Currently, only fire-resistance rated glazings are permitted in sizes greater than 100 sq.in. in temperature rise doors. Fire-resistance rated glazing is heavier and more expensive than fire-protection rated glazing. Allowing properly tested, listed and labeled fire-protection rated glazings in temperature rise doors will reduce the weight and the cost of such doors. Allowing fire-protection rated glazings in these applications will reduce, rather than increase, the cost of construction.

	1	$^{1}/_{3}$	Maximum size tested	D-20	$^{3}/_{4}$		D-H-OH-45	

For SI: 1 square inch = 645.2 mm.

a. Two doors, each with a fire protection rating of $1^{1}/_{2}$ hours, installed on opposite sides of the same opening in a fire wall, shall be deemed equivalent in fire protection rating to one 3-hour fire door.

b. Fire-resistance-rated glazing tested to ASTM E 119 in accordance with Section 716.2 shall be permitted, in the maximum size tested.

c. Except where the building is equipped throughout with an automatic sprinkler and the fire-rated glazing meets the criteria established in Section 716.5.5.

d. Under the column heading "Fire-rated glazing marking door vision panel," W refers to the fire-resistance rating of the glazing, not the frame.

e. See Section 716.5.8.1.2.1.

716.5.6 Fire door frames with transom lights and sidelights. ~~Door~~ Fire-protection rated glazing shall be permitted in door frames with transom lights, sidelights or both, ~~shall be permitted~~ where a $^{3}/_{4}$-hour *fire protection rating* or less is required and in 2-hour fire-resistance rated exterior walls in accordance with Table 716.5. *Fire door* frames with transom lights, sidelights, or both, installed with fire-resistance-rated glazing tested as an assembly in accordance with ASTM E 119 or UL 263 shall be permitted where a fire protection rating exceeding $^{3}/_{4}$ hour is required in accordance with_ Table 716.5.

Reason: This proposal is intended to correct an inconsistency in the way fire windows are treated in comparison to transoms and sidelights found in the same frame with a fire door. In that regard, Table 716.6 currently allows fire windows in 2-hour exterior walls to use either 90-minute fire-protection rated glass - or - fire-resistance rated glass with a fire rating equal to that of the exterior wall. However, if a fire window is in the same frame as a fire door, (and is, therefore, called a transom or sidelight), Section 716.5.6 prohibits the use of fire-protection rated glass and requires, instead, fire-resistance rated glass.

The only real difference between a "fire window" and a "transom" or a "sidelight" is whether it is, or is not, in the same frame as a fire door. This is evident in Section 716.5.3.2. It specifies that "[i]n a 20- minute fire door assembly, the glazing material in the door itself shall have a minimum fire-protection-rated glazing of 20 minutes and shall be exempt from the hose stream test." However, it goes on to provide that glazing in the transom and sidelights of the assembly are to be tested as a fire window, "including the hose stream test, in accordance with Section 716.6."

It should be noted, that, according to Table 716.5, doors with sidelights and transoms in the same frame are required to be tested to both the fire door test standard, NFPA 252, and the fire window test stardard, NFPA 257. And, that is exactly what is being proposed here.

The adoption of this proposal will, simply, allow the same type of glazing that is currently allowed in fire windows to be used in transoms and sidelights in 2-hour exterior walls.

Cost Impact: Will not increase the cost of construction
Currently, only fire-resistant glazing is permitted in transoms and sidelights in 2-hour rated exterior walls. This proposal would permit the use of 90-minute fire-protection rated glazing in those applications, the same type of glass currently allowed in fire windows in such exterior walls. Fire-resistance rated glazing is significantly heavier and more expensive than fire-protection rated glazing. Allowing both fire-resistance rated or fire-protection rated glazing in these applications, expands the choices of architect/specifiers and the number of products available for these types of applications. If adopted, this proposal will reduce, not increase, the cost of construction.

Smoke barriers					Fire protection			
	1	$^1/_3$	Maximum size tested	D-20	$^3/_4$		D-H-OH-45	

For SI: 1 square inch = 645.2 mm.

a. Two doors, each with a fire protection rating of $1^1/_2$ hours, installed on opposite sides of the same opening in a fire wall, shall be deemed equivalent in fire protection rating to one 3-hour fire door.

b. Fire-resistance-rated glazing tested to ASTM E 119 in accordance with Section 716.2 shall be permitted, in the maximum size tested.

c. Except where the building is equipped throughout with an automatic sprinkler and the fire-rated glazing meets the criteria established in Section 716.5.5.

d. Under the column heading "Fire-rated glazing marking door vision panel," W refers to the fire-resistance rating of the glazing, not the frame.

e. See Section 716.5.8.1.2.1.

716.5.8.1.2 Fire-protection-rated glazing in door assemblies in fire walls and fire barriers rated greater than 1 hour. Fire-protection-rated glazing shall be ~~prohibited~~ permitted in *fire walls* and *fire barriers* ~~except~~ as provided in Sections 716.5.8.1.2.1 and 716.5.8.1.2.2.

716.5.8.1.2.1 ~~Horizontal exits.~~Fire walls Fire-protection-rated glazing shall be permitted ~~as vision panels~~ in ~~*self-closing* swinging~~*fire* ~~*door*~~doors ~~assemblies serving as horizontal exits~~ in *fire walls* where limited to 100 square inches (0.065 m^2) ~~with no dimension exceeding 10 inches (0.3 mm)~~.

716.5.8.1.2.2 Fire barriers. Fire-protection-rated glazing shall be permitted in *fire doors* ~~having a $1^1/_2$-hour *fire protection rating*~~ intended for installation in *fire barriers*, where limited to 100 square inches (0.065 m^2).

Reason: The code currently prohibits the use of fire-protection rated glazing as vision panels in 3-hour fire doors permitted in 3 and 4-hour fire walls and fire barriers. There are numerous fire-protection rated glazing products listed as 100 sq. in. vision panels for use in 3-hour fire doors.
The code currently allows fire-resistance rated glazing in these doors in unlimited size. Nothing in this proposal would change that. Instead, adopting this proposal would also permit the use of fire-protection rated glazing, but limited in size to 100 sq. in. While fire-resistance rated glazing offers

protection against thermal transfer, it will do so be becoming opaque. Fire-protection rated glazing, on the other hand, will remain transparent, enabling fire fighters and first responders to see what is on the other side of the fire door, while at the same time limiting thermal transfer by reason of the 100 sq. in. size limitation associated with its use.

Adopting this proposal will provide architect/specifiers with significantly greater flexibility with no loss of safety. Currently, if the architect/specifier determines, for whatever reason, that the use of fire-resistance rated glazing in these applications is inappropriate, the only other choice would be to use a fire door with no view panel. If this proposal is adopted, a 100 sq. in. view panel would be an available option using listed and labeled fire-protection rated glass.

Consitent with changes to Section 716.5.8.1.2, Table 716.5 would also be changed to limit "door and vision panel size" to 100 sq. in. where fire-protection rated glazing is used in fire walls and fire barriers where 3-hour fie door and fire shutter assemblies are allowed. This would allow glazings in these applications to be marked either "D-H-180" when fire-protection rated glazing is used in 3 or 4 hour fire-resistance rated walls - or - "D-H-W-240" when fire-resistance rated glazing is used in 4-hour fire-resistance walls and "D-H-W-180" when used in 3-hour fire-resistance rated walls.

Cost Impact: Will not increase the cost of construction
Permitting the use of fire-protection glazing will reduce, not increase, the cost of construction. Fire-protection rated glazing is lighter and less expensive than fire-resistance rated glazing.

FS 83-15 : T716.5.8.1.2-ZAREMBA5366

FS 84-15

Table 716.5

Proponent: Amber Armstrong, City of Edmond (Oklahoma), representing self (amber.armstrong@edmondok.com)

2015 International Building Code

Revise as follows:

TABLE 716.5
OPENING FIRE PROTECTION ASSEMBLIES, RATINGS AND MARKINGS

	0.5	1/3[b]	Maximum size tested	D-20	1/3		D-H-OH-20	
Other fire partitions	1	3/4	Maximum size tested	D-H-45	3/4		D-H-45	
	0.5	1/3	Maximum size tested	D-H-20	1/3		D-H-20	

For SI: 1 square inch = 645.2 mm.

a. Two doors, each with a fire protection rating of $1^1/_2$ hours, installed on opposite sides of the same opening in a fire wall, shall be deemed equivalent in fire protection rating to one 3-hour fire door.

b. Fire-resistance-rated glazing tested to ASTM E 119 in accordance with Section 716.2 shall be permitted, in the maximum size tested.

c. Except where the building is equipped throughout with an automatic sprinkler and the fire-rated glazing meets the criteria established in Section 716.5.5.

d. Under the column heading "Fire-rated glazing marking door vision panel," W refers to the fire-resistance rating of the glazing, not the frame.

e. See Section 716.5.8.1.2.1.

Reason: This code change is intended to provide requirements for opening protection assemblies in 1-hour fire walls.
According to IBC Section 706.2, "fire walls designed and constructed in accordance with NFPA 221 shall be deemed to comply with this section." In NFPA 221 2015 edition, requirements for a specific type of fire wall called a Double Fire Wall are detailed. A Double Fire Wall consists of two walls, parallel to each other which have no connections between them and are independently supported by structural elements on either side. According to Section 4.5 and Table 4.5, when each wall of a double fire wall assembly is supported by structural elements which have a fire-resistance rating less than that required for the wall, the fire-resistance rating of each wall may be reduced by one hour.

For example, a building is required to be divided by a 2-hour fire wall. The designer chooses to construct two walls, back-to-back as opposed to a single fire wall. Each wall is supported by a structural frame which does not have a fire-resistance rating. Per NFPA 221, Table 4.5, each wall of the double fire wall assembly is permitted to have a fire-resistance rating of 1-hour. NFPA 221 Section 6.10.3 requires that openings in each wall which comprises the double fire wall be protected separately. Neither NFPA 221~~, Table 4.8.2~~nor IBC Table 716.5 list the opening requirements for a 1-hour fire wall.

There are many conditions when construction of two independent walls is a more desirable option than a single fire wall. Openings between the "separate" buildings are common. With no direction on a fire-resistance rating for that opening protection, the designer does not know what to provide, and the code official must determine the appropriate rating. This decision is subjective based on each code official and will not be consistent from jurisdiction to jurisdiction.

Cost Impact: Will not increase the cost of construction
This change will not increase the cost of construction because the fire-resistance rating of 60-minutes is less than the minimum stated for any fire wall.

FS 84-15 : T716.5-ARMSTRONG5679

FS 85-15

716.5.1

Proponent: Adolf Zubia, representing Fire Code Action Committee (fcac@iccsafe.org)

2015 International Building Code

Revise as follows:

716.5.1 Side-hinged or pivoted swinging doors. *Fire door* assemblies with side-hinged and pivoted swinging doors shall be tested in accordance with NFPA 252 or UL 10C.~~ After 5 minutes into~~ For tests conducted in accordance with NFPA 252, the fire test shall be conducted using the ~~NFPA 252 test, the neutral~~positive pressure ~~level~~method specified in the ~~furnace shall be established at 40 inches (1016 mm) or less above the sill~~standard.

Reason: This proposal is submitted by the ICC Fire Code Action Committee (FCAC). This ICC committee was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. The Fire-CAC has held 10 open meetings and numerous Regional Work Group and Task Group meetings and conference calls for the current code development cycle which included members of the committees as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the FAC website at: http://www.iccsafe.org/cs/CAC/Pages/default.aspx?usertoken={token}&Site=icc
NFPA 252 describes two fire test procedures, a positive pressure test and a "test conducted at other than positive pressure" (a neutral pressure test). The current description in Section 716.5.1 does not accurately reflect the required positive pressure conditions described in the current edition of NFPA 252. As such, this proposal is intended to correct that situation by simply requiring the test to be conducted in accordance with the positive pressure method specified in the standard. UL 10C only includes a positive pressure test, so there is no need to mention pressure conditions for it.

The FCAC opening protective work group included interested industry and testing lab representatives working together to make this section more user friendly. The work group unanimously agreed on a number of proposed changes to IBC Section 716, including this one.

Cost Impact: Will not increase the cost of construction
This code change proposal only clarifies references to testing criteria.

FS 85-15 : 716.5.1-ZUBIA4204

FS 86-15

716.5.1.1 (New), 716.5.3.1

Proponent: John Woestman, Kellen Company, representing Builders Hardware Manufacturers Association (BHMA) (jwoestman@kellencompany.com)

2015 International Building Code

Add new text as follows:

716.5.1.1 **Smoke and draft control.** Fire door assemblies shall meet the requirements for a smoke and draft control door assembly tested in accordance with UL 1784. The air leakage rate of the door assembly shall not exceed 3.0 cubic feet per minute per square foot (0.01524 m3/s • m2) of door opening at 0.10 inch (24.9 Pa) of water for both the ambient temperature and elevated temperature tests. Louvers shall be prohibited. Installation of smoke doors shall be in accordance with NFPA 105.

Revise as follows:

716.5.3.1 Smoke and draft control. ~~*Fire door*~~
Door assemblies in corridors and smoke barriers shall ~~meet~~comply with th~~e requirements for a~~ smoke and draft control door assembly ~~tested~~requirements in ~~accordance with UL 1784. The air leakage rate of the door assembly shall not exceed 3.0 cubic feet per minute per square foot (0.01524 $m^3/s \cdot m^2$) of door opening at 0.10 inch (24.9 Pa) of water for both the ambient temperature and elevated temperature tests. Louvers shall be prohibited. Installation of smoke doors shall be in accordance with NFPA 105.~~Section 716.5.1.1.

Reason: The IBC currently does not require fire-rated doors to also control smoke as required for smoke and draft control door assemblies. This could be the intent of the code. Or, this could be a technical oversight of the code. This proposal attempts to address this question. It seems logical that fire rated doors should also perform as smoke and draft control doors as smoke is the most common cause of fatalities from a fire.
BHMA recommends the IBC should require all side-hinged doors required to be fire-rated doors to also perform to the requirements of a smoke and draft control door. This proposal moves the text of Section 716.5.3.1 to apply to side-hinged or pivoted swinging doors.

The new text proposed for Section 716.5.3.1 maintains the current requirements of 716.5.3 for door assemblies in corridors and smoke barriers. This sentence is needed as the charging language of 716.5 requires compliance to Sections 716.5.1, 716.5.2 **or** 716.5.3 (emphasis added).

Cost Impact: Will increase the cost of construction
May increase the cost of construction. It seems logical that fire rated doors should also perform as smoke and draft control doors as smoke is the most common cause of fatalities from a fire.

FS 86-15 : 716.5.1.1 (New)-WOESTMAN5515

FS 87-15

716.5.2

Proponent: Adolf Zubia, representing Fire Code Action Committee (fcac@iccsafe.org)

2015 International Building Code

Revise as follows:

716.5.2 Other types of assemblies. *Fire door* assemblies with other types of doors, including swinging elevator doors, horizontal sliding fire door assemblies, and fire shutter assemblies, bottom and side-hinged chute intake doors, and top-hinged chute discharge doors, shall be tested in accordance with NFPA 252 or UL 10B. ~~The pressure~~ For tests conducted in accordance with NFPA 252, the neutral pressure plane in the furnace shall be maintained as nearly equal to the atmospheric pressure as possibl~~e. Once established,~~ at the ~~pressure shall be maintained during~~top of the ~~entire test period.~~door, as specified in the standard.

Reason: This proposal is submitted by the ICC Fire Code Action Committee (FCAC). This ICC committee was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. The Fire-CAC has held 10 open meetings and numerous Regional Work Group and Task Group meetings and conference calls for the current code development cycle which included members of the committees as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the FAC website at: http://www.iccsafe.org/cs/CAC/Pages/default.aspx?usertoken={token}&Site=icc
NFPA 252 describes two fire test procedures, a positive pressure test and a "test conducted at other than positive pressure" (i.e. a neutral pressure test). Currently Section 716.5.1 defines the positive pressure conditions for NFPA 252 tests for the side-hinged and pivoted swinging doors. But Section 716.5.2 does not define this for the other types of assemblies. This proposal provides that clarification. UL 10B only includes a neutral pressure test, so there is no need to mention pressure conditions for it.

The FCAC opening protective work group included interested industry and testing lab representatives working together to make this section more user friendly. The work group unanimously agreed on a number of proposed changes to IBC Section 716, including this one.

Cost Impact: Will not increase the cost of construction
This code change proposal only clarifies references to testing criteria.

FS 87-15 : 716.5.2-ZUBIA4205

FS 88-15

716.5.2

Proponent: Joseph Hetzel, representing Door & Access Systems Manufacturers Association (Jhetzel@thomasamc.com)

2015 International Building Code

Revise as follows:

716.5.2 Other types of assemblies. *Fire door* assemblies with other types of doors, including swinging elevator doors, horizontal sliding fire ~~door assemblies~~doors, ~~and~~rolling steel fire ~~shutter assemblies~~doors, fire shutters, bottom and side-hinged chute intake doors, and top-hinged chute discharge doors, shall be tested in accordance with NFPA 252 or UL 10B. The pressure in the furnace shall be maintained as nearly equal to the atmospheric pressure as possible. Once established, the pressure shall be maintained during the entire test period.

Reason: Rolling steel fire doors should be included in the list since they have been successfully required to be tested and listed to either NFPA 252 or UL 10B for many years. The other changes are typographical for consistency within the list of door types.

Cost Impact: Will not increase the cost of construction
None.The language change has no effect on the product and thus no effect on construction cost, thus no study is needed.

FS 88-15 : 716.5.2-HETZEL3422

FS 89-15

716.5.3.1.1 (New)

Proponent: John Woestman, representing Builders Hardware Manufacturers Association (BHMA) (jwoestman@kellencompany.com)

2015 International Building Code

Add new text as follows:

716.5.3.1.1 **Terminated stops.** On doors required by this code to be smoke and draft control doors, stops on door frames shall be permitted to terminate not more than 6" above the floor.

> **Exception:** Section 716.5.3.1.1 shall not apply to smoke and draft control doors required by Sections 3006.3, 3007.6.3, and 3008.6.3.

Reason: Many doors installed in hollow metal frames in health care facilities have terminated stops. These terminated stops are also known as "hospital stops" or "sanitary stops." A terminated stop is a factory modification to a door frame, where the stop is terminated above the floor. The bottom of the stop is closed at a 45-degree or 90-degree angle. The purpose of a terminated stop is to make it easier to clean that area of the floor without the extra corners to catch debris or pathogens, and to avoid getting cart or bed wheels caught on the stop.
The code is silent regarding terminated stops. This proposal provides guidance where terminated stops would be allowed, and not allowed, by the code. This proposal is consistent with the testing requirements of UL 1784.

Cost Impact: Will not increase the cost of construction
No mandatory costs. Door frames with terminated stops may have a slight increase in cost compared to door frames with full length stops. However, installation of door frames with terminated stops is optional.

FS 89-15 : 716.5.3.1.1 (New)-WOESTMAN5522

FS 90-15

716.5.3.1

Proponent: Adolf Zubia, representing Fire Code Action Committee (fcac@iccsafe.org)

2015 International Building Code

Revise as follows:

716.5.3.1 Smoke and draft control. *Fire door* assemblies ~~shall meet the requirements for a~~ that also serve as smoke and draft control ~~door assembly~~ assemblies shall be tested in accordance with UL 1784. The air leakage rate of the door assembly shall not exceed 3.0 cubic feet per minute per square foot (0.01524 $m^3/s \cdot m^2$) of door opening at 0.10 inch (24.9 Pa) of water for both the ambient temperature and elevated temperature tests. Louvers shall be prohibited. Installation of smoke doors shall be in accordance with NFPA 105.

Reason: This proposal is submitted by the ICC Fire Code Action Committee (FCAC). This ICC committee was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. The Fire-CAC has held 10 open meetings and numerous Regional Work Group and Task Group meetings and conference calls for the current code development cycle which included members of the committees as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the FAC website at:http://www.iccsafe.org/cs/CAC/Pages/default.aspx?usertoken={token}&Site=icc
Editorial change only. The FCAC opening protective work group included interested industry and testing lab representatives working together to make this section more user friendly. The work group unanimously agreed on a number of proposed changes to IBC Section 716, including this one.

Cost Impact: Will not increase the cost of construction
This code change proposal will not increase the cost of construction because they are Editorial changes only.

FS 90-15 : 716.5.3.1-ZUBIA4206

FS 91-15

716.5.8

Proponent: Adolf Zubia, representing Fire Code Action Committee (fcac@iccsafe.org)

2015 International Building Code

Revise as follows:

716.5.8 Glazing material. Fire-rated glazing ~~and fire-resistance-rated glazing~~ conforming to the opening protection requirements in Section 716.5 shall be permitted in *fire door* assemblies.

Reason: This proposal is submitted by the ICC Fire Code Action Committee (FCAC). This ICC committee was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. The Fire-CAC has held 10 open meetings and numerous Regional Work Group and Task Group meetings and conference calls for the current code development cycle which included members of the committees as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the FAC website at:http://www.iccsafe.org/cs/CAC/Pages/default.aspx?usertoken={token}&Site=icc
The definition of the phrase *fire-rated glazing* is "Glazing with either a *fire protection rating* or a *fire-resistance rating*." As such, the reference to *fire-resistance-rated* glazing in Section 716.5.8 is redundant.

The FCAC opening protective work group included interested industry and testing lab representatives working together to make this section more user friendly. The work group unanimously agreed on a number of proposed changes to IBC Section 716, including this one.

Cost Impact: Will not increase the cost of construction
This code change proposal will not increase the cost of constructio because they are editorial changes only.

FS 91-15 : 716.5.8-ZUBIA4207

FS 92-15

716.5.8.1.2.1

Proponent: Adolf Zubia, representing Fire Code Action Committee (fcac@iccsafe.org)

2015 International Building Code

Revise as follows:

716.5.8.1.2.1 Horizontal exits. Fire-protection-rated glazing shall be permitted as vision panels in *self-closing* swinging *fire door* assemblies serving as horizontal exits in *fire walls* where limited to 100 square inches (0.065 m^2) ~~with no dimension exceeding 10 inches (0.3 mm)~~.

Reason: This proposal is submitted by the ICC Fire Code Action Committee (FCAC). This ICC committee was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. The Fire-CAC has held 10 open meetings and numerous Regional Work Group and Task Group meetings and conference calls for the current code development cycle which included members of the committees as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the FAC website at: http://www.iccsafe.org/cs/CAC/Pages/default.aspx?usertoken={token}&Site=icc
This code change deletes the 10 inch maximum dimension applied to 100 square inch vision panels limits for swinging doors in horizontal exits. The 10 inch dimension limit is not applied to any other 100 square inch maximum glazing size references in Section 716, including Sections 716.5.5.1, 716.5.8.1.2.2 and Table 716.5. The 10 inch dimension limit may also result in a conflict with ADA Standards for Accessible Design, which specifies glazing height requirements for doors and sidelights adjacent to doors.

Deleting the 10 inch maximum dimension limit for horizontal exits will allow for a fire door vision panel that meets ADA 43 inch height limits and the goal of accessible design.

The FCAC opening protective work group included interested industry and testing lab representatives working together to make this section more user friendly. The work group unanimously agreed on a number of proposed changes to IBC Section 716, including this one.

Cost Impact: Will not increase the cost of construction
If anything this proposal allows greater construction options.

FS 92-15 : 716.5.8.1.2.1-ZUBIA4216

FS 93-15

716.5.9.1

Proponent: Joseph Hetzel, Thomas Associates, Inc. representing DASMA, representing Door & Access Systems Manufacturers Association (Jhetzel@thomasamc.com)

2015 International Building Code

Revise as follows:

716.5.9.1 Latch required. Unless otherwise specifically permitted, single <u>*side-hinged swinging*</u> *fire doors* and both leaves of pairs of side-hinged swinging *fire doors* shall be provided with an active latch bolt that will secure the door when it is closed.

Reason: Clarification is needed to show that side-hinged swinging fire doors, and no other types of fire doors, are being addressed in these provisions.

Cost Impact: Will not increase the cost of construction
None.The language change has no effect on the product and thus no effect on construction cost, thus no study is needed.

FS 93-15 : 716.5.9.1-HETZEL3306

FS 94-15

202 (New), 716.5.9.2, 716.5.9.3 (New)

Proponent: John Woestman, Kellen Company, representing Builders Hardware Manufacturers Association (BHMA) (jwoestman@kellencompany.com)

2015 International Building Code

Add new definition as follows:

SECTION 202 DEFINITIONS

DELAYED ACTION CLOSER. Self-closing device that incorporates a delay prior to the intiation of closing. Delayed action closers are mechanical devices with an adjustable delay.

716.5.9.2 Automatic-closing fire door assemblies. Automatic-closing *fire door* assemblies shall be *self-closing* in accordance with NFPA 80.

Add new text as follows:

716.5.9.3 Delayed action closers Doors required to be self-closing and not requried to be automatic closing shall be permitted to be equipped with delayed action closers with not more than 60 seconds delay before the door is closed.

Reason: The IBC is silent regarding allowing delayed action closers, and applicable requirements.
Delayed action closer functionality is commonly required and / or desired for closers installed on doors. Example: delayed action closers are frequently used in schools to allow a teacher to lead a group of students from one area of the building to another. A door with a delayed action closer allows the teacher with a group of students to pass through the door before it closes, helping to keep the group intact.

Unlike automatic-closing doors which are commonly held in an open position, self-closing doors which are not automatic-closing doors are normally in a closed position unless being used. Thus, in a fire situation, the doors within the scope of this proposal would be closed except when being used and during the relatively brief delay caused by the delayed action closer.

The delay of delayed action closers is usually adjustable. A maximum 60 seconds delay seems reasonable for a common application in schools.

For reference; IBC definition: SELF-CLOSING. As applied to a fire door or other opening protective, means equipped with a device that will ensure closing after having been opened.

Cost Impact: Will not increase the cost of construction
None. Delayed action closers are not currently required or prohibited by the code. This proposal provides appropriate guidance where delayed action closers are installed.

FS 94-15 : 716.5.9.2-WOESTMAN5525

FS 95-15

716.5.9.3

Proponent: John Williams, CBO, Chair, representing Adhoc Health Care Committee (AHC@iccsafe.org); Adolf Zubia, Chair, reprsenting Fire Code Action Committee (fcac@iccsafe.org)

2015 International Building Code

Revise as follows:

716.5.9.3 Smoke-activated doors. Automatic-closing doors installed in the following locations shall be permitted to have hold-open devices. Doors shall automatically close~~automatic closing~~ by the actuation of smoke detectors installed in accordance with Section 907.3 or by loss of power to the smoke detector or hold-open device. Doors that are automatic-closing by smoke detection shall not have more than a 10-second delay before the door starts to close after the smoke detector is actuated.~~:~~ Automatic-closing doors that protect openings installed in the following locations shall comply with this section:

~~1. Doors installed across a corridor.~~
~~2. Doors installed in the enclosures of exit access stairways and ramps in accordance with Sections 1019 and 1023, respectively.~~
~~3. Doors that protect openings in exits or corridors required to be of fire-resistance-rated construction.~~
1.~~4. Doors that protect openings~~ in walls ~~that are capable of resisting the passage of smoke~~ that seperate incidental uses in accordance with Section 509.4.
2.~~7. Doors installed~~ In *fire ~~wall~~ walls* in accordance with Section 706.8.
3. In *fire barriers* in accordance with Section 707.6
4.~~6. Doors installed~~ In *fire partitions* in accordance with Section 708.6.
5.~~Doors installed~~ In *smoke barriers* in accordance with Section 709.5.
6.~~12. Doors installed~~ In smoke partitions in accordance with Section 710.5.2.3.
7.~~8. Doors installed~~ In shaft enclosures in accordance with Section 713.7.
8.~~9. Doors installed~~ In waste and linen chutes, discharge openings and access and discharge rooms in accordance with Section 713.13. Loading doors installed in waste and linen chutes shall meet the requirements of Sections 716.5.9 and 716.5.9.1.1.
~~10 Doors installed in the walls for compartmentation of underground buildings in accordance with Section 405.4.2.~~
~~11. Doors installed in the elevator lobby walls of underground buildings in accordance with Section 405.4.3.~~

Reason: The intent of this proposal is clarification. Current items 1, 2, 3, 10 and 11 are addressed in the items specific to smoke barriers, shaft enclosures, fire barriers and smoke barriers respectively. They should be deleted as redundant. Current items 4 through 9 and 12 are reworded to be consistent and to be technically correct. Fire barriers were added to the list to address doors that protect openings in exit enclosures, vertical shafts, incidental uses, etc. Items are proposed to be renumbered to be in the same order as they are found in the code.

The ICC Ad Hoc Committee on Healthcare (AHC) has just completed its 4th year. The AHC was established by the ICC Board to evaluate and assess contemporary code issues relating to hospitals and ambulatory healthcare facilities. This is a joint effort between ICC and the American Society for Healthcare Engineering (ASHE), a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. Information on the AHC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the AHC effort can be downloaded from the AHC website at: http://www.iccsafe.org/cs/AHC/Pages/default.aspx.

This ICC committee was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the Fire-CAC has held 10 open meetings and numerous Regional Work Group and Task Group meetings and conference calls which included members of the committees as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the FAC website at: http://www.iccsafe.org/cs/CAC/Pages/default.aspx?usertoken={token}&Site=icc

Cost Impact: Will not increase the cost of construction
This proposal is a clarification of requirements; therefore, there is no increase in cost.

FS 95-15 : 716.5.9.3-WILLIAMS4237

FS 96-15

716.5.9.4

Proponent: Joseph Hetzel, representing Door & Access Systems Manufacturers Association (Jhetzel@thomasamc.com)

2015 International Building Code

Revise as follows:

716.5.9.4 Doors in pedestrian ways. ~~Vertical sliding~~
Sliding or ~~vertical~~ rolling steel *fire doors* in openings through which pedestrians travel shall be heat activated or activated by smoke detectors with alarm verification.

Reason: Sliding fire doors can operate horizontally, thus the "vertical" descriptor is not needed because it is too limiting. Rolling steel fire doors always operate vertically by definition, so the "vertical" descriptor is redundant and unnecessary.

Cost Impact: Will not increase the cost of construction
None.The language change has no effect on the product and thus no effect on construction cost, thus no study is needed.

FS 96-15 : 716.5.9.4-HETZEL3420

FS 97-15

Table 716.6, 716.6.7.1

Proponent: Robert Davidson, Davidson Code Concepts, LLC, representing SAFTI FIRST (rjd@davidsoncodeconcepts.com)

2015 International Building Code

TABLE 716.6
FIRE WINDOW ASSEMBLY FIRE PROTECTION RATINGS

TYPE OF WALL ASSEMBLY	REQUIRED WALL ASSEMBLY RATING (hours)	MINIMUM FIRE WINDOW ASSEMBLY RATING (hours)	FIRE-RATED GLAZING MARKING
Interior walls			
Fire walls	All	NP[a]	W-XXX[b]
Fire barriers	>1 1	NP[a] NP[a]	W-XXX[b] W-XXX[b]
Incidental use areas (Section 707.3.7), Mixed occupancy separations (Section 707.3.9), <u>Atrium separations (Section 707.3.6)</u>	1	$^3/_4$	OH-45 or W-60
Fire partitions	1 0.5	$^3/_4$ $^1/_3$	OH-45 or W-60 OH-20 or W-30
Smoke barriers	1	$^3/_4$	OH-45 or W-60
Exterior walls	>1 1 0.5	$1^1/_2$ $^3/_4$ $^1/_3$	OH-90 or W-XXX[b] OH-45 or W-60 OH-20 or W-30
Party wall	All	NP	Not Applicable

NP = Not Permitted.

a. Not permitted except fire-resistance-rated glazing assemblies tested to ASTM E 119 or UL 263, as specified in Section 716.2.

b. XXX = The fire rating duration period in minutes, which shall be equal to the fire-resistance rating required for the wall assembly.

Revise as follows:

716.6.7.1 Where $^3/_4$-hour fire protection window assemblies permitted. Fire-protection-rated glazing requiring 45-minute opening protection in accordance with Table 716.6 shall be limited to *fire partitions* designed in accordance with Section 708 and *fire barriers* utilized in the applications set forth in Sections <u>707.3.6,</u> 707.3.7 and 707.3.9 where the *fire-resistance rating* does not exceed 1 hour. Fire-resistance-rated glazing assemblies tested in accordance with ASTM E 119 or UL 263 shall not be subject to the limitations of this section.

Reason: The purpose of this proposal is to clarify application of the code. Sections 404.6 Enclosure of atriums, 707.3.6 Atriums, and 707.6 Openings Exception 4 all provide for the use of a 1 hour fire-resistance rated fire barrier for enclosing an atrium and provide for the use of fire windows.

However, if the designer decides to provide for a fire window in the fire barrier, Section 716.6.7.1 does not include the atrium section reference, (Section 707.3.6), and Table 716.6 does not have provisions for the Minimum Window Assmbly Rating or Fire-Rated Glazing Marking for the Atrium separation assembly and has led some designers and code officials to question whether fire windows could be utilized because of the general limitation against fire windows in fire barriers.
By including the added language in the table clarification and guidance will be provided to the code user.

Cost Impact: Will not increase the cost of construction
The clarifying labguage will provide for a reduced cost of construction.

FS 97-15 : T716.6-DAVIDSON5287

FS 98-15

716.6.2

Proponent: Adolf Zubia, representing Fire Code Action Committee (fcac@iccsafe.org)

2015 International Building Code

Revise as follows:

716.6.2 Nonsymmetrical glazing systems. Nonsymmetrical fire-protection-rated glazing systems in *fire partitions*, *fire barriers* or in *exterior walls* with a *fire separation distance* of ~~5~~ 10 feet (~~1524~~3048 mm) or less pursuant to Section 705 shall be tested with both faces exposed to the furnace, and the assigned *fire protection rating* shall be the shortest duration obtained from the two tests conducted in compliance with NFPA 257 or UL 9.

Reason: This proposal is submitted by the ICC Fire Code Action Committee (FCAC). This ICC committee was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. The Fire-CAC has held 10 open meetings and numerous Regional Work Group and Task Group meetings and conference calls for the current code development cycle which included members of the committees as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the FAC website at: http://www.iccsafe.org/cs/CAC/Pages/default.aspx?usertoken={token}&Site=icc
Section 705.5 of the 2015 International Building Code (IBC) states the required *fire-resistance rating* of *exterior walls* with a *fire separation distance* of greater than 10 feet shall be rated for exposure to fire from the inside only. This distance was increased from 5 feet to 10 feet with the 2009 edition of the IBC. This proposed change to the Section 716.6.2 brings consistency between the requirements for exterior walls and glazing systems installed within exterior walls.

The FCAC opening protective work group included interested industry and testing lab representatives working together to make this section more user friendly. The work group unanimously agreed on a number of proposed changes to IBC Section 716, including this one.

Cost Impact: Will not increase the cost of construction
This code change proposal provides better correlation to existing code requirements.

FS 98-15 : 716.6.2-ZUBIA4210

FS 99-15

716.6.5

Proponent: Adolf Zubia, representing Fire Code Action Committee (fcac@iccsafe.org)

2015 International Building Code

Revise as follows:

716.6.5 Installation. Fire-protection-rated glazing shall be in the fixed position or be automatic-closing and shall be installed in ~~approved~~*labeled* frames.

Reason: This proposal is submitted by the ICC Fire Code Action Committee (FCAC). This ICC committee was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. The Fire-CAC has held 10 open meetings and numerous Regional Work Group and Task Group meetings and conference calls for the current code development cycle which included members of the committees as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the FAC website at: http://www.iccsafe.org/cs/CAC/Pages/default.aspx?usertoken={token}&Site=icc
Fire door and fire window frames are commonly listed and labeled, and code authorities typically look for labels during installation. This proposal reflects common installation practice and is consistent with NFPA 80, Section 17.1.3 which requires these frames to be labeled.

The FCAC opening protective work group included interested industry and testing lab representatives working together to make this section more user friendly. The work group unanimously agreed on a number of proposed changes to IBC Section 716, including this one.

Cost Impact: Will not increase the cost of construction
This code change proposal merely clarifies a current NFPA 80 requirement.

FS 99-15 : 716.6.5-ZUBIA4212

FS 100-15

716.6.7.3

Proponent: Amber Armstrong, City of Edmond (Oklahoma), representing self (amber.armstrong@edmondok.com)

2015 International Building Code

Revise as follows:

716.6.7.3 Where $^1/_3$-hour fire-protection window assemblies permitted. Fire-protection-rated glazing shall be permitted in window assemblies tested to NFPA 257 or UL 9 in ~~*smoke barriers* and~~ *fire partitions* requiring $^1/_3$-hour opening protection in accordance with Table 716.6.

Reason: This code change is intended to remove the term "smoke barrier" from this section on the grounds that:

A) The charging section for this sub section does not include smoke barriers. Section 716.6.7 addresses the use of fire window assemblies in fire partitions and fire barriers only.

B) This section states the fire-protection rating for window assemblies in smoke barriers is 1/3-hour in accordance with Table 716.6, however Table 716.6 states the minimum fire window assembly rating in a smoke barrier is 3/4-hour.

Cost Impact: Will not increase the cost of construction
There is no impact to the cost of construction because this change corrects a mistake and the language should not appear where it is stated.

FS 100-15 : 716.6.7.3-ARMSTRONG5060

FS 101-15

716 (New)

Proponent: Adolf Zubia, representing Fire Code Action Committee (fcac@iccsafe.org)

2015 International Building Code

Delete Section 716 in its entirety and replace as follows:

716.1 General Opening protectives required by other sections of this code shall comply with the provisions of this section.

716.1.1 Alternative methods for determining fire protection ratings The application of any of the alternative methods listed in this section shall be based on the fire exposure and acceptance criteria specified in NFPA 252, NFPA 257 or UL 9. The required *fire resistance* of an opening protective shall be permitted to be established by any of the following methods or procedures:

1. Designs documented in *approved* sources.
2. Calculations performed in an a*pproved* manner.
3. Engineering analysis based on a comparison of opening protective designs having *fire protection ratings* as determined by the test procedures set forth in NFPA 252, NFPA 257 or UL 9.
4. Alternative protection methods as allowed by Section 104.11.

716.1.2 Glazing Glazing used in *fire door assemblies* and *fire window assemblies* shall comply with this section in addition to the requirements of Sections 716.2 and 716.3, respectively.

716.1.2.1 Safety glazing *Fire-protection-rated* glazing and *fire-resistance-rated* glazing installed in *fire doorassemblies* and *fire window assemblies* shall comply with the safety glazing requirements of Chapter 24 where applicable.

716.1.2.2 Marking fire-rated glazing assemblies. *Fire-rated glazing* assemblies shall be marked in accordance with Tables 716.1.A, 716.1.B and 716.1.C.

716.1.2.2.1 Fire-rated glazing identification For *fire-rated glazing*, the label shall bear the identification required in Tables 716.1.A and 716.1.B. "D" indicates that the glazing is permitted to be used in fire door assemblies and that the glazing meets the fire protection requirements of NFPA 252. "H" shall indicate that the glazing meets the hose stream requirements of NFPA 252. "T" shall indicate that the glazing meets the temperature requirements of Section 716.2.2.3.1. The placeholder "XXX" represents the fire-rating period, in minutes.

716.1.2.2.2 Fire-protection-rated glazing identification For *fire-protection-rated* glazing, the label shall bear the following identification required in Tables 716.1.A and 716.1.C: "OH – XXX." "OH" indicates that the glazing meets both the fire protection and the hose-stream requirements of NFPA 257 or UL 9 and is permitted to be used in fire window openings. The placeholder "XXX" represents the fire-rating period, in minutes.

716.1.2.2.3 Fire-resistance-rated glazing identification For *fire-resistance-r*ated glazing, the label shall bear the identification required in Section 703.6 and Table 716.1.A.

716.1.2.2.4 Fire-rated glazing that exceeds the code requirements *Fire-rated glazing* assemblies marked as complying with hose stream requirements (H) shall be permitted in applications that do not require compliance with hose stream requirements. *Fire-rated glazing* assemblies marked as complying with temperature rise requirements (T) shall be permitted in applications that do not require compliance with temperature rise requirements. *Fire-rated glazing* assemblies marked with ratings (XXX) that exceed the ratings required by this code shall be permitted.

716.1.2.3 Fire-resistance-rated glazing *Fire-resistance-rated* glazing tested as part of a *fire-resistance-rated* wall or floor/ceiling assembly in accordance with ASTM E 119 or UL 263 and labeled in accordance with Section 703.6 shall not otherwise be required to comply with this section where used as part of a wall or floor/ceiling assembly.

716.1.2.3.1 Glazing in fire door and fire window assemblies *Fire-resistance-rated* glazing shall be permitted in *fire door assemblies* and *fire window assemblies* where tested and installed in accordance with their listings and where in compliance with the requirements of Sections 716.2 and 716.3, respectively.

TABLE 716.1.A
MARKING FIRE-RATED GLAZING ASSEMBLIES

FIRE TEST STANDARD	MARKING	DEFINITION OF MARKING
ASTM E 119 or UL 263	W	Meets wall assembly criteria.

NFPA 257 or UL 9	OH	Meets fire window assembly criteria including the hose stream test.
NFPA 252 or UL 10B or UL 10C	D H T	Meets fire door assembly criteria. Meets fire door assembly hose stream test. Meets 450ºF temperature rise criteria for 30 minutes
-	XXX	The time in minutes of the fire resistance or fire protection rating of the glazing assembly.

For SI: ºC = [(ºF) - 32]/1.8.

For SI: 1 square inch = 645.2 mm.

a. Two doors, each with a fire protection rating of $1\frac{1}{2}$ hours, installed on opposite sides of the same opening in a fire wall, shall be deemed equivalent in fire protection rating to one 3-hour fire door.

b. Fire-resistance-rated glazing tested to ASTM E 119 in accordance with Section 716.2 shall be permitted, in the maximum size tested.

c. Except where the building is equipped throughout with an automatic sprinkler and the fire-rated glazing meets the criteria established in Section 716.5.5.

d. Under the column heading "Fire-rated glazing marking door vision panel," W refers to the fire-resistance rating of the glazing, not the frame.

e. See Section 716.5.8.1.2.1.

TABLE 716.1.C

TYPE OF WALL ASSEMBLY	**REQUIRED WALL ASSEMBLY RATING (hours)**	**MINIMUM FIRE WINDOW ASSEMBLY RATING (hours)**	**FIRE-RATED GLAZING MARKING**
Interior walls	-	-	-
Fire walls	All	NP[a]	W-XXX[b]
Fire barriers	>1 1	NP[a] NP[a]	W-XXX[b] W-XXX[b]
Incidental use areas (Section 707.3.7), Mixed occupancy separations (Section 707.3.9)	1	$\frac{3}{4}$	OH-45 or W-60

Fire partitions	1 0.5	3/4 1/3	OH-45 or W-60 OH-20 or W-30
Smoke barriers	1	3/4	OH-45 or W-60
Exterior walls	>1 1 0.5	1 1/2 3/4 1/3	OH-90 or W-XXX[b] OH-45 or W-60 OH-20 or W-30
Party wall	All	NP	Not Applicable

NP = Not Permitted.

a. Not permitted except fire-resistance-rated glazing assemblies tested to ASTM E 119 or UL 263, as specified in Section 716.2.

b. XXX = The fire rating duration period in minutes, which shall be equal to the fire-resistance rating required for the wall assembly.

716.2 Fire door assemblies *Fire door assemblies* required by other sections of this code shall comply with the provisions of this Section. *Fire door* frames with transom lights, sidelights or both shall be permitted in accordance with Section 716.2.5.4.

716.2.1 Testing requirements *Approved fire door* and fire shutter assemblies shall be constructed of any material or assembly of component materials that conforms to the test requirements of Sections 716.2.1.1, 716.2.1.2, 716.2.1.3 or 716.2.1.4 and the *fire protection r*ating indicated in Table 716.1.B.

Exceptions:

1. *Labeled* protective assemblies that conform to the requirements of this section or UL 10A, UL 14B, and UL 14C for tin-clad *fire door assemblies.*
2. Floor *fire door* assemblies in accordance with Section 712.1.13.1.

716.2.1.1 Side-hinged or pivoted swinging doors *Fire door assemblies* with side-hinged and pivoted swinging doors shall be tested in accordance with NFPA 252 or UL 10C. After 5 minutes into the NFPA 252 test, the neutral pressure level in the furnace shall be established at 40 inches (1016 mm) or less above the sill.
716.2.1.2 Other fire door assemblies. Fire door assemblies with other types of doors, including swinging elevator doors, horizontal sliding fire door assemblies, and fire shutter assemblies, bottom and side-hinged chute intake doors, and top-hinged chute discharge doors, shall be tested in accordance with NFPA 252 or UL 10B. The pressure in the furnace shall be maintained as nearly equal to the atmospheric pressure as possible. Once established, the pressure shall be maintained during the entire test period.

716.2.1.2 Other fire door assemblies *Fire door assemblies* with other types of doors, including swinging elevator doors, horizontal sliding fire door assemblies, and fire shutter assemblies, bottom and side-hinged chute intake doors, and top-hinged chute discharge doors, shall be tested in accordance with NFPA 252 or UL 10B. The pressure in the furnace shall be maintained as nearly equal to the atmospheric pressure as possible. Once established, the pressure shall be maintained during the entire test period.

716.2.1.3 Glazing in transoms lights and sidelights in corridors and smoke barriers Glazing material in transom lights and sidelights of *fire door assemblies* shall be tested in accordance with NFPA 257 or UL 9, including the hose stream test, in accordance with Section 716.3.1.1.

716.2.1.4 Smoke and draft control Smoke and draft control door assemblies shall be tested in accordance with UL 1784.

716.2.2 Performance requirements *Fire door assemblies* shall be installed in the assemblies specified in Table 716.1.B and shall comply with the *fire-protection rating* specified.

716.2.2.1 Door assemblies in corridors and smoke barriers *Fire door assemblies* required to have a minimum *fire protection rating* of 20 minutes where located in *corridor* walls or *smoke barrier* walls having a *fire-resistance rating* in accordance with Table 716.1.B shall be tested in accordance with NFPA 252 or UL 10C without the hose stream test.

Exceptions:

1. Viewports that require a hole not larger than 1 inch (25 mm) in diameter through the door, have not less than a 0.25-inch-thick (6.4 mm) glass disc and the holder is of metal that will not melt out where subject to temperatures of 1,700°F (927°C).
2. *Corridor* door assemblies in occupancies of Group I-2 shall be in accordance with Section 407.3.1.

3. Unprotected openings shall be permitted for *corridors* in multitheater complexes where each motion picture auditorium has not fewer than one-half of its required *exit* or *exit access doorways* opening directly to the exterior or into an *exit* passageway.
4. Horizontal sliding doors in *smoke barriers* that comply with Sections 408.6 and 408.8.4 in occupancies in Group I-3.

716.2.2.1.1 Smoke and draft control The air leakage rate of the door assembly shall not exceed 3.0 cubic feet per minute per square foot (0.01524 m3/s m2) of door opening at 0.10 inch (24.9 Pa) of water for both the ambient temperature and elevated temperature tests. Louvers shall be prohibited.

716.2.2.2 Door assemblies in other fire partitions *Fire door assemblies* required to have a minimum *fire protection rating* of 20 minutes where located in other *fire partitions* having a fire-resistance rating of 0.5 hour in accordance with Table 716.1.B shall be tested in accordance with NFPA 252, UL 10B or UL 10C with the hose stream test.

716.2.2.3 Doors in interior exit stairways and ramps and exit passageways *Fire door assemblies* in interior *exit* stairways and ramps and *exit* passageways shall have a maximum transmitted temperature rise of not more than 450°F (250°C) above ambient at the end of 30 minutes of standard fire test exposure.
Exception: The maximum transmitted temperature rise is not required in buildings equipped throughout with an *automatic sprinkler system* installed in accordance with Section 903.3.1.1 or 903.3.1.2.

716.2.2.3.1 Glazing in doors *Fire-protection-rated* glazing in excess of 100 square inches (0.065 m2) is not permitted. *Fire-resistance-rated* glazing in excess of 100 square inches (0.065 m2) shall be permitted in *fire doors*. *Listed fire-resistance-rated* glazing in a *fire door* shall have a maximum transmitted temperature rise in accordance with Section 716.2.2.3 when the *fire door* is tested in accordance with NFPA 252, UL 10B or UL 10C.

716.2.3 Fire doors *Fire doors* installed within a *fire door assembly* shall meet the fire rating indicated in Table 716.1.B.

716.2.4 Fire door frames *Fire door* frames installed as part of a *fire door assembly* shall meet the fire rating indicated in Table 716.1.B.

716.2.5 Glazing in fire door assemblies *Fire-rated glazing* and *fire resistance-rated* glazing conforming to the opening protection requirements in Section 716.2.2 shall be permitted in *fire door assemblies*.

716.2.5.1 Size limitations *Fire-resistance-rated* glazing shall comply with the size limitations in Section 716.2.5.1.1. *Fire-protection-rated* glazing shall comply with the size limitations of NFPA 80, and as provided in Section 716.2.5.1.2.

716.2.5.1.1 Fire-resistance-rated glazing in door assemblies in fire walls and fire barriers rated greater than 1 hour. *Fire-resistance-rated* glazing tested to ASTM E 119 or UL 263 and NFPA 252, UL 10B or UL 10C shall be permitted in *fire door assemblies* located in *fire walls* and in *fire barriers* in accordance with Table 716.1.B to the maximum size tested and in accordance with their listings.

716.2.5.1.2 Fire-protection-rated glazing in door assemblies in fire walls and fire barriers rated greater than 1 hour. *Fire-protection-rated* glazing shall be prohibited in *fire walls* and *fire barriers* except as provided in Sections 716.2.5.1.2.1 and 716.2.5.1.2.2.

716.2.5.1.2.1 Horizontal exits *Fire-protection-rated* glazing shall be permitted as vision panels in self-closing swinging *fire door assemblies* serving as *horizontal exits* in *fire walls* where limited to 100 square inches (0.065 m2) with no dimension exceeding 10 inches (0.3 mm).

716.2.5.1.2.2 Fire barriers *Fire-protection-rated* glazing shall be permitted in *fire doors* having a 1-1/2-hour *fire protection rating* intended for installation in *fire barriers*, where limited to 100 square inches (0.065 m2).

716.2.5.2 Elevator, stairway and ramp protectives *Approved fire-protection-rated* glazing used in *fire door assemblies* in elevator, stairway and ramp enclosures shall be so located as to furnish clear vision of the passageway or approach to the elevator, stairway or ramp.

716.2.5.3 Glazing in door assemblies in corridors and smoke barriers In a 20-minute *fire door assembly*, the glazing material in the door itself shall have a minimum *fire-protection-rated* glazing of 20 minutes and shall be exempt from the hose stream test.

716.2.5.4] Glazing in fire door frames with transom lights and sidelights Door frames with transom lights, sidelights or both, shall be permitted where a 3/4-hour *fire protection rating* or less is required in accordance with Table 716.1.B. Fire door frames with transom lights, sidelights, or both, installed with *fire-resistance-rated* glazing tested as an assembly in accordance with ASTM E 119 or UL 263 shall be permitted where a *fire protection rating* exceeding 3/4 hour is required in accordance with Table 716.1.B.

716.2.6 Fire door hardware and closures *Fire door* hardware and closures shall be installed on *fire door assemblies* in accordance with requirements of this section.

716.2.6.1 Door closing *Fire doors* shall be latching and self- or automatic-closing in accordance with this section.

Exceptions:

1. *Fire doors* located in common walls separating sleeping units in Group R-1 shall be permitted without automatic- or self-closing devices.
2. The elevator car doors and the associated hoistway enclosure doors at the floor level designated for recall in accordance with Section 3003.2 shall be permitted to remain open during Phase I emergency recall operation.

716.2.6.2 Latch required Unless otherwise specifically permitted, single *fire doors* and both leaves of pairs of side-hinged swinging *fire doors* shall be provided with an active latch bolt that will secure the door when it is closed.

716.2.6.3 Chute intake door latching Chute intake doors shall be positive latching, remaining latched and closed in the event of latch spring failure during a fire emergency.

716.2.6.4 Auomatic-closing fire door assemblies Automatic-closing *fire door assemblies* shall be self-closing in accordance with NFPA 80.

716.2.6.5 Smoke-activated doors Automatic-closing doors installed in the following locations shall be automatic-closing by the actuation of smoke detectors installedin accordance with Section 907.3 or by loss of power to the smoke detector or hold-open device. Doors that are automatic-closing by smoke detection shall not have more than a 10-second delay before the door starts to close after the smoke detector is actuated:

1. Doors installed across a *corridor.*
2. Doors installed in the enclosures of *exit access stairways* and *ramps* in accordance with Sections 1019 and 1023, respectively.
3. Doors that protect openings in *exits* or *corridors* required to be of *fire-resistance-rated* construction.
4. Doors that protect openings in walls that are capable of resisting the passage of smoke in accordance with Section 509.4.
5. Doors installed in *smoke barriers* in accordance with Section 709.5.
6. Doors installed in *fire partitions* in accordance with Section 708.6.
7. Doors installed in a *fire wall* in accordance with Section 706.8.
8. Doors installed in shaft enclosures in accordance with Section 713.7.
9. Doors installed in waste and linen chutes, discharge openings and access and discharge rooms in accordance with Section 713.13. Loading doors installed in waste and linen chutes shall meet the requirements of Sections 716.2.6.1 and 716.2.6.3.
10. Doors installed in the walls for compartmentation of underground buildings in accordance with Section 405.4.2.
11. Doors installed in the elevator lobby walls of underground buildings in accordance with Section 405.4.3.
12. Doors installed in *smoke partitions* in accordance with Section 710.5.2.3.

716.2.6.6 Doors in pedestrian ways Vertical sliding or vertical rolling steel fire doors in openings through which pedestrians travel shall be heat activated or activated by smoke detectors with alarm verification.

716.2.7 Swinging fire shutters Where fire shutters of the swinging type are installed in exterior openings, not less than one row in every three vertical rows shall be arranged to be readily opened from the outside, and shall be identified by distinguishing marks or letters not less than 6 inches (152 mm) high.

716.2.8 Rolling fire shutters Were fire shutters of the rolling type are installed, such shutters shall include *approved* automatic-closing devices.

716.2.9 Labeled protective assemblies. *Fire door assemblies* shall be *labeled* by an *approved* agency. The labels shall comply with NFPA 80, and shall be permanently affixed to the door or frame.

716.2.9.1 Fire door labeling requirements *Fire doors* shall be *labeled* showing the name of the manufacturer or other identification readily traceable back to the manufacturer, the name or trademark of the third party inspection agency, the *fire protection rating* and, where required for *fire doors* in interior *exit stairways* and *ramps* and *exit passageways* by Section 716.2.2.3, the maximum transmitted temperature end point. Smoke and draft control doors complying with UL 1784 shall be *labeled* as such and shall comply with Section 716.2.9.3. Labels shall be *approved* and permanently affixed. The label shall be applied at the factory or location where fabrication and assembly are performed.

716.2.9.1.1 Light kits, louvers and components *Listed* light kits and louvers and their required preparations shall be considered as part of the *labeled* door where such installations are done under the listing program of the third-party agency. *Fire doors* and *fire door assemblies* shall be permitted to consist of components, including glazing, vision light kits and hardware that are *listed* or classified and labeled for such use by different third-party agencies.

716.2.9.2 Oversized doors Oversized *fire doors* shall bear an oversized *fire door* label by an *approved* agency or shall be provided with a certificate of inspection furnished by an *approved* testing agency. Where a certificate of inspection is furnished by an *approved* testing agency, the certificate shall state that the door conforms to the requirements of design, materials and construction, but has not been subjected to the fire test.

716.2.9.3 Smoke and draft control door labeling requirements Smoke and draft control doors complying with UL 1784 shall be labeled in accordance with Section 716.2.9.1 and shall show the letter "S" on the fire-rating *label* of the door. This marking shall indicate that the door and frame assembly are in compliance where listed or labeled gasketing is installed.

716.2.9.4 Fire door frame labeling requirements *Fire door* frames shall be *labeled* showing the names of the manufacturer and the third-party inspection agency.

716.2.9.5 Fire door glazing labeling requirements *Fire-rated glazing* shall bear a *label* or other identification showing the name of the manufacturer, the test standard and information required in Table 716.1.A that shall be issued by an *approved* agency and shall be permanently identified on the glazing.

716.2.9.6 Fire door operator labeling requirements *Fire door* operators for horizontal sliding doors shall be *labeled* and *liste*d for use with the assembly.

716.2.10 Installation of fire door assemblies and fire shutter assemblies *Fire door assemblies* and shutters shall be installed in accordance with the provisions of this section and NFPA 80.

716.2.10.1 Doors assemblies in corridors and smoke barriers Installation of smoke doors shall be in accordance with NFPA 105.

716.3 Fire window assemblies *Fire window assemblies* required by other sections of this code shall comply with the provisions of this Section.

716.3.1 Testing requirements *Fire window assemblies* shall be constructed of any material or assembly of component materials that conforms to the test requirements of Section 716.3.1.1 and 716.3.1.2 and the *fire protection rating* indicated in Table 716.1.C.

716.3.1.1 Testing under positive pressure NFPA 257 or UL 9 shall evaluate *fire-protection-rated* glazing under positive pressure. Within the first 10 minutes of a test, the pressure in the furnace shall be adjusted so not less than two-thirds of the test specimen is above the neutral pressure plane, and the neutral pressure plane shall be maintained at that height for the balance of the test.

716.3.1.2 Nonsymmetrical glazing systems Nonsymmetrical *fire-protection-rated* glazing systems in *fire partitions*, *fire barriers* or in exterior walls with a *fire separation distance* of 5 feet (1524 mm) or less pursuant to Section 705 shall be tested with both faces exposed to the furnace, and the assigned *fire protection rating* shall be the shortest duration obtained from the two tests conducted in compliance with NFPA 257 or UL 9.

716.3.2 Performance requirements *Fire window assemblies* shall be installed in the assemblies specified in Table 716.1.C and shall comply with the *fire-protection rating* specified.

716.3.2.1 Interior fire window assemblies *Fire-protection-rated* glazing used in *fire window assemblies* located in *fire partitions* and *fire barriers* shall be limited to use in assemblies with a maximum *fire-resistance rating* of 1 hour in accordance with this section.

716.3.2.1.1 Where 3/4-hour fire protection window assemblies permitted *Fire-protection-rated* glazing requiring 45-minute opening protection in accordance with Table 716.1.C shall be limited to *fire partition* designed in accordance with Section 708 and *fire barriers* utilized in the applications set forth in Sections 707.3.6 and 707.3.8 where the *fire-resistance rating* does not exceed 1 hour. *Fire-resistance-rated glazing* assemblies tested in accordance with ASTM E 119 or UL 263 shall not be subject to the limitations of this section.

716.3.2.1.2 Area limitations The total area of the glazing in *fire-protection-rated* window assemblies shall not exceed 25 percent of the area of a common wall with any room.

716.3.2.1.3 Where 1/3-hour fire-protection window assemblies permitted. *Fire-protection-rated* glazing shall be permitted in window assemblies tested to NFPA 257 or UL 9 in *smoke barriers* and *fire partitions* requiring 1/3-hour opening protection in accordance with Table 716.1.C.

716.3.3 Fire window frames Fire window frames installed with a *fire window assembly* shall meet the *fire-protection rating* indicated in Table 716.1.C.

716.3.3.1 Window mullions Metal mullions that exceed a nominal height of 12 feet (3658 mm) shall be protected with materials to afford the same *fire-resistance rating* as required for the wall construction in which the protective is located.

716.3.4 Glazing in fire window assemblies Glazing in *fire window assemblies* shall be *fire protection rated* in accordance with this section and Table 716.1.C. *Fire-protection-rated* glazing in *fire window assemblies* shall be tested in accordance with and shall meet the acceptance criteria of NFPA 257 or UL 9. *Fire-protection-rated* glazing shall comply with NFPA 80. Openings in nonfire-resistance-rated exterior wall assemblies that require protection in accordance with Section 705.3, 705.8, 705.8.5 or 705.8.6 shall have a *fire protection rating* of not less than 3/4 hour. *Fire-protection-rated* glazing in 0.5-hour fire-resistance-rated partitions is permitted to have an 0.33-hour *fire protection rating*.

716.3.4.1 Glass and glazing Glazing in *fire window assemblies* shall be *fire-protection-rated* glazing installed in accordance with and complying with the size limitations set forth in NFPA 80.

716.3.5 Labeled protective assemblies Glazing in *fire window assemblies* shall be *labeled* by an *approved* agency. The labels shall comply with NFPA 80, and shall comply with Section 716.3.5.2.

716.3.5.1 Fire window frames Fire window frames shall be *approved* for the intended application.

716.3.5.2 Fire window glazing labeling requirements *Fire-protection-rated* glazing shall bear a label or other identification showing the name of the manufacturer, the test standard and information required in Section 716.1.2.2.2 and Table 716.1.C that shall be issued by an *approved* agency and permanently identified on the glazing.

716.3.6 Installation *Fire window assemblies* shall be installed in accordance with the provisions of this Section.

716.3.6.1 Closure *Fire-protection-rated* glazing shall be in the fixed position or be automatic-closing and shall be installed in *approved* frames.

Reason: This proposal is submitted by the ICC Fire Code Action Committee (FCAC). This ICC committee was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. The Fire-CAC has held 2 open meetings and numerous Regional Work Group and Task Group meetings and conference calls for the current code development cycle which included members of the committees as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the FAC website at:
http://www.iccsafe.org/cs/CAC/Pages/default.aspx?usertoken={token}&Site=icc

The FCAC opening protective work group included interested industry and testing lab representatives working together to make this section more user friendly. The work group unanimously agreed on a wide range of proposed changes to IBC Section 716.
This proposal is essentially a reorganization of Section 716 with no substantive changes, except for the some new titles and new charging statements to make the section flow smoother. The reorganization was needed because the current requirements are not in a logical order, and skip around between testing requirements, rating requirements, installation and labeling. The new Section 716 is organized into General (716.1), Fire door assemblies (716.2), and Fire window assemblies (716.3) sections.
+++++++++++++++++++++++++
For clarity, the above proposal shows how the new section is intended to appear. The following guide shows how the current 2015 IBC requirements were moved and modified to accomplish the above proposal.
Text Revision Key
1. Underlined – New or modified text added to enhance document flow
2. **Bold &** underline – Section or Table references which have been updated
3. Strikethrough – Text which has been relocated, or deleted as not appropriate in the reorganized Section
4. (Parenthesis) – 2015 IBC Section 716 source of text, or where deleted text has been relocated to in the reorganized Section
Revised Text
716.1 General. (From 716.1) Opening protectives required by other sections of this code shall comply with the provisions of this section.
716.1.1 Alternative methods for determining fire protection ratings. (From 716.4) The application of any of the alternative methods listed in this section shall be based on the fire exposure and acceptance criteria specified in NFPA 252, NFPA 257 or UL 9. The required fire resistance of an opening protective shall be permitted to be established by any of the following methods or procedures:
1. Designs documented in approved sources.
2. Calculations performed in an approved manner.
3. Engineering analysis based on a comparison of opening protective designs having fire protection ratings as determined by the test procedures set forth in NFPA 252, NFPA 257 or UL 9.
4. Alternative protection methods as allowed by Section 104.11.
716.1.2 Glazing. (New) Glazing used in fire door assemblies and fire window assemblies shall comply with this section in addition to the requirements of Sections 716.2 and 716.3, respectively.
716.1.2.1 Safety glazing. (From 716.5.8.4 and 716.6.3) Fire-protection-rated glazing and fire-resistance-rated glazing installed in fire door assemblies and fire window assemblies shall comply with the safety glazing requirements of Chapter 24 where applicable.
716.1.2.2 Marking fire-rated glazing assemblies. (From 716.3) Fire-rated glazing assemblies shall be marked in accordance with Tables ~~716.3~~**716.1.A**, ~~716.5~~ **716.1.B** and ~~716.6~~**716.1.C.**
716.1.2.2.1 Fire-rated glazing identification. (From 716.3.1) For fire-rated glazing, the label shall bear the identification required in Tables ~~716.3~~**716.1.A** and ~~716.5~~**716.1.B**. "D" indicates that the glazing is permitted to be used in fire door assemblies and that the glazing meets the fire protection requirements of NFPA 252. "H" shall indicate that the glazing meets the hose stream requirements of NFPA 252. "T" shall indicate that the glazing meets the temperature requirements of Section ~~716.5.5.1~~**716.2.2.3.1**. The placeholder "XXX" represents the fire-rating period, in minutes.
716.1.2.2.2 Fire-protection-rated glazing identification. (From 716.3.2) For fire-protection-rated glazing, the label shall bear the following identification required in Tables ~~716.3~~**716.1.A** and ~~716.6~~**716.1.C**: "OH – XXX." "OH" indicates that the glazing meets both the fire protection and the hose-stream requirements of NFPA 257 or UL 9 and is permitted to be used in fire window openings. The placeholder "XXX" represents the fire-rating period, in minutes.
716.1.2.2.3 Fire-resistance-rated glazing identification. (New) For fire-resistance-rated glazing, the label shall bear the identification required in Section 703.6 and Table 716.1.A.
716.1.2.2.4 Fire-rated glazing that exceeds the code requirements. (From 716.3.3) Fire-rated glazing assemblies marked as complying with hose stream requirements (H) shall be permitted in applications that do not require compliance with hose stream requirements. Fire-rated glazing assemblies marked as complying with temperature rise requirements (T) shall be permitted in applications that do not require compliance with temperature rise requirements. Fire-rated glazing assemblies marked with ratings (XXX) that exceed the ratings required by this code shall be permitted.
716.1.2.3 Fire-resistance-rated glazing. (From 716.2) Fire-resistance-rated glazing tested as part of a fire-resistance-rated wall or floor/ceiling assembly in accordance with ASTM E 119 or UL 263 and labeled in accordance with Section 703.6 shall not otherwise be required to comply with this section where used as part of a wall or floor/ceiling assembly. ~~Fire-resistance-rated glazing shall be permitted in fire door and fire window assemblies~~

~~where tested and installed in accordance with their listings and where in compliance with the requirements of this section.~~ (Relocated to new Section 716.1.2.3.1)
716.1.2.3.1 Glazing in fire door and fire window assemblies. (From 716.2) Fire-resistance-rated glazing shall be permitted in fire door and fire window assemblies where tested and installed in accordance with their listings and where in compliance with the requirements of Sections 716.2 and 716.3, respectively.
716.2 Fire door assemblies. (New) Fire door assemblies required by other sections of this code shall comply with the provisions of this Section. (From 716.5.6) Fire door frames with transom lights, sidelights or both shall be permitted in accordance with Section ~~716.5.6~~**716.2.5.4.**
716.2.1 Testing requirements. (From 716.5) Approved fire door and fire shutter assemblies shall be constructed of any material or assembly of component materials that conforms to the test requirements of Sections ~~716.5.1~~**716.2.1.1,**~~716.5.2~~**716.2.1.2,**~~716.5.3~~**716.2.1.3** or ~~716.4~~716.2.1.4 and the fire protection rating indicated in Table ~~716.5~~716.1.B. ~~Fire door frames with transom lights, sidelights or both shall be permitted in accordance with Section 716.5.6. (Relocated to new Section 716.2) Fire door assemblies and shutters shall be installed in accordance with the provisions of this section and NFPA 80. (~~Relocated to new Section 716.2.10)
Exceptions:
1. Labeled protective assemblies that conform to the requirements of this section or UL 10A, UL 14B, and UL 14C for tin-clad fire door assemblies.
2. Floor fire door assemblies in accordance with Section 712.1.13.1.
716.2.1.1 Side-hinged or pivoted swinging doors. (From 716.5.1) Fire door assemblies with side-hinged and pivoted swinging doors shall be tested in accordance with NFPA 252 or UL 10C. After 5 minutes into the NFPA 252 test, the neutral pressure level in the furnace shall be established at 40 inches (1016 mm) or less above the sill.
716.2.1.2 Other fire door assemblies. (From 716.5.2) Fire door assemblies with other types of doors, including swinging elevator doors, horizontal sliding fire door assemblies, and fire shutter assemblies, bottom and side-hinged chute intake doors, and top-hinged chute discharge doors, shall be tested in accordance with NFPA 252 or UL 10B. The pressure in the furnace shall be maintained as nearly equal to the atmospheric pressure as possible. Once established, the pressure shall be maintained during the entire test period.
716.2.1.3 Glazing in transoms lights and sidelights in corridors and smoke barriers. (From 716.5.3.2) ~~Glazing material in any other part of the door assembly, including~~ (Deleted as not relevant to reorganized document) transom lights and sidelights of fire door assemblies, shall be tested in accordance with NFPA 257 or UL 9, including the hose stream test, in accordance with Section ~~716.6~~**716.3.1.1.**
716.2.1.4 Smoke and draft control. (From 716.5.3.1) ~~Fire door assemblies shall meet the requirements for a s~~ Smoke and draft control door ~~assembly~~assemblies shall be tested in accordance with UL 1784. ~~The air leakage rate of the door assembly shall not exceed 3.0 cubic feet per minute per square foot (0.01524 m3/s m2) of door opening at 0.10 inch (24.9 Pa) of water for both the ambient temperature and elevated temperature tests. Louvers shall be prohibited~~. (Relocated to new Section 716.2.2.1.1) ~~Installation of smoke doors shall be in accordance with NFPA 105~~. (Relocated to new Section 716.2.10.1)
716.2.2 Performance requirements. (New) Fire door assemblies shall be installed in the assemblies specified in Table 716.1.B and shall comply with the fire-protection rating specified.
716.2.2.1 Door assemblies in corridors and smoke barriers. (From 716.5.3) Fire door assemblies required to have a minimum fire protection rating of 20 minutes where located in corridor walls or smoke barrier walls having a fire-resistance rating in accordance with Table ~~716.5~~ **716.1.B**shall be tested in accordance with NFPA 252 or UL 10C without the hose stream test.
Exceptions:
1. Viewports that require a hole not larger than 1 inch (25 mm) in diameter through the door, have not less than a 0.25-inch-thick (6.4 mm) glass disc and the holder is of metal that will not melt out where subject to temperatures of 1,700°F (927°C).
2. Corridor door assemblies in occupancies of Group I-2 shall be in accordance with Section 407.3.1.
3. Unprotected openings shall be permitted for corridors in multitheater complexes where each motion picture auditorium has not fewer than one-half of its required exit or exit access doorways opening directly to the exterior or into an exit passageway.
4. Horizontal sliding doors in smoke barriers that comply with Sections 408.6 and 408.8.4 in occupancies in Group I-3.
716.2.2.1.1 Smoke and draft control. (From 716.5.3.1) The air leakage rate of the door assembly shall not exceed 3.0 cubic feet per minute per square foot (0.01524 m3/s m2) of door opening at 0.10 inch (24.9 Pa) of water for both the ambient temperature and elevated temperature tests. Louvers shall be prohibited.
716.2.2.2 Door assemblies in other fire partitions. (From 716.5.4) Fire door assemblies required to have a minimum fire protection rating of 20 minutes where located in other fire partitions having a fire-resistance rating of 0.5 hour in accordance with Table ~~716.5~~**716.1.**B shall be tested in accordance with NFPA 252, UL 10B or UL 10C with the hose stream test.
716.2.2.3 Doors in interior exit stairways and ramps and exit passageways. (From 716.5.5) Fire door assemblies in interior exit stairways and ramps and exit passageways shall have a maximum transmitted temperature rise of not more than 450°F (250°C) above ambient at the end of 30 minutes of standard fire test exposure.
Exception: The maximum transmitted temperature rise is not required in buildings equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2.
716.2.2.3.1 Glazing in doors. (From 716.5.5.1) Fire-protection-rated glazing in excess of 100 square inches (0.065 m2) is not permitted. Fire-resistance-rated glazing in excess of 100 square inches (0.065 m2) shall be permitted in ~~door~~ fire doors. Listed fire-resistance-rated glazing in a fire door shall have a maximum transmitted temperature rise in accordance with Section ~~716.5.5~~ **716.2.2.3**when the fire door is tested in accordance with NFPA 252, UL 10B or UL 10C.
716.2.3 Fire doors. (New) Fire doors installed within a fire door assembly shall meet the fire rating indicated in Table 716.1.B.
716.2.4 Fire door frames. (New) Fire door frames installed as part of a fire door assembly shall meet the fire rating indicated in Table 716.1.B.
716.2.5 Glazing in fire doors assemblies. (From 716.5.8) Fire-rated glazing and fire resistance-rated glazing conforming to the opening protection requirements in Section ~~716.5~~**716.2.2** shall be permitted in fire door assemblies.
716.2.5.1 Size limitations. (From 716.5.8.1) Fire-resistance-rated glazing shall comply with the size limitations in Section ~~716.5.8.1.1~~**716.2.5.1.1**. Fire-protection-rated glazing shall comply with the size limitations of NFPA 80, and as provided in Section ~~716.5.8.1.2~~**716.2.5.1.2**.
716.2.5.1.1 Fire-resistance-rated glazing in door assemblies in fire walls and fire barriers rated greater than 1 hour. (From 716.5.8.1.1) Fire-resistance-rated glazing tested to ASTM E 119 or UL 263 and NFPA 252, UL 10B or UL 10C shall be permitted in fire door assemblies located in fire walls and in fire barriers in accordance with Table ~~716.5~~**716.1.B** to the maximum size tested and in accordance with their listings.
716.2.5.1.2 Fire-protection-rated glazing in door assemblies in fire walls and fire barriers rated greater than 1 hour. (From 716.5.8.1.2) Fire-protection-rated glazing shall be prohibited in fire walls and fire barriers except as provided in Sections ~~716.5.8.1.2.1~~ **716.2.5.1.2.1** and ~~716.5.8.1.2.2~~**716.2.5.1.2.2.**
716.2.5.1.2.1 Horizontal exits. (From 716.5.8.1.2.1) Fire-protection-rated glazing shall be permitted as vision panels in self-closing swinging fire door assemblies serving as horizontal exits in fire walls where limited to 100 square inches (0.065 m2) with no dimension exceeding 10 inches (0.3 mm).
716.2.5.1.2.2 Fire barriers. (From 716.5.8.1.2.2) Fire-protection-rated glazing shall be permitted in fire doors having a 1-1/2-hour fire protection rating intended for installation in fire barriers, where limited to 100 square inches (0.065 m2).

716.2.5.2 Elevator, stairway and ramp protectives. (From 716.5.8.2) Approved fire-protection-rated glazing used in fire door assemblies in elevator, stairway and ramp enclosures shall be so located as to furnish clear vision of the passageway or approach to the elevator, stairway or ramp.
716.2.5.3 Glazing in door assemblies in corridors and smoke barriers. (From 716.5.3.2) In a 20-minute fire door assembly, the glazing material in the door itself shall have a minimum fire-protection-rated glazing of 20 minutes and shall be exempt from the hose stream test. ~~Glazing material in any other part of the door assembly, including transom lights and sidelights, shall be tested in accordance with NFPA 257 or UL 9, including the hose stream test, in accordance with Section 716.6.~~ (Relocated to new Section 716.2.1.3)
716.2.5.4 Glazing in fire door frames with transom lights and sidelights. (From 716.5.6) Door frames with transom lights, sidelights or both, shall be permitted where a 3/4-hour fire protection rating or less is required in accordance with Table ~~716.5~~**716.1.B.** Fire door frames with transom lights, sidelights, or both, installed with fire-resistance-rated glazing tested as an assembly in accordance with ASTM E 119 or UL 263 shall be permitted where a fire protection rating exceeding 3/4 hour is required in accordance with Table ~~716.5~~**716.1.B.**
716.2.6 Fire door hardware and closures. (New) Fire door hardware and closures shall be installed on fire door assemblies in accordance with requirements of this section.
716.2.6.1 Door closing. (From 716.5.9) Fire doors shall be latching and self- or automatic-closing in accordance with this section.
Exceptions:
1. Fire doors located in common walls separating sleeping units in Group R-1 shall be permitted without automatic- or self-closing devices.
2. The elevator car doors and the associated hoistway enclosure doors at the floor level designated for recall in accordance with Section 3003.2 shall be permitted to remain open during Phase I emergency recall operation.
716.2.6.2 Latch required. (From 716.5.9.1) Unless otherwise specifically permitted, single fire doors and both leaves of pairs of side-hinged swinging fire doors shall be provided with an active latch bolt that will secure the door when it is closed.
716.2.6.3 Chute intake door latching. (From 716.5.9.1.1) Chute intake doors shall be positive latching, remaining latched and closed in the event of latch spring failure during a fire emergency.
716.2.6.4 Automatic-closing fire door assemblies. (From 716.5.9.2) Automatic-closing fire door assemblies shall be self-closing in accordance with NFPA 80.
716.2.6.5 Smoke-activated doors. (From 716.5.9.3) Automatic-closing doors installed in the following locations shall be automatic-closing by the actuation of smoke detectors installed in accordance with Section 907.3 or by loss of power to the smoke detector or hold-open device. Doors that are automatic-closing by smoke detection shall not have more than a 10-second delay before the door starts to close after the smoke detector is actuated:
1. Doors installed across a corridor.
2. Doors installed in the enclosures of exit access stairways and ramps in accordance with Sections 1019 and 1023, respectively.
3. Doors that protect openings in exits or corridors required to be of fire-resistance-rated construction.
4. Doors that protect openings in walls that are capable of resisting the passage of smoke in accordance with Section 509.4.
5. Doors installed in smoke barriers in accordance with Section 709.5.
6. Doors installed in fire partitions in accordance with Section 708.6.
7. Doors installed in a fire wall in accordance with Section 706.8.
8. Doors installed in shaft enclosures in accordance with Section 713.7.
9. Doors installed in waste and linen chutes, discharge openings and access and discharge rooms in accordance with Section 713.13. Loading doors installed in waste and linen chutes shall meet the requirements of Sections ~~716.5.9~~**716.2.6.1** and ~~716.5.9.1.1~~**716.2.6.3.**
10. Doors installed in the walls for compartmentation of underground buildings in accordance with Section 405.4.2.
11. Doors installed in the elevator lobby walls of underground buildings in accordance with Section 405.4.3.
12. Doors installed in smoke partitions in accordance with Section 710.5.2.3.
716.2.6.6 Doors in pedestrian ways. (From 716.5.9.4) Vertical sliding or vertical rolling steel fire doors in openings through which pedestrians travel shall be heat activated or activated by smoke detectors with alarm verification.
716.2.7 Swinging fire shutters. (From 716.5.10) Where fire shutters of the swinging type are installed in exterior openings, not less than one row in every three vertical rows shall be arranged to be readily opened from the outside, and shall be identified by distinguishing marks or letters not less than 6 inches (152 mm) high.
716.2.8 Rolling fire shutters. (From 716.5.11) Where fire shutters of the rolling type are installed, such shutters shall include approved automatic-closing devices.
716.2.9 Labeled protective assemblies. (From 716.5.7) Fire door assemblies shall be labeled by an approved agency. The labels shall comply with NFPA 80, and shall be permanently affixed to the door or frame.
716.2.9.1 Fire door labeling requirements. (From 716.5.7.1) Fire doors shall be labeled showing the name of the manufacturer or other identification readily traceable back to the manufacturer, the name or trademark of the third party inspection agency, the fire protection rating and, where required for fire doors in interior exit stairways and ramps and exit passageways by Section ~~716.5.5~~**716.2.2.3,** the maximum transmitted temperature end point. Smoke and draft control doors complying with UL 1784 shall be labeled as such and shall comply with Section ~~716.5.7.3~~**716.2.9.3.** Labels shall be approved and permanently affixed. The label shall be applied at the factory or location where fabrication and assembly are performed.
716.2.9.1.1 Light kits, louvers and components. (From 716.5.7.1.1) Listed light kits and louvers and their required preparations shall be considered as part of the labeled door where such installations are done under the listing program of the third-party agency. Fire doors and door assemblies shall be permitted to consist of components, including glazing, vision light kits and hardware that are listed or classified and labeled for such use by different third-party agencies.
716.2.9.2 Oversized doors. (From 716.5.7.2) Oversized fire doors shall bear an oversized fire door label by an approved agency or shall be provided with a certificate of inspection furnished by an approved testing agency. Where a certificate of inspection is furnished by an approved testing agency, the certificate shall state that the door conforms to the requirements of design, materials and construction, but has not been subjected to the fire test.
716.2.9.3 Smoke and draft control door labeling requirements. (From 716.5.7.3) Smoke and draft control doors complying with UL 1784 shall be labeled in accordance with Section ~~716.5.7.1~~**716.2.9.1** and shall show the letter "S" on the fire-rating label of the door. This marking shall indicate that the door and frame assembly are in compliance where listed or labeled gasketing is installed.
716.2.9.4 Fire door frame labeling requirements. (From 716.5.7.4) Fire door frames shall be labeled showing the names of the manufacturer and the third-party inspection agency.
716.2.9.5 Fire door glazing labeling requirements. (From 716.5.8.3) Fire-rated glazing shall bear a label or other identification showing the name of the manufacturer, the test standard and information required in Table ~~716.3~~**716.1.A** that shall be issued by an approved agency and shall be permanently identified on the glazing.
716.2.9.6 Fire door operator labeling requirements. (From 716.7.5) Fire door operators for horizontal sliding doors shall be labeled and listed for use with the assembly.
716.2.10 Installation of fire door assemblies and fire shutter assemblies. (From 716.5) Fire door assemblies and shutters shall be installed in accordance with the provisions of this section and NFPA 80.

716.2.10.1 Doors assemblies in corridors and smoke barriers. (From 716.5.3.1) Installation of smoke doors shall be in accordance with NFPA 105.
716.3 Fire window assemblies. (New) Fire window assemblies required by other sections of this code shall comply with the provisions of this Section.
716.3.1 Testing requirements. (New, but wording similar to 716.5) Fire window assemblies shall be constructed of any material or assembly of component materials that conforms to the test requirements of Section 716.3.1.1 and 716.3.1.2 and the fire protection rating indicated in Table 716.1.C.
716.3.1.1 Testing under positive pressure. (From 716.6.1) NFPA 257 or UL 9 shall evaluate fire-protection-rated glazing under positive pressure. Within the first 10 minutes of a test, the pressure in the furnace shall be adjusted so not less than two-thirds of the test specimen is above the neutral pressure plane, and the neutral pressure plane shall be maintained at that height for the balance of the test.
716.3.1.2 Nonsymmetrical glazing systems. (From 716.6.2) Nonsymmetrical fire-protection-rated glazing systems in fire partitions, fire barriers or in exterior walls with a fire separation distance of 5 feet (1524 mm) or less pursuant to Section 705 shall be tested with both faces exposed to the furnace, and the assigned fire protection rating shall be the shortest duration obtained from the two tests conducted in compliance with NFPA 257 or UL 9.
716.3.2 Performance requirements. (New) Fire window assemblies shall be installed in the assemblies specified in Table 716.1.C and shall comply with the fire-protection rating specified.
716.3.2.1 Interior fire window assemblies. (From 716.6.7) Fire-protection-rated glazing used in fire window assemblies located in fire partitions and fire barriers shall be limited to use in assemblies with a maximum fire-resistance rating of 1 hour in accordance with this section.
716.3.2.1.1 Where 3/4-hour fire protection window assemblies permitted. (From 716.6.7.1) Fire-protection-rated glazing requiring 45-minute opening protection in accordance with Table ~~716.6~~716.1.C shall be limited to fire partition designed in accordance with Section 708 and fire barriers utilized in the applications set forth in Sections 707.3.6 and 707.3.8 where the fire-resistance rating does not exceed 1 hour. Fire-resistance-rated glazing assemblies tested in accordance with ASTM E 119 or UL 263 shall not be subject to the limitations of this section.
716.3.2.1.2 Area limitations. (From 716.6.7.2) The total area of the glazing in fire-protection-rated window assemblies shall not exceed 25 percent of the area of a common wall with any room.
716.3.2.1.3 Where 1/3-hour fire-protection window assemblies permitted. (From 716.6.7.3) Fire-protection-rated glazing shall be permitted in window assemblies tested to NFPA 257 or UL 9 in smoke barriers and fire partitions requiring 1/3-hour opening protection in accordance with Table ~~716.6~~**716.1.C.**
716.3.3 Fire window frames. (New) Fire window frames installed with a fire window assembly shall meet the fire-protection rating indicated in Table 716.1.C.
716.3.3.1 Window mullions. (From 716.6.6) Metal mullions that exceed a nominal height of 12 feet (3658 mm) shall be protected with materials to afford the same fire-resistance rating as required for the wall construction in which the protective is located.
716.3.4 Glazing in fire window assemblies. (From 716.6) Glazing in fire window assemblies shall be fire protection rated in accordance with this section and Table ~~716.6~~**716.1.**C. ~~Glazing in fire door assemblies shall comply with Section 716.5.8.~~ (Deleted as not relevant to reorganized document) Fire-protection-rated glazing in fire window assemblies shall be tested in accordance with and shall meet the acceptance criteria of NFPA 257 or UL 9. Fire-protection-rated glazing shall comply with NFPA 80. Openings in nonfire-resistance-rated exterior wall assemblies that require protection in accordance with Section 705.3, 705.8, 705.8.5 or 705.8.6 shall have a fire protection rating of not less than 3/4 hour. Fire-protection-rated glazing in 0.5-hour fire-resistance-rated partitions is permitted to have an 0.33-hour fire protection rating.
716.3.4.1 Glass and glazing. (From 716.6.4) Glazing in fire window assemblies shall be fire-protection-rated glazing installed in accordance with and complying with the size limitations set forth in NFPA 80.
716.3.5 Labeled protective assemblies. (New, but wording similar to 716.5.7) Glazing in fire window assemblies shall be labeled by an approved agency. The labels shall comply with NFPA 80, and shall comply with Section 716.3.5.2.
716.3.5.1 Fire window frames. (New) Fire window frames shall be approved for the intended application.
716.3.5.2 Fire window glazing labeling requirements. (From 716.6.8) Fire-protection-rated glazing shall bear a label or other identification showing the name of the manufacturer, the test standard and information required in Section ~~716.3.2~~**716.1.2.2.2**and Table ~~716.6~~ **716.1.C** that shall be issued by an approved agency and permanently identified on the glazing.
716.3.6 Installation. (New) Fire window assemblies shall be installed in accordance with the provisions of this Section.
716.3.6.1 Closure. (From 716.6.5) Fire-protection-rated glazing shall be in the fixed position or be automatic-closing and shall be installed in approved frames.

Renumber Existing Tables as Follows
1. Table 716.3 becomes Table 716.1.A
2. Table 716.5 becomes Table 716.1.B
3. Table 716.6 becomes Table 716.1.C

Cost Impact: Will not increase the cost of construction
This code change is a reorganization of existing requirements. No new requirements for providing opening protectives have been added.

Proponent: Stephen Thomas, Colorado Code Consulting, LLC, representing Smoke Guard (sthomas@coloradocode.net)

Part I

2015 International Building Code

Add new definition as follows:

SECTION 202 DEFINITIONS

Fire Curtain FIRE CURTAIN. A flexible membrane assembly constructed of materials designed to restrict the spread of fire when tested in accordance with UL 10D.

Add new text as follows:

SECTION717 Fire and Smoke Curtains

717.1 General Fire and smoke curtains permitted by other sections of this code shall comply with the provisions of this section.

717.2 Fire Test Criteria Fire and smoke curtains shall be tested in accordance with the requirements of UL 10D.

717.3 Activation Fire and smoke curtains shall comply with the following criteria:

1. Fire and smoke curtains shall be actuated by approved spot-type detectors listed for releasing service.
2. Fire detection systems providing control input or output signals to fire and smoke curtains or elements thereof shall comply with the requirements of Section 907. Such systems shall be equipped with a control unit complying with UL 864 and listed as smoke control equipment.

721.1.17 Fire curtains. Vertical floor openings shall be permitted where protected by a fire curtain in accordance with Section 717. Fire curtains shall achieve a minimum one-hour fire-protection rating, and not less than the assembly being penetrated, but need not exceed 2 hours.

Add new standard(s) as follows:
UL 10D-2014 Standard for Fire Tests of Fire Protective Curtain Assemblies

Part II

2015 International Building Code

Revise as follows:

404.6 Enclosure of atriums. *Atrium* spaces shall be separated from adjacent spaces by a 1-hour *fire barrier* constructed in accordance with Section 707 or a *horizontal assembly* constructed in accordance with Section 711, or both.

Exceptions:

1. A *fire barrier* is not required where a glass wall forming a smoke partition is provided. The glass wall shall comply with all of the following:
   1.1. Automatic sprinklers are provided along both sides of the separation wall and doors, or on the room side only if there is not a walkway on the *atrium* side. The sprinklers shall be located between 4 inches and 12 inches (102 mm and 305 mm) away from the glass and at intervals along the glass not greater than 6 feet (1829 mm). The sprinkler system shall be designed so that the entire surface of the glass is wet upon activation of the sprinkler system without obstruction;
   1.2. The glass wall shall be installed in a gasketed frame in a manner that the framing system deflects without breaking (loading) the glass before the sprinkler system operates; and
   1.3. Where glass doors are provided in the glass wall, they shall be either *self-closing* or automatic-closing.
2. A *fire barrier* is not required where a glass-block wall assembly complying with Section 2110 and having a $^3/_4$-hour *fire protection rating* is provided.
3. A *fire barrier* is not required between the *atrium* and the adjoining spaces of any three floors of the *atrium* provided such spaces are accounted for in the design of the smoke control system.
4. <u>A fire barrier is not required between the atrium and the adjoining spaces when a fire curtain having a one-hour fire-protection rating in accordance with Section 717 is installed at the perimeter of the atrium opening. The curtain shall not be placed in such a location as to obstruct the means of egress.</u>

Add new text as follows:

<u>SECTION717</u> <u>Fire and Smoke Curtains</u>

<u>717.1</u> <u>General</u> <u>Fire and smoke curtains permitted by other sections of this code shall comply with the provisions of this section.</u>

<u>717.2</u> <u>Fire Test Criteria</u> <u>Fire and smoke curtains shall be tested in accordance with the requirements of UL 10D.</u>

<u>717.3</u> <u>Activation</u> <u>Fire and smoke curtains shall comply with the following criteria:</u>

1. <u>Fire and smoke curtains shall be actuated by approved spot-type detectors listed for releasing service.</u>
2. <u>Fire detection systems providing control input or output signals to fire and smoke curtains or elements thereof shall comply with the requirements of Section 907. Such systems shall be equipped with a control unit complying with UL 864 and listed as smoke control equipment.</u>

Add new definition as follows:

SECTION 202 DEFINITIONS

<u>FIRE CURTAIN</u> <u>A flexible membrane assembly constructed of materials designed to restrict the spread of fire when tested in accordance with UL 10D.</u>

Add new standard(s) as follows:
<u>UL 10D-2014 Standard for Fire Tests of Fire Protective Curtain Assemblies</u>

Part III

2015 International Building Code

Add new definition as follows:

SECTION 202 DEFINITIONS

<u>FIRE CURTAIN.</u> <u>A flexible membrane assembly constructed of materials designed to restrict the spread of fire when tested in accordance with UL 10D.</u>

Add new text as follows:

<u>SECTION717</u> <u>Fire and Smoke Curtains</u>

<u>717.1</u> <u>General</u> <u>Fire and smoke curtains permitted by other sections of this code shall comply with the provisions of this section.</u>

717.2 **Fire Test Criteria** Fire and smoke curtains shall be tested in accordance with the requirements of UL 10D.

717.3 **Activation** Fire and smoke curtains shall comply with the following criteria:

1. Fire and smoke curtains shall be actuated by approved spot-type detectors listed for releasing service.
2. Fire detection systems providing control input or output signals to fire and smoke curtains or elements thereof shall comply with the requirements of Section 907. Such systems shall be equipped with a control unit complying with UL 864 and listed as smoke control equipment.

Revise as follows:

1019.3 Occupancies other than Groups I-2 and I-3. In other than Group I-2 and I-3 occupancies, floor openings containing *exit access stairways* or *ramps* that do not comply with one of the conditions listed in this section shall be enclosed with a shaft enclosure constructed in accordance with Section 713.

1. *Exit access stairways* and *ramps* that serve or atmospherically communicate between only two stories. Such interconnected stories shall not be open to other stories.
2. In Group R-1, R-2 or R-3 occupancies, *exit accessstairways* and *ramps* connecting four stories or less serving and contained within an individual *dwelling unit* or *sleeping unit* or *live/work unit.*
3. *Exit access stairways* serving and contained within a Group R-3 congregate residence or a Group R-4 facility are not required to be enclosed.
4. *Exit access stairways* and *ramps* in buildings equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1, where the area of the vertical opening between stories does not exceed twice the horizontal projected area of the *stairway* or *ramp* and the opening is protected by a draft curtain and closely spaced sprinklers in accordance with NFPA 13. In other than Group B and M occupancies, this provision is limited to openings that do not connect more than four stories.
5. *Exit access stairways* and *ramps* within an *atrium* complying with the provisions of Section 404.
6. *Exit access stairways* and *ramps* in *open parking garages* that serve only the parking garage.
7. *Exit access stairways* and *ramps* serving open-air seating complying with the *exit access* travel distance requirements of Section 1029.7.
8. *Exit access stairways* and *ramps* serving the balcony, gallery or press box and the main assembly floor in occupancies such as theaters, *places of religious worship*, auditoriums and sports facilities.
9. Stairways that serve, or atmospherically communicate between a maximum of four stories, and are not part of the required means of egress shall be permitted to be enclosed by a fire curtain installed in accordance with Section 717.

Add new standard(s) as follows:
UL 10D-2014 Standard for Fire Tests of Fire Protective Curtain Assemblies

Reason:

Part I: This proposal introduces fire curtains into the code to be used in protecting vertical openings. The current code has several different ways to protect these openings. These curtains have been tested in accordance with UL 10D which is similar to UL 263 without the hose stream test. Horizontal assemblies are not required to pass the hose stream test. Therefore, the standards are similar in how they evaluate the system. This proposal would permit a horizontally deployed curtain that would enclose the vertical floor opening and provide the same protection as the horizontal assembly.

Part II: Section 404.6 requires that an atrium be separated from other spaces of the building by a one-hour fire barrier. The exceptions to that requirement permit the installation of a non-fire rated assembly in exception 1. ThIS proposal will permit the installation of a fire curtain around the perimeter of the atrium as an additional option. It is our position that a fire curtain provides an equivalent level of protection to glass forming a smoke partition protected by automatic sprinklers outlined in exception 1. In fact, this installation has been approved by many jurisidictions as an equivalent design. The intent of the exception is to provide a smoke separation at the atrium. The proposal is also creating a new section and definition to address the testing and installation requirements for the curtain. UL 10D has been specified as the test standard for the fire curtains. It is similar to other fire-resistance tests with the exception of a hose stream test.

Part III: This proposal presents a new type of separation requirement for exit access stairways. It introduces the concept of fire curtains into the code and permits their use to enclose exit access stairs that serve a maximum of four stories. Fire curtains are tested to UL 10D which does not include the hose stream test. The intent is to allow an alternative to a full enclosure. The current code permits stairs to be open between adjacent stories without enclosure. This proposal is also consistent with the protection that Exception 4 of Section 1099.3 provides, with the draft curtain and closely spaced sprinklers. In fact, the fire curtain will provide a better level of protection than the 18 inch draft curtains.

Cost Impact:

Part I: Will not increase the cost of construction
By installing a horizontal curtain across a floor opening, the need for a smoke control system can be eliminated. Therefore, this proposal will reduce the cost of construction.

Part II: Will not increase the cost of construction
This change will reduce the cost of construction. It will decrease the volume of the atrium and reduce the cost of the smoke control system in a building.

Part III: Will not increase the cost of construction
This change provides an alternate to enclosing stairs. Therefore, the cost of construction will not be affected.

Analysis:

Part I: A review of the standard proposed for inclusion in the code, UL 10D, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2015.

Part II: A review of the standard proposed for inclusion in the code, UL 10D, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2015.

Part III: A review of the standard proposed for inclusion in the code, UL 10D, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2015.

FS 102-15 : 717 (New)-THOMAS4504

FS 103-15

717.1.2 (IMC 607.1.2)

Proponent: Homer Maiel, PE, CBO, representing ICC Tri-Chapter (Peninsula, East Bay, Monterey Bay) (hmaiel@gmail.com)

2015 International Building Code

Revise as follows:

717.1.2 Ducts that penetrate fire-resistance-rated assemblies without dampers. Ducts that penetrate fire-resistance-rated ~~assemblies~~ walls and are not required by this section to have *dampers* shall comply with the requirements of Sections 714.2 through 714.3.3. Ducts that penetrate *horizontal assemblies* not required to be contained within a shaft and not required by this section to have *dampers* shall comply with the requirements of Sections 714.4 through 714.5.2.

Reason: The purpose of this proposal is to clarify that Section 714.3 is on rated walls and 714.3 is on horizontal assemblies. To say "fire-resistance-rated assemblies" may confuse some code users.

Cost Impact: Will not increase the cost of construction
This proposal will not increase cost of construction.Since this proposal is only clarification to the code language, it will not increase the cost of construction. Here, "assemblies" actually is eluding to "walls" all along. There are no newly added technical requirements that would trigger additional cost.

FS 103-15 : 717.1.2-MAIEL4574

FS 104-15

714.1.1, 717.1.2

Proponent: Tony Crimi, representing International Firestop Council (tcrimi@sympatico.ca)

2015 International Building Code

714.1.1 Ducts and air transfer openings. Penetrations of fire-resistance-rated walls by ducts that are not protected with *dampers* shall comply with Sections 714.2 through 714.3.3. Penetrations of *horizontal assemblies* not protected with a shaft as permitted by Section 717.6, and not required to be protected with fire *dampers* by other sections of this code, shall comply with Sections 714.4 through 714.5.2. Ducts and air transfer openings that are protected with *dampers* shall comply with Section 717.

Revise as follows:

717.1.2 Ducts that penetrate fire-resistance-rated assemblies without dampers. Ducts that penetrate fire-resistance-rated assemblies and are not required by this section to have *fire dampers* shall comply with the requirements of Sections 714.2 through 714.3.3. Ducts that penetrate *horizontal assemblies* not required to be contained within a shaft and not required by this section to have *fire dampers* shall comply with the requirements of Sections 714.4 through 714.5.2.

Reason: This proposal is editorial in nature, but may have minor technical implications for some jurisdictions. The proposal clarifies that requirement to comply with 714.2 through 714.3.3, and 714.4 through 714.5.2 applies to all ducts that penetrate fire resistance-rated assemblies, not contained within a shaft, and not required by this section to have fire dampers. This change would then employ the defined terminology "*fire damper*" instead of the term "damper", which can include "Ceiling radiation dampers," "Combination fire/smoke dampers," "Corridor dampers," "Fire dampers" and "Smoke dampers.".

The exception to the provisions for firestopping should not be applied when only smoke dampers, ceiling radiation dampers, corridor dampers are required to be installed.

Cost Impact: Will not increase the cost of construction
The proposal switches between one of the two options already required. Either fire dampers or firestopping is currently required.

FS 104-15 : 717.1.2-CRIMI4311

FS 105-15

717.2.1 (IMC 607.2.1), Chapter 35

Proponent: Tony Crimi, representing International Firestop Council (tcrimi@sympatico.ca)

2015 International Building Code

Revise as follows:

717.2.1 Smoke control system. Where the installation of a *fire damper* will interfere with the operation of a required smoke control system in accordance with Section 909, <u>ducts used to supply uncontaminated air shall be protected with a shaft enclosures in accordance with Section 713, or tested in accordance with ASTM E2816-11, with a minimum F and T rating of not less than 2 hours, continuously from the air handling appliance or equipment to the air outlet and inlet terminal, or</u> *approved* alternative protection shall be utilized. Where mechanical systems including ducts and *dampers* utilized for normal building ventilation serve as part of the smoke control system, the expected performance of these systems in smoke control mode shall be addressed in the rational analysis required by Section 909.4.

Add new standard(s) as follows:

<u>ASTM E2816-11, Standard Test Methods for Fire Resistive Metallic HVAC Duct Systems.</u>

Reason: This proposal would require HVAC ducts installed for the purposes of stairwell pressurization to be enclosed within a shaft or protected by a tested and listed assembly conforming to the new ASTM E2816-11, Standard Test Methods for Fire Resistive Metallic HVAC Duct Systems evaluated for the specific purpose. The new ASTM Standard evaluates the HVAC duct systems for surface burning characteristics, non-combustibility, fire resistance, durability, and fire engulfment with horizontal and vertical through-penetration firestops. The Standard can evaluate the fire performance of HVAC ducts for both supply (pressurization) and return air, in the vertical and horizontal orientation, with or without openings. These test methods evaluate the ability of a HVAC duct system to resist the spread of fire from one compartment to another compartment separated by fire resistance rated construction when the HVAC duct system is exposed to fire from the outside of the horizontal or vertical HVAC duct system, or from the outside with hot gases entering the inside of the HVAC duct system from unprotected openings, when subjected to the standard time-temperature curve of ASTM E119. This test is now also referenced as part of ICC-ES AC179, Acceptance Criteria for Metallic HVAC Duct Enclosure Assemblies.

The purpose of these acceptance criteria is to establish requirements for fire protection enclosure systems applied to metallic HVAC ducts, which provides an alternate to required fire-resistance-rated shafts or an alternate to required fire dampers in specific locations. This criteria provides an alternate to shaft enclosures for vertical ducts, and an alternate to fire dampers in horizontal ducts (penetrating fire barriers, fire partitions, and or smoke barriers) and vertical ducts connecting multiple stories. The purpose of a closed pressurization system is to provide fresh air directly to stairwells or egress areas. This design air pressures need to be sufficient to maintain closed doors while preventing smoke from entering the egress path. Smoke control systems have been required in nearly two thirds of the United States for over a decade. High-rise buildings constructed to the requirements of International Building Code, but without any specific measures to control smoke migration, are all the more vulnerable to property damage and occupants' loss of life.

Pressurization results in airflows of high velocity in the gaps around closed doors and construction cracks, thereby preventing smoke from flowing back into the pressurized space through these openings. Pressurized stairwells are provided with the goal of maintaining a tenable environment within the escape routes in the event of a building fire. While the option to use stairwell pressurization exists, the IBC does not require stairwell pressurization in high-rise buildings, and only requires smoke control in underground buildings, atriums, and covered mall buildings. Section 403.5.4 of the 2012 IBC requires smokeproof exit enclosures for high-rise buildings in every required stairway serving floors more than 75 feet (22.86 m) above the ground. Section 909.20.5 merely permits sprinklered buildings to use stairwell pressurization as an alternate to the smokeproof enclosures. When employed, ducts used for Stair pressurization to provide uncontaminated air within required interior exit stairwells or areas of egress need to be protected from the effect of fire, or constructed as fire resistant systems.

This principle of protecting HVAC ducts used as part of a smoke control system from the effects of fire exposure is already contained in section 909.4 as part of a rational analysis supporting the design of smoke control systems to be employed. Section 909.4.4 requires that the design shall consider the effects of the heating, ventilating and air-conditioning (HVAC) systems on both smoke and fire transport. The analysis must include all permutations of systems status, and the design shall consider the effects of the fire on the HVAC systems.

Particularly in the case of tall buildings, the predominant factors that cause smoke movement are stack effects, the affect of external wind forces, and forced air movement within the building. Smoke removal and venting practices are complicated by stack effects, which will tend to favour natural air movement vertically through the building as a results of differences in temperature and densities between the inside and outside air. [1]

Options such as the use of natural ventilation are only available where openings in exterior stairwells can be accommodated. Even then, a number of problems have been identified with this approach. Firstly, the required volume of fresh air is high. Secondly, natural supply and exhaust through vents may be subject to adverse exterior wind conditions, and even when functioning satisfactorily, would generally require vents located on different exterior walls. Thirdly, the performance of natural vents is influenced by building stack effects, which may be particularly significant on the upper or lowermost stories for tall buildings. This effect can range from either strong inflow or strong outflow from all natural vents on a given storey.[2]

2. Building Research Establishment, UK, Smoke Ventillation of Common Access Areas of Flats & Maisonettes (BD2410), Final Factual Report, Appendix A (Review), BRE Ltd, 2005

Cost Impact: Will increase the cost of construction
This proposal introduces a neccessary life safety feature that is often overlooked.

Analysis: A review of the standard proposed for inclusion in the code, ASTM E2816, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2015.

FS 105-15 : 717.2.1-CRIMI4313

FS 106-15

717.2.3 (New) [IMC 607.2.3 (New)]

Proponent: Rebecca Baker, representing Colorado Association of Plumbing and Mechanical Officials (CAPMO) (bbaker@co.jefferson.co.us)

2015 International Building Code

Add new text as follows:

717.2.3 **Smoke damper location.** Smoke damper blades in the closed position shall be located at or adjacent to but not more than 24 inches away from the smoke barrier or partition penetration. There shall be no inlets or outlets between the damper and the smoke barrier.

Reason: This user friendly language is found in all smoke damper installation instructions that few in the industry are aware of. This language will aid in understanding the flexibility associated with property location requirements for installers, designers and inspectors. These requirements can be found in Greenheck, Ruskin, Pottorff and all the other manufacturers instructions. One of the problems is UL 555-S only requires that one set of instructions be furnished *per shipment* of dampers and are rarely available for those who may need them in the field. This is consistent with NFPA 90.A

Cost Impact: Will not increase the cost of construction
This new section calls out the existing requirement in the code rather than the manufacturers information, which is often not readily available. By having the requirement, which increases flexibility, easier to find the new code section may actually reduce costs.

FS 106-15 : 717.2.3 (New)-BAKER3332

FS 107-15

717.3.1 (IMC 607.3.1)

Proponent: Jonathan Roberts, UL LLC, representing UL LLC (jonathan.roberts@ul.com)

2015 International Building Code

Revise as follows:

717.3.1 Damper testing. Dampers shall be listed and labeled in accordance with the standards in this section.

1. Fire dampers shall comply with the requirements of UL 555. Only fir~~e dampers and ceiling radiation~~ dampers labeled for use in dynamic systems shall be installed in heating, ventilation and air-conditioning systems designed to operate with fans on during a fire.
2. Smoke dampers shall comply with the requirements of UL 555S.
3. Combination fire/smoke dampers shall comply with the requirements of both UL 555 and UL 555S.
4. Ceiling radiation dampers shall comply with the requirements of UL 555C or shall be tested as part of a fire-resistance-rated floor/ceiling or roof/ceiling assembly in accordance with ASTM E119 or UL 263. Only *ceiling radiation dampers* labeled for use in dynamic systems shall be installed in heating, ventilation and air-conditioning systems designed to operate with fans on during a fire.
5. Corridor dampers shall comply with requirements of both UL 555 and UL 555S. Corridor dampers shall demonstrate acceptable closure performance when subjected to 150 feet per minute (0.76 mps) velocity across the face of the damper during the UL 555 fire exposure test.

Reason: The phrase "and ceiling radiation dampers" was added to Section 717.3.1, Provision 1 during the previous code cycle to differentiate ceiling radiation dampers labeled for use in dynamic systems. However, Provision 1 deals with fire dampers so the reference to ceiling radiation dampers is inappropriate. This proposal relocates the reference to ceiling radiation dampers labeled for use in dynamic systems to Provision 4 addressing ceiling radiation dampers.

Cost Impact: Will not increase the cost of construction
This code change simply clarifies the current requirements.

FS 107-15 : 717.3.1-ROBERTS4051

FS 108-15

717.3.2.1 (IMC 607.3.2.1), 717.3.2.3 (IMC 607.3.2.3)

Proponent: Jonathan Roberts, UL LLC, representing UL LLC (jonathan.roberts@ul.com)

2015 International Building Code

Revise as follows:

717.3.2.1 Fire damper ratings. *Firedampers* shall have the minimum ~~*fire protection*~~ *rating* specified in Table 717.3.2.1 for the type of penetration.

717.3.2.3 Combination fire/smoke damper ratings. *Combination fire/smokedampers* shall have the minimum ~~*fire protection*~~ *rating* specified for *firedampers* in Table 717.3.2.1 ~~for the type of penetration~~ and shall have ~~a~~the minimum rating specified for *smoke* ~~*damper*~~*dampers* ~~rating as specified~~ in Section 717.3.2.2.

Reason: This proposal is intended to clarify the requirements in this section. The term "fire-protection rating" is being changed to "rating" because fire dampers carry an hourly rating, not a "fire-protection rating". The term "for the type of penetration" was deleted because it is not needed.

Cost Impact: Will not increase the cost of construction
This simply clarifies the existing requirements.

FS 108-15 : 717.3.2.1-ROBERTS4045

FS 109-15

717.5.2 (IMC 607.5.2), Chapter 35

Proponent: Tony Crimi, representing International Firestop Council (tcrimi@sympatico.ca)

2015 International Building Code

Revise as follows:

717.5.2 Fire barriers. Ducts and air transfer openings of *fire barriers* shall be protected with *approved fire dampers* installed in accordance with their listing. Ducts and air transfer openings shall not penetrate enclosures for *interior exit* stairways and ramps and exit passageways, except as permitted by Sections 1023.5 and 1024.6, respectively.

Exception: *Fire dampers* are not required at penetrations of *fire barriers* where any of the following apply:

1. Penetrations are tested in accordance with ASTM E 119 or UL 263 as part of the fire-resistance-rated assembly.
2. Ducts are used as part of an *approved* smoke control system in accordance with Section 909 and where the use of a *fire damper* would interfere with the operation of a smoke control system.
3. Such walls are penetrated by ducted HVAC systems, have a required *fire-resistance rating* of 1 hour or less, are in areas of other than Group H and are in buildings equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1 or 903.3.1.2. For the purposes of this exception, a ducted HVAC system shall be a duct system for conveying supply, return or exhaust air as part of the structure's HVAC system. Such a duct system shall be constructed of sheet steel not less than No. 26 gage thickness and shall be continuous from the air-handling appliance or equipment to the air outlet and inlet terminals.
4. <u>HVAC ducts are installed as tested in accordance with ASTM E2816-11, and achieve a minimum F and T rating of not less than 2 hours, continuously from the air handling appliance or equipment to the air outlet and inlet terminal.</u>

Add new standard(s) as follows:
<u>ASTM E2816-11, Standard Test Methods for Fire Resistive Metallic HVAC Duct Systems.</u>

Reason: This proposal permits an additional exception to the requirement to install fire dampers in duct and air transfer openings through fire barriers provided the HVAC ducts are protected by a tested and listed assembly conforming to the new ASTM E2816-11, Standard Test Methods for Fire Resistive Metallic HVAC Duct Systems evaluated for the specific purpose. The test method evaluates the ability of a HVAC duct system to resist the spread of fire from one compartment to another compartment separated by a fire resistance rated construction when the HVAC duct system is exposed to fire.

The level of fire protection offered by the proposal is typically greater than currently required by Table 717.3.2.1 for fire dampers. For example, a typical 2-hour fire-resistance rated construction only requires a fire damper having a 1-1/2-hour fire-resistance rating, whereas the duct will maintain the same fire-resistance rating of the building construction being penetrated by the duct. In addition to providing protection against flame passage, like a fire damper, these ducts provide a reduction in temperature transmission across the surface of the duct through the rated assembly.

This ASTM Standard is now referenced as part of ICC-ES AC179, Acceptance Criteria for Metallic HVAC Duct Enclosure Assemblies. The purpose of these acceptance criteria is to establish requirements for fire protection enclosure systems applied to metallic HVAC ducts, which provides an alternate to required fire-resistance-rated shafts or an alternate to required fire dampers in specific locations. This proposal is consistent with AC 179 criterion providing an alternate to shaft enclosures for vertical ducts, and an alternate to fire dampers in horizontal ducts (penetrating fire barriers, fire partitions, and or smoke barriers) and vertical ducts.

Cost Impact: Will not increase the cost of construction
This proposal adds another option for designers. The option would most commonly be used when it reduces the cost of construction.

Analysis: A review of the standard proposed for inclusion in the code, ASTM E2816, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2015.

FS 109-15 : 717.5.2-CRIMI4312

FS 110-15

717.5.2 (IMC 607.5.2), 717.5.3 (IMC 607.5.5)

Proponent: Homer Maiel, PE, CBO, representing ICC Tri-Chapter (Peninsula, East Bay, Monterey Bay) (hmaiel@gmail.com)

2015 International Building Code

Revise as follows:

717.5.2 Fire barriers. Ducts and air transfer openings of *fire barriers* shall be protected with ~~approved~~ listed *fire dampers* installed in accordance with their listing. Ducts and air transfer openings shall not penetrate enclosures for *interior exit* stairways and ramps and exit passageways, except as permitted by Sections 1023.5 and 1024.6, respectively.

> **Exception:** In occupancies other than Group H, ~~*Fire*~~*fire dampers* are not required at penetrations of *fire barriers* where any of the following apply:
> 1. Penetrations are tested in accordance with ASTM E 119 or UL 263 as part of the fire-resistance-rated assembly.
> 2. Ducts are used as part of an *approved* smoke control system in accordance with Section 909 and where the use of a *fire damper* would interfere with the operation of a smoke control system.
> 3. Such walls are penetrated by ducted HVAC systems, have a required *fire-resistance rating* of 1 hour or less, are in areas of other than Group H and are in buildings equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1 or 903.3.1.2. For the purposes of this exception, a ducted HVAC system shall be a duct system for conveying supply, return or exhaust air as part of the structure's HVAC system. Such a duct system shall be constructed of sheet steel not less than No. 26 gage thickness and shall be continuous from the air-handling appliance or equipment to the air outlet and inlet terminals.

717.5.3 Shaft enclosures. Shaft enclosures that are permitted to be penetrated by ducts and air transfer openings shall be protected with ~~approved~~ listed fire and smoke *dampers* installed in accordance with their listing.

Exceptions:

1. ~~*Fire*~~In occupancies other than Group H, *fire dampers* are not required at penetrations of shafts where any of the following criteria are met:
   - 1.1. Steel exhaust subducts are extended not less than 22 inches (559 mm) vertically in exhaust shafts, provided there is a continuous airflow upward to the outside.
   - 1.2. Penetrations are tested in accordance with ASTM E 119 or UL 263 as part of the fire-resistance-rated assembly.
   - 1.3. Ducts are used as part of an *approved* smoke control system designed and installed in accordance with Section 909 and where the *firedamper* will interfere with the operation of the smoke control system.
   - 1.4. The penetrations are in parking garage exhaust or supply shafts that are separated from other building shafts by not less than 2-hour fire-resistance-rated construction.
2. In Group B and R occupancies equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1, *smokedampers* are not required at penetrations of shafts where all of the following criteria are met:
   - 2.1. Kitchen, clothes dryer, bathroom and toilet room exhaust openings are installed with steel exhaust subducts, having a minimum wall thickness of 0.0187-inch (0.4712 mm) (No. 26 gage).
   - 2.2. The subducts extend not less than 22 inches (559 mm) vertically.
   - 2.3. An exhaust fan is installed at the upper terminus of the shaft that is powered continuously in accordance with the provisions of Section 909.11, so as to maintain a continuous upward airflow to the outside.
3. *Smoke dampers* are not required at penetration of exhaust or supply shafts in parking garages that are separated from other building shafts by not less than 2-hour fire-resistance-rated construction.
4. *Smoke dampers* are not required at penetrations of shafts where ducts are used as part of an *approved* mechanical smoke control system designed in accordance with Section 909 and where the *smoke damper* will interfere with the operation of the smoke control system.
5. *Fire dampers* and *combination fire/smokedampers* are not required in kitchen and clothes dryer exhaust systems where installed in accordance with the *International Mechanical Code*.

Reason: Section 717.5.4 (fire partitions) already exclude H occupancies from these exceptions. Fire barriers which are more restrictive than fire partitions should have the same requirements. in entire Section 717.5, fire and smoke dampers or combination of F/S dampers are required to be "listed", except for these two locations that are calling for "approved" for no apparent reason.

Cost Impact: Will increase the cost of construction
This proposal could potentially increase the cost of construction. Switching from "approved" to "listed" could increase the cost of construction. The definition for "approved" is: "Acceptable to the code official or AHJ". This leaves it to the discretion of the AHJ on how to approve a damper. On the other hand, the definition of "listed" is more specific to evaluation of products by a recognized laboratory or a testing agency.
The other change, excluding H Occupancies from this exception, will increase the cost of construction since all ducts penetrating shaft enclosures in H Occupancies will, now, have to be equipped with fire dampers.

FS 110-15 : 717.5.2-MAIEL4399

FS 111-15

717.5.2 (IMC 607.5.2), 717.5.3 (IMC 607.5.5)

Proponent: Jonathan Roberts, UL LLC, representing UL LLC (jonathan.roberts@ul.com)

2015 International Building Code

Revise as follows:

717.5.2 Fire barriers. Ducts and air transfer openings of *fire barriers* shall be protected with listed~~approved~~ *fire dampers* installed in accordance with their listing. Ducts and air transfer openings shall not penetrate enclosures for *interior exit* stairways and ramps and exit passageways, except as permitted by Sections 1023.5 and 1024.6, respectively.

Exception: *Fire dampers* are not required at penetrations of *fire barriers* where any of the following apply:

1. Penetrations are tested in accordance with ASTM E 119 or UL 263 as part of the fire-resistance-rated assembly.
2. Ducts are used as part of an *approved* smoke control system in accordance with Section 909 and where the use of a *fire damper* would interfere with the operation of a smoke control system.
3. Such walls are penetrated by ducted HVAC systems, have a required *fire-resistance rating* of 1 hour or less, are in areas of other than Group H and are in buildings equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1 or 903.3.1.2. For the purposes of this exception, a ducted HVAC system shall be a duct system for conveying supply, return or exhaust air as part of the structure's HVAC system. Such a duct system shall be constructed of sheet steel not less than No. 26 gage thickness and shall be continuous from the air-handling appliance or equipment to the air outlet and inlet terminals.

717.5.3 Shaft enclosures. Shaft enclosures that are permitted to be penetrated by ducts and air transfer openings shall be protected with ~~approved~~listed fire and smoke *dampers* installed in accordance with their listing.

Exceptions:

1. *Firedampers* are not required at penetrations of shafts where any of the following criteria are met:
   - 1.1. Steel exhaust subducts are extended not less than 22 inches (559 mm) vertically in exhaust shafts, provided there is a continuous airflow upward to the outside.
   - 1.2. Penetrations are tested in accordance with ASTM E 119 or UL 263 as part of the fire-resistance-rated assembly.
   - 1.3. Ducts are used as part of an *approved* smoke control system designed and installed in accordance with Section 909 and where the *firedamper* will interfere with the operation of the smoke control system.
   - 1.4. The penetrations are in parking garage exhaust or supply shafts that are separated from other building shafts by not less than 2-hour fire-resistance-rated construction.
2. In Group B and R occupancies equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1, *smokedampers* are not required at penetrations of shafts where all of the following criteria are met:
   - 2.1. Kitchen, clothes dryer, bathroom and toilet room exhaust openings are installed with steel exhaust subducts, having a minimum wall thickness of 0.0187-inch (0.4712 mm) (No. 26 gage).
   - 2.2. The subducts extend not less than 22 inches (559 mm) vertically.
   - 2.3. An exhaust fan is installed at the upper terminus of the shaft that is powered continuously in accordance with the provisions of Section 909.11, so as to maintain a continuous upward airflow to the outside.
3. *Smoke dampers* are not required at penetration of exhaust or supply shafts in parking garages that are separated from other building shafts by not less than 2-hour fire-resistance-rated construction.
4. *Smoke dampers* are not required at penetrations of shafts where ducts are used as part of an *approved* mechanical smoke control system designed in accordance with Section 909 and where the *smoke damper* will interfere with the operation of the smoke control system.
5. *Fire dampers* and *combination fire/smokedampers* are not required in kitchen and clothes dryer exhaust systems where installed in accordance with the *International Mechanical Code*.

Reason: Section 717.3.1 of the 2015 International Building Code is very clear that all five types of dampers shall be listed and labeled. However there are two provisions within Section 717 which reference "approved" dampers instead of "listed" dampers. This intent of this proposal is simply to bring consistency in terminology within Section 717. This does not represent a technical change, as Section 717.3.1 already requires dampers to be listed and labeled.

Cost Impact: Will not increase the cost of construction
This does not represent a technical change, as Section 717.3.1 already requires dampers to be listed and labeled.

FS 112-15

717.5.2 (IMC 607.5.2)

Proponent: James Peterkin, representing Self (jpeterki@heery.com)

2015 International Building Code

Revise as follows:

717.5.2 Fire barriers. Ducts and air transfer openings of *fire barriers* shall be protected with *approved fire dampers* installed in accordance with their listing. Ducts and air transfer openings shall not penetrate enclosures for *interior exit* stairways and ramps and exit passageways, except as permitted by Sections 1023.5 and 1024.6, respectively.

Exception: *Fire dampers* are not required at penetrations of *fire barriers* where any of the following apply:

1. Penetrations are tested in accordance with ASTM E 119 or UL 263 as part of the fire-resistance-rated assembly.
2. Ducts are used as part of an *approved* smoke control system in accordance with Section 909 and where the use of a *fire damper* would interfere with the operation of a smoke control system.
3. Such walls are penetrated by fully ducted HVAC systems, have a required *fire-resistance rating* of 1 hour or less, are in areas of other than Group H and are in buildings equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1 or 903.3.1.2. For the purposes of this exception, a fully ducted HVAC system shall be a duct system for conveying supply, return or exhaust air as part of the structure's HVAC system. Such a duct system shall be constructed of sheet steel not less than No. 26 gage thickness and shall be continuous from the air-handling appliance or equipment to the air outlet and inlet terminals. Flexible connections shall be permitted in the following locations:

   1. Non-metal flex connections shall be permitted at the duct connection to the Air Handling Unit or Equipment located within the mechanical room.
   2. Non-metal flex connections shall be permitted from an overhead metal duct to a ceiling diffuser within the same room.

Reason: The code currently implies that any flex duct (or equipment flex connections) negates the use of the exception for fire dampers in 1 hour walls in fully ducted, fully sprinklered buildings.

The code permits the omission of the fire damper for a metal duct system that terminates either at a wall (such as a sidewall grille) or continues on to a duct opening past the fire barrier and has openings in the duct ("continuous from the air-handling appliance or equipment to the air outlet and inlet terminals"). This section does not even prohibit openings to be on both sides of the duct as long as the openings are in metal duct. However, for some reason, if flex duct is used to connect a metal duct to a ceiling diffuser (standard practice) this triggers the requirement for a fire damper. See attached sketch.
The flex connection within the concealed space does not constitute a greater hazard then other conditions that would permit the omission of the fire dampers.

Likewise, an flex connection at the AHU within the mechanical space does not constitute a hazard that should trigger the fire damper within the system

As noted above, this exception only applies in fully sprinklered buildings.

Cost Impact: Will not increase the cost of construction
The proposed wording will clear up this interpretation and reduce the cost of fire damper installation and maintenance in locations that do not constitute a significant hazard.

FS 112-15 : 717.5.2-PETERKIN5245

FS 113-15

717.5.3 (IMC 607.5.5)

Proponent: Vickie Lovell, InterCode Incorporated, representing Air Movement and Control Association International (vickie@intercodeinc.com)

2015 International Building Code

Revise as follows:

717.5.3 Shaft enclosures. Shaft enclosures that are permitted to be penetrated by ducts and air transfer openings shall be protected with *approved* fire and smoke *dampers* installed in accordance with their listing.

Exceptions:

1. *Firedampers* are not required at penetrations of shafts where any of the following criteria are met:
   - 1.1. Steel exhaust subducts are extended not less than 22 inches (559 mm) vertically in exhaust shafts, provided there is a continuous airflow upward to the outside<u>, provided by an exhaust fan installed at the upper terminus of the shaft that is powered continuously in accordance with the provisions 909.11</u>.
   - 1.2. Penetrations are tested in accordance with ASTM E 119 or UL 263 as part of the fire-resistance-rated assembly.
   - 1.3. Ducts are used as part of an *approved* smoke control system designed and installed in accordance with Section 909 and where the *firedamper* will interfere with the operation of the smoke control system.
   - 1.4. The penetrations are in parking garage exhaust or supply shafts that are separated from other building shafts by not less than 2-hour fire-resistance-rated construction.
2. In Group B and R occupancies equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1, *smokedampers* are not required at penetrations of shafts where all of the following criteria are met:
   - 2.1. Kitchen, clothes dryer, bathroom and toilet room exhaust openings are installed with steel exhaust subducts, having a minimum wall thickness of 0.0187-inch (0.4712 mm) (No. 26 gage).
   - 2.2. The subducts extend not less than 22 inches (559 mm) vertically.
   - 2.3. An exhaust fan is installed at the upper terminus of the shaft that is powered continuously in accordance with the provisions of Section 909.11, so as to maintain a continuous upward airflow to the outside.
3. *Smoke dampers* are not required at penetration of exhaust or supply shafts in parking garages that are separated from other building shafts by not less than 2-hour fire-resistance-rated construction.
4. *Smoke dampers* are not required at penetrations of shafts where ducts are used as part of an *approved* mechanical smoke control system designed in accordance with Section 909 and where the *smoke damper* will interfere with the operation of the smoke control system.
5. *Fire dampers* and *combination fire/smokedampers* are not required in kitchen and clothes dryer exhaust systems where installed in accordance with the *International Mechanical Code*.

Reason: The exceptions permit elimination of both fire dampers and smoke dampers in shafts under certain conditions.
In order to eliminate smoke dampers in a shaft, an exhaust fan must be installed at the upper terminus of the shaft that will operate on standby power so as to maintain a continuous upward airflow to the outside. (See Criteria 2.3 in Exception 2 of this section).

This proposal seeks to require the same conditions for an exhaust fan in order to be able to eliminate the fire damper in the shaft.

The system can be intentionally or unintentionally powered down if there is shorted/melted wiring or other ignited debris within the ventilation shaft. Without a fire damper and no upward airflow to the outside, fire (and smoke) could migrate via the shaft to a floor remote from the area of origin. At present a smoke damper is required in some cases while a fire damper is not required and vice versa. Both should be required under the same conditions, and exempted by the same conditions.

By adding the requirement for powered air movement in the shaft if fire damper is not required, safety is increased.

Cost Impact: Will increase the cost of construction
The cost of construction will increase due to the added cost for the fan and continuous power.

FS 113-15 : 717.5.3-LOVELL4468

FS 114-15

717.5.3 (IMC 607.5.5)

Proponent: Douglas Evans, representing self (dhefpe@gmail.com)

2015 International Building Code

Revise as follows:

717.5.3 Shaft enclosures. Shaft enclosures that are permitted to be penetrated by ducts and air transfer openings shall be protected with *approved* fire and smoke *dampers* installed in accordance with their listing.

Exceptions:

1. *Firedampers* are not required at penetrations of shafts where any of the following criteria are met:
   1.1. Steel exhaust subducts are extended not less than 22 inches (559 mm) vertically in exhaust shafts, provided there is a continuous airflow upward to the outside.
   1.2. Penetrations are tested in accordance with ASTM E 119 or UL 263 as part of the fire-resistance-rated assembly.
   1.3. Ducts are used as part of an *approved* smoke control system designed and installed in accordance with Section 909 and where the *firedamper* will interfere with the operation of the smoke control system.
   1.4. The penetrations are in parking garage exhaust or supply shafts that are separated from other building shafts by not less than 2-hour fire-resistance-rated construction.
2. In ~~Group B and R occupancies~~buildings equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1, *smokedampers* are not required at penetrations of shafts where all of the following criteria are met:
   2.1. Kitchen, clothes dryer, bathroom and toilet room exhaust openings are installed with steel exhaust subducts, having a maximum diameter of 5" (127 mm) or maximum area of 19.7 in^2 (0.012 m^2) and a minimum wall thickness of 0.0187-inch (0.4712 mm) (No. 26 gage).
   2.2. The subducts extend not less than 22 inches (559 mm) vertically.
   2.3. An exhaust fan is installed at the upper terminus of the shaft that is powered continuously in accordance with the provisions of Section 909.11, so as to maintain a continuous upward airflow to the outside.
3. *Smoke dampers* are not required at penetration of exhaust or supply shafts in parking garages that are separated from other building shafts by not less than 2-hour fire-resistance-rated construction.
4. *Smoke dampers* are not required at penetrations of shafts where ducts are used as part of an *approved* mechanical smoke control system designed in accordance with Section 909 and where the *smoke damper* will interfere with the operation of the smoke control system.
5. *Fire dampers* and *combination fire/smokedampers* are not required in kitchen and clothes dryer exhaust systems where installed in accordance with the *International Mechanical Code*.

Reason: For all occupancy classifications, Exceptions 1 allows deletion of fire dampers when specific conditions are met. Exception 2 allows deletion of the smoke damper under the conditions specified, but is limited to B and R occupancies. The 22-inch subduct as described, mitigates the fire damper. For fully sprinklered buildings, the fan described in Exception 2 that is continuously operating and on standby power, mitigates the smoke damper. This combination creates an equivalent and safe condition that need not be limited to B and R occupancies.

Cost Impact: Will not increase the cost of construction
This proposal is expected to decrease the cost of construction.The allowance to eliminate smoke dampers not only saves the cost of the damper, also saved is the cost of the respective smoke detector and interconnected controls. The continued maintenance and testing of the damper(s) and smoke detector(s) are also eliminated.

Analysis: Code change proposals FS 114 and FS 115 propose revisions to Section 717.5.3. The committee needs to make its intent clear with respect to these revisions.

FS 115-15

717.5.3 (IMC 607.5.5)

Proponent: Raymond Grill, Arup, representing Arup (ray.grill@arup.com)

2015 International Building Code

Revise as follows:

717.5.3 Shaft enclosures. Shaft enclosures that are permitted to be penetrated by ducts and air transfer openings shall be protected with *approved* fire and smoke *dampers* installed in accordance with their listing.

Exceptions:

1. *Firedampers* are not required at penetrations of shafts where any of the following criteria are met:
   - 1.1. Steel exhaust subducts are extended not less than 22 inches (559 mm) vertically in exhaust shafts, provided there is a continuous airflow upward to the outside.
   - 1.2. Penetrations are tested in accordance with ASTM E 119 or UL 263 as part of the fire-resistance-rated assembly.
   - 1.3. Ducts are used as part of an *approved* smoke control system designed and installed in accordance with Section 909 and where the *firedamper* will interfere with the operation of the smoke control system.
   - 1.4. The penetrations are in parking garage exhaust or supply shafts that are separated from other building shafts by not less than 2-hour fire-resistance-rated construction.
2. ~~In Group B and R occupancies equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1, *smokedampers*~~Smoke dampers are not required at penetrations of shafts ~~where all of the following criteria~~in buildings that are ~~met:~~
   - 2.1. ~~Kitchen, clothes dryer, bathroom and toilet room exhaust openings are installed~~equipped throughout with ~~steel exhaust subducts, having a minimum wall thickness of 0.0187-inch (0.4712 mm) (No. 26 gage).~~
   - ~~2.2. The subducts extend not less than 22 inches (559 mm) vertically.~~
   - 2.2. ~~An exhaust fan is installed at the upper terminus of the shaft that is powered continuously~~an automatic sprinkler system in accordance with ~~the provisions of~~ Section ~~909.11, so as to maintain a continuous upward airflow to the outside~~903.3.1.1.
3. *Smoke dampers* are not required at penetration of exhaust or supply shafts in parking garages that are separated from other building shafts by not less than 2-hour fire-resistance-rated construction.
4. *Smoke dampers* are not required at penetrations of shafts where ducts are used as part of an *approved* mechanical smoke control system designed in accordance with Section 909 and where the *smoke damper* will interfere with the operation of the smoke control system.
5. *Fire dampers* and *combination fire/smokedampers* are not required in kitchen and clothes dryer exhaust systems where installed in accordance with the *International Mechanical Code*.

Reason: The requirement for smoke dampers at penetrations in shafts was first included in the IBC during the comment phase of the development of the first edition of the International Building Code. This requirement did not exist in any of the model building codes (BOCA, UBC & SBC). A requirement for smoke dampers at penetrations of shafts has never been incorporated in the NFPA system of codes.

The justification for smoke dampers in the original code change is that smoke can travel through a duct to locations in a building that are remote from the fire. While this statement is correct, smoke travel through ducted ventilation shafts has not been a contributing factor to fire spread or fire deaths in buildings. Smoke detectors at HVAC equipment have been required to accomplish automatic shut off of HVAC equipment to minimize the potential of smoke spread through ventilation ducts. For example, the majority of fire deaths in upper stories of the MGM grand fire of 1980 were due to smoke spread through stair shafts and seismic joints that were not protected. Fancoil units in guestrooms drew air from the corridors which also contributed to fatalities. While the HVAC system was cited as a potential source of smoke spread, smoke detectors were not present to provide automatic shutoff of equipment (NFPA Preliminary Report of the MGM Grand Hotel Fire). The MGM Grand was not sprinkler protected.

There was only one fatality in an upper story of the San Juan DuPont fire in 1986 which was not readily explained. The San Juan Dupont was not sprinker protected. Smoke travel through ventilation shafts was not a contributing factor in the First Interstate fire in Los Angeles or the Meridian fire in Philadelphia. Sprinklers were not active on fire floors in either of those buildings. Even in the World Trade Center bombing of 1993, 6 fatalities were attributed to the explosion, but there were no fatalities due to the effects of smoke (Isner, Michael S. and Klem, Thomas J., "World Trade Center Explosion and Fire," National Fire Protection Association). While these fires were thoroughly investigated, and code changes promulgated to address fire safety issues, smoke dampers in duct penetrations of shafts were never adopted as changes to any of the model codes as a result of these fires.

The original code change in the IBC did not present any technical substantiation for the additional requirement for smoke dampers and there has never been an instance that I am aware of where the provision of smoke dampers in shafts would have made a difference in the fire performance of a fully sprinklered building.

This requirement has been massaged based on negotiation with manufactures and building ownership groups over the past code cycles because it has always been difficult to implement. The requirement for smoke dampers at penetrations of shafts should be removed for fully sprinklered buildings.

There have been jurisdictions and federal agencies that have never adopted the smoke damper requirement for sprinklered buildings. There have not been any incidences reported to show a need for smoke dampers. Agencies include the General Services Administration, Department of Veteran Affairs, and Department of Defense. These agencies own and operate buildings that include all of the occupancy types addressed by the IBC. Smoke dampers are not required in shaft penetrations in their buildings.

Performance of Fully Sprinklered Buildings

It is important to note that the IBC requires sprinkler protection for most buildings of any significant size or occupant load. Therefore, the performance of sprinklered buildings is relevant. There has never been a multiple life loss fire in a fully sprinklered building of any occupancy type where the occupants have not been intimate with the fire or where an explosive or terrorist event has occurred.

Fire incidents in fully sprinklered buildings have never been identified to demonstrate the need for smoke dampers at shaft penetrations..

Maintaining Operability

Smoke dampers are operated by either a pneumatic actuator or electric motor. Smoke dampers require regular testing and maintenance to keep them operating. Even the most diligent building owners have a difficult time maintaining operability of smoke dampers.

Sustainability

There is a significant amount of resources that go into the implementation of smoke dampers at shaft penetrations. There has not been a demonstrated value to property protection or life safety in fully sprinklered buildings to justify their need.

Cost Impact: Will not increase the cost of construction
This code change will significantly reduce the cost of construction. A rough installed cost estimate for the smoke dampers and associated required equipment can range from $2000-$3000 per damper or even more for large dampers. This does not include the ongoing cost of testing the dampers and detectors that are required to operate the dampers. Regular testing is also required at regular frequencies. Testing costs per damper can vary depending on the number of dampers being tested and the accessibility and complexity of the system.

Analysis: Code change proposals FS 114 and FS 115 propose revisions to Section 717.5.3. The committee needs to make its intent clear with respect to these revisions.

FS 115-15 : 717.5.3-GRILL5132

FS 116-15

717.5.3 (IMC 607.5.5)

Proponent: Douglas Evans, representing self (dhefpe@gmail.com)

2015 International Building Code

Revise as follows:

717.5.3 Shaft enclosures. Shaft enclosures that are permitted to be penetrated by ducts and air transfer openings shall be protected with *approved* fire and smoke *dampers* installed in accordance with their listing.

Exceptions:

1. *Firedampers* are not required at penetrations of shafts where any of the following criteria are met:
   - 1.1. Steel exhaust subducts are extended not less than 22 inches (559 mm) vertically in exhaust shafts, provided there is a continuous airflow upward to the outside.
   - 1.2. Penetrations are tested in accordance with ASTM E 119 or UL 263 as part of the fire-resistance-rated assembly.
   - ~~1.3. Ducts are used as part of an *approved* smoke control system designed and installed in accordance with Section 909 and where the *firedamper* will interfere with the operation of the smoke control system.~~
   - 1.3. The penetrations are in parking garage exhaust or supply shafts that are separated from other building shafts by not less than 2-hour fire-resistance-rated construction.
2. In Group B and R occupancies equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1, *smokedampers* are not required at penetrations of shafts where all of the following criteria are met:
   - 2.1. Kitchen, clothes dryer, bathroom and toilet room exhaust openings are installed with steel exhaust subducts, having a minimum wall thickness of 0.0187-inch (0.4712 mm) (No. 26 gage).
   - 2.2. The subducts extend not less than 22 inches (559 mm) vertically.
   - 2.3. An exhaust fan is installed at the upper terminus of the shaft that is powered continuously in accordance with the provisions of Section 909.11, so as to maintain a continuous upward airflow to the outside.
3. *Smoke dampers* are not required at penetration of exhaust or supply shafts in parking garages that are separated from other building shafts by not less than 2-hour fire-resistance-rated construction.
4. ~~*Smoke dampers* are not required at penetrations of shafts where ducts are used as part of an *approved* mechanical smoke control system designed in accordance with Section 909 and where the *smoke damper* will interfere with the operation of the smoke control system.~~
4. *Fire dampers* and *combination fire/smokedampers* are not required in kitchen and clothes dryer exhaust systems where installed in accordance with the *International Mechanical Code.*

Reason: These allowances can easily be misapplied. Just because dampers (fire or smoke) are part of a 909 smoke control system is not a reason to delete them. The following statements have been gleaned from various editions of the ICC Smoke Control book by Evans and Klote:

"One thing to consider is the effect of automatic sprinklers. If we accept **the concepts outlined in Section 909**, we must **assume that automatic sprinklers have activated and minimized the fire size, as well as the heat output, or that the fire is fuel-limited**. Section 909 is not intended to be used when uncontrolled fires can be expected."

"It may be argued that fire dampers can invariably interfere with proper operation of a smoke control system. Does this mean that all fire dampers in smoke control systems should be deleted? The code even allows increased activation temperatures for fire dampers installed within smoke control systems. If there is sufficient heat at a fire damper to cause the fusible link to melt, there may be the possibility of spreading fire from one side of the barrier to the other. In most cases, **it may be preferable to allow the fire damper to close and maintain the fire resistance of the passive barrier**, knowing full well that the mechanical smoke control system may no longer be able to perform its intended function. The impact of this subject can be minimized by careful layout of the smoke control system to reduce the number of fire dampers required."

"If the linkage temperature of a fire damper is hot enough for the damper to close, there is likely a greater concern of keeping the fire within the zone of origin than whether the smoke control system is functioning properly. In other words, **let the fire damper fulfill its intended function by maintaining the passive barrier**. "

"The Exception allows **smoke dampers**, which are part of an approved smoke control system, to be **omitted when they "are not necessary for the operation and control of the system**." This allowance should only be considered on a case-by-case basis. When the smoke control system is operating properly, smoke dampers can be programmed to remain in the open position and still allow the smoke control system to function within the intent of its design. When airflow sensors do not indicate adequate air movement, these dampers can be programmed to close and maintain the passive smoke barrier. **If smoke can migrate from one smoke zone to another** through a ducted or non-ducted damper **when fans are off, recognition of this allowance is not appropriate**. A fire damper must still be installed if required by this code."

One can virtually always argue that a fire or smoke damper will adversely affect the smoke control system. Although this may be correct, careful routing of ducts can substantially reduce the need for dampers.

It is virtually impossible to design a smoke control system in accordance with Section 909 without taking into account a sprinkler limited fire. In a sprinkler controlled fire, its unlikely fire dampers will get hot enough to close.

The leakage rated portion of the damper (smoke damper) can be programmed to remain open when the smoke control system is functioning properly and close upon an appropriate fault condition. As such, it is unlikely a smoke damper will adversely affect a properly functioning smoke control system.

As such, these allowances are inappropriate and should only be considered when one of the other existing exceptions applies.

Cost Impact: Will increase the cost of construction
Careful layout of the smoke control system to limit penetration of rated assemblies can substantially reduce the number of fire dampers required. As such, this proposal will have little to no increase in the cost of construction for a properly designed smoke control system.

FS 116-15 : 717.5.3-EVANS5405

FS 117-15

717.5.3 (IMC 607.5.5)

Proponent: Maureen Traxler, Seattle Dept of Planning & Development, representing Seattle Dept of Planning & Development (maureen.traxler@seattle.gov)

2015 International Building Code

Revise as follows:

717.5.3 Shaft enclosures. Shaft enclosures that are permitted to be penetrated by ducts and air transfer openings shall be protected with *approved* fire and smoke *dampers* installed in accordance with their listing.

Exceptions:

1. *Firedampers* are not required at penetrations of shafts where any of the following criteria are met:
   - 1.1. Steel exhaust subducts are extended not less than 22 inches (559 mm) vertically in exhaust shafts, provided there is a continuous airflow upward to the outside.
   - 1.2. Penetrations are tested in accordance with ASTM E 119 or UL 263 as part of the fire-resistance-rated assembly.
   - 1.3. Ducts are used as part of an *approved* smoke control system designed and installed in accordance with Section 909 and where the *firedamper* will interfere with the operation of the smoke control system.
   - 1.4. The penetrations are in parking garage exhaust or supply shafts that are separated from other building shafts by not less than 2-hour fire-resistance-rated construction.
2. In Group B and R occupancies equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1, *smokedampers* are not required at penetrations of shafts where all of the following criteria are met:
   - 2.1. Kitchen, clothes dryer, bathroom and toilet room exhaust openings are installed with steel exhaust subducts, having a minimum wall thickness of 0.0187-inch (0.4712 mm) (No. 26 gage).
   - 2.2. The subducts extend not less than 22 inches (559 mm) vertically.
   - 2.3. An exhaust fan is installed at the upper terminus of the shaft that is powered continuously in accordance with the provisions of Section 909.11, so as to maintain a continuous upward airflow to the outside.
3. *Smoke dampers* are not required at penetration of exhaust or supply shafts in parking garages that are separated from other building shafts by not less than 2-hour fire-resistance-rated construction.
4. *Smoke dampers* are not required at penetrations of shafts where ducts are used as part of an *approved* mechanical smoke control system designed in accordance with Section 909 and where the *smoke damper* will interfere with the operation of the smoke control system.
5. *Fire dampers* and *combination fire/smokedampers* are not required in kitchen and clothes dryer exhaust systems where ~~installed in accordance with~~ dampers are prohibited by the *International Mechanical Code*.

Reason: The purpose of exception 5 is to eliminate an inconsistency between the IBC & IMC. Without the exception, the IBC would require dampers while the IMC specifically prohibits them for clothes dryers (IMC Sec. 504.2), multistory domestic kitchen exhaust (IMC Sec. 505.3), and in grease ducts (IMC Sec. 505.3). However, the exception as written goes beyond that to allow undampered shaft penetrations in all kitchen exhausts that comply with the IMC.

Cost Impact: Will not increase the cost of construction
This proposal merely clarifies existing language and will not increase the cost of construction.

FS 117-15 : 717.5.3-TRAXLER3308

FS 118-15

717.5.5 (IMC 607.5.4)

Proponent: Vickie Lovell, InterCode Incorporated, representing Air Movement Control Association International (vickie@intercodeinc.com)

2015 International Building Code

Revise as follows:

717.5.5 Smoke barriers. A *listed smoke damper* designed to resist the passage of smoke shall be provided at each point a duct or air transfer opening penetrates a *smoke barrier*. *Smoke dampers* and *smoke damper* actuation methods shall comply with Section 717.3.3.2.

Exceptions:

1. *Smoke dampers* are not required where the openings in ducts are limited to a single *smoke compartment* and the ducts are constructed of steel.
2. Smoke dampers are not required in smoke barriers required by Section 407.5 for Group I-2, Condition 2— where the HVAC system is fully ducted in accordance with Section 603 of the *International Mechanical Code* and where buildings are equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1 and equipped with quick-response sprinklers in accordance with Section 903.3.2. <u>For the purposes of this exception, a ducted HVAC system shall be a duct system for conveying supply, return or exhaust air as part of the structure's HVAC system. Such a duct system shall be constructed of sheet steel not less than No. 26 gage thickness and shall be continuous from the air-handling appliance or equipment to the air outlet and inlet terminals.</u>

Reason: Smoke barrier walls are used to divide areas of a building into separate smoke compartments so that occupants can be evacuated or relocated to adjacent smoke compartments or other areas of the building. They are also used to enclose areas of refuge and or elevator lobbies. Although not required by the IBC, smoke barriers can also be used as part of a smoke control system, accessible means of egress, and compartmentation of underground buildings. IBC Section 709.3 "Fire-resistance rating" states that a 1-hour fire-resistance rating is required for smoke barriers. In addition to a 1 hour fire resistance rating for the smoke barrier, the IBC also requires that all the elements such as doors, penetrations, joints and ducts of a smoke barrier have quantifiable resistance to smoke/air leakage. Smoke barriers are required to be permanently identified and marked with signs or stenciling with wording that requires that openings should be protected after construction and during ongoing maintenance and repairs.
Without any technical justification other than the cost of installation and maintenance of a smoke damper, smoke dampers were removed as duct opening protection in a smoke barrier in fully ducted HVAC systems. No meaningful supporting data was provided to show that eliminating a smoke damper in a smoke barrier duct opening, and replying solely on the sprinkler system and the duct itself is an equivalent alternative to a 1 hour of fire resistance rated assembly, or would satisfy the requirement to limit the migration of smoke and toxic gases if the duct breaks away from the smoke barrier wall. Therefore this proposed text has been added to better define when the exception for smoke dampers should apply based on the construction of the HVAC system. It has excerpted from the exception permitted in fire partitions (also fire rated for 1 hour) for fire dampers in fully ducted systems in sprinklered buildings as follows:

> 717.5.4 Fire partitions, Exception #4. Such walls are penetrated by ducted HVAC systems, have a required fire-resistance rating of 1 hour or less, and are in buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2. For the purposes of this exception, a ducted HVAC system shall be a duct system for conveying supply, return or exhaust air as part of the structure's HVAC system. Such a duct system shall be constructed of sheet steel not less than No. 26 gage thickness and shall be continuous from the air-handling appliance or equipment to the air outlet and inlet terminals.

Cost Impact: Will not increase the cost of construction
The code change proposal will not increase the cost of construction because the code section already requires a fully ducted system in order to eliminate a smoke damper. This proposal brings into this section the description of what a fully ducted system is, which the code already defined in 717.5.4 Fire partitions.

FS 118-15 : 717.5.5-LOVELL4473

FS 119-15

717.6.2 (IMC 607.6.2), 717.6.2.1 (IMC 607.6.2.1)

Proponent: Homer Maiel, PE, CBO, representing ICC Tri-Chapter (Peninsula, East Bay, Monterey Bay) (hmaiel@gmail.com)

2015 International Building Code

Revise as follows:

717.6.2 Membrane penetrations. Ducts and air transfer openings constructed of *approved* materials in accordance with the *International Mechanical Code* that penetrate the ceiling membrane of a fire-resistance-rated floor/ceiling or roof/ceiling assembly shall be protected with one of the following:

1. A shaft enclosure in accordance with Section 713.
2. A *listedceiling radiation damper* installed at the ceiling line where a duct penetrates the ceiling of a fire-resistance-rated floor/ceiling or roof/ceiling assembly.

Exceptions:

1. A fire resistance rated assembly tested in accordance with ASTM E 119 or UL 263 showing that ceiling radiation dampers are not required in order to maintain the fire resistance rating of the assembly.

2. Where exhaust duct penetrations are protected in accordance with Section 714.4.1.2 are located within the cavity of a wall and do not pass through another dwelling unit or tenant space.

3. Where duct and air transfer openings are protected with a duct outlet penetration system tested as part of a fire-resistance-rated assembly in accordance with ASTM E 119 or UL 263.

3. A *listedceiling radiation damper* installed at the ceiling line where a diffuser with no duct attached penetrates the ceiling of a fire-resistance-rated floor/ceiling or roof/ceiling assembly.

Exceptions:

1. A fire resistance rated assembly tested in accordance with ASTM E 119 or UL 263 showing that ceiling radiation dampers are not required in order to maintain the fire resistance rating of the assembly.

2. Where duct and air transfer openings are protected with a duct outlet penetration system tested as part of a fire-resistance-rated assembly in accordance with ASTM E 119 or UL 263.

717.6.2.1 Ceiling radiation dampers testing and installation. *Ceiling radiation dampers* shall be tested in accordance with Section 717.3.1. *Ceiling radiation dampers* shall be installed in accordance with the details *listed* in the fire-resistance-rated assembly and the manufacturer's instructions and the listing.~~*Ceiling radiation dampers* are not required where one of the following applies:~~

~~1. Tests in accordance with ASTM E 119 or UL 263 have shown that *ceiling radiation dampers* are not necessary in order to maintain the *fire-resistance rating* of the assembly.~~

~~1. Where exhaust duct penetrations are protected in accordance with Section 714.4.2, are located within the cavity of a wall and do not pass through another *dwellingunit* or tenant space.~~

~~2. Where duct and air transfer openings are protected with a duct outlet protection system tested as part of a fire-resistance-rated assembly in accordance with ASTM E 119 or UL 263.~~

Reason: This proposal combines Section 717.6.2 and 717.6.2.1 in a way that the requirements could be understood better. The changes are merely editorial and not technical.

Cost Impact: Will not increase the cost of construction
The proposal will not increase the cost of construction since the code change, as mentioned under "reason", is merely editorial for the code user to understand it better.

FS 119-15 : 717.6.2-MAIEL4514

FS 120-15

717.6.2.1 (IMC 607.6.2.1)

Proponent: Mike Moore, Newport Ventures, representing Broan-NuTone, representing Newport (mmoore@newportventures.net)

2015 International Building Code

Revise as follows:

717.6.2.1 Ceiling radiation dampers. *Ceiling radiation dampers* shall be tested in accordance with Section 717.3.1. *Ceiling radiation dampers* shall be installed in accordance with the details *listed* in the fire-resistance-rated assembly and the manufacturer's instructions and the listing. *Ceiling radiation dampers* are not required where one of the following applies:

1. Tests in accordance with ASTM E 119 or UL 263 have shown that *ceiling radiation dampers* are not necessary in order to maintain the *fire-resistance rating* of the assembly.
2. Where exhaust <u>duct or outdoor air</u> duct penetrations are protected in accordance with Section 714.4.2, are located within the cavity of a wall and do not pass through another *dwellingunit* or tenant space.
3. Where duct and air transfer openings are protected with a duct outlet protection system tested as part of a fire-resistance-rated assembly in accordance with ASTM E 119 or UL 263.

Reason:
This section provides multiple exemptions for ceiling radiation dampers. Exception 2 exempts exhaust air ducts that meet certain requirements. There is no apparent reason to not also exempt outdoor air ducts meeting the same requirements. This appears to simply be an oversight.

