Reason: The purpose of this proposal is to substantially improve the energy performance of residential buildings that comply with the IECC. This proposal is one part of an effort by DOE and other stakeholders to improve the energy efficiency of the IECC by 30% compared to the 2006 edition of the code. DOE recognizes that recent federal legislation, potential new legislation, movements in numerous state and local building code jurisdictions, and general environmental concerns dictate an unquestionable call for substantial reductions in the energy consumption of residential buildings. This proposal addresses that need via improvements to several key areas of the IECC, while minimizing the extent of structural/format change in the code, an important consideration for maximizing returns on past investments in training and infrastructure by code jurisdictions. There are four key areas of improvement in this proposal:

Reduced leakage in duct systems and building envelopes, verified by testing. The proposal requires that all ductwork be inside conditioned space, sets new leakage limits on the ductwork, and adds a new requirement for testing the air tightness of the building envelope. As an alternative, homes with high-efficiency HVAC equipment are exempted from the requirement for ducts inside the conditioned space and are subject to less stringent duct and whole-house testing requirements.

Several studies of recently built residences in states with the IECC code or other codes that require building envelope sealing show a distribution of air leakage rates, varying from low to high leakage. Based on these studies, DOE believes the proposed maximum leakage rates are already being achieved in well-sealed homes. The main effect of the proposed leakage rate limits will be to improve the considerable share of homes that have higher leakage rates.

The proposal would allow the code official to permit sampling (of not less than 1 in 7 buildings) for air tightness testing from a specific builder. The idea is that once the code official has gained confidence that the builder has a good track record of sealing properly to code, the sampling could be permitted to lower costs associated with the air leakage testing. The code official would still be required to do a visual inspection of air sealing in every new building.

Improved envelope insulation. Fenestration U-factors (including skylights) are reduced in most zones. The proposed U-factors for fenestration other than skylights in zones 2 and 3 match those that were approved by the IECC committee in the 07/08 cycle though these improvements were ultimately overturned at the final action hearings. Wood-frame wall insulation is increased from R-13 to R-20 in zone 4 and ceiling insulation levels are increased on zones 3 and 5.

New provisions to limit energy loss from domestic hot water pipes. The IECC and IRC currently have minimal requirements for energy efficiency related to water heating. This proposed pipe insulation requirement represent a modest initial investment that will save energy for the life of the home, even through water heating equipment changeouts. The proposed requirements are structured to encourage "short and skinny" pipe runs that will minimize energy losses due to stranded water in pipes. Hot water pipes that are longer and/or larger in diameter will require insulation. Either way, these requirements help save water and limit the energy wasted when a faucet or appliance is turned off and the pipes are left full of hot water.

Larger fraction of high efficacy lighting. The proposal increases the fraction of lamps that must be high-efficacy from 50% to 75%, a reasonable improvement given the advances in efficient lighting and the approaching Federal standards that will require efficient lighting by 2014.
This proposal has a number of other more minor changes to improve and clarify code language and save energy.

Cost Impact: The code change proposal will increase the cost of construction.

Analysis: A review of the standard(s) proposed for inclusion in the code, DOE 10 CFR 430, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

PART II – IRC BUILDING/ENERGY

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: MAJETTE-EC-65-202-CH 4-IRC R202-CH 11-

EC14–09/10

202 (New), 401.2, Table 402.1.1, 401.3, Table 402.1.3, Table 402.2.5, Section 402.4, 402.4.1.1 (New), 402.4.1.2.1 (New),403.2, 403.2.3 (New), 403.2.4 (New), 403.4, Table 403.4.2 (new), 403.5, 404 (New), Table 405.5.2(1), Chapter 6

Proponent: Ron Nickson, representing National Multi Housing Council

1. Add new definition as follows:

DEMAND RECIRCULATION WATER SYSTEM. A water distribution system where pumps prime the service hot water piping with heated water upon demand for hot water.

2. Revise as follows:

401.2 Compliance. Projects shall comply with Sections identified as "mandatory" and with either sections identified as "prescriptive" or the performance approach in Section 406. ~~Sections 401, 402.4, 402.5, and 403.1, 403.2.2, 403.2.3, and 403.3 through 403.9 (referred to as the mandatory provisions) and either:~~

1. ~~Sections 402.1 through 402.3, 403.2.1 and 404.1 (prescriptive); or~~
2. ~~Section 405 (performance).~~

401.3 Certificate (Mandatory). A permanent certificate shall be completed and posted on or in the electrical distribution panel by the builder or registered design professional. The certificate shall not cover or obstruct the visibility of the circuit directory label, service disconnect label or other required labels. ~~The certificate shall be completed by the builder or registered design professional.~~ The certificate shall list the predominant *R*-values of insulation installed in or on ceiling/roof, walls, foundation (slab, *basement wall*, crawlspace wall and/or floor) and ducts outside conditioned spaces; *U*-factors for fenestration and the solar heat gain coefficient (SHGC) of fenestration, and the results from any duct system and building envelope air leakage testing done on the building. Where there is more than one value for each component, the certificate shall list the value covering the largest area. The certificate shall list the types and efficiencies of heating, cooling and service water heating equipment. Where a gas-fired unvented room

heater, electric furnace, or baseboard electric heater is installed in the residence, the certificate shall list "gas-fired unvented room heater," "electric furnace" or "baseboard electric heater," as appropriate. An efficiency shall not be *listed* for gas-fired unvented room heaters, electric furnaces or electric baseboard heaters.

TABLE 402.1.1
INSULATION AND FENESTRATION REQUIREMENTS BY Component

4 except Marine	0.35	0.55 ~~0.60~~	NR	38	~~13~~ 20 or 13+5[g, h]	~~5 / 10~~ 8 / 13	19	10 / 13	10, 2 ft	10/13
5 and Marine 4	~~0.35~~ 0.32	0.55 ~~0.60~~	NR	~~38~~49	20 or 13+5[h]	13 / 17	30[g]	10/13	10,2ft	10/13
6	~~0.35~~ 0.32	0.55 ~~0.60~~	NR	49	20+5 or ~~13+5~~ 10[h]	15 / ~~19~~ 20	30[g]	15/19	10,4ft	10/13
7 and 8	~~0.35~~ 0.32	0.55 ~~0.60~~	NR	49	~~21~~ 20+5 or 13+10[h]	19 / 21	38[g]	15/19	10,4ft	10/13

For SI: 1 foot = 304.8 mm.

a. *R*-values are minimums. *U*-factors and SHGC are maximums. R-19 batts compressed into a nominal 2x6 framing cavity such that the R-value is reduced by R-1 or more shall be marked with the compressed batt R-value in addition to the full thickness R-value.
b. The fenestration *U*-factor column excludes skylights. The SHGC column applies to all glazed fenestration.
c. 15/19" means R-15 continuous ~~insulated sheathing~~ insulation on the interior or exterior of the home or R-19 cavity insulation at the interior of the basement wall. "15/19" shall be permitted to be met with R-13 cavity insulation on the interior of the basement wall plus R-5 continuous ~~insulated sheathing~~ insulation on the interior or exterior of the home. "10/13" means R-10 continuous ~~insulated sheathing~~ insulation on the interior or exterior of the home or R-13 cavity insulation at the interior of the basement wall.
d. R-5 shall be added to the required slab edge *R*-values for heated slabs. Insulation depth shall be the depth of the footing or 2 ft, whichever is less, in zones 1 through 3 for heated slabs.
e. There are no SHGC requirements in the Marine zone.
f. Basement wall insulation is not required in warm-humid locations as defined by Figure 301.1 and Table 301.1.
g. Or insulation sufficient to fill the framing cavity, R-19 minimum.
h. First value is cavity insulation, second is continuous insulation, so "13+5" means R-13 cavity insulation plus R-5 insulated sheathing. If structural sheathing covers 25 percent or less of the exterior, insulating sheathing is not required in the locations where structural sheathing is used. If structural sheathing covers more than 25 percent of exterior, structural sheathing shall be supplemented with insulated sheathing of at least R-2.
i. The second R-value applies when more than half the insulation is on the interior of the mass wall.
j. For impact rated fenestration in wind-borne debris regions ~~complying with Section R301.2.1.2 of the IRC or Section 1608.1.2 of the IBC~~, the maximum U-factor shall be 0.75 in Zone 2 and 0.65 in Zone 3.

TABLE 402.1.3

a. Nonfenestration *U*-factors shall be obtained from measurement, calculation or an approved source.
b. When more than half the insulation is on the interior, the mass wall U-factors shall be a maximum of 0.17 in zone 1, 0.14 in zone 2, 0.12 in zone 3, 0.10 in zone 4 except Marine, 0.087 in zone 5 and Marine 4, and the same as the frame wall U-factor in Marine zone 4 and zones 5 through 8.
c. Basement wall U-factor of 0.360 in warm-humid locations as defined by Figure 301.1 and Table 301.2.

TABLE 402.2.5
STEEL-FRAME CEILING, WALL AND FLOOR INSULATION

R-19	R-19+6 in 2×6; R-19+12 in 2×8 or 2×10

a. Cavity insulation *R*-value is listed first, followed by continuous insulation *R*-value.
b. Insulation exceeding the height of the framing shall cover the framing.

402.4 Air leakage (Mandatory).

402.4.1 Building thermal envelope. The *building thermal envelope* shall comply with Sections 402.4.1.1 and 402.4.1.2. ~~be durably sealed to limit infiltration.~~ The sealing methods between dissimilar materials shall allow for differential expansion and contraction. ~~The following shall be caulked, gasketed, weatherstripped or otherwise sealed with an air barrier material, suitable film or solid material:~~

~~1. All joints, seams and penetrations.~~
~~2. Site-built windows, doors and skylights.~~
~~3. Openings between window and door assemblies and their respective jambs and framing.~~
~~4. Utility penetrations.~~
~~5. Dropped ceilings or chases adjacent to the thermal envelope.~~
~~6. Knee walls.~~
~~7. Walls and ceilings separating a garage from conditioned spaces.~~
~~8. Behind tubs and showers on exterior walls.~~
~~9. Common walls between dwelling units.~~
~~10. Attic access openings.~~
~~11. Rim joist junction.~~
~~12. Other sources of infiltration.~~

3. Add new text as follows:

402.4.1.1 Installation. The components of the *building thermal envelope* as listed in Table 402.4.1.1 shall be installed in accordance with the manufacturer's instructions and the criteria listed in Table 402.4.1.1, as applicable to the method of construction. Where required by the *code official*, an *approved* party shall inspect all components and verify compliance.

4. Revise as follows:

TABLE ~~402.4.2~~ 402.4.1.1
AIR BARRIER AND INSULATION ~~INSPECTION COMPONENT CRITERIA~~ INSTALLATION

COMPONENT	CRITERIA
Air barrier and thermal barrier	A continuous air barrier shall be installed in the building envelope. ~~Exterior thermal envelope insulation for framed walls is installed in substantial contact and continuous alignment with building envelope air barrier.~~ Breaks or joints in the air barrier ~~are filled or repaired~~ shall be sealed. Air permeable insulation ~~is~~ shall not be used as a sealing material. Any air permeable insulation shall be installed ~~is~~ inside of an air barrier.
Ceiling / attic	The air barrier in any dropped ceiling / soffit ~~is substantially~~ shall be aligned with the insulation and any gaps ~~are~~ in the air barrier sealed. ~~Attic access (except unvented attic), knee wall door, or drop down stair is sealed.~~ Access openings, drop down stairs or knee wall doors to unconditioned attic spaces shall be sealed.
Walls	Corners and headers shall be ~~are~~ insulated and the~~.~~ junction of the foundation and sill plate ~~is~~ shall be sealed. The junction of the top plate and top of exterior walls shall be sealed. Exterior thermal envelope insulation for framed walls shall be installed in substantial contact and continuous alignment with the air barrier. Knee walls shall be sealed.
Windows, skylights and doors	The space between window/door jambs and framing and skylights and framing ~~is~~ shall be sealed.
Rim joists	Rim joists ~~are~~ shall be insulated and include ~~an~~ the air barrier.
Floors (including above garage and cantilevered floors)	Insulation ~~is~~ shall be installed to maintain permanent contact with underside of subfloor decking. The air barrier ~~is~~ shall be installed at any exposed edge of insulation.
Crawlspace walls	Where provided in lieu of floor insulation, insulation ~~is~~ shall be permanently attached to the crawlspace walls. Exposed earth in unvented crawlspaces ~~is~~ shall be covered with a class I vapor retarder with overlapping joints taped.
Shafts, penetrations	Duct shafts, utility penetrations, ~~knee walls,~~ and flue shafts opening to exterior or unconditioned space ~~are~~ shall be sealed.
Narrow cavities	Batts in narrow cavities ~~are~~ shall be cut to fit, or narrow cavities ~~are~~ shall be filled by ~~spayed/blown~~ insulation that on installation readily conforms to the available cavity space.
Garage separation	Air sealing ~~is~~ shall be provided between the garage and conditioned spaces.
Recessed lighting	Recessed light fixtures installed in the building thermal envelope ~~are~~ shall be airtight, IC rated, and sealed to the drywall. ~~Exception--fixtures in conditioned space.~~
Plumbing and Wiring	~~Insulation is placed between outside and pipes.~~ Batt insulation ~~is~~ shall be cut neatly to fit around wiring and plumbing in exterior walls, or ~~sprayed/blown~~ insulation that on installation readily conforms to available space shall extend~~s~~ behind piping and wiring.
Shower / tub on exterior wall	Exterior walls adjacent to showers and tubs ~~on exterior walls~~ shall be ~~have~~ insulat~~ion~~ed and ~~an~~ the air barrier installed separating them from the ~~exterior wall~~ showers and tubs.
Electrical / phone box on exterior walls	The air barrier ~~extends~~ shall be installed behind electrical or communication boxes or ~~an~~ air sealed ~~type~~ boxes ~~are~~ shall be installed.
Common wall	An air barrier ~~is~~ shall be installed in the common wall between dwelling units.
HVAC register boots	HVAC register boots that penetrate building thermal envelope ~~are~~ shall be sealed to the subfloor or drywall.
Fireplace	An air barrier shall be installed on fireplace walls. ~~include an air barrier.~~ Fireplaces shall have gasketed doors.

5. Delete and substitute as follows:

~~**402.4.2 Air sealing and insulation.** Building envelope air tightness and insulation installation shall be demonstrated to comply with one of the following options given by Section 402.4.2.1 or 402.4.2.2.~~

~~**402.4.2.1 Testing option.** Building envelope tightness and insulation installation shall be considered acceptable when tested air leakage is less than seven air changes per hour (ACH) when tested with a blower door at a pressure of 33.5 psf (50 Pa). Testing shall occur after rough in and after installation of penetrations of the building envelope, including penetrations for utilities, plumbing, electrical, ventilation and combustion appliances.~~

402.4.1.2 Testing. The building or dwelling unit shall be tested and verified as having an air leakage rate not exceeding 5 air changes per hour (ACH50) in Climate Zones 1 and 2, and 3 air changes per hour in Climate Zones 3 through 8. Testing shall be conducted with a blower door at a pressure of 0.2 inches w.g. (50 Pascals). Where required by the *code official*, testing shall be conducted by an *approved* party. A written report of the results of the test shall be signed by the party conducting the test and provided to the *code official*. Testing shall be performed at any time after rough in and creation of all penetrations of the *building thermal envelope*

Exception: Where heating and cooling equipment meets the requirements of Section 404, maximum leakage rate shall be seven air changes per hour (ACH50) in zones 1 and 2 and five air changes per hour in zones 3 through 8. Additions less than 1000 ft^2 are exempt from testing.

During testing:

1. Exterior windows and doors, fireplace and stove doors shall be closed, but not sealed~~,~~ beyond the intended weatherstripping or other infiltration control measures;
2. Dampers including exhaust, intake, makeup air, backdraft and flue dampers shall be closed, but not sealed, ~~including exhaust, intake, makeup air, backdraft and flue dampers~~ beyond intended infiltration control measures;
3. Interior doors, if installed at the time of test, shall be open;
4. Exterior openings for continuous ventilation systems and heat recovery ventilators shall be closed and sealed;
5. Heating and cooling system(s), if installed at the time of the test, shall be turned off; and
6. ~~HVAC ducts shall not be sealed; and~~

~~7~~ 6. Supply and return registers, if installed at the time of the test, shall ~~not~~ be ~~sealed~~ fully ~~open~~.

6. Add new text as follows:

402.4.1.2.1 Sampling. Where groups of seven or more buildings of similar design and construction are completed and are issued occupancy permits during a 120-day period, or where a multifamily structure contains more than four dwelling units, testing of less than 100%, but not less than 15%, of the buildings from a specific builder and/or contractor or of dwelling units in a multifamily structure shall be permitted when *approved* by the *code official*. The specific buildings or dwelling units to be tested shall be selected by the *code official*. If any tested building or dwelling unit fails to comply with the maximum air leakage requirement in Section 402.4.1.2 then all buildings or dwelling units shall be tested until a minimum of three consecutive buildings or dwelling units comply from that specific builder and/or contractor or multifamily structure before the *code official* may permit sampling to resume.

7. Delete without substitution:

~~**402.4.2.2 Visual inspection option.** Building envelope tightness and insulation installation shall be considered acceptable when the items listed in Table 402.4.2, applicable to the method of construction, are field verified. Where required by the *code official*, an *approved* party independent from the installer of the insulation shall inspect the air barrier and insulation.~~

~~**402.4.3 Fireplaces.** New wood-burning fireplaces shall have gasketed doors and outdoor combustion air.~~

8. Revise as follows:

403.2.2 Sealing (Mandatory). All ducts, air handlers, and filter boxes ~~and building cavities used as ducts~~ shall be sealed. Joints and seams shall comply with Section M1601.4.1 of the *International Residential Code*.

Exception: Duct tightness test is not required if the air handler and all ducts are located within *conditioned space*.

Duct tightness shall be verified by either of the following:

1. Postconstruction test: Total leakage ~~to outdoors~~ shall be less than or equal to ~~8~~ 4 cfm (~~226.5~~ 113.3 L/min)

per 100 ft^2 (9.29 m^2) of *conditioned floor area* ~~or a total leakage less than or equal to 12 cfm (12 L/min) per 100 ft^2 (9.29 m^2) of *conditioned floor area*~~ when tested at a pressure differential of 0.1 inches w.g. (25 Pa) across the entire system, including the manufacturer's air handler enclosure. All register boots shall be taped or otherwise sealed during the test.

2. Rough-in test: Total leakage shall be less than or equal to ~~6~~ 4 cfm (~~169.9~~ 113.3 L/min) per 100 ft^2 (9.29 m^2) of *conditioned floor area* when tested at a pressure differential of 0.1 inches w.g. (25 Pa) across the ~~roughed in~~ system, including the manufacturer's air handler enclosure. All register ~~boot~~s shall be taped or otherwise sealed during the test. If the air handler is not installed at the time of the test, total leakage shall be less than or equal to ~~4~~ 3 cfm (~~113.3~~ 85.0 L/min) per 100 ft^2 (9.29 m^2) of *conditioned floor area*.

   ~~**Exceptions:** Duct tightness test is not required if the air handler and all ducts are located within *conditioned space*~~.

   Exception: Where heating and cooling equipment meets the requirements of Section 404:

   1. Maximum total leakage shall be less than or equal to 6 cfm (169.9 L/min) per 100 ft^2 (9.29m^2) of conditioned floor area for ducts located outside conditioned space, and
   2. The maximum leakage test is not required for ducts and air handlers located entirely within conditioned space.

9. Add new text as follows:

403.2.3 Building cavities (Mandatory). Building framing cavities shall not be used as supply ducts.

403.2.4 Location (Prescriptive). All ducts and air handlers shall be located within the conditioned space.

Exception: Where heating and cooling equipment meets the requirements of Section 404.

10. Revise as follows:

403.4 Service hot water systems.

~~**403.4**~~ **403.4.1 Circulating hot water systems (Mandatory).** ~~All circulating service hot water piping shall be insulated to at least R-2.~~ Circulating hot water systems shall ~~include~~ be provided with an automatic or readily accessible manual switch that can turn off the hot water circulating pump when not in use.

11. Add new text and table as follows:

403.4.2 Hot water pipe insulation (Prescriptive). Insulation with a minimum thermal resistance (R-value) of at least R-3 shall be applied to the following:

1. Piping larger than 3/4 in. nominal diameter
2. Piping serving more than one dwelling unit
3. Piping from the water heater to kitchen outlets
4. Piping located outside the conditioned space
5. Piping from the water heater to a distribution manifold
6. Piping located under a floor slab
7. Buried piping
8. Supply and return piping in recirculation systems other than demand recirculation systems

All remaining piping shall be insulated to at least R-3 or meet the run length requirements of Table 403.4.2.

TABLE 403.4.2
MAXIMUM RUN LENGTH (feet)[a]

Nominal Pipe Diameter of Largest Diameter Pipe in the Run (in.)	3/8	1/2	3/4	> 3/4
Maximum Run Length	30	20	10	5

a. Total length of all piping from the distribution manifold or the recirculation loop to a point of use.

12. Revise as follows:

403.5 Mechanical ventilation (Mandatory). Bathrooms and kitchens shall be provided with ventilation that meets the requirements of Section M1507.3 of the *International Residential Code* or with other approved means of ventilation. Outdoor air intakes and exhausts shall have automatic or gravity dampers that close when the ventilation system is not operating.

Exception: If the building is designed to comply with the 3 ACH50 requirement specified in Section 402.4.1.2, the building shall comply with ASHRAE Standard 62.2.

13. Add new text as follows:

SECTION 404
IMPROVED EQUIPMENT EFFICIENCY ALTERNATIVE
(Prescriptive)

404.1 General. For new residences, Sections 404.1 and 402.2 shall be permitted as an alternative to certain requirements as specified by exceptions in Sections 402.4.1.2, 403.2.2, and 403.2.4.

404.2 Heating equipment. In Climate Zones 3 and 4 gas furnace AFUE shall be at least 90. In Climate Zones 5 through 8, gas furnace AFUE shall be at least 92. In Climate Zones 3 through 8, gas boiler, oil boiler, or oil furnace AFUE shall be at least 85. In Climate Zones 3 through 8, heat pump HSPF shall be at least 8.5. Ground source heat pumps shall have a minimum efficiency as specified in Table 503.2.3(2). All-electric heated buildings shall utilize either an air-source or ground source heat pump.

404.3 Cooling equipment. In Climate Zones 1 and 2, vapor compression air conditioning SEER shall be at least 16.0 and EER at least 12.5. In Climate Zone 3, vapor compression air conditioning SEER shall be at least 15.0 and EER at least 12.5. In Climate Zones 1 through 3, room air conditioner EER shall be at least 11.0 for air conditioners with capacity less than 20,000 Btu/hr, or 10.0 for capacities equal to or greater than 20,000 Btu/hr. Ground source heat pumps shall have a minimum efficiency as specified in Table 503.2.3(2).

14. Revise as follows:

SECTION ~~404~~ 405
ELECTRICAL POWER AND LIGHTING SYSTEMS

~~404.1~~ 405.1 Lighting equipment (Prescriptive). A minimum of ~~50~~ seventy-five percent of the lamps in permanently installed lighting fixtures shall be high efficacy lamps or a minimum of seventy-five percent of the permanently installed lighting fixtures shall contain only high efficacy lamps.

Exception: Low-voltage lighting.

TABLE 405.5.2(1)
SPECIFICATIONS FOR THE STANDARD REFERENCE AND PROPOSED DESIGNS

BUILDING COMPONENT	STANDARD REFERENCE DESIGN	PROPOSED DESIGN
Air Exchange Rate	~~Specific leakage area (SLA)[d] = 0.00036~~ The applicable natural leakage ACH rate at a pressure of 33.5 psf (50 Pa) as specified in Section 402.4.1.2 including the exception. ~~assuming no energy recovery~~. The mechanical ventilation rate shall be in addition to the natural leakage rate and the same as in the proposed design, but no greater than 0.01 x *CFA* + 7.5 x (*Nbr*+1) where: *CFA* = conditioned floor area *Nbr* = number of bedrooms Energy recovery shall not be assumed for mechanical ventilation.	For residences that are not tested, the same natural leakage rate as the standard reference design. ~~For residences without mechanical ventilation that are tested in accordance with ASHRAE 119, Section 5.1, the measured air exchange rate[e] but not less than 0.35 ACH~~ For tested residences ~~with mechanical ventilation that are tested in accordance with ASHRAE 119, Section 5.1~~, the measured air exchange rate[e] ~~combined with the~~

BUILDING COMPONENT	STANDARD REFERENCE DESIGN	PROPOSED DESIGN
		~~proposed~~ ~~mechanical ventilation rate, *f* which shall not be less than 0.01 x *CFA* + 7.5 x (*Nbr*+1)~~ ~~where:~~ ~~*CFA* = conditioned floor area~~ ~~*Nbr* = number of bedrooms~~ The mechanical ventilation rate is in addition to the natural leakage rate and shall be as proposed.
Thermal distribution systems	~~A thermal distribution system efficiency (DSE) of 0.88 shall be applied to both the heating and cooling system efficiencies for all systems other than tested duct systems. Duct insulation: From Section 403.2.1. For tested duct systems, the leakage rate shall be the applicable maximum rate from Section 403.2.2. 4 cfm (113.3 L/min) per 100 ft2 (9.29 m2) of conditioned floor area at a pressure differential of 0.1 inches w.g. (25 Pa).~~	Thermal distribution system efficiency shall be as tested or as specified by Table 405.5.2(2) if not tested. Duct insulation shall be as proposed.

e. Where required by the *code official*, testing shall be conducted by an *approved* party independent from the builder and the installer of insulation, air barrier and other sealing materials. ~~Tested envelope leakage shall be determined and documented by an independent party approved by the *code official*.~~ Hourly calculations as specified in the ~~2001~~ASHRAE *Handbook of Fundamentals*~~, Chapter 26, page 26.21, Equation 40 (Sherman-Grimsrud model)~~ or the equivalent shall be used to determine the energy loads resulting from infiltration.

(Portions of table and footnotes not shown remain unchanged)

15. Add new standard to Chapter 6 as follows:

ASHRAE

ANSI/ASHRAE
Standard 62.2-2007 Ventilation and Acceptable Indoor Air Quality in Low-Rise Residential Buildings

Reason: To add and Exception to Section 403.2.2 that exempts ducts in condition spaces from the requirement for duct sealing. This proposal repositions the current exception, which was deleted by DOE, concerning the exception that ducts do not need to be tested if the ducts and air handler are located within the condition space. Duct leakage is important only if the leakage is to the outside. Air leakage to the inside, if the ducts and air handler are located within the conditioned space, does not create any additional energy usage.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: The only difference between this code change proposal and EC5-09/10 is the added exception in Section 403.2.2.

Analysis: A review of the standard(s) proposed for inclusion in the code, ANSI/ASHRAE Standard 62.2-2007, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: NICKSON-EC-4-202-CH 4

EC15–09/10

202 (New), 401.2, Table 402.1.1, 401.3, Table 402.1.3, Table 402.2.5, Section 402.4, 402.4.1.1 (New), 402.4.1.2.1 (New),403.2, 403.2.3 (New), 403.2.4 (New), 403.4, Table 403.4.2 (new), 403.5, 404 (New), Table 405.5.2(1), Chapter 6

Proponent: Ron Nickson, representing National Multi Housing Council

1. Add new definition as follows:

DEMAND RECIRCULATION WATER SYSTEM. A water distribution system where pump(s) prime the service hot water piping with heated water upon demand for hot water.

2. Revise as follows:

401.2 Compliance. Projects shall comply with Sections identified as "mandatory" and with either sections identified as "prescriptive" or the performance approach in Section 406. ~~Sections 401, 402.4, 402.5, and 403.1, 403.2.2, 403.2.3, and 403.3 through 403.9 (referred to as the mandatory provisions) and either:~~

~~1. Sections 402.1 through 402.3, 403.2.1 and 404.1 (prescriptive); or~~
~~2. Section 405 (performance).~~

401.3 Certificate (Mandatory). A permanent certificate shall be completed and posted on or in the electrical distribution panel by the builder or registered design professional. The certificate shall not cover or obstruct the visibility of the circuit directory label, service disconnect label or other required labels. ~~The certificate shall be completed by the builder or registered design professional.~~ The certificate shall list the predominant *R*-values of insulation installed in or on ceiling/roof, walls, foundation (slab, *basement wall*, crawlspace wall and/or floor) and ducts outside conditioned spaces; *U*-factors for fenestration and the solar heat gain coefficient (SHGC) of fenestration, and the results from any duct system and building envelope air leakage testing done on the building. Where there is more than one value for each component, the certificate shall list the value covering the largest area. The certificate shall list the types and efficiencies of heating, cooling and service water heating equipment. Where a gas-fired unvented room heater, electric furnace, or baseboard electric heater is installed in the residence, the certificate shall list "gas-fired unvented room heater," "electric furnace" or "baseboard electric heater," as appropriate. An efficiency shall not be *listed* for gas-fired unvented room heaters, electric furnaces or electric baseboard heaters.

TABLE 402.1.1
INSULATION AND FENESTRATION REQUIREMENTS BY Component

CLIMATE ZONE	FENESTRATION *U*-FACTOR	SKYLIGHT *U*-FACTOR	GLAZED FENESTRATION SHGC	CEILING *R*-VALUE	WOOD FRAME WALL *R*-VALUE	MASS WALL *R*-VALUE[i]	FLOOR *R*-VALUE	BASEMENT[c] WALL *R*-VALUE	SLAB[d] *R*-VALUE & DEPTH	CRAWL SPACE[c] WALL *R*-VALUE

4 except Marine	0.35	0.55 ~~0.60~~	NR	38	~~13~~ 20 or 13+5[g, h]	~~5 / 10~~ 8 / 13	19	10 / 13	10, 2 ft	10/13
5 and Marine 4	~~0.35~~ 0.32	0.55 ~~0.60~~	NR	~~38~~49	20 or 13+5[h]	13 / 17	30[g]	10/13	10,2ft	10/13
6	~~0.35~~ 0.32	0.55 ~~0.60~~	NR	49	20+5 or 13+~~5~~ 10[h]	15 / ~~19~~ 20	30[g]	15/19	10,4ft	10/13
7 and 8	~~0.35~~ 0.32	0.55 ~~0.60~~	NR	49	~~21~~ 20+5 or 13+10[h]	19 / 21	38[g]	15/19	10,4ft	10/13

For SI: 1 foot = 304.8 mm.

a. *R*-values are minimums. *U*-factors and SHGC are maximums. R-19 batts compressed into a nominal 2x6 framing cavity such that the R-value is reduced by R-1 or more shall be marked with the compressed batt R-value in addition to the full thickness R-value.
b. The fenestration *U*-factor column excludes skylights. The SHGC column applies to all glazed fenestration.
c. 15/19" means R-15 continuous ~~insulated sheathing~~ insulation on the interior or exterior of the home or R-19 cavity insulation at the interior of the basement wall. "15/19" shall be permitted to be met with R-13 cavity insulation on the interior of the basement wall plus R-5 continuous ~~insulated sheathing~~ insulation on the interior or exterior of the home. "10/13" means R-10 continuous ~~insulated sheathing~~ insulation on the interior or exterior of the home or R-13 cavity insulation at the interior of the basement wall.
d. R-5 shall be added to the required slab edge *R*-values for heated slabs. Insulation depth shall be the depth of the footing or 2 ft, whichever is less, in zones 1 through 3 for heated slabs.
e. There are no SHGC requirements in the Marine zone.
f. Basement wall insulation is not required in warm-humid locations as defined by Figure 301.1 and Table 301.1.
g. Or insulation sufficient to fill the framing cavity, R-19 minimum.
h. First value is cavity insulation, second is continuous insulation, so "13+5" means R-13 cavity insulation plus R-5 insulated sheathing. If structural sheathing covers 25 percent or less of the exterior, insulating sheathing is not required in the locations where structural sheathing is used. If structural sheathing covers more than 25 percent of exterior, structural sheathing shall be supplemented with insulated sheathing of at least R-2.
i. The second R-value applies when more than half the insulation is on the interior of the mass wall.
j. For impact rated fenestration in wind-borne debris regions ~~complying with Section R301.2.1.2 of the IRC or Section 1608.1.2 of the IBC~~, the maximum U-factor shall be 0.75 in Zone 2 and 0.65 in Zone 3.

TABLE 402.1.3
EQUIVALENT *U*-FACTORS[a]

a. Nonfenestration *U*-factors shall be obtained from measurement, calculation or an approved source.
b. When more than half the insulation is on the interior, the mass wall U-factors shall be a maximum of 0.17 in zone 1, 0.14 in zone 2, 0.12 in zone 3, 0.10 in zone 4 except Marine, 0.087 in zone 5 and Marine 4, and the same as the frame wall U-factor in Marine zone 4 and zones 5 through 8.
c. Basement wall U-factor of 0.360 in warm-humid locations as defined by Figure 301.1 and Table 301.2.

TABLE 402.2.5

a. Cavity insulation *R*-value is listed first, followed by continuous insulation *R*-value.
b. Insulation exceeding the height of the framing shall cover the framing.

402.4 Air leakage (Mandatory).

402.4.1 Building thermal envelope. The *building thermal envelope* shall comply with Sections 402.4.1.1 and 402.4.1.2. ~~be durably sealed to limit infiltration.~~ The sealing methods between dissimilar materials shall allow for differential expansion and contraction. ~~The following shall be caulked, gasketed, weatherstripped or otherwise sealed with an air barrier material, suitable film or solid material:~~

~~1. All joints, seams and penetrations.~~
~~2. Site-built windows, doors and skylights.~~
~~3. Openings between window and door assemblies and their respective jambs and framing.~~
~~4. Utility penetrations.~~
~~5. Dropped ceilings or chases adjacent to the thermal envelope.~~
~~6. Knee walls.~~

7. ~~Walls and ceilings separating a garage from conditioned spaces.~~
8. ~~Behind tubs and showers on exterior walls.~~
9. ~~Common walls between dwelling units.~~
10. ~~Attic access openings.~~
11. ~~Rim joist junction.~~
12. ~~Other sources of infiltration.~~

3. Add new text as follows:

402.4.1.1 Installation. The components of the *building thermal envelope* as listed in Table 402.4.1.1 shall be installed in accordance with the manufacturer's instructions and the criteria listed in Table 402.4.1.1, as applicable to the method of construction. Where required by the *code official*, an *approved* party shall inspect all components and verify compliance.

4. Revise as follows:

Table 402.4.2~~.~~1.1
AIR BARRIER AND INSULATION ~~INSPECTION COMPONENT CRITERIA~~ INSTALLATION

COMPONENT	CRITERIA
Air barrier and thermal barrier	A continuous air barrier shall be installed in the building envelope. ~~Exterior thermal envelope insulation for framed walls is installed in substantial contact and continuous alignment with building envelope air barrier.~~ Breaks or joints in the air barrier ~~are filled or repaired~~ shall be sealed. Air permeable insulation ~~is~~ shall not be used as a sealing material. Any air permeable insulation shall be installed ~~is~~ inside of an air barrier.
Ceiling / attic	The air barrier in any dropped ceiling / soffit ~~is substantially~~ shall be aligned with the insulation and any gaps ~~are~~ in the air barrier sealed. ~~Attic access (except unvented attic), knee wall door, or drop down stair is sealed.~~ Access openings, drop down stairs or knee wall doors to unconditioned attic spaces shall be sealed.
Walls	Corners and headers shall be ~~are~~ insulated and the~~.~~ junction of the foundation and sill plate ~~is~~ shall be sealed. The junction of the top plate and top of exterior walls shall be sealed. Exterior thermal envelope insulation for framed walls shall be installed in substantial contact and continuous alignment with the air barrier. Knee walls shall be sealed.
Windows, skylights and doors	The space between window/door jambs and framing and skylights and framing ~~is~~ shall be sealed.
Rim joists	Rim joists ~~are~~ shall be insulated and include ~~an~~ the air barrier.
Floors (including above garage and cantilevered floors)	Insulation ~~is~~ shall be installed to maintain permanent contact with underside of subfloor decking. The air barrier ~~is~~ shall be installed at any exposed edge of insulation.
Crawlspace walls	Where provided in lieu of floor insulation, insulation ~~is~~ shall be permanently attached to the crawlspace walls. Exposed earth in unvented crawlspaces ~~is~~ shall be covered with a class I vapor retarder with overlapping joints taped.
Shafts, penetrations	Duct shafts, utility penetrations, ~~knee walls,~~ and flue shafts opening to exterior or unconditioned space ~~are~~ shall be sealed.
Narrow cavities	Batts in narrow cavities ~~are~~ shall be cut to fit, or narrow cavities ~~are~~ shall be filled by ~~spayed/blown~~ insulation that on installation readily conforms to the available cavity space.
Garage separation	Air sealing ~~is~~ shall be provided between the garage and conditioned spaces.
Recessed lighting	Recessed light fixtures installed in the building thermal envelope ~~are~~ shall be airtight, IC rated, and sealed to the drywall. ~~Exception - fixtures in conditioned space.~~
Plumbing and Wiring	~~Insulation is placed between outside and pipes.~~ Batt insulation ~~is~~ shall be cut neatly to fit around wiring and plumbing in exterior walls, or ~~sprayed/blown~~ insulation that on installation readily conforms to available space shall extend~~s~~ behind piping and wiring.
Shower / tub on exterior wall	Exterior walls adjacent to showers and tubs ~~on exterior walls~~ shall be ~~have~~ insulation~~ed~~ and ~~an~~ the air barrier installed separating them from the ~~exterior wall~~ showers and tubs.
Electrical / phone box on exterior walls	The air barrier ~~extends~~ shall be installed behind electrical or communication boxes or ~~an~~ air sealed ~~type~~ boxes ~~are~~ shall be installed.
Common wall	An air barrier ~~is~~ shall be installed in the common wall between dwelling units.
HVAC register boots	HVAC register boots that penetrate building thermal envelope ~~are~~ shall be sealed to the subfloor or drywall.
Fireplace	An air barrier shall be installed on fireplace walls. ~~include an air barrier.~~ Fireplaces shall have gasketed doors.

5. Delete and substitute as follows:

~~**402.4.2 Air sealing and insulation.** Building envelope air tightness and insulation installation shall be demonstrated to comply with one of the following options given by Section 402.4.2.1 or 402.4.2.2.~~

~~**402.4.2.1 Testing option.** Building envelope tightness and insulation installation shall be considered acceptable when~~

~~tested air leakage is less than seven air changes per hour (ACH) when tested with a blower door at a pressure of 33.5 psf (50 Pa). Testing shall occur after rough in and after installation of penetrations of the building envelope, including penetrations for utilities, plumbing, electrical, ventilation and combustion appliances.~~

402.4.1.2 Testing. The building or dwelling unit shall be tested and verified as having an air leakage rate not exceeding 5 air changes per hour (ACH50) in Climate zones 1 and 2, and 3 air changes per hour in Climate Zones 3 through 8. Testing shall be conducted with a blower door at a pressure of 0.2 inches w.g. (50 Pascals). Where required by the *code official*, testing shall be conducted by an *approved* party. A written report of the results of the test shall be signed by the party conducting the test and provided to the *code official*. Testing shall be performed at any time after rough in and creation of all penetrations of the *building thermal envelope*

Exceptions:

1. Where heating and cooling equipment meets the requirements of Section 404, maximum leakage rate shall be seven air changes per hour (ACH50) in zones 1 and 2 and five air changes per hour in zones 3 through 8. Additions less than 1000 ft^2 are exempt from testing.
2. Dwelling units of multi-family residential buildings with more than four individual units shall be excepted from the testing requirements if they satisfy the requirements of Section 402.1.1.

During testing:

1. Exterior windows and doors, fireplace and stove doors shall be closed, but not sealed~~;~~ beyond the intended weatherstripping or other infiltration control measures;
2. Dampers including exhaust, intake, makeup air, backdraft and flue dampers shall be closed, but not sealed, ~~including exhaust, intake, makeup air, backdraft and flue dampers~~ beyond intended infiltration control measures;
3. Interior doors, if installed at the time of test, shall be open;
4. Exterior openings for continuous ventilation systems and heat recovery ventilators shall be closed and sealed;
5. Heating and cooling system(s), if installed at the time of the test, shall be turned off; and
6. ~~HVAC ducts shall not be sealed; and~~

~~7~~ 6. Supply and return registers, if installed at the time of the test, shall ~~not~~ be ~~sealed~~ fully ~~open~~.

6. Add new text as follows:

402.4.1.2.1 Sampling. Where groups of seven or more buildings of similar design and construction are completed and are issued occupancy permits during a 120-day period, or where a multifamily structure contains more than four dwelling units, testing of less than 100%, but not less than 1 in 7 or 15%, of the buildings from a specific builder and/or contractor or of dwelling units in a multifamily structure shall be permitted when *approved* by the *code official*. The specific buildings or dwelling units to be tested shall be selected by the *code official*. If any tested building or dwelling unit fails to comply with the maximum air leakage requirement in Section 402.4.1.2 then all buildings or dwelling units shall be tested until a minimum of three consecutive buildings or dwelling units comply from that specific builder and/or contractor or multifamily structure before the *code official* may permit sampling to resume.

7. Delete without substitution:

~~**402.4.2.2 Visual inspection option.** Building envelope tightness and insulation installation shall be considered acceptable when the items listed in Table 402.4.2, applicable to the method of construction, are field verified. Where required by the *code official*, an *approved* party independent from the installer of the insulation shall inspect the air barrier and insulation.~~

~~**402.4.3 Fireplaces.** New wood-burning fireplaces shall have gasketed doors and outdoor combustion air.~~

8. Revise as follows:

403.2.2 Sealing (Mandatory). All ducts, air handlers, and filter boxes ~~and building cavities used as ducts~~ shall be sealed. Joints and seams shall comply with Section M1601.4.1 of the *International Residential Code*.

Duct tightness shall be verified by either of the following:

1. Postconstruction test: Total leakage ~~to outdoors~~ shall be less than or equal to ~~8~~ 4 cfm (~~226.5~~ 113.3 L/min) per

100 ft^2 (9.29 m^2) of *conditioned floor area* ~~or a total leakage less than or equal to 12 cfm (12 L/min) per 100 ft^2 (9.29 m^2) of *conditioned floor area*~~ when tested at a pressure differential of 0.1 inches w.g. (25 Pa) across the entire system, including the manufacturer's air handler enclosure. All register boots shall be taped or otherwise sealed during the test.

2. Rough-in test: Total leakage shall be less than or equal to ~~6~~ 4 cfm (~~169.9~~ 113.3 L/min) per 100 ft^2 (9.29 m^2) of *conditioned floor area* when tested at a pressure differential of 0.1 inches w.g. (25 Pa) across the ~~roughed in~~ system, including the manufacturer's air handler enclosure. All register ~~boot~~s shall be taped or otherwise sealed during the test. If the air handler is not installed at the time of the test, total leakage shall be less than or equal to ~~4~~ 3 cfm (~~113.3~~ 85.0 L/min) per 100 ft^2 (9.29 m^2) of *conditioned floor area*.

~~**Exceptions:** Duct tightness test is not required if the air handler and all ducts are located within *conditioned space*~~.

Exception: Where heating and cooling equipment meets the requirements of Section 404:

1. Maximum total leakage shall be less than or equal to 6 cfm (169.9 L/min) per 100 ft^2 (9.29m^2) of conditioned floor area for ducts located outside conditioned space, and
2. The maximum leakage test is not required for ducts and air handlers located entirely within conditioned space.

9. Add new text as follows:

403.2.3 Building cavities (Mandatory). Building framing cavities shall not be used as supply ducts.

403.2.4 Location (Prescriptive). All ducts and air handlers shall be located within the conditioned space.

Exception: Where heating and cooling equipment meets the requirements of Section 404.

10. Revise as follows:

403.4 Service hot water systems.

~~403.4~~ 403.4.1 Circulating hot water systems (Mandatory). ~~All circulating service hot water piping shall be insulated to at least R-2.~~ Circulating hot water systems shall ~~include~~ be provided with an automatic or readily accessible manual switch that can turn off the hot water circulating pump when not in use.

11. Add new text and table as follows:

403.4.2 Hot water pipe insulation (Prescriptive). Insulation with a minimum thermal resistance (R-value) of at least R-3 shall be applied to the following:

1. Piping larger than 3/4 in. nominal diameter
2. Piping serving more than one dwelling unit
3. Piping from the water heater to kitchen outlets
4. Piping located outside the conditioned space
5. Piping from the water heater to a distribution manifold
6. Piping located under a floor slab
7. Buried piping
8. Supply and return piping in recirculation systems other than demand recirculation systems

All remaining piping shall be insulated to at least R-3 or meet the run length requirements of Table 403.4.2.

TABLE 403.4.2
MAXIMUM RUN LENGTH (feet)[a]

Nominal Pipe Diameter of Largest Diameter Pipe in the Run (in.)	3/8	1/2	3/4	> 3/4
Maximum Run Length	30	20	10	5

a. Total length of all piping from the distribution manifold or the recirculation loop to a point of use.

12. Revise as follows:

403.5 Mechanical ventilation (Mandatory). Bathrooms and kitchens shall be provided with ventilation that meets the requirements of Section M1507.3 of the *International Residential Code* or with other approved means of ventilation. Outdoor air intakes and exhausts shall have automatic or gravity dampers that close when the ventilation system is not operating.

Exception: If the building is designed to comply with the 3 ACH50 requirement specified in Section 402.4.1.2, the building shall comply with ASHRAE Standard 62.2.

13. Add new text as follows:

404 Improved equipment efficiency alternative. (Prescriptive) For new residences, Sections 404.1 and 402.2 shall be permitted as an alternative to certain requirements as specified by exceptions in Sections 402.4.1.2, 403.2.2, and 403.2.4.

404.1 Heating equipment. In Climate Zones 3 and 4 gas furnace AFUE shall be at least 90. In Climate Zones 5 through 8, gas furnace AFUE shall be at least 92. In Climate Zones 3 through 8, gas boiler, oil boiler, or oil furnace AFUE shall be at least 85. In Climate Zones 3 through 8, heat pump HSPF shall be at least 8.5. Ground source heat pumps shall have a minimum efficiency as specified in Table 503.2.3(2). All-electric heated buildings shall utilize either an air-source or ground source heat pump.

404.2 Cooling Equipment. In Climate Zones 1 and 2, vapor compression air conditioning SEER shall be at least 16.0 and EER at least 12.5. In Climate Zone 3, vapor compression air conditioning SEER shall be at least 15.0 and EER at least 12.5. In Climate Zones 1 through 3, room air conditioner EER shall be at least 11.0 for air conditioners with capacity less than 20,000 Btu/hr, or 10.0 for capacities equal to or greater than 20,000 Btu/hr. Ground source heat pumps shall have a minimum efficiency as specified in Table 503.2.3(2).

14. Revise as follows:

SECTION ~~404~~ 405
ELECTRICAL POWER AND LIGHTING SYSTEMS

~~404.1~~ 405.1 Lighting equipment (Prescriptive). A minimum of ~~50~~ seventy-five percent of the lamps in permanently installed lighting fixtures shall be high efficacy lamps or a minimum of seventy-five percent of the permanently installed lighting fixtures shall contain only high efficacy lamps.

Exception: Low-voltage lighting.

TABLE 405.5.2(1)
SPECIFICATIONS FOR THE STANDARD REFERENCE AND PROPOSED DESIGNS

BUILDING COMPONENT	STANDARD REFERENCE DESIGN	PROPOSED DESIGN
Air Exchange Rate	~~Specific leakage area (SLA)[d] = 0.00036~~ The applicable natural leakage ACH rate at a pressure of 33.5 psf (50 Pa) as specified in Section 402.4.1.2 including the exception. ~~assuming no energy recovery~~. The mechanical ventilation rate shall be in addition to the natural leakage rate and the same as in the proposed design, but no greater than 0.01 x *CFA* + 7.5 x (*Nbr*+1) where: *CFA* = conditioned floor area *Nbr* = number of bedrooms Energy recovery shall not be assumed for mechanical ventilation.	For residences that are not tested, the same natural leakage rate as the standard reference design. ~~For residences without mechanical ventilation that are tested in accordance with ASHRAE 119, Section 5.1, the measured air exchange rate[e] but not less than 0.35 ACH~~ For tested residences ~~with mechanical ventilation that are tested in accordance with ASHRAE 119, Section 5.1~~, the measured air exchange rate[e] ~~combined with the~~ proposed mechanical ventilation rate, ~~*f* which shall not be less than 0.01 x *CFA* + 7.5 x (*Nbr*+1)~~

BUILDING COMPONENT	STANDARD REFERENCE DESIGN	PROPOSED DESIGN
		~~where:~~ ~~*CFA* = conditioned floor area~~ ~~*Nbr* = number of bedrooms~~ The mechanical ventilation rate is in addition to the natural leakage rate and shall be as proposed.
Thermal distribution systems	~~A thermal distribution system efficiency (DSE) of 0.88 shall be applied to both the heating and cooling system efficiencies for all systems other than tested duct systems. Duct insulation: From Section 403.2.1. For tested duct systems, the leakage rate shall be the applicable maximum rate from Section 403.2.2. 4 cfm (113.3 L/min) per 100 ft2 (9.29 m2) of conditioned floor area at a pressure differential of 0.1 inches w.g. (25 Pa).~~	Thermal distribution system efficiency shall be as tested or as specified by Table 405.5.2(2) if not tested. Duct insulation shall be as proposed.

e. Where required by the *code official*, testing shall be conducted by an *approved* party independent from the builder and the installer of insulation, air barrier and other sealing materials. ~~Tested envelope leakage shall be determined and documented by an independent party approved by the *code official*.~~ Hourly calculations as specified in the ~~2001~~ASHRAE *Handbook of Fundamentals*~~, Chapter 26, page 26.21, Equation 40 (Sherman-Grimsrud model)~~ or the equivalent shall be used to determine the energy loads resulting from infiltration.

(Portions of table and footnotes not shown remain unchanged)

15. Add new standard to Chapter 6 as follows:

ASHRAE

ANSI/ASHRAE
Standard 62.2-2007 Ventilation and Acceptable Indoor Air Quality in Low-Rise Residential Buildings

Reason: To address issues in the DOE proposal which are of concern to multifamily and would cause a major problem and expense to multi-famliy construction. Specifically:

Section 402.4.1.2 Testing. The NMHC proposed modification adds a second exception exempting multi-family residential properties from the blower door testing requirement. Changes were also made to Section 402.4.1.2.1 Sampling which are necessary if the proposed modification to not require testing of multi-family properties is accepted. It is very difficult if not impossible to obtain accurate and meaningful testing of multifamily properties because of the size of the building, the division of the building into many sub units (apartments), and the construction sequence.

a. Size of the building. The test is impractical because of the size of the building. Blower door testing of the entire building would require more than just the normal blower placed in the door opening of the building. The test would require either one very large blower or many individual blowers at multiple openings to pressurize the building as needed for the test. Even if done, because of the size of the building it would be virtually impossible to determine where the leaks are, or if the leakage problem is a combination of many small leaks or one large leak.
b. Sub units (apartments). Testing of individual apartments, as suggested in the DOE proposal, does not provide any accurate information on the leakage to the outside of the building which is the concerning in sealing up the building. Any leakage of air could just as well be leaking to the apartment next door, to the apartment above or below or to the hallway. Leakage to these areas is of little concern as they are all conditioned spaces and the leakage does not impose a additional load of the heating and cooling system.
c. Construction sequence. In most cases apartment type buildings are completed on a floor by floor bases, with apartments units on the lower floors being completed and in some cases occupied while work is being completed in apartments on the upper floors. This sequencing makes it difficult if not impossible to test the entire building because the different levels of the building completion and occupancy would have an impact of the true building performance during the blower door testing.

NMHC does not oppose the specific inspection requirements currently in the code and specifically detailed in Table 402.4.2 (DOE Table 402.4.1.1) as they, if done properly, will insure that the air barrier is installed.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: The only difference between this code change proposal and EC4-09/10 is the added exception in Section 402.4.1.2 and a slight difference in wording in Section 402.4.1.2.1.

Analysis: A review of the standard(s) proposed for inclusion in the code, ANSI/ASHRAE Standard 62.2-2007, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: NICKSON-EC-5-202-CH 4

EC16–09/10
103, 202, Chapter 4; IRC R202, N1102, N1103, N1104, N1105 (New)

Proponent: Ken Sagan, representing National Association of Home Builders

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IECC COMMITTEE. PART II WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IECC

1. Revise as follows:

103.2 Information on construction documents. Construction documents shall be drawn to scale upon suitable material. Electronic media documents are permitted to be submitted when *approved* by the *code official*. Construction documents shall be of sufficient clarity to indicate the location, nature and extent of the work proposed, and show in sufficient detail pertinent data and features of the building, systems and equipment as herein governed. Details shall include, but are not limited to, as applicable, cardinal directions; insulation materials and their R-values; fenestration U-factors and SHGCs; area-weighted U-factor and SHGC calculations; projection factor calculations; mechanical system design criteria; mechanical and service water heating system and equipment types, sizes and efficiencies; economizer description; equipment and systems controls; fan motor horsepower (hp) and controls; duct sealing, duct and pipe insulation and location; lighting fixture schedule with wattage and control narrative; and air sealing details.

2. Add new definitions as follows:

DEMAND RECIRCULATION WATER SYSTEM. A water distribution system where pumps prime the service water heating with heated water when triggered by a manual button or switch, or by sensing the presence of a person where the heated water is used.

PROJECTION FACTOR. The ratio of the horizontal depth of an overhang, eave, or permanently attached shading device, divided by the distance measured vertically from the bottom of the fenestration glazing to the underside of the overhang, eave, or permanently attached shading device.

3. Revise as follows:

401.1 Scope. This chapter applies to residential buildings.

401.2 Compliance. Projects shall comply with Sections 401, ~~402.4~~ 403.4, ~~402.5,~~ ~~403.1~~ 404.1, ~~403.2.2~~ 404.2.2, ~~403.2.3~~ 404.2.3 and ~~403.3~~ 404.3 through ~~403.9~~ 404.9 (referred to as the mandatory provisions) and either:

1. Sections 402, ~~402.1~~ 403.1 through ~~402.3~~ 403.3, ~~403.2.1~~ 404.2.1, 404.2.3, and ~~404.1~~ 405.1 (prescriptive); or
2. Section ~~405~~ 406 (performance).

401.3 Certificate. A permanent certificate shall be posted on or in the electrical distribution panel. The certificate shall not cover or obstruct the visibility of the circuit directory label, service disconnect label or other required labels. The certificate shall be completed by the builder or registered design professional. The certificate shall list the predominant *R*-values of insulation installed in or on ceiling/roof, walls, foundation (slab, basement wall, crawlspace wall and/or floor) and ducts outside conditioned spaces; *U*-factors for fenestration, ~~; and~~ the solar heat gain coefficient (SHGC) of fenestration and tested or sampled ACH_{50}. Where there is more than one value for each component, the certificate shall list the value covering the largest area. The certificate shall list the types and efficiency of heating, cooling and service water heating equipment. Where a gas-fired unvented room heater, electric furnace, and/or baseboard electric heater is installed in the residence, the certificate shall list "gas-fired unvented room heater", "electric furnace", or "baseboard electric heater" as appropriate. An efficiency shall not be listed for gas-fired unvented room heaters, electric furnaces, or electric baseboard heaters.

4. Add new text and table as follows:

401.4 Compliance testing. Where testing is required to determine air leakage of buildings or duct systems, the code official shall be permitted to require random sample testing of no fewer than one in seven residences.

SECTION 402
PRESCRIPTIVE REQUIREMENT TABLES

402.1 General (Prescriptive). The building thermal envelope and mechanical systems shall meet the requirements of one path in Table 402.1 based on the climate zone specified in Chapter 3. The prescriptive and mandatory provisions of Section 402, 403 and 404 shall be used in applying the requirements of Table 402.1.

TABLE 402.1

For SI: 1 foot = 304.8 mm.

(relettered and reordered in order of table)

a. *R*-values are minimums. *U*-factors and SHGC are maximums. R-19 batts compressed into a nominal 2x6 framing cavity such that the R-value is reduced by R-1 or more shall be marked with the compressed batt R-value in addition to the full thickness R-value.

b. The fenestration *U*-factor column excludes skylights. The SHGC column applies to all glazed fenestration. "NR" means no requirement.

cj. For impact rated fenestration complying with Section R301.2.1.2 of the International Residential Code or Section 1609.1.2 of the International Building Code, the maximum U-factor in Climate Zones 1-3 shall be permitted to be 0.15 higher than that specified in Table 402.1~~0.75 in Zone 2 and 0.65 in Zone 3~~.

de. There are no SHGC requirements in the Marine Zone.

e. SHGC calculations and exceptions are covered under Section 403.3.

fh. "xx+yy" means R-xx cavity insulation plus R-yy insulated sheathing. ~~"13+5" means R-13 cavity insulation plus R-5 insulated sheathing.~~ If structural sheathing covers 25 percent or less of the exterior, insulating sheathing is not required where structural sheathing is used. If structural sheathing covers more than 25 percent of exterior, structural sheathing shall be supplemented with insulated sheathing of at least R-2.

gi. The second R-value applies when more than half the insulation is on the interior of the mass wall and applies interior cavity insulation.

hg. Or insulation sufficient to fill the framing cavity, R-19 minimum.

ie. "15/19" means R-15 continuous insulated sheathing on the interior or exterior of the home or R-19 cavity insulation at the interior of the basement wall. "15/19" shall be permitted to be met with R-13 cavity insulation on the interior of the basement wall plus R-5 continuous insulated sheathing on the interior or exterior of the home. "10/13" means R-10 continuous insulated sheathing on the interior or exterior of the home or R-13 cavity insulation at the interior of the basement wall.

jd. R-5 shall be added to the required slab edge *R*-values for heated slabs. Insulation depth shall be the depth of the footing or 2 ft, whichever is less, in Zones 1 through 3 for heated slabs.

k. Air tightness testing requirements are listed in Section 403.4.1.1.

l. "Cond or Tested" means that the duct system shall either be located within conditioned space or tested in accordance with Section 404.2.2. "Reduced Leakage" means that the duct system shall comply with the requirements of section 404.2.3.

m. Heating system performance tested in accordance with ASHRAE Standard 103 or ARI Standard 210/240 or equivalent. Coefficient of Performance (COP) is converted into HSPF by multiplying by 3.413. "Standard" represents the prevailing minimum efficiency acceptable under federal law.

n. Cooling system performance tested in accordance with ARI Standard 210/240 or equivalent. Energy Efficiency Ratio (EER) is converted to SEER by multiplying EER*1.143. "Standard" represents the prevailing minimum efficiency acceptable under federal law.

o. Water heater Energy Factor requirements for Gas (G) and Electric (E) water heaters. "Standard" represents the prevailing minimum efficiency acceptable under federal law.

p. Basement wall insulation is not required in warm-humid locations as defined by Figure 301.1 and Table 301.1.

5. Revise as follows:

SECTION 403
BUILDING THERMAL ENVELOPE

~~402.1~~ 403.1 General (Prescriptive).

~~402.1.1 Insulation and fenestration criteria.~~ ~~The building thermal envelope shall meet the requirements of Table 402.1.1 based on the climate zone specified in Chapter 3.~~

403.1.1 Insulation Installation. All insulation installed as part of the building thermal envelope to achieve compliance with Table 402.1 shall be installed in accordance with the manufacturer's installation instructions and in a manner such that as installed it meets the specified performance levels provided in Table 402.1. An area-weighted average of each component shall be permitted to satisfy the requirements in Table 402.1.

~~402.1.2~~ 403.1.2 *R*-value computation. Insulation material used in layers, such as framing cavity insulation and insulating sheathing, shall be summed to compute the component *R*-value. The manufacturer's settled *R*-value shall be used for blown insulation. Computed *R*-values shall not include an *R*-value for other building materials or air films.

6. Delete table without substitution:

~~**TABLE 402.1.1**~~
~~**INSULATION AND FENESTRATION REQUIREMENTS BY COMPONENT**~~

7. Revise and renumber as follows:

TABLE ~~402.1.3~~ 403.1.3
EQUIVALENT *U*-FACTORS[a]

CLIMATE ZONE	FENES-TRATION *U*-FACTOR	SKYLIGHT *U*-FACTOR	Glazed Fenestration SHGC	CEILING *U*-FACTOR	FRAME WALL *U*-FACTOR	MASS WALL *U*-FACTOR[b]	FLOOR *U*-FACTOR	BASEMENT WALL *U*-FACTOR[d]	CRAWL SPACE WALL *U*-FACTOR[c]	ENVELOPE LEAKAGE RATES (ACH50)

a. Nonfenestration *U*-factors shall be obtained from measurement, calculation or an approved source.
b. When more than half the insulation is on the interior, the mass wall U-factors shall be a maximum of 0.17 in Zone 1, 0.14 in Zone 2, 0.12 in Zone 3, 0.10 in Zone 4 except Marine, and the same as the frame wall U-factor in Marine Zone 4 and Zones 5 through 8.
c. Basement wall U-factor of 0.360 in warm-humid locations as defined by Figure 301.1 and Table 301.2.
d. Foundation U-factor requirements shown in Table ~~402.1.3~~ 403.1.3 include wall construction and interior air films but exclude soil conductivity and exterior air films. U-factors for determining code compliance in accordance with Section ~~402.1.4~~ 403.1.4 (total UA alternative) of Section 405 (Simulated Performance Alternative) shall be modified to include soil conductivity and exterior air film.

~~402.1.3~~ 403.1.3 *U*-factor alternative. An assembly with a *U*-factor equal to or less than the equivalent R-value specified in Table 402.1 determined by using a method consistent with the ASHRAE *Handbook of Fundamentals* including the thermal bridging effects of framing materials shall be permitted as an alternative to the required *R*-value in Table 402.1.1 for the selected path. Nonfenestration *U*-factors or R-values shall be obtained from measurement, calculation or an approved source.~~that specified in Table 402.1.3 shall be permitted as an alternative to the *R*-value in Table 402.1.1.~~

~~402.1.4~~ 403.1.4 Total UA alternative. If the total building thermal envelope UA (sum of *U*-factor times assembly area) is less than or equal to the total UA resulting from using the *U*-factors in Table ~~402.1.3~~ 403.1.3 (multiplied by the same assembly area as in the proposed building), the building shall be considered in compliance with the R-value and U-factor requirements of Table ~~402.1.1~~ 402.1. The UA calculation shall be done using a method consistent with the ASHRAE *Handbook of Fundamentals* and shall include the thermal bridging effects of framing materials. The SHGC and Envelope Leakage rate requirements in Table 403.1.3 shall be met in addition to UA compliance.

~~402.2~~ 403.2 Specific insulation requirements (Prescriptive).

8. Add new text and table as follows:

403.2.1 Ceilings with attic space. Wherever full height of uncompressed insulation extends over the wall top plate at the eaves, the reduced values in Table 403.2.1 shall be deemed to satisfy the ceiling insulation requirements. This reduction shall not apply to the U-factor alternative approach in Section 403.1.3 and the Total UA alternative in Section 403.1.4.

TABLE 403.2.1
ALLOWABLE CEILING R-VALUE WITH FULL HEIGHT PERIMETER INSULATION

TABLE 402.1 LISTED CEILING R-VALUE	ALLOWABLE R-VALUE WITH FULL HEIGHT PERIMETER INSULATION
38	30
49	38
60	49

9. Delete without substitution:

~~402.2.1 Ceilings with attic spaces.~~ ~~When Section 402.1.1 would require R-38 in the ceiling, R-30 shall be deemed to satisfy the requirement for R-38 wherever the full height of uncompressed R-30 insulation extends over the wall top plate at the eaves. Similarly R-38 shall be deemed to satisfy the requirement for R-49 wherever the full height of uncompressed R-38 insulation extends over the wall top plate at the eaves. This reduction shall not apply to the U-factor alternative approach in Section 402.1.3 and the Total UA alternative in Section 402.1.4.~~

10. Revise and renumber as follows:

~~402.2.2~~ 403.2.2 Ceilings without attic spaces. Where Section ~~402.1.1~~ 402.1 would require insulation levels above R-30 and the design of the roof/ceiling assembly does not allow sufficient space for the required insulation, the minimum required insulation for such roof/ceiling assemblies shall be R-30. This reduction of insulation from the requirements of Section 402.1.1 shall be limited to 500 square feet (46 m^2) or 20% of the total insulated ceiling area, whichever is less. This reduction shall not apply to the U-factor alternative approach in Section ~~402.1.3~~ 403.1.3 and the Total UA alternative in Section ~~402.1.4~~ 403.1.4.

~~402.2.3~~ 403.2.3 Access hatches and doors. Access doors from conditioned spaces to unconditioned spaces (e.g., attics and crawl spaces) shall be weatherstripped and insulated to a level equivalent to the insulation on the surrounding surfaces. Access shall be provided to all equipment which prevents damaging or compressing the insulation. A wood framed or equivalent baffle or retainer is required to be provided when loose fill insulation is installed, the purpose of which is to prevent the loose fill insulation from spilling into the living space when the attic access is opened, and to provide a permanent means of maintaining the installed R-value of the loose fill insulation.

~~402.2.4~~ **403.2.4 Mass walls.** Mass walls for the purposes of this Chapter shall be considered above grade walls of concrete block, concrete, insulated concrete form (ICF), masonry cavity, brick (other than brick veneer), earth (adobe, compressed earth block, rammed earth) and solid timber/logs.

~~402.2.5~~ **403.2.5 Steel-frame ceilings, walls and floors.** Steel-frame ceilings, walls and floors shall meet the insulation requirements of Table ~~402.2.5~~ 403.2.5 or shall meet the *U*-factor requirements in Table ~~402.1.3~~ 403.1.3. The calculation of the *U*-factor for a steel-frame envelope assembly shall use a series-parallel path calculation method.

~~**Exception:** In Climate Zones 1 and 2, the continuous insulation requirements in Table 403~~2.2.4~~5~~ ~~shall be permitted to be reduced to R-3 for steel frame wall assemblies with studs spaced at 24 inches (610 mm) on center.~~

TABLE ~~402.2.5~~ 403.2.5
STEEL-FRAME CEILING, WALL AND FLOOR INSULATION
(*R*-VALUE)

WOOD FRAME *R*-VALUE REQUIREMENT	COLD-FORMED STEEL EQUIVALENT *R*-VALUE[a]
	Steel Truss Ceilings[b]
R-30	R -38 or R-30+3 or R-26+5
R-38	R -49 or R-38+3
R-49	R-38+5
	Steel Joist Ceilings[b]
R-30	R-38 in 2×4 or 2×6 or 2×8 R - 49 in any framing
R-38	R -49 in 2×4 or 2×6 or 2×8 or 2×10
	Steel Framed Wall
R-13[c]	R -13+5 or R-15+4 or R-21+3 or R-0+10
R-19	R -13+9 or R-19+8 or R-25+7
R-21	R-13+10 or R-19+9 or R-25+8
	Steel Joist Floor
R-13	R-19 in 2×6; R-19+6 in 2×8 or 2×10
R-19	R-19+6 in 2×6; R-19+12 in 2×8 or 2×10

a. Cavity insulation *R*-value is listed first, followed by continuous insulation *R*-value.
b. Insulation exceeding the height of the framing shall cover the framing.
c. Under prescriptive paths 2, 3, and 4, insulation for steel framed wall assemblies with studs spaced 24 inches (610mm) on center shall be permitted to be R-13+0 when ceiling insulation is increased to a wood framed equivalent of R-38 in climate zones 1 and 2 and permitted to be R-13+3 when ceiling insulation is increased to a wood framed equivalent of R-49 in climate zones 3 and 4.

~~402.2.6~~ **403.2.6 Floors.** Floor insulation shall be installed to maintain permanent contact with the underside of the subfloor decking.

~~402.2.7~~ **403.2.7 Basement walls.** Walls associated with conditioned basements shall be insulated from the top of the basement wall down to 10 feet (3048 mm) below grade or to the basement floor, whichever is less. Walls associated with unconditioned basements shall meet this requirement unless the floor overhead is insulated in accordance with Sections ~~402.1.1~~ 402.1 and ~~402.2.6~~ 403.2.6.

~~402.2.8~~ **403.2.8 Slab-on-grade floors.** Slab-on-grade floors with a floor surface less than 12 inches (305 mm) below grade shall be insulated in accordance with Table ~~402.1.1~~ 402.1. The insulation shall extend downward from the top of the slab on the outside or inside of the foundation wall. Insulation located below grade shall be extended the distance provided in Table ~~402.1.1~~ 402.1 by any combination of vertical insulation, insulation extending under the slab or insulation extending out from the building. Insulation extending away from the building shall be protected by pavement or by a minimum of 10 inches (254 mm) of soil. The top edge of the insulation installed between the exterior wall and the edge of the interior slab shall be permitted to be cut at a 45-degree (0.79 rad) angle away from the exterior wall. Slab-edge insulation is not required in jurisdictions designated by the code official as having a very heavy termite infestation.

~~402.2.9~~ **403.2.9 Crawl space walls.** As an alternative to insulating floors over crawl spaces, crawl space walls shall be permitted to be insulated when the crawl space is not vented to the outside. Crawl space wall insulation shall be permanently fastened to the wall and extend downward from the floor to the finished grade level and then vertically and/or horizontally for at least an additional 24 inches (610 mm). Exposed earth in unvented crawl space foundations

shall be covered with a continuous Class I vapor retarder. All joints of the vapor retarder shall overlap by 6 inches (153 mm) and be sealed or taped. The edges of the vapor retarder shall extend at least 6 inches (153 mm) up the stem wall and shall be attached to the stem wall.

~~402.2.10~~ 403.2.10 **Masonry veneer.** Insulation shall not be required on the horizontal portion of the foundation that supports a masonry veneer.

~~402.2.11~~ 403.2.11 **Thermally isolated sunroom insulation.** The minimum ceiling insulation *R*-values shall be R-19 in zones 1 through 4 and R-24 in zones 5 though 8. The minimum wall *R*-value shall be R-13 in all zones. New wall(s) separating a sunroom from conditioned space shall meet the building thermal envelope requirements.

~~402.3~~ 403.3 **Fenestration (Prescriptive).**

~~402.3.1~~ 403.3.1 ***U*-factor.** An area-weighted average of fenestration products shall be permitted to satisfy the *U*-factor requirements.

~~402.3.2~~ 403.3.2 **Glazed fenestration SHGC.** An area-weighted average of fenestration products more than 50 percent glazed shall be permitted to satisfy the SHGC requirements.

11. Add new text and table as follows:

403.3.3 Glazed Fenestration SHGC exception. In climate zones 1-3, vertical fenestration shaded by an overhang, eave, or permanently attached shading device shall be permitted to satisfy the SHGC requirements provided the projection factor is greater than or equal to the value listed in table N1103.3.3 for the appropriate orientation. The overhang, eave, or permanently attached shading device shall have a minimum projection that shall extend beyond each side of the glazing a minimum of 12 inches. Where different windows and glazed doors have different projection factors, they shall each be evaluated separately, or an area-weighted projection factor value shall be calculated and used. Each orientation shall be rounded to the nearest cardinal orientation (+/-45 degrees or 0.79 rad) for purposes of calculations and demonstrating compliance.

TABLE 403.3.3
MINIMUM PROJECTION FACTOR REQUIRED BY ORIENTATION FOR SHGC EXCEPTION

ORIENTATION	PROJECTION FACTOR
North	>=0.30
South	>=0.20
East	>=0.50
West	>=0.50

12. Revise and renumber as follows:

~~402.3.3~~ 403.3.4 **Glazed fenestration exemption.** Up to 15 square feet (1.4 m^2) of glazed fenestration per dwelling unit shall be permitted to be exempt from *U*-factor and SHGC requirements in Section ~~402.1.1~~ 402.1. This exemption shall not apply to the U-factor alternative approach in Section ~~402.1.3~~ 403.1.3 and the Total UA alternative in Section ~~402.1.4~~ 403.1.4.

~~402.3.4~~ 403.3.5 **Opaque door exemption.** One side-hinged opaque door assembly up to 24 square feet (22 m^2) in area is exempted from the *U*-factor requirement in Section 402.1.1. This exemption shall not apply to the U-factor alternative approach in Section ~~402.1.3~~ 403.1.3 and the Total UA alternative in Section 403~~2~~.1.4.

~~402.3.5~~ 403.3.6 **Thermally isolated sunroom *U*-factor.** For Zones 4 through 8, the maximum fenestration *U*-factor shall be 0.50 and the maximum skylight *U*-factor shall be 0.75. New windows and doors separating the sunroom from conditioned space shall meet the building thermal envelope requirements.

~~402.3.6~~ 403.3.7 **Replacement fenestration.** Where some or all of an existing fenestration unit is replaced with a new fenestration product, including sash and glazing, the replacement fenestration unit shall meet the ~~applicable~~ following requirements for *U*-factor and SHGC ~~in Table 402.1.1~~. : SHGC in climate zones 1-3 of 0.30, U-Factor of 0.5 in climate zones 2, 3, 0.35 in climate zones 4,5, 0.32 in climate zones 6, 7 and 8 subject to the all the provisions in Section 403.3.

~~402.4~~ 403.4 **Air leakage (Mandatory).**

~~402.4.1~~ 403.4.1 **Building thermal envelope.** The building thermal envelope shall be durably sealed to limit infiltration. The sealing methods between dissimilar materials shall allow for differential expansion and contraction. ~~The following shall be caulked, gasketed, weatherstripped or otherwise sealed with an air barrier material, suitable film or solid material:~~

~~1. All joints, seams and penetrations.~~
~~2. Site-built windows, doors and skylights.~~
~~3. Openings between window and door assemblies and their respective jambs and framing.~~
~~4. Utility penetrations.~~
~~5. Dropped ceilings or chases adjacent to the thermal envelope.~~
~~6. Knee walls.~~
~~7. Walls and ceilings separating a garage from conditioned spaces.~~
~~8. Behind tubs and showers on exterior walls.~~
~~9. Common walls between dwelling units.~~
~~10. Attic access openings~~
~~11. Rim joist junction~~
~~12. Other sources of infiltration.~~

~~**402.4.2 Air sealing and insulation.**~~ Building envelope air tightness shall be demonstrated to comply with a pre-close visual inspection and air tightness testing in accordance with Sections 403.4.1.1 and 403.4.1.2. ~~and insulation installation shall be demonstrated to comply with one of the following options given by Section 402.4.2.1 or 402.4.2.2:~~

~~**402.4.2.1**~~ 403.4.1.1 **Testing ~~option~~.** Building envelope tightness and insulation installation shall be considered acceptable when tested air leakage is less than or equal to the building ~~seven~~ air changes per hour (ACH) listed in the selected path of Table 402.1 when tested with a blower door apparatus at a pressure of 0.2 in w.c.~~33.5 psi~~ (50 Pa). Testing shall occur after rough in and after installation of penetrations of the building envelope, including penetrations for utilities, plumbing, electrical, ventilation, and combustion appliances.

During testing:

1. Exterior windows and doors, fireplace and stove doors shall be closed, but not sealed;
2. Dampers shall be closed, but not sealed; including exhaust, intake, makeup air, back draft, and flue dampers;
3. Interior doors shall be open;
4. Exterior openings for continuous ventilation systems and heat recovery ventilators shall be closed and sealed;
5. Heating and cooling system(s) shall be turned off;
6. HVAC ducts shall not be sealed; and
7. Supply and return registers shall not be sealed.

13. Add new text as follows:

403.4.1.1.1 Multi-family and single family attached. For residential occupancies other than single family detached dwellings, testing shall be permitted to be the entire building tested simultaneously or a sampling of no fewer than 1 in 7 individual units within the structure. Individual unit tightness shall be permitted to be determined by either total unit leakage or leakage to unconditioned space (including outside). Where multiple tests are performed for a building, the average tightness of tested units shall be permitted to satisfy the required building envelope airtightness level.

403.4.1.1.2 Failed testing. If the dwelling does not achieve the air-leakage requirement on the initial test, after an attempt to correct, a subsequent test must be performed that demonstrates compliance or at least a 10% reduction in leakage and within 1 ACH of the required tightness.

Exception: Testing is not required in climate zones 1-4 for residences claiming an air tightness level of 7 ACH50.

14. Revise and renumber as follows:

~~**402.4.2.2**~~ 403.4.1.2 **Visual inspection ~~option~~:** Building envelope tightness and insulation installation shall be considered acceptable when the items listed in Table ~~402.4.2~~ 403.4.1.2, applicable to the method of construction, are field verified~~. Where required by the code official,~~ or an approved party ~~independent from the installer of the insulation, shall inspect the air barrier and insulation~~.

~~402.4.3~~ **403.4.2 Fireplaces.** New wood-burning fireplaces shall have gasketed doors and outdoor combustion air.

~~402.4.4~~ **403.4.3 Fenestration air leakage.** Windows, skylights and sliding glass doors shall have an air infiltration rate of no more than 0.3 cfm per square foot (1.5 L/s/m^2), and swinging doors no more than 0.5 cfm per square foot (2.6 L/s/m^2), when tested according to NFRC 400 or AAMA/WDMA/CSA 101/I.S.2/A440 by an accredited, independent laboratory and listed and labeled by the manufacturer.

Exceptions: Site-built windows, skylights and doors.

TABLE ~~402.4.2~~ 403.4.1.2
AIR BARRIER AND INSULATION INSPECTION COMPONENT CRITERIA

COMPONENT	CRITERIA
Air barrier and thermal barrier	Exterior thermal envelope insulation for framed walls is installed in substantial contact and continuous alignment with building envelope air barrier. Breaks or joints in the air barrier are filled or repaired. Air permeable insulation is not used as a sealing material. Air permeable insulation is inside of an air barrier.
Ceiling / attic	Air barrier in any dropped ceiling / soffit is substantially aligned with insulation and any gaps are sealed. Attic access (except unvented attic), knee wall door, or drop down stair is sealed.
Walls	Corners and headers are insulated. Junction of foundation and sill plate is sealed.
Windows and doors	Space between window/door jambs and framing is sealed.
Rim joists	Rim joists are insulated and include an air barrier.
Floors (including above garage and cantilevered floors)	Insulation is installed to maintain permanent contact with underside of subfloor decking. Air barrier is installed at any exposed edge of insulation.
Crawl space walls	Insulation is permanently attached to walls. Exposed earth in unvented crawlspaces is covered with class I vapor retarder with overlapping joints taped.
Shafts, penetrations	Duct shafts, utility penetrations, knee walls, and flue shafts opening to exterior or unconditioned space are sealed.
Narrow cavities	Batts in narrow cavities are cut to fit, or narrow cavities are filled by spayed/blown insulation.
Garage separation	Air sealing is provided between the garage and conditioned spaces.
Recessed lighting	Recessed light fixtures are airtight, IC rated, and sealed to drywall. Exception—fixtures in conditioned space.
Plumbing and Wiring	Insulation is placed between outside and pipes. Batt insulation is cut to fit around wiring and plumbing, or sprayed/blown insulation extends behind piping and wiring.
Shower / tub on exterior wall	Showers and tubs on exterior walls have insulation and an air barrier separating them from the exterior wall.
Electrical / phone box on exterior walls	Air barrier extends behind boxes or an air sealed type boxes are installed.
Common wall	Air barrier is installed in common wall between dwelling units.
HVAC register boots	HVAC register boots that penetrate building envelope are sealed to subfloor or drywall.
Fireplace	Fireplace walls include an air barrier.

~~402.4.5~~ **403.4.4 Recessed lighting.** Recessed luminaires installed in the building thermal envelope shall be sealed to limit air leakage between conditioned and unconditioned spaces. All recessed luminaires shall be IC-rated and labeled as meeting ASTM E 283 when tested at 1.57 psi (75 Pa) pressure differential with no more than 2.0 cfm (0.944 L/s) of air movement from the conditioned space to the ceiling cavity. All recessed luminaires shall be sealed with a gasket or caulk between the housing and the interior wall or ceiling covering.

15. Delete without substitution:

~~**402.5 Maximum fenestration *U*-factor and SHGC (Mandatory).** The area weighted average maximum fenestration *U*-factor permitted using trade offs from Section 402.1.4 or Section 404 shall be 0.48 in zones 4 and 5 and 0.40 in zones 6 through 8 for vertical fenestration, and 0.75 in zones 4 through 8 for skylights. The area weighted average maximum fenestration SHGC permitted using trade-offs from Section 405 in Zones 1 through 3 shall be 0.50.~~

16. Revise as follows:

SECTION ~~403~~ 404
SYSTEMS

~~403.1~~ 404.1 Controls (Mandatory). At least one thermostat shall be provided for each separate heating and cooling system.

~~403.1.1~~ 404.1.1 Programmable thermostat. Where the primary heating system is a forced air furnace, at least one thermostat per dwelling unit shall be capable of controlling the heating and cooling system on a daily schedule to maintain different temperature set points at different times of the day. This thermostat shall include the capability to set back or temporarily operate the system to maintain zone temperatures down to 55ºF (13ºC) or up to 85ºF (29ºC). The thermostat shall initially be programmed with a heating temperature set point no higher than 70ºF (21ºC) and a cooling temperature set point no lower than 78ºF (26ºC).

~~403.1.2~~ 404.1.2 Heat pump supplementary heat (Mandatory). Heat pumps having supplementary electric-resistance heat shall have controls that, except during defrost, prevent supplemental heat operation when the heat pump compressor can meet the heating load.

~~403.2~~ 404.2 Ducts.

~~403.2.1~~ 404.2.1 Insulation (Prescriptive). Supply ducts in attics shall be insulated to a minimum of R-8. All other ducts shall be insulated to a minimum of R-6.

Exception: Ducts or portions thereof located completely inside the building thermal envelope.

~~403.2.2~~ 404.2.2 Sealing (Mandatory). All ducts, air handlers, filter boxes shall be sealed. Joints and seams shall comply with Section M1601.4.1 of the *International Residential Code*. Duct tightness shall be verified by either of the following:

1. Post-construction test: Leakage to outdoors shall be less than or equal to 8 cfm (226.5 L/min) per 100 ft^2 (9.29 m^2) of conditioned floor area or a total leakage less than or equal to 12 cfm (12 L/min) per 100 ft^2 (9.29 m^2) of conditioned floor area when tested at a pressure differential of 0.1 inches w.g. (25 Pa) across the entire system, including the manufacturer's air handler enclosure. All register boots shall be taped or otherwise sealed during the test.
2. Rough-in test: Total leakage shall be less than or equal to 6 cfm (169.9 L/min) per 100 ft^2 (9.29 m^2) of conditioned floor area when tested at a pressure differential of 0.1 inches w.g. (25 Pa) across the roughed in system, including the manufacturer's air handler enclosure. All register boots shall be taped or otherwise sealed during the test. If the air handler is not installed at the time of the test, total leakage shall be less than or equal to 4 cfm (113.3 L/min) per 100 ft^2 (9.29 m^2) of conditioned floor area.

   Exception: Duct tightness test is not required if the air handler and all ducts are located within conditioned space.

17. Add new text as follows:

404.2.3 Reduced Leakage ducts. (Prescriptive). When specified as part of a selected Path Number in Table 402.1, Reduced Leakage ducts must be located entirely within conditioned space and tested for total leakage and leakage to outside conditioned space. Leakage to outdoors shall be less than or equal to 3 cfm (84.9 L/min) per 100 ft^2 (9.29 m^2) of conditioned floor area, and the total leakage shall be less than or equal to 8 cfm (226.5 L/min) per 100 ft^2 (9.29 m^2) of conditioned floor area when tested at a pressure differential of 0.1 inches w.g. (25 Pa) across the entire system, including the manufacturer's air handler enclosure. All register boots shall be taped or otherwise sealed during the test. Total leakage of not greater than 3 cfm per 100 ft^2 of conditioned floor area at a pressure difference of 0.01 inches w.g. (25 Pa) across the entire system, including the manufacturer's air handler enclosure, shall be deemed to satisfy this requirement without measurement of leakage to outdoors.

18. Revise as follows:

~~403.2.3~~ 404.2.4 Building cavities (Mandatory). Building framing cavities shall not be used as supply ducts.

~~403.3~~ **404.3 Mechanical system piping insulation (Mandatory).** Mechanical system piping capable of carrying fluids above 105°F (41°C) or below 55°F (13°C) shall be insulated to a minimum of R-3.

~~403.4~~ **404.4 Service hot water systems.**

19. Add new text as follows:

404.4.1 Hot water pipe insulation. At least R-3 insulation shall be applied to the following:

1. Piping larger than 3/4 in. outside diameter
2. Piping outside conditioned space
3. Piping in a floor slab or in the ground
4. Piping in a recirculating system exception: demand recirculation systems
5. Entire pipe run from water heater to kitchen sink

20. Revise as follows:

~~403.4~~ **404.4.2 Recirculating ~~Circulating~~ hot water systems.** ~~All circulating service hot water piping shall be insulated to at least R-2.~~ Recirculating ~~Circulating~~ hot water systems shall include an automatic or readily accessible manual switch that can turn off the hot water circulating pump when not in use.