Cost Impact: Will not increase the cost of construction
This proposal will reduce costs by reducing the number of applications requiring a ceiling radiation damper. The cost reduction expected is $50-$130 per instance. Prices estimates are retail based on Google shopping search, key words "ceiling radiation damper", conducted December 19, 2014.

Part I:

718.3.2

Part II:

718.4.2

THIS IS A 2 PART CODE CHANGE. BOTH PARTS WILL BE HEARD BY THE IBC-FIRE SAFETY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THIS COMMITTEE.

Proponent: Stephen DiGiovanni, Clark County Building Department, representing Southern Nevada Chapter of ICC (sdigiovanni@clarkcountynv.gov)

Part I

2015 International Building Code

Revise as follows:

718.3.2 Groups R-1, R-2, R-3 and R-4. Draftstopping shall be provided in floor/ceiling spaces in Group R-1 buildings, in Group R-2 buildings with three or more *dwellingunits*, in Group R-3 buildings with two *dwellingunits* and in Group R-4 buildings. Draftstopping shall be located above and in line with the *dwellingunit* and *sleeping unit* separations.

Exceptions:

1. Draftstopping is not required in buildings equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1.
2. Draftstopping is not required in buildings equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.2, provided that automatic sprinklers in accordance with Section 903.3.1.1 are installed in the combustible concealed spaces where the draftstopping is being omitted.

Part II

2015 International Building Code

Revise as follows:

718.4.2 Groups R-1 and R-2. Draftstopping shall be provided in *attics*, mansards, overhangs or other concealed roof spaces of Group R-2 buildings with three or more *dwellingunits* and in all Group R-1 buildings. Draftstopping shall be installed above, and in line with, *sleeping unit* and *dwellingunit* separation walls that do not extend to the underside of the roof sheathing above.

Exceptions:

1. Where *corridor* walls provide a *sleeping unit* or *dwellingunit* separation, draftstopping shall only be required above one of the *corridor* walls.
2. Draftstopping is not required in buildings equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1.
3. In occupancies in Group R-2 that do not exceed four *storiesabovegrade plane*, the *attic* space shall be subdivided by *draftstops* into areas not exceeding 3,000 square feet (279 m^2) or above every two *dwellingunits*, whichever is smaller.
4. Draftstopping is not required in buildings equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.2, provided that automatic sprinklers in accordance with Section 903.3.1.1 are installed in the combustible concealed space where the draftstopping is being omitted.

Reason: The requirement to have an NFPA 13R sprinkler system protect combustible concealed spaces contradicts the intent of a 13R system. The NFPA 13R code specifically excludes the installation of sprinklers in combustible concealed spaces. Section 6.6.6 of NFPA 13R, 2010 edition (the edition referenced by the 2012 IBC), reads as follows:

"**6.6.6** Sprinklers shall not be required in attics, penthouse equipment rooms, elevator machine rooms, concealed spaces dedicated exclusively to and containing only dwelling unit ventilation equipment, crawl spaces, floor/ceiling spaces, noncombustible elevator shafts where the elevator cars comply with ANSI A17.1, *Safety Code for Elevators and Escalators*, and other concealed spaces that are not used or intended for living purposes or storage and do not contain fuel-fired equipment."

Because NFPA 13R specifically does not include within its scope the installation of sprinklers in concealed spaces, there are no criteria within NFPA 13R that are suitable for the protection of concealed spaces. NFPA 13, on the other hand, sets forth requirements for protecting concealed combustible spaces. As such, NFPA 13 has suitable design criteria for protection of concealed combustible spaces. Specifically, NFPA 13 provides "Section 8.16.1 Concealed Spaces" (too lengthy to retype). This section sets forth the concealed spaces where sprinklers are required, methods to mitigate sprinklers in concealed spaces, the density criteria for the sprinklers, provisions for localized protection of combustibles, and sprinkler head listing requirements for protection of spaces that of shallower heights.

Because NFPA 13R does not have design criteria for the protection of combustible concealed spaces, it is not appropriate to refer to that standard for protection of concealed combustible spaces. This amendment seeks to require that protection of concealed combustible spaces be provided in an appropriate manner, using the only recognized reference sprinkler code that provides criteria for protection of concealed combustible spaces.

Cost Impact:

Part I: Will not increase the cost of construction
This proposal does not increase the cost of construction, as the requirements for sprinklers currently exist, and are being clarified only.

Part II: Will not increase the cost of construction
This proposal will not increase the cost of construction as the requirements currently exist, and are just being clarified by this proposal.

FS 121-15 : 718.3.2-DIGIOVANNI3829

FS 122-15

718.3.2

Proponent: Carl Baldassarra, P.E., FSFPE, Chair, ICC Code Technology Committee, representing Code Technology Committee (CTC@iccsafe.org)

2015 International Building Code

Revise as follows:

718.3.2 Groups R-1, R-2, R-~~3 and R-4~~. Draftstopping shall be provided in floor/ceiling spaces in Group R-1 buildings, in Group R-2 buildings with three or more *dwellingunits*, in Group R-3 buildings with two *dwellingunits* ~~and in Group R-4 buildings~~. Draftstopping shall be located above and in line with the *dwellingunit* and *sleeping unit* separations.

Exceptions:

1. Draftstopping is not required in buildings equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1.
2. Draftstopping is not required in buildings equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.2, provided that automatic sprinklers are installed in the combustible concealed spaces where the draftstopping is being omitted.

Reason: Group R-4 congregate residences are groups of sleeping units that operate as a single-family home. Requiring draftstopping between bedrooms is a significantly higher requirement than specified for any other occupancy. By letting the provisions for Group R-4 fall back to the Group R-3 requirements, there would be draftstopping between dwellings.

Sections 903.2.8.3 through 903.2.8.3.2 were added in 2015 IBC/IFC for attic protection in Group R-4 Condition 2 facilities to address the issue of the possibility of fires within an attic space.

[F] 903.2.8.3 Group R-4 Condition 2. An automatic sprinkler system installed in accordance with Section 903.3.1.2 shall be permitted in Group R-4 Condition 2 occupancies. Attics shall be protected in accordance with Section 903.2.8.3.1 or 903.2.8.3.2.

[F] 903.2.8.3.1 Attics used for living purposes, storage or fuel-fired equipment. Attics used for living purposes, storage or fuel-fired equipment shall be protected throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.2.

[F] 903.2.8.3.2 Attics not used for living purposes, storage or fuel-fired equipment. Attics not used for living purposes, storage or fuel-fired equipment shall be protected in accordance with one of the following:
1. Attics protected throughout by a heat detector system arranged to activate the building fire alarm system in accordance with Section 907.2.10.
2. Attics constructed of noncombustible materials. .
3. Attics constructed of fire-retardant-treated wood framing complying with Section 2303.2.
4. The automatic sprinkler system shall be extended to provide protection throughout the attic space.

The ICC Code Technology Committee (CTC) has just completed its 10th year. The ICC Board has decided to sunset the CTC. The sunset plan includes re-assigning many of the CTC Areas of Study to the applicable Code Action Committee (CAC). The two remaining CTC Areas of Study are Care Facilities and Elevator Lobbies/WTC Elevator issues. This proposal falls under the Care Facilities Area of Study. Information on the CTC, including: the sunset plan; meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the CTC website at: http://www.iccsafe.org/cs/CTC/Pages/default.aspx.

Cost Impact: Will not increase the cost of construction
Clarification of the intent of draft stopping could reduce the requirements for the number of draft stops.

FS 122-15 : 718.3.2-BALDASSARRA4270

FS 123-15

720.1

Proponent: Marcelo Hirschler, representing GBH International (gbhint@aol.com)

2015 International Building Code

Revise as follows:

720.1 General. Insulating materials~~, including facings such as vapor retarders and *vapor-permeable membranes*, similar coverings and all layers of single and multilayer reflective foil insulations,~~ shall comply with the requirements of this section. Where a flame spread index or a smoke-developed index is specified in this section, such index shall be determined in accordance with ASTM E 84 or UL 723. Any material that is subject to an increase in flame spread index or smoke-developed index beyond the limits herein established through the effects of age, moisture or other atmospheric conditions shall not be permitted. <u>Insulating materials include but are not limited to facings such as vapor retarders, vapor permeable membranes and similar coverings, and all layers of single and multilayer reflective foil insulations.</u>

Exceptions:

1. Fiberboard insulation shall comply with Chapter 23.
2. Foam plastic insulation shall comply with Chapter 26.
3. Duct and pipe insulation and duct and pipe coverings and linings in plenums shall comply with the *International Mechanical Code*.
4. All layers of single and multilayer reflective plastic core insulation shall comply with Section ~~2613~~<u>2614</u>.

Reason: This is simple clarification and language cleanup. Section 720.1 is intended to apply to all insulating materials but the sentence as is causes confusion because it refers to two types of insulation materials, namely (1) facings such as vapor retarders and vapor-permeable membranes and similar coverings and (2) all layers of single and multilayer reflective foil insulations. Therefore it is better if they are shown in a separate sentence at the end of the section that way the sentence is clearer.
The other change is that the correct section for reflective plastic core insulation materials (which are a subset of reflective insulation materials) is 2614 and not 2613.

Cost Impact: Will not increase the cost of construction
No change in requirements - simple clarification.

FS 123-15 : 720.1-HIRSCHLER4583

FS 124-15

720.1, 720.2.1

Proponent: Lamont Millspaugh, Reflectix, Inc., representing Reflective Insulation Manufacturers Association International (monty.millspaugh@reflectixinc.com)

2015 International Building Code

Revise as follows:

720.1 General. Insulating materials, including facings such as vapor retarders and *vapor-permeable membranes*, similar coverings and ~~all layers of~~ single and multilayer reflective ~~foil~~ insulations, shall comply with the requirements of this section. Where a flame spread index or a smoke-developed index is specified in this section, such index shall be determined in accordance with ASTM E 84 or UL 723. Any material that is subject to an increase in flame spread index or smoke-developed index beyond the limits herein established through the effects of age, moisture or other atmospheric conditions shall not be permitted.

Exceptions:

1. Fiberboard insulation shall comply with Chapter 23.
2. Foam plastic insulation shall comply with Chapter 26.
3. Duct and pipe insulation and duct and pipe coverings and linings in plenums shall comply with the *International Mechanical Code*.
4. All layers of single and multilayer reflective plastic core insulation shall comply with Section 2613.

720.2.1 Facings. Where such materials are installed in concealed spaces in buildings of Type III, IV or V construction, the flame spread and smoke-developed limitations do not apply to facings, coverings, and layers of reflective ~~foil~~ insulation that are installed behind and in substantial contact with the unexposed surface of the ceiling, wall or floor finish.

Exception: All layers of single and multilayer reflective plastic core insulation shall comply with Section 2613.

Reason: The stricken language "all layers" is redundant and could cause confusion. Furthermore, this is not the correct method for testing these types of products. ASTM E 84 procedures call for the entire product to be tested, not each component of the product.
The word "foil" is an outdated describer of reflective insulation products. Some do contain foil, but a majority of the industry has moved to metalized films. All reflective insulations require the same testing regiment independent of composition.

Cost Impact: Will not increase the cost of construction
This proposal will not increase the cost of construction. The proposal updates the material reference language within the code, in order to be current with standard industry practice.

FS 124-15 : 720.1-MILLSPAUGH4896

FS 125-15

720.1, 720.5.1 (New)

Proponent: Wesley Hall, Reflectix, Inc., representing Reflective Insulation Manufacturers Association International (wes.hall@reflectixinc.com)

2015 International Building Code

Revise as follows:

720.1 General. Insulating materials, including facings such as vapor retarders and *vapor-permeable membranes*, similar coverings and all layers of single and multilayer reflective foil insulations and radiant barriers fully laminated to the underside of a wood roof deck, shall comply with the requirements of this section. Where a flame spread index or a smoke-developed index is specified in this section, such index shall be determined in accordance with ASTM E 84 or UL 723. Any material that is subject to an increase in flame spread index or smoke-developed index beyond the limits herein established through the effects of age, moisture or other atmospheric conditions shall not be permitted.

Exceptions:

1. Fiberboard insulation shall comply with Chapter 23.
2. Foam plastic insulation shall comply with Chapter 26.
3. Duct and pipe insulation and duct and pipe coverings and linings in plenums shall comply with the *International Mechanical Code*.
4. All layers of single and multilayer reflective plastic core insulation shall comply with Section 2613.

Add new text as follows:

720.5.1 Radiant barrier fully laminated to the underside of a wood roof deck The use of radiant barrier fully laminated to the underside of a wood roof deck shall be permitted in any type of construction provided the low emittance side of the product is facing an air space below the roof deck with an *approved* roof covering. The fire classification of the wood roof deck including the radiant barrier shall not be lower than that of the wood roof deck in the absence of the radiant barrier.

Reason: The proposal adds necessary language to ensure that radiant barriers attached to wood roof decks are properly installed below an *approved* roof covering. The current language in the code does not include any reference to a very predominant product type in the market place for **almost 30 years**. This proposed language addresses this need.

- Product History Acceptance and Distribution
  - Of the top 100 U.S. builders, 87 utilize this product type
  - 650,000,000+ sq. ft. of this product is installed annually
- Current ASTM Standards include C 1313 and C 1744
- Codes that include Radiant Barrier:
  - HI-Chapter 181 of Title 3, Table 402.1.1.1, Section 402.1.1.6 and Section 402.1.1.8.1
  - TX-Austin, Chapter 25-12, Article 12. Energy Code, Section 402.6
  - FL-2010 Florida Building Code, Section 405.6.1, Figure 405.6.1 and Table 303.2 (ASTM Standards)
  - CA-Title 24, Part 6, Subsection 8, Section (f), Subsection 2, Table 151-B, Table 151-C, Table 151-D
- Additional supporting references:
  - ICC ES - AC220

Proper installation of radiant barrier systems are covered in "Radiant Barriers: A Question and Answer Primer", available from the Florida Solar Energy Center (http://www.fsec.ucf.edu/en/publications/html/fsec-en-15/), and the ORNL website offers a "Radiant Barrier Fact Sheet" (http://web.ornl.gov/sci/ees/etsd/btric/RadiantBarrier/RBFactSheet2010.pdf) and included in ASTM C 1744.

REFERENCES:

ASTM C 1313/C 1313M Standard Specification for Sheet Radiant Barriers for Building Construction Applications

ASTM C 1744 Practice for Installation and Use of Radiant Barrier Systems (RBS) in Commercial/Industrial Building Construction.

Cost Impact: Will not increase the cost of construction
The code change proposal will not increase the cost of construction. The proposal does not change requirements for existing materials but offers an additional option of alternate materials into the code.

FS 125-15 : 720.1-HALL4563

FS 126-15

720.1, 720.1.1 (New), 2615 (New), 2615.1 (New), 2615.2 (New), 2615.3 (New), 2615.3.1 (New), 2615.3.2 (New)

Proponent: Amanda Hickman, InterCode Incorporated, representing Reflective Insulation Manufacturers Association International (amanda@intercodeinc.com)

2015 International Building Code

Delete and substitute as follows:

720.1 General. ~~Insulating materials, including facings such as vapor retarders and *vapor-permeable membranes*, similar coverings and all layers of single and multilayer reflective foil insulations, shall comply with the requirements of this section. Where a flame spread index or a smoke-developed index is specified in this section, such index shall be determined in accordance with ASTM E 84 or UL 723. Any material that is subject to an increase in flame spread index or smoke-developed index beyond the limits herein established through the effects of age, moisture or other atmospheric conditions shall not be permitted.~~

~~**Exceptions:**~~

1. ~~Fiberboard insulation shall comply with Chapter 23.~~
2. ~~Foam plastic insulation shall comply with Chapter 26.~~
3. ~~Duct and pipe insulation and duct and pipe coverings and linings in plenums shall comply with the *International Mechanical Code*.~~
4. ~~All layers of single and multilayer reflective plastic core insulation shall comply with Section 2613.~~

Insulating materials, including the following, shall comply with the requirments of this section.

1. Facings such as vapor retarders and vapor-permeable membranes and similar coverings.
2. All layers of single and multilayer reflective foil insulations, including reflective plastic core insulation, complying with Section 2614.
3. Radiant barriers with plastic core, complying with Section 2615, when installed below the roof deck with an air space between the roof deck and the radiant barrier.

Exceptions

1. Fiberboard insulation shall comply with Chapter 23.
2. Foam plastic insulation shall comply with Chapter 26.
3. Duct and pipe insulation and duct and pipe coverings and linings in plenums shall comply with the International Mechanical Code.

Add new text as follows:

720.1.1 Flame Spread and Smoke Indexes Where a flame spread index or a smoke-developed index is specified in this section, such index shall be determined in accordance with ASTM E 84 or UL 723. Any material that is subject to an increase in flame spread index or smoke-developed index beyond the limits herein established through the effects of age, moisture or other atmospheric conditions shall not be permitted.

SECTION2615 RADIANT BARRIER WITH PLASTIC CORE

2615.1 General The provisions of this section shall govern the requirements for radiant barrier with plastic core installed below the roof deck with an air space between the roof deck and the radiant barrier.

2615.2 Identification. Packages and containers of radiant barriers with plastic core delivered to the job site shall show the manufacturer's or supplier's name, product identification and manufacturer's installation instructions and information sufficient to determine that the end use will comply with the code requirements.

2615.3 Fire Testing These materials shall comply with either 2615.3.1 or 2615.3.2:

2615.3.1 Surface-burning characteristics Radiant barrier with plastic core installed below the roof deck with an air space between the roof deck and the radiant barrier shall have a flame spread index of not more than 25 and a smoke-developed index of not more than 450 when tested in accordance with ASTM E 84 or UL 723. The test specimen preparation and mounting requirements shall be in accordance with ASTM E 2599.

2615.3.2 Room corner test heat release Radiant barriers with plastic core installed below the roof deck with an air space between the roof deck and the radiant barrier shall comply with the acceptance criteria of Section 803.1.2.1 when tested in accordance with NFPA 286 in the configuration of final installation.

Reason: This proposal addresses three issues that currently exist in this code section.

1. It corrects an editorial mistake in section 720.1 exception 4. The exception should reference 2614 instead of 2613. This exception is being rewritten in affirmative language rather than as an exception. The change recognizes that the reflective insulations explicitly covered by the code (in section 2614) are reflective plastic core insulations.
2. NO technical changes have been made to this section, except for adding radiant barriers to the materials listed.
3. This proposal establishes a new section on radiant barriers with plastic core that are installed with an air space between the radiant barrier and the roof deck. A new section 2615 is proposed for these insulation materials. This is a different and distinct product category separate from the existing section 2614 Reflective Plastic Core Insulation. Radiant barriers with plastic core provide different types of performances, are installed in different locations and are labeled differently than reflective plastic core insulation.

This new language is needed in order to ensure that these radiant barrier materials comply with the appropriate fire tests and are properly marked or labeled and installed correctly. The sections in Chapter 26 address different types of plastic which is why this technology has been included in this section. These product types are a long-standing, energy-saving technology having first been evaluated in the late 1950s (Joy, 1958). As far back as the 1970s, sheets of highly reflective surfaces called Radiant Barrier Systems (RBS) have been installed.

Product design innovations have resulted in a radiant barrier product configuration that requires the same treatment as *reflective plastic core insulation* as it pertains to flame/smoke safety. This proposal will require the same flame/smoke requirements for radiant barriers as those determined by UL 723 or ASTM E 84 or NFPA 286.

Proper installation of radiant barrier systems are covered in "Radiant Barriers: A Question and Answer Primer", available from the Florida Solar Energy Center (http://www.fsec.ucf.edu/en/publications/html/fsec-en-15/), and the ORNL website offers a "Radiant Barrier Fact Sheet" (http://web.ornl.gov/sci/ees/etsd/btric/RadiantBarrier/RBFactSheet2010.pdf) and the products are specified in ASTM C 1744.

ASTM C 1744 Practice for Installation and Use of Radiant Barrier Systems (RBS) in Commercial/Industrial Building Construction
Joy, F.S. (1958). Improving Attic Space Insulating Values. ASHRAE Transaction, 64 251-266

Cost Impact: Will not increase the cost of construction
This code change proposal will not increase the cost of construction. The proposal does not change the requirements for existing materials but offers an additional option of alternative materials to the code.

FS 126-15 : 720.1-HICKMAN4420

FS 127-15

720.1, 720.5.1 (New), 720.5.2 (New), 202 (New)

Proponent: Vickie Lovell, InterCode Incorporated, representing Reflective Insulation Manufacturers Association International (vickie@intercodeinc.com)

2015 International Building Code

Revise as follows:

720.1 General. Insulating materials, including facings such as vapor retarders and *vapor-permeable membranes*, similar coverings and all layers of single and multilayer reflective foil insulations and interior radiation control coatings, shall comply with the requirements of this section. Where a flame spread index or a smoke-developed index is specified in this section, such index shall be determined in accordance with ASTM E 84 or UL 723. Any material that is subject to an increase in flame spread index or smoke-developed index beyond the limits herein established through the effects of age, moisture or other atmospheric conditions shall not be permitted.

Exceptions:

1. Fiberboard insulation shall comply with Chapter 23.
2. Foam plastic insulation shall comply with Chapter 26.
3. Duct and pipe insulation and duct and pipe coverings and linings in plenums shall comply with the *International Mechanical Code*.
4. All layers of single and multilayer reflective plastic core insulation shall comply with Section 2613.

Add new text as follows:

720.5.1 Interior radiation control coatings (IRCC) applied to the underside of a non-combustible roof deck. Interior radiation control coatings applied to the underside of a non-combustible roof deck shall face an interior air space and have an *approved* roof covering. The IRCC shall have a flame spread index of not more than 25 and a smoke-developed index of not more than 450.

720.5.2 Interior radiation control coatings (IRCC) applied to the underside of a wood roof deck Interior radiation control coatings applied to the underside of a wood roof deck shall face an interior air space and have an *approved* roof covering. The Fire Classification of the wood roof deck including the IRCC shall not be lower than that of the wood roof deck in the absence of the IRCC.

Add new definition as follows:

SECTION 202 DEFINITIONS

INTERIOR RADIATION CONTROL COATING (IRRC). A coating, having an emittance of 0.25 or less, applied as a liquid to building assemblies by roller or spray.

Reason: This proposal addresses the following issues that currently exist in this code section.

1. The proposal adds necessary language to ensure that interior radiation control coatings in roof systems are properly installed below an approved roof covering. The current language in the code does not include any reference to a very predominant product type in the market place. This proposed language addresses this need.
2. This proposal adds a new definition and section for Interior Radiation Control Coatings (IRCC). It also adds the term to the changing language of this section to ensure that the IRCC **WHEN** installed complies with the fire safety requirements in this section.

As characterized by ASTM, an Interior Radiation Control Coating (IRCC) is a non-thickness dependent, low emittance coating. When applied to building materials such as plywood, OSB or metal roofing, according to the manufacturer's installation instruction, it lowers the normal surface emittance of these materials to 0.25 or lower.

An IRCC works by changing the emittance of the surface where it is applied. Building products, such as wood, brick, painted surfaces and plasterboard exhibit high emissivities (0.7 - 0.95). When heated above the temperature of adjacent surfaces, they radiate most of their heat energy to cooler surfaces. An IRCC works by lowering their surface emittance to 0.25 or lower, lessening their ability to radiate heat.

An IRCC is normally applied using airless spray equipment, resulting in very low labor costs and greatly reduced installation times. Also, a water based IRCC can be safely installed in existing structures where the costs of installing foil or film products may be prohibitive or impractical.

REFERENCED STANDARD:

ASTM C 1321 Standard Practice for Installation and Use of Interior Radiation Control Coating Systems (IRCCs) in Building Construction.

Cost Impact: Will not increase the cost of construction
The code change proposal will not increase the cost of construction. The proposal does not change requirements for existing materials, but offers an additional option of alternative materials into the code.

FS 128-15

Table 721.1(2)

Proponent: Mike Fischer, Kellen Company, representing The Gypsum Association (mfischer@kellencompany.com)

2015 International Building Code

Revise as follows:

TABLE 721.1(2)

RATED FIRE-RESISTANCE PERIODS FOR VARIOUS WALLS AND PARTITIONS [a, o, p]

MATERIAL	ITEM NUMBER	CONSTRUCTION	MINIMUM FINISHED THICKNESS FACE-TO- FACE[b](inches)			
			4 hours	3 hours	2 hours	1 hour
15. Exterior or interior walls	15-2.4[d]	$3^5/_8$" No. 16 gage steel studs at 16" on center or 2" × 4" wood studs at 16" on center. Where metal lath is used, attach to the exterior side of studs with minimum 1" long No. 6 drywall screws at 6" on center. Brick units of clay or shale not less than $2^5/_8$" thick complying with ASTM C 216 installed in accordance with Section 1405.6 with a minimum 1" airspace. Interior side covered with two layers of $^5/_8$" thick Type X gypsum wallboard. Bottom layer attached to studs with 1" long No. 6 drywall screws at 24" on center. Top layer attached to studs with $1^5/_8$" long No. 6 drywall screws at 12" on center.	---	---	$8^1/_2$	—
<u>15. Exterior or interior walls (cont.)</u>	<u>15-3.1</u>	<u>One layer 1" thick liner panel, inserted between 2 ½" floor and ceiling runners with 2 ½" C-H, C-T or I-shape studs between panels.</u> <u>2 layers of 5/8" Type X gypsum board or gypsum panel products applied parallel or at right angles to studs with 1" long drywall screws spaced 24" on center on base layer and 1-5/8" long drywall screws spaced 12" on center on face layer.</u>	<u>---</u>	<u>---</u>	<u>3-3/4</u>	<u>---</u>
<u>15. Exterior or interior walls (cont.)</u>	<u>15-3.2</u>	<u>One layer 1" thick liner panel, inserted between 2 ½" floor and ceiling runners with 2 ½" C-H, C-T or I-shape studs between panels.</u> <u>1 layer of 5/8" Type X gypsum board or gypsum panel products applied parallel or at right angles to each side of studs with 1" long drywall screws spaced 12" on center.</u>	<u>---</u>	<u>---</u>	<u>3-3/4</u>	<u>---</u>

(Portions of table and footnotes not shown remain unchanged)

Reason: This proposal adds in two new configurations for wall assemblies to Table 721.1(2).
These assemblies are found in the latest edition of the Gypsum Association Fire-Resistance Design Manual (the first one is based on GA File Nos. WP 7054, WP 7058, WP 7060, WP 7065.2, WP 7065.4, WP 7065.5, WP 7076, WP 7078, and WP 7265; the second one is based on WP 7059, WP 7061, WP 7077, and WP 7257) and are consistent with UL designs (U415, U417, U438, U497, U498, V455, V473, and V493).

Inclusion of these additional configurations provide appropriate guidance for designers to achieve a 2-hour rating with a minimum assembly thickness of 3-3/4"

Cost Impact: Will not increase the cost of construction
The proposal adds additional options for the user of the code to meet current testing provisions and adds no new additional requirements to the code.

FS 128-15 : T721.1-FISCHER5358

FS 129-15

Table 721.1 (3)

Proponent: David Tyree, representing American Wood Council (dtyree@awc.org)

2015 International Building Code

Revise as follows:

TABLE 721.1 (3)
MINIMUM PROTECTION FOR FLOOR AND ROOF SYSTEMS[a, q]

FLOOR OR ROOF CONSTRUCTION	ITEM NUMBER	CEILING CONSTRUCTION	THICKNESS OF FLOOR OR ROOF SLAB (inches)				MINIMUM THICKNESS OF CEILING (inches)			
			4 hours	3 hours	2 hours	1 hour	4 hours	3 hours	2 hours	1 hour

30. Wood I-joist (minimum I-joist depth 9$^{1}/_{2}$" with a minimum flange depth of 1$^{1}/_{2}$" and a minimum flange cross-sectional area of 2.25 square inches; minimum web thickness of $^{3}/_{8}$") @ 24" o.c. Fiberglass insulation placed between I-joists supported by the resilient channels.	30-1.1	Minimum 0.019" thick resilient channel 16" o.c. (channels doubled at wallboard end joints), placed perpendicular to the joists and attached to each joist by 1$^{1}/_{4}$" Type S drywall screws. Two layers of $^{1}/_{2}$" Type X gypsum wallboard applied with the long dimension perpendicular to the ~~I-joists~~resilient channels with end joints staggered. The base layer is fastened with 1$^{1}/_{4}$" Type S drywall screws spaced 12" o.c. and the face layer is fastened with 1$^{5}/_{8}$" Type S drywall screws spaced 12" o.c. Face layer end joints shall not occur on the same I-joist as base layer end joints and edge joints shall be offset 24" from base layer joints. Face layer to be attached to base layer with 1$^{1}/_{2}$" Type G drywall screws spaced 8" o.c. placed 6" from face layer end joints. Face layer wallboard joints to be taped and covered with joint compound.	—	—	—	Varies	—	—	—	1

(Portions of table and footnotes not shown remain unchanged)

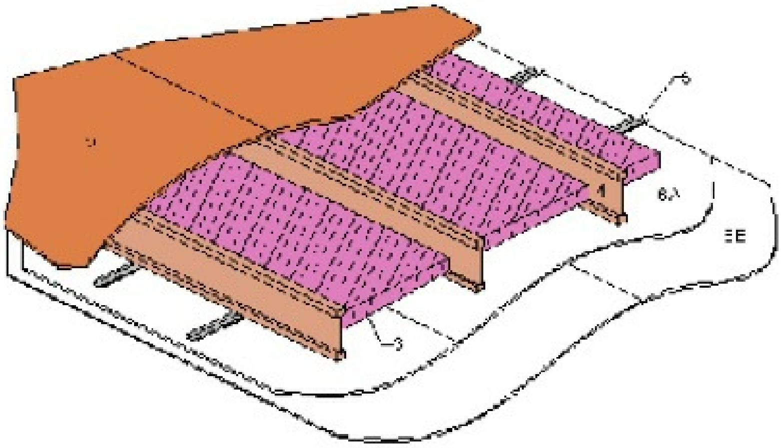
Reason: This proposal, in our opinion, is an editoral change as it simply is provided to correct what is currently specified in the 2015 IBC. The current text entry as published in the 2015 IBC is not correctly shown as the current code does not specify the resilient channel requirement as shown in the following link and the figure shown in the reason. This figure was referenced in the AWC code proposal submitted last code cycle and approved by the membership. (http://www.awc.org/publications/dca/dca3/WIJ-1.7.I-joist_2-layers_with_RCs.htm)
The reason statement for including this proposal previously in the 2015 IBC stated:

Many code officials have come to rely upon Table 720 as the preferred source of information regarding fire resistance rated assemblies. Because of its importance, we believe that the table should offer the most common generic assemblies. Floor systems utilizing I-joists have increased from less than 10 percent in 1990 to more than 50 percent. With the increased prevalence of I-joist floor/ceiling assemblies, including this assembly in the table will make the IBC more complete and it will be more useful to code officials. It is also expected that the document will be "user friendly", particularly for designers. In an effort to fulfill this expectation, we propose this common assembly for incorporation into Table 720.1(3). It is supported by ASTM E-119 test results as shown on the attached page. The following information and test results are provided with the understanding that their inclusion does not place them within the copyright release requirements of the signature statement.

For a complete list of AWC code change proposals and additional information please go to http://www.awc.org/Code-Officials/2015-IBC-Code-Changes.

WIJ-1.7 One-Hour Fire-Resistive Ceiling Assembly

Floor[a]/Ceiling - 100% Design Load - 1 Hour Rating - ASTM E 119 / NFPA 251



1. Floor Topping (optional, not shown): Gypsum concrete, lightweight or normal concrete topping.
2. Floor Sheathing: Minimum 23/32 inch thick tongue-and-groove wood sheathing (Exposure 1). Installed per code requirements with minimum 8d common nails.
3. Insulation: Fiberglass insulation placed between I-joists supported by the resilient channels.
4. Structural Members: Wood I-joists spaced a maximum of 24 inches on center.

Minimum I-joist flange depth: 1-1/2 inches — Minimum I-joist flange area: 2.25 inches^2
Minimum I-joist web thickness: 3/8 inch — Minimum I-joist depth: 9-1/2 inches

See ASTM D 5055-07 for qualification requirements.

5. Resilient Channels: Minimum 0.019 inch thick galvanized steel resilient channel attached perpendicular to the bottom flange of the I-joists with one 1-1/4 inch drywall screw. Channels spaced a maximum of 16 inches on center [24 inches on center when I-joists are spaced a maximum of 16 inches on center].
6. Gypsum Wallboard: Two layers of minimum 1/2 inch Type X gypsum wallboard attached with the long dimension perpendicular to the resilient channels as follows:

6a. Wallboard Base Layer: Base layer of wallboard attached to resilient channels using 1-1/4 inch Type S drywall screws at 12 inches on center.

6b. Wallboard Face Layer: Face layer of wallboard attached to resilient channels through base layer using 1-5/8 inch Type S drywall screws spaced 12 inches on center. Edge joints of wallboard face layer offset 24 inches from those of base layer. Additionally, wallboard face layer attached to base layer with 1-1/2 inch Type G drywall screws spaced 8 inches on center, placed 1-1/2 inches from face layer end joints.

7. Finish System (not shown): Face layer joints covered with tape and coated with joint compound. Screw heads covered with joint compound.

AMERICAN WOOD COUNCIL — — January 2009

Cost Impact: Will not increase the cost of construction
An editorial correction to the existing code.

FS 129-15 : T721.1-TYREE5069

FS 130-15

Table 721.1 (3)

Proponent: David Tyree, representing American Wood Council (dtyree@awc.org); Sam Francis (sfrancis@awc.org)

2015 International Building Code

Revise as follows:

TABLE 721.1 (3)
MINIMUM PROTECTION FOR FLOOR AND ROOF SYSTEMS[a, q]

FLOOR OR ROOF CONSTRUCTION	ITEM NUMBER	CEILING CONSTRUCTION	THICKNESS OF FLOOR OR ROOF SLAB (inches)				MINIMUM THICKNESS OF CEILING (inches)			
			4 hours	3 hours	2 hours	1 hour	4 hours	3 hours	2 hours	1 hour

27. Wood I-joist (minimum I-joist depth 9 $^{1}/_{2}$ " with a minimum flange depth of 1 $^{5}/_{16}$ " and a minimum flange cross-sectional area of 1.95 square inches; minimum web thickness of $^{3}/_{8}$ ") @ 24" o.c.	27-1.1	Minimum 0.019" thick resilient channel 16" o.c. (channels doubled at wallboard end joints), placed perpendicular to the joist and attached to each joist by 1 $^{1}/_{4}$ " Type S drywall screws. Two layers of $^{1}/_{2}$ " Type X gypsum wallboard applied with the long dimension perpendicular to the ~~I-joists~~resilient channels with end joints staggered. The base layer is fastened with 1 $^{1}/_{4}$ " Type S drywall screws spaced 12" o.c. and the face layer is fastened with 1 $^{5}/_{8}$ " Type S drywall screws spaced 12" o.c. Face layer end joints shall not occur on the same I-joist as base layer end joints and edge joints shall be offset 24" from base layer joints. Face layer to also be attached to base layer with 1 $^{1}/_{2}$ " Type G drywall screws spaced 8" o.c. placed 6" from face layer end joints. Face layer wallboard joints to be taped and covered with joint compound.	—	—	—	Varies	—	—	—	1

(Portions of table and footnotes not shown remain unchanged)

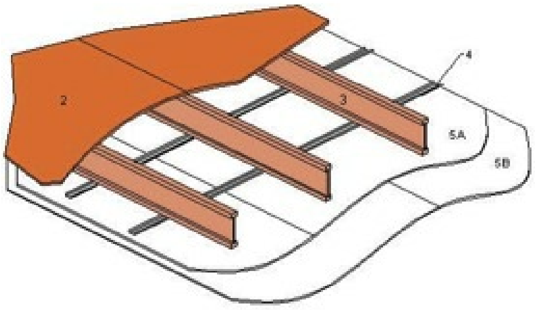
Reason: This proposal, in our opinion, is an editoral change as it simply is provided to correct what is currently specified in the 2015 IBC. The current text entry as published in the 2015 IBC is not correctly shown as the current code does not specify the resilient channel requirement as shown in the following link and the figure shown in the reason. This figure was referenced in the AWC code proposal submitted last code cycle and approved by the membership. (http://www.awc.org/publications/dca/dca3/WIJ-1.6.I-joist_2-layers_with_RCs.htm)
The reason statement for including this proposal previously in the 2015 IBC stated:

Reason: Many code officials have come to rely upon Table 720 as the preferred source of information regarding fire resistance rated assemblies. Because of its importance, we believe that the table should offer the most common generic assemblies. Floor systems utilizing I-joists have increased from less than 10 percent in 1990 to more than 50 percent. With the increased prevalence of I-joist floor/ceiling assemblies, including this assembly in the table will make the IBC more complete and it will be more useful to code officials. It is also expected that the document will be "user friendly", particularly for designers. In an effort to fulfill this expectation, we propose this common assembly for incorporation into Table 720.1(3). It is supported by ASTM E-119 test results as shown on the attached page. The following information and test results are provided with the understanding that their inclusion does not place them within the copyright release requirements of the signature statement. For a complete list of AWC code change proposals and additional information please go to http://www.awc.org/Code-Officials/2015-IBC-Code-Changes. For more information concerning CLT lumber and construction, please go to http://www.rethinkwood.com/tall-wood-survey.

For a complete list of AWC code change proposals and additional information please go to http://www.awc.org/Code-Officials/2015-IBC-Code-Changes.

WIJ-1.6 One-Hour Fire-Resistive Ceiling Assembly

Floor[a]/Ceiling - 100% Design Load - 1 Hour Rating - ASTM E 119 / NFPA 251



1. Floor Topping (optional, not shown): Gypsum concrete, lightweight or normal concrete topping.
2. Floor Sheathing: Minimum 23/32 inch thick tongue-and-groove wood sheathing (Exposure 1). Installed per code requirements with minimum 8d common nails.
3. Structural Members: Wood I-joists spaced a maximum of 24 inches on center.

Minimum I-joist flange depth: 1-5/16 inches — Minimum I-joist flange area: 1.95 inches^2
Minimum I-joist web thickness: 3/8 inch — Minimum I-joist depth: 9-1/2 inches

See ASTM D 5055-07 for qualification requirements.

4. Resilient Channels[b]: Minimum 0.019 inch thick galvanized steel resilient channel attached perpendicular to the bottom flange of the I-joists with one 1-1/4 inch drywall screw. Channels spaced a maximum of 16 inches on center [24 inches on center when I-joists are spaced a maximum of 16 inches on center].
5. Gypsum Wallboard: Two layers of minimum 1/2 inch Type X gypsum wallboard attached with the long dimension perpendicular to the resilient channels as follows:

5a. Wallboard Base Layer: Base layer of wallboard attached to resilient channels using 1-1/4 inch Type S drywall screws at 12 inches on center.

5b. Wallboard Face Layer: Face layer of wallboard attached to resilient channels through base layer using 1-5/8 inch Type S drywall screws spaced 12 inches on center. Edge joints of wallboard face layer offset 24 inches from those of base layer. Additionally, wallboard face layer attached to base layer with 1-1/2 inch Type G drywall screws spaced 8 inches on center, placed 1-1/2 inches from face layer end joints.

6. Finish System (not shown): Face layer joints covered with tape and coated with joint compound. Screw heads covered with joint compound.

Fire Test conducted at National Research Council of Canada — Report No: A-4440.1 — June 24, 1997

AMERICAN WOOD COUNCIL — AMERICAN FOREST & PAPER ASSOCIATION, INC — January 2009

Cost Impact: Will not increase the cost of construction
Editoral correction to existing code language.

FS 130-15 : T721.1-TYREE5066

FS 131-15

722

Proponent: Victor Cuevas, representing City of Los Angeles

2015 International Building Code

Delete without substitution:

~~**SECTION 722**~~
~~**CALCULATED FIRE RESISTANCE**~~

Reason: Delete entire section and reference out of the code since it's not frequently used.

Cost Impact: Will increase the cost of construction
Revision to Section 722 will remove the design options from the code and place them on a separate document. This will increase the cost of construction if a designer has to purchase the separate design standard.

FS 131-15 : 722-CUEVAS4805

FS 132-15

803.3

Proponent: David Tyree, representing American Wood Council (dtyree@awc.org)

2015 International Building Code

Revise as follows:

803.3 Heavy timber exemption. Exposed portions of building elements complying with the requirements for buildings of Type IV construction in Section 602.4 shall not be subject to *interior finish* requirements except in interior exit stairways, interior exit ramps, and exit passageways.

Reason: Cross laminated timber may be used to form the entire interior surfaces of egress elements and should be regulated in those circumstances. The requirement is the same for any other material used in those circumstances. For a complete list of AWC code change proposals and additional information please go to http://www.awc.org/Code-Officials/2015-IBC-Code-Changes.

Cost Impact: Will increase the cost of construction
May increase cost of construction as a higher flamespread requirement would be required in these new areas.

FS 132-15 : 803.3-TYREE4646

FS 133-15

803.9.1 (New)

Proponent: William Koffel, representing Self (wkoffel@koffel.com)

2015 International Building Code

Add new text as follows:

803.9.1 **Identification.** Each HDPE or PP panel used as an interior finish shall be identified by the manufacturer with a *manufacturer's designation* indicating compliance with 803.1.2. The designation shall be acid etched, sand blasted, laser etched, embossed, or of a type that, once applied, cannot be removed without being destroyed.

Reason: The Manufacturer's Designation provides a method by which code officials and others can determine that the panels are in compliance with the Code. This can be easily done and the requirement is similar to that which is required for safety glazing.

Cost Impact: Will not increase the cost of construction
The cost of compliance is with the testing. Provided the panels have been tested as required by the Code, there should be no cost impact associated with providing a Manufacturer's Designation.

FS 133-15 : 803.9.1 (New)-
KOFFEL5442

FS 134-15

Table 803.11

Proponent: John Williams, CBO, Chair, representing Adhoc Health Care Committee (AHC@iccsafe.org)

2015 International Building Code

Revise as follows:

TABLE 803.11
INTERIOR WALL AND CEILING FINISH REQUIREMENTS BY OCCUPANCY[k]

A-3[f] , A-4, A-5	B	B	C	A	A[d]	C
B, E, M, R-1	B	C[m]	C	A	B	C
R-4	B	C	C	A	B	B
F	C	C	C	B	C	C
H	B	B	C[g]	A	A	B
I-1	B	C	C	A	B	B
I-2	B	B	B[h, i]	A	A	B
I-3	A	A[j]	C	A	A	B
I-4	B	B	B[h, i]	A	A	B
R-2	C	C	C	B	B	C
R-3	C	C	C	C	C	C
S	C	C	C	B	B	C
U	No restrictions			No restrictions		

For SI: 1 inch = 25.4 mm, 1 square foot = 0.0929m^2 .

a. Class C interior finish materials shall be permitted for wainscotting or paneling of not more than 1,000 square feet of applied surface area in the grade lobby where applied directly to a noncombustible base or over furring strips applied to a noncombustible base and fireblocked as required by Section 803.13.1.

b. In other than Group I-3 occupancies in buildings less than three stories above grade plane, Class B interior finish for nonsprinklered buildings and Class C interior finish for sprinklered buildings shall be permitted in interior exit stairways and ramps.

c. Requirements for rooms and enclosed spaces shall be based upon spaces enclosed by partitions. Where a fire-resistance rating is required for structural elements, the enclosing partitions shall extend from the floor to the ceiling. Partitions that do not comply with this shall be considered enclosing spaces and the rooms or spaces on both sides shall be considered one. In determining the applicable requirements for rooms and enclosed spaces, the specific occupancy thereof shall be the governing factor regardless of the group classification of the building or structure.

d. Lobby areas in Group A-1, A-2 and A-3 occupancies shall not be less than Class B materials.

e. Class C interior finish materials shall be permitted in places of assembly with an occupant load of 300 persons or less.

f. For places of religious worship, wood used for ornamental purposes, trusses, paneling or chancel furnishing shall be permitted.

g. Class B material is required where the building exceeds two stories.

h. Class C interior finish materials shall be permitted in administrative spaces.

i. Class C interior finish materials shall be permitted in rooms with a capacity of four persons or less.

j. Class B materials shall be permitted as wainscotting extending not more than 48 inches above the finished floor in corridors and exit access stairways and ramps.

k. Finish materials as provided for in other sections of this code.

l. Applies when protected by an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2.

m. Corridors in ambulatory care facilities shall be provided with Class A or B materials.

Reason: This footnote increases the corridor finish requirements for ambulatory care facilities, eliminated the Class C option for sprinklered facilities. The sub-group of Group contains occupants who are incapable of self-preservation. While it is not a defend-in-place scenario, where occupants are expected to stay inside of the building, it is a staged evacuation scenario. Occupants will stay in the building for a short period of time, but the ultimate goal is complete evacuation. This upgrade is to ensure that the corridor are tenable until evacuation is complete. This also matches the current requirements for certification under Medicaid and Medicare.
The ICC Ad Hoc Committee on Healthcare (AHC) has just completed its 4th year. The AHC was established by the ICC Board to evaluate and assess contemporary code issues relating to hospitals and ambulatory healthcare facilities. This is a joint effort between ICC and the American Society for Healthcare Engineering (ASHE), a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. Information on the AHC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the AHC effort can be downloaded from the AHC website at: http://www.iccsafe.org/cs/AHC/Pages/default.aspx.

Cost Impact: Will increase the cost of construction
Increasing the finish rating on a corridor will add new construction cost over what is required currently in the IBC/IFC. Any medicare certified ambulatory care facilities are required by federal CMS regulations to have this system, therefore, the cost of construction will not increase for those facilities. Note that not all ambulatory care facilities are medicare certified.

FS 134-15 : T803.11-WILLIAMS4167

FS 135-15

803.11 (New)

Proponent: Marcelo Hirschler, representing GBH International (gbhint@aol.com)

2015 International Building Code

Add new text as follows:

803.11 Laminated products factory-produced with a wood substrate Laminated products factory-produced with a wood substrate shall comply with one of the following:

1. The laminated product shall meet the criteria of Section 803.1.1 when tested in accordance with NFPA 286 using the product mounting system, including adhesive, of actual use, as described in Section 5.8 of NFPA 286.
2. The laminated product shall have a Class A, B, or C flame spread index and smoke developed index, based on the requirements of Table 803.1.1, in accordance with ASTM E84 or UL 723. Test specimen preparation and mounting shall be in accordance with ASTM E2579.

Add new standard(s) as follows: ASM E2579-13 Standard Practice for Specimen Preparation and Mounting of Wood Products to Assess Surface Burning

Reason: This language has not yet been incorporated into the IFC (which did incorporate the language dealing with on site applied facings in IFC section 803.7), because it wanted the IBC to take the lead. ASTM has developed mounting methods for both "facings or wood veneer intended to be applied on site over a wood substrate" and laminated products that are factory-produced and have a wood substrate. The concept is that facings that are produced as part of a commercial (factory-produced) panel are finished products and the manufacturer should be responsible to ensure that the product itself (the full panel) is safe and there is no need to discuss a substrate. It has been shown that, when veneers are applied over a wood substrate the resulting flame spread is much higher than when applied over gypsum board or over a non-combustible substrate. Therefore the requirement in ASTM E2579 is that the testing be done with the full product and, thus, there will no need to retest for different substrates. Similarly, NFPA 286 contains a section that addresses testing of wall covering materials, including facings applied on site and laminated products produced in the factory. Facings applied on site over wood substrates are tested using ASTM E2404.
Note that this proposal is not intended to replace existing section 803.11 but to be incorporated between existing sections 803.10 and 803.12. Note also that the proposal to add a clarification of the requirements for facings or wood veneers intended to be applied on site over a wood substrate is also intended to be incorporated as a new section between existing sections 803.10 and 803.12.

NFPA 286 language

5.8 Wall or Ceiling Covering Materials.

5.8.2 Where the wall or ceiling covering system is a factory produced wall panel, the adhesive shall be the same one used in the manufacture of the factory-produced wall or ceiling panel.

ASM E2579 - Standard Practice for Specimen Preparation and Mounting of Wood Products to Assess Surface Burning

1. Scope

1.1 This practice describes procedures for specimen preparation and mounting when testing wood products to assess flame spread and smoke development as surface burning characteristics using Test Method E84.

1.2 This practice applies also to laminated products factory produced with a wood substrate (see 8.6). This practice does not apply to wood veneers or facings intended to be applied on site over a wood substrate, which are covered by Practice E2404.

1.3 Testing is conducted with Test Method E84.

ASTM E2404 – Standard Practice for Specimen Preparation and Mounting of Textile, Paper or Polymeric (Including Vinyl) Wall or Ceiling Coverings, and of Facings and Wood Veneers Intended to be Applied on Site Over a Wood Substrate, to Assess Surface Burning Characteristics

1. Scope

1.1 This practice describes procedures for specimen preparation and mounting when testing textile, paper or polymeric (including vinyl and expanded vinyl) wall or ceiling covering materials to assess flame spread and smoke development as surface burning characteristics using Test Method E84.

1.2 This practice applies also to facings or wood veneers intended to be applied on site over a wood substrate (see 8.7). This practice does not apply to laminated products factory produced with a wood substrate, which are covered by Practice E2579.

1.3 Testing is conducted with Test Method E84.

Cost Impact: Will not increase the cost of construction
Clarifies the mounting method for factory produced panels mounted on wood substrates.

Analysis: A review of the standard proposed for inclusion in the code, ASTM E2579, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2015.

FS 135-15 : 803.11 (New)-
HIRSCHLER4298

FS 136-15

803.11 (New)

Proponent: Marcelo Hirschler, representing GBH International (gbhint@aol.com)

2015 International Building Code

Add new text as follows:

803.11 Facings or wood veneers intended to be applied on site over a wood substrate Facings or veneers intended to be applied on site over a wood substrate shall comply with one of the following:

1. The facing or veneer shall meet the criteria of Section 803.1.1 when tested in accordance with NFPA 286 using the product-mounting system, including adhesive, as described in Section 5.9 of NFPA 286.
2. The facing or veneer shall have a Class A, B or C flame spread index and smoke-developed index, based on the requirements of Table 803.11, in accordance with ASTM E 84 or UL 723. Test specimen preparation and mounting shall be in accordance with ASTM E 2404.

Reason: This language has already been approved by the IFC (section 803.7). ASTM has developed mounting methods for both "facings or wood veneer intended to be applied on site over a wood substrate" and laminated products that are factory-produced and have a wood substrate. The IFC agreed to move ahead with this one (dealing with on site facings) but wanted the IBC to take the lead with the factory-produced ones. The concept is that these facings (applied on site) are basically the same as wall coverings and the manufacturer should be responsible for the facing only and needs to ensure that the material is safe and should test over the appropriate substrate. It has been shown that, when veneers are applied over a wood substrate the resulting flame spread is much higher than when applied over gypsum board or over a non-combustible substrate. Therefore the requirement in ASTM E2404 is that the testing be done over a standard wood substrate and, thus, there will no need to retest for different types of wood. Similarly, NFPA 286 contains a section that addresses testing of wall covering materials, including facings applied on site and laminated products produced in the factory. Panels including factory applied facings with wood substrates are tested using ASTM E2579.
Note that this proposal is not intended to replace existing section 803.11 but to be incorporated between existing sections 803.10 and 803.12. Note also that the proposal to add a clarification of the requirements for laminated products factory-produced with a wood substrate is also intended to be incorporated as a new section between existing sections 803.10 and 803.12.

NFPA 286 language

5.9 Laminated Products with Wood Substrates.

5.9.1 Laminated products shall be tested as they are intended to be installed.

5.9.1.1 The test specimens shall consist of the finished product, namely the combination of the facing or veneer, the adhesives or fasteners used, and the specific wood substrate that will be used.

5.9.2 If the laminated product consists of a facing or veneer intended to be applied on-site over a wood substrate, the facing or veneer shall be tested as described in 5.9.2.1 and 5.9.2.2.

5.9.2.1* The test specimens shall comply with the following:

(1) Specimens shall consist of the facing or veneer mounted on the "A" face of nominal 12 mm (15⁄32 in.) untreated plywood with a face veneer of Douglas fir.

(2) The plywood shall comply with NIST Voluntary Product Standard PS 1, Structural Plywood.

(3) The plywood shall carry one of the following grade stamps: (a) APA-The Engineered Wood Association (b) TECO, indicating that the plywood has been graded PS 1 A-B and is for exterior exposure (c) CSA Standard O121, Douglas Fir Plywood.

5.9.2.2 The adhesive used to attach the facing or veneer to the wood substrate in 5.9.2.1 shall be that specified by the manufacturer of the facing or veneer and applied in accordance with manufacturer's application instructions.

Also, for information, from NFPA 286:

5.8.9 Wall or Ceiling Coverings Intended to Be Applied over a Wood Substrate. If the wall or ceiling coverings are intended to be applied over a wood substrate, the specimens shall consist of the wall or ceiling covering mounted on untreated plywood, with a face veneer of Douglas fir. The plywood shall have the same thickness as the wood substrate used in actual installations, and shall comply with NIST Voluntary Product Standard PS 1-07, Structural Plywood. The plywood shall be marked with a grade stamp indicating that the plywood has been graded PS 1-07 A-B and is for exterior exposure. The grade stamp shall be issued by a quality control agency. Alternatively, the plywood shall be permitted to be stamped as conforming to CSA Standard O121, Douglas Fir Plywood.

ASTM E2404 – Standard Practice for Specimen Preparation and Mounting of Textile, Paper or Polymeric (Including Vinyl) Wall or Ceiling Coverings, and of Facings and Wood Veneers Intended to be Applied on Site Over a Wood Substrate, to Assess Surface Burning Characteristics

1. Scope

1.1 This practice describes procedures for specimen preparation and mounting when testing textile, paper or polymeric (including vinyl and expanded vinyl) wall or ceiling covering materials to assess flame spread and smoke development as surface burning characteristics using Test Method E84.

1.2 This practice applies also to facings or wood veneers intended to be applied on site over a wood substrate (see 8.7). This practice does not apply to laminated products factory produced with a wood substrate, which are covered by Practice E2579.

1.3 Testing is conducted with Test Method E84.

ASM E2579 - Standard Practice for Specimen Preparation and Mounting of Wood Products to Assess Surface Burning Characteristics

1. Scope

1.1 This practice describes procedures for specimen preparation and mounting when testing wood products to assess flame spread and smoke development as surface burning characteristics using Test Method E84.

1.2 This practice applies also to laminated products factory produced with a wood substrate (see 8.6). This practice does not apply to wood veneers or facings intended to be applied on site over a wood substrate, which are covered by Practice E2404.

1.3 Testing is conducted with Test Method E84.

Cost Impact: Will not increase the cost of construction
This clarifies the testing protocol.

FS 136-15 : 803.11 (New)-HIRSCHLER4299

FS 137-15

803.13.1, 803.13.1.1

Proponent: Lee Kranz, City of Bellevue, WA, representing Washington Association of Building Officials Technical Code Development Committee

2015 International Building Code

Revise as follows:

803.13.1 Direct attachment and furred construction. Where walls ~~and~~, ceilings or structural elements are required by any provision in this code to be of fire-resistance-rated or noncombustible construction, the *interior finish* material shall be applied directly against such construction or to furring strips not exceeding $1^3/_4$ inches (44 mm), applied directly against such surfaces.

803.13.1.1 Furred construction~~.~~ If the interior finish material is applied to furring strips, the intervening spaces between such furring strips shall comply with one of the following:

1. Be filled with material that is inorganic or noncombustible;
2. Be filled with material that meets the requirements of a Class A material in accordance with Section 803.1.1 or 803.1.2; or
3. Be fireblocked at a maximum of 8 feet (2438 mm) in every direction in accordance with Section 718.

Exception: Concealed spaces created with noncombustible furring strips.

Reason: Currently, Section 803.13.1.1 could be interpreted to require fire stopping or fire blocking materials even if there were no combustible materials within the concealed spaces created by the furring stripes. The proposed exception clarifies that there is no need for fire stopping or fire blocking when there is nothing combustible within the concealed space.
The term "structural elements" is added to Section 803.13.1 for consistency with Section 803.13.

Cost Impact: Will not increase the cost of construction
This code change will save money because there will be no need to provide fire blocking or fire stopping unless there are combustible materials within a fire-reistance rated wall assembly.

FS 137-15 : 803.13.1.1-KRANZ3769

FS 138-15

803.13.2

Proponent: Stephen DiGiovanni, Clark County Building Department, representing Southern Nevada Chapter of ICC (sdigiovanni@clarkcountynv.gov)

2015 International Building Code

Revise as follows:

803.13.2 Set-out construction. Where walls and ceilings are required to be of fire-resistance-rated or noncombustible construction and walls are set out or ceilings are dropped distances greater than specified in Section 803.13.1, Class A finish materials, in accordance with Section 803.1.1 or 803.1.2, shall be used.

Exceptions:

1. Where *interior finish* materials are protected on both sides by an *automatic sprinkler system* in accordance with Section 903.3.1.1 or 903.3.1.2.
2. Where *interior finish* materials are attached to noncombustible backing or furring strips installed as specified in Section 803.13.1.1.
3. <u>Where the combustible void is filled with an approved noncombustible material.</u>

Reason: The proposed third exception meets the intent of the code in that noncombustible material, while not structural, meets the combustibility requirements of Section 803.13.1. The applicability of this solution is codified in 803.13.1 item 2. This proposal simply allows larger areas to be filled. This would reduce the complexity of framing small pop-outs and covering with gypsum board or plaster.

Cost Impact: Will not increase the cost of construction
This proposal adds an additional option when addressing set-out construction, but does not change the current code requirements, so the cost of construction is not affected by this proposal.

FS 138-15 : 803.13.2-DIGIOVANNI3839

FS 139-15

803.1, 803.1.1, 803.1.1.1 (New), 803.1.2, 803.1.2.1, 803.1.3, 803.1.3.1, 803.1.4, 803.5, 803.5.1 (New), 803.5.1.1 (New), 803.5.2 (New), 803.6, 803.7, 803.8, 803.9, 803.11

Proponent: Marcelo Hirschler, GBH International, representing GBH International (gbhint@aol.com)

2015 International Building Code

Revise as follows:

803.1 General. *Interior wall and ceiling finish* materials shall be classified for fire performance and smoke development in accordance with Section 803.1.1 or 803.1.2, except as shown in Sections ~~803.2~~803.1.3 through 803.13. Materials tested in accordance with Section ~~803.1.2~~80 3.1.1 shall not be required to be tested in accordance with Section ~~803.1.1~~803.1.2.

803.1.1 Interior wall and ceiling finish materials~~.~~ tested in accordance with NFPA 286 Interior wall and ceiling finish materials shall be classified in accordance with ~~ASTM E 84 or UL 723~~NFPA 286 and comply with Section 803.1.1.1. ~~Such *interior finish* materials~~Materials complying with Section 803.1.1.1 shall be ~~grouped in~~considered to also comply with the ~~following classes in accordance with their flame spread and *smoke-developed indexes*.~~
requirements of a Class A~~:= Flame spread index 0-25; smoke developed index 0-450.~~
~~Class B:= Flame spread index 26-75; smoke developed index 0-450.~~
~~Class C:= Flame spread index 76-200; smoke developed index 0-450.~~

> ~~**Exception:** Materials tested~~, in accordance with Section 803.1.2.

Add new text as follows:

803.1.1.1 Acceptance Criteria for NFPA 286 The interior finish shall comply with the following:

1. During the 40 kW exposure, flames shall not spread to the ceiling.
2. The flame shall not spread tot he outer extremity of the sample on any wall or ceiling.
3. Flashover, as defined in NFPA 286, shall not occur.
4. The peak heat release rate throughout the test shall not exceed 800 kW.
5. The total smoke released throughout the test shall not exceed 1,000 m^2.

Revise as follows:

803.1.2 ~~Room corner test for interior~~Interior wall or ceiling finish materials~~.~~ tested in accordance with ASTM E84 or UL 723
Interior wall ~~or~~and ceiling finish materials shall be ~~permitted to~~classified in accordancew ith ASTM E 84 or UL 723. Such interior finish materials shall be grouped in the following classes in accordance with their flame spread and smoke-developed indexes.
Class A: = Flame spread index 0-25; smoke-developed index 0-450.
Class B: = Flame spread index 26-75; smoke-developed index 0-450.
Class C: - Flame spread index 76-200; smoke-developed index 0-450.

> **Exception:** Materials tested in accordance with ~~NFPA 286. Interior wall or ceiling finish materials tested~~Section 803.1.1 and as indicated in ~~accordance with NFPA 286 shall comply with Section 803.1.2.1.~~Sections 803.1.3 through 803.13.

~~**803.1.2.1 Acceptance criteria for NFPA 286.** The interior finish shall comply with the following:~~

1. ~~During the 40 kW exposure, flames shall not spread to the ceiling.~~
2. ~~The flame shall not spread to the outer extremity of the sample on any wall or ceiling.~~
3. ~~Flashover, as defined in NFPA 286, shall not occur.~~
4. ~~The peak heat release rate throughout the test shall not exceed 800 kW.~~
5. ~~The total smoke released throughout the test shall not exceed 1,000 m^2.~~

803.1.3 ~~Room corner test for textile~~Interior wall ~~coverings~~ and ~~expanded vinyl wall coverings.~~ceiling finish materials with different requirements ~~Textile wall coverings and expanded vinyl wall coverings~~
The materials indicated in Sections 803.2 through 803.13 shall ~~meet the criteria of Section 803.1.3.1 when~~be tested as indicated in the ~~manner intended for use in accordance with the Method B protocol of NFPA 265 using the product-mounting system, including adhesive.~~corresponding sections.

~~**803.1.3.1 Acceptance criteria for NFPA 265.** The interior finish shall comply with the following:~~

1. ~~During the 40 kW exposure, flames shall not spread to the ceiling.~~
2. ~~The flame shall not spread to the outer extremities of the samples on the 8-foot by 12-foot (203 by 305 mm) walls.~~
3. ~~Flashover, as defined in NFPA 265, shall not occur.~~

4. ~~The total smoke released throughout the test shall not exceed 1,000 m^2.~~

~~**803.1.4 Acceptance criteria for textile and expanded vinyl wall or ceiling coverings tested to ASTM E 84 or UL 723.** Textile wall and ceiling coverings and expanded vinyl wall and ceiling coverings shall have a Class A flame spread index in accordance with ASTM E 84 or UL 723 and be protected by an *automatic sprinkler system* installed in accordance with Section 903.3.1.1 or 903.3.1.2. Test specimen preparation and mounting shall be in accordance with ASTM E 2404.~~

803.5 Textile wall coverings. Where used as interior wall finish materials, textile wall coverings, including materials having woven or nonwoven, napped, tufted, looped or similar surface and carpet and similar textile materials, shall be tested in the manner intended for use, using the product mounting system, including adhesive, and shall comply with the requirements of one of the following: Section ~~803.1.2~~803.1.1, ~~803.1.3~~Section 803.5.1 or ~~803.1.4~~Section 803.5.2.

Add new text as follows:

803.5.1 Room corner test for textile wall coverings and expanded vinyl wall coverings Textile wall coverings and expanded vinyl wall coverings shall meet the criteria of Section 803.5.1.1 when tested in the manner intended for use in accordance with the Method B protocol of NFPA 265 using the product mounting system, including adhesive.

803.5.1.1 Acceptance Criteria for NFPA 265 The interior finish shall comply with the following:

1. During the 40 kW exposure, flames shalln ot spread to the ceiling.
2. The flame shall not spread to the outer extremities of the samples on the 8-foot by 12-foot (203 by 305 mm) walls.
3. Flashover, as defined in NFPA 265, shall not occur.
4. The total smoke release throughout the test shall not exceed 1,000 m^2.

803.5.2 Acceptance Criteria for textile and expanded vinyl wall or ceiling coverings tested to ASTM E 84 or UL 723 Textile wall and ceiling coverings and expanded vinyl wall and ceiling coverings shall have a Class A flame spread index in accordance with ASTM E 84 or UL 723 and be protected by an automatic sprinkler system installed in accordance with Section 903.1.1 or 903.1.2. Test specimen preparation and mounting shall be in accordance with ASTM E 2404.

Revise as follows:

803.6 Textile ceiling coverings. Where used as interior ceiling finish materials, textile ceiling coverings, including materials having woven or nonwoven, napped, tufted, looped or similar surface and carpet and similar textile materials, shall be tested in the manner intended for use, using the product mounting system, including adhesive, and shall comply with the requirements of Section ~~803.1.2~~803.1.1 or ~~803.1.4~~of Section 803.5.2.

803.7 Expanded vinyl wall coverings. Where used as interior wall finish materials, expanded vinyl wall coverings shall be tested in the manner intended for use, using the product mounting system, including adhesive, and shall comply with the requirements of one of the following: Section ~~803.1.2~~803.1.1, ~~803.1.3~~Section 803.5.1 or ~~803.1.4~~Section 803.5.2.

803.8 Expanded vinyl ceiling coverings. Where used as interior ceiling finish materials, expanded vinyl ceiling coverings shall be tested in the manner intended for use, using the product mounting system, including adhesive, and shall comply with the requirements of Section ~~803.1.2~~803.1.1 or ~~803.1.4~~Section 803.5.2.

803.9 High-density polyethylene (HDPE) and polypropylene (PP). Where high-density polyethylene or polypropylene is used as an interior finish it shall comply with Section ~~803.1.2~~803.1.1.

803.11 Interior finish requirements based on group. *Interior wall and ceiling finish* shall have a flame spread index not greater than that specified in Table 803.11 for the group and location designated. *Interior wall and ceiling finish* materials tested in accordance with NFPA 286 and meeting the acceptance criteria of Section ~~803.1.2.1~~803.1.1.1, shall be permitted to be used where a Class A classification in accordance with ASTM E 84 or UL 723 is required.

Reason: This reorganizes section 803 to make it follow the testing logic, but it does not change any of the requirements.
Any interior wall and ceiling finish material is permitted to be tested to NFPA 286 and therefore this should come first, as section 803.1.1. This needs to be followed by the criteria for NFPA 286 testing. The section also needs to say that anything that passes NFPA 286 (i.e. the corresonding criteria) is acceptable as a Class A in accordance with ASTM E84 and does not need retesting. Then comes the section on ASTM E84, with the corresponding criteria, as section 803.1.2.

The next section, 803.1.3, addresses the materials that have other requirements and cannot simply be tested to either one of the above without further details. That includes all of the materials in sections 803.2 through 803.13.

Textile wall coverings and expanded vinyl wall coverings are covered in 803.5 and 803.7. Therefore the testing in accordance with NFPA 265 needs to move to those sections and that is being done. When dealing with expanded vinyl wall coverings the criteria are not repeated but just reference the textile wall coverings section.

Textile and expanded vinyl ceiling coverings stay as is, just with the section reference changed. The same is true for HDPE and PP.

The only other change is the section reference in 803.11, again without changing requirements.

Table 803.1 does not need any changes.

In order to ensure that the proposed reorganization appears in the correct order, I attach a copy of the final text as it should read, legislative language.

The text as it should read, in its final form is shown below:

Section 803, as proposed for IBC 2018, in final form

803.1 General. Interior wall and ceiling finish materials shall be classified for fire performance and smoke development in accordance with Section 803.1.1 or 803.1.2, except as shown in Sections 803.1.3 through 803.13. Materials tested in accordance with Section 803.1.1 shall not be required to be tested in accordance with Section 803.1.2.

803.1.1 Interior wall and ceiling finish materials tested in accordance with NFPA 286. Interior wall and ceiling finish materials shall be classified in accordance with NFPA 286 and comply with Section 803.1.1.1. Materials complying with Section 803.1.1.1 shall be considered also to comply with the requirements of a Class A in accordance with Section 803.1.2.

803.1.1.1 Acceptance criteria for NFPA 286. The interior finish shall comply with the following:
1. During the 40 kW exposure, flames shall not spread to the ceiling.
2. The flame shall not spread to the outer extremity of the sample on any wall or ceiling.
3. Flashover, as defined in NFPA 286, shall not occur.
4. The peak heat release rate throughout the test shall not exceed 800 kW.
5. The total smoke released throughout the test shall not exceed 1,000 m^2.

803.1.2 Interior wall and ceiling finish materials tested in accordance with ASTM E84 or UL 723. Interior wall and ceiling finish materials shall be classified in accordance with ASTM E 84 or UL 723. Such interior finish materials shall be grouped in the following classes in accordance with their flame spread and smoke-developed indexes.
Class A: = Flame spread index 0-25; smoke developed index 0-450.
Class B: = Flame spread index 26-75; smoke developed index 0-450.
Class C: = Flame spread index 76-200; smoke developed index 0-450.
Exception: Materials tested in accordance with Section 803.1.1 and as indicated in Section 803.1.3 through 803.13.

803.1.3 Interior wall and ceiling finish materials with different requirements. The materials indicated in Sections 803.2 through 803.13 shall be tested as indicated in the corresponding sections.

803.2 Thickness exemption. Materials having a thickness less than 0.036 inch (0.9 mm) applied directly to the surface of walls or ceilings shall not be required to be tested.

803.3 Heavy timber exemption. Exposed portions of building elements complying with the requirements for buildings of Type IV construction in Section 602.4 shall not be subject to interior finish requirements.

803.4 Foam plastics. Foam plastics shall not be used as interior finish except as provided in Section 2603.9. This section shall apply both to exposed foam plastics and to foam plastics used in conjunction with a textile or vinyl facing or cover.

803.5 Textile wall coverings. Where used as interior wall finish materials, textile wall coverings, including materials having woven or nonwoven, napped, tufted, looped or similar surface and carpet and similar textile materials, shall be tested in the manner intended for use, using the product mounting system, including adhesive, and shall comply with the requirements of one of the following: Section 803.1.1, Section 803.5.1 or Section 803.5.2.

803.5.1 Room corner test for textile wall coverings and expanded vinyl wall coverings. Textile wall coverings and expanded vinyl wall coverings shall meet the criteria of Section 803.5.1.1 when tested in the manner intended for use in accordance with the Method B protocol of NFPA 265 using the product-mounting system, including adhesive.

8**03.5.1.1 Acceptance criteria for NFPA 265**. The interior finish shall comply with the following:
1. During the 40 kW exposure, flames shall not spread to the ceiling.
2.The flame shall not spread to the outer extremities of the samples on the 8-foot by 12-foot (203 by 305 mm) walls.
3. Flashover, as defined in NFPA 265, shall not occur.
4. The total smoke released throughout the test shall not exceed 1,000 m2.

803.5.2 Acceptance criteria for textile and expanded vinyl wall or ceiling coverings tested to ASTM E 84 or UL 723. Textile wall and ceiling coverings and expanded vinyl wall and ceiling coverings shall have a Class A flame spread index in accordance with ASTM E 84 or UL 723 and be protected by an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2. Test specimen preparation and mounting shall be in accordance with ASTM E 2404.

803.6 Textile ceiling coverings. Where used as interior ceiling finish materials, textile ceiling coverings, including materials having woven or nonwoven, napped, tufted, looped or similar surface and carpet and similar textile materials, shall be tested in the manner intended for use, using the product mounting system, including adhesive, and shall comply with the requirements of Section 803.1.1 or of Section 803.5.2.

803.7 Expanded vinyl wall coverings. Where used as interior wall finish materials, expanded vinyl wall coverings shall be tested in the manner intended for use, using the product mounting system, including adhesive, and shall comply with the requirements of one of the following: Section 803.1.1, Section 803.5.1 or Section 803.5.2.

803.8 Expanded vinyl ceiling coverings. Where used as interior ceiling finish materials, expanded vinyl ceiling coverings shall be tested in the manner intended for use, using the product mounting system, including adhesive, and shall comply with the requirements of Section 803.1.1 or of Section 803.5.2.

803.9 High-density polyethylene (HDPE) and polypropylene (PP). Where high-density polyethylene or polypropylene is used as an interior finish it shall comply with Section 803.1.1.

803.10 Site-fabricated stretch systems. Where used as interior wall or interior ceiling finish materials, site-fabricated stretch systems containing all three components described in the definition in Chapter 2 shall be tested in the manner intended for use, and shall comply with the requirements of Section 803.1.1 or 803.1.2. If the materials are tested in accordance with ASTM E 84 or UL 723, specimen preparation and mounting shall be in accordance with ASTM E 2573.

803.11 Interior finish requirements based on group. Interior wall and ceiling finish shall have a flame spread index not greater than that specified in Table 803.11 for the group and location designated. Interior wall and ceiling finish materials tested in accordance with NFPA 286 and meeting the acceptance criteria of Section 803.1.1.1, shall be permitted to be used where a Class A classification in accordance with ASTM E 84 or UL 723 is required.

803.12 Stability. Interior finish materials regulated by this chapter shall be applied or otherwise fastened in such a manner that such materials will not readily become detached where subjected to room temperatures of 200°F (93°C) for not less than 30 minutes.

803.13 Application of interior finish materials to fire resistance-rated or noncombustible building elements.
Where interior finish materials are applied on walls, ceilings or structural elements required to have a fire-resistance rating or to be of noncombustible construction, these finish materials shall comply with the provisions of this section.

803.13.1 Direct attachment and furred construction. Where walls and ceilings are required by any provision in this code to be of fire-resistance-rated or noncombustible construction, the interior finish material shall be applied directly against such construction or to furring strips not exceeding 13/4 inches (44 mm), applied directly against such surfaces.

803.13.1.1 Furred construction. If the interior finish material is applied to furring strips, the intervening spaces between such furring strips shall comply with one of the following:
1. Be filled with material that is inorganic or noncombustible;
2. Be filled with material that meets the requirements of a Class A material in accordance with Section 803.1.1 or 803.1.2; or
3. Be fire-blocked at a maximum of 8 feet (2438 mm) in every direction in accordance with Section 718.

803.13.2 Set-out construction. Where walls and ceilings are required to be of fire-resistance-rated or noncombustible construction and walls are set out or ceilings are dropped distances greater than specified in Section 803.13.1, Class A finish materials, in accordance with Section 803.1.1 or 803.1.2, shall be used.

Exceptions:
1. Where interior finish materials are protected on both sides by an automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2.
2. Where interior finish materials are attached to noncombustible backing or furring strips installed as specified in Section 803.13.1.1.

803.13.2.1 Hangers and assembly members. The hangers and assembly members of such dropped ceilings that are below the horizontal fire-resistance-rated floor or roof assemblies shall be of noncombustible materials. The construction of each set-out wall and horizontal fire-resistance-rated floor or roof assembly shall be of fire-resistance-rated construction as required elsewhere in this code.

Exception: In Type III and V construction, fire retardant-treated wood shall be permitted for use as hangers and assembly members of dropped ceilings.

803.13.3 Heavy timber construction. Wall and ceiling finishes of all classes as permitted in this chapter that are installed directly against the wood decking or planking of Type IV construction or to wood furring strips applied directly to the wood decking or planking shall be fire-blocked as specified in Section 803.13.1.1.

803.13.4 Materials. An interior wall or ceiling finish material that is not more than 1/4 inch (6.4 mm) thick shall be applied directly onto the wall, ceiling or structural element without the use of furring strips and shall not be suspended away from the building element to which that finish material it is applied.

Exceptions:
1. Noncombustible interior finish materials.
2. Materials that meet the requirements of Class A materials in accordance with Section 803.1.1 or 803.1.2 where the qualifying tests were made with the material furred out from the noncombustible backing shall be permitted to be used with furring strips.
3. Materials that meet the requirements of Class A materials in accordance with Section 803.1.1 or 803.1.2 where the qualifying tests were made with the material suspended away from the noncombustible backing shall be permitted to be used suspended away from the building element.

Cost Impact: Will not increase the cost of construction
This is simply a reorganization without changing requirements.

FS 139-15 : 803.1-HIRSCHLER3573

FS 140-15

406.8.3, 424.2, 804.2, 804.3, Chapter 35

Proponent: Tim Earl, GBH International, representing GBH International (tearl@gbhinternational.com)

2015 International Building Code

Revise as follows:

406.8.3 Floor surface.
Repair garage floors shall be of concrete or similar noncombustible and nonabsorbent materials.

> **Exception:** Slip-resistant, nonabsorbent, *interior floor finishes* having a critical radiant flux not more than 0.45 W/cm^2, as determined by <u>ASTM E648 or </u>NFPA 253, shall be permitted.

424.2 Materials. Children's play structures shall be constructed of noncombustible materials or of combustible materials that comply with the following:

1. *Fire-retardant-treated* wood complying with Section 2303.2.
2. Light-transmitting plastics complying with Section 2606.
3. Foam plastics (including the pipe foam used in softcontained play equipment structures) having a maximum heat-release rate not greater than 100 kilowatts when tested in accordance with UL 1975 or when tested in accordance with NFPA 289, using the 20 kW ignition source.
4. Aluminum composite material (ACM) meeting the requirements of Class A *interior finish* in accordance with Chapter 8 when tested as an assembly in the maximum thickness intended for use.
5. Textiles and films complying with the fire propagation performance criteria contained in Test Method 1 or Test Method 2, as appropriate, of NFPA 701.
6. Plastic materials used to construct rigid components of soft-contained play equipment structures (such as tubes, windows, panels, junction boxes, pipes, slides and decks) exhibiting a peak rate of heat release not exceeding 400 kW/ m^2 when tested in accordance with ASTM E 1354 at an incident heat flux of 50 kW/m^2 in the horizontal orientation at a thickness of 6 mm.
7. Ball pool balls, used in soft-contained play equipment structures, having a maximum heat-release rate not greater than 100 kilowatts when tested in accordance with UL 1975 or when tested in accordance with NFPA 289, using the 20 kW ignition source. The minimum specimen test size shall be 36 inches by 36 inches (914 mm by 914 mm) by an average of 21 inches (533 mm) deep, and the balls shall be held in a box constructed of galvanized steel poultry netting wire mesh.
8. Foam plastics shall be covered by a fabric, coating or film meeting the fire propagation performance criteria contained in Test Method 1 or Test Method 2, as appropriate, of NFPA 701.
9. The floor covering placed under the children's play structure shall exhibit a Class I interior floor finish classification, as described in Section 804, when tested in accordance with <u>ASTM E648 or </u>NFPA 253.

804.2 Classification. *Interior floor finish* and floor covering materials required by Section 804.4.2 to be of Class I or II materials shall be classified in accordance with <u>ASTM E648 or </u>NFPA 253. The classification referred to herein corresponds to the classifications determined by<u> ASTM E648 or</u> NFPA 253 as follows: Class I, 0.45 watts/cm^2 or greater; Class II, 0.22 watts/cm^2 or greater.

804.3 Testing and identification. *Interior floor finish* and floor covering materials shall be tested by an agency in accordance with<u> ASTM E648 or</u> NFPA 253 and identified by a hang tag or other suitable method so as to identify the manufacturer or supplier and style, and shall indicate the *interior floor finish* or floor covering classification in accordance with Section 804.2. Carpet-type floor coverings shall be tested as proposed for use, including underlayment. Test reports confirming the information provided in the manufacturer's product identification shall be furnished to the building official upon request.

Add new standard(s) as follows:
<u>E648-14c Standard Test Method for Critical Radiant Flux of Floor-Covering Systems Using a Radiant Heat Energy Source</u>

Reason: ASTM E648 is technically equivalent to NFPA 253. Since the flooring industry routinely references ASTM E648, this proposal will remove confusion when people reference the ASTM test instead of the NFPA test.

Cost Impact: Will not increase the cost of construction
This change simply adds a reference to another standard, allowing users to reference either ASTM E648 or NFPA 253, so there is no impact on cost.

Analysis: A review of the standard proposed for inclusion in the code, ASTM E648, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2015.

FS 141-15

901.7

Proponent: Maureen Traxler, City of Seattle, representing Washington Association of Building Officials Technical Code Development Committee (maureen.traxler@seattle.gov)

2015 International Building Code

Revise as follows:

901.7 Fire areas. Where buildings, or portions thereof, are divided into *fire areas* so as not to exceed the limits established for requiring a *fire protection system* in accordance with this chapter, such *fire areas* shall be separated by *fire* walls constructed in accordance with Section 706, *fire barriers* constructed in accordance with Section 707, exterior walls constructed in accordance with Section 705, or *horizontal assemblies* constructed in accordance with Section 711, or ~~both, having a *fire-resistance rating* of not less than that determined in accordance with Section 707.3.10~~combination.

Reason: The definition of "fire area" specifically includes areas "enclosed and bounded by fire walls, fire barriers, exterior walls or horizontal assemblies." Section 901.7 seems to conflict with that by specifying only fire barriers and horizontal assemblies to create fire areas. The reference to the fire-resistance rating of the wall is deleted because the reference to Section 707 includes Table 707.3.10.

Cost Impact: Will not increase the cost of construction
This is an editorial proposal that will not affect the cost of construction.

FS 141-15 : 901.7-TRAXLER3871

FS 142-15

909.20.1

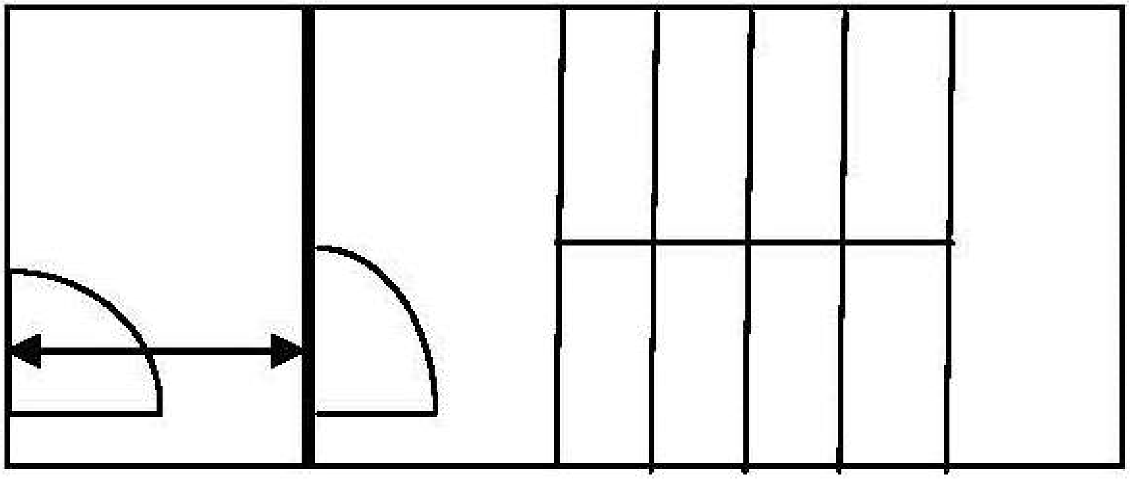
Proponent: Ali Fattah, City of San Diego Development Services Department, representing City of San Diego (afattah@sandiego.gov)

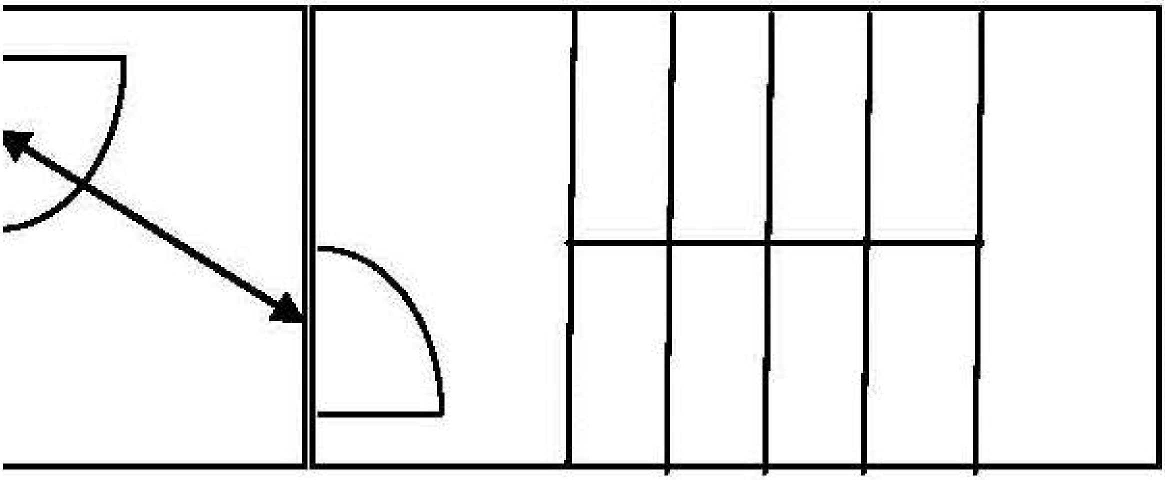
2015 International Building Code

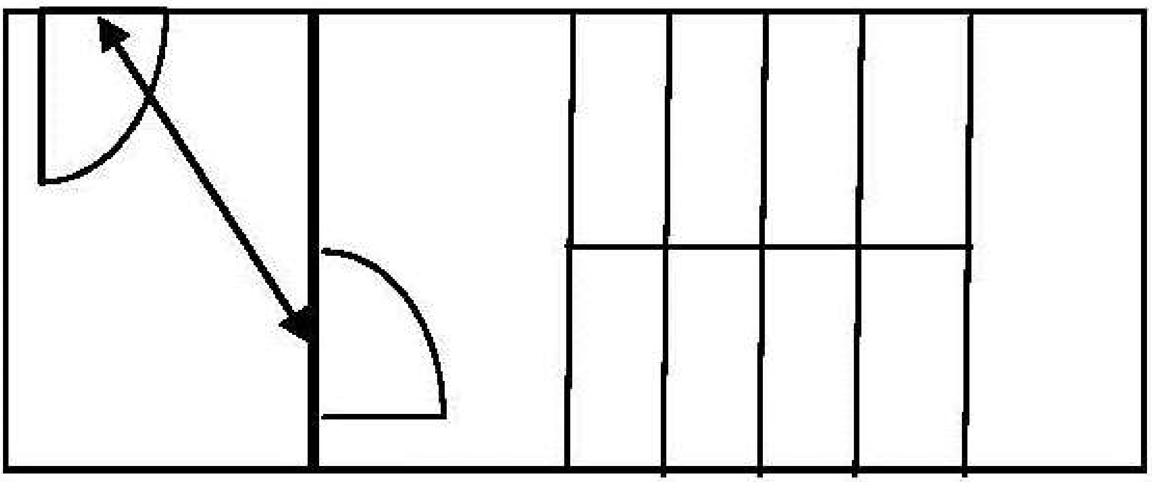
Revise as follows:

909.20.1 Access. Access to the *stairway* or *ramp* shall be by way of a vestibule or an open exterior balcony. The minimum dimension of the vestibule shall be not less than the required width of the *corridor* leading to the vestibule but shall not have a clear width of less than 44 inches (1118 mm) and shall not have a length of less than 72 inches (1829 mm) in the direction of egress travel into the stairway between the centerline of the doorways into the vestibule and stairway.

Reason: The proposed code change seeks to clarify the dimensional requirements in vestibules used to access stairway doors in smoke proof enclosures. A smoke proof enclosure is an interior exit stairway that is protected with a two-hour fire barrier and incudes a vestibule separating the occupied story from the stairway. The vestibule seeks to keep smoke from migrating into the stairway portion due to egress by occupants and due to fire fighting operations. The dimensional requirements for the vestibule seek to allow sufficient distance between the doorway into the vestibule and into the stairway such that both doorways are not open at the same time. Additionally the vestibule provides fire fighters with a safe area to attack a fire on the fire floor without compromising the smoke proof integrity of the stairway. Both the handbook and the commentary conservatively dimension the 72 inch dimension to be perpendicular to the access doorway into the stairway from the vestibule. If the two doorways are not in line, offset or perpendicular to one another the direction of travel into the vestibule, within the vestibule and into the stairway can change and it does not appear reasonable to require 72 inch by 72 inch vestibules if sufficient space is provided to clear the doorways arcs. The code change also requires that the 44 inch width be a clear width for consistency with the requirements in Section 1003.3.3 in the event a standpipe is placed within the vestibule or pressurization ductwork is located within the vestibule.
Please see the atached figures that address possible configurations of vestibules that are addressed by this code change.







Cost Impact: Will not increase the cost of construction
This code change may reduce the size of vestibules thereby increasing useable floor area.

FS 142-15 : 909.20.1-FATTAH5006

FS 143-15

909.20.5

Proponent: William Webb, representing Self (webbfpc@gmail.com)

2015 International Building Code

Revise as follows:

909.20.5 Stairway and ramp pressurization alternative. Where the building is equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1, the vestibule is not required, provided each interior *exitstairway* or *ramp* is pressurized to not less than ~~0.10~~0.05 inch of water (~~25~~12.5 Pa) and not more than 0.35 inches of water (87 Pa) in the shaft relative to the building measured with all *interior exitstairway* and *ramp* doors closed under maximum anticipated conditions of stack effect and wind effect.

Reason: This change is consistent with a similar requirement for the pressure differential across smoke barriers. It is also consistent with the NFPA *Life Safety Code, NFPA 101* for smokeproof enclosures in sprinkler protected buildings. It is recognized in NFPA 92, *Standard for Smoke Control Systems. The Handbook of Smoke Control Engineering* and the *Principles of Smoke Management* contain tables giving the suggested minimum pressure design difference across a barrier, Table 9.1 and Table 6.12, respectively. The latter text states on page 107, "These values for sprinklered buildings were calculated from the equation for buoyancy of combustion gases (Chapter 5) for a gas temperature of 1700°F (927°C), for a neutral plane located at a height of two-thirds of the ceiling height below the ceiling and with a safety factor of 0.03 in. H_2O (7.5 Pa)."

Bibliography: IBC 2012, ¶ 909.6.1; NFPA Life Safety Code, NFPA 101 2012, ¶7.2.3.9.1; Standard for Smoke Control Systems, NFPA 92-2012 ¶ 4.4.2.1.1 and Table 4.4.2.1.1 Handbook of Smoke Control Engineering; John H. Klote, James A. Milke, Paul G. Turnbull, Ahmed Kashef and Michael J. Ferreira; 2012;Page 223
ManagementPrinciples of Smoke; John H. Klote and James A. Milke; 2002; Pages 107 & 108

Cost Impact: Will not increase the cost of construction
The proposed change should result in no increased cost is because the requirements are less than the code currently, so it will be easier to meet the revised requirements.

FS 143-15 : 909.20.5-WEBB3443

FS 144-15

909.21.1

Proponent: William Webb, Rolf Jensen & Associates, Inc., representing Rolf Jensen & Associates, Inc. (wwebb@rjagroup.com)

2015 International Building Code

Revise as follows:

909.21.1 Pressurization requirements.
Elevator hoistways shall be pressurized to maintain a minimum positive pressure of 0.10 inch of water (25 Pa) and a maximum positive pressure of ~~0.25~~0.35 inch of water (~~67~~88 Pa) with respect to adjacent occupied space on all floors. This pressure shall be measured at the midpoint of each hoistway door, with all elevator cars at the floor of recall and all hoistway doors on the floor of recall open and all other hoistway doors closed. The pressure differentials shall be measured between the hoistway and the adjacent elevator landing. The opening and closing of hoistway doors at each level must be demonstrated during this test. The supply air intake shall be from an outside, uncontaminated source located a minimum distance of 20 feet (6096 mm) from any air exhaust system or outlet.

Exceptions:

1. On floors containing only Group R occupancies, the pressure differential is permitted to be measured between the hoistway and a *dwelling unit* or *sleeping unit* .
2. Where an elevator opens into a lobby enclosed in accordance with Section 3007.6 or 3008.6, the pressure differential is permitted to be measured between the hoistway and the space immediately outside the door(s) from the floor to the enclosed lobby.
3. The pressure differential is permitted to be measured relative to the outdoor atmosphere on floors other than the following:
   - 3.1. The fire floor.
   - 3.2. The two floors immediately below the fire floor.
   - 3.3. The floor immediately above the fire floor.
4. The minimum positive pressure of 0.10 inch of water (25 Pa) and a maximum positive pressure of ~~0.25~~0.35 inch of water (~~67~~88 Pa) with respect to occupied floors are not required at the floor of recall with the doors open.
5. Where the building is equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1, the minimum pressure differential shall be 0.05 inch water (12 Pa).

Reason: There has been no research about the maximum pressure differential for elevator pressurization systems. There is no technical reason to limit the value to 0.25 in water (67 Pa). The suggested value of 0.35 in water (88 Pa) is the recognized maximum for stair pressure systems. It is recognized that the minimum pressure differential across smoke barriers in sprinklered protected buildings is 0.05 inch water (12 Pa), as noted in IBC 909.6.1.

Cost Impact: Will not increase the cost of construction
The proposed change should result in no increased cost is because the requirements are less than the code currently, so it will be easier to meet the revised requirements.

FS 144-15 : 909.21.1-WEBB3440

FS 145-15

909.21.3, Chapter 35

Proponent: Tony Crimi, representing International Firestop Council (tcrimi@sympatico.ca)

2015 International Building Code

Revise as follows:

909.21.3 Ducts for system. Any duct system that is part of the pressurization system shall be protected with the same *fire-resistance rating* as required for the elevator shaft enclosure.

Exception: HVAC ducts tested and listed for in accordance with ASTM E2816 with minimum F and T rating of not less than 2 hours, continuously from the air handling appliance or equipment to the air outlet and inlet terminal.

Add new standard(s) as follows:

ASTM E2816-11, Standard Test Methods for Fire Resistive Metallic HVAC Duct Systems

Reason: This proposal permits an additional option for protection of ducts that are part of a pressurization system by using a tested and listed assembly conforming to the new ASTM E2816-11, Standard Test Methods for Fire Resistive Metallic HVAC Duct Systems evaluated for the specific purpose. IBC section 717.2,1 requires that where the installation of a fire damper will interfere with the operation of a required smoke control system in accordance with Section 909, approved alternative protection shall be utilized. Where mechanical systems, including ducts and dampers, serve as part of the smoke control system, the expected performance of these systems in smoke control mode must be addressed in the rational analysis required by Section 909.4.

This principle of protecting HVAC ducts used as part of a smoke control system from the effects of fire exposure is also already contained in section 909.4.4 which requires that the design consider the effects of the heating, ventilating and air-conditioning (HVAC) systems on both smoke and fire transport. This analysis includes the types of smoke control systems to be employed, their methods of operation, and the methods of construction to be utilized. The analysis is required to include, but not be limited to, stack effects, buoyancy effects, wind effects, HVAC design, climate, duration of operation, and the interaction effects of the operation of multiple smoke control systems for all design scenarios. The ASTM test method achieves this by evaluate the ability of a HVAC duct system to resist the spread of fire from one compartment to other compartments separated by a fire resistance rated construction when the HVAC duct system is exposed to fire under various conditions. This test is now also referenced as part of ICC-ES AC179, Acceptance Criteria for Metallic HVAC Duct Enclosure Assemblies. The purpose of these acceptance criteria is to establish requirements for fire protection enclosure systems applied to metallic HVAC ducts, which provides an alternate to required fire-resistance-rated shafts or an alternate to required fire dampers in specific locations. This criteria provides an alternate to shaft enclosures for vertical ducts.

Cost Impact: Will not increase the cost of construction
This proposal may reduce the cost of construction as it provides an alternative to the existing provision, while maintaining a comparable level of safety.

Analysis: A review of the standard proposed for inclusion in the code, ASTM E2816, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2015.

FS 145-15 : 909.21.3-CRIMI4314

FS 146-15

1403.5

Proponent: Henry Green, National Institute of Building Sciences, representing National Institute of Building Sciences (hgreen@nibs.org)

2015 International Building Code

Revise as follows:

1403.5 Vertical and lateral flame propagation. Exterior walls on buildings of Type I, II, III or IV construction that are greater than 40 feet (12 192 mm) in height above grade plane and contain a combustible *water-resistive barrier* in accordance with Section 1404.2 shall be tested in accordance with and comply with the acceptance criteria of NFPA 285. For the purposes of this section, fenestration products ~~and~~, flashing of fenestration products and water resistive barrier flashing and accessories at other locations, including through-wall flashings, shall not be considered part of the *water-resistive barrier*.

Exceptions:

1. Walls in which the *water-resistive barrier* is the only combustible component and the *exterior wall* has a wall covering of brick, concrete, stone, terra cotta, stucco or steel with minimum thicknesses in accordance with Table 1405.2.
2. Walls in which the *water-resistive barrier* is the only combustible component and the *water-resistive barrier* has a peak heat release rate of less than 150 kW/m^2, a total heat release of less than 20 MJ/m^2 and an effective heat of combustion of less than 18 MJ/kg as determined in accordance with ASTM E 1354 and has a flame spread index of 25 or less and a smoke-developed index of 450 or less as determined in accordance with ASTM E 84 or UL 723. The ASTM E 1354 test shall be conducted on specimens at the thickness intended for use, in the horizontal orientation and at an incident radiant heat flux of 50 kW/m^2.

Reason: This proposal clarifies the intention of the current code that the trigger for requiring NFPA 285 testing is the water-resistive barrier material and not its accessories. It extends to the excepted accessories specifically mentioned to include flashings that are not associated with fenestration.

Cost Impact: Will not increase the cost of construction
This proposal will not increase the cost of construction. The proposal seeks to clarify only, not to alter or increase requirements.

FS 146-15 : 1403.5-GREEN5428

FS 147-15

1403.5

Proponent: Marcelo Hirschler, representing GBH International (gbhint@aol.com)

2015 International Building Code

Revise as follows:

1403.5 Vertical and lateral flame propagation. Exterior walls on buildings of Type I, II, III or IV construction that are greater than 40 feet (12 192 mm) in height above grade plane and contain a combustible *water-resistive barrier* shall be tested in accordance with and comply with the acceptance criteria of NFPA 285. For the purposes of this section, fenestration products and flashing of fenestration products shall not be considered part of the *water-resistive barrier*.

Exceptions:

1. Walls in which the *water-resistive barrier* is the only combustible component and the *exterior wall* has a wall covering of brick, concrete, stone, terra cotta, stucco or steel with minimum thicknesses in accordance with Table 1405.2.
2. Walls in which the *water-resistive barrier* is the only combustible component and the *water-resistive barrier* complies with the following: (a) It has a peak heat release rate of less than 150 kW/m^2, a total heat release of less than 20 MJ/m^2 and an effective heat of combustion of less than 18 MJ/kg as determined in accordance with ASTM ~~E 1354 and has a flame spread index of 25 or less and a smoke-developed index of 450 or less as determined in accordance with ASTM E 84 or UL 723~~E1354. The ASTM ~~E 1354~~E1354 test shall be conducted on specimens at the thickness intended for use, in the horizontal orientation and at an incident radiant heat flux of 50 kW/m^2. (b) It has a flame spread index of 25 or less and a smoke developed index of 450 or less as determined in accordance with ASTM E84 or UL 723, when tested using Type X gypsum board as the substrate.

Reason: Exception 2 was added during the cycle leading to IBC 2015. There has been a lot of concern that insufficient clarification exists as to how to test the water-resistive barriers with ASTM E84, since the substrate used will affect the test results, particularly for this materials. The proposed clarification should make it clear that Type X gypsum board should be used as the substrate.

Cost Impact: Will not increase the cost of construction
This is clarification regarding the testing protocol and will not change the materials involved.

FS 147-15 : 1403.5-HIRSCHLER4297

FS 148-15

1403.5

Proponent: Theresa Weston, DuPont Building Innovations, representing DuPont Building Innovations (theresa.a.weston@usa.dupont.com)

2015 International Building Code

Revise as follows:

1403.5 Vertical and lateral flame propagation. Exterior walls on buildings of Type I, II, III or IV construction that are greater than 40 feet (12 192 mm) in height above grade plane and contain a combustible *water-resistive barrier* shall be tested in accordance with and comply with the acceptance criteria of NFPA 285. Water-resistive barrier materials complying with Section 703.5.1 or water-resistive barrier materials applied over a noncombustible structural base in compliance with Section 703.5.2 are noncombustible. For the purposes of this section, fenestration products and flashing of fenestration products shall not be considered part of the *water-resistive barrier*.

Exceptions:

1. Walls in which the *water-resistive barrier* is the only combustible component and the *exterior wall* has a wall covering of brick, concrete, stone, terra cotta, stucco or steel with minimum thicknesses in accordance with Table 1405.2.
2. Walls in which the *water-resistive barrier* is the only combustible component and the *water-resistive barrier* has a peak heat release rate of less than 150 kW/m^2, a total heat release of less than 20 MJ/m^2 and an effective heat of combustion of less than 18 MJ/kg as determined in accordance with ASTM E 1354 and has a flame spread index of 25 or less and a smoke-developed index of 450 or less as determined in accordance with ASTM E 84 or UL 723. The ASTM E 1354 test shall be conducted on specimens at the thickness intended for use, in the horizontal orientation and at an incident radiant heat flux of 50 kW/m^2.

Reason: There is significant industry confusion as whether the combusitbility testing in Sections 703.5.1 and 703.5.2 applies to water-resistive barriers. This proposal provides a pointer to those sections and clarifies the meaning of combusitible and noncombustible.

Cost Impact: Will not increase the cost of construction
This proposal provides clarity only and does not change code requirements.

FS 148-15 : 1403.5-WESTON5619

Proponent: John Woestman, Kellen Company, representing Extruded Polystyrene Foam Association (XPSA) (jwoestman@kellencompany.com)

Part I

2015 International Building Code

Revise as follows:

1403.5 Vertical and lateral flame propagation. Exterior walls on buildings of Type I, II, III or IV construction that are greater than 40 feet (12 192 mm) in height above grade plane and contain a combustible *water-resistive barrier* shall be tested in accordance with and comply with the acceptance criteria of NFPA 285. For the purposes of this section, fenestration products and flashing of fenestration products shall not be considered part of the *water-resistive barrier*. The required NFPA 285 fire performance of the exterior wall assembly shall be permitted to be established by any of the following methods or procedures:

1. NFPA 285 fire performance designs documented in an approved source.
2. NFPA 285 fire performance designs certified by an approved agency.
3. Engineering analysis of an exterior wall assembly based on a comparison of building element, component or assemblies designs that are equivalent to the fire exposure and acceptance criteria set forth in NFPA 285.

Exceptions:

1. Walls in which the *water-resistive barrier* is the only combustible component and the *exterior wall* has a wall covering of brick, concrete, stone, terra cotta, stucco or steel with minimum thicknesses in accordance with Table 1405.2.
2. Walls in which the *water-resistive barrier* is the only combustible component and the *water-resistive barrier* has a peak heat release rate of less than 150 kW/m^2, a total heat release of less than 20 MJ/m^2 and an effective heat of combustion of less than 18 MJ/kg as determined in accordance with ASTM E 1354 and has a flame spread index of 25 or less and a smoke-developed index of 450 or less as determined in accordance with ASTM E 84 or UL 723. The ASTM E 1354 test shall be conducted on specimens at the thickness intended for use, in the horizontal orientation and at an incident radiant heat flux of 50 kW/m^2.

1407.10.4 Full-scale tests. The MCM system shall be tested in accordance with, and comply with, the acceptance criteria of NFPA 285. Such testing shall be performed on the MCM system with the MCM in the maximum thickness intended for use. The required NFPA 285 fire performance of the exterior wall assembly shall be permitted to be established by any of the following methods or procedures:

1. NFPA 285 fire performance designs documented in an approved source.
2. NFPA 285 fire performance designs certified by an approved agency.
3. Engineering analysis of an exterior wall assembly based on a comparison of building element, component or assemblies designs that are equivalent to the fire exposure and acceptance criteria set forth in NFPA 285.

1409.10.4 Full-scale tests. The HPL system shall be tested in accordance with, and comply with, the acceptance criteria of NFPA 285. Such testing shall be performed on the HPL system with the HPL in the minimum and maximum thicknesses intended for use. The required NFPA 285 fire performance of the exterior wall assembly shall be permitted to be established by any of the following methods or procedures:

1. NFPA 285 fire performance designs documented in an approved source.
2. NFPA 285 fire performance designs certified by an approved agency.
3. Engineering analysis of an exterior wall assembly based on a comparison of building element, component or assemblies designs that are equivalent to the fire exposure and acceptance criteria set forth in NFPA 285.

Part II

2015 International Building Code

Revise as follows:

2603.5.5 Vertical and lateral fire propagation. The exterior wall assembly shall be tested in accordance with and comply with the acceptance criteria of NFPA 285. The required NFPA 285 fire performance of the exterior wall assembly shall be permitted to be established by any of the following methods or procedures:

1. NFPA 285 fire performance designs documented in an approved source.
2. NFPA 285 fire performance designs certified by an approved agency.
3. Engineering analysis of an exterior wall assembly based on a comparison of building element, component or assemblies designs that are equivalent to the fire exposure and acceptance criteria set forth in NFPA 285.

Exceptions:

1. One-story buildings complying with Section 2603.4.1.4.
2. Wall assemblies where the foam plastic insulation is covered on each face by not less than 1-inch (25 mm) thickness of masonry or concrete and meeting one of the following:
   2.1 There is no airspace between the insulation and the concrete or masonry.
   2.2 The insulation has a flame spread index of not more than 25 as determined in accordance with ASTM E 84 or UL 723 and the maximum airspace between the insulation and the concrete or masonry is not more than 1 inch (25 mm).

Reason: This code change specifies the documentation requirements for NFPA 285 fire performance designs. In a similar manner as Section 703.3, the proposed wording will allow NFPA 285 tests to be documented in an approved source, listed by an approved agency, or engineering judgments and other performance designs to be used in lieu of an actual NFPA 285 test on the specific assembly. This will recognize existing NPFA 285 test reports and third-party listings as well as permit the addition or substitution of materials within an NFPA 285 complying assemblies provided sufficient analytical data (i.e. engineering analysis) is made available to the code official. The code change reflects current practice in the market. This code change proposal delineates sources available for compliance documentation for a wide variety of NFPA 285 tested assemblies.

Cost Impact:

Part I: Will not increase the cost of construction
No cost increase. This proposal identifies options to comply with existing NFPA 285 testing requirements.

Part II: Will not increase the cost of construction
No cost increase. This proposal identifies options to comply with existing NFPA 285 testing requirements.

FS 149-15 : 1403.5-WOESTMAN5559

FS 150-15

1404.2

Proponent: Jay Crandell, ARES Consulting, representing Foam Sheathing Committee of the American Chemistry Council

2015 International Building Code

Revise as follows:

1404.2 Water-resistive barrier. *Water-resistive barrier* material assemblies shall be installed in accordance with the manufacturer's installation instructions using and *approved* installation method tested for water penetration resistance in accordance with one of the following:

1. The *water-resistive barrier* assembly shall be tested as a component of a complete exterior wall envelope system in accordance with Section 1403.2, Exception 2; or
2. The *water-resistive barrier* assembly shall be tested in accordance with Section 1403.2, Exception 2, without exterior wall finish materials using a minimum differential pressure of 2.86 pounds per square foot (psf)(0.136 kN/m^2) and a minimum test exposure duration of 15 minutes.

> **Exception:**Not fewer than one layer of No.15 asphalt felt, complying with ASTM D 226 for Type 1 felt ~~or other *approved* materials,~~ shall be attached to the studs or sheathing, with flashing as described in Section 1405.4, in such a manner as to provide a continuous *water-resistive barrier* behind the *exterior wall* veneer.

Reason: The proposal specifies that water-resistive barriers be installed in accordance with the manufacturer's installation instructions to assist in proper use and enforcement. It also coordinates and unifies WRB assembly water penetration testing requirements. Furthermore, an exception statement continues to prescriptively recognize ASTM D226 Type 1 asphalt felt as a deemed-to-comply solution (i.e., assembly water resistance testing not required).
The concept of this proposal is to use the same test method (ASTM E 331) and adjust test conditions for two optional qualification approaches to account for the presence or absence of an exterior wall finish material over the water-resistive barrier. It is important to be able to test these two ways to appropriate qualify WRB asemblies (1) for use with a specific exterior wall envelope system (including a specific cladding material) or (2) to more generally qualify a WRB assembly for use with multiple exterior wall finish materials by testing the WRB assembly in an unprotected or exposed condition.

The water penetration resistance test criteria proposed for the second condition, where the WRB assembly is unprotected, is consistent with criteria specified in ASTM E 331 (e.g., 2.86 psf and 15 minute duration with no water penetration). This requirement is also consistent with that used in another code referenced standard for water-resistive barrier coatings that are tested in an unprotected condition (refer to Section 1408.4.1.1) for use with EIFS. Thus, the proposal is consistent with two-code referenced standards. It is also reasonably consistent with the performance of asphalt felt when tested in an unprotected condition and, therefore, complies with the equivalency intent of the code as based on testing by three different certified laboratories where performance of 5 to 15 minutes at 2.86 psf was observed for asphalt felt using ASTM E 331.

The need for a uniform and effective water-penetration resistance requirement is documented in the literature (Hall and Hoigard, 2005; Dorin, 2006; Lstiburek, 2012). In particular, Hall and Hoigard (2005) evaluated current code requirements, acceptance criteria, and field experience. They also report comparative test data under installed water exposure conditions, demonstrating that at least some polymeric building wrap materials are capable of performing equivalenty to asphalt-saturated felt materials. The relevant conclusions from the study include:

1. "Current builing code provisions offer no rational means of assessing the equivalency of alternative WRB products to ASTM D-226 type I asphalt-saturated felt..."

2. "The [material only water resistance tests] fail to address several important moisture transport mechanisms that affect the in-service performance of WRBs."

The proposed requirements are consistent with the intent of equivalency between code-recognized materials and methods (e.g., asphalt felt) and other alternative WRB materials and assemblies. Therefore, this proposal will help to ensure acceptable and consistent perormance of various types of alternative WRB materials and assemblies in a non-exclusionary and effective manner.

Bibliography: Dorin, L. (2005). The importance of integrating flashing and the water resistive barrier in the exterior wall systems of residential buildings. *Journal of the ASTM International*, Vol. 3, No. 5, ASTM International, West Conshohocken, PA
Hall, G.D. and Hoigard, K.R., "Water-Resistive Barriers: How do they compare?", *Interface*, November 2005.

Lstiburek, J., "Leaks & Holes", *ASHRAE Journal*, December 2012.

Cost Impact: Will not increase the cost of construction
This code change proposal has no cost impact because it does not change the requirement for any code-recognized water resistive barrier, such as asphalt felt. For WRB materials and assemblies that are not code recognized, but which are tested for assembly water-penetration resistance meeting the performance intent of the code and equivalency to code-recognized materials, there also are no cost impacts because there is no change in requirements. Thus, a variety of code-compliant options are maintained and potential long-term cost impacts to construction of non-compliant materials will be reduced or avoided.

FS 151-15

1404.2

Proponent: Brian Johnson, Forensic Building Science, representing Forensic Building Science

2015 International Building Code

Revise as follows:

1404.2 Water-resistive barrier. ~~Not fewer than one~~One layer of No.15 asphalt felt, free from holes and breaks, complying with ASTM D 226 for Type 1 felt or other *approved* ~~materials,~~ water-resistive barrier shall be ~~attached to the~~ applied over studs or sheathing of all exterior walls. Such felt or material shall be applied horizontally, with the upper layer lapped over the lower layer not less than 2 inches (51 mm). Where joints occur, felt shall be lapped not less than 6 inches (152 mm). The felt or other approved material shall be continuous to the top of walls and terminated at penetrations and in building appendages in a manner to meet the requirements of the exterior wall envelope as described in Section 1403.2 with flashing as described in Section 1405.4, in such a manner as to provide a continuous *water-resistive barrier* behind the *exterior wall* veneer.

Reason: The language between the IRC and IBC do not match for the same material. The laps required in the IRC are generally a match to the laps required by felt manufacturers in their ESRs and a number of synthetic weather-resistive barrier manufacturers (Tyvek, Typar, R-wrap, etc).
The change reduces the burden on building officials by allowing generic (typical, historical, and customary) requirements that match those in the IRC to be enforced here without forcing the building official to find the manufacturer installation details or ESR to verify the minimum dimensions. Not all felts come with manufacturer identification lables or stamps indicating conformity with ASTM D226 Type I. The change also provides a uniform level of weather protection between building and residential codes.

Cost Impact: Will not increase the cost of construction
No cost impact. These requirements formalize current (and best) practice, match the existing requirements in the IRC, and therefore no increase in costs is associated with the (largely editorial, code-correlation) revision.

FS 151-15 : 1404.2-JOHNSON5603

FS 152-15

1403.2, 1404.2, 1404.2.1 (New)

Proponent: Theresa Weston, DuPont Building Innovations, representing DuPont Building Innovatons (theresa.a.weston@usa.dupont.com)

2015 International Building Code

Revise as follows:

1403.2 Weather protection. Exterior walls shall provide the building with a weather-resistant *exterior wallenvelope*. The *exterior wallenvelope* shall include flashing, as described in Section 1405.4. The *exterior wallenvelope* shall be designed and constructed in such a manner as to prevent the accumulation of water within the wall assembly by providing a *water-resistive barrier* behind the exterior veneer, as described in Section 1404.2, and a means for draining water that ~~enters~~<u>intrudes past</u> the ~~assembly~~<u>exterior veneer</u> to the exterior. Protection against condensation in the *exterior wall* assembly shall be provided in accordance with Section 1405.3.

Exceptions:

1. A weather-resistant *exterior wallenvelope* shall not be required over concrete or masonry walls designed in accordance with Chapters 19 and 21, respectively.
2. Compliance with the requirements for a means of drainage, and the requirements of Sections 1404.2 and 1405.4, shall not be required for an *exterior wallenvelope* that has been demonstrated through testing to resist wind-driven rain, including joints, penetrations and intersections with dissimilar materials, in accordance with ASTM E 331 under the following conditions:
    - 2.1. *Exterior wallenvelope* test assemblies shall include at least one opening, one control joint, one wall/eave interface and one wall sill. Tested openings and penetrations shall be representative of the intended end-use configuration.
    - 2.2. *Exterior wallenvelope* test assemblies shall be at least 4 feet by 8 feet (1219 mm by 2438 mm) in size.
    - 2.3. *Exterior wallenvelope* assemblies shall be tested at a minimum differential pressure of 6.24 pounds per square foot (psf) (0.297 kN/m^2).
    - 2.4. *Exterior wallenvelope* assemblies shall be subjected to a minimum test exposure duration of 2 hours.The *exterior wallenvelope* design shall be considered to resist wind-driven rain where the results of testing indicate that water did not penetrate control joints in the *exterior wall* envelope, joints at the perimeter of openings or intersections of terminations with dissimilar materials.
3. Exterior insulation and finish systems (EIFS) complying with Section 1408.4.1.

1404.2 Water-resistive barrier. Not fewer than one layer of No.15 asphalt felt, complying with ASTM D 226 for Type 1 felt or other *approved* materials~~, shall be attached to the studs or sheathing, with flashing as described in Section 1405.4, in such a manner as to provide a continuous *water-resistive barrier* behind the *exterior wall* veneer.~~<u>.</u>

Add new text as follows:

<u>**1404.2.1** **Installaton** The water-resistive barrier, free from holes or breaks other those required by fasteners, shall be attached to the studs or sheathing, and integrated with flashing as described in Section 1405.4, in such a manner to provide a continuous water-resistive barrier behind the exterior wall veneer. The water-resistive barrier shall be continuous to the top of walls and terminated at penetrations and building appendages in a manner to meet the requirements of the exterior wall envelope as described in Section 1403.2.</u>

Reason: This proposal is intended to provide clarity by:

(1) clarifying is Section 1403.2 that the means of drainage is to manage water from weather which intrudes past the exterior surface of the veneer (either through the veneer or at penetration interfaces) rather than all water that asssembly, which might be interpreted to include the need to drain an internal insulation cavity from condensation moisture or a burst pipe.

(2) separating the WRB material requirements from its installation requirements in Section 1404.2. Additional text in this section specifies installation attributes critical to ensuring the continuity of the water-resistive barrier currently required in the code, and provides more consistency with the International Residential Code.

Cost Impact: Will not increase the cost of construction
There are no changes in requirements only clarification of existing code language.

FS 152-15 : 1403.2-WESTON5343

FS 153-15

1404.2

Proponent: Theresa Weston, DuPont Building Innovations, representing DuPont Building Innovatons (theresa.a.weston@usa.dupont.com)

2015 International Building Code

Revise as follows:

1404.2 Water-resistive barrier. Not fewer than one layer of ~~No.15 asphalt felt~~water-resistive barrier, complying with ASTM ~~D 226 for Type 1 felt~~E 2556 or other *approved* materials, shall be attached to the studs or sheathing, with flashing as described in Section 1405.4, in such a manner as to provide a continuous *water-resistive barrier* behind the *exterior wall* veneer.

Reason: The proposal updates the water-resistive barrier reference to the most recent consensus standard. ASTM E2556 includes housewrap materials, building papers and felt, instead of just felt and therefore is more representative of the state of the industry. Furthermore, the current reference standard is scoped for roof systems, while ASTM E2556 was developed and is scoped for wall systems and so, therefore, is more appropriate for this section of the code. ASTM E2556 is currently referenced in Section 2510 for Stucco water-resistive barriers so its adoption in this section would increase consistency within the code. ASTM E2556 is consistent with the current ICC-ES acceptance criteria for water-resistive barriers (AC-38) and therefore should not limit the use of current WRBs.

Cost Impact: Will not increase the cost of construction
The requirements in the referenced standard are consistent with requirements in ICC-ES Acceptance Criteria AC-38, the most broadly used water-resistive barrier qualification criteria, so will not change the water-resistive barriers requirements or costs associated with them.

FS 153-15 : 1404.2-WESTON5376

FS 154-15

202 (New), , 1402.1, 1404.3 (New), 1405.5 (New)

Proponent: Laverne Dalgleish, Building Professionals, representing Air Barrier Association of America

2015 International Building Code

Add new definition as follows:

SECTION 202 DEFINITIONS

AIR BARRIER. Materials assembled and joined together to provide a barrier to air leakage through the buildling envelope. An air barrier may be a single material or a combination of materials.

SECTION 202 DEFINITIONS

CONTINUOUS AIR BARRIER. A combination of materials and assemblies that restrict or prevent the passage of air thorugh the building thermal envelope.

Revise as follows:

1402.1 Definitions. The following terms are defined in Chapter 2:
ADHERED MASONRY VENEER.
AIR BARRIER.
ANCHORED MASONRY VENEER.
BACKING.
CONTINUOUS AIR BARRIER.
EXTERIOR INSULATION AND FINISH SYSTEMS (EIFS).
EXTERIOR INSULATION AND FINISH SYSTEMS (EIFS) WITH DRAINAGE.
EXTERIOR WALL.
EXTERIOR WALL COVERING.
EXTERIOR WALL ENVELOPE.
FENESTRATION.
FIBER-CEMENT SIDING.
HIGH-PRESSURE DECORATIVE EXTERIOR-GRADE COMPACT LAMINATE (HPL).
HIGH-PRESSURE DECORATIVE EXTERIOR-GRADE COMPACT LAMINATE (HPL) SYSTEM.
METAL COMPOSITE MATERIAL (MCM).
METAL COMPOSITE MATERIAL (MCM) SYSTEM.
POLYPROPYLENE SIDING.
PORCELAIN TILE.
VENEER.
VINYL SIDING.
WATER-RESISTIVE BARRIER.

Add new text as follows:

1404.3 Air barriers. Air barrier materials shall comply with Section C402.5.1.2.1 of the *International Energy Conservation Code*. Air barrier assemblies shall comply with Section C402.5.1.2.2 of the *International Energy Conservation Code*.

1405.5 Air barrier installation. A continuous air barrier shall be provided in accordance with Section C402.5.1.1 of the *International Energy Conservation Code*.

Reason: To clarify the need for air-barriers in the construction of building envelope assemblies and coordinate with energy code provisions for air-barriers.
Air barriers should not just be a requirement for energy code compliance from the standpoint of controlling overall building air leakage. Air barriers also play an important role in controlling leakage of warm, moist air into building cavities where it can increase the risk of condensation on cold surfaces within a building envelope assembly. In this requard, air barriers should be considered to be at least as important as vapor retarders as addressed in current Section 1405.3 of the IBC. Thus, it is important to include a reference to air barriers in the IBC to recognize that air barriers are not just an energy code concern and are important to durable construction in the IBC. With the above purpose in mind, this proposal simply coordinates the IBC wall construction requirements with air-barrier requirments already found in the IECC (without any technical change). The definitions are directly from the IECC.

Bibliography: IECC 2015 Published May 30, 2014 Page 325
IECC 2015 Published May 30, 2014 Page 326

Cost Impact: Will increase the cost of construction
If a state has adopted the IECC 2012 or ASHRAE 90.1 2010, then there is no increase cost of construction. If a state has not adopted IECC 2012 or ASHRAE 90.1 2010, then adding a requirment for air barrier will increase the cost of construction by aproximately $4.00 per square foot of area. This cost is offset by reducing both building maintainance and building repair by an even greater amount over the life of the building.

FS 154-15 : 1402.1-DALGLEISH5452

FS 155-15

1404.12.2

Proponent: Matthew Dobson, representing Vinyl Siding Institute (mdobson@vinylsiding.org)

2015 International Building Code

Revise as follows:

1404.12.2 Fire separation distance. ~~The~~
Polypropylene siding shall not be installed on walls with a fire separation distance ~~between a building with polypropylene siding and the adjacent building shall be not~~of less than ~~10~~5 feet (~~3048~~1524 mm).

Exception: Walls perpendicular to the line used to determine the fire separation distance.

Reason: This is a clarification of where the limitation on polypropylene should apply. It should only apply to walls where the product is used and not the whole building. In many cases the product is used on front elevations or areas of high architectural interest. If the product is only used on a few walls only those walls should be counted and regulated by this provision.
Also, the perpendicular wall exception has been added because the exposure hazard being limited here typically will not create a problem as the exposure will not be facing the adjacent building.

Cost Impact: Will not increase the cost of construction
This change has no impact on cost as it simply clarifies where the product can be used relative to fire safety.

FS 155-15 : 1404.12.2-DOBSON5336

FS 156-15

202 (New), 1404.13 (New), Table 1405.2, 1405.15 (New), 1405.15.1 (New), Chapter 35

Proponent: Matthew Dobson, representing Vinyl Siding Institute

2015 International Building Code

Add new text as follows:

SECTION 202 DEFINITIONS

INSULATED VINYL SIDING A vinyl cladding product, with manufacturer-installed foam plastic insulating material as an integral part of the cladding product, having a thermal resistance of not less than R-2.

1404.13 Insulated Vinyl Siding. Insulated vinyl siding shall be certified and labeled as conforming to the requirements of ASTM D 7793 by an approved quality control agency.

TABLE 1405.2
MINIMUM THICKNESS OF WEATHER COVERINGS

COVERING TYPE	MINIMUM THICKNESS (inches)
Insulated Vinyl Siding	0.035 (vinyl siding layer only)

(Portions of table and footnotes not shown remain unchanged)

1405.15 Insulated vinyl siding. Insulated vinyl siding complying with ASTM D7793 shall comply with Section 1405.14.

1405.15.1 Insulated vinyl siding and accessories Insulated vinyl siding and accessories shall be installed in accordance with manufacturer's instructions

Add new standard(s) as follows: ASTM D7793-13 Standard Specification for Insulated Vinyl Siding

Reason: This proposal carries forward changes from the 2015 International Residential Code and 2015 International Energy Conservation Code. Insulated vinyl siding's ASTM standard was developed over the past few years and product is now being certified to this standard. It was not ready for adoption during the last cycle of the International Building Code.
Insulated vinyl siding, which is a form of insulated siding, is included in the 2015 International Energy Conservation Code among the materials that can be used as continuous insulation outside of the building framing to provide the required total wall R-value for buildings in the coldest climate zones.

The foam plastic used with insulated vinyl siding is required to meet the requirements of Chapter 26 of the IBC.

Installation practices, wind, and height limitations are the same for insulated vinyl siding as vinyl siding. Therefore we have referenced the installation section for vinyl siding for this area.

Cost Impact: Will not increase the cost of construction
This change standardizes a cladding and continuous insulation category and will provide additional options.

Analysis: A review of the standard proposed for inclusion in the code, ASTM D7793, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2015.

FS 156-15 : 1404.13 (New)-DOBSON5330

FS 157-15

Table 1405.2

Proponent: Charles Clark, Jr, Brick Industry Association, representing Brick Industry Association (cclark@bia.org)

2015 International Building Code

Revise as follows:

TABLE 1405.2
MINIMUM THICKNESS OF WEATHER COVERINGS

COVERING TYPE	MINIMUM THICKNESS (inches)
Anchored masonry veneer	2.0 ~~2.625~~

(Portions of table and footnotes not shown remain unchanged)

Reason: For more than 30 years, the minimum nominal thickness of anchored masonry veneer allowed by the most prevalent residential model code available at the time has been 2 inches. The IRC has allowed a minimum nominal thickness of 2 inches since its inception in the year 2000. All editions of the CABO One and Two Family Dwelling Code in our office library that go back as far as the year 1983 have allowed a minimum nominal thickness of 2 inches. In short, anchored masonry veneer has performed well for thirty years with an allowable minimum nominal dimension of 2 inches on residential structures and should be permitted as the minimum dimension on all structures.

Cost Impact: Will not increase the cost of construction
This change will not result in an increase to the cost of construction. In fact, this change may result in a reduction in the cost of construction as brick shelves in foundations could be slightly smaller, lintels and shelf angles supporting brick could be slightly smaller, and the seismically-induced load of brick veneer would be slightly lower.

FS 157-15 : T1405.2-CLARK5503

FS 158-15

Table 1405.2

Proponent: Jason Thompson, representing National Concrete Masonry Association (jthompson@ncma.org)

2015 International Building Code

Revise as follows:

TABLE 1405.2
MINIMUM THICKNESS OF WEATHER COVERINGS

COVERING TYPE	MINIMUM THICKNESS (inches)
Adhered masonry veneer Architectural Cast Stone Other	 0.75 0.25
Anchored masonry veneer Stone (natural) Architectural Cast Stone Other	 2 1.25 2.625
~~Stone (cast artificial, anchored)~~	~~1.5~~
~~Stone (natural)~~	~~2~~

(Portions of table and footnotes not shown remain unchanged)

Reason: Table 1405.2 addresses several types of masonry veneer systems; including both anchored (attached to a backup system using ties or anchors) as well as adhered (bonded to a backup system using mortar or other approved adhesive material). This change proposes to reorganize the minimum veneer thickness requirements in Table 1405.2 to clarify which minimum thickness requirements apply to specific products depending upon whether they are used as an anchored or adhered veneer.

While mostly a reorganization, there are some minor substantive revisions proposed, including:

The term "stone (cast artificial)" is replaced with "architectural cast stone" as this is consistent with industry practices and the terminology used in Chapter 21.

A minimum thickness of 0.75 inches for adhered architectural cast stone products has been added. The default thickness of 0.25 inches for adhered veneer systems is not appropriate for architectural cast stone due to production, transportation, and installation constraints. The minimum thickness of 0.75 inches is consistent with industry practices and recommendations from the Cast Stone Institute.

The minimum thickness of anchored architectural cast stone is reduced slightly from 1.5 inches to 1.25 inches, also consistent with industry practices and recommendations from the Cast Stone Institute. While minor, the changes proposed here bring the requirements of Table 1405.2 in line with referenced standards and industry practice.

Cost Impact: Will not increase the cost of construction

The changes proposed are primarily to clarify the requirements of Table 1405.2 and make them consistent with referenced standards and industry recommendations.

FS 158-15 : T1405.2-THOMPSON5341

FS 159-15

1405.3

Proponent: Jay Crandell, representing Foam Sheathing Committee of the American Chemistry Council

2015 International Building Code

Revise as follows:

1405.3 Vapor retarders. Vapor retarders as described in Section 1405.3.3 shall be provided in accordance with Sections 1405.3.1 and 1405.3.2~~, or an~~. An approved design using accepted engineering practice for hygrothermal analysis shall be provided for any of the following conditions:

1. Buildings with high indoor moisture generation.
2. Exterior building envelope assemblies that are enclosed when the framing members or insulation materials exceed 19 percent moisture content.
3. Alternative means and methods to Sections 1405.3.1 and 1405.3.2.

Reason: This proposal establishes some basic (but important) conditions of use associated with the intended performance of the moisture vapor control provisions in the code. These concerns are consistently repeated in various studies, ASTM and ASHRAE guides, expert recommendations, and some state and local codes. Experience has shown that when one or more of these factors is "out of control", they are commonly associated with observed moisture problems in buildings or assemblies. Without these use conditions declared, the provisions of the code may be applied to conditions that they were not intended for and there is no means for enforcement to assist in avoiding such cases. Without these limitations specified (or as an alternative meeting the intent of this proposal), the moisture vapor control requirements should be revised to more specifically address variations in vapor retarder requirements with variations in use conditions and climate to avoid inadvertent misapplication.

Cost Impact: Will not increase the cost of construction
These requirements are already required by the intent of the code and are often done as a matter of good construction practice to control risk and reduce construction cost and business cost in the long run. These factors help control intial wall moisture content which also can reduce short term serviceability or "call-back" costs, such as nail pops or bowing walls.

FS 159-15 : 1405.3-CRANDELL5001

FS 160-15

1405.3.1

Proponent: Maureen Traxler, representing Seattle Dept of Planning & Development (maureen.traxler@seattle.gov)

2015 International Building Code

Revise as follows:

1405.3.1 Class I and II vapor retarders. Class I and II vapor retarders shall not be provided on the interior side of frame walls in Zones 1 and 2. Class I vapor retarders shall not be provided on the interior side of frame walls in Zones 3 and 4 other than Marine 4. Class I or II vapor retarders shall be provided on the interior side of frame walls in Zones 5, 6, 7, 8 and Marine 4. The appropriate zone shall be selected in accordance with Chapter 3 of the *International Energy Conservation Code*.

Exceptions:

1. Basement walls.
2. Below-grade portion of any wall.
3. Construction where moisture or its freezing will not damage the materials.
4. Conditions where Class III vapor retarders are required in Section 1405.3.2.

Reason: This proposal clarifies the vapor retarder requirement for Zone Marine 4. The second sentence of the paragraph forbids Class I vapor retarders on the interior side of walls in Zone 4, but the thrid sentence requires either Class I or II vapor retarder on the interior side in Zone Marine 4. We propose that the prohibition applies to Zone 4 except in Marine areas.

Cost Impact: Will not increase the cost of construction
This proposal will not increase the cost of construction because it is a clarification of existing code language.

FS 160-15 : 1405.3.1-TRAXLER4695

FS 161-15

202 (New), Table 1405.3.2

Proponent: Matthew Dobson, representing Vinyl Siding Institute (mdobson@vinylsiding.org)

2015 International Building Code

Add new definition as follows:

SECTION 202 DEFINITIONS

CONTINUOUS INSULATION Insulating material that is continuous across all structural members without thermal bridges other than fasteners and service openings. It is installed on the interior or exterior or is integral to any opaque surface of the building envelope.

Revise as follows:

TABLE 1405.3.2
CLASS III VAPOR RETARDERS

ZONE	CLASS III VAPOR RETARDERS PERMITTED FOR:[a]
Marine 4	Vented cladding over wood structural panels Vented cladding over fiberboard Vented cladding over gypsum Continuous insulation~~Insulated sheathing~~ with *R*-value ≥ R2.5 over 2 × 4 wall Continuous Insulation~~Insulated sheathing~~ with *R*-value ≥ R3.75 over 2 × 6 wall
5	Vented cladding over wood structural panels Vented cladding over fiberboard Vented cladding over gypsum Continuous insulation~~Insulated sheathing~~ with *R*-value ≥ R5 over 2 × 4 wall Continuous insulation ~~Insulated sheathing~~ with *R*-value ≥ R7.5 over 2 × 6 wall
6	Vented cladding over fiberboard Vented cladding over gypsum Continuous insulation ~~Insulated sheathing~~ with *R*-value ≥ R7.5 over 2 × 4 wall Continuous insulation~~Insulated sheathing~~ with *R*-value ≥ R11.25 over 2 × 6 wall
7 and 8	Continuous insulation Insulated sheathingwith *R*-value ≥ R10 over 2 × 4 wall Continuous insulation~~Insulated sheathing~~ with *R*-value ≥ R15 over 2 × 6 wall

For SI: 1 pound per cubic foot = 16 kg/m^3 .

a. Spray foam with a minimum density of 2 lbs/ft^3 applied to the interior cavity side of wood structural panels, fiberboard, insulating sheathing or gypsum is deemed to meet the insulating sheathing requirement where the spray foam *R*-value meets or exceeds the specified insulating sheathing *R*-value.

Reason: This change makes the IBC constent with the term now defined and used in the IECC, continuous insulation.

Cost Impact: Will not increase the cost of construction
This is simply a correlation change.

FS 161-15 : T1405.3.2-DOBSON5372

FS 162-15

202, Table 1405.3.2

Proponent: Mike Fischer, Kellen Company, representing The Center for the Polyurethanes Industry of the American Chemistry Council and Polyisocyanurate Insulation Manufacturers Association (PIMA) (mfischer@kellencompany.com)

2015 International Building Code

Add new definition as follows:

SECTION 202 DEFINITIONS

~~**DEFINITIONS**~~**CONTINUOUS INSULATION (ci)** Insulating material that is continuous across all structural members without thermal bridges other than fasteners and service openings. It is installed on the interior or exterior or is integral to any opaque surface of the building envelope.

Revise as follows:

TABLE 1405.3.2
CLASS III VAPOR RETARDERS

ZONE	CLASS III VAPOR RETARDERS PERMITTED FOR:[a]
Marine 4	Vented cladding over wood structural panels Vented cladding over fiberboard Vented cladding over gypsum Continuous insulation~~Insulated sheathing~~ with *R*-value ≥ R2.5 over 2 × 4 wall Continuous insulation~~Insulated sheathing~~ with *R*-value ≥ R3.75 over 2 × 6 wall
5	Vented cladding over wood structural panels Vented cladding over fiberboard Vented cladding over gypsum Continuous insulation~~Insulated sheathing~~ with *R*-value ≥ R5 over 2 × 4 wall Continuous insulation~~Insulated sheathing~~ with *R*-value ≥ R7.5 over 2 × 6 wall
6	Vented cladding over fiberboard Vented cladding over gypsum Continuous insulation~~Insulated sheathing~~ with *R*-value ≥ R7.5 over 2 × 4 wall Continuous insulation Insulated ~~sheathing~~ with *R*-value ≥ R11.25 over 2 × 6 wall
7 and 8	Continuous insulation~~Insulated sheathing~~ with *R*-value ≥ R10 over 2 × 4 wall Continuous insulation~~Insulated sheathing~~ with *R*-value ≥ R15 over 2 × 6 wall

For SI: 1 pound per cubic foot = 16 kg/m^3 .

a. Spray foam with a maximum permeance of 1.5 perms at the installed thickness.~~minimum density of 2 lbs/ft^3~~applied to the interior cavity side of wood structural panels, fiberboard, insulating sheathing or gypsum is deemed to meet the continuous insulation ~~insulating sheathing~~ requirement where the spray foam *R*-value meets or exceeds the specified insulating sheathing *R*-value.

Reason: The 2015 International Codes have introduced a new term, continuous insulation, which has replaced the previous term "insulated sheathing"

in the codes. Insulated sheathing generally refers to a rigid board product; the intent of the product is to provide an insulation material that contains limited thermal bridging- particularly at framing members (see definition below). While all insulated sheathing meets the criteria for continuous insulation, not all continuous insulation is a "sheathing" product.
The proposal revises the table to broaden the available product solutions to include all types of continuous insulation in order to meet the intent of the code as it related to the appropriate use of vapor retarders, and adds the definition of continuous insulation from the IRC and IECC.

The proposal further modifies the footnote to remove the density requirement, and replace it with a vapor permeance requirement that more appropriately addresses the intent of the footnote.

These changes are consistent with changes made to the 2015 IRC, Table R702.7.1.

[RE] CONTINUOUS INSULATION (ci). Insulating material that is continuous across all structural members without thermal bridges other than fasteners and service openings. It is installed on the interior or exterior or is integral to any opaque surface of the building envelope.

Cost Impact: Will not increase the cost of construction
The proposal is a clarification of current requirements.

FS 162-15 : T1405.3.2-FISCHER5432

FS 163-15

1405.3.4

Proponent: Matthew Dobson, representing Vinyl Siding Institute (mdobson@vinylsiding.org)

2015 International Building Code

Revise as follows:

1405.3.4 Minimum clear airspaces and vented openings for vented cladding. For the purposes of this section, vented cladding shall include the following minimum clear airspaces:

1. Vinyl, polypropylene, or insulated vinyl lap or horizontal aluminum siding applied over a weather-resistive barrier as specified in this chapter.
2. Brick veneer with a clear airspace as specified in this code.
3. Other *approved* vented claddings.

Reason: This change recognizes the similar characteristics polypropylene siding and insulated vinyl siding have to vinyl siding as vented cladding. Polypropylene siding is very similar to vinyl siding as it has similar profiles and is installed by hanging it on the wall.
Insulated vinyl siding has been studied closely and has shown to have as good if not better performance as a vented cladding like vinyl siding. Here is the link to this study: http://web.ornl.gov/sci/buildings/2012/2010%20B11%20papers/49_Drumheller.pdf.

Bibliography: http://web.ornl.gov/sci/buildings/2012/2010%20B11%20papers/49_Drumheller.pdf

Cost Impact: Will not increase the cost of construction
This a simple recognition of performance, it will not impact cost.

FS 163-15 : 1405.3.4-DOBSON5384

FS 164-15

1405.4, Chapter 35

Proponent: Theresa Weston, DuPont Building Innovations, representing DuPont Building Innovations (theresa.a.weston@usa.dupont.com)

2015 International Building Code

Revise as follows:

1405.4 Flashing. Flashing shall be installed in such a manner so as to prevent moisture from entering the wall or to redirect that moisture to the exterior. Flashing shall be installed at the perimeters of exterior door and window assemblies, penetrations and terminations of *exterior wall* assemblies, *exterior wall* intersections with roofs, chimneys, porches, decks, balconies and similar projections and at built-in gutters and similar locations where moisture could enter the wall. Flashing with projecting flanges shall be installed on both sides and the ends of copings, under sills and continuously above projecting *trim*. <u>When self-adhered membranes are used as flashings, those self-adhered flashings shall comply with AAMA 711.</u>

Add new standard(s) as follows:

<u>AAMA 711-13 Voluntary Specification for Self Adhering Flashing Used for Installation of Exterior Wall Fenestration Products</u>

Reason: Self-adhered membranes are a growing segment of the flashing material market, but no material property or performance requirements for these materials are currently included in the code. AAMA 711 was developed to insure that this type of material meet minimum performance specifications. This proposal incorporates this industry standard by reference into the code, as was previously done in the 2012 International Residential Code. The properties and quality of flashing materials are crucial to successful implementation of the water management in wall systems.

Cost Impact: Will not increase the cost of construction
The proposal does not mandate the use of a specific material, and therefore does not increase code requirements or associated costs.

Analysis: A review of the standard proposed for inclusion in the code, AAMA 711, with regard to the ICC criteria for referenced stanards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2015.

FS 164-15 : 1405.4-WESTON5390

FS 165-15

1405.4, Chapter 35

Proponent: Theresa Weston, DuPont Building Innovations, representing DuPont Building Innovations (theresa.a.weston@usa.dupont.com)

2015 International Building Code

Revise as follows:

1405.4 Flashing. Flashing shall be installed in such a manner so as to prevent moisture from entering the wall or to redirect that moisture to the exterior. Flashing shall be installed at the perimeters of exterior door and window assemblies, penetrations and terminations of *exterior wall* assemblies, *exterior wall* intersections with roofs, chimneys, porches, decks, balconies and similar projections and at built-in gutters and similar locations where moisture could enter the wall. Flashing with projecting flanges shall be installed on both sides and the ends of copings, under sills and continuously above projecting *trim*. <u>When fluid applied membranes are used as flashing, those fluid applied membrane flashings shall comply with AAMA 714.</u>

Add new standard(s) as follows:

<u>AAMA 714-15 Voluntary Specification for Liquid Applied Flashing Used to Create a Water-Resistive Seal around Exterior Wall Openings in Buildings</u>

Reason: Fluid applied membranes are gaining in use in the market, but no material property or performance requirements for these materials are currently included in the code. Industry has developed standard AAMA 714 to insure that this type of material meets minimum performance specificatons. This proposal incorporates AAMA 714 by reference into the code. The properties and quality of flashing materials are crucial to the successful implementation of the water management in building envelopes.

Cost Impact: Will not increase the cost of construction
This proposal does not mandate the use of any material, and therefore does not increase code requirements or have associated costs.

Analysis: A review of the standard proposed for inclusion in the code, AAMA 714, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2015.

FS 165-15 : 1405.4-WESTON5633

FS 166-15

1405.4.2

Proponent: Charles Clark, Jr, representing Masonry Alliance for Codes and Standards (cclark@bia.org)

2015 International Building Code

Revise as follows:

1405.4.2 Masonry. Flashing and weep holes in anchored veneer designed in accordance with Section 1405.6 shall be located ~~in the first course of masonry~~not more than 16 inches (407 mm) above finished ground level above the foundation wall or slab~~, and~~. At other points of support, including structural floors, shelf angles and lintels~~ where anchored veneers are designed~~, flashing and weep holes shall be located in ~~accordance with Section 1405.6.~~the first course of masonry above the support.

Reason: Far too often, flashing and weep holes in anchored masonry veneer are located in the base of the wall such that they end up below the finished grade making them ineffective. This code change removes the text that indicates that they must be installed in the first course above grade at the base of a wall and instead requires that they be installed within a minimum distance above the finished grade. Flashing and weep holes supported on shelf angles or lintels would still be required to be in the first course of masonry located immediately above the support.

Cost Impact: Will not increase the cost of construction
If anything, this should lower the cost of construction as it would alleviate relocation of the grade to ensure that flashing and weep holes are indeed above grade.

FS 166-15 : 1405.4.2-CLARK5529

FS 167-15

1406.3, 2612.5

Proponent: John Woestman, Kellen Company, representing Composite Lumber Manufacturers Association (CLMA) (jwoestman@kellencompany.com)

2015 International Building Code

Revise as follows:

1406.3 Balconies and similar projections. Balconies and similar projections of combustible construction other than fire-retardant-treated wood shall be fire-resistance rated where required by Table 601 for floor construction or shall be of Type IV construction in accordance with Section 602.4. The aggregate length of the projections shall not exceed 50 percent of the building's perimeter on each floor.

Exceptions:

1. On buildings of Type I and II construction, three stories or less above *grade plane*, *fire-retardant-treated wood* shall be permitted for balconies, porches, decks and exterior stairways not used as required exits.
2. Untreated wood ~~is~~, and plastic composites that comply with ASTM D7032 and Section 2612, are permitted for pickets and rails or similar guardrail devices that are limited to 42 inches (1067 mm) in height.
3. Balconies and similar projections on buildings of Type III, IV and V construction shall be permitted to be of Type V construction, and shall not be required to have a *fire-resistance rating* where sprinkler protection is extended to these areas.
4. Where sprinkler protection is extended to the balcony areas, the aggregate length of the balcony on each floor shall not be limited.

2612.5 Construction requirements. Plastic composites meeting the requirements of Section 2612 shall be permitted to be used as exterior deck boards, stair treads, handrails and guards ~~in buildings of Type VB~~where combustible construction is permitted.

Reason: In Section 1406.3, plastic composites which comply with ASTM D7032 and Section 2612.3 are required to be tested to ASTM E84 and achieve a flame spread index of not more than 200. While most untreated wood has an ASTM E84 flame spread index below 200, a few species of untreated wood has a FSI of potentially over 200 (Ponderosa Pine, Northern White Pine), and a few species have FSI approaching 200 (Southern Pine, Poplar). Source: http://www.fpl.fs.fed.us/documnts/fplgtr/fplgtr190/chapter_18.pdf. This proposal, in 1406.3, seeks to allow plastic composites meeting the specified criteria to be used in the same applications where untreated wood may be used in balcony construction.
Regarding Section 2612.5: In the IBC, there are several specific exterior applications where combustible construction is allowed, or where noncombustible construction is not required, with buildings of other than Type VB. This proposal seeks to allow plastic composites which comply with the requirements of Section 2612 in those applications. IBC Section 1403.6 Balconies, is one of those applications. IBC 3104.3 Pedestrian walkways, is another.

Cost Impact: Will not increase the cost of construction
No mandatory cost increase. This proposal would allow additional materials (plastic composites) to be used in several specific applications. It may be noted plastic composites generally cost more than wood but the use of plastic composites is at the discretion of the building owner.

FS 167-15 : 1406.3-WOESTMAN5573

FS 168-15

1409.2

Proponent: Jesse Beitel, representing Trespa NA (jbeitel@haifire.com)

2015 International Building Code

Revise as follows:

1409.2 Exterior wall finish. HPL used as exterior wall covering or as elements of balconies and similar projections and bay and oriel windows to provide cladding or weather resistance shall comply with Sections 1409.4 ~~and~~ through 1409.14.

Reason: This code proposal is a correction to the original proposal. When the Section for High Pressure Laminates was added to the IBC via FS164-09/10, there was an error in the submitted proposal. In the reason statement, it was stated that FS164 was to add language for HPL the paralled Section 1407. Section 1407.2 reads "....shall comply with Sections 1407.4 through 1407.14." The error that occurred in Section 1409.2 was "......shall comply with Sections 1407.4 and 1407.14." In both the 2012 and the 2015 Codes the "and" is used versus the "through" which was the original intent. The use of the "and" eliminates fire testing, etc. that are needed for the application of the HPLs.
Currently HPL manufacturers do use the "through" intent to evaluate their products.

Cost Impact: Will not increase the cost of construction
The manufacturers of the HPLs currently test as if the "through" was in the code.

FS 168-15 : 1409.2-BEITEL5352

FS 169-15

2603.3

Proponent: Mike Fischer, Kellen Company, representing The Center for the Polyurethanes (mfischer@kellencompany.com)

2015 International Building Code

Revise as follows:

2603.3 Surface-burning characteristics. Unless otherwise indicated in this section, foam plastic insulation and foam plastic cores of manufactured assemblies shall have a flame spread index of not more than 75 and a smoke-developed index of not more than 450 where tested in the maximum thickness intended for use in accordance with ASTM E 84 or UL 723. Loose fill-type foam plastic insulation shall be tested as board stock for the flame spread and smoke-developed indexes.

Exceptions:

1. Smoke-developed index for interior *trim* as provided for in Section 2604.2.
2. In cold storage buildings, ice plants, food plants, food processing rooms and similar areas, foam plastic insulation where tested in a thickness of 4 inches (102 mm) shall be permitted in a thickness up to 10 inches (254 mm) where the building is equipped throughout with an automatic fire sprinkler system in accordance with Section 903.3.1.1. The approved *automatic sprinkler system* shall be provided in both the room and that part of the building in which the room is located.
3. Foam plastic insulation that is a part of a Class A, B or C roof-covering assembly provided the assembly with the foam plastic insulation satisfactorily passes NFPA 276 or UL 1256. The smoke-developed index shall not be limited for roof applications.
4. Foam plastic insulation greater than 4 inches (102 mm) in thickness shall have a maximum flame spread index of 75 and a smoke-developed index of 450 where tested at a minimum thickness of 4 inches (102 mm), provided the end use is approved in accordance with Section 2603.9 using the <u>maximum </u>thickness and density intended for use.
5. Flame spread and smoke-developed indexes for foam plastic interior signs in *covered and open mall buildings* provided the signs comply with Section 402.6.4.

Reason: This change is a clarification only; it provides consistency with the IRC and clarifies that testing at a maximum thickness is appropriately applied to installations of thicknesses at or less than the tested specimen.

Cost Impact: Will not increase the cost of construction
The change is a clarification only; it does not add in new requirements.

2015 International Building Code

Revise as follows:

2603.3 Surface-burning characteristics. Unless otherwise indicated in this section, foam plastic insulation and foam plastic cores of manufactured assemblies shall have a flame spread index of not more than 75 and a smoke-developed index of not more than 450 where tested in the maximum thickness intended for use in accordance with ASTM E 84 or UL 723. Loose fill-type foam plastic insulation shall be tested as board stock for the flame spread and smoke-developed indexes.

Exceptions:

1. Smoke-developed index for interior *trim* as provided for in Section 2604.2.
2. In cold storage buildings, ice plants, food plants, food processing rooms and similar areas, foam plastic insulation where tested in a thickness of 4 inches (102 mm) shall be permitted in a thickness up to 10 inches (254 mm) where the building is equipped throughout with an automatic fire sprinkler system in accordance with Section 903.3.1.1. The approved *automatic sprinkler system* shall be provided in both the room and that part of the building in which the room is located.
3. Foam plastic insulation that is a part of a Class A, B or C roof-covering assembly provided the assembly with the foam plastic insulation satisfactorily passes NFPA 276 or UL 1256. The smoke-developed index shall not be limited for roof applications.
4. Foam plastic insulation greater than 4 inches (102 mm) in thickness shall have a maximum flame spread index of 75 and a smoke-developed index of 450 where tested at a minimum thickness of 4 inches (102 mm), provided the end use is approved in accordance with Section 2603.9 using the thickness and density intended for use.
5. Flame spread and smoke-developed indexes for foam plastic interior signs in *covered and open mall buildings* provided the signs comply with Section 402.6.4.
6. <u>Foam plastic insulation located between a concrete slab on grade and its subgrade. Such insulation shall also be exempt from the limiting oxygen index (LOI) requirements of ASTM C578.</u>

Reason: This proposal exempts foam plastic insulation used between a concrete slab on grade and its subgrade from the flame spread index (FSI) and smoke-developed index (SDI) requirements of Section 2603.3 and from the limiting oxygen index (LOI) criteria of ASTM C578. This will maintain building fire safety while reducing the health and environmental impacts of toxic or potentially toxic flame retardant chemicals, and it will increase consumer choice.

Ignition and propagation of fire requires three elements: fuel, an ignition source, and oxygen. The proposed exemption from FSI, SDI, and LOI requirements applies only to foam plastic insulation protected between a concrete slab on grade and its subgrade, where there is no significant exposure to ignition sources or oxygen. Since the foam plastic insulation will not burn under these conditions, the provisions of Section 2603.3, which limit the surface burning characteristics (FSI and SDI) of foam plastic insulation, are not relevant and provide no fire safety benefit. Similarly, there is no fire safety benefit from meeting the limiting oxygen index (LOI) criteria in ASTM C578. FSI, SDI, and LOI requirements are unnecessary for below-grade uses of foam plastic insulation, where the elements required for a fire do not exist. However, the flame retardants used in foam plastic insulation to meet these requirements pose a significant hazard to human health and ecosystems.

The proposed change does not require additional protection at slab joints or penetrations beyond those required by other applicable code provisions. At these locations it is highly unlikely that foam plastic insulation will be exposed to an ignition source, and if a portion of the insulation were somehow exposed, there would not be sufficient oxygen to propagate fire. Other slab-on-grade insulation that is not substantially covered by the slab, such as insulation between a slab edge and a foundation wall, is not covered by the proposed exception, and must comply with Section 2603.3 as well as Section 2603.4 (thermal barriers).

Satisfying the FSI, SDI, and LOI criteria typically requires the addition of flame retardants to foam plastic insulation. During manufacture and installation, workers are likely to be exposed to these flame retardants, which have been associated with neurological and reproductive impairments, hormonal and immune problems, and cancer. These flame retardants are released into the environment during manufacture, demolition, and disposal, and they will eventually migrate out of landfills and other repositories. When thermally processed or burned (for instance, in an incinerator or a landfill), insulation containing halogenated flame retardants can generate highly persistent and toxic halogenated dioxins and furans and other toxic combustion byproducts. Exposure to these dioxins and furans has been associated with cancer and other human health and ecological harm.

HBCD (hexabromocyclododecane) is the flame retardant used most commonly in polystyrene insulation, a typical variety of foam plastic insulation used below-grade. In 2013 under the Stockholm Convention, over 150 countries agreed to eliminate HBCD from the global marketplace due to its persistence and toxicity. The chemical alternatives to HBCD are also highly persistent halogenated flame retardants and are expected to have some comparable adverse human health and ecological impacts. Reducing the unnecessary use of harmful flame retardants will reduce exposure and harm to construction workers, emergency responders, the general public, and ecosystems.

The proposed change does not prohibit the use of flame retardants in foam plastic insulation. Instead, it describes conditions under which foam plastic insulation without added flame retardants can be used safely in buildings.

It is envisioned that insulation without flame retardants for use as described in this proposed exception would require labeling that complies with Section 2603.2. This labeling would be the responsibility of the insulation manufacturer, in the same way that it is currently the manufacturer's responsibility to properly label foam plastic insulation for the end uses described in Exceptions 1 through 5 of Section 2603.3.

This code change will maintain fire safety, reduce the adverse health and environmental impacts of toxic flame retardants used in foam plastic insulation, and expand consumer choice.

Cost Impact: Will not increase the cost of construction
The proposed code change will not require any action that increases construction costs since it does not mandate any change from current practice. Utilizing the proposed code change would not require any alteration to design or construction practices. The proposed change would enable voluntary manufacture and use of alternative foam plastic insulation products that do not contain flame retardant chemicals. The cost of using these alternative insulation products may be higher, lower, or the same as the cost of using currently available insulation depending on formulation costs, production volumes, consumer demand, and level of competition.

2015 International Building Code

Revise as follows:

2603.3 Surface-burning characteristics. Unless otherwise indicated in this section, foam plastic insulation and foam plastic cores of manufactured assemblies shall have a flame spread index of not more than 75 and a smoke-developed index of not more than 450 where tested in the maximum thickness intended for use in accordance with ASTM E 84 or UL 723. Loose fill-type foam plastic insulation shall be tested as board stock for the flame spread and smoke-developed indexes.

Exceptions:

1. Smoke-developed index for interior *trim* as provided for in Section 2604.2.
2. In cold storage buildings, ice plants, food plants, food processing rooms and similar areas, foam plastic insulation where tested in a thickness of 4 inches (102 mm) shall be permitted in a thickness up to 10 inches (254 mm) where the building is equipped throughout with an automatic fire sprinkler system in accordance with Section 903.3.1.1. The approved *automatic sprinkler system* shall be provided in both the room and that part of the building in which the room is located.
3. Foam plastic insulation that is a part of a Class A, B or C roof-covering assembly provided the assembly with the foam plastic insulation satisfactorily passes NFPA 276 or UL 1256. The smoke-developed index shall not be limited for roof applications.
4. Foam plastic insulation greater than 4 inches (102 mm) in thickness shall have a maximum flame spread index of 75 and a smoke-developed index of 450 where tested at a minimum thickness of 4 inches (102 mm), provided the end use is approved in accordance with Section 2603.9 using the thickness and density intended for use.
5. Flame spread and smoke-developed indexes for foam plastic interior signs in *covered and open mall buildings* provided the signs comply with Section 402.6.4.
6. Foam plastic insulation located a minimum of 6 inches (152 mm) below finished grade and separated from building interiors by a masonry or concrete wall or foundation. Such insulation shall also be exempt from the limiting oxygen index (LOI) requirements of ASTM C578.

Reason: This proposal exempts foam plastic insulation used below grade and separated from the building interior from the flame spread index (FSI) and smoke-developed index (SDI) requirements of Section 2603.3 and from the limiting oxygen index (LOI) criteria of ASTM C578. This will maintain building fire safety while reducing the health and environmental impacts of toxic or potentially toxic flame retardant chemicals, and it will increase consumer choice.

Ignition and propagation of fire requires three elements: fuel, an ignition source, and oxygen. The proposed exemption from FSI, SDI, and LOI requirements applies only to foam plastic insulation that is at least 6 inches below finish grade, where there is no significant exposure to ignition sources or oxygen. Since the foam plastic insulation will not burn under these conditions, the provisions of Section 2603.3, that limit surface burning characteristics (FSI and SDI) of foam plastic insulation, are not relevant and provide no fire safety benefit. Similarly, there is no fire safety benefit from meeting the limiting oxygen index (LOI) criteria in ASTM C578. FSI, SDI, and LOI requirements are unnecessary for below-grade uses of foam plastic insulation, where the elements required for a fire do not exist. However, the flame retardants used in foam plastic insulation to meet these requirements pose a significant hazard to human health and ecosystems.

The proposed change does not require additional protection at below-grade wall penetrations beyond those required by other applicable code provisions. At these locations it is highly unlikely that foam plastic insulation on the exterior side of the wall will be exposed to an ignition source, and if a portion of the insulation were somehow exposed, there would not be sufficient oxygen to propagate fire.

Satisfying the FSI, SDI, and LOI criteria typically requires the addition of flame retardants to foam plastic insulation. During manufacture and installation, workers are likely to be exposed to these flame retardants, which have been associated with neurological and reproductive impairments, hormonal and immune problems, and cancer. These flame retardants are released into the environment during manufacture, demolition, and disposal, and they will eventually migrate out of landfills and other repositories. When thermally processed or burned (for instance, in an incinerator or a landfill), insulation containing halogenated flame retardants can generate highly persistent and toxic halogenated dioxins and furans and other toxic combustion byproducts. Exposure to these dioxins and furans has been associated with cancer and other human health and ecological harm.

HBCD (hexabromocyclododecane) is the flame retardant used most commonly in polystyrene insulation, a typical variety of foam plastic insulation used below-grade. In 2013 under the Stockholm Convention, over 150 countries agreed to eliminate HBCD from the global marketplace due to its persistence and toxicity. The chemical alternatives to HBCD are also highly persistent halogenated flame retardants and are expected to have some comparable adverse health and ecological impacts. Reducing the unnecessary use of harmful flame retardants will reduce exposure and harm to construction workers, emergency responders, the general public, and ecosystems.

The proposed change does not prohibit the use of flame retardants in foam plastic insulation. Instead, it describes conditions under which foam plastic insulation without flame retardants can be used safely in buildings. This change would include below-grade insulation placed horizontally for frost-protected shallow foundations per Section 1809.5(2); such insulation must also comply with the insulation protection requirements of this section and the referenced standard ASCE 32.

It is envisioned that insulation without flame retardants for use as described in this proposed exception would require labeling that complies with Section 2603.2. This labeling would be the responsibility of the insulation manufacturer, in the same way that it is currently the manufacturer's responsibility to properly label foam plastic insulation for the end uses described in Exceptions 1 through 5 of Section 2603.3.

This code change will maintain fire safety, reduce the adverse health and environmental impacts of toxic flame retardants used in foam plastic insulation, and expand consumer choice.

Cost Impact: Will not increase the cost of construction
The proposed code change will not require any action that increases construction costs since it does not mandate any change from current practice. Utilizing the proposed code change would not require any alteration to design or construction practices. The proposed change would enable voluntary manufacture and use of alternative foam plastic insulation products that do not contain flame retardant chemicals. The cost of using these alternative insulation products may be higher, lower, or the same as the cost of using currently available insulation depending on formulation costs, production volumes, consumer demand, and level of competition.

FS 171-15 : 2603.3-LINDEMAN3805

FS 172-15

2603.4

Proponent: Marcelo Hirschler, representing GBH International (gbhint@aol.com)

2015 International Building Code

Revise as follows:

2603.4 Thermal barrier. Except as provided for in Sections 2603.4.1 and 2603.9, foam plastic shall be separated from the interior of a building by an approved thermal barrier of $^{1}/_{2}$-inch (12.7 mm) gypsum wallboard, heavy timber in accordance with Section 602.4, or a material that is tested in accordance with and meets the acceptance criteria of both the Temperature Transmission Fire Test and the Integrity Fire Test of NFPA 275. Combustible concealed spaces shall comply with Section 718.

Reason: Thermal barriers are materials that comply with NFPA 275. In order to comply with NFPA 275 thermal barrier materials (in combination with the foam plastic insulation they are supposed to protect) are supposed to resist flashover after exposure to a room-corner test (using a test specimen that covers 3 walls and the ceiling of an 8 ft. by 12 ft. by 8 ft. room) such as NFPA 286, as well as comply with a number of other requirements (peak heat release rate of no more than 800 kW, flames that don't reach the extremities of the test specimen, total smoke release of no more than 1,000 m^2). As an alternative to testing to NFPA 286 the thermal barriers are allowed to be tested to FM 4880, UL 1040 or UL 1715, all severe large scale tests.

Beyond the test just mentioned, thermal barriers must also be able to pass a fire resistance test using a time-temperature curve like the one in ASTM E119 for 15 minutes.

It is clear (and fire test data have shown this) that thin wood panel materials will not comply with these requirements, because if a thin wood panel, covering a foam plastic insulation material, is exposed to the fire source in NFPA 286, it will reach flashover well before the end of the 15 minute test period.

Discussions held during the IRC hearings for the 2015 edition addressed the interest by some proponents that a wood material be permitted to be used as a thermal barrier without testing. Therefore, this proposal suggests that heavy timber is a wood material that could safely be used as a thermal barrier, while thin wood panels are not appropriate thermal barriers.

Cost Impact: Will not increase the cost of construction
This provides an alternate option for use as a thermal barrier and does not mandate any material.

FS 172-15 : 2603.4-HIRSCHLER4580

FS 173-15

2603.5.5

Proponent: John Woestman, Kellen Company, representing Extruded Polystyrene Foam Association (XPSA) (jwoestman@kellencompany.com)

2015 International Building Code

Revise as follows:

2603.5.5 Vertical and lateral fire propagation. The exterior wall assembly shall be tested in accordance with and comply with the acceptance criteria of NFPA 285 and the foam plastic insulation shall comply with the provisions of Section 2603.5.4.

Exceptions:

1. One-story buildings complying with Section 2603.4.1.4.
2. Wall assemblies where the foam plastic insulation is covered on each face by not less than 1-inch (25 mm) thickness of masonry or concrete and meeting one of the following:
    2.1. There is no airspace between the insulation and the concrete or masonry.
    2.2. The insulation has a flame spread index of not more than 25 as determined in accordance with ASTM E 84 or UL 723 and the maximum airspace between the insulation and the concrete or masonry is not more than 1 inch (25 mm).

Reason: This proposed code change clarifies the existing dual requirement of a satisfactory NFPA 285 test in Section 2603.5.5 and an ASTM E 84 / UL 723 test in Section 2603.5.4. This proposal does not add any additional test requirements to the code. There is currently a misunderstanding in the market that a foam plastic insulation material which would not meet the ASTM E84 Class A performance requirements is allowed by the code to be used in an assembly which has passed the NFPA 285 assembly fire test. This proposal clarifies the applicability of the code provisions of 2603.5.4, by requiring a Class A material in an NFPA 285 assembly.

Cost Impact: Will not increase the cost of construction
No cost increase. Proposed change reinforces current code requirement.

FS 173-15 : 2603.5.5-WOESTMAN5564

FS 174-15

2603.5.5

Proponent: Henry Green, National Institute of Building Sciences, representing National Institute of Building Sciences (hgreen@nibs.org)

2015 International Building Code

Revise as follows:

2603.5.5 Vertical and lateral fire propagation. The exterior wall assembly shall be tested in accordance with and comply with the acceptance criteria of NFPA 285.

Exceptions:

1. One-story buildings complying with Section 2603.4.1.4.
2. Wall assemblies where the foam plastic insulation is covered on each face by not less than 1-inch (25 mm) thickness of masonry or concrete and meeting one of the following:
   - 2.1. There is no airspace between the insulation and the concrete or masonry.
   - 2.2. The insulation has a flame spread index of not more than 25 as determined in accordance with ASTM E 84 or UL 723 and the maximum airspace between the insulation and the concrete or masonry is not more than 1 inch (25 mm).

3. In other than *high rise building*, buildings equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1

Reason: Currently, Section 2603.5 requires all foam plastic exterior insulation materials to conform to the limits of NFPA 285. This test replicates the response of materials to a fire extending through an exterior window of a building. The code does not differentiate as to whether there is a potential for such a fire to occur in a building. Flashover fires that would cause the flame to break out of the building will not occur in a building that has a fully operational sprinkler system.

Cost Impact: Will not increase the cost of construction
This proposal would establish an exception to the testing requirement thus reducing the cost of construction for buildings that fall under the exception. It will have no impact on buildings not subject to the exception.

FS 174-15 : 2603.5.5-GREEN5435

FS 175-15

2603.5.8 (New)

Proponent: Mike Fischer, Kellen Company, representing the Center for the Polyurethanes Industry of the American Chemistry Council (mfischer@kellencompany.com)

2015 International Building Code

Add new text as follows:

2603.5.8 Concealed spaces. Concealed spaces of exterior walls and exterior wall coverings shall comply with Section 718.

Reason: This proposal seeks to provide language referencing the Section 718 fireblocking requirements for concealed spaces of exterior walls and exterior wall coverings.

Cost Impact: Will not increase the cost of construction
The proposal is a clarification and adds no new requirements.

FS 175-15 : 2603.5.8 (New)-FISCHER5521

FS 176-15

2603.6 (New)

Proponent: Anthony Apfelbeck, City of Altamonte Building/Fire Safety, representing City of Altamonte Springs (ACApfelbeck@altamonte.org)

2015 International Building Code

Add new text as follows:

2603.6 Exterior Walls Foam plastic in thicknesses of ½ inch (12.7 mm) or greater on exterior walls shall be separated from the exterior of a building by an approved thermal barrier consisting of one of the following:

1. Minimum 1/2-inch (12.7 mm) gypsum wallboard.
2. A material that is tested in accordance with and meets the acceptance criteria of both the Temperature Transmission Fire Test and the Integrity Fire Test of NFPA 275.
3. Minimum ½ in. thick exterior wall coverings of:

    Concrete, stone or masonry veneer,
    Fiber cement siding,
    Hardboard siding,
    Particle board,
    Wood siding, or
    Wood structural panel.

Reason: Historically the IBC required foam plastic insulation to be protected from the interior by a thermal barrier, such as ½ in. gypsum wallboard (2603.4). This provided an acceptable level of fire performance from a fire originating within the home. There are no requirements to provide a thermal barrier to protect the insulation from an exterior fire because foam plastic insulation in the wall cavity would typically be protected by a ½ in. OSB attached to the exterior of the wall studs which serves as a shear wall.
Energy efficiency requirements now require exterior walls to include higher R-values, which is often provided by continuous insulation in the form of foam board stock attached on the outside of the shear wall. The only covering provided over the insulation is typically a thin water barrier and exterior siding, such as vinyl siding.

Fire test experiments conducted by UL http://www.youtube.com/watch?v=K8pGUULE3Xc (a compelling seven minute video) compare the fire performance between traditional residential exterior wall constructions with no continuous insulation outside of the exterior ½ in. OSB shear wall, versus two constructions with ½ in. and 1 in. polystyrene foam continuous insulation with vinyl exterior wall covering. When subjected to a small exterior fire, similar to that produced by a gas grill, the two wall constructions with exterior continuous insulation performed badly. In one case the fire extended up the wall and into the attic vents in 1:51 minutes, and in the other case the fire fully involved the exterior wall and the roofing became involved in just over two minutes. In a real life fire, the home would be totally involved before the first responding engine company could be expected to arrive, assuming they were notified when the fire first impinged on the wall.

This proposal requires foam insulation on exterior walls in thickness ½ in. or greater (the same min. thickness in the UL fire experiments) to be protected from the exterior of the building by an approved thermal barrier that complies with Section 2603.4 requirements (items 1 and 2) or min. ½ in. thick exterior wall coverings with comparable thermal transmission properties.

Bibliography: UL Fire Test Demonstration Video:
http://www.youtube.com/watch?v=K8pGUULE3Xc

Cost Impact: Will increase the cost of construction
The proposal is not likely to increase the cost of construction if one of the exterior sidings described in the proposal is used. The cost of construction is likely to increase if a siding not described in the proposal is used, and an additional thermal barrier is required under that siding.

FS 176-15 : 2603.6 (New)-APFELBECK3714

FS 177-15

202 (New), , 2603.6 (New), 2603.6.1 (New), 2603.6.2 (New), 2603.6.3 (New)

Proponent: Mike Fischer, Kellen Company, representing the Center for the Polyurethanes Industry of the American Chemistry Council (mfischer@kellencompany.com)

2015 International Building Code

Add new definition as follows:

SECTION 202 DEFINITIONS

BUILDING ELEMENT. A building assembly used to determine the construction classification that is a primary structural frame, a wall or partition, or a floor or roof assembly and the associated structural members.

SECTION 202 DEFINITIONS

BUILDING ELEMENT, INTERIOR. A building element that is not part of an exterior wall or roof assembly.

SECTION 202 DEFINITIONS

INTERIOR BUILDING ELEMENT. See "Building Element, Interior"

Add new text as follows:

2603.6 Interior building elements. Interior building elements of all Construction Types shall comply with Sections 2603.2 through 2603.4 and Sections 2603.6.1 through 2603.6.3.

2603.6.1 Fire resistant rated constuction Where interior building elements are required to have a fire-resistance rating, substantiation of the fire-resistance rating shall be in accordance with the methods permitted in Section 703.3 or from data based on tests of assemblies consistent with the end-use configuration and conducted in accordance with ASTM E 119 or UL 263.

2603.6.2 Thermal barrier Any foam plastic insulation shall be separated from the building interior by a thermal barrier in accordance with Section 2603.4, unless special approval is obtained on the basis of Section 2603.9.

2603.6.3 Concealed spaces Concealed spaces within interior building elements shall comply with Section 718

Reason: Section 603.1, Exception 3 permits the use of "Foam plastics in accordance with Chapter 26." in Type I and II construction. Chapter 26 addresses foam plastic in Section 2603 Foam Plastic Insulation and Section 2604 Interior finish and trim, however, specific discussion regarding Construction Type is primarily limited to 2603.4.1.13 for installations in sill plates and headers without a prescriptive thermal barrier and in 2603.5 relative to exterior walls. Although one may interpret Section 602.2 and Section 603.1, Exception 3 as allowing the use of foam plastics in all building elements of Type I and II construction, Chapter 26 does not clearly confirm this interpretation.
This proposal provides language to Section 2603 to clarify the acceptable use of foam plastic in all types of construction. The proposed new definitions are intended to clarify the meaning of "interior building element" as used in Section 602 to differentiate exterior walls from interior elements such as interior walls, floors, ceilings and roofs.

Cost Impact: Will not increase the cost of construction
The proposed change clarifies existing requirements of the IBC, therefore, will not increase the cost of construction.

FS 177-15 : 2603.6 (New)-FISCHER5524

FS 178-15

2603.7, 2603.7.1, 2603.7.2

Proponent: Tony Crimi, representing North American Insulation Manufacturers Association (tcrimi@sympatico.ca)

2015 International Building Code

2603.7 Foam plastic insulation used as interior finish or interior trim in plenums. Foam plastic insulation used as interior wall or ceiling finish or as interior trim in plenums shall exhibit a flame spread index of 75 or less and a smoke-developed index of 450 or less when tested in accordance with ASTM E 84 or UL 723 and shall comply with one or more of Sections 2603.7.1, 2603.7.2 and 2607.3.

2603.7.1 Separation required. The foam plastic insulation shall be separated from the plenum by a thermal barrier complying with Section 2603.4 and shall exhibit a flame spread index of 75 or less and a smoke-developed index of 450 or less when tested in accordance with ASTM E 84 or UL 723 at the thickness and density intended for use.

Revise as follows:

2603.7.2 Approval. The foam plastic insulation shall exhibit a flame spread index of 25 or less and a smoke-developed index of 50 or less when tested in accordance with ASTM E 84 or UL 723 at the thickness and density intended for use and shall meet the acceptance criteria of Section 803.1.2 when tested in accordance with NFPA 286. ~~The foam plastic insulation shall be approved based on tests conducted in accordance with Section 2603.9.~~

Reason: The last sentence of 2603.7.2 creates a conflict with the remainder of the requirement.
IBC 2603.7 and 2603.7.1 are clear in stating that ASTM E84 or UL 723 are to be used to determine the flame spread index and smoke developed index. This is very typical in the IBC. IBC 2603.7.2 also identifies the required test methods as ASTM E 84 and UL 723, and the required ratings to be derived from those tests, and identifies NFPA 286 and the acceptance criteria in 803.1.2 (which includes smoke measurement) as a requirement.

The problem is then with the last sentence of 2603.7.2 which directs the Code official to "approve" the insulation based on a different set of room fire tests, which do not all provide a flame spread and smoke developed value. It is not clear if this is to be in addition to the flame spread and smoke developed results, or in place of those tests.

Since 2603.9 does not exempt the material from compliance with 2603.7, it appears that both sets of criteria must be met. This is reasonable in that 3 of the 4 large-scale tests identified in 2603.9 do not have limitations on smoke development. Furthermore, based on the language in 2603.9, alternative tests could also be permitted, and what those do or do not measure is not known. However, since compliance with NFPA 286 is already required in 2603.7.2, and NFPA 286 and the acceptance criteria in 803.1.2 are also identified in 2603.9, it appears this sentence is redundant.

Cost Impact: Will not increase the cost of construction
The proposal will potentially eliminate redundant testing to additional standards other than UL 723, ASTM E84, and NFPA 286

FS 178-15 : 2603.7.2-CRIMI4628

FS 179-15

2603.7.4 (New)

Proponent: Tony Crimi, representing North American Insulation Manufacturers Association (tcrimi@sympatico.ca)

2015 International Building Code

Add new text as follows:

<u>**2603.7.4 Building panel systems** Foam plastic insulation used as part of a factory assembled panel system shall be covered by corrosion-resistant steel having a base metal thickness of not less than 0.0160 inch (0.4 mm). The foamed plastic insulation shall exhibit a flame spread index of 75 or less and a smoke-developed index of 450 or less when tested in accordance with ASTM E 84 or UL 723 at the thickness and density intended for use. The manufactured building panel system shall also conform to the flame spread and smoke-developed requirements of Chapter 8 when tested in accordance with ASTM E 84 or UL 723 at the thickness intended for use, unless special approval is obtained on the basis of Section 2603.9. Assemblies tested shall include seams, joints and other typical details used in the installation of the assembly and shall be tested in the manner intended for use.</u>

Reason: This proposal introduces clear language for testing of metal faced foamed plastic core sandwich panels. The proposal clarifies that both the foamed plastic insulation and the foam filled panel systems need to be tested. The requirement to test a joint or seam is included for consistency with current laboratory and Certification practices. This portion of the proposal language is taken directly from IBC section 2603.9. The requirements for the foamed plastic core material are identical to 2603.7.3. However, the requirements for the finished panel system would be as required by Chapter 8, depending upon the use of the product.
The IBC has several references to foamed plastic sandwich panels. Typically, sandwich panels are manufactured products. Many use a covering of corrosion-resistant steel having a base metal thickness of not less than 0.0160 inch (0.4 mm). However, it is not clear whether the current provision in 2603.7.3 applies to factory assembled panels because the ASTM E84/UL 723 testing requirement only expresses limits for the foam insulation core, not for the composite product.

When sandwich wall or ceiling panels are tested, they do not always yield better flame spread and smoke developed values than the base foam insulation core. For example, higher smoke developed indexes This is demonstrated in numerous UL Listings under their CCN "BLBT" for Surface Burning Characteristics of Building Units. Based on this experience, Laboratories like UL evaluate this effect by testing the sample with a longitudinal butt joint, using a factory or field joint (as applicable).

For building units consisting of an interior core material faced on both surfaces, the UL certification of the product already includes the surface-burning characteristics of the core material in addition to the surface-burning characteristics of the finished product.

Cost Impact: Will not increase the cost of construction

The proposal is consistent with the practices of Laboratories such as UL.

FS 179-15 : 2603.7.4 (New)-CRIMI4717

FS 180-15

2606.11

Proponent: Mike Fischer, Kellen Company, representing the Plastic Glazing Coalition of the American Chemistry Council (mfischer@kellencompany.com)

2015 International Building Code

Revise as follows:

2606.11 Greenhouses. Light-transmitting plastics shall be permitted in lieu of ~~plain~~ glass in greenhouses.

Reason: The use of the word "plain" glass is not defined. Does plain glass refer to non-tempered? Clear (as in non-coated, or as in non-tinted?) Non-wired? The proposal removes the ambiguous and unnecessary adjective.

Cost Impact: Will not increase the cost of construction
The proposal is editorial only. There is no change in requirements.

FS 180-15 : 2606.11-FISCHER3638

FS 181-15

2609.4

Proponent: David Kulina, representing Engel Architects (david@engelarch.com)

2015 International Building Code

Revise as follows:

2609.4 Area limitations. Roof panels shall be limited in area and the aggregate area of panels shall be limited by a percentage of the floor area of the room or space sheltered in accordance with Table 2609.4.

Exceptions:

1. The area limitations of Table 2609.4 shall be permitted to be increased by 100 percent in buildings equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1.
2. Low-hazard occupancy buildings, such as swimming pool shelters, shall be exempt from the area limitations of Table 2609.4, provided that the buildings do not exceed 5,000 square feet (465 m^2) in area and have a minimum fire separation distance of 10 feet (3048 mm).
3. Greenhouses that are occupied for growing ~~plants on a production~~ or ~~research basis~~maintaining plants, without public access, shall be exempt from the area limitations of Table 2609.4 provided they have a minimum fire separation distance of 4 feet (1220 mm).
4. Roof coverings over terraces and patios in occupancies in Group R-3 shall be exempt from the area limitations of Table 2609.4 and shall be permitted with light-transmitting plastics.

Reason: Light transmitting plastics are necessary in most greenshoues used for plants, irregardless of whether those plants are grown or simply maintained. For example, many retailers have greenhouses not open to the public in which they keep plants until ready for sale. Also, many colleges have greenhouses to hold plants during winter months. Furthermore, current plastics are actually safer than glass in the event of large hail.

Cost Impact: Will not increase the cost of construction
This change will actually decrease the cost of construction by allowing for the use of light transmitting plastics in lieu of glass.

FS 181-15 : 2609.4-KULINA4562

FS 182-15

2611.1, 2611.2, 2611.3, 2611.3 (New), 2611.4

Proponent: Stephen DiGiovanni, Clark County Building Department, representing Southern Nevada Chapter of ICC (sdigiovanni@clarkcountynv.gov)

2015 International Building Code

Revise as follows:

2611.1 General. Light-transmitting plastic interior~~ wall~~ signs shall be limited as specified in Section 2606 and Sections 2611.2 through 2611.4.

> **Exception:** Light-transmitting plastic interior wall signs in *covered and open mall buildings* shall comply with Section 402.6.4~~. Light-transmitting plastic interior signs shall also comply with Section 2606.~~

Delete without substitution:

~~**2611.2 Aggregate area.** The sign shall not exceed 20 percent of the wall area.~~

Revise as follows:

~~**2611.3**~~**2611.2 Maximum area.** The ~~sign~~ aggregate area of all light-transmitting plastics shall not exceed 24 square feet (2.23 m^2).

> **Exception:** In buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1, the aggregate area of light-transmitting plastics shall not exceed 100 square feet, provided all plastics are Class CC1 in accordance with Section 2606.4.

Add new text as follows:

2611.3 Separation Signs exceeding the aggregate area of 2611.2 shall be separated from each other by not less than 4 feet horizontally and 8 feet vertically.

Revise as follows:

2611.4 Encasement. ~~Edges~~Backs of wall mounted signs and ~~backs~~non-illuminated portions of ~~the sign~~ all signs regulated by this section shall be fully encased in metal.

Reason: Base code is out of date and creates undue impact on interior signs. These allowances have been incorporated into the Southern Nevada Building Code for several code cycles without incident.

1. The intent of this amendment is to codify an equivalent level of protection to allow larger signs.

2. It makes no sense to only regulate wall mounted signs inside buildings and not pole, and ceiling mounted signs too. Deletion of the reference to "wall" in the first sentence of Section 2611.1 clarifies that Section 2611 applies to all light-transmitting plastic interior signs, including wall-mounted, hanging, and base-supported signs.

3. The original proponent of this section, which is now 2611 of the IBC, intended it to apply to all plastic faced signs, not just wall mounted signs. In addition, the initial development of this requirement did not take into account a CC1 plastic, or fully sprinklered buildings.

4. A minimum CC1 plastic is required to limit the burning characteristics of the light-transmitting material.

5. The way 2611.1 is written, and according to the original proponent of this section, mall signs are only regulated in Section 402.6.4. Moving this stipulation into an exception provides clarification.

6. The original Section 2611.2 has been replaced with reasonable separation distances as described in the following item.

7. The separation requirements stipulated in 2611.2 eliminate the potential for multiple signs, each less than the allowable square footage (24 or 100), creating a single fuel package. The intent is to treat multiple signs in close proximity, or possibly multiple pieces/portions of the same sign, as a single fuel package. These separation distances were gleaned from Table 2607.4. This stipulation can be considered to be more conservative than base code and be used as partial justification for the increased sizes in the exceptions to Section 2611.3.

8. The modification to Section 2611.3 is proposed to eliminate interpretations of what the 24 square feet maximum area applies to. With the proposed modification, the 24 square feet limitation applies to the total area of light-transmitting plastics in the sign, regardless if the sign has a plastic facing on one or more sides. The intent is to treat the sign as a single fuel package regardless of configuration.

9. The size limitation in the Exception to Section 2611.3 was partially based on Sections 2607 and 2608, along with Table 2607.4. Section 2607 does not allow light-transmitting plastic wall panels to be used in Groups A-1 or A-2 occupancies. Item 1 of Section 2608.2 has a basic limitation of 16 square feet with a vertical dimension not exceeding 4 feet for a single panel of light-transmitting plastic glazing. Other restrictions are listed in Section 2608.2, but are exempt in sprinklered buildings. The size allowances in Table 2607.4, along with the sprinkler allowances in Section 2607.5, allow a CC2 light-transmitting plastic wall panel up to a maximum of 200 square feet with the required separation distances to an adjacent panel. Since 2611 requires compliance with 2606, at a minimum, a CC2 plastic would be required. Since 2607 is not applicable to A-1 or A-2 occupancies, it should be reasonable to allow light-transmitting plastic interior signs of Class CC1 with the additional mitigating aspects specified.

10. In addition to the preceding item, partial justification for the size limitations listed have been gleaned from Appendix H. Although the definition of sign in Section H102 appears to only apply to exterior signs, Appendix H can be used for guidance. Section H106 limits approved plastics in internally illuminated signs to 120 square feet. Section H107 appears to apply to externally illuminated plastic faced signs and has a basic limitation of 200 square feet. Therefore, the 120 square foot limitation appears to be the Appendix H reference most applicable to the intent of this amendment. With the

additional separation requirements and protection specified, it seems reasonable to allow the increased area specified.

11. Under the base IBC language, all light-transmitting plastic interior signs are required to have metal on five sides (edges and backs). However, suspended or base supported multi-faced light-transmitting plastic interior signs are relatively common. The amendment clarifies that hanging or base supported signs that have metal encasement on the sides only are permitted.

Cost Impact: Will not increase the cost of construction
This proposal is intended to clarify requirements for interior light-transmitting plastic signs, and allow for flexibility in increasing the size of such signs.

FS 182-15 : 2611-DIGIOVANNI3853

FS 183-15

1410.1, 2612.2, 2612.2.1, 2612.2.2, 2612.3, 2612.4, 2612.6

Proponent: John Woestman, representing Composite Lumber Manufacturers Association (CLMA) (jwoestman@kellencompany.com)

2015 International Building Code

Revise as follows:

1410.1 Plastic composite decking. Exterior deck boards, stair treads, handrails and ~~guardrail systems~~guards constructed of plastic composites, including plastic lumber, shall comply with Section 2612.

2612.2 Labeling ~~and identification.~~ ~~Packages~~
Plastic composite deck boards and ~~containers of plastic composites used in exterior applications~~stair treads, or their packaging, shall bear a *label* ~~showing~~ that indicates compliance to ASTM D7032 and includes the ~~manufacturer's name, product identification~~allowable load and ~~information sufficient~~maximum allowable span determined in accordance with ASTM D7032. Plastic composite handrails and guards, or their packaging, shall bear a label that indicates compliance to ~~determine that~~ASTM D7032 and includes the ~~end use will comply~~maximum allowable span determined in accordance with ~~code requirements.~~ASTM D7032.

Delete without substitution:

~~**2612.2.1 Performance levels.** The label for plastic composites used in exterior applications as deck boards, stair treads, handrails and guards shall indicate the required performance levels and demonstrate compliance with the provisions of ASTM D 7032.~~

~~**2612.2.2 Loading.** The label for plastic composites used in exterior applications as deck boards, stair treads, handrails and guards shall indicate the type and magnitude of the load determined in accordance with ASTM D 7032.~~

Revise as follows:

2612.3 Flame spread index. Plastic ~~composites~~composite deck boards, stair treads, handrails and guards shall exhibit a flame spread index not exceeding 200 when tested in accordance with ASTM E 84 or UL 723 with the test specimen remaining in place during the test.

Exception: Materials determined to be noncombustible in accordance with Section 703.5.

2612.4 Termite and decay resistance. ~~Plastic composites~~
Where required by Section 2304.12 plastic composite deck boards, stair treads, handrails and guards containing wood, cellulosic or any other biodegradable materials shall be termite and decay resistant as determined in accordance with ASTM D 7032.

2612.6 Plastic composite ~~decking~~deck boards, stair treads, handrails and guards. Plastic composite ~~decking~~deck boards, stair treads, handrails and guards shall be installed in accordance with this code and the manufacturer's instructions.

Reason: This proposal is intended to be clarifications and simplification of the requirements for plastic composites identified in this section.
The 2015 IBC included, for the first time, specific requirements for plastic composite deck boards, stair treads, and guard systems. The existing language was developed and finalized during the 2012 code development cycle for the IBC. The following year, the requirements in the IRC for these same products were revised, but the result is there are some differences between the IBC and the IRC. This code change proposal is an effort to move the language of the IBC to be in close alignment with the language of the IRC.

Cost Impact: Will not increase the cost of construction
No cost implications. No technical changes to the code requirements.

TENTATIVE ORDER OF DISCUSSION
2015 PROPOSED CHANGES TO THE INTERNATIONAL BUILDING CODE (GENERAL)

The following is the tentative order in which the proposed changes to the code will be discussed at the public hearings. Proposed changes which impact the same subject have been grouped to permit consideration in consecutive changes.

Proposed change numbers that are indented are those which are being heard out of numerical order. Indentation does not necessarily indicate that one change is related to another. Proposed changes may be grouped for purposes of discussion at the hearing at the discretion of the chair. Note that some G code change proposals may not be included on this list, as they are being heard by another committee.

Proponent: Victor Cuevas, representing City of Los Angeles

2015 International Building Code

Revise as follows:

SECTION 202 DEFINITIONS

AREA, BUILDING. The area included within surrounding *exterior walls* (or *exterior walls* and *fire walls*) exclusive of vent *shafts* and *courts*. Areas of the building not provided with surrounding walls shall be included in the building area if such ~~areas are included within the~~area has horizontal projection of the roof or floor above. Areas underneath any horizontal projections of five feet or more of roofs, balconies or architectural features shall also be included in the building area.

Reason: Since the code does not specify how much of a projection (12", 3', or 5') becomes floor area, establishing a threshold becomes necessary.

Cost Impact: Will not increase the cost of construction
The code change proposal will not increase the cost of construction.

G 1-15 : 202-AREA, BUILDING-CUEVAS4536

G 2-15

202

Proponent: Stephen Thomas, Colorado Code Consulting, LLC, representing Colorado Chapter ICC (sthomas@coloradocode.net)

2015 International Building Code

Revise as follows:

SECTION 202 DEFINITIONS

AREA, BUILDING. The area included within surrounding *exterior walls* (or *exterior walls* and *fire walls*) exclusive of vent *shafts* and *courts*. Areas of the building not provided with surrounding walls shall be included in the building area if such areas are included within the horizontal projection of the roof or floor above, and the space is usable by the building occupants.

Reason: The strict letter of the definition of building area would say that the area under a roof eave extending beyond the exterior wall 18-24 inches would need to be included in the building area. Therefore, this change is intended to clarify the intent of the definition by adding language to say that the area under the projecting floor or roof needs to be usable area. Areas within the building are usable by the occupants and would be the same condition.

Cost Impact: Will not increase the cost of construction
This change is a clarification of the code language. There is no impact on construction costs.

G 2-15 : 202-AREA, BUILDING-THOMAS4445

G 3-15

202

Proponent: Homer Maiel, PE, CBO, representing ICC Tri-Chapter (Peninsula, East Bay, Monterey Bay) (hmaiel@gmail.com)

2015 International Building Code

SECTION 202 DEFINITIONS

ATRIUM. An opening connecting two or more *stories* other than enclosed *stairways*, elevators, hoistways, escalators, plumbing, electrical, air-conditioning or other equipment, which is closed at the top and not defined as a mall. *Stories*, as used in this definition, do not include balconies within assembly groups or *mezzanines* that comply with Section 505. Openings that comply with Section 712.1.9 and 1019.3, Condition 1, shall not be considered an atrium.

Reason: One can look at the two Sections; 712.1.9 and 1019.3 (Condition 1) and conclude that those kinds of openings will constitute atrium under the definition of atrium. This has never been the intent of the code. So by adding this sentence, the clarification is made.

Cost Impact: Will not increase the cost of construction
This proposal will not increase the cost of construction.

G 3-15 : 202-ATRIUM-MAIEL4572

G 4-15

202 (New)

Proponent: Marcelo Hirschler, representing GBH International (gbhint@aol.com)

2015 International Building Code

Add new definition as follows:

SECTION 202 DEFINITIONS

<u>**CHILDREN'S PLAY STRUCTURE.**</u> <u>A structure composed of one or more components, where the user enters a play environment that utilizes combustible materials.</u>

Reason: Sections 402.6.3 and 424 of the IBC contain requirements regarding children's play structures. However, no definition exists and there have been discussions that there is some ambiguity about what is meant by the term. The concept incorporated into this definition is that a children's play structure is one that: (a) is constructed of combustible materials, (b) is a structure into which the user (typically a child) enters and (c) has at least one structural component.
A separate definition is being proposed for "soft contained play equipment structure", which is mentioned in items 3,6 and 7 of 424.2.

Cost Impact: Will not increase the cost of construction
This proposal simply adds a definition.

G 4-15 : 202-CHILDREN'S PLAY STRUCTURE (New)-HIRSCHLER3568

G 5-15

202 (New),

Proponent: Theresa Weston, DuPont Building Innovations, representing DuPont Building Innovations (theresa.a.weston@usa.dupont.com)

THIS PROPOSAL WILL BE HEARD BY THE FIRE SAFETY COMMITTEE. PLEASE SEE THE TENTATIVE HEARING ORDER FOR THE FS COMMITTEE.

2015 International Building Code

Add new definition as follows:

SECTION 202 DEFINITIONS

COMBUSTIBLE Any material not defined as noncombustible.

NONCOMBUSTIBLE Elementary or composite materials that are not capable of undergoing combustion under specified conditions.

Reason: This proposal adds two needed definitions to the code. There is significant confusion in the industry on how to define combustible and noncombustible materials. The proposed language was developed by considering the testing requirements in Section 703.5 and the definition in *ASTM E176 Terminology of Fire Standards.*

Cost Impact: Will not increase the cost of construction
The proposal adds clarity through definitions only, and does not change code requirements.

G 5-15 : 202-COMBUSTIBLE (New)-WESTON5608

G 6-15

202

Proponent: Gerald Anderson, City of Overland Park, kansas, representing self (Jerry.Anderson@opkansas.org)

2015 International Building Code

Revise as follows:

SECTION 202 DEFINITIONS

CUSTODIAL CARE. Assistance with day-to-day living tasks; such as assistance with cooking, taking medication, bathing, using toilet facilities and other tasks of daily living. Custodial care includes persons receiving care who have ~~the ability to respond to emergency situations and evacuate at a slower rate and/or who have~~ mental and psychiatric complications.

Reason: With this definition we are trying to define or expand upon what exactly "Custodial Care" entails. A persons ability to respond to emergency situations has no connection with the type of care that is provided. It lends nothing to the goal of defining a type of care one receives.
In addition, having a definition that speaks to a persons ability to evacuate in emergency situations, leads to confusion when applying IBC sections 308.3.1 and 308.3.2 as well as sections 310.6.1 and 310.6.2. In applying those sections for I-1 and R-4 occupancies we have two different conditions that specifically address one's capacity to respond to an emergency situation in occupancies that provide for "custodial care". Having a definition, that speaks to a person's ability to respond to an emergency leads to confusion when applying the code.

Cost Impact: Will not increase the cost of construction
changing a definition will have no cost impace

G 6-15 : 202-CUSTODIAL CARE-ANDERSON5694

G 7-15

202

Proponent: Michael Anthony, University of Michigan, representing University of Michigan (maanthon@umich.edu)

2015 International Building Code

Revise as follows:

SECTION 202 DEFINITIONS

DORMITORY~~.~~ (STUDENT RESIDENCE FACILITY) A space in a building where group sleeping and cooking accommodations are provided in one room, or in a series of closely associated rooms, for persons not members of the same family group, under joint occupancy and single management, as in college dormitories (student residence facilities) or fraternity houses.

Reason: This proposal is intended to correlate with related proposals:
a) Section 310.2 for Residential Group - R, where the word dormitory appears

b) A proposal submitted separately, but coordinated with Brian Fitzgerald, Associate Director of Housing at the University of Michigan and an active member of ACUHO-1, the trade association for campus housing and student residence life professionals.

The term DORMITORY is used in both NFPA 101 and IBC. The common understanding of the term should not only be harmonized between both documents, but the term "dormitory" should be dropped from the vocabulary of the IBC entirely as it applies to the education facilities industry. This proposal is written with parenthetic clarification with the hope that after 2 or 3 revisions of the IBC, the term dormitory will be used in the context of prison, detention or military facilities.

1. The term "dormitory" is used less frequently as the reference material from ACUHO-i indicates. This pattern -- away from the word dormitory (which carries with it the association of detention, correctional, and military facilities) is likely to be seen in the plan review of building departments where the IBC is use. At the time the word "dormitory" came into use the education industry was smaller, did not have the requirement for in-residence instruction, and the financing of (frequently lavish) student living centers by student housing property trusts.

2. The word "dormitory" is used also in NFPA 101 in connection with detention and correctional facilities

3. Part of the year, these facilities are used by permanent residences to live and learn without having to leave student living center to another building on campus; thus the cooking facilities.

4. During the summer months these student living centers are used by transient "campers" -- frequently below 12-grade.

Another term -- STUDENT HOUSING -- may be acceptable to the commitee. A correlating proposal will be submitted to NFPA 101. A task group should be set up to develop a crosswalk between the IBC and NFPA 101. There can be significant out of step conditions between NFPA 101 and the IBC because many states will not adopt the latest version. For the convenience of the committee, selected passages from the 2015 NFPA are shown below. Admittedly, some consideration should be informed by loss history as to whether modification of the definition to reflect a new epoch in the education facilities industry would change the egress, sprinkler, fire separation, hazard classification, and other life safety canons.

Getting two standards to reflect a common understanding of the occupancy and use classification and terminology is no small feat. It may take 3 - 6 years to harmonized them. We have to start somewhere. We prefer not to have to continue struggling with these definitions 6 years from now.

==

2015 NFPA 101 Reference Material - *Selected* Passages to provide the committee insight into the current status of the Life Safety Code

3.3.64* Dormitory. A building or a space in a building in which group sleeping accommodations are provided for more than 16 persons who are not members of the same family in one room, or a series of closely associated rooms, under joint occupancy and single management, with or without meals, but without individual cooking facilities. (SAF-RES)

A.3.3.64 Dormitory. Rooms within dormitories intended for the use of individuals for combined living and sleeping purposes are guest rooms or guest suites. Examples of dormitories are college dormitories, fraternity and sorority houses, and military barracks.

6.1.8.1.4* Definition — Dormitory. A building or a space in a building in which group sleeping accommodations are provided for more than 16 persons who are not members of the same family in one room, or a series of closely associated rooms, under joint occupancy and single management, with or without meals, but without individual cooking facilities.

Chapter 14 New Educational Occupancies

14.1.3.4 Dormitory and Classrooms.

14.1.3.4.1 Any building used for both classroom and dormitory purposes shall comply with the applicable provisions of Chapter 28 in addition to complying with Chapter 14.

14.1.3.4.2 Where classroom and dormitory sections are not subject to simultaneous occupancy, the same egress capacity shall be permitted to serve both sections

15.1.3.4 Dormitory and Classrooms.

15.1.3.4.1 Any building used for both classroom and dormitory purposes shall comply with the applicable provisions of Chapter 29 in addition to complying with Chapter 15.

15.1.3.4.2 Where classroom and dormitory sections are not subject to simultaneous occupancy, the same egress capacity shall be permitted to serve both sections.

Chapter 22 New Detention and Correctional Occupancies

22.3.4.4.3* Smoke detectors shall not be required in Use Condition II open dormitories where staff is present within the dormitory whenever the dormitory is occupied.

A.22.3.4.4.3 An open dormitory is a dormitory that is arranged to allow staff to observe the entire dormitory area at one time

22.2.6.7 The maximum travel distance limitation of 22.2.6.6 shall be permitted to be increased to 100 ft (30 m) in open dormitories, provided that both of the following criteria are met:

(1) The enclosing walls of the dormitory space shall be of smoke-tight construction.

(2) Not less than two exit access doors remotely located from each other shall be provided where travel distance to the exit access door from any point within the dormitory exceeds 50 ft (15 m).

Chapter 28 New Hotels and Dormitories

28.1 General Requirements.
28.1.1 Application.
28.1.1.1 The requirements of this chapter shall apply to new buildings or portions thereof used as hotel or dormitory occupancies. (See 1.3.1.)
28.1.1.2 Administration. The provisions of Chapter 1, Administration, shall apply.

28.1.1.3 General. The provisions of Chapter 4, General, shall apply.

28.1.1.4 Any dormitory divided into suites of rooms, with one or more bedrooms opening into a living room or study that has a door opening into a common corridor serving a number
of suites, shall be classified as an apartment building.

28.1.1.5 The term hotel, wherever used in this Code, shall include a hotel, an inn, a club, a motel, a bed and breakfast, or any other structure meeting the definition of hotel

28.1.4.2 Special Definitions. A list of special terms used in this chapter follows:

(1) Dormitory. See 3.3.64.
(2) Guest Room. See 3.3.132.
(3) Guest Suite. See 3.3.273.1.
(4) Hotel. See 3.3.145.

28.2.11.2 Lockups. Lockups in hotel and dormitory occupancies shall comply with the requirements of 22.4.5

28.3.7 Subdivision of Building Spaces. Buildings shall be subdivided in accordance with 28.3.7.1 or 28.3.7.2.
28.3.7.1 In buildings not protected throughout by an approved, supervised automatic sprinkler system, each hotel guest room, including guest suites, and dormitory room shall be separated from other guest rooms or dormitory rooms by
walls and floors constructed as fire barriers having a minimum 1-hour fire resistance rating.

Bibliography: FROM THE ASSOCIATION OF COLLEGE AND UNIVERSITY HOUSING OFFICERS INTERNATIONAL WEB SITE:
http://www.acuho-i.org/blog/articleid/3976/you-were-asking-residence-halls-vs-dormitories

A member recently asked this question. I thought it was interesting, and that the answer is too. Hopefully you feel the same. Does anyone know of any articles or studies as to when/why the lingo changed from dorm to res hall (to living center, etc)? As far as I know, there aren't any articles specifically on this (please post in the comments if you know otherwise). However, this is the answer I sent. Below I pasted the definitions from the online etymology dictionary, to which I'm referring here. (I love the Online Etymology Dictionary, by the way. It is fabulous.) Basically, "dormitory" comes from the word dormir which means to sleep or to become dormant. I've included some related definitions as well; cubicle (derived from a word that meant "to lie down, to bend oneself"), was the space in which someone slept in the dormitory. The word "cemetery" was derived from words related to dormitory, as it is a "sleeping place." The references to folding oneself into cubicles and death are likely the reason "dormitory" fell out of favor. Further below, there's the historical meanings for the words "residence" and "hall" which have much grander and more home-like pedigrees than that of "dormitory." These connotations are what universities and colleges refer to when explaining why those buildings are residence halls, not dormitories. (A number of examples can be found at the link.) I think the terms "living-learning" and similar, to specifically denote the educational aspects of residence halls, were used more commonly following the publishing of the Residential Nexus, which argued for a strong educational presence in the residence halls. As this is also a way to show the benefits of housing to students, parents and the administration, housing pros emphasize the home-like and educational aspects of housing, rather than the sleeping, dormant aspect.EDIT: Kevin Guidry's comment about an article in the Talking Stick sent me on a hunt through late-80s copies of the magazine. After flipping through many pages of--it must be said--ill-advised editorial, advertisement and fashion decisions, I found the article to which he was likely referring. Here it is: TalkingStick87 ResHallsDorms From the Online Etymology Dictionary: Dormitory: mid-15c., from L. dormitorium, from dormire "to sleep" (see dormant). Dorm: 1900, colloquial shortening of dormitory. Cubicle: late 15c., from L. cubiculum "bedroom," from cubare "to lie down," originally "bend oneself," from PIE base *keu(b)- "to bend, turn." Obsolete from 16c., but revived 19c. for "dormitory sleeping compartment," sense of "any partitioned space" (such as a library carrel) is first recorded 1926. Cemetery:late 14c., from O.Fr. cimetiere "graveyard" (12c.), from L.L. coemeterium, from Gk. koimeterion "sleeping place, dormitory," from koimao "to put to sleep," keimai "I lie down," from PIE base *kei- "to lie, rest" (cf. Goth haims "village," O.E. ham "home, house, dwelling"); see home. Early Christian writers were the first to use it for "burial ground," though the Greek word also were anciently used of the sleep of death. Hall: O.E. heall "place covered by a roof, spacious roofed residence, temple," from P.Gmc. *khallo "to cover, hide" (cf. O.H.G. halla, Ger. halle, Du. hal, O.N. höll "hall;" O.E. hell, Goth. halja "hell"), from PIE base *kel- "to hide, conceal" (see cell). Sense of "entry, vestibule" evolved 17c., at a time when the doors opened onto the main room of a house. Older sense preserved in town hall, music hall, etc., and in university dormitory names. Hall of Fame first attested 1901, in ref. to Columbia College. Residence: c.1380, from M.L. residential, from L. residentem (nom. residens) "residing, dwelling," prp. of residere "reside" (see reside). Residential is attested from 1654, "serving as a residence;" meaning "having to do with housing" is from 1856.

For related information: http://standards.plantops.umich.edu/acuho-i/

Cost Impact: Will not increase the cost of construction
Greater granularity in the definition will likely reduce enforcement mis-match and mis-understanding and thereby reduce cost but it is difficult to count something that does not happen. It is safer to suggest that this change is likely to add to cost.

G 8-15

202

Proponent: Michael Barrett, Salt Lake County, representing Salt Lake County (mbarrett@slco.org)

2015 International Building Code

Revise as follows:

SECTION 202 DEFINITIONS

DWELLING. A building that contains one or two *dwelling units* used, intended or designed to be used, rented, leased, let or hired out to be occupied for living purposes for any period or length of time.

Reason: Introduction -
The code provisions in the IRC and IBC do not assign lease or rental time frames to detached one and two family dwellings and townhouses. The IBC and IRC define a dwelling as; "A building that contains one or two dwelling units used, intended or designed to be used, rented, leased, let or hired out to be occupied for living purposes".
Neither Code requires that the IBC be applied to detached one and two family dwellings and townhouses simply based upon the period of time they are rented. Providing some clarifying and defining language would ensure that the appropriate code is applied.

Justification -

Many detached one and two family dwellings and townhouses are "second homes". Often they are used, rented, leased, let or hired out to be occupied for living purposes, as a single family unit, for periods of time ranging anywhere from one day to years. Whereas they are occupied as a single family unit, and fall within the scope of the IRC, it would be appropriate that they be regulated under the IRC. This clarification is important as it eliminates confusion and a tendency to use the IBC to regulate detached one and two family dwellings and townhouses in this particular situation when the home is within the scope of the IRC and is occupied as a single family unit for less than thirty days. A large number of these homes are located within resort communities and rented for short periods of time. These dwellings may also be used as a housing resource, post disaster, for long or short term housing during the community's disaster recovery process. Applying the IBC would introduce a myriad of challenges. Moreover, the associated costs to comply with IBC requirements would be significant. Using Teton County Wyoming as a model, a cost benefit analysis was performed by Crystal Springs Ranch, Inc., A prominent developer in Teton County Wyoming.

Summary –

Detached one and two family dwellings and townhouses occupied as a single-family unit that fall within the scope of the IRC, should be governed under those provisions regardless of the length of time they are occupied. The proposed language inserted into the referenced code sections is consistent with language used elsewhere in the code and provides much needed clarification as to the proper application of the correct code.

Cost Impact: Will increase the cost of construction
Twelve Standalone Townhouse Units in Teton Village, Wyoming (Approximately 3800 Sq. Ft.)

Item	Description	IBC Cost Increases Per Unit
1	General Conditions - increased construction duration	$ 4,635
2	Fire Sprinklers	$ 15,162
3	Fire Resistance Requirements or Exterior Walls based on Fire Separation Distance	$ 2,575
4	Floor Elevations at the Required Egress Doors	$ -
5	Stairways	$ -
6	Stairway Landings	$ -
7	Accessibility	$ -
8	Handrails	$ -
9	Wiring Methods	$ 22,660
Total	--	**$ 45,032**

Four Standalone Townhouse Units in Teton Village, Wyoming (Approximately 3800 Sq. Ft.)

Total All Items **$ 47,028**

-

Twelve Standalone Townhouse Units in Teton Village, Wyoming (Approximately 4,000 - 5,300 Sq. Ft.)

Total All Items **$ 60,174**

A large number of these homes are located within resort communities and rented for short periods of time. These dwellings may also be used as a housing resource post disaster for long or short term housing during the community's disaster recovery process. Applying the IBC would introduce a myriad of challenges. Moreover, the associated costs to comply with IBC requirements would be significant. Using Teton County Wyoming as a model, a cost benefit analysis was performed by Crystal Springs Ranch, Inc., A prominent developer in Teton County Wyoming.

G 9-15

202

Proponent: Carl Baldassarra, P.E., FSFPE, Chair, Code Technology Committee, representing Code Technology Committee (CTC@iccsafe.org); Adolf Zubia, Chair, Fire Code Action Committee (fcac@iccsafe.org); Edward Kulik, Chair, Building Code Action Committee (bcac@iccsafe.org)

2015 International Building Code

Revise as follows:

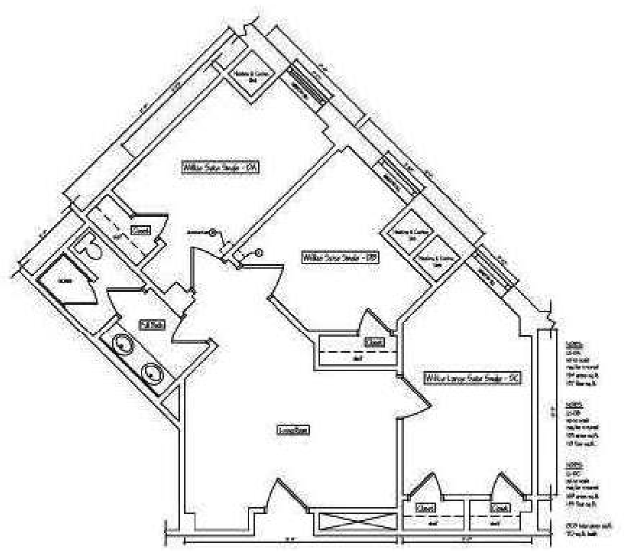
SECTION 202 DEFINITIONS

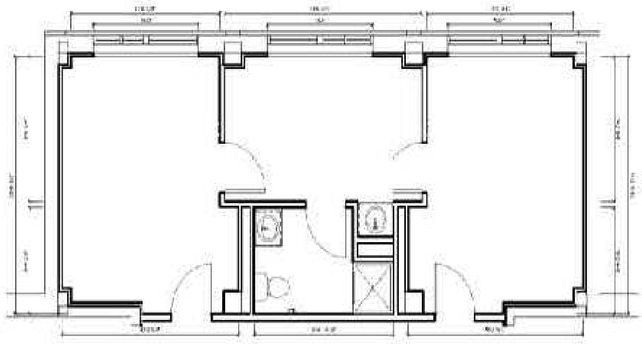
DWELLING UNIT. A single unit providing complete, independent living facilities for one or more persons, including permanent provisions for living, sleeping, eating, cooking and sanitation.

SLEEPING UNIT. A ~~room~~single unit providing rooms or ~~space in which people sleep, which~~spaces for one or more persons,which can also include permanent provisions for living, eating, sleeping, and either sanitation or kitchen facilities but not both. Such rooms and spaces that are also part of a *dwelling unit* are not sleeping units.

Reason: Some hotel rooms, assisted living and dormitories are designed as suites. In a hotel or assisted living space, common designs are one or two bedrooms a living space and private bath. In a dorm, common designs are two rooms with a private bath between; or three or four bedrooms with a living space and private bathrooms. These units act as a group similar to an apartment. Currently the definition for sleeping unit could be interpreted to be just a bedroom. When these bedrooms are combined into suites, they should be considered as one sleeping unit.

Figures for CTC Care proposal to to Section 420 (6B)





This is part of a group of proposals to address this style of design and group homes within single family residences. Changes are proposed for the definition for sleeping units, the Group classifications in Section 310.4 and 310.5, separation requirements in Section 420, and coordination with accessibility requirements in Section 1107. Proposals will be put forward as part of Group B for fire and smoke alarm systems. The proposals could work separately.

The ICC Code Technology Committee (CTC) has just completed its 10th year. The ICC Board has decided to sunset the CTC. The sunset plan includes re-assigning many of the CTC Areas of Study to the applicable Code Action Committee (CAC). The two remaining CTC Areas of Study are Care Facilities and Elevator Lobbies/WTC Elevator issues. This proposal falls under the Care Facilities Area of Study. Information on the CTC, including: the sunset plan; meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the CTC website at: http://www.iccsafe.org/cs/CTC/Pages/default.aspx

This ICC committee was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the Fire-CAC has held 10 open meetings and numerous Regional Work Group and Task Group meetings and conference calls which included members of the committees as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the FAC website at: http://www.iccsafe.org/cs/CAC/Pages/default.aspx?usertoken={token}&Site=icc

The BCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the BCAC has held 13 open meetings and numerous workgroup calls which included members of the BCAC as well as any interested party to discuss and debate the proposed changes and the public comments. Related documentation and reports are posted on the BCAC website at: http://www.iccsafe.org/cs/BCAC/Pages/default.aspx.

Cost Impact: Will not increase the cost of construction
This will increase design options and is a clarification.

202 (New)

Proponent: John Woestman, Kellen Company, representing Builders Hardware Manufacturers Association (BHMA) (jwoestman@kellencompany.com)

THIS PROPOSAL WILL BE HEARD BY THE MEANS OF EGRESS COMMITTEE. PLEASE SEE THE TENTATIVE HEARING ORDER FOR THE MOE COMMITTEE.

2015 International Building Code

Add new text as follows:

SECTION 202 DEFINITIONS

EGRESS SIDE The side of the door first encountered when attempting to leave a room, a story or a building.

Reason: "Egress side" is used in multiple places in the I-Codes but not defined or described. In many uses of "egress side", the context provides an understanding of what is meant by the term. However, in some uses of the term "egress side", the context may be ambiguous as to which side of the door the term refers to. To ensure consistent interpretation and application of requirements pertaining to the egress side of the door, we are proposing this definition.

Cost Impact: Will not increase the cost of construction
No technical revisions.

G 10-15 : 202-EGRESS SIDE (New)-WOESTMAN5499

G 11-15

202

Proponent: Victor Cuevas, representing City of Los Angeles (victor.cuevas@lacity.org)

2015 International Building Code

Revise as follows:

SECTION 202 DEFINITIONS

FOOD COURT. A ~~public~~ seating area located in the *mall* that serves adjacent food preparation tenant spaces.

Reason: If the word "public" is deleted, compliance requirements can also be applied to private clubs, resorts and hotels.

Cost Impact: Will not increase the cost of construction
The code change proposal claifries application of the section of the code and will not increase the cost of construction.

G 11-15 : 202-FOOD COURT-CUEVAS4691

G 12-15

202

Proponent: Victor Cuevas, representing City of Los Angeles (victor.cuevas@lacity.org)

2015 International Building Code

Revise as follows:

SECTION 202 DEFINITIONS

GRADE PLANE. A reference plane representing the average of finished ground level adjoining the building at *exterior walls*.~~ Where the finished ground level slopes away from the *exterior walls*, the~~ The reference plane ~~shall be~~is established by averaging the highest and the lowest ~~points~~ elevation within the area between the exterior wall of the building or structure and the *lot line* or, where the *lot line* is more than 6 feet (1829 mm) from the building, between the building and a point 6 feet (1829 mm) from the building.

Reason: The current definition is confusing, not clear and lengthy.

Cost Impact: Will not increase the cost of construction
The code change proposal will not increase the cost of construction.

G 12-15 : 202-GRADE PLANE-CUEVAS4577

G 13-15

202 (New)

Proponent: Vickie Lovell, InterCode Incorporated, representing National Greenhouse Manufacturers Association (vickie@intercodeinc.com)

2015 International Building Code

Add new definition as follows:

SECTION 202 DEFINITIONS

<u>**GREENHOUSE.** A structure or thermally isolated area of a building that maintains a specialized sunlit environment exclusively used for, and essential to, the cultivation, protection or maintenance of plants.</u>

Reason: Greenhouses are a type of special structure intended to create and maintain a unique sunlit environment used exclusively for, and essential to, the cultivation and protection or maintenance of plants. This definition intends to clarify that it is the unique ENVIRONMENT of the structure, not the structure itself or the presence of plants that makes such a structure a greenhouse.
Buildings made for human habitation maintain specific lighting, ventilation, heating and cooling that is suitable for the health and welfare of humans and their property, even though plants can co-exist in such environments. The main distinguishing feature between a greenhouse and other structures is that the environment in a greenhouse is designed and maintained exclusively for, and is essential for the aggressive propagation of plants used by commercial growers for plant production. However, other activities can be conducted in a greenhouse such as retail business, research by schools and universities, conservation, education, display by botanical institutions holding documented collections of specialty plants, and similar activities. Most importantly, the unique environment must be carefully controlled for the environment specific to the plants in the greenhouse; otherwise, the plants will not survive.

For that reason, this proposed definition ONLY addresses greenhouse structures, and NOT other spaces such as sunrooms, solariums, glass enclosed walkways, atria or other types of interior spaces that permit ample sunlight and ventilation so as to prominently feature plants for aesthetic purposes.

Although there are numerous requirements for greenhouses in the IBC, there is currently no definition of "greenhouse" in the IBC. The definition makes a distinction between structures as mentioned above. Making this distinction between greenhouses and other sunny interior spaces and structures with plants and/or planted areas will help code enforcers apply the appropriate code requirement for such spaces.

This proposal for a definition for greenhouses was approved for the 2015 International Energy Conservation Code.

Cost Impact: Will not increase the cost of construction
There is no cost impact related to this proposal because this code change only adds a new definition to the code.

G 13-15 : 202-GREENHOUSE (New)-LOVELL4393

G 14-15

Proponent: Adolf Zubia, representing Fire Code Action Committee (fcac@iccsafe.org)

THIS PROPOSAL WILL BE HEARD BY THE FIRE SAFETY COMMITTEE. PLEASE SEE THE TENTATIVE HEARING ORDER FOR THE FS COMMITTEE.

2015 International Building Code

Add new definition as follows:

SECTION 202 DEFINITIONS

OPENING PROTECTIVE. A *fire door assembly*, fire shutter assembly, *fire window assembly* or glass-block assembly in a fire-resistance-rated wall or partition.

Reason: This proposal is submitted by the ICC Fire Code Action Committee (FCAC). This ICC committee was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. The Fire-CAC has held 10 open meetings and numerous Regional Work Group and Task Group meetings and conference calls for the current code development cycle which included members of the committees as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the FAC website at:http://www.iccsafe.org/cs/CAC/Pages/default.aspx?usertoken={token}&Site=icc
This term is used extensively in the code, including the title of Section 716, but is not always understood by code users. This definition provides clarity.

The FCAC opening protective work group included interested industry and testing lab representatives working together to make this section more user friendly. The work group unanimously agreed on a number of proposed changes to IBC Section 716, including this one.

Cost Impact: Will not increase the cost of construction
This code change proposal only adds a definition of this term.

G 14-15 : 202-OPENING PROTECTIVE (New)-ZUBIA4201

G 15-15

202

Proponent: John Woestman, Kellen Company, representing Composite Lumber Manufacturers Association (CLMA) (jwoestman@kellencompany.com)

THIS PROPOSAL WILL BE HEARD BY THE FIRE SAFETY COMMITTEE. PLEASE SEE THE TENTATIVE HEARING ORDER FOR THE FS COMMITTEE.

2015 International Building Code

Revise as follows:

SECTION 202 DEFINITIONS

PLASTIC COMPOSITE. A generic designation that refers to wood/plastic composites ~~and~~, plastic lumber, and similar materials.

Delete without substitution:

~~**PLASTIC LUMBER.** A manufactured product made primarily of plastic materials (filled or unfilled) which is generally rectangular in cross section.~~

~~**WOOD/PLASTIC COMPOSITE.** A composite material made primarily from wood or cellulose-based materials and plastic.~~

Reason: This proposal is intended to be clarifications and simplification of the requirements for plastic composites identified in this section.
The 2015 IBC included, for the first time, specific requirements for plastic composite deck boards, stair treads, and guard systems. The existing language was developed and finalized during the 2012 code development cycle for the IBC. The following year, the requirements in the IRC for these same products were revised, but the result is there are some differences between the IBC and the IRC. This code change proposal is an effort to move the language of the IBC to be in close alignment with the language of the IRC. The revised definition would address plastic composite deck boards, stair treads, and guard systems made with such recycled material as carper fiber or material such as mineral-filled PVC.
The two definitions proposed for deletion are also not included / deleted in the IRC. The two deleted definitions are not needed as the terms are self-explanatory.

Cost Impact: Will not increase the cost of construction
No cost implications. No technical changes to the code requirements.

G 15-15 : 202-PLASTIC COMPOSITE-WOESTMAN5568

G 16-15

202

Proponent: Mike Fischer, Kellen Company, representing the Plastic Glazing Coalition of the American Chemistry Council (mfischer@kellencompany.com)

THIS PROPOSAL WILL BE HEARD BY THE FIRE SAFETY COMMITTEE. PLEASE SEE THE TENTATIVE HEARING ORDER FOR THE FS COMMITTEE.

2015 International Building Code

Revise as follows:

SECTION 202 DEFINITIONS

PLASTIC GLAZING. Plastic materials that are glazed or set in frame or sash ~~and not held by mechanical fasteners that pass through the glazing material~~.

Reason: The current definition of Plastic Glazing includes a restriction on attachment that is arbitrary and unnecessary. Many plastic glazing elements include penetrations as well as attachment hardware that passes through the glazing material. This restriction should not be in a definition; all other structural, fire, and safety provisions in the IBC apply.

Cost Impact: Will not increase the cost of construction
The proposal adds no new requirements.

G 17-15

202

Proponent: Marcelo Hirschler, GBH International, representing GBH International (gbhint@aol.com)

THIS PROPOSAL WILL BE HEARD BY THE FIRE SAFETY COMMITTEE. PLEASE SEE THE TENTATIVE HEARING ORDER FOR THE FS COMMITTEE.

2015 International Building Code

Revise as follows:

SECTION 202 DEFINITIONS

LIGHT TRANSMITTING PLASTIC, APPROVED. Any light transmitting thermoplastic, thermosetting or reinforced thermosetting plastic material that conforms to combustibility classifications specified in the section applicable to the application and plastic type.

Reason: The IBC discusses approved light transmitting plastics in the sections associated with such plastics within Chapter 26 of the code. The concepts included in the definition refer to the classifications of Class CC1 and Class CC2 in section 2606.4 of the code. For all other uses there is nothing different about approving a plastic material than approving a wood material or any other type of material.
Proposals are also being submitted to the relevant sections that reference "approved plastic" when they should reference "approved light transmitting plastic"

Cost Impact: Will not increase the cost of construction
This is simply a change in the definition of "plastic, approved" to "light transmitting plastic, approved" that would clarify the intent of the definition.

G 17-15 : 202-PLASTIC, APPROVED-HIRSCHLER3513

G 18-15

202

Proponent: Edward Kulik, representing Building Code Action Committee (bcac@iccsafe.org)

2015 International Building Code

Revise as follows:

SECTION 202 DEFINITIONS

PRIVATE GARAGE. A building or portion of a building in which motor vehicles used by the owner or tenants of the building or buildings on the premises are stored or kept, without provisions for repairing or servicing such vehicles for profit.

Reason: Private garages can also be used by the owners of the building.
This public proposal is submitted by the ICC Building Code Action Committee (BCAC). The BCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the BCAC has held 13 open meetings and numerous workgroup calls which included members of the BCAC as well as any interested party to discuss and debate the proposed changes and the public comments. Related documentation and reports are posted on the BCAC website at: http://www.iccsafe.org/cs/BCAC/Pages/default.aspx.

Cost Impact: Will not increase the cost of construction
This code proposal will not increase the cost of construction. It permits additional use of the building.

G 18-15 : 202-PRIVATE GARAGE-KULIK4798

G 19-15

202 (New)

Proponent: Marcelo Hirschler, representing GBH International (gbhint@aol.com)

2015 International Building Code

Add new definition as follows:

SECTION 202 DEFINITIONS

SOFT CONTAINED PLAY EQUIPMENT STRUCTURE. A children's play structure containing one or more components where the user enters an enclosed play environment that utilizes pliable materials.

Reason: Section 424 discusses children's play structures and a definition is being proposed for that. Items 3, 6 and 7 of 424.2 also talks about "soft-contained play equipment structures", and a definition is being proposed for that as well, to identify that "soft-contained play equipment structures" are those that contain pliable materials and where the user is enclosed.

Cost Impact: Will not increase the cost of construction
Simply adds a definition.

G 19-15 : 202-SOFT CONTAINED PLAY EQUIPMENT STRUCTURE (New)-HIRSCHLER4582

G 20-15

202

Proponent: Jennifer Hatfield, J. Hatfield & Associates, PL, representing Association of Pool & Spa Professionals (jhatfield@apsp.org)

2015 International Building Code

Revise as follows:

SECTION 202 DEFINITIONS

SWIMMING POOL. Any structure intended to be used for swimming~~, recreational~~ or bathing ~~or wading~~and that ~~contains water over 24 inches (610 mm) deep~~is operated by an owner, lessee, operator, licensee or concessionaire, regardless of whether a fee is charged for use. This includes in-ground, aboveground and on-ground pools; hot tubs; spas and fixed-inplace wading pools that are designed and manufactured to be connected to a circulation system.

Reason: This definition is being amended to bring it in better alignment with the definitions and scope of the International Swimming Pool & Spa Code. A swimming pool is no longer defined with the limitation that it must contain water over 24 inches deep; rather, based on the scope of the ISPSC a key element is that they are designed and manufactured to be connected to a circulation system. Other edits were made to closely align with the definition of a Public Swimming Pool in the ISPSC. In this case allowance was made to incorporate spas, hot tubs, and other types of pools within this definition, with the limited requirements for these structures found in the IBC, but the reader can find detailed definitions of each in the ISPSC.

Bibliography: International Swimming Pool & Spa Code, 2015 edition, Sections 101.2 and 202

Cost Impact: Will not increase the cost of construction
This code change is simply aligning the verbiage with that found in another I-code, the ISPSC, due to the fact certain requirements remain in the IBC (Section 1110.4.13 for example) for swimming pools and spas. It does not make a change that would add requirements to a pool; therefore, no cost increase exists.

202

Proponent: Jay Crandell, ARES Consulting, representing Foam Sheathing Committee of the American Chemistry Council

THIS PROPOSAL WILL BE HEARD BY THE FIRE SAFETY COMMITTEE. PLEASE SEE THE TENTATIVE HEARING ORDER FOR THE FS COMMITTEE.

2015 International Building Code

Revise as follows:

SECTION 202 DEFINITIONS

VAPOR RETARDER CLASS. A measure of a material or assembly's ability to limit the amount of moisture that passes through that material or assembly. Vapor retarder class shall be defined using the desiccant method <u>with Procedure A </u>of ASTM E 96 as follows:

Class I: 0.1 perm or less.
Class II: 0.1 < perm ≤ 1.0 perm.
Class III: 1.0 < perm ≤ 10 perm.

Reason: To make IBC and IRC definitions of vapor retarder class more consistent by adding reference to Procedure A of ASTM E 96. The IRC definition also should be later adjusted to be more grammatically correct and consistent with the IBC (e.g., the IRC definition reads "A measure of a material or assembly to limit..." which misses the word "ability" included in the IBC definition).

Cost Impact: Will not increase the cost of construction
This is a definition editorial change to coordinate codes with no cost impact.

Reason: The intent of this proposal is to remove the definition list sections scattered about the code and the lists of defined terms included within each such section. Starting with the 2012 edition of the IBC all of the definitions were consolidated into Chapter 2. These sections are vestigages of historic organization of the code. In general when new terms are added to Chapter 2, they rarely find themselves being added to one of these lists. Terms can be removed from Chapter 2, but don't always get removed from these lists. Most of the ICC codes simply have a Chapter 2 of definitions, there are no lists scattered about the code. It is time to remove these lists. I see this as an editorial action. The proposal was not accepted by the Code Correlation Committee because of a concern that the language in each section implied that all terms were defined. I have revised that language to provide a simple reference for defined terms.
This proposal simply amends the sections to remove the lists and send the code users directly to Chapter 2. An alternative the committee might consider is to delete all of these sections (except the two that list notations). Deletion would force renumber of the balance of the sections in these chapters.

In two sections, these lists also contain a list of scientific notations used in the chapter. Those notations are not found in Chapter 2. Thus the current text is incorrect and needs to be addressed. The proposal retains Section 1602 and 2102, but only for the listed notations.

Cost Impact: Will not increase the cost of construction
The proposal is purely editorial in nature and will have no impact on actual construction.

G 22-15 : 304.2-RICE5794

G 23-15

302.1, 508.2.4, 508.3.3

Proponent: Ali Fattah, City of San Diego Development Services Department, representing City of San Diego (afattah@sandiego.gov)

2015 International Building Code

Revise as follows:

302.1 General. Structures or portions of structures shall be classified with respect to occupancy in one or more of the groups listed in this section. A room or space that is intended to be occupied at different times for different purposes shall comply with all of the requirements that are applicable to each of the purposes for which the room or space will be occupied. <u>Occupied roof decks, other than private roof decks accessed from individual dwelling units in Group R-3 and Group R-2 occupancies, shall be classified based on the proposed use of the space.</u> Structures with multiple occupancies or uses shall comply with Section 508. Where a structure is proposed for a purpose that is not specifically provided for in this code, such structure shall be classified in the group that the occupancy most nearly resembles, according to the fire safety and relative hazard involved.

1. Assembly (see Section 303): Groups A-1, A-2, A-3, A-4 and A-5.
2. Business (see Section 304): Group B.
3. Educational (see Section 305): Group E.
4. Factory and Industrial (see Section 306): Groups F-1 and F-2.
5. High Hazard (see Section 307): Groups H-1, H-2, H-3, H-4 and H-5.
6. Institutional (see Section 308): Groups I-1, I-2, I-3 and I-4.
7. Mercantile (see Section 309): Group M.
8. Residential (see Section 310): Groups R-1, R-2, R-3 and R-4.
9. Storage (see Section 311): Groups S-1 and S-2.
10. Utility and Miscellaneous (see Section 312): Group U.

508.2.4 Separation of occupancies. No separation is required between accessory occupancies and the main occupancy.

Exceptions:

1. Group H-2, H-3, H-4 and H-5 occupancies shall be separated from all other occupancies in accordance with Section 508.4.
2. Group I-1, R-1, R-2 and R-3 *dwellingunits* and *sleeping units* shall be separated from other *dwelling* or *sleeping units* and from accessory occupancies contiguous to them in accordance with the requirements of Section 420.
3. <u>Occupied roof decks classified as Group A and located on buildings constructed with three or more stories above grade plane and constructed of Type VB, IIIB and IIB construction shall be separated from all other occupancies in accordance with Section 508.4.</u>

508.3.3 Separation. No separation is required between nonseparated occupancies.

Exceptions:

1. Group H-2, H-3, H-4 and H-5 occupancies shall be separated from all other occupancies in accordance with Section 508.4.
2. Group I-1, R-1, R-2 and R-3 *dwellingunits* and *sleeping units* shall be separated from other *dwelling* or *sleeping units* and from other occupancies contiguous to them in accordance with the requirements of Section 420.
3. <u>Occupied roof decks classified as Group A and located on buildings constructed with three or more stories above grade plane and constructed of Type VB, IIIB and IIB construction shall be separated from all other occupancies in accordance with Section 508.4.</u>

Reason: Modify Section 301 and add exception 3 to Section 508.2.4 and to Section 508.3.3 to require an occupancy separation between occupied roof decks classified as Group A and the building below.
Section 302.1 of the IBC requires that rooms or spaces be classified into one or more occupancies. In addition to determining allowable height and area requirements, as well fire protection requirements, establishing the occupancy of a space is required to determine means of egress requirements and fire alarm and occupant notification requirements. The IBC is not clear on how to address occupied roofs used for public assembly or other uses. Section 1004.5 requires compliance with the means of egress requirements of Ch 10 for certain outdoor areas that are enclosed and to and from which building occupants pass. The code is not clear what other occupancy specific requirements should be applicable due to the occupancy within the occupied roof deck.

The purpose of this code change is to require not less than one hour construction for the floor supporting occupied roof decks classified in Group A when required by Table 508.4 and when located on buildings of Type VB, IIIB, IIB construction. Table 508.4 requires at least a one hour occupancy separation for all occupancies other than F-2, S-2, U and E when adjacent to a Group A occupancy. Occupants on the occupied roof deck may not be at risk due to a fire event occurring on the roof deck, however they are unaware of the hazards in the building below which can be several stories below.

For example a Group A occupancy can be located on an occupied roof above a 74 ft high Type IIIB sprinkler protected building with two stories of type IA construction below 5 stories of Type IIIB construction. 500 occupants can be located on this occupied roof deck and are provided with two 2 hour interior exit stairways. Fire alarm activation of this non-high rise building will simultaneously cause the evacuation of all occupants in the building served by the two stairways and as a consequence queuing will occur. The occupancy separation will provide sufficient time for occupants on the roof to queue and enter the exit stairways and safely egress down the stairways.

This code changes provides balanced fire protection and does not rely only on sprinkler protection required in the building below by Section 903.2.1.6. The proposed code change only requires that the occupancy separation be required when the occupied roof deck is located above a building three or more stories above grade plane. Private roof decks associated with Group R-3 and individual units in R-2 are not classified as group A and will not be required to comply with the proposed code change.

Section 903.2.1.6 was added in the last code change cycle in code change # F121, F122, F124 -13 by Aon Fire Protection, Tennessee Code Development Committee and the ICC Fire Code Action Committee to require sprinkler protection below occupied roofs with more than 100 occupants for Group A-2 and 300 for all other Group A occupancies when not on open parking garages constructed of Type I or Type II. The substantiation for Code Change # F124 that prevailed with modifications, and that was approved under public comment # 1, stated in part that "The occupants of the Group A occupancy, whether within the building or on the roof, are unaware of the hazards in the building and need to evacuate through the building."

Cost Impact: Will increase the cost of construction
This code change will increase the cost of construction due to required additional fire resistance of the roof ceiling assembly under the occupied roof deck and supporting construction. The majority of wood framed buildings are covered with gypsum sheathing board or exterior plaster wall finish so the cost impact is not significant when compared to the overall cost of construction.

G 24-15

302.1, 503.1.4 (New)

Proponent: Stephen Thomas, representing Colorado Chapter (sthomas@coloradocode.net)

2015 International Building Code

Revise as follows:

302.1 General. Structures or portions of structures shall be classified with respect to occupancy in one or more of the groups listed in this section. A room or space that is intended to be occupied at different times for different purposes shall comply with all of the requirements that are applicable to each of the purposes for which the room or space will be occupied. Structures with multiple occupancies or uses shall comply with Section 508. Where a structure is proposed for a purpose that is not specifically provided for in this code, such structure shall be classified in the group that the occupancy most nearly resembles, according to the fire safety and relative hazard involved. Yards, patios, courts, occupied roofs and similar outdoor areas accessible to and usable by the building occupants shall be classified in the group that the occupancy most nearly resembles, according to the fire safety and relative hazard involved.

1. Assembly (see Section 303): Groups A-1, A-2, A-3, A-4 and A-5.
2. Business (see Section 304): Group B.
3. Educational (see Section 305): Group E.
4. Factory and Industrial (see Section 306): Groups F-1 and F-2.
5. High Hazard (see Section 307): Groups H-1, H-2, H-3, H-4 and H-5.
6. Institutional (see Section 308): Groups I-1, I-2, I-3 and I-4.
7. Mercantile (see Section 309): Group M.
8. Residential (see Section 310): Groups R-1, R-2, R-3 and R-4.
9. Storage (see Section 311): Groups S-1 and S-2.
10. Utility and Miscellaneous (see Section 312): Group U.

Add new text as follows:

503.1.4 Occupied roofs Occupied roofs are not subject to the building height, number of stories and building area limitations of Sections 504 and 506.

Reason: Many buildings are being built or altered to create an occupied roof. The code is not clear as to the requirements for these "spaces". Chapter 10 takes care of the means of egress requirements. But, the rest of the code does not address these issues. Some areas are used as gathering spaces, dining areas, swimming pools, etc. The question has come up as to whether these uses are an "occupancy". Some jurisdictions classify them as occupancies and others do not. We were originally going to look at writing a much larger change that would state that they are not occupancies and provide exceptions throughout the code. However, the fact is that the code is an occupancy driven document. Therefore, we decided to use similar language in Section 302.1 combined with the language in Section 1004.5. An occupied roof would be classified to an occupany that it most resembles. For example, a roof off of a private office would be classified as a Group B occupancy. However a roof above a restaurant would be classified as a Group A-2 occupancy.
We have also provided language stating that the hieght and area requirements do not apply to occupied roofs. We conducted a survey of several building departments and code consultants and found that most respondents did not require an occupied roof to comply with the height and area provisions of the code. We are also not aware of any issues with the use of a roof as an occupied space.

This proposal provides users of the code some guidance and clarification on how to apply the provisions to an occupied roof.

Cost Impact: Will not increase the cost of construction
This change is a clarification to the code. It will not affect the overall cost of construction.

G 24-15 : 302.1-THOMAS4437

G 25-15

303.1.1, 303.1.2

Proponent: Johnna Grizzard, representing Virginia Building and Code Officials Association

2015 International Building Code

Revise as follows:

303.1.1 Small buildings and tenant spaces. A building or tenant space used for assembly purposes with an *occupant load* of less than 50 persons ~~shall~~ is permitted to be classified as a Group B occupancy.

303.1.2 Small assembly spaces. The following rooms and spaces shall not be classified as Assembly occupancies:

1. A room or space used for assembly purposes with an *occupant load* of less than 50 persons and accessory to another occupancy ~~shall~~is permitted to be classified as a Group B occupancy or as part of that occupancy.
2. A room or space used for assembly purposes that is less than 750 square feet (70 m^2) in area and accessory to another occupancy ~~shall~~ is permitted to be classified as a Group B occupancy or as part of that occupancy.

Reason: The current language requires that Group A, Assembly buildings, tenant spaces, and small areas with an occupant load less than 50 be classified as a Group B occupancy. These exceptions were likely originally intended to be Exceptions--not requirements. By requiring such spaces to be classified as a B occupancy, a *change of occupancy* could be forced when the actual hazard is being decreased. When a space undergoes a change of use the accessisible route, plumbing fixture calculations, outside air calculations, etc. have to be evaluated under current code provisions. If applied literally, this current language is a significant burden on a business owners.

For example, if a small cafe had an occupant load less than 50 due to fixture layout and were to move into a space that was previously classified as an A-2, the current language would required that the space be re-classified to a Business occupancy.

Cost Impact: Will not increase the cost of construction
Clarifying the intent of these exceptions would likely reduce the cost because Assesmbly occupancies with less than 50 occupants would not be forced into a *change of occupancy*.

G 25-15 : 303.1.1-GRIZZARD5463

G 26-15

303.1.1, 303.1.2

Proponent: Gregory Keith, Professional heuristic Development, representing The Boeing Company (grkeith@mac.com)

2015 International Building Code

Revise as follows:

303.1.1 Small buildings and tenant spaces. A building or tenant space used for assembly purposes with an *occupant load* of less than 50 persons <u>that is not accessory to another occupancy</u> shall be classified as a Group B occupancy.

303.1.2 Small assembly spaces. The following rooms and spaces shall not be classified as Assembly occupancies:

1. A room or space used for assembly purposes with an *occupant load* of less than 50 persons and accessory to another occupancy shall be classified as a Group B occupancy or as part of that occupancy.
2. A room or space used for assembly purposes that is less than 750 square feet (70 m^2) in area and accessory to another occupancy shall be classified as a Group B occupancy or as part of that occupancy.

Reason: This proposal is intended to provide clarity to users. There is a technical relationship between Sections 303.1.1 and 303.1.2. Both deal with buildings or portions of buildings having an occupant load of less than 50 persons. The qualifying conditions for both sections are somewhat similar. However, Section 303.1.2 states that applicable spaces are accessory to another occupancy. If such is the case, such space may be classified as a Group B occupancy or the occupancy to which they are accessory. Until a person reads Section 303.1.2, the intent of Section 303.1.1 does not become readily apparent. That is, Section 303.1.1 is applicable to tenant spaces <u>not</u> accessory to another occupancy. Inclusion of this clarifying language will place Section 303.1.1 in technical context and assist code users as they attempt to classify occupancies containing assembly uses.

Cost Impact: Will not increase the cost of construction
This proposal results in no technical change.

G 26-15 : 303.1.1-KEITH5457

G 27-15

303.4

Proponent: Vickie Lovell, InterCode Incorporated, representing National Greenhouse Manufacturers Association (vickie@intercodeinc.com)

2015 International Building Code

Revise as follows:

303.4 Assembly Group A-3. Group A-3 occupancy includes assembly uses intended for worship, recreation or amusement and other assembly uses not classified elsewhere in Group A including, but not limited to:
Amusement arcades
Art galleries
Bowling alleys
Community halls
Courtrooms
Dance halls (not including food or drink consumption)
Exhibition halls
Funeral parlors
<u>Greenhouses with public access for the conservation and exhibition of plants</u>
Gymnasiums (without spectator seating)
Indoor *swimming pools* (without spectator seating) Indoor tennis courts (without spectator seating)
Lecture halls
Libraries
Museums
Places of religious worship
Pool and billiard parlors
Waiting areas in transportation terminals

Reason: Buildings made for human habitation maintain specific lighting, ventilation, heating and cooling levels that are suitable for the health and welfare of humans and their property, even though plants can co-exist in such environments. The main distinguishing feature between a greenhouse and other structures is that the environment in a greenhouse is designed and maintained exclusively for, and is essential for the aggressive propagation of plants.
However, other activities can be conducted in a greenhouse, such as retail business, research by schools and universities, conservation, education, display by botanical institutions holding documented collections of specialty plants, and similar activities.

The intent of this proposal is to clarify that greenhouses, while typically determined to be Group U, are also used for public venues for the conservation and exhibition of specialty collections of plants, such as botanical gardens, private collections open to the public, and municipal parks. This proposal recognizes that trend, and helps code users and enforcers to consistently apply the requirements appropriately for greenhouses determined to be in this occupancy group.

Most importantly, even though the greenhouse is accessible by the public, it is still intended to maintain a unique environment with carefully controlled conditions specific to the plants in the greenhouse; otherwise, the plants will not survive. Greenhouses with public access for the conservation and exhibition of plants should not be confused with other sunlit interior spaces that feature plants for aesthetic purposes.

Cost Impact: Will not increase the cost of construction
There is no cost impact related to this proposal because this code change only adds greenhouses to Group A-3.

G 27-15 : 303.4-LOVELL5751

G 28-15

303.5

Proponent: Michael Anthony, University of Michigan, representing University of Michigan (maanthon@umich.edu)

2015 International Building Code

Revise as follows:

303.5 Assembly Group A-4. Group A-4 occupancy includes assembly uses intended for viewing of indoor sporting events and activities with spectator seating including, but not limited to:
Arenas
Skating rinks
Swimming pools
Tennis courts
Sports practice facilities

Reason: These large faciities are now in common use for intercollegiate football programs. Recognition here will correlate with another proposal we will submit for Section 906.

Cost Impact: Will not increase the cost of construction
This is just a proposal for refinement of an existing definition that will likely reduce variance requests. From that standpoint, this definition may actually reduce construction cost farther upstream in the design phase.

G 28-15 : 303.5-ANTHONY5460

G 29-15

304.1

Proponent: Vickie Lovell, InterCode Incorporated, representing National Greenhouse Manufacturers Association (vickie@intercodeinc.com)

2015 International Building Code

Revise as follows:

304.1 Business Group B. Business Group B occupancy includes, among others, the use of a building or structure, or a portion thereof, for office, professional or service-type transactions, including storage of records and accounts. Business occupancies shall include, but not be limited to, the following:
Airport traffic control towers
Ambulatory care facilities
Animal hospitals, kennels and pounds
Banks
Barber and beauty shops
Car wash
Civic administration
Clinic, outpatient
Dry cleaning and laundries: pick-up and delivery stations and self-service
Educational occupancies for students above the 12th grade
Electronic data processing
Food processing establishments and commercial kitchens not associated with restaurants, cafeterias and similar dining facilities not more than 2,500 square feet (232 m^2) in area.
Greenhouses attached to structures classified as Group B
Laboratories: testing and research
Motor vehicle showrooms
Post offices
Print shops
Professional services (architects, attorneys, dentists, physicians, engineers, etc.)
Radio and television stations
Telephone exchanges
Training and skill development not in a school or academic program (this shall include, but not be limited to, tutoring centers, martial arts studios, gymnastics and similar uses regardless of the ages served, and where not classified as a Group A occupancy).

Reason: Buildings made for human habitation maintain specific lighting, ventilation, heating and cooling levels that are suitable for the health and welfare of humans and their property, even though plants can co-exist in such environments. The main distinguishing feature between a greenhouse and other structures is that the environment in a greenhouse is designed and maintained exclusively for, and is essential for the aggressive propagation of plants by commercial growers. However, other activities can be conducted in a greenhouse, such as retail business, research by schools and universities, conservation, education, display by botanical institutions holding documented collections of specialty plants, and similar activities. Most importantly, the unique environment must be carefully controlled with conditions specific to the plants in the greenhouse; otherwise, the plants will not survive.
The intent of this proposal is to clarify that greenhouses, typically considered to be Group U, are being used for educational occupancies for students above the 12th grade such as universities and schools, laboratories for research, and other professional settings. This proposal helps code users and enforcers to apply the requirements consistently and appropriately for greenhouses that have been determined to be in this occupancy group.

Greenhouses can be free standing or attached to a university classroom or laboratory for scientific studies. Access is limited to students and faculty - Use Group B or U.

Cost Impact: Will not increase the cost of construction
There is no cost impact related to this proposal because this code change only adds greenhouses to Group B.

G 29-15 : 304.1-LOVELL4395

G 30-15

305.1.2 (New)

Proponent: Vickie Lovell, InterCode Incorporated, representing National Greenhouse Manufacturers Association (vickie@intercodeinc.com)

2015 International Building Code

Add new text as follows:

305.1.2 Greenhouses Greenhouses attached to structures classified as Group E occupancies shall be classified as Group E.

Reason: Buildings made for human habitation maintain specific lighting, ventilation, heating and cooling levels that are suitable for the health and welfare of humans and their property, even though plants can co-exist in such environments. The main distinguishing feature between a greenhouse and other structures is that the environment in a greenhouse is designed and maintained exclusively for, and is essential for the aggressive propagation of plants by commercial growers. However, other activities can be conducted in a greenhouse, such as retail business, research by schools and universities, conservation, education, display by botanical institutions holding documented collections of specialty plants, and similar activities. Most importantly, the unique environment must be carefully controlled with conditions specific to the plants in the greenhouse; otherwise, the plants will not survive.

The intent of this proposal is to clarify that greenhouses, while typically determined to be Group U, are being used for educational occupancies for students in private and public schools, laboratories, and other educational venues. This proposal helps code users and enforcers to consistently apply the requirements appropriately for greenhouses determined to be in this occupancy group.

Cost Impact: Will not increase the cost of construction
There is no cost impact related to this proposal because this code change only adds greenhouses to Group E.

G 30-15 : 305.1.2 (New)-LOVELL5092

G 31-15

306.3

Proponent: Vickie Lovell, InterCode Incorporated, representing National Greenhouse Manufacturers Association (vickie@intercodeinc.com)

2015 International Building Code

Revise as follows:

306.3 Low-hazard factory industrial, Group F-2. Factory industrial uses that involve the fabrication or manufacturing of noncombustible materials that during finishing, packing or processing do not involve a significant fire hazard shall be classified as F-2 occupancies and shall include, but not be limited to, the following:
Beverages: up to and including 16-percent alcohol content
Brick and masonry
Ceramic products
Foundries
Glass products
Gypsum
Ice
Metal products (fabrication and assembly)
<u>Plants cultivated in detached production greenhouses</u>

Reason: Although greenhouses have historically been classified in the IBC as Group U occupancy group, many of today's greenhouses are actually manufacturing and process facilities intensively cultivating flowers, vegetables, fruits, and herbs for food, medicine, etc. They maintain a highly controlled interior environment for heating, cooling, watering, and the management of sunlight for maximum yield. Such facilities have a low occupant load and manufacture "products" that are not a significant fire hazard and require minimal packaging. Such facilities are technologically sophisticated and are not consistent with other low-tech Group U structures such a stables, barns, sheds and carports, and exceed the area limitations for that use group.
This proposal helps code users and enforcers to consistently apply the requirements appropriately for greenhouses determined to be in this occupancy group.

Commercial production greenhouse. Use Group F-2.

Cost Impact: Will not increase the cost of construction
There is no cost impact related to this proposal because this code change only adds plants in commercial greenhouses to Group F-2.

G 31-15 : 306.3-LOVELL5094

G 32-15

202 (New), 308.3, 310.6, 420.4

Proponent: Edward Kulik, representing Building Code Action Committee (bcac@iccsafe.org)

2015 International Building Code

Add new definition as follows:

SECTION 202 DEFINITIONS

CRISIS CENTER. A building or part thereof housing persons, on a 24-hour basis, who due to an emergent situation need housing. The occupants are generally capable of responding to an emergency situation, but may require physical prompting from staff and may include adults or children with an adult, parent or guardian.

Revise as follows:

308.3 Institutional Group I-1. Institutional Group I-1 occupancy shall include buildings, structures or portions thereof for more than 16 persons, excluding staff, who reside on a 24-hour basis in a supervised environment and receive custodial care. Buildings of Group I-1 shall be classified as one of the occupancy conditions specified in Section 308.3.1 or 308.3.2. This group shall include, but not be limited to, the following:

Alcohol and drug centers

Assisted living facilities

Congregate care facilities

Crisis Center

Group homes

Halfway houses

Residential board and care facilities

Social rehabilitation facilities

310.6 Residential Group R-4. Residential Group R-4 occupancy shall include buildings, structures or portions thereof for more than five but not more than 16 persons, excluding staff, who reside on a 24-hour basis in a supervised residential environment and receive *custodial care*. Crisis center facilities shall be permitted to be used for the care of not more than 10 children under the age of 2-1/2 on a transient basis. Buildings of Group R-4 shall be classified as one of the occupancy conditions specified in Section 310.6.1 or 310.6.2. This group shall include, but not be limited to, the following:

Alcohol and drug centers

Assisted living facilities

Congregate care facilities

Crisis center

Group homes

Halfway houses

Residential board and care facilities

Social rehabilitation facilities

Group R-4 occupancies shall meet the requirements for construction as defined for Group R-3, except as otherwise provided for in this code.

420.4 Smoke barriers in Group I-1, Condition 2. Smoke barriers shall be provided in Group I-1, Condition 2 and *crisis centers*, to subdivide every story used by persons receiving care, treatment or sleeping and to provide other stories with an occupant load of 50 or more persons, into no fewer than two smoke compartments. Such stories shall be divided into smoke compartments with an area of not more than 22,500 square feet (2092 m^2) and the distance of travel from any point in a smoke compartment to a smoke barrier door shall not exceed 200 feet (60 960 mm). The smoke barrier shall be in accordance with Section 709.

Reason: This public proposal is submitted by the ICC Building Code Action Committee (BCAC). The BCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the BCAC has held 13 open meetings and numerous workgroup calls which included members of the BCAC as well as any interested party to discuss and debate the proposed changes and the public comments. Related documentation and reports are posted on the BCAC website at: http://www.iccsafe.org/cs/BCAC/Pages/default.aspx.
The IBC currently would have us classify any Child Care Facility having more than 5 children less than 2 ½ years old staying there for up to three days as an I-2 Occupancy. For a two-story that would require the building be built of II-A construction even if fully protected by an NFPA 13 sprinkler system due to the I-2 classification. We feel that is excessive for a small crisis type center that provides shelter for a mother and child for a short period of time while they find a place to live. For that reason, we feel it is more reasonable to include such a use in the special occupancy section of the code.

Also, IBC Chapter 11 does not specifically address this type of care and accordingly lacks direction as to applying accessibility provisions. Currently code users and code officials can evaluate the building for accessibility using "anticipated need" and because Chapter 11 does not have provisions for a "Crisis Center" one can be led to "R-4" provisions using "anticipated need" for applying the accessibility provisions. That still leaves code officials in the awkward position of requiring the higher levels of costly construction for items like fire resistive rated noncombustible construction, shafts, dampers and exiting due to the I-2 occupancy.

For those reasons we feel it would be best to include a definition in Chapter 2, a reference to those facilities in sections 308.3 and 310.6 and the details within Section 420.

Cost Impact: Will not increase the cost of construction
This proposal will not increase the cost of construction. The cost of construction and maintenance should be reduced for these types of facilities.

G 32-15 : 308.3-KULIK3682

G 33-15

308.3.4, 308.4.2, 310.5.1, [F] 903.2.8.4 (IFC 903.2.8.4)

Proponent: Carl Baldassarra, P.E., FSFPE, Chair, Code Technology Committee, representing Code Technology Committee (CTC@iccsafe.org)

2015 International Building Code

Revise as follows:

308.3.4 Five or fewer persons receiving custodial care. A facility with five or fewer persons receiving custodial care shall be classified as Group R-3 ~~or shall comply with the *International Residential Code* provided an *automatic sprinkler system* is installed in accordance with Section 903.3.1.3 or Section P2904 of the *International Residential Code*~~.

308.4.2 Five or fewer persons receiving medical care. A facility with five or fewer persons receiving medical care shall be classified as Group R-3 ~~or shall comply with the *International Residential Code* provided an *automatic sprinkler system* is installed in accordance with Section 903.3.1.3 or Section P2904 of the *International Residential Code*~~.

310.5.1 Care facilities ~~within a dwelling~~. ~~Care facilities for~~
A dwelling with five or fewer persons receiving custodial or medical care ~~that are within a single-family dwelling are~~, shall be permitted to ~~comply~~be constructed in accordance with the *International Residential Code*~~provided an *automatic sprinkler system* is installed in accordance with Section 903.3.1.3 or Section P2904 of the *International Residential Code*~~.

2015 International Fire Code

Revise as follows:

903.2.8.4 Care facilities. An *automatic sprinkler system* installed in accordance with Section 903.3.1.3 shall be permitted in ~~care facilities~~a dwelling with five or fewer individuals ~~in a single-family dwelling.~~providing custodial or medical care.

Reason: The intent of this proposal is to coordinate the language between sections and to let the IRC requirements determine the sprinkler regulations. The provisions for 5 or fewer persons receiving care under Group I-1 and I-2 (308.3.4, 308.4.2) is strictly a reference to the requirements in Group R-3 (310.5.1). If a care facility is not within a dwelling, it is a Group R-3. If care is provided for individuals within a home, they can follow the IRC for construction requirements.
The dwelling with 5 or fewer persons receiving care can literally be single family homes or small group home. The Group R-4 facilities were developed to be consistent with the Fair Housing Act. Over time, changes have been made to the codes that have resulted in jurisdictions being subject to discrimination lawsuits under the Fair Housing Act.

The IRC has a sprinkler requirement, so these homes should be permitted to be constructed in accordance with the IRC. Forcing a facility to drag a sprinkler system with them, just in case a jurisdiction may decide to not require single family home to sprinkler, is not good code practice.

NFPA 13D sprinkler systems are required for care facilities with 5 or fewer residents (Section 903.2.8.4) that decide to construct in the IBC. The proposed wording is for consistency in the language in Chapter 3.

The change to IFC 903.2.8.4 is strictly consistency in terminology and is not a technical change.

The ICC Code Technology Committee (CTC) has just completed its 10th year. The ICC Board has decided to sunset the CTC. The sunset plan includes re-assigning many of the CTC Areas of Study to the applicable Code Action Committee (CAC). The two remaining CTC Areas of Study are Care Facilities and Elevator Lobbies/WTC Elevator issues. This proposal falls under the Care Facilities Area of Study. Information on the CTC, including: the sunset plan; meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the CTC website at:
http://www.iccsafe.org/cs/CTC/Pages/default.aspx.

Cost Impact: Will not increase the cost of construction
Sprinklers requirements for homes are addressed in the IRC. Working within the family of codes, this is not a change in requirements.

G 33-15 : 308.3.4-BALDASSARRA4268

G 34-15

308.3.4, 308.4.2, 310.5.1

Proponent: Gerald Anderson, representing self (Jerry.Anderson@opkansas.org)

2015 International Building Code

Revise as follows:

308.3.4 Five or fewer persons receiving custodial care. A facility with five or fewer persons receiving custodial care shall be classified as Group R-3 or shall comply with the *International Residential Code*. ~~provided an *automatic sprinkler system* is installed in accordance with Section 903.3.1.3 or Section P2904 of the *International Residential Code*.~~

308.4.2 Five or fewer persons receiving medical care. A facility with five or fewer persons receiving medical care shall be classified as Group R-3 or shall comply with the *International Residential Code*~~provided an *automatic sprinkler system* is installed in accordance with Section 903.3.1.3 or Section P2904 of the *International Residential Code*.~~.

310.5.1 Care facilities within a dwelling. Care facilities for five or fewer persons receiving care that are within a single-family dwelling are permitted to ~~comply~~be constructed in accordance with the *International Residential Code*. ~~provided an *automatic sprinkler system* is installed in accordance with Section 903.3.1.3 or Section P2904 of the *International Residential Code*.~~

Reason: It is not necessary to state that an automatic fire sprinkler system is required because Section 313 of the International Residential Code (IRC) already requires that such systems be installed in all one and two family dwellings.
I would also argue that it is inappropriate for the IBC to dictate what needs to be accomplished in the IRC. Either it is or it is not okay for these types of uses to constructed in accordance with the requirements of the IRC.

We also need to be consistent in our language. I would note that IBC Section 308.6.4 of the IBC (I-4 day care facilities) makes reference to the IRC without the additional language concerning fire sprinklers. Also, in IBC Section 310.5.2 (lodging houses) if makes reference to the IRC without the additional language concerning fire sprinklers.

I also made an additional change to section 310.5.1. Instead of saying 'permitted to comply' I am suggesting that it state 'permitted to be constructed in accordance'. This language is consistant with the language in 310.5.2 for lodging houses.

Every code cycle the code increases in size. Any effort that can be made to reduce unneccessary language should be taken up immediately.

Cost Impact: Will not increase the cost of construction
This change will have no bearing on cost.

G 34-15 : 308.3.4-ANDERSON5628

G 35-15

202 (New), 308.2, 308.5, 308.5.6 (New)

Proponent: Edward Kulik, representing Building Code Action Committee (bcac@iccsafe.org)

2015 International Building Code

Add new definition as follows:

SECTION 202 DEFINITIONS

LOCKUP FACILITY Buildings containing holding cells, rooms or areas where occupants are restrained or detained.

Revise as follows:

308.2 Definitions. The following terms are defined in Chapter 2:
24-HOUR BASIS.
CUSTODIAL CARE.
DETOXIFICATION FACILITIES.
FOSTER CARE FACILITIES.
HOSPITALS AND PSYCHIATRIC HOSPITALS.
LOCKUP FACILITY
INCAPABLE OF SELF-PRESERVATION.
MEDICAL CARE.
NURSING HOMES.

308.5 Institutional Group I-3. Institutional Group I-3 occupancy shall include all buildings and structures or portions thereof that are inhabited by ~~more than five persons~~ people who are under restraint or security. A Group I-3 facility is occupied by persons who are generally *incapable of self-preservation* due to security measures not under the occupants' control. This group shall include, but not be limited to, the following:
Correctional centers
Detention centers Jails
Lockup facility
Prerelease centers
Prisons
Reformatories
Buildings of Group I-3 shall be classified as one of the occupancy conditions specified in Sections 308.5.1 through 308.5.5 (see Section 408.1).

Add new text as follows:

308.5.6 Lockup facilities. A lockup facility for five or fewer persons shall be classified as a Group B occupancy or as part of the primary occupancy of the building. Such facilties shall comply with all of the following:

1. The area containing a lockup facility shall be separated from other rooms, spaces or areas by smoke barrier complying with Section 709.
2. The building containing a lockup facility shall be protected with an automatic fire sprinkler system complying with Section 903.
3. The area containing a lockup facility shall be provided with an automatic smoke detection system installed in accordance with Section 907.
4. There shall be not more than one lock-up facility within a building.
5. The restraint of individuals within the lock-up facility shall be for less than 24 hours.

Reason: This public proposal is submitted by the ICC Building Code Action Committee (BCAC). The BCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the BCAC has held 13 open meetings and numerous workgroup calls which included members of the BCAC as well as any interested party to discuss and debate the proposed changes and the public comments. Related documentation and reports are posted on the BCAC website at: http://www.iccsafe.org/cs/BCAC/Pages/default.aspx.
This code proposal adds a definition for lockup facilities that is needed in the Code that clarifies the use occupancies for buildings/spaces that contain five or less occupants under restraint or detained.

This code proposal includes the revision of Section 308.5 and the addition of Section 308.5.6. The revision removes more than five persons, and adds buildings and structures containing a room, holding cell or cellblock used to place persons under restraint or security. The new section adds lockup facilities and also clarifies that an approved smoke barrier complying with Section 709 be provided, and also fire sprinkler and smoke detectors be installed. There would be no more than one lockup facility within a building and the restraint of individuals is for less than 24 hours.

Cost Impact: Will increase the cost of construction
This proposal will increase the cost of construction of rooms or spaces used to restrain or detain occupants.

G 35-15 : 308.5.6 (New)-KULIK4893

G 36-15

309.1

Proponent: Vickie Lovell, InterCode Incorporated, representing National Greenhouse Manufacturers Association (vickie@intercodeinc.com)

2015 International Building Code

Revise as follows:

309.1 Mercantile Group M. Mercantile Group M occupancy includes, among others, the use of a building or structure or a portion thereof for the display and sale of merchandise, and involves stocks of goods, wares or merchandise incidental to such purposes and accessible to the public. Mercantile occupancies shall include, but not be limited to, the following:
Department stores
Drug stores
<u>Greenhouses with public access that maintain plants for display and sale</u>
Markets
Motor fuel-dispensing facilities
Retail or wholesale stores
Sales rooms

Reason: Buildings made for human habitation maintain specific lighting, ventilation, heating and cooling levels that are suitable for the health and welfare of humans and their property, even though plants can co-exist in such environments. The main distinguishing feature between a greenhouse and other structures is that the environment in a greenhouse is designed and maintained exclusively for, and is essential to maintain plants for display and sale. However, other activities can be conducted in a greenhouse, such as retail business, research by schools and universities, conservation, education, display by botanical institutions holding documented collections of specialty plants, and similar activities. Most importantly, the unique environment must be carefully controlled with conditions specific to the plants in the greenhouse; otherwise, the plants will not survive.
The intent of this proposal is to clarify that greenhouses, while typically determined to be Group U, are also commonly used for retail purchases by the public. This proposal helps code users and enforcers to consistently apply the requirements appropriately for greenhouses determined to be in this occupancy group.

Greenhouse for display and retail sales of plants intended for public access - Use Group M.

Cost Impact: Will not increase the cost of construction
There is no cost impact related to this proposal because this code change only adds greenhouses to Group M.

G 36-15 : 309.1-LOVELL5096

G 37-15

310.4, 310.5

Proponent: Carl Baldassarra, P.E., FSFPE, Chair, Code Technology Committee, representing Code Technology Committee (CTC@iccsafe.org); Adolf Zubia, Chair, Fire Code Action Committee (fcac@iccsafe.org); Edward Kulik, Chair, Building Code Action Committee (bcac@iccsafe.org)

2015 International Building Code

Revise as follows:

310.4 Residential Group R-2. Residential Group R-2 occupancies containing *sleeping units* or more than two *dwelling units* where the occupants are primarily permanent in nature, including:

Apartment houses with three or more dwelling units
~~*Boarding houses* (nontransient) with more than 16 occupants~~
Congregate *living facilities* (non-transient) with more than 16 occupants
Boarding houses (non transient)
Convents
Dormitories
Fraternities and sororities
Monasteries
Hotels (nontransient)
Live/work units
Motels (nontransient)
Vacation timeshare properties

310.5 Residential Group R-3. Residential Group R-3 occupancies where the occupants are primarily permanent in nature and not classified as Group R-1, R-2, R-4 or I, including:

Buildings that do not contain more than two *dwelling units*
~~*Boarding houses* (nontransient) with 16 or fewer occupants~~
~~*Boarding houses* (*transient*) with 10 or fewer occupants~~
Care facilities that provide accommodations for five or fewer persons receiving care
Congregate living facilities (nontransient) with 16 or fewer occupants
Boarding houses (nontransient)
Convents
Dormitories
Fraternities and sororities
Monasteries
Congregate living facilities (*transient*) with 10 or fewer occupants
Boarding houses (transient)
Lodging houses with five or fewer *guest rooms*

Reason: Currently convents, dormitories, fraternities, sororities and monasteries are only listed as Group R-2. If these facilities are small enough (i.e., 16 or fewer occupants), they should be permitted to comply with Group R-3 requirements. This would be consistent with current allowances for boarding houses and non-transient congregate residences.
This is part of a group of proposals to address this style of design and group homes within single family residences. Changes are proposed for the definition for sleeping units, the Group classifications in Section 310.4 and 310.5, separation requirements in Section 420, and coordination with accessibility requirements in Section 1107. Proposals will be put forward as part of Group B for fire and smoke alarm systems. The proposals could work separately.
The ICC Code Technology Committee (CTC) has just completed its 10th year. The ICC Board has decided to sunset the CTC. The sunset plan includes re-assigning many of the CTC Areas of Study to the applicable Code Action Committee (CAC). The two remaining CTC Areas of Study are Care Facilities and Elevator Lobbies/WTC Elevator issues. This proposal falls under the Care Facilities Area of Study. Information on the CTC, including: the sunset plan; meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the CTC website at: http://www.iccsafe.org/cs/CTC/Pages/default.aspx

This ICC committee was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the Fire-CAC has held 10 open meetings and numerous Regional Work Group and Task Group meetings and conference calls which included members of the committees as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the FAC website at: http://www.iccsafe.org/cs/CAC/Pages/default.aspx?usertoken={token}&Site=icc

The BCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the BCAC has held 13 open meetings and numerous workgroup calls which included members of the BCAC as well as any interested party to discuss and debate the proposed changes and the public comments. Related documentation and reports are posted on the BCAC website at: http://www.iccsafe.org/cs/BCAC/Pages/default.aspx.

310.5 - congregate living facilities should not be indented

Cost Impact: Will not increase the cost of construction
This will increase design options and is a clarification.

G 37-15 : 310.4-BALDASSARRA4295

G 38-15

310.4

Proponent: Michael Anthony, University of Michigan, representing University of Michigan (maanthon@umich.edu)

2015 International Building Code

Revise as follows:

310.4 Residential Group R-2. Residential Group R-2 occupancies containing *sleeping units* or more than two *dwelling units* where the occupants are primarily permanent in nature, including:
Apartment houses
Boarding houses (nontransient) with more than 16 occupants
Congregate living facilities (nontransient) with more than 16 occupants
Convents
Dormitories <u>*(Student residence facilities)*</u>
Fraternities and sororities
Hotels (nontransient)
Live/work units
Monasteries
Motels (nontransient)
Vacation timeshare properties

Reason: Submitted to draw attention to 2 other proposals submitted by the University of Michigan -- both are conceptually similar. Whichever definition the committee accepts, the definition should be carried over to this part of the IBC for consistency.

Cost Impact: Will not increase the cost of construction
This is just a bit of wordsmithing to make sure any new defintion proposed in Section 202 gets conveyed into Section 310

G 38-15 : 310.4-ANTHONY5411

G 39-15

310.4

Proponent: Stephen DiGiovanni, representing Southern Nevada Chapter of ICC (sdigiovanni@clarkcountynv.gov)

2015 International Building Code

Revise as follows:

310.4 Residential Group R-2. Residential Group R-2 occupancies containing *sleeping units* or more than two *dwelling units* where the occupants are primarily permanent in nature, including:
Apartment houses
Boarding houses (nontransient) with more than 16 occupants
<u>Condominiums (nontransient)</u>
Congregate living facilities (nontransient) with more than 16 occupants
Convents
Dormitories
Fraternities and sororities
Hotels (nontransient)
Live/work units
Monasteries
Motels (nontransient)
Vacation timeshare properties

Reason: Condominiums are not defined and could be interpreted as R-1 or R-2 occupancies depending on the use by the Owner as either a rental unit on a short term basis (less than 30 days) or as a longer term rental or permanent residence. However, in terms of actual use, Condominiums (nontransient) most closely resemble apartment houses, with an ownership component. In addition, the index references apartment houses for the term condominium. Further, condominium units always provide complete, independent living facilities, including permanent provisions for living, sleeping, eating, cooking and sanitation. As such, condominiums contain dwelling units and not just sleeping units. Since Group R-1 occupancies are limited to residential occupancies containing sleeping units where the occupants are primarily transient in nature, it is not appropriate to classify condominiums as Group R-1 occupancies. This proposal eliminates any misinterpretation by mandating that condominiums be classified as Group R-2.

Cost Impact: Will not increase the cost of construction
This proposal will not increase construction costs, as it simply clarifies that condominium are to be deemed a R-2 occupancy.

G 39-15 : 310.4-DIGIOVANNI3814

G 40-15

310.5, 310.5.2

Proponent: Edward Kulik, representing Building Code Action Committee (bcac@iccsafe.org)

2015 International Building Code

Revise as follows:

310.5 Residential Group R-3. Residential Group R-3 occupancies where the occupants are primarily permanent in nature and not classified as Group R-1, R-2, R-4 or I, including:
Buildings that do not contain more than two *dwelling units*
Boarding houses (nontransient) with 16 or fewer occupants
Boarding houses (*transient*) with 10 or fewer occupants
Care facilities that provide accommodations for five or fewer persons receiving care
Congregate living facilities (nontransient) with 16 or fewer occupants
Congregate living facilities (*transient*) with 10 or fewer occupants
<u>Owner-occupied</u>*Lodging houses* <u>*(transient)*</u> with five or fewer *guest rooms* <u>and 10 or fewer occupants</u>

310.5.2 Lodging houses. Owner-occupied *lodging houses* with five or fewer *guest rooms* <u>*and* 10 or fewer occupants</u> shall be permitted to be constructed in accordance with the *International Residential Code*.

Reason: This public proposal is submitted by the ICC Building Code Action Committee (BCAC). The BCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the BCAC has held 13 open meetings and numerous workgroup calls which included members of the BCAC as well as any interested party to discuss and debate the proposed changes and the public comments. Related documentation and reports are posted on the BCAC website at: http://www.iccsafe.org/cs/BCAC/Pages/default.aspx.
The purpose of this code change is to provide for further clarification of the correlation between the International Residential Code and the International Building Code. During the 2009/2010 code cycle, an exemption to IRC Section R101.2 was approved allowing owner-occupied lodging houses with five or fewer guestrooms to be constructed under the IRC. However, a correlating provision was not added to the IBC, resulting in a conflict between the two codes and a potential for confusion in enforcement. Last cycle language was added to the IBC at the final action hearing to correlate the IBC with the IRC.

This proposal further refines the added language by inserting "owner occupied" which is a qualifier already in the IRC; by clarifying that the lodging use is of a "transient" nature consistent with other Group R-3 use language. It further ties in the 10 or fewer occupant load criteria which is also intended for consistency with the current Board house language, a lodging house is a form of a boarding house.

Cost Impact: Will not increase the cost of construction
This proposal will decrease the cost of construction by further clarifying that certain owner-occupied lodging houses can be constructed under the IRC rather than the IBC and by providing increased consistency of language and application.

G 40-15 : 310.5-KULIK5031

G 41-15

310.5.2

Proponent: Anthony Apfelbeck, representing City of Altamonte Springs (ACApfelbeck@altamonte.org)

2015 International Building Code

Revise as follows:

310.5.2 Lodging houses. Owner-occupied *lodging houses* with five or fewer *guest rooms* shall be permitted to be constructed in accordance with the *International Residential Code* provided an *automatic sprinkler system* is installed in accordance with Section 903.3.1.3 or Section P2904 of the *International Residential Code*.

Reason: The base requirements of the IRC and the IBC require fire sprinkler protection for all Group R occupancies and for all One-and two-family dwelling and townhomes. This code change proposal clarifies fire sprinkler protection is still required for these uses regardless of an application under the IRC or IBC. This is similar language to that used above in 310.5.1 and other sections of the code that permit a use under the IRC but require fire sprinkler protection for occupant life safety protection under the base code requirements.

Cost Impact: Will not increase the cost of construction
As the base IRC and the IBC already require fire sprinkler protection for this type of occupancy there is no cost when a jurisdiction adopts the IRC and IBC in unamended format.

G 41-15 : 310.5.2-APFELBECK3859

G 42-15

310.6

Proponent: Carl Baldassarra, P.E., FSFPE, Chair, Code Technology Committee, representing Code Technology Committee (CTC@iccsafe.org)

2015 International Building Code

Revise as follows:

310.6 Residential Group R-4. Residential Group R-4 occupancy shall include buildings, structures or portions thereof for more than five but not more than 16 persons, excluding staff, who reside on a 24-hour basis in a supervised residential environment and receive *custodial care*. Buildings of Group R-4 occupancy shall be classified as one of the occupancy conditions specified in Section 310.6.1 or 310.6.2. This group shall include, but not be limited to, the following:
Alcohol and drug centers
Assisted living facilities
Congregate care facilities
Group homes
Halfway houses
Residential board and care facilities
Social rehabilitation facilities

Group R-4 occupancies shall meet the requirements for construction as defined for Group R-3, except ~~as otherwise provided~~where specific requirements for Group R-4 are prescribed. Group R-4, Condition 1 occupancies shall be permitted to comply with the construction requirements in ~~this code~~the *International Residential Code*.

Reason: The Group R-4 facilities were developed to be consistent with the Fair Housing Act. Over time, changes have been made to the codes that have resulted in jurisdictions being subject to discrimination lawsuits under the Fair Housing Act. The Group R-4 occupancy, when it first was developed for the code, was permitted to comply with IRC. This allowance was taken away without technical justification.
The IRC has a sprinkler requirement, so these homes should be permitted to be constructed in accordance with the IRC. Forcing a facility to drag a sprinkler system with them, just in case a jurisdiction may decide to not require single family home to sprinkler, is not good code practice.
If facilities decide to stay in the IBC, Group R-4, Condition 1 are required to have a NFPA 13D sprinkler system (Section 903.2.8.2) and Group R-4, Condition 2 are required to have a NFPA 13R sprinkler system (Section 903.2.8.3). The proposed wording is for consistency in the language in Chapter 3. The Group R-4, Condition 2, due to the level of care provided for the residents, the Condition 2 will stay with the IBC so it gets the increased sprinkler protection and attic protection. Group R-4, Condition 1, has residents capable of self-preservation, so they can go to the IRC and the sprinkler protection there.

The ICC Code Technology Committee (CTC) has just completed its 10th year. The ICC Board has decided to sunset the CTC. The sunset plan includes re-assigning many of the CTC Areas of Study to the applicable Code Action Committee (CAC). The two remaining CTC Areas of Study are Care Facilities and Elevator Lobbies/WTC Elevator issues. This proposal falls under the Care Facilities Area of Study. Information on the CTC, including: the sunset plan; meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the CTC website at:
http://www.iccsafe.org/cs/CTC/Pages/default.aspx.

Cost Impact: Will not increase the cost of construction
The prescriptive requirements of the IRC are generally the same or lesser cost that IBC Type 5 construction.

G 42-15 : 310.6-BALDASSARRA4269

G 43-15

311.1.1

Proponent: Stephen Thomas, Colorado Code Consulting, LLC, representing International Association of Building Officials (sthomas@coloradocode.net)

2015 International Building Code

Revise as follows:

311.1.1 Accessory storage spaces. A room or space used for storage purposes that is ~~less than 100 square feet (9.3 m²) in area and~~ accessory to another occupancy shall be classified as part of that occupancy. ~~The aggregate area of such rooms or spaces shall not exceed the allowable area limits of Section 508.2.~~

Reason: The subject of storage rooms has been discussed since the first edition of the IBC. The original code considered storage rooms as incidental uses and required them to be separated from the remainder of the building or be provided with a fire extinguishing system. The original requirement was based on health care uses, but was not introduced that way. That provision was deleted from the Incidental Use Table because it was causing problems with the design of buildings and there was no technical justification to maintain the requirement.
The 2015 IBC was revised with the above section limiting the area to 100 square feet once again. However, it does not tell the user what to do if it exceeds 100 square feet. There was also no technical justification provided to support the 100 square foot limit. This proposal deletes the square footage limit as well as deleting the last sentence that did not give any direction as to what occupancy was to be used to determine the maximum aggregate area.

Cost Impact: Will not increase the cost of construction
This change is a clarification of the code and reduction in the potential requirements. Therefore, it may be a reduction in construction cost.

G 43-15 : 311.1.1-THOMAS5290

G 44-15

311.2

Proponent: Anthony Apfelbeck, City of Altamonte Springs Building/Fire Safety Division, representing City of Altamonte Springs (ACApfelbeck@altamonte.org)

2015 International Building Code

Revise as follows:

311.2 Moderate-hazard storage, Group S-1. Storage Group S-1 occupancies are buildings occupied for storage uses that are not classified as Group S-2, including, but not limited to, storage of the following:
Aerosols, Levels 2 and 3
Aircraft hangar (storage and repair)
Bags: cloth, burlap and paper
Bamboos and rattan
Baskets
Belting: canvas and leather
Books and paper in rolls or packs
Boots and shoes
Buttons, including cloth covered, pearl or bone
Cardboard and cardboard boxes
Clothing, woolen wearing apparel
Cordage
Dry boat storage (indoor)
Furniture
Furs
Glues, mucilage, pastes and size
Grains
Horns and combs, other than celluloid
Leather
Linoleum
Lumber
Motor vehicle repair garages complying with the maximum allowable quantities of hazardous materials listed in Table 307.1(1) (see Section 406.8)
Photo engravings
Resilient flooring
Self-service storage (mini-storage)
Silks
Soaps
Sugar
Tires, bulk storage of
Tobacco, cigars, cigarettes and snuff
Upholstery and mattresses
Wax candles

Reason: This proposal clarifies that "self-service storage" facilities (otherwise known as mini-storage facilities) are an S-1 occupancy. Based on variable contents of these facilities, the S-1 occupancy classification appears to the be appropriate one. By including this term within the list of 311.2, it will provide additional clarity to the code for owners, developers, designers and code officials.

Cost Impact: Will not increase the cost of construction
This proposal does not change the occupancy classification of self-storage faclities but just provides greater clarity as to the occupancy classification of S-1. Therefore, there is no cost impact.

G 44-15 : 311.2-APFELBECK3943

G 45-15

202, 202 (New), 312.1, C101.1

Proponent: Joe Scibetta, representing Self

2015 International Building Code

Revise as follows:

SECTION 202 DEFINITIONS

AGRICULTURAL BUILDING. A structure designed and constructed to house farm implements, hay, grain~~, poultry, livestock~~ or other horticultural products. This structure shall not be a place of human habitation or a place of employment where agricultural products are processed, treated or packaged, nor shall it be a place used by the public.

Add new definition as follows:

ANIMAL HOUSING FACILITY. Area of a building or structure, including interior and adjacent exterior spaces, where humans interact with animals for the purpose of feeding, resting, working, exercising, treating, examining, or exhibiting the animals in their care. Examples of animal housing facilities include, but are not limited to, barns, kennels, coops, stables, sheds, pens, corrals, runs, vivaria, terraria, laboratories, and zoos.

Revise as follows:

312.1 General. Buildings and structures of an accessory character and miscellaneous structures not classified in any specific occupancy shall be constructed, equipped and maintained to conform to the requirements of this code commensurate with the fire and life hazard incidental to their occupancy. Group U shall include, but not be limited to, the following:

Agricultural buildings
Aircraft hangars, accessory to a oneor two-family residence (see Section 412.5)
Animal housing facilities
Barns
Carports
Fences more than 6 feet (1829 mm) in height
Grain silos, accessory to a residential occupancy
Greenhouses
~~Livestock shelters~~
Private garages
Retaining walls
Sheds
~~Stables~~
Tanks
Towers

C101.1 Scope. The provisions of this appendix shall apply exclusively to agricultural buildings and animal housing facilities. Such buildings shall be classified as Group U and shall include, but not be limited to, the following uses:

1. Livestock shelters or buildings, including shade structures and milking barns.
2. Poultry buildings or shelters.
3. Barns.
4. Storage of equipment and machinery used exclusively in agriculture.
5. Horticultural structures, including detached production greenhouses and crop protection shelters.
6. Sheds.
7. Grain silos.
8. Stables.

Reason: Agricultural buildings do not encompass the wide variety of animal housing facilities where humans interact with animals for the purpose of feeding, treating, exercising, working, etc. Therefore, animal housing facilities need to be incorporated into the current Group U listing. To avoid redundancies, and since animal housing facilities include but are not limited to livestock shelters and stables, those two entries have been deleted, as animal housing facilities would incorporate those structures and others fitting the definition of an animal housing facility. The current, individual listings of livestock shelters and stables do not, on their own, account for the variety of animal housing facilities that exist, whereas the term "animal housing facilities" does. The revision to the list in Section 312 is necessary to provide a better representation of structures where animals are housed and where human interaction occurs, as opposed to agricultural buildings where there is little to no human occupancy or interaction with animals. Such a refinement consolidates the separate listings of livestock shelters and stables into a broader and more encompassing heading of animal housing facilities. A corresponding definition of an animal housing facility is proposed for Chapter 2.
In keeping with those proposed changes, and since Appendix C addresses Group U structures, this proposal seeks to incorporate animal housing facilities accordingly. Since the listing in Appendix C lists some, but not all, types of animal housing facilities, the proposed language here includes the interjectory phrase "but not be limited to" so that animal housing facilities that do not fall within the categories of livestock shelter, poultry house or stable, may still be incorporated and viewed as a Group U occupancy.

Cost Impact: Will not increase the cost of construction
No cost impact as this is simply a refinement of the existing list of Group U structures and providing a differentiation in terminology between animal housing facilities and agricultural buildings to ensure that both types of structures are addressed here.

G 45-15 : 312.1-SCIBETTA3446

G 46-15

312.1

Proponent: David Kulina, representing Engel Architects (david@engelarch.com)

2015 International Building Code

Revise as follows:

312.1 General. Buildings and structures of an accessory character and miscellaneous structures not classified in any specific occupancy shall be constructed, equipped and maintained to conform to the requirements of this code commensurate with the fire and life hazard incidental to their occupancy. Group U shall include, but not be limited to, the following:

Agricultural buildings
Aircraft hangars, accessory to a oneor two-family residence (see Section 412.5)
Barns
Carports
Fences more than 6 feet (1829 mm) in height
Grain silos, accessory to a residential occupancy
Greenhouses
Livestock shelters
<u>Maintenance and groundskeeping storage</u>
Private garages
Retaining walls
Sheds
Stables
Tanks
Towers

Reason: Unless combined with other types of facilities, such as groundskeeping offices, these buildings are typically not occupied unless equipment and supplies are being moved. These often occur at colleges and schools, where they are considered too big to be just a shed

Cost Impact: Will not increase the cost of construction
There are no cost implications. In fact, the cost of building will be less as the requirements of other sections regards U are less stringent

G 46-15 : 312.1-KULINA4540

G 47-15

312.1

Proponent: Jeffrey Betz, AT&T, representing AT&T (jbetz@att.com)

2015 International Building Code

Revise as follows:

312.1 General. Buildings and structures of an accessory character and miscellaneous structures not classified in any specific occupancy shall be constructed, equipped and maintained to conform to the requirements of this code commensurate with the fire and life hazard incidental to their occupancy. Group U shall include, but not be limited to, the following:

Agricultural buildings
Aircraft hangars, accessory to a oneor two-family residence (see Section 412.5)
Barns
Carports
<u>Communication equipment structures with a *gross floor area* of less than 1,500 square feet</u>
Fences more than 6 feet (1829 mm) in height
Grain silos, accessory to a residential occupancy
Greenhouses
Livestock shelters
Private garages
Retaining walls
Sheds
Stables
Tanks
Towers

Reason: This addition identifies the placement of communication equipment structures less than 1,500 sq ft gross into Group U. The selection of 1,500 sq ft is a typical structure size that would be visited infrequently by only authorized and knowledgeable personnel. The characteristics of "Structures housing accessory equipment that is part of a utility or communications system are often classified as Group U occupancies when there is no intent that these structures be occupied except for servicing and maintaining the equipment with the structure. A pump house for a water or sewage system or equipment building at the base of a telecommunication tower is an example of such buildings". (IBC 2009 and 2012 Code and Commentary Volume 1). This proposal memorializes the communication equipment structures under the U group and continues to require conformance to basis fire and life hazard while better identifying the occupancy and activities intended for the structure. The thousands of existing and future structures of this occupancy range from a small subterranean room, on-grade equipment housing or small communications structure visited only for equipment installation and maintenance will benefit from this clarification.

Bibliography: International Building Code and Commentary 2009 pages 3-50 and 51, 2012 page 3-40.

Cost Impact: Will not increase the cost of construction
Proposal clarifies section 312 UTILITY AND MISCELLANEOUS GROUP U to specifically include Communications Equipment Structures less than 1,500 sq ft gross into the examples of Group U. This reduces the AHJ and applicants time in clarifying the correct group for this kind of structure and eliminates potential non-required construction expenses.

G 47-15 : 312.1-BETZ5454

G 48-15

312.1, 312.1.1 (New)

Proponent: Vickie Lovell, InterCode Incorporated, representing National Greenhouse Manufacturers Association (vickie@intercodeinc.com)

2015 International Building Code

Revise as follows:

312.1 General. Buildings and structures of an accessory character and miscellaneous structures not classified in any specific occupancy shall be constructed, equipped and maintained to conform to the requirements of this code commensurate with the fire and life hazard incidental to their occupancy. Group U shall include, but not be limited to, the following:

Agricultural buildings
Aircraft hangars, accessory to a oneor two-family residence (see Section 412.5)
Barns
Carports
Fences more than 6 feet (1829 mm) in height
Grain silos, accessory to a residential occupancy
~~Greenhouses~~
Livestock shelters
Private garages
Retaining walls
Sheds
Stables
Tanks
Towers

Add new text as follows:

312.1.1 Greenhouses. Greenhouses not classified as Group A-3, B, Group E, F-2 or Group M shall be classified as Use Group U. Greenhouses that are accessory buildings to Group B, E or M occupancies, and utility or accessory greenhouses that are not classified in any specific occupancy shall be classified as Group U.

Reason: Greenhouses are a type of special structure intended to create and maintain a unique sunlit environment used exclusively for, and essential to, the commercial cultivation, protection or maintenance of plants. This proposal ONLY addresses commercial greenhouse structures and NOT other spaces such as sunrooms, solariums, glass enclosed walkways, atria or other types of interior spaces that permit ample sunlight so as to prominently feature plants for aesthetic purposes.
The majority of commercial greenhouses are truly agricultural structures that are classified as Group U.

The primary purpose of a greenhouse is for the propagation of plants. Many typical building requirements intended for human comfort, health, safety and welfare are not applicable or necessary for the construction or operation of greenhouses. However, this proposal is intended to clarify that some greenhouses can be used for other enterprises, such as retail business, research by schools and universities, conservation, education, display by botanical institutions holding documented collections of specialty plants, and similar activities. This proposal, along with the other proposals that modify the occupancies to include greenhouses, has created indicators to assist the designer and the code official to recognize when appropriate design distinctions should be made, and to help determine more consistently when a greenhouse should be classified as a use group other than Group U.

Greenhouse - Use Group U.

Cost Impact: Will not increase the cost of construction
THERE IS NO COST IMPACT RELATED TO THIS PROPOSAL BECAUSE THIS PROPOSAL MAINLY CLARIFIES EXISTING CODE LANGUAGE REGARDING GROUP U GREENHOUSES. THE PROPOSAL DOES NOT ADD REQUIREMENTS FOR GROUP B, E, OR M GREENHOUSES BEYOND WHAT THE CODE ALREADY REQUIRES FOR THOSE OCCUPANCIES.

G 49-15

~~402.8.6.1~~507.13.9.6.1 Exit passageways.

~~402.8.7~~507.13.9.7 Service areas fronting on exit passageways.

~~402.8.8~~507.13.9.8 Security grilles and doors.

Reason: Chapter 4 of the IBC includes a hodge-podge of various criteria for "special use and occupancy." However, these are often exceptions to specific limits or allowances from having to meet such limits, or even specific requirements for specific occupancy groups. The issue in general is that they are "gotcha's" built into the code. This series of code changes moves these special criteria into the chapters and sections where these issues are typically addressed, removing any doubt in the mind of the code user as to how these criteria are to be integrated into the design and construction of a building that includes these features.
Malls are probably one of the more interesting special use and occupancy provisions, particularly since the open mall provisions were included. While there are several very specific criteria associated with a mall (the occupant load calculation, anchor buildings, etc.), fundamentally they are exceptions to the area limits of buildings. Having these provisions hidden in Chapter 4 clouds the choices users of the code have when designing large developments. One-story and two-story unlimited area buildings are included in the exceptions for the area limts of buildings, however malls, having many of the same limitations are permitted to be three stories in height and to have almost any occupancy. When examining choices for how to configure such a development should be rather simple by looking at the list within the section on area limitations.

By moving the provisions in Chapter 4 for mall buildings into the area limits in Chapter 5, the triggers and allowances for malls will be clear and obvious choices. Correlation of references to new code locations are not included in the proposal but need to be provided by the editorial staff.

Cost Impact: Will not increase the cost of construction
There are no technical changes in the sections of the code and there should be no cost impact related to what is currently required as compared with what is proposed. In reality it may reduce the cost of construction as the option to use the allowances for malls as an unlimited area building will become more obvious.

~~SECTION 403~~
~~HIGH-RISE BUILDINGS~~

Revise as follows:

~~403.1~~504.3.1 Applicability. *High-rise buildings* shall comply with Sections ~~403.2~~504.3.2 through ~~403.6~~504.3.6.

Exception: The provisions of Sections ~~403.2~~504.3.2 through ~~403.6~~504.3.6 shall not apply to the following buildings and structures:

1. Airport traffic control towers in accordance with Section 412.3.
2. *Open parking garages* in accordance with Section 406.5.
3. The portion of a building containing a Group A-5 occupancy in accordance with Section 303.6.
4. Special industrial occupancies in accordance with Section 503.1.1.
5. Buildings with:
   5.1. A Group H-1 occupancy;
   5.2. A Group H-2 occupancy in accordance with Section 415.8, 415.9.2, 415.9.3 or 426.1; or,
   5.3. A Group H-3 occupancy in accordance with Section 415.8.

~~403.6.2~~504.3.6.2 Occupant evacuation elevators.

Reason: Chapter 4 of the IBC includes a hodge-podge of various criteria for "special use and occupancy." However, these are often exceptions to specific limits or allowances from having to meet such limits, or even specific requirements for specific occupancy groups. The issue in general is that they are "gotcha's" built into the code. This series of code changes moves these special criteria into the chapters and sections where these issues are typically addressed, removing any doubt in the mind of the code user as to how these criteria are to be integrated into the design and construction of a building that includes these features.
High-rise buildings is a good example of the issues with the use of the IBC and tall buildings. Section 504 very speicifically limits the height of buildings but references the criteria in Section 510 for some exceptions. Nowhere in that section is high-rise buildings mentioned. Is the designer supposed to know that Chapter 4 contains provisions that simply because of the buildings preportions these additional allowances and criteria must be met? Does the code official understand when the thresholds for the specific requirements in Chapter 4 are meant to apply to buildings that Table 503 would allow to be built in excess of the 75 foot, 120 foot and 420 foot limits? Nothing in the code provides that clarity.

By moving the provisions in Chapter 4 for high-rise buildings into the height limits in Chapter 5, the triggers and requirements for high-rise will be clear and obvious. Correlation of references to new code locations are not included in the proposal but need to be provided by the editorial staff.

Cost Impact: Will not increase the cost of construction
This change simply reorganizes the code to make it clearer for code userrs to understand how the code is intended to apply. There is no cost impact for this change.

~~SECTION 404~~
~~ATRIUMS~~

~~**404.1 General.** In other than Group H occupancies, and where permitted by Section 712.1.7, the provisions of Sections 404.1 through 404.10 shall apply to buildings or structures containing vertical openings defined as "Atriums."~~

~~**404.1.1 Definition.** The following term is defined in Chapter 2:~~

Revise as follows:

712.1.7 Atriums. In other than Group H occupancies, ~~atriums~~floor openings connecting three or more stories and complying with ~~Section 404~~this section shall be permitted.

Exception: As used in this section, balconies within assembly groups or mezzanines that comply with Section 505 are not considered stories.

~~404.2~~712.1.7.1 Use.

(The text of this section and subsequent sections would be unchanged except to update section references.)

[F] ~~404.3~~712.1.7.2 Automatic sprinkler protection.

[F] ~~404.4~~712.1.7.3 Fire alarm system.

~~404.5~~712.1.7.4 Smoke control.

~~404.6~~712.1.7.5 Enclosure of atriums.

[F] ~~404.7~~712.1.7.6 Standby power.

~~404.8~~712.1.7.7 Interior finish.

~~404.9~~712.1.7.8 Exit access travel distance.

~~404.9.1~~712.1.7.8.1 Egress not through the atrium.

~~404.9.2~~712.1.7.8.2 Exit access travel distance at the level of exit discharge.

~~404.9.3~~712.1.7.8.3 Exit access travel distance at other than the level of exit discharge.

~~404.10~~712.1.7.9 Interior exit stairways.

Reason: Reason: Chapter 4 of the IBC includes a hodge-podge of various criteria for "special use and occupancy." However, these are often exceptions to specific limits or allowances from having to meet such limits, or even specific requirements for specific occupancy groups. The issue in general is that they are "gotcha's" built into the code. This series of code changes moves these special criteria into the chapters and sections where these issues are typically addressed, removing any doubt in the mind of the code user as to how these criteria are to be integrated into the design and construction of a building that includes these features.
The provisions for Atriums in Chapter 4 are a classic case of the confusion caused by the code. As defined an atrium includes virtually any opening between two or more floors. However, in the code there are a miriad of options for openings through two or more floors and indeed, an atrium is simply only one option for creation of openings and providing the necessary protection because of that opening as listed in section 712.1. However, because it is listed in Chapter 4 without any direction that limits its application to a choice by the designer, it is often cited as being necessary, when in fact it is not because another option has been chosen. Similarly, because of the definition other floor openings are not being permitted, which is why the definition is being deleted and the charging language in the Section 712.1 for atriums includes the appropriate limitations from the definition.

By moving the provisions for atrium design to Chapter 7 and referencing the determination of when it is to be applied, the code users will much more readily understand the intent of the code.

Cost Impact: Will not increase the cost of construction
As a needed clarification of the code, this will actually reduce the cost of construction where the unnecessary application of this section will allow for less onerous solutions the code allows.

Delete without substitution:

~~SECTION 405~~
~~UNDERGROUND BUILDINGS~~

Revise as follows:

504.4 Number of stories above grade plane. The maximum number of stories of a building shall not exceed the limits specified in Table 504.4.

~~405.1~~504.5 ~~General~~Floors below the level of exit discharge. The provisions of Sections ~~405.2~~504.5.1 through ~~405.9~~504.5.8 apply to building spaces having a floor level used for human occupancy more than 30 feet (9144 mm) below the finished floor of the lowest *level of exit discharge.*

Exceptions: The provisions of Section ~~405~~504.5 are not applicable to the following buildings or portions of buildings**:**

1. One- and two-family *dwellings*, sprinklered in accordance with Section 903.3.1.3.
2. Parking garages provided with *automatic sprinkler systems* in compliance with Section 405.3.
3. Fixed guideway transit systems.
4. *Grandstands*, *bleachers*, stadiums, arenas and similar facilities.
5. Where the lowest *story* is the only *story* that would qualify the building as an underground building and has an area not greater than 1,500 square feet (139 m^2) and has an *occupant load* less than 10.
6. Pumping stations and other similar mechanical spaces intended only for limited periodic use by service or maintenance personnel.

~~405.2~~504.5.1 Construction requirements.

(The text of this section and subsequent sections would be unchanged except to update section references.)

~~[F] 405.3~~504.5.2 Automatic sprinkler system.

~~405.4~~504.5.3 Compartmentation.

~~405.4.1~~504.5.3.1 Number of compartments.

~~405.4.2~~504.5.3.2 Smoke barrier penetration.

~~405.4.3~~504.5.3.3 Elevators.

~~405.5~~504.5.4 Smoke control system.

~~405.5.1~~504.5.4.1 Control system.

~~405.5.2~~504.5.4.2 Compartment smoke control system.

[F] ~~405.6~~504.5.5 Fire alarm systems.

~~405.7~~504.5.6 Means of egress.

~~405.7.1~~504.5.6.1 Number of exits.

~~405.7.2~~504.5.6.2 Smokeproof enclosure.

[F] ~~405.8~~504.5.7 Standby and emergency power.

[F] ~~405.8.1~~504.5.7.1 Standby power loads.

[F] ~~405.8.2~~504.5.7.2 Emergency power loads.

[F] ~~405.9~~504.5.8 Standpipe system.

Reason: Chapter 4 of the IBC includes a hodge-podge of various criteria for "special use and occupancy." However, these are often exceptions to specific limits or allowances from having to meet such limits, or even specific requirements for specific occupancy groups. The issue in general is that they are "gotcha's" built into the code. This series of code changes moves these special criteria into the chapters and sections where these issues are typically addressed, removing any doubt in the mind of the code user as to how these criteria are to be integrated into the design and construction of a building that includes these features.
All criteria for the height of buildings is found in Chapter 5 of the IBC. Requirements associated with portions below grade and the distinction between basements and "underground buildings" is located in Chapter 4. These concepts and principles in the code for parts of buildings are not distinct, but are tied directly to the design and planning for the arrangement of facilities and their support areas which are often found in spaces whicn meet the underground portions of a building. Isolating these criteria from the typical height limitations does not help the code user understand the ramifications of decisions being made often very early in the design process.

By moving the provisions in Chapter 4 for underground buildings into the height limits in Chapter 5, the triggers and requirements for underground builsings will be clear and obvious. Correlation of references to new code locations are not included in the proposal but need to be provided by the editorial staff.

Cost Impact: Will not increase the cost of construction
This code change simply clarifies and connects portions of the code addressing the same subject and will nto increase the cost of construction.

2015 International Building Code

Delete without substitution:

~~**SECTION 406**~~
~~**MOTOR-VEHICLE-RELATED OCCUPANCIES**~~

~~**406.1 General.** Motor-vehicle-related occupancies shall comply with Sections 406.1 through 406.8.~~

~~**406.2 Definitions.** The following terms are defined in Chapter 2:~~
~~**MECHANICAL-ACCESS OPEN PARKING GARAGES.**~~
~~**OPEN PARKING GARAGE.**~~
~~**PRIVATE GARAGE.**~~
~~**RAMP-ACCESS OPEN PARKING GARAGES.**~~

Revise as follows:

~~406.3~~312.2 Private garages and carports.

(The text of this section and subsequent sections would be unchanged except to update section references.)

~~406.3.1~~312.2.1 Classification.

~~406.3.2~~312.2.2 Clear height.

~~406.3.3~~312.2.3 Garage floor surfaces.

~~406.3.4~~312.2.4 Separation.

~~406.3.4.1~~312.2.4.1 Dwelling unit separation..

~~406.3.4.2~~312.2.4.2 Openings prohibited.

~~406.3.4.3~~312.2.4.3 Ducts.

~~406.3.5~~312.2.5 Carports.

~~406.3.5.1~~312.2.5.1 Carport separation.

~~406.3.6~~312.2.6 Automatic garage door openers.

Reason: Chapter 4 of the IBC includes a hodge-podge of various criteria for "special use and occupancy." However, these are often exceptions to specific limits or allowances from having to meet such limits, or even specific requirements for specific occupancy groups. The issue in general is that they are "gotcha's" built into the code. This series of code changes moves these special criteria into the chapters and sections where these issues are typically addressed, removing any doubt in the mind of the code user as to how these criteria are to be integrated into the design and construction of a building that includes these features.
Requirements for motor vehicle related occupancies are located in Chapter 4 and all the limitations for where they are parts of other occupancies is found in Chapter 5, while the classification is found in Chapter 3 with limitations for when it is classified as a Group U, but no indication as to what the classification should be if it is larger than the U limitations. Moving the provisions from Chapter 4 to Chapter 3 and adding provisions for when it is not a Group U, users will more readily understand and use the code appropriately.

Cost Impact: Will not increase the cost of construction
Because the identical language is simply being moved to a new section and clafiying language indicating the intent of the section, no increae is cost should occur as a result of this change.

~~407.5~~308.4.3.5 Smoke barriers.

~~407.5.1~~308.4.3.5.1 Refuge area.

~~407.5.2~~308.4.3.5.2 Independent egress.

~~407.5.3~~308.4.3.5.3 Horizontal assemblies.

[F] ~~407.6~~308.4.3.6 Automatic sprinkler system.

[F] ~~407.7~~308.4.3.7 Fire alarm system.

[F] ~~407.8~~308.4.3.8 Automatic fire detection.

~~407.9~~308.4.3.9 Secured yards.

~~407.10~~308.4.3.10 Electrical systems.

Reason: Chapter 4 of the IBC includes a hodge-podge of various criteria for "special use and occupancy." However, these are often exceptions to specific limits or allowances from having to meet such limits, or even specific requirements for specific occupancy groups. The issue in general is that they are "gotcha's" built into the code. This series of

code changes moves these special criteria into the chapters and sections where these issues are typically addressed, removing any doubt in the mind of the code user as to how these criteria are to be integrated into the design and construction of a building that includes these features.
I-2 criteria in Chapter 4 are typical of the occupancy criteria that provide a summary of various provisions from the code for one occupancy. While an I-2 is somewhat special, many of these criteria are well recognized in the code for various occupancies. To make the application of these provisions obvious to the code user, their placement in Chapter 3 along with the classification information will provide greater clarity to their necessity by the code users.

Cost Impact: Will not increase the cost of construction
By making the special provisions for an I-2 occupancy obvious, the cost of construction should be reduced.

2015 International Building Code

Revise as follows:

[F] 307.1.1 Uses other than Group H. An occupancy that stores, uses or handles hazardous materials as described in one or more of the following items shall not be classified as Group H, but shall be classified as the occupancy that it most nearly resembles.

1. Buildings and structures occupied for the application of flammable finishes, provided that such buildings or areas conform to the requirements of Section 416 and the *International Fire Code*.
2. Wholesale and retail sales and storage of flammable and combustible liquids in mercantile occupancies conforming to the *International Fire Code*.
3. Closed piping system containing flammable or combustible liquids or gases utilized for the operation of machinery or equipment.
4. Cleaning establishments that utilize combustible liquid solvents having a flash point of 140°F (60°C) or higher in closed systems employing equipment *listed* by an *approved* testing agency, provided that this occupancy is separated from all other areas of the building by 1-hour *fire barriers* constructed in accordance with Section 707 or 1hour *horizontal assemblies* constructed in accordance with Section 711, or both.
5. Cleaning establishments that utilize a liquid solvent having a flash point at or above 200°F (93°C).
6. Liquor stores and distributors without bulk storage.
7. Refrigeration systems.
8. The storage or utilization of materials for agricultural purposes on the premises.
9. Stationary batteries utilized for facility emergency power, uninterruptable power supply or telecommunication facilities, provided that the batteries are provided with safety venting caps and *ventilation* is provided in accordance with the *International Mechanical Code.*
10. Corrosive personal or household products in their original packaging used in retail display.
11. Commonly used corrosive building materials.
12. Buildings and structures occupied for aerosol storage shall be classified as Group S-1, provided that such buildings conform to the requirements of the *International Fire Code*.
13. Display and storage of nonflammable solid and nonflammable or noncombustible liquid hazardous materials in quantities not exceeding the maximum allowable quantity per *control area* in Group M or S occupancies complying with Section 414.2.5.
14. The storage of black powder, smokeless propellant and small arms primers in Groups M and R-3 and special industrial explosive devices in Groups B, F, M and S, provided such storage conforms to the quantity limits and requirements prescribed in the *International Fire Code*.
15. <u>Motion picture projection rooms in which ribbon-type cellulose accetate or other safety film is utilized in conjunction with electric arc, xenon or other light-cource projection equipment that develops hazrdous gases, dust or ratiation. Where cellulose nitrate film is utilized or stored, such rooms shall comply with NFPA 40. All such projection rooms, appertenant electrical equipment, such as rheostats, transformers and generators shall be enclosed in an enclosure meeting the requirements of Section 307.1.3.</u>

Delete without substitution:

~~SECTION 409~~
~~MOTION PICTURE PROJECTION ROOMS~~

Revise as follows:

~~409.1~~<u>307.1.3</u> ~~General.~~<u>Motion picture projection rooms</u> The provisions of Sections ~~409.1~~<u>307.1.3.1</u> through ~~409.5~~<u>307.1.3.5</u> shall apply to rooms in which ribbon-type cellulose acetate or other safety film is utilized in conjunction with electric arc, xenon or other light-source projection equipment that develops hazardous gases, dust or radiation. Where cellulose nitrate film is utilized or stored, such rooms shall comply with NFPA 40.

~~409.1.1~~<u>307.1.3.1</u> Projection room required.

(The text of this section and subsequent sections would be unchanged except to update section references.)

~~409.2~~<u>307.1.3.2</u> Construction of projection rooms.