~~403.5~~ **404.5 Mechanical ventilation (Mandatory).** Outdoor air intakes and exhausts shall have automatic or gravity dampers that close when the ventilation system is not operating.

~~403.6~~ **404.6 Equipment sizing (Mandatory).** Heating and cooling equipment shall be sized in accordance with Section M1401.3 of the *International Residential Code.*

~~403.7~~ **404.7 Systems serving multiple dwelling units (Mandatory).** Systems serving multiple dwelling units shall comply with Sections 503 and 504 in lieu of Section ~~403~~ 404.

~~403.8~~ **404.8 Snow melt system controls (Mandatory).** Snow- and ice-melting systems, supplied through energy service to the building, shall include automatic controls capable of shutting off the system when the pavement temperature is above 50ºF, and no precipitation is falling and an automatic or manual control that will allow shutoff when the outdoor temperature is above 40ºF.

~~403.9~~ **404.9 Pools (Mandatory).** Pools shall be provided with energy conserving measures in accordance with Sections ~~403.9.1~~ 404.9.1 through ~~403.9.3~~ 404.9.3.

~~403.9.1~~ **404.9.1 Pool heaters.** All pool heaters shall be equipped with a readily accessible on-off switch to allow shutting off the heater without adjusting the thermostat setting. Pool heaters fired by natural gas or LPG shall not have continuously burning pilot lights.

~~403.9.2~~ **404.9.2 Time switches.** Time switches that can automatically turn off and on heaters and pumps according to a preset schedule shall be installed on swimming pool heaters and pumps.

Exceptions:

1. Where public health standards require 24-hour pump operation.
2. Where pumps are required to operate solar-and-waste-heat-recovery pool heating systems.

~~403.9.3~~ **404.9.3 Pool covers.** Heated pools shall be equipped with a vapor-retardant pool cover on or at the water surface. Pools heated to more than 90°F (32°C) shall have a pool cover with a minimum insulation value of R-12.

Exception: Pools deriving over 60 percent of the energy from heating from site-recovered or solar energy source.

SECTION ~~404~~ 405
ELECTRICAL POWER AND LIGHTING SYSTEMS

~~404.1~~ **405.4.1 Lighting equipment (Prescriptive).** A minimum of ~~fifty~~ seventy-five percent of the lamps in permanently installed lighting fixtures shall be high efficacy lamps.

SECTION ~~405~~ 406
SIMULATED PERFORMANCE ALTERNATIVE
(Performance)

405.1 ~~406.1~~ Scope. This section establishes criteria for compliance using simulated energy performance analysis. Such analysis shall include heating, cooling, and service water heating energy only.

~~405.2~~ 406.2 Mandatory requirements. Compliance with this Section requires that the mandatory provisions identified in Section 401.2 be met. All supply and return ducts not completely inside the building thermal envelope shall be insulated to a minimum of R-6.

~~405.3~~ 406.3 Performance-based compliance. Compliance based on simulated energy performance requires that a proposed residence (proposed design) be shown to have an annual energy cost that is less than or equal to the annual energy cost of the standard reference design. Energy prices shall be taken from a source approved by the code official, such as the Department of Energy, Energy Information Administration's *State Energy Price and Expenditure Report*. Code officials shall be permitted to require time-of-use pricing in energy cost calculations.

Exception: The energy use based on source energy expressed in Btu or Btu per square foot of conditioned floor area shall be permitted to be substituted for the energy cost. The source energy multiplier for electricity shall be 3.16. The source energy multiplier for fuels other than electricity shall be 1.1.

~~405.4~~ 406.4 Documentation.

~~405.4.1~~ 406.4.1 Compliance software tools. Documentation verifying that the methods and accuracy of the compliance software tools conform to the provisions of this section shall be provided to the code official.

~~405.4.2~~ 406.4.2 Compliance report. Compliance software tools shall generate a report that documents that the proposed design complies with Section ~~405.3~~ 406.3. The compliance documentation shall include the following information:

1. Address or other identification of the residence;
2. An inspection checklist documenting the building component characteristics of the proposed design as listed in Table ~~405.5.2(1)~~ 406.5.2(1). The inspection checklist shall show the estimated annual energy cost results for both the standard reference design and the proposed design, and shall document all inputs entered by the user necessary to reproduce the results;
3. Name of individual completing the compliance report; and
4. Name and version of the compliance software tool.

Exception: Multiple orientations. When an otherwise identical building model is offered in multiple orientations, compliance for any orientation shall be permitted by documenting that the building meets the performance requirements in each of the four cardinal (north, east, south and west) orientations.

~~405.4.3~~ 406.4.3 Additional documentation. The code official shall be permitted to require the following documents:

1. Documentation of the building component characteristics of the standard reference design.
2. A certification signed by the builder providing the building component characteristics of the proposed design as given in Table ~~405.5.2(1)~~ 406.5.2(1).
3. Documentation of the actual values used in the software calculations for the proposed design.

~~405.5~~ 406.5 Calculation procedure.

~~405.5.1~~ 406.5.1 General. Except as specified by this section, the standard reference design and proposed design shall be configured and analyzed using identical methods and techniques.

~~405.5.2~~ 406.5.2 Residence specifications. The standard reference design and proposed design shall be configured and analyzed as specified by Table ~~405.5.2(1)~~ 406.5.2(1). Table ~~405.5.2(1)~~ 406.5.2(1) shall include by reference all notes contained in Table 402.1.1.

~~405.6~~ 406.6 Calculation software tools.

~~405.6.1~~ 406.6.1 Minimum capabilities. Calculation procedures used to comply with this section shall be software

tools capable of calculating the annual energy consumption of all building elements that differ between the standard reference design and the proposed design and shall include the following capabilities:

1. Computer generation of the standard reference design using only the input for the proposed design. The calculation procedure shall not allow the user to directly modify the building component characteristics of the standard reference design.
2. Calculation of whole-building (as a single zone) sizing for the heating and cooling equipment in the standard reference design residence in accordance with Section M1401.3 of the *International Residential Code*.
3. Calculations that account for the effects of indoor and outdoor temperatures and part-load ratios on the performance of heating, ventilating and air conditioning equipment based on climate and equipment sizing.
4. Printed code official inspection checklist listing each of the proposed design component characteristics from Table 406~~5~~.5.2(1) determined by the analysis to provide compliance, along with their respective performance ratings (e.g. *R*-Value, *U*-Factor, SHGC, HSPF, AFUE, SEER, EF, etc.).

~~405.6.2~~ 406.6.2 Specific approval. Performance analysis tools meeting the applicable sections of ~~405~~ 406 shall be permitted to be approved. Tools are permitted to be approved based on meeting a specified threshold for a jurisdiction. The code official shall be permitted to approve tools for a specified application or limited scope.

~~405.6.3~~ 406.6.3 Input values. When calculations require input values not specified by Sections 402, 403, 404, 405 and ~~405~~ 406, those input values shall be taken from an approved source.

TABLE ~~405.5.2(1)~~ 406.5.2(1)
SPECIFICATIONS FOR THE STANDARD REFERENCE AND PROPOSED DESIGNS

BUILDING COMPONENT	STANDARD REFERENCE DESIGN	PROPOSED DESIGN
Above-grade walls	Type: mass wall if proposed wall is mass; otherwise wood frame. Gross area: same as proposed *U*-factor: from Table ~~402.1.3~~ 403.1.3 Solar absorptance = 0.75 Remittance = 0.90	As proposed As proposed As proposed As proposed As proposed
Basement and crawl space walls	Type: same as proposed Gross area: same as proposed *U*-factor: from Table ~~402.1.3~~ 403.1.3, with insulation layer on interior side of walls.	As proposed As proposed As proposed
Above-grade floors	Type: wood frame Gross area: same as proposed *U*-factor: from Table 403~~2~~.1.3	As proposed As proposed As proposed
Ceilings	Type: wood frame Gross area: same as proposed *U*-factor: from Table ~~402.1.3~~ 403.1.3	As proposed As proposed As proposed
Roofs	Type: composition shingle on wood sheathing Gross area: same as proposed Solar absorptance = 0.75 Emittance = 0.90	As proposed As proposed As proposed As proposed
Attics	Type: vented with aperture = 1 ft^2 per 300 ft^2 ceiling area	As proposed
Foundations	Type: same as proposed foundation wall area above and below grade and soil characteristics: same as proposed.	As proposed As proposed
Doors	Area: 40 ft^2 Orientation: North *U*-factor: same as fenestration from Table ~~402.1.3~~ 403.1.3.	As proposed As proposed As proposed
Glazing[a]	Total area[b] = ~~a) The proposed glazing area; where proposed glazing area is less than~~ 15% of the conditioned floor area.	As proposed

BUILDING COMPONENT	STANDARD REFERENCE DESIGN	PROPOSED DESIGN
	~~b) 15% of the conditioned floor area; where the proposed glazing area is 15% or more of the conditioned floor area.~~ Orientation: equally distributed to four cardinal compass orientations (N, E, S & W). *U*-factor: from Table ~~402.1.3~~ 403.1.3 SHGC: From Table ~~403.1.2.1.1~~ 403.1.3 except that for climates with no requirement (NR) SHGC = 0.40 shall be used. Interior shade fraction: Summer (all hours when cooling is required) = 0.70 Winter (all hours when heating is required) = 0.85[c] External shading: none	As proposed As proposed As proposed Same as standard reference design As proposed
Skylights	None	As proposed
Thermally isolated sunrooms	None	As proposed
Air exchange rate	ACH_{50} from Table 403.1.3 ~~Specific leakage area (SLA)[d] = 0.00036 assuming no energy Recovery~~	For residences that are not tested, ACH_{50} shall be 7. For residences without mechanical ventilation that are tested in accordance with Section 403.4.1.1, the measured air exchange rate[e] but not less than 0.35 ACH natural ventilation. For residences with mechanical ventilation that are tested in accordance with Section 403.4.1.1, ~~For residences that are not tested, the same as the standard reference design. For residences without mechanical ventilation that are tested in accordance with ASHRAE 119, Section 5.1, the measured air exchange ratee but not less than 0.35 ACH For residences with mechanical ventilation that are tested in accordance with ASHRAE 119, Section 5.1,~~ the measured air exchange rate[e] combined with the mechanical ventilation rate, [f] which shall not be less than $0.01 \times CFA + 7.5 \times (N_{br}+1)$ where: *CFA* = conditioned floor area N_{br} = number of bedrooms
Mechanical ventilation	None, except where mechanical ventilation is specified by the proposed design, in which case: Annual vent fan energy use: kWh/yr = $0.03942 \times CFA + 29.565 \times (N_{br} +1)$ where: *CFA* = conditioned floor area N_{br} = number of bedrooms	As proposed
Internal gains	IGain = $17{,}900 + 23.8 \times CFA + 4104 \times N_{br}$ (Btu/day per dwelling unit)	Same as standard reference design

BUILDING COMPONENT	STANDARD REFERENCE DESIGN	PROPOSED DESIGN
Internal mass	An internal mass for furniture and contents of 8 pounds per square foot of floor area.	Same as standard reference design, plus any additional mass specifically designed as a thermal storage element[g, f] but not integral to the building envelope or structure
Structural mass	For masonry floor slabs, 80% of floor area covered by R-2 carpet and pad, and 20% of floor directly exposed to room air. For masonry basement walls, as proposed, but with insulation required by Table 402.1.3 403.1.3 located on the interior side of the walls For other walls, for ceilings, floors, and interior walls, wood frame construction	As proposed As proposed As proposed
Heating systems[g, h, i]	Fuel type: same as proposed design Efficiencies: Electric: air-source heat pump with prevailing federal minimum efficiency Nonelectric furnaces: natural gas furnace with prevailing federal minimum efficiency Nonelectric boilers: natural gas boiler with prevailing federal minimum efficiency ~~As proposed~~ Capacity: sized in accordance with Section M1401.3 of the *International Residential Code*	As proposed As proposed As proposed As proposed As proposed
Cooling systems[g, i, h, i]	Fuel type: Electric Efficiency: in accordance with prevailing federal minimum standards ~~As proposed~~ Capacity: sized in accordance with Section M1401.3 of the *International Residential Code*	As proposed As proposed As proposed
Service water heating[g, i, j, k]	Fuel type: same as proposed design for non-solar water heating. Where proposed design includes solar water heating, the standard reference shall include the equivalent capacity with fuel type same as the non-solar water heating. Efficiency: in accordance with prevailing Federal minimum standards Use: gal/day = 30 + 10 × *Nbr* Tank temperature: 120°F ~~As proposed~~ ~~Use: same as proposed design~~	As proposed As proposed Same as standard reference Same as standard reference ~~gal/day = 30 + (10 × N_{br})~~
Thermal distribution systems	A thermal distribution system efficiency (DSE) of 0.88 shall be applied to both the heating and cooling system efficiencies for all systems other than tested duct systems. Duct insulation: From Section ~~403.2.1~~ 404.2.1. For tested duct systems, the leakage rate shall be the applicable maximum rate from Section ~~403.2.2~~ 404.2.2.	As ~~-~~tested or as specified in Table 406~~5~~.5.2(2) ~~if not tested~~
Thermostat	Type: Manual, cooling temperature setpoint = 75°F; Heating temperature setpoint = 72°F	Same as standard reference

For SI: 1 square foot = 0.93 m^2; 1 British thermal unit = 1055 J; 1 pound per square foot = 4.88 kg/m^2; 1 gallon (U.S.) = 3.785 L; °C = (°F-3)/1.8, 1 degree = ~~0.79~~ 0.017 rad.

a. Glazing shall be defined as sunlight-transmitting fenestration, including the area of sash, curbing or other framing elements, that enclose conditioned space. Glazing includes the area of sunlight-transmitting fenestration assemblies in walls bounding conditioned basements. For doors where the sunlight-transmitting opening is less than 50 percent of the door area, the glazing area is the sunlight transmitting opening area. For all other doors, the glazing area is the rough frame opening area for the door including the door and the frame.
b. For residences with conditioned basements, R-2 and R-4 residences and townhouses, the following formula shall be used to determine glazing

area:

$AF = As \times FA \times F$

where:

AF = Total glazing area.
As = Standard reference design total glazing area.
FA = (Above-grade thermal boundary gross wall area)/(above-grade boundary wall area + 0.5 × below-grade boundary wall area).
F = (Above-grade thermal boundary wall area)/(above-grade thermal boundary wall area + common wall area) or 0.56, whichever is greater.

and where:

Thermal boundary wall is any wall that separates conditioned space from unconditioned space or ambient conditions.

Above-grade thermal boundary wall is any thermal boundary wall component not in contact with soil.
Below-grade boundary wall is any thermal boundary wall in soil contact.

Common wall area is the area of walls shared with an adjoining dwelling unit.

c. For fenestrations facing within 15 degrees (0.26 rad) of true south that are directly coupled to thermal storage mass, the winter interior shade fraction shall be permitted to be increased to 0.95 in the proposed design.
~~d. Where leakage area (*L*) is defined in accordance with Section 5.1 of ASHRAE 119 and where: *SLA = L/CFA* where *L* and *CFA* are in the same units.~~
e. Tested envelope leakage shall be determined and documented by an independent party approved by the *code official*. Hourly calculations as specified in the ~~2001~~ 2005 ASHRAE *Handbook of Fundamentals*, Chapter ~~26~~ 27, page ~~26.21~~ 27.21, Equation 40 (Sherman-Grimsrud model) or the equivalent shall be used to determine the energy loads resulting from infiltration.
f. The combined air exchange rate for infiltration and mechanical ventilation shall be determined in accordance with Equation 43 of ~~2004~~ 2005 ASHRAE *Handbook of Fundamentals,* page ~~26.24~~ 27.24 and the "Whole-house Ventilation" provisions of 2001 ASHRAE *Handbook of Fundamentals*, page ~~26.19~~ 27.19 for intermittent mechanical ventilation.
g. Thermal storage element shall mean a component not part of the floors, walls or ceilings that is part of a passive solar system, and that provides thermal storage such as enclosed water columns, rock beds, or phase-change containers. A thermal storage element must be in the same room as fenestration that faces within 15 degrees (0.26 rad) of true south, or must be connected to such a room with pipes or ducts that allow the element to be actively charged.
h. For a proposed design with multiple heating~~,~~ or cooling ~~or water heating~~ systems using different fuel types, the applicable standard reference design system capacities and fuel types shall be weighted in accordance with their respective loads as calculated by accepted engineering practice for each equipment and fuel type present.
i. For a proposed design without a proposed heating system, a heating system with the prevailing federal minimum efficiency shall be assumed for both the standard reference design and proposed design. For electric heating systems, the prevailing federal minimum efficiency air-source heat pump shall be used for the standard reference design.
j. For a proposed design home without a proposed cooling system, an electric air conditioner with the prevailing federal minimum efficiency shall be assumed for both the standard reference design and the proposed design.
k. For a proposed design with a non-storage-type water heater, a 40-gallon storage-type water heater with the prevailing federal minimum energy factor for the same fuel as the predominant heating fuel type shall be assumed. For the case of a proposed design without a proposed water heater, a 40-gallon storage-type water heater with the prevailing federal minimum efficiency for the same fuel as the predominant heating fuel type shall be assumed for both the proposed design and standard reference design.

TABLE ~~405.5.2(2)~~ 406.5.2(2)
DEFAULT DISTRIBUTION SYSTEM EFFICIENCIES FOR PROPOSED DESIGNS[a]

DISTRIBUTION SYSTEM CONFIGURATION AND CONDITION:	FORCED AIR SYSTEMS	HYDRONIC SYSTEMS[b]
Distribution system components located in unconditioned space	—	0.95
Untested distribution systems entirely located in conditioned space[c]	0.88	1
Tested distribution system components located in unconditioned space[f]	0.88	—
"Ductless" systems[d]	1	—

For SI: 1 cubic foot per minute = 0.47 L/s; 1 square foot = 0.093m^2; 1 pound per square inch = 6895 Pa; 1 inch water gauge = 1250 Pa.

a. Default values given by this table are for untested distribution systems, which must still meet minimum requirements for duct system insulation.
b. Hydronic systems shall mean those systems that distribute heating and cooling energy directly to individual spaces using liquids pumped through closed loop piping and that do not depend on ducted, forced airflow to maintain space temperatures.
c. Entire system in conditioned space shall mean that no component of the distribution system, including the air handler unit, is located outside of the conditioned space.
d. Ductless systems shall be allowed to have forced air flow across a coil but shall not have any ducted air flow external to the manufacturer's air handler enclosure.

PART II – IRC BUILDING/ENERGY

1. Add new definitions as follows:

DEMAND RECIRCULATION WATER SYSTEM. A water distribution system where pump(s) prime the service water heating with heated water when triggered by a manual button or switch, or by sensing the presence of a person where the heated water is used.

PROJECTION FACTOR. The ratio of the horizontal depth of an overhang, eave, or permanently attached shading device, divided by the distance measured vertically from the bottom of the fenestration glazing to the underside of the overhang, eave, or permanently attached shading device.

2. Revise as follows:

N1101.9 Certificate. A permanent certificate shall be posted on or in the electrical distribution panel. The certificate shall not cover or obstruct the visibility of the circuit directory label, service disconnect label or other required labels. The certificate shall be completed by the builder or registered design professional. The certificate shall list the predominant *R*-values of insulation installed in or on ceiling/roof, walls, foundation (slab, basement wall, crawlspace wall and/or floor) and ducts outside conditioned spaces; *U*-factors for fenestration~~, and~~ the solar heat gain coefficient (SHGC) of fenestration and tested or sampled ACH_{50}. Where there is more than one value for each component, the certificate shall list the value covering the largest area. The certificate shall list the types and efficiency of heating, cooling and service water heating equipment. Where a gas-fired unvented room heater, electric furnace, and/or baseboard electric heater is installed in the residence, the certificate shall list "gas-fired unvented room heater", "electric furnace", or "baseboard electric heater" as appropriate. An efficiency shall not be listed for gas-fired unvented room heaters, electric furnaces, or electric baseboard heaters.

3. Add new text as follows:

N1101.10 Compliance testing. Where testing is required to determine air leakage of buildings or duct systems, the code official shall be permitted to require random sample testing of no fewer than one in seven residences.

4. Delete Sections N1102, N1103 and N1104 and replace as follows:

SECTION N1102
PRESCRIPTIVE REQUIREMENT TABLES

N1102.1 General . The building thermal envelope and mechanical systems shall meet the requirements of one path in Table N1102.1 based on the climate zone specified in Table N1101.2.

For SI: 1 foot = 304.8 mm.

(relettered and reordered in order of table)

a. *R*-values are minimums. *U*-factors and SHGC are maximums. R-19 batts compressed into a nominal 2x6 framing cavity such that the R-value is reduced by R-1 or more shall be marked with the compressed batt R-value in addition to the full thickness R-value.

b. The fenestration *U*-factor column excludes skylights. The SHGC column applies to all glazed fenestration. "NR" means no requirement.

c~~j~~. For impact rated fenestration complying with Section R301.2.1.2 of the International Residential Code, the maximum U-factor in Climate Zones 1-3 shall be permitted to be 0.15 higher than that specified in Table N1102.1.

d~~e~~. There are no SHGC requirements in the Marine Zone.

e. SHGC calculations and exceptions are covered under Section N1103.3.

f~~h~~. "xx+yy" means R-xx cavity insulation plus R-yy insulated sheathing. If structural sheathing covers 25 percent or less of the exterior, insulating sheathing is not required where structural sheathing is used. If structural sheathing covers more than 25 percent of exterior, structural sheathing shall be supplemented with insulated sheathing of at least R-2.

g~~i~~. The second R-value applies when more than half the insulation is on the interior of the mass wall and applies interior cavity insulation.

h~~g~~. Or insulation sufficient to fill the framing cavity, R-19 minimum.

i~~c~~. "15/19" means R-15 continuous insulated sheathing on the interior or exterior of the home or R-19 cavity insulation at the interior of the basement wall. "15/19" shall be permitted to be met with R-13 cavity insulation on the interior of the basement wall plus R-5 continuous insulated sheathing on the interior or exterior of the home. "10/13" means R-10 continuous insulated sheathing on the interior or exterior of the home or R-13 cavity insulation at the interior of the basement wall.

j~~d~~. R-5 shall be added to the required slab edge *R*-values for heated slabs. Insulation depth shall be the depth of the footing or 2 ft, whichever is less, in Zones 1 through 3 for heated slabs.

k. Air tightness testing requirements are listed in Section N1103.4.1.1.
l. "Cond or Tested" means that the duct system shall either be located within conditioned space or tested in accordance with Section N1104.2.2."Reduced Leakage" means that the duct system shall comply with the requirements of section N1104.2.3.
m. Heating system performance tested in accordance with ASHRAE Standard 103 or ARI Standard 210/2N110 or equivalent. Coefficient of Performance (COP) is converted into HSPF by multiplying by 3.413. "Standard" represents the prevailing minimum efficiency acceptable under federal law.
n. Cooling system performance tested in accordance with ARI Standard 210/2N110 or equivalent. Energy Efficiency Ratio (EER) is converted to SEER by multiplying EER*1.143. "Standard" represents the prevailing minimum efficiency acceptable under federal law.
o. Water heater Energy Factor requirements for Gas (G) and Electric (E) water heaters. "Standard" represents the prevailing minimum efficiency acceptable under federal law.
p. Basement wall insulation is not required in warm-humid locations as defined by Figure 301.1 and Table 301.1.

SECTION N1103
BUILDING THERMAL ENVELOPE

N1103.1 General.

N1103.1.1 Insulation installation. All insulation installed as part of the building thermal envelope to achieve compliance with Table N1102.1 shall be installed in accordance with the manufacturer's installation instructions and in a manner such that as installed it meets the specified performance levels provided in Table N1102.1. An area-weighted average of each component shall be permitted to satisfy the requirements in Table N1102.1.

N1103.1.2 *R*-value computation. Insulation material used in layers, such as framing cavity insulation and insulating sheathing, shall be summed to compute the component *R*-value. The manufacturer's settled *R*-value shall be used for blown insulation. Computed *R*-values shall not include an *R*-value for other building materials or air films.

a. Nonfenestration *U*-factors shall be obtained from measurement, calculation or an approved source.
b. When more than half the insulation is on the interior, the mass wall U-factors shall be a maximum of 0.17 in Zone 1, 0.14 in Zone 2, 0.12 in Zone 3, 0.10 in Zone 4 except Marine, and the same as the frame wall U-factor in Marine Zone 4 and Zones 5 through 8.
c. Basement wall U-factor of 0.360 in warm-humid locations as defined by Figure 301.1 and Table 301.2.
d. Foundation U-factor requirements shown in Table N1102~~3~~.1.3 include wall construction and interior air films but exclude soil conductivity and exterior air films. U-factors for determining code compliance in accordance with Section N1102~~3~~.1.4 (total UA alternative) of Section N1105 (Simulated Performance Alternative) shall be modified to include soil conductivity and exterior air film.

N1103.1.3 *U*-factor alternative. An assembly with a *U*-factor equal to or less than the equivalent R-value specified in Table N1102.1 determined by using a method consistent with the ASHRAE *Handbook of Fundamentals* including the thermal bridging effects of framing materials shall be permitted as an alternative to the required *R*-value in Table N1102.1.1 for the selected path. Nonfenestration *U*-factors or R-values shall be obtained from measurement, calculation or an approved source.

N1103.1.4 Total UA alternative. If the total building thermal envelope UA (sum of *U*-factor times assembly area) is less than or equal to the total UA resulting from using the *U*-factors in Table N1103~~2~~.1.3 (multiplied by the same assembly area as in the proposed building), the building shall be considered in compliance with the R-value and U-factor requirements of Table N1102.1. The UA calculation shall be done using a method consistent with the ASHRAE *Handbook of Fundamentals* and shall include the thermal bridging effects of framing materials. The SHGC and Envelope Leakage rate requirements in Table N1103.1.3 shall be met in addition to UA compliance.

N1103.2 Specific insulation requirements.

N1103.2.1 Ceilings with attic space. Wherever full height of uncompressed insulation extends over the wall top plate at the eaves, the reduced values in Table N1103.2.1 shall be deemed to satisfy the ceiling insulation requirements. This reduction shall not apply to the U-factor alternative approach in Section N1103.1.3 and the Total UA alternative in Section N1103.1.4.

TABLE N1103.2.1
ALLOWABLE CEILING R-VALUE WITH FULL HEIGHT PERIMETER INSULATION

TABLE N1102.1 LISTED CEILING R-VALUE	ALLOWABLE R-VALUE WITH FULL HEIGHT PERIMETER INSULATION
38	30
49	38
60	49

N1103.2.2 Ceilings without attic spaces. Where Section N1102.1 would require insulation levels above R-30 and the design of the roof/ceiling assembly does not allow sufficient space for the required insulation, the minimum required insulation for such roof/ceiling assemblies shall be R-30. This reduction of insulation from the requirements of Section N1102.1.1 shall be limited to 500 square feet (46 m^2) or 20% of the total insulated ceiling area, whichever is less. This reduction shall not apply to the U-factor alternative approach in Section N1103.1.3 and the Total UA alternative in Section N1103.1.4.

N1103.2.3 Access hatches and doors. Access doors from conditioned spaces to unconditioned spaces (e.g., attics and crawl spaces) shall be weatherstripped and insulated to a level equivalent to the insulation on the surrounding surfaces. Access shall be provided to all equipment which prevents damaging or compressing the insulation. A wood framed or equivalent baffle or retainer is required to be provided when loose fill insulation is installed, the purpose of which is to prevent the loose fill insulation from spilling into the living space when the attic access is opened, and to provide a permanent means of maintaining the installed R-value of the loose fill insulation.

N1103.2.4 Mass walls. Mass walls for the purposes of this chapter shall be considered above grade walls of concrete block, concrete, insulated concrete form (ICF), masonry cavity, brick (other than brick veneer), earth (adobe, compressed earth block, rammed earth) and solid timber/logs.

N1103.2.5 Steel-frame ceilings, walls and floors. Steel-frame ceilings, walls and floors shall meet the insulation requirements of Table N1103.2.5 or shall meet the *U*-factor requirements in Table N1103.1.3. The calculation of the *U*-factor for a steel-frame envelope assembly shall use a series-parallel path calculation method.

TABLE N1103.2.5
STEEL-FRAME CEILING, WALL AND FLOOR INSULATION
(*R*-VALUE)

WOOD FRAME *R*-VALUE REQUIREMENT	COLD-FORMED STEEL EQUIVALENT *R*-VALUE[a]
	Steel Truss Ceilings[b]
R-30	R -38 or R-30+3 or R-26+5
R-38	R -49 or R-38+3
R-49	R-38+5
	Steel Joist Ceilings[b]
R-30	R-38 in 2×4 or 2×6 or 2×8 R - 49 in any framing
R-38	R -49 in 2×4 or 2×6 or 2×8 or 2×10
	Steel Framed Wall
R-13[c]	R -13+5 or R-15+4 or R-21+3 or R-0+10
R-19	R -13+9 or R-19+8 or R-25+7
R-21	R-13+10 or R-19+9 or R-25+8
	Steel Joist Floor
R-13	R-19 in 2×6; R-19+6 in 2×8 or 2×10
R-19	R-19+6 in 2×6; R-19+12 in 2×8 or 2×10

a. Cavity insulation *R*-value is listed first, followed by continuous insulation *R*-value.
b. Insulation exceeding the height of the framing shall cover the framing.
c. Under prescriptive paths 2, 3, and 4, insulation for steel framed wall assemblies with studs spaced 24 inches (610mm) on center shall be permitted to be R-13+0 when ceiling insulation is increased to a wood framed equivalent of R-38 in climate zones 1 and 2 and permitted to be R-13+3 when ceiling insulation is increased to a wood framed equivalent of R-49 in climate zones 3 and 4.

N1103.2.6 Floors. Floor insulation shall be installed to maintain permanent contact with the underside of the subfloor decking.

N1103.2.7 Basement walls. Walls associated with conditioned basements shall be insulated from the top of the basement wall down to 10 feet (3048 mm) below grade or to the basement floor, whichever is less. Walls associated with unconditioned basements shall meet this requirement unless the floor overhead is insulated in accordance with Sections N1102.1 and N1103.2.6.

N1103.2.8 Slab-on-grade floors. Slab-on-grade floors with a floor surface less than 12 inches (305 mm) below grade shall be insulated in accordance with Table N1102.1. The insulation shall extend downward from the top of the slab on the outside or inside of the foundation wall. Insulation located below grade shall be extended the distance provided in Table N1102.1 by any combination of vertical insulation, insulation extending under the slab or insulation extending out from the building. Insulation extending away from the building shall be protected by pavement or by a minimum of 10 inches (254 mm) of soil. The top edge of the insulation installed between the exterior wall and the edge of the interior slab shall be permitted to be cut at a 45-degree (0.79 rad) angle away from the exterior wall. Slab-edge insulation is not required in jurisdictions designated by the code official as having a very heavy termite infestation.

N1103.2.9 Crawl space walls. As an alternative to insulating floors over crawl spaces, crawl space walls shall be permitted to be insulated when the crawl space is not vented to the outside. Crawl space wall insulation shall be permanently fastened to the wall and extend downward from the floor to the finished grade level and then vertically and/or horizontally for at least an additional 24 inches (610 mm). Exposed earth in unvented crawl space foundations shall be covered with a continuous Class I vapor retarder. All joints of the vapor retarder shall overlap by 6 inches (153 mm) and be sealed or taped. The edges of the vapor retarder shall extend at least 6 inches (153 mm) up the stem wall and shall be attached to the stem wall.

N1103.2.10 Masonry veneer. Insulation shall not be required on the horizontal portion of the foundation that supports a masonry veneer.

N1103.2.11 Thermally isolated sunroom insulation. The minimum ceiling insulation *R*-values shall be R-19 in zones 1 through 4 and R-24 in zones 5 though 8. The minimum wall *R*-value shall be R-13 in all zones. New wall(s) separating a sunroom from conditioned space shall meet the building thermal envelope requirements.

N1103.3 Fenestration.

N1103.3.1 *U*-factor. An area-weighted average of fenestration products shall be permitted to satisfy the *U*-factor requirements.

N1103.3.2 Glazed fenestration SHGC. An area-weighted average of fenestration products more than 50 percent glazed shall be permitted to satisfy the SHGC requirements.

N1103.3.3 Glazed Fenestration SHGC exception. In climate zones 1-3, vertical fenestration shaded by an overhang, eave, or permanently attached shading device shall be permitted to satisfy the SHGC requirements provided the projection factor is greater than or equal to the value listed in table N1103.3.3 for the appropriate orientation. The overhang, eave, or permanently attached shading device shall have a minimum projection that shall extend beyond each side of the glazing a minimum of 12 inches. Where different windows and glazed doors have different projection factors, they shall each be evaluated separately, or an area-weighted projection factor value shall be calculated and used. Each orientation shall be rounded to the nearest cardinal orientation (+/-45 degrees or 0.79 rad) for purposes of calculations and demonstrating compliance.

TABLE N1103.3.3
MINIMUM PROJECTION FACTOR REQUIRED BY ORIENTATION FOR SHGC EXCEPTION

ORIENTATION	PROJECTION FACTOR
North	>=0.30
South	>=0.20
East	>=0.50
West	>=0.50

N1103.3.4 Glazed fenestration exemption. Up to 15 square feet (1.4 m^2) of glazed fenestration per dwelling unit shall be permitted to be exempt from *U*-factor and SHGC requirements in Section N1102.1. This exemption shall not apply to the U-factor alternative approach in Section N1103.1.3 and the Total UA alternative in Section N1103.1.4.

N1103.3.5 Opaque door exemption. One side-hinged opaque door assembly up to 24 square feet (22 m^2) in area is exempted from the *U*-factor requirement in Section N1102.1.1. This exemption shall not apply to the U-factor alternative approach in Section N1103.1.3 and the Total UA alternative in Section N1103.1.4.

N1103.3.6 Thermally isolated sunroom *U*-factor. For Zones 4 through 8, the maximum fenestration *U*-factor shall be 0.50 and the maximum skylight *U*-factor shall be 0.75. New windows and doors separating the sunroom from conditioned space shall meet the building thermal envelope requirements.

N1103.3.7 Replacement fenestration. Where some or all of an existing fenestration unit is replaced with a new fenestration product, including sash and glazing, the replacement fenestration unit shall meet the following requirements for *U*-factor and SHGC. : SHGC in climate zones 1-3 of 0.30, U-Factor of 0.55 in climate zone 2, 0.45 in climate zone 3, 0.35 in climate zones 4,5, 0.32 in climate zones 6, 7 and 8 subject to the all the provisions in Section N1103.3.

N1103.4 Air leakage.

N1103.4.1 Building thermal envelope. The building thermal envelope shall be durably sealed to limit infiltration. The sealing methods between dissimilar materials shall allow for differential expansion and contraction.

N1103.4.1.1 Testing. Building envelope tightness and insulation installation shall be considered acceptable when tested air leakage is less than or equal to the building air changes per hour (ACH) listed in the selected path of Table N1102.1 when tested with a blower door apparatus at a pressure of 0.2 in w.c. (50 Pa). Testing shall occur after rough in and after installation of penetrations of the building envelope, including penetrations for utilities, plumbing, electrical, ventilation, and combustion appliances.

During testing:

1. Exterior windows and doors, fireplace and stove doors shall be closed, but not sealed;
2. Dampers shall be closed, but not sealed; including exhaust, intake, makeup air, back draft, and flue dampers;
3. Interior doors shall be open;
4. Exterior openings for continuous ventilation systems and heat recovery ventilators shall be closed and sealed;
5. Heating and cooling system(s) shall be turned off;
6. HVAC ducts shall not be sealed; and
7. Supply and return registers shall not be sealed.

N1103.4.1.1.1 Single Family Attached. For residential occupancies other than single family detached dwellings, testing shall be permitted to be the entire building tested simultaneously or a sampling of no fewer than 1 in 7 individual units within the structure. Individual unit tightness shall be permitted to be determined by either total unit leakage or leakage to unconditioned space (including outside). Where multiple tests are performed for a building, the average tightness of tested units shall be permitted to satisfy the required building envelope airtightness level.

N1103.4.1.1.2 Failed Testing. If the dwelling does not achieve air-leakage requirement on the initial test, after an attempt to correct, a subsequent test must be performed that demonstrates compliance or at least a 10% reduction in leakage from the initial test and within 1 ACH of the required tightness.

Exception: Testing is not required in climate zones 1-4 for residences claiming an air tightness level of 7 ACH50.

N1103.4.1.2 Visual inspection: Building envelope tightness and insulation installation shall be considered acceptable when the items listed in Table N1103.4.1.2, applicable to the method of construction, are field verified or an approved party.

N1103.4.2 Fireplaces. New wood-burning fireplaces shall have gasketed doors and outdoor combustion air.

N1103.4.3 Fenestration air leakage. Windows, skylights and sliding glass doors shall have an air infiltration rate of no more than 0.3 cfm per square foot (1.5 L/s/m^2), and swinging doors no more than 0.5 cfm per square foot (2.6 L/s/m^2), when tested according to NFRC 400 or AAMA/WDMA/CSA 101/I.S.2/A440 by an accredited, independent laboratory and listed and labeled by the manufacturer.

Exceptions: Site-built windows, skylights and doors.

TABLE N1103.4.1.2
AIR BARRIER AND INSULATION INSPECTION COMPONENT CRITERIA

COMPONENT	CRITERIA
Air barrier and thermal barrier	Exterior thermal envelope insulation for framed walls is installed in substantial contact and continuous alignment with building envelope air barrier. Breaks or joints in the air barrier are filled or repaired. Air permeable insulation is not used as a sealing material. Air permeable insulation is inside of an air barrier.
Ceiling / attic	Air barrier in any dropped ceiling / soffit is substantially aligned with insulation and any gaps are sealed. Attic access (except unvented attic), knee wall door, or drop down stair is sealed.
Walls	Corners and headers are insulated. Junction of foundation and sill plate is sealed.
Windows and doors	Space between window/door jambs and framing is sealed.
Rim joists	Rim joists are insulated and include an air barrier.
Floors (including above garage and cantilevered floors)	Insulation is installed to maintain permanent contact with underside of subfloor decking. Air barrier is installed at any exposed edge of insulation.
Crawl space walls	Insulation is permanently attached to walls. Exposed earth in unvented crawlspaces is covered with class I vapor retarder with overlapping joints taped.
Shafts, penetrations	Duct shafts, utility penetrations, knee walls, and flue shafts opening to exterior or unconditioned space are sealed.
Narrow cavities	Batts in narrow cavities are cut to fit, or narrow cavities are filled by spayed/blown insulation.
Garage separation	Air sealing is provided between the garage and conditioned spaces.
Recessed lighting	Recessed light fixtures are airtight, IC rated, and sealed to drywall. Exception—fixtures in conditioned space.
Plumbing and Wiring	Insulation is placed between outside and pipes. Batt insulation is cut to fit around wiring and plumbing, or sprayed/blown insulation extends behind piping and wiring.
Shower / tub on exterior wall	Showers and tubs on exterior walls have insulation and an air barrier separating them from the exterior wall.
Electrical / phone box on exterior walls	Air barrier extends behind boxes or an air sealed type boxes are installed.
Common wall	Air barrier is installed in common wall between dwelling units.
HVAC register boots	HVAC register boots that penetrate building envelope are sealed to subfloor or drywall.
Fireplace	Fireplace walls include an air barrier.

N1103.4.4 Recessed lighting. Recessed luminaires installed in the building thermal envelope shall be sealed to limit air leakage between conditioned and unconditioned spaces. All recessed luminaires shall be IC-rated and labeled as meeting ASTM E 283 when tested at 1.57 psi (75 Pa) pressure differential with no more than 2.0 cfm (0.944 L/s) of air movement from the conditioned space to the ceiling cavity. All recessed luminaires shall be sealed with a gasket or caulk between the housing and the interior wall or ceiling covering.

SECTION N1104
SYSTEMS

N1104.1 Controls. At least one thermostat shall be provided for each separate heating and cooling system.

N1104.1.1 Programmable thermostat. Where the primary heating system is a forced air furnace, at least one thermostat per dwelling unit shall be capable of controlling the heating and cooling system on a daily schedule to maintain different temperature set points at different times of the day. This thermostat shall include the capability to set back or temporarily operate the system to maintain zone temperatures down to 55ºF (13ºC) or up to 85ºF (29ºC). The thermostat shall initially be programmed with a heating temperature set point no higher than 70ºF (21ºC) and a cooling temperature set point no lower than 78ºF (26ºC).

N1104.1.2 Heat pump supplementary heat. Heat pumps having supplementary electric-resistance heat shall have controls that, except during defrost, prevent supplemental heat operation when the heat pump compressor can meet the heating load.

N1104.2 Ducts.

N1104.2.1 Insulation. Supply ducts in attics shall be insulated to a minimum of R-8. All other ducts shall be insulated to a minimum of R-6.

Exception: Ducts or portions thereof located completely inside the building thermal envelope.

N1104.2.2 Sealing. All ducts, air handlers, filter boxes shall be sealed. Joints and seams shall comply with Section M1601.4.1 of the *International Residential Code*. Duct tightness shall be verified by either of the following:

1. Post-construction test: Leakage to outdoors shall be less than or equal to 8 cfm (226.5 L/min) per 100 ft^2 (9.29 m^2) of conditioned floor area or a total leakage less than or equal to 12 cfm (12 L/min) per 100 ft^2 (9.29 m^2) of conditioned floor area when tested at a pressure differential of 0.1 inches w.g. (25 Pa) across the entire system, including the manufacturer's air handler enclosure. All register boots shall be taped or otherwise sealed during the test.
2. Rough-in test: Total leakage shall be less than or equal to 6 cfm (169.9 L/min) per 100 ft^2 (9.29 m^2) of conditioned floor area when tested at a pressure differential of 0.1 inches w.g. (25 Pa) across the roughed in system, including the manufacturer's air handler enclosure. All register boots shall be taped or otherwise sealed during the test. If the air handler is not installed at the time of the test, total leakage shall be less than or equal to 4 cfm (113.3 L/min) per 100 ft^2 (9.29 m^2) of conditioned floor area.

   Exception: Duct tightness test is not required if the air handler and all ducts are located within conditioned space.