~~409.3~~<u>307.1.3.3</u> Projection room and equipment ventilation.

~~409.3.1~~<u>307.1.3.3.1</u> Supply air.

~~409.3.2~~<u>307.1.3.3.2</u> Exhaust air.

~~409.3.3~~<u>307.1.3.3.3</u> Projection machines.

~~409.4~~<u>307.1.3.4</u> Lighting control.

~~409.5~~<u>307.1.3.5</u> Miscellaneous equipment.

Reason: Chapter 4 of the IBC includes a hodge-podge of various criteria for "special use and occupancy." However, these are often exceptions to specific limits or allowances from having to meet such limits, or even specific requirements for specific occupancy groups. The issue in general is that they are "gotcha's" built into the code. This series of code changes moves these special criteria into the chapters and sections where these issues are typically addressed, removing any doubt in the mind of the code user as to how these criteria are to be integrated into the design and construction of a building that includes these features.
Motion picture projection rooms as classified by this special section are indicated as having hazardous materials or producing them. How those are treated is addressed in part in Chapters 3 and 4. This change consolidates them into one section where a great deal of information regrding the application of the codes for hazardous materails is located making it easier for the code user to understand how to treat these spaces.

Cost Impact: Will not increase the cost of construction
This correlation of provisions for motion picture rooms will not increase the cost of construction.

~~SECTION 410~~
~~STAGES, PLATFORMS AND TECHNICAL PRODUCTION AREAS~~

.

Add new text as follows:

602.6 Stages, platforms and technical production areas The provisions of Sections 602.6.1 through 602.6.8 shall apply to all parts of buildings and structures that contain stages or platforms and similar appurtenances as herein defined.

Revise as follows:

~~410.1~~602.6.1 Applicability. The provisions of Sections ~~410.1~~602.6.1 through ~~410.8~~602.6.8 shall apply to all parts of buildings and structures that contain *stages* or *platforms* and similar appurtenances as herein defined.

~~410.2~~602.6.2 Definitions.

(The text of this section and subsequent sections would be unchanged except to update section references.)

~~410.3~~602.6.3 Stages.

~~410.3.1~~602.6.3.1 Stage construction.

~~410.3.1.1~~602.6.3.1.1 Stage height and area.

~~410.3.2~~602.6.3.2 Technical production areas: galleries, gridirons and catwalks.

~~410.3.3~~602.6.3.3 Exterior stage doors.

~~410.3.4~~602.6.3.4 Proscenium wall.

~~410.3.5~~602.6.3.5 Proscenium curtain.

~~410.3.6~~602.6.3.6 Scenery.

~~410.3.7~~602.6.3.7 Stage ventilation.

~~410.3.7.1~~602.6.3.7.1 Roof vents.

[F] ~~410.3.7.2~~602.6.3.7.2 Smoke control.

~~410.4~~602.6.4 Platform construction.

~~410.4.1~~602.6.4.1 Temporary platforms.

~~410.5~~602.6.5 Dressing and appurtenant rooms.

~~410.5.1~~602.6.5.1 Separation from stage.

~~410.5.2~~602.6.5.2 Separation from each other.

~~410.6~~602.6.6 Means of egress.

~~410.6.1~~602.6.6.1 Arrangement.

~~410.6.2~~602.6.6.2 Stairway and ramp enclosure.

~~410.6.3~~602.6.6.3 Technical production areas. .

~~410.6.3.1~~602.6.6.3.1 Number of means of egress.

~~410.6.3.2~~602.6.6.3.2 Exit access travel distance.

~~410.6.3.3~~602.6.6.3.3 Two means of egress.

~~410.6.3.4~~602.6.6.3.4 Path of egress travel.

~~410.6.3.5~~602.6.6.3.5 Width.

[F] ~~410.7~~602.6.7 Automatic sprinkler system.

[F] ~~410.8~~602.6.8 Standpipes.

Reason: Chapter 4 of the IBC includes a hodge-podge of various criteria for "special use and occupancy." However, these are often exceptions to specific limits or allowances from having to meet such limits, or even specific requirements for specific occupancy groups. The issue in general is that they are "gotcha's" built into the code. This series of code changes moves these
special criteria into the chapters and sections where these issues are typically addressed, removing any doubt in the mind of the code user as to how these criteria are to be integrated into
the design and construction of a building that includes these features.

The prrovisions in the code for stages, platforms and technical production areas in Chapter 4 includes elements of construction, wall criteria and opening protection methods required because of the hazards present. Moving these requirements to Chapter 6 to coincide with the construction requirements of buildings will make it obvious to users of the code how such features are to be integrated with the building construction limitations in the code.

Cost Impact: Will not increase the cost of construction
Moving these provisions from Chapter 4 to Chapter 6 will not change the cost of construction.

G 58-15 : 410-COLLINS4811

2015 International Building Code

Delete without substitution:

~~SECTION 411~~
~~SPECIAL AMUSEMENT BUILDINGS~~

Revise as follows:

~~411.1~~303.7 ~~General~~Special amusement buildings. *Special amusement buildings* having an *occupant load* of 50 or more shall comply with the requirements for the appropriate Group A occupancy and Sections ~~411.1~~303.7.1 through ~~411.8~~303.7.7.~~*Special amusement buildings* having an *occupant load* of less than 50 shall comply with the requirements for a Group B occupancy and Sections 411.1 through 411.8.~~

Exception: *Special amusement buildings* or portions thereof that are without walls or a roof and constructed to prevent the accumulation of smoke need not comply with this section.

For flammable *decorative materials*, see the *International Fire Code*.

~~411.2~~303.7.1 Definition.

(The text of this section and subsequent sections would be unchanged except to update section references.)

[F] ~~411.3~~303.7.2 Automatic fire detection.

[F] ~~411.4~~303.7.3 Automatic sprinkler system.

[F] ~~411.5~~303.7.4 Alarm.

[F] ~~411.6~~303.7.5 Emergency voice/alarm communications system.

~~411.7~~303.7.6 Exit marking.

~~411.7.1~~303.7.6.1 Photoluminescent exit signs.

~~411.8~~303.7.7 Interior finish.

Add new text as follows:

304.3 Special amusement buildings. Special amusement buildings having an occupant load of less than 50 shall comply with the requirements for a Group B occupancy and Sections 303.7.1 through 303.7.7.

Exception: Special amusement buildings or portions thereof that are without walls or a roof and constructed to prevent the accumulation of smoke need not comply with this section.

For flammable decorative materials, see the *International Fire Code.*

Reason: Chapter 4 of the IBC includes a hodge-podge of various criteria for "special use and occupancy." However, these are often exceptions to specific limits or allowances from having to meet such limits, or even specific requirements for specific occupancy groups. The issue in general is that they are "gotcha's" built into the code. This series of code changes moves these special criteria into the chapters and sections where these issues are typically addressed, removing any doubt in the mind of the code user as to how these criteria are to be integrated into the design and construction of a building that includes these features.

Special amusement buildings with more than 50 occupants or more are classified in Section 411.1 as being in an A occupancy. Those that are less than 50 are part of the B occupancy. This same requirements apply to assembly spaces within an office building, but are clearly delineated in Sections 301 and 304. With this change the same clarity for special amusement facilities will be brought to the code.

Cost Impact: Will not increase the cost of construction
By moving these provisions out of Chapter 4 into Chapter 3, no change in the cost of construction will result.

[F] ~~412.8.5~~1510.10.5 Standpipe system.

Reason: Chapter 4 of the IBC includes a hodge-podge of various criteria for "special use and occupancy." However, these are often exceptions to specific limits or allowances from having to meet such limits, or even specific requirements for specific occupancy groups. The issue in general is that they are "gotcha's" built into the code. This series of code changes moves these special criteria into the chapters and sections where these issues are typically addressed, removing any doubt in the mind of the code user as to how these criteria are to be integrated into the design and construction of a building that includes these features.
Aircraft related occupancies involves a broad number of applications. Aircraft control towers are listed as a B occupancy and items specific to them have been move to this location. Other elements of Section 412 include hangers and manufacturing which are part of the storage occupancies, as well as heliports and helitstops that are addressed as facilities on a rooftop. Those requirements are moved to the storage parts of the code and rooftop structures which include them for clarification.

Cost Impact: Will not increase the cost of construction
These provisions are moved for clarification with no technical changes and should not affect the cost of construction.

~~SECTION 412~~
~~AIRCRAFT-RELATED OCCUPANCIES~~

Revise as follows:

~~412.4~~311.2.1 Aircraft hangars. Aircraft hangars shall be in accordance with Sections ~~412.4.1~~311.2.1.1 through ~~412.4.6~~311.2.1.6.

~~412.4.1~~311.2.1.1 Exterior walls.

(The text of this section and subsequent sections would be unchanged except to update section references.)

~~412.4.2~~311.2.1.2 Basements.

~~412.4.3~~311.2.1.3 Floor surface.

~~412.4.4~~311.2.1.4 Heating equipment.

~~412.4.5~~311.2.1.5 Finishing.

[F] ~~412.4.6~~311.2.1.6 Fire suppression.

TABLE [F] ~~412.4.6~~ 311.2.1.6
HANGAR FIRE SUPPRESSION REQUIREMENTS[a,b,c]

[F] ~~412.4.6.1~~311.2.1.6.1 Hazardous operations.

[F] ~~412.4.6.2~~311.2.1.6.2 Separation of maximum single fire areas.

Reason: Chapter 4 of the IBC includes a hodge-podge of various criteria for "special use and occupancy." However, these are often exceptions to specific limits or allowances from having to meet such limits, or even specific requirements for specific occupancy groups. The issue in general is that they are "gotcha's" built into the code. This series of code changes moves these special criteria into the chapters and sections where these issues are typically addressed, removing any doubt in the mind of the code user as to how these criteria are to be integrated into the design and construction of a building that includes these features.

By moving the provisions in Chapter 4 for aircraft hangers into the area limits in Chapter 3, the triggers and allowances for malls will be clear and obvious choices. Correlation of references to new code locations are not included in the proposal but need to be provided by the editorial staff.

Cost Impact: Will not increase the cost of construction
Simply moving the technical requirements from Chapter 4 to Chapter 3 does not change their application and will not increase the cost of construction.

G 61-15 : 412-COLLINS4967

G 62-15

413, 413.1, 413.2

Proponent: David Collins, representing The American Institute of Architects (dcollins@preview-group.com)

2015 International Building Code

Delete without substitution:

~~SECTION 413~~
~~COMBUSTIBLE STORAGE~~

Revise as follows:

~~413.1~~311.2.1 ~~General~~High-piled stock or rack storage. High-piled stock or rack storage in any occupancy group shall comply with the *International Fire Code*.

~~413.2~~311.2.2 Attic, under-floor and concealed spaces.

(The text of this section would be unchanged except to update section references.)

Reason: Chapter 4 of the IBC includes a hodge-podge of various criteria for "special use and occupancy." However, these are often exceptions to specific limits or allowances from having to meet such limits, or even specific requirements for specific occupancy groups. The issue in general is that they are "gotcha's" built into the code. This series of code changes moves these special criteria into the chapters and sections where these issues are typically addressed, removing any doubt in the mind of the code user as to how these criteria are to be integrated into the design and construction of a building that includes these features.

Provisions of the code for high-piles stock or rack storage are being moved to the occupancy sections which include the criteria for these conditions of storage and will provide a single location for users to find the requirements for this condition.

Cost Impact: Will not increase the cost of construction
The provisions for storage are not being changed and the new location should not create any additional cost of construction.

~~**SECTION414**~~
~~**HAZARDOUS MATERIALS**~~

Revise as follows:

[F] ~~414.1~~307.9 General. The provisions of Sections ~~414.1~~307.9.1 through ~~414.6~~307.9.6 shall apply to buildings and structures occupied for the manufacturing, processing, dispensing, use or storage of hazardous materials.

[F] ~~414.1.1~~307.9.1.1 Other provisions.

(The text of this section and subsequent sections would be unchanged except to update section references.)

[F] ~~414.1.2~~307.9.1.2 Materials.

[F] ~~414.1.2.1~~307.9.1.2.1 Aerosols.

[F] ~~414.1.3~~307.9.1.3 Information required.

[F] ~~414.2~~307.9.2 Control areas.

[F] ~~414.2.1~~307.9.2.1 Construction requirements.

TABLE [F] ~~414.2.2~~ 307.9.2.2
DESIGN AND NUMBER OF CONTROL AREAS

[F] ~~414.2.2~~307.9.2.2 Percentage of maximum allowable quantities.

[F] ~~414.2.3~~307.9.2.3 Number.

[F] ~~414.2.4~~307.9.2.4 Fire-resistance-rating requirements.

[F] ~~414.2.5~~307.9.2.5 Hazardous material in Group M display and storage areas and in Group S storage areas.

TABLE [F]~~414.2.5(1)~~ 307.9.2.5 (1)
MAXIMUM ALLOWABLE QUANTITY OF FLAMMABLE AND COMBUSTIBLE LIQUIDS IN WHOLESALE AND RETAIL SALES OCCUPANCIES PER CONTROL AREA[a]

TABLE [F] ~~414.2.5(2)~~ 307.9.2.5(2)
MAXIMUM ALLOWABLE QUANTITY PER INDOOR AND OUTDOOR CONTROL AREA IN GROUP M AND S OCCUPANCIES NONFLAMMABLE SOLIDS AND NONFLAMMABLE AND NONCOMBUSTIBLE LIQUIDS[d,e,f]

[F] ~~414.3~~307.9.3 Ventilation.

[F] ~~414.4~~307.9.4 Hazardous material systems.

[F] ~~414.5~~307.9.5 Inside storage, dispensing and use.

TABLE [F]~~414.5.1~~ 307.9.5.1
EXPLOSION CONTROL REQUIREMENTS[a, h]

[F] ~~414.5.1~~307.9.5.1 Explosion control.

[F] ~~414.5.2~~307.9.5.2 Emergency or standby power.

[F] ~~414.5.2.1~~307.9.5.2.1 Exempt applications.

[F] ~~414.5.2.2~~307.9.5.2.2 Fail-safe engineered systems.

[F] ~~414.5.3~~307.9.5.3 Spill control, drainage and containment.

[F] ~~414.6~~307.9.6 Outdoor storage, dispensing and use.

[F] ~~414.6.1~~307.9.6.1 Weather protection.

[F] ~~414.6.1.1~~307.9.6.1.1 Walls.

[F] ~~414.6.1.2~~307.9.6.1.2 Separation distance.

[F] ~~414.6.1.3~~307.9.6.1.3 Noncombustible construction.

Reason: Chapter 4 of the IBC includes a hodge-podge of various criteria for "special use and occupancy." However, these are often exceptions to specific limits or allowances from having to meet such limits, or even specific requirements for specific occupancy groups. The issue in general is that they are "gotcha's" built into the code. This series of code changes moves these special criteria into the chapters and sections where these issues are typically addressed, removing any doubt in the mind of the code user as to how these criteria are to be integrated into the design and construction of a building that includes these features.
Provisions of the code for manufacturing, processing, dispensing, use or storage are being moved to the occupancy sections which include the criteria for these conditions and will provide a single location for users to find the requirements for this condition.

Cost Impact: Will not increase the cost of construction
Because the technical provisions of the code are not being changed, but simply moved, there is no impact on the cost of construction.

[F] ~~415.11.11.3~~307.7.1.11.3 Automatic sprinkler locations.

Reason: Chapter 4 of the IBC includes a hodge-podge of various criteria for "special use and occupancy." However, these are often exceptions to specific limits or allowances from having to meet such limits, or even specific requirements for specific occupancy groups. The issue in general is that they are "gotcha's" built into the code. This series of code changes moves these special criteria into the chapters and sections where these issues are typically addressed, removing any doubt in the mind of the code user as to how these criteria are to be integrated into the design and construction of a building that includes these features.
Provisions of the code for manufacturing, processing, dispensing, use or storage are being moved to the occupancy sections which include the criteria for these conditions and will provide a single location for users to find the requirements for this condition.

Cost Impact: Will not increase the cost of construction
Because the technical provisions of the code are not being changed, but simply moved, there is no impact on the cost of construction.

Delete without substitution:

~~SECTION 416~~
~~APPLICATION OF FLAMMABLE FINISHES~~

Revise as follows:

[F] ~~416.1~~307.1.3 ~~General.~~Application of flammable finishes The provisions of this section shall apply to the construction, installation and use of buildings and structures, or parts thereof, for the application of flammable finishes. Such construction and equipment shall comply with the *International Fire Code*.

[F] ~~416.2~~307.1.3.1 Spray rooms.

(The text of this section and subsequent sections would be unchanged except to update section references.)

[F] ~~416.2.1~~307.1.3.1.1 Surfaces.

[F] ~~416.2.2~~307.1.3.1.2 Ventilation.

[F] ~~416.3~~307.1.3.2 Spraying spaces.

[F] ~~416.3.1~~307.1.3.2.1 Surfaces.

[F] ~~416.4~~307.1.3.3 Spray booths.

[F] ~~416.5~~307.1.3.4 Fire protection.

Reason: Chapter 4 of the IBC includes a hodge-podge of various criteria for "special use and occupancy." However, these are often exceptions to specific limits or allowances from having to meet such limits, or even specific requirements for specific occupancy groups. The issue in general is that they are "gotcha's" built into the code. This series of code changes moves these special criteria into the chapters and sections where these issues are typically addressed, removing any doubt in the mind of the code user as to how these criteria are to be integrated into the design and construction of a building that includes these features.
Flammable finishes are specifically part of the hazardous materials requirements and with this change are moved to Section 307 where all the criteria are located for identifying such materials. With this change once the code user is clear that the materials are hazardous, the requirements will be located in the same section making it clear what is necessary as a result.

Cost Impact: Will not increase the cost of construction
Because there are no changes to the technical requirements of the code for the spray applications of flammable materials, there will be no change in the cost of construction as a result of this change.

2015 International Building Code

Delete without substitution:

~~SECTION 417~~
~~DRYING ROOMS~~

Revise as follows:

[F] ~~417.1~~307.6.2.1 ~~General.~~Drying rooms A drying room or dry kiln installed within a building shall be constructed entirely of *approved* noncombustible materials or assemblies of such materials regulated by the *approved* rules or as required in the general and specific sections of this chapter for special occupancies and where applicable to the general requirements of the *International Mechanical Code*.

[F] ~~417.2~~307.6.2.1.1 Piping clearance.

(The text of this section and subsequent sections would be unchanged except to update section references.)

[F] ~~417.3~~307.6.2.1.2 Insulation.

[F] ~~417.4~~307.6.2.1.3 Fire protection.

Reason: Chapter 4 of the IBC includes a hodge-podge of various criteria for "special use and occupancy." However, these are often exceptions to specific limits or allowances from having to meet such limits, or even specific requirements for specific occupancy groups. The issue in general is that they are "gotcha's" built into the code. This series of code changes moves these special criteria into the chapters and sections where these issues are typically addressed, removing any doubt in the mind of the code user as to how these criteria are to be integrated into the design and construction of a building that includes these features.
Drying rooms often involve the use of materaials with hazardous characteristics and must be addressed by their classification as such and the quantities of such materials when they exceed the exempt quantities. By moving the provisions from Chapter 4 to the hazardous materaials classifications, the code user will better understand the link with these provisions.

Cost Impact: Will not increase the cost of construction
Because there is no technical change to the code requirements, there will be no increase in the cost of construction.

~~SECTION 419~~
~~LIVE/WORK UNITS~~

Revise as follows:

~~419.1~~510.10 ~~General~~Live/Work units. A *live/work unit* shall comply with Sections ~~419.1~~510.10.1 through ~~419.9~~510.10.9.

> **Exception:** Dwelling or sleeping units that include an office that is less than 10 percent of the area of the *dwelling unit* are permitted to be classified as *dwelling units* with accessory occupancies in accordance with Section 508.2.

~~419.1.1~~510.10.1 Limitations.

(The text of this section and subsequent sections would be unchanged except to update section references.).

~~419.2~~510.10.2 Occupancies.

~~419.3~~510.10.3 Means of egress.

~~419.3.1~~510.10.3.1 Egress capacity.

~~419.3.2~~510.10.3.2 Spiral stairways.

~~419.4~~510.10.4 Vertical openings. .

[F] ~~419.5~~510.10.5 Fire protection.

~~419.6~~510.10.6 Structural.

~~419.7~~510.10.7 Accessibility. .

~~419.8~~510.10.8 Ventilation.

~~419.9~~510.10.9 Plumbing facilities.

Reason: Chapter 4 of the IBC includes a hodge-podge of various criteria for "special use and occupancy." However, these are often exceptions to specific limits or allowances from having to meet such limits, or even specific requirements for specific occupancy groups. The issue in general is that they are "gotcha's" built into the code. This series of code changes moves these special criteria into the chapters and sections where these issues are typically addressed, removing any doubt in the mind of the code user as to how these criteria are to be integrated into the design and construction of a building that includes these features.
Live/work units, which perhaps a special subclassification of residential occupancy is in fact at part of the special provisions in Chapter 5 for mixed uses that are not separated. Section 510 is titled special provisions and is where the live/work provisions should also be found.

Cost Impact: Will not increase the cost of construction
No technical changes are made to the requirements for live/work and will not change how the code applies and will cause no increase in cost of construction.

2015 International Building Code

Delete and substitute as follows:

~~**SECTION 420**~~
~~**GROUPS I-1, R-1, R-2, R-3 AND R-4**~~

~~**420.1 General.** Occupancies in Groups I-1, R-1, R-2, R-3 and R-4 shall comply with the provisions of Sections 420.1 through 420.6 and other applicable provisions of this code.~~

~~**420.2 Separation walls.** Walls separating *dwelling units* in the same building, walls separating *sleeping units* in the same building and walls separating *dwelling* or *sleeping units* from other occupancies contiguous to them in the same building shall be constructed as *fire partitions* in accordance with Section 708.~~

~~**420.3 Horizontal separation.** Floor assemblies separating *dwelling units* in the same buildings, floor assemblies separating *sleeping units* in the same building and floor assemblies separating *dwelling* or *sleeping units* from other occupancies contiguous to them in the same building shall be constructed as *horizontal assemblies* in accordance with Section 711.~~

~~**420.4 Smoke barriers in Group I-1, Condition 2.** Smoke barriers shall be provided in Group I-1, Condition 2, to subdivide every story used by persons receiving care, treatment or sleeping and to provide other stories with an occupant load of 50 or more persons, into no fewer than two smoke compartments~~

~~. Such stories shall be divided into smoke compartments with an area of not more than 22,500 square feet (2092 m^2) and the distance of travel from any point in a smoke compartment to a smoke barrier door shall not exceed 200 feet (60 960 mm). The smoke barrier shall be in accordance with Section 709.~~

~~**420.4.1 Refuge area.** Refuge areas shall be provided within each smoke compartment. The size of the refuge area shall accommodate the occupants and care recipients from the adjoining smoke compartment. Where a smoke compartment is adjoined by two or more smoke compartments, the minimum area of the refuge area shall accommodate the largest occupant load of the adjoining compartments. The size of the refuge area shall provide the following:~~

1. ~~Not less than 15 net square feet (1.4 m^2) for each care recipient.~~
2. ~~Not less than 6 net square feet (0.56 m^2) for other occupants.~~

~~Areas or spaces permitted to be included in the calculation of the refuge area are corridors, lounge or dining areas and other low-hazard areas.~~

~~**[F] 420.5 Automatic sprinkler system.** Group R occupancies shall be equipped throughout with an *automatic sprinkler system* in accordance with Section 903.2.8. Group I-1 occupancies shall be equipped throughout with an *automatic sprinkler system* in accordance with Section 903.2.6. Quickresponse or residential automatic sprinklers shall be installed in accordance with Section 903.3.2.~~

~~**[F] 420.6 Fire alarm systems and smoke alarms.** Fire alarm systems and smoke alarms shall be provided in Group I-1, R-1, R-2 and R-4 occupancies in accordance with Sections 907.2.6, 907.2.8, 907.2.9 and 907.2.10, respectively. Single- or multiple-station smoke alarms shall be provided in Groups I-1, R-2, R-3 and R-4 in accordance with Section 907.2.11.~~

Add new text as follows:

308.3.5 Separation walls and horizontal assemblies. Walls or floor assemblies separating I-1 dwelling units in the same building, walls separating I-1 sleeping units in the same building and walls separating I-1 dwelling or sleeping units from other occupancies contiguous to them in the same building shall be constructed as fire partitions in accordance with Section 708 and horizontal assemblies in accordance with Section 711.

308.3.6 Automatic sprinkler system Group I-1 occupancies shall be equipped throughout with an automatic sprinkler system in accordance with Seciton 903.2.6. Quickresponse or residential automatic sprinklers shall be installed in accordance with Section 903.3.2.

308.3.7 Fire alarm systems and smoke alarms 308.3.7 Fire alarm systems and smoke alarms. Fire alarm systems and smoke alarms shall be provided in Group I-1 occupancies in accordance with Sections 907.2.6.1. Single or multiple-station smoke alarms shall be provided in Groups I-1 in accordance with Section 907.2.11.2.

308.3.8 Smoke barriers in Group I-1, Condition 2 Smoke barriers shall be provided in Group I-1, Condition 2, to subdivide every story used by persons receiving care, treatment or sleeping and to provide other stories with an occupant load of 50 or more persons, into no fewer than two smoke compartments.

Such stories shall be divided into smoke compartments with an area of not more than 22,500 square feet (2092 m^2) and the distance of travel from any point in a smoke compartment to a smoke barrier door shall not exceed 200 feet (60 960 mm). The smoke barrier shall be in accordance with Section 709.

308.3.8.1 Refuge area Refuge areas shall be provided within each smoke compartment. The size of the refuge area shall accommodate the occupants and care recipients from the adjoining smoke compartment. Where a smoke compartment is adjoined by two or more smoke compartments, the minimum area of the refuge area shall accommodate the largest occupant load of the adjoining compartments. The size of the refuge area shall provide the following:
1. Not less than 15 net square feet (1.4 m^2) for each care recipient.
2. Not less than 6 net square feet (0.56 m^2) for other occupants.

Areas or spaces permitted to be included in the calculation of the refuge area are corrid ors, lounge or dining areas and other low-hazard areas.

310.3 **Separation walls and horizontal assemblies** Walls or floor assemblies separating R-1 dwelling units in the same building, walls separating R-1, R-2, R-3 and R-4 sleeping units in the same building and walls separating R-1, R-2, R-3 and R-4 dwelling or sleeping units from other occupancies contiguous to them in the same building shall be constructed as fire partitions in accordance with Section 708 and horizontal assemblies in accordance with Section 711.

310.4 **Automatic sprinkler system** Group R-1, R-2, R-3 and R-4 occupancies shall be equipped throughout with an automatic sprinkler system in accordance with Seciton 903.2.8. Quickresponse or residential automatic sprinklers shall be installed in accordance with Section 903.3.2.

310.5 **Fire alarm systems and smoke alarms** Fire alarm systems and smoke alarms shall be provided in Group R-1, R-2 and R-4 occupancies in accordance with Sections 907.2.8, 907.2.9 and 907.2.11 respectively. Single or multiple-station smoke alarms shall be provided in Groups R-2, R-3 and R-4 in accordance with Section 907.2.11.

Reason: Chapter 4 of the IBC includes a hodge-podge of various criteria for "special use and occupancy." However, these are often exceptions to specific limits or allowances from having to meet such limits, or even specific requirements for specific occupancy groups. The issue in general is that they are "gotcha's" built into the code. This series of code changes moves these special criteria into the chapters and sections where these issues are typically addressed, removing any doubt in the mind of the code user as to how these criteria are to be integrated into the design and construction of a building that includes these features.
I-1, R-1, R-2, R-3 and R-4 have similarities but differences as well and putting them all in one section can be confusing. This change moves them into two parts of Chapter 3 where the I-1 Group is classified and the provisions for compartments are more appropriately identified. The R occupancies are moved into the R Group where the requirements for separation are more easily found and applied appropriately.

Cost Impact: Will not increase the cost of construction
No technical changes are made by this code, simply moving provisions from one part of the code to another, not increasing the cost of construction.

2015 International Building Code

Delete without substitution:

~~**SECTION 421**~~
~~**HYDROGEN FUEL GAS ROOMS**~~

Revise as follows:

[F] ~~421.1~~509.5 ~~General~~ Hydrogen fuel gas rooms. Where required by the *International Fire Code*, hydrogen fuel gas rooms shall be designed and constructed in accordance with Sections ~~421.1~~509.5.1 through ~~421.7~~509.5.7.

[F] ~~421.2~~509.5.1 Definitions.

(The text of this section and subsequent sections would be unchanged except to update section references.)

[F] ~~421.3~~509.5.2 Location.

[F] ~~421.4~~509.5.3 Design and construction.

[F] ~~421.4.1~~509.5.3.1 Pressure control.

[F] ~~421.4.2~~509.5.3.2 Windows.

[F] ~~421.5~~509.5.4 Exhaust ventilation.

[F] ~~421.6~~509.5.5 Gas detection system.

[F] ~~421.6.1~~509.5.5.1 System design.

[F] ~~421.6.2~~509.5.5.2 Gas detection system components.

[F] ~~421.6.3~~509.5.5.3 Operation.

[F] ~~421.6.4~~509.5.5.4 Failure of the gas detection system.

[F] ~~421.7~~509.5.6 Explosion control.

[F] ~~421.8~~509.5.7 Standby power.

Reason: Chapter 4 of the IBC includes a hodge-podge of various criteria for "special use and occupancy." However, these are often exceptions to specific limits or allowances from having to meet such limits, or even specific requirements for specific occupancy groups. The issue in general is that they are "gotcha's" built into the code. This series of code changes moves these special criteria into the chapters and sections where these issues are typically addressed, removing any doubt in the mind of the code user as to how these criteria are to be integrated into the design and construction of a building that includes these features.

Hydrogen fuel gas rooms are listed as incidental uses in Table 509 of the IBC and the IFC when not an H occupancy. This change simply moves it from Chapter 4 and puts it into the requirements for indicental uses in Chapter 5 making the application of the code easier to understand and easier for appropriate application for the user.

Cost Impact: Will not increase the cost of construction
This change will simply clarify how these rooms, once identified as incidental must be constructed, and will not increase the cost of construction.

G 70-15 : [F] 421-COLLINS4825

G 71-15

422, 422.1, 422.2, 422.3, 422.3.1, 422.3.2, 422.3.3, [F] 422.4, [F] 422.5

2015 International Building Code

Delete without substitution:

~~SECTION 422~~
~~AMBULATORY CARE FACIILITIES~~

Revise as follows:

~~422.1~~304.2 ~~General~~Ambulatory care facilities. Occupancies classified as *ambulatory care facilities* shall comply with the provisions of Sections ~~422.1~~ 304.2.1 through ~~422.5~~ 304.2.4 and other applicable provisions of this code.

~~422.2~~304.2.1 Separation.

(The text of this section and subsequent sections would be unchanged except to update section references.)

~~422.3~~304.2.2 Smoke compartments.

~~422.3.1~~304.2.2.1 Means of egress.

~~422.3.2~~304.2.2.2 Refuge area.

~~422.3.3~~304.2.2.3 Independent egress.

[F] ~~422.4~~304.2.3 Automatic sprinkler systems.

[F] ~~422.5~~304.2.4 Fire alarm systems.

Reason: Chapter 4 of the IBC includes a hodge-podge of various criteria for "special use and occupancy." However, these are often exceptions to specific limits or allowances from having to meet such limits, or even specific requirements for specific occupancy groups. The issue in general is that they are "gotcha's" built into the code. This series of code changes moves these special criteria into the chapters and sections where these issues are typically addressed, removing any doubt in the mind of the code user as to how these criteria are to be integrated into the design and construction of a building that includes these features.
Ambulatory facilities are classified as a B occupancy. Being a relatively new occupancy having the specific requirements located in Chapter 4 with no reference to it in Chapter 3 leaves many questions in the code users mind. Moving it here will clearly identify these types of care facilities as a business and include the specific criteria for it in that same section.

By moving the provisions in Chapter 4 for ambulatory care facilities into the the occupancy classification in Chapter 3, the triggers and allowances for ambulatory care will be clear and obvious choices. Correlation of references to new code locations are not included in the proposal but need to be provided by the editorial staff.

Cost Impact: Will not increase the cost of construction
By moving the provisions for ambulatory care into the occupancy classification it will make the code simpler to understand and apply and will not increase the cost of construction.

2015 International Building Code

Delete without substitution:

~~SECTION 423~~
~~STORM SHELTERS~~

Revise as follows:

~~423.1~~504.5 ~~General~~Storm shelters. In addition to the requirements of this section and other applicable requirements in this code, storm shelters shall be constructed in accordance with ICC 500.

~~423.1.1~~504.5.1 Scope.

(The text of this section and subsequent sections would be unchanged except to update section references.)

~~423.2~~504.5.2 Definitions.

~~423.3~~504.5.3 Critical emergency operations.

~~423.4~~504.5.4 Group E occupancies.

Reason: Chapter 4 of the IBC includes a hodge-podge of various criteria for "special use and occupancy." However, these are often exceptions to specific limits or allowances from having to meet such limits, or even specific requirements for specific occupancy groups. The issue in general is that they are "gotcha's" built into the code. This series of code changes moves these special criteria into the chapters and sections where these issues are typically addressed, removing any doubt in the mind of the code user as to how these criteria are to be integrated into the design and construction of a building that includes these features.

Moving the provisions for storm shelters from Chapter 4 into Section 504 will more closely align such structures for their typical location above or below ground. With other changes for structures below ground (underground structures) this will maintain the common location of buildings, their height and their relationship with grade consistent and make it more understandable for code users.

Cost Impact: Will not increase the cost of construction
Moving the provisions for storm shelters from Chapter 4 to Chapter 5 will not affect the cost of construction.

G 72-15 : 423-COLLINS4872

~~**CHILDREN'S PLAY STRUCTURES**~~

Delete and substitute as follows:

~~**424.1 Children's play structures.** Children's play structures installed inside all occupancies covered by this code that exceed 10 feet (3048 mm) in height and 150 square feet (14 m^2) in area shall comply with Sections 424.2 through 424.5.~~

602.6 Children's play structures

Children's play structures installed inside all occupancies covered by this code that exceed 10 feet (3048 mm) in height and 150 square feet (14 m^2) in area shall comply with Sections 602.6.1 through 602.6.4.

Revise as follows:

~~424.2~~602.6.1 Materials.

(The text of this section and subsequent sections would be unchanged except to update section references.)

[F] ~~424.3~~602.6.2 Fire protection.

~~424.4~~602.6.3 Separation.

~~424.5~~602.6.4 Area limits.

Reason: Chapter 4 of the IBC includes a hodge-podge of various criteria for "special use and occupancy." However, these are often exceptions to specific limits or allowances from having to meet such limits, or even specific requirements for specific occupancy groups. The issue in general is that they are "gotcha's" built into the code. This series of code changes moves these special criteria into the chapters and sections where these issues are typically addressed, removing any doubt in the mind of the code user as to how these criteria are to be integrated into the design and construction of a building that includes these features.
The requirements for children's play area are based solely on the materials they are constructed of and their relationship with the structure in which they are located. Moving these requirements into Chapter 6 where other maerails performance and their relationship with the building is appropriate and more easily understood by code users.

Cost Impact: Will not increase the cost of construction
Moving these provisions with no change will not affect the cost of construction.

Revise as follows:

~~425.1~~308.7 Hyperbaric facilities.

(The text of this section would be unchanged except to update section references.).

Add new text as follows:

304.5 Hyperbaric facilities Hyperbaric facilities shall meet the requirements contained in Chapter 14 of NFPA 99.

Reason: Chapter 4 of the IBC includes a hodge-podge of various criteria for "special use and occupancy." However, these are often exceptions to specific limits or allowances from having to meet such limits, or even specific requirements for specific occupancy groups. The issue in general is that they are "gotcha's" built into the code. This series of code changes moves these special criteria into the chapters and sections where these issues are typically addressed, removing any doubt in the mind of the code user as to how these criteria are to be integrated into the design and construction of a building that includes these features.
By moving the provisions in Chapter 4 for hypberbaric facilities into Chapter 3, the typical applications within Group I-2 facilities and Group B outpatient facilities will be captured for understanding by the code user. This change also references the criteira for reporting in the International Fire Code.

Cost Impact: Will not increase the cost of construction
Simply moving the provisions from Chapter 4 to Chapter 3 will have no affect on the cost of construction.

2015 International Building Code

Delete without substitution:

~~SECTION[F] 426~~
~~COMBUSTIBLE DUSTS, GRAIN PROCESSING AND STORAGE~~

Revise as follows:

~~426.1~~[F] 307.4.1 Combustible dusts, grain processing and storage. The provisions of Sections ~~426.1.1~~307.4.1.1 through ~~426.1.7~~307.4.1.7 shall apply to buildings in which materials that produce combustible dusts are stored or handled. Buildings that store or handle combustible dusts shall comply with the applicable provisions of NFPA 61, NFPA 85, NFPA 120, NFPA 484, NFPA 654, NFPA 655 and NFPA 664 and the *International Fire Code*.

[F] ~~426.1.1~~307.4.1.1 Type of construction and height exceptions.

(*The text of this section and subsequent sections would be unchanged except to update section references.)*

[F] ~~426.1.2~~307.4.1.2 Grinding rooms.

[F] ~~426.1.3~~307.4.1.3 Conveyors.

[F] ~~426.1.4~~307.4.1.4 Explosion control.

[F] ~~426.1.5~~307.4.1.5 Grain elevators.

[F] ~~426.1.6~~307.4.1.6 Coal pockets.

[F] ~~426.1.7~~307.4.1.7 Tire rebuilding.

Reason: Chapter 4 of the IBC includes a hodge-podge of various criteria for "special use and occupancy." However, these are often exceptions to specific limits or allowances from having to meet such limits, or even specific requirements for specific occupancy groups. The issue in general is that they are "gotcha's" built into the code. This series of code changes moves these special criteria into the chapters and sections where these issues are typically addressed, removing any doubt in the mind of the code user as to how these criteria are to be integrated into the design and construction of a building that includes these features.
The handling and use of combustible dusts and grains is another example of special use and occupancy that is better found in Chapter 3 where the specifics of the hazards are classified and their application within the code determined. The wholesale provisions from 426 are moved to Section 307.4 for another part of the complicated H-2 occupancy conditions.

Cost Impact: Will not increase the cost of construction
Simply moving the provisions from one section of the code to another will not change the cost of construction.

G 75-15 : 426-COLLINS4880

G 76-15

402.7.6 (New)

Proponent: Stephen DiGiovanni, Clark County Building Department, representing Southern Nevada Chapter of ICC (sdigiovanni@clarkcountynv.gov)

2015 International Building Code

Add new text as follows:

402.7.6 **Fire command center** For covered mall buildings exceeding 50,000 square feet (4645 m²) a *fire command center* complying with Section 911 shall be provided in a location approved by the fire department.

Reason: The IFC alludes to a fire command center for covered mall buildings in Section 408.11.1. However, the trigger requirement for a covered mall building is not apparent. Base code requirements for covered mall buildings have significant triggers occurring at 50,000 sf. These include emergency voice alarm systems, and emergency power. Section 402.7.5 has requirements for fire department access to controls for sprinklers, HVAC, and "other detection, suppression or control elements shall be identified for use by the fire department." In addition Section 402.7.2 requires smoke control in covered malls with atriums over two stories.

For larger buildings, preplanning the use of fire protection equipment such as hose stations, and the above mentioned equipment will aid in fire department response. Providing the necessary information and equipment controls in one accessible location such as a fire command center, can only aid the response. Without a fire command center there is no requirement to consolidate equipment controls to aid emergency response. This proposal will formalize the requirement alluded to in the fire code for mall buildings over 50,000 sf. and provide a single location for emergency equipment controls and responders to coordinate their efforts.

Cost Impact: Will increase the cost of construction
This proposal will increase the cost of construction by adding a fire command center to certain mall buildings.

G 76-15 : 402.7.6 (New)-DIGIOVANNI3816

G 77-15

402.8.6.1

Proponent: Robert Davidson, representing Myself (rjd@davidsoncodeconcepts.com)

2015 International Building Code

Revise as follows:

402.8.6.1 Exit passageways. Where *exit passageways* provide a secondary *means of egress* from a tenant space~~, doorways to~~ the *exit* ~~*passageway*~~ passageways shall be ~~protected by 1-hour *fire door assemblies* that are self- or automatic-closing by smoke detection~~constructed in accordance with Section ~~716.5.9.3~~1024.

Reason: The purpose of this proposal is to point the user to all of the code requirements for exit passageways. The 1 hour fire-resistance rating is maintained, for openings Section 1024.5 points the user to Section 716 and applying that portion of the code maintains the requirement for the 1 hour rated fire doors, (see Table 716.5), and maintains the requirement for the smoke activated closure, (see Section 716.5.9.3, Item 3).
There has been cases of confusion in that a user looks at Sections 402.8.6.1 and 402.8.7 and interprets that these are the only sections needed to be complied with for an exit passageway in this occupancy. For example, the application of Section 1024.6 for penetration limitations. With the suggest change the level of protection is unchanged and application of the exit passageway requirements are clarified.

Cost Impact: Will not increase the cost of construction
Since the modification clarifies application of the code there should be a reduction in unnecessary costs associated with correcting erros in construction.

G 77-15 : 402.8.6.1-DAVIDSON5504

G 78-15

402.8.7.1 (New)

Proponent: Gene Boecker, representing Code Consultants, Inc. (geneb@codeconsultants.com)

2015 International Building Code

Add new text as follows:

402.8.7.1 Utility systems in exit passageways The following utility systems and equipment are permitted in mall exit passageways:

1. Electrical wiring in conduit not greater than 480 volts phase-to-phase and 277 volts phase-to-neutral.
2. Exposed low-voltage wiring.
3. Enclosed junction boxes.
4. Fire alarm equipment and wiring.
5. Noncombustible waste piping.
6. Cold/hot water piping.
7. Automatic fire sprinkler piping.
8. Storm water piping.

All penetrations of fire barriers shall be protected in accordance with Section 714.

Reason: The covered mall building provisions (Section 402.8.7) allow for building utility service rooms to open into exit passageways. However, the current text does not specificvally address the distribution of utilities within exit passageways of malls.
For maintenance reasons, utilities are typically distributed within the service corridors at the rear of the tenant space which, in most cases, also serves as the exit passagway. Section 402.8.7 permits openings from the service rooms into these exit passageways for other than means of egress but does not address the distribution of those utilities once they leave the service room.

Becase the covered mall provisions for service rooms allow for service rooms to open into exit passageways, similar low-hazard service equipment should be allowed to be distributed in the exit passageways provided that the penetration is properly protected, egress heights are maintained and egress widths are maintained. By referring to Section 714, proper penetration protection of the fire barrier will occur. Egress heights and widths are addressed elsewhere in the code and would not need to be clarified or repeated herein.

Cost Impact: Will not increase the cost of construction
Because the distribution of utilities is currently allowed in a number of cases (one of the legacy codes specifically allowed it) the proposal will not increase costs. The alternatives would requier additional costs for horizontal shaft construction and separate service rooms for utility connections.

G 78-15 : 402.8.7.1 (New)-BOECKER5456

G 79-15

403.1

Proponent: Stephen DiGiovanni, representing Southern Nevada Chapter of ICC (sdigiovanni@clarkcountynv.gov)

2015 International Building Code

Revise as follows:

403.1 Applicability. *High-rise buildings* shall comply with Sections 403.2 through 403.6.

Exception: The provisions of Sections 403.2 through 403.6 shall not apply to the following buildings and structures:

1. Airport traffic control towers in accordance with Section 412.3.
2. *Open parking garages* in accordance with Section 406.5.
3. The portion of a building containing a Group A-5 occupancy in accordance with Section 303.6. <u>This exception does not apply to uses that are located on an occupied roof.</u>
4. Special industrial occupancies in accordance with Section 503.1.1.
5. Buildings with <u>primary occupancy of</u>:
   - 5.1. A Group H-1 occupancy;
   - 5.2. A Group H-2 occupancy in accordance with Section 415.8, 415.9.2, 415.9.3 or 426.1; or,
   - 5.3. A Group H-3 occupancy in accordance with Section 415.8.

Reason: There is concern about the impact of exceptions 3 and 5.

For exception 3, there are instances where a swimming pool deck is located on the roof of a high-rise building. Being outdoors, those areas could be considered an A-5 occupancy. There is concern about eliminating the high-rise provisions, such as fire alarm coverage, standpipe system coverage, etc, for these areas. In certain jurisdictions, these areas can be used for parties and nightclub uses, which bring with them a higher level of hazard that justifies the application of high-rise provisions, as applicable. This proposal attempts to ensure that the exception does not include roof top uses such as swimming pool decks.

For exception 5, there is concern about any such building that is a portion of a high-rise building. The way that exception 5 reads, if any of these occupancies are collocated with a high-rise building, then the high-rise provisions would not be applicable to the high-rise building. While there is no concern with a H-1 occupancy required to be a separate building by Section 415.7, or a Group H-2 or H-3 occupancy required to be in a detached building per Section 415.8, there is concern about the other H-2 occupancies that may be collocated with a high-rise building. Specifically, LPG facilities described in Section 415.9.2 are not defined, and may be within a high-rise building. Also, NFPA 58 allows bulk LPG facilities to be attached to other structures. The dry cleaning plants described in Section 415.9.3 could be found in larger hotels that have on-site uniform maintenance. Finally, there are larger high-rise complexes that have on-site engineering maintenance staff with the capability of producing combustible dusts in designated maintenance areas. The way exception 5 reads, having any of these H-2 occupancies within or attached to the high-rise building, would seem to say that the high-rise provisions no longer apply. By adding the phrase regarding the primary occupancy, having a minor part of a building be an H-2 occupancy would not negate the applicability to high-rise provisions for that building.

Cost Impact: Will increase the cost of construction
Depending on previous interpretations, this proposal may increase construction costs for certain buildings or portions thereof that were not previously constructed in accordance with the high-rise provisions.

G 79-15 : 403.1-DIGIOVANNI3817

G 80-15

403.2.1.1

Proponent: Edward Kulik, representing Building Code Action Committee (bcac@iccsafe.org)

2015 International Building Code

Revise as follows:

403.2.1.1 Type of construction. The following reductions in the minimum *fire-resistance rating* of the building elements in Table 601 shall be permitted as follows:

1. For buildings not greater than 420 feet (128 000 mm) in *building height*, the *fire-resistance rating* of the building elements in Type IA construction shall be permitted to be reduced to the minimum *fire-resistance ratings* for the building elements in Type IB.
   Exception: The required fire-resistance rating of columns supporting floors shall not be reduced.
2. In other than Group F-1, H, M and S-1 occupancies, the *fire-resistance rating* of the building elements in Type IB construction shall be permitted to be reduced to the *fire-resistance ratings* in Type IIA.
3. The *building height* and *building area* limitations of a building containing building elements with reduced *fire-resistance ratings* shall be permitted to be the same as the building without such reductions.

Reason: This public proposal is submitted by the ICC Building Code Action Committee (BCAC). The BCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the BCAC has held 13 open meetings and numerous workgroup calls which included members of the BCAC as well as any interested party to discuss and debate the proposed changes and the public comments. Related documentation and reports are posted on the BCAC website at: http://www.iccsafe.org/cs/BCAC/Pages/default.aspx.
During the last code development cycle the committee approved a code change proposal that clarified the allowance for H Group uses within a high-rise buildings. During the hearing, committee members correctly questioned why Group H was not included within Section 403.2.1.1 Exception 2 when Groups of a lesser fire hazard potential were included. Since Section 403.2.1.1 was not part of the proposal before the committee, there was no way to address the issue during last cycle.

This proposal addresses the issue identified by the committee and adds Group H to Section 403.2.1.1 Exception 2 wherein Groups F-1, M, and S-1 are currently restricted from lowering their type of construction.

Cost Impact: Will increase the cost of construction
The cost of construction for a mixed occupancy high-rise containing an H Group occupancy will be increased by elimination of the ability to reduce the construction type.

G 80-15 : 403.2.1.1-KULIK4892

G 81-15

403.5.2

Proponent: Raymond Grill, Arup, representing Arup (ray.grill@arup.com)

2015 International Building Code

Revise as follows:

403.5.2 Additional interior exit stairway. For buildings other than Group R-2 and their ancillary spaces that are more than 420 feet (128 000 mm) in *building height*, one additional *interior exit stairway* meeting the requirements of Sections 1011 and 1023 shall be provided in addition to the minimum number of *exits* required by Section 1006.3. The total width of any combination of remaining *interior exit stairways* with one *interior exit stairway* removed shall be not less than the total width required by Section 1005.1. *Scissor stairways* shall not be considered the additional *interior exit stairway* required by this section.

> **Exception:** An additional *interior exit stairway* shall not be required to be installed in buildings having elevators used for occupant self-evacuation in accordance with Section 3008.

Reason: Ancillary spaces used as amenity space (e.g., rooftop terrace, pool, fitness center, clubhouse, etc.) that serve residential units are primarily used by the same occupants of the residential units, which should not drive the requirement for a redundant stair.

Cost Impact: Will not increase the cost of construction
This code proposal is intended to clarify application of the code. If anything, the cost impact of the change is that cost of construction will be reduced.

G 81-15 : 403.5.2-GRILL5342

G 82-15

403.5.2

Proponent: Raymond Grill, Arup, representing Arup (ray.grill@arup.com)

2015 International Building Code

Revise as follows:

403.5.2 Additional interior exit stairway. For buildings other than Group R-1 and R-2 that are more than 420 feet (128 000 mm) in *building height*, one additional *interior exit stairway* meeting the requirements of Sections 1011 and 1023 shall be provided in addition to the minimum number of *exits* required by Section 1006.3. The total width of any combination of remaining *interior exit stairways* with one *interior exit stairway* removed shall be not less than the total width required by Section 1005.1. *Scissor stairways* shall not be considered the additional *interior exit stairway* required by this section.

> **Exception:** An additional *interior exit stairway* shall not be required to be installed in buildings having elevators used for occupant self-evacuation in accordance with Section 3008.

Reason: The requirement for the additional stair in building over 420 was incorporated to address the perceived issue of counter flow in stairs during emergency responder response.
R-1 occupancies have the same occupant loading as R-2 occupancies (200 sf per person). R-2 occupancies should be considered the same as R-2 occupancies for the purpose of this requirement.

Cost Impact: Will not increase the cost of construction
This code change will reduce the construction cost for R-1 occupancies over 420 feet in height.

G 82-15 : 403.5.2-GRILL5345

G 83-15

403.5.2

Proponent: Jonathan Siu, City of Seattle, Department of Planning and Development, representing Washington Association of Building Officials Technical Code Development Committee (jon.siu@seattle.gov)

2015 International Building Code

Revise as follows:

403.5.2 Additional interior exit stairway. For buildings other than Group R-2 that are more than 420 feet (128 000 mm) in *building height*, one additional *interior exit stairway* meeting the requirements of Sections 1011 and 1023 shall be provided in addition to the minimum number of *exits* required by Section 1006.3. The total ~~width~~ capacity of any combination of remaining *interior exit stairways* with one *interior exit stairway* removed shall be not less than the total ~~width~~ capacity required by Section 1005.1. *Scissor stairways* shall not be considered the additional *interior exit stairway* required by this section.

> **Exception:** An additional *interior exit stairway* shall not be required to be installed in buildings having elevators used for occupant self-evacuation in accordance with Section 3008.

Reason: This proposal is a clarification to reflect what we believe was intended when this section was placed into the IBC. In the 2015 code, egress "width" and "capacity" were carefully separated in Chapter 10. "Width" refers to a minimum dimension stated in the code for a particular egress component. "Capacity" now refers to a dimension that is calculated based on an occupant load. It appears that the code change that made this separation did not address this section, and the failure to do so results in a question as to what was intended. We believe that the intent is to maintain the capacity of the remaining stairs. This is not an issue for most buildings that we have dealt with, but if the building has large assembly spaces higher up in the building, it can result in another stair being required.

Cost Impact: Will not increase the cost of construction
This proposal is a clarification of the code. If a jursidiction has been interpreting the code in a way that is consistent with this proposal, there will be no change in cost of construction. If a jurisdiction has been applying the code differently, then there may be an increase in the cost of construction.

G 83-15 : 403.5.2-SIU4266

G 84-15

403.5.2

Proponent: Stephen DiGiovanni, representing Southern Nevada Chapter of ICC (sdigiovanni@clarkcountynv.gov)

2015 International Building Code

Revise as follows:

403.5.2 Additional interior exit stairway. For buildings other than Group R-2 that are more than 420 feet (128 000 mm) in *building height*, one additional *interior exit stairway* meeting the requirements of Sections 1011 and 1023 shall be provided in addition to the minimum number of *exits* required by Section 1006.3. The total width of any combination of remaining *interior exit stairways* with one *interior exit stairway* removed shall be not less than the total width required by Section 1005.1. *Scissor stairways* shall not be considered the additional *interior exit stairway* required by this section.

> **~~Exception~~Exceptions:** ~~An~~1.An additional *interior exit stairway* shall not be required to be installed in buildings having elevators used for occupant self-evacuation in accordance with Section 3008.
> 2. An additional *interior exit stairway* shall not be required for redundancy to stairways serving only those portions of the building less than 420 feet (128 000 mm) in building height.

Reason: The intent of these codes sections was to provide additional means of egress for the super high-rise structures (i.e., over 420-feet tall). It was not the intent of the code to establish the additional exit stairway provisions for connected podiums, other towers, and other portions of the same building that are less than 420 feet in building height. The code language as written could be interpreted to require the additional exit stairway for these other building areas.

For larger facilities, project designs have included multiple towers connected to a podium, which are considered a single building in building height and area. By adding new Exception No. 2 to Sections 403.5.2, the interpretation to require the additional exit stairway for other building areas or towers with building heights less than 420 feet becomes more uniform.

Cost Impact: Will not increase the cost of construction
This proposal will not increase the cost of construction, as no additional building elements or more stringent means of construction are being added to the existing code by this proposal.

G 84-15 : 403.5.2-DIGIOVANNI3819

G 85-15

403.5.3, 403.5.3.1 (New), 403.5.3.1.1 (New), 403.5.3.1

Proponent: Dave Frable, US General Services Administration, representing US General Services Administration

2015 International Building Code

Revise as follows:

403.5.3 Stairway door operation. Stairway doors other than the *exit discharge* doors shall meet one of the following conditions:

1. Re-entry from the stairway enclosure to the interior of the building shall be ~~permitted to be locked from the *stairway* side~~provided.

2. *Stairway* doors that are locked from the *stairway* side shall be capable of being unlocked simultaneously without unlatching upon a signal from the *fire command center* *to allow re-entry*.

3. Selected re-entry shall be provided in accordance with Section 403.5.3.1

Add new text as follows:

403.5.3.1 Stairway door re-entry Stairway doors shall be permitted to be equipped with hardware that prevents re-entry into the interior of the building, provided that all of the following criteria are met:

1. There shall be not less than two levels where it is possible to leave the stair enclosure to access another exit.

2. There shall be not more than four stories intervening between stories where it is possible to leave the stair enclosure to access another exit.

3. Re-entry shall be possible on the top story or next-to-top story served by the stair enclosure, and such story shall allow access to another exit.

4. Stairway doors allowing re-entry shall be identified as such on the stair side of the door leaf.

5. Stairway doors not allowing re-entry shall be provided with a sign on the stairway side indicating the location of the nearest door opening, in each direction of travel, that allows re-entry or exit.

403.5.3.1.1 Stairway re-entry signage Where the provisions of 403.5.3.1 are used, signage on the stair door leaves shall be required as follows;

1. Stairway doors allowing re-entry shall be identified as such on the stair side of the door leaf.

2. Stairway doors not allowing re-entry shall be provided with a sign on the stair side indicating the location of the nearest door opening, in each direction of travel that allows re-entry or exit.

Revise as follows:

~~403.5.3.1~~403.5.3.2 Stairway communication system. A telephone or other two-way communications system connected to an *approved constantly attended station* shall be provided at not less than every fifth floor in each *stairway* where the doors to the *stairway* are locked.

Reason: The intent of this code change is to re-arrange the subject section and provide another option for designers of high-rise buildings when considering building security and locking stairway doors from the stairway side of the enclosure. This code change proposal recognizes stairway re-entry provisions that are currently permitted in the 2015 edition of the National Fire Protection Association (NFPA), Life Safety Code.

Cost Impact: Will increase the cost of construction
The intent of this code change may increase the cost of construction due to additional signage requirements. However, the communication will not be required if this option is used.

G 85-15 : 403.5.3-FRABLE5493

G 86-15

403.5.3.1

Proponent: Dave Frable, representing US General Services Administration (dave.frable@gsa.gov)

2015 International Building Code

Delete without substitution:

~~**403.5.3.1 Stairway communication system.** A telephone or other two-way communications system connected to an *approved constantly attended station* shall be provided at not less than every fifth floor in each *stairway* where the doors to the *stairway* are locked.~~

Reason: In a companion proposal, we have proposed to is to re-arrange the provisions of stairway reentry and to provide another option for designers of high-rise buildings when considering building security and locking stairway doors from the stairway side of the enclosure. This code change proposal recognizes stairway re-entry provisions that are currently permitted in the 2015 edition of the National Fire Protection Association (NFPA), Life Safety Code. In the companion proposal Section 403.5.3.1 is retained.
This proposal is to delete Section 403.5.3.1. The intent of the communication system is to provide occupants a means to notify an attended location that the stairway prevents its continued use. However, the subject communication system has no operating instructions and it appears to provide a false sense of assurance that the stairway doors will be unlocked in a timely manner since in all likelihood the person being notified is not within the vicinity of the controls within the building to unlock the stairway doors.

Cost Impact: Will not increase the cost of construction
The intent of this code change will reduce cost of construction due to the elimination of the stairweay communication system.

G 86-15 : 403.5.3.1-FRABLE5508

G 87-15

403.6.1

Proponent: Brad Schiffer, representing self (brad@taxis-usa.com)

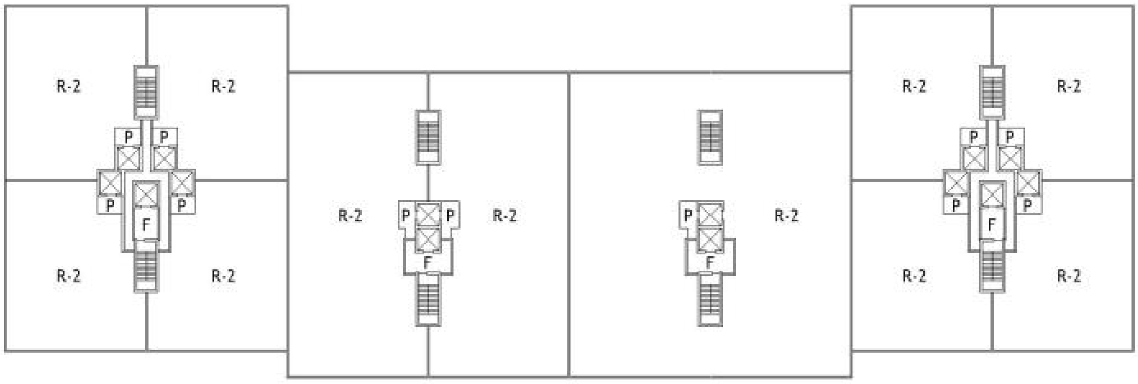
2015 International Building Code

Revise as follows:

403.6.1 Fire service access elevator. In buildings with an occupied floor more than 120 feet (36 576 mm) above the lowest level of fire department vehicle access, no fewer than two fire service access elevators, or all elevators, whichever is less, shall be provided in accordance with Section 3007. Each fire service access elevator shall have a capacity of not less than 3,500 pounds (1588 kg) and shall comply with Section 3002.4.

Exception: One fire service access elevator is required in Group R-2 occupancies with a hoistway group serving not more than six dwelling units.

Reason: Residential buildings with private elevators have multiple elevator groups serving each level. These elevator groups have the private elevators serving the units with a service elevator meeting the Fire Service Access Elevator requirements. Requiring two Fire Service Access Elevators causes at least one of the private elevators to become a Fire Service Access Elevator. This also requires that private elevator to provide Phase 1 recall.
These cores serve a small occupant load.



P=private
F=fire service

Cost Impact: Will not increase the cost of construction
Due to the removal of an additional Fire Service Access Elevator this will decrease building costs.

G 87-15 : 403.6.1-SCHIFFER4483

G 88-15

404.2

Proponent: Jeff Hugo, National Fire Sprinkler Association, representing National Fire Sprinkler Association (hugo@nfsa.org)

2015 International Building Code

Revise as follows:

404.2 Use. The floor of the *atrium* shall not be used for other than low fire hazard uses and only *approved* materials and decorations in accordance with the *International Fire Code* shall be used in the *atrium* space.

> **Exception:** The *atrium* floor area is permitted to be used for any *approved* use where the individual space, regardless of the ceiling height of the atrium, is provided with an *automatic sprinkler system* in accordance with Section 903.3.1.1.

Reason: This proposal clarifies that the sprinkler exception in Section 404.3 cannot be used when the floor of the atrium is used for other than a low fire hazard use. While NFPA 13 does not limit the height of when sprinklers are used, the exception in 404.3 is mistakenly applied when using this section.

Cost Impact: Will not increase the cost of construction
No technical change made to code.

G 88-15 : 404.2-HUGO4517

G 89-15

404.2, [F] 404.3

Proponent: Robert Davidson, representing Myself (rjd@davidsoncodeconcepts.com)

2015 International Building Code

Revise as follows:

404.2 Use. ~~The floor of the *atrium* shall not be used for other than low fire hazard uses and only~~ Only *approved* materials and decorations in accordance with the *International Fire Code* shall be used in the *atrium* space.

> ~~**Exception:** The *atrium* floor area is permitted to be used for any *approved* use where the individual space is provided with an *automatic sprinkler system* in accordance with Section 903.3.1.1.~~

[F] 404.3 Automatic sprinkler protection. An *approved automatic sprinkler system* shall be installed throughout the entire building. The floor of the atrium shall not be used for any activities that exceed the designed capability of the automatic sprinkler system. Where a smoke control system is present the use and arrangement of the atrium floor shall be consistent with the design of the smoke control system.

Exceptions:

1. That area of a building adjacent to or above the *atrium* need not be sprinklered provided that portion of the building is separated from the *atrium* portion by not less than 2-hour *fire barriers* constructed in accordance with Section 707 or *horizontal assemblies* constructed in accordance with Section 711, or both.
2. ~~Where the ceiling of the *atrium* is more than 55 feet (16 764 mm) above the floor, sprinkler~~Sprinkler protection at the ceiling of the *atrium* is not required~~.~~ provided the following criteria are met:
   2.1. The ceiling of the atrium is more than 55 feet (16764 mm) above the floor, and
   2.2. The floor of the atrium shall not be used for other than low fire hazard uses.

Reason: The purpose of this proposal is to improve the code language to obtain the intended goal of the sections involved. There is no intention of a major technical change or increase in requirements.

The existing Section 404.2 has two requirements, low fire hazard use restriction for the atrium and compliance with the fire code for materials and decorations. Then there is an exception when a sprinkler system is present, however, Section 404.3 mandates a sprinkler system to be present anytime there is an atrium. So the exception would always apply unless exception 2 in Section 404.3 is applied.

The other problem with the language in 404.2 and that the exception could be read to give exception to the fire code provisions on materials and decorations and this creates a conflict with teh fire code.

The proposed changes are to simply have Section 404.2 maintain the language setting up the relationship with the fire code for materials and decorations. The floor use of the atrium is then related directly to the designed capabilities of the sprinkler system and a smoke control system if one is present, both of which is a normal part of the design process for fire protection systems, (i.e., what is the expected fuel load of the atrium). This is done with the language proposed to be added to Section 404.3.

The final modification is to take the language restricting the use of the atrium to low fire hazard uses and attach that requirement to Section 404.3, Exception 2 where the atrium ceiling protection is eliminated.

The intent of the current language is maintained, but technical application of the requirements are clarified with this proposal.

Cost Impact: Will not increase the cost of construction
Since there is no increase in code requirements there will not be an increase in costs.

G 89-15 : 404.2-DAVIDSON5297

G 90-15

404.5

Proponent: Masoud Sabounchi, Colorado Chapter of ICC, representing masoud sabounchi (masoud@acecode.com)

2015 International Building Code

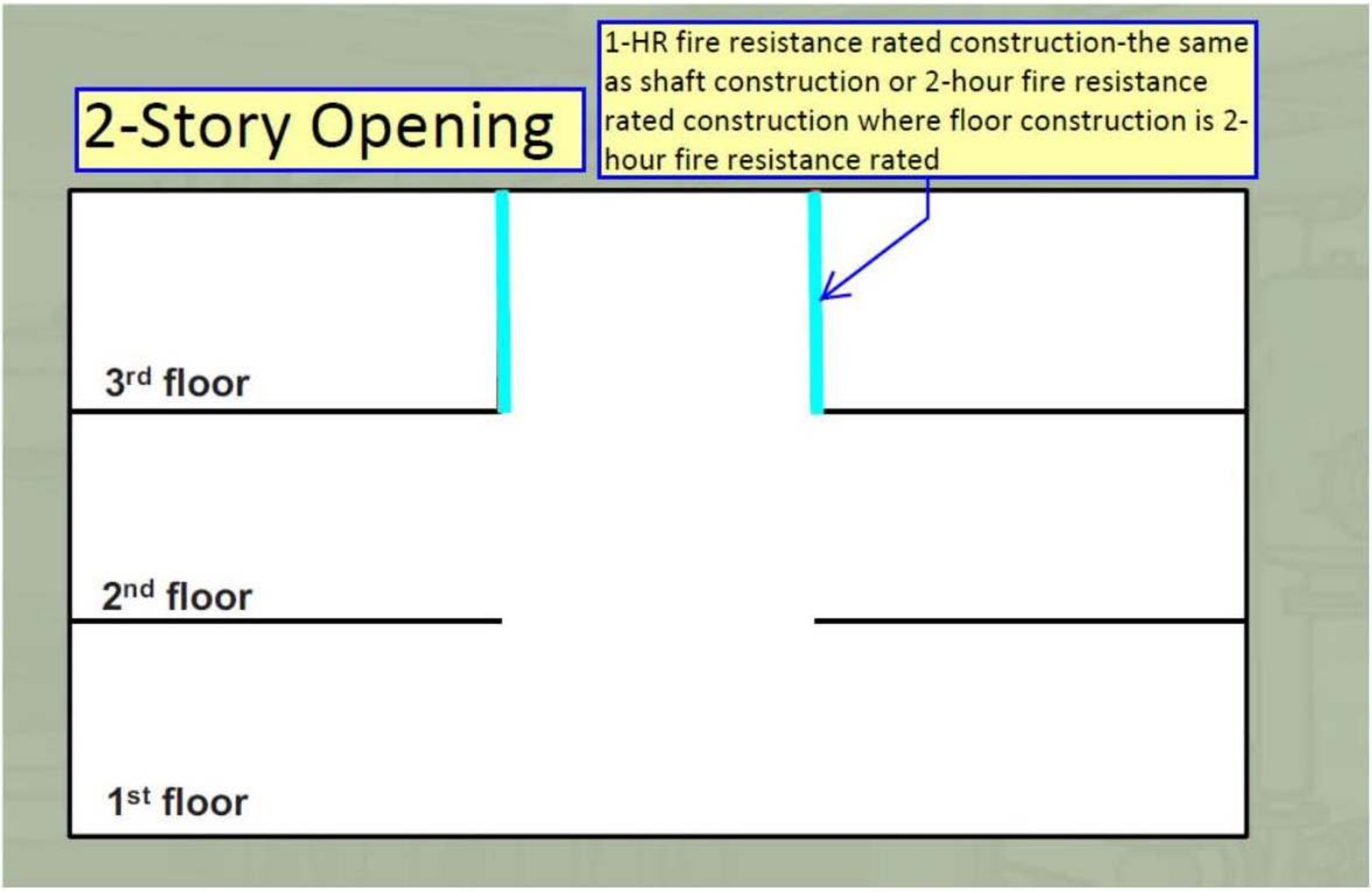
Revise as follows:

404.5 Smoke control. A smoke control system shall be installed in accordance with Section 909.

~~**Exception**~~**Exceptions:** A smoke control system is not required in the following conditions:
1. In other than Group I-2, and Group I-1, Condition 2, ~~smoke control is not required~~ for *atriums* that connect only two *stories*.
2. Where an atrium connects three stories in other than Group I-2 or Group I-1 condition 2 occupancies, smoke control is not required where:
  - 2.1. Either the second or third story is atmospherically separated from the atrium by a fire barrier; and
  - 2.2. The fire barrier is constructed as a shaft enclosure and is of not less than 1-hour fire-resistive construction or the required rating of the floor assemblies, whichever is greater.

3. Where an atrium connects two stories in a Group I-2 or Group I-1 condition 2 occupancies, smoke control is not required where:
3.1. The second story is atmospherically separated from the atrium by a fire barrier; and
3.2. The fire barrier is constructed as a shaft enclosure and is of not less than 1-hour fire-resistive construction or the required rating of the floor assemblies, whichever is greater.

Reason: To introduce natural light to the first or second floors in a multi-story building, a light-well is typically introduced. Also, often the entry lobbies to buildings have a high ceiling extending through two or three stories and atmospherically separated at the top level with fire resistance rated fire barriers. While this scheme has been approved administratively and as an alternate method with varying requirements, this proposal would bring consistency to the application. This proposal requires atmospheric separation such that not more than two stories are connected to each other and in case of I-2 occupancy groups one story with a high ceiling lobby entry area would be permitted to extend thru the second floor and be atmospherically separated from the second story. When the highest story is separated from the floor opening, it creates a larger reservoir for smoke to collect. The reason this proposal limits the separations to the upper floors (not permitted on the first story) is because if separation is provided at the first floor, three level including the interior area of the first floor separated by the fire barrier would create a 3 story opening. Please refer to the attached drawings for further clarification.
This approach is consistent with provisions of Section 712.1.9 pertaining to two story openings. Also, section 712.1.13.1 allows horizontal fire door assemblies to limit number of floor openings and this proposal provides safeguards equivalent to horizontal fire door assemblies by separating the floor openings on at least one level. Since this exception is introduced in the atrium section, the building will have sprinkler protection throughout.



Cost Impact: Will not increase the cost of construction
This proposal does not increase the cost of construction.

G 90-15 : 404.5-SABOUNCHI4603

G 91-15

404.5

Proponent: Raymond Grill, Arup, representing Arup (ray.grill@arup.com)

2015 International Building Code

Revise as follows:

404.5 Smoke control. A smoke control system shall be installed in accordance with Section 909.

~~**Exception**~~**Exceptions**:

1. In other than Group I-2, and Group I-1, Condition 2, smoke control is not required for *atriums* that connect only two *stories*.
2. In other than Group I-2 and Group I-1, Condition 2, smoke control is not required for atriums where levels above the lowest level are separated from the atrium in accordance with Section 404.6.

Reason: In the event of a fire on the lowest level of the atrium, the atrium space will provide a heat and smoke sink that would enhance the safety of occupants at the base of the atrium. Heated products of combustion will rise and will allow more time for egress. The separation of upper levels in accordance with 404.6 precludes exposure to occupants on upper levels.
Smoke removal after the event can be performed in the same manner as in any other building without an atrium. There is no greater exposure presented.

In other sections of the code, multiple interconnected levels are allowed without smoke control. Section 712.1.3.1 allows an unlimited number of levels in Group B and M occupancies to be interconnected by escalators when draft stops and sprinklers are provided around the floor opening. Section 1019.3 allows exit access stairs to interconnect an unlimited number of stories in Group B and M occupancies to be interconnected without shaft enclosures if draft stops and sprinklers are provided around the openings. The code allows escalators and exit access stairs to interconnect up to 4 stories in other occupancies without shaft enclosures provided draft stops and sprinklers are provided around the floor openings.

The proposed exception would present less of a fire safety risk than is currently allowed by the code.

Cost Impact: Will not increase the cost of construction
The proposed exception could significantly reduce the cost of construction and reduce the ongoing maintenance cost of the building since a system requiring regular testing would no longer be required.

G 91-15 : 404.5-GRILL4975

G 92-15

404.6, 709.4.2

Proponent: Stephen Thomas, representing Smoke Guard (sthomas@coloradocode.net)

2015 International Building Code

Revise as follows:

404.6 Enclosure of atriums. *Atrium* spaces shall be separated from adjacent spaces by a 1-hour ~~*fire*~~ *smoke barrier* constructed in accordance with Section ~~707 or a *horizontal assembly* constructed in accordance with Section 711, or both~~ 709.

Exceptions:

1. A ~~*fire*~~ *smoke barrier* is not required where a glass wall forming a smoke partition is provided. The glass wall shall comply with all of the following:
    1.1. Automatic sprinklers are provided along both sides of the separation wall and doors, or on the room side only if there is not a walkway on the *atrium* side. The sprinklers shall be located between 4 inches and 12 inches (102 mm and 305 mm) away from the glass and at intervals along the glass not greater than 6 feet (1829 mm). The sprinkler system shall be designed so that the entire surface of the glass is wet upon activation of the sprinkler system without obstruction;
    1.2. The glass wall shall be installed in a gasketed frame in a manner that the framing system deflects without breaking (loading) the glass before the sprinkler system operates; and
    1.3. Where glass doors are provided in the glass wall, they shall be either *self-closing* or automatic-closing.
2. A ~~*fire*~~ *smoke barrier* is not required where a glass-block wall assembly complying with Section 2110 and having a $^{3}/_{4}$-hour *fire protection rating* is provided.
3. A smoke ~~*fire*~~ *barrier* is not required between the *atrium* and the adjoining spaces of any three floors of the *atrium* provided such spaces are accounted for in the design of the smoke control system.

709.4.2 Smoke-barrier walls enclosing atriums, areas of refuge or elevator lobbies. *Smoke-barrier* walls used to enclose atriums in accordance with Section 404.6, areas of refuge in accordance with Section 1009.6.4, or to enclose elevator lobbies in accordance with Section 405.4.3, 3007.6.2, or 3008.6.2, shall form an effective membrane enclosure that terminates at a *fire barrier* wall having a level of *fire protection rating* not less than 1 hour, another *smoke barrier* wall or an outside wall. A smoke and draft control door assembly as specified in Section 716.5.3.1 shall not be required at each elevator hoistway door opening or at each exit doorway between an area of refuge and the exit enclosure.

Reason: This proposal replaces the fire barrier separation between an atrium and adjacent spaces with a smoke barrier. The purpose of the atrium separation is to assist the smoke control system in containing the smoke to just the atrium area. A fire barrier is not totally designed to contain smoke. However, a smoke barrier is designed to contain smoke. The fire-resistance rating and continuity of the assembly does not change. Only the smoke resistance requirements are added to the assembly to assist in containing the smoke within the atrium. Since smoke barriers are defined as both horizontal and vertical assemblies, the language regarding horizontal assemblies has been deleted.
A change to Section 709.4.2 has also been included to include atrium separations in the continuity requirements for smoke barriers.

Cost Impact: Will not increase the cost of construction
It is not believed that the cost of construction will not change. The walls are essentially constructed the same with the exception of smoke protection at openings and penetrations. The reduction in the opening protection between a fire barrier and smoke barrier will balance out the cost of the smoke protection.

G 92-15 : 404.6-THOMAS4458

G 93-15

404.6

Proponent: Stephen DiGiovanni, Clark County Building Department, representing Southern Nevada Chapter of ICC (sdigiovanni@clarkcountynv.gov)

2015 International Building Code

Revise as follows:

404.6 Enclosure of atriums. *Atrium* spaces shall be separated from adjacent spaces by a 1-hour *fire barrier* constructed in accordance with Section 707 or a *horizontal assembly* constructed in accordance with Section 711, or both.

Exceptions:

1. A *fire barrier* is not required where a glass wall forming a smoke partition is provided. The glass wall shall comply with all of the following:
   - 1.1. Automatic sprinklers are provided along both sides of the separation wall and doors, or on the room side only if there is not a walkway on the *atrium* side. The sprinklers shall be located between 4 inches and 12 inches (102 mm and 305 mm) away from the glass and at intervals along the glass not greater than 6 feet (1829 mm). The sprinkler system shall be designed so that the entire surface of the glass is wet upon activation of the sprinkler system without obstruction;
   - 1.2. The glass wall shall be installed in a gasketed <u>or similarly sealed</u> frame in a manner that the framing system deflects without breaking (loading) the glass before the sprinkler system operates; and
   - 1.3. Where glass doors are provided in the glass wall, they shall be either *self-closing* or automatic-closing.
2. A *fire barrier* is not required where a glass-block wall assembly complying with Section 2110 and having a $^3/_4$-hour *fire protection rating* is provided.
3. A *fire barrier* is not required between the *atrium* and the adjoining spaces of any three floors of the *atrium* provided such spaces are accounted for in the design of the smoke control system.

Reason: The term "gasket" is generally defined as "*a shaped piece or ring of rubber or other material sealing the junction between two surfaces…*". In this instance, it refers to a pre-manufactured (shaped) piece that is compressed to form a sealed junction between the glass and the frame that is meant to restrict the passage of gases between them. The word "gasketed" does not allow for structural or wet-set glazed systems to be used. However, these tested assemblies are approved for rated glass, and do not utilize gaskets.

For example, PLO/WA90-01 uses PVC tape, sealant, and angle stops. The frame is still being loaded but no gaskets are used. The current language is overly restrictive given that there are proven technologies available that produce the same outcomes. This allows the use of other materials that address unique designs or systems not currently anticipated in the code.

Additionally, traditional "gaskets" in frames have been prohibited in many Group I-3 (detention) occupancies. This is because gaskets can potentially be removed and used as weapons by the inmates.

Therefore, it is important to clarify that the use of other approved methods to affix and/or seal the glass to the frame are acceptable methods of compliance. This proposal is intended to include products based on new technology.

Cost Impact: Will not increase the cost of construction
This proposal does not increase construction costs as it only offers an option to the current requirement, without removing or changing the current requirements.

G 93-15 : 404.6-DIGIOVANNI3820

G 94-15

404.6

Proponent: John Terry, State of New Jersey- DCA, representing State of New Jersey - Department of Community Affairs- Division of Codes and Standards (jterry@dca.nj.gov)

2015 International Building Code

Revise as follows:

404.6 Enclosure of atriums.
Atrium spaces shall be separated from adjacent spaces by a 1-hour *fire barrier* constructed in accordance with Section 707 or a *horizontal assembly* constructed in accordance with Section 711, or both.

Exceptions:

1. A *fire barrier* is not required where a glass wall forming a smoke partition is provided. The glass wall shall comply with all of the following:
   - 1.1. Automatic sprinklers are provided along both sides of the separation wall and doors, or on the room side only if there is not a walkway on the *atrium* side. The sprinklers shall be located between 4 inches and 12 inches (102 mm and 305 mm) away from the glass and at intervals along the glass not greater than 6 feet (1829 mm). The sprinkler system shall be designed so that the entire surface of the glass is wet upon activation of the sprinkler system without obstruction;
   - 1.2. The glass wall shall be installed in a gasketed frame in a manner that the framing system deflects without breaking (loading) the glass before the sprinkler system operates; and
   - 1.3. Where glass doors are provided in the glass wall, they shall be either *self-closing* or automatic-closing.
2. A *fire barrier* is not required where a glass-block wall assembly complying with Section 2110 and having a $^{3}/_{4}$-hour *fire protection rating* is provided.
3. A *fire barrier* is not required between the *atrium* and the adjoining spaces of ~~any~~ up to three floors of the *atrium* provided such spaces are accounted for in the design of the smoke control system.
4. A fire barrier is not required between the atrium and the adjoining spaces where the atrium is not required to be provided with a smoke control system.

Reason: As currently written, the code allows three floors to be open to an atrium provided the volume of the three floors is accounted for in the design of the smoke control system. Technically, the current text is silent regarding one or two floors being open to the atrium without separation. Replacing the word "and" with "up to" corrects the wording to allow one, two or three floors to be open to the atrium provided the volume of the space is accounted for in the design of the smoke control system. But what if the atrium is in a building not required to be provided with a smoke control system? It has been interpreted that a two-story atrium, in other than Group I-2 and Group I-1 Condition 2, would be allowed to have the adjacent spaces unprotected without a smoke control system. Still others have interpreted the need for a smoke control in a two-story building when the adjacent spaces are open as a result of the current exception #3. By adding exception #4, it will be made clear that the requirments for the non-separated space to be accounted for in the design of the smoke control system applies only for atriums required to be provided with smoke control systems in the first place.

Cost Impact: Will not increase the cost of construction
This code change will have no impact on the cost of construction.

G 94-15 : 404.6-TERRY3407

G 95-15

406, 406 (New), Chapter 35

Proponent: Edward Kulik, representing Building Code Action Committee (bcac@iccsafe.org)

2015 International Building Code

Revise as follows:

406.1 General. ~~Motor-vehicle-related~~ All motor-vehicle-related occupancies shall comply with Section 406.1. Private garages and carports shall also comply with Section 406.3. Open public parking garages shall also comply with Sections ~~406.1 through~~ 406.4 and 406.5. Enclosed public parking garages shall also comply with Sections 406.4 and 406.6. Motor fuel-dispensing facilities shall also comply with Section 406.7. Repair garages shall also comply with Section 406.8.

Add new text as follows:

406.1.1 Automatic garage door openers and vehicular gates. Where provided, automatic garage door openers shall be listed and labeled in accordance with UL 325. Where provided, automatic vehicular gates shall comply with Section 3110.

406.1.2 Clear height The clear height of each floor level in vehicle and pedestrian traffic areas shall be not less than 7 feet (2134 mm). Canopies under which fuels are dispensed shall have a clear height in accordance with Section 406.7.2.

Exception: A lower clear height is permitted for a parking tier in mechanical-access open parking garages where approved by the building official.

406.1.3 Accessible parking spaces. Where parking is provided, accessible parking spaces shall be provided in accordance with Section 1106.

406.1.4 Floor surfaces. Floor surfaces shall be of concrete or similar approved noncombustible and nonabsorbent materials. The area of floor used for the parking of automobiles or other vehicles shall be sloped to facilitate the movement of liquids to a drain or toward the main vehicle entry doorway. The surface of vehicle fueling pads in motor fuel-dispensing facilities shall be in accordance with Section 406.7.1.

Exceptions:

1. Asphalt parking surfaces shall be permitted at ground level for public parking garages and private carports.
2. Floors of Group S-2 parking garages shall not be required to have a sloped surface.
3. Slip-resistant, nonabsorbent, interior floor finishes having a critical radiant flux not more than 0.45 W/cm^2, as determined by NFPA 253, shall be permitted in repair garages.

406.1.5 Sleeping rooms. Openings between a motor vehicle-related occupancy and a room used for sleeping purposes shall not be permitted.

406.1.6 Fuel dispensing. The dispensing of fuel shall only be permitted in motor fuel dispensing facilities in accordance with Section 406.7.

406.1.7 Electric vehicle charging stations. Electric vehicle charging stations shall be installed in accordance with NFPA 70. Electric vehicle charging system equipment shall be listed and labeled in accordance with UL 2202. Electric vehicle supply equipment shall be listed and labeled in accordance with UL 2594. Accessibility to electric vehicle charging stations shall be provided in accordance with Chapter 11.

406.1.8 Mixed occupancies and separation. Mixed uses shall be allowed in the same building as public parking garages and repair garages in accordance with 508.1. Mixed uses in the same building as an open parking garage are subject to Sections 402.4.2.3, 406.5.11, 508.1, 510.3, 510.4 and 510.7.

406.1.9 Equipment and appliances. Equipment and appliances shall be installed in accordance with Sections 406.1.9.1 through 406.1.9.3 and the *International Mechanical Code*, *International Fuel Gas Code* and NFPA 70.

406.1.9.1 Elevation of ignition sources. Equipment and appliances having an ignition source and located in hazardous locations and public garages, private garages, repair garages, automotive motor fuel-dispensing facilities and parking garages shall be elevated such that the source of ignition is not less than 18 inches (457 mm) above the floor surface on which the equipment or appliance rests. For the purpose of this section, rooms or spaces that are not part of the living space of a dwelling unit and that communicate directly with a private garage through openings shall be considered to be part of the private garage.

Exception: Elevation of the ignition source is not required for appliances that are listed as flammable vapor ignition resistant.

406.1.9.1.1 Parking garages. Connection of a parking garage with any room in which there is a fuel-fired appliance shall be by means of a vestibule providing a two-doorway separation, except that a single door is permitted where the sources of ignition in the appliance are elevated in accordance with Section 406.1.9.

Exception: This section shall not apply to appliance installations complying with Sections 406.1.9.2 or 406.1.9.3.

406.1.9.2 Public garages. Appliances located in public garages, motor fueling-dispensing facilities, repair garages or other areas frequented by motor vehicles, shall be installed not less than 8 feet (2438 mm) above the floor. Where motor vehicles are capable of passing under an appliance, the appliance shall be installed at the clearances required by the appliance manufacturer and not less than 1 foot (305 mm) higher than the tallest vehicle garage door opening.

Exception: The requirements of this section shall not apply where the appliances are protected from motor vehicle impact and installed in accordance with Section 406.1.9.1 and NFPA 30A.

406.1.9.3 Private garages. Appliances located in private garages and carports shall be installed with a minimum clearance of 6 feet (1829 mm) above the floor.

Exception: The requirements of this section shall not apply where the appliances are protected from motor vehicle impact and installed in accordance with Section 406.1.9.1.

Revise as follows:

406.3 Private garages and carports. Private garages and carports shall comply with Sections ~~406.3.1 through 406.3.6.~~406.1 and 406.3.

406.3.1 Classification. Private garages and carports shall be classified as Group U occupancies. Each private garage shall be not greater than 1,000 square feet (93 m^2) in area. Multiple private garages are permitted in a building where each private garage is separated from the other private garages by 1-hour *fire barriers* in accordance with Section 707, or 1-hour *horizontal assemblies* in accordance with Section 711, or both.

Delete without substitution:

~~**406.3.2 Clear height.** In private garages and carports, the clear height in vehicle and pedestrian traffic areas shall be not less than 7 feet (2134 mm). Vehicle and pedestrian areas accommodating van-accessible parking shall comply with Section 1106.5.~~

Revise as follows:

~~406.3.4~~406.3.2 Separation. For other than private garages adjacent to dwelling units, the separation of private garages from other occupancies shall comply with Section 508. Separation of private garages from *dwellingunits* shall comply with Sections ~~406.3.4.1 through 406.3.4.3.~~406.3.2.1 and 406.3.2.2.

~~406.3.4.1~~406.3.2.1 Dwelling unit separation. The private garage shall be separated from the *dwelling unit* and its *attic* area by means of gypsum board, not less than $^1/_2$ inch (12.7 mm) in thickness, applied to the garage side. Garages beneath habitable rooms shall be separated from all habitable rooms above by not less than a $^5/_8$- inch (15.9 mm) Type X gypsum board or equivalent and $^1/_2$-inch (12.7 mm) gypsum board applied to structures supporting the separation from habitable rooms above the garage. Door openings between a private garage and the *dwelling unit* shall be equipped with either solid wood doors or solid or honeycomb core steel doors not less than $1^3/_8$ inches (34.9 mm) in thickness, or doors in compliance with Section 716.5.3 with a fire protection rating of not less than 20 minutes. Doors shall be *self-closing* and self-latching.

~~406.3.4.3~~406.3.2.2 Ducts. Ducts in a private garage and ducts penetrating the walls or ceilings separating the *dwelling unit* from the garage, including its *attic* area, shall be constructed of sheet steel of not less than 0.019 inch (0.48 mm) in thickness and shall have no openings into the garage.

~~406.3.5~~406.3.3 Carports. Carports shall be open on at least two sides. ~~Carport floor surfaces shall be of an *approved* noncombustible material.~~ Carports not open on at least two sides shall be considered a garage and shall comply with the requirements for private garages.

~~**Exception:** Asphalt surfaces shall be permitted at ground level in carports.~~

~~The area of floor used for parking of automobiles or other vehicles shall be sloped to facilitate the movement of liquids to a drain or toward the main vehicle entry doorway.~~

Delete without substitution:

~~**406.3.3 Garage floor surfaces.** Garage floor surfaces shall be of *approved* noncombustible material. The area of floor used for parking of automobiles or other vehicles shall be sloped to facilitate the movement of liquids to a drain or toward the main vehicle entry doorway.~~

Revise as follows:

~~406.3.5.1~~406.3.3.1 Carport separation. *No change to text.*

Delete without substitution:

~~**406.3.4.2 Openings prohibited.** Openings from a private garage directly into a room used for sleeping purposes shall not be permitted.~~

~~**406.3.6 Automatic garage door openers.** Automatic garage door openers, where provided, shall be *listed* in accordance with UL 325.~~

Revise as follows:

406.4 Public parking garages. Parking garages, other than *private garages*, shall be classified as public parking garages and shall comply with the provisions of ~~Sections 406.4.2 through 406.4.8~~ Section 406.1, Section 406.4 and shall be classified as either an *open parking garage* or an enclosed parking garage. *Open parking garages* shall also comply with Section 406.5. Enclosed parking garages shall also comply with Section 406.6. See Section 510 for special provisions for parking garages.

Delete without substitution:

~~**406.4.1 Clear height.** The clear height of each floor level in vehicle and pedestrian traffic areas shall be not less than 7 feet (2134 mm). Vehicle and pedestrian areas accommodating van-accessible parking shall comply with Section 1106.5.~~

Revise as follows:

~~406.4.2~~406.4.1 Guards. Guards shall be provided in accordance with Section 1015. Guards serving as *vehicle barriers* shall comply with Sections ~~406.4.3~~406.4.2 and 1015.

~~406.4.3~~406.4.2 Vehicle barriers. *Vehicle barriers* not less than 2 feet 9 inches (835 mm) in height shall be placed where the vertical distance from the floor of a drive lane or parking space to the ground or surface directly below is greater than 1 foot (305 mm). *Vehicle barriers* shall comply with the loading requirements of Section 1607.8.3.

Exception: *Vehicle barriers* are not required in vehicle storage compartments in a mechanical access parking garage.

~~406.4.4~~406.4.3 Ramps. Vehicle ramps shall not be considered as required *exits* unless pedestrian facilities are provided. Vehicle ramps that are utilized for vertical circulation as well as for parking shall not exceed a slope of 1:15 (6.67 percent).

Delete without substitution:

~~**406.4.5 Floor surface.** Parking surfaces shall be of concrete or similar noncombustible and nonabsorbent materials.~~

~~The area of floor used for parking of automobiles or other vehicles shall be sloped to facilitate the movement of liquids to a drain or toward the main vehicle entry doorway.~~

~~**Exceptions:**~~

~~1. Asphalt parking surfaces shall be permitted at ground level.~~
~~2. Floors of Group S-2 parking garages shall not be required to have a sloped surface.~~

~~**406.4.6 Mixed occupancy separation.** Parking garages shall be separated from other occupancies in accordance with Section 508.1.~~

~~**406.4.7 Special hazards.** Connection of a parking garage with any room in which there is a fuel-fired appliance shall be by means of a vestibule providing a two-doorway separation.~~

> ~~**Exception:** A single door shall be allowed provided the sources of ignition in the appliance are not less than 18 inches (457 mm) above the floor.~~

~~**406.4.8 Attached to rooms.** Openings from a parking garage directly into a room used for sleeping purposes shall not be permitted.~~

Revise as follows:

406.5 Open parking garages. *Open parking garages* shall comply with Sections ~~406.5.1 through 406.5.11.~~406.1, 406.4 and 406.5.

406.5.4.1 Single use. Where the *open parking garage* is used exclusively for the parking or storage of private motor vehicles, with no other uses in the building, the area and height shall be permitted to comply with Table 406.5.4, along with increases allowed by Section 406.5.5.

> **Exception:** The grade-level tier is permitted to contain an office, waiting and toilet rooms having a total combined area of not more than 1,000 square feet (93 m^2). Such area need not be separated from the *open parking garage*.

In *open parking garages* having a spiral or sloping floor, the horizontal projection of the structure at any cross section shall not exceed the allowable area per parking tier. In the case of an *open parking garage* having a continuous spiral floor, each 9 feet 6 inches (2896 mm) of height, or portion thereof, shall be considered a tier.

~~The clear height of a parking tier shall be not less than 7 feet (2134 mm), except that a lower clear height is permitted in mechanical-access *open parking garages* where *approved* by the *building official*.~~

406.6 Enclosed parking garages. Enclosed parking garages shall comply with Sections ~~406.6.1 through 406.6.3.~~406.1, 406.4 and 406.6.

406.7 Motor fuel-dispensing facilities. Motor fuel-dispensing facilities shall comply with the *International Fire Code* and Sections ~~406.7.1~~406.1 and ~~406.7.2~~406.7.

406.8 Repair garages. Repair garages shall be constructed in accordance with the *International Fire Code* and Sections ~~406.8.1 through 406.8.6~~406.1 and 406.8. This occupancy shall not include motor fuel-dispensing facilities, as regulated in Section 406.7.

Delete without substitution:

~~**406.8.1 Mixed uses.** Mixed uses shall be allowed in the same building as a repair garage subject to the provisions of Section 508.1.~~

Revise as follows:

~~406.8.2~~406.8.1 Ventilation. Repair garages shall be mechanically ventilated in accordance with the *International Mechanical Code*. The *ventilation* system shall be controlled at the entrance to the garage.

Delete without substitution:

~~**406.8.3 Floor surface.** Repair garage floors shall be of concrete or similar noncombustible and nonabsorbent materials.~~

> ~~**Exception:** Slip-resistant, nonabsorbent, *interior floor finishes* having a critical radiant flux not more than 0.45 W/cm², as determined by NFPA 253, shall be permitted.~~

~~**406.8.4 Heating equipment.** Heating equipment shall be installed in accordance with the *International Mechanical Code*.~~

Add new standard(s) as follows:

UL2202-09 (2012) - Standard for Electric Vehicle (EV) Charging System Equipment, 2013, UL LLC, 333 Pfingsten Road, Northbrook, IL 60062.

UL2594-13 - Standard for Electric Vehicle Supply Equipment, 2013, UL LLC, 333 Pfingsten Road, Northbrook, IL 60062.

Reason: This public proposal is submitted by the ICC Building Code Action Committee (BCAC). The BCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the BCAC has held 13 open meetings and numerous workgroup calls which included members of the BCAC as well as any interested party to discuss and debate the proposed changes and the public comments. Related documentation and reports are posted on the BCAC website at: http://www.iccsafe.org/cs/BCAC/Pages/default.aspx.

This proposal relocates all the general requirements that apply to all motor-vehicle related occupancies into the general section, Section 406.1, and also provides in the beginning of Section 406 directions as to what sections apply to private garages and carports, open and enclosed parking garages, motor fuel-dispensing facilities, and repair garages.

The general global requirements are:

1. Automatic garage door openers and vehicular gates (originally in Section 406.3.6) – This equipment is not required to be installed, but where provided in any occupancy, minimum safeguards should be provided. UL 325 is applicable for certifying products for use in both residential and commercial applications, and addresses fire, shock, and entrapment hazards. The reference to Section 3110 provides the user with direction to the use of automatic vehicular gates, where provided.

2. Clear height (originally in Sections 406.3.2, 406.4.1, and 406.5.4.1) – A minimum clear height should be provided in any occupancy for people and vehicles.

3. Accessible parking spaces – This provides a link to the requirements in Chapter 11 for accessible parking spaces, where provided.

4. Floor surface (originally in Sections 406.3.3, 406.3.5, 406.4.5, and 406.8.3) – Where vehicles are parked, the floor surface should be both noncombustible and nonabsorbent. Motor Fuel-Dispensing Facilities and Repair garages have unique floor surface requirements.

5. Sleeping rooms (originally in Sections 406.3.4.2 and 406.4.8) – In all motor vehicle related occupancies, no openings directly into a sleeping room should be permitted due to the production of carbon monoxide by the vehicles.

6. Fuel dispensing (originally in Section 406.5.11) – In all motor vehicle related occupancies, except for motor fuel dispensing facilities, the dispensing of fuel should not be permitted.

7. Electric vehicle charging stations – The installation of electric vehicle charging stations is rapidly increasing. This new provision would provide minimum requirements to provide minimum safeguards for the installation of these stations, where provided in any motor vehicle related occupancy.

8. Mixed uses (originally in Sections 406.4.6, 406.5.3, and 406.8.1) - Mixed occupancies requirements are applied to Open parking, Enclosed parking, and Repair Garages. The general requirement for open and enclosed parking garages in Section 406.4.6 references Section 508.1, whereas the requirement specifically for Open parking garages in Section 406.5.3 references several additional sections. Private Garages has its own specific mixed use equirement. Motor-Fuel dispensaries direct the user to the IFC and 407.1 and 407.2. A combined requirement clarifies the application.

9. Equipment and appliances – Sections 304.3 and 304.3.1 of the IMC provide specific requirements for the installation of equipment and appliances in any motor vehicle related occupancy. Section 304.3.1 of the IMC has additional exceptions for the installation of fuel-fired appliances in parking garages than Section 406.4.7 of the IBC. This new requirement correlates the IBC with the IMC.

10. Hydrogen-generating appliances and refueling systems - This new provision would provide minimum requirements to provide minimum safeguards for the installation of these appliances and systems, where provided in any motor vehicle related occupancy. Specific requirements, including ventilation, are provided in Chapter 7 of the IFGC for the installation of hydrogen-generating appliances and refueling systems.

Cost Impact: Will not increase the cost of construction
Cost impact. This code change proposal will not increase the cost of construction. The proposal attempts to clarify the code, but does not make any technical changes to code requirements.

Analysis: A review of the standards proposed for inclusion in the code, UL2202-09 (2012) - Standard for Electric Vehicle (EV) Charging System Equipment, 2013, and UL2594-13 - Standard for Electric Vehicle Supply Equipment, 2013, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2015.

G 95-15 : 406-KULIK4756

G 96-15

202 (New), 406.2

Proponent: Edward Kulik, representing Building Code Action Committee (bcac@iccsafe.org)

2015 International Building Code

Add new text as follows:

SECTION 202 DEFINITIONS

REPAIR GARAGE A building, structure or portion thereof used for servicing or repairing motor vehicles.

406.2 Definitions. The following terms are defined in Chapter 2:
MECHANICAL-ACCESS OPEN PARKING GARAGES.
OPEN PARKING GARAGE.
PRIVATE GARAGE.
RAMP-ACCESS OPEN PARKING GARAGES.
REPAIR GARAGE

Reason: The term "repair garage" is used in the building code (primarily Section 406.8), but is not defined in the building code. Including the definition from the fire code will assist the user of the building code for these facilities.
This public proposal is submitted by the ICC Building Code Action Committee (BCAC). The BCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the BCAC has held 13 open meetings and numerous workgroup calls which included members of the BCAC as well as any interested party to discuss and debate the proposed changes and the public comments. Related documentation and reports are posted on the BCAC website at: http://www.iccsafe.org/cs/BCAC/Pages/default.aspx.

Cost Impact: Will not increase the cost of construction
This code proposal will not increase the cost of construction. This proposal provides clarity by defining a term already used in the building code with a definition already established in the fire code.

G 96-15 : 406.2-KULIK4796

G 97-15

406.3

Proponent: William King, City of Alexandria, representing Virginia Building Code Officials Association (william.king@alexandriava.gov)

2015 International Building Code

Revise as follows:

406.3 Private garages and carports. Private garages and carports shall comply with Sections 406.3.1 through 406.3.6.

Exception: Private garages conforming to the requirements of public parking garage in accordance with Section 406.4.

Reason: Based upon the current definition of private garage, a parking garage for an apartment building would be a private garage and subject to limitations including a size limitation of 1,000 sf unless separated with fire barriers. In highly urbanized jurisdictions, parking for apartment complexes are provided either separate parking garages or underground parking. This parking is exclusively for the use of the tenants so would qualify as a private garage. These structures are currently constructed as either open or enclosed parking garages due to the number of cars and the scale of the structures. Limiting the size of these larger parking structures appears to be an unintended consequence of this new definition and without this exception large scale parking garages used just by the building's tenants would effectively be prohibited. This exception would restore the options that were previously available and widely utilized. Given the occupants familiarity with garages that they park in every day, these private garages would provide a higher level of occupant safety than an equivalent public garage if designed to the same standard.

Cost Impact: Will not increase the cost of construction
Given that the current code would require private parking garages to be subdivided into 1,000 sf sections with fire barriers and associated opening protectives. This exception would remove all of this additional construction therefor reducing the cost of construction.

G 97-15 : 406.3-KING3250

G 98-15

406.3.1

Proponent: Jay Hyde, representing Sacramento Valley Association of Building Officials (jhyde@mognot.com)

2015 International Building Code

Revise as follows:

406.3.1 Classification. Private garages and carports shall be classified as Group U occupancies. Each private garage shall be not greater than 1,000 square feet (93 m^2) in area. Multiple private garages are permitted in a building where each private garage is separated from the other private garages by 1-hour *fire barriers* in accordance with Section 707, or 1-hour *horizontal assemblies* in accordance with Section 711, or both.

Exception: The area of a private garage that is accessory to an R-3 occupancy shall not be greater than 3,000 square feet (279 m^2).

Reason: the 2012 edition of the International Building Code reduced the allowable size of all private garages to 1,000 square feet in area. Section 406.3.1 substantially upgraded the separation requirements between a private garage and the remainder of the building, including for R-3 occupancies. Many R-3 dwellings are designed with large garages, often to house the collections of automobile collectors. It does not seem reasonable to classify these garages as an S2 enclosed parking garage with its accompanying ventilation requirements required by Section 406.2.

Cost Impact: Will not increase the cost of construction
May decrease the cost due to the elimination of a ventilation system clearly designed for a multiple occupant parking facility.

G 98-15 : 406.3.1-HYDE5262

G 99-15

406.5.1

Proponent: Maureen Traxler, Seattle Dept of Planning & Development, representing Washington Association of Building Officials Technical Code Development Committee (maureen.traxler@seattle.gov)

2015 International Building Code

Revise as follows:

406.5.1 Construction. *Open parking garages* shall be of Type I, II or IV construction. *Open parking garages* shall meet the design requirements of Chapter 16. For *vehicle barriers*, see Section 406.4.3.

> <u>**Exception**: Open parking garages are permitted to be of Type III or V construction if they comply with the allowable heights and areas specified in Sections 504 and 506 as modified by Section 507.</u>

Reason: As the code is currently written, all open parking garages are required to comply with Section 406.6, which prohibits Types III and V construction. There are two major differences in the way open and enclosed garages are treated--open parking garages are allowed increased height and area; and open parking garages are not required to provide mechanical ventilation. This proposal allows open parking garages that meet the height and area limitations of Chapter 5 to be of Type III or V construction. These garages are allowed to substitute the openness required by Section 406.5.2 for the mechanical ventilation that would otherwise be required. Section 406.6.1 tells us that parking garages that don't meet the openness requirements for open parking garages are limited to chapter 5's height and area provisions. This proposal addresses garages that meet both the openness requirements and the Chapter 5 provisions.

Cost Impact: Will not increase the cost of construction
This change will not increase the cost of construction because it will allow parking garages to be constructed of less-costly materials without mechanical ventilation systems.

G 99-15 : 406.5.1-TRAXLER4747

G 100-15

TABLE 406.5.4

Proponent: Anthony Apfelbeck, City of Altamonte Springs Building/Fire Safety Division, representing City of Altamonte Springs (ACApfelbeck@altamonte.org)

2015 International Building Code

Revise as follows:

TABLE 406.5.4
OPEN PARKING GARAGES AREA AND HEIGHT

TYPE OF CONSTRUCTION	AREA PER TIER (square feet)	HEIGHT (in tiers)		
		~~Ramp access~~	~~Mechanical access~~ Automatic sprinkler system	
			No	Yes
IA	Unlimited	~~Unlimited~~	Unlimited	Unlimited
IB	Unlimited	~~12 tiers~~	12 tiers	18 tiers
IIA	50,000	~~10 tiers~~	10 tiers	15 tiers
IIB	50,000	~~8 tiers~~	8 tiers	12 tiers
IV	50,000	~~4 tiers~~	4 tiers	4 tiers

For SI: 1 square foot = 0.0929 m^2.

Reason: A review of the code commentary and the hazard presented by ramp access vs mechanical access does not appear to provide any justification for a more restrictive height limitation on Ramp Access vs Mechanical Access. Nor does evidence provide any justification as why a mechanical access system should not receive a similar credit for automatic sprinklers as a ramp access system. This proposal eliminates the distinction between ramp access and mechanical systems.

Cost Impact: Will not increase the cost of construction
Application of the mechanical access height limits to the ramp access will reduce the cost of construction in some limited applications by providing increased flexibility of design.

G 100-15 : T406.5.4-APFELBECK4057

G 101-15

TABLE 406.5.4

Proponent: Stephen Skalko, representing Precast/Prestressed Concrete Institute (svskalko@cox.net)

2015 International Building Code

Revise as follows:

TABLE 406.5.4
OPEN PARKING GARAGES AREA AND HEIGHT

TYPE OF CONSTRUCTION	AREA PER TIER (square feet)	HEIGHT (in tiers)		
		Ramp access	Mechanical access	
			Automatic sprinkler system	
			No	Yes
IA	Unlimited	Unlimited	Unlimited	Unlimited
IB	Unlimited	12 tiers	12 tiers	18 tiers
IIA	117,000 ~~50,000~~	10 tiers	10 tiers	15 tiers
IIB	78,000~~50,000~~	8 tiers	8 tiers	12 tiers
IV	50,000	4 tiers	4 tiers	4 tiers

For SI: 1 square foot = 0.0929 m^2.

Reason: During the development of the International Building Code the drafting committees commonly used the least stringent fire safety provisions from one of the legacy codes (i.e BOCA National Building Code, Standard Building Code, Uniform Building Code) in establishing the requirements. However, for open parking garages the least stringent values in the Standard Building Code (SBC) were not used. The SBC permitted open parking structures of non-combustible construction with less fire resistance (i.e. SBC Type IV construction, IBC Type II construction) to be built up to 400,000 sqft in area per tier. This area value, which was placed in the SBC in the early 1980's, was based on the use of noncombustible materials for construction of the open parking structure, the open sided features for the parking structure which reduced the risk of adverse impact from vehicle fires and the documented low fire risk vehicles pose to the stability of open parking structures[1],[2].
Additional studies of fire experience in open parking structures in the United States since those earlier ones still supports the conclusion that vehicle fires pose a low fire risk to the parking structure. The more recent analysis of parking garage structure fires (i.e NFPA[3], Parking Market Research Company [4]) by the Fire Safety

Committee of the Parking Consultants Council concluded that in about 98.7% of the fires no structural damage occurred due to the parking structure fires studied[5]. This suggests that the present values in Table 406.5.4 for Open Parking Garages of IBC Type II construction are more stringent than necessary based on the low risk of fire damage to the structural elements from vehicle fires and should be permitted to increase.

Parking garages are classified as Group S-2, Low-hazard occupancies in Section 311.3 of the IBC, whether open or enclosed. For enclosed parking garages Table 506.2 permits sprinklered multi-story garages to be 117,000 square feet in area for Type IIA construction and 78,000 square feet for Type IIB construction. Table 406.5.4 recognizes the benefit of having open sides in the parking garage to reduce the risk from fire in lieu of providing sprinkler protection. Based on the low fire risk from vehicle fires and the open sided features of these garages this proposal will permit open parking garages of Type II construction to be built to the same areas permitted for sprinklered enclosed parking garage.

Bibliography: [1] Harris, Dr. Leslie, Market Research Associates, Survey of Fire Experience in Automobile Parking Structures in the United States and Canada, January 31, 1972.

[5] Parking Consultants Council Fire Safety Committee, Parking Structure Fire Facts, December 2008

Cost Impact: Will not increase the cost of construction
Open parking garages of Type II construction that exceed 50,000 square feet must be built to requirements of at least Type IB construction. Permitting larger open parking garages of Type IIA and IIB construction will result in a reduction in cost through savings in material and construction methods required for buildings that meet Type IB construction.

G 101-15 : T406.5.4-SKALKO5478

G 102-15

406.6.2

Proponent: Edward Kulik, representing Building Code Action Committee (bcac@iccsafe.org)

2015 International Building Code

Revise as follows:

406.6.2 Ventilation. A mechanical *ventilation* system and an exhaust system shall be provided in accordance with Sections 404 and 502.13 of the *International Mechanical Code*.

Reason: Section 404 of the IMC provides specific requirements for the ventilation of an enclosed parking garage. There are additional requirements for the exhaust system for enclosed parking garages in Section 502.13 of the IMC. Identifying the specific sections will assist in ensuring all mechanical requirements for parking garages are used.
This public proposal is submitted by the ICC Building Code Action Committee (BCAC). The BCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the BCAC has held 13 open meetings and numerous workgroup calls which included members of the BCAC as well as any interested party to discuss and debate the proposed changes and the public comments. Related documentation and reports are posted on the BCAC website at: http://www.iccsafe.org/cs/BCAC/Pages/default.aspx.

Cost Impact: Will not increase the cost of construction
This code change proposal will not increase the cost of construction. The proposal attempts to clarify the code, but does not make any technical changes to code requirements.

G 102-15 : 406.6.2-KULIK4799

G 103-15

406.6.2

Proponent: Jay Hyde, representing Sacramento Valley Association of Building Officials (jhyde@mognot.com)

2015 International Building Code

Revise as follows:

406.6.2 Ventilation. A mechanical *ventilation* system shall be provided in accordance with the *International Mechanical Code*.

<u>**Exception:** Mechanical ventilation shall not be required for enclosed parking garages that are accessory to Group R-3 occupancies.</u>

Reason: The 2015 International Building Code reduced the allowable area of a Private Garage to 1,000 sq. ft. Larger garages are frequently required by automobile collectors. These garages would not be subject to uncontrolled use by unrelated individuals. The ventilation required to remove exhaust fumes from multiple vehicles running at the same time seems excessive for a R3 residence, regardless of the size of the garage.

Cost Impact: Will not increase the cost of construction
It may reduce cost of construction by allowing unventilated garages serving R3 occupancies.

G 103-15 : 406.6.2-HYDE5789

G 104-15

407.2.1

Proponent: John Williams, CBO, Chair, representing Adhoc Health Care Committee (AHC@iccsafe.org)

2015 International Building Code

Revise as follows:

407.2.1 Waiting and similar areas. Waiting areas ~~and similar~~, public-use areas, or group meeting spaces constructed as required for *corridors* shall be permitted to be open to a *corridor*, only where all of the following criteria are met:

1. The spaces are not occupied as care recipient's sleeping rooms, treatment rooms, incidental uses in accordance with Section 509, or hazardous uses.
2. The open space is protected by an automatic fire detection system installed in accordance with Section 907.
3. The *corridors* onto which the spaces open, in the same *smoke compartment*, are protected by an automatic fire detection system installed in accordance with Section 907, or the *smoke compartment* in which the spaces are located is equipped throughout with quick-response sprinklers in accordance with Section 903.3.2.
4. The space is arranged so as not to obstruct access to the required *exits*.

Reason: The terminology "similar spaces" is vague and prone to interpretation. This change will allow for clarification of the original intent of the language. By amending this terminology to "public use areas" or "group meeting spaces" it will allow spaces such as family gathering areas, child play areas in children's wards, conservatories/game room/social interaction areas in long term recovery that are constructed as required for corridors and meet all of the established requirements to be permitted to be open to a corridor. Allowing these areas to be open to the corridor will provide better over sight and security of these areas thus allowing for quicker responses by staff to issues that develop in these areas. With the ban of smoking within hospitals there is not a risk of smoking within these areas and having these areas open to the corridor will allow staff to quickly sense and respond to any smoking that does occur. Being public spaces the need for privacy is not an issue. This change mirrors what is currently permitted in a nursing home environment and provide for a more open and inviting atmosphere.

The ICC Ad Hoc Committee on Healthcare (AHC) has just completed its 4th year. The AHC was established by the ICC Board to evaluate and assess contemporary code issues relating to hospitals and ambulatory healthcare facilities. This is a joint effort between ICC and the American Society for Healthcare Engineering (ASHE), a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. Information on the AHC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the AHC effort can be downloaded from the AHC website at: http://www.iccsafe.org/cs/AHC/Pages/default.aspx.

Cost Impact: Will not increase the cost of construction
This is a clarification; therefore, there is no change in cost.

G 104-15 : 407.2.1-WILLIAMS4231

G 105-15

407.2.6

Proponent: Edward Kulik, representing Building Code Action Committee (bcac@iccsafe.org)

2015 International Building Code

Revise as follows:

407.2.6 Nursing home cooking facilities. In Group I-2, Condition 1, occupancies, rooms or spaces that contain a cooking facility with domestic cooking appliances shall be permitted to be open to the corridor where all of the following criteria are met:

1. The number of care recipients housed in the smoke compartment ~~is~~shall not be greater than 30.
2. The number of care recipients served by the cooking facility ~~is~~shall not be greater than 30.
3. Only one cooking facility area ~~is~~shall be permitted in a smoke compartment.
4. The types of domestic cooking appliances permitted ~~are~~shall be limited to ovens, cooktops, ranges, warmers and microwaves.
5. The corridor ~~is~~shall be a clearly identified space delineated by construction or floor pattern, material or color.
6. The space containing the domestic cooking facility shall be arranged so as not to obstruct access to the required exit.
7. ~~A domestic~~ Domestic cooking ~~hood~~hoods installed and constructed in accordance with Section 505 of the *International Mechanical Code* ~~is~~shall be provided over ~~the cooktop or range~~cooktops and ranges.
8. ~~The domestic cooking hood provided over the cooktop or range~~Cooktops and ranges shall be ~~equipped with an automatic fire-extinguishing system of a type recognized for protection of domestic cooking equipment. Preengineered automatic extinguishing systems shall be tested~~protected in accordance with ~~UL 300A and *listed* and *labeled* for the intended application. The system shall be installed in accordance with this code, its listing and the manufacturer's instructions~~Section 904.13.
9. ~~A manual actuation device for the hood suppression system shall be installed in accordance with Sections 904.12.1 and 904.12.2.~~
10. ~~An interlock device shall be provided such that upon activation of the hood suppression system, the power or fuel supply to the cooktop or range will be turned off.~~
10. A shut-off for the fuel and electrical power supply to the cooking equipment shall be provided in a location that is accessible only to staff.
11. A timer shall be provided that automatically deactivates the cooking appliances within a period of not more than 120 minutes.
12. A portable fire extinguisher shall be ~~installed~~provided. Installation shall be in accordance with Section 906 ~~of~~and the ~~*International Fire Code*.~~extiguisher shall be located within a 30-foot (9144 mm) distance of travel from each domestic cooking appliance.

Reason: This public proposal is submitted by the ICC Building Code Action Committee (BCAC). The BCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the BCAC has held 13 open meetings and numerous workgroup calls which included members of the BCAC as well as any interested party to discuss and debate the proposed changes and the public comments. Related documentation and reports are posted on the BCAC website at: http://www.iccsafe.org/cs/BCAC/Pages/default.aspx.
During the 2015 code cycle requirements were added to allow domestic cooking appliances to be installed in areas of Group I-2, Condition 1 occupancies that are open to the corridor when certain conditions were met. That included protecting cooktops and ranges with UL 300A compliant extinguishing systems in the hood. This proposal accomplishes the following:

1. Introduces mandatory language into Section 407.2.6

2. Allows an option for cooktops and ranges with listed ignition resistant burners to be provided in lieu of a UL 300A extinguishing system. These types of systems are investigated to verify that pans and cooking materials do not exceed 350 degrees C (662 degrees F). Recent work by the Fire Protection Research Foundation confirms that burners meeting these specifications are highly unlikely to ignite cooking materials. See: http://www.nfpa.org/research/fire-protection-research-foundation/reports-and-proceedings/other-research-topics/analytical-modeling-of-pan-and-oil-heating-on-an-electric-coil-cooktop

There will be a Group B corresponding code change proposal to IFC Section 904.13. The ICC Fire Code Action Committee (FCAC) supports this proposal and will be submitting the Group B proposal that follows:

904.13 Domestic cooking systems in Group I-2 Condition 1. In Group I-2 Condition 1, occupancies where cooking facilities are installed in accordance with Section 407.2.6 of this code, cooktops and ranges shall be protected in accordance with one of the following. ~~the domestic cooking hood provided over the cooktop or range shall be equipped with an automatic fire-extinguishing system of a type recognized for protection of domestic cooking equipment. Preengineered automatic extinguishing systems shall be tested in accordance with UL 300A and listed and labeled for the intended application. The system shall be installed in accordance with this code, its listing and the manufacturer's instructions.~~

1. Cooktops and ranges shall include heating elements or burners that have been tested and listed to not allow cooking pan temperatures to exceed 662 degrees F (350 degrees C), or

2 . The domestic cooking hood provided over the cooktop or range shall be equipped with an automatic fire-extinguishing system complying with both of the following:

a. The automatic fire-extinguishing system shall be of a type recognized for protection of domestic cooking equipment. Preengineered automatic extinguishing systems shall be tested in accordance with UL 300A and listed and labeled for the intended application. The system shall be installed in accordance with this code, its listing and the manufacturer's instructions, and

b. Manual actuation and system interconnection for the hood suppression system shall be installed in accordance with Sections 904.12.1 and 904.12.2, respectively.

~~904.13.1 Manual system operation and interconnection. Manual actuation and system interconnection for the hood suppression system shall be installed in accordance with Sections 904.12.1 and 904.12.2, respectively.~~

~~904.13.2 Portable fire extinguishers for domestic cooking equipment in Group I-2 Condition 1. A portable fire extinguisher complying with Section 906 shall be installed within a 30-foot (9144 mm) distance of travel from domestic cooking appliances.~~

Cost Impact: Will not increase the cost of construction
This code change proposal will not increase the cost of construction. It includes editorial revisions and adds an option to the existing requirements to use ignition prevention cooktops.

G 105-15 : 407.2.6-KULIK4658

G 106-15

407.4.1.1

Proponent: Edward Kulik, representing Building Code Action Committee (bcac@iccsafe.org)

2015 International Building Code

Revise as follows:

407.4.1.1 Locking devices. Locking devices that restrict access to a care recipient's room from the *corridor* and that are operable only by staff from the *corridor* side shall not restrict the *means of egress* from the care recipient's room.

Exceptions:

1. This section shall not apply to rooms in psychiatric treatment and similar care areas.
2. Locking arrangements in accordance with Section 1010.1.9.6 <u>or 1010.1.9.7</u>.

Reason: Clarifying / explicitly allowing delayed egress locking systems in this application in the unlikely event a delayed egress locking system is desirable for this application. Delayed egress locking systems are currently not precluded from this application by the "shall be permitted" language and requirements of 1010.1.9.7.
This public proposal is submitted by the ICC Building Code Action Committee (BCAC). The BCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the BCAC has held 13 open meetings and numerous workgroup calls which included members of the BCAC as well as any interested party to discuss and debate the proposed changes and the public comments. Related documentation and reports are posted on the BCAC website at: http://www.iccsafe.org/cs/BCAC/Pages/default.aspx.

Cost Impact: Will not increase the cost of construction
No cost impact unless the building owner chooses to install this locking arrangement.

G 106-15 : 407.4.1.1-KULIK3664

G 107-15

407.5

Proponent: John Williams, CBO, Chair, representing Adhoc Health Care Committee (AHC@iccsafe.org)

2015 International Building Code

Revise as follows:

407.5 Smoke barriers. *Smoke barriers* shall be provided to subdivide every *story* used by persons receiving care, treatment or sleeping ~~and~~, into not fewer than two smoke compartments. Smoke barriers shall be provided to ~~divide~~subdivide other *stories* with an *occupant load* of 50 or more persons, into no fewer than two *smoke compartments*. The smoke barrier shall be in accordance with Section 709.

407.5.1 Smoke compartment size. .~~Such~~ Stories shall be divided into smoke compartments with an area of not more than 22,500 square feet (2092 m^2) in Group I-2, Condition 1, and not mroe than 40,000 square feet (3716 m^2) in Group I-2, Condition 2 occupancies ~~and~~.

407.5.2 Exit access travel distance. The distance of travel from any point in a smoke compartment to a smoke barrier door shall be not greater than 200 feet (60 960 mm).

Reason: This proposal clarifies the requirements for at least two compartments on a floor by separating section into separate sentences and sections.

The ICC Ad Hoc Committee on Healthcare (AHC) has just completed its 4th year. The AHC was established by the ICC Board to evaluate and assess contemporary code issues relating to hospitals and ambulatory healthcare facilities. This is a joint effort between ICC and the American Society for Healthcare Engineering (ASHE), a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. Information on the AHC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the AHC effort can be downloaded from the AHC website at: http://www.iccsafe.org/cs/AHC/Pages/default.aspx.

Cost Impact: Will not increase the cost of construction
This proposal is for clarification only, therefore, there are no changes to construction requirements or the cost of construction.

G 107-15 : 407.5-WILLIAMS4234

G 108-15

407.5

Proponent: John Williams, CBO, Chair, representing Adhoc Health Care Committee (AHC@iccsafe.org)

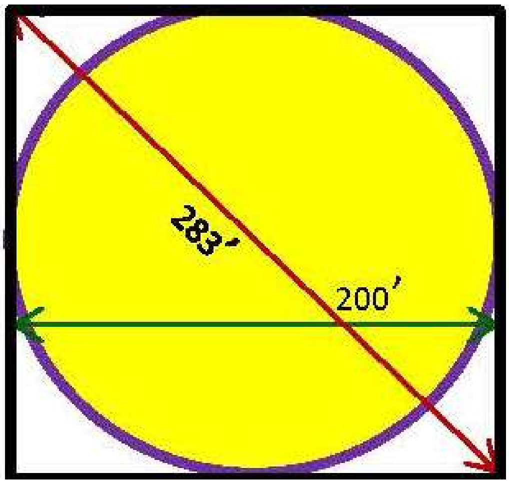
2015 International Building Code

Revise as follows:

407.5 Smoke barriers. *Smoke barriers* shall be provided to subdivide every *story* used by persons receiving care, treatment or sleeping and to divide other *stories* with an *occupant load* of 50 or more persons, into no fewer than two *smoke compartments*. Such stories shall be divided into *smoke compartments* with an area of not more than 22,500 square feet (2092 m^2) in Group I-2, Condition 1, and not more than ~~40,000~~31,400 square feet (~~3716~~2197 m^2) in Group I-2, Condition 2, and the distance of travel from any point in a *smoke compartment* to a *smoke barrier* door shall be not greater than 200 feet (60 960 mm). The *smoke barrier* shall be in accordance with Section 709.

Reason: The ICC Ad Hoc Committee on Healthcare (AHC) has just completed its 4th year. The AHC was established by the ICC Board to evaluate and assess contemporary code issues relating to hospitals and ambulatory healthcare facilities. This is a joint effort between ICC and the American Society for Healthcare Engineering (ASHE), a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. Information on the AHC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the AHC effort can be downloaded from the AHC website at: http://www.iccsafe.org/cs/AHC/Pages/default.aspx.

The original square footage for Group I-2, smoke compartments was based on the product of the 150 foot travel distance which equals 22,500 square feet. During the 2015 code change cycle the Ad hoc Committee on Healthcare (AHC) presented the reason statement below to justify the increase of space within the Group I-2, Condition 2 facilities to allow for additional smoke compartment sizing to accommodate for the required increase of patient care and treatment areas to 40,000 sf. This size was, like the previous size, based on the limiting factor of the travel distance being the product of a 200 foot travel distance. Over the last couple of years interested parties have called to question the rationality of the 40,000 sf since due to room and corridor configurations it is not possible to achieve a smoke compartment of 40,000 sf. To collaborate with these interested parties the AHC has attempted to achieve a more realistic smoke compartment size based on the 200 foot travel distance. Since the travel distance is the true limiting factor using this distance in a more restrictive geometrical fashion – that of the area of a circle instead of a square – will therefore provide the true restriction for the actual square footage based on the actual travel distance from a given point. The area of a circle with a diameter of 200 feet is approximately 31,416 square feet. The AHC therefore recommends that the square footage for smoke zones be changed to better reflect this more restrictive requirement of the travel distance by changing the 40,000 sf to 31,400 sf.



This graphic indicates the more restrictive nature of the circular geometric shape and although not a typical construction shape using this geometrical shape to determine the allowable square footage for a smoke compartment will more appropriately reflect the restrictive nature of the 200 foot travel distance. By providing the additional square footage over the previous 22,500 square feet this change will still meet the intent of the original request to increase the square footage and provide the additional area needed to meet the increased requirements of patient treatment areas while yet more appropriately reflecting the desired restriction of the 200 foot travel distance.

ORIGINAL REASON STATEMENT FOR 40,000 SF SMOKE ZONE:
Reason: This proposal is submitted by the ICC Ad Hoc Committee for Healthcare (AHC). The AHC was established by the ICC Board of Directors to evaluate and assess contemporary code issues relating to hospitals and ambulatory healthcare facilities. The AHC is composed of building code officials, fire code officials, hospital facility engineers, and state healthcare enforcement representatives. The goals of the committee are to ensure that the ICC family of codes appropriately addresses the fire and life safety concerns of a highly specialized and rapidly evolving healthcare delivery system. This process is part of a joint effort between ICC and the American Society for Healthcare Engineering, a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. Since its inception in April 2011, the AHC has held 5 open meetings and over 80 workgroup calls which included members of the AHC as well as any interested party to discuss and debate the proposed changes. All meeting materials and reports are posted on the AHC website at: http://www.iccsafe.org/cs/AHC/Pages/default.aspx
This code change addresses outdated code material. Historically, smoke compartment size has been driven by the allowable travel distance within the smoke compartment. Past code changes have increased the travel distance without a corresponding change in smoke compartment size. Secondly, the size of the functional patient areas has increased, but the occupant load has remained the same or has been reduced. Therefore, we are asking for an increase in smoke compartment size to accommodate the operational needs of the modern hospital.

A summary of the history of smoke compartment requirements is as a requirement is as follows:

- October 1984 BCMC – Maximum length and width equals 150 feet.
- 1987 BOCA – 610.5 – Maximum length and width equals 150 feet
- 1992 BOCA Supplement – 610.4 – 22,500 square feet, with maximum travel distance of 150 feet.
- Code Change No. B20-95 – 22,500 square feet, with maximum travel distance proposed to be increased to 200 feet.
- 1996 BOCA – 409.4 - 22,500 square feet, with maximum travel distance of 200 feet.
- 2000 IBC – 407.4 - 22,500 square feet, with maximum travel distance of 200 feet.

Originally, there was no limit to smoke compartment size, other what was imposed by travel distance. The 22,500 square foot requirement was based on the old travel distance requirement of 150 feet, and used it to extrapolate an area (150ft x150ft = 22,500 square feet). This proposal uses the same logic and applies the current 200 foot travel distance maximum (200ft x200ft), resulting in a 40,000 square foot smoke compartment. This proposal would maintain the existing requirement that each floor be divided into two smoke compartments. Practically the requirement for 200' travel distance within smoke compartments will still drive smaller smoke compartment sizes in some cases.
Over the past 20 years, there has been a steady increase in the size of patient treatment rooms in hospitals. The primary reason for the increase is the equipment and utilities

necessary for the treatment of a patient, such as patient monitoring, gases, and diagnostics equipment, while maintaining space for staff access to the patient. In response, the widely adopted and enforced "Guidelines for the Design and Construction of Health Care Facilities" from the FGI Institute have also increased, making these operational considerations actual code requirements. In the case of the inpatient units, the adoption of a single bed in a patient room has had the largest impact on square footage, while not significantly increasing the number of occupants on the unit.

The concept of an "individual patient space" is becoming the standard design in other types throughout the hospital. Many emergency departments are opting for private patient exam spaces with hard walls, primarily for infection control and patient privacy considerations. Similarly, radiology areas are being driven by technology and clearance issues which go beyond the required minimums, and have impacts on square footages to achieve clearances. In some units, there has also been an increase in the types of required support spaces, including ratios of equipment storage per treatment room, the increased importance of computer equipment rooms, and various staff areas. However, support spaces have remained largely the same, while the main increases have been in the size of the patient treatment areas themselves. While these spaces have been increasing in size, the smoke compartment size requirements have been left unchanged in the building codes.

When studying the contemporary sizes of functions such as emergency departments, radiology operations, and bed units, the larger size allows for greater visualization from the staff to the patient, which is a crucial aspect of planning a patient area. This operational consideration could more easily be achieved before the increase in patient areas, but the same operational considerations require an increase to the smoke zone size to match contemporary requirements, delivery of care and technologies. Attached is a study of space programs which compare the 2010 Guideline requirements with the 1996-97 Guidelines. In short, today's hospital takes more square footage to care for the same amount of patients. These programs demonstrate the need to increase to 40,000 square foot smoke compartment. See program analysis at the following link.
http://www.iccsafe.org/cs/AHC/Pages/WG-General.aspx

Cost Impact: Will increase the cost of construction
The increase will vary depending on the design and size of each facility. By reducing the size of the smoke compartment, it could increase the number of smoke barriers required.

G 108-15 : 407.5-WILLIAMS4235

G 109-15

407.5

Proponent: Vickie Lovell, InterCode Incorporated, representing Fire Safe North America (vickie@intercodeinc.com)

2015 International Building Code

Revise as follows:

407.5 Smoke barriers. *Smoke barriers* shall be provided to subdivide every *story* used by persons receiving care, treatment or sleeping and to divide other *stories* with an *occupant load* of 50 or more persons, into no fewer than two *smoke compartments*. Such stories shall be divided into *smoke compartments* with an area of not more than 22,500 square feet (2092 m^2) in Group I-2~~, Condition 1, and not more than 40,000 square feet (3716 m^2) in Group I-2, Condition 2, and the~~. The distance of travel from any point in a *smoke compartment* to a *smoke barrier* door shall be not greater than 200 feet (60 960 mm). The *smoke barrier* shall be in accordance with Section 709.

Exceptions

1. A smoke compartment in Group I-2, Condition 2, is permitted to have an area of not more than 35,000 square feet (3252 m^2) provided all patient rooms within that smoke compartment are configured for one single bed per room.
2. A smoke compartment in Group I-2, Condition 2, is permitted to have an area of not more than 40,000 square feet (3716 m^2) used primarily as a radiology suite. For the purposes of this exception, a radiology suite is a dedicated space that includes the area for MRI, general radiology, PET, CT, flouroscopy, interventional radiology or gamma camera procedures and their needed support and staff areas, without any patient sleeping rooms.

Reason: The discussions of the Ad Hoc Healthcare group in the 2015 development cycle indicated that the larger smoke compartments were needed due to healthcare construction and design moving exclusively to one patient per room. In support of that, they had their spreadsheets that detailed exactly how many square feet every different room within a smoke compartment required to create a properly functioning unit, and then added up all of those square feet. Except for a radiology suite, which their spreadsheet indicated would now require the increase to 40,000 sq. ft., 35,000 sq. ft. would be sufficient for the other documented unit types (inpatient beds, emergency department with pediatrics, intensive care unit) as is recommended in this proposal.
In addition, knowing that the IBC is used in other countries as a model code, and in other countries the norm may be 2 patients (or more) per room, this would clearly indicate that the new, larger smoke compartments are only to be considered if and when a hospital goes to the 1 patient-per-room layout.

Substantiation for larger square
footage in smoke compartments
IntensiveCareUnit

Cost Impact: Will increase the cost of construction

This code change will increase the cost of construction as compared to the 2015 IBC, due to the need for some additional smoke barrier walls to create the smoke compartments smaller than the 40,000 sq. ft. smoke compartments. This code change will decrease the cost of construction as compared to the 2012 IBC, all previous editions of the IBC, all three of the legacy codes, and also as compared to the Life Safety Code (through 2015), due to the smoke compartments being larger than 22,500 sq. ft., and thus needing fewer smoke barrier walls than each of those codes could have required.

G 109-15 : 407.5-LOVELL4195

G 110-15

407.5

Proponent: Amanda Hickman, InterCode Incorporated, representing Fire Safe North America (amanda@intercodeinc.com)

2015 International Building Code

Revise as follows:

407.5 Smoke barriers. *Smoke barriers* shall be provided to subdivide every *story* used by persons receiving care, treatment or sleeping and to divide other *stories* with an *occupant load* of 50 or more persons, into no fewer than two *smoke compartments*. Such stories shall be divided into *smoke compartments* with an area of not more than 22,500 square feet (2092 m^2) in Group I-2~~, Condition 1, and not more than 40,000 square feet (3716 m^2) in Group I-2, Condition 2, and the~~. The distance of travel from any point in a *smoke compartment* to a *smoke barrier* door shall be not greater than 200 feet (60 960 mm). The *smoke barrier* shall be in accordance with Section 709.

Reason: In the event of a fire, hospitals have a population with special concerns and vulnerabilities. To maintain an effective fire and smoke management system in health care environments, multiple compartments subdivided with smoke barrier walls must be incorporated and maintained in the life safety design for hospitals.
A full evacuation is often neither practical nor in the best interest of hospital patients. Therefore, the International Building Code (IBC) and NFPA 101 Life Safety Code both require that the safety of patients in hospitals be provided through the use of a defend-in-place strategy using multiple fire safety features, including construction, compartmentation, fire detection and suppression, and a well-trained staff to assist in emergency relocation/evacuation of patients.

Smoke barriers are used to separate smoke compartments. Walls and floors designed and constructed as smoke barriers separate adjacent smoke compartments in a building. Smoke barriers are required to be constructed with a minimal fire resistance rating of 1 hour. This will ensure that they are not quickly breached in the event of a fire, especially if sprinkler operation is delayed, shielded, or prevented altogether, such as due to a water supply impairment . As the name implies, smoke barriers are also intended to restrict the movement of smoke. Ensuring the ability of smoke barriers to survive exposure to a fire and to restrict smoke movement in a fire incident is critical to the defend-in-place concept used in health care. A key part of this strategy is to use smoke compartments formed by smoke barriers to create temporary, safe areas for patients. The International Building Code requires that areas used for patients must be divided into a minimum of two smoke compartments. Patients in smoke compartments not directly involved in a fire are protected at least temporarily, and can be moved horizontally on gurneys if necessary across smoke barriers into an adjacent smoke compartment. This will buy valuable time, depending on the circumstances, to avoid the need for total evacuation.

Code changes in the 2015 Edition of the International Building Code resulted in the approval of two new code changes that changed smoke compartments in hospitals. Smoke compartments in I-2 occupancies are now less protected.

- Section 717.5.5 (new exception #2 in the 2015 IBC) permits smoke barriers in smoke compartments to eliminate smoke dampers in smoke barriers in sprinklered I-2 buildings, if the HVAC system is fully ducted; and
- Section 407.5 (2015 IBC) permits the area of smoke compartments in I-2, condition 2, to be nearly doubled in size, expanded in area from 22,500 sq. ft. to 40,000 sq. ft.

The Section 407.5 change represents two major changes to current requirements without substantial justification and without consideration of implementation of both changes to the protection of smoke compartments. Fire Safe North America (FSNA) was strongly opposed to both of the changes in the protection of smoke compartments and testified in opposition. (The Air Movement and Control Association Intl (AMCA) has submitted a code change this cycle that further clarifies when a smoke damper can be eliminated from the duct system.)

Regarding the increased size of the smoke compartment, there was no correlation to the measurement of travel distances in a 40,000 sq. ft. compartment size. While travel distances are measured along a path of travel, the compartment sizes are measured in straight line distances. This major adjustment in smoke compartment size would potentially expose a greater number of patients to a fire incident, and establish the need for staff to relocate this higher number of patients to an adjacent area of safety, imposing an unacceptable level of safety for those patients. Current text has no limitations on the number of patients or the number of associated staff who may be located in any one smoke compartment. The change was based on the assumption that the size of functional patient areas has increased with no corresponding increase in patient population, but the code does not require such a limitation.

The proposal that significantly increased the allowable area of a smoke compartment in hospitals from 22,500 sq. ft. to 40,000 sq. ft. did not adequately address numerous issues in their substantiation, and was not resolved satisfactorily. The following contains excerpts from testimony from those who were opposed to these changes, including the National Association of State Fire Marshals, Fire Safe North America, International Association of Fire Fighters, the International Firestop Council, the Air Movement and Control Association International, and others:

1. The substantiation provided for increasing smoke compartment size in hospitals from 22,500 sq. ft. to 40,000 sq. ft. was only based on a study showing that the size of functional patient areas is increasing in most hospitals (for example, to private patient rooms from semiprivate rooms) from the "Facilities Management Guidelines", and not on any technical substantiation addressing specific concerns of patient safety.
2. The new code section does not address the concerns related to increasing the travel time for egressing patients out of one smoke compartment into another one, and the fire and smoke safety impact on those patients and staff.
3. The new code section has no limitations on the maximum number of patients that may be located in any one 40,000 sq. ft. smoke compartment. Without limitations on patient or occupancy limits, a larger smoke compartment size than what was previously permitted, could expose a higher number of patients, visitors, and hospital staff to a fire incident.
4. The new code section could be interpreted to allow existing hospitals to increase smoke compartment sizes in order to reduce maintenance costs by decommissioning some of their smoke barriers without actually reducing the number of patients within their smoke compartments.

An important point of interest is that an identical proposal to increase the size of a smoke compartment to 40,000 sq. ft. was proposed to the 2015 Life Safety Code, published and distributed worldwide by the National Fire Protection Association. Although approved narrowly by the Technical Committee, it was disapproved by the NFPA membership during the NFPA Association Members Meeting in Las Vegas in June, 2014. As a result, the change to 40,000 sq. ft. that is in the 2015 IBC and is not the 2015 Life Safety Code. There remains a conflict between the two regulatory documents, which causes problems for hospitals that need to comply with CMS regulations, as they require conformance with NFPA 101, including the 22,500 sq. ft. limitation on smoke compartment size.

This proposal seeks to restore the size of the smoke compartments in hospitals to 22,500 sq. ft. which will make the Life Safety Code and the IBC consistent with one another.

Cost Impact: Will increase the cost of construction
This code change will increase the cost of construction as compared to the 2015 IBC, due to cost of constructing additional smoke barrier walls to make smoke compartments smaller than the currently required 40,000 sq. ft. smoke compartments.

G 110-15 : 407.5-HICKMAN4344

G 111-15

407.5.2

Proponent: John Williams, CBO, Chair, representing Adhoc Health Care Committee (AHC@iccsafe.org)

2015 International Building Code

Revise as follows:

407.5.2 Independent egress. A *means of egress* shall be provided from each *smoke compartment* created by *smoke barriers* without having to return through the smoke compartment from which *means of egress* originated. Smoke compartments that do not contain an exit shall be provided with direct access to not less than two adjacent smoke compartments.

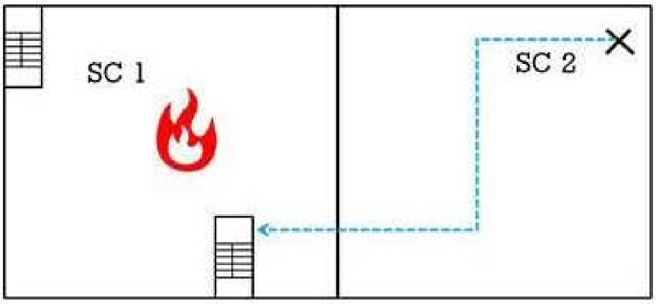
Reason: The ICC Ad Hoc Committee on Healthcare (AHC) has just completed its 4th year. The AHC was established by the ICC Board to evaluate and assess contemporary code issues relating to hospitals and ambulatory healthcare facilities. This is a joint effort between ICC and the American Society for Healthcare Engineering (ASHE), a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. Information on the AHC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the AHC effort can be downloaded from the AHC website at: http://www.iccsafe.org/cs/AHC/Pages/default.aspx.

This code change is intended to more appropriately handle arrangement of the means of egress in a defend in place environment (i.e. hospitals and nursing homes.) The intent is to ensure that the arrangement of smoke compartments and exits prevents a situation where you have a "dead end smoke compartment." This requirement already exists within the federal Medicare requirements. This proposes rule (and the existing section) does not require a stair in every smoke compartment.

In Example 1, an occupant in smoke compartment 2 (SC2) would be forced to travel into smoke compartment 1 to access one of the two required exits for the floor. This is compliant with the current requirement that the occupant does not "return through the smoke compartment of egress origin." The smoke compartment where the mean of egress originates is smoke compartment 2. The dashed path does not leave smoke compartment 2, then RETURN back into smoke compartment 2. While this example meets current code, it creates an unacceptable hazard by creating a "dead end smoke compartment."

The proposed language would require that one of the stairs be located in smoke compartment 2, or, that the floor plate be rearranged to create access to two adjacent smoke compartments from compartment SC2.

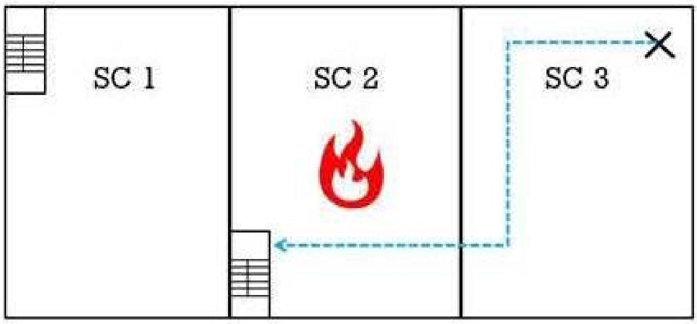
Example 1



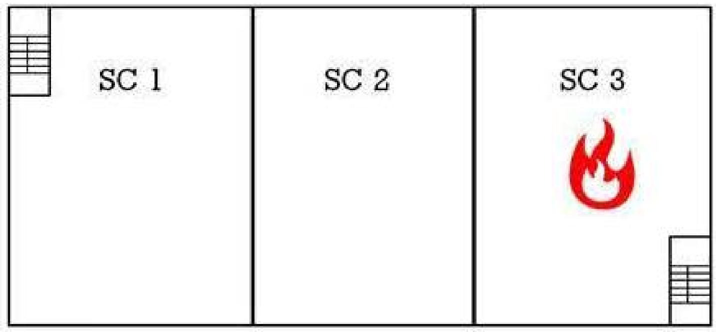
A similar condition exists in Example 2. An occupant in smoke compartment 3 would be required to travel through smoke compartment 2 to access an exit. If smoke compartment #2 has a fire, then the exiting is compromised. In this example, SC3 would be non-compliant with the proposed rule because it 1) does not have a stair, or, 2) it does not have access to two directly adjacent smoke compartments.

There is an easy fix to this problem: relocate the stair to smoke compartment #3 (see Example 3). That way, smoke compartments 1 and 3 have access directly to the stair, and smoke compartment #2 has access to at least two directly adjacent smoke compartments.

Example 2



Example 3



Cost Impact: Will not increase the cost of construction
This change will typically not increase the cost of construction, in that it does not affect how many exits are provided. It does limit the location on the floor plate, which could have cost implications. In worse case an additional smoke compartment would be required, which would definitely increase construction cost. Practically, since this is a federal requirement already there will be no perceived increase to facilities.

G 111-15 : 407.5.2-WILLIAMS4238

G 112-15

407.6 (New), 709.5.1

Proponent: John Williams, CBO, Chair, representing Adhoc Health Care Committee (AHC@iccsafe.org)

2015 International Building Code

Add new text as follows:

407.6 Automatic closing doors Automatic closing doors with hold-open devices shall comply with Sections 709.5 and 716.5.

Revise as follows:

709.5.1 Group I-2 and ambulatory care facilities. In Group I-2 and ambulatory care facilities, where doors protecting openings in smoke barriers are installed across a corridor and have hold-open devices, the doors shall be automatic-closing ~~by smoke detection~~ in accordance with Section 716.5.9.3 ~~and~~. Such doors shall have a vision panel with fire-protection-rated glazing materials in fire-protection-rated frames, the area of which shall not exceed that tested.

Reason: This proposal has two main functions: The first is to provide a pointer in the I-2 specific section to the requirements for automatic closing doors in healthcare facilities. The hold open feature is one that is used quite frequently, yet the specific requirements are often missed. The pointer in Chapter 4 will remind designers to comply with BOTH sections.
The second change clarifies that not all cross corridor doors need to be provided with automatic closers. The context of this section is doors in smoke barriers, so we have added language to focus the requirement.
The ICC Ad Hoc Committee on Healthcare (AHC) has just completed its 4th year. The AHC was established by the ICC Board to evaluate and assess contemporary code issues relating to hospitals and ambulatory healthcare facilities. This is a joint effort between ICC and the American Society for Healthcare Engineering (ASHE), a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. Information on the AHC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the AHC effort can be downloaded from the AHC website at: http://www.iccsafe.org/cs/AHC/Pages/default.aspx.

Cost Impact: Will not increase the cost of construction
This proposal is a clarification of requirements; therefore, there is no increase in cost.

G 112-15 : 407.6 (New)-WILLIAMS4236

G 113-15

408.9

Proponent: James Peterkin, Heery International, representing Self (jpeterki@heery.com)

2015 International Building Code

Revise as follows:

408.9 Windowless buildings~~.~~ For the purposes of this section, a windowless building or portion of a building is one with nonopenable windows, windows not readily breakable or without windows. ~~Windowless~~

To facilitate smoke removal in post-fire salvage and overhaul operations, windowless buildings shall be ~~provided~~equipped with ~~an engineered smoke control system to provide a tenable environment~~mechanical ventilation for ~~exiting from~~ the ~~*smoke compartment* in the area~~removal of ~~fire origin in accordance with Section 909~~products of combustion using mechanical air-handling equipment providing one exhaust air change every 15 minutes for each ~~windowless~~ *smoke compartment*. Return and exhaust air shall be moved directly to the outside without re-circulation to other portions of the building.

Reason: The mechanical ventilation requirements for an I-3 occupancy should be similar to that required in a high rise building. The ventilation system replaces the lack of breakable windows. Requiring a smoke control system in accordance with 909 to maintain a "tenable environment" is a problem since the only method for maintaining a tenable environment is an "Exhaust" method under Section 909.8. This section stipulates that this method is used to control smoke in large enclosed volumes such as in atriums and malls. I-3 occupancies are generally designed with inmate cells opening into a day room. These are usually a single story with a mezzanine (not a two story space). Trying to maintain a smoke interface layer 6 ft. above the highest occupied space in accordance with the design requirements of 909.8 (NFPA 92) is extremely difficult since there is no volume of space for smoke collection. In addition, the fire load within these compartments is generally very low (fire retardant furnishings) and these spaces are under constant surveillance by security personnel. The fire loss data does not indicate a need for maintaining tenable conditions in these occupancies which are required to be protected by automatic sprinkler systems.

Cost Impact: Will not increase the cost of construction
The cost of a smoke control systems that must be designed to maintain tenable conditions significantly increases the cost of prison. Dedicated smoke control systems also increase the annual maintenance and testing costs over a manually operated ventilation system

G 113-15 : 408.9-PETERKIN5235

G 114-15

410.3.4

Proponent: Stephen DiGiovanni, representing Southern Nevada Chapter of ICC (sdigiovanni@clarkcountynv.gov)

2015 International Building Code

Revise as follows:

410.3.4 Proscenium wall. Where the *stage* height is greater than 50 feet (15 240 mm), all portions of the *stage* shall be completely separated from the seating area by a proscenium wall with not less than a 2-hour *fire-resistance rating* extending continuously from the foundation to the roof.

Exception: Where the *stage* is located in a building of Type I construction, *proscenium walls*:

1. Where located above a minimum 2-hour *horizontal assembly* shall be permitted to extend from the top of this *horizontal assembly*.
2. Where located beneath a minimum 2-hour *horizontal assembly* are permitted to terminate at the underside of this *horizontal assembly*.
3. Are not permitted to terminate at a *horizontal assembly*where the provisions of Item 2 of Section 403.2.1.1 have been applied.

Reason: Stages with heights of greater than 50 feet are more commonly occurring in venues throughout the country. Additionally, these venues are also increasingly designed with either/both basements (beneath) and/or additional floors above the actual theater levels.

Basements help these venues to attract popular traveling "Broadway-style" shows that utilize large floor lifts from beneath the stage as part of their productions. In many cases, these basements are enlarged to include additional uses such as; office, storage rooms, and other back-of-house spaces.

Levels above the stage are more frequently occurring due to the proliferation of these venues being incorporated into the footprint of high-rise hotel towers, beneath "green" roof gardens (occupiable), and/or beneath additional meeting room/spaces (such as those used in urban-area convention centers).

Currently, Section 410.3.4 requires 2-hour proscenium walls to be continuously constructed from the foundation to the roof of a structure containing a stage with a height greater than 50 feet. Where venues are constructed with floors above and/or below such theaters, this provision requires proscenium walls to continue entirely through those floor levels regardless of the use and/or risks associated with them. This fails to recognize that venues having large stages are no longer limited to single-story buildings.

The proposed amendment would allow the proscenium to terminate at minimum 2-hour fire-resistance-rated horizontal assemblies above and/or below the space containing the stage.

Cost Impact: Will not increase the cost of construction
This proposal does not add to the cost of construction, and the added exception allows an option to existing code, but does not limit the use of the existing code provisions.

2015 International Building Code

412.3 Airport traffic control towers. The provisions of Sections 412.3.1 through 412.3.8 shall apply to airport traffic control towers occupied only for the following uses:

1. Airport traffic control cab.
2. Electrical and mechanical equipment rooms.
3. Airport terminal radar and electronics rooms.
4. Office spaces incidental to the tower operation.
5. Lounges for employees, including sanitary facilities.

Add new text as follows:

<u>**412.3.1** **Construction.** The construction of airport traffic control towers shall comply with the provisions of Sections 412.3.1.1 through 412.3.1.3.</u>

TABLE 412.3.1.1
HEIGHT LIMITATIONS FOR AIRPORT TRAFFIC CONTROL TOWERS

TYPE OF CONSTRUCTION	HEIGHT[a] (feet)
IA	Unlimited
IB	240
IIA	100
IIB	85
IIIA	65

For SI: 1 foot = 304.8 mm, 1 square foot = 0.0929 m^2.

a. Height to be measured from grade plane to cab floor.

Revise as follows:

~~412.3.1~~<u>412.3.1.1</u> Type of construction. Airport traffic control towers shall be constructed to comply with the height limitations of Table ~~412.3.1~~<u>412.3.1.1</u>.

Add new text as follows:

<u>**412.3.1.2** **Structural integrity of interior exit stairways and elevator hoistway enclosures.** Enclosures for interior exit stairways and elevator hoistway enclosures shall comply with Section 403.2.3.</u>

<u>**412.3.1.3** **Sprayed fire-resistant materials (SFRM).** The bond strength of the SFRM installed in airport traffic control towers shall be in accordance with Section 403.2.4.</u>

<u>**412.3.2** **Means of egress and evacuation.** The means of egress in airport traffic control towers shall comply with Sections 412.3.2.1 through 412.3.2.3.</u>

Revise as follows:

~~412.3.2~~<u>412.3.2.1</u> Stairways. Stairways in airport traffic control towers shall be in accordance with Section 1011. ~~Stairways~~<u>Exit stairways</u> shall be smokeproof enclosures complying with one of the alternatives provided in Section 909.20.

> **Exception:** Stairways in airport traffic control towers are not required to comply with Section 1011.12.