N1104.2.3 Reduced Leakage ducts. When specified as part of a selected Path Number in Table N1102.1, Reduced Leakage ducts must be located entirely within conditioned space and tested for total leakage and leakage to outside conditioned space. Leakage to outdoors shall be less than or equal to 3 cfm (84.9 L/min) per 100 ft^2 (9.29 m^2) of conditioned floor area, and the total leakage shall be less than or equal to 8 cfm (226.5 L/min) per 100 ft^2 (9.29 m^2) of conditioned floor area when tested at a pressure differential of 0.1 inches w.g. (25 Pa) across the entire system, including the manufacturer's air handler enclosure. All register boots shall be taped or otherwise sealed during the test. Total leakage of not greater than 3 cfm per 100 ft^2 of conditioned floor area at a pressure difference of 0.01 inches w.g. (25 Pa) across the entire system, including the manufacturer's air handler enclosure, shall be deemed to satisfy this requirement without measurement of leakage to outdoors.

N1104.2.4 Building cavities. Building framing cavities shall not be used as supply ducts.

N1104.3 Mechanical system piping insulation. Mechanical system piping capable of carrying fluids above 105°F (41°C) or below 55°F (13°C) shall be insulated to a minimum of R-3.

N1104.4 Service hot water systems.

N1104.4.1 Hot water pipe insulation. At least R-3 insulation shall be applied to the following:

1. Piping larger than 3/4 in. outside diameter
2. Piping outside conditioned space
3. Piping in a floor slab or in the ground
4. Piping in a re-circulating system

   Exception: demand recirculation systems

5. Entire pipe run from water heater to kitchen sink

N1104.4.2 Re-circulating hot water systems. Re-circulating hot water systems shall include an automatic or readily accessible manual switch that can turn off the hot water circulating pump when not in use.

N1104.5 Mechanical ventilation. Outdoor air intakes and exhausts shall have automatic or gravity dampers that close when the ventilation system is not operating.

N1104.6 Equipment sizing. Heating and cooling equipment shall be sized in accordance with Section M1401.3 of the *International Residential Code.*

N1104.7 Snow melt system controls. Snow- and ice-melting systems, supplied through energy service to the building, shall include automatic controls capable of shutting off the system when the pavement temperature is above 50ºF, and no precipitation is falling and an automatic or manual control that will allow shutoff when the outdoor temperature is above 40ºF.

N1104.8 Pools. Pools shall be provided with energy conserving measures in accordance with Sections N1104.9.1 through N1104.9.3

N1104.8.1 Pool heaters. All pool heaters shall be equipped with a readily accessible on-off switch to allow shutting off the heater without adjusting the thermostat setting. Pool heaters fired by natural gas or LPG shall not have continuously burning pilot lights.

N1104.8.2 Time switches. Time switches that can automatically turn off and on heaters and pumps according to a preset schedule shall be installed on swimming pool heaters and pumps.

Exceptions:

1. Where public health standards require 24-hour pump operation.
2. Where pumps are required to operate solar-and-waste-heat-recovery pool heating systems.

N1104.8.3 Pool covers. Heated pools shall be equipped with a vapor-retardant pool cover on or at the water surface. Pools heated to more than 90^{o}F (32^{o}C) shall have a pool cover with a minimum insulation value of R-12.

Exception: Pools deriving over 60 percent of the energy from heating from site-recovered or solar energy source.

SECTION N1105
ELECTRICAL POWER AND LIGHTING SYSTEMS

N1105.1 Lighting equipment. A minimum of seventy-five percent of the lamps in permanently installed lighting fixtures shall be high efficacy lamps.

Reason: The main purpose of this Proposal is two-fold. One is to achieve energy efficiency that is 30% above the 2006 IECC. The second is to achieve consistency between the IECC and the IRC for low-rise residential buildings. This proposal is also designed to bring together sound building science practices, energy efficiency options, code compliance verification, and practicality with respect to the construction of residential dwellings, without creating a market advantage for any one product or practice.

Significant energy savings is achieved several ways in this proposal by limiting whole house air leakage limiting fenestration area, increasing the building envelope requirements and equipment performance, resulting in a 30% improvement over the 2006 IECC.

This proposal has multiple prescriptive paths that builders and code officials can easily follow and without complicated calculations. Some paths use equipment to achieve the savings, others use air tightness and/or additional insulation.

As written in the 2009 IECC, many low SHGC windows are very dark resulting in higher lighting usage and an increased desire for more windows, thus do not save energy. Projection factor trade-offs for window SHGC requirements have successfully been used in the commercial and high rise residential energy codes for many years and have proven to be simple to calculate. The projection factor in this proposal allows builders to incorporate shading devices to satisfy the SHGC requirement.

Moreover, fenestration is a significant contributor to space conditioning costs in every climate. Solar heat gains in the Southern climates and conduction losses in the Northern climates are significantly reduced when a typical R-2 to R-3 window is replaced by an R-13 to R-21 wall. Providing an incentive for lower fenestration area by limiting window percentage in the prescriptive path will provide for increased opaque wall area, again, resulting in energy savings.

Another area that this proposal addresses is the percentage of windows (one of the least energy efficient components in a house) relative to the overall window-to-wall ratio. Recognizing the impact of the windows on the performance of the house, it is necessary to provide options to off-set the energy requirements of the windows. The window-to-floor area (UA) factor is adjusted according to the energy saving items listed in that particular climate zone and path option.

A tight building envelope and duct system are integral parts of an energy efficient home. Blower door and duct testing are recognized as tools used to evaluate these items and are addressed in this proposal. Once properly trained, contractors who perform air sealing and duct installation repeatedly install the systems in a consistent manner, testing would not necessarily be required in every home. Sample testing provides valuable periodic feedback to keep the performance levels consistent and acceptable. This has been demonstrated by the Energy Star program that has allowed sample testing for many years. Testing does not save energy, sealing ducts and the building envelope do.

Although the equipment trade-off Tables were eliminated from the 2009 IECC, increasing equipment efficiency is often a practical and cost effective means of saving energy. With the 4 option paths in this proposal, the builder can comply with the code by increased equipment efficiency or

other options that would meet the required energy savings. As new technologies are developed that increases equipment efficiencies, it would only makes sense to incorporate the improved HVAC equipment to save energy.

Builders understand the need to increase energy efficiency in homes, but they must be given a variety of options and paths with which to reach their targets without being overburdened with complicated calculations that could easily lead to errors. This proposal provides that level of stringency and allows code officials an easy path to certify compliance of the code without requiring expensive testing.

Cost Impact: The code change proposal will increase the cost of construction.

EC17–09/10
202; IRC R202

Proponent: Matthew Dobson, representing Vinyl Siding Institute

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IECC COMMITTEE. PART II WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IECC

Add new definition as follows:

SECTION 202
GENERAL DEFINITIONS

INSULATED SIDING. A cladding system with integral insulating material, having a minimum thermal resistance of R-2.

PART II – IRC ENERGY

Add new definition as follows:

SECTION R202
DEFINITIONS

INSULATED SIDING. A cladding system with integral insulating material, having a minimum thermal resistance of R-2.

Reason: Forms of insulated siding have been commercially available for at least twelve years. Current versions of insulated vinyl siding as well as other types of insulated claddings are now being tested to show actual field R-values. Many of these tests are being conducted using the appropriate testing methodology using the "hot box" test or ASTM C1363. This building component presents a viable option. A minimal performance value of R-value is consistent with the minimal R-value requirements to establish the product as a home insulation or insulation.

In addition to the thermal resistance characteristics, insulated siding's components and other non-related energy performance characteristics are covered by the code and specific product standards. For example the foam plastic used with insulated siding is addressed in the foam plastic sections of the IBC and IRC as well as through AC12. In addition ASTM C578 is the standard for foam plastics. Over the past few years both an acceptance criteria and product standard have been developed to address the non-thermal characteristics of what is termed as "backed siding". These material standards (ASTM D7445-09 and AC 37 (both vinyl and backed vinyl siding)) provide performance criteria for the siding including areas required by the building codes for example warp, shrinkage, impact strength, expansion, appearance, and wind load resistance.

Testing relative to moisture and water management issues indicated that use of insulated siding has no negative effect on the performance of the wall panels in relationship to moisture absorption. In field studies where the product had been installed for nearly ten years there were no indications of any problems of moisture entrapment related issues. Further the industry knows of no claims or complaints relating to moisture issues and the performance insulated vinyl siding.

Included with this proposal is an example of testing that has been completed using the ASTM C1363 test method as well as recent research co-funded by VSI through the New York State Energy Research and Development Authority's High Performance Residential Development Challenge program. Both testing and research support insulated siding as a viable option to help increase the energy efficiency of buildings.

As a part of this proposal please visit the link provided of an example of testing that has been completed using the ASTM C1363 test method as well as a link to recent research co-funded by VSI through the New York State Energy Research and Development Authority's High Performance Residential Development Challenge program. Both testing and research support insulated siding as a viable option to help increase the energy efficiency of buildings.

Here is the link to the example ASTM C1363 testing results
http://www.vinylsiding.org/aboutsiding/insulatedvinylsiding/ASTM%5FC1363%5Ftest%5Fresults%2Epdf.

404.1.1 (New); IRC N1104.1.1 (New)

Proponents: Bill Prindle, ICF International, representing the Energy Efficient Codes Coalition; Jeff Harris, Alliance to Save Energy; Harry Misuriello, American Council for an Energy-Efficient Economy (ACEEE); Garrett Stone, Brickfield, Burchette, Ritts & Stone; Steve Rosenstock, Edison Electric Institute; Brian Dean, ICF International

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IECC COMMITTEE. PART II WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IECC

Add new text as follows:

404.1.1 Lighting equipment (Mandatory). Fuel gas lighting systems shall not have continuously burning pilot lights.

PART II – IRC BUILDING/ENERGY

Add new text as follows:

N1104.1.1 Lighting equipment. Fuel gas lighting systems shall not have continuously burning pilot lights.

Reason: This language is consistent with the ban on continuously burning pilot lights for pool heaters currently found in the *IECC*. Under a new federal rulemaking, gas cooking equipment will also not be allowed to have continuously burning pilot lights.

There are significant energy savings. Typical gas lights use 18 therms per month, most of that due to the pilot light (about 2,500 Btu/hr for many systems). At a national average cost of $1.20 per therm, the cost to a typical consumer is $21.60 per month, or $259.20 per year. With advanced controls (electronic spark ignition, for example), the standby energy losses are eliminated, and the consumer saves at least $200 per year (assuming lights are turned off 80% of the time. If the lights operate for 50% of the time, the savings are $129.60 per year).

Cost Impact: The code change proposal will increase the cost of construction.

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IECC COMMITTEE. PART II WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IECC

1. Add new definition as follows:

CHAPTER 2
DEFINITIONS

DEMAND RECIRCULATION WATER SYSTEM. A water distribution system where pump(s) prime the service hot water piping with heated water upon demand for hot water.

2. Revise as follows:

CHAPTER 4
RESIDENTIAL ENERGY EFFICIENCY

401.2 Compliance. Projects shall comply with Sections identified as "mandatory" and with either sections identified as "prescriptive" or the performance approach in Section 406. ~~Sections 401, 402.4, 402.5, and 403.1, 403.2.2, 403.2.3, and 403.3 through 403.9 (referred to as the mandatory provisions) and either:~~

1. ~~Sections 402.1 through 402.3, 403.2.1 and 404.1 (prescriptive); or~~
2. ~~Section 405 (performance).~~

401.3 Certificate (Mandatory). A permanent certificate shall be completed and posted on or in the electrical distribution panel by the builder or registered design professional. The certificate shall not cover or obstruct the visibility of the circuit directory label, service disconnect label or other required labels. ~~The certificate shall be completed by the builder or registered design professional.~~ The certificate shall list the predominant *R*-values of insulation installed in or on ceiling/roof, walls, foundation (slab, *basement wall*, crawlspace wall and/or floor) and ducts outside conditioned spaces; *U*-factors for fenestration and the solar heat gain coefficient (SHGC) of fenestration, and the results from any duct system and building envelope air leakage testing done on the building. Where there is more than one value for each component, the certificate shall list the value covering the largest area. The certificate shall list the types and efficiencies of heating, cooling and service water heating equipment. Where a gas-fired unvented room heater, electric furnace, or baseboard electric heater is installed in the residence, the certificate shall list "gas-fired unvented room heater," "electric furnace" or "baseboard electric heater," as appropriate. An efficiency shall not be *listed* for gas-fired unvented room heaters, electric furnaces or electric baseboard heaters.

TABLE 402.1.1
INSULATION AND FENESTRATION REQUIREMENTS BY Component

CLIMATE ZONE	FENESTRATION *U*-FACTOR	SKYLIGHT *U*-FACTOR	GLAZED FENESTRATION SHGC	CEILING *R*-VALUE	WOOD FRAME WALL *R*-VALUE	MASS WALL *R*-VALUE[i]	FLOOR *R*-VALUE	BASEMENT[c] WALL *R*-VALUE	SLAB[d] *R*-VALUE & DEPTH	CRAWL SPACE[c] WALL *R*-VALUE

5 and Marine 4	~~0.35~~ 0.32	0.55 ~~0.60~~	NR	~~38~~49	20 or 13+5[h]	13 / 17	30[g]	10/13	10,2ft	10/13
6	~~0.35~~ 0.32	0.55 ~~0.60~~	NR	49	20~~+5~~ or 13+~~5~~ 10[h]	15 / ~~19~~ 20	30[g]	15/19	10,4ft	10/13
7 and 8	~~0.35~~ 0.32	0.55 ~~0.60~~	NR	49	~~21~~ 20+5 or 13+10[h]	19 / 21	38[g]	15/19	10,4ft	10/13

For SI: 1 foot = 304.8 mm.

a. *R*-values are minimums. *U*-factors and SHGC are maximums. R-19 batts compressed into a nominal 2x6 framing cavity such that the R-value is reduced by R-1 or more shall be marked with the compressed batt R-value in addition to the full thickness R-value.

b. The fenestration *U*-factor column excludes skylights. The SHGC column applies to all glazed fenestration.

c. 15/19" means R-15 continuous ~~insulated sheathing~~ insulation on the interior or exterior of the home or R-19 cavity insulation at the interior of the basement wall. "15/19" shall be permitted to be met with R-13 cavity insulation on the interior of the basement wall plus R-5 continuous ~~insulated sheathing~~ insulation on the interior or exterior of the home. "10/13" means R-10 continuous ~~insulated sheathing~~ insulation on the interior or exterior of the home or R-13 cavity insulation at the interior of the basement wall.

d. R-5 shall be added to the required slab edge *R*-values for heated slabs. Insulation depth shall be the depth of the footing or 2 ft, whichever is less, in zones 1 through 3 for heated slabs.

e. There are no SHGC requirements in the Marine zone.

f. Basement wall insulation is not required in warm-humid locations as defined by Figure 301.1 and Table 301.1.

g. Or insulation sufficient to fill the framing cavity, R-19 minimum.

h. First value is cavity insulation, second is continuous insulation, so "13+5" means R-13 cavity insulation plus R-5 insulated sheathing. If structural sheathing covers 25 percent or less of the exterior, insulating sheathing is not required in the locations where structural sheathing is used. If structural sheathing covers more than 25 percent of exterior, structural sheathing shall be supplemented with insulated sheathing of at least R-2.

i. The second R-value applies when more than half the insulation is on the interior of the mass wall.

j. For impact rated fenestration in wind-borne debris regions ~~complying with Section R301.2.1.2 of the IRC or Section 1608.1.2 of the IBC~~, the maximum U-factor shall be 0.75 in Zone 2 and 0.65 in Zone 3.

TABLE 402.1.3
EQUIVALENT *U*-FACTORS[a]

a. Nonfenestration *U*-factors shall be obtained from measurement, calculation or an approved source.

b. When more than half the insulation is on the interior, the mass wall U-factors shall be a maximum of 0.17 in Climate Zone 1, 0.14 in Climate Zone 2, 0.12 in Climate Zone 3, 0.10 in Climate Zone 4 except Marine, 0.087 in Climate Zone 5 and Marine 4, and the same as the frame wall U-factor in Marine Zone 4 and Climate Zones 5 through 8.

c. Basement wall U-factor of 0.360 in warm-humid locations as defined by Figure 301.1 and Table 301.2.

a. Cavity insulation *R*-value is listed first, followed by continuous insulation *R*-value.
b. Insulation exceeding the height of the framing shall cover the framing.

402.4 Air leakage (Mandatory).

402.4.1 Building thermal envelope. The *building thermal envelope* shall comply with Sections 402.4.1.1 and 402.4.1.2. ~~be durably sealed to limit infiltration.~~ The sealing methods between dissimilar materials shall allow for differential expansion and contraction. ~~The following shall be caulked, gasketed, weatherstripped or otherwise sealed with an air barrier material, suitable film or solid material:~~

~~1. All joints, seams and penetrations.~~
~~2. Site-built windows, doors and skylights.~~
~~3. Openings between window and door assemblies and their respective jambs and framing.~~
~~4. Utility penetrations.~~
~~5. Dropped ceilings or chases adjacent to the thermal envelope.~~
~~6. Knee walls.~~
~~7. Walls and ceilings separating a garage from conditioned spaces.~~
~~8. Behind tubs and showers on exterior walls.~~
~~9. Common walls between dwelling units.~~
~~10. Attic access openings.~~
~~11. Rim joist junction.~~
~~12. Other sources of infiltration.~~

402.4.1.1 Installation. The components of the *building thermal envelope* as listed in Table 402.4.1.1 shall be installed in accordance with the manufacturer's instructions and the criteria listed in Table 402.4.1.1, as applicable to the method of construction. Where required by the *code official*, an *approved* party shall inspect all components and verify compliance.

TABLE ~~402.4.2.1.1~~ 402.4.1.1
AIR BARRIER AND INSULATION ~~INSPECTION COMPONENT CRITERIA~~ INSTALLATION

COMPONENT	CRITERIA
Air barrier and thermal barrier	A continuous air barrier shall be installed in the building envelope. ~~Exterior thermal envelope insulation for framed walls is installed in substantial contact and continuous alignment with building envelope air barrier.~~ Breaks or joints in the air barrier ~~are filled or repaired~~ shall be sealed. Air permeable insulation ~~is~~ shall not be used as a sealing material. Any ~~A~~air permeable insulation shall be installed ~~is~~ inside of an air barrier.
Ceiling / attic	The air barrier in any dropped ceiling / soffit ~~is substantially~~ shall be aligned with the insulation and any gaps ~~are~~ in the air barrier sealed. ~~Attic access (except unvented attic), knee wall door, or drop down stair is sealed.~~ Access openings, drop down stairs or knee wall doors to unconditioned attic spaces shall be sealed.
Walls	Corners and headers shall be ~~are~~ insulated and the~~.~~ junction of the foundation and sill plate ~~is~~ shall be sealed. The junction of the top plate and top of exterior walls shall be sealed. Exterior thermal envelope insulation for framed walls shall be installed in substantial contact and continuous alignment with the air barrier. Knee walls shall be sealed.
Windows, skylights and doors	The space between window/door jambs and framing and skylights and framing ~~is~~ shall be sealed.
Rim joists	Rim joists ~~are~~ shall be insulated and include ~~an~~ the air barrier.
Floors (including above garage and cantilevered floors)	Insulation ~~is~~ shall be installed to maintain permanent contact with underside of subfloor decking. The air barrier ~~is~~ shall be installed at any exposed edge of insulation.
Crawlspace walls	Where provided in lieu of floor insulation, insulation ~~is~~ shall be permanently attached to the crawlspace walls. Exposed earth in unvented crawlspaces ~~is~~ shall be covered with a class I vapor retarder with

COMPONENT	CRITERIA
	overlapping joints taped.
Shafts, penetrations	Duct shafts, utility penetrations, ~~knee walls,~~ and flue shafts opening to exterior or unconditioned space ~~are~~ shall be sealed.
Narrow cavities	Batts in narrow cavities ~~are~~ shall be cut to fit, or narrow cavities ~~are~~ shall be filled by ~~spayed/blown~~ insulation that on installation readily conforms to the available cavity space.
Garage separation	Air sealing ~~is~~ shall be provided between the garage and conditioned spaces.
Recessed lighting	Recessed light fixtures installed in the building thermal envelope ~~are~~ shall be airtight, IC rated, and sealed to the drywall. ~~Exception: fixtures in conditioned space.~~
Plumbing and Wiring	~~Insulation is placed between outside and pipes.~~ Batt insulation ~~is~~ shall be cut neatly to fit around wiring and plumbing in exterior walls, or ~~sprayed/blown~~ insulation that on installation readily conforms to available space shall extend~~s~~ behind piping and wiring.
Shower / tub on exterior wall	Exterior walls adjacent to showers and tubs ~~on exterior walls~~ shall be ~~have~~ insulat~~ion~~ed and ~~an~~ the air barrier installed separating them from the ~~exterior wall~~ showers and tubs.
Electrical / phone box on exterior walls	The air barrier ~~extends~~ shall be installed behind electrical or communication boxes or ~~an~~ air sealed ~~type~~ boxes ~~are~~ shall be installed.
Common wall	An air barrier ~~is~~ shall be installed in the common wall between dwelling units.
HVAC register boots	HVAC register boots that penetrate building thermal envelope ~~are~~ shall be sealed to the subfloor or drywall.
Fireplace	An air barrier shall be installed on fireplace walls. ~~include an air barrier.~~ Fireplaces shall have gasketed doors.

~~**402.4.2 Air sealing and insulation.** Building envelope air tightness and insulation installation shall be demonstrated to comply with one of the following options given by Section 402.4.2.1 or 402.4.2.2.~~

~~**402.4.2.1 Testing option.** Building envelope tightness and insulation installation shall be considered acceptable when tested air leakage is less than seven air changes per hour (ACH) when tested with a blower door at a pressure of 33.5 psf (50 Pa). Testing shall occur after rough in and after installation of penetrations of the building envelope, including penetrations for utilities, plumbing, electrical, ventilation and combustion appliances.~~

402.4.1.2 Testing. The building or dwelling unit shall be tested and verified as having an air leakage rate not exceeding 5 air changes per hour (ACH50) in Climate Zones 1 and 2, and 3 air changes per hour in Climate Zones 3 through 8. Testing shall be conducted with a blower door at a pressure of 0.2 inches w.g. (50 Pascals). Where required by the *code official*, testing shall be conducted by an *approved* party. A written report of the results of the test shall be signed by the party conducting the test and provided to the *code official*. Testing shall be performed at any time after rough in and creation of all penetrations of the *building thermal envelope*

Exception: Where heating and cooling equipment meets the requirements of Section 404, maximum leakage rate shall be seven air changes per hour (ACH50) in Climate Zones 1 and 2 and five air changes per hour in Climate Zones 3 through 8. Additions less than 1000 ft^2 are exempt from testing. Buildings with more than four dwelling units are exempt from testing.

During testing:

1. Exterior windows and doors, fireplace and stove doors shall be closed, but not sealed~~;~~ beyond the intended weatherstripping or other infiltration control measures;
2. Dampers including exhaust, intake, makeup air, backdraft and flue dampers shall be closed, but not sealed, ~~including exhaust, intake, makeup air, backdraft and flue dampers~~ beyond intended infiltration control measures;
3. Interior doors, if installed at the time of test, shall be open;
4. Exterior openings for continuous ventilation systems and heat recovery ventilators shall be closed and sealed;
5. Heating and cooling system(s), if installed at the time of the test, shall be turned off; and
~~6. HVAC ducts shall not be sealed; and~~
~~7.~~ 6. Supply and return registers, if installed at the time of the test, shall ~~not~~ be ~~sealed~~ fully open.

402.4.1.2.1 Sampling. The *code official* shall be permitted to require testing of an approved sample of residences constructed by a specific builder, but not less than 1 in 7 residences The specific buildings or dwelling units to be tested shall be selected by the *code official*. If any tested building or dwelling unit fails to comply with the maximum air

leakage requirement in Section 402.4.1.2 then all buildings or dwelling units shall be tested until a minimum of three consecutive buildings or dwelling units comply from that specific builder and/or contractor or multifamily structure before the *code official* may permit sampling to resume.

~~**402.4.2.2 Visual inspection option.** Building envelope tightness and insulation installation shall be considered acceptable when the items listed in Table 402.4.2, applicable to the method of construction, are field verified. Where required by the *code official*, an *approved* party independent from the installer of the insulation shall inspect the air barrier and insulation.~~

402.4.3 Fireplaces. New wood-burning fireplaces shall have ~~gasketed doors and~~ outdoor combustion air.

403.2.2 Sealing (Mandatory). All ducts, air handlers, and filter boxes ~~and building cavities used as ducts~~ shall be sealed. Joints and seams shall comply with Section M1601.4.1 of the *International Residential Code*.

Duct tightness shall be verified by either of the following:

1. Postconstruction test: Total leakage ~~to outdoors~~ shall be less than or equal to ~~8~~ 4 cfm (~~226.5~~ 113.3 L/min) per 100 square feet (9.29 m^2) of *conditioned floor area* ~~or a total leakage less than or equal to 12 cfm (12 L/min) per 100 ft^2 (9.29 m^2) of *conditioned floor area*~~ when tested at a pressure differential of 0.1 inches w.g. (25 Pa) across the entire system, including the manufacturer's air handler enclosure. All register boots shall be taped or otherwise sealed during the test.
2. Rough-in test: Total leakage shall be less than or equal to ~~6~~ 4 cfm (~~169.9~~ 113.3 L/min) per 100 square feet (9.29 m^2) of *conditioned floor area* when tested at a pressure differential of 0.1 inches w.g. (25 Pa) across the ~~roughed in~~ system, including the manufacturer's air handler enclosure. All register ~~boot~~s shall be taped or otherwise sealed during the test. If the air handler is not installed at the time of the test, total leakage shall be less than or equal to ~~4~~ 3 cfm (~~113.3~~ 85.0 L/min) per 100 ft^2 (9.29 m^2) of *conditioned floor area*.

   ~~**Exceptions:** Duct tightness test is not required if the air handler and all ducts are located within *conditioned space*.~~

   Exception: Where heating and cooling equipment meets the requirements of Section 404:

   1. Maximum total leakage shall be less than or equal to 6 cfm (169.9 L/min) per 100 square feet (9.29 m^2) of conditioned floor area for ducts located outside conditioned space, and
   2. The maximum leakage test is not required for ducts and air handlers located entirely within conditioned space.

403.2.4 Location (Prescriptive). All ducts and air handlers shall be located within the conditioned space.

Exception: Where heating and cooling equipment meets the requirements of Section 404.

403.4 Service hot water systems. Energy conservation measures for hot water service systems shall be in accordance with Sections 403.4.1 and 403.4.2.

~~**403.4**~~ **404.4.1 Circulating hot water systems (Mandatory).** ~~All circulating service hot water piping shall be insulated to at least R-2.~~ Circulating hot water systems shall ~~include~~ be provided with an automatic or readily accessible manual switch that can turn off the hot water circulating pump when not in use.

403.4.2 Hot water pipe insulation (Prescriptive). Insulation for hot water pipe with a minimum thermal resistance (R-value) of at least R-3 shall be applied to the following:

1. Piping larger than 3/4 inch nominal diameter
2. Piping serving more than one dwelling unit
3. Piping from the water heater to kitchen outlets
4. Piping located outside the conditioned space
5. Piping from the water heater to a distribution manifold
6. Piping located under a floor slab
7. Buried piping
8. Supply and return piping in recirculation systems other than demand recirculation systems

9. Piping with run lengths greater than the maximum run lengths for the nominal pipe diameter given in Table 403.4.2.

TABLE 403.4.2
MAXIMUM RUN LENGTH (FEET)[1]

Nominal Diameter of Largest Diameter Pipe in the Run (in.)	3/8	1/2	3/4	> 3/4
Maximum Run Length (ft.)	30	20	10	5

1. Total length of all piping from the distribution manifold or the recirculation loop to a point of use.

403.5 Mechanical ventilation (Mandatory). The building shall be provided with ventilation that meets the requirements of Section M1507 of the *International Residential Code* or with other approved means of ventilation. Outdoor air intakes and exhausts shall have automatic or gravity dampers that close when the ventilation system is not operating.

All combustion equipment in new residences in Climate Zones 3 through 8 shall be sealed combustion, induced draft, or power vented.

Exception: Stoves and ovens in kitchens with vents and fireplaces that meet the applicable requirements of Section 402.

SECTION 404
IMPROVED EQUIPMENT EFFICIENCY ALTERNATIVE

404.1 General (Prescriptive). For new residences, Sections 404.2 and 402.3 shall be permitted as an alternative to certain requirements as specified by exceptions in Sections 402.4.1.2, 403.2.2, and 403.2.4.

404.2 Heating equipment. In Climate Zones 3 and 4 gas furnace AFUE shall be at least 90. In Climate Zones 5 through 8, gas furnace AFUE shall be at least 92. In Climate Zones 3 through 8, gas boiler, oil boiler, or oil furnace AFUE shall be at least 85. In Climate Zones 3 through 8, heat pump HSPF shall be at least 8.5. Ground source heat pumps shall have a minimum efficiency as specified in Table 503.2.3(2). All-electric heated buildings shall utilize either an air-source or ground source heat pump.

404.3 Cooling equipment. In Climate Zones 1 and 2, vapor compression air conditioning SEER shall be at least 16.0 and EER at least 13. In Climate Zone 3, vapor compression air conditioning SEER shall be at least 15.0 and EER at least 12.5. In Climate Zones 1 through 3, room air conditioner EER shall be at least 11.0 for air conditioners with capacity less than 20,000 Btu/hr, or 10.0 for capacities equal to or greater than 20,000 Btu/hr. Ground source heat pumps shall have a minimum efficiency as specified in Table 503.2.3(2).

404.3.1 Future updates to federal manufacturing standards. If applicable Federal manufacturing standards as specified in 10 CFR 430 are updated to establish new efficiency requirements, equipment efficiency requirements in this section shall be improved by a percentage equivalent to the percentage improvement from the efficiency required by 10 CFR 430 as of January 1, 2011 to the efficiency required by 10 Code of Federal Regulations 430 at the date of plan check approval.

Exception: AFUEs for furnaces and boilers shall not be required to exceed the higher of 95 or the requirement in 10 CFR 430 at the date of plan check approval.

SECTION ~~404~~ 405
ELECTRICAL POWER AND LIGHTING SYSTEMS

~~404.1~~ 405.1 Lighting equipment (Prescriptive). A minimum of ~~50~~ seventy-five percent of the lamps in permanently installed lighting fixtures shall be high efficacy lamps or a minimum of seventy-five percent of the permanently installed lighting fixtures shall contain only high efficacy lamps.

Exception: Low-voltage lighting.

TABLE 405.5.2(1)
SPECIFICATIONS FOR THE STANDARD REFERENCE AND PROPOSED DESIGNS

BUILDING COMPONENT	STANDARD REFERENCE DESIGN	PROPOSED DESIGN
Air Exchange Rate	~~Specific leakage area (SLA)[e] = 0.00036~~ Air leakage rate of 5 air changes per hour in zones 1 and 2, and 3 air changes per hour in zones 3 through 8 at a pressure of 0.2 inches w.g. (50 Pa). ~~assuming no energy recovery~~. The mechanical ventilation rate shall be in addition to the air leakage rate and the same as in the proposed design, but no greater than 0.01 x *CFA* + 7.5 x (N_{br}+1) where: *CFA* = conditioned floor area N_{br} = number of bedrooms Energy recovery shall not be assumed for mechanical ventilation.	For residences that are not tested, the same air leakage rate as the standard reference design. ~~For residences without mechanical ventilation that are tested in accordance with ASHRAE 119, Section 5.1, the measured air exchange rate[e] but not less than 0.35 ACH~~ For tested residences ~~with mechanical ventilation that are tested in accordance with ASHRAE 119, Section 5.1~~, the measured air exchange rate[e] ~~combined with the proposed mechanical ventilation rate, *f* which shall not be less than 0.01 x *CFA* + 7.5 x (N_{br}+1) where: *CFA* = conditioned floor area N_{br} = number of bedrooms~~ The mechanical ventilation rate shall be in addition to the air leakage rate and shall be as proposed.
Thermal distribution systems	A thermal distribution system efficiency (DSE) of 0.88 shall be applied to both the heating and cooling system efficiencies for all systems other than tested duct systems. Duct insulation: From Section 403.2.1. For tested duct systems, the leakage rate shall be ~~the applicable maximum rate from Section 403.2.2.~~ 4 cfm (113.3 L/min) per 100 ft^2 (9.29 m^2) of *conditioned floor area* at a pressure differential of 0.1 inches w.g. (25 Pa).	Thermal distribution system efficiency shall be as ~~As~~ tested or as specified by Table 405.5.2(2) if not tested. Duct insulation shall be as proposed.

e. Where required by the *code official*, testing shall be conducted by an *approved* party. ~~Tested envelope leakage shall be determined and documented by an independent party approved by the *code official*.~~ Hourly calculations as specified in the ~~2001~~ASHRAE *Handbook of Fundamentals*~~, Chapter 26, page 26.21, Equation 40 (Sherman-Grimsrud model)~~ or the equivalent shall be used to determine the energy loads resulting from infiltration.

(Portions of table and footnotes not shown remain unchanged)

PART II – IRC ENERGY

1. Add new definition as follows:

SECTION 202
DEFINITIONS

DEMAND RECIRCULATION WATER SYSTEM. A water distribution system where pump(s) prime the service hot water piping with heated water upon demand for hot water.

2. Revise as follows:

CHAPTER 11
ENERGY EFFICIENCY

N1101.9 Certificate. A permanent certificate shall be completed and posted on or in the electrical distribution panel by the builder or registered design professional. The certificate shall not cover or obstruct the visibility of the circuit directory label, service disconnect label or other required labels. ~~The certificate shall be completed by the builder or registered design professional.~~ The certificate shall list the predominant *R*-values of insulation installed in or on ceiling/roof, walls, foundation (slab, *basement wall*, crawlspace wall and/or floor) and ducts outside conditioned spaces; *U*-factors for fenestration and the solar heat gain coefficient (SHGC) of fenestration, and the results from any duct system and building envelope air leakage testing done on the building. Where there is more than one value for each component, the certificate shall list the value covering the largest area. The certificate shall list the types and efficiencies of heating, cooling and service water heating equipment. Where a gas-fired unvented room heater, electric furnace, or baseboard electric heater is installed in the residence, the certificate shall list "gas-fired unvented room heater," "electric furnace" or "baseboard electric heater," as appropriate. An efficiency shall not be *listed* for gas-fired unvented room heaters, electric furnaces or electric baseboard heaters.

TABLE N1102.1
INSULATION AND FENESTRATION REQUIREMENTS BY COMPONENT

7 and 8	~~0.35~~ 0.32	0.55 ~~0.60~~	NR	49	~~21~~ 20+5 or 13+10[h]	19 / 21	38[g]	15/19	10,4ft	10/13

For SI: 1 foot = 304.8 mm.

a. *R*-values are minimums. *U*-factors and SHGC are maximums. R-19 batts compressed into a nominal 2x6 framing cavity such that the R-value is reduced by R-1 or more shall be marked with the compressed batt R-value in addition to the full thickness R-value.

b. The fenestration *U*-factor column excludes skylights. The SHGC column applies to all glazed fenestration.

c. The first value applies to continuous insulation, the second to framing cavity insulation; either insulation meets the requirement.

d. R-5 shall be added to the required slab edge *R*-values for heated slabs. Insulation depth shall be the depth of the footing or 2 ft, whichever is less, in zones 1 through 3 for heated slabs.

e. There are no SHGC requirements in the Marine zone.

f. Basement wall insulation is not required in warm-humid locations as defined by Figure N1101.2 and Table N1101.2.

g. Or insulation sufficient to fill the framing cavity, R-19 minimum.

h. First value is cavity insulation, second is continuous insulation, so "13+5" means R-13 cavity insulation plus R-5 insulated sheathing. If structural sheathing covers 25 percent or less of the exterior, insulating sheathing is not required in the locations where structural sheathing is used. If structural sheathing covers more than 25 percent of exterior, structural sheathing shall be supplemented with insulated sheathing of at least R-2.

i. For impact rated fenestration in wind-borne debris regions ~~complying with Section R301.2.1.2~~, the maximum U-factor shall be 0.75 in Zone 2 and 0.65 in Zone 3.

~~j. For impact rated fenestration complying with Section R301.2.1.2 of the *International Residential Code*, the maximum SHGC shall be 0.40.~~

~~k.~~ j. The second R-value applies when more than half the insulation is on the interior of the mass wall.

TABLE N1102.1.2

a. Nonfenestration *U*-factors shall be obtained from measurement, calculation or an approved source.

b. When more than half the insulation is on the interior, the mass wall U-factors shall be a maximum of 0.17 in zone 1, 0.14 in zone 2, 0.12 in zone 3, 0.10 in zone 4 except Marine, 0.087 in zone 5 and Marine 4, and the same as the frame wall U-factor in Marine zone 4 and zones 5 through 8.

c. Basement wall U-factor of 0.360 in warm-humid locations as defined by Figure N1101.2 and Table N1101.2.

TABLE N1102.2.5

a. Cavity insulation *R*-value is listed first, followed by continuous insulation *R*-value.
b. Insulation exceeding the height of the framing shall cover the framing.

N1102.4 Air leakage (Mandatory).

N1102.4.1 Building thermal envelope. The *building thermal envelope* shall comply with Sections N1102.4.1.1 and N1102.4.1.2. ~~be durably sealed to limit infiltration.~~ The sealing methods between dissimilar materials shall allow for differential expansion and contraction. ~~The following shall be caulked, gasketed, weatherstripped or otherwise sealed with an air barrier material, suitable film or solid material:~~

~~1. All joints, seams and penetrations.~~
~~2. Site-built windows, doors and skylights.~~
~~3. Openings between window and door assemblies and their respective jambs and framing.~~
~~4. Utility penetrations.~~
~~5. Dropped ceilings or chases adjacent to the thermal envelope.~~
~~6. Knee walls.~~
~~7. Walls and ceilings separating a garage from conditioned spaces.~~
~~8. Behind tubs and showers on exterior walls.~~
~~9. Common walls between dwelling units.~~
~~10. Attic access openings.~~
~~11. Rim joist junction.~~
~~12. Other sources of infiltration.~~

N1102.4.1.1 Installation. The components of the *building thermal envelope* as listed in Table N1102.4.1.1 shall be installed in accordance with the manufacturer's instructions and the criteria listed in Table N1102.4.1.1, as applicable to the method of construction. Where required by the *code official*, an *approved* party shall inspect all components and verify compliance.

TABLE ~~N1102.4.2.1.1~~ N1102.4.1.1
AIR BARRIER AND INSULATION ~~INSPECTION COMPONENT CRITERIA~~ INSTALLATION

COMPONENT	CRITERIA
Air barrier and thermal barrier	A continuous air barrier shall be installed in the building envelope. ~~Exterior thermal envelope insulation for framed walls is installed in substantial contact and continuous alignment with building envelope air barrier.~~ Breaks or joints in the air barrier ~~are filled or repaired~~ shall be sealed. Air permeable insulation ~~is~~ shall not be used as a sealing material. Any ~~A~~air permeable insulation shall be installed ~~is~~ inside of an air barrier.
Ceiling / attic	The air barrier in any dropped ceiling / soffit ~~is substantially~~ shall be aligned with the insulation and any gaps ~~are~~ in the air barrier sealed. ~~Attic access (except unvented attic), knee wall door, or drop down stair is sealed.~~ Access openings, drop down stairs or knee wall doors to unconditioned attic spaces shall be sealed.
Walls	Corners and headers shall be ~~are~~ insulated and the~~.~~ junction of the foundation and sill plate ~~is~~ shall be sealed. The junction of the top plate and top of exterior walls shall be sealed. Exterior thermal envelope insulation for framed walls shall be installed in substantial contact and continuous alignment with the air barrier. Knee walls shall be sealed.
Windows, skylights and doors	The space between window/door jambs and framing and skylights and framing ~~is~~ shall be sealed.
Rim joists	Rim joists ~~are~~ shall be insulated and include ~~an~~ the air barrier.
Floors (including above garage and cantilevered floors)	Insulation ~~is~~ shall be installed to maintain permanent contact with underside of subfloor decking. The air barrier ~~is~~ shall be installed at any exposed edge of insulation.
Crawlspace walls	Where provided in lieu of floor insulation, insulation ~~is~~ shall be permanently attached to the crawlspace walls. Exposed earth in unvented crawlspaces ~~is~~ shall be covered with a class I vapor retarder with overlapping joints taped.
Shafts, penetrations	Duct shafts, utility penetrations, ~~knee walls,~~ and flue shafts opening to exterior or unconditioned space ~~are~~ shall be sealed.
Narrow cavities	Batts in narrow cavities ~~are~~ shall be cut to fit, or narrow cavities ~~are~~ shall be filled by ~~spayed/blown~~ insulation that on installation readily conforms to the available cavity space.
Garage separation	Air sealing ~~is~~ shall be provided between the garage and conditioned spaces.
Recessed lighting	Recessed light fixtures installed in the building thermal envelope ~~are~~ shall be airtight, IC rated, and sealed to the drywall. ~~Exception--fixtures in conditioned space.~~
Plumbing and Wiring	~~Insulation is placed between outside and pipes.~~ Batt insulation ~~is~~ shall be cut neatly to fit around wiring and plumbing in exterior walls, or ~~sprayed/blown~~ insulation that on installation readily conforms to available space shall extend~~s~~ behind piping and wiring.
Shower / tub on exterior wall	Exterior walls adjacent to showers and tubs ~~on exterior walls~~ shall be ~~have~~ insulat~~ion~~ed and ~~an~~ the air barrier installed separating them from the ~~exterior wall~~ showers and tubs.
Electrical / phone box on exterior walls	The air barrier ~~extends~~ shall be installed behind electrical or communication boxes or ~~an~~ air sealed ~~type~~ boxes ~~are~~ shall be installed.
Common wall	An air barrier ~~is~~ shall be installed in the common wall between dwelling units.
HVAC register boots	HVAC register boots that penetrate building thermal envelope ~~are~~ shall be sealed to the subfloor or drywall.
Fireplace	An air barrier shall be installed on fireplace walls. ~~include an air barrier.~~ Fireplaces shall have gasketed doors.

~~N1102.4.2 Air sealing and insulation.~~ ~~Building envelope air tightness and insulation installation shall be demonstrated to comply with one of the following options given by Section N1102.4.2.1 or N1102.4.2.2.~~

~~N1102.4.2.1 Testing option.~~ ~~Building envelope tightness and insulation installation shall be considered acceptable when tested air leakage is less than seven air changes per hour (ACH) when tested with a blower door at a pressure of 33.5 psf (50 Pa). Testing shall occur after rough in and after installation of penetrations of the building envelope, including penetrations for utilities, plumbing, electrical, ventilation and combustion appliances.~~

N1102.4.1.2 Testing. The building or dwelling unit shall be tested and verified as having an air leakage rate not exceeding 5 air changes per hour (ACH50) in Climate Zones 1 and 2, and 3 air changes per hour in Climate Zones 3 through 8. Testing shall be conducted with a blower door at a pressure of 0.2 inches w.g. (50 Pascals). Where required by the *code official*, testing shall be conducted by an *approved* party. A written report of the results of the test shall be signed by the party conducting the test and provided to the *code official*. Testing shall be performed at any time after rough in and creation of all penetrations of the *building thermal envelope*

Exception: Where heating and cooling equipment meets the requirements of Section N1104, maximum leakage rate shall be seven air changes per hour (ACH50) in Climate Zones 1 and 2 and five air changes per hour in Climate Zones 3 through 8. Additions less than 1000 square feet are exempt from testing. Buildings with more than four dwelling units are exempt from testing.

During testing:

1. Exterior windows and doors, fireplace and stove doors shall be closed, but not sealed~~;~~ beyond the intended weatherstripping or other infiltration control measures;
2. Dampers including exhaust, intake, makeup air, backdraft and flue dampers shall be closed, but not sealed, ~~including exhaust, intake, makeup air, backdraft and flue dampers~~ beyond intended infiltration control measures;
3. Interior doors, if installed at the time of test, shall be open;
4. Exterior openings for continuous ventilation systems and heat recovery ventilators shall be closed and sealed;
5. Heating and cooling system(s), if installed at the time of the test, shall be turned off; and
6. ~~HVAC ducts shall not be sealed; and~~
7. ~~6.~~ Supply and return registers, if installed at the time of the test, shall ~~not~~ be ~~sealed~~ fully open.

N1102.4.1.2.1 Sampling. The *code official* shall be permitted to require testing of an approved sample of residences constructed by a specific builder, but not less than 1 in 7 residences. The specific buildings or dwelling units to be tested shall be selected by the *code official*. If any tested building or dwelling unit fails to comply with the maximum air leakage requirement in Section N1102.4.1.2 then all buildings or dwelling units shall be tested until a minimum of three consecutive buildings or dwelling units comply from that specific builder and/or contractor before the *code official* may permit sampling to resume.

~~**N1102.4.2.2 Visual inspection option.** Building envelope tightness and insulation installation shall be considered acceptable when the items listed in Table N1102.4.2, applicable to the method of construction, are field verified. Where required by the *code official*, an *approved* party independent from the installer of the insulation shall inspect the air barrier and insulation.~~

N1102.4.3 Fireplaces. New wood-burning fireplaces shall have ~~gasketed doors and~~ outdoor combustion air.

N1103.2.2 Sealing (Mandatory). All ducts, air handlers, and filter boxes ~~and building cavities used as ducts~~ shall be sealed. Joints and seams shall comply with Section M1601.4. Duct tightness shall be verified by either of the following:

1. Postconstruction test: Total leakage ~~to outdoors~~ shall be less than or equal to ~~8~~ 4 cfm (~~226.5~~ 113.3 L/min) per 100 ft^2 (9.29 m^2) of *conditioned floor area* ~~or a total leakage less than or equal to 12 cfm (12 L/min) per 100 ft^2 (9.29 m^2) of *conditioned floor area*~~ when tested at a pressure differential of 0.1 inches w.g. (25 Pa) across the entire system, including the manufacturer's air handler enclosure. All register boots shall be taped or otherwise sealed during the test.
2. Rough-in test: Total leakage shall be less than or equal to ~~6~~ 4 cfm (~~169.9~~ 113.3 L/min) per 100 ft^2 (9.29 m^2) of *conditioned floor area* when tested at a pressure differential of 0.1 inches w.g. (25 Pa) across the ~~roughed in~~ system, including the manufacturer's air handler enclosure. All register ~~boot~~s shall be taped or otherwise sealed during the test. If the air handler is not installed at the time of the test, total leakage shall be less than or equal to ~~4~~ 3 cfm (~~113.3~~ 85.0 L/min) per 100 ft^2 (9.29 m^2) of *conditioned floor area*.

   ~~**Exceptions:** Duct tightness test is not required if the air handler and all ducts are located within *conditioned space*.~~

   Exception: Where heating and cooling equipment meets the requirements of Section N1104:

   1. Maximum total leakage shall be less than or equal to 6 cfm (169.9 L/min) per 100 ft^2 (9.29 m^2) of conditioned floor area for ducts located outside conditioned space, and
   2. The maximum leakage test is not required for ducts and air handlers located entirely within conditioned space.

N1103.2.4 Location (Prescriptive). All ducts and air handlers shall be located within the conditioned space.

Exception: Where heating and cooling equipment meets the requirements of Section N1104.

N1103.4 Service hot water systems. Energy conservation measures for hot water service systems shall be in accordance with Sections 1103.4.1 and 1103.4.2.

N1103.4.1 Circulating hot water systems (Mandatory). ~~All circulating service hot water piping shall be insulated to at least R-2.~~ Circulating hot water systems shall ~~include~~be provided with an automatic or readily accessible manual switch that can turn off the hot water circulating pump when not in use.

N1103.4.2 Hot water pipe insulation (Prescriptive). Insulation for hot water pipe with a minimum thermal resistance (R-value) of at least R-3 shall be applied to the following:

1. Piping larger than 3/4 inch nominal diameter
2. Piping serving more than one dwelling unit
3. Piping from the water heater to kitchen outlets
4. Piping located outside the conditioned space
5. Piping from the water heater to a distribution manifold
6. Piping located under a floor slab
7. Buried piping
8. Supply and return piping in recirculation systems other than demand recirculation systems
9. piping with run lengths greater than the maximum run lengths for the nominal pipe diameter given in Table N1103.4.2.

All remaining piping shall be insulated to at least R-3 or meet the run length requirements of Table N1103.4.2.

TABLE N1103.4.2
MAXIMUM RUN LENGTH (FEET)[1]

Nominal Diameter of Largest Pipe in the Run (in.)	3/8	1/2	3/4	> 3/4
Maximum Run Length (feet)	30	20	10	5

1. Total length of all piping from the distribution manifold or the recirculation loop to a point of use.

N1103.5 Mechanical ventilation (Mandatory). The building shall be provided with ventilation that meets the requirements of Section M1507 of the *International Residential Code* or with other approved means of ventilation. Outdoor air intakes and exhausts shall have automatic or gravity dampers that close when the ventilation system is not operating.

All combustion equipment in new residences in zones 3 to 8 shall be sealed combustion, induced draft, or power vented.

Exception: Stoves and ovens in kitchens with vents and fireplaces that meet the applicable requirements of Section N11402.

N1104 Improved equipment efficiency alternative. (Prescriptive) For new residences, Sections N1104.1 and N1102.2 shall be permitted as an alternative to certain requirements as specified by exceptions in Sections N1102.4.1.2, N1103.2.2, and N1103.2.4.

N1104.1 Heating equipment. In Climate Zones 3 and 4 gas furnace AFUE shall be at least 90 and EER at least 13. In Climate Zones 5 through 8, gas furnace AFUE shall be at least 92. In Climate Zones 3 through 8, gas boiler, oil boiler, or oil furnace AFUE shall be at least 85. In Climate Zones 3 through 8, heat pump HSPF shall be at least 8.5. Ground source heat pumps shall have a minimum efficiency as specified in Table 503.2.3(2). All-electric heated buildings shall utilize either an air-source or ground source heat pump.

N1104.2 Cooling equipment. In Climate Zones 1 and 2, vapor compression air conditioning SEER shall be at least 16.0 and EER at least 12.5. In Climate Zone 3, vapor compression air conditioning SEER shall be at least 15.0 and EER at least 12.5. In Climate Zones 1 through 3, room air conditioner EER shall be at least 11.0 for air conditioners with capacity less than 20,000 Btu/hr, or 10.0 for capacities equal to or greater than 20,000 Btu/hr. Ground source heat pumps shall have a minimum efficiency as specified in Table 503.2.3(2).

N1104.2.3 Future updates to federal manufacturing standards. If applicable Federal manufacturing standards as specified in 10 CFR 430 are updated to establish new efficiency requirements, equipment efficiency requirements in this section shall be improved by a percentage equivalent to the percentage improvement from the efficiency required

by 10 CFR 430 as of January 1, 2011 to the efficiency required by 10 Code of Federal Regulations 430 at the date of plan check approval.

Exception: AFUEs for furnaces and boilers shall not be required to exceed the higher of 95 or the requirement in 10 CFR 430 at the date of plan check approval.

SECTION ~~N1104~~ N1105
LIGHTING SYSTEMS

~~N1104.~~1 N1105.1 Lighting equipment. A minimum of ~~50~~ seventy-five percent of the lamps in permanently installed lighting fixtures shall be high efficacy lamps or a minimum of seventy-five percent of the permanently installed lighting fixtures shall contain only high efficacy lamps.

Exception: Low-voltage lighting.

Reason: This proposal is a key part of increasing the I-code energy efficiency to at least 30% over the 2006 IECC. This proposal includes a number of efficiency upgrades, as well as editorial improvements. These changes have been discussed among a variety of stakeholders and have been improved by that discussion.

Improved heating and cooling equipment efficiency is largest single savings in this proposal. To be consistent with Federal law this proposal allows increased building enclosure air tightness with increased duct tightness as an alternative to higher equipment efficiency.

To its credit the Department of Energy (DOE) actively participated in, encouraged and at times lead the discussion that preceded most parts of this proposal. This proposal is very similar to the DOE proposal. To make it easier to compare the proposals, the only four differences between this proposal and the DOE proposal are noted at the end of this reason statement.

The main changes are as follows, ordered by section-

Where available, tested air tightness results are added to the residence's energy certificate. (Sections 401.3, N1101.9- Certificate.**)**

This proposal includes several upgrades to the building enclose to reduce heat loss and heat gain. (See Tables 402.1.1, 402.1.3, N1102.1, and N1102.1.2.) The U-factor measures conductive heat flow, so a lower U-factors mean less heat flow. Looking at the U-factors already in the code shows that the windows are easily the highest U-factor and therefore the highest heat loss. This proposal reduces window and skylight U-factors in most climate zones. Thermally the weakest part of the opaque building enclose is the walls, as is shown by comparing the wall U-factors to the ceiling and floor U-factors. In this proposal frame wall U-factors are reduced (R-values are increased) in the northern and middle climate zones where heating is most important. These lower wall U-factors could represent a number of construction alternatives; insulated sheathing that covers the framing, ICFs, SIPs, or double wall construction. In a few places the IRC and IECC differ based on changes approved in the last code cycle; therefore the IECC and IRC are made consistent in this proposal by adopting IECC R-values and SHGC into the IRC tables. (Tables 402.1.1, 402.1.3, N1102.1, N1102.1.2.)

R-value equivalences for steel framing in walls are added. (Table 402.2.5, N1102.2.5.)

The redundant listing of items to be air sealed is deleted and the inspection "checklist" table for the air barrier and insulation installation is clarified with a large number of mostly editorial changes. (Sections 402.4.1, N1102.4.1- Building thermal envelope; Tables 402.4.1.1, N1102.4.1.1.)

The allowed air leakage through the building enclosure (infiltration) is reduced significantly. Alternately the allowed air leakage is only moderately reduced if high efficiency heating and cooling equipment is used. Instead of allowing a visual inspection as an alternative to air tightness testing, the proposed code requires both a visual inspection and air tightness testing. Requirements for the testing are clarified. Testing of a sample of the homes, rather than all homes, is allowed if the code official chooses. (Sections 402.4.1.2 N1102.4.1.2 Testing.)

The allowed duct leakage is reduced significantly. Alternately the allowed duct leakage is only moderately reduced or ducts are indoors, provided the residence uses high efficiency heating and cooling equipment. (Sections 403.2.2, N1103.2.2- Sealing.)

New requirements are added for efficient distribution of service hot water. Insulation is required on the hot water pipes that are the most actively used (larger trunk lines, kitchen, …) or in locations with high heat loss (outside conditioned space, in slab, …). Less used pipes must either be insulated or the piping to the water using fixtures must be "short and skinny". Short and skinny pipes mean less heat is lost by "stranded hot water" which usually cools in the piping between periods of use. Because piping is shorter and skinnier, the piping will probably be less expensive. Because less water is moved to provide hot water at the points of water use, the wait time for hot water is also reduced; thereby, providing better service to the home's occupant. (Demand recirculation definition, Sections 403.4, N1103.4- Service hot water systems.)

Ventilation is improved to maintain indoor air quality. Ventilation specified in Section M1507 of the *International Residential Code* is required. Due to the tighter building enclosures combustion equipment is limited to sealed-combustion, induced draft, or power-vented. Some combustion equipment relies on a natural draft, the tendency for warm air to rise up a chimney to vent the combustion products. More efficient equipment sends much less heat up the chimney, weakening the natural draft. The combination of a weaker natural draft and the tighter building enclosure proposed here can lead to back drafting, therefore combustion equipment is required to be sealed combustion, induced draft, or power vented. (Sections 403.5 and N1103.5- Mechanical ventilation.)

High efficiency heating and cooling equipment is specified for new residences. Greater heating equipment efficiency is specified in the climates with larger heating loads. Condensing gas furnaces are required in the north and middle zones. Due to the problem with condensing oil equipment, there is a lesser requirement for oil furnaces. Higher efficiency heat pumps are required. Higher efficiency cooling equipment is specified in the south. Higher efficiency cooling equipment is required for both central and room air conditioners. An adjustment is added for possible increases in Federally required equipment efficiency. (Sections 404, N1104- Improved equipment efficiency alternative; Sections 402.4.1.2 and N1102.4.1.2- Testing; Table 405.5.2(1).)

The minimum fraction of lighting required to be energy efficient (compact fluorescent or equivalent) is increased to 75%. An option for compliance based on either fixtures or bulbs is added to accommodate multi-bulb chandler-type fixtures. (Sections 405.1 and N1105.1- Lighting equipment.)

The base case building enclosure air leakage and duct leakage rates in the performance calculation are adjusted to be consistent with the new minimum leakage rates in this code change. (Table 405.5.2(1).)

The are only four differences between this proposal and DOE's similar proposal:

1) Residences with more than four dwelling units are exempted from the building enclosure air tightness testing. Testing large residential structures for overall air tightness is not practical. These large residential buildings must still comply with the inspection list on air barriers and insulation installation (Sections 402.4.1.2 and N402.4.1.2; Tables 402.4.1.1, N1102.4.1.1)

2) The language allowing the code official to approve testing a sample of a builder's residences rather than every residence was simplified. This still requires air leakage testing, but removes the impractical record keeping related to groups of homes, the similarities between the houses and the confusing 120-day period in DOE's change. (Sections 402.4.1.2.1 and N1102.4.1.2- Sampling.)
3) The required air conditioning efficiency in the most southern zones (zones 1 and 2) is 16 SEER with a 13 EER, as opposed to a 12.5 EER in DOE's proposal. The higher EER matches the EER specified in the current tax credit for energy efficient equipment and Consortium for Energy Efficiency's (CEE) Tier III. A higher EER means better equipment performance during electric utility peak loads on the hottest days. (Sections 404.2, N1104.2)
4) Fossil fueled combustion must be sealed combustion, induced draft, or power vented. Combustion equipment that relies on a natural draft utilizes the wasted heat to get warm air to rise up a chimney. More efficient equipment sends much less heat up the chimney, weakening the natural draft. The combination of a weaker natural draft and the tighter building enclosure proposed here can lead to back drafting, therefore combustion equipment is required to be sealed combustion, induced draft, or power vented to avoid indoor air quality problems. (Sections 403.5 and N1103.5- Mechanical ventilation.)

Approval of this code change will greatly increase the energy efficiency of the I-codes and move significantly towards the goal of an energy code that is at least 30% more energy efficient.

Cost Impact: The code change proposal will increase the cost of construction.

EC20–09/10
401.2

Proponent: Bill Prindle, ICF International, representing the Energy Efficient Codes Coalition; Jeff Harris, Alliance to Save Energy; Harry Misuriello, American Council for an Energy-Efficient Economy (ACEEE); Garrett Stone, Brickfield, Burchette, Ritts & Stone; Steve Rosenstock, Edison Electric Institute; Brian Dean, ICF International

Revise as follows:

401.2 Compliance. Projects shall comply with Sections 401, 402.4, 402.5, and 403.1, 403.2.2, 403.2.3, ~~and~~ 403.3 through 403.9 (referred to as the mandatory provisions), <u>and 404.1</u> and either:

1. Sections 402.1 through 402.3, <u>and</u> 403.2.1 ~~and 404.1 (prescriptive)~~; or
2. Section 405 (performance).

Reason: This proposal is intended to add in the mandatory requirements that can be approved for the IECC in this cycle. This proposal is a placeholder to allow the committee to add all sections, and includes the lighting section 404.1 as a mandatory section.

Cost Impact: The code change proposal will not increase the cost of construction.

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IECC COMMITTEE. PART II WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IECC

Add new text as follows:

401.2.2 Compliance testing. Where testing is required to determine air leakage of duct systems, the code official shall be permitted to require random sample testing of no fewer than one in seven homes.

PART II – IRC BUILDING/ENERGY

Add new text as follows:

N1101.2.2 Compliance testing. Where testing is required to determine air leakage of duct systems, the code official shall be permitted to require random sample testing of no fewer than one in seven homes.

Reason: The EPA Energy Star program, an above code program, only requires duct testing on 1 out of every 7 homes because EPA recognizes that once a trained installer understands how to seal a duct they continue to do it correctly on subsequent homes.

Cost Impact: The code change proposal will not increase the cost of construction.

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IECC COMMITTEE. PART II WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IECC

Revise as follows:

401.3 Certificate. A permanent certificate shall be completed and posted on or in the electrical distribution panel by the builder or registered design professional. The certificate shall not cover or obstruct the visibility of the circuit directory label, service disconnect label or other required labels. ~~The certificate shall be completed by the builder or registered design professional.~~ The certificate shall list the predominant *R*-values of insulation installed in or on ceiling/roof, walls, foundation (slab, *basement wall*, crawlspace wall and/or floor) and ducts outside conditioned spaces; *U*-factors for fenestration and the solar heat gain coefficient (SHGC) of fenestration, and the results from any duct system and building envelope air leakage testing . Where there is more than one value for each component, the certificate shall list the value covering the largest area. The certificate shall list the types and efficiencies of heating, cooling and service water heating equipment. Where a gas-fired unvented room heater, electric furnace, or baseboard electric heater is installed in the residence, the certificate shall list "gas-fired unvented room heater," "electric furnace" or "baseboard electric heater," as appropriate. An efficiency shall not be *listed* for gas-fired unvented room heaters, electric furnaces or electric baseboard heaters.

PART II – IRC BUILDING/ENERGY

Revise as follows:

N1101.9 Certificate. A permanent certificate shall be completed and posted on or in the electrical distribution panel by the builder or registered design professional. The certificate shall not cover or obstruct the visibility of the circuit directory label, service disconnect label or other required labels. ~~The certificate shall be completed by the builder or registered design professional.~~ The certificate shall list the predominant *R*-values of insulation installed in or on

ceiling/roof, walls, foundation (slab, *basement wall*, crawlspace wall and/or floor) and ducts outside conditioned spaces; *U*-factors for fenestration and the solar heat gain coefficient (SHGC) of fenestration, and the results from any duct system and building envelope air leakage testing . Where there is more than one value for each component, the certificate shall list the value covering the largest area. The certificate shall list the types and efficiencies of heating, cooling and service water heating equipment. Where a gas-fired unvented room heater, electric furnace, or baseboard electric heater is installed in the residence, the certificate shall list "gas-fired unvented room heater," "electric furnace" or "baseboard electric heater," as appropriate. An efficiency shall not be *listed* for gas-fired unvented room heaters, electric furnaces or electric baseboard heaters.

Reason: For clarification and to include the results for any duct or infiltration testing, both of which are important to documenting the specifications as built and documenting compliance with the code.

Cost Impact: The code change proposal will not increase the cost of construction.

EC23–09/10
401.3; IRC N1101.9

Proponent: Bill Prindle, ICF International, representing the Energy Efficient Codes Coalition; Jeff Harris, Alliance to Save Energy; Harry Misuriello, American Council for an Energy-Efficient Economy (ACEEE); Garrett Stone, Brickfield, Burchette, Ritts & Stone; Steve Rosenstock, Edison Electric Institute; Brian Dean, ICF International

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IECC COMMITTEE. PART II WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IECC

Revise as follows:

401.3 Certificate. A permanent certificate shall be posted on or in the electrical distribution panel. The certificate shall not cover or obstruct the visibility of the circuit directory label, service disconnect label or other required labels. The certificate shall be completed and signed by the builder or registered design professional and shall constitute such individual's certification of the information contained on the certificate. The certificate shall list:

1. The ~~predominant~~ location and R-values of insulation installed in or on the ceiling/roof, walls, foundation (slab, *basement wall*, crawlspace wall and/or floor), pipes and ducts inside and outside of conditioned space~~s~~*;*
2. The U-factors ~~for fenestration~~ and the solar heat gain coefficient (SHGC) of fenestration. Where there is more than one value for each component, the certificate shall either list the individual values with associated square footage or the weighted-average value; ~~covering the largest area.~~
3. The tested air leakage and the tested duct leakage where required for compliance;
4. The types and listed wattage for all lamps in permanently installed locations where required for compliance; and
5. ~~The certificate shall list~~ the types, capacities and efficiencies of heating, cooling and service water heating and any related equipment, including fan motor horsepower, controls, mechanical ventilation, economizer or energy recovery ventilation equipment, dehumidification, or pumping equipment. ~~Where a gas-fired unvented room heater, electric furnace, or baseboard electric heater is installed in the residence, the certificate shall list "gas-fired unvented room heater," "electric furnace," or "baseboard electric heater" as appropriate. An efficiency shall not be *listed* for gas-fired unvented room heaters, electric furnaces, or electric baseboard heaters.~~

PART II – IRC BUILDING/ENERGY

Revise as follows:

N1101.9 Certificate. A permanent certificate shall be posted on or in the electrical distribution panel. The certificate shall not cover or obstruct the visibility of the circuit directory label, service disconnect label or other required labels. The certificate shall be completed and signed by the builder or registered *design professional* and shall constitute such individual's certification of the information contained on the certificate. The certificate shall list:

1. The ~~predominant~~ location and R-values of insulation installed in or on the ceiling/roof, walls, foundation (slab, *basement wall*, crawlspace wall and/or floor), pipes and ducts inside and outside of *conditioned spaces~~;~~*
2. *T*he U-factors ~~for fenestration~~ and the solar heat gain coefficient (SHGC) of fenestration. Where there is more than one value for each component, the certificate shall either list the individual values with associated square footage or the weighted-average value~~; covering the largest area.~~
3. The tested air leakage and the tested duct leakage where required for compliance;
4. The types and listed wattage for all lamps in permanently installed locations where required for compliance; and
5. ~~The certificate shall list~~ the types, capacities and efficiencies of heating, cooling and service water heating and any related *equipment*, including fan motor horsepower, controls, mechanical ventilation, economizer or energy recovery ventilation equipment, dehumidification, or pumping equipment. ~~Where a gas-fired unvented room heater, electric furnace, or baseboard electric heater is installed in the residence, the certificate shall list "gas-fired unvented room heater," "electric furnace," or "baseboard electric heater" as appropriate. An efficiency shall not be *listed* for gas-fired unvented room heaters, electric furnaces, or electric baseboard heaters.~~

Reason: The purpose of this proposal is to update the certificate requirements to include recent requirements added to the code and potential new requirements and also to improve the clarity of required information on the certificate. The proposal is also intended to require the certificate to be signed by the responsible party as a certification of the accuracy of the information on the certificate.

Two new sections have been added, including:

1. Testing for air leakage and ducts
2. Lighting

In addition, the section on heating, cooling and service water heating is proposed to be expanded to include various other equipment that are already required as information on construction documents in this section to increase consistency in the information that code officials and builders are using.

Finally, the last two lines were deleted to ensure that any equipment is reported consistently in the heating, cooling and service water heating section of this section.

These proposed modifications to this section are reasonable and will improve the usability and accuracy of the currently required certificate.

Cost Impact: The code change proposal will not increase the cost of construction.

401.3

Proponent: Guy Tomberlin, Fairfax County, VA, representing the VA Plumbing and Mechanical Inspectors/VA Building and Code Officials

Delete without substitution:

~~**401.3 Certificate.** A permanent certificate shall be posted on or in the electrical distribution panel. The certificate shall not cover or obstruct the visibility of the circuit directory label, service disconnect label or other required labels. The certificate shall be completed by the builder or registered design professional. The certificate shall list the predominant~~

~~*R*-values of insulation installed in or on ceiling/roof, walls, foundation (slab, *basement wall*, crawlspace wall and/or floor) and ducts outside conditioned spaces; *U* factors for fenestration and the solar heat gain coefficient (SHGC) of fenestration. Where there is more than one value for each component, the certificate shall list the value covering the largest area. The certificate shall list the types and efficiencies of heating, cooling and service water heating equipment. Where a gas-fired unvented room heater, electric furnace, or baseboard electric heater is installed in the residence, the certificate shall list "gas-fired unvented room heater," "electric furnace" or "baseboard electric heater," as appropriate. An efficiency shall not be *listed* for gas-fired unvented room heaters, electric furnaces or electric baseboard heaters.~~

Reason: This section requires a certificate be placed on the electrical panel stating certain energy related building components such as R-values, U-factors etc… Unfortunately this is nothing more than a good idea with no energy conserving benefit what so ever. This information is no more useful than if the builder were required to place a label on the panel stating the joist size, framing wall sizes, etc or the type of plumbing and electrical fixtures. Yes it's nice to know but does it lend itself in anyway to increased energy conservation or enhanced building safety, no. In fact it will be create problems throughout the life of the building. For example what if the owner changes some components with out the benefit of permits and inspections, then sells the building and the next owner comes in years later to make adjustments and finds that the building is not what the certificate says it was? It may be better, what then? What does the code official do when the label contains the wrong information? Do they reject occupancy from someone moving into their new home? Lets face it when a building component needs to be replaced it is almost always financial economics and market availability that drives the decision on replacement items, not a certificate that was posted years prior. The certificate is completely useless for any and all practical purpose. In fact, it could easily cause a chaotic exercise that builders would have to deal with in the 11th hour. Finial inspections and occupancy are being withheld because this label may have not been posted. Lets not endorse rules and practice just because they are good ideas lets stay with the long standing fundamentals that the code is a minimum standard set in place to assure safety and uphold the concepts of energy conservation.

Cost Impact: The code change proposal will not increase the cost of construction.

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IECC COMMITTEE. PART II WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IECC

1. Revise as follows:

101.3 Intent. This code shall regulate the design and construction of buildings for the effective use and conservation of energy over the useful life of each building. This code is intended to provide flexibility to permit the use of innovative approaches and techniques to achieve this objective. ~~the effective use of energy.~~ This code is not intended to abridge safety, health or environmental requirements contained in other applicable codes or ordinances.

SECTION 202
GENERAL DEFINITIONS

ENERGY RECOVERY VENTILATION SYSTEM. Systems that employ air-to-air heat exchangers to recover energy from exhaust air for the purpose of preheating, precooling, humidifying or dehumidifying outdoor ventilation air prior to supplying the air to a space, either directly or as part of an HVAC system. Such systems include equipment referred to as an "energy recovery ventilator" (ERV) or as a "heat recovery ventilator" (HRV).

2. Add new text as follows:

SECTION 202
GENERAL DEFINITIONS

SPECIFIC LEAKAGE AREA (SLA). The air leakage area (L) per conditioned floor area (CFA) of a home (L/CFA), where leakage area (L) is defined in accordance with section 5.1 of ASHRAE 119 and where L and CFA are in the same units.

3. Revise as follows:

TABLE 402.1.1

402.4.1 Building thermal envelope. The *building thermal envelope* shall comply with Section 402.4.2 and be durably sealed to limit infiltration. The sealing methods between dissimilar materials shall allow for differential expansion and contraction. The following shall be caulked, gasketed, weatherstripped or otherwise sealed with an air barrier material, suitable film or solid material:

1. All joints, seams and penetrations.
2. Site-built windows, doors and skylights.
3. Openings between window and door assemblies and their respective jambs and framing.
4. Utility penetrations.
5. Dropped ceilings or chases adjacent to the thermal envelope.
6. Knee walls.
7. Walls and ceilings separating a garage from conditioned spaces.
8. Behind tubs and showers on exterior walls.
9. Common walls between dwelling units.
10. Attic access openings.
11. Rim joist junction.
12. Other sources of infiltration.

402.4.2 Air sealing and insulation. The components of the *building thermal envelope* as listed in Table 402.4.2 shall be installed in accordance with the manufacturer's instructions and the criteria listed in Table 402.4.2, as applicable to the method of construction. Building envelope air tightness and insulation installation shall be demonstrated to comply with ~~one of~~ the ~~following options given~~ requirements established by Section 402.4.2.1 ~~or~~ and 402.4.2.2:

402.4.2.1 Performance testing requirement ~~option~~. The building shall meet the air leakage standard set forth below as demonstrated by an air leakage test conducted as specified below:

1. Building envelope tightness ~~and insulation installation~~ shall be ~~considered acceptable when~~ tested by a party *approved* by the code official. Where required by the code official, the *approved* party shall be independent from both the builder and any other entity responsible for installing the insulation and air barrier and otherwise sealing the building. A written report specifying the results of the test and attesting to the accuracy of the results shall be signed by the party conducting the testing and provided to the builder and *code official*.
2. The building shall be required to have an air leakage ~~is~~ less than 0.00030 *specific leakage area (SLA)* ~~seven air changes per hour (ACH)~~ when tested with a blower door at a pressure of 33.5 psf (50 Pa). Testing shall occur any time after rough in and after (i) installation of all penetrations of the building envelope, including penetrations for utilities, plumbing, electrical, ventilation, and combustion appliances, and (ii) completion of sealing of the *building thermal envelope* as required in section 402.4.1.
3. During testing:

    1. Exterior windows and doors, fireplace and stove doors shall be closed, but not sealed beyond the weather-stripping, caulking and other intended permanent air infiltration control measures;
    2. Dampers shall be closed, but not sealed, including exhaust, intake, makeup air, backdraft, fireplace and flue dampers beyond intended permanent air infiltration control measures;
    3. Interior doors connecting conditioned spaces shall be open, doors connecting to unconditioned spaces closed but not sealed;
    4. Exterior openings for continuous ventilation systems and heat recovery ventilators shall be closed and sealed;

5. Heating and cooling system(s) shall be turned off;
6. ~~HVAC ducts systems shall not be sealed; and~~
7. ~~7.~~ Supply and return registers shall be fully open at the time of the test ~~not be sealed~~.

Exception: Multi-family residential buildings, with more than four dwelling units per building, may be individually exempted from the testing requirement only when meeting all of the following requirements:

1. The exemption is approved by the *code official* after inspection of the sealing of thermal envelope in accordance with Section 402.4.1 and Table 402.4.2;
2. At least 15% of the units are tested to have an air leakage less than 0.00036 *specific leakage area (SLA)* when tested with a blower door at a pressure of 33.5 psf (50 Pa), with the units to be tested specified by the code official; and
3. The tests demonstrate compliance for such units.

When any tested dwelling unit subject to this exception fails to meet the maximum air leakage requirement stated in Section 402.4.2.1, then the builder must resolve any leakage problems so that such unit passes the test and then must continue to test each additional dwelling unit in such building until a minimum of three consecutive dwelling units pass the test before the builder can return to testing as specified in Item 2 of this exception.

402.4.2.2 Visual insulation inspection ~~option~~ (Mandatory). Building envelope ~~tightness and~~ insulation installation shall be ~~considered acceptable when the items listed in Table 402.4.2, applicable to the method of construction, are~~ field verified to meet the Insulation Installation Criteria in Table 402.4.2. Where required by the *code official*, an *approved* party independent from the builder and the installer of the insulation, shall inspect the ~~air barrier and~~ insulation; in such case, a written inspection report, including a checklist demonstrating compliance shall be provided to the *code official* and builder before interior finish materials are applied.

402.4.2.3 Visual air barrier inspection. For any building or dwelling unit not required to be tested under section 402.4.2.1, building envelope tightness shall be field verified to meet the Air Barrier Criteria in Table 402.4.2. Where required by the *code official*, an *approved* party independent from the builder and the installer of any air barrier materials, shall inspect the air barrier; in such case, a written inspection report, including a checklist demonstrating compliance shall be provided to the *code official* and builder before interior finish materials are applied. In cases where the building or dwelling unit satisfies the testing requirement of section 402.4.2.1, the *code official* may also require field verification to show that the building meets the Air Barrier Criteria if deemed necessary.

4. Delete Table 402.4.2 and replace with the following table:

~~TABLE 402.4.2~~
~~AIR BARRIER AND INSULATION INSPECTION COMPONENT CRITERIA~~
TABLE 402.4.2
VISUAL AIR BARRIER AND INSULATION INSPECTION

COMPONENT	INSULATION INSTALLATION CRITERIA	AIR BARRIER CRITERIA
General Requirements	Exterior thermal envelope insulation for framed walls is installed in substantial contact and continuous alignment with building envelope air barrier.	A continuous air barrier is installed in the thermal envelope. Breaks or joints in the air barrier are sealed. Air permeable insulation is not used as a sealing material.
Ceiling / attic	In any dropped ceiling/soffit, the insulation is substantially aligned with the air barrier.	Air barrier in any dropped ceiling / soffit is substantially aligned with insulation and any gaps are sealed. Attic access, knee wall door or drop down stair to unconditioned attic is sealed.
Walls	All corners and headers are insulated. Insulation is in substantial contact and continuous alignment with air barrier.	Junction of foundation and sill plate is sealed. Junction of exterior wall and top plate is sealed. Junction of the exterior wall and floor sheathing is sealed. Knee wall is sealed.
Fenestration		Space between fenestration jambs and framing is sealed.
Rim joists	Rim joists are insulated.	Air barrier is installed at the rim joist.
Floors (including above garage	Insulation is installed to maintain permanent contact	Air barrier is installed at any exposed edge of

COMPONENT	INSULATION INSTALLATION CRITERIA	AIR BARRIER CRITERIA
and cantilevered floors)	with underside of subfloor decking.	insulation.
Crawl space walls	Insulation is permanently attached to walls.	Exposed earth in unvented crawlspaces is covered with Class I vapor retarder with overlapping joints taped.
Shafts, penetrations		Duct shafts, utility penetrations, knee walls, and flue shafts opening to exterior or unconditioned space are sealed.
Narrow cavities	Batts in narrow cavities are cut to fit; narrow cavities are filled by sprayed/blown insulation.	
Garage separation		Air sealing is provided between the garage and conditioned spaces.
Recessed lighting		Recessed light fixtures installed in the building thermal envelope are airtight, IC rated, and sealed to drywall.
Plumbing and Wiring	Insulation is placed between the exterior of the wall assembly and pipes. Batt insulation is cut and fitted around wiring and plumbing, or sprayed/blown insulation extends between piping and wiring and to the exterior of the wall assembly.	All plumbing and wiring penetrations shall be sealed to the air barrier.
Shower / tub on exterior wall	Exterior walls adjacent to showers and tubs have insulation filling any gaps or voids between tub or shower walls and unconditioned space.	Exterior walls adjacent to showers and tubs have an air barrier separating the exterior wall from the shower and tubs.
Electrical / phone box on exterior walls	Insulation completely fills voids between the box and exterior sheathing	Air barrier extends behind boxes or air sealed type boxes are installed.
Common wall		Air barrier is installed in common wall between dwelling units.
HVAC register boots		HVAC register boots that penetrate building envelope are sealed to subfloor or drywall.
Fireplace		Air barrier is installed on fireplace walls. Fireplace shall have gasketed doors.

5. Revise as follows:

403.2.1 Insulation (Prescriptive). Supply ducts in attics shall be insulated to a minimum of R-8. All other ducts shall be insulated to a minimum of R-6.

Exception: Where all ducts ~~or portions thereof~~ are located completely within *conditioned space* ~~inside the *building thermal envelope*~~, supply ducts shall be insulated to a minimum of R-4.

403.2.2 Sealing (Mandatory). All ducts, air handlers, and filter boxes~~, and building cavities used as ducts~~ shall be sealed. Joints and seams shall comply with Section M1601.4.1 of the *International Residential Code* or Section 603.9 of the *International Mechanical Code,* as applicable.

Duct tightness shall be verified by a test performed by a party *approved* by the *code official* after construction is completed. Where required by the code official, testing shall be conducted by an approved party independent from the builder and the installer of the ducts. ~~either of the following:~~ A written report specifying the results of the test and attesting to the accuracy of the results shall be signed by the party conducting the testing and provided to the builder and the *code official*.

1. ~~Post-construction test: L~~ As tested, total duct l~~L~~eakage ~~to outdoors~~ shall be less than ~~or equal to 8 cfm (226.5 L/min) per 100 ft^2 (9.29 m^2) of *conditioned floor area* or a total leakage less than~~ or equal to 6 ~~12~~ cfm (226.5~~12~~ L/min) per 100 ft^2 (9.29 m^2) of *conditioned floor area* when tested at a pressure differential of 0.1 inches w.g. (25 Pa) across the entire system, including the manufacturer's air handler enclosure. All register boots shall be taped or otherwise sealed during the test.
2. ~~Rough-in test: Total leakage shall be less than or equal to 6 cfm (169.9 L/min) per 100 ft^2 (9.29 m^2) of *conditioned floor area* when tested at a pressure differential of 0.1 inches w.g. (25 Pa) across the roughed in system, including the manufacturer's air handler enclosure. All register boots shall be taped or otherwise sealed during the test. If the air handler is not installed at the time of the test, total leakage shall be less than or equal to 4 cfm (113.3 L/min) per 100 ft^2 (9.29 m^2) of *conditioned floor area*.~~

Exceptions~~:~~ ~~Duct tightness test is not required if~~ Where the air handler and all ducts are located within conditioned space, total duct leakage shall not exceed 12 cfm per 100 ft^2 of conditioned floor area when tested as specified above.

403.2.3 Building cavities (Mandatory). Building framing cavities shall not be used as ~~supply~~ ducts.

403.4 Service water heating (Mandatory). Service hot water piping shall be installed in accordance with Sections 403.4.1 through 403.4.3.

403.4.1 Pipe length and Insulation. Service hot water piping shall be no more than a total of 60 linear feet of pipe length to all fixtures being served by one service water heating unit. All service hot water piping shall be insulated to at least R-3 for pipes sized 1" in diameter or less and R-4 for pipes larger than 1" in diameter for the distance between the service water heating equipment to within 5 feet of each fixture connected to the hot water pipe and the first 5 feet of hot and cold water pipes from the storage tank for non-recirculating service water heating systems.

Exception: Hot water distribution systems that are not located below ground or in a mass floor or mass wall in contact with the ground and that supply hot water from one of the following sources:

1. Condensing gas service water heating equipment,
2. Solar thermal water heating equipment that is designed to provide more than 50% of annual hot water requirements from solar heated water,
3. Heat pump electric service water heating equipment,
4. Tankless demand service gas water heating equipment, or
5. Tankless demand service electric heating equipment, where either: (a) heated water is provided through piping that is insulated to R-3 or (b) there is no more than a total of 15 linear feet of pipe length to all fixtures being served by each unit.

403.4.2 Circulating hot water systems ~~(Mandatory)~~. All circulating service hot water piping shall be insulated to at least R-3~~2~~ for pipes sized 1" in diameter or less and R-4 for pipes larger than 1" in diameter. Circulating hot water systems shall include an automatic or readily accessible manual switch that can turn off the hot water circulating pump when the system is not in use.

403.4.3 Heat Traps. Water heating equipment not supplied with integral heat traps and serving non-circulating systems shall be provided with heat traps on the supply and discharge piping associated with the equipment.

6. Add new text as follows:

403.11 *Energy Recovery Ventilation System* and Air leakage supplemental requirements. The building shall meet the following the requirements:

1. An *energy recovery ventilation system* shall be installed. For warm humid counties as identified in table 301.1, a dehumidifier with a built in humidistat shall be installed in addition to the *energy recovery ventilation system*.
2. Building air leakage shall be tested in accordance with the procedure prescribed in Section 402.4.2.1, except that the air leakage shall not exceed 0.00015 *specific leakage area (SLA)* for all buildings except multifamily, which shall not exceed 0.00018 *specific leakage area (SLA),* when tested with a blower door at a pressure of 33.5 psf (50 Pa) by an approved party independent of the builder and any contractors involved in any aspect of sealing the building.

Exceptions:

1. Buildings located in climate zones 1 or 2 with installed cooling equipment with an efficiency that exceeds prevailing federal minimum standards by at least 20% and meets or exceeds 12.5 EER.
2. Buildings located in climate zones 3, 4 or 5 with installed heating and cooling equipment with an efficiency that exceeds prevailing federal minimum standards by at least 15% and cooling equipment that meets or exceeds 12.5 EER.
3. Buildings located in climate zones 6, 7 or 8 with installed heating equipment with an efficiency that exceeds prevailing federal minimum standards by at least 20%.
4. In the event the heating or cooling equipment specified in the exception applicable to a particular climate zone above is not available in the market, the equipment with the highest rated efficiency commercially available can be substituted, when *approved* by the *code official*,

5. As an alternative to the heating equipment specified in Exceptions 2 and 3 above, a ground source heat pump with an efficiency of greater than or equal to 2.8 COP and 13 EER may be installed.