~~412.3.3~~<u>412.3.2.2</u> Exit access. *No change to text.*

~~412.3.4~~<u>412.3.2.3</u> Number of exits. *No change to text.*

~~412.3.4.1~~<u>412.3.2.3.1</u> Interior finish. *No change to text.*

Add new text as follows:

<u>**412.3.3** **Emergency Systems.** The detection, alarm and emergency systems of airport traffic control towers shall comply with Sections 412.3.3.1 through 412.3.3.3.</u>

Revise as follows:

[F] ~~412.3.5~~<u>412.3.3.1</u> Automatic ~~fire~~<u>smoke</u> detection systems. Airport traffic control towers shall be provided with an automatic ~~fire~~

smoke detection system installed in accordance with Section ~~907.2~~907.2.22.

Add new text as follows:

412.3.3.2 Fire command center. The fire command center of an airport control tower shall comply with Section 911.

Exceptions:

1. Location. The fire command center is permitted to be located in the airport control tower or an adjacent contiguous building where building functions are interdependent.

2. Size. The room shall be not less than 150 square feet (14 m^2) in area with a minimum dimension of 10 feet (3048 mm).

3. Required features. The following features shall not be required in an airport traffic control tower fire command center.

3.1. Emergency voice/alarm control unit.
3.2. Public address system.
3.3. Status indicators and controls for the air distributions centers.
3.4. Generator supervision devices, manual start and transfer features.
3.5. Elevator emergency or standby power switches where emergency or standby power is provided.

412.3.3.3 Smoke removal Smoke removal in airport traffic control towers shall be provided in accordance with Section 403.4.7.

Revise as follows:

~~412.3.6~~412.3.4 Automatic sprinkler system. *No change to text.*

Add new text as follows:

412.3.4.1 Fire pump room. Fire pumps shall be located in rooms that are separated from all other areas of the building by 2-hour fire barriers constructed in accordance with Section 707 or 2-hour horizontal assemblies constructed in accordance with Section 711, or both.

Exception: Separation is not required for fire pumps physically separated in accordance with NFPA 20.

Revise as follows:

~~412.3.7~~412.3.5 ~~Elevator protection.~~Protection of elevator wiring and cables. ~~Wires or~~ Wiring and cables ~~that provide normal or standby power,~~serving elevators in airport traffic control ~~signals, communication with the car, lighting, heating, air conditioning, *ventilation* and fire detecting systems to elevators~~towers shall be protected ~~by construction having a *fire-resistance rating* of not less than 1 hour, or shall be circuit integrity cable having a fireresistance rating of not less than 1 hour.~~in accordance with Section 3007.8.1.

~~412.3.7.1~~412.3.5.1 Elevators for occupant evacuation. *No change to text.*

~~412.3.8~~412.3.6 Accessibility. Airport traffic control towers ~~need not~~shall be *accessible* except as specified in ~~the provisions of Chapter 11.~~Section 1104.4.

Reason: All of the proposed changes are the recommendation of the Air Traffic Control Tower Fire Life Safety Task Group, and reflect the current approach to fire protection and life safety in airport traffic control towers (ATCT). The fire safety criteria applicable to ATCTs are originally based on an agreement between the operator of and controllers utilizing the ATCTs. Many of the changes relate to providing extra protection for the controllers and fire service.
ATCTs create a unique hazard. ATCTs typically have a limited number of occupants. In addition, occupants must be awake and alert. The hazard associated with ATCTs is affected by the building's limited uses, height, and the potential delay in evacuation because of the handoff of flights.

The occupied levels of an ATCT are typically located at the top of the structure that typically contains support equipment and services but has limited occupancy. In addition, the area of ATCTs has been increasing, even though the number of floors located on top of the shaft is still typically limited.

Based on the previous revision to the ATCT section, all high-rise requirements were no longer applicable. The sections added are specifically chosen from a review of code requirements that are applicable to high rise buildings. The limited sections applied to ATCTs reflect the limited area of the ATCT, especially the shaft; communications protocol; power applications; construction methods; fire and ATCT shut down history; and that the typical locations of ATCT is in secluded areas.

Section 412.3.1 – The proposed revisions add a construction sub-section for ATCTs. This subsection would include the original requirement regarding construction types and also include proposed criteria for the structural integrity of interior exit stairways and elevator hoistway enclosures and sprayed fire-resistant materials in limited seismic circumstances.

Section 412.3.1.2 – The proposed revision provides additional protection for the controllers when egressing the facility. Adding structural integrity criteria to the exit enclosures provides additional protection in an occupancy where delayed evacuations may be required.

Section 412.3.1.3 – The proposed revision provides additional structural protection by increasing the minimum bond strengths for sprayed fire-resistant materials. This raises the minimum bond strength from 150 psf to 430 psf for all ATCTs, with additional increases based on the height of the ATCT. The proposed requirement provides additional protection of the structural frame where delayed evacuations may be required.

Section 412.3.2 – The proposed revisions add a means of egress subsection. This proposed subsection provides consistency in Section 412.3 by organizing the various ATCT requirements into subsections.

Section 412.3.3 – The proposed revisions add an emergency systems subsection which includes the existing automatic fire detections systems requirements. New provisions of this subsection would include fire command centers and smoke removal.

Section 412.3.3.1 – The terminology of this section was changed to match that of section 907.2.22 and IFC section 914.8.1. This section is referenced from IFC section 914.8.1.

Section 412.3.3.2 is proposed to provide a control location for fire fighter operations due to the unique aspects of fighting fires in ATCTs. It is proposed that the fire command center be located in either the tower footprint or the adjacent base building (where provided). The base building supports the tower operations and is built contiguous to the ATCT. The majority of the requirements were taken from Section 911 with a few exceptions. The emergency voice/alarm communication system and public address system controls were removed as ATCTs are not provided with these systems. The fire alarm control unit would be located in the fire command center and provide status indicators for all associated systems. Status indicators and controls for the air distribution system was also removed due to the limited HVAC system sizes provided in ATCTs. Generator supervision devices, manual start and transfer features were also removed as the fire alarm system will monitor the generator conditions. The requirement for elevator power selector switches was removed as ATCTs are typically designed with a single elevator.

Section 412.3.3.3 is proposed to provide a method to aid fire fighter and salvage operations and get the ATCT back to operational status faster. The addition of smoke removal will reduce the down time of the tower and provide a method to remove smoke in a structure that has many compartments.

Section 412.3.4.1 is proposed to provide additional protection for the fire pump and require a minimum of 2 hour fire resistance rated separations from surrounding areas. As

ATCTs are not considered a high-rise building, the 1-hour exception for fire pump room enclosures could be used. The intent of this section is to clarify that 2-hour separations should be provided for ATCTs.

Section 412.3.5 has been revised to address changes in code language to the 2015 Edition and reference appropriate criteria.

Section 412.3.6 is proposed to be revised due to confusion based on the wording of the current requirement. In some cases, the current wording has been taken to mean that accessibility requirements do not apply to ATCTs. The revision clarifies that ATCTs are required to be accessible except as exempted by Section 1104.4.

Cost Impact: Will increase the cost of construction
This code change will increase the cost of construction from the current code requirements; however, reflects building practices of ATCTs.

G 115-15 : 412.3-MORAN5043

G 116-15

412.3.4, 412.3.4.1, 412.3.4.2 (New)

Proponent: Christopher Moran, JENSEN HUGHES, representing Airport Traffic Control Tower Fire/Life Safety Technical Working Group (cmoran@haifire.com); Eric Rosenbaum, JENSEN HUGHES, representing Airport Traffic Control Tower Fire/Life Safety Technical Working Group

2015 International Building Code

412.3.4 Number of exits. Not less than one *exit stairway* shall be permitted for airport traffic control towers of any height provided that the *occupant load* per floor is not greater than 15 and the area per floor does not exceed 1,500 square feet (140 m^2).

412.3.4.1 Interior finish. Where an airport traffic control tower is provided with only one exit stairway, interior wall and ceiling finishes shall be either Class A or Class B.

Add new text as follows:

412.3.4.2 **Two exits or exit access doorways.** Where an airport traffic control tower is equipped throughout with an automatic sprinkler system in accordance with 903.3.1.1 and two exits are required, the exit separation distance required by Section 1007.1 shall be not less than one-fourth of the length of the maximum overall dimension of the area served.

Reason: The proposed change is the recommendation of the Air Traffic Control Tower Fire Life Safety Task Group. The fire safety criteria applicable to ATCTs are originally based on an agreement between the operator of and controllers utilizing the ATCTs.
ATCTs create a unique hazard. ATCTs typically have a limited number of occupants. In addition, occupants must be awake and alert. The hazard associated with ATCTs is affected by the building's limited uses, size and height.

The occupied levels of an ATCT are located at the top of the structure that typically contains support equipment and services but has limited occupancy. The lower levels of the ATCT are typically limited in size while the upper levels are larger in size. This means that towards the upper floors of the building where the structure flares out, the diagonal distance of the building increases. This flared space is used for equipment that serves air traffic control. Architectural analysis has shown that meeting the 1/3 diagonal distance separation requirement is possible by routing access to one of the two means of egress through an equipment room. It is this task group's judgment that an arrangement routing egress though an equipment room creates a larger risk than reducing the diagonal separation requirement. The limited area and layout of the normally unoccupied lower levels can make separation of the exit access by 1/3 of the diagonal of the floor plan difficult. This revision reduces the required separation distance of multiple exit ATCTs in ATCTs that are typically low in occupancy and size.

Cost Impact: Will not increase the cost of construction
This requirement does not require an additional exit but only provides greater flexibility for tower designs where space is limited.

Proponent: Robert Davidson (rjd@davidsoncodeconcepts.com)

2015 International Building Code

Revise as follows:

412.3.7 Elevator protection. Wires or cables that provide normal or standby power, control signals, communication with the car, lighting, heating, air conditioning, *ventilation* and fire detecting systems to elevators shall be protected by ~~construction having~~one of the following methods:

1. Cables used for survivability of required critical circuits shall be listed in accordance with UL 2196 and shall have a *fire-resistance rating* of not less than 1 hour~~, or~~.
2. Electrical circuit protective systems shall be ~~circuit integrity cable having~~tested in accordance with ASTM E 1725 and shall have a ~~fireresistance~~*fire-resistance rating* of not less than 1 hour. Electrical circuit protective systems shall be installed in accordance with their listing requirements.
3. Construction having a *fire-resistance rating* of not less than 1 hour.

909.20.6.1 Ventilation systems. Smokeproof enclosure ventilation systems shall be independent of other building ventilation systems. The equipment, control wiring, power wiring and ductwork shall comply with one of the following:

1. Equipment, control wiring, power wiring and ductwork shall be located exterior to the building and directly connected to the smokeproof enclosure or connected to the smokeproof enclosure by ductwork enclosed by not less than 2-hour *fire barriers* constructed in accordance with Section 707 or *horizontal assemblies* constructed in accordance with Section 711, or both.
2. Equipment, control wiring, power wiring and ductwork shall be located within the smokeproof enclosure with intake or exhaust directly from and to the outside or through ductwork enclosed by not less than 2-hour *fire barriers* constructed in accordance with Section 707 or *horizontal assemblies* constructed in accordance with Section 711, or both.
3. Equipment, control wiring, power wiring and ductwork shall be located within the building if separated from the remainder of the building, including other mechanical equipment, by not less than 2-hour *fire barriers* constructed in accordance with Section 707 or *horizontal assemblies* constructed in accordance with Section 711, or both.

~~Exceptions~~Exception:

1. Control wiring and power wiring ~~utilizing~~located outside of a 2-hour ~~rated cable or cable system~~fire barrier construction shall be protected using any one of the following methods:

1.1 Cables used for survivability of required critical circuits shall be listed in accordance with UL 2196 and shall have a *fire-resistance rating* of not less than 2 hours.

1.2 Where encased with not less than 2 inches (51 mm) of concrete.

1.3 ~~Control wiring and power wiring protected by a listed electrical~~Electrical circuit protective ~~system~~systems tested in accordance with ASTM E 1725 and shall have a *fire-resistance rating* of not less than 2 hours. Electrical circuit protective systems shall be installed in accordance with their listing requirements.

[F] 913.2.2 Circuits supplying fire pumps. Cables used for survivability of circuits supplying fire pumps shall be protected using one of the following methods:

1. Cables used for survivability of required critical circuits shall be listed in accordance with UL 2196 and shall have a *fire-resistance rating* of not less than 1 hour.
2. Electrical circuit protective systems shall be tested in accordance with ASTM E 1725 and shall have a *fire-resistance rating* of not less than 1 hour. Electrical circuit protective systems shall be installed in accordance with their listing requirements.
3. Construction having a *fire-resistance rating* of not less than 1 hour.

[F] 2702.3 Critical circuits. Required critical circuits shall be protected using one of the following methods:

1. Cables used for survivability of required critical circuits shall be listed in accordance with UL 2196 and shall have a fire-resistance rating of not less than 1 hour.
2. Electrical circuit protective systems shall be tested in accordance with ASTM E 1725 and shall have a *fire-resistance rating* of not less than 1 hour. Electrical circuit protective systems shall be installed in accordance with their listing requirements.
3. Construction having a *fire-resistance rating* of not less than 1 hour.

3007.8.1 Protection of wiring or cables. Wires or cables that are located outside of the elevator hoistway and machine room and that provide normal or standby power, control signals, communication with the car, lighting, heating, air conditioning, *ventilation* and fire-detecting systems to fire service access elevators shall be protected ~~by construction having~~using one of the following methods:

1. Cables used for survivability of required critical circuits shall be listed in accordance with UL 2196 and shall have a *fire-resistance rating* of not less than 2 hours~~,~~.
2. Electrical circuit protective systems shall be ~~a circuit integrity cable having~~tested in accordance with ASTM E 1725 and shall have a *fire-resistance rating* of not less than 2 hours ~~or~~. Electrical circuit protective systems shall be ~~protected by a listed electrical protective system~~installed in accordance with their listing requirements.
3. Construction having a *fire-resistance rating* of not less than 2 hours.**E**

Exception: Wiring and cables to control signals are not required to be protected provided that wiring and cables do not serve Phase II emergency in-car operations.

3008.8.1 Protection of wiring or cables. Wires or cables that are located outside of the elevator hoistway, machine room, control room and control space and that provide normal or standby power, control signals, communication with the car, lighting, heating, air conditioning, *ventilation* and fire-detecting systems to occupant ~~evactuation~~evacuation elevators shall be protected ~~by construction having~~ using one of the following methods:

1. Cables used for survivability of required critical circuits shall be listed in accordance with UL 2196 and shall have a *fire-resistance rating* ~~of not less than 2 hours, shall be circuit integrity cable having a fire-resistance rating of not less than 2 hours or shall be protected by a listed electrical circuit protective system having a *fire-resistance rating*~~ of not less than 2 hours.

2. Electrical circuit protective systems shall be tested in accordance with ASTM E 1725 and shall have a *fire-resistance rating* of not less than 2 hours. Electrical circuit protective systems shall be installed in accordance with their listing requirements.

3. Construction having a *fire-resistance rating* of not less than 2 hours.

Exception: Wiring and cables to control signals are not required to be protected provided that wiring and cables do not serve Phase II emergency in-car operation.

Add new standard(s) as follows: ADD NEW STANDARD TO CHAPTER 35:
ASTM E 1725 "STANDARD TEST METHODS FOR FIRE TESTS OF FIRE-RESISTIVE BARRIER SYSTEMS FOR ELECTRICAL SYSTEM COMPONENTS"

Reason: This series of code changes is intended to standardize the methods of protecting wiring or cables determined to be essential for the operation of systems and building services during emergency conditions. The basic intent of the code change proposals is already in the code, albeit somewhat random and inconsistent between sections. The change would permit protection of critical circuits using the most up to date technology based on current test methods while still recognizing the commonly used generic fire resistant materials constructed as an assembly already approved for use. Other than reformatting each section and adding a requirement for electrical circuit protective systems to be tested to the appropriate ASTM standard, there is no other significant change to what we believe is the intent of the code, and what the code already requires and/or permits.

Cost Impact: Will not increase the cost of construction
This code change will not increase the cost of construction since the intent of the code is not changed by this proposal.

Analysis: A review of the standard proposed for inclusion in the code, ASTM E 1725 "STANDARD TEST METHODS FOR FIRE TESTS OF FIRE-RESISTIVE BARRIER SYSTEMS FOR ELECTRICAL SYSTEM COMPONENTS", , with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2015.

G 117-15 : 412.3.7-DAVIDSON4353

G 118-15

420.2

Proponent: Carl Baldassarra, P.E., FSFPE, Chair, Code Technology Committee, representing Code Technology Committee (CTC@iccsafe.org); Edward Kulik, Chair, Building Code Action Committee (bcac@iccsafe.org)

2015 International Building Code

Revise as follows:

420.2 Separation walls. Walls separating *dwelling units* in the same building, walls separating *sleeping units* in the same building and walls separating *dwelling* or *sleeping units* from other occupancies contiguous to them in the same building shall be constructed as *fire partitions* in accordance with Section 708.

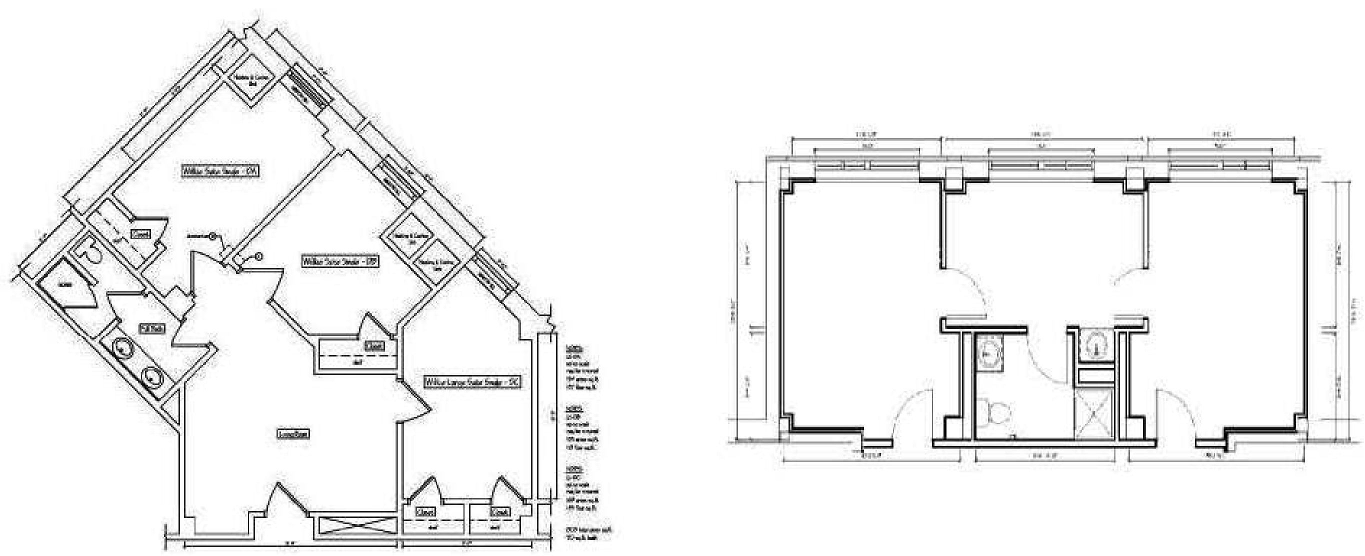
<u>Exceptions:</u>

1. <u>Where sleeping units include private bathrooms, walls between bedrooms and the associated private bathrooms are not required to be constructed as fire partitions.</u>
2. <u>Where sleeping units are constructed as suites, walls between bedrooms within the sleeping unit and the walls between the bedrooms and associated living spaces are not required to be constructed as fire partitions.</u>

Reason: There are two concerns related to separation – 1) suites within hotels, dormitories, and assisted living where a sleeping rooms may share a bathroom, or sleeping rooms may have associated living space, and 2) group homes that operate as a single family unit. There are separate proposals to deal with each. It is the intent for these proposals to work together. This proposal is for the suites.

Some hotel rooms, assisted living and dormitories are designed as suites (see examples below). In a hotel or assisted living space, common designs are one or two bedrooms a living space and private bath. In a dorm, common designs are two rooms with a private bath between; or three or four bedrooms with a living space and private bathrooms. These units act as a group similar to an apartment; and without a kitchen, the associated fire hazards are reduced. When these bedrooms are combined into suites, they should be considered as one unit for purposes of separation. A separation would still be required between these units and the common corridor.

Figures for CTC Care proposal to to Section 420 (6B)



This is part of a group of proposals to address this style of design and group homes within single family residences. Changes are proposed for the definition for sleeping units, the Group classifications in Section 310.4 and 310.5, separation requirements in Section 420, and coordination with accessibility requirements in Section 1107. Proposals will be put forward as part of Group B for fire and smoke alarm systems. The proposals could work separately.

The ICC Code Technology Committee (CTC) has just completed its 10th year. The ICC Board has decided to sunset the CTC. The sunset plan includes re-assigning many of the CTC Areas of Study to the applicable Code Action Committee (CAC). The two remaining CTC Areas of Study are Care Facilities and Elevator Lobbies/WTC Elevator issues. This proposal falls under the Care Facilities Area of Study. Information on the CTC, including: the sunset plan; meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the CTC website at: http://www.iccsafe.org/cs/CTC/Pages/default.aspx.

The BCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the BCAC has held 13 open meetings and numerous workgroup calls which included members of the BCAC as well as any interested party to discuss and debate the proposed changes and the public comments. Related documentation and reports are posted on the BCAC website at: http://www.iccsafe.org/cs/BCAC/Pages/default.aspx.

Cost Impact: Will not increase the cost of construction
It is the committee's understanding that current language is not clear for where separations are required. In some cases this would be a reduction in separation requirements, and therefore a decrease in cost.

G 118-15 : 420.2 -BALDASSARRA4272

G 119-15

420.2, 420.3

Proponent: Carl Baldassarra, P.E., FSFPE, Chair, Code Technology Committee, representing Code Technology Committee (CTC@iccsafe.org); Edward Kulik, Chair, Building Code Action Committee (bcac@iccsafe.org)

2015 International Building Code

Revise as follows:

SECTION 420
GROUPS I-1, R-1, R-2, R-3 AND R-4

420.1 General. Occupancies in Groups I-1, R-1, R-2, R-3 and R-4 shall comply with the provisions of Sections 420.1 through 420.6 and other applicable provisions of this code.

420.2 Separation walls. Walls separating *dwelling units* in the same building, walls separating *sleeping units* in the same building and walls separating *dwelling* or *sleeping units* from other occupancies contiguous to them in the same building shall be constructed as *fire partitions* in accordance with Section 708.

> **Exception:** In Group R-3 and Group R-4 facilities, walls within the dwelling unit or between sleeping unit are not required to be constructed as fire partitions.

420.3 Horizontal separation. Floor assemblies separating *dwelling units* in the same buildings, floor assemblies separating *sleeping units* in the same building and floor assemblies separating *dwelling* or *sleeping units* from other occupancies contiguous to them in the same building shall be constructed as *horizontal assemblies* in accordance with Section 711.

> **Exception:** In Group R-3 and R-4 facilities, floor assemblies within the dwelling or between sleeping units are not required to be constructed as horizontal assemblies.

Reason: There are two concerns related to separation – 1) suites within hotels, dormitories, and assisted living where a sleeping rooms may share a bathroom, or sleeping rooms may have associated living space, and 2) group homes that operate as a single family unit. There are separate proposals to deal with each. It is the intent for these proposals to work together. This proposal is for the Group R-3 and R-4.

Group R-4 group homes operate as a single family home. If these facilities are considered dwelling units or sleeping units is not consistently interpreted. Separation requirements would require bedrooms to be separated from each other and the corridor. Doors would have to be rated and have closers. This is not appropriate for this type of facility.

There have been a series of lawsuits against jurisdictions across the United States regarding enforcement of requirements for group homes that exceed the requirements for single family homes. This is being interpreted as a violation of the Fair Housing Act. The CTC committee reviewed the requirements for group homes in the codes to see where there were differences and if these differences were justified due to the level of care provided for the residents. In some limited situations, where there was a question for Group R-4 group homes, the same issue existing for Group R-3 congregate residences. For consistency in the code, these need to be considered together rather than separately. Therefore, this proposal is for both Group R-4 and Group R-3 congregate residences (both with 16 or fewer residents per Sections 310.5 and 310.6.)

This is part of a group of proposals to address this style of design and group homes within single family residences. Changes are proposed for the definition for sleeping units, the Group classifications in Section 310.4 and 310.5, separation requirements in Section 420, and coordination with accessibility requirements in Section 1107. Proposals will be put forward as part of Group B for fire and smoke alarm systems. The proposals could work separately.

The ICC Code Technology Committee (CTC) has just completed its 10th year. The ICC Board has decided to sunset the CTC. The sunset plan includes re-assigning many of the CTC Areas of Study to the applicable Code Action Committee (CAC). The two remaining CTC Areas of Study are Care Facilities and Elevator Lobbies/WTC Elevator issues. This proposal falls under the Care Facilities Area of Study. Information on the CTC, including: the sunset plan; meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the CTC website at: http://www.iccsafe.org/cs/CTC/Pages/default.aspx.

This public proposal is submitted by the ICC Building Code Action Committee (BCAC). The BCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the BCAC has held 13 open meetings and numerous workgroup calls which included members of the BCAC as well as any interested party to discuss and debate the proposed changes and the public comments. Related documentation and reports are posted on the BCAC website at: http://www.iccsafe.org/cs/BCAC/Pages/default.aspx.

Cost Impact: Will not increase the cost of construction
It is the committee's understanding that current language is not clear for where separations are required. In some cases this would be a reduction in separation requirements, and therefore a decrease in cost.

G 119-15 : 420.2 -BALDASSARRA4271

G 120-15

420.7 (New)

Proponent: Carl Baldassarra, P.E., FSFPE, Chair, Code Technology Committee, representing Code Technology Committee (CTC@iccsafe.org)

2015 International Building Code

Add new text as follows:

420.7 Assisted living housing units. In Group I-1 occupancies, where a fire resistance corridor is provided, in areas where assisted living residents are housed, shared living spaces, group meeting or multipurpose therapeutic spaces open to the corridor shall be in accordance with all of the following criteria:

1. The walls and ceilings of the space are constructed as required for corridors.
2. The spaces are not occupied as resident sleeping rooms, treatment rooms, incidental uses in accordance with Section 509, or hazardous uses.
3. The open space is protected by an automatic fire detection system installed in accordance with Section 907.
4. In Group I-1, Condition 1, the corridors onto which the spaces open are protected by an automatic fire detection system installed in accordance with Section 907, or the spaces are equipped throughout with quick-response sprinklers in accordance with Section 903.3.2.
5. In Group I-1, Condition 2, the corridors onto which the spaces open, in the same smoke compartment, are protected by an automatic fire detection system installed in accordance with Section 907, or the smoke compartment in which the spaces are located is equipped throughout with quick-response sprinklers in accordance with Section 903.3.2.
6. The space is arranged so as not to obstruct access to the required exits.

Reason: The intent of the two proposals for a new Section 420.7 and 420.8 is to allow the same 'home style' environment for Group I-1 that is permitted to Sections 407.2.5 and 407.2.6 for Group I-2 nursing homes.
Section 420.7: This section allows similar open spaces to corridors as in Group I-2 with similar safeguards added from Group I-2 in Section 407. Prior to the 2015 IBC many assisted living and memory care were designed as Group I-2 which allows spaces open to corridors. Under the 2015 IBC Group I-1 can integrate intervening rooms from Chapter 10 and are not required to integrate corridors to serve sleeping units and dwelling units. It is only when the enclosed exit access component corridor is provided that the added protection features of corridors to be included. The issue is that there is a wide range of interpretation of if, when, and where corridors are required when showing typical "household" plans that most memory care and some assisted living are designed as. These plans typically are designed similar to a household where a bedroom opens directly to a living, dining, and activity area. A wide range of interpretation occurs despite the fact there is no intervening room limit for Group I-1 or corridor requirement for Group I-1. It is only Group I-2 that states that corridors are required to serve sleeping units in Section 407. This proposed section confirms that it is acceptable to use intervening rooms or these open spaces to corridor provisions in these care type settings.

The ICC Code Technology Committee (CTC) has just completed its 10th year. The ICC Board has decided to sunset the CTC. The sunset plan includes re-assigning many of the CTC Areas of Study to the applicable Code Action Committee (CAC). The two remaining CTC Areas of Study are Care Facilities and Elevator Lobbies/WTC Elevator issues. This proposal falls under the Care Facilities Area of Study. Information on the CTC, including: the sunset plan; meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the CTC website at: http://www.iccsafe.org/cs/CTC/Pages/default.aspx.

Cost Impact: Will increase the cost of construction
This is an increase in cost for Group I-1 facilities that use this option, however, it will allow for greater freedom in design.

G 120-15 : 420.7 (New)-BALDASSARRA4292

G 121-15

420.7 (New), 420.7.1 (New), 420.7.2 (New)

Proponent: Adolf Zubia, representing IAFC Fire & Life Safety Section

2015 International Building Code

Add new text as follows:

420.7 Dormitory cooking facilties. Domestic cooking appliances for use by residents of Group R-2 college dormitories shall be in accordance with Sections 420.7.1 and 420.7.2.

420.7.1 Cooking appliances. Where located in Group R-2 college dormitories, domestic cooking appliances for use by residents shall be in compliance with all of the following:

1. The types of domestic cooking appliances shall be limited to ovens, cooktops, ranges, warmers, coffee makers and microwaves.
2. Domestic cooking appliances shall be limited to approved locations.
3. Cooktops and ranges shall be protected in accordance with Section 904.13.
4. Cooktops and ranges shall be provided with a domestic cooking hood installed and constructed in accordance with Section 505 of the *international Mechanical Code.*

420.7.2 Cooking appliances in sleeping rooms. Cooktops, ranges and ovens shall not be installed or used in sleeping rooms.

Reason: This proposal is submitted by Fire and Life Safety Section of the International Association of Fire Chiefs.
This proposal accomplishes the following:
1. There currently are no requirements in the IBC that regulate domestic cooking appliances for use by residents in Group R-2 college dormitories. This proposal includes basic requirements for the code official to follow in approving such installations.
2. Proposed Sections 420.7 and 420.7.1 include requirements that permit domestic cooking appliances in both common areas and sleeping rooms in college dormitories. It does not cover resident dwelling units in college campuses that are not classified as dormitories.
3. Section 420.7.1 covers domestic cooking appliances in common areas in college dormitories. The cooking appliances allowed are the same as those allowed in Section 407.2.6, Item 4 for Group I-2, Condition 1 occupancies.
4. Section 420.7.2 prohibits ovens, cooktops and ranges from being used in sleeping rooms. This reflects that fact that cooktops and ranges are the leading causes of fires in residential settings. For details see: http://www.iafc.org/files/1FIREPREV/flss_ResidentialRangeTopSafetyReport.pdf. This section does allow the use of other cooking appliances, such as microwaves and coffee makers, in sleeping rooms. However individual colleges may have more restrictive rules that prohibit some of these appliances from being used in their dormitories.

IFC/IBC Section 914.13 and 904.13.1 will be revised in the Group B code change cycle. The intent is to provide the same protection for domestic cooking appliances in R-2 college dormitories as currently provided in Group I-2, Condition 1 facilities. In essence a UL 300A fire-extinguishing system is required when a cooktop or range is provided. An automatic fire-extinguishing system is not required when only ovens, ranges, warmers, coffee makers or microwaves are provided. the revisions in Group B will be:

[F] 904.13 Domestic cooking systems ~~in Group I-2 Condition 1~~. Cooktops and ranges installed in the following occupancies shall be protected in accordance with Sections 904.13.1 through 904.13.2:
1. In Group I-2 Condition 1, occupancies where domestic cooking facilities are installed in accordance with Section 407.2.6 of the International Building Code,
2. In Group R-2 college dormitories where domestic cooking facilities are installed in accordance with Section 420.7. ~~the domestic cooking hood provided over the cooktop or range shall be equipped with an automatic fire-extinguishing system of a type recognized for protection of domestic cooking equipment. Preengineered automatic extinguishing systems shall be tested in accordance with UL 300A and listed and labeled for the intended application. The system shall be facilities are installed in accordance with this code, its listing and the manufacturer's instructions.~~

[F] 904.13.1 ~~Manual operation and interconnection~~ Automatic fire-extinguishing system. ~~Manual actuation and system interconnection shall be in accordance with Section 904.12.1 and 904.12.2, respectively.~~ The domestic cooking hood provided over the cooktop or range shall be equipped with an approved automatic fire-extinguishing system complying with the following:
1. The automatic fire-extinguishing system shall be of a type recognized for protection of domestic cooking equipment. Preengineered automatic fire-extinguishing systems shall be listed and labeled in accordance with UL 300A and installed in accordance with the manufacturer's instructions.
2. Manual actuation of the fire-extinguishing system shall be provided in accordance with Section 904.12.1.
3. Interconnection of the fuel and electric power supply shall be in accordance with Section 904.12.2.

Cost Impact: Will increase the cost of construction
This code change has the potential to increase the cost of construction due to the additional protection.

G 121-15 : 420.7 (New)-ZUBIA4622

G 122-15

420.7 (New)

Proponent: Stephen DiGiovanni, Clark County Building Department, representing Southern Nevada Chapter of ICC (sdigiovanni@clarkcountynv.gov)

2015 International Building Code

Add new text as follows:

420.7 Visual access The primary entrance door of individual units in dormitories, motels, hotels, apartment houses, condominiums, and vacation timeshare properties shall contain a means to allow the occupant to visually identify a visitor without unlatching the unit entry door.

Reason: The proposed new Section essentially requires a peephole or other type of door viewer, which provides an additional safety feature for occupants to determine if a hazard exists without exposing themselves to the hazard by opening the door.

Cost Impact: Will increase the cost of construction
This proposal will increase the cost of construction by requiring a peephole or other means of visual access through doors when such was not previously required.

G 122-15 : 420.7 (New)-DIGIOVANNI3825

G 123-15

420.8 (New), 420.8.1 (New), 420.9 (New)

Proponent: Carl Baldassarra, P.E., FSFPE, Chair, Code Technology Committee, representing Code Technologies Committee (CTC@iccsafe.org)

2015 International Building Code

Add new text as follows:

420.8 Group I-1 cooking facilities. In Group I-1 occupancies rooms or spaces that contain a cooking facilities with domestic cooking appliances shall be in accordance with all the following criteria:

1. In Group I-1 Condition 1 occupancies, the number of care recipients served by one cooking facility shall not be greater than 30.
2. In Group I-1 Condition 2 occupancies, the number of care recipients served by one cooking facility and within the same smoke compartment shall not be greater than 30.
3. The types of domestic cooking appliances permitted shall be limited to ovens, cooktops, ranges, warmers and microwaves.
4. The space containing the domestic cooking facilities shall be arranges so as not to obstruct access to the required exit.
5. Domestic cooking hoods installed and constructed in accordance with Section 505 of the International Mechanical Code shall be provided over cooktops or ranges.
6. Cooktops and ranges shall be protected in accordance with Section 904.13.
7. A shut-off for the fuel and electrical supply to the cooking equipment shall be provided in a location that is accessible only to staff.
8. A timer shall be provided that automatically deactivates the cooking appliances within a period of not more than 120 minutes.
9. A portable fire extinguisher shall be provided. Installation shall be in accordance with Section 906 and the extinguisher shall be located within a 30-foot (9144 mm) distance of travel from each domestic cooking appliance.

420.8.1 Cooking facilities open to the corridor. Cooking facilities located in a room or space open to a corridor, aisle or common space shall comply with Section 420.8.

420.9 Group R cooking facilities. In Group R occupancies, cooking appliances used for domestic cooking operations shall be in accordance with Section 917.2 of the *International Mechanical Code.*

Reason: The intent of the two proposals for a new Section 420.7 and 420.8 is to allow the same 'home style' environment for Group I-1 that is permitted to Sections 407.2.5 and 407.2.6 for Group I-2 nursing homes.

Section 420.8 and 420.8.1: This additional protection feature requirement clarifies that kitchens in typical memory care neighborhood plans or assisted living neighborhood plans are allowed in contiguous spaces to rooms used for sleeping. This proposal then implements the additional protection features required in similar applications from Group I-2 as was approved for the 2015 IBC is Section 407.
Section 420.9: While Group R (other than Group R-4) outside the scope of the CTC Care study group, since Section 420 includes provisions for Group I-1 and R, it was felt that something had to be said regarding Group R cooking facilities following the provisions of Group I-1 cooking facilities. The intent of Section 420.9 is to allow for hotel rooms, assisted living suites, dorm suites, and small congregate residences to be allowed to use the provisions in the IMC for domestic cooking appliances. If the hotel or dormitory has a central restaurant or cafeteria, this section would not be applicable because it would be commercial cooking.
A correlative change to IFC Section 904.13 for installation of the cooking systems will be provided in Group B. Basically the Group I-1 will follow the same limits as the Group I-2, Condition 2. This proposal is coordinated with a proposal coming from FCAC and BCAC for Group I-2, Condition 1 cooking facilities.

The ICC Code Technology Committee (CTC) has just completed its 10th year. The ICC Board has decided to sunset the CTC. The sunset plan includes re-assigning many of the CTC Areas of Study to the applicable Code Action Committee (CAC). The two remaining CTC Areas of Study are Care Facilities and Elevator Lobbies/WTC Elevator issues. This proposal falls under the Care Facilities Area of Study. Information on the CTC, including: the sunset plan; meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the CTC website at: http://www.iccsafe.org/cs/CTC/Pages/default.aspx.

Cost Impact: Will increase the cost of construction
This is an increase in cost for Group I-1 facilities that use this option, however, it will allow for greater freedom in design. Alternatively, requiring a commercial appliance and hood in place of the domestic appliance could be more costly. This should not be a change for domestic cooking appliances in Group R.

G 123-15 : 420.8 (New)-BALDASSARRA4912

G 124-15

202, 422.2, [F] 903.2.2 (IFC 903.2.2)

Proponent: John Williams, CBO, Chair, representing Adhoc Health Care Committee (AHC@iccsafe.org)

2015 International Building Code

Revise as follows:

SECTION 202 DEFINITIONS

AMBULATORY CARE FACILITY. Buildings or portions thereof used to provide medical, surgical, psychiatric, nursing or similar care on a less than 24-hour basis to persons who are rendered *incapable of self-preservation* by the services provided or staff has accepted responsibility for care recipients already incapable.

422.2 Separation. *Ambulatory care facilities* where the potential for four or more care recipients are to be *incapable of self-preservation* at any time, ~~whether rendered incapable by staff or staff accepted responsibility for a care recipient already incapable,~~ shall be separated from adjacent spaces, *corridors* or tenants with a *fire partition* installed in accordance with Section 708.

[F] 903.2.2 Ambulatory care facilities. An *automatic sprinkler system* shall be installed throughout the entire floor containing an *ambulatory care facility* where either of the following conditions exist at any time:

1. Four or more care recipients are incapable of self-preservation~~, whether rendered incapable by staff or staff has accepted responsibility for care recipients already incapable~~.
2. One or more care recipients that are incapable of self-preservation are located at other than the level of exit discharge serving such a facility.

In buildings where ambulatory care is provided on levels other than the *level of exit discharge*, an *automatic sprinkler system* shall be installed throughout the entire floor where such care is provided as well as all floors below, and all floors between the level of ambulatory care and the nearest *level of exit discharge*, including the *level of exit discharge*.

Reason: This proposal modifies the definition of the term ambulatory care facility. The current definition envisions typical scenarios for when a care facility might house a person who is incapable of self preservation. The definition does not capture people who are unexpectedly incapable of preservation, such as a person fainting in an office building. It does capture those facilitites who intend to render a patient incapable. The point was brought up in one of the previous cycles, what about those facilities that accept responsibility for patients who are incapable. For example, free standing emergency centers. A code change was approved that addressed this change when setting sprinkler requirements. The code change moves that accepted concept into the definition from the two locations where it is currently found.
The ICC Ad Hoc Committee on Healthcare (AHC) has just completed its 4th year. The AHC was established by the ICC Board to evaluate and assess contemporary code issues relating to hospitals and ambulatory healthcare facilities. This is a joint effort between ICC and the American Society for Healthcare Engineering (ASHE), a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. Information on the AHC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the AHC effort can be downloaded from the AHC website at: http://www.iccsafe.org/cs/AHC/Pages/default.aspx.

Cost Impact: Will not increase the cost of construction
This revision is a clarification. The proposal essentially moves text from the code to the defintion, therefore, this will not increase the construction.

G 124-15 : 422.2-WILLIAMS4168

G 125-15

422.6 (New), 604.2.1(IBC [F] 2702.2.1) (New)

Proponent: John Williams, CBO, Chair, representing Adhoc Health Care Committee (AHC@iccsafe.org)

2015 International Building Code

Add new text as follows:

422.6 **Electrical systems** In *ambulatory care facilities*, the essential electrical system for electrical components, equipment and systems shall be designed and constructed in accordance with the provisions of Chapter 27 and NFPA 99.

2015 International Fire Code

604.2.1(IBC [F] 2702.2.1) **Ambulatory care facilities.** Essential electrical systems fo*r ambulatory care facilities* shall be in accordance with Section 422.6 of the *International Building Code.*

Reason: The IBC currently has no direction on whether essential electrical systems (such as emergency generator) are required at ambulatory care facilities. This proposal adds the direction to go to NFPA 99, the Healthcare Facilities Code for that assessment. NFPA 99 provides a risk based approach to determine the need for an essential electrical system, what class system is required and general design requirements for each type of system.
The ICC Ad Hoc Committee on Healthcare (AHC) has just completed its 4th year. The AHC was established by the ICC Board to evaluate and assess contemporary code issues relating to hospitals and ambulatory healthcare facilities. This is a joint effort between ICC and the American Society for Healthcare Engineering (ASHE), a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. Information on the AHC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the AHC effort can be downloaded from the AHC website at: http://www.iccsafe.org/cs/AHC/Pages/default.aspx.

Cost Impact: Will increase the cost of construction
The code change proposal will increase the cost of construction. Adding an essential electrical system will add the cost of a generator, as well as maintenance and testing over what is required currently in the IBC/IFC. However, any medicare certified ambulatory care facilities are required by federal CMS regulations to have this system, therefore, the cost of construction will not increase. Note that not all ambulatory care facilities are medicare certified.

G 125-15 : 422.6 (New)-WILLIAMS4166

G 126-15

424.1

Proponent: Marcelo Hirschler, representing GBH International (gbhint@aol.com)

2015 International Building Code

Revise as follows:

424.1 Children's play structures. Children's play structures installed inside all occupancies covered by this code that exceed 10 feet (3048 mm) in height ~~and~~ or 150 square feet (14 m^2) in area shall comply with Sections 424.2 through 424.5.

Reason: The intent of this code section is to protect children from exposure to fire in large play structures. Code officials have expressed a concern that there have been instances where suggested structures were proposed where one of the dimensions (width or height) was just slightly smaller than the cut off and the other one vastly exceeded the cut off. With the language requiring both dimensions to exceed the limits this may be interpreted that, as long as as one dimension does not exceed the limits the other dimension has no limits. That is not safe.
The change should clarify that there is a limitation on each dimension.

Cost Impact: Will increase the cost of construction
This will prevent the construction/installation of unsafe structures where one dimension is unlimited.

G 126-15 : 424.1-HIRSCHLER3519

G 127-15

427 (New), 427.1 (New)

Proponent: Lee Kranz, City of Bellevue, WA, representing Washington Association of Building Officials Technical Code Development Committee

2015 International Building Code

Add new text as follows:

SECTION 427
MEDICAL GAS SYSTEMS

427.1 Medical gas systems. Medical gas systems shall comply with Section 5306 of the *International Fire Code.*

Reason: Provisions for medical gas installations are currently found in Section 5306 of the IFC but many of the requirements for these installations require a building permit and should also be regulated from the IBC. There are no substantive changes proposed to the language found in the IFC. Examples of similar references to other codes and standards are found in Sections 425 & 916.

Cost Impact: Will not increase the cost of construction
Inserting a reference to the medical gas regulations currently found in the IFC will not change the cost of installation.

G 127-15 : 427 (New)-KRANZ3770

G 128-15

427.1 (New), 427.2 (New), 427.3 (New), 427.4 (New)

Proponent: William Hall, Portland Cement Association, representing Portland Cement Association (jhall@cement.org); Jason Thompson, Masonry Alliance for Codes and Standards, representing Masonry Alliance for Codes and Standards (jthompson@ncma.org); Stephen Skalko (svskalko@cox.net)

2015 International Building Code

Add new text as follows:

SECTION 427
HIGH RISK AREAS

427.1 General. The provisions of Sections 427.2 though 427.4 shall apply to buildings or structures classified as Risk Category II, III or IV where either of the following conditions exists:

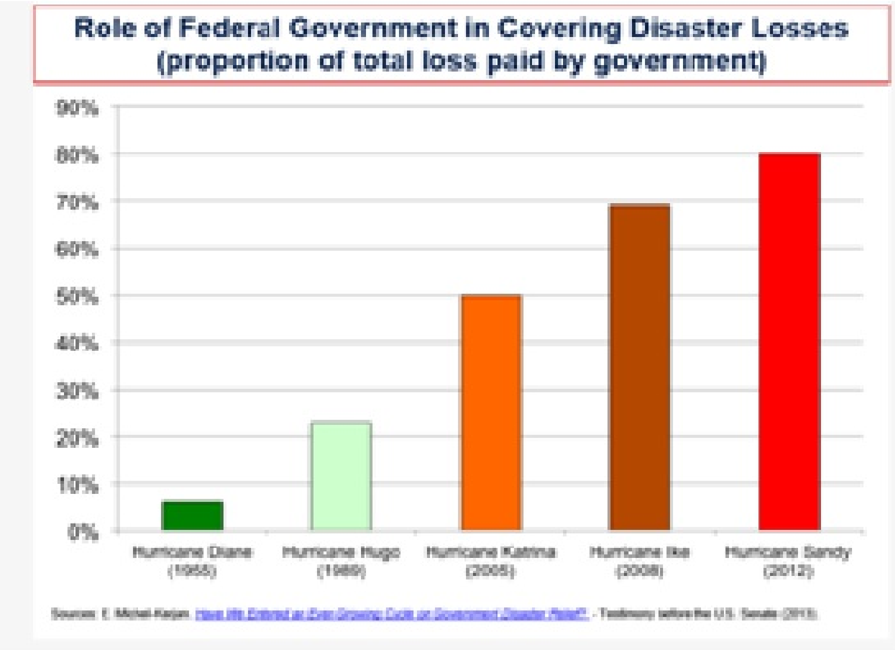
1. Located in Hurricane-Prone Regions
2. Assigned to Seismic Design Category C or greater.

427.2 Height in feet. The maximum height, in feet, of a building shall not exceed the limits specified in Table 504.3 for non-sprinklered (NS) buildings.

427.3 Number of stories. The maximum number of stories of a building shall not exceed the limits specified in Table 504.4 for non-sprinklered (NS) buildings.

427.4 Allowable area. The maximum allowable area of a building shall not exceed the limits specified in Table 506.2 for non-sprinklered (NS) buildings.

Reason: Natural disasters, in areas shown to be at high risk, continue to cost this nation billions of dollars each year in damaged and destroyed property, clean-up, lost revenue, displacement of residents, re-building efforts and more. 650,000 housing units were damaged or destroyed and 300,000 business properties in New York and New Jersey during Hurricane Sandy in 2012, while an estimated 7 million were without power. An estimated 80 Billion dollars in FEMA money will be spent solely on re-building and repair costs from just one storm. Katrina, in 2005 was more costly, with $81 billion in construction costs and over 1500 deaths directly associated with the storm.



Studies by National Oceanic Atmospheric Administration (NOAA) show the trends for hurricanes to be on the increase through the year 2100 and the probability of seismic activity continues to increase based on studies and new maps released by the United States Geological Surveys (USGS). Low lying areas in coastal communities are at high risk of storm surge flooding. During and after these major events, damage to infrastructure and utilities is enormous. Major roadways can be destroyed or roadways impassable due to flooding and in addition the affected areas will experience large scale loss of power, loss of water, gas line ruptures and fire. Damage from fires after a high wind event, earthquake or storm surge can be devastating in both residential and commercial properties. The captions below show conflagration results from Hurricane Sandy – 2012 in both commercial and residential areas.

Emergency service resources are limited at best after a natural disaster and non-existent while a hurricane passes. Fires are left to burn until either they burn out or become accessible and become a priority. A fire within a building, with combustible construction, without an operational sprinkler system, is not likely to be controlled without passive fire containment. As recently as August 2014, the Napa Valley, CA area experienced an earthquake which caused moderate damage but still sustained 16 fires after the event.

While the safety of fire sprinklers during normal times has a very good track record, the fact is: fire sprinklers will not work without a water supply and may not work without electrical service. During seismic and flooding events, water mains and electrical services are often damaged, electric fire pumps fail to operate, diesel fire pumps and emergency generators fail to operate if flooded, water pressure levels will be significantly lower from broken lines within the system, and exterior fire exposure from buildings without protection increases the risk of fire spread.

Aftermath of Hurricane Sandy

Even with clear evidence that sprinkler systems cannot be a reliable suppression source in high risk areas and historical evidence that natural disasters are increasing in number and severity, the building code still provides significant trade off incentives for sprinkler systems to allow buildings to be built bigger and higher while allowing reductions in passive fire protection. This code change recognizes that active fire protection during and after a natural disaster can not be relied upon to operate exposing structures to a level of fire protection that is dramatically less than the minimum intended by the building code. To assure a minimum level of fire protection consistent with the intent of the code following disasters, this change seeks to eliminate sprinkler trade-offs for height and area increases in high risk areas.

To accurately evaluate the relative construction cost it was determined that a multi-family residential structure should be schematically designed meeting all of the requirements of the International Building Code. Once designed, the buildings were reviewed for code compliance, and cost estimates would be prepared. The study was conducted by:
Architect & Engineer: Haas Architects Engineers1
Code Official: Tim E. Knisely2
Cost Estimation : Poole Anderson Construction3

The building model chosen for the project was a 4 story multi-family residential structure encompassing approximately 25,000 gross square feet of building area per floor. The cost comparisons are based on the proposed target building assembled using a typical mix of one and two bedroom dwelling units

The following construction types and alternates were included in the evaluation:
Conventional Type V framing with Type V floor system
Alternate: Conventional Type VA framing with Type VA floor system
Non-combustible framing with fire-rated non-combustible floors (concrete on steel deck)
Fire-rated load bearing non-combustible construction with fire rated non-combustible floor system (block and plank)
The cost estimate for each building model included the complete fit out of each building with the exception of movable appliances and furniture. For more details on the specific criteria visit: www.psfscac.org.

Bibliography: http://www.nytimes.com/2013/09/13/nyregion/fire-ravages-jersey-shore-boardwalk-rebuilt-after-hurricane-sandy.html?_r=0

http://www.cnn.com/2012/10/30/us/hurricane-sandy-color/index.html

Cost Impact: Will increase the cost of construction
To evaluate the cost impact for every occupancy and use, type of construction and building configuration is excessively burdensome for any proposed code change. In an effort to satisfy the request in the code development process that construction type determined by the proponent to be influence by cost was evaluated to the most significant cost potential impacts relative to this proposal, rectangular 4-story Type V multi-family dwellings. The independent third party studies indicate that the cost differential ranges between minus 3% to plus 3% for the most significant cost impact associated with the code change proposal which typically shifted the design from Type V construction to other Types of construction.

See reasoning statement

G 128-15 : 427 (New)-HALL5371

G 129-15

503.1

Proponent: Homer Maiel, PE, CBO, representing ICC Tri-Chapter (Peninsula, East Bay, Monterey Bay) (hmaiel@gmail.com)

2015 International Building Code

Revise as follows:

503.1 General. Unless otherwise specifically modified in Chapter 4 and this chapter, *building height*, number of stories and *building area* shall not exceed the limits specified in Sections 504 and 506 based on the type of construction as determined by Section 602 and the occupancies as determined by Section 302 except as modified hereafter. *Building height*, number of stories and *building* area provisions shall be applied independently. Each portion of a building separated by one or more *fire walls* complying with Section 706 shall be considered to be a separate building. Buildings shall not cross lot lines.

Reason: No where in the code has any mention that buildings should not be crossing the property lines. Although this has been an obvious understanding and practice, there are still some designers that take the advantage of absence of this statement and claim that the code does not disallow this practice.

Cost Impact: Will not increase the cost of construction
This Code proposal does not increase the cost of construction.

G 129-15 : 503.1-MAIEL4490

G 130-15

503.1, 706.1

Proponent: Edward Kulik, representing Building Code Action Committee (bcac@iccsafe.org)

2015 International Building Code

Revise as follows:

503.1 General. Unless otherwise specifically modified in Chapter 4 and this chapter, *building height*, number of stories and *building area* shall not exceed the limits specified in Sections 504 and 506 based on the type of construction as determined by Section 602 and the occupancies as determined by Section 302 except as modified hereafter. *Building height*, number of stories and *building* area provisions shall be applied independently. ~~Each~~For the purposes of determining area limitations, height limitations and type of construction, each portion of a building separated by one or more *fire walls* complying with Section 706 shall be considered to be a separate building.

706.1 General. ~~Each portion of a building separated by one or more *fire*~~ *Fire walls* ~~that comply with the provisions of this section~~ shall be ~~considered a separate building~~constructed in accordance with Sections 706.2 through 706.11. The extent and location of such *fire walls* shall provide a complete separation. Where a *fire wall* separates occupancies that are required to be separated by a *fire barrier* wall, the most restrictive requirements of each separation shall apply.

Reason: This public proposal is submitted by the ICC Building Code Action Committee (BCAC). The BCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the BCAC has held 13 open meetings and numerous workgroup calls which included members of the BCAC as well as any interested party to discuss and debate the proposed changes and the public comments. Related documentation and reports are posted on the BCAC website at: http://www.iccsafe.org/cs/BCAC/Pages/default.aspx.
The purpose of this proposal is to clarify the intent of the these sections of the Code that the requirement for a fire wall in Sections 503.1 and 706.1 is predicated on the determination of the maximum allowable height and area calculations under Chapter 5. Using these sections of Code to control other building features or elements such as means of egress, building systems or building utilities is not intended or implied by these sections of the Code. However, by inclusion of the first sentence in Section 706.1 some code officials have incorrectly interpreted that language to mean that the portions of the various elements and systems on each side of a fire wall must be completely self-contained. There are no requirements in the I Codes that mandate that the placement of fire walls to create a separate building such that its building features need to be separated from other like building features in adjacent buildings. The scope of Section 706 is to provide the technical requirements for the construction of a fire wall.

The added language in Section 503.1 along with the strikeout and added language in Section 706.1 will clarify application of these two sections.

Cost Impact: Will not increase the cost of construction
The cost of construction will be reduced by eliminating incorrect application of Section 706.1.

G 130-15 : 503.1-KULIK4966

G 131-15

503.1.4 (New), 1004.5

Proponent: Lee Kranz, City of Bellevue, WA, representing City of Bellevue, Washington

2015 International Building Code

Add new text as follows:

503.1.4 Occupied roofs. For the purposes of Tables 504.3 and 504.4, occupancies are permitted on roofs where the occupancy is permitted on the story immediately below. The area to be used as an occupied roof shall comply with the allowable area limitations of Table 506.2 for the intended occupancy.

> **Exception:** Occupied roofs are not required to comply with Tables 504.3 and 504.4 where located on buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2 and fire alarm notification in accordance with Section 907 is provided in the area of the occupied roof.

Revise as follows:

1004.5 Outdoor areas. *Yards*, patios, *courts*, occupied roofs, and similar outdoor areas accessible to and usable by the building occupants shall be provided with *means of egress* as required by this chapter. The *occupant load* of such outdoor areas shall be assigned by the *building official* in accordance with the anticipated use. Where outdoor areas are to be used by persons in addition to the occupants of the building, and the path of egress travel from the outdoor areas passes through the building, *means of egress* requirements for the building shall be based on the sum of the *occupant loads* of the building plus the outdoor areas.

Exceptions:

1. Outdoor areas used exclusively for service of the building need only have one *means of egress*.
2. Both outdoor areas associated with Group R-3 and individual dwelling units of Group R-2.

Reason: Occupied roofs host different occupancy groups but most often consist of Groups A and B. Means of egress, accessibility, structural design, access to plumbing fixtures and guardrails are already addressed in the code and must be provided for occupants utilizing the area of an occupied roof. Type of construction limitations based on occupancy classification are not currently addressed in the code for occupied roofs because an occupied roof in not considered to be a story, as defined in the code. If approved, this code change will clarify that occupied roofs are limited to the roof level of the highest story per Tables 504.3 and 504.4 for the applicable occupancy and must comply with the limitations of Table 506.2 for the area of the roof to be occupied even though it is not considered to be a "story".
The proposed exception allows occupied roofs to be located on any story and at any height in a building protected with an automatic sprinkler system throughout and with fire alarm notification in the area of the occupied roof. The exception is appropriate since smoke will not accumulate on an occupied roof as it does inside the building and there is an added level of protection provided by the sprinkler and fire alarm systems.

"Occupied roofs" is proposed to be added to Section 1004.5 to clairfy that they shall be provided with means of egress as required by Chapter 10.

Cost Impact: Will increase the cost of construction
This code change will require additional cost due to a new requirement to install sprinkler protection and fire alarm notification in some cases to accommodate an occupied roof on a building that may not otherwise require these systems.

G 131-15 : 503.1.4 (New)-KRANZ3867

G 132-15

503.1.2.1 (New)

Proponent: Victor Cuevas, representing City of Los Angeles (victor.cuevas@lacity.org)

2015 International Building Code

Add new text as follows:

503.1.2.1 Buildings on same property and buildings containing courts. For the purposes of determining the required wall and opening protection and roof-covering requirements, buildings on the same property and court walls of buildings over one story in height shall be assumed to have a propertly line between them.

Reason: For the purpose of life –safety and fire protection, it's important to establish opening limitations for courts.

Cost Impact: Will increase the cost of construction
The code change proposal increases construction cost where the separation between the assumed propertly line and the building facade will require fire resistant construction.

Note: UL = Unlimited; NP = Not permitted;

For SI: 1 square foot = 0.0929 m^2.

NS = Buildings not equipped throughout with an automatic sprinkler system; S1 = Buildings a maximum of one story above grade plane equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1; SM = Buildings two or more stories above grade plane equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1; S13R = Buildings equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.2; S13D = Buildings equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.3.

a. See Chapters 4 and 5 for specific exceptions to the allowable height in this chapter.

b. See Section 903.2 for the minimum thresholds for protection by an automatic sprinkler system for specific occupancies.

c. New Group H occupancies are required to be protected by an automatic sprinkler system in accordance with Section 903.2.5.

d. The NS value is only for use in evaluation of existing building area in accordance with the *International Existing Building Code.*

e. New Group I-1 and I-3 occupancies are required to be protected by an automatic sprinkler system in accordance with Section 903.2.6. For new Group I-1 occupancies, Condition 1, see Exception 1 of Section 903.2.6.

f. New and existing Group I-2 occupancies are required to be protected by an automatic sprinkler system in accordance with Section 903.2.6 and Section 1103.5 of the *International Fire Code.*

g. New Group I-4 occupancies see Exceptions 2 and 3 of Section 903.2.6.

h. New Group R occupancies are required to be protected by an automatic sprinkler system in accordance with Section 903.2.8.

TABLE 803.11

INTERIOR WALL AND CEILING FINISH REQUIREMENTS BY OCCUPANCY[k]

S	C	C	C	B	B	C
U	No restrictions			No restrictions		

For SI: 1 inch = 25.4 mm, 1 square foot = 0.0929m^2 .

a. Class C interior finish materials shall be permitted for wainscotting or paneling of not more than 1,000 square feet of applied surface area in the grade lobby where applied directly to a noncombustible base or over furring strips applied to a noncombustible base and fireblocked as required by Section 803.13.1.

b. In other than Group I-3 occupancies in buildings less than three stories above grade plane, Class B interior finish for nonsprinklered buildings and Class C interior finish for sprinklered buildings shall be permitted in interior exit stairways and ramps.

c. Requirements for rooms and enclosed spaces shall be based upon spaces enclosed by partitions. Where a fire-resistance rating is required for structural elements, the enclosing partitions shall extend from the floor to the ceiling. Partitions that do not comply with this shall be considered enclosing spaces and the rooms or spaces on both sides shall be considered one. In determining the applicable requirements for rooms and enclosed spaces, the specific occupancy thereof shall be the governing factor regardless of the group classification of the building or structure.

d. Lobby areas in Group A-1, A-2 and A-3 occupancies shall not be less than Class B materials.

e. Class C interior finish materials shall be permitted in places of assembly with an occupant load of 300 persons or less.

f. For places of religious worship, wood used for ornamental purposes, trusses, paneling or chancel furnishing shall be permitted.

g. Class B material is required where the building exceeds two stories.

h. Class C interior finish materials shall be permitted in administrative spaces.

i. Class C interior finish materials shall be permitted in rooms with a capacity of four persons or less.

j. Class B materials shall be permitted as wainscotting extending not more than 48 inches above the finished floor in corridors and exit access stairways and ramps.

k. Finish materials as provided for in other sections of this code.

l. Applies when protected by an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2.

m. Where Group R-3 and R-4 occupancies are permitted in Section 903.2.8 to be protected by an automatic sprinkler system installed in accordance with Section 903.3.1.3 the requirements for a non-sprinklered building shall apply.

TABLE 1006.2.1
SPACES WITH ONE EXIT OR EXIT ACCESS DOORWAY

OCCUPANCY	MAXIMUM OCCUPANT LOAD OF SPACE	MAXIMUM COMMON PATH OF EGRESS TRAVEL DISTANCE (feet)		
		Without Sprinkler System (feet)		With Sprinkler System (feet)

For SI: 1 foot = 304.8 mm.

NP = Not Permitted

a. Buildings equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1 or 903.3.1.2. See Section 903 for occupancies where *automatic sprinkler systems* are permitted in accordance with Section 903.3.1.2.

b. Group H occupancies equipped throughout with an *automatic sprinkler system* in accordance with Section 903.2.5.

c. For a room or space used for assembly purposes having *fixed seating*, see Section 1029.8.

d. For the travel distance limitations in Group I-2, see Section 407.4.

e. The length of *common path of egress travel* distance in a Group R-3 occupancy located in a mixed occupancy building or within a Group R-3 or R-4 *congregate living facility*.

f. The length of *common path of egress travel* distance in a Group S-2 *open parking garage* shall be not more than 100 feet.

g. For the travel distance limitations in Group R-3 and R-4 equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.3, see Section 1006.2.2.6.

1006.2.2 Egress based on use. The numbers of *exits* or access to *exits* shall be provided in the uses described in Sections 1006.2.2.1 through ~~1006.2.2.5~~1006.2.2.6.

Add new text as follows:

1006.2.2.6 Group R-3 and R-4. Where Group R-3 occupancies are permitted by Section 903.2.8 to be protected by an automatic sprinkler system installed in accordance with Section 903.3.1.3, the exit access travel distance for Group R-3 shall not be more than 125 feet. Where Group R-4 occupancies are permitted by Section 903.2.8 to be protected by an automatic sprinkler system installed in accordance with Section 903.3.1.3, the exit access travel distance for Group R-4 shall not be more than 75 feet.

TABLE 1017.2
EXIT ACCESS TRAVEL DISTANCE[a]

OCCUPANCY	WITHOUT SPRINKLER SYSTEM (feet)	WITH SPRINKLER SYSTEM (feet)
A, E, F-1, M, R, S-1	200[e]	250[b]
I-1	Not Permitted	250[b]
B	200	300[c]
F-2, S-2, U	300	400[c]
H-1	Not Permitted	75[d]
H-2	Not Permitted	100[d]
H-3	Not Permitted	150[d]
H-4	Not Permitted	175[d]
H-5	Not Permitted	200[c]
I-2, I-3, I-4	Not Permitted	200[c]

For SI: 1 foot = 304.8 mm.

a. See the following sections for modifications to *exit access* travel distance requirements:

Section 402.8: For the distance limitation in malls.

Section 404.9: For the distance limitation through an atrium space.

Section 407.4: For the distance limitation in Group I-2.

Sections 408.6.1 and 408.8.1: For the distance limitations in Group I-3.

Section 411.4: For the distance limitation in special amusement buildings.

Section 412.7: For the distance limitations in aircraft manufacturing facilities.

Section 1006.2.2.2: For the distance limitation in refrigeration machinery rooms.

Section 1006.2.2.3: For the distance limitation in refrigerated rooms and spaces.

Section 1006.3.2: For buildings with one exit.

Section 1017.2.2: For increased distance limitation in Groups F-1 and S-1.

Section 1029.7: For increased limitation in assembly seating.

Section 3103.4: For temporary structures.

Section 3104.9: For pedestrian walkways.

b. Buildings equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1 or 903.3.1.2. See Section 903 for occupancies where *automatic sprinkler systems* are permitted in accordance with Section 903.3.1.2.

c. Buildings equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1.

d. Group H occupancies equipped throughout with an *automatic sprinkler system* in accordance with Section 903.2.5.1.

e. Group R-3 and R-4 buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.3. See Section 903.2.8 for occupancies where automatic sprinkler systems are permitted in accordance with Section 903.3.1.3.

TABLE 1020.1
CORRIDOR FIRE-RESISTANCE RATING

OCCUPANCY	OCCUPANT LOAD SERVED BY CORRIDOR	REQUIRED FIRE-RESISTANCE RATING (hours)	
		Without sprinkler system	With sprinkler system[c]
H-1, H-2, H-3	All	Not Permitted	1
H-4, H-5	Greater than 30	Not Permitted	1
A, B, E, F, M, S, U	Greater than 30	1	0
R	Greater than 10	~~Not Permitted~~ 1[d]	0.5
I-2[a] , I-4	All	Not Permitted	0
I-1, I-3	All	Not Permitted	1[b]

a. For requirements for occupancies in Group I-2, see Sections 407.2 and 407.3.

b. For a reduction in the *fire-resistance rating* for occupancies in Group I-3, see Section 408.8.

c. Buildings equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1 or 903.3.1.2 where allowed.

d. Group R-3 and R-4 buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.3. See Section 903.2.8 for occupancies where automatic sprinkler systems are permitted in accordance with Section 903.3.1.3.

Reason:
The current tables do not include any requirement for Group R-3 and R-4 occupancies that are permitted to use a NFPA 13D systems. Saying just use the non-sprinklered requirements does not work because in some cases that is allowing a taller building then a building with an NFPA13R system.
This is NOT asking for ANY tradeoffs for an NFPA13D system. The provisions applied are always the MOST RESTRICTIVE of what is permitted for a non-sprinklered building or a building using an NFPA13R system.
There have been a series of lawsuits against jurisdictions across the United States regarding enforcement of requirements for group homes that exceed the requirements for single family homes. This is being interpreted as a violation of the Fair Housing Act. The CTC committee reviewed the requirements for group homes in the codes to see where there were differences and if these differences were justified due to the level of care provided for the residents. In some limited situations, where there was a question for Group R-4 group homes, the same issue existing for Group R-3 congregate residences. For consistency in the code, these need to be considered together rather than separately. Therefore, this proposal is for both Group R-4 and Group R-3 congregate residences (both with 16 or fewer residents per Sections 310.5 and 310.6.)
The ICC Code Technology Committee (CTC) has just completed its 10th year. The ICC Board has decided to sunset the CTC. The sunset plan includes re-assigning many of the CTC Areas of Study to the applicable Code Action Committee (CAC). The two remaining CTC Areas of Study are Care Facilities and Elevator Lobbies/WTC Elevator issues. This proposal falls under the Care Facilities Area of Study. Information on the CTC, including: the sunset plan; meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the CTC website at: http://www.iccsafe.org/cs/CTC/Pages/default.aspx.

The BCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the BCAC has held 13 open meetings and numerous workgroup calls which included members of the BCAC as well as any interested party to discuss and debate the proposed changes and the public comments. Related documentation and reports are posted on the BCAC website at: http://www.iccsafe.org/cs/BCAC/Pages/default.aspx.

Cost Impact: Will not increase the cost of construction
This is a clarification of the code, therefore, there will not be an increase in cost.

G 133-15 : T504.3-BALDASSARRA4275

G 134-15

504.4

Proponent: Jay Hyde, representing Sacramento Valley Association of Building Officials (jhyde@mognot.com)

2015 International Building Code

Revise as follows:

504.4 Number of stories. The maximum number of stories of a building shall not exceed the limits specified in Table 504.4. For the purposes of determining the allowable number of stories, an occupied roof shall not be considered a story.

Reason: An occupied roof does not have side walls or a floor or roof above. Products of Combustion, such as smoke or hot gasses will not be trapped endangering the occupants. In adition, an occupied roof would not contribute appreciably to the fuel load of the building. This clarification makes it clear that the story limits for a given occupancy in a building of a given construction type apply to a story as defined by Chapter 2 and that an occupied roof may be above the top story with out violating the story limits of Table 504.4.

Cost Impact: Will not increase the cost of construction
May decrease the cost of construction by not requiring that a construction type be increased due to the location of an occupied roof.

G 134-15 : 504.4-HYDE5273

G 135-15

Section 504.5 (New)

Proponent: Stephen Skalko, representing Masonry Alliance for Codes and Standards (svskalko@cox.net)

2015 International Building Code

Add new text as follows:

Section 504.5 **Fire apparatus access roads** Not less than two fire apparatus access roads shall be provided for buildings of Type III, IV or V construction that are four or more stories in height. The fire apparatus access roads shall comply with Section 503 of the *International Fire Code.* The termination point of the fire apparatus access roads on the building site shall be placed a distance apart not less than one-third of the length of the maximum overall diagonal dimension of the building or area to be served, as measured in a straight line.

Reason: As buildings of Type III, IV and V construction are being built to taller heights as allowed in Tables 504.3 and 504.4 of the code, they are representing a significant challenge for the fire service in responding to and attempting to extinguish or control the burning of the combustible structure, especially at the higher elevations. In addition, these buildings of combustible material necessitate response by larger numbers of fire fighters and fire apparatus. This is evident by the fires that have occurred in recent years for buildings of combustible framing under construction.
A recent example is a major fire in Los Angeles with five stories of wood framing over a two story concrete podium on December 8, 2014. The apartment building known as the DaVinci required more than 250 firefighters to be dispatched to the scene. Access to parts of the building under fire was limited by the site layout.

Other recent large combustible framed building that experienced fires also presented significant challenges for the fire service include:

1. Monroe Apartments, Portland, OR August 8,2013
2. Student Apartments, Kingston, Ontario, CAN December 17, 2013
3. 550 East and 500 South, Salt Lake City, UT February 9, 2014
4. Commercial Building, Roxbury, MA, March 3, 2014
5. Mission Bay Project, San Francisco, CA March 11, 2014
6. Axis Apartments, Houston, TX , March 25, 2014
7. Beacon Street,Boston, MA March 27, 20t4
8. Gables Upper Rock, Rockville, MD Apri , 2014
9. SE Tech Cente rDrive, Vancouver, WA, June 19, 2014
10. Victoria Commons, Kitchener, Ontario, CAN, July 22, 2014
11. Apollo Way,Madison, WI August 8, 2014

This proposal will require at least two fire apparatus access roads be provided for these taller buildings of combustible construction to assist the fire service in responding to and possibly gaining early control of the fire. To insure reasonable remoteness of the location of these access roads on site they are being required to be placed a distance equal to 1/3 the overall diagonal of the building similar to criteria for remoteness of exits and exit access in Section 1007.1.1.

Cost Impact: Will increase the cost of construction
This proposal is expected to increase the cost of construction due to the additional fire apparatus access roads required on site. This increased cost however is necessary to reduce the risk of damage to adjacent properties due to fire exposure and provide the fire service with improved access for firefighting response to these taller buildings of combustible construction.

G 135-15 : 504.5 (New)-SKALKO5797

G 136-15

505.2

Proponent: Stephen DiGiovanni, Clark County Building Department, representing Southern Nevada Chapter of ICC (sdigiovanni@clarkcountynv.gov)

2015 International Building Code

Revise as follows:

505.2 Mezzanines. A *mezzanine* or *mezzanines* in compliance with Section 505.2 shall be considered a portion of the *story* below. Such *mezzanines* shall not contribute to either the *building area* or number of *stories* as regulated by Section 503.1. The area of the *mezzanine* shall be included in determining the *fire area*. The clear height above and below the *mezzanine* floor construction shall be not less than 7 feet 6 inches (2286 mm).

Exception: The clear height above and below the mezzanine shall not be less than 7 feet (2134 mm) where occupant loads are equal to or less than those shown in Table 1006.2.1.

Reason: Mezzanines are grouped with equipment platforms in the code. This is consistent with the thought that mezzanines are primarily small areas for equipment or storage. However the size of the mezzanine is only limited by the area of the floor below; larger floor plates allow larger mezzanines. The code encourages the use of large mezzanines since they do not count as stories and do not contribute to building area. The occupancy group of mezzanines is also not limited. As a consequence of these two conditions the code allows large occupancy loads in mezzanines. Greater occupancy loads increases evacuation times. Section 1208.2 dictates a minimum ceiling height of 7'-6" for occupiable spaces, habitable spaces and corridors.
Section 1003.2 requires the clear height of a means of egress be at least 7-6" with some exceptions. One exception being a mezzanine designed in accordance with Section 505. By limiting the occupant loads to those shown in Table 1006.2.1 for the threshold at which additional means of egress would be required would reduce any potential risk of endangering occupant in a fire event.

Cost Impact: Will increase the cost of construction
For larger mezzanines, this proposal will increase the cost of construction by requiring taller ceiling heights than are currently required by code.

G 136-15 : 505.2-DIGIOVANNI3826

G 137-15

505.2.1, 505.2.1.1 (New), 505.3.1

Proponent: Maureen Traxler, City of Seattle Dept of Planning & Development, representing Washington Association of Building Officials Technical Code Development Committee (maureen.traxler@seattle.gov)

2015 International Building Code

Revise as follows:

505.2.1 Area limitation. The aggregate area of a *mezzanine* or *mezzanines* within a room shall be not greater than one-third of the floor area of that room or space in which they are located. The enclosed portion of a room shall not be included in a determination of the floor area of the room in which the *mezzanine* is located. In determining the allowable *mezzanine* area, the area of the *mezzanine* shall not be included in the floor area of the room.

~~Where a room contains both a *mezzanine* and an *equipment platform*, the aggregate area of the two raised floor levels shall be not greater than two-thirds of the floor area of that room or space in which they are located.~~

Exceptions:

1. The aggregate area of *mezzanines* in buildings and structures of Type I or II construction for special industrial occupancies in accordance with Section 503.1.1 shall be not greater than two-thirds of the floor area of the room.
2. The aggregate area of *mezzanines* in buildings and structures of Type I or II construction shall be not greater than one-half of the floor area of the room in buildings and structures equipped throughout with an *approved automatic sprinkler system* in accordance with Section 903.3.1.1 and an *approved emergency voice/alarm communication system* in accordance with Section 907.5.2.2.

505.2.1.1 Aggregate area of mezzanines and equipment platforms Where a room contains both a mezzanine and an equipment platform, the aggregate area of the two raised floor levels shall be not greater than two-thirds of the floor area of that room or space in which they are located. The area of the mezzanine shall not exceed the area determined according to Section 505.2.1

505.3.1 Area limitation. The aggregate area of all *equipment platforms* within a room shall be not greater than two-thirds of the area of the room in which they are located. Where an *equipment platform* is located in the same room as a *mezzanine*, the area of the *mezzanine* shall be determined by Section 505.2.1 and the combined aggregate area of the *equipment platforms* and *mezzanines* shall be not greater than two-thirds of the room in which they are located. The area of the mezzanine shall not exceed the area determined according to Section 505.2.1.

Reason: The current language states that, when a mezzanine and an equipment platform are located in the same room, their total area can be 2/3 the area of the room. This language allows mezzanines to be larger than is intended by the code. For example, it allows a room to have a small equipment platform with an area 1% the size of the room and a large mezzanine with an area 65% the size of the room.
The statement that the mezzanine's area is determined by Section 505.2.1 doesn't quite solve the problem because the same language about aggregating the area appears there, too. We propose putting the provisions related to aggregate area of mezzanines and platforms into a new subsection 505.2.1.1 to allow us to refer to the base language about mezzanine area separately. No change to the Section 505.2.1 exceptions is proposed; they are merely moved so they stay with the base language about area of mezzanines.

Cost Impact: Will not increase the cost of construction
This proposal is a clarification of existing code provisions and will not increase the cost of construction.

G 137-15 : 505.2.1-TRAXLER4267

G 138-15

505.2.1

Proponent: Marshall Klein, representing NMHC

2015 International Building Code

Revise as follows:

505.2.1 Area limitation. The aggregate area of a *mezzanine* or *mezzanines* within a room shall be not greater than one-third of the floor area of that room or space in which they are located. The enclosed portion of a room shall not be included in a determination of the floor area of the room in which the *mezzanine* is located. In determining the allowable *mezzanine* area, the area of the *mezzanine* shall not be included in the floor area of the room.

Where a room contains both a *mezzanine* and an *equipment platform*, the aggregate area of the two raised floor levels shall be not greater than two-thirds of the floor area of that room or space in which they are located.

Exceptions:

1. The aggregate area of *mezzanines* in buildings and structures of Type I or II construction for special industrial occupancies in accordance with Section 503.1.1 shall be not greater than two-thirds of the floor area of the room.
2. The aggregate area of *mezzanines* in buildings and structures of Type I or II construction shall be not greater than one-half of the floor area of the room in buildings and structures equipped throughout with an *approved automatic sprinkler system* in accordance with Section 903.3.1.1 and an *approved emergency voice/alarm communication system* in accordance with Section 907.5.2.2.
3. <u>The aggregate area of a *mezzanine* within a *dwelling unit* that is located in a building equipped throughout with an approved automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2 shall not be greater than one-half of the floor area of the room, provided:</u>
   3.1. <u>The *mezzanine*, other than enclosed closets and bathrooms, shall be open to the room in which such *mezzanine* is located.</u>
   3.2. <u>The opening to the room shall be unobstructed except for walls not more than 42 inches (1067 mm) in height, columns and posts, and</u>
   3.3. <u>Exceptions to Section 505.2.3 shall not be permitted.</u>

Reason: Currently, Section 505.2.3 permits mezzanines with an occupant load of 10 or less to be entirely enclosed, with an enclosed area up to 1/3 of the area of the room in which the mezzanine is located. This proposal provides an option to forfeit a fully enclosed mezzanine to gain an allowable area up to 1/2 of the room area. From a safety perspective, having the mezzanine open to the space below provides increased awareness for occupants in either area to a hazardous condition that develops within the space. The proposed slight increase in mezzanine area is reasonable based on the increase in safety associated with not allowing the entire mezzanine to be enclosed.

Cost Impact: Will not increase the cost of construction
Because this proposal simply provides an optional exception, there is no impact on the cost of construction unless someone chooses to apply the exception. Where the exception is applied, the cost of construction will presumably decrease based on eliminating the wall that might have otherwise been installed to separate the mezzanine from the room.

G 138-15 : 505.2.1-KLEIN4533

G 139-15

505.2.3

Proponent: Edward Kulik, representing Building Code Action Committee (bcac@iccsafe.org)

2015 International Building Code

Revise as follows:

505.2.3 Openness. A *mezzanine* shall be open and unobstructed to the room in which such *mezzanine* is located except for walls not more than 42 inches (1067 mm) in height, columns and posts.

Exceptions:

1. *Mezzanines* or portions thereof are not required to be open to the room in which the *mezzanines* are located, provided that the *occupant load* of the aggregate area of the enclosed space is not greater than 10.
2. A *mezzanine* having two or more exits or access to exits is not required to be open to the room in which the *mezzanine* is located.
3. *Mezzanines* or portions thereof are not required to be open to the room in which the *mezzanines* are located, provided that the aggregate floor area of the enclosed space is not greater than 10 percent of the *mezzanine* area.
4. In industrial facilities, *mezzanines* used for control equipment are permitted to be glazed on all sides.
5. In occupancies other than Groups H and I, that are no more than two *stories* above *grade plane* and equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1, a *mezzanine* having two or more ~~*means of egress*~~exits or access to exits shall not be required to be open to the room in which the *mezzanine* is located.

Reason: The intent of this proposal is to revise Exception 5 to be consistent with the terminology in Exception 2.
In July/2014 the ICC Board decided to sunset the activities of the Code Technology Committee (CTC). This is being accomplished by re-assigning many of the CTC Areas of Study to the applicable Code Action Committee (CAC). This proposal falls under the CTC Area of Study entitled Unenclosed Exit Stairs. Information on the CTC, including: the sunset plan; meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the CTC website.

This public proposal is submitted by the ICC Building Code Action Committee (BCAC). The BCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the BCAC has held 13 open meetings and numerous workgroup calls which included members of the BCAC as well as any interested party to discuss and debate the proposed changes and the public comments. Related documentation and reports are posted on the BCAC website at: http://www.iccsafe.org/cs/BCAC/Pages/default.aspx.

Cost Impact: Will not increase the cost of construction
This proposal is a clarification of provisions.

G 139-15 : 505.2.3-KULIK3642

G 140-15

506.1.4 (New)

Proponent: Vickie Lovell, InterCode Incorporated, representing Fire Safe North America (vickie@intercodeinc.com)

2015 International Building Code

Add new text as follows:

506.1.4 **Allowable area for buildings in disaster prone regions.** For buildings more than one story in height above grade plane that are of construction Types IIB, IIIB and VB, the maximum allowable area shall not be greater than the area permitted for non-sprinklered (NS) buildings in accordance with Table 506.2, adjusted for any frontage increase in accordance with 506.3 and where such buildings are any of the following:

1. Assigned to Seismic Design Category C or D in Table 1613.3.5(1).
2. Located in a flood hazard area established in accordance with Section 1612.3.
3. Located in a hurricane-prone region.

Reason: The purpose of this code change is to reduce the total reliance of a community and its firefighters on sprinkler systems in disaster-prone areas of the country where the water supply and/or power may be interrupted, or are likely to have municipal water system operation issues. This proposal is a very conservative proposal to promote community resiliency by limiting the footprint of multi-story buildings that have no vertical fire compartmentation to that which would be allowed for non-sprinklered buildings. The Type IIB, IIIB, and VB buildings may have a fully involved fire in a very short amount of time in the event that water supplies for sprinklers are reduced or impaired after a natural catastrophe. Such water supply interruptions are not uncommon after natural disasters. For non-rated multi-story buildings, meaning buildings that have no fire resistance rated floors, fire may spread freely and quickly from story to story. Limiting the per-floor area of Type IIB, IIB, and VB buildings is intended to result in protecting buildings in areas at high risk for natural catastrophes the most essential combustible buildings and facilities with both sprinkler protection and increased fire resistance rated vertical compartmentation. This proposal may be fairly considered to be the proverbial "belt-and suspenders" approach. If one were to fail, the other protection method would provide an added layer of protection that would serve to prevent a life safety disaster.
The 2012 IBC Sections 504.2 and 506.3 had specific allowable increases that were permitted when automatic sprinkler systems were installed. Those allowances have been incorporated into Tables 504.3 and Table 504.4 as S1 and SM. Such allowable area increases permitted by the code assumed that power and water supply will be readily available and reliable for the successful operation of fire suppression systems. This is especially true for combustible construction such as Types IIB, IIIB and VB, and also for non-combustible construction without any vertical compartmentation. For some parts of the country where buildings impacted by a natural disaster may remain without reliable water and or power for a considerable period of time, that general assumption may not be an acceptable risk. It may also be an unacceptable risk to assume that firefighters will be able to respond at their normal efficiencies.

Responding to the challenge of mitigating damage from natural disasters, California has more stringent requirements on buildings they have designated as "high-risk ". But more than 15% of the U.S. population lives in potential major earthquake areas. 41 states and territories have moderate to high risk. There is a real likelihood of power and water supplies being interrupted following a major seismic event, along with the potential for multiple simultaneous structure fires and also uncontrollable building-to-building fire spread. In October 17, 1989, a 7.1 earthquake in Santa Cruz Mountains was responsible for 26 fires in San Francisco, 60 miles from epicenter. There were 67 documented breaks in water mains which effectively eliminated water pressure in the area. In January 19, 1994, a 6.8 earthquake centered in Northridge, CA. There were approximately 100 fire ignitions, 30 to 50 of those were considered significant. The main cause of fire was largely due to natural gas leaks. Additionally, the water supply systems in the area were damaged causing low pressure in water distribution. On January 17, 1995, a 6.8 (approx.) earthquake near Kobe, Japan caused 90 fires to start within minutes. 85 spread to adjacent buildings and 10 approached or reached conflagration status. 1,700 water line breaks occurred within a couple of hours. There were 7,000 buildings destroyed by fire alone. Similar data of increased fire incidents are available in hurricane and flood prone regions. History has shown that increased incidents of fires after a disaster can be more destructive to life and property than the disaster itself.

This change is limited in its application to multi-story buildings without any vertical fire compartmentation in the higher risk, disaster prone regions defined by the code. There may be some types of combustible materials of these buildings that should appropriately be exempted from this area limitation.

Cost Impact: Will increase the cost of construction
This code change proposal will increase the cost of construction for some building types.

Note: UL = Unlimited; NP = Not permitted;

For SI: 1 square foot = 0.0929 m^2.

NS = Buildings not equipped throughout with an automatic sprinkler system; S1 = Buildings a maximum of one story above grade plane equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1; SM = Buildings two or more stories above grade plane equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1; S13R = Buildings equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.2.

a. See Chapters 4 and 5 for specific exceptions to the allowable height in this chapter.

b. See Section 903.2 for the minimum thresholds for protection by an automatic sprinkler system for specific occupancies.

c. New Group H occupancies are required to be protected by an automatic sprinkler system in accordance with Section 903.2.5.

d. The NS value is only for use in evaluation of existing building area in accordance with the *International Existing Building Code.*

e. New Group I-1 and I-3 occupancies are required to be protected by an automatic sprinkler system in accordance with Section 903.2.6. For new Group I-1 occupancies, Condition 1, see Exception 1 of Section 903.2.6.

f. New and existing Group I-2 occupancies are required to be protected by an automatic sprinkler system in accordance with Section 903.2.6 and Section 1103.5 of the *International Fire Code.*

g. New Group I-4 occupancies see Exceptions 2 and 3 of Section 903.2.6.

h. New Group R occupancies are required to be protected by an automatic sprinkler system in accordance with Section 903.2.8.

i. The maximum allowable area for a single story non-sprinklered Group U greenhouse is permitted to be 9,000 sq. ft., or shall be permitted to comply with Table C102.1 of Appendix C in this code.

-

Reason: The primary function of a greenhouse is to create a controlled environment for the propagation and cultivation of plants, and is intended to achieve the optimum environment for the protection of the plants from the outside environment. Many typical building requirements intended for human comfort, health, safety and welfare are not applicable or necessary for the construction or operation of greenhouses. The majority of commercial greenhouses are truly agricultural structures and classified as Group U. Nearly all greenhouses are built as Type VB (NS) construction. This purpose of this proposal increases the maximum allowable area of single story Group U greenhouses (NS) from 5,500 to 9,000. The allowable area for other structures in use Group U would remain unchanged.

Appendix C of the IBC permits 12,000 sq. ft. of allowable area for ALL Group U structures, including greenhouses.

The IBC currently permits a minimum allowable area of 9,000 sq. ft. for non-sprinklered, Type VB greenhouses classified as Group B, E, M or F-2 (which could have significant occupant load due to access by the public). Using a determination based on "equivalent risk" described in the preface pages of the IBC on page xi, "equivalent risk involves three interdependent considerations: (1) the level of fire hazard associated with the specific occupancy of the facility; (2) the reduction of fire hazard by limiting the floor area(s) and the height of the building based on the fuel load (combustible contents and burnable building components) and (3) the level of overall fire resistance provided by the type of construction used for the building. The greater the potential fire hazards indicated as a function of the group, the lesser the height and area allowances for a particular construction type." Therefore, it would be difficult to justify why a Group U greenhouse should be permitted less allowable area than an identical greenhouse permitted as Group B, E, F-2 or M. This proposal permits a Group U greenhouse to have the same allowable area as other use groups when there is no increased risk.

Cost Impact: Will not increase the cost of construction
There is no cost impact related to this proposal because the code already permits the allowable area to be more than 5,500 sq. ft. in greenhouses.

G 142-15

506.3, 506.3.1

Proponent: William Hall, representing Portland Cement Association (jhall@cement.org)

2015 International Building Code

Revise as follows:

506.3 Frontage increase. Every building shall adjoin or have access to a public way to receive an area factor increase based on frontage. ~~Area~~ Buildings four stories or more in height, as measured from the grade plane, of Type III and V construction, using combustible framing material shall also not have less than 25 percent of its perimenter on a public way or open space. Such open space shall be either on the same lot or dedicated for public use and shall be accessed from a street or approved fire lane. The area factor increase shall be determined in accordance with Sections 506.3.1 through 506.3.3.

506.3.1 Minimum percentage of perimeter. To qualify for an area factor increase based on frontage, a building shall have not less than 25 percent of its perimeter on a public way or open space. Such open space shall be either on the same lot or dedicated for public use and shall be accessed from a street or approved fire lane. Open space for buildings four or more stories in height as measured from the grade plane, of Type III and V construction, using combustible framing material shall have a grade of not more than 10 percent and be provided with a *fire apparatus access road in* accordance with Section 503 of the *International Fire Code* for full length of open space. Open space that is not used for open perimeter area increases are not required to provide fire apparatus access roads or 10 percent grade.

Reason: Fires during construction have been on the increase across the U.S and other countries which utilize combustible construction in multi-story buildings. The intensity of these fires put adjacent buildings, businesses and residents at risk until the project is complete, which can take up to 2 years to complete or more if the project stalls. These fires are caused by a multitude of reasons including but not limited to arson, smoking, cooking, heating and hot work. Fire service, even in large well equipped jurisdictions cannot effectively stop these conflagrations and most of these incidents end in total loss of the building under construction as well as damaged or destroyed adjacent buildings. Many times adjacent buildings are at risk due to the extreme heat, flying embers and wind speeds, as seen in the recent Los Angeles fire where paper, laying on a desk in an adjacent high rise structure caught fire and 6 six floors of the high rise were on fire. Currently the building code allows a 75% increase in the base tabular area when the structure has an on open perimeter of 20-30 feet, in more than 25 percent of total building perimeter. Currently the open space is not required to be open or traversable by fire apparatus vehicles.

This code proposal does two things: First requires that all Type III and V buildings, 4 or more stories, be required to provde 25% open space or public space and secondly would require that the open space, used for an increase in allowable area, be usable by the fire service and apparatus, in Type III and V buildings 4 or more stories in height.

Fire serviice must be able to access the structure to effectively battle the fire. If a building is allowed to be built bigger by providing open space, the space should serve as access for fire fighting.

Cost Impact: Will increase the cost of construction

This change will increase the cost of construction for Type III and V construction, 4 stories and over, using combustible construction.

G 142-15 : 506.3-HALL4560

G 143-15

202 (New), 506.3.1

Proponent: Ali Fattah, City of San Diego Development Services Department, representing City of San Diego (afattah@sandiego.gov)

2015 International Building Code

Add new text as follows:

SECTION 202 DEFINITIONS

FIRE APPARATUS ACCESS ROAD A road that provides fire apparatus access from a fire station to a facility, building or portion thereof. This is a general term inclusive of all other terms such as fire lane, public street, private street, parking lot lane and access roadway.

Revise as follows:

506.3.1 Minimum percentage of perimeter. To qualify for an area factor increase based on frontage, a building shall have not less than 25 percent of its perimeter fronting on a public way or ~~open space~~yard. Such open space shall be either on the same lot or dedicated for public use and shall be accessed from a street or approved *fire ~~lane~~apparatus access road*.

Reason: Section 202 of the International Fire Code more clearly describes what the I codes intend when the term fire lane is used. The term makes it clear that it's purpose is for the movement and staging of fire apparatus and includes private streets, parking lo lanes and access roadways. This editorial code change adds consistency and clarity.
The term fire lane is too restrictive since it is evident from definition in IBC Section 202 and states that a fire lane is "A road or other passageway developed to allow the passage of fire apparatus. A fire lane is not necessarily intended for vehicular traffic other than fire apparatus". A fire apparatus access road can be used by vehicles other than fire apparatus. Additionally open space is not a defined term however yard is and yard is required to be clear and open to the sky which is what is intended for the open space.

The term fire lane is used in three instances in the IBC (Section 202, 506.3.1 and 705.8.1 Except 1 and 2) and since it is a a permissible element within the fire aparatus roadway definition the proposed definition will not add conflicts with other parts of the code.

Cost Impact: Will not increase the cost of construction
This code change is editorial. A fire access roadway will be required by the fire code to access exterior portions of a building within 200 ft of the response point.

G 143-15 : 506.3.1-FATTAH4661

G 144-15

506.3.3, 506.3.3.1 (New), 506.3.3.2 (New)

Proponent: William Hall, representing Portland Cement Association (jhall@cement.org); Jason Thompson (jthompson@ncma.org)

2015 International Building Code

Revise as follows:

506.3.3 Amount of increase. The area factor increase based on frontage shall be determined in accordance with ~~Equation 5-5:~~ Sections 506.3.3.1 and 506.3.3.2.

~~I_f=[*F*/*P*-0.25]*W*/30~~ ~~**(Equation 5-5)**~~

~~where:~~

~~I_f~~	~~=~~	~~Area factor increase due to frontage.~~
~~*F*~~	~~=~~	~~Building perimeter that fronts on a *public way* or open space having minimum distance of 20 feet (6096 mm).~~
~~*P*~~	~~=~~	~~Perimeter of entire building (feet).~~
~~*W*~~	~~=~~	~~Width of *public way* or open space (feet) in accordance with Section 506.3.2.~~

506.3.3.1 Type II contruction The area factor increase based on frontage shall be determined in accordance with equation 5.5.

I_f=[F/P- 0.25]W/30 (Equation 5-5)

where:

I_f = Area factor increase due to frontage.
F = Building perimeter that fronts on a public way or open space having minimum distance of 20 feet (6096 mm).
P = Perimeter of entire building (feet).
W = Width of public way or open space (feet) in accordance with Section 506.3.2.

Add new text as follows:

506.3.3.2 Type III, IV and V Construction. The area factor increase based on frontage shall be determined in accordance with equation 5.6.

I_f=[*F*/*P*- 0.25]*W*/30-H **(Equation 5-6**

where:

I_f	=	Area factor due to frontage
F	=	Building perimeter that fronts on a *public way* or open space having minimum distance of 20 feet (6096 mm)
P	=	Perimeter of entire building (feet).
W	=	Width of *public way* or open space (feet) in accordance with Section 506.3.2.
H	=	0 if 1 story 25% if 2 story 50% if 3 story 75% if 4 or more stories

Where increase factor is negative, 0 shall be used.

Reason: Fires during construction have been on the increase across the U.S and other countries which utilize combustible construction in multi-story buildings. The intensity of these fires put adjacent buildings, businesses and residents at risk until the project is complete, which can take up to 2 years to complete or more if the project stalls. These fires are caused by a multitude of reasons including but not limited to arson, smoking, cooking, heating and hot work. Fire service, even in large well equipped jurisdictions cannot effectively stop these conflagrations and most of these incidents end in total loss of the building under construction as well as damaged or destroyed adjacent buildings. Many times adjacent buildings are at risk due to the extreme heat, flying embers and wind speeds, as seen in the recent Los Angeles fire where paper, laying on a desk in an adjacent high rise structure caught fire and 6 six floors of the high rise were on fire. Currently the building code allows a 75% increase in the base tabular area when the structure has an on open perimeter of 20-30 feet, in more than 25 percent of total building perimeter.
This amount of distance does not correctly relate to safe distances needed to mitigate fire spread by thermal radiation. Based on the research report titled "External fire spread: building separation and boundary distances" published by the Fire Research Station, separation distances of 30 feet during construction are not adequate in limiting fire exposure in adjacent buildings and obviously do not provide safe distances for firefighting operations.
To paraphrase the report, the minimum intensity for fire ignition is 0.3 cal cm-2s-1. To maintain levels at or below this rate of thermal radiation, fire separation distances are based on the height and width of the burning building, the number of windows and a presumed heat release ranging from 2 to 4 cal cm-2s-1 depending on fire load. Office and residential usually are calculated at 2 cal cm-2s-1 but in the construction phase, a total burnout is expected with full exposure so 4 cal cm-2s-1 is the appropriate rate and is very

conservative. Thermal radiation rates could be much higher depending on wind and openness of the structure. Based on this information, fire separation distances for a small building 100 wide by 30 feet tall requires 52 feet of separation to keep adjacent structures at or below the minimum intensity for ignition. A large building, 7 stories, such as the one in LA, would have required a minimum of 141 feet separation distance.

This proposal limits the open perimeter area increase on multi-story combustible buildings based on a separation distance of 30 feet by introducing a new height variable into the equation.

Cost Impact: Will increase the cost of construction
While not directly increasing the cost of construction, this proposal will limit the allowable area increases in some buildings using combustible construction for multi-story construction. The cost impact is difficult to determine, based on means and methods used by the designer.

G 144-15 : 506.3.3-HALL4939

G 145-15

202 (New), 507.2

Proponent: Ali Fattah, City of San Diego Development Services Department, representing City of San Diego (afattah@sandiego.gov)

2015 International Building Code

Add new definition as follows:

SECTION 202 DEFINITIONS

FIRE APPARATUS ACCESS ROAD A road that provides fire apparatus access from a fire station to a facility, building or portion thereof. This is a general term inclusive of all other terms such as fire lane, public street, private street, parking lot lane and access roadway.

Revise as follows:

507.2 Measurement of open spaces.
Where Sections 507.3 through 507.13 require buildings to be surrounded and adjoined by *public ways* and *yards*, those open spaces shall be determined as follows:

1. Yards shall be measured from the building perimeter in all directions to the closest interior *lot lines* or to the exterior face of an opposing building located on the same *lot*, as applicable.
2. Where the building fronts on a *public way*, the entire width of the *public way* shall be used.
3. Yards shall be on the same lot and shall be accessed from a *fire apparatus access road.*

Reason: This code change is necessary to ensure that yards used for 60 ft wide open space required for unlimited area buildings be accessible by the fire department. The code change makes Section 507.2 consistent with Section 506.3.1 requires that the yard be located on the same lot and that the yard be accessed rom a fire apparatus access road. The term fire apparatus access road is also added in the definitions of the IBC as a part of this code change since the IFC definition is more descriptive of than fire lane of the options that are permissible.
Yards and streets surrounding unlimited area buildings serve two purposes. They provide a fire separation distance of not less than 60 ft for unlimited area buildings to protect adjoining properties. The yard is also used for fire department access for staging and fire fighting purposes.

2012 IBC commentary page 5-15 through 5-17 while intended for Section 507.2 includes figures depicting code intent for access to yards which this code change proposes to codify in the affected Sections.

Unlimited area buildings are large buildings with exterior exit doors ont he perimeter, additionally the IFC will require fire access roadways on the sides and possible the rear of the fire hose pull distance to all portions of the exterior wall of 200 ft is exceeded.

Cost Impact: Will not increase the cost of construction
This is an editorial code change and is necessary to ensure public safety and fire fighter safety.

G 145-15 : 507.2-FATTAH4666

G 146-15

507.4

Proponent: Anthony Apfelbeck, City of Altamonte Springs Building/Fire Safety Division, representing City of Altamonte Springs (ACApfelbeck@altamonte.org)

2015 International Building Code

Revise as follows:

507.4 Sprinklered, one-story buildings. The area of a Group A-4 building no more than one *story above grade plane* of other than Type V construction, or the area of a Group B, F, M or S building no more than one story above grade plane of any construction type, shall not be limited where the building is provided with an *automatic sprinkler system* throughout in accordance with Section 903.3.1.1 and is surrounded and adjoined by *public ways* or *yards* not less than 60 feet (18 288 mm) in width.

Exceptions:

1. Buildings and structures of Type I or II construction for rack storage facilities that do not have access by the public shall not be limited in height, provided that such buildings conform to the requirements of Sections 507.4 and 903.3.1.1 and Chapter 32 of the *International Fire Code* .
2. The *automatic sprinkler system* shall not be required in areas occupied for indoor participant sports, such as tennis, skating, swimming and equestrian activities in occupancies in Group A-4, provided that ~~both~~all of the following criteria are met:
    2.1. *Exit* doors directly to the outside are provided for occupants of the participant sports areas.
    2.2. The building is equipped with a *fire alarm system* with *manual fire alarm boxes* installed in accordance with Section 907.
    2.3. An *automatic sprinkler system* is provided in storage rooms, press boxes, concession booths or other spaces ancillary to the sport activity space.

Reason: While it is appropriate to eliminate fire sprinklers in the large open spaces of these facilities, protection of ancillary spaces by fire sprinklers should still be provided. Many of these spaces are concealed and don't contribute to the awareness of a developing fire condition. In addition, many ancillary spaces can have significant amounts of combustible contents. Concession spaces and equipment storage spaces are two examples that should still be protected with a fire sprinkler system.

Cost Impact: Will increase the cost of construction
This proposals will increase the cost of construction in order to protect ancillary spaces in these Group A-4 occupancies.

G 146-15 : 507.4-APFELBECK3863

G 147-15

508.2.3

Proponent: Jeff Hugo, National Fire Sprinkler Association, representing National Fire Sprinkler Association (hugo@nfsa.org)

2015 International Building Code

Revise as follows:

508.2.3 Allowable building area. The allowable area of the building shall be based on the applicable provisions of Section 506 for the main occupancy of the building. Aggregate accessory occupancies shall not occupy more than 10 percent of the floor area of the story in which they are located and shall not exceed the tabular values for nonsprinklered buildings in Table 506.2 for each such accessory occupancy.

Exception: Where a building is equipped throughout with an approved automatic sprinkler system in accordance with Section 903.3.1.2, aggregate accessory occupancies shall be not more than 50 per cent of the floor area of the floor of the story in which they are located where such accessary occupancies are permitted by NFPA 13R to be protected by quick-response or residential sprinklers. The allowable building area for stories with such accessory occupancies shall be based on the allowable building area for the main occupancy in accordance with Section 503.1.

Reason: The application of the 10% of the floor area criteria under IBC Section 508.2.3 to such types of residential occupancies covered under NFPA 13R creates major design and cost problems with 2 hour separations for accessary occupancies in such residential buildings. 2013 NFPA 13R Sections 6.2.2, 6.4.7 & 7.2 have detailed sprinkler and compartment requirements incorporated into the NFPA 13R standard to address accessary spaces outside the dwelling units when considered part of the residential (predominant) occupancy. This proposed code change would better correlate with the requirements in NFPA 13R for area/spaces outside the dwelling units that have fire loads similar to residential fire loads and/or are compartmented into 500 square feet or less in area.

Cost Impact: Will not increase the cost of construction
Reduces construction costs by reducing fire barriers between floors and adjacent occupancies.

G 147-15 : 508.2.3-HUGO4650

G 148-15

508.3.1

Proponent: John Williams, CBO, Chair, representing Adhoc Health Care Committee (AHC@iccsafe.org)

2015 International Building Code

Revise as follows:

508.3.1 Occupancy classification. Nonseparated occupancies shall be individually classified in accordance with Section 302.1. The requirements of this code shall apply to each portion of the building based on the occupancy classification of that space. In addition, the most restrictive provisions of Chapter 9 that apply to the nonseparated occupancies shall apply to the total nonseparated occupancy area. Where nonseparated occupancies occur in a *high-rise building*, the most restrictive requirements of Section 403 that apply to the nonseparated occupancies shall apply throughout the *high-rise building*. Where one of the non-separated occupancies is Group I-2, Condition 2, the most restrictive requirements of Sections 407, 509, 712, and Chapter 10 shall apply.

Reason: This proposal modifies the requirements for non-separated mixed uses. In a hospital buildings, it is important to maintain some fire protection features throughout the building. Many of these restrictions directly support the defend-in-place concept that hospitals rely on. Specifically included are incidental use areas, protected vertical openings, and hospital-specific egress provisions. As written, the current code would allow an unprotected vertical opening to be located in the non-separated business portion of a hospital building. Arguably you could use the definition of a smoke compartment to challenge this idea, but that argument is very subtle and highlights an inherent conflict ion the code. Section 407 is specific to I-2 occupancies, not to building that contain I-2 occupancies. Yet section 407 contains provisions for corridor construction, smoke compartmentation and hospital specific egress provisions that should be maintained to support the defend in place concept.

By clearly stating in this section that there are some concepts in a hospital building that need to be treated differently, we can provide clear direction to designers and enforcers. This code change is needed to be consistent with the requirements of Medicaid and Medicare (CMS.)

The ICC Ad Hoc Committee on Healthcare (AHC) has just completed its 4th year. The AHC was established by the ICC Board to evaluate and assess contemporary code issues relating to hospitals and ambulatory healthcare facilities. This is a joint effort between ICC and the American Society for Healthcare Engineering (ASHE), a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. Information on the AHC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the AHC effort can be downloaded from the AHC website at: http://www.iccsafe.org/cs/AHC/Pages/default.aspx.

Cost Impact: Will increase the cost of construction
While this is an increase in construction based on only IBC requirements, however, this is a requirement from federal CMS in hospitals; therefore, this is not an increase in actual construction cost.

G 148-15 : 508.3.1-WILLIAMS4243

G 149-15

508.3.2, 508.4.3

Proponent: Robert Snyder, City of Bellevue, representing Washington Association of Building Officials Technical Code Development Committee (rsnyder@bellevuewa.gov)

2015 International Building Code

Revise as follows:

508.3.2 Allowable building area, height and ~~height~~number of stories. The allowable *building area, height* and ~~height~~number of stories of the building or portion thereof shall be based on the most restrictive allowances for the occupancy groups under consideration for the type of construction of the building in accordance with Section 503.1.

508.4.3 Allowable building height and number of stories. Each separated occupancy shall comply with the *building height and story* limitations based on the type of construction of the building in accordance with Section 503.1.

> **Exception:** Special provisions of Section 510 shall permit occupancies at *building heights and number of stories* other than those provided in Section 503.1.

Reason: This proposal provides consistency between IBC Sections 503.1, 504.1, 504.2, 508.3.2 and 508.4.3 by including both building height and number of stories. The number of stories, as well as, the building height must be considered when determining the requirements for separated and non-separated occupancies.

Cost Impact: Will not increase the cost of construction
The code change proposal will not increase the cost of construction. Changes presented are editorial.

G 149-15 : 508.3.2-SNYDER4503

G 150-15

508.4.1

Proponent: Gregory Keith, Professional heuristic Development, representing The Boeing Company (grkeith@mac.com)

2015 International Building Code

Revise as follows:

508.4.1 Occupancy classification. Separated occupancies shall be individually classified in accordance with Section 302.1. Each separated space shall comply with this code based on the occupancy classification of that portion of the building. The most restrictive provisions of Chapter 9 that apply to the occupancies not required to have an occupancy separation in accordance with Table 508.4 shall apply to the total un-separated occupancy areas. Where such un-separated occupancies occur in a high-rise building, the most restrictive requirements of Section 403 that apply to the un-separated occupancies shall apply throughout the high-rise building.

Reason: IBC mixed occupancy provisions have evolved over several editions. The separated occupancy design option now includes conditions where given occupancies are not required to have a physical occupancy separation. The nonseparated occupancy provisions at Section 508.3.1 state that specific Chapter 9 and Section 403 requirements potentially apply to the entire applicable space. It is only logical that the same requirements apply to un-separated occupancies allowed by Section 508.4. This proposal effectively duplicates the Section 508.3 provisions in Section 508.4. Approval of this proposal will result in the consistent protection of nonseparated and un-separated occupancies.

Cost Impact: Will increase the cost of construction
Potentially, approval of this proposal could result in an increase of cost in some occupancies using the separated mixed occupancy design option. However, such costs will not exceed those currently associated with the nonseparated occupancy design option.

G 150-15 : 508.4.1-KEITH4376

G 151-15

508.4.1, TABLE 508.4

Proponent: Edward Kulik, representing Building Code Action Committee (bcac@iccsafe.org)

2015 International Building Code

Revise as follows:

508.4.1 Occupancy classification. Separated occupancies shall be individually classified in accordance with Section 302.1. Each separated space shall comply with this code based on the occupancy classification of that portion of the building. The most restrictive provisions of Chapter 9 that apply to the separate occupancies shall apply to the total non-fire barrier separated occupancy areas. Occupancy separations that serve to define fire area limits established in Chapter 9 for requiring a fire protection system shall also comply with Section 901.7.

TABLE 508.4
REQUIRED SEPARATION OF OCCUPANCIES (HOURS)

I-2	—	—	—	—	N	N	2	NP	2	NP	2	NP	NP	NP	3	NP	2	NP	2	NP
R[a]	—	—	—	—	—	—	N	N	1[c]	2[c]	1	2	NP	NP	3	NP	2	NP	2	NP
F-2, S-2[b] , U	—	—	—	—	—	—	—	—	N	N	1	2	NP	NP	3	4	2	3	2	NP
B[e] , F-1, M, S-1	—	—	—	—	—	—	—	—	—	—	N	N	NP	NP	2	3	1	2	1	NP
H-1	—	—	—	—	—	—	—	—	—	—	—	—	N	NP	NP	NP	NP	NP	NP	NP
H-2	—	—	—	—	—	—	—	—	—	—	—	—	—	—	N	NP	1	NP	1	NP
H-3, H-4	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	1[d]	NP	1	NP
H-5	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	N	NP

S = Buildings equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1.

NS = Buildings not equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1.

N = No separation requirement.

NP = Not permitted.

a See Section 420.

b. The required separation from areas used only for private or pleasure vehicles shall be reduced by 1 hour but not to less than 1 hour.

c. See Section 406.3.4.

d. Separation is not required between occupancies of the same classification.

e. See Section 422.2 for ambulatory care facilities.

f. Occupancy separations that serve to define fire area limits established in Chapter 9 for requiring fire protection systems shall also comply with Section 707.3.10 and Table 707.3.10 in accordance with Section 901.7.

Reason: This proposal is intended to clarify how to address fire protection installations for separated occupancies where the table does not require a fire separation. The concepts contained within Chapter 9 of the code are that area fire protection systems are installed throughout a fire area at a minimum for proper functioning. The additional language proposed for Section 508.4.1 is copied from Section 508.3.1 and the added note F. provides direct linkage to the fire area provisions found in Chapter 9 and links to the requirements for fire barriers in Chapter 7. This clarification eliminates confusion that occasionally occurs when a designer or code official applies occupancy linked fire protection requirements in a "separated" occupancy that Table 508.4 does not specify a fire rated separation for.
This public proposal is submitted by the ICC Building Code Action Committee (BCAC). The BCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the BCAC has held 13 open meetings and numerous workgroup calls which included members of the BCAC as well as any interested party to discuss and debate the proposed changes and the public comments. Related documentation and reports are posted on the BCAC website at: http://www.iccsafe.org/cs/BCAC/Pages/default.aspx.

Cost Impact: Will not increase the cost of construction
This proposal will not increase the cost of construction. By clarifying how to apply the fire protection requirements for an occupancy classification when dealing with separated occupancies the cost of compliance may be reduced by eliminating costly errors in application.

G 152-15

508.4.4.2 (New)

Proponent: Vickie Lovell, InterCode Incorporated, representing Fire Safe North America (vickie@intercodeinc.com)

2015 International Building Code

Add new text as follows:

508.4.4.2 **Fire-resistance ratings.** The *fire-resistance ratings* in Table 508.4 shall not be permitted to be reduced to less than 2 hours in buildings of construction Types IIB, IIIB and VB in Risk Categories III and IV identified in Table 1604.5 where such buildings are any of the following:

1. Assigned to Seismic Design Category C or D in Table 1613.3.5(1).
2. Located in a flood hazard area established in accordance with Section 1612.3.
3. Located in a hurricane-prone region.

Reason: As hazard events, both naturally-occurring and man-made, are increasing in number and severity in the United States and around the world, the resilience of communities and the individual buildings within those communities is becoming of vital importance.
A National Institute of Building Sciences Publication (May, 2014) entitled "Moving Forward: Findings and Recommendations", states that "while a long history of building codes has laid the foundation for addressing the impacts of natural and man-made hazards, changes in the frequency and severity of events have brought new challenges — challenges requiring the engagement and support of policymakers. While building codes serve as the minimum requirements for life-safety in the building stock, basic life-safety protections do not fully address building performance requirements to achieve resilience."

Mitigation includes, among other things, fortifying buildings so that they are less likely to be severely damaged or completely destroyed during or immediately after a disaster. It is the key to recovery after a disaster. Mitigation allows individuals and communities to lessen post-disaster disruption and rebuild more quickly. States and cities have started implementing more stringent requirements in specific geographic areas they have designated as higher-risk. The purpose of this series of code changes proposed by Fire Safe North America is to encourage the debate in the code development process to identify what constitutes resilient buildings, and begin to identify issues that will become the basis for "new minimum requirements" for increased building resiliency.

Responding to the challenge of mitigating damage and resilient buildings is an admittedly complex topic. Fire Safe North America proposals are intended to reduce the total reliance of a community and its firefighters on automatic sprinkler systems in disaster-prone areas of the country where the water supply and/or power are likely to be interrupted, or are likely to have water supply system operational issues. The proposals, if approved, will fortify the building code requirements for the most vulnerable buildings to fire - Type IIB, IIIB, and VB construction, which are also classified as Risk Category III and IV in Table 1604.5, and in high-risk, disaster prone regions. The proposals modify the following code requirements in such buildings:

1. Reduce allowable area limits
2. Protect the path of egress by limiting travel distances
3. Protect the path of egress by protecting corridors
4. Require higher fire resistance ratings for occupancy separations
5. Require higher fire resistance ratings for building elements

These proposals are intended to be conservative so as to promote community resiliency and disaster mitigation by protecting essential buildings with both sprinkler protection AND fire resistance rated compartmentation. These proposals may be fairly considered to be the proverbial "belt-and suspenders" approach, requiring both sprinkler protection and increased fire resistance rated compartmentation in specific buildings in high risk areas for disasters.

Historically, the code has been written using the general assumption that automatic sprinklers will operate satisfactorily and there will be suitable power for such building operations. Code users design and build assuming that firefighters will be able to respond at their normal efficiencies. In some parts of the country, buildings impacted by disasters may remain without reliable water and/or power for a considerable period of time, well after the occurrence of the disaster. History has shown that increased incidents of fires after a disaster can be more destructive to life and property than the disaster itself. Total reliance on an uninterrupted power and water supply may not be an acceptable risk. It may also be an unacceptable risk to assume that firefighters will be able to respond at their normal efficiencies.

For example, more than 15% of the U.S. population lives in potential major earthquake areas. 41 states and territories have moderate to high risk. There is a real likelihood of power and water supplies being interrupted following a major seismic event, along with the potential for multiple simultaneous structure fires and also building-to-building fire spread. In October 17, 1989, a 7.1 earthquake in Santa Cruz Mountains was responsible for 26 fires in San Francisco, 60 miles from epicenter. There were 67 documented breaks in water mains which effectively eliminated water pressure in the area. On January 19, 1994, a 6.8 earthquake centered in Northridge, CA. There were approximately 100 fire ignitions, 30 to 50 of those were considered significant. The water supply systems in the area were damaged causing low pressure in water distribution. On January 17, 1995, a 6.8 (approx.) earthquake near Kobe, Japan caused 90 fires to start within minutes. 85 spread to adjacent buildings and 10 approached or reached conflagration status. 1,700 water line breaks occurred within a couple of hours. There were 7,000 buildings destroyed by fire alone.

In 1997, the Red River flooded Grand Forks, North Dakota, causing $3.7 billion in flood losses, and displaced thousands of families and businesses. Similar data of increased fire incidents are available in other flood and hurricane-prone areas.

Undoubtedly, this will increase the cost of construction in these specific buildings. However, a recent FEMA's 2010 report "Mitigation's Value to Society" statement described how mitigation is an investment that needs to be made. A recent study by the NIBS Multihazard Mitigation Council (MMC) identified that each dollar spent on mitigation saves an average of $4.00 in disaster recovery.

The two-volume NIBS MMC study report is available for free download at:
http://www.nibs.org/index.php/mmc/projects/nhms

Cost Impact: Will increase the cost of construction
This code change proposal will increase the cost of construction of some building types.

G 152-15 : 508.4.4.2 (New)-LOVELL5291

G 153-15

508.4.5 (New)

Proponent: Ronald Geren, RLGA Technical Services, LLC, representing Self (ron@specsandcodes.com)

2015 International Building Code

Add new text as follows:

508.4.5 Exterior walls. Portions of exterior walls of the same building, or multiple buildings on the same lot that are considered as one building in accordance with Exception 1 of Section 705.3 and face occupancies requiring not more than a 2-hour separation in accordance with Table 508.4 shall be separated by not less than 10 feet (3048 mm), measured at right angles, from the surfaces of the facing exterior walls. For occupancies requiring a 3-hour or greater separation, the separation distance shall be not less than 15 feet (4572 mm).

> **Exception:** Walls and openings protected in accordance with Section 705 based on an assumed lot line between them. The use of the assumed lot line shall only apply to those portions of exterior walls that have a fire separation distance distance less than the required minimum distance.

Reason: Per Section 508.4.4, occupancies that are adjacent to each other within a buildng require separation per Table 508.4. However, where exterior walls of the same building face each other and the occupancy groups within those portions of the building would require separation, then some kind of protection should be provided. As it currently stands, there are no restrictions on the distance, fire-resistance rating, or opening protection between facing exterior walls of occupancy groups that require separation.
This proposal follows similar separation requirement for exterior exit stairways and ramps per Section 1027.5, which requires a 10-foot fire separation distance between the exterior exit stairway or ramp and other portions of the building. Thus, this distance has the equivalency of a maximum 2-hour fire-resistance rating, since there is not a limitation on the number of stories connected by the exterior exit stairway or ramp. Similar protection requirements based on a 10-foot fire separation distance are found in Section 1021.4 for egress balconies and Section 1028.4.2 for egress courts.

Since some occupancies require a 3- or 4-hour occupancy separation, a greater distance is specified.

The exception allows the use of an imaginary lot line to determine exterior wall and opening protection for only thos portions of th exterior wall that have a fire separation distance less than the required minimums. This exception is considered since the imaginary lot line method can be applied to any building, regardless of construction type or the occupancy groups within.

Cost Impact: Will increase the cost of construction
This will have a minor increase in construction cost when applied to building designs that would have previously been acceptable with narrower fire separation distances. The cost increase can be avoided through design by ensuring the minimum fire separation distances specified are maintained between the opposing walls. Some jurisdictions have been enforcing the imaginary lot line for separation of exterior walls, whether they are the same building or not, when the occupancies of the opposing portions of the building require separation and the separated occupancies method is used. In these locations, there would be no cost impact.

G 154-15

TABLE 509

Proponent: Jeffrey Betz, representing AT&T (jbetz@att.com)

2015 International Building Code

Revise as follows:

TABLE 509
INCIDENTAL USES

ROOM OR AREA	SEPARATION AND/OR PROTECTION
Furnace room where any piece of equipment is over 400,000 Btu per hour input	1 hour or provide automatic sprinkler system
Rooms with boilers where the largest piece of equipment is over 15 psi and 10 horsepower	1 hour or provide automatic sprinkler system
Refrigerant machinery room	1 hour or provide automatic sprinkler system
Hydrogen fuel gas rooms, not classified as Group H	1 hour in Group B, F, M, S and U occupancies; 2 hours in Group A, E, I and R occupancies.
Incinerator rooms	2 hours and provide automatic sprinkler system
Paint shops, not classified as *Group* H, located in occupancies other than Group F	2 hours; or 1 hour and provide automatic sprinkler system
In Group E occupancies, laboratories and vocational shops not classified as Group H	1 hour or provide automatic sprinkler system
In Group I-2 occupancies, laboratories not classified as Group H	1 hour and provide automatic sprinkler system
In ambulatory care facilities, laboratories not classified as Group H	1 hour and provide automatic sprinkler system
Laundry rooms over 100 square feet	1 hour or provide automatic sprinkler system
In Group I-2, laundry rooms over 100 square feet	1 hour
Group I-3 cells and Group I-2 patient rooms equipped with padded surfaces	1 hour
In Group I-2, physical plant maintenance shops	1 hour
In ambulatory care facilities or Group I-2 occupancies, waste and linen collection rooms with containers that have an aggregate volume of 10 cubic feet or greater	1 hour
In other than ambulatory care facilities and Group I-2 occupancies, waste and linen collection rooms over 100 square feet	1 hour or provide automatic sprinkler system
In ambulatory care facilities or Group I-2 occupancies, storage rooms greater than 100 square feet	1 hour

Stationary storage battery systems in accordance with Section 609 of the *International Fire Code* and ~~having a liquid electrolyte capacity of more than 50 gallons for flooded lead-acid, nickel cadmium or VRLA, or more than 1,000 pounds for lithium-ion and lithium metal polymer~~ used for facility standby power, emergency power or uninterruptable power supplies	1 hour in Group B, F, M, S and U occupancies; 2 hours in Group A, E, I and R occupancies.

For SI: 1 square foot = 0.0929 m^2, 1 pound per square inch (psi) = 6.9 kPa, 1 British thermal unit (Btu) per hour = 0.293 watts, 1 horsepower = 746 watts, 1 gallon = 3.785 L, 1 cubic foot = 0.0283 m^3.

Reason: This proposal links International Building Code Table 509 to the specific definitions, scope and section of the International Fire Code related to Stationary Storage Battery Systems. By using the definition and terms in the Internatioanl Fire Code section related to stationary storage battery systems this provides the ability to modify the various aspects of these systems in one code within one code cycle process. As new technology emerges and changes or additional types of batteries are added a change in the fire code requirement as to types of batteries and quantities will be automatically addressed for Table 509 of the International Building Code.

Bibliography: International Fire Code and Commentary, 2012, Page 6-32 through 6-35

Cost Impact: Will not increase the cost of construction
This proposal aligns the application of the International Buiilding Code (IBC) and International Fire Code (IFC) regarding stationary storage battery systems. By referring the application criteria (scope) to the International Fire Code for the additional and deletion of battery types and quantities in one source document and under one code cycle.

G 154-15 : T509 -BETZ4714

G 155-15

TABLE 509

Proponent: Jeffrey Betz, AT&T, representing AT&T (jbetz@att.com)

2015 International Building Code

Revise as follows:

TABLE 509
INCIDENTAL USES

ROOM OR AREA	SEPARATION AND/OR PROTECTION
Furnace room where any piece of equipment is over 400,000 Btu per hour input	1 hour or provide automatic sprinkler system
Rooms with boilers where the largest piece of equipment is over 15 psi and 10 horsepower	1 hour or provide automatic sprinkler system
Refrigerant machinery room	1 hour or provide automatic sprinkler system
Hydrogen fuel gas rooms, not classified as Group H	1 hour in Group B, F, M, S and U occupancies; 2 hours in Group A, E, I and R occupancies.
Incinerator rooms	2 hours and provide automatic sprinkler system
Paint shops, not classified as Group H, located in occupancies other than Group F	2 hours; or 1 hour and provide automatic sprinkler system
In Group E occupancies, laboratories and vocational shops not classified as Group H	1 hour or provide automatic sprinkler system
In Group I-2 occupancies, laboratories not classified as Group H	1 hour and provide automatic sprinkler system
In ambulatory care facilities, laboratories not classified as Group H	1 hour and provide automatic sprinkler system
Laundry rooms over 100 square feet	1 hour or provide automatic sprinkler system
In Group I-2, laundry rooms over 100 square feet	1 hour
Group I-3 cells and Group I-2 patient rooms equipped with padded surfaces	1 hour
In Group I-2, physical plant maintenance shops	1 hour
In ambulatory care facilities or Group I-2 occupancies, waste and linen collection rooms with containers that have an aggregate volume of 10 cubic feet or greater	1 hour
In other than ambulatory care facilities and Group I-2 occupancies, waste and linen collection rooms over 100 square feet	1 hour or provide automatic sprinkler system
In ambulatory care facilities or Group I-2 occupancies, storage rooms greater than 100 square feet	1 hour

Stationary storage battery systems having a liquid electrolyte capacity of more than 50 gallons for flooded lead-acid, nickel cadmium or VRLA, or more than 1,000 pounds for lithium-ion and lithium metal polymer used for facility standby power, emergency power or uninterruptable power supplies. Stationary storage battery systems shall be located within a room or space separated as required by this Table. Stationary storage battery systems are permitted to be located in the same room as equipment they support and power additional equipment in other areas of the building as designed.	1 hour in Group B, F, M, S and U occupancies; 2 hours in Group A, E, I and R occupancies.

For SI: 1 square foot = 0.0929 m^2, 1 pound per square inch (psi) = 6.9 kPa, 1 British thermal unit (Btu) per hour = 0.293 watts, 1 horsepower = 746 watts, 1 gallon = 3.785 L, 1 cubic foot = 0.0283 m^3.

Reason: This proposal aligns the basic criteria of the International Building and International Fire Codes. The intent of the International Building Code is to provide a fire-resistance-rated separation from the remainder of the building. The International Fire Code (IFC) section 608 defines the requirements for STATIONARY STORAGE BATTERY SYSTEMS and directs the reader to section 608.4 stating "Room design and construction. Enclosure of stationary battery systems shall comply with International Building Code. Battery systems shall be allowed to be in the same room with the equipment they support." The International Fire Code Commentary for this section reads "This section requires that battery rooms meet the basic construction requirements of the IBC. Section and Table 509 of the IBC treat rooms housing stationary storage battery systems as incidental use areas based on the electrolyte capacity of the system. In that case, though no different occupancy group is assigned to it, the battery rooms fire-resistance rating must be 1 or 2 hours, depending on the occupancy group or groups from which it must be separated in the building in which it is located. The construction of the battery room must also comply with the material requirements of the IBC for the type of construction required for the building. Additionally, there is no requirement for separating the equipment that the battery system supports from the battery system itself". (Footnote 2012 International Fire Code and Commentary 608.4) This ongoing operational use is not addressed in the International Building Code and leads to confusion and misapplication which can be interpreted as a conflict between the International Building Code and International Fire Code. Many Authorities Having Jurisdiction use the International Building Code as the controlling document when a perceived conflict is identified. Thus, the current allowance for commingling of batteries and equipment may not be understood and consequently is therefore occasionally not permitted by Building Officials.
Stationary storage battery systems housed in either a telecommunications or information technology space are currently separated from the remaining spaces by the design requirement of these activities with a minimum of a 1 hour fire barrier. Both the telecommunications and information technology industries have collocated battery systems with equipment installations for many years without serious risk to the occupancy or occupants. The equipment rooms utilized in these industries are accessible only to authorize personnel. Battery systems for non-dedicated equipment spaces are required to be housed in a non-combustible, locked cabinet or other enclosure to prevent access to unauthorized personnel as directed within the International Fire Code. Stationary storage battery systems in occupied work centers are separately addressed in the International Fire Code. Thus the intention to separate the stationary battery systems is met by the requirements of Table 509. The prohibition of utilizing the power produced by a stationary battery system is contradictory to the intent of the separation environment. Code required fire barrier are not deleted or modified by this proposal. Fire barriers continue to protect the general public when the storage battery power supplied equipment spaces are accessible only to authorized personnel and meet the requirements of Table 509.
This code change proposal also incorporates modification to eliminate restricting the stationary storage battery systems power production only to the room that the batteries may be contained. The code currently inhibits the long term industry practice of utilizing stationary storage battery systems contained within existing equipment spaces to power similar equipment housed in other fire barrier separated equipment spaces within the building. Current technology and deployment incorporates distributed integrated power within the design of signal processing and server applications and this proposal supports industry design.

Bibliography: International Builidng Code and Commentary ICC 2012 page 5-43 and 44
International Fire Code and Commentary ICC 2012 6-32 through 6-35

Cost Impact: Will not increase the cost of construction
Clarifies current requirements found in teh International Fire Code. Reduces cost and resources for AHJ and applicant by directly defining the application of Table 509.

G 156-15

TABLE 509

Proponent: Randall McCarver, representing CenturyLink and Verizon (randall.mccarver@ericsson.com)

2015 International Building Code

Revise as follows:

TABLE 509
INCIDENTAL USES

ROOM OR AREA	SEPARATION AND/OR PROTECTION
Furnace room where any piece of equipment is over 400,000 Btu per hour input	1 hour or provide automatic sprinkler system
Rooms with boilers where the largest piece of equipment is over 15 psi and 10 horsepower	1 hour or provide automatic sprinkler system
Refrigerant machinery room	1 hour or provide automatic sprinkler system
Hydrogen fuel gas rooms, not classified as Group H	1 hour in Group B, F, M, S and U occupancies; 2 hours in Group A, E, I and R occupancies.
Incinerator rooms	2 hours and provide automatic sprinkler system
Paint shops, not classified as Group H, located in occupancies other than Group F	2 hours; or 1 hour and provide automatic sprinkler system
In Group E occupancies, laboratories and vocational shops not classified as Group H	1 hour or provide automatic sprinkler system
In Group I-2 occupancies, laboratories not classified as Group H	1 hour and provide automatic sprinkler system
In ambulatory care facilities, laboratories not classified as Group H	1 hour and provide automatic sprinkler system
Laundry rooms over 100 square feet	1 hour or provide automatic sprinkler system
In Group I-2, laundry rooms over 100 square feet	1 hour
Group I-3 cells and Group I-2 patient rooms equipped with padded surfaces	1 hour
In Group I-2, physical plant maintenance shops	1 hour
In ambulatory care facilities or Group I-2 occupancies, waste and linen collection rooms with containers that have an aggregate volume of 10 cubic feet or greater	1 hour
In other than ambulatory care facilities and Group I-2 occupancies, waste and linen collection rooms over 100 square feet	1 hour or provide automatic sprinkler system
In ambulatory care facilities or Group I-2 occupancies, storage rooms greater than 100 square feet	1 hour

A stationary~~Stationary~~ storage battery system ~~systems~~ having a liquid electrolyte capacity of more than 50 gallons for flooded lead-acid, nickel cadmium or VRLA, or more than 1,000 pounds for lithium-ion and lithium metal polymer used for facility standby power, emergency power or uninterruptable power supplies. Battery systems shall be allowed to be in the same room with the equipment they support.	1 hour in Group B, F, M, S and U occupancies; 2 hours in Group A, E, I and R occupancies.

For SI: 1 square foot = 0.0929 m^2, 1 pound per square inch (psi) = 6.9 kPa, 1 British thermal unit (Btu) per hour = 0.293 watts, 1 horsepower = 746 watts, 1 gallon = 3.785 L, 1 cubic foot = 0.0283 m^3.

Reason: In locations where a battery system exceeding the limits in Table 509 is considered an incidental occupancy, there is a conflict with provisions of the IFC. IFC 608.4 specifically permits battery systems to be in the same room with the equipment they support. If a fire separation is required, it should be allowed to encompass the equipment served, also. This change makes it clear that the required separation can encompass that equipment. The text was revised to indicate that the limits apply to individual battery systems, not an aggregate of all battery systems in the incidental accessory occupancy. Any increased hazard from battery systems will occur in a single cell, not in the aggregate of all systems in an occupancy.

Cost Impact: Will not increase the cost of construction
This change provides clarification to ensure consistency with the IFC. No change in construction is required.

In ambulatory care facilities or Group I-2 occupancies, waste and linen collection rooms with containers that have an aggregate volume of 10 cubic feet or greater	1 hour
In other than ambulatory care facilities and Group I-2 occupancies, waste and linen collection rooms over 100 square feet	1 hour or ~~provide~~ automatic sprinkler system[a]
In ambulatory care facilities or Group I-2 occupancies, storage rooms greater than 100 square feet	1 hour

Stationary storage battery systems having a liquid electrolyte capacity of more than 50 gallons for flooded lead-acid, nickel cadmium or VRLA, or more than 1,000 pounds for lithium-ion and lithium metal polymer used for facility standby power, emergency power or uninterruptable power supplies	1 hour in Group B, F, M, S and U occupancies; 2 hours in Group A, E, I and R occupancies.
Electrical dry-type transformer rated over 112 ½ kVA Exception: Where transformers with Class 155 or higher insulation systems are separated from combustible material by a fire-resistant, heat-insulating barrier or by not less than 6 feet horizontally and 12 feet vertically or completely enclosed except for ventilating openings.	1 hour [d]
Electrical dry-type transformer rated over 35,000 volts.	1 hour and automatic sprinkler system [a b d]
Electrical oil-insulated transformer of any rating.	1-hour and automatic sprinkler system and oil containment serving all if multiple transformers; sized to contain the volume of oil in the largest unit [a b c d]

a. Automatic sprinkler system in accordance with Seciton 903.3.1.1.

b. An alternative automatic fire extinguishing system provided in lieu of an automatic sprinkler system in accordance with Section 903.1.1.

c. See the National Electric Code (NFPA 70) for detailed construction requirements and exceptions regarding oil and other liquid insulated transformers.

d. See additional requirements in Section 509.5.

For SI: 1 square foot = 0.0929 m^2, 1 pound per square inch (psi) = 6.9 kPa, 1 British thermal unit (Btu) per hour = 0.293 watts, 1 horsepower = 746 watts, 1 gallon = 3.785 L, 1 cubic foot = 0.0283 m^3.

Add new text as follows:

509.5 Electrical room construction. Rooms containing transformers shall be in accordance with Section 1010.1.10 and with this section.

1. Where Table 509 only specifies separation without protection for rooms containing electrical transformers, the room shall be in accordance with the following:

1.1. Ventilation openings in surrounding building exterior walls or roof/ceiling construction shall be provided with an open area of not less than 3 square inches for each kVA of transformer capacity or not less than 1 square foot, whichever is greater. Ventilation openings shall be in accordance with Table 716.5 and protected wtih screens, grating or louvers. The ventilation openings shall be located in accordance with one of the following:

1.1.1. Provide 100 percent of ventilation openings near the ceiling of the electrical room; or

1.1.2. Proivde half of the ventilation openings at the floor and the balance of the openings near the ceiling of the electrical room.

1.2. Electrical rooms shall be provided at the exterior of the building to allow natural ventilation in accordance with Item 1, or shall be provided with mechanical ventilation located and sized to effectively control the transformer full load losses and limit the termperature rise in accordance with the transformer rating.

1.3. Where the room is located at slab on grade condition, a concrete slab not less than 4 inches thick shall be provided.

1.4. Doors from the electrical room shall sw2ing in the diretion of egress travel away from teh electrical room. Doors shall be self-closing to a latched and locked position and shall be provided with panic hardware.

1.5. Pipes and ducts, other than those that service the electrical room, shall not pass through an electrical room.

2. Where table 509 specifies both separation and protection for rooms containing electrical transformers, the room shall be in accordance with Item 1 and the following:

2.1. the room shall be separated and protected as specified in Table 509 or it shall be located in an enclosure constructed of concrete or similar materials providing not less than three hour fire-resistance-rated construction with opening protectives provided in accordance with Table 716.5.

For SI: 1 square inch = 645.2 mm.

a. Two doors, each with a fire protection rating of 1 1/2 hours, installed on opposite sides of the same opening in a fire wall, shall be deemed equivalent in fire protection rating to one 3-hour fire door.

b. Fire-resistance-rated glazing tested to ASTM E 119 in accordance with Section 716.2 shall be permitted, in the maximum size tested.

c. Except where the building is equipped throughout with an automatic sprinkler and the fire-rated glazing meets the criteria established in Section 716.5.5.

d. Under the column heading "Fire-rated glazing marking door vision panel," W refers to the fire-resistance rating of the glazing, not the frame.

e. See Section 716.5.8.1.2.1.

Reason: Construction requirements for electrical room floors, walls, ceilings, openings, hardware etc are contained in the National Electrical Code (NFPA 70). The terms used are not the same as those in the IBC. The differences can cause confusion for the design professional which can result in costly mistakes or unecessary features. This proposal brings the building related requirements in the NEC into the IBC in terms consistent with the rest of the building element nomenclature to add clarity and consistency. While editing Table 509 the term "provide" was deleted from its positions before "automatic sprinkler system" and inserted at the top of the table so that all enclosures and protection would be provided as intended by the table.

For the automatic sprinkler system requirement, a footnote was added for consistency with the rest of the IBC regarding automatic sprinkler systems.

Cost Impact: Will not increase the cost of construction
There is no intended change in construction requirements. Hopefully this proposal will clarify some confusing language and reduce costs.

2015 International Building Code

Delete without substitution:

~~**509.3 Area limitations.** Incidental uses shall not occupy more than 10 percent of the *building area* of the *story* in which they are located.~~

Reason: This section is unenforceable. Many incidental uses exceed 10% of the floor area of the story they are located in. In some cases the entire building can be an incidental use. For example, a heating plant for a hospital will have boilers that exceed the limits of Table 509, but are located in a single building. Another example is the location of laboratories and vocational classrooms in a high school. It is very common to have these areas exceed 10% of the area of the story that they are located in. The interpretation from ICC is to classify these areas as a different occupancy. This is contrary to the requirements of Section 509.2. It states "Incidental uses shall not be individually classified in accordance with Section 302.1". If you do classify the chemistry laboratory as an occupancy, it would be classified as a Group E occupancy (assuming the amount of chemicals do not exceed the MAQ's in Section 307.1). Therefore, if the lab exceeds 10% of the story area, there would be no separation between the lab and an adjacent classroom. However, if it was less than 10%, a separation would be required. This doesn't make sense. By deleting the area limitation, this problem is resolved and a separation would be required regardless of the size.

Bibliography: None

Cost Impact: Will not increase the cost of construction
There is no cost impact from this change. This change is a clarification of th existing language back to the way it was in the 2006 IBC.

TABLE 509, 509.1, 509.2, 509.3, 509.4, 509.4.1, 509.4.2, 509.4.2.1

Proponent: Stephen Thomas, Colorado Code Consulting, LLC, representing Colorado Chapter (sthomas@coloradocode.net)

2015 International Building Code

Revise as follows:

~~509~~ 427 INCIDENTAL USES

~~509.1~~ 427.1 General. Incidental uses located within single occupancy or mixed occupancy buildings shall comply with the provisions of this section. Incidental uses are ancillary functions associated with a given occupancy that generally pose a greater level of risk to that occupancy and are limited to those uses listed in Table ~~509~~ 427.1.

Exception: Incidental uses within and serving a *dwelling unit* are not required to comply with this section.

TABLE ~~509~~ 427.1
INCIDENTAL USES

ROOM OR AREA	SEPARATION AND/OR PROTECTION
Furnace room where any piece of equipment is over 400,000 Btu per hour input	1 hour or provide automatic sprinkler system
Rooms with boilers where the largest piece of equipment is over 15 psi and 10 horsepower	1 hour or provide automatic sprinkler system
Refrigerant machinery room	1 hour or provide automatic sprinkler system
Hydrogen fuel gas rooms, not classified as Group H	1 hour in Group B, F, M, S and U occupancies; 2 hours in Group A, E, I and R occupancies.
Incinerator rooms	2 hours and provide automatic sprinkler system
Paint shops, not classified as Group H, located in occupancies other than Group F	2 hours; or 1 hour and provide automatic sprinkler system
In Group E occupancies, laboratories and vocational shops not classified as Group H	1 hour or provide automatic sprinkler system
In Group I-2 occupancies, laboratories not classified as Group H	1 hour and provide automatic sprinkler system
In ambulatory care facilities, laboratories not classified as Group H	1 hour and provide automatic sprinkler system
Laundry rooms over 100 square feet	1 hour or provide automatic sprinkler system
In Group I-2, laundry rooms over 100 square feet	1 hour
Group I-3 cells and Group I-2 patient rooms equipped with padded surfaces	1 hour
In Group I-2, physical plant maintenance shops	1 hour
In ambulatory care facilities or Group I-2 occupancies, waste and linen collection rooms with containers that have an aggregate volume of 10 cubic feet or greater	1 hour
In other than ambulatory care facilities and Group I-2 occupancies, waste and linen collection rooms over 100 square feet	1 hour or provide automatic sprinkler system

In ambulatory care facilities or Group I-2 occupancies, storage rooms greater than 100 square feet	1 hour
Stationary storage battery systems having a liquid electrolyte capacity of more than 50 gallons for flooded lead-acid, nickel cadmium or VRLA, or more than 1,000 pounds for lithium-ion and lithium metal polymer used for facility standby power, emergency power or uninterruptable power supplies	1 hour in Group B, F, M, S and U occupancies; 2 hours in Group A, E, I and R occupancies.

For SI: 1 square foot = 0.0929 m^2, 1 pound per square inch (psi) = 6.9 kPa, 1 British thermal unit (Btu) per hour = 0.293 watts, 1 horsepower = 746 watts, 1 gallon = 3.785 L, 1 cubic foot = 0.0283 m^3.

~~509.2~~ 427.2 Occupancy classification. Incidental uses shall not be individually classified in accordance with Section 302.1. Incidental uses shall be included in the building occupancies within which they are located.

~~509.3~~ 427.3 Area limitations. Incidental uses shall not occupy more than 10 percent of the *building area* of the *story* in which they are located.

~~509.4~~ 427.4 Separation and protection. The incidental uses listed in Table ~~509~~427.1 shall be separated from the remainder of the building or equipped with an *automatic sprinkler system*, or both, in accordance with the provisions of that table.

~~509.4.1~~ 427.4.1 Separation. Where Table ~~509~~427.1 specifies a fire-resistance-rated separation, the incidental uses shall be separated from the remainder of the *building* by a *fire barrier* constructed in accordance with Section 707 or a *horizontal assembly* constructed in accordance with Section 711, or both. Construction supporting 1-hour *fire barriers* or *horizontal assemblies* used for incidental use separations in buildings of Type IIB, IIIB and VB construction is not required to be fire-resistance rated unless required by other sections of this code.

~~509.4.2~~ 427.4.2 Protection. Where Table ~~509~~427.1 permits an *automatic sprinkler system* without a *fire barrier*, the incidental uses shall be separated from the remainder of the building by construction capable of resisting the passage of smoke. The walls shall extend from the top of the foundation or floor assembly below to the underside of the ceiling that is a component of a fire-resistance-rated floor assembly or roof assembly above or to the underside of the floor or roof sheathing, deck or slab above. Doors shall be self- or automatic-closing upon detection of smoke in accordance with Section 716.5.9.3. Doors shall not have air transfer openings and shall not be undercut in excess of the clearance permitted in accordance with NFPA 80. Walls surrounding the incidental use shall not have air transfer openings unless provided with smoke dampers in accordance with Section 710.8.

~~509.4.2.1~~ 427.4.2.1 Protection limitation. Where an automatic sprinkler system is provided in accordance with Table ~~509~~ 427.1, only the space occupied by the incidental use need be equipped with such a system.

Reason: This change is intended to relocate the incidental use requirements to Chapter 4 of the IBC. Incidental uses are not occupancies. Therefore, they do not belong in the occupancy chapter. They are areas in a building that have a higher level of risk and are separated from the rest of the building. By placing the requirements in Chapter 4, they are then considered special uses and will eliminate the confusion of whether they are occupancies or not. We believe that this will provide better clarification for these areas in a building that have special requirements. The title of Chapter 4 is Special Detailed Requirements Based on Use and Occupancy. The location of these requirements is more appropriate in this chapter.

Cost Impact: Will not increase the cost of construction
This change is a relocation of the requirements. There is no technical change that will affect the cost of construction.

G 159-15 : CHAPTER 5-THOMAS4425

G 160-15

510.2

Proponent: Marshall Klein, representing NMHC

2015 International Building Code

Revise as follows:

510.2 Horizontal building separation allowance. A building shall be considered as separate and distinct buildings for the purpose of determining area limitations, continuity of *fire walls*, limitation of number of *stories* and type of construction where all of the following conditions are met:

1. The buildings are separated with a *horizontal assembly* having a *fire-resistance rating* of not less than 3 hours. The horizontal assembly shall not include vertical offsets except where the offset assemblies and their supporting structures have a fire-resistance rating of not less than 3 hours..
2. The building below the *horizontal assembly* is of Type IA construction.
3. *Shaft*, *stairway*, *ramp* and escalator enclosures through the *horizontal assembly* shall have not less than a 2-hour *fire-resistance rating* with opening protectives in accordance with Section 716.5.

   Exception: Where the enclosure walls below the *horizontal assembly* have not less than a 3-hour *fire-resistance rating* with opening protectives in accordance with Section 716.5, the enclosure walls extending above the *horizontal assembly* shall be permitted to have a 1-hour *fire-resistance rating*, provided:

   1. The building above the *horizontal assembly* is not required to be of Type I construction;
   2. The enclosure connects fewer than four *stories*; and
   3. The enclosure opening protectives above the *horizontal assembly* have a *fire protection rating* of not less than 1 hour.
4. The building or buildings above the *horizontal assembly* shall be permitted to have multiple Group A occupancy uses, each with an *occupant load* of less 300, or Group B, M, R or S occupancies.
5. The building below the *horizontal assembly* shall be protected throughout by an *approved automatic sprinkler system* in accordance with Section 903.3.1.1, and shall be permitted to be any occupancy allowed by this code except Group H.
6. The maximum *building height* in feet (mm) shall not exceed the limits set forth in Section 504.3 for the building having the smaller allowable height as measured from the *grade plane*.

Reason: It is very common for projects built under the provisions of Section 510.2 to include vertical offsets to accommodate elevation changes for a particular site or different ceiling heights within a story. Currently, the code provides no guidance on how to deal with these vertical offset assemblies, and the designer and code official are left to handle them as alternative methods or modifications in accordance with Chapter 1. This change will provide appropriate regulations for ensuring that any vertical offset maintains a proper and continuous fire rating for both the horizontal and vertical portions of the separation, plus it ensures that the supporting structure for a vertical offset has an equivalent fire-resistance rating.

It is worth noting that the code deals with this issue in reverse for firewalls by permitting horizontal offsets in those vertical assemblies, as described in Section 706.1 of the 2012 IBC Commentary, which states "...offsetting two vertical sections of firewalls is permissible as long as the required fire resistance rating and structual stability are maintained."

Cost Impact: Will not increase the cost of construction

There should be no impact on the cost of construction because the intent of this proposal is simply to state how the current provisions should be applied. However, there will be a decrease in administrative costs for cases where an alternative method or modification would have previously been necessary as part of the complaince path.

G 160-15 : 510.2-KLEIN4223

G 161-15

510.2

Proponent: Homer Maiel, PE, CBO, representing ICC Tri-Chapter (Peninsula, East Bay, Monterey Bay) (hmaiel@gmail.com)

2015 International Building Code

Revise as follows:

510.2 Horizontal building separation allowance. A building shall be considered as separate and distinct buildings for the purpose of determining area limitations, continuity of *fire walls*, limitation of number of *stories* and type of construction where all of the following conditions are met:

1. The buildings are separated with a *horizontal assembly* having a *fire-resistance rating* of not less than 3 hours. <u>The horizontal assembly shall be of Type 1 construction.</u>
2. The building below the *horizontal assembly* is of Type IA construction.
3. *Shaft*, *stairway*, *ramp* and escalator enclosures through the *horizontal assembly* shall have not less than a 2-hour *fire-resistance rating* with opening protectives in accordance with Section 716.5.

   Exception: Where the enclosure walls below the *horizontal assembly* have not less than a 3-hour *fire-resistance rating* with opening protectives in accordance with Section 716.5, the enclosure walls extending above the *horizontal assembly* shall be permitted to have a 1-hour *fire-resistance rating*, provided:

   1. The building above the *horizontal assembly* is not required to be of Type I construction;
   2. The enclosure connects fewer than four *stories*; and
   3. The enclosure opening protectives above the *horizontal assembly* have a *fire protection rating* of not less than 1 hour.
4. The building or buildings above the *horizontal assembly* shall be permitted to have multiple Group A occupancy uses, each with an *occupant load* of less 300, or Group B, M, R or S occupancies.
5. The building below the *horizontal assembly* shall be protected throughout by an *approved automatic sprinkler system* in accordance with Section 903.3.1.1, and shall be permitted to be any occupancy allowed by this code except Group H.
6. The maximum *building height* in feet (mm) shall not exceed the limits set forth in Section 504.3 for the building having the smaller allowable height as measured from the *grade plane*.

Reason: Existing language is unclear and can be interpreted to only require the greater type of construction below the 3 hour separation. The addition of the sentence to Item 1 makes it clear that the 3 hour horizontal assembly can not be constructed out of a type of construction that is different than the lower building.

Cost Impact: Will not increase the cost of construction
This code change does not create a new requirement. It clarifies existing code language to prevent misinterpretation of the code

G 162-15

510.2

Proponent: Mark Nowak, representing Steel Framing Alliance (mnowak@steelframing.org)

2015 International Building Code

Revise as follows:

510.2 Horizontal building separation allowance. A building shall be considered as separate and distinct buildings for the purpose of determining area limitations, continuity of *fire walls*, limitation of number of *stories* and type of construction where all of the following conditions are met:

1. The buildings are separated with a *horizontal assembly* having a *fire-resistance rating* of not less than 3 hours.
2. The building below the *horizontal assembly* is of Type IA construction.
3. *Shaft*, *stairway*, *ramp* and escalator enclosures through the *horizontal assembly* shall have not less than a 2-hour *fire-resistance rating* with opening protectives in accordance with Section 716.5.

    Exception: Where the enclosure walls below the *horizontal assembly* have not less than a 3-hour *fire-resistance rating* with opening protectives in accordance with Section 716.5, the enclosure walls extending above the *horizontal assembly* shall be permitted to have a 1-hour *fire-resistance rating*, provided:

    1. The building above the *horizontal assembly* is not required to be of Type I construction;
    2. The enclosure connects fewer than four *stories*; and
    3. The enclosure opening protectives above the *horizontal assembly* have a *fire protection rating* of not less than 1 hour.
4. The building or buildings above the *horizontal assembly* shall be permitted to have multiple Group A occupancy uses, each with an *occupant load* of less 300, or Group B, M, R or S occupancies.
5. The building below the *horizontal assembly* shall be protected throughout by an *approved automatic sprinkler system* in accordance with Section 903.3.1.1, and shall be permitted to be any occupancy allowed by this code except Group H.
6. The maximum *building height* in feet (mm) shall not exceed the limits set forth in Section 504.3 for the building having the smaller allowable height as measured from the *grade plane*.
7. <u>Type V buildings with combustible structural elements above the horizontal separation shall be separated from lot lines and buildings on the same lot by not less than 50 feet.</u>

Reason: This proposal will correct an inconsistency in the code that currently permits a shorter separation distance to adjacent buildings or lot lines for buildings with combustible structural elements versus similar sized Type IIA noncombustible buildings. The code currently requires Type IIA residential buildings, constructed with non-combustible structural elements, to be separated by a minimum of 50 feet in Section 510.6 but no such separation is required for combustible Type V construction in Section 510.2 despite the higher risk with combustible construction.
More builders and designers are using Section 510 of the code to extend the allowable height and stories of residential buildings that use combustible structural framing. Marketing efforts such as WoodWorks, a program with support of the major wood and timber associations, government agencies, and other partners, continue to promote the use of combustible framing in mid-rise residential and other structures through Section 510 of the code. It is questionable that the code ever intended combustible framing to be used at heights now being constructed -- the allowable heights have crept upward with allowances for sprinkler systems added since the requirements in Section 510 first entered buildings codes.

Fires from mid-rise Type V buildings with combustible structural elements are epidemic and catastrophic yet there is little protection required of them relative to their risk versus other types of construction. This proposal will correct this deficiency in the code to better protect nearby buildings and provide firefighters clearance between buildings to address fires during and after construction. The 50 foot separation is a minimum requirement that will ensure at least the same level of protection for buildings with combustible structures as for similar Type IIA buildings when additional height is obtained though use of the special provisions in Section 510 of the code. The 50 foot distance in this proposal extends the precedent set in the code for buildings with lower risk (Type IIA) of similar size to the higher-risk combustible framing used in Type V buildings under Section 510 of the code.

In addition to providing a separation for finished buildings, the proposed 50 foot distance will also improve the ability of firefighters to address fires during construction. In just the past few years, a significant number of major fires throughout the United States in buildings under construction have occurred in four story and higher buildings that have used combustible framing members. During the construction phase, these buildings are extremely vulnerable due to the lack of operational active and passive fire resistance. These fires have damaged nearby properties, required major street closures including interstates, and occupied fire fighting resources to the extent that other areas were left under-protected for extended periods. As recently as December of 2014, a major fire in Los Angeles with five stories of wood framing over a two story concrete podium not only resulted in millions of dollars in damage to the building under construction, but also damaged adjacent buildings. The seven-story apartment building known as the DaVinci was a complete loss after the fire that was fueled by the five stories of wood frame construction. More than 250 firefighters were dispatched to the scene. Flames were visible for miles and the structure's wooden frame forced the closure of northbound Harbor (110) Freeway. Computers and cubicles melted in neighboring buildings. Hundreds of thick windows cracked as well. This is typical of the risk that these buildings pose to themselves and surrounding properties. Some examples of other larger recent fires that illustrate the risk of combustible framing in mid-rise buildings include:

1. Monroe Apartments, Portland, OR August 8, 2013
2. Student Apartments, Kingston, Ontario, CAN December 17, 2013
3. 550 East and 500 South, Salt Lake City, UT February 9, 2014
4. Commercial Building, Roxbury, MA March 3, 2014
5. Mission Bay Project, San Francisco, CA March 11, 2014
6. Axis Apartments, Houston, TX, March 25, 2014
7. Beacon Street, Boston, MA, March 27, 2014
8. Gables Upper Rock, Rockville, MD, April 1, 2014
9. SE Tech Center Drive, Vancouver, WA, June 19, 2014
10. Victoria Commons, Kitchener, Ontario, CAN, July 22, 2014
11. Apollo Way, Madison, WI, August 8, 2014

Cost Impact: Will increase the cost of construction
This proposal will impact the cost of construction for some buildings on small lots or in urban or other high density areas where the separation distance is especially important for increased safety. Depending on the size of the lot and proposed building, some buildings may not be able to meet the separation distance and will need to be reduced in height or number of stories. In some cases, non-combustible construction could be used to protect the building if the setback cannot be achieved. Any added costs in these few buildings can be offset by the added safety and lower insurance costs throughout construction and the life of the structure. Building with reasonable separation distances will also be offset by the avoided costs of rebuilding after fires and avoidance of damage to nearby properties and occupants.

G 163-15

510.2, TABLE 510.2 (New)

Proponent: Dennis Richardson, representing American Wood Council (drichardson@awc.org)

2015 International Building Code

Revise as follows:

510.2 Horizontal building separation allowance. A building shall be considered as separate and distinct buildings for the purpose of determining area limitations, continuity of *fire walls*, limitation of number of *stories* and type of construction where all of the following conditions are met:

1. The buildings are separated with a *horizontal assembly* having a *fire-resistance rating* of not less than 3 hours.
2. The building below the *horizontal assembly* is of Type IA construction or Type IV construction protected as required in Table 510.2.
3. *Shaft*, *stairway*, *ramp* and escalator enclosures through the *horizontal assembly* shall have not less than a 2-hour *fire-resistance rating* with opening protectives in accordance with Section 716.5.

    Exception: Where the enclosure walls below the *horizontal assembly* have not less than a 3-hour *fire-resistance rating* with opening protectives in accordance with Section 716.5, the enclosure walls extending above the *horizontal assembly* shall be permitted to have a 1-hour *fire-resistance rating*, provided:
    1. The building above the *horizontal assembly* is not required to be of Type I construction;
    2. The enclosure connects fewer than four *stories*; and
    3. The enclosure opening protectives above the *horizontal assembly* have a *fire protection rating* of not less than 1 hour.
4. The building or buildings above the *horizontal assembly* shall be permitted to have multiple Group A occupancy uses, each with an *occupant load* of less 300, or Group B, M, R or S occupancies.
5. The building below the *horizontal assembly* shall be protected throughout by an *approved automatic sprinkler system* in accordance with Section 903.3.1.1, and shall be permitted to be any occupancy allowed by this code except Group H.
6. The maximum *building height* in feet (mm) shall not exceed the limits set forth in Section 504.3 for the building having the smaller allowable height as measured from the *grade plane*.

Add new text as follows:

TABLE 510.2
TYPE IV BUILDING BELOW, PROTECTION CRITERIA

	Required layers of 5/8 inch type X gypsum board for protection based on Occupancy or Fire Area Occupancy Conditions: [a, b]		
Type IV (HT) building element:	**A, B, E, F-2, I, R, S-2 occupancies**	**F-1, M, S-1 occupancies**	**F-1, M, S-1 occupancies containing any of he following:** **1. The manufacture, storage or display of upholstered furniture or mattresses exceeds 2500 square feet;** **2. Woodworking operations in excess of 2500 square feet;** **3 Repair garages greater than 10,000 square feet or located in basements;** **4. Repair or storage of commercial vehicles greater than 5000 square feet;** **5. Bulk storage of tires exceeding 20,000 cubic feet**
Interior vertical surface of heavy timber beams, columns, and CLT walls	2	3	4
Interior horizontal or sloping surface of heavy timber beams and CLT ceilings	3	4	5
CLT exterior wall surface; FSD < 10 feet	2	2	2
CLT exterior wall surface; 10 ≤ feet FSD < 30 feet	1	1	1
CLT exterior wall surface; FSD ≥ 30 feet	Section 602.4	Section 602.4	Section 602.4

CLT = Cross laminated timber; FSD - fire separation distance. For SI: 1 foot = 304.8 mm; 1 square foot = 0.0929 m^2; 1 cubic foot = 0.028 m^3

a. Heavy timber columns and beams that are designed to be 2 hour fire resistance rated as exposed wood members, as allowed by Section 722.1 and the NDS Chapter 16, are permitted to be considered 3 hour fire resistance rated when further encapsulated as incorporated in this table.

b. Wall and ceiling assemblies with multiple layers of gypsum board shall be permitted to be furred with noncombustible or fire retardant treated lumber furring provided the cavity is filled with securely attached mineral wool insulation and at least one layer of gypsum board is directly attached to the heavy timber structure. Multiple layers of gypsum board shall be permitted to be secured to furring as required in Section 722.5.1.2.1 ,or Figure 722.5.1(3) for columns and in Section 722.3.2.5 for walls. Attachment of multi-layer gypsum wallboard to ceilings shall be permitted to be as required for two layer assemblies attached to

<u>resilient channels in Table 721.1(3) and the base layer or layers shall be permitted to be attached directly to the type IV structure as required by item 21 of Table 721.1(3). Other attachment shall be permitted to be used if specified by the manufacturer and approved.</u>

Reason: There has been considerable interest in the utilization of wood for urban infill residential projects where land costs are at a premium and there is a need to utilize the full extent of the allowable height to incorporate housing over commercial uses below. G133 in the 2015 IBC allows type IA three hour podiums to be more than one story. That code change was successful as proponents pointed out that many jurisdictions already allow this practice approving multi-story podiums through alternate methods of construction. The three-hour separation at the top of the lower building must be supported by three-hour construction to the foundation. Another code change lessened the occupancy restrictions on the three-hour type IA lower building. These two changes allow significant retail and commercial mixed use projects with larger commercial occupancies below while maintaining light frame residential uses above.

The provisions for 510.2 are the most stringent in the code as the podium or pedestal is currently required to both be noncombustible and provide both 3 hour separation and support of the structure up above. Many have referred to it as a horizontal fire wall since fire walls from the structure above are not required to extend into the structure below and different types of construction can be utilized in the structure above and below.

This code change proposes to allow Type IV heavy timber construction below that is 3 hour fire reistance rated instead of the noncombustible podium.

Cross Laminated Timber has been manufactured for over 30 years in Europe and has just recently caught hold on the American Continent where some major structures are under way in Canada and smaller buildings are being built in the US. In Europe buildings of 8 to 10 stories and above are regularly constructed. The following link gives examples of CLT buildings throughout the world. http://www.rethinkwood.com/tall-wood-survey

Basically 2x nominal lumber is laminated in alternate 90 degree directions forming a solid billet of wood from 4.5 inches to 18 inches in thickness perpendicular to grain and in-plane dimensions of up to 9 feet by 65 feet. This material is extremely strong and stiff particularly in the plane direction where both sheet directions have parallel to grain laminated lumber elements. Because of this two way parallel grain it is dimensionally stable in the 9 foot and 65 foot direction.

CLT was approved for use in the 2015 IBC and the design standard can be found in Section 2303.1.4. As part of that public comment code submittal an E119 test was provided showing a five layer CLT wall loaded with 87,000 lbs. and with one layer of 5/8" type X gypsum board on each side. The test resulted in a three hour fire resistance rating and was stopped when fire came through near an edge of the wall panel. Manufactures have run additional tests since then in a variety of configurations.

The following link provides access to additional information regarding this or other code changes proposed by American Wood Council.
http://www.awc.org/Code-Officials/2015-IBC-Code-Changes/

Recently, the 2015 NDS was published which provides for calculated fire resistance of CLT as well as other exposed timber. Chapter 16 of the NDS has been recognized for years in the IBC as a procedure whereby exposed glulam and timber beams and columns can be calculated to provide fire resistance up to 2 hours. Newly updated Technical Report 10 is available on the AWC website providing more detail of this method. Fire resistance rating of exposed wood occurs because the exterior of the wood chars and insulates the interior of the wood member. The member is designed and detailed to meet the required structural performance with the outer char layer sacrificed to provide protection from heat and fire. The 2015 NDS extends this calculation method to CLT. Members with calculated fire resistance of exposed wood can be provided with further fire resistance rating by providing additional protection of that member with gypsum board. Recent tests show the horizontal surfaces of a timber beam to be protected for approximately 30 minutes for each 5/8" layer of gypsum board applied on the horizontal beam bottom and and 40 minutes for each layer applied vertically on both sides. Similar timeframes are added to CLT wall and floor ceiling materials when gypsum is applied. This is not much different, in the case of walls, to a method for calculating the fire resistance rating of concrete walls that are further protected with gypsum board found in IBC Section 722.2.1.4.

All building materials have some form of "bad behavior". Some other materials significantly loose strength when subjected to elevated temperatures and must be protected. Many other materials may suffer significant distortions causing structural failure due to uneven heating of some portions of the structure when subjected to a compartment fire while other portions of the structure remain at room temperature. Still other bad behaviors include brittle spalling of material when subjected to heat.

Heavy timber wood construction has the advantage of remaining relatively dimensionally stable as the wood chars and is not a good conductor of heat. Wood also retains its strength in the remaining section as large members char to around exposed surfaces. The main issue raised about wood is the potential to contribute to the fire as additional fuel. The code relies on the limitation of noncombustible materials in the definition of Type IA construction to limit the potential of the structure to contribute to the fire. This is especially critical in taller major structures and podium type buildings supporting other buildings.

In order to obtain similar performance regarding the potential contribution of wood to a fire, this code change proposal gives the requirements for additional gypsum board protection to delay the onset of the fire causing the wood to char and contribute to combustion. Although the building is required have NFPA 13 sprinklers throughout that is not considered in the design and provides a belt and double suspender approach to ensuring safety while protecting the heavy timber structure and gypsum board from the effects of common nuisance fires.

Table 510.2 is provided which specifies increased protection of the proposed heavy timber structure based on the potential fire load of the occupancy. Fire area requirements in certain occupancies with additional combustible material typically call for reduced fire area size or sprinklers in section 903 due additional fire load. These are also provided with additional layers of gypsum board keeping the CLT cool and delaying the onset of wood contribution to the fire load in these fire areas with up to 4 layers of 5/8" type X gypsum board on walls and 5 layers on the ceilings. This protection can push the fire resistance rating performance in an E119 test upwards of 4 to 5 hours or more with a four layers of gypsum on a CLT wall. The heavy amount of additional gypsum board provided in this proposal for podiums is used to limit the probability of contribution of the wood structure to a fire also serves to provide a substantial margin of safety against structural failure when compared with other materials. Once the wood structure starts to char, it still has a large margin time where the strength of the material is not affected.

It is worthy to note that not all fires are equal and the only time the E119 time and temperature curve is standard is when in the controlled environment of a test furnace. Actual time temperature curves are affected by a variety of factors including fire load, insulation of compartment, ventilation, and configuration. All materials are affected differently some leading to brittle failure or sudden onset of strength loss. The actual performance of any material is affected by specific material characteristics and fire conditions.

The E119 test while not intended to measure contribution of the tested material to the fire does provide an apple to apple measure of performance of measurable characteristics of test assemblies subjected to the same conditions. By significantly delaying or eliminating the contribution of the heavy timber with heavy gypsum board protection, this apple to apple comparison is made more consistent. Typical fires may actually have higher spiking of temperatures well above the E119 levels with decay in temperature as the fire progresses and decays. E119 tests also may not predict the performance of materials where the strength or dimensions are temperature sensitive. Heavy timber tends to remain stable in actual fire conditions and the main adverse effect of the early spike in temperature is slightly faster char rates but followed by slower char rates when the fire decays. The predictability, strength and dimensional stability of highly protected heavy timber, is not nearly as susceptible to non-standard fires as may be with other materials.

In Section 510.2 the three hour type IA structure below is unlimited in size. This proposal relies on the allowable area of type IV construction in the building below and is more conservative since the 3 hour building below would be required to be limited as allowed for type IV or divided by three hour fire walls if the allowable area of the lower building exceeds the allowable area for type IV construction.

This code proposal is a first attempt at utilizing massive timber in a new way. Because of that, the level of gypsum protection is conservative based on fire load. This is in addition to the behavior of wood char in heavy timber to provide reliable structural performance and in addition to the installation of an NFPA 13 sprinkler system.

Cost Impact: Will not increase the cost of construction
This code change provides a new option for construction that is not currently available.

G 163-15 : 510.2-RICHARDSON4776

G 164-15

510.5, 708.3, 711.2.3, 711.2.4.1, 711.2.4.3

Proponent: Stephen Skalko, representing Masonry Alliance For Codes and Standards (svskalko@cox.net)

2015 International Building Code

Revise as follows:

510.5 Group R-1 and R-2 buildings of Type IIIA construction. The height limitation for buildings of Type IIIA construction in Groups R-1 and R-2 shall be increased to six *stories* and 75 feet (22 860 mm) where the first floor assembly above the *basement* has a *fire-resistance rating* of not less than 3 hours and the ~~floor area is subdivided by~~ *dwelling unit* and *sleeping unit* separations are a minimum of 2-hour fire-resistance-rated *fire* barrier walls ~~into areas of not more than 3,000 square feet (279 m²)~~.

708.3 Fire-resistance rating. Fire partitions shall have a *fire-resistance rating* in accordance with the following

1. Not less than 2-hour for Group I-1, R-1 and R-2 occupancies in buildings of ~~not~~ Type III, IV and V construction that are 4 or more stories in height.
2. Not less than 1 hour except for buildings covered in Item 1 above.

Exceptions:

1. Corridor walls permitted to have a $^1/_2$-hour *fire-resistance rating* by Table 1020.1.
2. ~~*Dwelling unit* and *sleeping unit* separations in buildings of Type IIB, IIIB and VB construction shall have *fire-resistance ratings* of not less than $^1/_2$ hour in buildings equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1.~~

711.2.3 Supporting construction. The supporting construction shall be protected to afford the required fire-resistance rating of the horizontal assembly supported.

Exception: In buildings of Type IIB, IIIB or VB construction, the construction supporting the horizontal assembly is not required to be fire-resistance rated at the following:

1. Horizontal assemblies at the separations of incidental uses as specified by Table 509 provided the required fire-resistance rating does not exceed 1 hour.
2. ~~Horizontal assemblies at the separations of dwelling units and sleeping units as required by Section 420.3.~~

~~3.~~ 2. Horizontal assemblies at smoke barriers constructed in accordance with Section 709.

711.2.4.1 Separating mixed occupancies. Where the horizontal assembly separates mixed occupancies, the assembly shall have a fire-resistance rating of not less than that required by the following:

1. Section 508.4 based on the occupancies being separated.
2. Not less than 2-hours for Group I-1, R-1, and R-2 occupancies in buildings of Type III, IV or V construction that are more than 4 stories in height.

711.2.4.3 Dwelling units and sleeping units. Horizontal assemblies serving as dwelling or sleeping unit separations in accordance with Section 420.3 shall be not less than the following:

1. One-hour fire-resistance-rated construction, or
2. Two-hour fire resistance rated construction for Group I-1, R-1 and R-2 occupancies in buildings of Type III, IV and V construction that are 4 or more stories in height.

~~**Exception:** Horizontal assemblies separating dwelling units and sleeping units shall be not less than $^1/_2$ hour fire-resistance-rated construction in a building of Type IIB, IIIB and VB construction, where the building is equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1.~~

Reason: Though the loss of life from fires affecting Group I-1, R-1 and R-2 occupancies is not high the amount of property damage continues to remain high. Section 101.3 of the code states the intent of the building code includes safety to property from fire. To reduce property loss this proposal modifies the requirements for Group I-1, R-1and R-2 occupancies of Types III, IV and V construction 4 or more stories in height to require these buildings to be constructed with fire rated separations between sleeping and dwelling units with a minimum of 2-hour fire resistance rating. The increase in the fire resistance provides a much higher degree of protection to property in the event of a fire in these taller buildings with combustible construction. In addition, when occupants in these types of buildings are sleeping they are less likely to be aware of conditions around them. Fires occurring during these times pose a high risk to the occupants. This increase in the fire resistance also provides a higher degree of protection to sleeping occupants in reducing the spread of fire.

Insert for Cost Statement to Group I-1, R-1 and R-2 code change by the Masonry Alliance for Codes and Standards.

dollars.

Cost Impact: Will increase the cost of construction
The code change proposal may or may not increase the cost of construction. Independent third party studies of rectangular 4-story Type V multi-family dwellings indicate that the cost differential ranges between minus 3% to plus 3% for the most significant cost impact associated with designs that may shift buildings such as those affected by this proposal from Type V construction to other Types of construction due to the increased fire resistance of the dwelling unit separations.

A multi-family residential structure should be schematically designed to meet all of the requirements of the International Building Code to accurately evaluate the relative construction cost. Once designed, the cost comparison buildings were reviewed for code compliance, and cost estimates prepared. The study was conducted by:

Architect & Engineer: Haas Architects Engineers1

Code Official: Tim E. Knisely2

Cost Estimation : Poole Anderson Construction3

The building model chosen for the project was a 4 story multi-family residential structure encompassing approximately 25,000 gross square feet of building area per floor. The cost comparisons are based on the proposed target building assembled using a typical mix of one and two bedroom dwelling units

The following construction types and alternates were included in the evaluation:

Conventional Type V framing with Type V floor system

Alternate: Conventional Type VA framing with Type VA floor system

Non-combustible framing with fire-rated non-combustible floors (concrete slab on steel deck)

Fire-rated load bearing non-combustible construction with fire rated non-combustible floor system (concrete block and precast plank)

The cost estimate for each building model included the complete fit out of each building with the exception of movable appliances and furniture. For more details on the specific criteria visit: www.psfscac.org.

The following charts show the cost comparisons between a multifamily building constructed in accordance with the minimum fire resistive provisions of the code for Type V construction and the other construction systems that would be expected to meet the increased fire resistance.

G 165-15

510.12 (New)

Proponent: Dennis Richardson, representing American Wood Council (drichardson@awc.org)

2015 International Building Code

Add new text as follows:

510.12 Group R-1 and R-2 buildings of Type IV HT construction. The height and story limitations for buildings of Type IV HT construction in Groups R-1 and R-2 shall be increased to nine stories and 100 feet (30 480 mm) provided all of the following are met:

1. The heavy timber construction shall be not less than 2 hour fire resistance rated and protected with a minimum of one layer of 5/8 inch type X gypsum board on all interior wall surfaces and a minimum of two layers of 5/8 inch type X gypsum board on the ceiling side of all horizontal assemblies.
2. The building has a fire separation distance of not less than 50 feet (15 240 mm).
3. The exits are segregated in an area enclosed by a cross laminated timber 2 hour fire-resistance-rated walls protected with two layers of 5/8 inch type X gypsum board or equivalent on the room side of all walls adjacent to the enclosure.
4. Wall and ceiling assemblies with multiple layers of gypsum board shall be permitted to be furred with noncombustible or fire retardant treated wood furring provided the cavity is filled with securely attached mineral wool insulation and at least one layer of gypsum board is directly attached to the heavy timber structure. Multiple layers of gypsum board shall be permitted to be secured to furring as required in Section 722.5.1.2.1 or Figure 722.5.1(3) for columns and in Section 722.3.2.5 for walls. Attachment of multi layer gypsum wallboard to ceilings shall be permitted to be as required for single assemblies attached to resilient channels in Table 721.1(3) and the base layer or layers shall be permitted to be attached directly to the Type IV structure as required by item 21 of Table 721.1(3). Other attachment shall be permitted to be used if specified by the manufacturer and approved.
5. Buildings of Type IV construction shall be permitted to be located over a building with multiple occupancy groups meeting the provisions of Section 510.2.

Reason: Reason: Mass timber products such as cross-laminated timber (CLT) provide the structural and fire resistance capabilities necessary for taller buildings. This proposal closely follows the special occupancy for Type IIA structures in 510.6 as a model. Existing section 510.6 allows 1 fire resistance rated light frame steel buildings to be up to 9 stories and 100 feet tall when surrounded by 50 feet. This proposal goes to the same height and number of stories but requires additional fire resistance (2 hours instead of 1 hour throughout). The CLT is provided with minimum protection throughout the inside with 5/8" type X gypsum (one layer at all interior walls and two layers at all ceilings) and the overall assembly must meet the 2 hour E119 fire resistance test. In addition to the mass timber protected with type X gypsum board, the building is provided with an NFPA 13 sprinkler system throughout and is surrounded by yards of 50 feet. The entire fire and life safety "package" is at least equivalent to what is currently specified in 510.6.
The current section 510.6 applying to one hour type II construction requires stairways to be segregated into areas separated by a two hour fire wall. Although the existing language for 510.6 is somewhat unclear, this can be accomplished in the current 510.6 with a two hour fire wall separating the one hour type II building into two fire areas, each with stairways or with separate fire walls at each exit enclosure.
A fire wall is not necessary with this proposal since the entire building is two hour fire resistance rated construction. Stairways are provided with additional protection with a second layer of 5/8" type x gypsum board on the fire side of rooms adjacent to the stairways. Provisions are included to allow the installation of resilient channels and spaces filled with insulation for sound attenuation. Additionally it is noted this building may incorporate a 3 hour separation below if additional occupancies are to be housed in a podium below.
This code change helps address concerns about climate change by allowing a taller building to utilize cross laminated timber which sequesters carbon and has low embodied energy. There is much focus on the future utilization of this building system. The following link gives examples of CLT buildings throughout the world.
http://www.rethinkwood.com/tall-wood-survey
In addition the following link provides access to any additional information regarding this or other code changes proposed by American Wood Council.
http://www.awc.org/Code-Officials/2015-IBC-Code-Changes/

Cost Impact: Will not increase the cost of construction
This new code section provides a new option for construction that is not currently available.

G 165-15 : 510.12 (New)-RICHARDSON4889

G 166-15

511.1 (New), 511.2 (New), 511.3 (New), 511.4 (New)

Proponent: Carl Wren, City of Austin, Texas, representing City of Austin, Texas; Planning and Development Review Department and the Austin Fire Department (carl.wren@austintexas.gov)

2015 International Building Code

Add new text as follows:

SECTION 511—OCCUPIED ROOFS

511.1 General. Buildings with occupied roofs shall comply with this section and with Sections 903.2.1.6 and 1006.3, as applicable.

511.2 Enclosure of occupied roof. Occupied roofs, rooftops, and rooftop decks that are provided with walls or overhead weather protection, whether permanent or temporary, shall be considered a story for the purpose of determining the required construction type for the structure or building, for applying the requirements of Section 403, for applying Chapter 10, and for applying the thresholds for fire safety features required by Sections 903, 905, and 907.

Exceptions:
1. A parapet complying with Section 705.11 and less than 59 inches in height shall not be considered a wall for the purposes of this section.
2. Occupied roofs with temporary weather protection need not be considered a story when compliant with the fire code and approved by the fire code official for specific events conducted for less than 30 days each and the aggregate duration of such events is less than 90 days per 12 month period.

511.3 Fall protection. Occupied roofs and rooftops shall be provided with guards in accordance with Section 1015.

511.4 Interstitial spaces. Where decks or other walking surfaces are constructed above a roof to facilitate rooftop occupancy, the space between the roof/ceiling assembly and the deck or surface shall be constructed in a manner that precludes the accumulation of materials between the roof/ceiling assembly and the deck or walking surface and that prevents the introduction of ignition sources to the space.

Reason: Rooftop occupancies are becoming more and more common and the installation of weather protection is creating new or expanded building areas and occupancies. Some of the issues have been addressed in the 2015 code in section 903.2.1.6 and in section 1006.3, but the issue of increased building heights and added occupancies is more prevalent and more varied than the current code can adequately address.
The exceptions to proposed section 511.2 would allow for flexibility in dealing with unplanned and unexpected circumstances that might cause a truly short term need for weather protection of a roof while still requiring appropriate protection of occupancies that will be ongoing and create internal spaces on rooftops.

Cost Impact: Will increase the cost of construction
The proponent wished to say that the code change would not increase construction costs, but the change really addresses measures and practices being used that actually create additional building area. One cannot necessarily build code compliant walls and ceilings for the same price as setting up tents or membrane structures on the tops of multi-story buildings that would not normally be allowed to include combustible construction. This code change simply acknowledges that these areas need to be treated as enclosed spaces and this will of necessity increase some construction costs.

G 166-15 : 511 (New)-WREN5657

G 167-15

TABLE 601

Proponent: Jonathan Humble, American Iron and Steel Institute, representing American Iron and Steel Institute (jhumble@steel.org)

2015 International Building Code

Revise as follows:

TABLE 601
FIRE-RESISTANCE RATING REQUIREMENTS FOR BUILDING ELEMENTS (HOURS)

BUILDING ELEMENT	TYPE I		TYPE II		TYPE III		TYPE IV	TYPE V	
	A	B	A	B	A	B	HT	A	B
Primary structural frame[f] (see Section 202)	3[a, b]	2[a, b]	1[b]	0	1[b]	0	HT	1[b]	0
Bearing walls Exterior[e, f] Interior	3 3[a]	2 2[a]	1 1	0 0	2 1	2 0	2 1/HT	1 1	0 0
Nonbearing walls and partitions Exterior	See Table 602								
Nonbearing walls and partitions Interior[d]	0	0	0	0	0	0	See Section 602.4.6	0	0
Floor construction and associated secondary members (see Section 202)	2	2	1	0	1	0	HT	1	0
Roof construction and associated secondary members (see Section 202)	1 1/2[b]	1[b,c]	1[b,c]	0[c]	1[b,c]	0	HT	1[b,c]	0

For SI: 1 foot = 304.8 mm.

a. Roof supports: Fire-resistance ratings of primary structural frame and bearing walls are permitted to be reduced by 1 hour where supporting a roof only.

b. Except in Group F-1, H, M and S-1 occupancies, fire protection of structural members in roof construction shall not be required, including protection of primary structural frame members, roof framing and decking where every part of the roof construction is 20 feet or more above any floor immediately below. Fire-retardant-treated wood members shall be allowed to be used for such unprotected members.

c. In all occupancies, heavy timber shall be allowed where a 1-hour or less fire-resistance rating is required.

d. Not less than the fire-resistance rating required by other sections of this code.

e. Not less than the fire-resistance rating based on fire separation distance (see Table 602).

f. Not less than the fire-resistance rating as referenced in Section 704.10.

Reason: This proposal has been submitted to address multiple interpretations of Table 601 Footnote "b." We have found that although the code membership has supported the exemption for fire protection of structural members 20 feet or more above any floor immediately below that framing, we have found that other entities are interpreting that the primary structural frame is not included in this exemption.
This proposal is designed to address that impact by modifying two aspects of Table 601. The first; to add the reference to footnote "b" to the primary structural frame row of fire resistance requirements, and two; to modify Footnote "b" by adding the phases "in roof construction" and "primary structural frame members" to the current list of items now shown.

Multiple attempts have been made in the past to restrict the original intent, however they have all been disapproved. The most recent was code change G139-12. The code development committee's response stated: "The proposal was disapproved as it is the intent of the footnote to allow all structural members to be unprotected. This proposal would only exempt the secondary members." The committee's disapproval of G139-12 was further upheld by the ICC membership during the Final Action Hearings in Portland, OR, October 2012. The public comment to G139-12 challenging the committee's decision was also disapproved by ICC membership.

Further, the reference of structural members applying to all structural members is further reinforced by the definition of "Primary Structural Frame" in Section 202, where it states in the charging sentence the following: "Primary structural frame. The primary structural frame shall include all of the following structural members…."

These responses to the proposals, along with reasons by the code development committees, and upheld by the ICC membership, are part of the ICC formal public record and constitute the formal position of the ICC on the issue.

Cost Impact: Will not increase the cost of construction
This proposal clarifies the intent of footnote "b" of the Table.

G 167-15 : T601-HUMBLE4725

G 168-15

TABLE 602

Proponent: Rick Lupton, representing City of Seattle, Dept of Planning & Development (rick.lupton@seattle.gov)

2015 International Building Code

Revise as follows:

TABLE 602
FIRE-RESISTANCE RATING REQUIREMENTS FOR EXTERIOR WALLS BASED ON FIRE SEPARATION DISTANCE[a, d, g]

FIRE SEPARATION DISTANCE = X (feet)	TYPE OF CONSTRUCTION	OCCUPANCY GROUP H[e]	OCCUPANCY GROUP F-1, M, S-1[f]	OCCUPANCY GROUP A, B, E, F-2, I, <u>R[i]</u>, S-2, U[h]
X < 5[b]	All	3	2	1
5 ≤ X < 10	IA Others	3 2	2 1	1 1
10 ≤ X < 30	IA, IB IIB, VB Others	2 1 1	1 0 1	1[c] 0 1[c]
X ≥ 30	All	0	0	0

For SI: 1 foot = 304.8 mm.

a. Load-bearing exterior walls shall also comply with the fire-resistance rating requirements of Table 601.

b. See Section 706.1.1 for party walls.

c. Open parking garages complying with Section 406 shall not be required to have a fire-resistance rating.

d. The fire-resistance rating of an exterior wall is determined based upon the fire separation distance of the exterior wall and the story in which the wall is located.

e. For special requirements for Group H occupancies, see Section 415.6.

f. For special requirements for Group S aircraft hangars, see Section 412.4.1.

g. Where Table 705.8 permits nonbearing exterior walls with unlimited area of unprotected openings, the required fire-resistance rating for the exterior walls is 0 hours.

h.For a building containing only a Group U occupancy private garage or carport, the exterior wall shall not be required to have a fire-resistance rating where the fire separation distance is 5 feet (1523 mm) or greater.

<u>i. For a Group R-3 building of Type II-B or Type V-B construction, the exterior wall shall not be required to have a fire-resistance rating where the fire separation distance is 5 feet (1523 mm) or greater.</u>

Reason: This change is intended to clarify exterior wall protection for Group R-3 occupancies of Type II-B and Type V-B construction. Where Table 705.8 allows unlimited area of unprotected openings, a fire resistive rating at non-bearing exterior walls is not required per Table 602, footnote h. The appropriate application to R-3 occupancies can be easily missed because unlimited area of unprotected openings for Group R-3 occupancies, where the fire separation distance is 5 feet or greater, is permitted per footnote f of Table 705.8, rather than in the table itself. In addition, bearing walls of Type II-B and Type V-B construction are not required to be rated in accordance with Table 601. As a result, Table 602 is the controlling table for bearing and non-bearing walls in those types of construction. By adding this footnote to Table 602 it is clear that a fire-resistive rating is not required at exterior walls of Type II-B or Type V-B Group R-3 buildings where the fire separation is 5 feet or greater.

Cost Impact: Will not increase the cost of construction
The proposed change is a clarification of existing requirements and so does not result in any cost increase.

G 168-15 : T602-LUPTON4763

G 169-15

TABLE 601

Proponent: Paul Coats, PE CBO, representing American Wood Council (pcoats@awc.org)

2015 International Building Code

Revise as follows:

TABLE 601
FIRE-RESISTANCE RATING REQUIREMENTS FOR BUILDING ELEMENTS (HOURS)

BUILDING ELEMENT	TYPE I		TYPE II		TYPE III		TYPE IV	TYPE V	
	A	B	A	B	A	B	HT	A	B
Primary structural frame[f] (see Section 202)	3[a]	2[a]	1	0	1	0	HT	1	0
Bearing walls Exterior[e, f] Interior	 3 3[a]	 2 2[a]	 1 1	 0 0	 2[g] 1	 2[g] 0	 2[g] 1/HT	 1 1	 0 0
Nonbearing walls and partitions Exterior	See Table 602								
Nonbearing walls and partitions Interior[d]	0	0	0	0	0	0	See Section 602.4.6	0	0
Floor construction and associated secondary members (see Section 202)	2	2	1	0	1	0	HT	1	0
Roof construction and associated secondary members (see Section 202)	1 1/2[b]	1[b,c]	1[b,c]	0[c]	1[b,c]	0	HT	1[b,c]	0

For SI: 1 foot = 304.8 mm.

a. Roof supports: Fire-resistance ratings of primary structural frame and bearing walls are permitted to be reduced by 1 hour where supporting a roof only.

b. Except in Group F-1, H, M and S-1 occupancies, fire protection of structural members shall not be required, including protection of roof framing and decking where every part of the roof construction is 20 feet or more above any floor immediately below. Fire-retardant-treated wood members shall be allowed to be used for such unprotected members.

c. In all occupancies, heavy timber shall be allowed where a 1-hour or less fire-resistance rating is required.

d. Not less than the fire-resistance rating required by other sections of this code.

e. Not less than the fire-resistance rating based on fire separation distance (see Table 602).

f. Not less than the fire-resistance rating as referenced in Section 704.10.

g. Shall be permitted to be 1 hour where the building is provided with an automatic sprinkler system in accordance with Section 903.1.1 and has a fire separation distance of not less than 30 feet on all sides.

Reason: Exterior wall ratings for Type III and IV construction address the hazards associated with exposure to other buildings. When there is no exposure to other buildings, it is difficult to identify a purpose for the two-hour rating of exterior walls when the rest of the structure can be one-hour or even unrated. The requirement for the two-hour rating itself, in platform construction, has caused some designers and jurisdictions to require special protection details and connections at the intersection of floor and wall construction in attempts to maintain a continuity of the rating for the exterior wall. But when there is no exposure to other buildings, this results only in protecting the exterior wall from the interior of the building, which serves no purpose and could jeopardize the overall performance of floors under fire conditions by requiring special connections that leave the floor vulnerable for the sake of protecting the wall.
The proposed required sprinkler system, in addition to the fire separation distance, will serve for better and more practical fire safety in the majority of Type III and IV buildings. The 30-foot fire separation distance is the distance at which Table 602 allows unrated walls for all occupancies; the sprinkler protection is a full NFPA 13 system.

Additional information related to this proposal may be posted at http://www.awc.org/Code-Officials/2015-IBC-Code-Changes/

Cost Impact: Will not increase the cost of construction
Will save cost without sacrificing safety.

Nonbearing walls and partitions Interior[d]	0	0	0	0	0	0	See Section ~~602.4.6~~ 602.4.1.6	0	0
Floor construction and associated secondary members (see Section 202)	2	2	1	0	1	0	HT	1	0
Roof construction and associated secondary members (see Section 202)	1 1/2[b]	1[b,c]	1[b,c]	0[c]	1[b,c]	0	HT	1[b,c]	0

For SI: 1 foot = 304.8 mm.

a. Roof supports: Fire-resistance ratings of primary structural frame and bearing walls are permitted to be reduced by 1 hour where supporting a roof only.

b. Except in Group F-1, H, M and S-1 occupancies, fire protection of structural members shall not be required, including protection of roof framing and decking where every part of the roof construction is 20 feet or more above any floor immediately below. Fire-retardant-treated wood members shall be allowed to be used for such unprotected members.

c. In all occupancies, heavy timber shall be allowed where a 1-hour or less fire-resistance rating is required.

d. Not less than the fire-resistance rating required by other sections of this code.

e. Not less than the fire-resistance rating based on fire separation distance (see Table 602).

f. Not less than the fire-resistance rating as referenced in Section 704.10.

~~602.2~~602.1.2 Types I and II. Types I and II construction are those types of construction in which the building elements listed in Table 601 ~~are~~shall be constructed of noncombustible materials~~, except as~~. Combustible materials are permitted in accordance with Section ~~603~~602.2 and elsewhere in this code.

~~602.3~~602.1.3 Type III. Type III construction is that type of construction in which the exterior walls ~~are~~shall be constructed of noncombustible materials and the interior building elements are of any material permitted by this code.~~*Fire-retardant-treated wood* framing complying~~ Combustible materials within exterior walls are permitted in accordance with Section ~~2303.2 shall be permitted within *exterior wall* assemblies of a 2-hour rating or less.~~602.2 and elsewhere in this code.

TABLE ~~602.4~~ 602.1.3
WOOD MEMBER SIZE EQUIVALENCIES

MINIMUM NOMINAL SOLID SAWN SIZE		MINIMUM GLUED-LAMINATED NET SIZE		MINIMUM STRUCTURAL COMPOSITE LUMBER NET SIZE	
Width, inch	Depth, inch	Width, inch	Depth, inch	Width, inch	Depth, inch
8	8	6 3/4	8 1/4	7	7 1/2
6	10	5	10 1/2	5 1/4	9 1/2
6	8	5	8 1/4	5 1/4	7 1/2
6	6	5	6	5 1/4	5 1/2
4	6	3	6 7/8	3 1/2	5 1/2

For SI:1 inch = 25.4 mm.

~~602.4~~602.1.4 Type IV. Type IV construction (Heavy Timber, HT) is that type of construction in which the exterior walls are of noncombustible materials and the interior building elements are of solid or laminated wood without concealed spaces. The details of Type IV construction shall comply with the provisions of this section and Section ~~2304.11. Exterior walls complying with Section 602.4.1 or 602.4.2 shall be permitted~~2304.10. Minimum solid sawn nominal dimensions are required for structures built using Type IV construction (HT) in accordance with this section. For gluedlaminated members and structural composite lumber (SCL) members, the equivalent net finished width and depths corresponding to the minimum nominal width and depths of solid sawn lumber are required as specified in Table ~~602.4.~~603.1.3.*Cross-laminated timber* (CLT) dimensions used in this section are actual dimensions. Combustible materials in exterior walls are permitted in accordance with Section 602.2 and elsewhere in this code.

~~**602.4.1 Fire-retardant-treated wood in exterior walls.** *Fire-retardant-treated wood* framing complying with Section 2303.2 shall be permitted within exterior wall assemblies with a 2-hour rating or less.~~

~~**602.4.2 Cross-laminated timber in exterior walls.** *Cross-laminated timber* complying with Section 2303.1.4 shall be permitted within exterior wall assemblies with a 2-hour rating or less, provided the exterior surface of the cross-laminated timber is protected by one the following:~~

1. ~~*Fire-retardant-treated wood* sheathing complying with Section 2303.2 and not less than 15/32 inch (12 mm) thick;~~
2. ~~*Gypsum board* not less than 1/2 inch (12.7 mm) thick; or~~
3. ~~A noncombustible material.~~

~~602.4.3~~602.1.4.1 Columns. Wood columns shall be sawn or glued laminated and shall be not less than 8 inches (203 mm), nominal, in any dimension where supporting floor loads and not less than 6 inches (152 mm) nominal in width and not less than 8 inches (203 mm) nominal in depth where supporting roof and ceiling loads only. Columns shall be continuous or superimposed and connected in an *approved* manner. Protection in accordance with Section 704.2 is not required.

~~602.4.4~~602.1.4.2 Floor framing. *No change to text.*

~~602.4.5~~602.1.4.3 Roof framing. Wood-frame or glued-laminated arches for roof construction, which spring from the floor line or from grade and do not support floor loads, shall have members not less than 6 inches (152 mm) nominal in width and have not less than 8 inches (203 mm) nominal in depth for the lower half of the height and not less than 6 inches (152 mm) nominal in depth for the upper half. Framed or glued-laminated arches for roof construction that spring from the top of walls or wall abutments, framed timber trusses and other roof framing, which do not support floor loads, shall have members not less than 4 inches (102 mm) nominal in width and not less than 6 inches (152 mm) nominal in depth. Spaced members shall be permitted to be composed of two or more pieces not less than 3 inches (76 mm) nominal in thickness where blocked solidly throughout their intervening spaces or where spaces are tightly closed by a continuous wood cover plate of not less than 2 inches (51 mm) nominal in thickness secured to the underside of the members. Splice plates shall be not less than 3 inches (76 mm) nominal in thickness. Where protected by *approved* automatic sprinklers under the roof deck, framing members shall be not less than 3 inches (76 mm) nominal in width.

~~602.4.6~~602.1.4.4 Floors. *No change to text.*

~~602.4.6.1~~602.1.4.4.1 Sawn or glued-laminated plank floors. Sawn or glued-laminated plank floors shall be one of the following:

1. Sawn or glued-laminated planks, splined or tongue-and-groove, of not less than 3 inches (76 mm) nominal in thickness covered with 1-inch (25 mm) nominal dimension tongue-and-groove flooring, laid crosswise or diagonally, 15/32-inch (12 mm) wood structural panel or 1/2-inch (12.7 mm) particleboard.
2. Planks not less than 4 inches (102 mm) nominal in width set on edge close together and well spiked and covered with 1-inch (25 mm) nominal dimension flooring or 15/32-inch (12 mm) wood structural panel or 1/2-inch (12.7 mm) particleboard.

The lumber shall be laid so that no continuous line of joints will occur except at points of support. Floors shall not extend closer than 1/2 inch (12.7 mm) to walls. Such 1/2-inch (12.7 mm) space shall be covered by a molding fastened to the wall and so arranged that it will not obstruct the swelling or shrinkage movements of the floor. Corbelling of masonry walls under the floor shall be permitted to be used in place of molding.

~~602.4.6.2~~602.1.4.4.2 Cross-laminated timber floors. *Cross-laminated timber* shall be not less than 4 inches (102 mm) in thickness. *Cross-laminated timber* shall be continuous from support to support and mechanically fastened to one another. *Cross-laminated timber* shall be permitted to be connected to walls without a shrinkage gap providing swelling or shrinking is considered in the design. Corbelling of masonry walls under the floor shall be permitted to be used.

~~**602.4.7**~~**602.1.4.5 Roofs.** Roofs shall be without concealed spaces and wood roof decks shall be sawn or glued laminated, splined or tongue-and-groove plank, not less than 2 inches (51 mm) nominal in thickness; $1^{1}/_{8}$-inch-thick (32 mm) wood structural panel (exterior glue); planks not less than 3 inches (76 mm) nominal in width, set on edge close together and laid as required for floors; or of cross-laminated timber. Other types of decking shall be permitted to be used if providing equivalent fire resistance and structural properties.

Cross-laminated timber roofs shall be not less than 3 inches (76 mm) nominal in thickness and shall be continuous from support to support and mechanically fastened to one another.

~~**602.4.8 Partitions and walls.** Partitions and walls shall comply with Section 602.4.8.1 or 602.4.8.2.~~

~~**602.4.8.1**~~**602.1.4.6 Interior walls and partitions.** *No change to text.*

~~**602.4.8.2 Exterior walls.** Exterior walls shall be of one of the following:~~

1. ~~Noncombustible materials.~~
2. ~~Not less than 6 inches (152 mm) in thickness and constructed of one of the following:~~
   - ~~2.1. *Fire-retardant-treated wood* in accordance with Section 2303.2 and complying with Section 602.4.1.~~
   - ~~2.2. *Cross-laminated timber* complying with Section 602.4.2.~~

~~**602.4.9**~~**602.1.4.7 Exterior structural members.** *No change to text.*

~~**602.5**~~**602.1.5 Type V.** Type V construction is that type of construction in which the structural elements, *exterior walls* and interior walls are of any materials permitted by this code.

602.2 Allowable uses of combustible materials. Building elements in Type I and II Construction and within exterior walls in Types III and IV Construction shall be permitted to be constructed of combustible materials in accordance with the following applications:

1. *Fire-retardant-treated wood* framing complying with Section 2303.2 shall be permitted as follows:
   - 1.1. Nonbearing partitions where the required *fire-resistance rating* is 2 hours or less in Types I and II construction.
   - 1.2. Nonbearing *exterior walls* where fire-resistance rated construction is not required in Types I and II construction.
   - 1.3. Roof construction, including girders, trusses, framing and decking in Types I and II construction.

     Exception: In buildings of Type IA construction exceeding two *stories* above *grade plane*, *fire-retardant- treated wood* is not permitted in roof construction where the vertical distance from the upper floor to the roof is less than 20 feet (6096 mm).
   - 1.4 Within exterior wall assemblies for Type III construction where the fireresistance rating of the wall assemblies are 2 hours or less.
   - 1.5 Within exterior wall assemblies for Type IV construction where the fireresistance rating of the wall assemblies are 2 hours or less and the thickness is not less than 6 inches.
2. In Type IV Construction, *Cross-laminated timber* complying with Section 2303.1.4 shall be permitted within exterior wall assemblies with a 2-hour rating or less, provided the exterior surface of the cross-laminated timber is protected by one the following:
   - 2.1. *Fire retardant treated wood* sheathing complying with 2303.2 and not less than 15/32 inch (12 mm) thick;
   - 2.2. *Gypsum board* not less than ½ inch (12.7 mm) thick; or
   - 2.3. A noncombustible material.
3. Millwork such as doors, door frames, window sashes and frames.
4. Where not installed greater than 15 feet (4572 mm) above grade, show windows, nailing or furring strips and wooden bulkheads below show windows, including their frames, aprons and show cases.
5. In Types I, II, and III construction partitions dividing portions of stores, offices or similar places occupied by one tenant only and that do not establish a *corridor* serving an *occupant load* of 30 or more shall be permitted to be constructed of *fire-retardant-treated wood*, 1-hour fire-resistance-rated construction or of wood panels or similar light construction up to 6 feet (1829 mm) in height.
6. Stages and platforms constructed in accordance with Sections 410.3 and 410.4, respectively.
7. Blocking such as for handrails, millwork, cabinets and window and door frames.
8. Mastics and caulking materials applied to provide flexible seals between components of *exterior wall* construction.
9. Heavy timber as permitted by Note c to Table 601 and Sections 602.1.4.5 and 1406.3.
10. Aggregates, component materials and admixtures as permitted by Section 703.2.2.
11. Sprayed fire-resistant materials and intumescent and mastic fire-resistant coatings, determined on the basis of *fire-resistance* tests in accordance with Section 703.2 and installed in accordance with Sections 1705.13 and 1705.14, respectively.
12. Materials used to protect penetrations in fire-resistance-rated assemblies in accordance with Section 714.
13. Wall construction of freezers and coolers of less than 1000 square feet (92.9 m2) in floor area, lined on both sides with noncombustible materials and the building is protected throughout with an automatic sprinkler system in accordance with Section 903.3.1.1.

Delete without substitution:

~~**SECTION603**~~

~~**COMBUSTIBLE MATERIAL IN TYPES I AND II CONSTRUCTION**~~

~~**603.1 Allowable materials. Combustible materials shall be permitted in buildings of Type I or II construction in the following applications and in accordance with Sections 603.1.1 through 603.1.3:**~~

1. ~~*Fire-retardant-treated wood* shall be permitted in:~~
   - ~~1.1. Nonbearing partitions where the required *fire-resistance rating* is 2 hours or less.~~
   - ~~1.2. Nonbearing *exterior walls* where fire-resistance-rated construction is not required.~~
   - ~~1.3. Roof construction, including girders, trusses, framing and decking.~~

     ~~**Exception:** In buildings of Type IA construction exceeding two *stories abovegrade plane*, *fire-retardant-treated wood* is not permitted in roof construction where the vertical distance from the upper floor to the roof is less than 20 feet (6096 mm).~~

2. ~~Thermal and acoustical insulation, other than foam plastics, having a *flame spread index* of not more than 25.~~

~~Exceptions:~~

1. ~~Insulation placed between two layers of noncombustible materials without an intervening airspace shall be allowed to have a *flame spread index* of not more than 100.~~
2. ~~Insulation installed between a finished floor and solid decking without intervening airspace shall be allowed to have a *flame spread index* of not more than 200.~~

3. ~~Foam plastics in accordance with Chapter 26.~~
4. ~~Roof coverings that have an A, B or C classification.~~
5. ~~*Interior floor finish* and floor covering materials installed in accordance with Section 804.~~
6. ~~Millwork such as doors, door frames, window sashes and frames.~~
7. ~~*Interior wall and ceiling finishes* installed in accordance with Sections 801 and 803.~~
8. ~~*Trim* installed in accordance with Section 806.~~
9. ~~Where not installed greater than 15 feet (4572 mm) above grade, show windows, nailing or furring strips and wooden bulkheads below show windows, including their frames, aprons and show cases.~~
10. ~~Finish flooring installed in accordance with Section 805.~~
11. ~~Partitions dividing portions of stores, offices or similar places occupied by one tenant only and that do not establish a *corridor* serving an *occupant load* of 30 or more shall be permitted to be constructed of *fire-retardant-treated wood*, 1-hour fire-resistance-rated construction or of wood panels or similar light construction up to 6 feet (1829 mm) in height.~~
12. ~~Stages and platforms constructed in accordance with Sections 410.3 and 410.4, respectively.~~
13. ~~Combustible *exterior wallcoverings*, balconies and similar projections and bay or oriel windows in accordance with Chapter 14.~~
14. ~~Blocking such as for handrails, millwork, cabinets and window and door frames.~~
15. ~~Light-transmitting plastics as permitted by Chapter 26.~~
16. ~~Mastics and caulking materials applied to provide flexible seals between components of *exterior wall* construction.~~
17. ~~Exterior plastic veneer installed in accordance with Section 2605.2.~~
18. ~~Nailing or furring strips as permitted by Section 803.11.~~
19. ~~Heavy timber as permitted by Note c to Table 601 and Sections 602.4.7 and 1406.3.~~
20. ~~Aggregates, component materials and admixtures as permitted by Section 703.2.2.~~
21. ~~Sprayed fire-resistant materials and intumescent and mastic fire-resistant coatings, determined on the basis of *fire resistance* tests in accordance with Section 703.2 and installed in accordance with Sections 1705.14 and 1705.15, respectively.~~
22. ~~Materials used to protect penetrations in fire-resistance-rated assemblies in accordance with Section 714.~~
23. ~~Materials used to protect joints in fire-resistance-rated assemblies in accordance with Section 715.~~
24. ~~Materials allowed in the concealed spaces of buildings of Types I and II construction in accordance with Section 718.5.~~
25. ~~Materials exposed within plenums complying with Section 602 of the *International Mechanical Code.*~~
26. ~~Wall construction of freezers and coolers of less than 1,000 square feet (92.9 m^2), in size, lined on both sides with noncombustible materials and the building is protected throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1.~~

~~**603.1.1 Ducts.** The use of nonmetallic ducts shall be permitted where installed in accordance with the limitations of the *International Mechanical Code.*~~

~~**603.1.2 Piping.** The use of combustible piping materials shall be permitted where installed in accordance with the limitations of the *International Mechanical Code* and the *International Plumbing Code.*~~

~~**603.1.3 Electrical.** The use of electrical wiring methods with combustible insulation, tubing, raceways and related components shall be permitted where installed in accordance with the limitations of this code.~~

Reason: The purpose of this code change proposal is to remove the extraneous, unnecessary information from Chapter 6 that only serves to confuse users of this Code. Section 603 provides an incomplete laundry list of combustible materials that are allowed in Types I and II construction. However, Section 602.2 states that the building elements of buildings of Type I and II construction are required to be noncombustible except as permitted in Section 603, and elsewhere in this code. Of the 29 items listed in Section 603, only 12 of them are materials that could be components of the building elements in Table 601. The remaining materials listed are also discussed in detail in other parts of the code regarding the limitations of their use in various types of construction. For instance, roof coverings are listed in item no. 4, that have a Class A, B, or C classification. Section 1505 provides in detail where roof coverings of different classifications are required in various types of construction. Why then, is this provision contained in Section 603? Roof coverings are not part of a building element listed in Table 601. Item no. 4 in Section 603.1 tells the user of the code nothing. Are the items in Section 603 the only combustible materials allowed in Types I and II Construction? This is a frequently confused point. For instance, Photovoltaic Rooftop panels and modules are permitted, as stated in Section 1510. But they are not listed in Section 603. Are they therefore only allowed in Types III, IV, and V construction? With this in mind, Section 603 is proposed for deletion, and only the items in Section 603 that can be part of the structural elements in Table 601 are listed in Section 602.2. Cross laminated timber in Type IV Construction (existing Section 602.4.2) has been relocated to the new Section 602.2 as Item 2, with all the other allowable combustible materials for the construction of building elements.

Here are the items that are moved from Section 603 to Section 602.2 (both the existing Item number and the proposed new Item number are provided):

1. Fire-retardant-treated wood. (Item 1)

6. Millwork such as doors, door frames, window sashes and frames. (Item 3)

9. Where not installed greater than 15 feet (4572 mm) above grade, show windows, nailing or furring strips and wooden bulkheads below show windows, including their frames, aprons and show cases. (Item 4)

11. Partitions dividing portions of stores, offices or similar places occupied by one tenant only and that do not establish a corridor serving an occupant load of 30 or more shall be permitted to be constructed of fire-retardant-treated wood, 1-hour fire-resistance-rated construction or of wood panels or similar light construction up to 6 feet (1829 mm) in height. (Item 5)

12. Stages and platforms constructed in accordance with Sections 410.3 and 410.4, respectively. (Item 6)

14. Blocking, such as for handrails, millwork, cabinets and window and door frames. (Item 7)

16. Mastics and caulking materials applied to provide flexible seals between components of exterior wall construction. (Item 8)

19. Heavy timber as permitted by Note c to Table 601 and Sections 602.4.7 and 1406.3. (Item 9)

20. Aggregates, component materials and admixtures as permitted by Section 703.2.2. (Item 10)

21. Sprayed fire-resistant materials and intumescent and mastic fire-resistant coatings, determined on the basis of fire-resistance tests in accordance with Section 703.2 and installed in accordance with Sections 1705.13 and 1705.14, respectively. (Item 11)

22. Materials used to protect penetrations in fire-resistance-rated assemblies in accordance with Section 714. (Item 12)

26. Wall construction of freezers and coolers of less than 1000 square feet (92.9 m2), in size, lined on both sides with noncombustible materials and the building is protected throughout with an automatic sprinkler system in accordance with Section 903.3.1.1. (Item 13)

The remaining items are removed from this Chapter because they do not comprise parts of the elements listed in Table 601 and any limitations on their use in noncombustible construction are provided elsewhere in the code:

2. Thermal and acoustical insulation: See Section 720.
3. Foam plastics: See Section 2603.
4. Roof coverings: See Chapter 15.
5. Interior floor finish and floor coverings: See Section 804.
7. Interior wall and ceiling finishes: See Sections 801 and 803.
8. Trim: See Section 806.
10. Finish flooring: See Section 805.
13. Combustible exterior wall coverings, balconies, and similar projections: See Section 1406.
15. Light-transmitting plastics: See Sections 2606- 2611.
17. Exterior plastic veneer: See Section 2605.2.
18. Nailing or furring strips: See Section 803.11.
23. Materials used to protect joints in fire-resistance rated assemblies: See Section 715.
24. Material in concealed spaces: See Section 718.5
25. Materials exposed within plenums: See Section 602 of the IMC

Cost Impact: Will not increase the cost of construction
The proposal attempts to clarify the code, but does not make any technical changes to code requirements.

G 171-15

602.1, 602.1.1, 602.1.1.1 (New)

Proponent: Vickie Lovell, InterCode Incorporated, representing Fire Safe North America (vickie@intercodeinc.com)

2015 International Building Code

Revise as follows:

602.1 General. Buildings and structures erected or to be erected, altered or extended in height or area shall be classified in one of the five construction types defined in Sections 602.2 through 602.5. ~~The building elements shall have a *fire-resistance rating* not less than that specified in Table 601 and exterior walls shall have a *fire-resistance rating* not less than that specified in Table 602. Where required to have a *fire-resistance rating* by Table 601, building elements shall comply with the applicable provisions of Section 703.2. The protection of openings, ducts and air transfer openings in building elements shall not be required unless required by other provisions of this code.~~

602.1.1 ~~**Minimum requirements.**~~**Fire-resistance ratings** ~~A~~ The building ~~or portion thereof~~elements shall have a *fire-resistance rating* not less than that specified in Table 601 and exterior walls shall have a *fire-resistance rating* not less than that specified in Table 602. Where required to have a fire resistance rating by Table 601, building elements shall comply with the applicable provisions of Section 703.2. The protection of openings, ducts and air transfer openings in building elements shall not be required ~~to conform to the details~~unless required by other provisions of ~~a type of construction higher than that type which meets the minimum requirements based on occupancy even though certain features of such a building actually conform to a higher type of construction.~~this code.

Add new text as follows:

602.1.1.1 Buildings in high risk areas. In Table 601 the building elements in multi-story buildings of construction Types IIB, IIIB and VB in Risk Categories III and IV identified in Table 1604.5 shall have a *fire-resistance rating* of not less than 1 hour where such buildings are any of the following:

1. Assigned to Seismic Design Category C or D in Table 1613.3.5(1).
2. Located in a flood hazard area established in accordance with Section 1612.3.
3. Located in a hurricane-prone region.

Reason: As hazard events, both naturally-occurring and man-made, are increasing in number and severity in the United States and around the world, the resilience of communities and the individual buildings within those communities is becoming of vital importance.
A National Institute of Building Sciences Publication (May, 2014) entitled "Moving Forward: Findings and Recommendations", states that "while a long history of building codes has laid the foundation for addressing the impacts of natural and man-made hazards, changes in the frequency and severity of events have brought new challenges — challenges requiring the engagement and support of policymakers. While building codes serve as the minimum requirements for life-safety in the building stock, basic life-safety protections do not fully address building performance requirements to achieve resilience."

Mitigation includes, among other things, fortifying buildings so that they are less likely to be severely damaged or completely destroyed during or immediately after a disaster. It is the key to recovery after a disaster. Mitigation allows individuals and communities to lessen post-disaster disruption and rebuild more quickly. States and cities have started implementing more stringent requirements in specific geographic areas they have designated as higher-risk. The purpose of this series of code changes proposed by Fire Safe North America is to encourage the debate in the code development process to identify what constitutes resilient buildings, and begin to identify issues that will become the basis for "new minimum requirements" for increased building resiliency.

Responding to the challenge of mitigating damage and resilient buildings is an admittedly complex topic. Fire Safe North America proposals are intended to reduce the total reliance of a community and its firefighters on automatic sprinkler systems in disaster-prone areas of the country where the water supply and/or power are likely to be interrupted, or are likely to have water supply system operational issues. The proposals, if approved, will fortify the building code requirements for the most vulnerable buildings to fire - Type IIB, IIIB, and VB construction, which are also classified as Risk Category III and IV in Table 1604.5, and in high-risk, disaster prone regions. The proposals modify the following code requirements in such buildings:

1. Reduce allowable area limits
2. Protect the path of egress by limiting travel distances
3. Protect the path of egress by protecting corridors
4. Require higher fire resistance ratings for occupancy separations
5. Require higher fire resistance ratings for building elements

These proposals are intended to be conservative so as to promote community resiliency and disaster mitigation by protecting essential buildings with both sprinkler protection AND fire resistance rated compartmentation. These proposals may be fairly considered to be the proverbial "belt-and suspenders" approach, requiring both sprinkler protection and increased fire resistance rated compartmentation in specific buildings in high risk areas for disasters.

Historically, the code has been written using the general assumption that automatic sprinklers will operate satisfactorily and there will be suitable power for such building operations. Code users design and build assuming that firefighters will be able to respond at their normal efficiencies. In some parts of the country, buildings impacted by disasters may remain without reliable water and/or power for a considerable period of time, well after the occurrence of the disaster. History has shown that increased incidents of fires after a disaster can be more destructive to life and property than the disaster itself. Total reliance on an uninterrupted power and water supply may not be an acceptable risk. It may also be an unacceptable risk to assume that firefighters will be able to respond at their normal efficiencies.

For example, more than 15% of the U.S. population lives in potential major earthquake areas. 41 states and territories have moderate to high risk. There is a real likelihood of power and water supplies being interrupted following a major seismic event, along with the potential for multiple simultaneous structure fires and also building-to-building fire spread. In October 17, 1989, a 7.1 earthquake in Santa Cruz Mountains was responsible for 26 fires in San Francisco, 60 miles from epicenter. There were 67 documented breaks in water mains which effectively eliminated water pressure in the area. On January 19, 1994, a 6.8 earthquake centered in Northridge, CA. There were approximately 100 fire ignitions, 30 to 50 of those were considered significant. The water supply systems in the area were damaged causing low pressure in water distribution. On January 17, 1995, a 6.8 (approx.) earthquake near Kobe, Japan caused 90 fires to start within minutes. 85 spread to adjacent buildings and 10 approached or reached conflagration status. 1,700 water line breaks occurred within a couple of hours. There were 7,000 buildings destroyed by fire alone.

In 1997, the Red River flooded Grand Forks, North Dakota, causing $3.7 billion in flood losses, and displaced thousands of families and businesses. Similar data of increased fire incidents are available in other flood and hurricane-prone areas.

Undoubtedly, this will increase the cost of construction in these specific buildings. However, a recent FEMA's 2010 report "Mitigation's Value to Society" statement described how mitigation is an investment that needs to be made. A recent study by the NIBS Multihazard Mitigation Council (MMC) identified that each dollar spent on mitigation saves an average of $4.00 in disaster recovery.

The two-volume NIBS MMC study report is available for free download at:
http://www.nibs.org/index.php/mmc/projects/nhms

Cost Impact: Will increase the cost of construction
This code change proposal will increase the cost of construction for some building types.

G 171-15 : 602.1-LOVELL5283

G 172-15

602.3

Proponent: David Tyree, representing American Wood Council (dtyree@awc.org); Sam Francis (sfrancis@awc.org)

2015 International Building Code

Revise as follows:

602.3 Type III. Type III construction is that type of construction in which the exterior walls are of noncombustible materials and the interior building elements are of any material permitted by this code. *Fire-retardant-treated wood* framing complying with Section 2303.2 shall be permitted within *exterior wall* assemblies of a 2-hour rating or less. <u>Exterior walls complying with Section 602.4.2 or 602.4.8.2 shall be permitted.</u>

Reason: Prior to the 2015 IBC, the requirements for exterior walls in Types III and IV construction were identical. They both permitted exterior walls to be of noncombustible material or to be of FRTW. The 2015 IBC now allows Cross-laminated timber, CLT, to also be used in those walls. The CLT is considered heavy timber in the 2015 IBC. So now, the Type III wall does not permit the three options of the Type IV wall. The 2015 code change created a difference that never existed and has no technical reason to continue to exist.

The exterior wall requirement for Type IV CLT walls are at least equivalent to what is currently required for FRTW exterior walls in Type III. This proposal will provide the same protection in Type III as is provided by exterior walls in Type IV construction. For a complete list of AWC code change proposals and additional information please go to http://www.awc.org/Code-Officials/2015-IBC-Code-Changes. For more information concerning CLT lumber and construction, please go to http://www.rethinkwood.com/tall-wood-survey.

Cost Impact: Will not increase the cost of construction
There is no increase in cost with this proposal as it just revises the protection requirements for Type II and Type IV construction identical.

G 172-15 : 602.3-TYREE4675

G 173-15

602.3

Proponent: Joseph Holland, representing Hoover Treated Wood Products (jholland@frtw.com)

2015 International Building Code

Revise as follows:

602.3 Type III. Type III construction is that type of construction in which the exterior walls are of noncombustible materials and the interior building elements are of any material permitted by this code. *Fire-retardant-treated wood* ~~framing~~ complying with Section 2303.2 shall be permitted within *exterior wall* assemblies of a 2-hour rating or less.

Reason: The term "framing" is not needed to understand the FRTW is permitted "within the exterior wall assemblies."

Cost Impact: Will not increase the cost of construction
There is no change in the requirements. It is only for clarification.

G 173-15 : 602.3-HOLLAND4215

G 174-15

602.4.1

Proponent: Joseph Holland, representing Hoover Treated Wood products (jholland@frtw.com)

2015 International Building Code

Revise as follows:

602.4.1 Fire-retardant-treated wood in exterior walls. *Fire-retardant-treated wood* ~~framing~~ complying with Section 2303.2 shall be permitted within exterior wall assemblies with a 2-hour rating or less.

Reason: The term "framing" is not needed to understand the FRTW is permitted "within the exterior wall assemblies."

Cost Impact: Will not increase the cost of construction
This is a clarification no change in construction costs.

G 174-15 : 602.4.1-HOLLAND4444

G 175-15

602.3, 602.4.1

Proponent: Homer Maiel, PE, CBO, representing ICC Tri-Chapter (Peninsula, East Bay, Monterey Bay) (hmaiel@gmail.com)

2015 International Building Code

Revise as follows:

602.3 Type III. Type III construction is that type of construction in which the exterior walls are of noncombustible materials and the interior building elements are of any material permitted by this code. *Fire-retardant-treated wood* framing <u>and sheathing</u> complying with Section 2303.2 shall be permitted within *exterior wall* assemblies of a 2-hour rating or less.

602.4.1 Fire-retardant-treated wood in exterior walls. *Fire-retardant-treated wood* framing <u>and sheathing</u> complying with Section 2303.2 shall be permitted within exterior wall assemblies with a 2-hour rating or less.

Reason: The word framing creates some confusion. some have interpreted that framing does not include the sheathing utilized for lateral resistance to be framing. This has resulted in at least one interpretation that the walls cannot have FRT structural wood panel framing and yet another interpretation that the structural wood panel is permitted to be installed but unlike the studs does not need to be FRT.
ASCE considers sheathing to be part of the framing system. The ICC ES has AQ for a product equivalent to FRT plywood for use on Type III construction.

The addition of sheathing clarifies wood framing and sheathing is permitted to be within the assembly if FRT.

Cost Impact: Will not increase the cost of construction
This code change does not create a new requirement. It clarifies existing code language to prevent misinterpretation of the code.

G 175-15 : 602.3-MAIEL4965

G 176-15

602.3, 602.4, 602.4.8

Proponent: Stephen Skalko, representing Masonry Alliance for Codes and Standards (svskalko@cox.net)

2015 International Building Code

Revise as follows:

602.3 Type III. Type III construction is that type of construction in which the exterior walls are of noncombustible materials and the interior building elements are of any material permitted by this code. Non-bearing ~~Fire-retardant-treated f~~ire-retardant-treated *wood* framing complying with Section 2303.2 shall be permitted within *exterior wall* assemblies of a 2-hour rating or less.

602.4 Type IV. Type IV construction (Heavy Timber, HT) is that type of construction in which the exterior walls are of noncombustible materials and the interior building elements are of solid or laminated wood without concealed spaces. The details of Type IV construction shall comply with the provisions of this section and Section ~~2304.11.~~ 2304.11.Non-bearing portions of Exterior walls complying with Section 602.4.1 or 602.4.2 shall be permitted. Minimum solid sawn nominal dimensions are required for structures built using Type IV construction (HT). For gluedlaminated members and structural composite lumber (SCL) members, the equivalent net finished width and depths corresponding to the minimum nominal width and depths of solid sawn lumber are required as specified in Table 602.4. *Cross-laminated timber* (CLT) dimensions used in this section are actual dimensions.

602.4.8 ~~Partitions~~Nonbearing partitions and walls. ~~Partitions~~ Nonbearing partitions and walls shall comply with Section 602.4.8.1 or 602.4.8.2.

Reason: Changes to the building code that allow the use of fire retardant treated wood for Types III and IV construction and cross-laminated lumber for Type IV construction have reduced the clarity in the code that these two types of construction are required to have the exterior load-bearing portions of the structure to be noncombustible materials. This is evident by the requirements in the first sentence to both 602.3 Type III and 602.4 Type IV specifying exterior walls to be noncombustible materials. It is implied, but not as clear, by the language in the last sentence of 602.3 for Type III construction and in 602.4.1 and 602.4.2 of Type IV construction, where fire retardant treated wood and cross-laminated lumber are permitted to be used "within" the exterior wall. This term "within" indicates the combustible materials are permitted for use as a component in the exterior wall but the structural exterior wall is still required to be noncombustible.

Historically building construction types in older building codes and the previous legacy codes were described based on noncombustible and/or combustible materials utilized in the building structural elements. The construction types ranged from buildings with no combustible structural framing, to those with noncombustible exterior walls and some combustible structural framing on the interior of the building, to buildings where the majority of the structural farming was combustible. This concept of describing the building construction type based on these combinations of noncombustible and/or combustible materials is reflected in the types of construction found in the International Building Code.

Types I and II reflect the construction type where noncombustible materials are utilized. Types III and IV construction comprise construction types where the exterior walls are of noncombustible materials and the interior framing is wholly or partly of combustible materials. In the case of Type III construction the interior framing members may be nominal light frame wood members. For Type IV construction the interior wood members are expected to be of such size to be classified as heavy timber. Finally Type V construction in the code would be a building where structural elements, including bearing exterior walls are of combustible members such as nominal light frame wood members.

Further, this proposal coordinates with Section 603.1 where it currently outlines the limitations on the use of FRTW for Types I and II construction which are also based on exterior load-bearing portions of the structure being noncombustible materials. In subpart #1 of 603.1 it states the following:

"1. Fire-retardant-treated wood shall be permitted in:

1.1 Nonbearing partitions where the required fire-resistance rating is 2 hours or less.

1.2 Nonbearing exterior walls where fire-resistance-rated construction is not required…."

This change will make clear that the bearing portion of the exterior walls in Types III and IV construction must be noncombustible to qualify for that type of construction.

Cost Impact: Will not increase the cost of construction
There is no cost impact from this change. It only clarifies the intent of the existing code.

G 176-15 : 602.3-SKALKO5513

G 177-15

602.3

Proponent: Carl Wren, City of Austin, Texas, representing City of Austin, Texas; Planning and Development Review Department and the Austin Fire Department (carl.wren@austintexas.gov)

2015 International Building Code

Revise as follows:

602.3 Type III. Type III construction is that type of construction in which the exterior walls are of noncombustible materials and the interior building elements are of any material permitted by this code. *Fire-retardant-treated wood* framing complying with Section 2303.2 shall be permitted <u>where enclosed </u>within *exterior wall* assemblies of a 2-hour rating or less.<u> The required fire resistance shall be maintained and the exposed inner and outer faces of such exterior walls shall be noncombustible.</u>

Reason: This jurisdiction has become aware of a lot of confusion as to what is required for the construction of a Type III exterior wall when the framing is fire retardant treated wood (FRTW). Some applicants have believed that the exterior wall could have FRTW plywood or OSB sheathing as the "noncombustible" exterior of the wall or that field applied ignition resistant coatings made wood sheathing noncombustible. Construction has been proposed where the FRTW plywood/OSB was to be applied directly to the FRTW framing and combustible siding installed on the exterior. These design approaches would potentially result in buildings up to 6 stories tall above the grade plane and as tall as 75-85 feet above the grade plane, without noncombustible and required fire resistive protection of the load bearing wall framing. These conditions are clearly contrary to the historical context of Type III wall construction and are at odds with the UBC source provision in section 503.4.3 of the 1997 UBC.

Bibliography: <u>Uniform Building Code</u>, International Conference of Buidling Officials/International Code Council, 1997 Edition, Seection 503.4.3, Page 1-51

Cost Impact: Will not increase the cost of construction
The proponent is proposing that the code change is a clarification and not a new requirement and therefore should not result in increased costs for code compliant construciton.

G 177-15 : 602.3-WREN5049

G 178-15

602.4

Proponent: Sam Francis, American Wood Council, representing American Wood Council (sfrancis@awc.org)

2015 International Building Code

Revise as follows:

602.4 Type IV. Type IV construction (Heavy Timber~~, HT~~) is that type of construction in which the exterior walls are of noncombustible materials and the interior building elements are of solid ~~or~~wood, laminated wood or structural composite lumber (SCL) without concealed spaces._ The details of Type IV construction shall comply with the provisions of this section and Section 2304.11._ Exterior walls complying with Section 602.4.1 or 602.4.2 shall be permitted._ Minimum ~~solid~~dimensions for building elements are as follows:

1. Solid sawn building elements shall be not less than the nominal dimensions ~~are required for structures built using Type IV construction (HT)~~in Sections 602.4.3 through 602.4.6.

2. ~~For gluedlaminated~~Glued-laminated members and structural composite lumber ~~(SCL) members,~~members shall be the equivalent net finished width and ~~depths~~depth corresponding to the minimum nominal width and ~~depths~~depth of solid sawn lumber ~~are required~~ as specified in Table 602.4.~~*Cross-laminated*~~

3. Cross-laminated timber (CLT) dimensions ~~used in this section~~ are actual dimensions and shall be not less than the dimensions required in Sections 602.4.6.2, 602.4.7, and 602.4.6.8.2, as applicable.

Reason:
In the last code cycle, the Heavy Timber section saw 5 code change proposals. The correlation of these changes was very difficult. We are submitting several changes which are intended to make this chapter more understandable. One of the issues to be clarified is the "minimum dimensions of the exterior walls. Another item is to make it absolutely clear that Structural Composite Lumber of the minimum dimensions for this chapter is, in fact, considered heavy timber. So this proposal will point the user to the proper sections to accomplish these tasks.
For a complete list of AWC code change proposals and additional information please go to http://www.awc.org/Code-Officials/2015-IBC-Code-Changes.

Cost Impact: Will not increase the cost of construction
This is an editorial rewrite and will have no cost impact other than to lower costs by making the minimum requirements more clear.

G 178-15 : 602.4-FRANCIS4679

G 179-15

602.4, TABLE 602.4, 602.4.1, 602.4.2, 602.4.3, 602.4.4, 602.4.5, 602.4.9, 2304.11, 2304.11.1, TABLE 2304.11.1.1, 2304.11.2, 2304.11.3, 602.4.8, 602.4.8.2, 602.4.8.1, 602.4.6, 602.4.6.2, 602.4.6.1, 2304.11.4, 2304.11.5, 602.4.7, 2304.11.4.2 (New)

Proponent: Dennis Richardson, representing American Wood Council

2015 International Building Code

Revise as follows:

602.4 Type IV. Type IV construction ~~(Heavy Timber, HT)~~ is that type of construction in which the exterior walls are of noncombustible materials and the interior building elements are of solid or laminated ~~wood~~heavy timber (HT), without concealed spaces. The minimum dimensions for permitted materials including solid timber, glued-laminated timber, structural composite lumber (SCL), and cross liminated timber (CLT) and details of Type IV construction shall comply with the provisions of this section and Section 2304.11. Exterior walls complying with Section 602.4.1 or 602.4.2 shall be permitted. ~~Minimum solid sawn nominal dimensions are required for structures built using Type IV construction (HT). For gluedlaminated members~~Interior walls and ~~structural composite lumber (SCL) members, the equivalent net finished width and depths corresponding to the minimum nominal width and depths~~partitions of ~~solid sawn lumber are required as specified in Table 602.4.~~not less than one hour~~*Cross*~~*fire-resistance rating*~~*-laminated*~~ *or heavy timber* ~~(CLT) dimensions used in this section are actual dimensions.~~ conforming with Section 2304.11.2.2 shall be permitted.

602.4.1 Fire-retardant-treated wood in exterior walls. *Fire-retardant-treated wood* framing complying with Section 2303.2 shall be permitted within exterior wall assemblies not less than 6 inches (152 mm) in thickness with a 2-hour rating or less.

602.4.2 Cross-laminated timber in exterior walls. *Cross-laminated timber* complying with Section 2303.1.4 shall be permitted within exterior wall assemblies not less than 6 inches (152 mm) in thickness with a 2-hour rating or less, provided the exterior surface of the cross-laminated timber is protected by one the following:

1. *Fire-retardant-treated wood* sheathing complying with Section 2303.2 and not less than $^{15}/_{32}$ inch (12 mm) thick;
2. *Gypsum board* not less than $^{1}/_{2}$ inch (12.7 mm) thick; or
3. A noncombustible material.

Delete without substitution:

~~**602.4.3 Columns.** Wood columns shall be sawn or glued laminated and shall be not less than 8 inches (203 mm), nominal, in any dimension where supporting floor loads and not less than 6 inches (152 mm) nominal in width and not less than 8 inches (203 mm) nominal in depth where supporting roof and ceiling loads only. Columns shall be continuous or superimposed and connected in an *approved* manner. Protection in accordance with Section 704.2 is not required.~~

~~**602.4.4 Floor framing.** Wood beams and girders shall be of sawn or glued-laminated timber and shall be not less than 6 inches (152 mm) nominal in width and not less than 10 inches (254 mm) nominal in depth. Framed sawn or glued-laminated timber arches, which spring from the floor line and support floor loads, shall be not less than 8 inches (203 mm) nominal in any dimension. Framed timber trusses supporting floor loads shall have members of not less than 8 inches (203 mm) nominal in any dimension.~~

~~**602.4.5 Roof framing.** Wood-frame or glued-laminated arches for roof construction, which spring from the floor line or from grade and do not support floor loads, shall have members not less than 6 inches (152 mm) nominal in width and have not less than 8 inches (203 mm) nominal in depth for the lower half of the height and not less than 6 inches (152 mm) nominal in depth for the upper half. Framed or glued-laminated arches for roof construction that spring from the top of walls or wall abutments, framed timber trusses and other roof framing, which do not support floor loads, shall have members not less than 4 inches (102 mm) nominal in width and not less than 6 inches (152 mm) nominal in depth. Spaced members shall be permitted to be composed of two or more pieces not less than 3 inches (76 mm) nominal in thickness where blocked solidly throughout their intervening spaces or where spaces are tightly closed by a continuous wood cover plate of not less than 2 inches (51 mm) nominal in thickness secured to the underside of the members. Splice plates shall be not less than 3 inches (76 mm) nominal in thickness. Where protected by *approved* automatic sprinklers under the roof deck, framing members shall be not less than 3 inches (76 mm) nominal in width.~~

Revise as follows:

~~602.4.9~~602.4.3 Exterior structural members. Where a horizontal separation of 20 feet (6096 mm) or more is provided, wood columns and arches conforming to heavy timber sizes complying with 2304.11 shall be permitted to be used externally.

2304.11 Heavy timber construction. Where a structure ~~or~~, portion thereof ~~is~~, or individual structural elements are required to be of ~~Type IV construction~~heavy timber by ~~other~~ provisions of this code, the building elements therein shall comply with the applicable provisions of Sections 2304.11.1 through ~~2304.11.5~~2304.11.4. Minimum dimensions of heavy timber shall comply as applicable in Table 2304.11 based on roofs or floors supported and the configuration of each structural element, or as applicable in Sections 2304.11.2 through 2304.11.4.

2304.11.1 ~~Columns~~Details of heavy timber structural members. ~~Columns~~ Heavy timber structural members shall be ~~continuous or superimposed throughout all stories by means of reinforced concrete or metal caps~~detailed and constructed in accordance with ~~brackets, or shall be connected by properly designed steel or iron caps, with pintles and base plates, or by timber splice plates affixed to the columns by metal connectors housed within the contact faces, or by other *approved* methods.~~Sections 2304.11.1.1 through 2304.11.1.3.

2304.11.1.1 ~~Column connections~~Columns. Minimum dimensions of columns shall be in accordance with Table 2304.11. Columns shall be continuous or superimposed throughout all stories and connected in an *approved* manner. Girders and beams at column connections shall be closely fitted around columns and adjoining ends shall be cross tied to each other, or intertied by caps or ties, to transfer horizontal loads across joints. Wood bolsters shall not be placed on tops of columns unless the columns support roof loads only. Where traditional heavy timber detailing is used, connections shall be permitted to be by means of reinforced concrete or metal caps with brackets, or shall be connected by properly designed steel or iron caps, with pintles and base plates, or by timber splice plates affixed to the columns by metal connectors housed within the contact faces, or by other approved methods.

~~**2304.11.2**~~**2304.11.1.2 Floor framing.** Minimum dimensions of floor framing shall be in accordance with Table 2304.11. *Approved* wall plate boxes or hangers shall be provided where wood beams, girders or trusses rest on masonry or concrete walls. Where intermediate beams are used to support a floor, they shall rest on top of girders, or shall be supported by ~~ledgers or blocks securely fastened to the sides of the girders, or they shall be supported by~~ an *approved* metal hanger into which the ends of the beams shall be closely fitted. Where traditional heavy timber detailing is used, these connections shall be permitted to be supported by ledgers or blocks securely fastened to the sides of the girders.

~~**2304.11.3**~~**2304.11.1.3 Roof framing.** Minimum dimensions of roof framing shall be in accordance with Table 2304.11. Every roof girder and at least every alternate roof beam shall be anchored to its supporting member~~; and every monitor and every sawtooth construction shall be anchored to the main roof construction. Such anchors shall consist of steel or iron bolts of sufficient strength~~ to resist ~~vertical uplift of the roof.~~forces as required in Chapter 16.

~~**602.4.8**~~**2304.11.2 Partitions and walls.** Partitions and walls shall comply with Section ~~602.4.8.1~~2304.11.2.1 or ~~602.4.8.2~~2304.11.2.2.

~~**602.4.8.2**~~**2304.11.2.1 Exterior walls.** Exterior walls shall permitted to be ~~of one of the following:~~

~~1. Noncombustible materials.~~

1. ~~Not less than 6 inches (152 mm) in thickness and constructed of one of the following:~~
   - ~~1.1. *Fire-retardant-treated wood* in accordance with Section 2303.2 and complying with Section 602.4.1.~~
   - 1.1. *Cross-laminated timber*~~complying with~~meeting the requirements of Section ~~602.4.2~~2303.1.4.

~~**602.4.8.1**~~**2304.11.2.2 Interior walls and partitions.** *No change to text.*

~~**602.4.6**~~**2304.11.3 Floors.** Floors shall be without concealed spaces. Wood floors shall be constructed in accordance with Section ~~602.4.6.1~~2304.11.3.1 or ~~602.4.6.2~~2304.11.3.2.

~~**602.4.6.2**~~**2304.11.3.1 Cross-laminated timber floors.** *Cross-laminated timber* shall be not less than 4 inches (102 mm) in actual thickness. *Cross-laminated timber* shall be continuous from support to support and mechanically fastened to one another. *Cross-laminated timber* shall be permitted to be connected to walls without a shrinkage gap providing swelling or shrinking is considered in the design. Corbelling of masonry walls under the floor shall be permitted to be used.

~~**602.4.6.1**~~**2304.11.3.2 Sawn or glued-laminated plank floors.** *No change to text.*

Delete without substitution:

~~**2304.11.4 Floor decks.** Floor decks and covering shall not extend closer than 1/2 inch (12.7 mm) to walls. Such 1/2-inch (12.7 mm) spaces shall be covered by a molding fastened to the wall either above or below the floor and arranged such that the molding will not obstruct the expansion or contraction movements of the floor. Corbeling of masonry walls under floors is permitted in place of such molding.~~

Revise as follows:

~~**2304.11.5**~~**2304.11.4 Roof decks.** Roofs shall be without concealed spaces and roof decks shall be constructed in accordance with Section 2304.11.4.1 or 2304.11.4.2. Other types of decking shall be permitted to be used where equivalent fire resistance and structural properties are being provided. Where supported by a wall, roof decks shall be anchored to walls to resist ~~uplift~~ forces determined in accordance with Chapter 16. Such anchors shall consist of steel bolts, lags, screws or ~~iron bolts~~*approved* hardware of sufficient strength to resist ~~vertical uplift of the roof.~~prescribed forces.

~~**602.4.7**~~**2304.11.4.1** ~~**Roofs**~~**Cross-laminated timber roofs.** ~~Roofs shall be without concealed spaces and wood roof decks shall be sawn or glued laminated, splined or tongue-and-groove plank, not less than 2 inches (51 mm) nominal in thickness; 1 1/8-inch-thick (32 mm) wood structural panel (exterior glue); planks not less than 3 inches (76 mm) nominal in width, set on edge close together and laid as required for floors; or of cross-laminated timber. Other types of decking shall be permitted to be used if providing equivalent fire resistance and structural properties.~~

Cross-laminated timber roofs shall be not less than 3 inches (76 mm) ~~nominal in~~in actual thickness and shall be continuous from support to support and mechanically fastened to one another.

Add new text as follows:

2304.11.4.2 Sawn, wood structural panel, or glued-laminated plank roofs.

Sawn, wood structural panel, or glued-laminated plank roofs shall be one of the following:

1. Sawn or glued laminated, splined or tongue-and-groove plank, not less than 2 inches (51 mm) nominal in thickness;
2. 11 /8-inch-thick (32 mm) wood structural panel (exterior glue);
3. Planks not less than 3 inches (76 mm) nominal in width, set on edge close together and laid as required for floors.

Revise as follows:

TABLE 2304.11
~~**WOOD MEMBER SIZE EQUIVALENCIES**~~**MINIMUM DIMENSIONS OF HEAVY TIMBER STRUCTURAL MEMBERS**

		MINIMUM NOMINAL SOLID SAWN SIZE		MINIMUM GLUED-LAMINATED NET SIZE		MINIMUM STRUCTURAL COMPOSITE LUMBER NET SIZE	
Supporting	Heavy Timber Structural Element	Width, inch	Depth, inch	Width, inch	Depth, inch	Width, inch	Depth, inch

Floor loads only or combined floor and roof loads	Columns; Framed sawn or glued-laminated timber arches which spring from the floor line; Framed timber trusses	8	8	6 3/4	8 1/4	7	7 1/2
	Wood beams and girders	6	10	5	10 1/2	5 1/4	9 1/2
Roof loads only	Columns (roof and ceiling loads); Lower half of: Wood-frame or glued-laminated arches which spring from the floor line or from grade	6	8	5	8 1/4	5 1/4	7 1/2
	Upper half of: Wood-frame or glued-laminated arches which spring from the floor line or from grade	6	6	5	6	5 1/4	5 1/2
	Framed timber trusses and other roof framing; [a] Framed or glued-laminated arches that spring from the top of walls or wall abutments	4 [b]	6	3 [b]	6 7/8	3 1/2 [b]	5 1/2

For SI:1 inch = 25.4 mm.

[a] Spaced members shall be permitted to be composed of two or more pieces not less than 3 inches (76 mm) nominal in thickness where blocked solidly throughout their intervening spaces or where spaces are tightly closed by a continuous wood cover plate of not less than 2 inches (51 mm) nominal in thickness secured to the underside of the members. Splice lates shall be not less than 3 inches (76 mm) nominal in thickness.

[b] Where protected by approved automatic sprinklers under the roof deck, framing members shall be not less than 3 inches (76 mm) nominal in width.

Reason: The cross laminated timber product standard was approved in the 2015 IBC in addition to a code change allowing this material to be utilized for the construction of 2 hour exterior walls in type IV-HT construction.
Cross Laminated Timber has been manufactured for over 30 years in Europe and has just recently caught hold on the American Continent where some major structures are under way in Canada and smaller buildings are being built in the US. In Europe buildings of 8 to 10 stories and above are regularly constructed. The following link gives examples of CLT buildings throughout the world. http://www.rethinkwood.com/tall-wood-survey
Because of the high level of carbon sequestration and low embodied energy, it is anticipated there will be a renewed interest in the use of type IV heavy timber as a type of construction. One bit of feedback American Wood Council received after CLT was approved in the 2015 IBC was the observation from one building department that the heavy timber and type IV provisions are confusing, sometimes redundant and spread across different sections of the building code.
This code change is an attempt to address that concern without making any change in the substance of the requirements. Currently type IV construction and heavy timber requirements are found in Sections 602.4 and 2304.11 of the IBC. The clean up and reorganization of those sections is part one of this effort. Part two is the identification and update of many references to type IV construction and heavy timber found throughout the code.

In order to pare down Section 602.4, only the provisions specific to type IV construction remain along with a list of the types of materials found in heavy timber and the reference to the requirements for those materials in Section 2304.11. Requirements specific to type IV remain in 602.4.
Section 2304.11 can best be described as "all things heavy timber". Heavy timber structural elements have long been referenced throughout other parts of the code where a specific heavy timber structural element is detailed for use incorporated in another type of construction. The most general example of this is table 601 footnote c allowing the use of heavy timber roof construction in place of one hour fire resistance rated roof construction in types IB, II, IIIA, and VA construction. The design professional may detail heavy timber as the roof structure and assembly for these different types of construction and they are treated as building elements but the type of construction for the overall structure does not change from the type IB, II, IIIA, or VA.
Heavy timber requirements removed from Section 602.4 are combined and organized with the existing content of Section 2304. Table 602.4 is moved and renamed Table 2304.11. It is updated with information placing a description of the elements that are applicable for a given size timber element based on whether the element supports roof loads and floor loads or only roof loads. Specific footnotes about the size and protection of spaced truss elements and the reduction of roof beam width for sprinklers are noted where applicable.
The non-size related detailing provisions for framing members and connections (columns, floor framing and roof framing) are coalesced into Sections 2304.11.1.1, 2304.11.1.2 and 2304.11.1.3. All of the information in table 2304.11 and the following sections are organized so that the most pertinent information for most designs is found first.
Finally, some of the detailing provisions for traditional heavy timber are identified as such and relocated later in each section while some other information that is archaic and better replaced by reference is removed. A good example of this is the removal of the requirement for the anchorage of "every monitor and every sawtooth construction" to the main roof construction in Section 2304.11.3. New Section 2304.11.1.3 requires roof girders and alternate roof beams to be anchored to their supports as required by Chapter 16.
Finally, Sections 2304.11.2 through 2304.11.4 contain pertinent thickness and detailing requirements for walls, roof and floor deck construction.
The following table gives a more detailed description of where specific requirements are moved.
Since this change is intended not to create any new requirements or delete pertinent content, there are other code changes which contain specific code changes to this information. It is intended this code change will serve as a template for the relocation of those other specific changes through the correlation process should other specific changes be approved.
Part 2 of this effort follows with the change to specific code references to: Section 602.4, type IV construction, heavy timber and Section 2304.11.
The following link provides access to additional information regarding this or other code changes proposed by American Wood Council.
http://www.awc.org/Code-Officials/2015-IBC-Code-Changes/

Section in 2015 IBC	Location in proposed change	Comments
602.4 Type IV	602.4 (same location)	modified to direct users to news section on heavy timber details; retains essentials for Type IV construction
Table 602.4	Table 2304.11	additional content is added describing the thickness of structural elements based on loading and configuration from 602.4.3 through 602.4.5
602.4.1 Fire-retardant treated wood in exterior walls, and 602.4.2 Cross-laminated timber in exterior walls	602.4.1 and 602.4.2 (same location)	thickness of wall assembly added from 602.4.8.2 item 2.
602.4.3 Columns	2304.11, Table 2304.11, and Section 2304.11.1.1	requirements combined with existing 2304.11.1 Columns; dimensions in new Table 2304.11.1
602.4.4 Floor framing	2304.11, Table 2304.11	
602.4.5 Roof framing	2304.11, Table 2304.11	
602.4.6 Floors	2304.11.3	
602.4.6.1 Sawn or glued-laminated plank floors	2304.11.3.2	the end of proposed Section 2304.11.3.2 comes from current 2304.11.2
602.4.6.2 Cross-laminated timber floors	2304.11.3.1	
602.4.7 Roofs	2304.11.4 and subsections 2304.11.4.1 and 2304.11.4.2	the current provisions of current section 2304.11.5 are folded into these sections
602.4.8 Partitions and walls and subsections 602.4.8.1 Interior walls and partitions and 602.4.8.2 Exterior walls	602.for exterior wall thickness in type IV; heavy timber in 2304.11.2 2304.11.2.1 and 2304.11.2.2	kept essentials for a Type IV building in 602.4; essentials for heavy timber in proposed section 2304.11.2
602.4.9 Exterior structural members	602.4.3	Unchanged but references proposed heavy timber section
2304.11 Heavy timber construction	2304.11 (same location)	Modified to become charging language for all heavy timber, not just Type IV construction; adds

		charging language for proposed Table 2304.11
2304.11.1 Columns	2304.11.1.1	new section 2304.11.1.1 combines current sections 2304.11.1 and 2304.11.1.1; updates text to be more design focused; retains traditional details
2304.11.1.1 Column connections	2304.11.1.1	incorporated in 2304.11.1
2304.11.2 Floor framing	2304.11.1.2	modifies text to make lesser-used methods a permitted option
2304.11.3 Roof framing	2304.11.1.3	modifies text to refer to design for all forces, not just uplift, archaic language deleted
2304.11.4 Floor decks	2304.11.3.2	current text appears at the end of the proposed section with hardware choices updated; this section incorporates requirements for floors moved from Chapter 6
2304.11.5 Roof decks	2304.11.4	current text appears at end of proposed section, and updates language to reflect current methods and to include consideration of all forces

Cost Impact: Will not increase the cost of construction
Since this is a reorganization of existing requirements, not the creation of new requirements, this code change will not increase the cost of construction.

406.7.2, TABLE 601, 603.1, 705.2.3, 803.3, 803.13.3, 1406.3, [BG] 1510.2.5, [BG] 1510.3, 3105.3, D102.2.8, 803.1

Proponent: Dennis Richardson, American Wood Council, representing American Wood Council (drichardson@awc.org)

2015 International Building Code

Revise as follows:

406.7.2 Canopies. Canopies under which fuels are dispensed shall have a clear, unobstructed height of not less than 13 feet 6 inches (4115 mm) to the lowest projecting element in the vehicle drive-through area. Canopies and their supports over pumps shall be of noncombustible materials, *fire-retardant-treated wood* complying with Chapter 23, ~~wood of Type IV sizes~~heavy timber complying with Section 2304.11 or of construction providing 1-hour *fire resistance*. Combustible materials used in or on a *canopy* shall comply with one of the following:

1. Shielded from the pumps by a noncombustible element of the *canopy*, or ~~wood of Type IV sizes~~heavy timber complying with Section 2304.11;
2. Plastics covered by aluminum facing having a thickness of not less than 0.010 inch (0.30 mm) or corrosion-resistant steel having a base metal thickness of not less than 0.016 inch (0.41 mm). The plastic shall have a *flame spread index* of 25 or less and a smokedeveloped index of 450 or less when tested in the form intended for use in accordance with ASTM E 84 or UL 723 and a self-ignition temperature of 650°F (343°C) or greater when tested in accordance with ASTM D 1929; or
3. Panels constructed of light-transmitting plastic materials shall be permitted to be installed in *canopies* erected over motor vehicle fuel-dispensing station fuel dispensers, provided the panels are located not less than 10 feet (3048 mm) from any building on the same *lot* and face *yards* or streets not less than 40 feet (12 192 mm) in width on the other sides. The aggregate areas of plastics shall be not greater than 1,000 square feet (93 m^2). The maximum area of any individual panel shall be not greater than 100 square feet (9.3 m^2).

TABLE 601
FIRE-RESISTANCE RATING REQUIREMENTS FOR BUILDING ELEMENTS (HOURS)

BUILDING ELEMENT	TYPE I		TYPE II		TYPE III		TYPE IV	TYPE V	
	A	B	A	B	A	B	HT	A	B
Primary structural frame[f] (see Section 202)	3[a]	2[a]	1	0	1	0	HT	1	0
Bearing walls Exterior[e, f] Interior	3 3[a]	2 2[a]	1 1	0 0	2 1	2 0	2 1/HT	1 1	0 0
Nonbearing walls and partitions Exterior	See Table 602								
Nonbearing walls and partitions Interior[d]	0	0	0	0	0	0	See Section ~~602.4.6~~2304.11.2	0	0
Floor construction and associated secondary members (see Section 202)	2	2	1	0	1	0	HT	1	0
Roof construction and associated secondary members (see Section 202)	1 1/2[b]	1[b,c]	1[b,c]	0[c]	1[b,c]	0	HT	1[b,c]	0

For SI: 1 foot = 304.8 mm.

a. Roof supports: Fire-resistance ratings of primary structural frame and bearing walls are permitted to be reduced by 1 hour where supporting a roof only.

b. Except in Group F-1, H, M and S-1 occupancies, fire protection of structural members shall not be required, including protection of roof framing and decking where every part of the roof construction is 20 feet or more above any floor immediately below. Fire-retardant-treated wood members shall be allowed to be used for such unprotected members.

c. In all occupancies, heavy timber complying with Section 2304.11 shall be allowed where a 1-hour or less fire-resistance rating is required.

d. Not less than the fire-resistance rating required by other sections of this code.

e. Not less than the fire-resistance rating based on fire separation distance (see Table 602).

f. Not less than the fire-resistance rating as referenced in Section 704.10.

603.1 Allowable materials. Combustible materials shall be permitted in buildings of Type I or II construction in the following applications and in accordance with Sections 603.1.1 through 603.1.3:

1. *Fire-retardant-treated wood* shall be permitted in:
   1.1. Nonbearing partitions where the required *fire-resistance rating* is 2 hours or less.
   1.2. Nonbearing *exterior walls* where fire-resistance-rated construction is not required.
   1.3. Roof construction, including girders, trusses, framing and decking.

   Exception: In buildings of Type IA construction exceeding two *stories abovegrade plane*, *fire-retardant-treated wood* is not permitted in roof construction where the vertical distance from the upper floor to the roof is less than 20 feet (6096 mm).
2. Thermal and acoustical insulation, other than foam plastics, having a *flame spread index* of not more than 25.

   Exceptions:
   1. Insulation placed between two layers of noncombustible materials without an intervening airspace shall be allowed to have a *flame spread index* of not more than 100.
   2. Insulation installed between a finished floor and solid decking without intervening airspace shall be allowed to have a *flame spread index* of not more than 200.
3. Foam plastics in accordance with Chapter 26.
4. Roof coverings that have an A, B or C classification.
5. *Interior floor finish* and floor covering materials installed in accordance with Section 804.
6. Millwork such as doors, door frames, window sashes and frames.
7. *Interior wall and ceiling finishes* installed in accordance with Sections 801 and 803.
8. *Trim* installed in accordance with Section 806.
9. Where not installed greater than 15 feet (4572 mm) above grade, show windows, nailing or furring strips and wooden bulkheads below show windows, including their frames, aprons and show cases.
10. Finish flooring installed in accordance with Section 805.
11. Partitions dividing portions of stores, offices or similar places occupied by one tenant only and that do not establish a *corridor* serving an *occupant load* of 30 or more shall be permitted to be constructed of *fire-retardant-treated wood*, 1-hour fire-resistance-rated construction or of wood panels or similar light construction up to 6 feet (1829 mm) in height.
12. Stages and platforms constructed in accordance with Sections 410.3 and 410.4, respectively.
13. Combustible *exterior wallcoverings*, balconies and similar projections and bay or oriel windows in accordance with Chapter 14.
14. Blocking such as for handrails, millwork, cabinets and window and door frames.
15. Light-transmitting plastics as permitted by Chapter 26.
16. Mastics and caulking materials applied to provide flexible seals between components of *exterior wall* construction.
17. Exterior plastic veneer installed in accordance with Section 2605.2.
18. Nailing or furring strips as permitted by Section 803.11.
19. Heavy timber as permitted by Note c to Table 601 and Sections ~~602.4.7~~602.4.3 and 1406.3.
20. Aggregates, component materials and admixtures as permitted by Section 703.2.2.
21. Sprayed fire-resistant materials and intumescent and mastic fire-resistant coatings, determined on the basis of *fire resistance* tests in accordance with Section 703.2 and installed in accordance with Sections 1705.14 and 1705.15, respectively.
22. Materials used to protect penetrations in fire-resistance-rated assemblies in accordance with Section 714.
23. Materials used to protect joints in fire-resistance-rated assemblies in accordance with Section 715.
24. Materials allowed in the concealed spaces of buildings of Types I and II construction in accordance with Section 718.5.
25. Materials exposed within plenums complying with Section 602 of the *International Mechanical Code*.
26. Wall construction of freezers and coolers of less than 1,000 square feet (92.9 m^2), in size, lined on both sides with noncombustible materials and the building is protected throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1.

705.2.3 Combustible projections. Combustible projections extending to within 5 feet (1524 mm) of the line used to determine the *fire separation distance* shall be of not less than 1-hour fire-resistance-rated construction, ~~Type IV~~heavy timber construction complying with Section 2304.11, fire-retardant-treated wood or as required by Section 1406.3.

Exception: Type VB construction shall be allowed for combustible projections in Group R-3 and U occupancies with a fire separation distance greater than or equal to 5 feet (1524 mm).

803.3 Heavy timber exemption. Exposed portions of building elements complying with the requirements for buildings of ~~Type IV~~heavy timber construction in Section 602.4 or Section 2304.11 shall not be subject to *interior finish* requirements.

803.13.3 Heavy timber construction. Wall and ceiling finishes of all classes as permitted in this chapter that are installed directly against the wood decking or planking of ~~Type IV~~heavy timber construction in Sections 602.4.2 or 2304.11 or to wood furring strips applied directly to the wood decking or planking shall be fireblocked as specified in Section 803.13.1.1.

1406.3 Balconies and similar projections. Balconies and similar projections of combustible construction other than fire-retardant-treated wood shall be fire-resistance rated where required by Table 601 for floor construction or shall be of ~~Type IV~~heavy timber construction in accordance with Section ~~602.4~~2304.11. The aggregate length of the projections shall not exceed 50 percent of the building's perimeter on each floor.

Exceptions:
1. On buildings of Type I and II construction, three stories or less above *grade plane*, *fire-retardant-treated wood* shall be permitted for balconies, porches, decks and exterior stairways not used as required exits.
2. Untreated wood is permitted for pickets and rails or similar guardrail devices that are limited to 42 inches (1067 mm) in height.
3. Balconies and similar projections on buildings of Type III, IV and V construction shall be permitted to be of Type V construction, and shall not be required to have a *fire-resistance rating* where sprinkler protection is extended to these areas.
4. Where sprinkler protection is extended to the balcony areas, the aggregate length of the balcony on each floor shall not be limited.

[BG] 1510.2.5 Type of construction. Penthouses shall be constructed with walls, floors and roofs as required for the type of construction of the building on which such penthouses are built.

Exceptions:

1. On buildings of Type I construction, the exterior walls and roofs of penthouses with a *fire separation distance* greater than 5 feet (1524 mm) and less than 20 feet (6096 mm) shall be permitted to have not less than a 1-hour fire-resistance rating. The exterior walls and roofs of penthouses with a fire separation distance of 20 feet (6096 mm) or greater shall not be required to have a fire-resistance rating.
2. On buildings of Type I construction two stories or less in height above grade plane or of Type II construction, the exterior walls and roofs of penthouses with a *fire separation distance* greater than 5 feet (1524 mm) and less than 20 feet (6096 mm) shall be permitted to have not less than a 1-hour fire-resistance rating or a lesser fire-resistance rating as required by Table 602 and be constructed of fire-retardant-treated wood. The exterior walls and roofs of penthouses with a *fire separation distance* of 20 feet (6096 mm) or greater shall be permitted to be constructed of fire-retardant-treated wood and shall not be required to have a fire-resistance rating. Interior framing and walls shall be permitted to be constructed of fire-retardant-treated wood.
3. On buildings of Type III, IV or V construction, the exterior walls of penthouses with a fire separation distance greater than 5 feet (1524 mm) and less than 20 feet (6096 mm) shall be permitted to have not less than a 1-hour fire-resistance rating or a lesser fire-resistance rating as required by Table 602. On buildings of Type III, IV or VA construction, the exterior walls of penthouses with a fire separation distance of 20 feet (6096 mm) or greater shall be permitted to be of ~~Type IV~~heavy timber construction complying with Sections 602.4 and 2304.11 or noncombustible construction or fire-retardant-treated wood and shall not be required to have a fire-resistance rating.

[BG] 1510.3 Tanks. Tanks having a capacity of more than 500 gallons (1893 L) located on the roof deck of a building shall be supported on masonry, reinforced concrete, steel or ~~Type IV~~heavy timber construction complying with Section 2304.11 provided that, where such supports are located in the building above the lowest *story*, the support shall be fire-resistance rated as required for Type IA construction.

3105.3 Design and construction. *Awnings* and *canopies* shall be designed and constructed to withstand wind or other lateral loads and live loads as required by Chapter 16 with due allowance for shape, open construction and similar features that relieve the pressures or loads. Structural members shall be protected to prevent deterioration. *Awnings* shall have frames of noncombustible material, *fire-retardant-treated wood*, ~~wood of Type IV size~~heavy timber complying with Section 2304.11, or 1-hour construction with combustible or noncombustible covers and shall be either fixed, retractable, folding or collapsible.

D102.2.8 Permanent canopies. Permanent canopies are permitted to extend over adjacent open spaces provided all of the following are met:

1. The canopy and its supports shall be of noncombustible material, *fire-retardant-treated wood*, ~~Type IV construction~~heavy timber complying with Section 2304.11 or of 1-hour fire-resistance-rated construction.
   Exception: Any textile covering for the canopy shall be flame resistant as determined by tests conducted in accordance with NFPA 701 after both accelerated water leaching and accelerated weathering.
2. Any canopy covering, other than textiles, shall have a *flame spread index* not greater than 25 when tested in accordance with ASTM E 84 or UL 723 in the form intended for use.
3. The canopy shall have at least one long side open.
4. The maximum horizontal width of the canopy shall not exceed 15 feet (4572 mm).
5. The *fire resistance* of *exterior walls* shall not be reduced.

2015 International Fire Code

803.1 General. The provisions of this section shall limit the allowable fire performance and smoke development of interior wall and ceiling finishes and interior wall and ceiling trim in existing buildings based on location and occupancy classification. Interior wall and ceiling finishes shall be classified in accordance with Section 803 of the *International Building Code*. Such materials shall be grouped in accordance with ASTM E 84, as indicated in Section 803.1.1, or in accordance with NFPA 286, as indicated in Section 803.1.2.

Exceptions:

1. Materials having a thickness less than 0.036 inch (0.9 mm) applied directly to the surface of walls and ceilings.
2. Exposed portions of structural members complying with the requirements of ~~buildings of Type IV construction~~heavy timber in accordance with the *International Building Code* shall not be subject to interior finish requirements.

Reason: This code change is part 2 of a proposal to reorganize Type IV Section 602.4 and heavy timber section 2304.11. This part of the change includes references found throughout the IBC to either: Type IV construciton, Section 602.4, Section 2304.11, or "heavy timber". This change should follow directly after the 602.4 change and the reason for the change is included in that reason statement.
The references found in this part are generally changed to Type IV or Section 602.4 when the section of the code is referring to the type of construction associated with a structure. The references are generally changed to "heavy timber complying with Section 2304.11" when the code is referring to a heavy timber element found in a building of another type of construction. This change is a reorganization of two sections and is not intended to change the intent of the code.

Cost Impact: Will not increase the cost of construction
Since this is a reorganization of existing requirements, not the creation of new requirements, this code change will not increase the cost of construction.

G 180-15 : 406.7.2-RICHARDSON5276

G 181-15

602.4, 602.4.6, 602.4.7, 602.4.10 (New)

Proponent: Paul Coats, PE CBO, American Wood Council, representing American Wood Council (pcoats@awc.org)

2015 International Building Code

Revise as follows:

602.4 Type IV. Type IV construction (Heavy Timber, HT) is that type of construction in which the exterior walls are of noncombustible materials and the interior building elements are of solid or laminated wood without concealed spaces or with concealed spaces meeting the requirements of Section 602.4.10. The details of Type IV construction shall comply with the provisions of this section and Section 2304.11. Exterior walls complying with Section 602.4.1 or 602.4.2 shall be permitted. Minimum solid sawn nominal dimensions are required for structures built using Type IV construction (HT). For gluedlaminated members and structural composite lumber (SCL) members, the equivalent net finished width and depths corresponding to the minimum nominal width and depths of solid sawn lumber are required as specified in Table 602.4. *Cross-laminated timber* (CLT) dimensions used in this section are actual dimensions.

602.4.6 Floors. Floors shall be without concealed spaces or with concealed spaces meeting the requirements of Section 602.4.10. Wood floors shall be constructed in accordance with Section 602.4.6.1 or 602.4.6.2.

602.4.7 Roofs. Roofs shall be without concealed spaces ~~and wood~~or with concealed spaces meeting the requirements of Section 602.4.10. Wood roof decks shall be sawn or glued laminated, splined or tongue-and-groove plank, not less than 2 inches (51 mm) nominal in thickness; $1^1/_8$-inch-thick (32 mm) wood structural panel (exterior glue); planks not less than 3 inches (76 mm) nominal in width, set on edge close together and laid as required for floors; or of cross-laminated timber. Other types of decking shall be permitted to be used if providing equivalent fire resistance and structural properties.

Cross-laminated timber roofs shall be not less than 3 inches (76 mm) nominal in thickness and shall be continuous from support to support and mechanically fastened to one another.

Add new text as follows:

602.4.10 Concealed spaces Concealed spaces shall not contain combustibles other than building elements and electrical, mechanical, fire protection, or plumbing materials and equipment, shall comply with all applicable provisions of Section 718, and in addition shall be protected in accordance with at least one, or any combination, of the following:

1. The building is sprinklered throughout and automatic sprinklers are also provided in the concealed space.
2. The concealed space shall be filled completely with noncombustible insulation.
3. The concealed space shall be lined continuously with a noncombustible material, not less than 1/2-inch gypsum board, or equivalent.

Exception: Concealed spaces within 1-hour fire resistance rated interior walls and partitions in accordance with Section 602.4.8.1 shall not require additional protection.

Reason: The option of having protected concealed spaces in Type IV buildings is important to encourage the adaptive re-use of existing heavy timber buildings as well as to provide for the installation of mechanicals in Type IV cross laminated timber (CLT) construction. In addition to the current requirements for all concealed spaces in combustible construction, this change would require additional protection of the concealed spaces with sprinkler coverage, or eliminating all air space with noncombustible insulation, or covering all combustible surfaces with noncombustible materials or gypsum. If sprinkler protection is chosen, the entire building must be protected by sprinklers.
Additional information related to the proposal may be posted at: http://www.awc.org/Code-Officials/2015-IBC-Code Changes/

Cost Impact: Will not increase the cost of construction
The code change provides the option of having protected concealed spaces in Type IV buildings, therefore does not increase the cost of construction.

G 181-15 : 602.4-COATS4032

G 182-15

602.4.2, 602.4.8.2

Proponent: David Tyree, American Wood Council, representing American Wood Council (dtyree@awc.org)

2015 International Building Code

Revise as follows:

602.4.2 Cross-laminated timber in exterior walls. *Cross-laminated timber* complying with Section 2303.1.4, and associated glued laminated timber and structural composite lumber elements that are rated as required for the wall, shall be permitted within exterior wall assemblies with a 2-hour rating or less, provided the exterior surface of the cross-laminated timber ~~is~~and associated elements are protected by one the following:

1. *Fire-retardant-treated wood* sheathing complying with Section 2303.2 and not less than $^{15}/_{32}$ inch (12 mm) thick;
2. *Gypsum board* not less than $^{1}/_{2}$ inch (12.7 mm) thick; or
3. A noncombustible material.

602.4.8.2 Exterior walls. Exterior walls shall be of one of the following:

1. Noncombustible materials.
2. Not less than 6 inches (152 mm) in thickness and constructed of one of the following:
   2.1. *Fire-retardant-treated wood* in accordance with Section 2303.2 and complying with Section 602.4.1.
   2.2. *Cross-laminated timber* and associated elements complying with Section 602.4.2.

Reason: Reason: The code currently does not recognize that no member of glued laminated or SCL wood of heavy timber dimensions may be used as a beam, header, column or other member within a wall of CLT which is, itself, considered to be heavy timber. It seems rather obvious that a heavy timber element may be used within the construction of a wall of heavy timber construction. This change is intended to place into the code that which may seem obvious.
For a complete list of AWC code change proposals and additional information please go to http://www.awc.org/Code-Officials/2015-IBC-Code-Changes. For more information concerning CLT lumber and construction, please go to http://www.rethinkwood.com/tall-wood-survey.

Cost Impact: Will not increase the cost of construction
No increase in construction costs as proposal only clarifies the intent of the code.

G 182-15 : 602.4.2-TYREE4642

G 183-15

602.4.8.2

Proponent: Joseph Holland, representing Hoover Treated Wood Products (jholland@frtw.com)

2015 International Building Code

Revise as follows:

602.4.8.2 Exterior walls. Exterior walls shall be of one of the following:

1. Noncombustible materials.

~~2. Not less than 6 inches (152 mm) in thickness and constructed of one of the following:~~

~~2.1.~~ 2. *Fire-retardant-treated wood* in accordance with Section 2303.2 and complying with Section 602.4.1.

~~2.2~~. 3.. *Cross-laminated timber* complying with Section 602.4.2 not less than 6 inches (152mm) in thickness.

Reason: Prior to the 2015 code there was no mandate to erect a wall constructed with FRTW to be at least 6 inches thick. This provision was added when the membership included cross laminated timber (CLT) to type four construction.
No justification was submitted to explain the rationale behind the 6-inch requirement for FRTW. FRTW has been allowed in Type IV building under the UBC since the late 1960's and the IBC since its inception. We are not aware of any problems. The change to the 2015 code will make any wall constructed before the 2015 code with 2X4 studs nonconforming.

The wall load and fire resistance requirements in the code will dictate how the wall is to be constructed. A minimum thickness is not needed.

Cost Impact: Will not increase the cost of construction
Could save on the construction costs.

G 183-15 : 602.4.8.2-HOLLAND4421

G 184-15

602.4.8.2

Proponent: Sam Francis, American Wood Council, representing American Wood Council (sfrancis@awc.org)

2015 International Building Code

602.4.8.2 Exterior walls. Exterior walls shall be of one of the following:

1. Noncombustible materials.
~~2. Not less than 6 inches (152 mm) in thickness and constructed of one of the following:~~
~~2.1~~ 2. *Fire-retardant-treated wood* in accordance with Section 2303.2 and complying with Section 602.4.1.
~~2.2.~~ 3. *Cross-laminated timber* not less than 4 inches in thickness and complying with Section 602.4.2.

Reason: When these provisions were introduced into the code in the last cycle, an overall wall thickness was deemed to be desirable. However, FRTW has performed suitably without an overall wall thickness requirement and the thickness of CLT will be driven by the required fire resistance rating and structural requirements. Citing an overall wall thickness is confusing and unnecessary, but the actual minimum thickness of the CLT is perhaps useful. Therefore we are proposing to delete the overall thickness of the wall in favor of citing an associated minimum CLT thickness, which requires a re-organization of the section.
When the original code section was developed, an overall thickness of 6 inches was proposed. It included the interior gypsum board (5/8 in.), the exterior gypsum board (5/8 in.) the exterior insulation (?? in.), the exterior cladding (3/4 in.). Thus, the overall thickness included at least 2 inches of non-CLT materials not even counting the insulation which would be required by the energy code. Subtracting the 2 inches of non-CLT material leaves 4 inches of CLT as a minimum dimension. This is completely consistent with the 6 inch requirement from the 2015 IBC. Of course, for a structure of more than 2 stories or which requires a 2 hr. FRR wall, the net dimension will still need to be greater than 6 inches, overall, to achieve the fire resistance rating and the structural capacity. Generally, the structural requirements will exceed this minimum number. But having such a number is necessary to insure the integrity of such a building.

Cost Impact: Will not increase the cost of construction
this change is not a substantive change and thus will not impact costs.

G 184-15 : 602.4.8.2-FRANCIS5409

G 185-15

603.1

Proponent: Homer Maiel, PE, CBO, representing ICC Tri-Chapter (Peninsula, East Bay, Monterey Bay) (hmaiel@gmail.com)

2015 International Building Code

Revise as follows:

603.1 Allowable materials.
Combustible materials shall be permitted in buildings of Type I or II construction in the following applications and in accordance with Sections 603.1.1 through 603.1.3:

1. *Fire-retardant-treated wood* shall be permitted in:
   1.1. Nonbearing partitions where the required *fire-resistance rating* is 2 hours or less.
   1.2. Nonbearing *exterior walls* where fire-resistance-rated construction is not required.
   1.3. Roof construction, including girders, trusses, framing and decking.
      Exception: In buildings of Type IA construction exceeding two *stories abovegrade plane* , *fire-retardant-treated wood* is not permitted in roof construction where the vertical distance from the upper floor to the roof is less than 20 feet (6096 mm).
   1.4. Balconies, porches, decks and exterior stairways not used as required exits on buildings three stories or less above grade plane.
2. Thermal and acoustical insulation, other than foam plastics, having a *flame spread index* of not more than 25.
   Exceptions:
   1. Insulation placed between two layers of noncombustible materials without an intervening airspace shall be allowed to have a *flame spread index* of not more than 100.
   2. Insulation installed between a finished floor and solid decking without intervening airspace shall be allowed to have a *flame spread index* of not more than 200.
3. Foam plastics in accordance with Chapter 26.
4. Roof coverings that have an A, B or C classification.
5. *Interior floor finish* and floor covering materials installed in accordance with Section 804.
6. Millwork such as doors, door frames, window sashes and frames.
7. *Interior wall and ceiling finishes* installed in accordance with Sections 801 and 803.
8. *Trim* installed in accordance with Section 806.
9. Where not installed greater than 15 feet (4572 mm) above grade, show windows, nailing or furring strips and wooden bulkheads below show windows, including their frames, aprons and show cases.
10. Finish flooring installed in accordance with Section 805.
11. Partitions dividing portions of stores, offices or similar places occupied by one tenant only and that do not establish a *corridor* serving an *occupant load* of 30 or more shall be permitted to be constructed of *fire-retardant-treated wood* , 1-hour fire-resistance-rated construction or of wood panels or similar light construction up to 6 feet (1829 mm) in height.
12. Stages and platforms constructed in accordance with Sections 410.3 and 410.4, respectively.
13. Combustible *exterior wall~~coverings~~coverings*, balconies and similar projections and bay or oriel windows in accordance with Chapter 14.
14. Blocking such as for handrails, millwork, cabinets and window and door frames.
15. Light-transmitting plastics as permitted by Chapter 26.
16. Mastics and caulking materials applied to provide flexible seals between components of *exterior wall* construction.
17. Exterior plastic veneer installed in accordance with Section 2605.2.
18. Nailing or furring strips as permitted by Section 803.11.
19. Heavy timber as permitted by Note c to Table 601 and Sections 602.4.7 and 1406.3.
20. Aggregates, component materials and admixtures as permitted by Section 703.2.2.
21. Sprayed fire-resistant materials and intumescent and mastic fire-resistant coatings, determined on the basis of *fire resistance* tests in accordance with Section 703.2 and installed in accordance with Sections 1705.14 and 1705.15, respectively.
22. Materials used to protect penetrations in fire-resistance-rated assemblies in accordance with Section 714.
23. Materials used to protect joints in fire-resistance-rated assemblies in accordance with Section 715.
24. Materials allowed in the concealed spaces of buildings of Types I and II construction in accordance with Section 718.5.
25. Materials exposed within plenums complying with Section 602 of the *International Mechanical Code* .
26. Wall construction of freezers and coolers of less than 1,000 square feet (92.9 m^2), in size, lined on both sides with noncombustible materials and the building is protected throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1.

Reason: The addition of Sub Section 1.4 is warranted to include the requirements of Section 1406.3, Exception 1 in here.

Cost Impact: Will not increase the cost of construction
The code change proposal will not increase the cost of construction.

G 185-15 : 603.1-MAIEL3437

G 186-15

1203.2 (New), 1203.2

Proponent: Mike Fischer, Kellen Company, representing the Ventilation Task Force of the Asphalt Roofing Manufacturers Association and the Center for the Polyurethanes Industry of the American Chemistry Council (mfischer@kellencompany.com)

2015 International Building Code

Add new text as follows:

1203.2 **Roof ventilation** Roof assemblies shall be ventilated in accordance with this section or shall meet the unvented attic or unvented enclosed rafter assembliy requirements of Section 1203.3.

Revise as follows:

~~**1203.2**~~1203.2.1 ~~**Ventilation required.**~~**Ventilated attics and rafter spaces.** *No change to text.*

Reason: The current code requirements for ventilated and unvented attics create an exception without clear direction. For example, 1203.2 includes mandatory ventilation provisions, but the unvented attic requirements aren't established as an exception to the ventilation requirements. The intent of introducing the unvented attic requirements into the code was to provide comprehensive provisions that replace the ventilation requirements as an optional path to address moisture concerns when the building thermal envelope is located at the roof assembly. This proposal clears up the ambiguity by indicating that there are two options available; ventilate the attic according to the code, or meet the detailed requirements for unvented attic spaces.

Cost Impact: Will not increase the cost of construction
The proposal is a clarification of existing requirements; it includes no technical changes to the code.

G 186-15 : 1203.2-FISCHER4003

G 187-15

1203.3

Proponent: Joseph Lstiburek, representing self (joe@buildingscience.com)

2015 International Building Code

Revise as follows:

1203.3 Unvented attic and unvented enclosed rafter assemblies. Unvented *attics* and unvented enclosed roof framing assemblies created by ceilings applied directly to the underside of the roof framing members/rafters and the structural roof sheathing at the top of the roof framing members shall be permitted where all the following conditions are met:

1. The unvented *attic* space is completely within the *building thermal envelope*.
2. No interior Class I vapor retarders are installed on the ceiling side (*attic* floor) of the unvented *attic* assembly or on the ceiling side of the unvented enclosed roof framing assembly.
3. Where wood shingles or shakes are used, a minimum $^1/_4$-inch (6.4 mm) vented airspace separates the shingles or shakes and the roofing underlayment above the structural sheathing.
4. In Climate Zones 5, 6, 7 and 8, any air-impermeable insulation shall be a Class II vapor retarder or shall have a Class II vapor retarder coating or covering in direct contact with the underside of the insulation.
5. Insulation shall be located in accordance with the following:
    - 5.1. Item 5.1.1, 5.1.2, 5.1.3 or 5.1.4 shall be met, depending on the air permeability of the insulation directly under the structural roof sheathing.
        - 5.1.1. Where only air-impermeable insulation is provided, it shall be applied in direct contact with the underside of the structural roof sheathing.
        - 5.1.2. Where air-permeable insulation is provided inside the building thermal envelope, it shall be installed in accordance with Item 5.1. In addition to the air-permeable insulation installed directly below the structural sheathing, rigid board or sheet insulation shall be installed directly above the structural roof sheathing in accordance with the R values in Table 1203.3 for condensation control.
        - 5.1.3. Where both air-impermeable and air-permeable insulation are provided, the *air-impermeable insulation* shall be applied in direct contact with the underside of the structural roof sheathing in accordance with Item 5.1.1 and shall be in accordance with the R values in Table 1203.3 for condensation control. The *air-permeable insulation* shall be installed directly under the *air-impermeable insulation*.
        - 5.1.4. Alternatively, sufficient rigid board or sheet insulation shall be installed directly above the structural roof sheathing to maintain the monthly average temperature of the underside of the structural roof sheathing above 45°F (7°C). For calculation purposes, an interior air temperature of 68°F (20°C) is assumed and the exterior air temperature is assumed to be the monthly average outside air temperature of the three coldest months.
    - 5.2. Where preformed insulation board is used as the <u>air-impermeable</u>~~*air-permeable*~~ *insulation* layer, it shall be sealed at the perimeter of each individual sheet interior surface to form a continuous layer.

Exceptions:

1. Section 1203.3 does not apply to special use structures or enclosures such as swimming pool enclosures, data processing centers, hospitals or art galleries.
2. Section 1203.3 does not apply to enclosures in Climate Zones 5 through 8 that are humidified beyond 35 percent during the three coldest months.

Reason: This is a technical error - arrising from a typo or transcription error in the orignal proposal - the section should refer to air-impermeable insulation not air-permeable insulation.
There is no cost impact. This is an editiorial correction.

Cost Impact: Will not increase the cost of construction
This is an editorial change correcting an error in the orignal code change. There is no cost impact.

G 187-15 : 1203.3-LSTIBUREK5406

G 188-15

TABLE 1203.3

Proponent: Joseph Lstiburek, representing self (joe@buildingscience.com)

2015 International Building Code

Revise as follows:

TABLE 1203.3
INSULATION FOR CONDENSATION CONTROL

CLIMATE ZONE	MINIMUM R-VALUE OF AIR-IMPERMEABLE INSULATION[a]
~~2B and 3B tile roof only~~	~~0 (none required)~~
1, 2A, 2B, 3A, 3B[b], 3C	~~R-5~~ (none required)
4C	R-10
4A, 4B	R-15
5	R-20
6	R-25
7	R-30
8	R-35

a. Contributes to, but does not supersede, thermal resistance requirements for attic and roof assemblies in Section C402.2.1 of the *International Energy Conservation Code*.

b. In climate zones 3A, 3B and 3C where air-permeable insulation is provided and applied in direct contact with the underside of the structural sheathing, it shall be a Class II vapor retarder, or shall have a Class II vapor retarder coating or covering in direct contact with the underside of the insulation.

Reason: This significantly reduces the cost of constructing unvented attics. It allows the use of cellulose and fiberglass insulation.

Cost Impact: Will not increase the cost of construction
This will significantly reduce the cost of construction

G 188-15 : T1203.3-LSTIBUREK5443

G 189-15

1203.4, 1203.4.1, 1203.4.1.1 (New), 1203.4.1.2 (New), 1203.4.2 (New), 1203.4.3 (New), 1203.4.3.1 (New), 1203.4.3.2 (New), 1203.4.2

Proponent: Edward Kulik, representing Building Code Action Committee (bcac@iccsafe.org)

2015 International Building Code

Revise as follows:

1203.4 Under-floor ventilation. The space between the bottom of the floor joists and the earth under any building except spaces occupied by basements or cellars shall be provided with ventilation ~~openings through foundation walls or *exterior walls*. Such openings shall be placed so as to provide cross ventilation of the under-floor space.~~in accordance with Sections 1203.4.1, 1203.4.2 and 1203.4.3.

1203.4.1 ~~**Openings for under-floor ventilation.**~~**Ventilation openings.** Ventilation openings through foundation walls shall be provided. The openings shall be placed so as to provide cross ventilation of the under-floor space. The net area of ventilation openings shall be ~~not less than 1 square foot for each 150 square feet (0.67 m^2 for each 100 m^2) of crawl-space area~~in accordance with Section 1203.4.1.1 or 1203.4.1.2. Ventilation openings shall be covered for their height and width with any of the following materials, provided that the least dimension of the covering shall be not greater than $^1/_4$ inch (6.4 mm):

1. Perforated sheet metal plates not less than 0.070 inch (1.8 mm) thick.
2. Expanded sheet metal plates not less than 0.047 inch (1.2 mm) thick.
3. Cast-iron grilles or gratings.
4. Extruded load-bearing vents.
5. Hardware cloth of 0.035-inch (0.89 mm) wire or heavier.
6. Corrosion-resistant wire mesh, with the least dimension not greater than $^1/_8$ inch (3.2 mm).
7. Operable louvres, where ventilation is provided in accordance with Section 1203.4.1.2.

For buildings in flood hazard areas as established in Section 1612.3, the openings for under-floor ventilation shall be designed and installed in accordance with ASCE 24.

1203.4.1.1 Ventilation area for crawl spaces with open earth floors. The net area of ventilation openings for crawl spaces with uncovered earth floors shall be not less than 1 square foot for each 150 square feet (0.67 m^2 for each 100 m^2) of crawl-space area.

1203.4.1.2 Ventilation area for crawl spaces with covered floors. The net area of ventilation openings for crawl spaces with the ground surface covered with a Class I vapor retarder shall be not less than 1 square foot for each 1500 square feet (0.67 m^2 for each 1000 m^2) of crawl-space area.

1203.4.2 Ventilation in cold climates. In extremely cold climates, where ventilation opening will cause a detrimental loss of energy, ventilation openings to the interior of the structure shall be provided.

1203.4.3 Mechanical ventilation. Mechanical ventilation shall be provided to crawl spaces where the ground surface is covered with a Class I vapor retarder. Ventilation shall be in accordance with Section 1203.4.3.1 or 1203.4.3.2.

1203.4.3.1 Continuous mechanical ventilation. Continuously operated mechanical ventilation shall be provided at a rate of 1.0 cubic foot per minute (cfm) for each 50 square feet (1.02 L/s for each 10 m^2) of crawl space ground surface area and the ground surface is covered with a Class I vapor retarder.

1203.4.3.2 Conditioned space. The crawl space shall be conditioned in accordance with the *International Mechanical Code* and the walls of the crawl space shall be insulated in accordance with the *International Energy Conservation Code*.

~~**1203.4.2 Exceptions.** The following are exceptions to Sections 1203.4 and 1203.4.1:~~

1. ~~Where warranted by climatic conditions, ventilation openings to the outdoors are not required if ventilation openings to the interior are provided.~~
2. ~~The total area of ventilation openings is permitted to be reduced to $^1/_{1,500}$ of the under-floor area where the ground surface is covered with a Class I vapor retarder material and the required openings are placed so as to provide cross ventilation of the space. The installation of operable louvers shall not be prohibited.~~
3. ~~Ventilation openings are not required where continuously operated mechanical ventilation is provided at a rate of 1.0 cubic foot per minute (cfm) for each 50 square feet (1.02 L/s for each 10 m^2) of crawlspace floor area and the ground surface is covered with a Class I vapor retarder.~~
4. ~~Ventilation openings are not required where the ground surface is covered with a Class I vapor retarder, the perimeter walls are insulated and the space is conditioned in accordance with the *International Energy Conservation Code*.~~
5. ~~For buildings in flood hazard areas as established in Section 1612.3, the openings for under-floor ventilation shall be deemed as meeting the flood opening requirements of ASCE 24 provided that the ventilation openings are designed and installed in accordance with ASCE 24.~~

Reason: The purpose of this code change proposal is to organize Section 1203.4 into a logical format, and to change the code requirements related to the option presented by Section 1203.4.2, Exception 4. That exception allows for ventilation of a crawl space with a Class I vapor retarder covering the ground when the space is insulated and conditioned in accordance with the IECC. This is a problem because the IECC does not provide any requirements for conditioning. Since space conditioning requirements for conditioning are given in the IMC, the reference was modified to this section.
This public proposal is submitted by the ICC Building Code Action Committee (BCAC). The BCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the BCAC has held 13 open meetings and numerous workgroup calls which included members of the BCAC as well as any interested party to discuss and debate the proposed changes and the public comments. Related documentation and reports are posted on the BCAC website at: http://www.iccsafe.org/cs/BCAC/Pages/default.aspx.

Cost Impact: Will not increase the cost of construction
Will not increase the cost of construction. The revisions are for clarification of the technical requirements and making reference to the appropriate I-code.

G 189-15 : 1203.4-KULIK5032

G 190-15

1207.2, 1207.3

Proponent: David Tyree, representing American Wood Council (dtyree@awc.org); Jason Smart (jsmart@awc.org); Kenneth Bland (kbland@awc.org); Sam Francis (sfrancis@awc.org); Bradford Douglas (bdouglas@awc.org)

2015 International Building Code

Revise as follows:

1207.2 Air-borne sound. Walls, partitions and floor/ceiling assemblies separating *dwelling units* and *sleeping units* from each other or from public or service areas shall have a sound transmission class of not less than 50, or not less than 45 if field tested, for air-borne noise when tested in accordance with ASTM E 90. Alternatively, the sound transmission class of walls, partitions and floor/ceiling assemblies shall be established by engineering analysis based on a comparison of walls, partitions and floor/ceiling assemblies having sound transmission class ratings as determined by the test procedures set forth in ASTM E 90. Penetrations or openings in construction assemblies for piping; electrical devices; recessed cabinets; bathtubs; soffits; or heating, ventilating or exhaust ducts shall be sealed, lined, insulated or otherwise treated to maintain the required ratings. This requirement shall not apply to entrance doors; however, such doors shall be tight fitting to the frame and sill.

1207.3 Structure-borne sound. Floor/ceiling assemblies between *dwelling units* and *sleeping units* or between a *dwelling unit* or *sleepingunit* and a public or service area within the structure shall have an impact insulation class rating of not less than 50, or not less than 45 if field tested, when tested in accordance with ASTM E 492. Alternatively, the impact insulation class of floor/ceiling assemblies shall be established by engineering analysis based on a comparison of floor/ceiling assemblies having impact insulation class ratings as determined by the test procedures set forth in ASTM E492.

Reason: Reason: The proposed performance alternative recognizes the current practice of STC and IIC interpolation based on data from testing performed in accordance with ASTM E90 and ASTM E492. It mirrors provisions of Section 703.3, which provides a similar engineering analysis alternative for establishing fire resistance ratings, thereby providing flexibility for designers. For a complete list of AWC code change proposals and additional information please go to http://www.awc.org/Code-Officials/2015-IBC-Code-Changes.

Cost Impact: Will not increase the cost of construction
This proposal does not increase the cost of construction as it only recognizes the use of ASTM E90 and E492.

G 190-15 : 1207.2-TYREE4803

G 191-15

202 (New), 1208.3, 1208.4

Proponent: Lee Kranz, representing Washington Association of Building Officials Technical Code Development Committee (lkranz@bellevuewa.gov)

2015 International Building Code

Add new definition as follows:

SECTION 202 DEFINITIONS

DWELLING UNIT, EFFICIENCY A dwelling unit containing not more than one habitable room.

Revise as follows:

1208.3 Room area. Every *dwelling unit* shall have no fewer than one room that shall have not less than 120 square feet (13.9 m^2) of *net floor area*. Other habitable rooms shall have a *net floor area* of not less than 70 square feet (6.5 m^2). *Efficiency dwelling units* shall be in accordance with Section 1208.4.

Exception: Kitchens are not required to be of a minimum floor area.

1208.4 Efficiency dwelling units. An efficiency ~~living~~dwelling unit shall conform to the requirements of the code except as modified herein:

1. The unit shall have a living room of not less than 220 square feet (20.4 m^2) of floor area. An additional 100 square feet (9.3 m^2) of floor area shall be provided for each occupant of such unit in excess of two.
2. The unit shall be provided with a separate closet.
3. The unit shall be provided with a kitchen sink, cooking appliance and refrigeration facilities, each having a clear working space of not less than 30 inches (762 mm) in front. Light and *ventilation* conforming to this code shall be provided.
4. The unit shall be provided with a separate bathroom containing a water closet, lavatory and bathtub or shower.

Reason: The current provisions of Section 1208.4 have no purpose in the building code because the scoping of these provisions depends on what is meant by "efficiency dwelling unit". Absent a clear definition of what an Efficiency Dwelling Unit (EDU) is in the building code there is no way to enforce the efficiency dwelling unit provisions found in IBC Section 1208.4. "Efficiency dwelling unit" is not a commonly used term, but our understanding is that it is what is more commonly called a studio apartment.
According to Section 1208.3, dwelling units may consist of a single room of 120 square feet. For example, this could be a single 10' X 12' room. This is not an acceptable amount of space for a dwelling unit. This code change will require that at least one room of not less than 220 square feet be provided in dwelling units containing only a single habitable room. It will also require a separate closet, bathroom, kitchen sink, a cooking appliance, & a refrigerator as well as the application of light and ventilation regulations.

Cost Impact: Will not increase the cost of construction
This code change adds a definition to clarify what an efficiency dwelling unit is and does not change the cost to construction.

THIS IS A 3 PART CODE CHANGE PROPOSAL. PART I WILL BE HEARD THE THE IBC GENERAL COMMMITTEE, PART II WILL BE HEARD BY THE IMC COMMITTEE AND PART III WILL BE HEARD BY THE IPC/IPSDC COMMITTEE. PLEASE SEE THE TENTATIVE HEARING ORDERS FOR THE RESPECTIVE COMMITTEES.

Proponent: Edward Kulik, representing Building Code Action Committee (bcac@iccsafe.org)

Part I

2015 International Building Code

Revise as follows:

2701.1 Scope. ~~This~~ The provisions of this chapter ~~governs~~and NFPA 70 shall govern the design, construction, erection, and installation of the electrical components, appliances, equipment and systems used in buildings and structures covered by this code. ~~Electrical~~The *International Fire Code*, the *International Property Maintenance Code*, and NFPA 70 shall govern the use and maintenance of electrical components, appliances, equipment and systems ~~shall be designed~~. The *International Existing Building Code* and ~~constructed in accordance with the provisions of~~ NFPA 70 shall govern the alteration, repair, relocation, replacement, and addition of electrical components, appliances, equipment and systems.

Part II

2015 International Building Code

Revise as follows:

[M] 2801.1 Scope. ~~Mechanical appliances, equipment~~
The provisions of this chapter and ~~systems shall be constructed, installed and maintained in accordance with~~ the *International Mechanical Code* and the *International Fuel Gas Code* shall govern the design, construction, erection and installation of mechanical appliances, equipment and systems used in buildings and structures covered by this code. Masonry chimneys, fireplaces and barbecues shall comply with the *International Mechanical Code* and Chapter 21 of this code. The *International Fire Code*, the *International Property Maintenance Code*, the *International Mechanical Code* and the *International Fuel Gas Code* shall govern the use and maintenance of mechanical components, appliances, equipment and systems. The *International Existing Building Code*, the *International Mechanical Code* and the *International Fuel Gas Code* shall govern the alteration, repair, relocation, replacement, and addition of mechanical components, appliances, equipment and systems.

Part III

2015 International Building Code

Revise as follows:

[P] 2901.1 Scope. The provisions of this chapter and the *International Plumbing Code* shall govern the design construction, erection, and installation~~, *alteration*, repairs, relocation, replacement, addition to, use or maintenance~~ of plumbing components, appliances, equipment and systems used in buildings and structures covered by this code. Toilet and bathing rooms shall be constructed in accordance with Section 1210~~. Plumbing systems and equipment shall be constructed, installed and maintained in accordance with the *International Plumbing Code*~~. Private sewage disposal systems shall conform to the *International Private Sewage Disposal Code*. The *International Fire Code*, the *International Property Maintenance Code*, and the *International Plumbing Code* shall govern the use and maintenance of plumbing components, appliances, equipment and systems. The *International Existing Building Code* and the *International Plumbing Code* shall govern the alteration, repair, relocation, replacement, and addition of plumbing components, appliances, equipment and systems.

Reason: This proposal provides consistency in the scoping for the Electrical, Plumbing, and Mechanical chapters. Direction is provided as to what codes govern use and maintenance, and alteration, repair, relocation, replacement and additions for existing electrical, plumbing, and mechanical systems.
This public proposal is submitted by the ICC Building Code Action Committee (BCAC). The BCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the BCAC has held 13 open meetings and numerous workgroup calls which included members of the BCAC as well as any interested party to discuss and debate the proposed changes and the public comments. Related documentation and reports are posted on the BCAC website at: http://www.iccsafe.org/cs/BCAC/Pages/default.aspx.

Cost Impact:

Part I: Will not increase the cost of construction
This proposal will not increase the cost of construction. This proposal may decrease the cost of construction, by providing clarity to the scoping of these chapters.

Part II: Will not increase the cost of construction
This proposal will not increase the cost of construction. This proposal may decrease the cost of construction, by providing clarity to the scoping of these chapters.

Part III: Will not increase the cost of construction
This proposal will not increase the cost of construction. This proposal may decrease the cost of construction, by providing clarity to the scoping of these chapters.

~~a. The fixtures shown are based on one fixture being the minimum required for the number of persons indicated or any fraction of the number of persons indicated. The number of occupants shall be determined by this code.~~

~~b. Toilet facilities for employees shall be separate from facilities for inmates or care recipients.~~

~~c. A single-occupant toilet room with one water closet and one lavatory serving not more than two adjacent patient *sleeping units* shall be permitted, provided that each patient *sleeping unit* has direct access to the toilet room and provisions for privacy for the toilet room user are provided.~~

~~d. The occupant load for seasonal outdoor seating and entertainment areas shall be included when determining the minimum number of facilities required.~~

~~e. For business and mercantile occupancies with an occupant load of 15 or fewer, service sinks shall not be required.~~

~~**[P] 2902.1 Minimum number of fixtures.** Plumbing fixtures shall be provided in the minimum number as shown in Table 2902.1 based on the actual use of the building or space. Uses not shown in Table 2902.1 shall be considered individually by the code official. The number of occupants shall be determined by this code.~~

~~**[P] 2902.1.1 Fixture calculations.** To determine the *occupant load* of each sex, the total *occupant load* shall be divided in half. To determine the required number of fixtures, the fixture ratio or ratios for each fixture type shall be applied to the *occupant load* of each sex in accordance with Table 2902.1. Fractional numbers resulting from applying the fixture ratios of Table 2902.1 shall be rounded up to the next whole number. For calculations involving multiple occupancies, such fractional numbers for each occupancy shall first be summed and then rounded up to the next whole number.~~

~~**Exception:** The total *occupant load* shall not be required to be divided in half where *approved* statistical data indicate a distribution of the sexes of other than 50 percent of each sex.~~

~~**[P] 2902.1.2 Family or assisted-use toilet and bath fixtures.** Fixtures located within family or assisted-use toilet and bathing rooms required by Section 1109.2.1 are permitted to be included in the number of required fixtures for either the male or female occupants in assembly and mercantile occupancies.~~

~~**[P] 2902.2 Separate facilities.** Where plumbing fixtures are required, separate facilities shall be provided for each sex.~~

~~**Exceptions:**~~

1. ~~Separate facilities shall not be required for *dwellingunits* and *sleeping units*.~~
2. ~~Separate facilities shall not be required in structures or tenant spaces with a total *occupant load*, including both employees and customers, of 15 or fewer.~~
3. ~~Separate facilities shall not be required in mercantile occupancies in which the maximum occupant load is 100 or less.~~

~~**[P] 2902.2.1 Family or assisted-use toilet facilities serving as separate facilities.** Where a building or tenant space requires a separate toilet facility for each sex and each toilet facility is required to have only one water closet, two family or assisted-use toilet facilities shall be permitted to serve as the required separate facilities. Family or assisted-use toilet facilities shall not be required to be identified for exclusive use by either sex as required by Section 2902.4.~~

~~**[P] 2902.3 Employee and public toilet facilities.** Customers, patrons and visitors shall be provided with public toilet facilities in structures and tenant spaces intended for public utilization. The number of plumbing fixtures located within the required toilet facilities shall be provided in accordance with Section 2902.1 for all users. Employees shall be provided with toilet facilities in all occupancies. Employee toilet facilities shall be either separate or combined employee and public toilet facilities.~~

~~**Exception:** Public toilet facilities shall not be required in:~~

1. ~~Open or enclosed parking garages where there are no parking attendants.~~
2. ~~Structures and tenant spaces intended for quick transactions, including takeout, pickup and drop-off, having a public access area less than or equal to 300 square feet (28 m^2).~~

~~**[P] 2902.3.1 Access.** The route to the public toilet facilities required by Section 2902.3 shall not pass through kitchens, storage rooms or closets. Access to the required facilities shall be from within the building or from the exterior of the building. Routes shall comply with the accessibility requirements of this code. The public shall have access to the required toilet facilities at all times that the building is occupied.~~

~~**[P] 2902.3.2 Location of toilet facilities in occupancies other than malls.** In occupancies other than covered and open mall buildings, the required public and employee toilet facilities shall be located not more than one *story* above or below the space required to be provided with toilet facilities, and the path of travel to such facilities shall not exceed a distance of 500 feet (152 m).~~

~~**Exception:** The location and maximum distances of travel to required employee facilities in factory and industrial occupancies are permitted to exceed that required by this section, provided that the location and maximum distance of travel are *approved*.~~

~~**[P] 2902.3.3 Location of toilet facilities in malls.** In covered and open mall buildings, the required public and employee toilet facilities shall be located not more than one story above or below the space required to be provided with toilet facilities, and the path of travel to such facilities shall~~

~~not exceed a distance of 300 feet (91 mm). In mall buildings, the required facilities shall be based on total square footage (m^2) within a covered mall building or within the perimeter line of an open mall building, and facilities shall be installed in each individual store or in a central toilet area located in accordance with this section. The maximum distance of travel to central toilet facilities in mall buildings shall be measured from the main entrance of any store or tenant space. In mall buildings, where employees' toilet facilities are not provided in the individual store, the maximum distance of travel shall be measured from the employees' work area of the store or tenant space.~~

~~**[P] 2902.3.4 Pay facilities.** Where pay facilities are installed, such facilities shall be in excess of the required minimum facilities. Required facilities shall be free of charge.~~

~~**[P] 2902.3.5 Door locking.** Where a toilet room is provided for the use of multiple occupants, the egress door for the room shall not be lockable from the inside of the room. This section does not apply to family or assisted-use toilet rooms.~~

~~**[P] 2902.3.6 Prohibited toilet room location.** Toilet rooms shall not open directly into a room used for the preparation of food for service to the public.~~

~~**[P] 2902.4 Signage.** Required public facilities shall be provided with signs that designate the sex as required by Section 2902.2. Signs shall be readily visible and located near the entrance to each toilet facility. Signs for accessible toilet facilities shall comply with Section 1111.~~

~~**[P] 2902.4.1 Directional signage.** Directional signage indicating the route to the required public toilet facilities shall be posted in a lobby, corridor, aisle or similar space, such that the sign can be readily seen from the main entrance to the building or tenant space.~~

~~**[P] 2902.5 Drinking fountain location.** Drinking fountains shall not be required to be located in individual tenant spaces provided that public drinking fountains are located within a distance of travel of 500 feet (152 m) of the most remote location in the tenant space and not more than one story above or below the tenant space. Where the tenant space is in a covered or open mall, such distance shall not exceed 300 feet (91 440 mm). Drinking fountains shall be located on an accessible route.~~

~~**[P] 2902.6 Small occupancies.** Drinking fountains shall not be required for an occupant load of 15 or fewer.~~

Reason: Chapter 29 is merely a reprint of specific sections out of the International Plumbing Code. There is no justification for reprinting verbiage from another code into the Building Code unless the language is specifically a building code item such as masonry fireplaces as referenced in Chapter 28. Instead, allow the charging statement in 2901 to direct the code official to the proper code or codes as done in Chapter 28 for Mechanical Systems.

Cost Impact: Will not increase the cost of construction
This will not increase the cost of construction as it is not adding additional code requirements it is merely directing the proponent to the correct code.

Analysis: This code change proposal addresses the scope and application of the International Building Code, Chapter 29. The action taken by the IBC-General Committee on this proposal coupled with the final action taken at the 2015 Final Action Hearings will be limited to an advisory recommendation to the ICC Board of Directors who will determine the final disposition on this proposed change in accordance with Section 1.3 of CP 28 which stipulates that the Board determines the scope of the I-Codes.

G 193-15 : 2902-SNYDER4424

G 194-15

3001.2, TABLE 3001.2 (New)

Proponent: Edward Kulik, representing Building Code Action Committee (bcac@iccsafe.org)

2015 International Building Code

Revise as follows:

3001.2 Referenced standards. Except as otherwise provided for in this code, the design, construction, installation, *alteration*, repair and maintenance of elevators and conveying systems and their components shall conform to ~~ASME A17.1/CSA B44, ASME A17.7/CSA B44.7, ASME A90.1, ASME B20.1, ANSI MH29.1, ALI ALCTV~~the applicable standard specified in Table 3001.2 and ASCE 24 for construction in flood hazard areas established in Section 1612.3.

Add new text as follows:

TABLE 3001.2
ELEVATORS AND CONVEYING SYSTEMS AND COMPONENTS

TYPE	**STANDARD**
Elevators, escalators, dumbwaiters, moving walks, material lifts	ASME A17.1/CSA B44
Belt manlifts	ASME A90.1
Conveyors and related equipment	ASME B20.1
Automotive lifts	ALI ALCTV
Platform lifts, stairway chairlifts, wheelchair lifts	ASME A18.1

Reason: The referenced installation and design standards do not apply to all elevators and conveying systems and their components. Each standard is for a certain type. Although covered for accessibility in Section 1109.8, the installation standard for Platform Lifts and Stairway Chairlifts, ASME A18.1, is not included in Chapter 30. ASME A18.1 is a separate standard, not covered by Section 1.1.2 of ASME A17.1.
This public proposal is submitted by the ICC Building Code Action Committee (BCAC). The BCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the BCAC has held 13 open meetings and numerous workgroup calls which included members of the BCAC as well as any interested party to discuss and debate the proposed changes and the public comments. Related documentation and reports are posted on the BCAC website at: http://www.iccsafe.org/cs/BCAC/Pages/default.aspx.

Cost Impact: Will not increase the cost of construction
This code change proposal will not increase the cost of construction due to the code already requires conformance with these standards. There may be a decrease in the cost of construction, due to providing clarity on what is required for specific equipment.

G 194-15 : 3001.2-KULIK5033

G 195-15

3001.2 (New)

Proponent: Andrew Cid, representing Private Citizen for The Initiative for Emergency Elevator Communication Systems for the Deaf, Hard of Hearing and Speech Impaired (andycid99@gmail.com)

2015 International Building Code

Add new text as follows:

3001.2 Emergency elevator communication systems for the deaf, hard of hearing and speech impaired An emergency two-way communication system shall be provided that:

1. Is a visual text-based and a video-based live interactive system,
2. Is fully accessible by the deaf and hard of hearing and speech impaired, and
3. Is located between the elevator car and the local emergency authorities at a point outside of the hoistway.

Reason: Reason for Addition / Change to the Language of IBC 3001.2:
The addition of the terms "visual, text-based and video-based live interactive communication systems" is strongly recommended to emphasize the need for totally accessible communication in elevators between local government emergency authorities and individuals who are: Deaf, Hard of Hearing, and Speech Impaired. This type of comunication system is long overdue and strongly recommended for installation and retrofit into public elevators in existing buildings and for new construction. A similar proposal was considered by the A117.1 Standards Committee in 2014, but not approved. The IBC and IEBC should take the lead on this topic and establish this requirement that is needed by our communities..

Cost Impact: Will not increase the cost of construction
Cost Impact - The cost impact, to a recommended 70% of the existing building inventory for public and commercial buildings that are three (3) stories or higher with elevators, is expected to be negligible or minimal to the building owner / operator. Any costs incurred is anticipated to be alleviated wth the use of various incentives such as tax write offs for complying with new accessibility standards. In addition, for new construction, it is expected that there will be no significant additional costs involved because it will be built into the design / build. For existing buildings, the estimated cost for such a system is approximately $2,500. For new construction, the system will cost approximately $5,000.

G 195-15 : 3001.2 (New)-CID3932

G 196-15

3004.1, 3004.5 (New)

Proponent: RW Bob O'Gorman, Automotive Lift Institute, representing Automotive Lift Institute, Inc.

2015 International Building Code

CHAPTER 30 ELEVATORS AND CONVEYING SYSTEMS
Revise as follows:

3004.1 General. Escalators, moving walks, conveyors, personnel hoists ~~and~~ , material hoists and automotive lifts shall comply with the applicable provisions of Sections 3004.2 through ~~3004.4~~3004.5.