6. Revise as follows:

TABLE 405.5.2(1)
SPECIFICATIONS FOR THE STANDARD REFERENCE AND PROPOSED DESIGNS

BUILDING COMPONENT	STANDARD REFERENCE DESIGN	PROPOSED DESIGN
Air Exchange Rate	*Specific leakage area (SLA)* = 0.0001536 ~~assuming no energy recovery.~~ with a 70% efficient *energy recovery ventilation system*. Exceptions: 1. For multifamily buildings, the specific leakage area shall be 0.00018 with a 70% efficient *energy recovery ventilation system*. 2. For buildings subject to the exceptions in section 403.11, SLA = 0.00030, assuming no energy recovery.	~~For residences that are not tested, the same as the standard reference design.~~ *Specific Leakage Area (SLA)* = the tested value for the proposed home and the tested value shall be in determined accordance with the methodology set out in section 402.4.2.1 and the ASHRAE 119, Section 5.1 and the SLA shall be: 1. For residences without mechanical ventilation ~~that are tested in accordance with ASHRAE 119, Section 5.1,~~ the measured air exchange rate[e] but not less than 0.35 ACH. 2. For residences with mechanical ventilation that is not an *energy recovery ventilation system* ~~that are tested in accordance with ASHRAE 119, Section 5.1,~~ the measured air exchange rate[e] combined with the mechanical ventilation rate, *f* which shall not be less than 0.01 x *CFA* + 7.5 x (N_{br} + 1) where: *CFA* = conditioned floor area N_{br} = number of bedrooms 3. For residences with *energy recovery ventilation systems*, the efficiency of the energy or heat recovery ventilation system shall be as proposed.

(Portions of table and notes not shown remain unchanged)

~~d. Where leakage area (L) is defined in accordance with Section 5.1 of ASHRAE 119 and where:~~
~~SLA = L/CFA~~

~~where L and CFA are in the same units.~~

PART II – IRC BUILDING/ENERGY

1. Add new text as follows:

SECTION R202
GENERAL DEFINITIONS

ENERGY RECOVERY VENTILATION SYSTEM. Systems that employ air-to-air heat exchangers to recover energy from exhaust air for the purpose of preheating, precooling, humidifying or dehumidifying outdoor ventilation air prior to supplying the air to a space, either directly or as part of an HVAC system. Such systems include equipment referred to as an "energy recovery ventilator" (ERV) or as a "heat recovery ventilator" (HRV).

SPECIFIC LEAKAGE AREA (SLA). The air leakage area (L) per conditioned floor area (CFA) of a home (L/CFA), where leakage area (L) is defined in accordance with Section 5.1 of ASHRAE 119 and where L and CFA are in the same units.

2. Revise as follows:

(Portions of table and notes not shown remain unchanged)

N1102.4.1 Building thermal envelope. The *building thermal envelope* shall comply with Section N1102.4.2 and be durably sealed to limit infiltration. The sealing methods between dissimilar materials shall allow for differential expansion and contraction. The following shall be caulked, gasketed, weatherstripped or otherwise sealed with an air barrier material, suitable film or solid material.

1. All joints, seams and penetrations.
2. Site-built windows, doors and skylights.
3. Openings between window and door assemblies and their respective jambs and framing.
4. Utility penetrations.
5. Dropped ceilings or chases adjacent to the thermal envelope.
6. Knee walls.
7. Walls and ceilings separating the garage from conditioned spaces.
8. Behind tubs and showers on exterior walls.
9. Common walls between dwelling units.
10. Attic access openings.
11. Rim joist junction.
12. Other sources of infiltration.

N1102.4.2 Air sealing and insulation. The components of the *building thermal envelope* as listed in Table N1102.4.2 shall be installed in accordance with the manufacturer's instructions and the criteria listed in Table N1102.4.2, as applicable to the method of construction. Building envelope air tightness and insulation installation shall be demonstrated to comply with ~~one of~~ the ~~following options given~~ requirements established by Section N1102.4.2.1 ~~or~~ and N1102.4.2.2.

N1102.4.2.1 Performance testing requirement ~~option~~. The building shall meet the air leakage standard set forth below as demonstrated by an air leakage test conducted as specified below:

1. Building envelope tightness shall be tested by a party *approved* by the code official. Where required by the code official, the *approved* party shall be independent from both the builder and any other entity responsible for installing the insulation and air barrier and otherwise sealing the building. A written report specifying the results of the test and attesting to the accuracy of the results shall be signed by the party conducting the testing and provided to the builder and *code official*.
2. ~~Tested~~ The building shall be required to have an air leakage ~~is~~ less than 0.00030 *specific leakage area (SLA)* ~~7 ACH~~ when tested with a blower door at a pressure of 33.5 psf (50 Pa) ~~pascals (0.007 psi)~~. Testing shall occur any time after rough in and after (i) installation of all penetrations of the building envelope, including penetrations for utilities, plumbing, electrical, ventilation, and combustion appliances, and (ii) completion of sealing of the *building thermal envelope* as required in section N1102.4.1.
3. During testing:
    1. Exterior windows and doors, fireplace and stove doors shall be closed, but not sealed beyond the weather-stripping, caulking and other intended permanent air infiltration control measures;
    2. Dampers shall be closed, but not sealed, including exhaust, intake, makeup air, backdraft, fireplace and flue dampers beyond intended permanent air infiltration control measures;
    3. Interior doors connecting conditioned spaces shall be open, doors connecting to unconditioned spaces closed but not sealed;
    4. Exterior openings for continuous ventilation systems and heat recovery ventilators shall be closed and sealed;
    5. Heating and cooling system(s) shall be turned off;
    6. ~~HVAC ducts systems shall not be sealed; and~~
    7. ~~7.~~ Supply and return registers shall be fully open at the time of the test ~~not be sealed~~.

Exception: Multi-family residential buildings, with more than four dwelling units per building, may be individually exempted from the testing requirement only when meeting all of the following requirements:

1. The exemption is approved by the *code official* after inspection of the sealing of thermal envelope in accordance with section N1102.4.1 and Table N1102.4.2;
2. At least 15% of the units are tested to have an air leakage less than 0.00036 *specific leakage area (SLA)* when tested with a blower door at a pressure of 33.5 psf (50 Pa), with the units to be tested specified by the code official; and
3. The tests demonstrate compliance for such units.

When any tested dwelling unit subject to this exception fails to meet the maximum air leakage requirement stated in Section N1102.4.2.1, then the builder must resolve any leakage problems so that such unit passes the test and then must continue to test each additional dwelling unit in such building until a minimum of three consecutive dwelling units pass the test before the builder can return to testing as specified in Item 2 of this Exception.

N1102.4.2.2 Visual insulation inspection ~~option~~. ~~The items listed in Table N1102.4.2, applicable to the method of~~

~~construction, are~~ Building envelope insulation installation shall be field verified to meet the Insulation Installation Criteria in Table N1102.4.2. Where required by the code official, an *approved* party independent from the builder and the installer of the insulation, shall inspect the ~~air barrier and~~ insulation; in such case, a written inspection report, including a checklist demonstrating compliance shall be provided to the *code official* and builder before interior finish materials are applied.

N1102.4.2.3 Visual air barrier inspection. For any building or dwelling unit not required to be tested under section N1102.4.2.1, building envelope tightness shall be field verified to meet the Air Barrier Criteria in Table N1102.4.2. Where required by the *code official*, an *approved* party independent from the builder and the installer of any air barrier materials, shall inspect the air barrier; in such case, a written inspection report, including a checklist demonstrating compliance shall be provided to the *code official* and builder before interior finish materials are applied. In cases where the building or dwelling unit satisfies the testing requirement of section N1102.4.2.1, the *code official* may also require field verification to show that the building meets the Air Barrier Criteria if deemed necessary.

3. Delete Table N1102.4.2 and replace with the following table:

~~**TABLE N1102.4.2**~~
~~**AIR BARRIER AND INSULATION INSPECTION**~~

TABLE N1102.4.2
VISUAL AIR BARRIER AND INSULATION INSPECTION

COMPONENT	INSULATION INSTALLATION CRITERIA	AIR BARRIER CRITERIA
General Requirements	Exterior thermal envelope insulation for framed walls is installed in substantial contact and continuous alignment with building envelope air barrier.	A continuous air barrier is installed in the thermal envelope. Breaks or joints in the air barrier are sealed. Air permeable insulation is not used as a sealing material.
Ceiling / attic	In any dropped ceiling/soffit, the insulation is substantially aligned with the air barrier.	Air barrier in any dropped ceiling / soffit is substantially aligned with insulation and any gaps are sealed. Attic access, knee wall door or drop down stair to unconditioned attic is sealed.
Walls	All corners and headers are insulated. Insulation is in substantial contact and continuous alignment with air barrier.	Junction of foundation and sill plate is sealed. Junction of exterior wall and top plate is sealed. Junction of the exterior wall and floor sheathing is sealed. Knee wall is sealed.
Fenestration		Space between fenestration jambs and framing is sealed.
Rim joists	Rim joists are insulated.	Air barrier is installed at the rim joist.
Floors (including above garage and cantilevered floors)	Insulation is installed to maintain permanent contact with underside of subfloor decking.	Air barrier is installed at any exposed edge of insulation.
Crawl space walls	Insulation is permanently attached to walls.	Exposed earth in unvented crawlspaces is covered with Class I vapor retarder with overlapping joints taped.
Shafts, penetrations		Duct shafts, utility penetrations, knee walls, and flue shafts opening to exterior or unconditioned space are sealed.
Narrow cavities	Batts in narrow cavities are cut to fit; narrow cavities are filled by sprayed/blown insulation.	

COMPONENT	INSULATION INSTALLATION CRITERIA	AIR BARRIER CRITERIA
Garage separation		Air sealing is provided between the garage and conditioned spaces.
Recessed lighting		Recessed light fixtures installed in the building thermal envelope are airtight, IC rated, and sealed to drywall.
Plumbing and Wiring	Insulation is placed between the exterior of the wall assembly and pipes. Batt insulation is cut and fitted around wiring and plumbing, or sprayed/blown insulation extends between piping and wiring and to the exterior of the wall assembly.	All plumbing and wiring penetrations shall be sealed to the air barrier.
Shower / tub on exterior wall	Exterior walls adjacent to showers and tubs have insulation filling any gaps or voids between tub or shower walls and unconditioned space.	Exterior walls adjacent to showers and tubs have an air barrier separating the exterior wall from the shower and tubs.
Electrical / phone box on exterior walls	Insulation completely fills voids between the box and exterior sheathing	Air barrier extends behind boxes or air sealed type boxes are installed.
Common wall		Air barrier is installed in common wall between dwelling units.
HVAC register boots		HVAC register boots that penetrate building envelope are sealed to subfloor or drywall.
Fireplace		Air barrier is installed on fireplace walls. Fireplace shall have gasketed doors.

4. Revise as follows:

N1103.2.1 Insulation. Supply ducts in attics shall be insulated to a minimum of R-8. All other ducts shall be insulated to a minimum of R-6.

Exception: Where all ~~D~~ducts ~~or portions thereof~~ are located completely within *conditioned space* ~~inside the building thermal envelope~~, supply ducts shall be insulated to a minimum of R-4.

N1103.2.2 Sealing. All ducts, air handlers, and filter boxes~~, and building cavities used as ducts~~ shall be sealed. Joints and seams shall comply with Section M1601.4 of the *International Residential Code.*

Duct tightness shall be verified by a test performed by a party *approved* by the *code official* after construction is completed. Where required by the code official, testing shall be conducted by an approved party independent from the builder and the installer of the ducts. ~~either of the following:~~ A written report specifying the results of the test and attesting to the accuracy of the results shall be signed by the party conducting the testing and provided to the builder and the *code official*.

1. ~~Post-construction test: L~~ As tested, total duct l~~L~~eakage ~~to outdoors~~ shall be less than ~~or equal to 8 cfm (3.78 L/S) per 100 ft^2 (9.29 m^2) of conditioned floor area or a total leakage less than~~ or equal to 6 ~~12~~ cfm (226.5 L/min ~~5.66 L/S~~) per 100 ft^2 (9.29 m^2) of *conditioned floor area* when tested at a pressure differential of 0.1 inch w.g. (25 Pa) across the entire system, including the manufacturer's air handler ~~end closure~~ enclosure. All register boots shall be taped or otherwise sealed during the test.
2. ~~Rough-in test: Total leakage shall be less than or equal to 6 cfm (2.83 L/S) per 100 ft^2 (9.29 m^2) of conditioned floor area when tested at a pressure differential of 0.1 inches w.g. (25 Pa) across the roughed in system, including the manufacturer's air handler enclosure. All register boots shall be taped or otherwise sealed during the test. If the air handler is not installed at the time of the test, total leakage shall be less than or equal to 4 cfm (1.89 L/S) per 100 ft^2 (9.29 m^2) of conditioned floor area.~~

Exceptions: ~~Duct tightness test is not required if~~ Where the air handler and all ducts are located within conditioned space, total duct leakage shall not exceed 12 cfm per 100 ft^2 of conditioned floor area when tested as specified above.

N1103.2.3 Building cavities. Building framing cavities shall not be used as ~~supply~~ ducts.

N1103.4 Service water heating. Service hot water piping shall be installed in accordance with Sections 403.4.1 through 403.4.3.

N1103.4.1 Pipe length and Insulation. Service hot water piping shall be no more than a total of 60 linear feet of pipe length to all fixtures being served by one service water heating unit. All service hot water piping shall be insulated to at least R-3 for pipes sized 1" in diameter or less and R-4 for pipes larger than 1" in diameter for the distance between the service water heating equipment to within 5 feet of each fixture connected to the hot water pipe. In addition, the first 5 feet of hot and cold water pipes from the storage tank for non-recirculating service water heating systems shall be insulated to at least R-3 for pipes sized 1" in diameter or less and R-4 for pipes larger than 1" in diameter.

Exception: Hot water distribution systems that supply hot water from one of the following sources (this exception does not apply to portions of hot water distribution systems located below ground or in a mass floor or mass wall in contact with the ground):

1. Condensing gas service water heating equipment,
2. Solar thermal water heating equipment that is designed to provide more than 50% of annual hot water requirements from solar heated water,
3. Heat pump electric service water heating equipment,
4. Tankless demand service gas water heating equipment, or
5. Tankless demand service electric heating equipment, where either: (a) heated water is provided through piping that is insulated to R-3 or (b) there is no more than a total of 15 linear feet of pipe length to all fixtures being served by each unit.

N1103.4.2 Circulating hot water systems. All circulating service hot water piping shall be insulated to at least R-3~~2~~ for pipes sized 1" in diameter or less and R-4 for pipes larger than 1" in diameter. Circulating hot water systems shall include an automatic or readily accessible manual switch that can turn off the hot water circulating pump when the system is not in use.

N1103.4.3 Heat Traps. Water heating equipment not supplied with integral heat traps and serving non-circulating systems shall be provided with heat traps on the supply and discharge piping associated with the equipment.

5. Add new text as follows:

N1103.10 *Energy Recovery Ventilation System* and air leakage supplemental requirements. The building shall meet the following the requirements:

1. An *energy recovery ventilation system* shall be installed. For warm humid counties as identified in table N1101.2, a dehumidifier with a built in humidistat shall be installed in addition to the *energy recovery ventilation system*.
2. Building air leakage shall be tested in accordance with the procedure prescribed in Section N1102.4.2.1, except that the air leakage shall not exceed 0.00015 *specific leakage area (SLA)* for all buildings except multifamily, which shall not exceed 0.00018 *specific leakage area (SLA),* when tested with a blower door at a pressure of 33.5 psf (50 Pa) by an *approved* party independent of the builder and any contractors involved in any aspect of sealing the building.

   Exceptions:

   1. Buildings located in climate zones 1 or 2 with installed cooling equipment with an efficiency that exceeds prevailing federal minimum standards by at least 20% and meets or exceeds 12.5 EER.
   2. Buildings located in climate zones 3, 4 or 5 with installed heating and cooling equipment with an efficiency that exceeds prevailing federal minimum standards by at least 15% and cooling equipment that meets or exceeds 12.5 EER.
   3. Buildings located in climate zones 6, 7 or 8 with installed heating equipment with an efficiency that exceeds prevailing federal minimum standards by at least 20%.
   4. In the event the heating or cooling equipment specified in the exception applicable to a particular climate zone above is not commercially available, the equipment with the highest rated efficiency commercially available can be substituted, when *approved* by the *code official*,
   5. As an alternative to the heating equipment specified in Exceptions 2 and 3 above, a ground source heat pump with an efficiency of greater than or equal to 2.8 COP and 13 EER may be installed.

Reason: At the 2009 Final Action Hearings, a majority of voting code officials supported proposals to substantially boost energy efficiency of the 2009 IECC's energy efficiency over its 2006 counterpart (including over 60% who voted for the Energy Efficient Codes Coalition's EC14, also known as "The 30% Solution"). Even though some of those votes fell short of the 2/3 majority needed for adoption, the final version of IECC 2009 will boost efficiency by more than 10% *(http://www.thirtypercentsolution.org/solution/EECC-Savings_Analysis-Jan-2009.pdf).*

This comprehensive proposal builds on the momentum ICC's members set in Minneapolis last year, while simultaneously responding to profound events that are shining a national spotlight on energy codes, the role buildings play in national energy use and the impact both can have on national energy policy.

Specifically, this **Core Package Proposal** was developed by the Energy Efficient Codes Coalition (EECC) to support the ICC (and its I-Code process) in reaching the energy savings targets proposed by many (including DOE) and being considered by Congress in several pending bills. Our proposal incorporates currently available technologies that are being included in new home construction every day and is designed to make the code as simple and clear as possible (to avoid undue burdens on code officials) and to be consistent with current federal law regarding efficient equipment covered by federal standards. Some of the major energy-saving improvements captured in this comprehensive package include:

(1) Improved envelope measures including better fenestration and insulation in most climate zones;
(2) Comprehensive air sealing, testing, and insulation inspection;
(3) Improved sealing and testing requirements for ducts;
(4) Requirements for efficient hot water service distribution system or equipment; and
(5) Requirements for reduced envelope infiltration along with energy recovery ventilation, or else more efficient HVAC equipment.

The elements of this and other individual EECC proposals have been reviewed by energy efficiency experts, building scientists and many others, and improved based on their comments. Individual EECC supporters are also submitting each element of this package, along with a number of other proposals, in the form of individual proposals to strengthen energy efficiency in both the *IECC* and *IRC.* The detailed reasons supporting the individual elements of this proposal can be found in these individual proposals, which are incorporated by reference into this reason statement.

We estimate that this Core Package Proposal will result in a 2012 IECC that is at least 20% more energy efficient than the 2009 IECC (and more than 30% more efficient than the 2006 IECC). Taken together with the efficiency gains in the 2009 IECC, adoption of this proposal by the full ICC will produce a 2012 IECC that comfortably exceeds Congress' initial 30% savings target (compared with IECC 2006) and puts the ICC on the path to the next target of 50% savings.

EECC is submitting this proposal to both the *IRC* and the *IECC*, in order to assure consistency between the two codes. However, EECC believes that America needs a single model energy code, the IECC (the only I-Code recognized in federal statutes)**. For this reason,** EECC is also submitting a separate proposal that would incorporate the IECC by reference in the IRC Chapter 11 (as is currently done with the International Building Code IBC).

Since September of 2008, three events have occurred that could transform the ICC's residential model energy code:

The US Conference of Mayors and other elected officials charged with establishing and implementing national, state and local energy policies have begun to recognize the profound impact that the model energy codes can have on achieving local, regional, and national goals for sustainable economic growth, and have endorsed the concept of a 30% improvement in model energy codes. Several city and state governments have adopted their own policies to achieve at least 30% efficiency improvements in new buildings.

Congress has also jumped into the energy code arena with legislative carrots and sticks designed to speed the rate of energy efficiency improvements in the I-Code and their adoption by state and local jurisdictions. First, Congress linked billions of dollars in stimulus funds to each state's adoption of the 2009 IECC (or equivalent), followed by the introduction of legislation that sets targets of 30%, then 50% and beyond, for ICC to meet or exceed. The proposed legislation also authorizes hundreds of millions of federal dollars for code development bodies and state and local governments for adoption, implementation and compliance with codes that meet these goals. Finally, the ICC's new schedule for I-Code development reduces the number of opportunities to meet these targets being considered in Congress to once in each three-year code cycle.

As the growing national interest in the ICC and its model energy code attests, our nation's energy policy is in a period of transition. As states scramble to meet increasing peak energy demands and to curb pollution and greenhouse gases, there has been an increased focus on energy efficiency at all levels of government and the private sector. Federal and state governments recognize that energy efficiency is the most cost-effective means of meeting increasing energy demand. The time has come to complete the transition to at least a 30% more efficient residential energy code before 2012, and this proposal will help to bring that about.

The Energy Efficient Codes Coalition (website: www.thirtypercentsolution.org) was established to boost the energy efficiency of the IECC, and its supporters include all forms of electric utilities, low-income homeowner groups, a wide-range of regional and national energy efficiency and environmental organizations, many levels of government, business and labor coalitions, and as well as many of the typical participants in the ICC process.

Cost Impact: This proposal will increase the cost of construction.

Proponent: Joseph Lstiburek, Building Science Corporation

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IECC COMMITTEE. PART II WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IECC

1. Revise as follows:

AIR BARRIER. Material(s) assembled and joined together to provide a barrier to air leakage through the building ~~envelope~~ enclosure. An air barrier may be a single material or a combination of materials.

BUILDING THERMAL ~~ENVELOPE~~ BARRIER. The basement walls, slab, exterior walls, floor, roof, and any other building element that enclose conditioned space. This boundary also includes the boundary between conditioned space and any exempt or unconditioned space.

2. Add new definitions as follows:

AIR-IMPERMEABLE. A material or assembly having an air permeance equal to or less than 0.02 L/s-m^2 at 75 Pa pressure differential tested according to ASTM E 2178 or ASTM E 283.

AIR-PERMEABLE. A material or assembly having an air permeance greater than 0.02 L/s-m^2 at 75 Pa pressure differential tested according to ASTM E 2178 or ASTM E 283.

BUILDING ENCLOSURE. A system or assembly of components that provides environmental separation between the conditioned space and the exterior environment.

3. Revise as follows:

SECTION 402
BUILDING THERMAL ~~ENVELOPE~~ BARRIER

402.1.1 Insulation and fenestration criteria. The building thermal ~~envelope~~ barrier shall meet the requirements of Table 402.1.1 based on the climate zone specified in Chapter 3.

402.1.4. Total UA alternative. If the total building thermal ~~envelope~~ barrier UA (sum of U-factor times assembly area) is less than or equal to the total UA resulting from the U-factors in Table 402.1.3 (multiplied by the same assembly area as in the proposed building), the building shall be considered in compliance with Table 402.1.1. The UA calculation shall be done using a method consistent with the ASHRAE Handbook of Fundamentals and shall include the thermal bridging effects of framing materials. The SHGC requirements shall be met in addition to UA compliance.

402.2.6 Floors. Floor framing cavity insulation shall be installed to maintain permanent contact with the underside of the subfloor decking or in contact with the topside of sheathing or insulating sheathing installed on the underside of floor framing.

402.2.11 Thermally isolated sunroom insulation. The minimum ceiling insulation R-values shall be R-19 in Zones 1 through 4 and R-24 in Zones 5 through 8. The minimum wall R-values shall be R-13 in all zones. New wall(s) separating a sunroom from conditioned space shall meet the building thermal ~~envelope~~ barrier requirements.

402.2.3.5 Thermally isolated sunroom U-factor. For Zones 4 through 8, the maximum fenestration U-factor shall be 0.50 and the maximum skylight U-factor shall be 0.75. New windows and doors separating the sunroom from conditioned space shall meet the building thermal ~~envelope~~ boundary requirements.

402.4.1 Building ~~thermal envelope~~ enclosure. The building ~~thermal envelope~~ enclosure shall be durably sealed to limit infiltration. The sealing methods between dissimilar materials shall allow for differential expansion and contraction.

The following shall be caulked, gasketed, weatherstripped or otherwise sealed with an air barrier material, suitable film or solid material:

402.4.2 Air sealing and insulation. Building ~~envelope~~ enclosure air tightness and insulation installation shall be demonstrated to comply with one of the following options given by Section 402.4.2.1 or 402.4.2.2.

402.4.2.1 Testing option. Building ~~envelope~~ enclosure tightness and insulation installation shall be considered acceptable when tested air leakage is less than seven air changes per hour (ACH) when tested with a blower door at a pressure of 33.5 psf (50 Pa). Testing shall occur after rough in and after installation of penetrations of the building ~~envelope~~ enclosure, including penetrations for utilities, plumbing, electrical, ventilation and combustion appliances.

402.4.2.2 Visual inspection option. Building ~~envelope~~ enclosure tightness and insulation installation shall be considered acceptable when the items listed in Table 402.4.2, applicable to the method of construction, are field verified. Where required by the code official, an approved party independent from the installer of the insulation shall inspect the air barrier and insulation.

402.4.5 Recessed lighting. Recessed luminaries installed in the building thermal ~~envelope~~ barrier shall be sealed to limit air leakage between conditioned and unconditioned spaces. All recessed luminaries shall be IC-rated and labeled as meeting ASTM E 283 when tested a 1.57 psf (75 Pa) pressure differential with no more than 2.0 cfm (0.944 L/s) of air movement from the conditioned space to the ceiling cavity. All recessed luminaries shall be sealed with a gasket or caulk between the housing and the interior wall or ceiling covering.

403.2.1 Insulation (Prescriptive). Supply ducts in attics shall be insulated to a minimum of R-8. All other ducts shall be insulated to a minimum of R-6.

Exception: Ducts or portions thereof located completely inside the building thermal ~~envelope~~ barrier.

TABLE 402.4.2
AIR BARRIER AND INSULATION INSPECTION COMPONENT CRITERIA

COMPONENT	CRITERIA
Air barrier and thermal barrier	~~Exterior thermal envelope~~ Cavity insulation for framed walls is installed in substantial contact and continuous alignment with ~~building envelope air barrier~~ exterior sheathing or with the interior sheathing or gypsum board. Breaks or joints in the air barrier are filled or repaired. Air-permeable insulation is not used as a sealing material. Air-permeable insulation is inside of an air barrier.
Floors (including above-garage and cantilevered floors)	~~Insulation~~ Floor framing cavity insulation is installed to maintain permanent contact with underside of subfloor decking or in contact with the topside of sheathing or insulating sheathing installed on the underside of floor framing. Air barrier is installed at any exposed edge of insulation.

(Portions of table not shown remain unchanged)

405.2 Mandatory requirements. Compliance with this section requires that the mandatory provisions identified in Section 401.2 be met. All supply and return ducts not completely inside the building thermal ~~envelope~~ barrier shall be insulated to a minimum of R-6.

TABLE 405.5.2(1)
SPECIFICATIONS FOR THE STANDARD REFERENCE AND PROPOSED DESIGNS
(Portions of table and footnotes not shown remain unchanged)

b. For residences with conditioned basements, R-2 and R-4 residences and townhouses, the following formula shall be used to determine glazing area:

$AF = As \times FA \times F$

where:

AF = Total glazing area.
As = Standard reference design total glazing area.
FA = (Above-grade thermal ~~boundary~~ barrier gross wall area)/(above-grade ~~boundary~~ barrier wall area + 0.5 × below-grade ~~boundary~~ barrier wall area).
F = (Above-grade thermal ~~boundary~~ barrier wall area)/(above-grade thermal ~~boundary~~ barrier wall area + common wall area) or 0.56, whichever is greater.

and where:

Thermal ~~boundary~~ barrier wall is any wall that separates conditioned space from unconditioned space or ambient conditions.
Above-grade thermal ~~boundary~~ barrier wall is any thermal boundary wall component not in contact with soil.
Below-grade ~~boundary~~ barrier wall is any thermal boundary wall in soil contact.
Common wall area is the area of walls shared with an adjoining dwelling unit.

e. Tested ~~envelope~~ enclosure leakage shall be determined and documented by an independent party approved by the code official. Hourly calculations as specified in the 2001 ASHRAE Handbook of Fundamentals, Chapter 26, page 26.21, Equation 40 (Sherman-Grimsrud model) or the equivalent shall be used to determine the energy loads from infiltration.

SECTION 502
BUILDING ~~ENVELOPE~~ ENCLOSURE REQUIREMENTS

502.1.1 Insulation and fenestration criteria. The building thermal ~~envelope~~ barrier shall meet the requirements of Tables 502.2(1) and 502.3 based on the climate zone specified in Chapter 3. Commercial buildings or portions of commercial buildings enclosing Group R occupancies shall use the R-values from the "Group R" column of Table 502.2 (1). Commercial buildings or portions of commercial buildings enclosing occupancies other than Group R shall use the R-values from the "All other" column of Table 502.2(1). Buildings with a vertical fenestration area or skylight area that exceeds that allowed in Table 502.3 shall comply with the building ~~envelope~~ enclosure provisions of ASHRAE/IESNA 90.1.

Section 502.4.3 Sealing of the building ~~envelope~~ enclosure. Openings and penetrations in the building ~~envelope~~ enclosure shall be sealed with caulking materials or closed with gasketing systems compatible with the construction materials and location. Joints and seams shall be sealed in the same manner or covered with an air-impermeable ~~moisture vapor-permeable~~ wrapping material. Sealing materials spanning joints between construction materials shall allow for expansion and contraction of the construction materials.

Section 502.4.8 Recessed lighting. Recessed luminaires installed in the building thermal ~~envelope~~ boundary shall be sealed to limit air leakage between conditioned and unconditioned spaces. All recessed luminaires shall be IC-rated and labeled as meeting ASTM E 283 when tested at 1.57 psf (75 Pa) pressure differential with no more than 2.0 cfm (0.944 L/s) of air movement from the conditioned space to the ceiling cavity. All recessed luminaires shall be sealed with a gasket or caulk between the housing and interior wall or ceiling covering.

BUILDING ~~ENVELOPE~~ ENCLOSURE REQUIREMENTS - OPAQUE ASSEMBLIES
(No change to table contents)

TABLE 502.3
BUILDING ~~ENVELOPE~~ ENCLOSURE REQUIREMENTS: FENESTRATION
(No change to table contents)

4. Add new standard to Chapter 6 as follows:

ASTM
E 2178 – 03 Standard Test Method for Air Permeance of Building Materials

PART II – IRC BUILDING/ENERGY

1. Revise as follows:

AIR BARRIER. Material(s) assembled and joined together to provide a barrier to air leakage through the building ~~envelope~~ enclosure. An air barrier may be a single material or a combination of materials.

BUILDING THERMAL ~~ENVELOPE~~ BARRIER. The basement walls, slab, exterior walls, floor, roof, and any other building element that enclose conditioned space. This boundary also includes the boundary between conditioned space and any exempt or unconditioned space.

2. Add new definitions as follows:

AIR-PERMEABLE. A material or assembly having an air permeance greater than 0.02 L/s-m^2 at 75 Pa pressure differential tested according to ASTM E 2178 or ASTM E 283.

BUILDING ENCLOSURE. A system or assembly of components that provides environmental separation between the conditioned space and the exterior environment.

3. Revise as follows:

N1101.1 Scope. This chapter regulates the energy efficiency for the design and construction of buildings regulated by this code.

Exception: Portions of the building ~~envelope~~ that do not enclose conditioned space.

N1101.4 Building thermal ~~Envelope~~ barrier. An R-value identification mark shall be applied by the manufacturer to each piece of building thermal ~~envelope~~ barrier insulation 12 inches 9305 mm) or more wide. Alternatively, the insulation installers shall provide a certification listing the type, manufacturer and R-value of insulation installed in each element of the building thermal ~~envelope~~ barrier. For blown or sprayed insulation (fiberglass and cellulose), the initial installed thickness, settled thickness, settled R-value, installed density, coverage area and number of bags installed shall be listed on the certification. For sprayed polyurethane foam (SPF) insulation, the installed thickness of area covered and R-value of installed thickness shall be listed on the certificate. The insulation installer shall sign, date and post the certificate in a conspicuous location on the job site.

N1101.7.1 Protection of exposed foundation insulation. Insulation applied to the exterior of basement walls, crawl space walls, and the perimeter of slab-on-grade floors shall have a rigid, opaque and ~~weather~~ water resistant protective covering to prevent the degradation of the insulation's thermal performance. The protective covering shall cover the exposed exterior insulation and extend a minimum of 6 inches (152 mm) below grade.

SECTION N1102
BUILDING THERMAL ~~ENVELOPE~~ BARRIER

N1102.1 Insulation and fenestration criteria. The building thermal ~~envelope~~ barrier shall meet the requirements of Table N1102.1 based on the climate zone specified in Table N1101.2.

N1102.1.3 Total UA alternative. If the total building thermal ~~envelope~~ barrier UA (sum of U-factor times assembly area) is less than or equal to the total UA resulting from the U-factors in Table N1102.1.2, (multiplied by the same assembly area as in the proposed building), the building shall be considered in compliance with Table N1102.1. The UA calculation shall be done using a method consistent with the ASHRAE Handbook of Fundamentals and shall include the thermal bridging effects of framing materials. The SHGC requirements shall be met in addition to UA compliance.

N1102.2.6 Floors. Floor framing cavity insulation shall be installed to maintain permanent contact with the underside of the subfloor decking or in contact with the topside of sheathing or insulating sheathing installed on the underside of floor framing.

N1102.2.11 Thermally isolated sunroom insulation. The minimum ceiling insulation R-values shall be R-19 in Zones 1 through 4 and R-24 in Zones 5 through 8. The minimum wall R-values shall be R-13 in all zones. New wall(s) separating a sunroom from conditioned space shall meet the building thermal ~~envelope~~ barrier requirements.

N1102.3.5 Thermally isolated sunroom U-factor. For Zones 4 through 8, the maximum fenestration U-factor shall be 0.50 and the maximum skylight U-factor shall be 0.75. New windows and doors separating the sunroom from conditioned space shall meet the building thermal ~~envelope~~ boundary requirements.

N1102.4.1 Building ~~thermal envelope~~ enclosure. The building ~~thermal envelope~~ enclosure shall be durably sealed to limit infiltration. The sealing methods between dissimilar materials shall allow for differential expansion and contraction. The following shall be caulked, gasketed, weatherstripped or otherwise sealed with an air barrier material, suitable film or solid material:

N1102.4.2 Air sealing and insulation. Building ~~envelope~~ enclosure air tightness and insulation installation shall be demonstrated to comply with one of the following options given by Section N1102.4.2.1 or N1102.4.2.2.

N1102.4.2.1 Testing option. Building ~~envelope~~ enclosure tightness and insulation installation shall be considered acceptable when tested air leakage is less than 7 air changes per hour (ACH) when tested with a blower door at a pressure of 50 Pa (0.007 psi). Testing shall occur after rough in and after installation of penetrations of the building ~~envelope~~ enclosure, including penetrations for utilities, plumbing, electrical, ventilation and combustion appliances.

N1102.4.5 Recessed lighting. Recessed luminaries installed in the building thermal ~~envelope~~ barrier shall be sealed to limit air leakage between conditioned and unconditioned spaces. All recessed luminaries shall be IC-rated and labeled as meeting ASTM E 283 when tested a 1.57 psf (75 Pa) pressure differential with no more than 2.0 cfm (0.944 L/s) of air movement from the conditioned space to the ceiling cavity. All recessed luminaries shall be sealed with a gasket or caulk between the housing and the interior wall or ceiling covering.

N1103.2.1 Insulation. Supply ducts in attics shall be insulated to a minimum of R-8. All other ducts shall be insulated to a minimum of R-6.

Exception: Ducts or portions thereof located completely inside the building thermal ~~envelope~~ barrier.

TABLE N1102.4.2
AIR BARRIER AND INSULATION INSPECTION

COMPONENT	CRITERIA
Air barrier and thermal barrier	~~Exterior thermal envelope~~ Cavity insulation for framed walls is installed in substantial contact and continuous alignment with ~~building envelope air barrier~~ exterior sheathing or with the interior sheathing or gypsum board. Breaks or joints in the air barrier are filled or repaired. Air-permeable insulation is not used as a sealing material.
Floors (including above-garage and cantilevered floors)	~~Insulation~~ Floor framing cavity insulation is installed to maintain permanent contact with underside of subfloor decking or in contact with the topside of sheathing or insulating sheathing installed on the underside of floor framing. Air barrier is installed at any exposed edge of insulation.

(Portions of table not shown remain unchanged)

Reason: The current language of the building code is inconsistent with terms in the engineering, scientific, technical, educational, building science and "common use" communities. In fact terms and language within the code itself are inconsistently used. "Codespeak" makes it difficult to communicate appropriate requirements and concepts. The I-Codes are likely the most effective educational documents used in the construction industry. It behooves us to use the language in them correctly. If you don't call "things" by their proper names how can you expect users of the documents to execute the actions correctly? The changes proposed in this code change do not change the intent of the sections – they only fix bad physics and bad terms and language. For example one of the worst terms every coined in "codespeak" is "building thermal envelope". No one outside of the coderoom uses that phrase. The correct term is "thermal barrier". Thermal barrier is in fact used correctly in Table 402.4.2 and Table N1102.4.2 but is not used consistently throughout the code. This code change fixes that. Another example, Federal Express uses "envelopes", architects and engineers and builders should use the word "enclosure". And another example, the phrase "air-permeable" is used but not defined. Air-impermeable is defined in the IRC but not in the IECC. Finally, some of the physics is just plane wrong - such as requiring insulation in floors to be in direct contact with the underfloor sheathing. Yes, this is one option, but a better one in cold climates is to have an airspace between the floor sheathing and the top of the cavity insulation as this leads to a warmer floor - yet does not change the heat loss as long as the cavity insulation is in direct contact with a sheathing below it. Isn't physics neat? Also, how do you deal with rigid insulation boards on the underside of insulated floors? This language fixes that.

The current language in Section 502.4.3 is a big error in the governing physics – the air sealing materials do not necessarily have to be vapor permeable. Many air barrier materials are vapor impermeable and are used regularly such as fully adhered membranes or liquid and trowelled

applied membranes applied/installed over paperless gypsum sheathing that are covered with exterior insulating sheathing boards. This language fixes that.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: ASTM E 283-04 and ASTM E 2178-03 are currently referenced in the IRC.

7 and 8	~~0.35~~ 0.32	0.55 ~~0.60~~	NR	49	~~21~~ 20+5 or 13+10[h]	19 / 21	38[g]	15/19	10,4ft	10/13

For SI: 1 foot = 304.8 mm.

a. *R*-values are minimums. *U*-factors and SHGC are maximums. R-19 batts compressed into a nominal 2x6 framing cavity such that the R-value is reduced by R-1 or more shall be marked with the compressed batt R-value in addition to the full thickness R-value.
b. The fenestration *U*-factor column excludes skylights. The SHGC column applies to all glazed fenestration.
c. 15/19" means R-15 continuous ~~insulated sheathing~~ insulation on the interior or exterior of the home or R-19 cavity insulation at the interior of the basement wall. "15/19" shall be permitted to be met with R-13 cavity insulation on the interior of the basement wall plus R-5 continuous ~~insulated sheathing~~ insulation on the interior or exterior of the home. "10/13" means R-10 continuous ~~insulated sheathing~~ insulation on the interior or exterior of the home or R-13 cavity insulation at the interior of the basement wall.
d. R-5 shall be added to the required slab edge *R*-values for heated slabs. Insulation depth shall be the depth of the footing or 2 ft, whichever is less, in zones 1 through 3 for heated slabs.
e. There are no SHGC requirements in the Marine zone.
f. Basement wall insulation is not required in warm-humid locations as defined by Figure 301.1 and Table 301.1.
g. Or insulation sufficient to fill the framing cavity, R-19 minimum.
h. First value is cavity insulation, second is continuous insulation, so "13+5" means R-13 cavity insulation plus R-5 insulated sheathing. If structural sheathing covers 25 percent or less of the exterior, insulating sheathing is not required in the locations where structural sheathing is used. If structural sheathing covers more than 25 percent of exterior, structural sheathing shall be supplemented with insulated sheathing of at least R-2.
i. The second R-value applies when more than half the insulation is on the interior of the mass wall.
j. For impact rated fenestration in wind-borne debris regions ~~complying with Section R301.2.1.2 of the IRC or Section 1608.1.2 of the IBC~~, the maximum U-factor shall be 0.75 in Zone 2 and 0.65 in Zone 3.

R-19	R-19+6 in 2×6; R-19+12 in 2×8 or 2×10

a. Cavity insulation *R*-value is listed first, followed by continuous insulation *R*-value.
b. Insulation exceeding the height of the framing shall cover the framing.

Reason: The proposed changes improve the thermal integrity of the building envelope by decreasing the allowed U-factors for several building components that are currently below their reasonable potential in some climate zones. Improvements in available technologies and the demonstrated viability of the proposed levels in programs such as Energy Star, Building America, and other beyond-code efforts make these changes viable improvements in the context of the current and increasing need for lower energy consumption by buildings in the U.S.

Cost Impact: The code change proposal will increase the cost of construction.

PART I – IECC

EC28–09/10
402.1.1; IRC N1101.7

Proponent: James Bowman, representing American Forest and Paper Association

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IECC COMMITTEE. PART II WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IECC

Revise as follows:

402.1.1 Insulation and fenestration criteria. The *building thermal envelope* shall meet the requirements of Table 402.1.1 based on the climate *zone* specified in Chapter 3. Where required, insulation board shall be installed in compliance with its listing and not alter the application of wood structural panels or the lateral force resisting system of the assembly.

PART II – IRC BUILDING/ENERGY

Revise as follows:

N1101.7 Installation. All materials, systems and equipment shall be installed in accordance with manufacturer's installation instructions and the provisions of this code. Insulation board shall be installed to not alter or preclude the approved application of structural panels, or the lateral force resisting system of the assembly.

Reason: With the increased specification of insulation-board only options, it may make the use of WSP more problematic in high-wind and seismic zones, where compliant structural components and connections are crucial. Each of these components must be attached per their listings, engineered designs and comply with structural code provisions of the IBC. This proposal simply reinforces and provides a reference to the need to adhere to pertinent attachment requirements and not use one set of fasteners for multiple panels or otherwise use inadequate attachments. Existing manufacturer's installation instructions don't anticipate and could be construed to allow through nailing if the specified gage and spacing were used. Structural panels must have nailing flush to the panel, not the insulation face if nailed through both layers.