Add new text as follows:

3004.5 Automotive Lifts. Automotive Lifts shall be listed and labeled in accordance with ANSI/ALI ALCTV.

Reason: ANSI/ALI ALCTV is ALREADY identified as a referenced National Safety Standard in section 3001.2 of Chapter 30. This proposal is NOT requiring that a new standard be placed into reference. The reference to ANSI/ALI ALCTV by the IBC has existed since the 2000 codes went into effect. AHJ's and those attempting to comply regarding Automotive Lifts are confused and need clarification within the cited sections.
ANSI/ALI ALCTV applies to permanently installed, automotive service and repair lifts, such as those installed and used to convey and support passenger cars, trucks, buses, rail, and specialty vehicles. ANSI/ALI ALCTV identifies the electrical and mechanical safety requirements for an automotive lift and dictates that any such electrically powered devices be "Listed" by an OSHA accredited, Nationally Recognized Testing Laboratory (NRTL) and that the mechanical characteristics such as structural components and control systems be "Certified" as conforming to this ANSI standard by an accredited, independent third party product certifier.

Unlike the other products currently addressed within section 3004 (escalators, conveyors, and personnel/material hoists), no expertise in automotive lifts was had by those responsible for this item being developed at the time it was placed within Chapter 30. As a result, there is no dedicated section of code providing greater detail to those attempting to comply....or for those utilizing the code to definitively determine risk and compliance with known electrical and mechanical safety requirements contained within ANSI/ALI ALCTV.

A problem exists throughout the vehicle lift industry - there are a number of manufacturers (both within the continental US and overseas) that are providing automotive lift products that have no electrical and mechanical product safety certifications as required by ANSI/ALI ALCTV. These products are regularly being installed and hard wired into new and current construction. In recent years these products have moved beyond commercial applications and are now being placed into residential environments. Unknowing purchasers and end users are winding up with automotive lifts that successfully circumvent known electrical safety requirements regularly, because when these lifts are installed without proper permits (or even with permits); many utilizing the code that challenge an installation do not know how to interpret the need for compliance with ANSI/ALI ALCTV when countered with the argument "show me where it says that in writing". My office has been contacted literally hundreds of times by electrical code enforcement officers and other AHJ's regarding their difficulty in "holding ground" when those that sold the product argue chapter 30 does NOT apply to automotive lifts - because it lacks discussion and direction found for other products in the section.

Cost Impact: Will not increase the cost of construction
Since Compliance with ANSI/ALI ALCTV is already referenced in section 3001.2 of the current edition of the IBC (it has been required within this section since the 2000 edition of the IBC) the writer of this proposal states there is zero cost impact.
The change requested will allow for clarification of an existing requirement for automotive lifts to comply with ANSI/ALI ALCTV. The clarification requested will assist AHJ's, consumers, specifiers and contractors attempting to comply, to have clear understanding of what is currently required for Automotive Lifts, such as those used in service and repair centers (shops and dealerships for example).

Cost of construction will NOT increase. Currently 24 major companies act responsibly and provide North America with more than 2500 certified variations of automotive lift products that range in capacity from 5,000 lbs to well over 150,000 lbs in some applications. Without clarification, the issue of automotive lift compliance with IBC will continue to be a matter of "Buyer Beware".

G 196-15 : 3004.1-O'GORMAN5630

G 197-15

3004.2.2

Proponent: David Collins, representing The American Institute of Architects (dcollins@preview-group.com)

2015 International Building Code

Revise as follows:

3004.2.2 Escalators. Where provided in below-grade transportation stations, escalators shall have a clear width of not less than 32 inches (815 mm).

~~**Exception:** The clear width is not required in existing facilities undergoing *alterations*.~~

Reason: The exception to this section addresses requirements for escalators undergoing alterations. Such provisions should be in the IEBC, not the IBC.

Cost Impact: Will not increase the cost of construction
This change and the companion change to put requirements for existing escalators undergoing alterations in the IEBC will clarify how the two codes work together. There should be no cost impact with this change.

G 197-15 : 3004.2.2-COLLINS4477

G 198-15

3005.4

Proponent: Quinton Owens, City of Rexburg, representing "self" (quintono@rexburg.org)

2015 International Building Code

Revise as follows:

3005.4 Machine rooms, control rooms, machinery spaces, and control spaces. Elevator machine rooms, control rooms, control spaces and machinery spaces outside of but attached to a hoistway that have openings into the hoistway shall be enclosed with *fire barriers* constructed in accordance with Section 707 or *horizontal assemblies* constructed in accordance with Section 711, or both. The *fire-resistance rating* shall be not less than the required rating of the hoistway enclosure served by the machinery. Openings in the *fire barriers* shall be protected with assemblies having a f*ire protection rating* not less than that required for the hoistway enclosure doors.

Exceptions:

1. For other than fire service access elevators and occupant evacuation elevators, where machine rooms, machinery spaces, control rooms and control spaces do not abut and have no openings to the hoistway enclosure they serve, the *fire barriers* constructed in accordance with Section 707 or *horizontal assemblies* constructed in accordance with Section 711, or both, shall be permitted to be reduced to a 1-hour *fire-resistance rating*.
2. For other than fire service access elevators and occupant evacuation elevators, in buildings ~~four~~three*stories* or less above *grade plane* where machine room, machinery spaces, control rooms and control spaces do not abut and have no openings to the hoistway enclosure they serve, the machine room, machinery spaces, control rooms and control spaces are not required to be fire-resistance rated.

Reason: As the fire rating on shafts increases from one hour to two hours beginning at 4 stories, it seems logical that a machine room serving only a one hour rated shaft should be in exception two and all other shafts would fall together under exception one.

Cost Impact: Will increase the cost of construction
Cost increase is limited only to raising assembly rating by 1 hour for machine rooms serving elevator shafts of 4 stories.

G 198-15 : 3005.4-OWENS5702

G 199-15

3005.7 (New)

Proponent: Lee Kranz, City of Bellevue, WA, representing The City of Bellevue Washington

2015 International Building Code

Add new text as follows:

3005.7 **Fire service access and occupant evacuation elevator machine rooms.** Fire service access elevator machinery and occupant evacuation elevator machinery shall not be located in the same room with machinery serving other elevators.

Exception: Co-location of elevator machinery is permitted where a clean-agent fire-extinguishing sytem is installed in the machinery room instead of an automatic sprinkler system. The clean-agent system shall be in accordance with Section 904.10. Openings in the machinery room floor, walls and ceiling shall be limited to insure the functionality of the clean-agent system.

Reason: There are cases where fire service access elevator machinery or occupant evacuation elevator machinery may need to be co-located in the same machinery room as other non-fire service elevator or non-occupant self evacuation elevator machinery. IBC Section 903 and NFPA 13 requires sprinkler protection in all elevator machinery rooms except those serving fire service access elevator machinery or occupant evacuation elevator machinery (see IBC Sections 3007.2.1 & 3008.2.1 prohibiting the use of automatic (wet) sprinklers in fire service access and occupant evacuation elevator machine rooms). Both fire service access elevator machinery and occupant evacuation elevator machinery must be protected from any water source so this proposal allows the use of a clean-agent system per NFPA 2001 to allow all elevator machinery to be in the same room. This will insure that the provisions of IBC Section 3007.4 & 3008.4 are met when co-location of machinery is desired to meet design requirements.

Cost Impact: Will not increase the cost of construction
This code change will not effect the cost of construction as in some cases it will be less expensive to install a clean-agent fire extinguishing system than an automatic sprinkler system.

G 199-15 : 3005.7 (New)-KRANZ3868

G 200-15

3006.2

Proponent: Carl Baldassarra, P.E., FSFPE, Chair, ICC Code Technology Committee, representing Code Technology Committee (CTC@iccsafe.org)

2015 International Building Code

Revise as follows:

3006.2 Hoistway opening protection required. Elevator hoistway door openings shall be protected in accordance with Section 3006.3 where ~~an~~ the elevator ~~hoistway~~ is required to be located in a shaft enclosure, connects more than three stories~~, is required to be enclosed within a shaft enclosure in accordance with Section 712.1.1~~ and where any of the following conditions ~~apply~~ exist

1. The elevator hoistway exceeds 420 feet in height.
2~~1~~. The building is not ~~protected~~equipped throughout with an *automatic sprinkler system* ~~in accordance with Section 903.3.1.1 or 903.3.1.2.~~
3~~2~~. The building contains a Group I-1 Condition 2 occupancy.
4~~3~~. The building contains a Group I-2 occupancy.
5~~4~~. The building contains a Group I-3 occupancy~~.~~
~~5. The building is a high rise and the elevator hoistway is more than 75 feet (22 860 mm) in height. The height of the hoistway shall be measured from the lowest floor to the highest floor of the floors served by the hoistway.~~

Exceptions:

1. Protection of elevator hoistway door openings is not required where the elevator serves only open parking garages in accordance with Section 406.5.
2. Protection of elevator hoistway door openings is not required at the level(s) of exit discharge, provided the level(s) of exit discharge is equipped with an *automatic sprinkler system* in accordance with Section 903.3.1.1.
3. Enclosed elevator lobbies and protection of elevator hoistway door openings are not required on levels where the elevator hoistway opens to the exterior

The height of the hoistway shall be measured from the top of the lowest finished floor to the top of the highest finished floor of the floors served by the hoistway.

The height of elevator hoistways sharing a common atmosphere by elevator door openings at a common floor or by openings between hoistways shall be measured from the top of the lowest finished floor to the top of the highest finished floor of the floors served by the non separated hoistways.

Reason: This proposal is a follow-up to what was proposed in the 2012 cycle as proposal FS66-12. This version has been updated to work with the new language found in Section 3006.2 and addresses the reasons for disapproval, including that midrise buildings may not have been equipped throughout with an automatic sprinkler system.
This issue has been viewed very differently throughout the US with many jurisidictions requiring elevator lobbies and many not. The IBC has required these lobbies since the 2000 edition and have always been heavily debated. This debate has been the reason the CTC has been carefully studying this issue. The work that led to FS66-12 included a technical analysis that looked at issues such as stack effect and also looked at the reliability of sprinklers through the use of the fire safety concepts tree. The technical analysis is available at the following link. https://cdpaccess.com/proposal/fileupload/get/280

The ICC Code Technology Committee (CTC) has just completed its 10th year. The ICC Board has decided to sunset the CTC. The sunset plan includes re-assigning many of the CTC Areas of Study to the applicable Code Action Committee (CAC). The two remaining CTC Areas of Study are Care Facilities and Elevator Lobbies/WTC Elevator issues. This proposal falls under the Elevator Lobbies Area of Study. Information on the CTC, including: the sunset plan; meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the CTC website at: http://www.iccsafe.org/cs/CTC/Pages/default.aspx.

Cost Impact: Will not increase the cost of construction
If the requirements for elevator lobbies are made less restrictive then the cost of construction would go down.

G 200-15 : 3006.2-BALDASSARRA4170

G 201-15

3006.2.1 (New), 1020.1.1(IFC [BE] 1020.1.1) (New)

Proponent: Carl Baldassarra, P.E., FSFPE, Chair, ICC Code Technology Committee, representing Code Technology Committee (CTC@iccsafe.org)

2015 International Building Code

Add new text as follows:

3006.2.1 **Rated corridors.** Where corridors are required to be fire resistance rated in accordance with Section 1020.1, elevator hoistway openings shall be protected in accordance with Section 3006.3.

1020.1.1(IFC [BE] 1020.1.1) **Hoistway opening protection** Elevator hoistway openings shall be protected in accordance with Section 3006.2.1.

Reason: During the 2012 cycle the CTC submitted a code change FS88-12 to clarify that it was not the intent to require protection of a hoistway opening in rated corridors. Instead, the elevator lobby requirements themselves addressed this issue. That proposal was not approved. Based upon that disapproval, it appears that it is within the intent to require protection of elevator hoistway openings based upon the requirement for rated corridor construction. Therefore, this requirement needs to be specifically clarified within Section 3006 to avoid the requirement being missed. A new section 3006.2.1 has been written to clarify that intent. Also, to further clarify this intent a Section 1020.1.1 has been provided as a pointer to these specific lobby requirements.
It should be noted that this requirement has limited application. The following summarizes the buildings not already addressed by Section 3006.2 that are required to have rated corridors.

Unsprinklered buildings:

Both conditions below apply to require hoistway opening protection:

- Group A, B, E, F, M, S and U occupancies with an occupant load served by a corridor greater than 30.
- Hoistways connecting only 3 stories.

Sprinklered buildings

Both conditions below apply to require hoistway opening protection:

- Applicable Occupancies
  - o Group R greater than 10 served by corridor (.5 hr)
  - o Group H1, H-2, H-3 (1 hr)
  - o Group H4, H5 greater than 30 served by Corridor (1 hr)
- Non High rise buildings

The ICC Code Technology Committee (CTC) has just completed its 10th year. The ICC Board has decided to sunset the CTC. The sunset plan includes re-assigning many of the CTC Areas of Study to the applicable Code Action Committee (CAC). The two remaining CTC Areas of Study are Care Facilities and Elevator Lobbies/WTC Elevator issues. This proposal falls under the Elevator Lobbies Area of Study. Information on the CTC, including: the sunset plan; meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the CTC website at: http://www.iccsafe.org/cs/CTC/Pages/default.aspx.

Cost Impact: Will not increase the cost of construction
This will not increase the cost of construction depending upon how this issue is being interpreted. This item will only increase construction if it had not been interpreted to require protection of the hoistway opening in rated corridors. This would involve having to comply with Section 3006.3.

G 201-15 : 3006.2.1 (New)-BALDASSARRA4172

G 202-15

405.4.3, 708.1, 716.5.9.3, [F] 907.5.2.1 (IFC 907.5.2.1), 3006.4, 3007.6, 3007.6.1, 3007.6.3, 3007.9, 3007.9.1, 3008.6

Proponent: Carl Baldassarra, P.E., FSFPE, Chair, Code Technology Committee, representing Code Technologies Committee (CTC@iccsafe.org)

2015 International Building Code

Revise as follows:

405.4.3 Elevators. Where elevators are provided, each compartment shall have direct access to an elevator. Where an elevator serves more than one compartment, an enclosed elevator lobby shall be provided and shall be separated from each compartment by a s*moke barrier* in accordance with Section 709. Doors shall be gasketed, have a drop sill and be automatic-closing by smoke detection in accordance with Section 716.5.9.3.

708.1 General. The following wall assemblies shall comply with this section.

1. Separation walls as required by Section 420.2 for Groups I-1, R-1, R-2 and R-3.
2. Walls separating tenant spaces in *covered and open mall buildings* as required by Section 402.4.2.1.
3. Corridor walls as required by Section 1020.1.
4. Enclosed Elevator lobby separation as required by Section 3006.2.
5. Egress balconies as required by Section 1019.2

716.5.9.3 Smoke-activated doors. Automatic-closing doors installed in the following locations shall be automatic-closing by the actuation of smoke detectors installed in accordance with Section 907.3 or by loss of power to the smoke detector or hold-open device. Doors that are automatic-closing by smoke detection shall not have more than a 10-second delay before the door starts to close after the smoke detector is actuated:

1. Doors installed across a *corridor.*
2. Doors installed in the enclosures of *exit access stairways* and *ramps* in accordance with Sections 1019 and 1023, respectively.
3. Doors that protect openings in *exits* or *corridors* required to be of fire-resistance-rated construction.
4. Doors that protect openings in walls that are capable of resisting the passage of smoke in accordance with Section 509.4.
5. Doors installed in *smoke barriers* in accordance with Section 709.5.
6. Doors installed in *fire partitions* in accordance with Section 708.6.
7. Doors installed in a *fire wall* in accordance with Section 706.8.
8. Doors installed in shaft enclosures in accordance with Section 713.7.
9. Doors installed in waste and linen chutes, discharge openings and access and discharge rooms in accordance with Section 713.13. Loading doors installed in waste and linen chutes shall meet the requirements of Sections 716.5.9 and 716.5.9.1.1.
10. Doors installed in the walls for compartmentation of underground buildings in accordance with Section 405.4.2.
11. Doors installed in the enclosed elevator lobby walls of underground buildings in accordance with Section 405.4.3.
12. Doors installed in smoke partitions in accordance with Section 710.5.2.3.

[F] 907.5.2.1 Audible alarms. Audible alarm notification appliances shall be provided and emit a distinctive sound that is not to be used for any purpose other than that of a fire alarm.

Exceptions:

1. Audible alarm notification appliances are not required in critical care areas of Group I-2 Condition 2 occupancies that are in compliance with Section 907.2.6, Exception 2.
2. A visible alarm notification appliance installed in a nurses' control station or other continuously attended staff location in a Group I-2 Condition 2 suite shall be an acceptable alternative to the installation of audible alarm notification appliances throughout the suite in Group I-2 Condition 2 occupancies that are in compliance with Section 907.2.6, Exception 2.
3. Where provided, audible notification appliances located in each enclosed occupant evacuation elevator lobby in accordance with Section 3008.9.1 shall be connected to a separate notification zone for manual paging only.

3006.4 Means of egress. Elevator lobbies shall be provided with at least one means of egress complying with Chapter 10 and other provisions in this code. Egress through an enclosed elevator lobby shall be permitted in accordance with Item 1 of Section 1016.2.

3007.6 Fire service access elevator lobby. The fire service access elevator shall open into ~~a~~an enclosed fire service access elevator lobby in accordance with Sections 3007.6.1 through 3007.6.5. Egress is permitted through the enclosed elevator lobby in accordance with Item 1 of Section 1016.2.

Exception: Where a fire service access elevator has two entrances onto a floor, the second entrance shall be permitted to ~~open into an elevator lobby~~be protected in accordance with Section 3006.3.

3007.6.1 Access to interior exit stairway or ramp. The enclosed fire service access elevator lobby shall have direct access from the enclosed elevator lobby to an enclosure for an *interior exit stairway* or *ramp*.

Exception: Access to an *interior exit stairway* or *ramp* shall be permitted to be through a protected path of travel that has a level of fire protection not less than the elevator lobby enclosure. The protected path shall be separated from the enclosed elevator lobby through an opening protected by a smoke and draft control assembly in accordance Section 716.5.3.

3007.6.3 Lobby doorways. Other than doors to the hoistway, elevator control room or elevator control space, each doorway to ~~a~~an enclosed fire service access elevator lobby shall be provided with a $^3/_4$-hour *fire door assembly* complying with Section 716.5. The *fire door assembly* shall comply with the smoke and draft control door assembly requirements of Section 716.5.3.1 with the UL 1784 test conducted without the artificial bottom seal.

3007.9 Standpipe hose connection. A Class I standpipe hose connection in accordance with Section 905 shall be provided in the *interior exit stairway* and *ramp* having direct access from the enclosed fire service access elevator lobby.

3007.9.1 Access. The *exit* enclosure containing the standpipe shall have access to the floor without passing through the enclosed fire service access elevator lobby.

3008.6 Occupant evacuation elevator lobby. Occupant evacuation elevators shall open into an enclosed elevator lobby in accordance with Sections 3008.6.1 through 3008.6.6. Egress is permitted through the elevator lobby in accordance with Item 1 of Section 1016.2.

Reason: This proposal is simply clarifying where elevator lobbies are intended to be enclosed. In some cases an elevator lobby is simply the area where the elevators open onto and no enclosure of the space is necessary. This does not necessarily mean the hoistway opening is not protected but instead that there is not a physical lobby enclosure. It should be noted that there are some sections such as Section 909.21.6 that are not necessarily intending to address whether such lobbies are enclosed or unenclosed.
The ICC Code Technology Committee (CTC) has just completed its 10th year. The ICC Board has decided to sunset the CTC. The sunset plan includes re-assigning many of the CTC Areas of Study to the applicable Code Action Committee (CAC). The two remaining CTC Areas of Study are Care Facilities and Elevator Lobbies/WTC Elevator issues. This proposal falls under the Elevator Lobby Area of Study. Information on the CTC, including: the sunset plan; meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the CTC website at:
http://www.iccsafe.org/cs/CTC/Pages/default.aspx.

Cost Impact: Will not increase the cost of construction
This is simply clarification of when elevator lobbies are enclosed.

G 202-15 : 405.4.3-BALDASSARRA4176

G 203-15

3007.1

Proponent: Carl Baldassarra, P.E., FSFPE, Chair, Code Technology Committee, representing Code Technology Committee (CTC@iccsafe.org)

2015 International Building Code

Revise as follows:

3007.1 General. Where required by Section 403.6.1, every floor above and including the lowest level of fire department vehicle access of the building shall be served by fire service access elevators complying with Sections 3007.1 through 3007.9. Except as modified in this section, fire service access elevators shall be installed in accordance with this chapter and ASME A17.1/CSA B44.

> **Exception:** Elevators that only service an open or enclosed parking garage and the lobby of the building shall not be required to serve as fire service access elevators in accordance with Section 3007.

Reason: There are two aspects that this proposal addresses. The first is that it was not the intention that FSAEs be available in the levels of the building below the lowest level of fire department access. Typically the fire department is more concerned with travelling high into the building and does not require that the same facilities be provided in the lower levels of the building. Most fire departments will likely not take an elevator below grade to a fire when the stairs are manageable. This will likely only affect buildings on steep grades where the lowest level of fire department access differs greatly from the main entrance. The second aspect addresses the issue that FSAEs are not necessary in parking garages. As noted the fire department is more likely to use FSAEs due to the height of the building. In addition, fire fighters typically are not willing to take an elevator past the fire floor. Instead in such cases they would prefer the use of the stairway.
The ICC Code Technology Committee (CTC) has just completed its 10th year. The ICC Board has decided to sunset the CTC. The sunset plan includes re-assigning many of the CTC Areas of Study to the applicable Code Action Committee (CAC). The two remaining CTC Areas of Study are Care Facilities and Elevator Lobbies/WTC Elevator issues. This proposal falls under the WTC Area of Study. Information on the CTC, including: the sunset plan; meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the CTC website at: http://www.iccsafe.org/cs/CTC/Pages/default.aspx.

Cost Impact: Will not increase the cost of construction
This will save money by not requiring FSAE elevators from the garage and clarifying that it is only the portion of the building above the lowest level of fire department vehicle access that need these elevators.

G 203-15 : 3007.1-BALDASSARRA4189

G 204-15

3007.3, 3008.3

Proponent: Carl Baldassarra, P.E., FSFPE, Chair, Code Technology Committee, representing Code Technologies Committee (CTC@iccsafe.org)

2015 International Building Code

Revise as follows:

3007.3 Water protection. ~~An *approved* method to prevent water~~ Water from the operation of an automatic sprinkler system outside the enclosed lobby shall be prevented from infiltrating into the hoistway enclosure ~~from the operation of the *automatic sprinkler system* outside the enclosed fire service access elevator lobby shall be provided.~~in accordance with an approved method.

3008.3 Water protection. ~~An *approved* method to prevent water~~ Water from the operation of an automatic sprinkler system outside the enclosed lobby shall be prevented from infiltrating into the hoistway enclosure ~~from the operation of the *automatic sprinkler system* outside the enclosed occupant evacuation elevator lobby shall be provided.~~in accordance with an approved method.

Reason: As currently written it is often misinterpreted that water protection should be provided from sprinklers activating within the enclosed lobby itself. In fact, this provision is specifically looking only at sprinkler activation outside the lobby. If a sprinkler was activated within the lobby itself then there are larger concerns about the safety of the elevator operations. Also if sprinklers have activated within the lobby the lobby smoke detection would have also activated and recalled the elevators to the lobby. This section is not intended to include fire fighter hose stream.
The ICC Code Technology Committee (CTC) has just completed its 10th year. The ICC Board has decided to sunset the CTC. The sunset plan includes re-assigning many of the CTC Areas of Study to the applicable Code Action Committee (CAC). The two remaining CTC Areas of Study are Care Facilities and Elevator Lobbies/WTC Elevator issues. This proposal falls under the WTC Area of Study. Information on the CTC, including: the sunset plan; meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the CTC website at: http://www.iccsafe.org/cs/CTC/Pages/default.aspx.

Cost Impact: Will not increase the cost of construction
This is merely a clarification. It may be a savings if it was interpreted to include the activation of an automatic sprinkler system within the enclosed elevator lobby.

G 204-15 : 3007.3-BALDASSARRA4191

G 205-15

3007.1

Proponent: Dave Frable, representing US General Services Administration

2015 International Building Code

Add new text as follows:

3007.1 General. Where required by Section 403.6.1, every floor above and including the lowest level of fire department vehicle access of the building shall be served by fire service access elevators complying with Sections 3007.1 through 3007.9. Except as modified in this section, fire service access elevators shall be installed in accordance with this chapter and ASME A17.1/CSA B44.

Reason: The intent of this code change proposal is to clarify the original intent of the installation requirements for fire service access elevators in buildings with an occupied floor more than 120 feet able the lowest level of fire department access.
Please note that it was not the intention of the submitter of the original code change proposal to require fire service access elevators be available on the levels of the building below the lowest level of fire department access. Typically the fire department is more concerned with travelling upward into the building and typically do not require that fire service access elevators be provided in the lower levels of the building. Most fire departments will likely
not take an elevator below grade to a fire when the stairs are manageable.

Cost Impact: Will not increase the cost of construction
This clarrification will reduce cost of construction by not requiring fire service access elevators to be installed in locations below the lowest level of fire department vehicle access and that it is only the portion of the building above and including the lowest level of fire department vehicle access that need these elevators.

G 205-15 : 3007.1-FRABLE5041

G 206-15

3007.8, 3007.8.1 (New)

Proponent: Dave Frable, US General Services Administration, representing US General Services Administration

2015 International Building Code

Revise as follows:

3007.8 Electrical power. ~~The following features serving each fire service access elevator shall be supplied by both~~ Sufficient normal ~~power~~ and Type 60/Class ~~2~~X/Level 1 standby power~~: 1. Elevator~~ shall be provided to simultaneously operate all designated fire service access elevators and their associated elevator equipment~~.2. Elevator~~, elevator hoistway lighting~~.3. *Ventilation*~~, elevator car lighting, and the ventilation and cooling equipment for their respective elevator machine rooms, control rooms, machine spaces and control spaces. ~~4. Elevator car lighting.~~

Add new text as follows:

3007.8.1 Standby power evaluation and analysis An evaluation and analysis shall be provided to determine the appropriate minimum time, in hours, that standby power must be provided following loss or failure of the normal power supply for the fire service access elevators to operate for the specific building and application. The subject evaluation and analysis shall be prepared by the responsible registered design professional and shall be approved prior to installation.

Reason: Currently as written all designated fire service access elevators must comply with Section 3007.8 which requires 2 hours of standby power for each designated fire service access elevator and associated equipment simultaneously.
In many 120 foot tall buildings across the country, the current 2-hour standby power requirement becomes costly and is likely much more conservative than necessary. The intent of this code change is to provide a more reasonable approach for providing standby power in lieu of using an arbitrary/absolute value of 2-hours. NFPA 110, Standard for Emergency and Standby Power Systems permits the use of Class X systems (Other time, in hours, as required by the application). Please note the Class defines the minimum time, in hours, for which the standby power system is designed to operate at its rated load without being refueled or recharged.

This proposal would permit the Building Official to approve an evaluation and analysis prepared by the registered design professions for determining the appropriate minimum time, in hours, that standby power must be provided for the respective building. In addition, it should also be pointed out that the 2-hour standby power requirement is also not consistent with reviews of the WTC bombing in 1996 that concluded buildings should not take longer than 1-hour to evacuate.

Cost Impact: Will not increase the cost of construction
This proposal will decrease the cost of construction as it will possibly reduce the size of the emergency power supply system providing standby power as well as determing the appropriate timeframe necessary for providing standby power for the operation of the fire service access elevators during an emergency.

G 206-15 : 3007.8-FRABLE5021

G 207-15

3008.1, 3008.1.1 (New), 3008.8.1 (New)

Proponent: Carl Baldassarra, P.E., FSFPE, Chair, Code Technology Committee, representing Code Technology Committee (CTC@iccsafe.org)

2015 International Building Code

Revise as follows:

3008.1 General. ~~Where elevators are to be~~ Elevators used for occupant self-evacuation during fires~~, all passenger elevators for general public use~~ shall comply with Sections 3008.1 through 3008.10.~~ Where other elevators are used for occupant self-evacuation, those elevators shall comply with these sections.~~

Add new text as follows:

3008.1.1 Number of occupant evacuation elevators. The number of elevators available for occupant evacuation shall be determined based on an egress analysis that addresses one of the following scenarios

1. Full building evacuation where the analysis demonstrates that the number of elevators provided for evacuation results in an evacuation time less than one hour.
2. Evacuation of the 5 consecutive floors with the highest cumulative occupant load where the analysis demonstrates that the number of elevators provided for evacuation results in an evacuation time less than 15 minutes.

A minimum of one elevator in each bank shall be designated for occupant evacuation. Not less than two shall be provided in each occupant evacuation elevator lobby where more than one elevator opens into the lobby. Signage shall be provided to denote which elevators are available for occupant evacuation.

3008.8.1 Determination of standby power load. Standby power loads shall be based upon the determination of the number of occupant evacuation elevators in Section 3008.1.1.

Reason: The alternative to the 3rd stair in Section 403.5.2 is to use occupant evacuation elevators. This is a viable and more efficient option, but can require an excessive amount of standby power. As currently written, all passenger elevators must be used to comply with Section 3008 and Section 3008.8 would require 2 hours of standby power for every elevator simultaneously. In a building with many elevators, this becomes excessive and may be much more conservative than necessary where occupant loads are low. This proposal provides a more reasonable performance-based approach but while retaining the capacity to evacuate buildings more quickly than with stairs alone.
Two options are provided to determine the number of occupant evacuation elevators necessary to meet the performance intent. The first focuses upon full building evacuation. This does not mandate full building evacuation but instead is a benchmark to use for analysis. The use of 1 hour sets an upper limit on evacuation time and is based upon concerns during review of events such as the WTC bombing in 1993 that buildings should not take longer than an hour to evacuate. The 1 hour criterion is consistent with the upper limit that the elevator industry typically uses to determine the use of elevators during the busier times of the day within buildings during normal operation. It is also consistent with the basis for the current code language. The second option is more closely associated with a more typical phased evacuation. This 15 minute criterion intends to remove occupants from the area to which the fire department will respond. In reviewing a number resources the time of arrival of most fire departments in a typical city is likely around 4 minutes. This does not include time for set-up at the scene. NFPA 1710 specifically requires a 240 second arrival time to 90 percent of the incidents in a jurisdiction. Again this is only arrival time of the first due company. Several fire service officers have stated that an additional 10 minutes are needed to begin incident assessment, leading to the 15 minute criterion. Using the highest occupant load for 5 consecutive floors will provide a safety factor for the required number of occupant evacuation elevators.

In addition since the initial publication of occupant evacuation elevator requirements, ASME A17.1 has been updated and revised to address occupant evacuation elevators. This also includes the interface with the fire department features on elevators. Elevators can now be individually recalled by the fire department thus leaving more elevators available for evacuation if necessary. ASME A17.1 also provides requirements for the prioritization of elevators during emergencies. This provides another level of rigor to the concept.

The ICC Code Technology Committee (CTC) has just completed its 10th year. The ICC Board has decided to sunset the CTC. The sunset plan includes re-assigning many of the CTC Areas of Study to the applicable Code Action Committee (CAC). The two remaining CTC Areas of Study are Care Facilities and Elevator Lobbies/WTC Elevator issues. This proposal falls under the WTC Area of Study. Information on the CTC, including: the sunset plan; meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the CTC website at: http://www.iccsafe.org/cs/CTC/Pages/default.aspx.

Bibliography: Fire Master Plan, Olympia Washington, Chapter 4 Emergency response – response times. Response times - Chapter 4 Fire Master Plan Olympia, WA
NYC City wide fire report -2014. NYC response times

NFPA 1710 – 2010

Cost Impact: Will not increase the cost of construction
This proposal will decrease the cost of construction as it will possibly reduce the number of elevators necessary for occupant evacuation and thus reduce the capacity necessary for standby power.

G 207-15 : 3008.1 #1-BALDASSARRA4188

G 208-15

3008.1, 3008.6.1

Proponent: Carl Baldassarra, P.E., FSFPE, Chair, Code Technology Committee, representing Code Technologies Committee (CTC@iccsafe.org)

2015 International Building Code

3008.1 General. Where elevators are to be used for occupant self-evacuation during fires, all passenger elevators for general public use shall comply with Sections 3008.1 through 3008.10. Where other elevators are used for occupant self-evacuation, those elevators shall comply with these sections.

-

Revise as follows:

3008.6.1 Access to interior exit stairway or ramp. The occupant evacuation elevator lobby shall have direct access from the enclosed elevator lobby to an *interior exit stairway* or *ramp*.

> ~~**Exception**~~**Exceptions:** 1. Access to an *interior exit stairway* or *ramp* shall be permitted to be through a protected path of travel that has a level of fire protection not less than the elevator lobby enclosure. The protected path shall be separated from the enclosed elevator lobby through an opening protected by a smoke and draft control assembly in accordance Section 716.5.3.
> 2. Elevators that only service an open parking garage and the lobby of the building shall not be required to provide direct access in accordance with this section.

Reason: Requiring occupant evacuation elevators to extend from a parking garages to the main lobby was not contemplated or intended to be addressed by the requirements for occupant evacuation elevators. Such elevators were intended to address portions of the building where height became an issue for evacuation. However it was felt that these elevators should still be available for occupant evacuation but the direct access requirement was felt to be overly restrictive for open parking garages. The direct access requirement often affects the location of the stairways and possibly leading to an additional stairway. There is an exception to Section 3008.6.1 if you provide protection to that stairway but in an open parking garage smoke accumulation is much less due to the open nature of the structure. The additional construction required to create that protected path would serve little benefit.
The ICC Code Technology Committee (CTC) has just completed its 10th year. The ICC Board has decided to sunset the CTC. The sunset plan includes re-assigning many of the CTC Areas of Study to the applicable Code Action Committee (CAC). The two remaining CTC Areas of Study are Care Facilities and Elevator Lobbies/WTC Elevator issues. This proposal falls under the WTC Area of Study. Information on the CTC, including: the sunset plan; meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the CTC website at: http://www.iccsafe.org/cs/CTC/Pages/default.aspx.

Cost Impact: Will not increase the cost of construction
Will decrease the cost of construction. This will simplify the location of the stairway. This exception eliminates the need for an additional stairway or of the creation of a protected path from the occupanct evacuation elevator lobby to the stairway.

2015 International Building Code

Add new text as follows:

SECTION 202
DEFINITIONS

ACTIVE SOIL-DEPRESSURIZATION SYSTEM. A system designed to lower the air pressure in the soil beneath a building, relative to the atmospheric pressure immediately above ground level, by continuously withdrawing air from below a membrane covering the soil. An active soil-depressurization system consists of a pressure distribution manifold, one or more radon vents, an operating fan and a fan-failure indicator.

RADON. A naturally occuring, chemically inert, radioactive gas. It is part of the uranium-238 decay series. For purposes of this code, radon applies to radon-222; thus, it is the direct decay product of radium-226.

SOIL GAS RETARDER MEMBRANE. A durable, flexible and non-deteriorating material, installed in a continuous sheet to retard the pressured-driven flow of soil gas through elements of a structure.

CHAPTER
30 RADON REDUCTION SYSTEMS

SECTION 3001
GENERAL

3001.1 Intent. The provisions of this chapter shall govern the design, construction and testing of radon reduction systems. These systems are intended to limit radon entry points through floors, walls and foundations and to limit the mechanicl depressurization of buildings, which can enhance radon entry.

3001.2 Required. This Chapter shall be mandatory for buildings of Group E (Educational) occupancy that are located in areas of high radon potential as determined by Table AF101(1) High Radon-Potential (Zone 1) Counties in Table 3001.2.

Table 3001.2
High Radon-potential, Zone 1, counties.

SECTION 3002
SOIL GAS RETARDER MEMBRANE.

3002.1 Membrane materials. Acceptable soil gas retarder membranes shall consist of a single layer of polyethylene, not less than 0.006-inch (6 mils) thick with a maximum perm rating of 0.3. Polyvinyl chloride (PVC), ethylene diene ter polymer (EPDM), neoprene or other non-deteriorating, non-porous material may be used instead of polyethylene, provide the installed thickness of the alternate material has greater or equal tensile strength, resistance to water-vapor transmission, resistance to puncture, and resistance to deterioration determined in accordance with ASTM E 154. The membrane shall be placed to minimize seams and to cover all of the soil below the building floor.

3002.2 Tape. Tape used to install the soil gas retarder shall have a minimum width of 2 inches and shall be pressure sensitive vinyl or other non-deteriorating pressure sensitive tape compatible with the surfaces being joined.

3002.3 Mastic. Mastic used to join sections of membrane to one another or to elements of the building foundation, or to seal penetrations in the membrane of the soil gas retarder shall be compatible with the surfaces being joined, and shall be installed in accordance wtih the manufaturer's recommendations for the materials, surface conditions and temperatures involved.

3002.4 Installation. The soil gass retarder shall be placed under the entire soil contact area of the floor in a manner than minimizes the required number of joints and seams. Care shall be taken to prevent damage to the membrance during the construction process. In buildings incorporating the sub-slab portions of an active soil-depressurization system, the soil gas retarder shall also serve to prevent mastic, cement or other materials from blocking the pressure distribution manifolds or pits.

3002.5 Seams Seams between portions of the soil gas retarder shall maintain not less than 12 inches of lap when concrete is placed. The membrane shall be secured with tape or mastic or by using larger unsecured overlaps prior to placing concrete.

3002.6 Slab edges and joints The soil gas retarder shall fully cover the soil beneath the building floor. Where the slab edge is cast against a foundation wall or grade beam, the soil gas retarder shall contact the foundation element, and shall not extend vertically into the slab more than one half of of the slab thickness.

3002.7 Penetrations At all points where pipes, conduits, reinforcing bars or other objects pass through the soil gas retarder membrane, the membrane shall be fitted to within one-half inch of the penetration and sealed to the penetration. Where penetrations occur within 24 inches of a soil-depressurization system mat or pit, the gap between the penetrating object and the soil gas retarder shall be taped closed. When necessary to meet this requirement a second layer of the membrane, cut so as to provide not less than a 12-inch lap on all sides, shall be placed over the object and shall be sealed to the soil gas retarder with a continuous band of tape.

3002.8 Punctures, cuts and tears All damaged portions of the soil gas retarder membrane within 24 inches of any portion of a soil-depressurization system mat or pit shall be sealed with tape or with a patch made from the same or compatible material, cut so as to provide not less than a 12-inch lap from any opening, and taped continuously about its perimeter.

3002.9 Mastics Mastic used to join sections of soil gas retarder to one another or to elements of the building foundation, or to seal penetrations in the soil gas retarder, shall be located not less than 24 inches from any portion of the soil-depressurization system mat or pit. Tape shall be used to seal those portions of the soil gas retarder membrane that are within 24 inches of a soil-depressurization system mat or pit.

3002.10 Repairs Where portions of an existing concrete slab-on-grade construction have been removed and are about to be replaced, the soil gas retarder membrane shall be carefully fitted to the opening, and all openings between the membrane and the soil shall be closed with tape or mastic. Special care shall be exercised to assure that mastic does not enter any portion of the soil-depressurization system that is located beneath the slab-on-grade construction.

SECTION 3003
CONCRETE FLOORS IN CONTACT WITH SOIL GAS

3003.1 General Concrete slab-on-grade construction that is supported on soil or spanning over exposed soil, and that is used as a floor for conditioned space or enclosed spaces that are adjacent to or are connected to conditioned spaces, shall be constructed in accordance with local codes for mix design, slump and workability, hot weather placing and finishing and curing.

3003.2 Concrete for slab-on-grade construction. Concrete for slab-on-grade construction that is in contact with soil gas shall be in accordance wtih Sections 3003.2.1 and 3003.2.2.

3003.2.1 Compressive strength Design strength for concrete mixes used in the construction of slab-on-grade floors shall be not less than 3,000 psi at 28 days and shall be designed, delivered and placed in accordance with ASTM C 94.

3003.2.2 Shrinkage sontrol Concrete mix design, placing practices, and curing practices prescribed shall be in accordance with this section. Concrete slab-on-grade or slabs spanning above exposed soil shall be designed, placed, finished and cured in accordance with this code.

3003.3 Sealing of construction joints, penetrations, cracks and other connections The sealing of construction joints, penetrations, cracks and other connections shall be in accordance wtih Sections 3003.3.1 through 3003.3.4.

3003.3.1 Sealants Sealants shall be selected and installed in compliance with ASTM C 920 and ASTM C 1193.

1. Sealant materials shall be compatible with the materials they join, including curing compounds and admixtures, and with materials that will be applied over them, including floor finishing materials.
2. Field-molded sealants shall be installed in sealant reservoirs proportioned, cleaned of laitance and prepared in accordance with the manufacturer's recommendations. For elastomeric sealants, this generally requires the installation of a bond breaker or backer rod shall be provided where required by the sealant manufacturer's installation instructions.
3. Where installed sealant is not protected by a finished floor or other protective surface, it shall be suitable to withstand the traffic to which it will be exposed.
4. Waterstops shall be preformed from polyvinyl chloride or other non-corrosive material.

3003.3.2 Joints Joints between sections of concrete floor slabs, between the floor slab and a wall or other vertical surface, and between a section of floor and another object that passes through the slab, shall be sealed to prevent soil gas entry in accordance with the provisions of this section. Joints and portions thereof shall not be covered or rendered inaccessible unless the seal has first been inspected and approved by the building official. Such joints shall be sealed prior to the structure being certified for occupancy.

1. **Butt joints.** Non-bonded butt joints shall be sealed to prevent radon entry using an elastomeric sealant or a waterstop as specified in Section 3003.3.1. The sealant reservoir shall be sufficiently large to prevent failure of the sealant or waterstop and shall not be less than 1/4-inch by 1/4-inch in cross-section
2. **Lap joints**. Non-boned lap joints shall be sealed with either a field-molded or preformed elastomeric sealant or with a flexible waterstop as specified in Section 3003.3.1. The lap joint shall be sufficiently large to prevent failure of the sealant or waterstop, but in no case shall the sealant reservoir be less than 1/2-inch by 1/2-inch in cross-section.
3. **Isolation joints.** Non-boned isolation joints shall be sealed with either a field-molded or preformed elastomeric sealant or with a flexible waterstop as specified in Section 3003.3.1. Isolation joints shall be sufficiently large enough to prevent failure of the sealant or waterstop, and shall be not less than 1/2-inch by 1/2-inch in cross-section.
4. **Control or contraction joints.** In locations where continued movement of the slab portions can be reasonably expected, flexible sealants shall be installed in reservoirs in accordance wtih Section 3003.3.2 Item 2, or a flexible waterstop shall be provided.
5. **Construction joints.** Bonded construction joints shall be sealed to prevent radon entry using either a rigid or an elastomeric sealant or a waterstop in accordance with Section 3003.3.1. Where movement of the joint is not prevented by continuous reinforcing and tie bars, flexible sealants shall be be installed in reservoirs in accordance with Section 3003.3.2 Item 2, or a flexible waterstop shall be provided.

3003.3.3 Cracks Cracks in concrete slabs supported on soil or spanning over exposed soil, that are used as floors for conditioned space or enclosed spaces adjacent to or connected to conditioned spaces, shall be sealed against radon entry in accordance with the provisions of this section and Section 3003.3.1, except that cracks less than 1/16-inch wide that do not meet any of the conditions described in Section 3003.3.3(1), shall not be required to be sealed.

1. Cracks greater than 1/4-inch wide; all cracks that exhibit vertical displacement; all cracks that connect weakened zones in the slab such as vertical penetrations or re-entrant corners; and, all cracks that cross changes in materials or planes in the structure, shall be sealed with a flexible field-molded elastomeric sealant installed in accordance with Section 3003.3.2, Item 3, for isolation joints.
2. Cracks greater than 1/16-inch wide; that do not meet any of the conditions described in 3003.3.3(1), shall be enlarged to contain a sealant reservoir not less than 1/4-inch by 1/4-inch in cross-section along the entire length of the crack; and shall be sealed with a flexible, field-molded elastomeric sealant installed in accordance with 3003.3.2(1).

3003.3.4 Stakes, pipe penetrations and other small objects Objects that pass through the slab shall be sealed gas tight. A sealant reservoir, appropropriately dimensioned to accommodate any differential movement between the object and the concrete, shall be formed continuously around the objects, and the joint shall be sealed with a field molded elastomeric sealant in accordance with Section 3003.3.2 Item 3 and Section 3003.3.1. Where pipes or other penetrations are separated from the concrete by flexible sleeves, the sleeve shall be removed to provide bonding of the sealant to the object. Where stakes are used to support plumbing, electrical conduits or other objects that will penetrate the slab, the stakes shall be solid, non-porous and resistant to decay, corrosion and rust. Special care shall be taken to avoid honeycombing between multiple or ganged penetrations.

1. Large utility service openings throught the slab shall be sealed gas-tight. For slab-on-grade construction, this shall be accomplished by fully covering the exposed soil with a vapor-retarder membrane, covered to a depth of not less than 1 inch with an elastomeric sealant. Alternatively, the opening shall be closed with an expansive concrete or hydraulic cement to within 1/2 inch of the top of the slab, and the remaining 1/2 inch shall be filled with an elastomeric sealant. Where the opening connects to a crawlspace, the opening shall be closed with sheet metal or other rigid impermeable materials and sealed with an elastomeric sealant compatible with the materials and conditions.
2. For openings made through existing slabs, sealing shall meet the applicable provisions of this section. Where the opening is partially repaired with concrete, any resulting crack shall be sealed in accordance with Section 3003.3.3.
3. Sumps located in habitable portions of a building and connecting to the soil, either directly or through drainage piping, shall be equipped with a gasketed lid. The lid shall be attached so as to provide a gas-tight seal between the sump and the access space above.

SECTION 3004
WALLS IN CONTACT WITH SOIL GAS

3004.1 General Walls separating below-grade conditioned space from the surrounding earth or from a crawlspace or other enclosed space with an exposed earth floor, shall be isolated from the soil by an approved structural barrier as in accordance with Section 3002. Foundation walls consisting of cavity walls, or constructed of hollow masonry products or of any material in such a way as to create an air-space within the wall, shall be capped as the floor-level of the first finished floor they intersect. The cap shall be either at least 8 inches of solid concrete or concrete filled block, or a cap that provides air-flow resistance at least equal to the adjacent floor. Cracks, honeycombs, joints, ducts, pipes conduit chases or other openings in the wall shall not be allowed to connect soil gas to a conditioned space or to an enclosed space adjacent to or connected to a conditioned space.

3004.2 Materials Walls governed by the provisions of Section 3004 shall be constructed of reinforced concrete, or solid reinforced masonry construction.

3004.3 Waterproofing Walls governed by Section 3004 shall be constructed with a continuous waterproofing membrane applied either

1. To the exterior surface from the top of the footing to not less than 6 inches above the finished grade, or where the wall separates interior space and a crawlspace; or
2. From the top of the footing to the bottom of the floor above.

3004.3.1 Application The waterproofing membrane shall be applied in accordance with this code and shall be sealed to the top of the footing so as to waterproof the joint between the footing and the wall. Where installed in accordance with Section 3004.3 Item 2, the membrane shall be attached to the bottom of the floor above in a manner that fully seals the joint between the floor and wall.

3004.3.2 Utility penetrations Below-grade utility penetrations through walls in partial or full contact with the soil shall be closed and sealed with a sealant in accordance wtih Section 3003.3.1. This seal shall be made on both faces of the wall. Where conduits or ducts do not provide a continuous and gas-tight separation from the soil, the end of the conduit or duct shall be sealed in accordance with Section 3003.3.1 to prevent soil gas entry.

3004.4 Doors and service openings Doors, hatches or removable closures of any kind that can create an opening between the interior and a crawlspace shall be gasketed and equipped with a latch or other permanent fastening device.

SECTION 3005
BUILDINGS WITH CRAWL SPACES

3005.1 General. For the purposes of Section 3005, buildings with crawl spaces shall include all buildings with a floor supported above grade.

3005.1.1 Reinforced concrete floor systems Reinforce concrete floors constructed over crawl spaces shall be in accordance with Section 3003.

3005.1.2 Wood-framed floor systems Wood-framed floors spanning over soil, that are used as floors for conditioned space or enclosed spaces adjacent to or connected to conditioned spaces, shall be constructed in accordance with Section 3005.

3005.2 Materials. Wood-framed floors constructed over a crawl space shall be constructed of APA certified tongue-in-groove plywood, and shall otherwise comply with this code. Oriented structural board shall not be considered to be an acceptable substitue material.

3005.3 Utility penetrations Penetrations through the floor shall be fully sealed to the floor structure with a sealant that complies with Section 3003.3.1. Large service openings through the slab shall be sealed gas-tight. Where large openenings are created, sheet metal or other rigid material shall be used in conjunction with sealants to close and seal the openings.

3005.4 Vertical joints Vertical joints between the subfloor and foundation wall or the subfloor and any vertical plane of the building that extends from the crawlspace to the top of the subfloor, shall be sealed with a sealant that complies with Section 3003.3.1.

3005.5 Doors and service openings. Doors, hatches or removable closures of any kind that have the potential to create an opening in the floor-plane shall be gasketed and equipped with a latch or other permanent fastening device.

3005.6 Other radon-entry paths Openings thatconnect a crawlspace and construction cavities, such as the space between wall studs, hollow masonry or precast concrete units, or floor and ceiling planes, shall be closed and sealed in accordance with Section 3003.3.1.

3005.7 Crawl space ventilation Crawl Spaces shall be passively ventilated or shall be constructed with an active soil-depressurization system in compliance with Sections 3008 and 3009. No portion of an air-distribution system shall pass through a crawlspace.

3005.7.1 Required ventilation. Crawl spaces shall be ventilated by openings through the perimeter wall connecting to the exterior of the foundation. Required vents shall have a combined net free area of not less than 1 square inch in each 1 square foot of crawl space, and shall conform to the following conditions:

1. Openings shall be distributed uniformly around the outside walls of the crawl space.
2. Vents shall be fitted with corrosion- and decay-resistant wire mesh or grilles with openings not less than 1/4 inch nor more than 1/2 inch in size. Vents shall not be fitted with operable louvers, dampers or other closure mechanisms.
3. Plumbing located in a ventilated crawlspace shall be protected from freezing with insulation or heat tape.

3005.7.2 Prohibited uses. Crawl spaces shall not be used as an air-duct or plenum or to house a duct or fan that is part of a heating, ventilating or air-conditioning system.

SECTION 3006
SPACE CONDITIONING SYSTEMS AND VENTILATING

3006.1 General. This Section limits radon entry points by means of the mechanical depressurizaiton of buildings. Ventilating systems shall be designed in accordance with applicable codes and the provisions of this section for use of outside air of low radon concentration.

3006.2 Condensate drains. Joints in condensate piping shall be solvent welded, soldered or otherwise connected in a leak-proof and gat-tight manner. Condensate drains shall be trapped and shall terminate in the building sewer or outside of buildings, at not less than 6 inches above finished grade. Where the condensate piping penetrates a floor or wall separating enclosed space from the soil or from a crawl space, the penetration shall be sealed in accordance with applicable provisions of Section 3003. Condensate drain piping shall not terminate in a return plenum.

3006.3 Other piping. Where piping penetrates a floor or wall separating enclosed space from the soil or from a crawl space, the penetration shall be sealed in accordance with applicable provisions of Section 3003. Where piping is insullated, the insulation shall be removed at the point of the seal, and the required seal shall be made between the pipe and the building structure. The sealant shall be compatible with the materials and anticipated operating temperatures. Piping shall not terminate in a return plenum.

3006.4 Plumbing and wiring chases. Where piping or wiring is installed in a chase that is at any point in contact with the soil or a crawl space, the chase shall be sealed to the floor or wall where it first enters the structure, in accordance with applicable provisions of Section 3003. Piping contained in such a chase shall be sealed to the chase at the interior plane of that floor or wall. A chase or portion thereof shall not terminate in a return air duct or plenum. Where it is impractical or prohibited by another code to seal wiring into an electrical chase or conduit, the chase shall comply with applicable portions of Section 3003 or the conduit shall be entirely fabricated of gas-tight components and materials.

SECTION 3007
AIR DISTRIBUTION SYSTEMS

3007.1 Air distribution systems. Air ducts, plenums, fan enclosures or fans that are part of a building's heating, ventilating or air-conditioning system shall be completely isolated from the soil gas by a structural barrier complying with this Chapter. Heating, ventilating and air-conditioning systems supplying spaces with floors or walls that are in contact with soil or soil gas shall be designated to minimize air pressure differences and eliminate negative pressures, that cause significant flow of soil gas through the structural barrier and into the building. Return ducts, plenums and air handlers shall not be located in a crawl space.

3007.2 Exhaust fans, hoods, equipment and appliances. For each zone, the required volume of outside ventilation air shall be not less than the combined volume of air capable of being exhausted by all exhaust fans, hoods, equipment and appliances installed in the zone. This amount shall not be reduced by use factors unless devices are wired and switched in a manner that prevents their simultaneous operation.

3007.3 Combustion air ducts. Ducts that provide combustion air to fuei-burning appliances and equipment shall be completely isolated from the soil gas by a structural barrier that complies with the provisions in this Chapter.

SECTION3008
ACTIVE SOIL-DEPRESSURIZATION SYSTEMS

3008.1 General. A soil-depressurization system causes the direction of air flow through any possible failure in the structural barrier to move out of the building and into the depressurization system, therby reducing radon. Soil-depressurization systems shall be installed beneath concrete slabs supported directly on the the soil, or beneath the soil gas retarder membrane in crawl spaces.

3008.2 Prohibited uses. Soil-depressurization systems components shall not extend beneath areas that are required to be depressurized by other codes for the protection of public health, such as, but not limited to, rooms containing general anesthesia or pathogens. Soil-depressurization systems shall be installed beneath rooms that are required to be depressurized for other reasons, such as, but not limited to, toilets and kitchens.

3008.3 System components. An active soil-depressurization system shall be comprised of the following components: a pressure distribution system porous media or manifolds; a soil cover; one or more vents; a suctio fan; and a system failure indicator.

3008.3.1 Pressure distribution media or manifold. The low-pressure zone shall be extended across the entire area beneath the structure in accordance with the following. Acceptable means of extending the low-pressure zone include, but are not limited to, synthetic ventilation mats, a system of perforated pipe and an air-permeable gravel layer. Different types of pressure distribution media shall be allowed to be used in the same system, provided each complies with the installation requirements of this Chapter. Pressure distribution media must be installed in such a way as to assure that they are never blocked by water.

1. Ventilation mats shall have a soil contact area of not less than 216 square inches per linear foot and provide a cross-section profile of not less than 9 square inches.
2. Perforated pipe that is used to consruct pressure extension manifolds shall be installed directly under the soil cover or in gravel or a similar porous medium that provides an adequate air flow connection between the pipe and the sub-soil and that protects the pipe from becoming blocked by soil.
3. Continuous gravel layers of at least 4-inches thickness are an acceptable pressure distribution medium, provided the completely cover the area of soil to be pressurized.

3008.3.2 Soil cover. In slab-on-grade construction, the soil cover shall consist of the soil gas retarder membrane and the concrete slab. In crawl spaces, the concrete slab shall be allowed to be omitted, provided that the soil-gas retarder membrane will not be subjected to wear and damage due to required maintenance procedures. In all instances, the soil gas retarder membrane shall be fully sealed to the radon vents in accordance with Section 3002.

3008.3.3 Radon vents. Radon vents that carry the soil gas to an area above and away from the building shall be gas-tight and of a material that is in accordance wtih the requirements for plumbing vents in the *International Plumbing Code.*

3008.3.4 Suction fans. Suction fans shall be designed for continuous operation. Fan perfomance shall comply with air flows and operating pressures that are determined by the system design, as determined using estimates from active soil-depressurization air flow models or in accordance with Section 3008.4.2.2.

3008.3.5 Fan failure iIndicator. Soil-depressurization systems shall have a failure indicator labeled with the words "Radon Reduction System Fan Failure Indicator" mounted so as to be conveniently visible to building occupants. The fan failure indicator shall be either a visual device consisting of a light not less than 1/5 footcandle at the floor level, or an alarm that produces a minimum of 60 db audible signal. The indicator shall be made to operate automatically when the pressure inside any radon vent pipe fitted with an operable fan is less than 0.40-inch water column (100 pascals) lower than the air pressure inside the building.

3008.4 Active soil-depressurization system design requirements.

3008.4.1 General. Active soil-depressurization systems shall be designed to be capable of maintaining a 0.02-inch (5-pascal) pressure differential over 90 percent of the slab or crawlspace.

3008.4.2 Ventilation mat systems. Ventilation mat systems shall be designed to be capable of maintaining a 5-pascal pressure differential over 90 percent of the slab area or in accordance with the *International Mechanical Code* for equipment and system sizing.

3008.4.2.1 Installation. Radon ventilation mats shall be installed immediately prior to placing the soil gas retarder membrane. Mats shall be arranged in a pattern that provides not less than two possible flow paths from any points on the mat to a radon vent pipe. Mats shall be placed with the filter material facing the compacted soil. Where sections of the mat join, a section of filter material not less than 6-inches long at the end of one of the mats shall be loosened and the other piece of mat shall be inserted between the loosened filter material and the first section of mat. The mats shall be pressed tightly together at this lap and mechanically attached together with hog rings or metal pins driven through the mat and into the soil so as not to puncture or tear the soil gas retarder membrane. When properly joined, the filter material will extend continuously across the joint and the full cross-sectional area of the mat shall be preserved across the splice.

3008.4.2.2 Alternate compliance method. Systems installed on sand or granular soil shall demonstrate compliance by meeting all of the following design limits:

1. Mats shall be located at least 15 feet and not more than 25 feet from the outside edge of the floor.
2. Mats shall be spaced not more than 50 feet on center.
3. No portion of a building floor shall be isolated from a mat by a construction feature, such as an internal footing, grade beam, foundation wall or other obstacle having a depth greater than the exterior foundation walls.
4. No portion of a building floor shall be more than 35 feet from the mat.
5. Mats shall be run parallel to the longest slab dimension unless obstructed by a construction feature, and arranged in a pattern that provides at least two possible flow paths from any point on the mat to a radon vent pipe.

3008.4.2.3 Radon vent connection. The radon vent pipe shall join to the mat in a manner that does not restrict the full air flow capacity of the pipe. Where required, dependent upon the thickness and effective net-free-area of the ventilation mat, the diameter of the vent pipe at the connections shall be enlarged with a suitable flange, or the the net-free-area of the mat shall be enlarged by installing additional layers of mat or a layer of gravel beneath the connection point. The soil gas retarder membrane shall be fully sealed to the radon vents in accordance with Section 3002.

3008.4.3 Perforated pipe systems. Perforated pipes shall be of a material that complies with this code for foundation drainage, and shall be sized according to the air flow estimated for the active soil-depressurization system. Perforated pipes installed in gravel shall be number 4 or 5 gravel compling with ASTM D 448, with not more than 5 percent passing a 3/8-inch screen.

3008.4.3.1 Installation. Perforated pipe pressure distribution manifolds shall be installed after the installation of all other utilities has been complete, and immediately prior to the soil gas retarder membrane. Pipes shall be installed with a row of perforations located at the bottom of the pipe, in order to allow condesate to drain from the system. Pipes shall be arranged in a pattern that provides at least two possible flow paths from any point in the system to a radon vent pipe. Separate sections of pipe shall be solvent welded or mechanically fastened together.

3008.4.3.2 Radon vent connection. The radon vent pipe shall join to the perforated pipe with a fitting that allows for the fill air flow capacity of the vent pipe. The soil gas retarder membrane shall be fully sealed to the radon vents in accordance with Section 3002.

3008.4.4 Continuous gravel layer system. Gravel used as the pressure distribution medium shall be installed only after the installation of other utilities has been completed, and immediately prior to the soil gas retarder membrane. Where regions of gravel are isolated from one another by interior foundation elements, separate suction points shall be provided in each region, or regions shall be interconnected with pipes run horizontally through the obstruction. The size and number of such pipes shall be sufficient to provide at least two-times the anticipated air flow. Not less than two pipes shall be used to interconnect one gravel area with another. These pipes shall be separated by a horizontal distance of not less than one-half the length of the boundary between the connecting gravel areas.

3008.4.4.1 Radon vent connection. The radon vent pipe shall join to the gravel layer with a "T" fitting that allows for the full air flow capacity of the vent pipe from either side of the "T". The fitting shall be installed with two arms in the gravel and a single arm connected to the radon vent pipe. The soil gas retarder membrane shall be fully sealed to the radon vents in accordance with Section 3002.

3008.4.5 Radon vent pipe installation. Radon vent pipes shall be solvent welded or otherwise joined to create a gas-tight connection from the soil suction point to the vent termination point. They shall be sloped at not less than 1/8-inch per foot in a mnner that will drain rain and condensate back to the soil, and shall be supported in accordance with the requirements for vents in the *International Plumbing Code.*

3008.4.5.1 Labeling. Portions of the radon vent pipe no permanently encased in a wall or chase shall be labeled to prevent accidental misuse. Labels shall consist of a pressure sensitive 2-inch yellow band with the words "Radon Reduction System" printed in black letters at least 1 inch in height. These labels shall be placed on every visible portion of the vent pipe at a spacing of not more than 3 feet. The labels shall be placed so as to be visible from any direction.

3008.4.5.2 Sizing. The size of vent pipes shall be determined by application of appropriate engineering principles and based on modeled air flow rates. For systems that comply with the alternate compliance method of Section 3008.4.2.2, and are installed in buildings with straight runs of vent pipes not more than 50 feet in height, the required number and size of vent pipes shall be determined as follows:

1. For up to 100 linear feet of ventilation mat, one 2-inch diameter pipe shall be used.
2. For up to 200 linear feet of ventilation mat, one 3-inch diameter pipe, or two 2-inch diamter pipes, shall be used.
3. For up to 400 linear feet of ventilation mat use one 4-inch diameter pipe, or two 3-inch diameter pipes, or four 2-inch diameter pipes shall be used.

3008.4.5.3 Terminals. Radon vent pipes shall terminate with a rain cap, installed above the roof of the structure, and shall be located in accordance with existing codes for toxic or noxious exhaust. Where not specifically addressed or applicable, vent pipes shall terminate in locations that minimize human exposure to their exhaust air, such that the location is:

1. At least 12 inches above the surface of the roof;
2. At least ten feet from any window, door or other openeing such as, but not limited to, an operable skylight or air intake to conditioned spaces of the structure; and
3. Ten feet from openings into an adjacent building. The total required distance (10 feet) shall be measured either directly between the two points or be the sum of measurements made around the intervening obstacles.

Where the discharge point is within two feet of the elevation of openings into conditioned space, the ten foot distance shall be the horizontal distance between the points.

3008.4.6 Suction fans. Soil-depressurization system fans shall be designed to maintain the following minimum air pressure differences at the lower opening of the radon vent pipe, as compared to the air pressure of the conditioned space above:

1. For systems using ventilation mats, 0.5 inches water column.
2. For systems using perforated pipe, 0.5 inches water column.
3. For systems using continuous gravel layers, 1.0 inches water column.

3008.4.6.1 Fan sizing. Soil-depressurization systems that comply with the alternative compliance method of Sections 3008.4.2.2 and 3008.4.5.2, shall comply by sizing the fan as follows:

1. For up to 100 linear of ventilation mat the fan shall be rated for 50 cfm (24 L/s) at 1-inch water column.
2. For 100 to 200 linear feet of ventilation mat, the fan shall be rated for not less than 100 cfm (47 L/s) at 1-inch water column.
3. For 200 to 400 linear feet of ventilation mat, the fan shall be rated for not less than 175 cfm (83 L/s) at 1-inch water column.

Add new standard(s) as follows: ASTM E 154-08a (Reapproved 2013) Standard Test Methods for Water Vapor Retarders Used in Contact with Earth Under Concrete Slabs, Walls or as Ground Cover.
ASTM C 1193-13 Standard Guilde for Use of Joint Sealants

Reason: Radon in schools presents significant health risk. Thousands of schools are affected by radon. EPA found that 41% of schools that had high radon were located geographically within Zone 1 (high radon potential), It is common knowledge that there is no way to know your building/room's radon level unless you test. Testing before a building is constructed is not possible; therefore, preventative measures, such as adding radon reducing features during construction, can save future costs and lives. Often, the preventative measures alone are enough to keep radon levels below the 4 pCi/L action level. This means that many times, no fan for radon removal would need to run; thus saving more energy.

Bibliography: Radon Prevention in the Design and Construction of Schools and Other Large Buildings [EPA 625-R-92-016, June 1994].
Reducing Radon in Schools: A Team Approach [EPA 402-R-94-008, April 1994] at www.epa.gov/radon/pubs/index.html

www.epa.gov/radon

Cost Impact: Will increase the cost of construction
If the gravel and vapor barrier are already being installed due to code requirements, the cost will be at the low end of this range.The cost of adding radon resistant features during construction is much less than the cost to test and fix radon after construction. Typically, costs can be approximately $10,000 and $50,000 if these radon resistant features are not added during construction.

Analysis: A review of the standards proposed for inclusion in the code, ASTM E154 and ASTM C1193 with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28), will be posted on the ICC website on or before April 2, 2014. All other
standards proposed for inclusion into the code are already in Chapter 35 of the 2015 IBC.

G 209-15 : Chapter 30 (New)-PALMER5624

G 210-15

3008.8, 3008.8.1 (New)

Proponent: Dave Frable, representing US General Services Administration

2015 International Building Code

Revise as follows:

3008.8 Electrical power. ~~The following features serving each occupant evacuation elevator shall be supplied by both~~Sufficient normal ~~power~~ and Type 60/Class ~~2~~X/Level 1 standby power: ~~1. Elevator~~shall be provided to simultaneously operate all occupant evacuation elevators along with their associated elevator equipment.~~2. Ventilation,~~elevator hoistway lighting, elevator car lighting, and the ventilation and cooling equipment for their respective elevator machine rooms, control rooms, ~~machinery~~machine spaces and control spaces. ~~3. Elevator car lighting.~~

3008.8.1 Standby power evaluation and analysis. An evaluation and analysis shall be provided to determine the appropriate minimum time, in hours, that standby power must be provided following loss or failure of the normal power supply for the occupant evacuation elevators to operate for the specific building and application. The subject evaluation and analysis shall be prepared by the responsible registered design professional and shall be approved prior to installation.

Reason: Currently as written all occupant evacuation elevators must comply with Section 3007.8 which requires 2 hours of standby power for each occupant evacuation elevator and associated equipment simultaneously.
In many tall buildings across the country, the current 2-hour standby power requirement becomes costly and is likely much more conservative than necessary. The intent of this code change is to provide a more reasonable approach for providing standby power in lieu of using an arbitrary/absolute value of 2-hours. NFPA 110, Standard for Emergency and Standby Power Systems permits the use of Class X systems (Other time, in hours, as required by the application). Please note the Class defines the minimum time, in hours, for which the standby power system is designed to operate at its rated load without being refueled or recharged.

This proposal would permit the Building Official to approve an evaluation and analysis prepared by the registered design professions for determining the appropriate minimum time, in hours, that standby power must be provided for the respective building. In addition, it should also be pointed out that the 2-hour standby power requirement is also not consistent with reviews of the WTC bombing in 1996 that concluded buildings should not take longer than 1-hour to evacuate.

Cost Impact: Will not increase the cost of construction
This proposal will decrease the cost of construction as it will possibly reduce the size of the emergency power supply system providing standby power as well as determing the appropriate timeframe necessary for providing standby power for the operation of occupant evacuation elevators during an emergency.

G 210-15 : 3008.8-FRABLE5036

G 211-15

3101.1, 3111, 3111.1, 3111.1.1, 3111.1.1 (New), 3111.1.2 (New), 3111.1.3 (New), 3111.2 (New), 3111.2.1 (New), 3111.3 (New), 3111.3.1 (New), 3111.3.2 (New), 3111.3.3 (New), 3111.3.4 (New), 3111.3.5 (New), 3111.3.5.1 (New)

Proponent: Edward Kulik, representing Building Code Action Committee (bcac@iccsafe.org)

2015 International Building Code

Revise as follows:

3101.1 Scope. The provisions of this chapter shall govern special building construction including membrane structures, temporary structures, *pedestrian walkways* and tunnels, automatic *vehicular gates*, *awnings* and *canopies*, *marquees*, signs, ~~and~~ towers and antennas, swimming pool enclosures and safety devices, and solar energy systems.

SECTION 3111
~~PHOTOVOLTAIC PANELS AND MODULES~~SOLAR ENERGY SYSTEMS

3111.1 General. ~~Photovoltaic panels and modules~~ Solar energy systems shall comply with the requirements of this ~~code and the *International Fire Code*~~section.

Delete without substitution:

~~**3111.1.1 Rooftop-mounted photovoltaic panels and modules.** Photovoltaic panels and modules installed on a roof or as an integral part of a roof assembly shall comply with the requirements of Chapter 15 and the *International Fire Code*.~~

Add new text as follows:

3111.1.1 Wind resistance. Rooftop mounted photovoltaic panels and modules and solar thermal collectors shall be designed in accordance with Section 1609.

3111.1.2 Roof live load. Roof structures that provide support for solar energy systems shall be designed in accordance with Section 1607.12.5.

3111.1.3 Guards. Installations shall comply with Section 1015.6 prior to installation of solar thermal systems or photovoltaic solar energy systems.

3111.2 Solar thermal systems. Solar thermal systems shall be designed and installed in accordance with Section 2606.12, the *International Plumbing Code*, the *International Mechanical Code*, and the *International Fire Code*.

3111.2.1 Equipment listings. Solar thermal systems and components shall be listed and labeled in accordance with ICC 900/SRCC 300 and ICC 901/SRCC 100.

3111.3 Photovoltaic solar energy systems. Photovoltaic solar energy systems shall be designed and installed in accordance with this section, the *International Fire Code*, NFPA 70, and the manufacturer's installation instructions.

3111.3.1 Equipment listings. Photovoltaic panels and modules shall be listed and labeled in accordance with UL 1703. Inverters shall be listed and labeled in accordance with UL 1741. Systems connected to the utility grid shall use inverters listed for utility interaction.

3111.3.2 Fire classification. Rooftop-mounted photovoltaic systems shall have a fire classification in accordance with Section 1505.9. Building integrated photovoltaic systems shall have a fire classification in accordance with Section 1505.8.

3111.3.3 Building integrated photovoltaic systems. Building integrated photovoltaic systems that serve as roof coverings shall be designed and installed in accordance with Section 1507.17.

3111.3.4 Access and pathways. Roof access, pathways and spacing requirements shall be provided in accordance with Section 605.11 of the *International Fire Code.*

3111.3.5 Ground mounted photovoltaic systems. Ground mounted photovoltaic systems shall be designed and installed in accordance with Chapter 16 and the *International Fire Code.*

3111.3.5.1 Fire separation distances. Ground mounted photovoltaic systems shall be subject to the fire separation distance requirements determined by the local jurisdiction.

Add new standard(s) as follows: ICC/SRCC
ICC 900/SRCC 300 Solar Thermal Systems
ICC 901/SRCC 100 Solar Thermal Collector

Reason: This public proposal is submitted by the ICC Building Code Action Committee (BCAC). The BCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the BCAC has held 13 open meetings and numerous workgroup calls which included members of the BCAC as well as any interested party to discuss and debate the proposed changes and the public comments. Related documentation and reports are posted on the BCAC website at: http://www.iccsafe.org/cs/BCAC/Pages/default.aspx.
Currently, provisions for solar energy systems, both solar thermal and photovoltaic, are scattered throughout the International Building Code, International Fire Code, International Plumbing Code, International Mechanical Code, and the National Electrical Code (NFPA 70). The intent of this proposed change is to do for these codes what was done in the 2015 International Residential Code through Proposal RM98-13. This proposed change consolidates and organizes all the requirements, with necessary section revisions and section additions, in an easily used format that assists the user to find all the applicable requirements – fire, electrical, structural, plumbing, and mechanical - related to solar thermal and photovoltaic systems.

Both of these systems are special building construction, and this proposal expands on the existing Section 3111 for photovoltaic panels and modules, providing clarity as to where specific requirements are located in the building and other codes.

As with the new Section R324 in the International Residential Code, expanding Section 3111 will allow for easy inclusion of new solar energy system types and locations.

Several of the new sections proposed to Section 3111 are located in other parts of the code, and a follow-up proposal will be made in the Group B cycle to address those sections, which include:

1510.7.1 (proposed new Section 3111.1)

1510.7.3, 1510.7.4, and 1512.1 (proposed new Section 3111.3)
1510.7.4 (proposed new Section 3111.3.1)
1510.7 (proposed new Section 3111.3.2)

Also a new section will be proposed in Group B cycle to address the specific structural requirements for wind resistance in Chapter 16. These requirements will be coordinated with new provisions in ASCE 7-16.

The requirement for guards in Section 3111.1.3 is already in Section 1015.6.

The new standards developed by ICC/SRCC are referenced for solar thermal equipment and installations.

Cost Impact: Will not increase the cost of construction
This code change proposal will not increase the cost of construction. The proposal attempts to clarify the code, but does not make any technical changes to code requirements.

Analysis: A review of the standards proposed for inclusion in the code, ICC 900/SRCC 300 and ICC 901/SRCC 100, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2015.

G 211-15 : 3101.1-KULIK4875

G 212-15

3102.1.1

Proponent: Jennifer Goupil, representing American Society of Civil Engineers (jgoupil@asce.org)

2015 International Building Code

Revise as follows:

3102.1.1 Tensile membrane structures and air-supported structures. Tensile membrane structures and air-supported structures, including permanent and temporary structures, shall be designed and constructed in accordance with ASCE 55. The provisions in Sections 3102.3 through 3102.6 shall apply.

Reason: This change proposes to add the new referenced standard *ASCE 55 Tensile Membrane Structures*. This Standard provides minimum criteria for the design and performance of tensile membrane cable and rigid member structures, including frame structures, collectively known as tensile membrane structures, including permanent and temporary structures as defined herein. The requirements of this Standard shall apply whether the tensile membrane structure is independent of or attached to another structure. This Standard does apply to air-supported structures.

In addition to the scope and definitions, the Standard includes chapters on membrane materials, connections, design, fabrication and erection, as well as appendices for special provisions and a procedure for determining modulus of elasticity.

ASCE/SEI 55 is published and maintained by the Structural Engineering Institute of the American Society of Civil Engineers (SEI/ASCE). The document is a nationally recognized consensus standard developed in full compliance with the ASCE *Rules for Standards Committees*. The ASCE standards process is fully accredited by the American National Standards Institute (ANSI).

The document is designated ASCE/SEI 55-10 *Tensile Membrane Structures* and it is currently available for purchase from ASCE. Any person interested in obtaining a public comment copy of ASCE/SEI 55 may do so by contacting the proponent at jgoupil@asce.org. A copy of the standard has been submitted with this proposal.

Cost Impact: Will not increase the cost of construction
This proposal coordinates the provisions of the code wtih the provisions of the referenced standard and provides the correct pointer to ASCE 55.

G 212-15 : 3102-GOUPIL4126

G 213-15

3102.1, 3103.1, 3103.5 (New)

Proponent: Adolf Zubia, IAFC Fire & Life Safety Section, representing IAFC Fire & Life Safety Section

2015 International Building Code

Revise as follows:

3102.1 General. The provisions of Sections 3102.1 through 3102.8 shall apply to air-supported, air-inflated, membrane-covered cable, membrane-covered frame and *tensile membrane structures*, collectively known as membrane structures, erected for a period of 180 days or longer. Those erected for a shorter period of time shall comply with Section 3103 and the *International Fire Code*. Membrane structures covering water storage facilities, water clarifiers, water treatment plants, sewage treatment plants, greenhouses and similar facilities not used for human occupancy are required to meet only the requirements of Sections 3102.3.1 and 3102.7. Membrane structures erected on a building, balcony, deck or other structure for any period of time shall comply with this section.

3103.1 General. The provisions of Sections 3103.1 through ~~3103.4~~3103.5 shall apply to structures erected for a period of less than 180 days. Tents and other membrane structures erected for a period of less than 180 days shall comply with Section 3103.5 and the *International Fire Code*. Those erected for a longer period of time shall comply with applicable sections of this code.

Add new text as follows:

3103.5 Structural design. Temporary tents and membrane structures, including those erected for a period of less than 180 days, shall be designed and constructed in accordance with Chapter 16 where any of the following conditions occur:

1. The occupant load of the tent or membrane structure exceeds 300.
2. The height of the tent or membrane structure exceeds 30 feet (9144 mm).
3. The tent or membrane structure exceeds one story.
4. The floor area of the tent or membrane structure exceeds 5,000 square feet (465 m^2).

Construction documents as required by Section 1603 shall be provided for such temporary tents and membrane structures.

Reason: This proposal is submitted by Fire and Life Safety Section of the International Association of Fire Chiefs.
Temporary tents and membrane structures are now being constructed of significant size, with many containing multiple stories or floor levels. The potential collapse of these tents or membrane structures creates significant hazards to the occupants and others in the immediate vicinity.

These temporary tents and membrane structures have traditionally been regulated solely by the IFC, however, the structural requirements are found in the IBC. Structural loads such as seismic, wind and snow loads impact temporary structures just the same as they would affect permanent structures.

This proposal accomplishes the following:

1. It provides a reference to the structural requirements for temporary tents and membrane structures in the IBC.

2. It includes the requirement that certain large tents and membrane structures must meet the same structural requirements that would be required for permanent structures.

This proposal will require a review of structural design for temporary tents and membrane structures over 30 feet in height or over 5,000 square feet,

over one story,

and over an occupant load of 300.

These categories of temporary tents and membrane structures are significantly larger than the typical, routine tent and membrane structure installation. The smaller tents are intentionally not included in this proposal.

A companion code change will be submitted to the IFC during the Group B code change cycle to complement this proposal.

Cost Impact: Will increase the cost of construction
The cost of construction will increase to cover the additional structural evaluation necessary to show compliance with Chapter 16.

G 214-15

3103.5 (New), 3103.5.1 (New)

Proponent: Ali Fattah, City of San Diego Development Services Department, representing City of San Diego (afattah@sandiego.gov)

2015 International Building Code

Add new text as follows:

3103.5 Accessibility. Temporary structures shall comply with the accessibility requirements of Chapter 11.

3103.5.1 Temporary outdoor performance areas. An accessible route is required to an temporary outdoor performance area. An accessible route shall directly connect the temporary outdoor performance area to the assembly seating or standing area where a circulation path directly connects a temporary outdoor performance area to the an assembly seating or standing area.

Exception: The vertical access to the elevated temporary outdoor performance area is not required at the time of initial construction provided:

1. A ramp, lift or elevator can be installed without reconfiguration or extension of the temporary outdoor performance area or extension of the electrical system; and
2. The accessible route is not required from the assembly seating or standing area to the temporary outdoor performance area.

Reason: The proposed amendment addresses the accessibility requirements for temporary structures. Section 107.2 requires temporary uses to comply with the IBC including the accessibility requirements. The proposed addition of Section 3103.5 references Chapter 11 and makes clear that the temporary construction need only comply if involving the applicable facilities regulated by Chapter 11. For example a snow ramp and similar elevated structures that do not covey users are not considered amusement rides and therefore not regulated.

Section 3103.5.1 is added to address a practical issue during temporary performances where the show producer knows that no persons with mobility impairments require access onto a performance stage and prefer to incur the additional costs of a ramp or platform lift. The ADA requires all employers to accommodate persons with disabilities and as a result the code change is proposed with permissive language to allow for circumstances where access can be provided. By requiring an accessible route up to the temporary platform or stage the code change will make it possible to add a temporary platform lift or ramp if necessary to provide access. A temporary structure is very similar to a moved or relocated building; the IEBC does not require that moved or relocated buildings be made accessible. Additionally, the employee work area definition in the IBC is broad enough to classify the performance stage or platform as an employee work area that Section 1103.2.2 only requires compliance with the accessibility requirements in Section 1104.3 that requires an accessible route to connect the employee work area to the rest of the facility.

Cost Impact: Will not increase the cost of construction
This code change will not increase the cost of construction since the cost of installing a ramp or a lift when not needed is avoided.

G 214-15 : 3103.5 (New)-FATTAH5007

G 215-15

3104.3

Proponent: Mike Fischer, Kellen Company, representing the Plastic Glazing Coalition of the American Chemistry Council (mfischer@kellencompany.com)

2015 International Building Code

Revise as follows:

3104.3 Construction. The *pedestrian walkway* shall be of noncombustible construction.

Exceptions:

1. Combustible construction shall be permitted where connected buildings are of combustible construction.
2. *Fire-retardant-treated wood*, in accordance with Section 603.1, Item 1.3, shall be permitted for the roof construction of the *pedestrian walkway* where connected buildings are a minimum of Type I or II construction.
3. Awnings or canopies installed at a *pedestrian walkway* shall be in accordance with Section 3105.

Reason: Awnings and canopies are often used at pedestrian walkways. Section 3104.3 requires that pedestrian walkways be of non-combustible construction, but provides no guidance on canopies or awnings that may cover, or project over, the walkway. The proposal provides a reference to indicate that the provisions of 3105, which apply to awnings and canopies in other locations, also apply over pedestrian walkways.

Cost Impact: Will not increase the cost of construction
The proposal is a clarification of existing code provisions; it does not add new requirements.

G 215-15 : 3104.3-FISCHER5483

G 216-15

3104.5.2.2

Proponent: Gary Lampella, representing Oregon Building Officials Association (gary.lampella@ci.redmond.or.us)

2015 International Building Code

Revise as follows:

3104.5.2.2 Glass. The wall shall be constructed of ~~a~~ tempered, wired or laminated glass. The glass wall and doors ~~or glass~~ separating the interior of the building from the *pedestrian walkway* ~~. The glass~~ shall be protected by an *automatic sprinkler system* in accordance with Section 903.3.1.1 that, when actuated, shall completely wet the entire surface of interior sides of the wall or glass. Obstructions shall not be installed between the sprinkler heads and the wall or glass. The glass shall be in a gasketed frame and installed in such a manner that the framing system will deflect without breaking (loading) the glass before the sprinkler operates.

Reason: When this section was reformatted by G19-12 we believe the proponent inadvertently added verbiage that resulted in an unintended provision. In the first sentence after "....tempered, wired or laminated glass wall and doors or glass..." The term "or glass" was not in the 2012 edition. This leads one to believe that you could have the option of using tempered, wired or laminated glass or just plain glass. We are sure that was not the intent of the proponent of G19-12. We know of a couple of instances where diesign professionals have read this to mean they had that option.
We have also divided the first sentence into two sentences. The first sentence tells you the type of glazing to be used, and the second sentence has the protection method.

This proposal would correct any confusion as to the type of glazing required.

Cost Impact: Will not increase the cost of construction
This is just a clarification of the type of glazing that is currently required for pedestrian walkways so there should be no cost increase

G 216-15 : 3104.5.2.2-LAMPELLA4992

G 217-15

3104.9

Proponent: Ronald Geren, RLGA Technical Services, LLC, representing Self (ron@specsandcodes.com)

2015 International Building Code

CHAPTER 31 SPECIAL CONSTRUCTION
Revise as follows:

3104.9 Exit access travel. The length of *exit access* travel that occurs within a *pedestrian walkway* shall be 200 feet (60 960 mm) or less.

Exceptions:

1. *Exit access* travel distance on a *pedestrian walkway* equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1 shall be 250 feet (76 200 mm) or less.
2. *Exit access* travel distance on a *pedestrian walkway* constructed with both sides not less than 50 percent open shall be 300 feet (91 440 mm) or less.
3. *Exit access* travel distance on a *pedestrian walkway* constructed with both sides not less than 50 percent open, and equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1, shall be 400 feet (122 m) or less.

Reason: The application of travel distance in a pedestrian walkway is not clearly stated. The language proposed is similar to the travel distance requirement for atriums in Section 404.9.3.

Cost Impact: Will not increase the cost of construction
This proposal only clarifies the application of the requirement and does not add any new requirements that would add material or labor cost to a building.

G 217-15 : 3104.9-GEREN5145

G 218-15

3105.1

Proponent: Victor Cuevas, representing City of Los Angeles

2015 International Building Code

Revise as follows:

3105.1 General. *Awnings*, *canopies* and ~~*canopies*~~ trellises shall comply with the requirements of Sections 3105.2 through 3105.4 and other applicable sections of this code.

Reason: Trellises are not currently addressed by the IBC. Trellises represent no greater hazard than awnings or canopies, which are similar to trellises, except that they have a cover.

Cost Impact: Will not increase the cost of construction
Adding the term trellis to the code will not requre that construction work be made any different than the way it's currently done.

G 218-15 : 3105.1-CUEVAS4921

G 219-15

202 (New), 3105.3

Proponent: Victor Cuevas, representing City of Los Angeles

2015 International Building Code

Add new definition as follows:

SECTION 202 DEFINITIONS

TRELLIS. A permanent structure or architectural projection of rigid construction that provides shading, identity or decoration. Trellises may be constructed of lattice members so that a sphere of 10 inches minimum in diameter can pass through, or of members running in one direction only with a minimum clear spacing between the members of not less than 4 inches. A trellis is permitted to be structurally independent or supported by attachment to a building on one or more sides.

Revise as follows:

3105.3 Design and construction. *Awnings*, *canopies* and ~~*canopies*~~trellises shall be designed and constructed to withstand wind or other lateral loads and live loads as required by Chapter 16 with due allowance for shape, open construction and similar features that relieve the pressures or loads. Structural members shall be protected to prevent deterioration. *Awnings* and trellises shall have frames of noncombustible material, *fire-retardant-treated wood*, wood of Type IV size, heavy timber or 1-hour construction with combustible or noncombustible covers and shall be either fixed, retractable, folding or collapsible.

Exception: Trellises in Group R-3 occupancies shall be permitted to be constructed of any materials allowed by this code.

Reason: The proposed new definition for trellis, is similar to a canopy, except without a covering. This definition incorporates spacing requirements that have been developed and used for trellises at single family dwellings.
Section 3105.3 is being amended to include trellises, and to include a reference to heavy timber. The exception is in place to continue allowances for trellises of any material or size in one- and two-family homes.

Cost Impact: Will not increase the cost of construction
This change does not require any change in the way buildings are built. It simply establishes a criteria/threshold for when floor area needs to be accounted for, when roof projections exceed the outer walls of a building.
Adding the term trellis to the code will not requre that construction work be made any different than the way it's currently done.

G 219-15 : 3105.3-CUEVAS4922

G 220-15

3105.4

Proponent: Mike Fischer, Kellen Company, representing the Plastic Glazing Coalition of the American Chemistry Council (mfischer@kellencompany.com)

2015 International Building Code

Revise as follows:

3105.4 Awnings and canopy materials. Awnings and *canopies* shall be provided with an *approved* covering that ~~meets~~complies with one of the following:

1. The fire propagation performance criteria of Test Method 1 or Test Method 2, as appropriate, of NFPA 701 ~~or has~~,
2. Has a *flame spread index* not greater than 25 ~~when~~where tested in accordance with ASTM E 84 or UL 723, or
3. Meets all of the following criteria as tested in accordance with NFPA 286:

    3.1. During the 40 kW exposure, flames shall not spread to the ceiling.
    3.2. Flashover, as defined in NFPA 286, shall not occur.
    3.3. The flame shall not spread to the outer extremity of the sample on any wall or ceiling.
    3.4. The peak heat release rate throughout the test shall not exceed 800 kW.

Exception: The fire propagation performance and flame spread index requirements shall not apply to awnings installed on detached one- and two-family dwellings.

Reason: The proposal provides an additional compliance path for awning and canopy covers through the addition of NFPA 286 to Section 3105.4. NFPA 286 is referenced in other sections of the IBC, including Chapter 26.

Cost Impact: Will not increase the cost of construction
The proposal provides additional options and adds no mandatory requirements.

G 220-15 : 3105.4-FISCHER5502

G 221-15

3111, 3111.1, 3111.1.1, 3111.1.1.1 (New), 3111.1.1.2 (New)

Proponent: Victor Cuevas, representing City of Los Angeles

2015 International Building Code

SECTION 3111 PHOTOVOLTAIC PANELS AND MODULES

3111.1 General. Photovoltaic panels and modules shall comply with the requirements of this code and the *International Fire Code*.

3111.1.1 Rooftop-mounted photovoltaic panels and modules. Photovoltaic panels and modules installed on a roof or as an integral part of a roof assembly shall comply with the requirements of Chapter 15 and the *International Fire Code*.

Add new text as follows:

3111.1.1.1 Height and area Photovoltaic panel arrays supported by a structure shall not constitute an additional story or additional floor area provided one of the following is met:

1. The highest point of the structure/panel array shall meet the lower of the two values below:
   1.1 Ten feet above the allowable building height; or
   1.2. Ten feet above the roof of the building immediately below.

2. Either no use is located on the roof beneath the photovoltaic array or the use of the roof shall be limited to parking complying with all of the following:
   2.1. The total area within the perimeter of each photovoltaic array shall not be greater than 6,000 square feet.
   2.2. The distance between solar photovoltaic array structures shall be not less than 10 feet.
   2.3. Where a driveway aisle is located between arrays, the distance between the arrays shall be not less than 25 feet.
   2.4. No storage shall occur beneath the array, and
   2.5. The structure supporting the array shall be completely open on all sides, with no interior partitions.

3111.1.1.2 Fire-resistance Noncombustible structural members supporting photovoltaic panel arrays shall not be required to have a fire-resistance rating as follows:

1. Where no use occurs beneath the array, the array structure and supported photovoltaic panels shall have uniformly distributed and unobructed openings throughout the top of the array as approved by the code official, to allow heat and gases to escape. The code official is authorized to require signage prohibiting use of the space beneath the array; or

2. Where parking is located beneath the array, the requirement of Section 3111.1.1.1 are met.

Reason: Add regulations similar to the State of California. The area limitation of 6,000 square feet will allow the Fire Department to get around the structures when putting out a fire.

Cost Impact: Will not increase the cost of construction
The code change proposal will not increase the cost of construction.

G 221-15 : 3111.1.1.1 (New)-CUEVAS4746

G 222-15

3112 (New), 3112.1 (New), 3112.2 (New), 3112.3 (New), 3112.4 (New), 3112.5 (New), 3112.6 (New), 3112.6.1 (New)

Proponent: Vickie Lovell, InterCode Incorporated, representing National Greenhouse Manufacturers Association (vickie@intercodeinc.com)

2015 International Building Code

Add new text as follows:

SECTION3112 GREENHOUSES

3112.1 General. The provisions of this section shall apply to structures defined as greenhouses by this code that are designed and used for the cultivation, maintenance, or protection of plants.

3112.2 Accessibility. Greenhouses shall be accessible in accordance with Chapter 11.

3112.3 Structural design. Greenhouses shall comply with the structural design requirements for greenhouses in Chapter 16.

3112.4 Glass and glazing. Glass and glazing used in greenhouses shall comply with Section 2405.

3112.5 Light-transmitting plastics. Light-transmitting plastics shall be permitted in lieu of plain glass in greenhouses and shall comply with Section 2606.

3112.6 Membrane structures. Greenhouses that are considered membrane structures shall comply with Section 3102.

3112.6.1 Plastic film. Plastic films used in greenhouses shall comply with Section 3102.3.

Reason: The word "greenhouse" is used throughout the IBC and important requirements for greenhouses are scattered throughout the code. They are often formatted as exceptions in sections that are otherwise unrelated to greenhouses, and could be easily overlooked by designers and enforcers. Therefore, the purpose of this proposal is to relocate (and direct the code user to) the current and relevant code requirements for greenhouses to a new section in Chapter 31, Special Construction. The new section will consolidate all the relevant information in the code into a single location without any technical changes to current code language.
The table below shows where the current code requirements are located in the 2015 IBC. The new section 3112 has pointers to these sections.

2015 IBC Section with Greenhouse Requirements
Chapter 312 Use Group U
Table 506.5 Group U Height and Area
1103.2.4 Accessibiity Exception for Group U
Table 1604.3 Deflection Limits
1607.12.2.1 Ordinary roofs, awnings and canopies
1609.1.2 Structural design and protection of openings
2405.3 Exception 3 Screening
2606.11 Greenhouses. Light transmitting plastics
2607.4 Exception 3 Area limitation and separation
2609.4 Exception 3 Area limitations
3102.1 General. Membrane Structures
3102.3 Exception Type of Construction
3102.3.1 Exception - Membrane and interior liner material
Appendix C Group U Agricultural Buildings
Appendix D D105 Exceptions to Restrictions in Fire District
Appendix G G1001 Utility and miscellaneous Group U

There are numerous other Group U requirements that could apply to greenhouses.

This proposal, along with the other greenhouse proposals that modify the occupancies to include greenhouses, will assist the designers, other code users and code officials to more consistenlty apply the requirements for greenhouses. As greenhouse food production and scientific research becomes increasingly vital and sophisticated, a single code section on greenhouses will promote more consistent enforcement of current code text, and facilitate the introduction of new technology related to greenhouses in the future.

Cost Impact: Will not increase the cost of construction
There is no cost impact related to this proposal because this proposal only reorganizes and references existing code language into a new section.

Proponent: Edward Kulik, representing Building Code Action Committee (bcac@iccsafe.org)

2015 International Building Code

Add new definition as follows:

SECTION 202 DEFINITIONS

RELOCATABLE BUILDING. A partially or completely assembled building constructed and designed to be reused multiple times and transported to different building sites.

Add new text as follows:

107.2.7 Relocatable buildings. Construction documents for relocatable buildings shall comply with this section and Section 3112.

Revise as follows:

3101.1 Scope. The provisions of this chapter shall govern special building construction including membrane structures, temporary structures, *pedestrian walkways* and tunnels, automatic *vehicular gates*, *awnings* and *canopies*, *marquees*, signs, and towers, antennas, and ~~antennas~~relocatable buildings.

Add new text as follows:

SECTION3112 RELOCATABLE BUILDINGS

3112.1 General. The provisions of this section shall apply to relocatable buildings. Relocatable buildings manufactured after the effective date of this code shall comply with the applicable provisions of this code.

3112.1.1 Compliance. A newly constructed relocatable building shall comply with this code for new construction. An existing relocatable building that is undergoing alteration, addition, change of occupancy or relocation shall comply with Chapter 13 of the *International Existing Buildings Code.*

3112.2 Supplemental information. Supplemental information specific to a relocatable building shall be submitted to the authority having jurisdiction. It shall, as a minimum, include all of the following in addition to the information required by Section 105.

1. Manufacturer's name and address.
2. Date of manufacture.
3. Serial number of module.
4. Manufacturer's design drawings.
5. Type of construction in accordance with Section 602.
6. Design loads including: roof live load, roof snow load, floor live load, wind load and seismic site class, use group and design category.
7. Additional building planning and structural design data.
8. Site built structure or appurtenance attached to the relocatable building.

3112.3 Manufacturer's data plate. Each relocatable module shall have a data plate that is permanently attached on or adjacent to the electrical panel, and shall include the following information:

1. Occupancy group.
2. Manufacturer's name and address.
3. Date of manufacture.
4. Serial number of module.
5. Design roof live load, design floor live load, snow load, wind and seismic design.
6. Approved quality assurance agency or approved inspection agency.
7. Codes, and standards of construction.
8. Envelope thermal resistance values.
9. Electrical service size.
10. Fuel burning equipment and size.
11. Special limitations if any.

3112.4 Inspection agencies. The building official is authorized to accept reports of inspections conducted by approved inspection agencies during off-site construction of the relocatable building, and to satisfy the applicable requirements of Sections 110.3 through 110.3.10.1.

Reason: In July/2014 the ICC Board decided to sunset the activities of the Code Technology Committee (CTC). This is being accomplished by re-assigning many of the CTC Areas of Study to the applicable Code Action Committee (CAC). This proposal falls under the CTC Area of Study entitled Relocatable Modular Buildings. Information on the CTC, including: the sunset plan; meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the CTC website.
This public proposal is submitted by the ICC Building Code Action Committee (BCAC). The BCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the BCAC has held 13 open meetings and numerous workgroup calls which included members of the BCAC as well as any interested party to discuss and debate the proposed changes and the public comments. Related documentation and reports are posted on the BCAC website at: http://www.iccsafe.org/cs/BCAC/Pages/default.aspx.

Unlike site-built buildings, which are typically intended to remain on their original site for the life of the building, relocatable modular buildings are designed and intended for relocation, reuse and/or repurposing. Many states have statutes that govern the building and relocating of relocatable modular buildings. For those that do not have state mandated requirements, much confusion and inconsistency exists about the requirements for relocatable modular buildings as existing buildings.
The Modular Building Institute (MBI) (www.modular.org) estimates that there are over 600,000 code compliant relocatable buildings in use in North America today. While it is impossible to determine the exact amount owned by the public at large, MBI estimates that public school districts across North America collectively own and operate about 180,000 relocatable classrooms with the industry owning and leasing an additional 120,000. Additionally, the industry owns and leases approximately 280,000 relocatable buildings for various other business occupancies, including construction site offices and temporary sales offices.
Unique characteristics of relocatable modular buildings that are unlike site-built buildings include:
• There are sections of the IBC that are applicable equally to both site-built and relocatable modular buildings, particularly for new construction.

• There are sections of the conflicting code sections that cannot be applied to both site-built and relocatable modular buildings, specifically related to construction documents, inspection, and relocation.
The IBC does not have specific requirements on how to treat these buildings. In the absence of clear definitions and requirements that are specific to both new and existing relocatable modular buildings, many code officials attempt to apply similar, but non-related sections of the building code intended for site built buildings to the relocatable modular industry. There are unique attributes to relocatable modular buildings that warrant their own requirements in a new chapter in this code.
Two proposals have been submitted on the subject of relocatable modular buildings. One proposal for new construction (this proposal) and a second proposal to address the relocation of modular buildings (proposal to the IEBC). This proposal includes:
• The definition has been reproduced from the definition that was added to the 2015 IEBC last cycle.
• Identification and inclusion of relocatables into Special Construction, Chapter 31. This chapter applies to new relocatable buildings, and also new site built structures.
Moving this document forward through the ICC code development process will help the modular building industry comply with the intent of the code, provide a clear and consistent path for enforcement professionals, and for compliance by owners of relocatable buildings who wish to re-use or repurpose their existing buildings.

Cost Impact: Will not increase the cost of construction
This code change proposal will not increase the cost of construction due to the re-usable/relocatable nature of such buildings.

G 223-15 : 3101.1-KULIK4952

G 224-15

3112 (New), 3112.1 (New), 3112.2 (New)

Proponent: Steve Martin, Representing the Florida Division of Emergency Management (steve.martin@em.myflorida.com); Sergio Ascunce, Representing the Building Officials Association of Florida (sascunce@cohb.org)

2015 International Building Code

Add new text as follows:

SECTION3112 PUBLIC USE RESTROOM BUILDINGS IN FLOOD HAZARD AREAS

3112.1 Scope Restroom buildings intended for public use that are located in flood hazard areas shall be in accordance with this section. Public use toilet rooms, bathrooms, showers and changing rooms and spaces that are not elevated or protected in accordance with Section 1612 shall comply with Section 3112.2. Portions of buildings that include uses other than public use toilet rooms, bathrooms, showers and changing rooms and spaces shall be subject to the requirements of Section 1612.

3112.2 Flood resistance Public use restroom buildings and portions of buildings that include public use restrooms, that are located in flood hazard areas shall comply with the applicable requirements of ASCE 24 and shall:

1. Be limited to a footprint of not more than 1,500 square feet.
2. Be located, designed and constructed to resist the effects of flood hazards and flood loads to minimize flood damage from combination of wind and water loads associated with the base flood.
3. Be anchored to prevent flotation, collapse or lateral movement resulting from hydrostatic loads, including the effects of buoyancy during conditions of the design flood.
4. Be constructed of flood damage-resistant materials.
5. Have flood openings, where enclosed by walls.
6. Have mechanical and electrical systems that are located above the design flood elevation.
7. Have plumbing fixtures and plumbing connections that are located above the design flood elevation.
8. Have an emergency plan if the design specifies implementation of protection measures prior to the onset of flooding conditions.

Exceptions:

1. Minimum electric service required to address life safety and electric code requirements is permitted below the design flood elevation provided it conforms to the provisions of the electrical part of this code for wet locations.
2. Plumbing fixtures and connections are permitted below the design flood elevation provided the fixtures and connections are designed and installed to minimize or eliminate infiltration of floodwaters into the sanitary sewage system and discharges from sanitary sewage systems into floodwaters.

Reason: Thousands of communities have public open space and parks along rivers and shorelines. Many communities experience economic value from tourism and public access to areas that feature water resources. Under the current requirements of the IBC, restrooms for public use, if located in flood hazard areas, must meet the same requirements as residential and commercial buildings. In flood hazard areas other than coastal high hazard areas and Coastal A Zones (i.e., in flood zones identified on Federal Emergency Management Agency Flood Insurance Rate Maps with the letter "A"), restroom buildings may be elevated or dry floodproofed. In coastal high hazard areas (flood Zone V) and Coastal A Zones, the current requirements specify that restroom buildings must be elevated.
In Florida and other coastal states, this has resulted in building public use restrooms as high as 7 to 18 feet above grade. This poses many challenges, not the least of which is access. See Figures 1, 2, 3 and 4. While ramps can be built to meet ADA requirements, to reach some heights required in some flood hazard areas the ramps may be as long as 300 feet or the length of a football field. Such exceptionally long ramps defeat the purpose of low slope facilities when the distance of travel still renders restroom facilities inaccessible to many persons with disabilities. Although the IBC (and FEMA) permits elevators to extend below the base flood elevation, installing elevators to provide access to elevated public use restrooms is expensive and creates many maintenance issues, and a high rate of failure to function, especially in beach areas where blowing sand and wind-borne salt aerosols create corrosive conditions.

This proposal creates a new section in IBC Chapter 31, Special Construction to limit the scope to restroom buildings that include public use toilet rooms, bathrooms, showers and changing rooms and spaces. Portions of such buildings that include other uses would have to fully comply with the elevation and other flood resistant requirements of IBC Section 1612, Flood Loads, which references ASCE 24, Flood Resistant Design and Construction.

In recognition that most public use restrooms are built on public land using public funds, the proposal is to limit the exposure of public facilities in two ways: by limiting the footprint to not more than 1,500 square feet and by specifying design requirements. Enabling public use restrooms to be designed to be located below the base flood elevation and to withstand the base flood is a reasonable alternative to the extremely high cost for design, construction and maintenance of elevated structures. Although the proposed design requirements are intended to preclude significant damage during flood conditions up to and including conditions of the design flood (e.g., the base or 100-year flood), more severe floods can and do occur.

The proposal includes requirements for flood resistance similar to those found in IBC Appendix G, Section G1001 for Utility and Miscellaneous Group U and similar to the requirements of ASCE 24-14 for Flood Design Class 1 (which is essentially equivalent to Structure/Risk Category I). Those requirements effectively are the same as the NFIP requirements in 44 Code of Federal Regulations Section 60.3(a)(3)(ii), (iii), and (iv). FEMA deems the flood provisions of the I-Codes, with reference to ASCE 24, to meet or exceed the requirements of the National Flood Insurance Program (NFIP).

The intent is to allow public use restroom buildings to be at-grade, provided they meet the design requirements listed in 3112.1. The proponent acknowledges that, at present, FEMA guidance states that restroom buildings and comfort stations in coastal high hazard areas must be elevated and meet the same design and construction requirements as other buildings. This proposal is intended to meet the intent of the NFIP to minimize flood damage, while acknowledging the special needs and access appropriate for public use restrooms. The Florida Floodplain Management Association prepared a white paper on this subject: Policy and Design Options for Public Restrooms in Special Flood Hazard Areas (2014), ***www.FLfloods.org/ffmawhitepaper***

Figure 1. Florida, flood Zone V. Ramp wraps around entire building. Has composting toilets, battery and solar electric system, emergency plan requires pumping out tank and filling with clean water.

Figure 3. Florida, Gulf Coast, flood Zone V. Ramp built after original elevator determined to be unsustainable due to significant maintenance problems.

Figure 2. Coastal Mississippi, flood Zone V. This facility cost $1.1 million.

Figure 4. Southwest Florida, flood Zone V. Extensive ramp wraps around three sides.

Bibliography: Policy and Design Options for Public Restrooms in Special Flood Hazard Areas, Florida Floodplain Management Associations, 2014.
www.FLfloods.org/ffmawhitepaper

Cost Impact: Will not increase the cost of construction
The cost to build as specified to resist the effects of flood hazards and flood loads will be higher than a typical restroom building in a flood hazard area that is not designed to resist flood loads and flood damage (not currently allowed) but the cost will be less than the cost to elevate and provide extensive ramp systems (current method of compliance).

G 224-15 : 3112 (New)-MARTIN4949

G 225-15

3302.3

Proponent: Anthony Apfelbeck, City of Altamonte Springs Building/Fire Safety, representing City of Altamonte Springs (ACApfelbeck@altamonte.org)

2015 International Building Code

Revise as follows:

3302.3 Fire safety <u>and security</u> during construction. Fire safety<u> and security</u> during construction shall comply with the applicable requirements of this code and the applicable provisions of Chapter 33 of the *International Fire Code.*

Reason: One of the primary fire causes during construction activity is arson. An effective method to mitigate this cause is implimenting basic security actions. While chapter 33 of the IFC does provide a direct reference to NFPA 241 *Safeguarding Construction and Alteration Operations* and NFPA 241 does contain a number of provisions addressing on-site security including references to guard service, security fences and secuirty of entrances, the need to review the security component is not obvious to the user of the code. The current pointer in the IBC to the IFC and NFPA 241 does not leave the user with the impression that security is a core component of the the construction site safety provisions necssary to ensure fire safety and an item to be addressed under the code. By inserting "and security" into the provisions of 3302.3, the importance of the security component is reinforced with the Code Official, contractor and designer.

Cost Impact: Will not increase the cost of construction
The reference to security is already provided in NFPA 241. This poposal does not change that reference.

G 225-15 : 3302.3-APFELBECK5333

G 226-15

3302.3, 3302.3.1 (New)

Proponent: William Hall, Portland Cement Association, representing Portland Cement Association (jhall@cement.org); Jason Thompson (jthompson@ncma.org); Jonathan Humble (jhumble@steel.org)

2015 International Building Code

3302.3 Fire safety during construction. Fire safety during construction shall comply with the applicable requirements of this code and the applicable provisions of Chapter 33 of the *International Fire Code.*

Add new text as follows:

3302.3.1 Special requirements for Type V buildings with combustible framing material. Where a building using combustible framing members exceeds the allowable height or number of stories for designation NS in Tables 504.3 or 504.4, the following shall be required:

1.The fire prevention program superintendent responsibilities required in Section 3308 of the International Fire Code shall be provided by an approved agency. The *approved agency* shall meet the following requirements:

- 1.1. Shall provide all information as necessary for the *building official* to determine that the agency meets the applicable requirements.
- 1.2. Shall be objective, competent and independent from the contractor or owner responsible for the fire prevention program.
- 1.3. Shall employ experienced personnel educated in supervising and evaluating safe jobsite practices to provide services to perform a fire watch and the enforcement of the fire prevention program.

2. Qualified personnel of the approved agency shall be onsite 24 hours of each day starting the day that framing materials are delivered to the site up through completion of the building.

3. Smoking and cooking shall be prohibited.

4. Temporary heating and hot work shall be supervised by the fire prevention program superintendent or agency.

Reason: Fires during construction have been on the increase across the U.S and other countries which utilize combustible construction in multi-story buildings. The intensity of these fires put adjacent buildings, businesses and residents at risk until the project is complete, which can take up to 2 years to complete or more if the project stalls. These fires are caused by a multitude of reasons including, but not limited to, arson, smoking, cooking, heating and hot work. Fire service, even in large well equipped jurisdictions cannot effectively stop these fires and most of these incidents end in total loss of the building under construction as well as damaged or destroyed adjacent buildings. Many times adjacent buildings are at risk due to the extreme heat, flying embers and wind speeds, as seen in the recent Los Angeles fire where paper, laying on a desk in an adjacent high rise structure caught fire and 6 six floors of the high rise were on fire.
The International Fire Code requries a Fire Prevention Program Superintendent be provided on all construction sites. This proposal would require that for combustible construction which is over the base allowable height or story, the agency or superintendent be onsite 24 hours a day to mitigate potential fire and conflagration.

Bibliography: http://magazine.sfpe.org/fire-protection-design/fire-safety-buildings-under-construction

Cost Impact: Will increase the cost of construction
This proposal will increase the cost of construction for buildings of Type V which are higher or contain more stories than the base allowable. The amount would be the cost difference to provide on a 24 hour basis, rather than daily basis which is already required by the fire code.

G 226-15 : 3302.3.1 (New)-HALL4716

G 227-15

3304.1.5 (New)

Proponent: Alexandrea Shaw, Howard County Government Department of Inspections, Licenses and Permits; Plan Review Division, representing Self (aeshaw@howardcountymd.gov); George Martin (gmartin@howardcountymd.gov)

2015 International Building Code

Add new text as follows:

3304.1.5 Burial of construction debris. The burial of construction debris shall be prohibited on lots that are equal to or less than 20,000 square feet in area and contain Group R (Residential) occupancies.

The burial of inert debris that are not contaminated by hazardous substances in concentrations sufficient to cause environmental contamination shall be prohibited on lots greater than or equal to 20,000 square fee in area and contain Group R (Residential) occupancies, except where the debris is generated on-site.

Construction debris as defined in EPA 40 CFR Part 268 Subpart C, Prohibition on Land Disposal, shall not be buried.

Construction debris shall not be buried in proposed driveway or parking area locations and shall not be located less than 50 feet from existing or proposed buildings.

Existing in-ground swimming pools that are abandoned or are not in use shall not be buried on lots that are equal to or greater than 20,00 square feet in area and contain Group R (Residential) occupancies. The walls and the bottom of buried existing swimming pools shall be provided with ground water drainage holes spaced at not less than 5 feet on center. Vinyl pool liners shall not be buried. Pool coping shall be removed and buried within the pool. Pool related utilites shall ve disonnected and removed. Well drainable soils shall be used as back fill.

Add new standard(s) as follows: Add new standard to Chapter 35 as follows:

EPA U.S. Environmental Protection Agency

40 CFR Part 268, Subpart C - 2005 Prohibition on Land Disposal

Reason: The IBC does not currently address this issue. It is feasible and realistic to have an enforceable policy implemented which outlines a more cost effective solution to handling certain residential construction debris. Additionally, allowing material to be buried rather than removed prevents negative erosion and sedimentation consequences.

Bibliography: "ECFR — Code of Federal Regulations." ECFR — Code of Federal Regulations. US Government Publishing Office, n.d. Web. 09 Jan. 2015. http://www.ecfr.gov/cgi-bin/text-idx?SID=9f532bd60026d6902b386fdf9b392beb&tpl=/ecfrbrowse/Title40/40CIsubchapI.tpl

Cost Impact: Will not increase the cost of construction
The code change proposal will not increase the cost of construction. If anything, this code change proposal will serve to eliminate many costs of having to remove certain building material from the site that would not negativley impact the environment or property otherwise. Costs related to renting equipment for removal of debris and hauling, as well as dumping costs would be saved with this code change proposal.

Analysis: A review of the standard proposed for inclusion in the code, EPA 40 CFR Part 268 Subpart C, Prohibition on Land Disposal, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2015.

G 227-15 : 3304.1.5 (New)-SHAW4884

G 228-15

3304.2 (New)

Proponent: Jonathan Humble, American Iron and Steel Institute, representing American Iron and Steel Institute (jhumble@steel.org); William Hall (jhall@cement.org); Larry Williams (Williams@steelframingassociation.org); Jason Thompson, Masonry Alliance for Codes and Standards, representing Masonry Alliance for Codes and Standards (jthompson@ncma.org)

2015 International Building Code

Add new text as follows:

3304.2 Access for fire fighting A vehicle access plan for fire fighting, complying with Section 3310 of the *International Fire Code*, shall be submitted to the fire departement for review and approval prior to construction. For Type V construction with combustible building elements, four stories or more above grade plane, an approved vehicle access plan shall also demonstrate access to all sides of the building's perimeter for purposes of fire fighting.

Reason: The intent of IBC Chapter 33 (Safeguards During Construction) is to govern the provisions for safety during construction and the protection of adjacent properties. Unfortunately, the Chapter lacks requirements addressing the ability for fire fighters access to construction sites in cases of emergency. While on the surface this may be viewed as solely a fire department issue, we present a case here indicating that coordination should take place to ensure that this aspect is addressed prior to construction.
The first part of this proposal is to have the simple reference to the International Fire Code Section 3310 (Access for Fire Fighting). It is the intent to use this proposal as a reference to what will be expected during construction and/or demolition of a project in accordance with the International Fire Code.

The second part of the proposal is to add planning requirements for buildings constructed of Type V combustible framing. Recent fires have demonstrated a need to recommend an additional enhancement to the provisions of the IBC. In these cases the size and volume of the buildings in those reported fires demonstrated a need to improve fire and life safeguards during construction. The four (4) story value was determined based on two sources; one – a review of other sections within IBC and IFC Chapter 33 where a height value was referenced (Sections 3310 and 3311); and two – analyzing fires of Type V construction and finding that buildings 4 stories or greater appeared to pose the greater threat to the building project and neighboring properties. Type V combustible construction when under construction represents a large quantity of combustible framing that when exposed will contribute to the spread and intensity of a fire.

Without adequate access, fire fighters have little options in extinguishing the fire or to protect adjacent property and occupants. We are therefore proposing to add the requirement for a plan of access for fire apparatus and fire fighters in order to have the opportunity fight the fire and protect adjacent properties with greater efficiency. We further believe that this proposal will compliment the provisions of the International Fire Code Section 3310, and Appendix D.

Cost Impact: Will increase the cost of construction
Providing vehicle access to all sides of the building's perimeter is currently required under IBC Section 3302.3, which sends the user to IFC Section 3310 (Access for Fire Fighting). Therefore, for the first part of this proposal there is no cost impact. However, the second part of this proposal will add a minor increase as the plan must be further enhanced to cover vehicle access to all sides of the project. The additional vehicle access to the project by fire fighters should outweigh that additional cost to prepare an enhanced plan as a result of the benefit of the increase access by the fire fighters, thus potentially reducing the spread of fire and the amount of fire damaged area to rebuild. The additional safety measure may also contribute to reducing the cost for construction insurance.

G 228-15 : 3304.2 (New)-HUMBLE4598

G 229-15

3310.1, [F] 3311.1

Proponent: Edward Kulik, representing Building Code Action Committee (bcac@iccsafe.org)

2015 International Building Code

Revise as follows:

3310.1 Stairways required. Where~~ a~~ building ~~has been constructed to a *building height* of 50~~construction exceeds 40 feet (~~15 240 mm) or four *stories*, or where an existing building exceeding 50 feet (15 240~~12 192 mm) in ~~*building height* is altered~~height above the lowest level of fire department vehicle access, ~~no fewer than one~~a temporary ~~lighted~~or permanent*stairway* shall be provided~~ unless~~. As construction progresses, such stairway shall be extended to within one ~~or more~~floor of the ~~permanent stairways are erected as the~~highest point of construction ~~progresses~~having secured decking or flooring.

[F] 3311.1 Where required. In buildings required to have standpipes by Section 905.3.1, no fewer than one standpipe shall be provided for use during construction. Such standpipes shall be installed prior to construction exceeding 40 feet (12 192 mm) in height above the lowest level of fire department vehicle access. Such standpipes shall be provided with fire department hose connections at accessible locations adjacent to ~~usable~~ *stairways*complying with Section 3310.1. ~~Such~~As construction progresses, such standpipes shall be extended~~ as construction progresses~~ to within one floor of the highest point of construction having secured decking or flooring.

Reason: This proposal provides consistency of temporary stairway requirements with existing provisions for stair access to temporary standpipes and clarifies the timing of when access stairs shall be provided in a building under construction.
This proposal is submitted by the ICC Building Code Action Committee (BCAC). This ICC committee was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the BCAC has held 13 open meetings and numerous workgroup calls which included members of the BCAC as well as any interested party to discuss and debate the proposed changes and the public comments. Related documentation and reports are posted on the BCAC website at: http://www.iccsafe.org/cs/BCAC/Pages/default.aspx.

The ICC Fire Code Action Committee (FCAC) also supports this proposal.

Cost Impact: Will increase the cost of construction
May increase or decrease the cost of construction depending on topography of construction site.

G 229-15 : 3310.1-KULIK4629

G 230-15

Section 3312.1 (New)

Proponent: Stephen Skalko, representing Masonry Alliance for Codes and Standards (svskalko@cox.net)

2015 International Building Code

Add new text as follows:

Section 3312.1 Completion during construction. Where an *automatic sprinkler system* is required by this code in buildings four or more stories in height of Types III, IV or V construction, the portion of the building or structure that is more than 40 feet in height above fire department vehicle access shall not begin construction until the *automatic sprinkler system* is operational for all stories below and has been tested and *approved.* Such *automatic sprinkler system* shall be extended as construction progresses to within one floor of the highest point of construction having secured decking or flooring.

Reason: Automatic sprinkler protection systems continue to be depended on to permit buildings to be built to larger heights and areas as allowed in Tables 504.3, 504.4 and 506.2 of the code. With these increases there has been a notable increase in fires, especially for Group R2 Residential Occupancies constructed of combustible framing, while the building is under construction. This has resulted significant loss of property for the building under construction and nearby properties exposed to the fire in part because important fire safety features such as passive fire protection for the combustible framing is not complete and automatic sprinkler system upon which these larger and taller buildings depend have not been made operational.
Besides the damage to the building under construction and to nearby properties some of these fires have required major street closures including interstates, and tied up firefighting resources to the extent that other areas of the communities were left under-protected for extended periods. A recent example is a major fire in LosAngeles with five stories of wood framing over a twostory concrete podium on December 8, 2014 that not only resulted in millions of dollars in damage to the building under construction,but also damaged adjacent buildings. The apartment building knownas the DaVinci was a complete loss after the fire that was fueled by the five stories of wood frame construction. More than 250 firefighters were dispatched to the scene. The burning of the structure's wooden frame forced the closure of northbound Harbor(110) Freeway and affected local streets causing major traffic disruptions for commuters and to the nearby business and residences. Buildings nearby were damaged by exposure to fire from the radiant heat as well as damage inside because the fire activated sprinklers in these adjacent buildings. It has been reported that the heat also melted or damaged computers and partition cubicles in neighboring building as well. The glazing in hundreds of windows of a nearby building was also damaged.

Besides this DaVinci fire other recent large combustible framed building fires that illustrate the risk of exposed combustible framing without operational sprinkler systems include:

1. Monroe Apartments, Portland, OR August8,2013
2. Student Apartments,Kingston,Ontario, CAN December 17, 2013
3. 550 East and 500 South,Salt Lake City, UT February 9,2014
4. Commercial Building,Roxbury, MA, March 3,2014
5. Mission Bay Project, San Francisco, CA March 11, 2014
6. Axis Apartments, Houston, TX , March 25, 2014
7. Beacon Street,Boston, MA March 27,20t4
8. Gables Upper Rock, Rockville, MD April !,2014
9. SE Tech Center Drive, Vancouver, WA, June 19, 2014
10. Victoria Commons,Kitchener,Ontario, CAN, Jul y22, 2014
11. Apollo Way,Madison, WI August 8,2014

Section 3311.1 of the code requires operational standpipes be in place when portions of buildings requiring standpipes are 40 feet or more above the lowest level of fire department vehicle access. This proposal takes a similar approach to the standpipe requirement for fire safety by requiring the sprinkler systems that are necessary to build these taller and larger buildings of combustible construction be operational when the construction reaches the 40 foot height above the fire department vehicle access. Too, like the standpipe requirements, the sprinkler system must be extended as each floor is provided with decking or flooring.

Cost Impact: Will increase the cost of construction
This proposal is expected to increase the cost of construction due to the sprinkler protection system having to be completed on lower floors before construction can begin higher up in the building. This increased cost however is necessary to reduce the risk of damage to adjacent properties due to fire exposure which results in economic hardship for repairs and disruption to businesses and residences, to minimize the impact to the public from traffic disruptions due to the size of the conflagrations, and to reduce the demand for fire service response due to these larger taller combustible framed buildings while under construction.

2015 International Building Code

Add new text as follows:

SECTION 3314
SAFETY OF INSPECTION PERSONNEL

3314.1 General Inspection personnel shall be provided safe access, as approved by the inspector, to conduct inspections in accordance with Section 110.

Reason: Inspectors are frequently placed in the difficult position of feeling pressured to conduct inspection in conditions that they do not deem to be safe. Ladders, floor openings, lifts, scaffolding and other unprotected hazards maybe present and go uncorrected by a contractor since the inspector does not have authority order workplace safety corrections. However, an inspector should never feel pressured to be placed in an unsafe condition in order to complete an inspection. Just as there is an obligation to the public to provide a safe construction site, there is an obligation to ensure our staff is not placed in an inappropriate unsafe environment. This proposal would provide a code section for the inspection staff and building code official to reference when it is unsafe to conduct an inspection.

Cost Impact: Will increase the cost of construction
May increase the cost of construction in some limited circumstances where a inspection request is rejected due to an unsafe environment.

G 231-15 : 3314 (New)-APFELBECK4105

G 232-15

3314 (New), 3314.1 (New)

Proponent: Ali Fattah, City of San Diego Development Services Department, representing City of San Diego (afattah@sandiego.gov)

2015 International Building Code

Add new text as follows:

SECTION 3314 FIRE WATCH

3314.1 Fire watch. Where required by the building official or fire code official, fire watch shall be provided during non-working hours for building construction that is combustible construction exceeding 40 feet in height above the lowest adjacent grade. Qualified personnel shall be provided to serve as an on-site fire watch and shall be provided with not less than one approved means for notification of the fire department. The sole duty of personnel providing fire watch shall be to perform constant patrols and watch for the occurrence of fire.

Reason: Add Section 3314 to require fire watch for construction sites with unprotected combustible construction exceeding 40 ft in height. This code change is necessary to protect adjacent properties in the event of fire when a construction site includes no construction activity. Recent fires have demonstrated the need for early notification that can only be provided by fire watch personnel since fire alarm and detection devices are normally not installed a working during framing operations. Early notification will limit the size of the fire and it's impacts on surrounding buildings. Recent fires have demonstrated the tremendous heat release from unprotected combustible framing that impacted buildings more than 80 ft away from the construction site involved. While Section 3304 of the International Fire Code addresses precautions against fire it is mainly focused on construction activities causing a fire. The proposed code change addresses fire safety not caused by construction activities. Table 504.3 permits most Type VB construction with no sprinkler protection to be 40 ft above grade plane. Height above lowest adjacent grade has been selected to facilitate identification by inspection personnel without the need for a survey of the construction site.

Cost Impact: Will increase the cost of construction
This code change is necessary due to public safety concerns for adjoining properties.

G 232-15 : 3314 (New)-FATTAH5008

G 233-15

I103.1

Proponent: Mike Fischer, Kellen Company, representing the Plastic Glazing Coalition of the American Chemistry Council (mfischer@kellencompany.com)

2015 International Building Code

Revise as follows:

I103.1 Enclosure walls. Enclosure walls shall be permitted to be of any configuration, provided the open or glazed area of the longer wall and one additional wall is equal to at least 65 percent of the area below a minimum of 6 feet 8 inches (2032 mm) of each wall, measured from the floor. Openings shall be permitted to be enclosed with insect screening, ~~approved~~ translucent or transparent plastic ~~not more than 0.125 inch (3.2 mm) in thickness~~conforming to the provisions of Sections 2606 through 2611, glass conforming to the provisions of Chapter 24, or any combination of the foregoing.

Reason: The Patio Cover Appendix contains language dating back to the UBC, and an arbitrary thickness limitation on the plastic panels. The history of this limit is related to the use of removable panels; that restriction is no longer applicable or appropriate. Furthermore, the chapter does not provide a clear path to ensuring the requirements in Chapter 26 apply. The proposal removes the maximum thickness and adds in a pointer to the appropriate requirements in Chapter 26.

Cost Impact: Will not increase the cost of construction
The proposal allows more product options and clarifies existing requirements; it does not add in any new restrictions.

G 233-15 : I103.1-FISCHER3639

G 234-15

APPENDIX N (New)

Proponent: Barry Greive, representing Target Corporation (barry.greive@target.com)

2015 International Building Code

Add new text as follows:

APPENDIX N
GUIDELINES FOR REPLICABLE BUILDINGS

SECTION N101
ADMINISTRATION.

N101.1 **Purpose** The purpose of this appendix is to provide a format and direction regarding the implementation of a replicable building program.

N101.2 **Objectives.** Replicable building programs allow a jurisdiction to recover from a natural disaster faster and allow for consistent application of the codes for replicable building projects. Replicable building programs result in faster turnaround for the end user, and a quicker turnaround through the plan review process.

SECTION N102
DEFINITIONS

N102.1 **General.** The following words and terms shall, for the purposes of this appendix, have the meanings shown herein. Refer to Chapter 2 of this code for general defintions.

REPLICABLE BUILDINGS. New and existing structures whose construction plans have been reviewed and deemed code compliant by a designated expert and accepted by the governing authority as substantially code compliant. Plans and associated documents are reviewed by the local authority for compliance with local amendments and conditions only.

SECTION N103
ESTABISHMENT OF REPLICABLE BUILDING GUIDELINE PROGRAM

N103.1 **Referenced guidelines.** The replicable building program shall be implemented in accordance with the ICC G1.

SECTION N104
REFERENCED STANDARDS

GUIDELINES FOR REPLICABLE BUILDINGS

N104.1–ICC G1-2010 Guidelines for Replicable Buildings....103.1.

Add new standard(s) as follows: ICC G1-2010 Guidelines for Replicable Buildings

Reason: In August 2010 the International Code Council published a document titled the "IGG G1-2010 Guideline for Replicable Buildings". The intent of this guideline is to give jurisdictions a tool that they could adopt to help streamline their document review process to ensure code compliance. This code change proposal adds the "Guidelines" into an Appendix chapter so jurisdictions have an legal way of incorporating this concept into their building code adoption process. The intent is to streamline the plan review process at the local level by removing redundant reviews by allowing the plan reviewer to focus on any state and local amendments to the International Family of Codes.

Bibliography: ICC G1-2010 Guideline For Replicable Buildings, ICC, August 2010, p. 8

Cost Impact: Will not increase the cost of construction
This would be an increase in costs because the owner will need to have a third party plan review completed, but in jurisdictions that are using this concept the savings to an owner offset those expenses resulting in a savings.

Analysis: A review of the standard proposed for inclusion in the code, ICC G1-2010, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2015.

APPENDIX N(New)

Proponent: Barry Greive, Target Corporation, representing Target Corporation (barry.greive@target.com)

2015 International Building Code

Add new text as follows:

APPEENDIX N
GUIDELINES FOR REPLICABLE BUILDINGS

SECTION N101
ADMINISTRATION

N101.1 Purpose. The purpose of this appendix is to provide a format and direction regarding the implementation of a Replicable Building Program.

N101.2 Objectives. Such programs allow a jurisdiction to recover from a natural disaster faster, allow for consistent application of the codes for replicable building projects. It will result in faster turnaround for the end user, and a quicker turnaround through the plan review process.

SECTION N102
DEFINITIONS

N102.1 Definitions. The following words and terms shall, for the purposes of this appendix, have the meanings shown herein.

REPLICABLE BUILDING. A building or structure utilizing a replicable design.

REPLICABLE DESIGN. A prototypical design developed for application in multiple locations with minimal variation or modification.

SECTION N103
REPLICABLE DESIGN REQUIREMENTS

N103.1 Prototypical construction documents. A replicable design shall establish prototypical construction documents for application at multiple locations. The construction documents shall include details appropriate to each wind region, seismic design category, and climate zone for locations in which the replicable design is intended for application. Application of replicable design shall not vary with regard to the following, except for allowable variations in accordance with Section N106.

1. Use and occupancy classification.
2. Building heights and area limitations.
3. Type of construction classification.
4. Fire resistance ratings.
5. Interior finishes.
6. Fire protection system.
7. Means of egress.
8. Accessibility.
9. Structural design criteria.
10. Energy efficiency.
11. Type of mechanical and electrical systems.
12. Type of plumbing system and number of fixtures.

SECTION N104
REPLICABLE DESIGN SUBMITTAL REQUIREMENTS

N104.1 General. A summary description of the replicable design and related construction documents shall be submitted to an approved agency. Where approval is requested for elements of the replicable design not within the scope of the *International Building Code*, the construction documents shall specifically designate the codes for which review is sought. Construction documents shall be signed, sealed and dated by a registered design professional.

N104.1.1 Architectural plans and specifications. Where approval of the architectural requirements of the replicable design is sought, the submittal documents shall include architectural plans and specifications as follows:

1. Description of uses and the proposed occupancy groups for all portions of the building.
2. Proposed type of construction of the building.
3. Fully dimensioned drawings to determine building areas and height.
4. Adequate details and dimensions to evaluate means of egress, including occupant loads for each floor, exit arrangement and sizes, corridors, doors, and stairs.
5. Exit signs and means of egress lighting, including power supply.
6. Accessibility scoping provisions.
7. Description and details of proposed special occupancies such as a covered mall, high-rise, mezzanine, atrium, and public garage.
8. Adequate details to evaluate fire resistive construction requirements, including data substantiating required ratings.
9. Details for plastics, insulation and safety glazing installation.
10. Details of required fire protection systems.
11. Material specifications demonstrating fire resistance criteria.

N104.1.2 Structural plans, specifications, and engineering details. Where approval of the structural requirements of the replicable design is sought, the submittal documents shall include details for each wind region, seismic design category and climate zone for which approval is sought; and shall include the following:

1. Signed and sealed structural design calculations which support the member sizes on the drawings.
2. Design load criteria, including; frost depth, live loads; snow loads; wind loads; earthquake design date; and other special loads
3. Details of foundations and superstructure.
4. Provisions for special inspections.

N104.1.3 Energy conservation details. Where approval of the energy conservation requirements of the replicable design is sought, the submittal documents shall include details for each climate zone for which approval is sought; and shall include the following:

1. Climate zones for which approval is sought.
2. Building envelope details.
3. Building mechanical system details.
4. Details of electrical power and lighting systems.
5. Provisions for system commissioning.

SECTION N105
REVIEW AND APPROVAL OF REPLICABLE DESIGN.

N105.1 General. Proposed replicable designs shall be reviewed by an approved agency. The review shall be applicable only to the replicable design features submitted in accordance with Section N104. The review shall determine compliance with this code and additional codes specified in Section N104.1.

N105.2 Documentation. The results of the review shall be documented indicating compliance with the code requirements.

N105.3 Deficiencies. Where the review of the submitted construction documents identifies elements where the design is deficient and will not comply with the applicable code requirements, the approved agency shall notify the proponent of the replicable design, in writing, of the specific areas of non-compliance and request correction.

N105.4 Approval. Where the review of the submitted construction documents determines that the design is in compliance with the codes designated in Section N104.4, and where deficiencies identified in Section N105.3 have been corrected the approved agency shall issue a summary report of Approved Replicable Design. The summary report shall include any limitations on the approved replicable design including, but not limited to climate zones, wind regions and seismic design categories.

SECTION N106
SITE SPECIFIC APPLICATION OF APPROVED REPLICABLE DESIGN

N106.1 General. Where site specific application of a replicable design that has been approved under the provisions of Section N105 is sought, the construction documents submitted to the building official shall comply with this section.

N106.2 Submittal documents. A summary description of the replicable design and related construction document shall be submitted. Construction documents shall be signed, sealed, and dated by the registered design professional. A statement, signed sealed and dated by the registered design professional, that the replicable design submitted for local review is the same as the replicable design reviewed by the approved agency shall be submitted.

N106.2.1 Architectural plans and specifications. Architectural plans and specifications shall include the following:

1. Construction documents for variations from the replicable design.
2. Construction for portions that are not part of the replicable design.
3. Documents for local requirements as identified by the building official.
4. Construction documents detailing the foundation system.

SECTION N107
SITE SPECIFIC REVIEW AND APPROVAL OF REPLICABLE DESIGN

N107.1 General. Proposed site specific application of replicable design shall be submitted to the building official in accordance with the provisions of Chapter 1 and Appendix N.

N107.2 Site specific review and approval of replicable design. The building official shall verify that the replicable design submitted for site specific application is the same as the approved replicable design reviewed by the approved agency. In addition, the building official shall review the following for code compliance.

1. Construction documents for variations from the replicable design.
2. Construction for portions of the building that are not part of the replicable design.
3. Documents for local requirements as identified by the building official.

Reason: In August 2010 the International Code Council published a document titled the "IGG G1-2010 Guideline for Replicable Buildings". The intent of this guideline is to give jurisdictions a tool that they could adopt to help streamline their document review process to ensure code compliance. This code change proposal adds the "Guidelines" into an Appendix chapter so jurisdictions have an legal way of incorporating this concept into their building code adoption process. The intent is to streamline the plan review process at the local level by removing redundant reviews by allowing the plan reviewer to focus on any state and local amendments to the International Family of Codes.
There are currently many areas that have some form of expedited review process for replicable buildings. The basic approach is captured in the ICC G1-2010 Guidelines for Replicable Buildings.

Bibliography: ICC G-1-2010 Guidelines for Replicable Buildings

Cost Impact: Will not increase the cost of construction
This would be an increase in costs because the owner will need to have a third party plan review completed, but in jurisdictions that are using this concept the savings to an owner offset those expenses resulting in a savings.

2015 International Building Code

Add new text as follows:

APPENDIX N
ENHANCED BUILDING RESILIENCE

SECTION N101
GENERAL

N101.1 Purpose. The purpose of this appendix is to promote enhanced public health, safety and general welfare and to reduce public and private property losses due to hazards and natural disasters associated with fires, flooding, high winds and earthquakes.

SECTION N102
BUILDING HEIGHTS AND AREA

N102.1 General. In order to limit the impact of fires on the building the building shall comply with Sections N102.1 through N102.3 and the requirements for Chapter 5.

N102.2 Building height, number of stories and allowable area. Building height, numbers of stories and allowable area shall be determined in accordance with N102.2.1 through N102.2.4.

N102.2.1 Height in feet. The maximum height, in feet, of a building shall not exceed the limits specified in Table N102 (1). Table N102 (1) shall be used in lieu of Table 504.3.

N102.2.1.1 Towers, spires, steeples and other roof structures. Towers, spires, steeples and other roof structures shall be permitted to meet the requirements in Section 504.3, Height in feet.

N102.2.2 Number of stories. The maximum number of stories of a building shall not exceed the limits specified in Table N102 (2). Table N102 (2) shall be used in lieu of Table 504.4.

N102.2.3 Allowable area factor, A_t. The allowable area factor, A_t, to be used in determining the allowable area of a building in accordance with Section 506.2.1, 506.2.3 or 506.2.4 shall be as specified in Table N102 (3). For application of Equations 5-1, 5-2 and 5-3 , the value of NS shall be equal to the allowable area factor, At, from Table N102 (3). Table N102 (3) shall be used in lieu of Table 506.2.

R-4	UL	UL	24,000	24,000	20,500	12,000
S-1	UL	48,000	26,000	26,000	25,500	14,000
S-2[b, c]	UL	79,000	39,000	39,000	38,500	21,000
U[c]	UL	35,500	19,000	14,000	18,000	9,000

Note: UL = Unlimited
For SI: 1 square foot = 0.0929 m2
a. See Chapters 4 and 5 for specific exceptions to the allowable height in this chapter.
b. See Sections 903.2 and N106.2 for the minimum thresholds for protection by an automatic sprinkler system for specific occupancies.

N102.3 Mixed occupancy and incidental use separations. All buildings containing mixed occupancies and incidental uses shall be provided with fire rated separations in accordance with Sections N102.3.1 and N102.3.2.

N102.3.1 Mixed occupancy separations. All occupancies except incidental uses in Table N102 (5) shall be separated from each other by fire barriers in accordance with Table N102 (4). Table N102 (4) shall be used in lieu of Table 508.4.

TABLE N102 (4)
REQUIRED SEPARATION OF OCCUPANCIES (HOURS)[d]

Occupancy	**A,E**	**B**	**I**	**R[a]**	**F-2, S-2[b], U**	**F-1, S-1, M**	**H-1**	**H-2**	**H-3, H-4, H-5**
A, E,	2	2	2	2	1	2	NP	4	3
B	—	N	2	2	1	2	NP	3	2
I	—	—	2	2	2	2	NP	NP	NP
R[a]	—	—	—	2	2[c]	2	NP	NP	NP
F-2, S-2[b], U	—	—	—	—	1	2	NP	4	3
F-1, S-1, M	—	—	—	—	—	2	NP	3	2
H-1	—	—	—	—	—	—	N	NP	NP
H-2	—	—	—	—	—	—	—	N	1
H-3, H-4, H-5	—	—	—	—	—	—	—	—	1

N = No fire rated separation requirement.
NP = Not permitted.
a See Section 420.
b. The required separation from areas used only for private or pleasure vehicles shall be reduced by 1 hour but to not less than 1 hour.
c. See Section 406.3.4.
d. Except as required in Section N104.7.1, N104.7.2, N104.9.1 and N104.9.2, separation is not required between occupancies of the same classification.

N102.3.2 Separation of incidental uses. Incidental accessory occupancies shall be separated from the remainder of the building by fire barriers with a fire resistance rating in accordance with Table N102 (5). Table N102 (5) shall be used in lieu of Table 509.

TABLE N102 (5)
INCIDENTAL USES

ROOM OR AREA	**SEPARATION AND/OR PROTECTION**
Furnace room where any piece of equipment is over 400,000 Btu per hour input	1 hour
Rooms with boilers where the largest piece of equipment is over 15 psi and 10 horsepower	1 hour
Refrigerant machinery rooms	1 hour
Hydrogen cut-off rooms, not classified as Group H	1-hour in Group B, F, M, S and U occupancies. 2-hours in Group A, E, I and R occupancies.
Incinerator rooms	2 hour and provide *automatic sprinkler system*
Paint shops, not classified as Group H, located in occupancies other than Group F	2 hours and provide automatic fire-extinguishing system
In Group E occupancies, laboratories and vocational shops not classified as Group H	1 hour
In Group I-2 occupancies, laboratories not classified as Group H	1 hour and provide *automatic sprinkler system*

In ambulatory care facilities, laboratories not classified as Group H	1 hour or provide *automatic sprinkler system*
In Group I-2 laundry rooms over 100 square feet	1 hour
Group I-3 cells and Group I-2 patient rooms equipped with padded surfaces	1 hour
In Group I-2, physical plant maintenance shops	1 hour
In ambulatory care facilities or Group I-2 occupancies waste and linen collection rooms with containers that have an aggregate volume of 10 cubic feet or greater	1 hour
In other than ambulatory care facilities and Group I- 2 occupancies, waste and linen collection rooms over 100 square feet	1 hour
In ambulatory care facilities or Group I-2 occupancies, storage rooms greater than 100 square feet	1 hour
Stationary storage battery systems having a liquid electrolyte capacity of more than 50 gallons for flooded lead-acid, nickel cadmium or VRLA , or more than 1000 pounds for lithium-ion and lithium metal polymer used for facility standby power, emergency power or uninterrupted power supplies	1-hour in Group B, F, M, S and U occupancies. 2-hours in Group A, E, I and R occupancies.

SECTION N103
TYPES OF CONSTRUCTION

N103.1 General. In order to limit the impact of fires on the building the building shall comply with Section N103.2 and the requirements in Chapter 6.
N103.2 Fire-resistance rating. Building elements shall have a fire resistance rating not less than that specified in Table N103 (1) and exterior walls shall have a fire resistance rating not less than that specified in Table 602 . Table N103 (1) shall be used in lieu of Table 601.

TABLE N103 (1)
FIRE-RESISTANCE RATING REQUIREMENT FOR BUILDING ELEMENTS (HOURS)[a]

BUILDING ELEMENT	TYPE I		TYPE II		TYPE III		TYPE IV	TYPE V	
	A	B	A	B	A	B	HT	A	B
Primary Structural Frame[g,h]	3[b]	2[b]	1	NP	1	NP	HT	1	NP
Bearing Walls	-	-	-	-	-	-	-	-	-
Exterior[f,g]	3	2	1	NP	2	NP	2	1	NP
Interior	3[b]	2[b]	1	NP	1	NP	1/HT	1	NP
Tenant Separation	-								
Residential spaces	See Section N104.7.1 and N104.9.1								
Non-residential spaces	See Section N104.7.2 and N104.9.2								
Mall tenant spaces	See Section 402.4.2.1								
Non-bearing Walls and Partitions	-	-	-	-	-	-		-	-
Interior[e]	0	0	0	NP	0	NP	See Section 602.4.6	0	NP
Floor Construction and Secondary Members[h]	2	2	1	NP	1	NP	HT	1	NP
Roof Construction and Secondary Members[h]	1½[b]	1[c,d]	1[c,d]	NP	1[c,d]	NP	HT	1[c,d]	NP

For SI: 1 foot = 304.8 mm.
NP = Not Permitted.
[a] The requirements in this table take precedence over Table 601, *Fire resistance rating for building elements*.
[b] Roof supports: Fire-resistance rating of primary structural frame and bearing walls are permitted to be reduced by 1 hour where supporting a roof only.
[c] Fire protection of structural members shall not be required, including protection of roof framing and decking where every part of the roof construction is 20 feet or more above any floor immediately below. Fire retardant wood members shall be allowed to be used for such unprotected members.
[d] In all occupancies, heavy timber shall be allowed where 1-hour or less fire-resistance rating is required.
[e] Not less than the fire-resistance rating required by other Sections.
[f] Not less than the fire-resistance rating based on fire separation distance (see Table 602).
[g] Not less than the fire-resistance rating as referenced in Section 704.10.
[h] See Section 202 , *Definitions*.

SECTION N104
FIRE PROTECTION FEATURES

N104.1 General. In order to limit the impact of fires on the building the building shall comply with Sections N104.1 through N104.12 and the requirements for Chapter 7.
N104.2 Buildings on the same lot. Exception 2 for the reduced fire resistance rated opening protective for R-2 buildings in Section 705.3, Buildings on the same lot shall not be permitted.

N104.3 Allowable area of openings. The maximum area of unprotected and protected openings permitted in an exterior wall in any story of the building shall not exceed the percentages specified in Table N104 (1). Table N104 (1) shall be used in lieu of Table 705.8.

N104.4 Protected openings. The exception for opening protectives in Section 705.8.2, Protected openings shall not be permitted.

N104.5 Vertical separation of openings. Exception 2 that eliminates vertical separation of openings where automatic sprinklers are present in Section 705.8.5, Vertical separation of openings shall not be permitted.

N104.6 Parapets. Exceptions 4 and 5 in Section 705.11, Parapet construction that eliminates exterior wall parapets shall not be permitted for Group R-2 occupancies.

N104.7 Fire walls. Fire walls shall meet the requirements of this section.

N104.7.1 Materials. Fire walls for all types of construction shall be of any approved noncombustible material permitted in NFPA 221.

N104.7.2 Fire-resistance rating. The fire-resistance ratings shall meet or exceed the ratings provided in Table N104 (2). Table N104 (2) shall be used in lieu of Table 706.4.

N104.7.3 Exceptions 2 and 4 in Section 706.6, Vertical continuity that allows termination of fire walls at the underside of roof sheathing or decks shall not be permitted.

N104.7.4 Exception 2 in Section 706.8, Openings that allows increased area of openings through fire walls where *automatic sprinkler systems* are present shall not be permitted.

N104.8 Fire barriers. Fire barriers shall comply with the provisions of this section.

N104.8.1 Separation of *dwelling units* and *sleeping units*. The separation between individual *dwelling units* and *sleeping units*, and between *dwelling units* and *sleeping units* and other spaces in the building shall be *fire barrier* assemblies or *horizontal assemblies* with a minimum *fire-resistance rating* of 2-hour.

N104.8.2 Separation of tenant spaces. Individual tenant spaces in a building shall be separated by *fire barrier assemblies* or *horizontal assemblies*, or both, with a minimum *fire-resistance rating* of 1-hour and the requirements of Section 508 Mixed Use and Occupancy.

N104.8.3 Exception 1 in Section 707.6, Openings that allows openings in a fire barrier to be larger than 156 square feet where *automatic sprinkler systems* are provided shall not be permitted.

N104.9 Fire partitions. Fire partitions shall comply with the provisions of this section.

N104.9.1 Fire partitions in Section 708.1 shall not be permitted for walls separating dwelling units in the same building.

N104.9.2 Fire partitions in Section 708.1 shall not be permitted for walls separating sleeping units in the same building.

N104.9.3 Fire partitions in Section 708.3, Fire-resistance rating shall not be permitted for corridor walls separating corridors from dwelling units or sleeping units in the same building.

N104.9.4 Exceptions 1 and 2 in Section 708.3, Fire-resistance rating that allows a reduction in the fire resistance rating of corridors and separations between dwelling units and sleeping units shall not be permitted.

N104.9.5 Exception 6 in Section 708.4, that allows elimination of fireblocking or draftstopping shall not be permitted.

N104.10 Horizontal assemblies. Horizontal assemblies shall comply with the requirements of this Section.

N104.10.1 Separation of *dwelling units* and *sleeping units*. The separation between individual *dwelling units* and *sleeping units*, and between *dwelling units* and *sleeping units* and other spaces in the building shall be *fire barrier* assemblies or *horizontal assemblies* with a minimum *fire-resistance rating* of 2-hour.

N104.10.2 Separation of tenant spaces. Individual tenant spaces in a building shall be separated by *fire barrier* assemblies or *horizontal assemblies*, or both, with a minimum *fire-resistance rating* of 1-hour and the requirements of Section 508, Mixed Use and Occupancy.

N104.10.3 The exception in Section 711.2.4.3 that allows a reduction of the fire-resistance rating of separations between dwelling unit and sleeping unit where *automatic sprinkler systems* are present shall not be permitted.

N104.11 Enclosed elevator lobby. Sprinkler protection or smoke partitions shall not be permitted to substitute for fire partitions in accordance with Section 708 for elevator lobby enclosures in Section 3007 Elevator lobbies where fire partitions are required.

N104.12 Opening protectives. The provisions of this section shall apply to opening protectives.

N104.12.1 The Exception in Section 716.5.5 that eliminate the maximum transmitted temperature requirements shall not be permitted.

N104.13 Concealed spaces. The provisions of this section shall apply to concealed spaces.

N104.13.1 Groups R-1, R-2, R-3 and R-4. Exceptions 1 and 2 in Section 718.3.2 that eliminate draftstopping where automatic sprinkler systems are present shall not be permitted for Groups R-1, R-2 or R-4 occupancies.

N104.13.2 Other groups. The exception in Section 718.3.3 that eliminates draftstopping where automatic sprinkler systems are present shall not be permitted.

TABLE N104 (1)

MAXIMUM AREA OF EXTERIOR WALL OPENING BASED ON FIRE SEPARATION DISTANCE AND DEGREE OF OPENING PROTECTION[a]

Fire Separation Distance (feet)	Degree of Opening Protection	Allowable Areas[b]
0 to less than 3[c,d]	Unprotected (UP)	Not Permitted
	Protected (P)	Not Permitted
	-	
3 to less than 5[e]	Unprotected (UP	Not Permitted
	Protected (P)	15%
	-	
5 to less than 10[g]	Unprotected (UP	10%
	Protected (P)	25%
	-	
10 to less than 15[f,g]	Unprotected (UP)	15%
Protected (P)	45%	
	-	
15 to less than 20[f,g]	Unprotected (UP)	25%

	Protected (P)	75%
-		
20 to less than 25[f,g]	Unprotected (UP)	45%
	Protected (P)	No Limit
-		
25 to less than 30[f,g]	Unprotected (UP)	70%
	Protected (P)	No Limit
-		
30 or greater	Unprotected (UP)	No Limit
	Protected (P)	Not Required

For SI: 1 foot = 304.8 mm
UP = Unprotected openings in buildings
P = Openings protected with an opening protective assembly in accordance with Section 705.8.2
[a] The requirements in this table take precedence over Table 705.8.
[b] Values indicated are the percentage of the area of the exterior wall per story.
[c] For the requirements for fire walls of buildings with differing heights see Section 706.6.1.
[d] For openings in a fire wall for buildings on the same lot, see Section 705.8.
[e] The maximum percentage of unprotected and protected openings shall be 25 percent for Group R-3 occupancies.
[f] The area of unprotected and protected openings shall not be limited for Group R-3 occupancies with a fire separation distance of 5 feet or greater.
[g] Includes buildings accessory to Group R-3.

TABLE N104 (2)
FIRE WALL FIRE-RESISTANCE RATINGS

GROUP	FIRE-RESISTANCE RATING (hours)
A, B, E, H-4, I, R-1, R-2, U	3
F-1, H-3[a], H-5, M, S-1	3
H-1, H-2	4[a]
F-2, S-2, R-3, R-4	2

a. For Group H-1, H-2 or H-3 buildings, also see Sections 415.4 and 415.5.

SECTION N105
INTERIOR FINISHES

N105. 1 General. In order to limit the impact of fires on the *building* the *building* shall comply with Sections N105.1 through N105.3 and the requirements for Chapter 8.
N105.2 Interior wall and ceiling finishes. Interior wall and ceiling finishes and conform to the requirements of this section.

N105.2.1 Finish by occupancy. Interior wall and ceiling finishes based on occupancy shall conform to the requirements in Table N105 (1). Table N105 (1) shall be used in lieu of Table 803.9.

TABLE N105 (1)
INTERIOR WALL AND CEILING FINISH REQUIREMENTS BY OCCUPANCY

GROUP	Interior exit stairways and ramps and exit passageways[a]	Corridors and enclosure for exit access stairways and ramps	Rooms and enclosed spaces[b]
A-1, A-2	A	A	B
A-3, A-4, A-5	A	A	C
B, E, M, R-1, R-4	A	B	C
F	B	C	C
H	A	A	B
I-1	A	B	B
R-2	B	B	C
R-3	A	C	C
S	B	B	C
U	No Restrictions		

For SI: 1 inch = 25.4 mm, 1 square inch = 0.0929m^2
[a] Class C interior finish materials shall be permitted for wainscoting or paneling of not more than 1,000 square feet of applied surface area in the grade lobby where applied directly to a noncombustible base or over furring strips applied to a noncombustible base and fire blocked as required by Section 803.11.1 .
[b] Requirements for rooms and enclosed spaces shall be based upon spaces enclosed by partitions. Where a fire-resistance rating is required for

structural elements, the enclosing partitions shall extend from the floor to the ceiling. Partitions that do not comply with this shall be considered enclosing spaces and rooms or spaces on both sides shall be considered as one. In determining the applicable requirements for rooms and enclosed spaces, the specific occupancy thereof shall be the governing factor regardless of the group classification of the building or structure.

N105.2.2 Set-out construction. Exception 1 in Section 803.11.2 shall not be permitted.

N105.3 Interior floor finishes. The Exception in Section 804.4.2 which eliminates the requirement for minimum critical radiant flux for floor finishes and floor coverings in exit enclosures, exit passageways, and corridors where *automatic sprinkler systems* are provided shall not be permitted.

SECTION N106
FIRE PROTECTION SYSTEMS

N106.1 General. In order to limit the impact of fires on the *building* the *building* shall comply with Sections N106.2 through N106.5 and the requirements for Chapter 9.

N106.2 Automatic sprinkler protection. An *approved automatic sprinkler system* shall be provided throughout all new buildings in accordance with Section 903.2 and Sections N106.2.1 through N106.2.7.