Cost Impact: The code change proposal will not increase the cost of construction

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IECC COMMITTEE. PART II WILL BE HEARD BY THE IRC BUILDING/ENERGYCOMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IECC

Revise table as follows:

TABLE 402.1.1
INSULATION AND FENESTRATION REQUIREMENTS BY COMPONENT

CLIMATE ZONE	FENESTRATION U-FACTOR[b]	SKYLIGHT[b] U-FACTOR	GLAZED FENESTRATION SHGC[b, e]	CEILING R-VALUE	WOOD FRAME WALL R-VALUE	MASS WALL R-VALUE[i]	FLOOR R-VALUE	BASEMENT[c] WALL R-VALUE	SLAB[d] R-VALUE & DEPTH	CRAWL SPACE[c] WALL R-VALUE
1	1.2	0.75	0.30 c	30	13	3/4	13	0	0	0
2	0.65j	0.75	0.30 c	30	13	4/6	13	0	0	0
3	0.50j	0.65	0.30 c	30	13	5/8	19	5/13f	0	5/13
4 except Marine	0.35	0.60	NR	38	13	5/10	19	10/13	10, 2 ft	10/13
5 and Marine 4	0.35	0.60	NR	38	20 or 13+5h	13/17	30g	10/13	10, 2 ft	10/13
6	0.35	0.60	NR	49	20 or 13+5h	15/19	30g	15/19	10, 4 ft	10/13
7 and 8	0.35	0.60	NR	49	21	19/21	38g	15/19	10, 4 ft	10/13

a. through b. (No change)
c. For skylights and thermally isolated sunrooms the maximum SHGC is 0.40.
c. through j. (Reletter)

PART II – IRC ENERGY

Revise table as follows:

TABLE N1102.1
INSULATION AND FENESTRATION REQUIREMENTS BY COMPONENT

CLIMATE ZONE	FENESTRATION U-FACTOR	SKYLIGHTb U-FACTOR	GLAZED FENESTRATION SHGC	CEILING R-VALUE	WOOD FRAME WALL R-VALUE	MASS WALL R-VALUEk	FLOOR R-VALUE	BASEMENTc WALL R-VALUE	SLABd R-VALUE AND DEPTH	CRAWL SPACEc WALL R-VALUE
1	1.2	0.75	~~0.35~~ 0.30[c, j]	30	13	3/4	13	0	0	0
2	0.65i	0.75	~~0.35~~ 0.30[c, j]	30	13	4/6	13	0	0	0
3	0.50i	0.65	~~0.35~~ 0.30[c, e, j]	30	13	5/8	19	5/13f	0	5/13
4 except Marine	0.35	0.60	NR	38	13	5/10	19	10/13	10, 2 ft	10/13
5 and Marine 4	0.35	0.60	NR	38	20 or 13 + 5h	13/17	30f	10/13	10, 2 ft	10/13
6	0.35	0.60	NR	49	20 or 13 + 5h	15/19	30g	10/13	10, 4 ft	10/13
7 and 8	0.35	0.60	NR	49	21	19/21	30g	10/13	10, 4 ft	10/13

a. through b. (No change)
c. For skylights and thermally isolated sunrooms the maximum SHGC is 0.40.
c. through k. (Reletter)

Reason: Higher SHGCs are generally associated with high transmission of visible light. Skylights need a higher SHGC to allow for the transmission of more visible light.

Likewise sunrooms are meant to admit sun. Thermally isolated sunrooms are sometimes used only 3 seasons of the year. Sunrooms used to house plants need to admit reasonable levels of sunlight

Cost Impact: The code change proposal will not increase the cost of construction.

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IECC COMMITTEE. PART II WILL BE HEARD BY THE IRC BUILDING/ENERGYCOMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IECC

Revise table footnote as follows:

TABLE 402.1.1
INSULATION AND FENESTRATION REQUIREMENTS BY COMPONENT
(No change to table contents)

a. R-values are minimums. U-factors and SHGC are maximums. ~~R-19 batts compressed into a nominal 2x6 framing cavity such that the R-value is reduced by R-1 or more shall be marked with the compressed batt R-value in addition to the full thickness R-value.~~ When insulation is installed in a cavity which is less than the label or design thickness of the insulation, the actual R-value of the insulation shall not be less than the R-value specified in the table.

b. through j. (No change)

PART II – IRC ENERGY

Revise table footnote as follows:

TABLE N1102.1
INSULATION AND FENESTRATION REQUIREMENTS BY COMPONENT
(No change to table contents)

a. R-values are minimums. U-factors and SHGC are maximums. ~~R-19 batts compressed into a nominal 2x6 framing cavity such that the R-value is reduced by R-1 or more shall be marked with the compressed batt R-value in addition to the full thickness R-value.~~ When insulation is installed in a cavity which is less than the label or design thickness of the insulation, the actual R-value of the insulation shall not be less than the R-value specified in the table.

b. through k. (No change)

Reason: The proposed change in wording is an improvement in the current code language for 2 reasons.

First, this new language does not change the intent of the existing language. Additionally it prohibits all types of insulation from being compressed to less than its design/ label thickness and meeting the code. The current language only addresses compression of R-19 batts being compressed to less than their design/label thickness (typically 6 ¼"), while the new language would prevent all insulation materials from being compressed to less than their design/label thickness and being presumed to meet the code requirements.

Second, as written, the code language is a violation of the Federal Trade Commission's ("FTC") "Labeling and Advertising of Home Insulation" Rule, 16 C.F.R. Part 460, also known as the R-value Rule because the code language requires insulation to be "marked" or labeled. The FTC has established jurisdiction over the advertising and labeling of insulation products sold or marketed to consumers in the United States. Specifically, the FTC has preempted conflicting laws:

16 C.F.R. 460.23(b).

State and local laws and regulations that are inconsistent with, or frustrate the purposes of, the provisions of this regulation are preempted. However, a State or local government may petition the Commission, for good cause, to permit the enforcement of any part of a State or local law or regulation that would be preempted by this section.

Federal preemption essentially means that a federal law supersedes and supplants any inconsistent state or local law or regulation. Currently this ICC code provision is in violation of the FTC R-value rule and is preempted by Federal law.

Making this proposed change will cover all instances of compressed insulation that may not meet the code requirements and eliminates the additional marking or labeling requirements, which are in conflict with the FTC Rule.

Cost Impact: The code change proposal will not increase the cost of construction.

PART I – IECC

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

PART II – IRC BUILDING/ENERGY

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: COTTRELL-EC-1-T. 402.1.1-T. N1102.1.DOC

402.1.1, Table 402.1.1; IRC N1102.1, Table N1102.1

Proponent: Donald J. Vigneau, AIA, Northeast Energy Efficiency Partnerships, Inc.

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IECC COMMITTEE. PART II WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IECC

Revise as follows:

402.1.1 Insulation and fenestration criteria. The *building thermal envelope* shall meet the minimum requirements of Table 402.1.1 based on the climate *zone* specified in Chapter 3. Use of the Table 402.1.1 prescriptive component option shall be limited to a maximum fenestration area of 20 percent of the gross conditioned floor area. U-factor and SHGC exemptions allowed under Sections 402.3.2 and 402.3.3 shall be included in the maximum allowable percentage area.

TABLE 402.1.1
INSULATION AND FENESTRATION REQUIREMENTS BY COMPONENT[a]
COMBINED WINDOW, SKYLIGHT AND DOOR AREAS NOT GREATER THAN 20 PERCENT OF GROSS CONDITIONED FLOOR AREA

(Table contents and footnotes remain unchanged)

PART II – IRC BUILDING/ENERGY

Revise as follows:

1102.1 Insulation and fenestration criteria. The *building thermal envelope* shall meet the requirements of Table N1102.1.1 based on the climate *zone* specified in Table N1101.2. Use of the Table N1102.1 prescriptive component alternative shall be limited to a maximum fenestration area of 20 percent of the gross conditioned floor area. U-factor and SHGC exemptions allowed under Sections N1102.3.3 and N1102.3.4 shall be included in the maximum allowable percentage area.

TABLE N1102.1
INSULATION AND FENESTRATION REQUIREMENTS BY COMPONENT[a]
COMBINED WINDOW, SKYLIGHT AND DOOR AREAS NOT GREATER THAN 20 PERCENT OF GROSS CONDITIONED FLOOR AREA

(Table contents and footnotes remain unchanged)

Reason
(Part I): Table 402.1.3 provides direct evidence that the use of glazing without limitation, as adopted in the IECC 2004 Supplement, allows for enormous energy waste and directly impacts both first cost and energy use, by allowing unlimited use of a thermal envelope component with inferior performance and a greater total installed cost. Affordability is NOT an issue in glazing allowed by a limited prescriptive option, only light, ventilation and emergency egress.

The proposed 20 percent of gross conditioned floor area limitation is greater than twice the minimum areas required to satisfy the above code requirements; including opaque door assemblies. The greater area proposed allows for flexibility in window selections and placement to accommodate design and construction issues. It applies uniformly to single and multi-family dwelling construction.

Currently, each square foot of code-compliant glazing still uses greater than 4 to over 10 TIMES as much energy as the adjacent complying envelope wall (see Table 402.1.3 for specific zone), and about twice the performance of the best windows available. Thus, each square foot of glazing beyond a reasonable minimum allows for undue waste of energy.

Since glazing area percentage has been changed to a percentage of the gross conditioned floor area (IECC 2004 Supplement), the prior IECC 2003 Chapter 6 limitation of 15 percent of thermal wall envelope area is proposed as 20 percent of conditioned floor area to realize about twice the glazing required by the above minimum standards possible within the prescriptive option.

The proposed change does not limit glazing; it only restricts the use of the prescriptive option to demonstrate compliance. The applicant is still able to use more than 20 percent fenestration by demonstrating compliance through the Section 402.1.3 U-factor alternative, the Section 402.1.4 Total UA alternative, or the Section 404.5 Simulated Performance Alternative.

PART II- Table N1102.1.2 provides direct evidence that the use of glazing without limitation, as adopted in the IRC 2006 Edition, allows for enormous energy waste and directly impacts both first cost and energy use, by allowing unlimited use of thermal envelope components with inferior performance and a greater total installed cost. Affordability is NOT an issue in glazing allowed by a limited prescriptive option; only light, ventilation and emergency egress.

The proposed 20 percent of gross conditioned floor area limitation is greater than twice the minimum areas required to satisfy the above code requirements; including opaque door assemblies. The greater area proposed allows for flexibility in window selections and placement to accommodate design and construction issues. It applies uniformly to single and townhouse dwelling construction.

Currently, each square foot of code-compliant glazing still uses greater than 4 to over 10 TIMES as much energy as the adjacent complying envelope wall (see Table N1102.1.2 for specific zone), and about twice the energy of the best windows available. Thus, each square foot of code-compliant glazing beyond a reasonable minimum allows for undue waste of energy.

Since glazing area percentage has been changed to a percentage of the gross conditioned floor area (IRC 2006), the prior IECC 2003 Chapter 6 limitation of 15 percent of thermal wall envelope area for detached One and Two Family homes is proposed as 20 percent of conditioned floor area to realize about twice the glazing required by the above minimum standards possible within the prescriptive option.

The proposed change does not limit glazing; it only restricts the use of the prescriptive option to demonstrate compliance. The applicant is still able to use more than 20 percent fenestration by demonstrating compliance through the Section N1102.1.2 U-factor alternative or the Section N1102.1.3 Total UA alternative, the method available in the RES*Check* energy software.

Cost Impact: The code change proposal will not increase the cost of construction.

7 and 8	~~0.35~~ 0.26	

(Footnotes remain unchanged)

2. Add new text as follows:

402.3.3 U-factor and SHGC alternative. Vertical windows with a U-factor of 0.27 and SHGC greater than or equal to 0.35, or a U-factor of 0.28 and SHGC greater than or equal to 0.40, shall be permitted to satisfy the fenestration *U*-factor requirements of Table 402.1.1 in Climate Zones 5, 6, 7 and 8. For compliance with this section, default SHGC values from Table 303.1.3(3) shall not be permitted.

PART II – IRC ENERGY

1. Revise tables as follows:

TABLE N1102.1
INSULATION AND FENESTRATION REQUIREMENTS BY COMPONENT[a]

CLIMATE ZONE	FENESTRATION *U*-FACTOR[b]	
1	1.2	**(Rest of table unchanged)**
2	0.65[j]	
3	0.50[j]	
4 except Marine	0.35	
5 and Marine 4	~~0.35~~ 0.26	
6	~~0.35~~ 0.26	
7 and 8	~~0.35~~ 0.26	

(Footnotes remain unchanged)

TABLE N1102.1.2
EQUIVALENT *U*-FACTORS[a]

CLIMATE ZONE	FENESTRATION *U*-FACTOR	
1	1.2	**(Rest of table unchanged)**
2	0.65	
3	0.50	
4 except Marine	0.35	
5 and Marine 4	~~0.35~~ 0.26	
6	~~0.35~~ 0.26	
7 and 8	~~0.35~~ 0.26	

(Footnotes remain unchanged)

2. Add new text as follows:

N1102.3.3 U-factor and SHGC alternative. Vertical windows with a U-factor of 0.27 and SHGC greater than or equal to 0.35, or a U-factor of 0.28 and SHGC greater than or equal to 0.40, shall be permitted to satisfy the fenestration *U*-factor requirements of Table N1102.1 in Climate Zones 5, 6, 7 and 8. For compliance with this section, default SHGC values from Table 303.1.3(3) shall not be permitted.

Reason: This proposal would significantly increase energy efficiency of windows in the northern climate by lowering the U-factor such that triple glazing will be required. Moving from double to triple glazing does have potentially significant cost implications, with the increase in window cost estimated to be least 15%.[1] However, this change becomes an important component if the code is heading towards a major increase in energy efficiency of first 30%, then 50%.

Therefore, an equally important component is to maximize cost effectiveness by ensuring the widest product flexibility. This is achieved by including both the lower basic U-factor in the table as well as the alternative criteria described in the new section. These alternative criteria are based upon a similar equivalent energy path in the recently announced 2010 Energy Star requirements.[2] This alternate path, based upon an analysis performed by Lawrence Berkeley National Laboratory, allows a U-factor 0.01 higher for SHGC 0.35 and 0.02 higher for SHGC 0.40. This same alternative is included here, and will ensure that a larger range of triple glazed products with various frame and glass types can satisfy the requirement, thus helping to maximize cost effectiveness through economy of scale.

1. "U.S. Department of Energy ENERGY STAR Program, Windows, Doors, and Skylights Draft Criteria and Analysis", D&R International Ltd, August 6, 2008. http://www.energystar.gov/ia/partners/prod_development/archives/downloads/windows_doors/WindowsDoorsSkylights_DraftCriteriaAnalysis_CORRECTED.pdf
2. "ENERGY STAR Program Requirements for Residential Windows, Doors, and Skylights – Version 5.0", U.S. Department of Energy, April 7, 2009. http://www.energystar.gov/ia/partners/prod_development/archives/downloads/windows_doors/WindowsDoorsSkylightsProgRequirements7Apr09.pdf

Cost Impact: The code change proposal will increase the cost of windows by requiring triple glazing in the north. An August 2008 report by D&R International for the U.S. Department of Energy's Energy Star program for Windows, Doors, and Skylights estimated a minimum cost increase of 15%.

6	0.35	0.60	NR	49	20 or 13+5h	15/19	30g	15/19	10, 4 ft	10/13
7 and 8	0.35	0.60	NR	49	21	19/21	38g	15/19	10, 4 ft	10/13

(Footnotes remain unchanged)

Reason: This proposal recommends the same U-factor for fenestration in climate zone 1 as in climate zone 2 to reduce the cooling load energy demand. Granted, a low SHGC is much more effective at reducing cooling energy demand, but improving the U-factor is also important for reducing energy demand. There are windows and doors available that meet the thermal performance requirements proposed and meet other performance requirements of climate zone 1.

Cost Impact: The code change proposal will increase the cost of construction.

7 and 8	0.35	0.60	0.026	0.057	0.057	0.033	0.059	0.065

(Footnotes remain unchanged)

Reason: This proposal substantially increases energy efficiency in climate zones 1-3 by specifying lower, more realistic fenestration U-factors that more closely resemble actual windows used to meet current requirements in these zones and, as a result, will close a significant gap in trade-off compliance paths and performance path calculations as well as make the code more efficient.

The current window U-factor requirements in the three southernmost climate zones are unreasonably high, given the current *IECC* SHGC requirement of 0.30 and *IRC* SHGC requirement of 0.35. To meet the SHGC requirement in these three zones, builders typically use low solar gain, low-e glass. As a result, the only issue is a reasonable choice of frame to meet increasing energy efficiency demands. With such a frame, the resulting product has a much lower U-factor than the current requirements for these climate zones. The practical effect of this lower U-factor for actual windows is that users who follow the Total UA alternative or the Simulated Performance Alternative automatically receive unnecessary free trade-off credit (the difference between the artificially high U-factor requirement and the window's actual U-factor), which is then used to reduce efficiency elsewhere in the home.

The proposed change sets U-factors at reasonable levels designed to match reasonably efficient windows available in all markets. According to the *2005 ASHRAE Handbook of Fundamentals* (page 31.8, Table 4), a low solar gain, low-e window (0.05 emissivity) with a ½ inch air space typically achieves the following U-factors:

	Operable w/o Argon	Fixed w/o Argon	Operable w/Argon	Fixed w/Argon
Aluminum Thermal Break	0.47	0.41	0.44	0.37
Wood/Vinyl	0.39	0.35	0.36	0.31

This proposal would continue to allow, under the prescriptive compliance path, any frame in climate zone 1, but would require a builder to use a more reasonable 0.50 U-factor (reflecting the range of U-factors portrayed above) where they elect to use a UA trade-off or the performance path. In climate zone 2, this proposal would use a vinyl framed window without argon as the baseline prescriptive path window (wood and clad-wood framed windows would also meet this requirement as well as some aluminum thermal break framed windows). In zone 3, to achieve a 0.35 U-factor, this proposal would typically require the addition of argon (beyond the level for climate zone 2) for the prescriptive path window. While this proposal may require some to switch from aluminum to vinyl windows if they choose to use the prescriptive path, there does not appear to be an additional cost to achieve the 0.40 or better U-factor, given that the cost of vinyl and aluminum window frames are reportedly very competitive. While there is a slight additional cost to add argon, such cost is relatively minimal and more than offset by the benefits of a better U-factor in climate zone 3. There is

also precedent for much lower U-factors in these climate zones. For example, under the 2009 American Recovery and Reinvestment Act (Stimulus Bill), the federal tax credit for replacement windows specifies a 0.30 U-factor nationwide.

This proposal substantially increases energy efficiency in climate zones 1-3. The table below illustrates the estimated energy cost savings from the prescriptive changes in climate zones 2 and 3 over the current 2009 *IECC* and *IRC* values. . These savings are significant and when coupled with other proposed code modifications can lead to significant overall energy savings for homes.

	Climate Zone 1	Climate Zone 2	Climate Zone 3
Heating, Cooling, Hot Water Purchased Energy Cost Percent Savings	-	7.5%	6.2%
Total Purchased Energy Cost Percent Savings (also including major appliances and lighting)	-	5.3%	4.5%

The proposed change is designed to match windows available in all markets. While most wood or vinyl-framed double-pane windows already meet the 0.35 U-factor requirement, any frame type could also be used under either the Total UA alternative or the Simulated Performance Alternative. In our experience, these values are already achieved by many, if not most, of the windows sold in these climate zones.

This proposal represents a reasonable and cost effective improvement that will provide states and local jurisdictions with an option to easily increase the efficiency of their code.

Cost Impact: The code change proposal will increase the cost of construction.

~~i. For impact-rated fenestration complying with Section R301.2.1.2, the maximum U-factor shall be 0.75 in Zone 2 and 0.65 in Zone 3.~~
~~j. For impact-resistant fenestration complying with Section R301.2.1.2 of the *International Residential Code*, the maximum SHGC shall be 0.40.~~

(Portions of footnotes not shown remain unchanged)

Reason:
(Prindle) This proposal will increase energy efficiency by eliminating unnecessary exceptions to the fenestration requirements for impact rated fenestration. The IECC exception for U-factor and the IRC exceptions for U-factor and SHGC should all be removed. The exceptions are written too broadly and create an unnecessary loophole in fenestration requirements.

Exceptions are Too Broad. Although impact rated fenestration may not be required (or even advisable) in every home in climate zones 1 through 3, these exception could apply to any home in this part of the country. These footnotes are not limited to those situations in which the *IBC* or I*RC* would *require* impact rated fenestration. The *IRC* only requires impact-rated glazing in Wind-Borne Debris Regions, and it defines Wind-Borne Debris Region as follows:

Areas within hurricane-prone regions within one mile of the coastal mean high water line where the basic wind speed is 110 miles per hour (49 m/s) or greater; or where the basic wind speed is equal to or greater than 120 miles per hour (54 m/s); or Hawaii.

IRC page 22. Regions that fit within that definition are much narrower than climate zones 2 and 3. See Figure R301.2(4), Basic Wind Speeds for 50-Year Mean Recurrence Interval. While Wind-Borne Debris Regions typically only cover coastal counties, the U-factor exception reaches all counties in these climate zones, even as far inland as Las Vegas, Nevada. The result is a significant wasted opportunity to make new homes more energy efficient, in exchange for windows that are unnecessary in these regions.

Products are Widely Available. Both exceptions were rejected by the *IECC* Committee in the 07/08 code cycle because they are unnecessary: The committee agreed with opponents that there were a sufficient amount of impact resistant products readily available that will meet fenestration U-factors for hurricane prone regions; therefore the exception for impact resistant windows is unnecessary.

There are many products already available on the market that meets both the prescriptive requirements and the wind-borne debris requirement. The exception simply wastes an opportunity to bring more energy efficiency to climate zones 1 through 3.

Weighted Average and Flexibility. Even if a builder installs windows that do not meet the prescriptive requirements, users may simply engage the Total UA Alternative or the Simulated Performance Alternative in Section 405 of the *IECC*, or the Department of Energy's free *RES*check software, and trade efficiency among all the envelope components. Because of the flexibility afforded by multiple compliance options, exceptions like these unnecessarily weaken the energy efficiency of the code.

(Lowinski) Fenestration thermal performance requirements should be independent of other performance criteria, such as providing protection from wind-borne debris or structural design pressure. This proposal seeks to undo a weakening of the energy code included in the 2009 IECC. There's plenty of windows and doors available in the market that can meet the thermal performance requirements as proposed, and meet the impact-resistant requirements of Section 1608.1.2.

Cost Impact: (Lowinski) The code change proposal will increase the cost of construction.

5 and Marine 4	0.35	N.R.	0.60	N.R.	
6	0.35	N.R.	0.60	N.R.	
7 and 8	0.35	N.R.	0.60	N.R.	

b. The fenestration *U*-factor and glazed fenestration SHGC columns exclude~~s~~ skylights. ~~The SHGC column applies to all glazed fenestration.~~

l. The maximum SHGC for tubular daylighting devices (TDDs) that do not exceed 1.30 sq. ft. (0.12 m^2) in cross sectional area shall be 0.45.

(Portions of table and footnotes not shown remain unchanged)

Reason: Significant energy savings can be achieved in all types of buildings through the use of daylighting, which is free and therefore does not contribute to the energy cost of a building at all. Toplighting by skylights can be an important component of good daylighting design, but only if an adequate amount of light is transmitted through the skylight. The Visible Transmittance (VT) of light through a skylight is directly proportional to its SHGC. A review of the NFRC database on March 30, 2009 found that domed skylights with SHGC less than 0.35 had VT less than 0.50 and flat glass skylights with SHGC less than 0.35 had VT less than 0.56.

Increasing the SHGC for residential skylights brings domed skylights with VT between 0.60 and 0.70, and flat glass skylights with VT between 0.63 and 0.69 into the range of availability. This proposal provides that increase for skylights only, and also includes a footnote that establishes a maximum SHGC of 0.45 for tubular daylighting devices (TDDs). TDDs permit a lot of light to enter a space through a relatively small opening in the roof structure, but their SHGC will commonly be between 0.40 and 0.45.

Use of these skylights (flat glass, domed and TDDs) to provide daylighting into residences are a cost effective way to save energy, and should be not only permitted, but encouraged within both the IRC and IECC.

Cost Impact: The code change proposal will not increase the cost of construction.

7 and 8	0.35	0.60	NR	49	21	19/21	38[g]	15/19	10, 4 ft	10/13

(Footnotes remain unchanged)

Reason: Skylights provide daylighting as a primary function. Low SHGC values might reduce the amount of daylighting available. WDMA proposes a revision to the maximum SHGC allowed for skylights in residential applications to allow an increase in visible light (daylighting).

Roof-mounted fenestration, such as skylights, provide lighting to the interior of spaces as a primary benefit and compliment lighting from windows and doors. Allowing for a slightly higher maximum SHGC value will preserve a level of natural visible light that is sufficient to maximize the opportunities for occupants to switch off artificial lights.

When the 2006 energy code modifications were being debated, the severe reductions in fenestration SHGC were accepted with the unintended consequence of reducing the availability of qualifying skylights that carry NFRC ratings. Discussion of the amended proposal centered exclusively on windows in walls and reducing cooling energy consumption, without regard to the significant offsetting lighting energy savings unique to natural toplighting with visible transmittance high enough to permit switching off lights even under an overcast sky.

It should also be noted that skylight area as a percentage of roof area is typically 0 to 3%, so the negative heat gain contribution on the average building from skylights is very minor in relation to that of the windows in the average house.

Cost Impact: This code change will not increase the cost of construction.

(Footnotes remain unchanged)

2. Add new text as follows:

N1102.3.3 U-factor and SHGC alternative. Window assemblies having a U-factor of 0.31 and SHGC greater than or equal to 0.35 or a U-factor of 0.32 and SHGC greater than or equal to 0.40 shall be permitted to satisfy the fenestration U-factor requirements of Table N1102.1 in Climate Zones 5, 6, 7 and 8. For compliance with this section, default SHGC values from Table N1101.5(3) shall not be permitted.

Reason: After Lawrence Berkeley National Laboratories (LBNL) did an extensive study of energy equivalency of matching U-factors with various SHGCs in northern climate zones, the Department of Energy issued a new Energy Star Windows criteria (Energy Star) which will take effect on January 4, 2010. The DOE established the following alternate, equivalent energy performance criteria for Energy Star labeled windows for IECC climate zones 5-8:

U-factor	SHGC
0.30	Any or NR
= 0.31	0.35
= 0.32	≥ 0.40

In support of these alternate paths, DOE's Energy Star report issued on April 7, 2009 explains:

> The energy savings analysis … revealed that in the North, a 0.01 increase in U-factor produces equivalent energy performance to a 0.05 increase in SHGC. DOE used this relationship to establish the proposed revised tradeoff levels: setting the … 0.30 U-factor and 0.30 SHGC as the base case, the minimum required SHGC in the revised tradeoffs rise 0.05 to balance a 0.01 rise in U-factor. The two alternative criteria specify U-factors of 0.31 and 0.32, while allowing the minimum SHGC to rise to 0.35

and 0.40 respectively. Windows with those specific U-factors and the corresponding SHGCs or higher will qualify.

If adopted, this proposal would harmonize the 2012 IECC to the criteria specified for Energy Star windows in the north. It would be timely for the IECC to do this since, even before the new Energy Star criteria takes effect in January 2010, the DOE plans to begin researching a new, Phase 2 proposal for Energy Star Windows.

Cost Impact: The code change proposal will not increase the cost of construction.

7 and 8	~~0.35~~ 0.32	0.60	0.026	0.057	0.057	0.033	0.059	0.065

(Footnotes remain unchanged)

Reason: This proposal specifies an improved fenestration U-factor requirement for colder climates. Lowering the U-factor to 0.32 in zones Marine 4, and 5-8 would result in a guaranteed increase of almost 10% in window insulating value (almost a 10% reduction in heat loss through these

windows) in these cold climates and would guarantee energy savings year-round in every home. A lower glazing U-factor is a proven energy saver for heating and cooling energy, so there will be savings on natural gas, heating oil and electric bills.

While the window U-factor and SHGC requirements in other climate zones have improved substantially in recent code cycles, U-factors in these northern climate zones have not been improved.

Many windows sold in the northern U.S. that meet the 0.35 U-factor also meet the 0.32 U-factor. Typically, the difference between a 0.35 and 0.32 window is the level of argon-fill, a low or no-cost option. While lowering the U-factor from 0.35 to 0.32 may be aggressive for some frame types, the area weighted average approach incorporated into the code will allow some windows to exceed this value, so long as the windows selected for the home on average meet the 0.32 value.

This proposal increases energy efficiency in climate zones Marine 4 and 5-8. The table below illustrates the estimated energy cost savings from this measure in each climate zone. These savings are significant and when coupled with other proposed code modifications can lead to significant overall energy savings for homes.

	Climate Zone 4 Marine	Climate Zone 5	Climate Zone 6	Climate Zone 7	Climate Zone 8
Heating, Cooling, Hot Water Purchased Energy Cost Percent Savings	2.3%	2.0%	2.0%	1.5%	1.7%
Total Purchased Energy Cost Percent Savings (also including major appliances and lighting)	1.8%	1.5%	1.6%	1.2%	1.4%

Cost Impact: The code change proposal will increase the cost of construction.

(Footnotes remain unchanged)

N1102.3.6 Replacement Fenestration. Where some or all of an existing fenestration unit is replaced with a new fenestration product, including sash and glazing, the replacement fenestration ~~unit~~ product shall meet the applicable requirements for U-factor and solar heat gain coefficient (SHGC)in Table N1102.1. Where more than one unit is being replaced, an area-weighted average of the replacement fenestration products shall be permitted to satisfy the U-factor and SHGC requirements.

Exception: Replacement skylights shall be permitted to have a weighted average U-factor not to exceed 0.60 and an SHGC not to exceed the value prescribed in Table N1102.1.

Reason: This proposal increases energy efficiency by eliminating separate specific skylight requirements in new construction and requiring that skylights meet overall fenestration U-factors on a weighted average basis. Since vertical fenestration maximum U-factors are lower than skylights maximum U-factors in all climate zones (except zone 1), this proposal will serve to produce energy savings in all homes built with skylights. Given that skylights (with R-values often less than R-2) occupy space that would otherwise be filled by a R-30 or R-49 roof, it is important that as much efficiency be captured as possible.

While skylights generally may not meet more stringent vertical fenestration U-factors on an individual unit basis, this is not a problem because the fenestration U-factor requirements can be satisfied on a weighted average basis. As a result, less stringent skylights will be offset by more stringent vertical fenestration. Since there are no limits on fenestration (including skylights) in the prescriptive path, this improvement will serve to ensure that the actual overall fenestration U-factor, including skylights, is lower under the prescriptive path. To illustrate, to meet a 0.35 U-factor fenestration requirement, the builder could install 40 square feet of skylights at a 0.60 U-factor and 360 square feet of vertical fenestration at a 0.32 U-factor. The resulting weighted average U-factor would be 0.348, thereby satisfying a 0.35 U-factor.

The proposed revisions to the replacement fenestration section are also necessary so that replacement fenestration can qualify on a weighted average basis and to permit skylight replacement (since vertical fenestration may not be replaced when skylights are replaced, it is necessary to offer a separate standard in the exception for replacement skylights).

Cost Impact: The code change proposal will increase the cost of construction.

(Footnotes remain unchanged)

Reason: This proposal increases energy efficiency, reduces peak demand and sizing of cooling systems, and improves comfort in climate zones 1-3 by lowering the prescriptive SHGC values to 0.25. The need for and viability of lower SHGCs for these cooling climates is already recognized in the 2006 and 2009 *IECC* for commercial buildings, where the prescriptive value without an overhang is 0.25, establishing a precedent for a 0.25 SHGC. This proposal would establish the same value for residential buildings as well.

This proposal would reduce fenestration solar gain in hot climates (zones 1-3) in the *IECC* by almost 17% and in the *IRC* by almost 29%. Without even factoring in the increased cost of on-peak energy that this proposal would avoid, this proposal would provide an average of approximately 1% in additional heating and cooling purchased energy savings, in additional to reduced peak electrical demand, over the values set in the 2009 *IECC*. There should be no negative construction cost impact from this increase in energy code stringency since the existing SHGC requirements already effectively dictate a low solar gain low-e window and the new requirements will also require low solar gain low-e glass, but only with a lower SHGC. Such lower SHGC glass is readily available in the market. Moreover, the potential for smaller HVAC systems could generate construction cost savings. Finally, by maintaining the same SHGC requirements for all three zones, this proposal will promote lower costs of construction as a result of economies of scale, reduced inventory requirements and increased competition among suppliers of these fenestration products.

This proposal represents a reasonable and cost effective improvement that will provide states and local jurisdictions with an option to easily increase the efficiency of their code.

Cost Impact: The code change proposal will increase the cost of construction.

(Footnotes remain unchanged)

Reason: This proposal promotes "the effective use of energy" (see *IECC* section 101.3) by reducing the need for peak electricity by adopting a modest and conservative Solar Heat Gain Coefficient (SHGC) requirement in climate zone 4 except Marine.

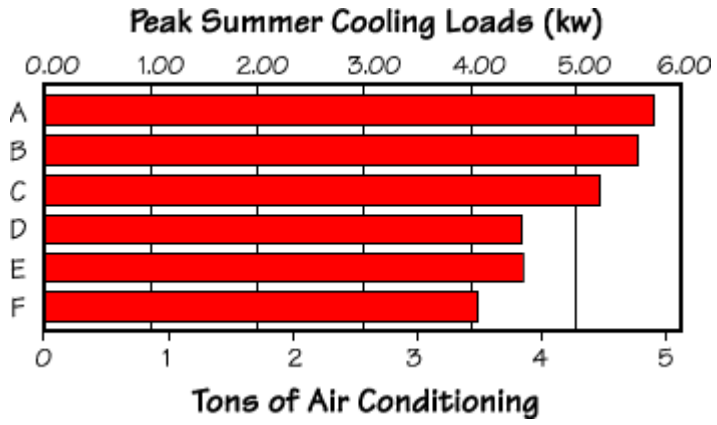
Precedent for a Maximum SHGC Requirement in Climate Zone 4.

DOE/EPA's ENERGY STAR for Windows program has included an SHGC maximum requirement in the North-Central zone (roughly *IECC* climate zone 4) for a number of years. The most recent Energy Star qualification criteria, released in April 2009, requires a maximum 0.40 SHGC in the North-Central zone. The 2009 American Recovery and Reinvestment Act (Stimulus Bill) goes even further, requiring a maximum 0.30 SHGC nationwide for the enhanced window tax credit. Chapter 5 of the *IECC* (Commercial Energy Efficiency) already requires a maximum SHGC of 0.40 in climate zones 4-6. ASHRAE 90.1-2007 also contains the same requirement in climate zones 4-6 for both high rise residential and commercial construction. See Table 5.5-4. It is time for the residential chapters of the *IECC* and *IRC* to move in the same direction.

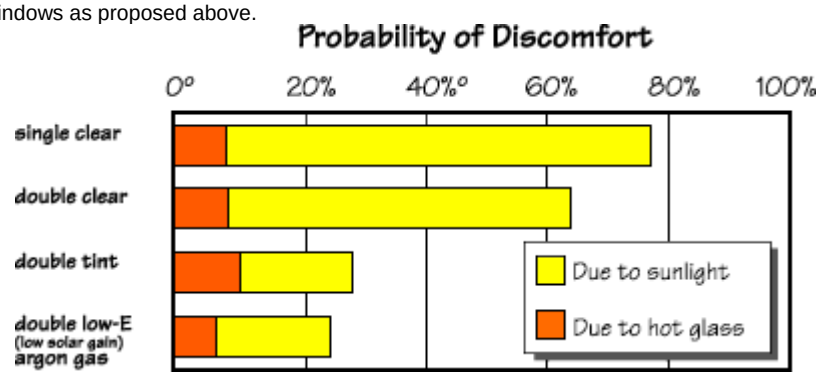
The proposed change would still allow a great deal of flexibility. The SHGC requirements in both ENERGY STAR and the Stimulus Bill apply to *each window*, as opposed to the area-weighted average flexibility allowed by the *IECC*. This proposal sets the *weighted average* at 0.40 SHGC, a level already achieved by most products on the market in climate zone 4.

Reduction of Peak Electricity Demand and Potential Energy Cost Savings.
Every state in climate zone 4 is "summer-peaking," meaning that demand for electricity is highest on the hottest summer days. Electricity during peaking times is scarce and exponentially more expensive on the open market. States have been forced to build and site new peaking power plants (or to revive retired, dirty plants) for the sake of keeping up with peak demand, due in large part to the increased use of air conditioners in new construction.

Windows with low SHGC are an obvious answer to this growing problem. The following chart, developed by the U.S. Department of Energy's Lawrence Berkley National Laboratory (LBNL), which is found on the Efficient Window Collaborative (EWC) website (www.efficientwindows.org), shows the potential for saving peak demand (and tons of HVAC) for different window types. Window E is a higher solar gain low-e double-pane window that meets the current U-factor requirement in climate zone 4. Window F is the low SHGC, low U-factor window that would meet the current U-factor requirement plus the SHGC maximum of this proposal. The reduction in peak cooling load is nearly half of a kW, reducing by almost a half ton the size of the air conditioning unit. As is readily apparent, improved windows will lead to smaller HVAC sizes (with lower costs to the homeowner) and lower peak cooling loads (saving the state from building additional peak capacity).



Similarly, the following chart shows the probability of discomfort during summer from sunlight and hot glass. The summertime probability of discomfort ranges from over 60% with double clear (which is currently allowed in climate zone 4 under the UA trade-off and performance paths) to almost 20% with low SHGC windows as proposed above.



Windows with low SHGC will reduce the volatility of temperatures in the home, which will reduce occupant discomfort and make it less likely that occupants will need to adjust the thermostat and use more energy.

Construction Costs/Benefits of a Low SHGC Requirement in Climate Zone 4.

There should be no increased construction cost for moving to a low SHGC requirement in climate zone 4. Climate zone 4 already requires a 0.35 U-factor window. Such a window, by definition, already incorporates low-e glass. Meeting a 0.40 SHGC merely requires that the low-e coating be designed to limit low solar gain, a feature that adds no additional cost.

On the other hand, use of lower SHGC windows will result in construction cost savings from properly downsizing the HVAC equipment.

Cost Impact: The code change proposal will not increase the cost of construction.

For S1: 1 foot = 304.8 mm.

a. *R*-values are minimums. *U*-factors are maximums. ~~and~~ SHGC are maximums("max") or minimums ("min") as noted. R-19 batts compressed into a nominal 2x6 framing cavity such that the *R*-value is reduced by R-1 or more shall be marked with the compressed batt *R*-value in addition to the full thickness *R*-value.
b. The fenestration *U*-factor column excludes skylights. The SHGC column applies to all glazed fenestration.
c. "15/19" means R-15 continuous insulated sheathing on the interior or exterior of the home or R-19 cavity insulation at the interior of the basement wall. "15/19" shall be permitted to be met with R-13 cavity insulation on the interior of the basement wall plus R-5 continuous insulated sheathing on the interior or exterior of the home. "10/13" means R-10 continuous insulated sheathing on the interior or exterior of the home or R-13 cavity insulation at the interior of the basement wall.
d. R-5 shall be added to the required slab edge *R*-values for heated slabs. Insulation depth shall be the depth of the footing or 2 feet, whichever is less in Zones 1 through 3 for heated slabs.
e. There are no SHGC requirements in the Marine Zone.
f. Basement wall insulation is not required in warm-humid locations as defined by Figure 301.1 and Table 301.1.
g. Or insulation sufficient to fill the framing cavity, R-19 minimum.
h. "13+5" means R-13 cavity insulation plus R-5 insulated sheathing. If structural sheathing covers 25 percent or less of the exterior, insulating sheathing is not required where structural sheathing is used. If structural sheathing covers more than 25 percent of exterior, structural sheathing shall be supplemented with insulated sheathing of at least R-2.
i. The second *R*-value applies when more than half the insulation is on the interior of the mass wall.
j. For impact rated fenestration complying with Section R301.2.1.2 of the *International Residential Code* or Section 1608.1.2 of the *International Building Code*, the maximum *U*-factor shall be 0.75 in Zone 2 and 0.65 in Zone 3.
k. To determine compliance of unlabeled fenestration with min SHGC, the default SHGC shall be 0.27, and use of default SHGC values from Table 303.1.3(3) shall not be permitted.

PART II- IRC BUILDING/ENERGY

TABLE N1102.1
INSULATION AND FENESTRATION REQUIREMENTS BY COMPONENT[a]

CLIMATE ZONE	FENESTRATION *U*-FACTOR	SKYLIGHT[b] *U*-FACTOR	GLAZED FENESTRATION SHGC	CEILING *R*-VALUE	WOOD FRAME WALL *R*-VALUE	MASS WALL *R*-VALUE[k] [i]	FLOOR *R*-VALUE	BASEMENT[c] WALL *R*-VALUE	SLAB[d] *R*-VALUE & DEPTH	CRAWL SPACE[c] WALL *R*-VALUE

7 and 8	0.35	0.60	0.30 min[k] NR	49	21	19/21	30[g]	10/13	10, 4 ft	10/13

a. *R*-values are minimums. *U*-factors are maximums. and SHGC are maximums ("max") or minimums ("min") as noted. R-19 batts compressed into a nominal 2x6 framing cavity such that the *R*-value is reduced by R-1 or more shall be marked with the compressed batt *R*-value in addition to the full thickness *R*-value.
b. The fenestration *U*-factor column excludes skylights. The SHGC column applies to all glazed fenestration.
c. The first *R*-value applies to continuous insulation, the second to framing cavity insulation; either insulation meets the requirement.
d. R-5 shall be added to the required slab edge *R*-values for heated slabs. Insulation depth shall be the depth of the footing or 2 feet, whichever is less, in zones 1 through 3 for heated slabs.
e. There are no SHGC requirements in the Marine Zone.
f. Basement wall insulation is not required in warm-humid locations as defined by Figure N1101.2 and Table N1101.2.
g. Or insulation sufficient to fill the framing cavity, R-19 minimum.
h. "13+5" means R-13 cavity insulation plus R-5 insulated sheathing. If structural sheathing covers 25% or less of the exterior, R-5 sheathing is not required where structural sheathing is used. If structural sheathing covers more than 25% of exterior, structural sheathing shall be supplemented with insulated sheathing of at least R-2.
i. For impact-rated fenestration complying with Section R301.2.1.2, the maximum *U*-factor shall be 0.75 in zone 2 and 0.65 in zone 3.
i j. For impact-resistant fenestration complying with Section R301.2.1.2 of the *International Residential Code*, or Section 1608.1.2 of the *International Building Code*, the maximum U-factor shall be 0.75 in Zone 2 and 0.65 in Zone 3SHGC shall be 0.40.
j ~~k~~. The second *R*-value applies when more than half the insulation is on the interior.
k. To determine compliance of unlabeled fenestration with min SHGC, the default SHGC shall be 0.27, and use of default SHGC values from Table N1101.5(3)shall not be permitted.