N106.2.1 Group A. An *automatic sprinkler system* shall be provided throughout buildings and portions thereof used as Group A occupancies as provided in this section.

N106.2.1.1 Group A-1. An a*utomatic sprinkler system* shall be provided for Group A-1 occupancies where one of the following conditions exists:

1. The *fire area* exceeds 6,000 square feet (557.5 m^2);
2. The *fire area* has an *occupant load* of 150 or more;
3. The *fire area* is located on a floor other than a *level of exit discharge* serving such occupancies; or
4. The *fire area* contains a multitheater complex.

N106.2.1.2 Group A-2. An *automatic sprinkler system* shall be provided for Group A-2 occupancies where one of the following conditions exists:

1. The *fire area* exceeds 2,500 square feet (232.2 m^2);
2. The *fire area* has an *occupant load* of 50 or more; or
3. The *fire area* is located on a floor other than a *level of exit discharge* serving such occupancies.

N106.2.1.3 Group A-3. An *automatic sprinkler system* shall be provided for Group A-3 occupancies where one of the following conditions exists:

1. The *fire area* exceeds 6,000 square feet (557.5 m^2);
2. The *fire area* has an *occupant load* of 150 or more; or
3. The *fire area* is located on a floor other than a *level of exit discharge* serving such occupancies.

N106.2.1.4 Group A-4. An *automatic sprinkler system* shall be provided for Group A-4 occupancies where one of the following conditions exists:

1. The *fire area* exceeds 6,000 square feet (557.5 m^2);
2. The *fire area* has an *occupant load* of 150 or more; or
3. The *fire area* is located on a floor other than a *level of exit discharge* serving such occupancies.

N106.2.2 Group E. An *automatic sprinkler system* shall be provided for Group E occupancies as provided in this section:

1. Throughout all Group E *fire areas* greater than 6,000 square feet (557.5 m^2) in area.
2. Throughout every portion of educational buildings below the lowest *level of exit discharge* serving that portion of the building.

Exception: An *automatic sprinkler system* is not required in any area below the lowest *level of exit discharge* serving that area where every classroom throughout the building has at least one exterior *exit* door at ground level.

N106.2.3 Group F-1. An *automatic sprinkler system* shall be provided throughout all buildings containing a Group F-1 occupancy where one of the following conditions exists:

1. A Group F-1 *fire area* exceeds 6,000 square feet (557.5 m^2);
2. A Group F-1 *fire area* is located more than three stories above *grade plane.*
3. The combined area of all Group F-1 *fire areas* on all floors, including any mezzanines, exceeds 12,000 square feet (1105 m^2).
4. A Group F-1 occupancy used for the manufacture of upholstered furniture or mattresses exceeds 2,500 square feet (232 m^2).

N106.2.3.1 Woodworking operations. An *automatic sprinkler system* shall be provided throughout all Group F-1 occupancy *fire areas* that contain woodworking operations in excess of 2,500 square feet (232 m^2) in area which generate finely divided combustible waste or use finely divided combustible materials.

N106.2.4 Group M. An *automatic sprinkler system* shall be provided throughout buildings containing a Group M occupancy where one of the following conditions exists:

1. A Group M *fire area* exceeds 6,000 square feet (557.5 m^2);
2. A Group M *fire area* is located more than three stories above *grade plane*.
3. The combined area of all Group M *fire areas* on all floors, including any mezzanines, exceeds 12,000 square feet (1105 m^2).
4. A Group M occupancy used for the display and sale of upholstered furniture or mattresses exceeds 2,500 square feet (232 m^2).

N106.2.5 Group S-1. An *automatic sprinkler system* shall be provided throughout all buildings containing a Group S-1 occupancy where one of the following conditions exists:

1. A Group S-1 *fire area* exceeds 6,000 square feet (557.5 m^2);
2. A Group S-1 *fire area* is located more than three stories above *grade plane.*
3. The combined area of all Group S-1 *fire areas* on all floors, including any mezzanines, exceeds 12,000 square feet (1105 m^2).
4. A Group S-1 *fire area* used for the storage of commercial trucks or buses where the *fire area* exceeds 2,500 square feet (232 m^2).

5. A Group S-1 occupancy used for the display and sale of upholstered furniture or mattresses exceeds 2,500 square feet (2326 m^2).

N106.2.5.1 Repair garages. An *automatic sprinkler system* shall be provided throughout all buildings used as repair garages in accordance with Section 406 , as shown:

1. Buildings having two or more stories above grade plane, including basements, with a *fire area* containing a repair garage exceeding 5000 square feet (464 m^2).
2. Buildings no more than one story above *grade plane*, with a *fire area* containing a repair garage exceeding 6,000 square feet (557.5 m^2).
3. Buildings with repair garages servicing vehicles parked in basements.
4. A Group S-1 fire area used for the repair of commercial trucks or buses where the *fire area* exceeds 2,500 square feet (232 m^2).

N106.2.5.2 Bulk storage of tires. Buildings and structures where the area for the storage of tires exceeds 10,000 cubic feet (283 m3) shall be equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1.

N106.2.6 Group S-2 enclosed parking garages. An *automatic sprinkler system* shall be provided throughout buildings classified as enclosed parking garages in accordance with Section 406.4 as follows:

1. Where the *fire area* of the enclosed parking garage exceeds 6,000 square feet (557.5 m^2); or
2. Where the enclosed parking garage is located beneath other groups.

Exception: Enclosed parking garages located beneath Group R-3 occupancies.

N106.2.6.1 Commercial parking garages. An *automatic sprinkler system* shall be provided throughout buildings used for storage of commercial trucks or buses where the *fire area* exceeds 2,500 square feet (232 m^2).

N106.2.7 Group B. An *automatic sprinkler system* shall be provided throughout buildings containing a Group B occupancy where one of the following conditions exists:

1. A Group B *fire area* exceeds 6,000 square feet (556 m^2).
2. A Group B *fire area* is located more than three stories above *grade plane.*
3. The combined area of all Group B *fire areas* on all floors, including any mezzanines, exceeds 12,000 square feet (1,115 m^2).

N106.3 Automatic Sprinkler Systems. Sprinkler systems shall be designed and installed in accordance with Section 903.3.1.1 NFPA 13 sprinkler systems. Sprinkler systems designed and installed in accordance with Section 903.3.1.2 NFPA 13R sprinkler systems shall not be permitted.

N106.4 Standpipes. Standpipes shall comply with the requirements of this Section.

N106.4.1 The exception to Section 905.4.1, Protection that allows elimination of the fire-resistance rated enclosure for laterals where *automatic sprinkler systems* are provided shall not be permitted.

N106.5 Fire Alarm and Detection Systems. Fire alarms and detection systems shall comply with the provisions of this Section.

N106.5.1 Manual pull station. The number of manual pull stations required in Section 907 Fire alarm and detection systems for fire alarm systems shall not be permitted to be reduced or eliminated where *automatic sprinkler systems* are provided.

SECTION N107
MEANS OF EGRESS

N107. 1 General. In order to limit the impact of fires on the *building* the *building* shall comply with Sections N107.1 through N107.7 and the requirements for Chapter 10.

N107.2. Means of egress capacity factor. The means of egress capacity factor used for calculating the egress capacity for stairways in Section 1005.3.1 shall be 0.3 inch (7.6 mm) per occupant with no reduction for automatic sprinkler protection in the building. The means of egress capacity factor used for calculating the egress capacity for other egress components in Section 1005.3.2 shall be 0.2 inch (5.1 mm) per occupant with no reduction for automatic sprinkler protection in the building.

N107.2. Accessible means of egress. Accessible means of egress shall comply with the requirements of this Section.

N107.2.1 Exception 2 of Section 1009.3, Stairways that reduces in the clear width between handrails shall not be permitted.

N107.2.2 Exception 5 of Section 1009.3, Stairways that eliminates of areas of refuge shall not be permitted.

N107.2.3 Exception 2 of Section 1009.4, Elevators that eliminates requirements for elevator access from areas of refuge or horizontal exit shall not be permitted.

N107.3 Stairways. The exception for Section 1009.7.4 Stairways that reduces in the clear width between handrails shall not be permitted.

N107.4 Exits and exit access. The exit and exit access shall comply with the requirements in Tables N107 (1) and N107 (2). Table N107 (1) shall be used in lieu of Table 1006.3.2 (1). Table N107 (2) shall be used in lieu of Table 1006.3.2 (2).

TABLE N107 (1)
STORIES WITH ONE EXIT OR ACCESS TO ONE EXIT FOR R-2 OCCUPANCIES

STORY	OCCUPANCY	MAXIMUM NUMBERS OF DWELLING UNITS	MAXIMUM EXIT ACCESS TRAVEL DISTANCE
Basement, first, or second story above grade plane	R-2[a, b]	4 dwelling units	125 feet
Third story above grade plane and higher	NP	NA	NA

For SI: 1 foot = 304.8 mm.
NP – Not Permitted
NA – Not Applicable
a. Buildings classified as Group R-2 equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1 and provided with *emergency escape* and *rescue openings* in accordance with Section 1030.
b. This table is used for R-2 occupancies consisting of *dwelling units*. For R-2 occupancies consisting of *sleeping units*, use Table N107 (2).

TABLE N107 (2)

STORIES WITH ONE EXIT OF ACCESS TO ONE EXIT FOR OTHER OCCUPANCIES

STORY	OCCUPANCY	MAXIMUM OCCUPANT LOAD PER STORY	MAXIMUM COMMON PATH OF EGRESS TRAVEL DISTANCE (feet)
First story above or below grade plane	A, B, E, F , M, U	49	75
	H-2, H-3	3	25
	H-4, H-5, I, R-1, R-2[a, b], R-4	10	75
	S[c]	29	75
Second story above grade plane	B, F, M, S[c]	29	75
Third story above grade plane and higher	NP	NA	NA

For SI: 1 foot = 304.8 mm.
NP – Not Permitted
NA – Not Applicable
a. Buildings classified as Group R-2 equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1 and provided with *emergency escape* and *rescue openings* in accordance with Section 1030.
b. This table is used for R-2 occupancies consisting of *sleeping units*. For R-2 occupancies consisting of *dwelling units*, use Table 1006.3.2(1).
c. The length of *exit access* travel distance in a Group S-2 *open parking garage* shall be not more than 100 feet.

N107.5 Exits and exit access doorways. Exits and exit access doorways shall comply with the requirements of this Section.

N107.5.1 Exception 1 in Section 1006.2.1, Egress based on occupant load and common path of egress travel, that reduces the number of means of egress shall not be permitted.

N107.5.2 Exception 2 of Section 1007.1.1, Two exits or exit access doorways, that reduces the separation distance between exit doors and between exit access doors shall not be permitted.

N107.6 Exit access travel distance. Exit access travel distance shall comply with the requirements in Table N107 (2) and this Section. Table N107 (3) shall be used in lieu of Table 1017.2.

TABLE N107 (3)
EXIT ACCESS TRAVEL DISTANCE[a]

OCCUPANCY	DISTANCE (feet)
A, E, F-1, M, R, S-1	200
I-1,I-2	200
B	200
F-2, S-2, U	300
H-1	75
H-2	100
H-3	150
H-4	175
H-5	200
I-3, I-4	150

For SI: 1 foot = 304.8 mm.
a. See the following sections for modifications to *exit access* travel distance requirements:
Section 402.8: For the distance limitation in *malls*.
Section 404.9: For the distance limitation through an *atrium space*.
Section 407.4: For the distance limitation in Group I-2.
Sections 408.6.1 and 408.8.1: For the distance limitations in Group I-3.
Section 411.4: For the distance limitation in special amusement buildings.
Section 412.7: For the distance limitation in aircraft manufacturing facilities.
Section 1006.2.2.2: For the distance limitation in refrigeration machinery rooms.
Section 1006.2.2.3: For the distance limitation in refrigerated rooms and spaces.
Section 1006.3.2: For buildings with one *exit*.
Section 1017.2.2: For increased distance limitation in Groups F-1 and S-1.
Section 1029.7: For increased limitation in assembly seating.
Section 1028.7: For increased limitation for assembly open-air seating.
Section 3103.4: For temporary structures.
Section 3104.9: For pedestrian walkways.

N107.6.1 Distance limitations through atrium spaces shall conform to Section 404.

N107.6.2 Exit access in buildings with one exit shall conform to Section 1006.3.2.

N107.7 Corridors. Corridors shall comply with the requirements of this section.

N107.7.1 The fire-resistance rating of corridor walls shall be at least 1-hour.

N107.7.2 Exception 2 in Section 1020.4, Dead ends that increases the length of dead-end corridors shall not be permitted.

SECTION N108

EXTERIOR WALLS

N108. 1 General. Exterior wall coverings shall comply with Sections N108.2 through N108.4 and the requirements for exterior walls in Chapter 14 and plastics in Chapter 26.

N108.2 Exterior wall covering limitations for reduced damage from fire. Exterior wall coverings shall comply with N108.2.1 and N108.2.2 to reduce damage from fire exposure. Exception. These criteria shall not apply where Sections 1406.2.1 through 1406.2.3 are satisfied.

N108.2.1 Vinyl siding and Exterior insulation and finish systems (EIFS). Vinyl siding and Exterior insulation and finish systems (EIFS) shall only be permitted to be installed on exterior walls of buildings with a minimum fire separation distance of 30 feet.

N108.2.2 Fire Separation 5 Feet or Less. Combustible exterior wall coverings are not permitted on exterior walls having a fire separation distance or 5 feet (1524 mm) or less.

N108.3 Exterior wall covering limitations for reduced damage from hail. Vinyl siding and Exterior insulation and finish systems (EIFS) shall comply with sections N108.3.1 and N108.3.2.

N108.3.1 Hail Exposure regions. Hail exposure regions in Figure N108 (1) shall be as follows:

1. **Moderate** – Three but less than six hail reports per 100 square miles.
2. **Severe** - Six or more hail reports per 100 square miles.

N108.3.2 Exterior wall coverings subject to hail exposure. Wall coverings used in regions where hail exposure is Moderate or Severe, as determined in accordance with Section N108.3.1 and Figure N108 (1), shall be tested, classified, and labeled in accordance with UL 2218 or FM 4473.

N108.4 Exterior wall covering limitations for reduced damage from wind. Vinyl siding and Exterior insulation and finish systems (EIFS) shall only be permitted to be installed on exterior walls of buildings located as follows:

1. Regardless of the Risk Category, in areas where V_{ult} as determined in accordance with Figure 1609A does not exceed 115 miles per hour (45 m/s) and the *building height* is less than or equal to 40 feet (12 192 mm) in Exposure C.
2. Regardless of the Risk Category, in areas where V_{ult} as determined in accordance with Figure 1609A exceeds 115 miles per hour (45 m/s) or the *building height* is equal to 40 feet (12192 mm) or greater in Exposure C, vinyl siding or EIFS shall be permitted on exterior walls when tested in accordance with ASTM D5206 or E330 using wind speed not less than the wind speed applicable for the building location determined in accordance with N110.4.
3. Regardless of the Risk Category, in areas where the wind speed is less than 250 mph (98 m/s) according to Figure 304.2(1) of ICC/NSSA 500 or the *building height* is equal to 40 feet (12192 mm) or greater in Exposure C, vinyl siding or EIFS shall be permitted on exterior walls when tested in accordance with ASTM D5206 or E330 using wind speed not less than the wind speed applicable for the building location determined in accordance with N110.4.

FIGURE N108 (1)
AVERAGE FREQUENCY OF HAIL (1-INCH OR LARGER) REPORTS PER 100 SQUARE MILES

SECTION N109
ROOF ASSEMBLIES

N109.1 General. Roof coverings shall also comply with Sections N109.2 through N109.4 and the requirements for Chapter 15.

N109.2 Non-classified roofs. Non-classified roof coverings in accordance with Section 1505.5 Non-classified roofing shall not be permitted on *buildings.*

N109.3 Roofs in Warm and Dry Climates. Roofs in climate zones 1, 2, 3, 4, 5B (dry), and 6B (dry) of the *International Energy Conservation Code* shall have a Class A roof covering or Class A roof assembly according to ASTM E108 or UL 790. For roof coverings where the profile allows a space between the roof covering and roof decking, the space at the eave ends shall be firestopped to preclude entry of flames or embers.

N109.4 Roof coverings subject to hail exposure. Roof coverings used in regions where hail exposure is Moderate or Severe, as determined in accordance with Section N109.4.1 and Figure N108 (1), shall be tested, classified, and labeled in accordance with UL 2218 or FM 4473.

N109.4.1 Hail Exposure regions in Figure N108 (1) shall be as follows:

1. **Moderate** – Three but less than six hail reports per 100 square miles.
2. **Severe** - Six or more hail reports per 100 square miles.

N109.5 Roof drain protection. All roof drains on low-slope roofs located in severe exposure areas in Figure 1904.2 shall have heating strips (heat trace) installed around them to prevent blockage of the drains by ice or ice dams.

SECTION N110
STRUCTURAL

N110.1 General. In order to limit the impact of loads from snow, ice, wind, floods and earthquakes on the *building* the *building* shall comply with Sections N110.1 through N110.9 and the requirements for Chapters 4 and 16.

N110.2 Importance factors by risk category. The minimum design loads for buildings shall be based on the Importance Factors in Table N110 (1).

TABLE N110 (1)
IMPORTANCE FACTORS BY RISK CATEGORY

Risk Category From Table 1604.5 in the IBC	Snow Importance Factor, I_s	Ice Importance Factor, I_i	Wind Importance Factor, I_w	Seismic Importance Factor, I_e	
				0.2 spectral response	
					> 0.40g
I	0.95	0.95	1.20	1.00	1.20
II	1.20	1.20	1.20	1.00	1.20

III	1.25	1.40	1.15	1.25	1.40
IV	1.30	1.40	1.15	1.50	1.65

N110.3 Snowloads. In order to limit the impact of snow on the *building* the Snow Load Importance Factor, I_S, shall be determined from Table N110 (1).

N110.4 Wind loads. In order to limit the impact of wind on the *building* the Wind Load Importance Factor, I_W, shall be determined from Table N110 (1). Component and cladding loads shall be determined for the design wind speed determined in accordance with Section 1609.1.1 Determination of wind loads and defined assuming terrain Exposure C regardless of the actual local exposure and the Wind Load Importance Factor, I_W, determined from Table N110 (1).

N110.4.1 Special wind region requirements. The following items are required in Wind Zones 3 or 4 determined in accordance with Section 1609.1.2.2;

1. Structural roof sheathing panels shall be rated for maximum deflection between supports of L/160 when subjected to a uniform live load of 100 pounds per square foot.
2. Connections and fasteners of structural roof sheathing panels shall be designed to provide panel resistance uplift with a minimum factor of safety of 2.0 based on a design wind pressure using terrain Exposure C.

N110.5 Flood loads. Buildings designed and constructed in flood hazard areas defined in Section 1612.2 Definitions shall comply with the following.

N110.5.1 Floors above base flood elevation. Floors required by ASCE 24 to be built above base flood elevations shall have the floor and their lowest horizontal supporting member not less than the higher of the following:

(a) Design flood elevation,
(b) Base flood elevation plus 3 feet, or
(c) advisory base flood elevation plus 3 feet, or
(d) 500-year flood, if known

N110.5.2 Flood protective works. Buildings designed and constructed in accordance with ASCE 24 shall not consider levees or floodwalls for providing flood protection during the design flood.

N110.5.3 Protection of mechanical, plumbing and electrical systems. Mechanical, plumbing and electrical systems, including plumbing fixtures and utility connections, shall comply with the following:

1. All components shall be elevated above the design *flood* elevation.

   Exception: Electrical systems, equipment and components, and heating, ventilating, air conditioning, and plumbing appliances, plumbing fixtures, duct systems and other service equipment shall be permitted to be located below the design flood elevation provided that all elements are designed and installed to prevent water from entering or accumulating within the components and to resist hydrostatic and hydrodynamic loads and stresses, including the effects of buoyancy. Electrical wiring systems shall be permitted to be located below the design flood elevation provided they conform to the provisions of NFPA70.

2. Where break away wall systems are required, vertical runs extending below the lowest habitable floor shall be protected by columns or other structural elements that are not part of any break away wall system and shall not be connected to any break away elements.

N110.6 Earthquake loads. In order to limit the impact of seismic events on the *building* the Seismic Load Importance Factor, Ie, shall be determined from Table N110 (1). The building shall also comply with Sections N110.6.1 and N110.6.2.

N110.6.1 Near fault sites. Buildings are not permitted on sites where the ground surface has the known potential to rupture at the structure due to ground motion. Determination shall be based on fault zones (areas subject to severe ground dislocations) that have been established and mapped.

N110.6.2 Seismic Design Categories C, D, E and F. Where the *seismic design category* is determined to be C, D, E or F in accordance with Section 1613.3.5, the building shall be designed by a *registered design professional*.

N110.7 Atmospheric ice loads. In order to limit the impact of atmospheric ice load events on the *building* the ice importance factor, I_i, shall be determined from Table N110 (1).

N110.8 Storm Shelters. *Buildings* and structures shall be provided with storm shelters in accordance with Section 423 and where required by Section N110.8.1 and N110.8.2.

N110.8.1 Other occupancies. Storm shelters shall be provided for buildings of Group A-3 (community halls, schools and libraries), B (civic administration), Group E (day care facilities, accessory to places of religious worship, and occupancies less than 50), I-1, I-2, I-3, M, and R occupants located in:

1. *Hurricane prone regions*
2. Tornado areas where the shelter design wind speed for tornadoes of Figure 304.2(1) of ICC/NSSA 500 is 250 mph or greater.

Exceptions:

1.
   1.1. *Buildings* meeting the requirements for shelter design in ICC/NSSA 500.
   1.2. Where the occupants of the proposed *building* have an *approved* storm shelters within 1/4-mile of travel distance of the proposed building available for use and the storm shelter has adequate size to accommodate the added occupant load of the proposed *building*.
   1.3. Where the code official determines the building size, location or occupant load does not warrant a shelter.

N110.8.2 Combined hurricane and tornado shelters. Where combined hurricane and tornado shelters are provided, the shelter shall comply with the more stringent requirements of ICC/NSSA-500 for both types of shelters.

N110.9 Wildland. In order to limit the impact of wildland fires on the building the building shall comply with Sections N110.9.1 through N110.9.3 N110.9.1 Wildland Fires. The provisions of the *International Wildland-Urban Interface Code* shall apply to the construction, alteration, movement, repair, maintenance and use of any building, structure or premises within the wildland interface areas in this jurisdiction.

N110.9.2 Exterior walls. Exterior wall requirements shall be based on the Fire Hazard Severity specified in Table 502.1 in the *International Wildland-Urban Interface Code.*

N110.9.3 Smoke Detection. An automatic smoke detection system in accordance with Section 907 shall be installed throughout buildings located within areas designated by the jurisdiction as being a wild land urban interface area.

Reason: This reason statement has the following four segments to explain the reasons for this change: (A) Background on these criteria with regard to the ICC code development process; (B) Substantiation for sustainability through enhanced resilience; (C) Additional life safety benefits for occupants through enhanced resilience and (D)

General background information identifying the need for enhanced property protection and functional resilience to strengthen the built environment.

(A)

Similar criteria were submitted as proposed mandatory provisions of the 2012 edition of the International Green Construction Code. Committee members identified these types of criteria as having merit but recommended that they be proposed to the International Building Code. Proposals were submitted as mandatory requirements within the body of the code and also as an optional appendix. Both approaches where disapproved for the IBC as not being minimum requirements for general construction.

It is noteworthy that state and local jurisdictions are considering criteria for enhanced resilience in their general building code, superseding the criteria of the I-Codes. For example the State of Georgia, under a U.S. Department of Housing and Urban Development grant and adopted an optional appendix to their statewide code to permit jurisdictions to adopt and enforce criteria for enhanced resiliency. Many jurisdictions like Lake County Illinois have adopted flood criteria that is more stringent the than the criteria in the I-Codes. As jurisdictions are adopting more stringent criteria for all buildings, criteria for enhanced resilience should be a prerequisite for all green or sustainable buildings to provide acceptable levels of longevity, durability, robustness, improved life safety, ease of adaptability for reuse as well as resistance to disasters. Such provisions will reduce time and resources for disaster response and recovery as well as helping to assure community continuity by better maintaining revenues and places for employment and to house employees.

The sustainability benefits of enhanced resiliency in building design and construction are not limited to the general continuity and welfare of communities but also have a significant role to minimize negative environmental impacts should disasters occur. The U.S. Army Corps of engineers reported that 44 million cubic yard of building materials and contents were disposed of in land following Hurricane Katrina. Most of the materials were not salvageable because they were contaminated. This is the equivalent of laying 21 cubic foot refrigerators end to end twice around the equator. Provisions for enhanced resiliency such as elevating habitable spaces above a specific natural flood elevation can significantly minimize the amount of materials disposed because they are damaged and contaminated. Reports after the tornado strike in Moore, Oklahoma advised that is placed on a single debris pile the pile of debris would have been more than a mile high. More resilient construction would clearly minimize the amount of damage, may not from a direct path of the funnel of an EF5 tornado, but at least for the lower perimeter wind forces and flying debris.

(B)

The following are reports of dollar loss to property from wind, cold weather and fire disasters.

- The American Society of Civil Engineers reported in *Normalized Hurricane Damage in the United States, 1900 – 2005*, National Hazard Review, ASCE 2008, that property damage from hurricanes was 81 billion dollars in 2005.
- The National Weather Service reports that U.S. property damage due to winter storms and ice exceeded 1.5 billion dollars in 2009.
- *Fire Losses in the United States During 2009* by the National Fire Protection Association, August 2010 shows that property loss due to structure fires in buildings other than one and two family dwellings was approximately 4.5 billion dollars.

Increasing the stringency of the design criteria of buildings for hazards such as wind, snow or fire results in more robust buildings. Such requirements reduce the amount of energy and resources required for repair, removal, disposal and replacement of building components and systems damaged from these disasters. A further benefit is a reduction in the amount of damaged building materials and content entering landfills.

While there has not been a proportionate increase in either frequency of events (which have remained relatively constant) construction put in place (which has maintained an upward trend of trend of 10% per decade or 40% over last four decades) or demographics (population growth even in the fastest growing regions has 10% per decade or 40% over the same time period) property losses due to natural disasters, adjusted to 2010 dollars, have increased by over a staggering 3500%, see Figure 1. Losses from fire, adjusted to 2010 dollars, have increased by 85% per fire, see Figure 2.

Figure 1: Increase in Property Losses Due to Natural Disasters, excluding Flood[1]

[1]Flood losses not collected by private insurance companies

Figure 1: Increase in Fire Losses Per Structure Fire[1]

These specific requirements help reduce commonly occurring property losses.

Building elements in need of repair due to rodent damage. Undetected damage can compromise the integrity of the building thermal envelope and moisture protection.

Further benefits are enhanced security and occupant comfort; potentially less demand on community resources required for emergency response; and allowing facilities to be more readily adapted for re-use if there is a change of occupancy in the future.

(C)

The 1987 landmark report "America Burning" (Report of the National Commission on Fire Prevention and Control) recommended the increased use of automatic sprinkler systems, and the sprinkler trade-off concept as a financial incentive to encourage the installation of sprinklers in buildings to enhance life safety to the benefit of the building occupants. Automatic fire sprinklers designed for the intended fire load that are installed correctly and maintained to operate with adequate water supply are undoubtedly have contributed significantly to reduced loss of life and reduced property damage. However, for the last two decades hundreds of sprinkler trade-offs have been incorporated into model building codes such as the International Building Code that drastically reduce built-in fire protection when sprinklers are present. The result is considerably less fire safety layers in a building and significant reliance only on the sprinkler system for occupant safety.

There is increasing concern about the reduction or complete elimination of fire rated assemblies based on reliance of automatic sprinklers. To address this concern this proposal removes many of the sprinkler trade-offs in order to encourage increase fire safety and resilience of buildings through a combination of fire resistant construction and sprinklers protection.

Too, natural disasters such earthquakes, hurricanes and floods disrupt water supplies and power to buildings adversely affecting the life safety systems such as sprinkler protection and fire alarm systems. These events also damage gas mains serving buildings resulting in gas leaks and increased fire incidents. Without the fire safety layers of sprinklers and fire alarms, the building will not be able to withstand as big of a fire and will fail sooner, putting occupants and especially firefighters at great risk. This proposal encourages enhanced resilience to these natural disasters to reduce fire safety risk to the occupants.

It has been widely accepted that when buildings are constructed with an appropriate combination of active and passive fire protection using the concept of fire safety layering, they are more resilient and better able to ensure continuity of operations, improved sustainability, increased durability, increased adaptability for reuse, increased resistance to disasters, and improved life safety for occupants and firefighters.

(D)

Minimum building requirements whether through energy codes, plumbing codes, mechanical codes, zoning codes, or basic building codes, do not encourage truly sustainable buildings. The proposal attempts to integrate the concepts of the Whole Building Design Guide (WBDG) into the International Building Code as a non-mandatory Appendix. This allows adopting jurisdictions the option of incorporating code requirements into the building code to improve the resilience of the built environment without the need to add another code to the community requirements.

The WBDG, developed in partnership between the National Institute of Building Sciences (NIBS) and the Sustainable Building Industries Council (SBIC), has as its key concepts: accessible, aesthetics, costeffective, functional/operational, historic preservation, productive, secure/safe, and sustainable.

There are numerous references about the economic, societal, and environmental benefits that result when enhanced functional resilience for resource minimization are integrated into building design and construction. Six examples demonstrating the importance and supporting the concepts are:

1. ***Natural Hazard Mitigation Saves: An Independent Study to Assess the Future Savings from Mitigation Activities -*** National Institute of Building Sciences Multi-Hazard Mitigation Council - 2005

   One of the findings in this report is "The analysis of the statistically representative sample of FEMA grants awarded during the study period indicates that a dollar spent on disaster mitigation saves society an average of $4." The programs studied often addressed issues and strategies other than enhanced disaster resistance of buildings and other structures. However, more disaster-resistant buildings enhance life safety; reduce costs and environmental impacts associated with repair, removal, disposal, and replacement; and reduce the time and resources required for community recovery.

2. ***Five Years Later – Are we better prepared? -*** Institute for Business and Home Safety - 2010

   This IBHS report states: "When Hurricane Katrina made landfall on Aug. 29, 2005, it caused an estimated $41.1 billion in insured losses across six states, and took an incalculable economic and social toll on many communities. Five years later, the recovery continues and some residents in the most severely affected states of Alabama, Louisiana and Mississippi are still struggling. There is no question that no one wants a repeat performance of this devastating event that left at least 1,300 people dead. Yet, the steps taken to improve the quality of the building stock, whether through rebuilding or new construction, call into question the commitment of some key stakeholders to ensuring that past mistakes are not repeated." This report indicates that there is a need to implement provisions to make buildings more disaster-resistant. Clearly this suggests that functional resilience should at least be integrated into the design and construction of sustainable buildings.

3. ***National Weather Service Office of Climate, Water and Weather Services -*** National Oceanic and Atmospheric Administration (NOAA) - 2010

   Data provided on the NOAA website [www.weather.gov/os/hazstats.shtml] indicates that the average annual direct property loss due to natural disasters in the United States exceeds of $35,000,000,000. This does not include indirect costs associated with loss of residences, business closures, and resources expended for emergency response and management. These direct property losses also do not reflect the direct environmental impact due to reconstruction after the disasters. Functional resilience will help alleviate the environmental impact and minimize both direct and indirect losses from natural disasters.

4. ***Global Climate Change Impacts in the United States -*** U.S. Global Change Research Program (USGCRP) - 2009

   The USGCRP includes the departments of Agriculture, Commerce, Defense, Energy, Health and Human Services, Interior, State and Transportation; National Aeronautic and Space Administration; Environmental Protection Agency, USA International Development, National Science Foundation and Smithsonian Institution

   The report identifies that: "Climate changes are underway in the United States and are projected to grow. Climate-related changes are already observed in the United States and its coastal waters. These include increases in heavy downpours, rising temperature and sea level, rapidly retreating glaciers, thawing permafrost, lengthening growing seasons, lengthening ice-free seasons in the ocean and on lakes and rivers, earlier snowmelt, and alterations in river flows. These changes are projected to grow." The report further identifies that the: "Threats to human health will increase. Health impacts of climate change are related to heat stress, waterborne diseases, poor air quality, extreme weather events, and diseases transmitted by insects and rodents. Robust public health infrastructure can reduce the potential for negative impacts." Key messages in the report on societal impacts include:

-
    - "City residents and city infrastructure have unique vulnerabilities to climate change."

- "Climate change affects communities through changes in climate-sensitive resources that occur both locally and at great distances."
- "Insurance is one of the industries particularly vulnerable to increasing extreme weather events such as severe storms, but it can also help society manage the risks."

Sustainable building design and construction cannot be about protecting the natural environment without consideration of the projected growth in severe weather. Minimum codes primarily based on past natural events are not appropriate for truly sustainable buildings. Buildings expected to have long term positive impacts on the environment must be protected from these extreme changes in the natural environment. The provisions for improved property protections are necessary to reduce the amount of energy and resources associated with repair, removal, disposal, and replacement due to routine maintenance and damage from disasters. Further such provisions reduce the time and resources required for community disaster recovery.

5. ***Sustainable Stewardship - Historic preservation plays an essential role in fighting climate change -*** Traditional Building, National Trust for Historic Preservation - 2008

   In the article Richard Moe summarizes the results of a study by the Brookings Institution which projects that by 2030 we will have demolished and replaced 82 billion square feet of our current building stock, or nearly 1/3 of our existing buildings, largely because the vast majority of them weren't designed and built to last any longer. Durability, as a component of functional resilience, can reduce these losses.

6. ***Opportunities for Integrating Disaster Mitigation and Energy Retrofit Programs -*** Senate Environment and Public Works Committee Room, Dirksen Senate Office Building, Washington, D.C. - 2010

   During this panel discussion a representative of the National Conference of State Historic Preservation Officers noted that more robust buildings erected prior to 1950 tend to be more adaptable for reuse and renovation. Prior to the mid-1950s most local jurisdictions developed their own building code requirements that uniquely addressed the community's needs, issues and concerns. Pre-1950 building codes typically resulted in more durable and robust construction that lasts longer. The total environmental impact of insulation, high efficiency equipment, components, and appliances, lowflow plumbing fixtures, and other building materials and contents are relatively insignificant when rendered irreparable or contaminated and must be disposed of in landfills after disasters. The US Army Corps of Engineers estimated that after Hurricane Katrina nearly 1.2 billion cubic feet of building materials and contents ended up in landfills. This is analogous to stacking enough refrigerators a fifth of the way to the moon or placing them end to end around the equator of the Earth twice.

Cost Impact: Will increase the cost of construction
Will increase the cost of construction.

Analysis: A review of the standards proposed for inclusion in the code, ASTM D 5206-13, FM 4473-11 and UL 2218-10, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28), will be posted on the ICC website on or before April 2, 2014. All other
standards proposed for inclusion into the code are already in Chapter 35 of the 2015 IBC.

2015 International Building Code

Revise as follows:

SECTION 202 DEFINITIONS

ATTIC The space between the ceiling ~~beams~~ framing of the top *story* and the roof rafters.

Reason: Not all ceilings have beams, but all ceilings have "framing".

Cost Impact: Will not increase the cost of construction
The code change proposal will not increase the cost of construction.

TENTATIVE ORDER OF DISCUSSION
2015 PROPOSED CHANGES TO THE INTERNATIONAL BUILDING CODE
(MEANS OF EGRESS)

The following is the tentative order in which the proposed changes to the code will be discussed at the public hearings. Proposed changes which impact the same subject have been grouped to permit consideration in consecutive changes.

Proposed change numbers that are indented are those which are being heard out of numerical order. Indentation does not necessarily indicate that one change is related to another. Proposed changes may be grouped for purposes of discussion at the hearing at the discretion of the chair. Note that some E code change proposals may not be included on this list, as they are being heard by another committee.

406.4.1, 1003.2, 1003.3.1, 1003.3.2, 1003.3.3, 1003.4, 1012.5.2, 1208.2; (IFC[BE] 1003.2, 1003.3.1, 1003.3.2, 1003.3.3, 1003.4, 1012.5.2)

Proponent: Edward Kulik, Chair, representing Building Code Action Committee (bcac@iccsafe.org)

2015 International Building Code

Revise as follows:

406.4.1 Clear height. The clear height of each floor level in vehicle and pedestrian traffic areas shall be not less than 7 feet (2134 mm). ~~Vehicle~~The parking spaces, access aisles and ~~pedestrian areas accommodating~~ vehicle route serving van-accessible parking shall comply with Section 1106.5.

1003.2 Ceiling height. The *means of egress* shall have a ceiling height of not less than 7 feet 6 inches (2286 mm) above the finished floor.

Exceptions:

1. Sloped ceilings in accordance with Section 1208.2.
2. Ceilings of *dwelling units* and *sleeping units* within residential occupancies in accordance with Section 1208.2.
3. Allowable projections in accordance with Section 1003.3.
4. *Stair* headroom in accordance with Section 1011.3.
5. Door height in accordance with Section 1010.1.1.
6. *Ramp* headroom in accordance with Section 1012.5.2.
7. The clear height of floor levels in vehicular and pedestrian traffic areas of public and private parking garages in accordance with Section 406.4.1.
8. Areas above and below *mezzanine* floors in accordance with Section 505.2.

1003.3 Protruding objects. Protruding objects on *circulation paths* shall comply with the requirements of Sections 1003.3.1 through 1003.3.4.

1003.3.1 Headroom. Protruding objects are permitted to extend below the minimum ceiling height required by Section 1003.2 where a minimum headroom of 80 inches (2032 mm) is provided over any ~~walking surface~~circulation paths, including walks, *corridors*, *aisles* and passageways. Not more than 50 percent of the ceiling area of a *means of egress* shall be reduced in height by protruding objects.

Exception: Door closers and stops shall not reduce headroom to less than 78 inches (1981 mm).

A barrier shall be provided where the vertical clearance above a circulation path is less than 80 inches (2032 mm) high above the finished floor. The leading edge of such a barrier shall be located 27 inches (686 mm) maximum above the finished floor.

1003.3.2 Post-mounted objects. A free-standing object mounted on a post or pylon shall not overhang that post or pylon more than 4 inches (102 mm) where the lowest point of the leading edge is more than 27 inches (686 mm) and less than 80 inches (2032 mm) above the ~~walking surface~~finished floor. Where a sign or other obstruction is mounted between posts or pylons and the clear distance between the posts or pylons is greater than 12 inches (305 mm), the lowest edge of such sign or obstruction shall be 27 inches (686 mm) maximum or 80 inches (2032 mm) minimum above the finished floor~~ or ground~~.

Exception: These requirements shall not apply to sloping portions of *handrails* between the top and bottom riser of *stairs* and above the *ramp* run.

1003.3.3 Horizontal projections. Objects with leading edges more than 27 inches (685 mm) and not more than 80 inches (2030 mm) above the finished floor shall not project horizontally more than 4 inches (102 mm) into the *circulation path* .

Exception:*Handrails* are permitted to protrude $4^{1}/_{2}$ inches (114 mm) from the wall or guard.

1003.4 ~~Floor~~Slip-resistant surface. ~~Walking surfaces~~ Circulation paths of the *means of egress* shall have a slip-resistant surface and be securely attached.

1012.5.2 Headroom. The minimum headroom in all parts of the *means of egress*~~ramp~~ramp shall be not less than 80 inches (2032 mm) above the finished floor of the ramp run and any intermediate landings. The minimum clearance shall be maintained for the full width of the ramp and landing.

1208.2 Minimum ceiling heights. Occupiable spaces, *habitable spaces* and *corridors* shall have a ceiling height of not less than 7 feet 6 inches (2286 mm) above the finished floor. Bathrooms, toilet rooms, kitchens, storage rooms and laundry rooms shall have a ceiling height of not less than 7 feet (2134 mm) above the finished floor.

Exceptions:

1. In one- and two-family *dwellings* , beams or girders spaced not less than 4 feet (1219 mm) on center shall be permitted to project not more than 6 inches (152 mm) below the required ceiling height.
2. If any room in a building has a sloped ceiling, the prescribed ceiling height for the room is required in one-half the area thereof. Any portion of the room measuring less than 5 feet (1524 mm) from the finished floor to the ceiling shall not be included in any computation of the minimum area thereof.
3. The height of *mezzanines* and spaces below *mezzanines* shall be in accordance with Section 505.1.
4. Corridors contained within a *dwelling unit* or *sleeping unit* in a Group R occupancy shall have a ceiling height of not less than 7 feet (2134 mm) above the finished floor.

Reason: The intent of this proposal is consistency in language and coordination with E10-12 for where headroom clearances are important/relevant and to what they are measured. This language would be consistent with Section 505.2, 1103.3 and 1106.5. The new text is coordinated with A117.1, and lets the parking lot designer know where additional headroom clearance is required.
In July/2014 the ICC Board decided to sunset the activities of the Code Technology Committee (CTC). This is being accomplished by re-assigning many of the CTC Areas of Study to the applicable Code Action Committee (CAC). This proposal falls under the CTC Area of Study entitled IBC Coordination with the New ADAAG. Information on the CTC, including: the sunset plan; meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the CTC website.

This public proposal is submitted by the ICC Building Code Action Committee (BCAC). The BCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the BCAC has held 13 open meetings and numerous workgroup calls which included members of the BCAC as well as any interested party to discuss and debate the proposed changes and the public comments. Related documentation and reports are posted on the BCAC website at: http://www.iccsafe.org/cs/BCAC/Pages/default.aspx.

Cost Impact: Will not increase the cost of construction
The proposal is a clarification and coordination of current requirements; therefore, there is no impact on the cost.

E 1-15 : 1003-KULIK3340

E 2-15

202(New), 1003.4, 1011.5.4, 1011.7.1, 1012.7.1, 1029.11.1, Chapter 35; (IFC[BE] 1003.4, 1011.5.4, 1011.7.1, 1012.7.1, 1029.11.1)

Proponent: Russell Kendzior, The National Floor Safety Institute (NFSI), representing National Floor Safety Institute (russk@nfsi.org)

2015 International Building Code

Add new definition as follows:

SECTION 202 DEFINITIONS

HIGH TRACTION. The physical property of a floor or walkway surface that is designed to mitigate slipping during normal human ambulation by providing a reasonably sufficient level of available contact friction.

Revise as follows:

1003.4 Floor surface. Walking surfaces of the *means of egress* shall have a ~~slip-resistant~~high-traction surface ~~and be~~that is securely attached. Walking surfaces that are subject to wet conditions shall have a high-traction surface that complies with ANSI/NFSI B101.1 or ANSI/NFSI B101.3.

1011.5.4.1 Nonuniform height risers. Where the bottom or top riser adjoins a sloping *public way*, walkway or driveway having an established grade and serving as a landing, the bottom or top riser is permitted to be reduced along the slope to less than 4 inches (102 mm) in height, with the variation in height of the bottom or top riser not to exceed one unit vertical in 12 units horizontal (8-percent slope) of *stair* width. The *nosings* or leading edges of treads at such nonuniform height risers shall have a distinctive marking stripe, different from any other *nosing* marking provided on the *stair flight*. The distinctive marking stripe shall be visible in descent of the *stair* and shall have a ~~slip-resistant~~high-traction surface. Marking stripes shall have a width of not less than 1 inch (25 mm) but not more than 2 inches (51 mm).

1011.7.1 Stairway walking surface. The walking surface of treads and landings of a *stairway* shall not be sloped steeper than one unit vertical in 48 units horizontal (2-percent slope) in any direction. *Stairway* treads and landings shall have a solid surface. ~~Finish floor~~Walking surfaces shall ~~be~~have a high-traction surface that is securely attached.

Exceptions:

1. Openings in *stair* walking surfaces shall be a size that does not permit the passage of $^1/_2$-inch-diameter (12.7 mm) sphere. Elongated openings shall be placed so that the long dimension is perpendicular to the direction of travel.
2. In Group F, H and S occupancies, other than areas of parking structures accessible to the public, openings in treads and landings shall not be prohibited provided a sphere with a diameter of $1^1/_8$ inches (29 mm) cannot pass through the opening.

1012.7.1 Ramp surface. The walking surface of *ramps* shall ~~be of slip-resistant materials~~have a high-traction surface that ~~are~~is securely attached.

1029.11.1 Walking surface. The surface of *aisles*, stepped *aisles* and ramped *aisles* shall ~~be of slip-resistant materials~~have a high-traction surface that ~~are~~is securely attached. The surface for stepped *aisles* shall comply with Section 1011.7.1.

Add new standard(s) as follows:

ANSI/NFSI B101.1-2005 "Test Method for Measuring Wet SCOF (static coefficient of friction) of Common Hard-Surface Floor Materials"

ANSI/NFSI B101.3-2012 "Test Method for Measuring Wet DCOF (dynamic coefficient of friction) of Common Hard-Surface Floor Materials"

Reason: Ambiguous Terminology

The term "Slip Resistant" is currently used in section 1003.4 "Floor Surface" as well as Section 1012.7.1 "Ramp surface" and applies to the list of sections named within this proposal to describe a safe walking surface however the term is not defined in the 2012 International Building Code nor is it defined by way of any nationally recognized industry consensus test standard (ie: ASTM, ANSI). Although commonly used in the past, the term Slip-Resistant is an ambiguous adjective which implies a safety benefit but is not defined by way of a measurable industry consensus test method and therefore is meaningless to those who seek to make their walkways safe (ie: property owners, architects, etc.). In short, because of the failure to properly define the term all walkways are by default perceived by property owners, architects, and end-users, etc., to be "Slip Resistant" even if they may not safe for pedestrian foot traffic.

The phrase Slip Resistant should, be omitted from all the relevant sections of the 2012 International Building Code and replaced with the term "High-Traction" which is defined by way of two nationally recognized consensus test methods/standards specifically the ANSI/NFSI B101.1-2009 "Test Method for Measuring Wet SCOF of Common Hard-Surface Floor Materials" and the ANSI/NFSI B101.3-2012 "Test Method for Measuring Wet DCOF of Common Hard-Surface Floor Materials" standards (attached). Both of these industry consensus test methods/standards speak directly to the subject of walkway safety and directly impacts the safety of all pedestrians especially those with disabilities. Therefore replacing the undefined term Slip Resistant with the well defined term High-Traction will better serve the general publics need for safe walking surfaces.

Furthermore, the term High-Traction should be added to Section 202 "Definitions" and should apply to the referenced sections included in this proposal. The definition of the term High-Traction should be listed in Section 202 and defined as it is defined in the ANSI/NFSI B101.1-2009 standard as: "The physical property of a floor or walkway surface that is designed to mitigate slipping during normal human ambulation by providing a reasonably sufficient level of available contact friction." Finally, a reference to the ANSI/NFSI B101.1-200 standard should be cited in Section 202 of the 2015 International Building Code.

Reference to ANSI A137.1

Historically the International Building Code has referenced the ANSI A137.1 "Specifications for Ceramic Tile" standard, which the most recent version cited, is that of the 2008 version. In 2012 the ANSI A137.1 standard was revised whereby they abandoned their long standing reference to the ASTM C-1028 dry SCOF test method and now reference an industry specific, wet DCOF test method, one which was created by and for the ceramic tile industry. Subsequently, the ASTM C-1028 standard was withdrawn by the ASTM and is no longer a recognized test method.

Historically the subject of how to measure a floors slip resistance has been hotly debated to which there were two camps of thought, one, which supported SCOF "drag sled" testing as described in ASTM D-2047 (polishes) and ASTM C-1028 (withdrawn) standards and the other camp, which supported a dynamic version or DCOF testing. In 2006 the ANSI B101 committee on slip, trip and fall prevention was established and has since published five slip and fall prevention standards including an SCOF (ANSI/NFSI B101.1-2009) and a DCOF (ANSI/NFSI B101.3-2012) test method, both of which are not specific to any type of flooring material or industry but rather can be used on any type of hard surface walkway both in the laboratory (manufacturing) as well as in-situ.

NFSI vs. TCNA

The NFSI is a 501(c)-3 non-for-profit organization and is an ANSI Standard Developing Organization (SDO) which in 2006 established the ANSI B101 committee on "slip, trip and fall prevention." The NFSI's mission is "to aid in the prevention of slips, trips, and falls through education, research, and standards development." The Tile Council of North America (TCNA) which serves as the SDO of the A108 committee which authored the A137.1 standard is a for-profit industry trade association which according to their website "… was created with the sole purpose of expanding the ceramic tile market in the United States." In-short, the ANSI B101 committee author's walkway safety standards while the ANSI A108 committee authors ceramic tile manufacturing specifications.

ANSI A137.1-2012

According to Section 1.0 "Purpose" of the ANSI A137.1-2012 standard states that: "these specifications serve as a reference standard for buyers and specifiers of Standard Grade and Second Grade ceramic tile, Decorative Tile, and Specialty Tile. These specifications are also a guide to producers in maintaining quality control of the manufacture of such ceramic tile" therefore the standard is as it states "a guide to producers in maintaining quality control" of un-installed tile and does not purport to describe any safety specifically slip and fall prevention capabilities of ceramic tile.

Section 2.0 "Scope" of the ANSI A137.1-2012 further states that: "These Specifications describe the normally available sizes and shapes of ceramic tile: the physical properties of Standard Grade and Second Grade Ceramic Tile, Decorative Tile and Specialty Tile; the basis for acceptance and methods of testing prior to installation; the marking and certification of ceramic tile; and the definitions of terms employed in these specifications." The ANSI A137.1 standard only applies to un-installed ceramic tile and not installed floors. Uninstalled ceramic tile is not considered a floor until it's installed. By way of example, a wooden 2"X4" is simply that, a piece of wood measuring 2"X4" in size. Although commonly used to construct walls, a wooden 2"X4" is not a wall until it is installed as such. The same is true for uninstalled ceramic tile. It becomes a floor after its installed to which the A137.1 standard does not govern the characteristics of installed tile.

Safety managers, risk managers, property/facility managers, and all other parties whose responsibility is to insure the safety of their walkways are only concerned with installed floors and not uninstalled materials and require an in-situ test method to insure compliance. Therefore, because of the limitations of the ANSI A137.1 standard as a laboratory lab test for quality control purposes only that it should no longer be referenced within the International Building Code.

Furthermore, it is estimated that only 12.9% of all installed floorcoverings are ceramic tile and 1.1% is stone. In-fact, according to the most recent research*, more vinyl sheet & floor tile is in use (16% of the total square footage sold), than that of ceramic tile, stone and laminate flooring combined! The A137.1-2012 standard only applies to ceramic tile and is not applicable to the remaining 87% of hard surface flooring materials used by property owners.

In contrast, the scope statements of the ANSI/NFSI B101.1 and B101.3 standards provide specific test methods and defined traction ranges for both laboratory (un-installed) as well as in-situ (installed) flooring materials and applies to all types of hard surface flooring materials.

Financial Burden to Industry

Although the ANSI A137.1 standard has been cited in previous versions of the International Building Code, with the recent development of the ANSI B101 walkway safety standards which have been widely embraced by the flooring, floor care, legal and insurance industries. Given the broad use and industry acceptance of the ANSI B101 standards we are requesting that any reference to the A137.1 standard as it relates to the measurement of slip resistance be removed and replaced with references to the ANSI B101.1-2009 and ANSI B101-3-2012 standards respectively.

Since the publication of the ANSI/NFSI B101.1 standard in 2009, hundreds of flooring manufacturers products have voluntarily submitted to the NFSI for certification. A wide range of industries have adopted the ANSI/NFSI B101 standards and have come to rely upon the NFSI to perform independent slip resistance testing, all of which are done in compliance with the ANSI/NFSI B101.1 or B101.3 standards.

One example is that of the polished concrete industry who shortly after the publication of the ANSI/NFSI B101.3 standard publicly announced their support. The polished concrete industry, through its representative trade association the Concrete Polishing Association of America (CPAA) openly adopted the ANSI/NFSI B101.3 standard (see enclosed CPAA press release) to which the NFSI has been awarding certificates of compliance (NFSI Certification) to manufacturers of polished concrete systems for many years. The economic burden to the floorcovering and floor care industries to abandon the tried and true published ANSI B101 walkway safety standards would be financially burdensome.

Bibliography: 2013 "Statistical Report 13" as published in Floor Covering Weekly magazine, July 21, 2014

Cost Impact: Will not increase the cost of construction
There is no cost impact to this proposal since manufacturers of flooring materials are and have been measuring their products safety performance to the ANSI/NFSI B101.1-2005 and ANSI/NFSI B101.3-2012 standards for years.

Analysis: A review of the standard proposed for inclusion in the code, ANSI/NFSI B101.1-2009 and ANSI/NFSI B101.3-2012, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2015.

2015 International Building Code

Add new text as follows:

1003.4 Floor surface. Walking surfaces of the *means of egress* shall have a slip-resistant surface and be securely attached.

1003.4.1 **Hard Surface Flooring.** Walking surfaces of the means of egress made of ceramic tiles, porcelain tiles, terrazzo, stone or polished concrete and subject to wet conditions shall have a slip-resistant surface complying with ANSI A137.1, Section 6.2.2.1.10 substituting the type of flooring where the word "tile" is used.

Reason: Currently, Section 1003.4 requires that walking surfaces of the means of egress be "slip resistant" with no method of measurement, quantitative threshold, or general principles to help the specifier, end-user, and code official. Given the Code's lack of criteria for "slip resistant," materials are sometimes being inappropriately specified, and accidents are occurring in areas of the means of egress. This can be especially dangerous for emergency responders who are entering a building for the first time, potentially under conditions with water and limited visibility (smoke).
The purpose of this revision is to provide slip resistance criteria for hard surface flooring used in interior walking surfaces of the means of egress. Section 6.2.2.1.10 of the ANSI A137.1-2012 standard for ceramic tile sets forth a quantitative minimum threshold, means of measurement, and general principles regarding slip resistance based on the consensus of a broad range of stakeholders, including the Construction Specifications Institute (CSI), Marble Institute of America (MIA), National Association of Homebuilders (NAHB), Underwriter Laboratories (UL), National Tile Contractors Association (NTCA), Tile Council of North America, and 52 additional stakeholders on the ASC-A108 Committee (for a total of 58). In addition to ceramic and porcelain tile, this Section of ANSI A137.1 is utilized and directly referenced within specifications for other types of hard surface flooring, including terrazzo, stone, and polished concrete.

This proposal to add the above language to the building code is supported by the Tile Council of North America (TCNA), executives of the Marble Institute of America (MIA - with a board vote to take place in the first quarter of 2015), the Executive Committee of the Concrete Polishing Association of America (CPAA) and their Subcommittee on slip resistance (with a board vote to take place in the first quarter of 2015), and the President of the National Terrazzo and Mosaic Association (NTMA - with a board vote to take place in the first quarter of 2015) and many other organizations.

When references to ANSI A137.1 Section 6.2.2.1.10 were proposed in 2012, the Means of Egress Code Committee spoke favorably regarding the criteria and encouraged the proponent to resubmit the proposal in 2015 when the referenced standard was more widely available in print.

Today, copies of ANSI A137.1 are easily accessible both in print and electronically, and all provisions pertinent to ANSI A137.1 Section 6.2.2.1.10 are available for free online via www.TCNAtile.com. Furthermore, these provisions are widely understood and specified throughout the architectural community with hard surface manufacturers/suppliers/installers providing the information needed by code officials as part of standard product submittals and information.

The section proposed to be referenced reads as follows:

6.2.2.1.10 Coefficient of Friction.

The coefficient of friction (COF) measurement provided in this standard is an evaluation of a tile surface under known conditions using a standardized sensor material prepared according to a specific protocol. As such it can provide a useful comparison of tile surfaces, but it does not predict the likelihood a person will or will not slip on a tile surface.

There are many factors that affect the possibility of a slip occurring on a tile surface including by way of example, but not in limitation, the following: the material of the shoe sole and the degree of its wear; the presence and nature of surface contaminants; the speed and length of stride at the time of a slip; the physical and mental condition of the individual at the time of a slip; whether the floor is flat or inclined, and how the tile surface is used and maintained; and the COF of the tile, how the tile is structured, and how drainage takes place if liquids are involved. Because many variables affect the risk of a slip occurring, the COF shall not be the only factor in determining the appropriateness of a tile for a particular application.

Unless otherwise specified, tiles suitable for level[1] interior spaces expected to be walked upon when wet shall have a wet DCOF of 0.42 or greater when tested using SLS solution as per the procedure in section 9.6.1. However, tiles with a DCOF of 0.42 or greater are not necessarily suitable for all projects. The specifier shall determine tiles appropriate for specific project conditions, considering by way of example, but not in limitation, type of use, traffic, expected contaminants, expected maintenance, expected wear[2] , and manufacturers' guidelines and recommendations.

Some specifiers find it useful to compare dry DCOF measurements to wet DCOF measurements to assess the risk of a slip when transitioning from dry to wet conditions. If dry DCOF measurements using the BOT 3000 are desired, the testing procedure found in section 9.6.2 shall be followed. Alternatively, a dry static coefficient of friction (SCOF) measurement can be made per the ASTM C1028 test method.

When wet SCOF measurements of tiles previously tested per ASTM C1028 are desired for direct comparison to historical values, the C1028 test method shall be followed. While BOT 3000 wet SCOF measurements with a Neolite sensor and distilled water generally correlate overall with ASTM C1028 measurements, results on individual tiles may not correlate and therefore cannot be directly compared.

The presence on installed tiles of water (including standing water as can exist on floors which are not properly sloped for drainage or on exterior tiles immediately after a rain storm or on which snow is melting), oil, grease, and/or any other elements which reduce traction, creates slippery conditions where the risk of a slip cannot be completely eliminated. Tile installations with exposure to such elements require extra caution in product selection, use, and maintenance. The risk of a slip can be diminished but not eliminated in these installations by installing tiles with a structured/textured surface, mosaic tiles, or certain extruded unglazed quarry tiles. The specifier shall follow manufacturers' guidelines and recommendations for these products.

When tested using SLS solution as per the procedure in section 9.6.1, tiles with a wet DCOF of less than 0.42 (including by way of example, but not in limitation, polished tiles), shall only be installed when the surface will be kept dry when walked upon and proper safety procedures will be followed when cleaning the tiles.

1. *Tiles appropriate for ramp applications shall be chosen for the specific properties and use of the ramp and require a wet DCOF greater than 0.42 if the ramp will be used under wet conditions. Specifier shall determine tiles appropriate for specific project conditions, considering by way of example, but*

not in limitation, type of use, traffic, grade of ramp, expected contaminants, expected maintenance, expected wear, and manufacturers' guidelines and recommendations.

2. *The COF of installed tiles can change over time as a result of wear and surface contaminants. In addition to regular cleaning, deep cleaning and traction-enhancing maintenance may be needed periodically to maintain DCOF values.*

The proposed reference is in the 2012 edition of ANSI A137.1. An update to this edition will be proposed for the Group B Administrative changes. This language is not in the 2008 edition of ANSI A137.1 that is currently referenced in the code for the definition for Porcelain tile.

2015 International Building Code

Add new text as follows:

1003.4 Floor surface. Walking surfaces of the *means of egress* shall have a slip-resistant surface and be securely attached.

1003.4.1 Ceramic and Porcelain Tile. Walking surfaces of the means of egress made of ceramic tiles or porcelain tiles and subject to wet conditions shall have a slip-resistant surface complying with ANSI A137.1, Section 6.2.2.1.10.

Reason: Currently, Section 1003.4 requires that walking surfaces of the means of egress be "slip resistant" with no method of measurement, quantitative threshold, or general principles to help the specifier, end-user, and code official. Given the Code's lack of criteria for "slip resistant," materials are sometimes being inappropriately specified, and accidents are occurring in areas of the means of egress. This can be especially dangerous for emergency responders who are entering a building for the first time, potentially under conditions with water and limited visibility (smoke).
The purpose of this revision is to provide slip resistance criteria for ceramic tiles used in interior walking surfaces of the means of egress. Section 6.2.2.1.10 of the ANSI A137.1-2012 standard for ceramic tile sets forth a quantitative minimum threshold, means of measurement, and general principles regarding slip resistance based on the consensus of a broad range of stakeholders, including the Construction Specifications Institute (CSI), Marble Institute of America (MIA), National Association of Homebuilders (NAHB), Underwriter Laboratories (UL), National Tile Contractors Association (NTCA), and many more.

When this same revision was proposed in 2012, the Means of Egress Code Committee spoke favorably regarding the criteria and encouraged the proponent to resubmit the proposal in 2015 when the referenced standard was more widely available in print. Today, copies of ANSI A137.1 are easily accessible both in print and electronically, and all provisions pertinent to ANSI A137.1 Section 6.2.2.1.10 are available for free online via www.TCNAtile.com. Furthermore, these provisions are referenced in their entirety in the "TCNA Handbook for Ceramic, Glass, and Stone Tile Installation" (commonly known as the "TCA Handbook" and referenced in Section 9300 specifications), and are widely understood and specified throughout the architectural community. Additionally, manufacturers provide the information needed by code officials as part of standard product information.

The section proposed to be referenced is as follows:

6.2.2.1.10 Coefficient of Friction.

The coefficient of friction (COF) measurement provided in this standard is an evaluation of a tile surface under known conditions using a standardized sensor material prepared according to a specific protocol. As such it can provide a useful comparison of tile surfaces, but it does not predict the likelihood a person will or will not slip on a tile surface.

There are many factors that affect the possibility of a slip occurring on a tile surface including by way of example, but not in limitation, the following: the material of the shoe sole and the degree of its wear; the presence and nature of surface contaminants; the speed and length of stride at the time of a slip; the physical and mental condition of the individual at the time of a slip; whether the floor is flat or inclined, and how the tile surface is used and maintained; and the COF of the tile, how the tile is structured, and how drainage takes place if liquids are involved. Because many variables affect the risk of a slip occurring, the COF shall not be the only factor in determining the appropriateness of a tile for a particular application.

Unless otherwise specified, tiles suitable for level[1] interior spaces expected to be walked upon when wet shall have a wet DCOF of 0.42 or greater when tested using SLS solution as per the procedure in section 9.6.1. However, tiles with a DCOF of 0.42 or greater are not necessarily suitable for all projects. The specifier shall determine tiles appropriate for specific project conditions, considering by way of example, but not in limitation, type of use, traffic, expected contaminants, expected maintenance, expected wear[2] , and manufacturers' guidelines and recommendations.

Some specifiers find it useful to compare dry DCOF measurements to wet DCOF measurements to assess the risk of a slip when transitioning from dry to wet conditions. If dry DCOF measurements using the BOT 3000 are desired, the testing procedure found in section 9.6.2 shall be followed. Alternatively, a dry static coefficient of friction (SCOF) measurement can be made per the ASTM C1028 test method.

When wet SCOF measurements of tiles previously tested per ASTM C1028 are desired for direct comparison to historical values, the C1028 test method shall be followed. While BOT 3000 wet SCOF measurements with a Neolite sensor and distilled water generally correlate overall with ASTM C1028 measurements, results on individual tiles may not correlate and therefore cannot be directly compared.

The presence on installed tiles of water (including standing water as can exist on floors which are not properly sloped for drainage or on exterior tiles immediately after a rain storm or on which snow is melting), oil, grease, and/or any other elements which reduce traction, creates slippery conditions where the risk of a slip cannot be completely eliminated. Tile installations with exposure to such elements require extra caution in product selection, use, and maintenance. The risk of a slip can be diminished but not eliminated in these installations by installing tiles with a structured/textured surface, mosaic tiles, or certain extruded unglazed quarry tiles. The specifier shall follow manufacturers' guidelines and recommendations for these products.

When tested using SLS solution as per the procedure in section 9.6.1, tiles with a wet DCOF of less than 0.42 (including by way of example, but not in limitation, polished tiles), shall only be installed when the surface will be kept dry when walked upon and proper safety procedures will be followed when cleaning the tiles.

1004.1 (IFC[BE]1004.1)
Part II:
Chapter 3, 301, 301.1, 302, 302.1, 302.2 (New)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IBC-MEANS OF EGRESS COMMITTEE. PART II WILL BE HEARD BY THE IBC-GENERAL COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

Proponent: Edward Kulik, Chair, representing Building Code Action Committee (bcac@iccsafe.org)

Part I

2015 International Building Code

Revise as follows:

1004.1 Design occupant load. In determining *means of egress* requirements, the number of occupants for whom *means of egress* facilities are provided shall be determined in accordance with this section. The determination of occupant loads for the purposes of means of egress design is based on the function of the area, room or space under consideration as listed in Table 1004.1.2. The assigned function of the space establishes an occupant load factor based on typical usage.

Part II

2015 International Building Code

Revise as follows:

CHAPTER 3

~~USE AND~~ OCCUPANCY CLASSIFICATION AND USE

SECTION 301 ~~GENERAL~~SCOPE

301.1 ~~Scope.~~General The provisions of this chapter shall control the classification of all buildings and structures as to ~~use~~occupancy and use. Different classifications of occupancy and use represent varying levels of hazard and risk to building occupants.

SECTION 302 OCCUPANCY CLASSIFICATION AND USE DESIGNATION

302.1 Occupancy classification. ~~General.~~~~Structures or portions of structures shall be classified with respect to occupancy in one or more of the groups listed in this section.~~Occupancy classification is the formal designation of the primary purpose of the building, structure or portion thereof. Structures shall be classified into one or more of the occupancy groups listed in this section based on the nature of the hazards and risks to building occupants generally associated with the intended purpose of the building or structure.An area,~~A~~ room or space that is intended to be occupied at different times for different purposes shall comply with all ~~of the~~ applicable requirements ~~that are applicable to each of the purposes for which the room or space will be occupied~~associated with such potential multi-purpose. Structures~~ with~~containing multiple occupancy groups~~occupancies or uses~~ shall comply with Section 508. Where a structure is proposed for a purpose that is not specifically ~~provided for in this code~~listed in this section such structure shall be classified in the ~~group that the~~ occupancy most nearly resembles~~, according to~~based on the fire safety and relative hazard ~~involved~~.

1. Assembly (see Section 303): Groups A-1, A-2, A-3, A-4 and A-5.
2. Business (see Section 304): Group B.
3. Educational (see Section 305): Group E.
4. Factory and Industrial (see Section 306): Groups F-1 and F-2.
5. High Hazard (see Section 307): Groups H-1, H-2, H-3, H-4 and H-5.
6. Institutional (see Section 308): Groups I-1, I-2, I-3 and I-4.
7. Mercantile (see Section 309): Group M.
8. Residential (see Section 310): Groups R-1, R-2, R-3 and R-4.
9. Storage (see Section 311): Groups S-1 and S-2.
10. Utility and Miscellaneous (see Section 312): Group U.

Add new text as follows:

302.2 Use designation. Occupancy groups contain subordinate uses having similar hazards and risks to building occupants. Uses include, but are not limited to, those functional designations listed within the occupancy group descriptions in this section. Certain uses require specific limitations and controls in accordance with the provisions of Chapter 4 and elsewhere in this code.

Reason: This public proposal is submitted by the ICC Building Code Action Committee (BCAC). The BCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the BCAC has held 13 open meetings and numerous workgroup calls which included members of the BCAC as well as any interested party to discuss and debate the proposed changes and the public comments. Related documentation and reports are posted on the BCAC website at: http://www.iccsafe.org/cs/BCAC/Pages/default.aspx.
Properly classifying the purpose of a given building or structure is the very important first step in the design or analysis process. The reason for this is that the various designations account for the inherent hazards and risks typically associated with the intended purpose. Based on those hazards and risks, appropriate limitations and controls are assigned to the building or structure. The International Building Code uses several specific terms to identify the purpose of the building or structure. Those are: occupancy classification, use and function. Occupancy classification and use are often confused and function is misunderstood.

The purpose of this code change is to simply formalize these terms and explain their relationship. This will assist code practitioners in properly establishing applicable code requirements and improve uniformity and continuity in the identification of appropriate provisions. Some of the current confusion is owed to the fact that the legacy codes used these terms, however, in different ways. For instance, BOCA used "use group" as the major designation with "occupancy" being the subordinate term. On the other hand, ICBO used "occupancy/division" as the major designation with "use" as the secondary term. The IBC was created using provisions from each of the legacy codes and the terms are often seen out of technical context.

This proposal will inform users of the IBC system of building classification and assist all concerned in the proper communication of applicable code requirements.

Cost Impact:

Part I: Will not increase the cost of construction
Provisions simply provide clarification of current requirements.

Part II: Will not increase the cost of construction
Provisions simply provide clarification of current requirements.

E 6-15

1004.1.1.1, 1026.4; (IFC[BE] 1004.1.1.1, 1026.4)

Proponent: Gregory Keith, Professional heuristic Development, representing The Boeing Company (grkeith@mac.com)

2015 International Building Code

Revise as follows:

1004.1.1.1 Intervening spaces or accessory areas. Where occupants egress from one or more rooms, areas or spaces through others, the design *occupant load* shall be the combined *occupant load* of interconnected accessory or intervening spaces. Design of egress path capacity shall be based on the cumulative portion of *occupant loads* of all rooms, areas or spaces to that point along the path of egress travel. <u>The anticipated occupant load from adjacent rooms, areas or spaces shall be based on either the capacity of the means of egress components providing access to the space under consideration, or the design occupant load of the adjacent space, whichever is less.</u>

1026.4 Refuge area. The refuge area of a *horizontal exit* shall be a space occupied by the same tenant or a public area and each such refuge area shall be adequate to accommodate the original *occupant load* of the refuge area plus the *occupant load* anticipated from the adjoining compartment. The anticipated *occupant load* from the adjoining compartment shall be based on the capacity of the *horizontal exit doors* entering the refuge area<u>, or the design occupant load of the adjoining compartment, whichever is less</u>.

Reason: Cumulative occupant load provisions were clarified in the 2015 IBC. This proposal is intended to provide further clarification. Section 1004.1.1.1 states, "Design of egress path capacity shall be based on the cumulative portion of occupant loads of all rooms, areas or spaces to that point along the path of egress travel." If a room, area or space having multiple exits or exit access doorways has one exit access doorway leading through an adjoining or intervening room providing an egress path to an exit, the question arises as to what portion of the occupant load of the original space is included in the cumulative occupant load? Some may simply divide the occupant load of the space by the number of exits or exit access doorways to determine the contribution. Based on the distribution of the required capacity within the space under consideration, that may or may not be an appropriate number. This proposal clarifies that the anticipated occupant load to be included in the cumulatative occupant load calculation is based on the actual capacity of the means of egress components providing access to the intervening room, area or space. This calculation technique is currently used in Section 1026.4 to determine the size of refuge areas serving horizontal exits. It was recognized that when determining the cumulative occupant load based on the capacity of egress doors, the resultant occupant load may actually exceed the design occupant load of the adjoining space. A single egress door can serve up to 160 occupants. If the design occupant load of the adjoining space was less than 160, the cumulative occupant loads based on capacity would be overly restrictive. Therefore, a design occupant load condition has been developed and has been added to both Sections 1004.1.1.1 and 1026.4 for purposes of practicality and uniformity. This method is an objective and consistent way of establishing contributing occupant loads from adjacent areas. Approval of this proposal would lead to more uniform interpretations and application of this fundamental IBC means of egress provision.

Cost Impact: Will not increase the cost of construction
This proposal is intended to provide clarification of current IBC provisions.

E 6-15 : 1004.1.1.1-KEITH4375

2015 International Building Code

Revise as follows:

SECTION 1004 OCCUPANT LOAD

1004.1 Design occupant load. *No change to text.*

~~**1004.1.1**~~**1004.2** **Cumulative occupant loads.** *No change to text.*

~~**1004.1.1.1**~~**1004.2.1** **Intervening spaces or accessory areas.** *No change to text.*

~~**1004.1.1.2**~~**1004.2.2** **Adjacent levels for mezzanines.** *No change to text.*

~~**1004.1.1.3**~~**1004.2.3** **Adjacent stories.***No change to text.*

Add new text as follows:

1004.3 **Multiple Function Occupant Load.** Where functions with both gross and net, or different occupant load factors of gross or net are on the same floor they shall be included in the calculation of the design occupant load using the area of each function calculated independently.

Revise as follows:

~~**1004.6**~~**1004.4** **Multiple occupancies.** *No change to text.*

~~**1004.1.2**~~**1004.5** **Areas without fixed seating.** The number of occupants shall be computed at the rate of one occupant per unit of area as prescribed in Table ~~1004.1.2~~1004.5. For areas without *fixed seating*, the occupant load shall be not less than that number determined by dividing the floor area under consideration by the *occupant load* factor assigned to the function of the space as set forth in Table ~~1004.1.2~~1004.5. Where an intended function is not listed in Table ~~1004.1.2~~1004.5, the *building official* shall establish a function based on a listed function that most nearly resembles the intended function.

> **Exception:** Where *approved* by the *building official*, the actual number of occupants for whom each occupied space, floor or building is designed, although less than those determined by calculation, shall be permitted to be used in the determination of the design *occupant load*.

TABLE ~~1004.1.2~~1004.5
MAXIMUM FLOOR AREA ALLOWANCES PER OCCUPANT

No change to table or footnotes.

~~**1004.2**~~**1004.5.1** **Increased occupant load.** The *occupant load* permitted in any building, or portion thereof, is permitted to be increased from that number established for the occupancies in Table ~~1004.1.2~~1004.5, provided that all other requirements of the code are met based on such modified number and the *occupant load* does not exceed one occupant per 7 square feet (0.65 m^2) of occupiable floor space. Where required by the *building official*, an *approved aisle*, seating or fixed equipment diagram substantiating any increase in *occupant load* shall be submitted. Where required by the *building official*, such diagram shall be posted.

~~**1004.4**~~**1004.6** **Fixed seating.** For areas having *fixed seats* and *aisles*, the *occupant load* shall be determined by the number of *fixed seats* installed therein. The *occupant load* for areas in which *fixed seating* is not installed, such as waiting spaces, shall be determined in accordance with Section ~~1004.1.2~~1004.5 and added to the number of *fixed seats*.

The *occupant load* of *wheelchair spaces* and the associated companion seat shall be based on one occupant for each *wheelchair space* and one occupant for the associated companion seat provided in accordance with Section 1108.2.3.

For areas having *fixed seating* without dividing arms, the *occupant load* shall be not less than the number of seats based on one person for each 18 inches (457 mm) of seating length.

The *occupant load* of seating booths shall be based on one person for each 24 inches (610 mm) of booth seat length measured at the backrest of the seating booth.

~~**1004.5**~~**1004.7** **Outdoor areas.** *No change to text.*

~~**1004.3**~~**1004.8** **Posting of occupant load.** *No change to text.*

Reason: The purpose for adding Section 1004.3, Multiple function occupanc load: The current table for determining the occupant load for a space or a building uses the term function. Since many of the activities noted in the table are not occupant specific that logic appears to be correct. However, there are differing ways to determine what the occupant load is based on the measurement by net or gross area. Both terms are defined in the code, and both are exclusive of each other (they don't overlap). However, within most buildings there are more than one function and quite often more than one occupancy. The application of Table 1004.1.2 does not provide guidance as to how to determine which load factor to use.
One very common area of confusion is often found in office buildings. The table indicates that for "business areas" that 100 sf. of gross area would provide the

basis for the occupant load. Gross floor area is by definition the entire building floor. So, a 10,000 sf. floor for business would have 100 occupants. However, within a typical office there are other functions as well, such assembly. The code specifically anticipates this in Chapter 3 and notes that assembly space within an office, with an occupant load of less than 50 is allowed to be classified as a B occupancy, thus eliminating a "mixed-use" condition. Assembly occupant loads are measured either by fixed seats or by net area. That leaves the assembly function in the business occupancy with no direction as to what is intended by the code for calculation of its occupant load.

The question that is constantly raised bby code users is what number should be used and what areas are they applied to? If the 100 sf. per person anticipates all the functional activities within a business function (stairs, hallways, restrooms, etc., etc.), then does it or doesn't it include the assembly functions? If it does, then the occupant load is simple to calculate. If it doesn't, then how do you determine what area to ascribe to the assembly space? Do you then subtract that area from the business space?

Using the simplest example of a 10,000 sf. office floor, with a 600 sf. conference room with no chairs, the occupant load could either be calculated by the gross number (100) based on the simultaneous use concept. Or should the net area for the assembly function could be deleted from the gross area. Assuming tables and chairs in the conference room, the occupant load for the space for that function would be 40, and the remaining office occupant load would be 94. The occupant load for design of the means of egress from the floor would then be 144.

The reason for reorganization: The current organization for this section is random. With this reorganization of Section 1004, Section 1004.2 through 1004.4 would be how spaces worked together, and Section 1004.5 through 1004.7 would be the specifics for calculating the occupant load of each space. This will also set up this section so that where specific spaces need unique criteria (e.g. the conference room proposal also submitted for consideration) there is a logical place to locate those sections. The final section, Section 1004.8, is for when that occupant load needs to be posted.

Cost Impact: Will not increase the cost of construction
There should be little impact as this is simply clarifying how to determine the occupant load for a floor with varying functions.

E 7-15 : 1004.1.3 (New)-COLLINS4481

E 8-15

Table 1004.1.2, 1004.1.3 (New); (IFC[BE] Table 1004.1.2, 1004.1.3 (New))

Proponent: David Collins, representing The American Institute of Architects (dcollins@preview-group.com)

2015 International Building Code

Add new text as follows:

1004.1.3 Conference and meeting rooms in Group B. In Group B buildings, the occupant load factor for determining *means of egress* requirements for conference and meeting rooms with fewer than 50 occupants, shall be 100 gross square feet per person.

Revise as follows:

TABLE 1004.1.2
MAXIMUM FLOOR AREA ALLOWANCES PER OCCUPANT

FUNCTION OF SPACE	OCCUPANT LOAD FACTOR[a]
Business areas	100 gross
Conference and meeting rooms in business areas	See Section 1004.1.3

(Portions of table not shown remain unchanged.)

For SI: 1 square foot = 0.0929 m^2, 1 foot = 304.8 mm.

a. Floor area in square feet per occupant.

Reason: This change is proposed for two reasons: 1) The cumulative occupant load for meeting rooms based on 15 square feet per person can far exceed a reasonable number of actual occupants in Group B, particularly without simultaneous use of work areas and meeting areas. The change will provide a more accurate reflection of the number of occupants for means of egress requirements only. 2) In consideration of the above, this code has been troublesome for tenant improvement projects for business areas when egress requirements are significantly more stringent than shell and core projects. The underlying basis of design for egress requirements in Group B shell and core projects is 100 square feet per occupant and the inclusion of meeting room areas at 15 square feet per occupant has triggered existing stairs to be widened and elevators added to meet the means of egress requirements. This is not necessary to meet the intent of use.

Cost Impact: Will not increase the cost of construction
The impact should reduce the cost of construction. Under the current code additional elements of egress may be required that are not warranted.

E 8-15 : T1004.1.2-COLLINS4480

E 9-15

Table 1004.1.2, 1004.6 (New); (IFC[BE] Table 1004.1.2, 1004.6 (New))

Proponent: Dave Frable, representing US General Services Administration

2015 International Building Code

TABLE 1004.1.2
MAXIMUM FLOOR AREA ALLOWANCES PER OCCUPANT

FUNCTION OF SPACE	OCCUPANT LOAD FACTOR[a]
Business area Concentrated business use areas	~~100~~150 gross See Section 1004.6

(Portions of table not shown remain unchanged)

For SI: 1 square foot = 0.0929 m^2, 1 foot = 304.8 mm.

a. Floor area in square feet per occupant.

Add new text as follows:

1004.6 Concentrated business use areas The occupant load factor for concentrated business use shall be applied to telephone call centers, trading floors, electronic data processing centers and similar business use areas with a higher density of occupants than would normally be expected in a typical business occupancy environment. The occupant load for concentrated business use areas shall be the actual occupant load, where approved by the code official, but not less than one occupant per 100 square foot gross of occupiable floor space.

Reason: The intent of this code change proposal is to revise the current maximum floor area allowance per occupant in Table 1004.1.2 for business occupancies from 100 ft^2/occupant (gross) to 150 ft^2/occupant (gross) for determining the means of egress requirements in business areas and to create a new occupant load sub-category for concentrated use areas in business occupancies having a higher density of occupants than would normally be expected in a typical business occupancy environment.

Our rationale is based on several past research studies that have concluded that the 100 ft^2/occupant (gross) occupant load factor for business occupancies is very conservative which has led to requiring Group B occupancies and office buildings in general to have additional egress capacity and a greater number of exits to accommodate an "over-estimated" building population. We believe the increase from 100 ft^2/occupant (gross) to 150 ft^2/occupant (gross) for business occupancies is still a conservative figure; yet reasonable, based on recent changes in office building design as well as changes in the North American workplace and work style trends; such as work station configurations, flexible work schedules, telecommuting, work at home, etc.

The existing occupant load factor of 100 ft^2/occupant (gross) for business occupancies first appeared in the 3rd edition of the Building Exits Code that was published in 1934. The occupant load factor of 100 ft^2/occupant (gross) was specified for office, factory, and workrooms. All occupant load factors were based on the gross floor area of the building, such that no deduction was permitted for corridors, closets, restrooms, or other subdivisions. To our knowledge there is no formal record indicating the basis of the occupant load factors included in the 1934 Buildings Exits Code. However, it seems likely that the results from a National Bureau of Standards (NBS) [now referred to as National Institute of Standards and Technology (NIST)] study published in 1935 were the most likely basis of the occupant load factors adopted into the 1934 Code. However, since the initial NBS study in 1935, several other studies have been conducted to determine the occupant load factors for various occupancies. One common similarity of each of the studies was that all of the subsequent studies have concluded that the 100 ft^2/occupant (gross) occupant load factor for business occupancies is conservative. Studies conducted between 1966 and 1992 have indicated that occupant load factors in business occupancies ranged from 150 ft^2/occupant (gross) to 278 ft^2/occupant (gross). In addition, a 1995 study of 23 Federal sector and private sector office buildings also indicated a mean occupant load factor of 248 ft^2/occupant for all office buildings.Lastly, a recent project to study the appropriateness of the 100 ft^2/occupant load factor for business occupancies has been undertaken by the NFPA Fire Protection Research Foundation. The study was conducted by WPI undergrad students. The recommendations of this study have indicated that it is reasonable to increase the occupant load factor to 150 ft^2/occupant in business occupancies and to create a new occupant load sub-category for concentrated use areas in business occupancies.

Based on the points stated above and the occupant load factor ranges cited in recent studies, I believe it would be reasonable to increase the occupant load factor of 100 ft^2/occupant (gross) in Table 1004.1.2 for determining the means of egress requirements in Business areas to 150 ft^2/occupant (gross) and to create a new occupant load sub-category for concentrated use areas in business occupancies having a range between 50 ft^2-100 ft^2/occupant depending on the work environment configuration.

Cost Impact: Will not increase the cost of construction
The overall outcome of this code change should not increase the cost of construction in most situations.

E 9-15 : T1004.1.2-FRABLE5100

E 10-15

TABLE 1004.1.2; (IFC[BE] TABLE 1004.1.2)

Proponent: Raymond Grill, Arup, representing Arup (ray.grill@arup.com)

2015 International Building Code

Revise as follows:

TABLE 1004.1.2
MAXIMUM FLOOR AREA ALLOWANCES PER OCCUPANT

FUNCTION OF SPACE	OCCUPANT LOAD FACTOR[a]
Business areas[b]	100 gross

(Portions of table not shown remain unchanged)

For SI: 1 square foot = 0.0929 m^2, 1 foot = 304.8 mm.

a. Floor area in square feet per occupant.

b. Uses incidental to the business use, such as conference rooms or break rooms, shall be included in the gross area calculation.

Reason: Incidental uses such as break rooms and conference rooms that are intended to be used by the occupants of the business use should not be loaded as if they were standalone assembly areas. Speculative office developments have regullarly been designed for egress and plumbing fixtures based on the gross area of the floor. The increase in build to suit office projects should not increase the occupant loads of a building and require increased egress width and more plumbing fixtures.
A independant study performed by the Univeristy of Maryland and published by NIST (Evaluation of Survey Procedures for Determining Occupant Load Factors in Contemporary Office Buildings, Issued September 1996) reported on the evaluation of a broad range of types of office buildings. Quoting from the study abstract, "Buildings that are primarily composed of open plan office designs are found to have greater occupant load factors than buildings composed of well-compartmented office designs. County government office buildings are found to be slightly greater occupant load factors than federal government buildings. Federal government buildings have lesser occupant load factors than private office buildings. The mean occupant load factor found in the study for all of the buildings is 248 ft^2/person."

Designers and reviewers who are unfamiliar with the origin and history of the code often over design or require over design when designing build to suit projects by counting conference rooms and break rooms to be considered as assembly uses with simutaneous occupancy with the office areas.
This significanlty increases the occupant load. The model codes historically had never been applied in this fashion and the occupant load study referenced above reinforces that is should not be applied in a manner that inappropriately increases the occupant load of the building.

Over design results in a waste of resources when we are collectively trying to achieve sustainable designs.

Cost Impact: Will not increase the cost of construction
This proposed code change will not increase the cost of compliance and could reduce the cost of code compliance.

E 10-15 : T1004.1.2-GRILL5198

E 11-15

TABLE 1004.1.2; (IFC[BE] TABLE 1004.1.2)

Proponent: Stephen Thomas, Colorado Code Consulting, LLC, representing International Association of Building Officials (sthomas@coloradocode.net)

2015 International Building Code

Revise as follows:

TABLE 1004.1.2
MAXIMUM FLOOR AREA ALLOWANCES PER OCCUPANT

FUNCTION OF SPACE	OCCUPANT LOAD FACTOR[a]
Industrial areas	~~100~~300 gross

(Portions of table not shown remain unchanged.)

For SI: 1 square foot = 0.0929 m^2, 1 foot = 304.8 mm.

a. Floor area in square feet per occupant.

Reason: The current occupant load factor for industrial areas has been around for decades. The Occupant load was appropriate for factories in the early 1900's. However, our factories are much different than they were back then. They have become more automated, requiring less factory workers. Therefore, I believe that the code should reflect how industrial areas are occupied today. Therefore, we have recommended that the occupant load factor be increased resulting in an overall lower occupant load for factories. The factor is based on storage areas and similar spaces.

Cost Impact: Will not increase the cost of construction
This change will reduce cost of construction. It will reduce the number of plumbing fixtures and exit required for such occupancies.

E 11-15 : T1004.1.2-THOMAS5294

E 12-15

TABLE 1004.1.2; (IFC[BE] TABLE 1004.1.2)

Proponent: Masoud Sabounchi, Representing Colorado Chapter of ICC , representing masoud sabounchi (masoud@acecode.com)

2015 International Building Code

Revise as follows:

TABLE 1004.1.2
MAXIMUM FLOOR AREA ALLOWANCES PER OCCUPANT

FUNCTION OF SPACE	OCCUPANT LOAD FACTOR[a]
Skating rinks, swimming pools	
Rink and pool	50 gross
Decks	15[b] gross

(Portions of table not shown remain unchanged.)

For SI: 1 square foot = 0.0929 m^2, 1 foot = 304.8 mm.

a. Floor area in square feet per occupant.

b. For swimming pools that serve Group R-2 and R-3 occupancies, the occupant load factor for the pool deck shall be 30 square feet gross.

Reason: Apartment buildings have swimming pools and decks that serve the apartment building only. Application of occupant load factor of 1:15 results in occupant loads that are very high and not reflecting the use of these decks as amenity spaces for the apartment buildings and unlike a public pool deck. In most cases the calculated occupant loads on these decks is much higher than considering all apartment residents using the decks. The proposed use of the 1:30 occupant load factor is in concert with other nationally recognized codes and more closely reflects the anticipated occupant loads on these decks.

Cost Impact: Will not increase the cost of construction
This proposal will not increase cost of construction

E 12-15 : T1004.1.2-SABOUNCHI4396

E 13-15

1004.3; (IFC[BE] 1004.3)

Proponent: William Freer, representing New York State Office of Fire Prevention and Control (wfreer@dhses.ny.gov)

2015 International Building Code

Revise as follows:

1004.3 Posting of occupant load. Every room or space that is an assembly occupancy shall have the *occupant load* of the room or space posted in a conspicuous place, near the main *exit* or *exit access doorway* from the room or space, for the intended configurations. Posted signs shall be of an approved legible permanent design and shall be maintained by the owner or the owner's authorized agent.

Reason: Many assembly occupancies have become multi-purpose. In many cases these rooms or spaces have been posted for the maximum occupant load as if the space was wide open and being used for standing room only. In these cases the posting would allow for too many persons. Section 1029.5 of the Fire Code states that it is prohibited to overcrowd a building or portion thereof, but without the appropriate occupancy load being posted it would be impossible to enforce this section as intended.
Many jurisdictions have started to require multiple postings for rooms having multiple configurations. Unfortunately that is not currently in the code and may become confusing. By adding for the 'intended configuration' in the code it would confirm that the code enforcement official could require that correct signage was posted.

Cost Impact: Will not increase the cost of construction
The code change proposal will not increase the cost of construction.

E 13-15 : 1004.3-FREER3784

E 14-15

1004.5; (IFC[BE] 1004.5)

Proponent: Timothy Pate, representing Colorado Chapter Code Change Committee, representing City and County of Broomfield (tpate@broomfield.org)

2015 International Building Code

Revise as follows:

1004.5 Outdoor areas. *Yards*, patios, <u>occupied roofs,</u> *courts* and similar outdoor areas accessible to and usable by the building occupants shall be provided with *means of egress* as required by this chapter. The *occupant load* of such outdoor areas shall be assigned by the *building official* in accordance with the anticipated use. Where outdoor areas are to be used by persons in addition to the occupants of the building, and the path of egress travel from the outdoor areas passes through the building, *means of egress* requirements for the building shall be based on the sum of the *occupant loads* of the building plus the outdoor areas.

Exceptions:

1. Outdoor areas used exclusively for service of the building need only have one *means of egress*.
2. Both outdoor areas associated with Group R-3 and individual dwelling units of Group R-2.

Reason: This proposal will add the language "occupied roofs" to this section which will allow the code user to understand that occupied roofs which are open to the sky will also need to meet means of egress requirements. There was this same language added to the 2012 IBC Section 1021.1 which is now section 1006.3 in the 2015 IBC This added language will also clarify that you would need to assign an occupant load based on the anticipated use and design exit system per that occupant load. There has been considerable confusion among building officials and designers on this issue and this should help tie this section to the language in section 1006.3.

Cost Impact: Will not increase the cost of construction
This proposal is only to help clarify the existing code requirements

Part I

2015 International Building Code

Revise as follows:

1005.3.1 Stairways. The capacity, in inches, of *means of egress stairways* shall be calculated by multiplying the *occupant load* served by such *stairways* by a means of egress capacity factor of 0.3 inch (7.6 mm) per occupant. Where *stairways* serve more than one story, only the occupant load of each story considered individually shall be used in calculating the required capacity of the *stairways* serving that story.

Exceptions:

~~1. For other than Group H and I-2 occupancies, the capacity, in inches, of *means of egress stairways* shall be calculated by multiplying the *occupant load* served by such *stairways* by a means of egress capacity factor of 0.2 inch (5.1 mm) per occupant in buildings equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2 and an *emergency voice/alarm communication* system in accordance with Section 907.5.2.2.~~

<u>1.</u> Facilities with *smoke-protected assembly seating* shall be permitted to use the capacity factors in Table 1029.6.2 indicated for stepped aisles for *exit access* or *exit stairways* where the entire path for *means of egress* from the seating to the *exit discharge* is provided with a smoke control system complying with Section 909.

2. Facilities with outdoor *smoke-protected assembly seating* shall be permitted to the capacity factors in Section 1029.6.3 indicated for stepped aisles for *exit access* or *exit stairways* where the entire path for *means of egress* from the seating to the *exit discharge* is open to the outdoors.

1005.3.2 Other egress components. The capacity, in inches, of *means of egress* components other than *stairways* shall be calculated by multiplying the *occupant load* served by such component by a means of egress capacity factor of 0.2 inch (5.1 mm) per occupant.

Exceptions:

~~1. For other than Group H and I-2 occupancies, the capacity, in inches, of *means of egress* components other than *stairways* shall be calculated by multiplying the *occupant load* served by such component by a means of egress capacity factor of 0.15 inch (3.8 mm) per occupant in buildings equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2 and an *emergency voice/alarm communication* system in accordance with Section 907.5.2.2.~~

<u>1.</u> Facilities with *smoke-protected assembly seating* shall be permitted to use the capacity factors in Table 1029.6.2 indicated for level or ramped *aisles* for *means of egress* components other than *stairways* where the entire path for *means of egress* from the seating to the *exit discharge* is provided with a smoke control system complying with Section 909.

2. Facilities with outdoor *smoke-protected assembly seating* shall be permitted to the capacity factors in Section 1029.6.3 indicated for level or ramped *aisles* for *means of egress* components other than *stairways* where the entire path for *means of egress* from the seating to the *exit discharge* is open to the outdoors.

Part II

2015 International Existing Building Code

Add new text as follows:

<u>**402.6 Means of egress capacity factors.** Where an addition is made to an existing building or structure, the existing building or structure together with its additions shall not be subject to the egress width factors in Sections 1005.3.1and 1005.3.2 of the International Building Code for new construction in determining the minimum egress widths in an existing building or structure. The minimum egress widths for the components of the means of egress shall be based on the means of egress width factors in the building code under which the building was constructed, and shall be considered as complying means of egress for any existing building together with its additions if, in the opinion of the code official, they do not constitute a distinct hazard to life.</u>

<u>**403.2 Means of egress capacity factors** Alterations to any existing building shall not be subject to the egress width factors in</u>

Sections 1005.3.1and 1005.3.2 of the *International Building Code* for new construction in determining the minimum egress widths in an existing building. The minimum egress widths for the components of the means of egress shall be based on the means of egress width factors in the building code under which the building was constructed, and shall be considered as complying means of egress for any alteration if, in the opinion of the code official, they do not constitute a distinct hazard to life.

407.4 Means of egress capacity factors An exisiting building undergoing a change of occupancy shall not be subject to the egress width factors in Sections 1005.3.1and 1005.3.2 of the International Building Code for new construction in determining the minimum egress widths in an existing building. The minimum egress widths for the components of the means of egress shall be based on the means of egress width factors in the building code under which the building was constructed, and shall be considered as complying means of egress for a change of occupancy if, in the opinion of the code official, it does not constitute a distinct hazard to life.

408.3 Means of egress capacity factors A historic building shall not be subject to the egress width factors in Sections 1005.3.1and 1005.3.2 of the International Building Code for new construction in determining the minimum egress widths in an existing building. The minimum egress widths for the components of the means of egress shall be based on the means of egress width factors in the building code under which the building was constructed, and shall be considered as complying means of egress for any alteration if, in the opinion of the code official, they do not constitute a distinct hazard to life.

704.2 Means of egress capacity factors Alterations to any existing building shall not be subject to the egress width factors in Sections 1005.3.1and 1005.3.2 of the International Building Code for new construction in determining the minimum egress widths in an existing building. The minimum egress widths for the components of the means of egress shall be based on the means of egress width factors in the building code under which the building was constructed, and shall be considered as complying means of egress for any alteration if, in the opinion of the code official, they do not constitute a distinct hazard to life.

1005.2 Means of egress capacity factors An exisitng building undergoing a change of occupancy shall not be subject to the egress width factors in Sections 1005.3.1and 1005.3.2 of the International Building Code for new construction in determining the minimum egress widths in an existing building. The minimum egress widths for the components of the means of egress shall be based on the means of egress width factors in the building code under which the building was constructed, and shall be considered as complying means of egress for a change of occupancy if, in the opinion of the code official, it does not constitute a distinct hazard to life.

Revise as follows:

1012.4.3 ~~Egress~~Means of egress capacity factors. ~~Egress capacity~~
An exisitng building undergoing a change of occupancy shall ~~meet or exceed~~not be subject to the ~~occupant load as specified~~egress width factors in Sections 1005.3.1and 1005.3.2 of the *International Building Code* for new construction in determining the minimum egress widths in an existing building. The minimum egress widths for the ~~new~~components of the means of egress shall be based on the means of egress width factors in the building code under which the building was constructed, and shall be considered as complying means of egress for a change of occupancy if, in the opinion of the code official, it does not constitute a distinct hazard to life.

Add new text as follows:

SECTION1107 MEANS OF EGRESS

1107.1 Means of egress capacity factors. Where an addition is made to an existing building or structure, the existing building or structure together with its additions shall not be subject to the egress width factors in Sections 1005.3.1and 1005.3.2 of the International Building Code for new construction in determining the minimum egress widths in an existing building or structure. The minimum egress widths for the components of the means of egress shall be based on the means of egress width factors in the building code under which the building was constructed, and shall be considered as complying means of egress for any existing building together with its additions if, in the opinion of the code official, they do not constitute a distinct hazard to life.

1203.4 Means of egress capacity factors A historic building shall not be subject to the egress width factors in Sections 1005.3.1and 1005.3.2 of the International Building Code for new construction in determining the minimum egress widths in an existing building. The minimum egress widths for the components of the means of egress shall be based on the means of egress width factors in the building code under which the building was constructed, and shall be considered as complying means of egress for any alteration if, in the opinion of the code official, they do not constitute a distinct hazard to life.

Revise as follows:

1401.6.11 Means of egress capacity and number. Evaluate the means of egress capacity and the number of exits available to the building occupants. In applying this section, the means of egress are required to conform to the following sections of the *International Building Code:* 1003.7, 1004, ~~1005.1~~1005, 1006, 1007, 1016.2, 1025.1, 1028.2, 1028.5, 1029.2, 1029.3, 1029.4 and 1030, except that for existing buildings the minimum width required by this Section can also be determined solely by the width for the required capacity in accordance with Table 1401.6.11(1). The number of exits credited is the number that is available to each occupant of the area being evaluated. Existing fire escapes shall be accepted as a component in the means of egress when conforming to Section 405.

Under the categories and occupancies in Table ~~1401.6.11~~1401.6.11(2), determine the appropriate value and enter that value into Table 1401.7 under Safety Parameter 1401.6.11, Means of Egress Capacity, for means of egress and general safety.

Add new table as follows:

TABLE 1401.6.11(1)
EGRESS WIDTH PER OCCUPANT SERVED

OCCUPANCY	Without sprinkler system and emergency voice/alarm communication system		With sprinkler system and emergency voice/alarn communiction system[a]	
	Stairways (inches pre occupant)	Other egress components (inches per occupant)	Stairways (inches per occupant)	Other egress componenets (inches per occupant)
Occupancies other than listed below	0.3	0.2	0.2	0.15
Hazardous: H-1, H-2, H-3, H-4	0.7	0.4	0.3	0.2
Institutional: I-2	N/A	N/A	0.3	0.2

For SI: 1 inch = 25.4 mm. N/A = Not applicable.
a. Buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2 and an emergency voice/alarm communication system in accordance with Section 907.5.2.2.

Revise as follows:

TABLE ~~1401.6.11~~1401.6.11(2)
MEANS OF EGRESS VALUES[a]

OCCUPANCY	CATEGORIES				
	a	b	c	d	e
A-1, A-2, A-3, A-4, E, I-2	-10	0	2	8	10
M	-3	0	1	2	4
B, F, S	-1	0	0	0	0
R	-3	0	0	0	0

a. The values indicated are for buildings six stories or less in height. For buildings over six stories above grade plane, add an additional -10 points.

1401.6.11.1 Categories. The categories for means-ofegress capacity and number of exits are:

1. Category a—Compliance with the minimum required means-of-egress capacity or number of exits is achieved through the use of a fire escape in accordance with Section 405.
2. Category b—Capacity of the means of egress complies with Section ~~1004~~1005 of the *International Building Code* or Table 1401.6.11(1), and the number of exits complies with the minimum number required by Section ~~1021~~1006 of the *International Building Code*.
3. Category c—Capacity of the means of egress is equal to or exceeds 125 percent of the required means-of-egress capacity, the means of egress complies with the minimum required width dimensions specified in the *International Building Code* or Table 1401.6.11(1), and the number of exits complies with the minimum number required by Section 1006 of the *International Building Code*.
4. Category d—The number of exits provided exceeds the number of exits required by Section 1006 of the *International Building Code*. Exits shall be located a distance apart from each other equal to not less than that specified in Section ~~1015.2~~1007 of the *International Building Code*.
5. Category e—The area being evaluated meets both Categories c and d.

Reason: The intent of this code change is to revise the egress capacity factors referenced in Sections 1005.3.1 and 1005.3.2 such that the concept of determining egress capacity for the components of the means of egress within a building is not a function of whether or not a building is protected by an automatic fire sprinkler system. Not all building emergencies that necessitate occupant egress either out of the building or within a building to a safe area are dependent on a fire sprinkler system and a evacuation voice/alarm communication system. In addition, revisions have also been incorporated into the IEBC to ensure existing buildings utilizing previously approved egress capacity factors are not significantly impacted by this code change.
The geometry of a building, its occupancy and related occupant load, travel distance to exits dictate, in large measure, the location of exits, the number of exits, the capacity of other egress components, and the capacity of exits and access thereto. As a consequence, the exits themselves influence the plan and layout of the entire means of egress system. The number of people that the means of egress system can accommodate is determined primarily by the

capacity (i.e., width) of the exits but it also is affected by the number of occupants each component within the exit access and exit discharge can accommodate. Therefore, exit stair capacity and the capacity factor for "other means of egress" components are stand-alone life safety fundamental concepts that need to be addressed properly, just as providing sprinkler protection and occupant notification via a voice/alarm communication system in building, to help ensure a reasonable level of safety in a building.
The number of occupants or occupant load for which a means of egress system must provide egress capacity is calculated. The occupant load is to reflect the maximum number of occupants anticipated to occupy the building rooms or spaces at any given time under all probable situations. The occupant load must not be based only on normal occupancy.
Currently, the base requirements in the IBC for determining egress capacity for exit stairways state that the egress capacity for exit stairways and means of egress components shall be based on a capacity factor of 0.3 inches/occupant and 0.2 inches/occupant respectively. However, the IBC has exceptions that permit a building that is equipped throughout by an automatic sprinkler system and an emergency alarm communication system to use a capacity factor of 0.2 inches/occupant for exit stairways and 0.15 inches/occupant for other means of egress components. The resulting action of these 2 exceptions can be demonstrated in the four scenarios described below:

Scenario 1; if the egress capacity of a 44 inch wide exit stair uses a capacity factor of 0.3 inches width/occupant, it would equate to 146 occupants for that stair. Therefore, if a floor has 2 similar configured exit stairways as stated above, Scenario 1 will limit the maximum allowable number of occupants on the floor to 292 occupants

Scenario 2; if the egress capacity of a 44 inch wide exit stair uses a capacity factor of 0.2 inches width/occupant, it would equate to 220 occupants for that stair. Therefore, if a floor has 2 similar configured exit stairways as stated above, Scenario 2 will limit the maximum allowable number of occupants on the floor to 440 occupants.

Scenario 3; if the egress capacity of a 36-inch door uses a capacity factor of 0.2 inches width/occupant, it would equate to 180 occupants egressing through that door.

Scenario 4; if the egress capacity of a 36-inch wide door uses a capacity factor of 0.15 inches width/occupant, it would equate to 240 occupants egressing through that door.

However, we strongly believe the exceptions permitted in the IBC do not take into account other types of life safety events not related to fire that have a comparable impact on occupants evacuating a building. For example, non-related fire emergencies such as, but not limited to, hazardous substance spills and leaks, suspicious packages, natural disasters, medical emergencies, etc. may necessitate all occupants, including those with mobility impairments, to take immediate action to evacuate a building in an efficient manner where evacuation time may be a critical factor in ensuring occupant safety. Therefore, reducing the exit stair capacity factor to 0.2 inches/occupant and reducing the capacity factor for "other egress components" to 0.15 inches/occupant may increase the overall occupant evacuation times which may impact occupant safety in these critical situations. In addition, reducing these core fundamental capacity factors in the means of egress may also impact occupant safety if the needed automatic sprinkler system and/or emergency voice/alarm communication system fails to operate.

Therefore, based on our substantiation, we believe the respective 2 exceptions should be deleted since in our opinion the current exceptions do not present any clear and substantial justification to reduce the exit stair capacity factor from 0.3 inches/occupant to 0.2 inches/occupant and the "other egress components" from 0.2 inches/occupant to 0.15 inches/occupant.

Cost Impact:

Part I: Will increase the cost of construction
This code change will probbaly increase constrcution costs to meet the new requirements but will enhance overall building safety during a building evacution. Howeevr, there should be no cost impact on exisiting buildings.

Part II: Will increase the cost of construction
This code change will probbaly increase constrcution costs to meet the new requirements but will enhance overall building safety during a building evacution. Howeevr, there should be no cost impact on exisiting buildings.

E 15-15 : 1005.3.1-FRABLE5123

E 16-15

1006.2.1, 1006.3; (IFC[BE] 1006.2.1, 1006.3)

Proponent: Edward Kulik, Chair, representing Building Code Action Committee (bcac@iccsafe.org)

2015 International Building Code

Revise as follows:

1006.2.1 Egress based on occupant load and common path of egress travel distance. Two *exits* or *exit access doorways* from any space shall be provided where the design *occupant load* or the *common path of egress travel* distance exceeds the values listed in Table 1006.2.1. The portion of the occupant load from adjacent rooms, areas or spaces shall be based on the capacity of the means of egress components providing access to the space under consideration.

Exceptions:

1. The number of exits from foyers, lobbies, vestibules or similar spaces need not be based on cumulative occupant loads for areas discharging through such spaces, but the capacity of the exits from such spaces shall be based on applicable cumulative occupant loads.
2. In Group R-2 and R-3 occupancies, one *means of egress* is permitted within and from individual *dwelling units* with a maximum *occupant load* of 20 where the *dwelling unit* is equipped throughout with an *automatic sprinkler* system in accordance with Section 903.3.1.1 or 903.3.1.2 and the *common path of egress travel* does not exceed 125 feet (38 100 mm).
3. *Care suites* in Group I-2 occupancies complying with Section 407.4.

1006.3 Egress from stories or occupied roofs. The *means of egress* system serving any *story* or occupied roof shall be provided with the number of *exits* or access to *exits* based on the aggregate *occupant load* served in accordance with this section. The *path of egress travel* to an *exit* shall not pass through more than one adjacent *story*. Where stairways serve more that one story, only the occupant load of each story considered individually shall be used in caculating the required number of exits or access to *exits* serving that story.

Exception: Where the only access to requried exits from a mezzanines is through and adjacent story, the entire occupant load of such mezzanines shall be added to the load of the adjacent story.

Reason: This public proposal is submitted by the ICC Building Code Action Committee (BCAC). The BCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the BCAC has held 13 open meetings and numerous workgroup calls which included members of the BCAC as well as any interested party to discuss and debate the proposed changes and the public comments. Related documentation and reports are posted on the BCAC website at: http://www.iccsafe.org/cs/BCAC/Pages/default.aspx.
Cumulative occupant load provisions were clarified in the 2015 IBC. There were several proposals initially submitted to address these provisions. For the final action hearings, proponents agreed to support one proposal: E15-12. E15 addressed the concerns by modifying Section 1004.1, Cumulative occupant loads.

This proposal is intended to enhance the functionality of these requirements by placing them in context with the applicable means of egress design requirements. For example, Section 1004.1.1.1 states, "Design of egress path capacity shall be based on the cumulative portion of the occupant loads of all rooms, areas or spaces to that point along the path of egress travel." This proposal places the same requirement at Section 1006.2.1 in the context of using capacity to determine the required number of exits or access to exits.

A new Exception 1 to Section 1006.2.1 has been added. This language was contained in proposal E16-12 and was lost in the consolidation. Nevertheless, it is a logical concern. Literally interpreted, a building with an occupant load of 4,000 and having four required exits with one of those exits having a foyer, lobby, vestibule or similar space would require four exits from such space based on the cumulative occupant load of 1,000. The number of exits from such space would be based on the occupant load of the space; however, the capacity of that exit(s) would be based on the cumulative occupant load served.

Perhaps the most important feature of the 2015 code change was that it clarified that cumulative occupant loads are not considered when calculating the required number of exits or access to exits serving an adjacent story. An exception clarifies that occupant loads from isolated mezzanines will be considered in determining the number of required exits from the adjacent story.

Some seasoned practitioners consult a specific code provision without reviewing the applicable general requirements when researching a given design condition. If for instance, a design professional or plans examiner is verifying the procedure for the determination of the required number of exits or access to exits, he or she will likely consult Section1006 although many other general provisions potentially apply to the situation, to include Section 1004. This proposal is intended to be user friendly in that it restates important cumulative occupant load provisions in technical context without providing a generic cross-reference.

Approval of this proposal will improve the consistency in the determination and application of fundamental IBC means of egress provisions.

Cost Impact: Will not increase the cost of construction
None. Provisions simply provide clarification of current requirements.

Staff note: Section 1006.3 has a published errata. The proposal includes the errata as existing text.

E 16-15 : 1006.2.1-KULIK3684

E 17-15

1006.2.1, TABLE 1006.2.1; (IFC[BE] 1006.2.1, TABLE 1006.2.1)

Proponent: Lee Kranz, City of Bellevue, Washington, representing Washington Association of Building Officials Technical Code Development Committee

2015 International Building Code

Revise as follows:

1006.2.1 Egress based on occupant load and common path of egress travel distance. Two *exits* or *exit access doorways* from any space shall be provided where the design *occupant load* or the *common path of egress travel* distance exceeds the values listed in Table 1006.2.1.

~~Exceptions~~Exception:

~~1.~~ ~~In Group R-2 and R-3 occupancies, one *means of egress* is permitted within and from individual *dwelling units* with a maximum *occupant load* of 20 where the *dwelling unit* is equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1 or 903.3.1.2 and the *common path of egress travel* does not exceed 125 feet (38 100 mm).~~

1. *Care suites* in Group I-2 occupancies complying with Section 407.4.

TABLE 1006.2.1
SPACES WITH ONE EXIT OR EXIT ACCESS DOORWAY

OCCUPANCY	MAXIMUM OCCUPANT LOAD OF SPACE	MAXIMUM COMMON PATH OF EGRESS TRAVEL DISTANCE (feet)		
		Without Sprinkler System (feet)		With Sprinkler System (feet)
		Occupant Load		
		OL ≤ 30	OL 30	
A[c], E, M	49	75	75	75[a]
B	49	100	75	100[a]
F	49	75	75	100[a]
H-1, H-2, H-3	3	NP	NP	25[b]
H-4, H-5	10	NP	NP	75[b]
I-1, I-2[d], I-4	10	NP	NP	75[a]
I-3	10	NP	NP	100[a]
R-1	10	NP	NP	75[a]
R-2	~~10~~ 20	NP	NP	125[a]
R-3[e]	~~10~~20	NP	NP	125[a]
R-4[e]	~~10~~20	75	75	125[a]
S[f]	29	100	75	100[a]
U	49	100	75	75[a]

For SI: 1 foot = 304.8 mm.

NP = Not Permitted

a. Buildings equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1 or 903.3.1.2. See Section 903 for occupancies where *automatic sprinkler systems* are permitted in accordance with Section 903.3.1.2.

b. Group H occupancies equipped throughout with an *automatic sprinkler system* in accordance with Section 903.2.5.

c. For a room or space used for assembly purposes having *fixed seating*, see Section 1029.8.

d. For the travel distance limitations in Group I-2, see Section 407.4.

e. The ~~length of~~*common path of egress travel* distance shall only apply in a Group R-3 occupancy located in a mixed occupancy building or within a Group R-3 or R-4 *congregate living facility*.

f. The length of *common path of egress travel* distance in a Group S-2 *open parking garage* shall be not more than 100 feet.

Reason: Exception #1 of Section 1006.2.1 is essentially an exception to the maximum occupant load limits of 10 in Table 1006.2.1 for R-2 and R-3. Increasing the maximum occupant load from 10 to 20 in the table for R-2, R-3 and R-4 and deleting exception #1 is appropriate since all Group R occupancies require sprinkler protection per Section 903.2.8 (NFPA 13 and NFPA 13-R system) and the 125' common path limit in the exception is consistent with the table so the exception is no longer needed.
The occupant load limit for R-4 in the table is also proposed to be modified from 10 to 20. Section 310.6 limits R-4 occupancies to 16 residents but does not include "staff" so it is likely that the occupant load will be 17 or more.

The change in footnote e is intended to clarify the intent and make it easier to understand.

Cost Impact: Will not increase the cost of construction
This code change eliminates a redundant provision and will not affect the cost of construction.

E 17-15 : 1006.2.1-KRANZ3767

E 18-15

TABLE 1006.2.1; (IFC[BE] TABLE 1006.2.1)

Proponent: Victor Cuevas, representing City of Los Angeles

2015 International Building Code

Revise as follows:

TABLE 1006.2.1
SPACES WITH ONE EXIT OR EXIT ACCESS DOORWAY

OCCUPANCY	MAXIMUM OCCUPANT LOAD OF SPACE	MAXIMUM COMMON PATH OF EGRESS TRAVEL DISTANCE (feet)		
		Without Sprinkler System (feet)		With Sprinkler System (feet)
		Occupant Load		
		OL ≤ 30	OL>30	
A[c] , E, M	49	75	75	75[a]
B	49	100	75	100[a]
F	49	75	75	100[a]
H-1, H-2, H-3	3	NP	NP	25[b]
H-4, H-5	10	NP	NP	75[b]
I-1, I-2[d] , I-4	10	NP	NP	75[a]
I-3	10	NP	NP	100[a]
R-1	10	~~NP~~75	~~NP~~75	75[a]
R-2	10	~~NP~~75	~~NP~~75	125[a]
R-3[e]	10	~~NP~~75	~~NP~~75	125[a]
R-4[e]	10	75	75	125[a]
S[f]	29	100	75	100[a]
U	49	100	75	75[a]

For SI: 1 foot = 304.8 mm.

NP = Not Permitted

a. Buildings equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1 or 903.3.1.2. See Section 903 for occupancies where *automatic sprinkler systems* are permitted in accordance with Section 903.3.1.2.

b. Group H occupancies equipped throughout with an *automatic sprinkler system* in accordance with Section 903.2.5.

c. For a room or space used for assembly purposes having *fixed seating*, see Section 1029.8.

d. For the travel distance limitations in Group I-2, see Section 407.4.

e. The length of *common path of egress travel* distance in a Group R-3 occupancy located in a mixed occupancy building or within a Group R-3 or R-4 *congregate living facility*.

f. The length of *common path of egress travel* distance in a Group S-2 *open parking garage* shall be not more than 100 feet.

Reason: The purpose of this proposal is to allow a maximum common path of egress travel distance to be 75' for Group R-1, R-2 and R-3. Without this change, any addition to an existing non-sprinklered building would require two exits from any room without any allowance for the common path of egress travle distance. This travel distance is the same as what was permitted in the code before all Group R was required to be sprinklered.

Cost Impact: Will not increase the cost of construction
There is not change in requirements.

E 18-15 : T1006.2.1-CUEVAS4824

E 19-15

TABLE 1006.2.1; (IFC[BE] TABLE 1006.2.1)

Proponent: Kathleen Petrie, representing City of Seattle, Department of Planning and Development (kathleen.petrie@seattle.gov)

2015 International Building Code

Revise as follows:

TABLE 1006.2.1
SPACES WITH ONE EXIT OR EXIT ACCESS DOORWAY

OCCUPANCY	MAXIMUM OCCUPANT LOAD OF SPACE	MAXIMUM COMMON PATH OF EGRESS TRAVEL DISTANCE (feet)		
		Without Sprinkler System (feet)		With Sprinkler System (feet)
		Occupant Load		
		OL ≤ 30	OL >30	
A[c] , E, M	49	75	75	75[a]
B	49	100	75	100[a]
F	49	75	75	100[a]
H-1, H-2, H-3	3	NP	NP	25[b]
H-4, H-5	10	NP	NP	75[b]
I-1, I-2[d] , I-4	10	NP	NP	75[a]
I-3	10	NP	NP	100[a]
R-1	10	NP	NP	75[a]
R-2	10	NP	NP	125[a]
R-3[e]	10	NP	NP	125[a]
R-4[e]	10	75	75	125[a]
S[f]	29	100	75	100[a]
U	49	100	75	75[a]

For SI: 1 foot = 304.8 mm.

NP = Not Permitted

a. Buildings equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1 or 903.3.1.2. See Section 903 for occupancies where *automatic sprinkler systems* are permitted in accordance with Section 903.3.1.2.

b. Group H occupancies equipped throughout with an *automatic sprinkler system* in accordance with Section 903.2.5.

c. For a room or space used for assembly purposes having *fixed seating*, see Section 1029.8.

d. For the travel distance limitations in Group I-2, see Section 407.4.

e. The length of *common path of egress travel* distance in a Group R-3 occupancy located in a mixed occupancy building or within a Group R-3 or R-4 *congregate living facility*.

~~f. The length of *common path of egress travel* distance in a Group S-2 *open parking garage* shall be not more than 100 feet.~~

Reason: This proposal deletes footnote 'f' in Table 1006.2.1 because it is unnecessary and adds confusion. Footnote 'f' currently limits the maximum common path of egress travel distance to 100 feet for open parking garages with an S-2 Occupancy. However, 100 feet is the maximum distance for any S Occupancy, so it is unnecessary to single out open parking garages. This footnote may also result in prompting the user to unnecessarily search for a requirement applying to enclosed parking garages.

Cost Impact: Will not increase the cost of construction
This proposal is a clarification of the requirement so there is no impact to the cost of construction

E 19-15 : T1006.2.1-PETRIE4005

E 20-15

1006.2.2.1, 1006.2.2.2 (New), 1006.2.2.2, 1010.1.10; (IFC[BE] 1006.2.2.1, 1006.2.2.2 (New), 1006.2.2.2, 1010.1.10)

Proponent: Edward Kulik, Chair, representing Building Code Action Committee (bcac@iccsafe.org)

2015 International Building Code

Revise as follows:

1006.2.2.1 Boiler, incinerator and furnace rooms. Two *exit access doorways* are required in boiler, incinerator and furnace rooms where the area is over 500 square feet (46 m^2) and any fuel-fired equipment exceeds 400,000 British thermal units (Btu) (422 000 KJ) input capacity. Where two *exit access doorways* are required, one is permitted to be a fixed ladder or an *alternating tread device*. *Exit access doorways* shall be separated by a horizontal distance equal to one-half the length of the maximum overall diagonal dimension of the room.
Doors shall swing in the direction of egress travel, regardless of the occupancy load served. Doors shall be provided with panic hardware or fire exit hardware.

Add new text as follows:

1006.2.2.2 Electrical Equipment Space. Entrance to and egress from the working space for electrical equipment shall be in compliance with the *International Fire Code* and Sections 110.26 and 110.33 of NFPA 70, as applicable.

Doors shall swing in the direction of egress travel, regardless of the occupancy load served. Doors shall be provided with panic hardware or fire exit hardware.

Revise as follows:

~~**1006.2.2.2**~~**1006.2.2.3 Refrigeration machinery rooms.** Machinery rooms larger than 1,000 square feet (93 m^2) shall have not less than two *exits* or *exit access doorways*. Where two *exit access doorways* are required, one such doorway is permitted to be served by a fixed ladder or an *alternating tread device*. *Exit access doorways* shall be separated by a horizontal distance equal to one-half the maximum horizontal dimension of the room.

All portions of machinery rooms shall be within 150 feet (45 720 mm) of an *exit* or *exit access doorway*. An increase in *exit access* travel distance is permitted in accordance with Section 1017.1.

Doors shall swing in the direction of egress travel, regardless of the *occupant load* served. Doors shall be tight fitting and self-closing. Doors shall be provided with panic hardware or fire exit hardware.

1010.1.10 Panic and fire exit hardware. Doors serving a Group H occupancy and doors serving rooms or spaces with an *occupant load* of 50 or more in a Group A or E occupancy shall not be provided with a latch or lock other than *panic hardware* or *fire exit hardware*.

Exceptions:

1. A main *exit* of a Group A occupancy shall be permitted to be locking in accordance with Section 1010.1.9.3, Item 2.
2. Doors serving a Group A or E occupancy shall be permitted to be electromagnetically locked in accordance with Section 1010.1.9.9.

~~Electrical rooms with equipment rated 1,200 amperes or more and over 6 feet (1829 mm) wide, and that contain overcurrent devices, switching devices or control devices with *exit* or *exit access doors*, shall be equipped with *panic hardware* or *fire exit hardware*. The doors shall swing in the direction of egress travel.~~

Reason: This public proposal is submitted by the ICC Building Code Action Committee (BCAC). The BCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the BCAC has held 13 open meetings and numerous workgroup calls which included members of the BCAC as well as any interested party to discuss and debate the proposed changes and the public comments. Related documentation and reports are posted on the BCAC website at: http://www.iccsafe.org/cs/BCAC/Pages/default.aspx.
Requirements for access and working space to and about electrical equipment is covered in the National Electrical Code, NFPA 70, and the International Fire Code. The requirements for electrical equipment rated 600 volts or less are covered in Section 110.26 of NFPA 70. The requirements for electrical equipment rated more than 600 volts are covered in Sections 110.32 and 110.33 of NFPA 70. These requirements are more detailed than what is currently in the building code, and apply to electrical equipment in all occupancies.

Section 2701.1 of the IBC requires electrical components, equipment, and systems to be designed and constructed in accordance with NFPA 70. By including a specific reference in Chapter 10 of the building code to the access and working space requirements in NFPA 70, registered design professionals will be aware to incorporate these requirements into the design of the building before starting construction.

The door requirements are added to current Sections 1006.2.2.1 and 1006.2.2.2 for consistency with these types of mechanical spaces.

Cost Impact: Will not increase the cost of construction
This code change proposal will not increase the cost of construction. This code proposal may actually decrease the cost of construction, because the design

of the building will include the requirements that are already required elsewhere in this code.

E 20-15 : 1006.2.2.2 (NEW)-KULIK3668

E 21-15

1006.2.2.2 (New); (IFC[BE] 1006.2.2.2 (New))

Proponent: Lee Kranz, City of Bellevue, WA, representing Washington Association of Building Officials Technical Code Development Committee

2015 International Building Code

Add new text as follows:

1006.2.2.2 **Electrical equipment rooms.** Rooms containing electrical equipment shall be provided with the number of exit or exit access doorways in accordance with NFPA70 Article 110 where all of the following apply:

1. The electrical equipment is rated at 1,200 amperes or more.
2. The electrical equipment is over 6 feet (1829 mm) wide;
3. The electrical equipment contains overcurrent devices, switching devices or control devices.

(Renumber subsequent sections.)

Reason: This code change is needed to create consistency with the NEC. NEC Article 110.26 (C) (2) requires a 2nd exit when large electrical equipment (over 6 feet wide) exceeding 1,200 amperes where the equipment contains overcurrent devices, switching devices or control devices. Most building code reviewers are not aware of the need for the 2nd exit in the NEC and the requirement is often not identified until after construction begins when it is costly to modify the architectural design. Rather than requiring a second exit or exit access doorway, the proposal specifies that the number of exits or exit access doorways shall be in accordance with NEC Article 110. This approach was taken due to several exceptions contained in Article 110 exempting the second exit doorway and which would not be appropriate to duplicate in the IBC.
Similar provisions are located in Section 1010.1.10 to require panic hardware or fire exit hardware for electrical rooms with large electrical equipment.

Cost Impact: Will not increase the cost of construction
This code change will save money by reducing costly change orders when the NEC requirement for a 2nd exit is not cought during plan review.

E 21-15 : 1006.2.2.2 (New)-KRANZ4099

E 22-15

1006.2.2.2; (IFC[BE] 1006.2.2.2)

Proponent: Jeffrey Shapiro, International Institute of Ammonia Refrigeration, representing International Institute of Ammonia Refrigeration (jeff.shapiro@intlcodeconsultants.com)

2015 International Building Code

Revise as follows:

1006.2.2.2 Refrigeration machinery rooms. Machinery rooms larger than 1,000 square feet (93 m^2) shall have not less than two *exits* or *exit access doorways*. Where two *exit access doorways* are required, one such doorway is permitted to be served by a fixed ladder or an *alternating tread device*. *Exit access doorways* shall be separated by a horizontal distance equal to one-half the maximum horizontal dimension of the room.

All portions of machinery rooms shall be within 150 feet (45 720 mm) of an *exit* or *exit access doorway*. An increase in *exit access* travel distance is permitted in accordance with Section 1017.1.

~~Doors~~ *Exit and exit access doorways* shall swing in the direction of egress travel, regardless of the *occupant load* served. ~~Doors~~*Exit* and exit access doorways shall be tight fitting and self-closing.

Reason: The proposed revision clarifies of how the code should currently be applied. The intent of this section is limited to regulating exit and exit access doors, but as currently written, the code incorrectly suggests that any door, even a door to an auxiliary space that doesn't lead to an exit, must swing in the direction of egress.

Cost Impact: Will not increase the cost of construction
The change has no impact on the cost of construction.

E 22-15 : 1006.2.2.2-SHAPIRO4702

E 23-15

1006.2.2.4, Table 1017.2, Table 1020.1; (IFC[BE] 1006.2.2.4, Table 1017.2, Table 1020.1)

Proponent: Carl Baldassarra, P.E., FSFPE, Chair, ICC Code Technology Committee, representing Code Technology Committee (CTC@iccsafe.org)

2015 International Building Code

Revise as follows:

1006.2.2.4 ~~Day care~~Group I-4 means of egress. ~~Day care~~
Group I-4 facilities, rooms or spaces where care is provided for more than 10 children that are $2^{1}/_{2}$ years of age or less, shall have access to not less than two *exits* or *exit access doorways*.

TABLE 1017.2
EXIT ACCESS TRAVEL DISTANCE[a]

OCCUPANCY	WITHOUT SPRINKLER SYSTEM (feet)	WITH SPRINKLER SYSTEM (feet)
A, E, F-1, M, R, S-1	200	250[b]
I-1	Not Permitted	250[b]
B	200	300[c]
F-2, S-2, U	300	400[c]
H-1	Not Permitted	75[d]
H-2	Not Permitted	100[d]
H-3	Not Permitted	150[d]
H-4	Not Permitted	175[d]
H-5	Not Permitted	200[c]
I-2, I-3~~, I-4~~	Not Permitted	200[c]
I-4	150	200[c]

For SI: 1 foot = 304.8 mm.

a. See the following sections for modifications to *exit access* travel distance requirements:

Section 402.8: For the distance limitation in malls.

Section 404.9: For the distance limitation through an atrium space.

Section 407.4: For the distance limitation in Group I-2.

Sections 408.6.1 and 408.8.1: For the distance limitations in Group I-3.

Section 411.4: For the distance limitation in special amusement buildings.

Section 412.7: For the distance limitations in aircraft manufacturing facilities.

Section 1006.2.2.2: For the distance limitation in refrigeration machinery rooms.

Section 1006.2.2.3: For the distance limitation in refrigerated rooms and spaces.

Section 1006.3.2: For buildings with one exit.

Section 1017.2.2: For increased distance limitation in Groups F-1 and S-1.

Section 1029.7: For increased limitation in assembly seating.

Section 3103.4: For temporary structures.

Section 3104.9: For pedestrian walkways.

b. Buildings equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1 or 903.3.1.2. See Section 903 for occupancies where *automatic sprinkler systems* are permitted in accordance with Section 903.3.1.2.

c. Buildings equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1.

d. Group H occupancies equipped throughout with an *automatic sprinkler system* in accordance with Section 903.2.5.1.

TABLE 1020.1
CORRIDOR FIRE-RESISTANCE RATING

OCCUPANCY	OCCUPANT LOAD SERVED BY CORRIDOR	REQUIRED FIRE-RESISTANCE RATING (hours)	
		Without sprinkler system	With sprinkler system[c]
H-1, H-2, H-3	All	Not Permitted	1
H-4, H-5	Greater than 30	Not Permitted	1
A, B, E, F, M, S, U	Greater than 30	1	0
R	Greater than 10	Not Permitted	0.5
I-2[a]~~, I-4~~	All	Not Permitted	0
I-4	All	1	0
I-1, I-3	All	Not Permitted	1[b]

a. For requirements for occupancies in Group I-2, see Sections 407.2 and 407.3.

b. For a reduction in the *fire-resistance rating* for occupancies in Group I-3, see Section 408.8.

c. Buildings equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1 or 903.3.1.2 where allowed.

Reason:
Section 903.2.6 Exception 2 allows for day cares to not be sprinklered and 903.2.6 allows for the building to not be fully sprinklered. This is a historical provision that has no incidence that would indicate that it should not be permitted. Therefore, there needs to be an option other than NP in travel distance and corridor ratings in non-sprinklered buildings for Group I-4 day care facilities. The provisions permitted were in past editions of the code.

IBC 308.6.1 Classification as Group E. A child day care facility that provides care for more than five but not more than 100 children 21/2 years or less of age, where the rooms in which the children are cared for are located on a level of exit discharge serving such rooms and each of these child care rooms has an exit door directly to the exterior, shall be classified as Group E.

IFC 903.2.6 (IBC [F] 903.2.6) Group I. An automatic sprinkler system shall be provided throughout buildings with a Group I fire area.
Exceptions:
1. An automatic sprinkler system installed in accordance with Section 903.3.1.2 shall be permitted in Group I-1 Condition 1 facilities.
2. An automatic sprinkler system is not required where Group I-4 day care facilities are at the level of exit discharge and where every room where care is provided has not fewer than one exterior exit door.
3. In buildings where Group I-4 day care is provided on levels other than the level of exit discharge, an automatic sprinkler system in accordance with Section 903.3.1.1 shall be installed on the entire floor where care is provided, all floors between the level of care and the level of exit discharge, and all floors below the level of exit discharge other than areas classified as an open parking garage.

The ICC Code Technology Committee (CTC) has just completed its 10th year. The ICC Board has decided to sunset the CTC. The sunset plan includes re-assigning many of the CTC Areas of Study to the applicable Code Action Committee (CAC). The two remaining CTC Areas of Study are Care Facilities and Elevator Lobbies/WTC Elevator issues. This proposal falls under the Care Facilities Area of Study. Information on the CTC, including: the sunset plan; meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the CTC website at: http://www.iccsafe.org/cs/CTC/Pages/default.aspx.

Cost Impact: Will not increase the cost of construction
This is coordination and correlation of requirements in existing provisions.

E 24-15

1006.3; (IFC[BE] 1006.3)

Proponent: Stephen Thomas, representing Colorado Chapter (sthomas@coloradocode.net)

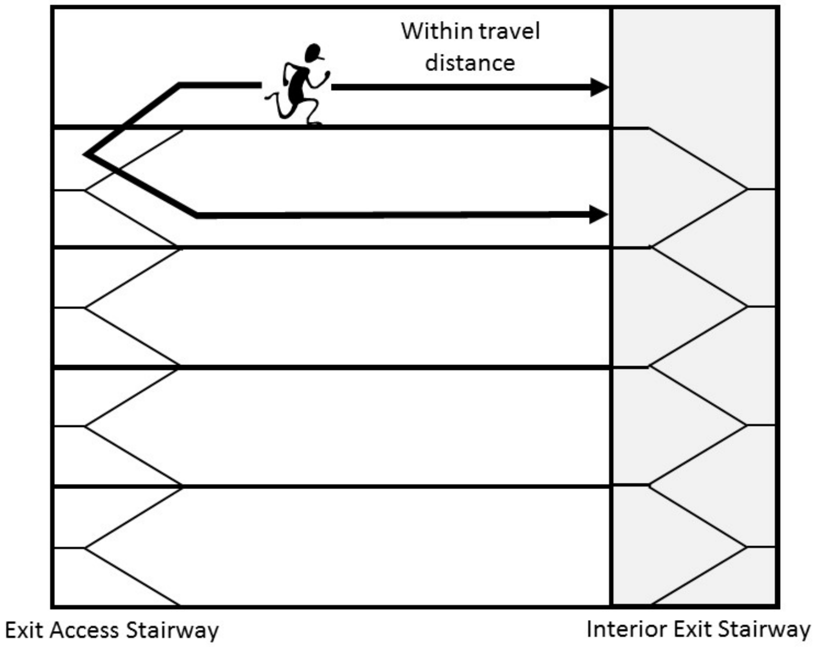
2015 International Building Code

Revise as follows:

1006.3 Egress from stories or occupied roofs. The *means of egress* system serving any *story* or occupied roof shall be provided with the number of independent *exits* or access to independent *exits* based on the aggregate *occupant load* served in accordance with this section. The *path of egress travel* to an *exit* shall not pass through more than one adjacent *story*.

Reason: This section has been interpreted to allow a single exit in a multi-story building. The intent is to clarify that there must be independent exits in a building. The interpretation has been that if a person is on an upper floor of a building, they have to have access to at least 2+ exits which can end up being the same interior exit stairway on an adjacent story.
This is how it works. A 5 story building has one interior exit stairway. An occupant has to have access to two exits. The first exit is accessed at the 5th floor within the required travel distance. The second exit is then accessed by going down an exit access stairway complying with Section 1019.3, item 4 to the 4th floor, across the floor to the single interior exit stairway, thus providing access to "two exits". Please see diagram below.

This was not the intent of the change in the 2015 code from my involvement in the committee. If that single stairway is lost for some reason, there is no other way for people in the building to egress through a protected means of egress.



Cost Impact: Will not increase the cost of construction
This is a clarification to the code and will not increase the cost of construction.

Staff note: There is a published errata to Section 1006.3. The errata in indicated in this proposal as existing text.

E 24-15 : 1006.3-THOMAS4557

E 25-15

1006.3, 1006.3.1; (IFC[BE] 1006.3, 1006.3.1)

Proponent: Gregory Keith, Professional heuristic Development, representing The Boeing Company (grkeith@mac.com); Stephen Thomas (sthomas@coloradocode.net)

2015 International Building Code

Revise as follows:

1006.3 Egress from stories or occupied roofs. The *means of egress* system serving any *story* or occupied roof shall be provided with the number of separate and distinct *exits* or access to *exits* based on the aggregate *occupant load* served in accordance with this section. Where an exit access stairway provides access to an exit at another story, a single interior or exterior exit stairway having entrances at each story shall not serve as both required exits for a single story. The *path of egress travel* to an *exit* shall not pass through more than one adjacent *story*.

1006.3.1 Egress based on occupant load. Each *story* and occupied roof shall have the minimum number of ~~independent~~ separate and distinct *exits*, or access to *exits*, as specified in Table 1006.3.1. A single *exit* or access to a single *exit* shall be permitted in accordance with Section 1006.3.2. The required number of *exits*, or *exit access stairways* or *ramps* providing access to *exits*, from any *story* or occupied roof shall be maintained until arrival at the *exit discharge* or a *public way*.

Reason: Section 1006.3.1 currently references "independent" exits. Independent can be a vague or judgemental term. The proposed "separate and distinct" language is more specific. Also, that terminology is currently used in the definition of common path of egress travel to identify a point where two exits or access to exits would be required.
Additionally, Section 1006.3 has been modified to include the qualifying requirement of "separate and distinct" as well. Conceivably, if both the entrance to an interior exit stairway at one story and the entrance to the same interior exit stairway at an adjacent story are both within the prescribed exit access travel distance limitations, it could be interpreted that the required number of exits requirement has been satisfied because the two entrances are "independent." To clarify the intent, a sentence has been added stating that a single interior exit stairway cannot serve as both exits from a given story. The separate and distinct terminology would require that there be a second formal exit available within established exit access travel limitations.

This proposal intends to amplify separate exit requirements. It is also intended to clarify that although required exits from a given story may be located at different building levels, the same interior exit stairway may not serve as satisfying multiple exit requirements. Obviously, if such interior exit stairway was compromised, the opportunity for a true alternate exit would be lost. Approval of this proposal increases occupant safety within the means of egress system.

Cost Impact: Will not increase the cost of construction
This proposal is intended to clarify current numbers of exits provisions.

Staff note: There is a published errata to Section 1006.3 and 1006.3.1. The errata is incorporated into this proposal as existing text.

E 25-15 : 1006.3-KEITH4704

E 26-15

1006.3; (IFC[BE] 1006.3)

Proponent: Rick Lupton, representing City of Seattle, Dept of Planning & Development (rick.lupton@seattle.gov)

2015 International Building Code

Revise as follows:

1006.3 Egress from stories or occupied roofs. The *means of egress* system serving any *story* or occupied roof shall be provided with the number of *exits* or access to *exits* based on the aggregate *occupant load* served in accordance with this section. The *path of egress travel* to an *exit* shall not pass through more than one adjacent *story*. <u>Where a story is required to have two or more exits or access to exits, the rooms, areas, or spaces within that story shall have access to no less that two exits, except as otherwise provided in this code.</u>

Reason: The code is not clear that where a story requires two or more exits (or access to exits) that all the rooms on that story require access to at least two exits, even if the room only requires one exit access -unless the room meets a specific exception such as direct egress to grade. The code change proposal clarifies the intent, while stiill enabling the single means of egress provisions for a space in Chapter 10 or elsewhere in the code, such as Section 402.8.3.

Cost Impact: Will not increase the cost of construction
No additional exits are required and so cost is not increased, though some designs may require further thought.

Staff note: There is a published errata to Section 1006.3. The errata is shown in the proposal as existing text.

E 26-15 : 1006.3-LUPTON5540

E 27-15

1006.3, 1006.3.1 (New); (IFC[BE] 1006.3, 1006.3.1 (New))

Proponent: Edward Kulik, Chair, representing Building Code Action Committee (bcac@iccsafe.org)

Revise as follows:

1006.3 Egress from stories or occupied roofs.
The *means of egress* system serving any *story* or occupied roof shall be provided with the number of *exits* or access to *exits* based on the aggregate *occupant load* served in accordance with this section. ~~The *path of egress travel* to an *exit* shall not pass through more than one adjacent *story*.~~

Add new text as follows:

<u>**1006.3.1 Adjacent story.** The path of egress travel to an exit shall not pass through more than one adjacent story.</u>

> <u>**Exception:** The path of egress travel to an exit shall be permitted to pass through more than one adjacent story in any of the following:</u>
>
> 1. <u>In Group R-1, R-2 or R-3 occupancies, exit access stairways and ramps connecting four stories or less serving and contained within an individual dwelling unit or sleeping unit or live/work unit.</u>
> 2. <u>Exit access stairways serving and contained within a Group R-3 congregate residence or a Group R-4 facility.</u>
> 3. <u>Exit access stairways and ramps in open parking garages that serve only the parking garage.</u>
> 4. <u>Exit access stairways and ramps serving open-air assembly seating complying with the exit access travel distance requirements of Section 1029.7.</u>
> 5. <u>Exit access stairways and ramps between the balcony, gallery or press box and the main assembly floor in occupancies such as theaters, places of religious worship, auditoriums and sports facilities.</u>

Reason: The intent of this proposal is to coordinate Section 1006.3 and the allowance for exit access stairways in Section 1019.3. The 2nd sentence of Section 1006.3 currently says that the required number of exits must be available not more than one story above or below the exit you are on. The first part of this proposal is to put that requirement in its own section, Section 1006.3.1.
Section 1019.3 Exception 1, allows for open exit access stairways for two story buildings. However, there are several situations where the intent was for open exit access stairways to be utilized for more than one story, provided that the travel distance is met – within a 3 or 4 story dwelling, in atriums, in open air seating, and from balconies. It is also the intent to allow for open stairways for multiple stories within open parking garages, per Section 1019.3 and Section 1017.3. Exceptions to new Section 1006.3.1 would clarify where this is permitted.

The exceptions here are direct copies of the exceptions in Section 1019.3. If there are revisions to those exceptions in this cycle, there will be a public comment to revise the language here to be consistent.

Alternatives also discussed where one exception to Section 1006.3.1 with a reference to specific exceptions in the open exit access stairway provisions in Section 1019.3; or removal of the sentence now in Section 1006.3.1.

In July/2014 the ICC Board decided to sunset the activities of the Code Technology Committee (CTC). This is being accomplished by re-assigning many of the CTC Areas of Study to the applicable Code Action Committee (CAC). This proposal falls under the CTC Area of Study entitled Unenclosed Exit Stairs. Information on the CTC, including: the sunset plan; meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the CTC website.http://www.iccsafe.org/cs/CTC/Pages/default.aspx

This public proposal is submitted by the ICC Building Code Action Committee (BCAC). The BCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the BCAC has held 13 open meetings and numerous workgroup calls which included members of the BCAC as well as any interested party to discuss and debate the proposed changes and the public comments. Related documentation and reports are posted on the BCAC website at:http://www.iccsafe.org/cs/BCAC/Pages/default.aspx .

Cost Impact: Will not increase the cost of construction
This is for clarification, therefore, there will be no additional requirements.

Staff note: There is a published errata to Section 1006.3. The errata is shown in the proposal as existing text.

E 27-15 : 1006.3-KULIK3645

E 28-15

1006.3.2, Table 1006.3.2(1) and Table 1006.3.2(2); (IFC[BE] 1006.3.2, Table 1006.3.2(1) and Table 1006.3.2(2))

Proponent: Wayne Jewell, Green Oak Charter Township, representing Green Oak Charter Township (wayne.jewell@twp.green-oak.mi.us); Dave Collins, representing the American Institute of Architects (dcollins@preview-group.com)

2015 International Building Code

Revise text as follows:

1006.3.2 Single exits. A single exit or access to a single exit shall be permitted from any story or occupied roof where one of the following conditions exists:

1. The occupant load, number of dwelling units and ~~common path of egress~~ exit access travel distance does not exceed the values in Table 1006.3.2(1) or 1006.3.2(2).
2. Rooms, areas and spaces complying with Section 1006.2.1 with exits that discharge directly to the exterior at the level of exit discharge, are permitted to have one exit or access to a single exit.
3. Parking garages where vehicles are mechanically parked shall be permitted to have one exit or access to a single exit.
4. Group R-3 and R-4 occupancies shall be permitted to have one exit or access to a single exit.
5. Individual single-story or multistory dwelling units shall be permitted to have a single exit or access to a single exit from the dwelling unit provided that both of the following criteria are met:
   5.1. The dwelling unit complies with Section 1006.2.1 as a space with one means of egress.
   5.2. Either the exit from the dwelling unit discharges directly to the exterior at the level of exit discharge, or the exit access outside the dwelling unit's entrance door provides access to not less than two approved independent exits.

TABLE 1006.3.2(1)
STORIES WITH ONE EXIT OR ACCESS TO ONE EXIT FOR R-2 OCCUPANCIES

STORY	OCCUPANCY	MAXIMUM NUMBER OF DWELLING UNITS	MAXIMUM ~~COMMON PATH OF EGRESS~~EXIT ACCESS TRAVEL DISTANCE
Basement, first, second or third story above grade plane	R-2[a, b]	4 dwelling units	125 feet
Fourth story above grade plane and higher	NP	NA	NA

For SI: 1 foot = 3048 mm.

NP = Not Permitted

NA = Not Applicable.

a. Buildings classified as Group R-2 equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1 or 903.3.1.2 and provided with *emergency escape and rescue openings* in accordance with Section 1030.

b. This table is used for R-2 occupancies consisting of *dwelling units.* For R-2 occupancies consisting of *sleeping units*, use Table 1006.3.2(2).

TABLE 1006.3.2(2)
STORIES WITH ONE EXIT OR ACCESS TO ONE EXIT FOR OTHER OCCUPANCIES

STORY	OCCUPANCY	MAXIMUM OCCUPANT LOAD PER STORY	MAXIMUM ~~COMMON PATH OF EGRESS~~EXIT ACCESS TRAVEL DISTANCE (feet)
	A, B[b] , E F[b] , M, U	49	75

First story above or below grade plane	H-2, H-3	3	25
	H-4, H-5, I, R-1, R-2[a,c] , R-4	10	75
	S[b,d]	29	75
Second story above grade plane	B, F, M, S[d]	29	75
Third story above grade plane and higher	NP	NA	NA

For SI: 1 foot = 304.8 mm.

NP = Not Permitted.

NA = Not Applicable.

a. Buildings classified as Group R-2 equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1 or 903.3.1.2 and provided with *emergency escape and rescue openings* in accordance with Section 1030.

b. Group B, F and S occupancies in buildings equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1 shall have a maximum *exit access* travel distance of 100 feet.

c. This table is used for R-2 occupancies consisting of *sleeping units*. For R-2 occupancies consisting of *dwelling units*, use Table 1006.3.2(1).

d. The length of *exit access* travel distance in a Group S-2 *open parking garage* shall be not more than 100 feet

Reason: Code hange E127 from the last cycle had the last column heading of both tables as maximum exit access travel distance. Code Change E1 changed it to maximum common path of egress. Since using that terminology of common path of travel distances when dealing with a single exit building can create confusion, it is suggested to return the terminology back to exit access travel distance which removes confusion and is still technically correct for single exit buildings or those where common path of travel is applicable. This change would literally not change the intent of the requirement – which is to measure to the top of an exit stairway or down the stairway with an exit access stairway. In the definition of 'common path of egress travel' we state that the occupants have 'access to two exits or exit access doorways' - how does that occur in a single exit building? *Common Path of Travel* distances are discussed in Section 1006.2.1 and prescribed in Table 1006.2.1; which do differ from the distances in Tables 1006.3.2(2) for some occupancies.

Cost Impact: Will not increase the cost of construction
This change is an editorial change and eliminates confusion. If it works maybe that redcues the cost of construction as time will be saved (which has a cost) trying to figure out what the code is saying, therefore saves cost.

Staff note: There is an errata to Section 1006.3.2 Item 1. This errata in incorporated into the code change as existing text.

E 28-15 : 1006.3.2-JEWELL5394

E 29-15

Table 1006.3.2, 1030.1 (IFC[BE] Table 1006.3.2, 1030.1)

Proponent: Carl Baldassarra, P.E., FSFPE, Chair, ICC Code Technology Committee, representing Code Technology Committee (CTC@iccsafe.org)

2015 International Building Code

Revise as follows:

1006.3.2 Single exits. A single *exit* or access to a single *exit* shall be permitted from any *story* or occupied roof where one of the following conditions exists:

1. The *occupant load*, number of *dwelling units* and common path of egress travel distance does not exceed the values in Table 1006.3.2(1) or 1006.3.2(2).
2. Rooms, areas and spaces complying with Section 1006.2.1 with *exits* that discharge directly to the exterior at the *level of exit discharge*, are permitted to have one *exit* or access to a single *exit*.
3. Parking garages where vehicles are mechanically parked shall be permitted to have one *exit* or access to a single *exit*.
4. Group R-3 and R-4 occupancies shall be permitted to have one *exit* or access to a single *exit*.
5. Individual single-story or multistory *dwelling units* shall be permitted to have a single exit or access to a single *exit* from the *dwelling unit* provided that both of the following criteria are met:
    1. The *dwelling unit* complies with Section 1006.2.1 as a space with one *means of egress.*
    2. Either the *exit* from the *dwelling unit* discharges directly to the exterior at the *level of exit discharge*, or the *exit access* outside the dwelling unit's entrance door provides access to not less than two approved independent *exits*.

TABLE 1006.3.2
STORIES WITH ONE EXIT OR ACCESS TO ONE EXIT FOR OTHER OCCUPANCIES

STORY	OCCUPANCY	MAXIMUM OCCUPANT LOAD PER STORY	MAXIMUM COMMON PATH OF EGRESS TRAVEL DISTANCE (feet)
First story above or below grade plane	A, B[b] , E F[b] , M, U	49	75
	H-2, H-3	3	25
	H-4, H-5, I, R-1, R-2[a,c]~~, R-4~~	10	75
	S[b,d]	29	75
Second story above grade plane	B, F, M, S[d]	29	75
Third story above grade plane and higher	NP	NA	NA

For SI: 1 foot = 304.8 mm.

NP = Not Permitted.

NA = Not Applicable.

a. Buildings classified as Group R-2 equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1 or 903.3.1.2 and provided with *emergency escape and rescue openings* in accordance with Section 1030.

b. Group B, F and S occupancies in buildings equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1 shall have a maximum *exit access* travel distance of 100 feet.

c. This table is used for R-2 occupancies consisting of *sleeping units*. For R-2 occupancies consisting of *dwelling units*, use Table 1006.3.2(1).

d. The length of *exit access* travel distance in a Group S-2 *open parking garage* shall be not more than 100 feet

1030.1 General.
In addition to the *means of egress* required by this chapter, provisions shall be made for *emergency escape and rescue openings* in Group R-2 occupancies in accordance with Tables 1006.3.2(1) and 1006.3.2(2) and Group R-3 and R-4 occupancies. *Basements* and sleeping rooms below the fourth story above *grade plane* shall have at least one exterior *emergency escape and rescue opening* in

accordance with this section. Where *basements* contain one or more sleeping rooms, *emergency escape and rescue openings* shall be required in each sleeping room, but shall not be required in adjoining areas of the *basement*. Such openings shall open directly into a *public way* or to a *yard* or *court* that opens to a *public way*.

Exceptions:

1. B*asements* with a ceiling height of less than 80 inches (2032 mm) shall not be required to have *emergency escape and rescue openings*.
2. *Emergency escape and rescue openings* are not required from *basements* or sleeping rooms that have an *exit* door or *exit access* door that opens directly into a *public way* or to a *yard*, *court* or exterior exit balcony that opens to a *public way*.
3. *Basements* without *habitable spaces* and having not more than 200 square feet (18.6 m^2) in floor area shall not be required to have *emergency escape and rescue openings*.

Reason: There is a conflict between Section 1006.3.2 Item 4 and Table 1006.3.2(2) due to multiple changes on the same section during the last cycle. Group R-4 are permitted to have multiple stories with one exit in the text, but limited to one story and 10 occupants in the table. Open exit access stairways are permitted in Group R-3 and R-4 in Section 1019.3 Item 3.

This will not negate the requirement for all bedrooms/sleeping units to have emergency escape windows in Section 1030.1. While Group R-4 should follow Group R-3 provisions, it is proposed to be added here to make sure it is applied.

The ICC Code Technology Committee (CTC) has just completed its 10th year. The ICC Board has decided to sunset the CTC. The sunset plan includes re-assigning many of the CTC Areas of Study to the applicable Code Action Committee (CAC). The two remaining CTC Areas of Study are Care Facilities and Elevator Lobbies/WTC Elevator issues. This proposal falls under the Care Facilities Area of Study. Information on the CTC, including: the sunset plan; meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the CTC website at: http://www.iccsafe.org/cs/CTC/Pages/default.aspx.

Cost Impact: Will not increase the cost of construction
This provides clarification in the current requirements.

Staff note: There is an errata to Section 1006.3.2 Item 1. This errata in incorporated into the code change as existing text.

1008.2; (IFC[BE] 1008.2)

Proponent: David Kulina, representing Engel Architects (david@engelarch.com)

2015 International Building Code

Revise as follows:

1008.2 Illumination required. The *means of egress* serving a room or space shall be illuminated at all times that the room or space is occupied.

Exceptions:

1. Occupancies in Group U.
2. *Aisle accessways* in Group A.
3. *Dwelling units* and *sleeping units* in Groups R-1, R-2 and R-3.
4. *Sleeping units* of Group I occupancies.
5. <u>Occupancies in Group F and S not served by artificial illumination.</u>

Reason: There is a significant minority of industrial and storage spaces that are either lit by sunlight (windows, daylight tubes, skylight, translucent panels, etc). These facilities are operated during daylight hours only, and so do not require artificial illumination. Therefore, if they have enough footcandles to adequately see the work being performed, they will have adequate light for egress.

Cost Impact: Will not increase the cost of construction
The costs will actually be decreased as unnecessary lights and emergency lights are eliminated.
This will encourage the use of natural lighting.