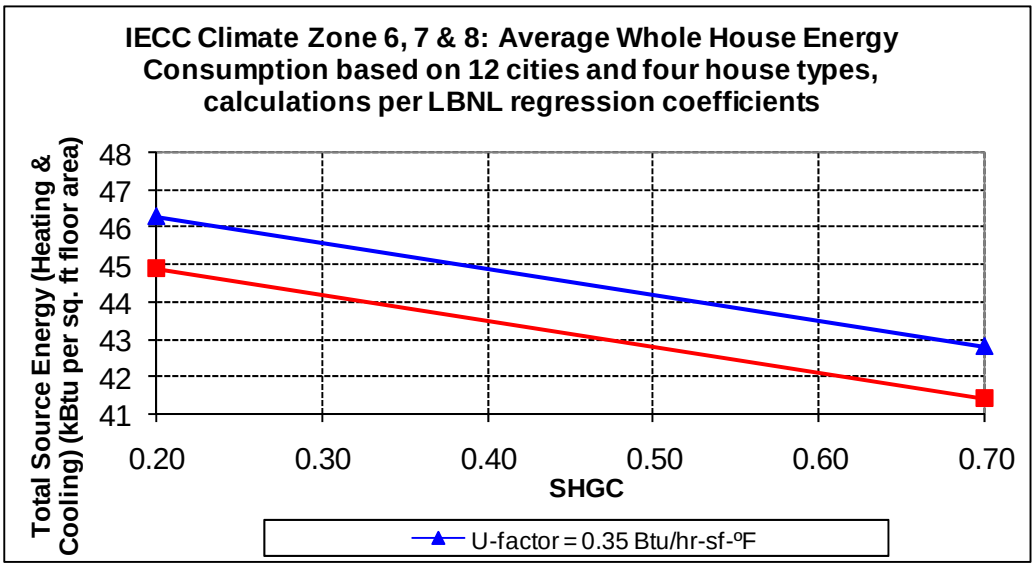
Reason:
Part I- The trend in prescriptive SHGCs in the south is clearly downward. The 2006 IECC prescribed a 0.40 SHGC in zones 1-3; the 2007 Supplement lowered that to 0.37; and it was lowered again in 2009 to 0.30 or lower.

For its full useful life, a 0.40 SHGC window means that it will permanently blocks 60% of the sun's energy while allowing 40% of its energy to pass into a home. Reducing solar gain from 40% to 30% by lowering SHGC to 0.30 makes sense in the south because southern climates are cooling dominated and reducing solar gain in the south reduces cooling loads which saves energy.
The Department of Energy is pressing for even lower SHGC windows in the south. Beginning on January 4, 2010, only windows with a 0.27 or lower SHGC will qualify for DOE's Energy Star Windows Program in zones 1 and 2. These windows will reduce solar gain to only 27%. Since consumers respond to the Energy Star label on windows, DOE's decision to qualify only 0.27 SHGC windows in the south will drive manufacturers in the direction of marketing ultra-low SHGC windows.

This proposal is intended to close a loop hole being created by lowering prescriptive SHGCs in the south, while leaving a "NR" or "No Rating" for SHGC in the north. Unless this loophole is closed, it will result in the code allowing ultra-low SHGC southern windows to be used in the north. This will reduce, rather than increase, energy efficiency. In that regard, window manufacturers distribute products through national networks. That means the current "NR" rating for SHGC in the north will permit national networks not only to market ultra-low SHGC windows in the south, where they make sense, but also in the north where no SHGC requirement currently exists. If ultra-low SHGC windows intended for the south are used in the north, it will increase annual energy consumption, rather than conserve it.

When windows with 0.30 or lower SHGCs are installed in homes in northern climates, they permanently block 70% or more of the sun's free energy from heating those homes all winter long. This means northern homes with low SHGC windows will necessarily burn more fossil fuels in the winter to compensate for the solar gain lost through the use of low SHGC windows. This, in turn, results in increased energy consumption, not increased energy efficiency.

The increase in energy consumption attributable to the use of low SHGC windows in the north is illustrated in the following chart which depicts total energy consumption of four different house types found in 12 northern cities in climate zones 6-8. (See bibliography for details). In simulating the whole house energy use depicted in these graphs, the U-factors were held constant at either 0.35 (blue line) or 0.30 (red line) while SHGC was increased from 0.20 to 0.70. (A 0.20 SHGC window only allows 20% of the sun's energy to enter a home while a 0.70 SHGC window allows 70%). These simulations show that when higher SHGC windows are used in northern homes, the sun's energy significantly reduces a home's total energy use. Conversely, when lower SHGC windows are used, it increases a home's total energy use:



The sun's energy is free and renewable. Using low SHGC windows in the south saves energy. However, using those same windows in the north will increase energy consumption. The minimum SHGC proposed here is intended only to eliminate the northern use of ultra-low SHGC windows mandated in the south. If adopted, this proposal will save energy in the north by using the free and renewable energy of the sun.
Part II- This proposal would make two types of changes: 1- it will harmonize the fenestration provisions of Table N1102.1 of the IRC with the fenestration provisions of Table 402.1.1 of the IECC, and 2- it will add a minimum SHGC in climate zones 5-8. The reasons for harmonizing the fenestration provisions of the IRC with the IECC are obvious and require no further explanation. The reasons supporting the addition of a minimum SHGC in the northern climate zones follow.

The trend in prescriptive SHGCs in the south is clearly downward. In 2006, the IECC prescribed a 0.40 SHGC in zones 1-3; the 2007 Supplement lowered that to 0.37; and it was lowered, again, in 2009 to 0.30 or lower. To harmonize the IRC's southern SHGCs with the 2009 IECC, this proposal lowers SHGC in climate zones 1 through 3 from 0.35 to 0.30.

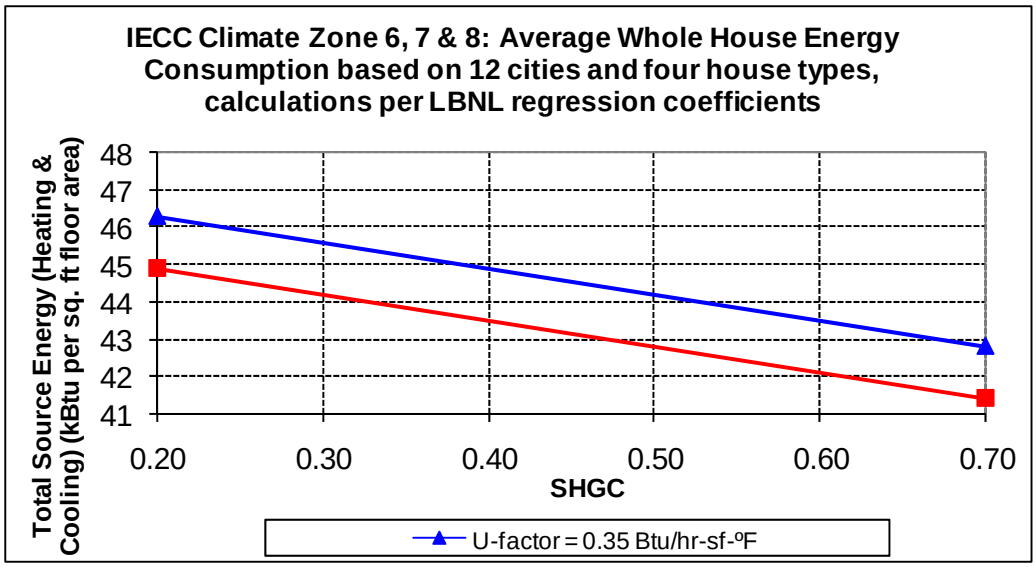
For its entire useful life, a 0.40 SHGC window will permanently block 60% of the sun's energy while allowing 40% of its energy to pass into a home. Reducing solar gain from 40% to 30% by lowering SHGC from 0.40 to 0.30 makes sense in the south because southern climates are cooling dominated and reducing solar gain in the south reduces cooling loads which saves energy.

The Department of Energy is pressing for even lower SHGC windows in the south. Beginning on January 4, 2010, only windows with a 0.27 or lower SHGC will qualify for DOE's Energy Star Windows Program in zones 1 and 2. These windows will reduce solar gain to only 27%. Since consumers respond to the Energy Star label on windows, DOE's decision to qualify only 0.27 SHGC windows in the south will drive manufacturers in the direction of marketing ultra-low SHGC windows.

This proposal is intended to close a loop hole created by lowering prescriptive SHGCs in the south, while leaving a "NR" or "No Rating" for SHGC in the north. Unless this loophole is closed, it will result in the code allowing ultra-low SHGC southern windows to be used in the north. This will reduce, rather than increase, energy efficiency. In that regard, window manufacturers distribute products through national networks. That means the current "NR" rating for SHGC in the north will permit these national networks not only to market ultra-low SHGC windows in the south, where they make sense, but also in the north where no SHGC requirement currently exists. If ultra-low SHGC windows intended for the south are used in the north, it will increase annual energy consumption, rather than conserve it.

When windows with 0.30 or lower SHGCs are installed in homes in northern climates, they permanently block 70% or more of the sun's free energy from heating those homes all winter long. This means northern homes with low SHGC windows will necessarily burn more fossil fuels in the winter to compensate for the solar gain lost through the use of low SHGC windows. This, in turn, results in increased energy consumption, not increased energy efficiency.

The increase in energy consumption attributable to the use of low SHGC windows in the north is illustrated in the following chart which depicts total energy consumption of four different house types found in 12 northern cities in climate zones 6-8. (See bibliography for details). In simulating the whole house energy use depicted in these graphs, the U-factors were held constant at either 0.35 (blue line) or 0.30 (red line) while SHGC was increased from 0.20 to 0.70. (A 0.20 SHGC window only allows 20% of the sun's energy to enter a home while a 0.70 SHGC window allows 70%). These simulations show that when higher SHGC windows are used in northern homes, the sun's energy significantly reduces a home's total energy use. Conversely, when lower SHGC windows are used, it increases a home's total energy use:



The sun's energy is free and renewable. Using low SHGC windows in the south saves energy. However, using those same windows in the north will increase energy consumption. The minimum SHGC proposed here is intended only to eliminate the northern use of ultra-low SHGC windows mandated in the south. If adopted, this proposal will save energy in the north by using the free and renewable energy of the sun.

Bibliography: The graphs were developed using regression equations developed by Lawrence Berkley National Laboratories (LBNL) for DOE in connection with the development of criteria for Energy Star Windows. These reports can be found at: http://windows.lbl.gov/EStar2008/. The graphs display averages of four housing types, (1) existing Furnace – one story, (2) existing Furnace – two story, (3) new Furnace – one story, and (4) new furnace – two story in these twelve (12) northern cities: (1) ME, Portland, (2) MI, Houghton, (3) MN, Duluth, (4) MN, International Falls, (5) MN, Minneapolis, (6) ND, Bismarck, (7) NH, Concord, (8) RI, Providence, (9) SD, Pierre, (10) VT, Burlington, (11) WI, Madison, and (12) WY, Cheyenne. While the annual energy savings resulting from higher SHGC windows is less in climate zone 5 than it is in climate zones 6-8, it still exists.

(No change to footnotes)

Reason: The purpose of this proposal is to retain the Solar Heat Gain Coefficient (SHGC) of the 2006 IECC and provide a more realistic target that can be compliant with which the products that are readily available in climate zones 1, 2 & 3 can comply. The current market produces very few windows with a solar heat gain coefficient (SHGC) less than 0.35. This makes it difficult for builders to comply with this requirement in the referenced zones. Moreover, there are even fewer doors manufactured with glazing that meets the 0.30 SHGC requirement.

Another concern is when the SHGC is lowered, less daylight passes through the window. This will cause the consumer to demand a greater number of windows or more interior lighting, thus negating the energy savings perceived to be found in the 2009 IECC. The 2009 IECC causes more energy to be consumed, instead of conserving energy, as is the intent of the code.

The lower SHGC's referenced by the IECC introduced a proprietary requirement that severely limits the number of manufacturers that can supply the glass required.

Retaining the original SHGC requirements of the 2006 IECC permits all types of window glass to remain competitive and benefit the builder with lower costs, and provide homeowners with available products that are not limited to a few manufacturers.

Cost Impact: The code change proposal will not increase the cost of construction.

(Footnotes remain unchanged)

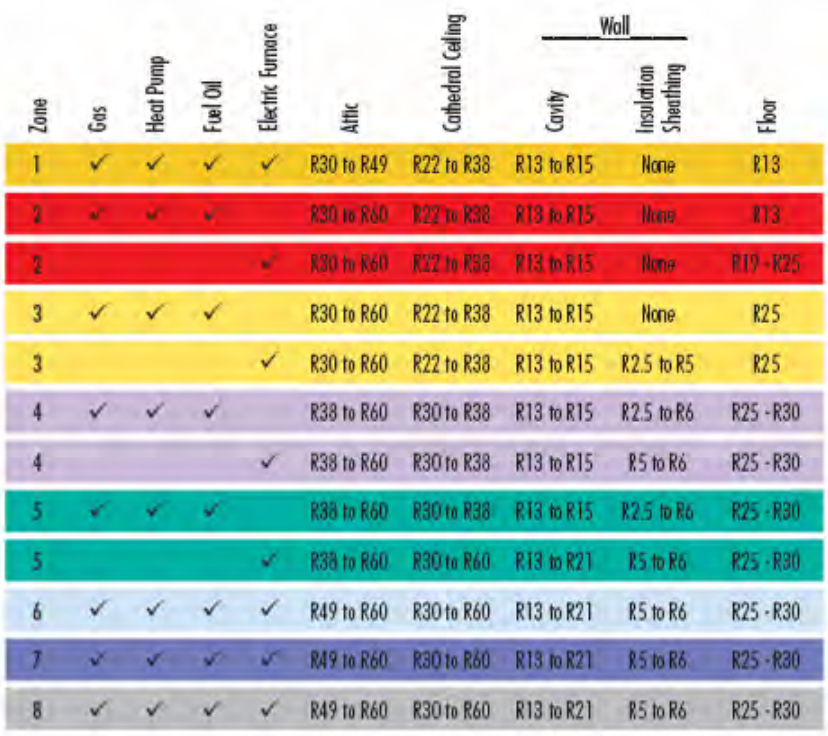
Reason: This code proposal is intended to improve thermal envelope efficiency through improved insulation in ceilings in climate zones 2-5. These proposed improvements are reasonable, producing savings in total heating, cooling and hot water energy ranging from 0.8% to 1.4% in these climate zones. These savings are significant and when coupled with other proposed code modifications can lead to significant overall energy savings for homes. Moreover, unlike many building components, ceiling insulation can last for the life of the building, delivering consistent energy savings far longer than most energy savings measures. The following table portrays estimated savings from these measures:

	Climate Zone 2	Climate Zone 3	Climate Zone 4	Climate Zone 4M	Climate Zone 5
Heating, Cooling, Hot Water Purchased Energy Cost Percent Savings	0.8%	1.0%	1.2%	1.4%	1.4%
Total Purchased Energy Cost Percent Savings (also including major appliances and lighting)	0.6%	0.8%	0.9%	1.1%	1.0%

The U.S. Department of Energy issued new recommendations for cost-effective insulation levels in new homes in early 2008. The R-values in this proposal are consistent with the recommendations for new construction as shown in the table below from the DOE.



Zone	Gas	Heat Pump	Fuel Oil	Electric Furnace	Attic	Cathedral Ceiling	Wall: Cavity	Wall: Insulation Sheathing	Floor

These modest, cost-effective savings are part of a larger package of proposals that together will get the IECC to the 30% improvement that national policymakers are seeking. Achieving this goal requires several modest improvements, in multiple components of the building. Recent energy price increases, despite softening effects of the current economic downturn, signal a new era of sharply higher energy costs. In addition, climate change policy is likely to be enacted before the 2012 IECC is published, and its effects will likely include further energy price increases This

proposal represents one of a set of reasonable and cost effective improvements that give states new options to increase the efficiency of their energy codes.

Cost Impact: The code change proposal will increase the cost of construction.

(Footnotes remain unchanged)

N1102.2.1 Ceilings with attic spaces. When Section N1102.1.1 would require R-38 in the ceiling, R-30 shall be deemed to satisfy the requirement for R-38 wherever the full height of uncompressed R-30 insulation extends over the wall top plate at the eaves. Similarly R-38 shall be deemed to satisfy the requirements for R-49 or higher wherever the full height of uncompressed R-38 insulation extends over the wall top plate at the eaves. This reduction shall not apply to the U-factor alternative approach in Section N1102.1.2 and the total UA alternative in Section N1102.1.3.

Reason: This code proposal is intended to improve thermal envelope efficiency through improved insulation in ceilings in climate zones 7 and 8. By increasing the ceiling insulation from R-49 to R-60 in climate zones 7 & 8 residential buildings can achieve approximately 0.6 to 0.7% purchased energy cost savings. These savings, especially coupled with other proposed code modifications can lead to significant overall energy savings for homes. Moreover, unlike many building components, ceiling insulation can last for the life of the building, delivering consistent energy savings far longer than many energy savings measures. Given that these climates are extremely cold, insulation measures are especially cost-effective.

	Climate Zone 7	Climate Zone 8
Heating, Cooling, Hot Water Purchased Energy Cost Percent Savings	1.0%	0.9%
Total Purchased Energy Cost Percent Savings (also including major appliances and lighting)	0.7%	0.6%

The U.S. Department of Energy issued new recommendations for cost-effective insulation levels in new homes in early 2008. The R-values proposed in here are consistent with those recommendations as shown in the table below from the DOE.

Zone	Gas	Heat Pump	Fuel Oil	Electric Furnace	Attic	Cathedral Ceiling	Wall		Floor

(Footnotes remain unchanged)

Reason: This code proposal is intended to improve the thermal envelope efficiency through improved insulation in walls in climate zones 3 and 4. The table below illustrates the estimated energy cost savings from this measure in each climate zone. These savings in these zones are substantial and when coupled with other proposed code modifications can lead to significant overall energy savings for homes. Moreover, unlike many building components, wall insulation can last for the life of the building, delivering consistent energy savings far longer than many energy savings measures. In addition, it is difficult to add additional wall insulation after the home is constructed. As a result, the failure to adequately insulate the walls would impose needlessly higher energy costs on homeowners for decades to come.

	Climate Zone 3	Climate Zone 4
Heating, Cooling, Hot Water Purchased Energy Cost Percent Savings	5.5%	6.9%
Total Purchased Energy Cost Percent Savings (including appliances and lighting)	4.0%	5.2%

For wood frame walls, the specific values proposed for climate zones 3 and 4 match exactly current requirements for the Marine 4 climate zone and climate zones 5 and 6. As we work to increase the energy efficiency of the code, it is reasonable to extend these prescriptive requirements that are already being met in these colder climate zones to climate zones 3 and 4.

It is important to remember that the builder need not install the specific wall insulation that is designated by the prescriptive path. Compliance with thermal envelope criteria can be achieved through several paths:

1. Any combination of cavity and sheathing—Builders can easily combine various types of batt and blown cavity insulation with continuous sheathing to achieve any of these nominal R-values. .
2. UA tradeoffs—Builders can calculate an average U-factor for the envelope, and adjust any component—walls, windows, ceilings, or floors—to adjust wall R-values to desired levels. Small changes in window specifications, for example, can easily allow builders to use a wide range of insulation solutions
3. Performance path—Builders can trade off wall insulation against a wide range of other measures.

Because of this built-in flexibility in the compliance options, as well as the fact that these requirements currently exist in three climate zones, there is no basis to claim that the insulation levels in this code change proposal are impractical or prevent competition. They are simply modest improvements in wall performance that are needed to achieve a larger overall performance improvement in American homes.

Cost Impact: The code change proposal will increase the cost of construction.

(Footnotes remain unchanged)

Reason: This code proposal is intended to improve the thermal envelope efficiency through improved insulation in walls in climate zones 6, 7 and 8. The table below illustrates the estimated energy cost savings from this measure in each climate zone. These savings are significant and when coupled with other proposed code modifications can lead to significant overall energy savings for homes. Moreover, unlike many building components, wall insulation can last for the life of the building, delivering consistent energy savings far longer than many energy savings measures. In addition, it is difficult to add additional wall insulation after the home is constructed. As a result, the failure to adequately insulate the walls would impose needlessly higher energy costs on homeowners for decades to come.

	Climate Zone 6	Climate Zone 7	Climate Zone 8
Heating, Cooling, Hot Water Purchased Energy Cost Percent Savings	3.5%	3.6%	3.8%
Total Purchased Energy Cost Percent Savings (including appliances and lighting)	2.7%	2.7%	3.0%

As we work to increase the energy efficiency of the code, it is reasonable to raise the bar and increase current prescriptive requirements for these coldest climate zones.

It is important to remember that the builder need not install the specific wall insulation that is designated by the prescriptive path. Compliance with thermal criteria can be achieved through several paths:

1. Any combination of cavity and sheathing—Builders can easily combine various types of batt and blown cavity insulation with continuous sheathing to achieve any of these nominal R-values. .
2. UA tradeoffs—Builders can calculate an average U-factor for the envelope, and adjust any component—walls, windows, ceilings, or floors—to adjust wall R-values to desired levels. Small changes in window specifications, for example, can easily allow builders to use a wide range of insulation solutions
3. Performance path—Builders can trade off wall insulation against a wide range of other measures.

Because of this built-in flexibility in compliance options, there is no basis to claim that the insulation levels in this public comment are impractical, not cost-effective, or prevent competition. They are simply modest improvements in wall performance that are needed to achieve a larger overall performance improvement in American homes.

Cost Impact: The code change proposal will increase the cost of construction.

(Footnotes remain unchanged)

Reason: This proposal will retain the original requirements of the 2006 IECC, and will allow multiple products to be used to insulate a home. Permitting all types of insulation to remain competitive will benefit the builder and home owner with lower construction costs.

The increased stringency of the 2009 IECC limits the number of insulation products that were previously available, and thus fails to adequately address all primary building materials in a fair and equitable manner. The blown cellulose and the spray foam used in residences can achieve R-19 in a 2x6 wall cavity but do not typically achieve R-20. Although cellulose and spray foam do not achieve the R-20, they have been proven to be effective in reducing air infiltration and should be considered viable options.

Air infiltration can account for 30% of a building's heating and cooling costs and contributes to problems with moisture and air quality. Reducing the infiltration can significantly cut annual heating and cooling costs, improve building durability and create a healthier indoor environment.

The change to the 2009 IECC excludes products that are widely used in the construction industry and would adversely affect the cost of construction. This change eliminates materials that have a proven track record of providing energy conservation, thus making it economically unreasonable and creating a negative financial impact.

Cost Impact: The code change proposal will not increase the cost of construction.

(Footnotes remain unchanged)

Reason: This code proposal is intended to improve thermal envelope efficiency through improved insulation in foundations, including both basements and crawlspaces, in the colder climates. The savings from this proposal, especially when coupled with other proposed code modifications can lead to significant overall energy savings for homes. Moreover, unlike many building components, foundation insulation can last for the life of the building, and is harder to install after new construction is complete than other building components. This helps in delivering consistent energy savings far longer than most energy savings measures. The following table portrays estimated savings from these measures:

	Basement Climate Zone 5	Basement Climate Zone 6	Basement Climate Zone 7	Basement Climate Zone8	Crawlspace Climate Zone 5	Crawlspace Climate Zone 6	Crawlspace Climate Zone 7	Crawlspace Climate Zone 8
Heating, Cooling, Hot Water Purchased Energy Cost Percent Savings	0.9%	0.9%	1.1%	0.9%	0.3%	0.3%	0.3%	0.3%
Total Purchased Energy Cost Percent Savings (also including major appliances and lighting)	0.7%	0.7%	0.8%	0.7%	0.2%	0.2%	0.3%	0.2%

These modest, cost-effective savings are part of a larger package of proposals that together will get the IECC to the 30% improvement that national policymakers are seeking. Achieving this goal requires several modest improvements, in multiple components of the building. Recent

energy price increases, despite softening effects of the current economic downturn, signal a new era of sharply higher energy costs. In addition, climate change policy is likely to be enacted before the 2012 IECC is published, and its effects will likely include further energy price increases This proposal represents one of a set of reasonable and cost effective improvements that give states new options to increase the efficiency of their energy codes.

Cost Impact: The code change proposal will increase the cost of construction.

(Footnotes remain unchanged)

Reason: The purpose of this proposal is to retain the basement wall R-values of the 2006 IECC, and provide a more realistic value and cost benefit. The 4-6% saving claimed by the proponent during the 2007/2008 Code Hearings are incorrect and cannot be substantiated. The documented increase in construction costs in the last code cycle, showed costs for installing the higher R-value insulation cannot be justified by the negligible amount of energy savings attained.

The basement wall requirement of the 2009 IECC in Climate Zones 6, 7 and 8 results in increased construction costs. In addition, the provisions in the 2009 IECC may cause basement moisture and health problems for the homeowner.

History has shown that basement moisture problems significantly increased in Minnesota when basement insulation requirements were increased. This additional interior insulation will cause the basement foundation wall to be colder, thus increasing the amount of moisture that condenses on the wall. Ultimately this moisture buildup behind a finished basement wall will result in mold, rot, and insect problems.

Specifically designed and costly moisture resistant designs that are not covered by the IECC will be needed in order to avoid these potential problems. This proposal will retain the basement insulation requirements of the 2006 IECC that are proven to be a method of reducing moisture build-up while providing building envelope insulation.

Cost Impact: The code change proposal will not increase the cost of construction.

(Portions of table and footnotes not shown remain unchanged)

Reason: WDMA suggests reformatting Table 402.1.1 for easier understanding, and by default, reformat complimentary Table 402.1.3. This proposal is intended to be only editorial and to not change any performance requirements. The reformatted table is quicker to use and easier to understand. After revising the format for the fenestration columns, the other columns in the table could be easily revised to follow the format of the fenestration columns.

With the reformatted table, footnotes b and e are proposed to be deleted. Footnote b is no longer needed with the format revisions to the fenestration columns. Footnote e is not needed because there are no SHGC requirements for fenestration in the line items containing the Marine Zone.

Cost Impact: The code change proposal will not increase the cost of construction.

202; IBC 202; IRC R202

Proponent: Daniel J. Walker, PE, Thomas Associates, Inc., representing National Sunroom Association

THIS IS A 3 PART CODE CHANGE. PARTS I AND II WILL BE HEARD BY THE IECC COMMITTEE. PART III WILL BE HEARD BY THE IRC BUILDING/ENERGY. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IECC

Revise definition as follows:

SUNROOM. A one-story structure attached to a dwelling with a glazing area in excess of 40 percent of the gross area of the structure's exterior walls ~~and roof~~.

PART II – IBC GENERAL

Revise definition as follows:

SUNROOM. A one-story structure attached to a dwelling with a glazing area in excess of 40 percent of the gross area of the structure's exterior walls ~~and roof~~.

PART III – IRC BUILDING/ENERGY

Revise definition as follows:

SUNROOM. A one-story structure attached to a dwelling with a glazing area in excess of 40 percent of the gross area of the structure's exterior walls ~~and roof~~.

Reason: The definition as it is currently written is in conflict with the code text. It has also caused confusion with regard to enforcement for officials. The dividing line for what would be considered a home addition or a sunroom is the limit on vertical glazing to 40% of the wall area in IECC Table 502.3. To allow a sunroom to be defined by both the wall and roof glazing could potentially include structures with less than 40% vertical glazing to be in compliance with the sunroom definition because skylights can be counted toward the total. IRC Section R303.1, exception No. 3 reflects the original intention that the wall fenestration is the only item that is to be counted toward the 40%.

Cost Impact: The code change proposal will not increase the cost of construction.

Proponent: Matthew Dobson, representing Vinyl Siding Institute

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IECC COMMITTEE. PART II WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IECC

Revise as follows:

TABLE 402.1.1
INSULATION AND FENESTRATION REQUIREMENTS BY COMPONENT[a]

h. "13+5" means R-13 cavity insulation plus R-5 insulated sheathing or insulated siding. If structural sheathing covers less 25 percent or less of the exterior, insulated sheathing is not required where structural sheathing is used. If structural sheathing covers more than 25 percent of exterior, structural sheathing shall be supplemented with insulated sheathing or insulated siding of at least R-2.

(Portions of table and footnotes not shown remain unchanged)

402.1.2 *R*-value computation. Insulation material used in layers, such as framing cavity insulation ~~and~~ insulating sheathing and insulated siding, shall be summed to compute the component *R*-value. The manufacturer's settled *R*-value shall be used for blown insulation. Computed *R*-values shall not include an *R*-value for other building materials or air films.

PART II – IRC BUILDING/ENERGY

Revise as follows:

TABLE N1102.1
INSULATION AND FENESTRATION REQUIREMENTS BY COMPONENT[a]

h. "13+5" means R-13 cavity insulation plus R-5 insulated sheathing or insulated siding. If structural sheathing covers less 25 percent or less of the exterior, insulated sheathing is not required where structural sheathing is used. If structural sheathing covers more than 25 percent of exterior, structural sheathing shall be supplemented with insulated sheathing or insulated siding of at least R-2.

(Portions of table and footnotes not shown remain unchanged)

N1102.1.1 *R*-value computation. Insulation material used in layers, such as framing cavity insulation and insulating sheathing and insulated siding, shall be summed to compute the component *R*-value. The manufacturer's settled *R*-value shall be used for blown insulation. Computed *R*-values shall not include an *R*-value for other building materials or air films.

Reason: Forms of insulated siding have been commercially available for at least twelve years. Current versions of insulated vinyl siding as well as other types of insulated claddings are now being tested to show actual field R-values. Many of these tests are being conducted using the appropriate testing methodology using the "hot box" test or ASTM C1363. This building component presents a viable option. A minimal performance value of R-value is consistent with the minimal R-value requirements to establish the product as a home insulation or insulation.

In addition to the thermal resistance characteristics, insulated siding's components and other non-related energy performance characteristics are covered by the code and specific product standards. For example the foam plastic used with insulated siding is addressed in the foam plastic sections of the IBC and IRC as well as through AC12. In addition ASTM C578 is the standard for foam plastics. Over the past few years both an acceptance criteria and product standard have been developed to address the non-thermal characteristics of what is termed as "backed siding". These material standards (ASTM D7445-09 and AC 37 (both vinyl and backed vinyl siding)) provide performance criteria for the siding including areas required by the building codes for example warp, shrinkage, impact strength, expansion, appearance, and wind load resistance.

Testing relative to moisture and water management issues indicated that use of insulated siding has no negative effect on the performance of the wall panels in relationship to moisture absorption. In field studies where the product had been installed for nearly ten years there were no indications of any problems of moisture entrapment related issues. Further the industry knows of no claims or complaints relating to moisture issues and the performance insulated vinyl siding.

Included with the insulated siding definition proposal is an example of testing that has been completed using the ASTM C1363 test method as well as recent research co-funded by VSI through the New York State Energy Research and Development Authority's High Performance Residential Development Challenge program. Both testing and research support insulated siding as a viable option to help increase the energy efficiency of buildings.

As a part of this proposal please visit the link provided of an example of testing that has been completed using the ASTM C1363 test method as well as a link to recent research co-funded by VSI through the New York State Energy Research and Development Authority's High Performance Residential Development Challenge program. Both testing and research support insulated siding as a viable option to help increase the energy efficiency of buildings.

Here is the link to the example ASTM C1363 testing results
http://www.vinylsiding.org/aboutsiding/insulatedvinylsiding/ASTM%5FC1363%5Ftest%5Fresults%2Epdf.

Here is a link to the New York State Energy Research and Development Authority report
http://www.vinylsiding.org/aboutsiding/newsroom/insulatedvs/090702_Building_Green_with_Insualted_Vinyl_Siding_Case_Study.pdf**.**

Cost Impact: The code change proposal will not increase the cost of construction as it will give specifiers another affordable option for achieving energy code compliance.

EC55–09/10
Table 402.1.3; IRC Table N1102.1.2

Proponent: Martha VanGeem, CTL Group, representing Masonry Alliance for Codes and Standards

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IECC CODE COMMITTEE. PART II WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IECC

Revise as follows:

TABLE 402.1.3
EQUIVALENT U-FACTORS
(Portions of table and footnotes not shown remain unchanged)

b. When more than half the insulation is on the interior, the mass wall *U*-factors shall be a maximum of 0.17 in Zone 1, 0.14 in Zone 2, 0.12 in Zone 3, 0.10 in Zone 4 except Marine, 0.065 in Zone 5 and Marine 4, and 0.060 in Zone 6, and 0.057 in Zones 7 and 8. ~~and the same as the frame wall *U*-factor in Marine Zone 4 and Zones 5 through 8~~.

PART II – IRC BUILDING/ENERGY

Revise as follows:

TABLE N1102.1.2
EQUIVALENT U-FACTORS
(Portions of table and footnotes not shown remain unchanged)

b. When more than half the insulation is on the interior, the mass wall *U*-factors shall be a maximum of 0.17 in Zone 1, 0.14 in Zone 2, 0.12 in Zone 3, 0.10 in Zone 4 except Marine, 0.065 in Zone 5 and Marine 4, 0.060 in Zone 6, and 0.057 in Zones 7 and 8. ~~and the same as the frame wall *U*-factor in Marine Zone 4 and Zones 5 through 8~~.

Reason: This proposal corrects and clarifies U-factors for mass walls with interior insulation to correspond with the R-values in Table N1102.1.

For Zone 5 and Marine 4: The U-factor that corresponds to R-17 insulation on the interior of a mass wall in Table N1102.1 is 0.065. This is for a cast-in-place concrete wall with R-17 insulation between 2x6 wood framing and gypsum wallboard insulation.

For Zone 6: The U-factor that corresponds with R-19 insulation on the interior of a mass wall is approximately 0.060. This proposal does not change the value, and leaves it at 0.060. However, as the frame wall U-factors are revised, it is more clear to print the actual U-factor that corresponds with the R-value for mass walls. This is 0.060 as in the 2009 IRC.

For Zones 7 and 8: The U-factor that corresponds with R-21 insulation on the interior of a mass wall is approximately 0.057. This proposal does not change the value. However, as the frame wall U-factors are revised, it is more clear to print the actual U-factor that corresponds with the R-value for mass walls. This is 0.057 as in the 2009 IRC.

Note that DOE2 simulations show mass effects for a 2400 sq foot homes in all climates. The U-factor for mass walls in Table N1102.1.2 should correspond to the R-value for mass walls in Table N1102.1 and not refer to the U-factor for frame walls.

Cost Impact: The code change proposal will not increase the cost of construction.

For SI: 1 foot = 304.8 mm.

a. *R*-values are minimums. *U*-factors and SHGC are maximums. R-19 batts compressed into a nominal 2x6 framing cavity such that the R-value is reduced by R-1 or more shall be marked with the compressed batt R-value in addition to the full thickness R-value.

b. The fenestration *U*-factor column excludes skylights. The SHGC column applies to all glazed fenestration. "NR" means no requirement.

c. For impact rated fenestration in wind-borne debris regions, the maximum U-factor in Climate Zones 1-3 shall be permitted to be 0.15 higher than that specified in Table 402.5.1.

d. There are no SHGC requirements in the Marine Zone.

e. First value is cavity insulation, second is continuous insulation, so "13+5" means R-13 cavity insulation plus R-5 continuous insulation. If structural sheathing covers 25 percent or less of the exterior, continuous insulation is not required where structural sheathing is used. If structural sheathing covers more than 25 percent of exterior, structural sheathing shall be supplemented with continuous insulation of at least R-2.

f. The second R-value applies when more than half the insulation is on the interior of the mass wall.

g. Or insulation sufficient to fill the framing cavity, R-19 minimum.

h. "15/19" means R-15 continuous insulation on the interior or exterior of the home or R-19 cavity insulation at the interior of the basement wall. "15/19" shall be permitted to be met with R-13 cavity insulation on the interior of the basement wall plus R-5 continuous insulation on the interior or exterior of the home. "10/13" means R-10 continuous insulation on the interior or exterior of the home or R-13 cavity insulation at the interior of the basement wall.

i. R-5 shall be added to the required slab edge *R*-values for heated slabs. Insulation depth shall be the depth of the footing or 2 ft, whichever is less, in Zones 1 through 3 for heated slabs.

j. Air tightness shall be demonstrated in accordance with Section 402.4.2.1.

k. "Cond or Tested" means that the duct system shall either be located within conditioned space or tested in accordance with Section 403.2.2. "Reduced Leakage" means that the duct system shall be located entirely within conditioned space and tested for total leakage and leakage to outside conditioned space. Leakage to outdoors shall be less than or equal to 3 cfm (84.9 L/min) per 100 ft2 (9.29 m2) of conditioned floor area, and the total leakage shall be less than or equal to 8 cfm (226.5 L/min) per 100 ft2 (9.29 m2) of conditioned floor area when tested at a pressure differential of 0.1 inches w.g. (25 Pa) across the entire system, including the manufacturer's air handler enclosure. All register boots shall be taped or otherwise sealed during the test. Total leakage of not greater than 3 cfm per 100 ft2 of conditioned floor area at a pressure difference of 0.01 inches w.g. (25 Pa) across the entire system, including the manufacturer's air handler enclosure, shall be deemed to satisfy this requirement without measurement of leakage to outdoors.

l. Heating system performance tested in accordance with ASHRAE Standard 103 or ARI Standard 210/240 or equivalent. Coefficient of Performance (COP) is converted into HSPF by multiplying by 3.413. "Standard" represents the prevailing minimum efficiency acceptable under federal law.

m. Cooling system performance tested in accordance with ARI Standard 210/240 or equivalent. Energy Efficiency Ratio (EER) is converted to SEER by multiplying EER*1.143. "Standard" represents the prevailing minimum efficiency acceptable under federal law.

n. Water heater Energy Factor requirements for Gas (G) and Electric (E) water heaters. "Standard" represents the prevailing minimum efficiency acceptable under federal law.

o. Basement wall insulation is not required in warm-humid locations as defined by Figure 301.1 and Table 301.1.

PART II – IRC BUILDING/ENERGY

Add new text and table as follows:

N1102.1.4 Alternative prescriptive requirements. If the building thermal envelope and mechanical systems meet the requirements of one path in Table N1102.1.4, the building shall be considered in compliance with Section N1102.1. The other provisions of Section N1102, N1103 and N1104 shall be used in applying the requirements of Table N1102.1.4.

7 and 8	4	0.35	0.6	NR	49	20 or 13+5	15/19	38	15/19	10; 4 ft	4	Reduced Leakage	92/9.1	Standard	Standard

For SI: 1 foot = 304.8 mm.

a. *R*-values are minimums. *U*-factors and SHGC are maximums. R-19 batts compressed into a nominal 2x6 framing cavity such that the R-value is reduced by R-1 or more shall be marked with the compressed batt R-value in addition to the full thickness R-value.

b. The fenestration *U*-factor column excludes skylights. The SHGC column applies to all glazed fenestration. "NR" means no requirement.

c. For impact rated fenestration in wind-borne debris regions, the maximum U-factor in Climate Zones 1-3 shall be permitted to be 0.15 higher than that specified in Table 402.5.1.

d. There are no SHGC requirements in the Marine Zone.

e. First value is cavity insulation, second is continuous insulation, so "13+5" means R-13 cavity insulation plus R-5 continuous insulation. If structural sheathing covers 25 percent or less of the exterior, continuous insulation is not required where structural sheathing is used. If structural sheathing covers more than 25 percent of exterior, structural sheathing shall be supplemented with continuous insulation of at least R-2.

f. The second R-value applies when more than half the insulation is on the interior of the mass wall.

g. Or insulation sufficient to fill the framing cavity, R-19 minimum.

h. "15/19" means R-15 continuous insulation on the interior or exterior of the home or R-19 cavity insulation at the interior of the basement wall. "15/19" shall be permitted to be met with R-13 cavity insulation on the interior of the basement wall plus R-5 continuous insulation on the interior or exterior of the home. "10/13" means R-10 continuous insulation on the interior or exterior of the home or R-13 cavity insulation at the interior of the basement wall.

i. R-5 shall be added to the required slab edge *R*-values for heated slabs. Insulation depth shall be the depth of the footing or 2 ft, whichever is less, in Zones 1 through 3 for heated slabs.

j. Air tightness shall be demonstrated in accordance with Section 402.4.2.1.

k. "Cond or Tested" means that the duct system shall either be located within conditioned space or tested in accordance with Section 403.2.2. "Reduced Leakage" means that the duct system shall be located entirely within conditioned space and tested for total leakage and leakage to outside conditioned space. Leakage to outdoors shall be less than or equal to 3 cfm (84.9 L/min) per 100 ft2 (9.29 m2) of conditioned floor area, and the total leakage shall be less than or equal to 8 cfm (226.5 L/min) per 100 ft2 (9.29 m2) of conditioned floor area when tested at a pressure differential of 0.1 inches w.g. (25 Pa) across the entire system, including the manufacturer's air handler enclosure. All register boots shall be taped or otherwise sealed during the test. Total leakage of not greater than 3 cfm per 100 ft2 of conditioned floor area at a pressure difference of 0.01 inches w.g. (25 Pa) across the entire system, including the manufacturer's air handler enclosure, shall be deemed to satisfy this requirement without measurement of leakage to outdoors.

l. Heating system performance tested in accordance with ASHRAE Standard 103 or ARI Standard 210/240 or equivalent. Coefficient of Performance (COP) is converted into HSPF by multiplying by 3.413. "Standard" represents the prevailing minimum efficiency acceptable under federal law.

m. Cooling system performance tested in accordance with ARI Standard 210/240 or equivalent. Energy Efficiency Ratio (EER) is converted to SEER by multiplying EER*1.143. "Standard" represents the prevailing minimum efficiency acceptable under federal law.

n. Water heater Energy Factor requirements for Gas (G) and Electric (E) water heaters. "Standard" represents the prevailing minimum efficiency acceptable under federal law.

o. Basement wall insulation is not required in warm-humid locations as defined by Figure 301.1 and Table 301.1.

Reason: This proposal will provide a significant increase in energy efficiency while also increasing flexibility and cost effectiveness by providing multiple paths in a way that facilitates easy demonstration of compliance. In each climate zone, four sets of equivalent alternative prescriptive requirements are provided. One path focuses on primarily envelope improvements, whereas the other three paths include a combination of improvements in envelope, air tightness, duct tightness, and equipment efficiency. When looking at above-code programs such as Building America, these high efficiency homes invariably include a combination of *all* these factors. The whole building must be considered, and it is wrong to only look at the envelope separately without also considering interactions with air sealing and equipment efficiency.

The four paths provided have been demonstrated to be equivalent in each climate zone through dozens of simulations using both REM/Rate™ and EnergyGuage software, and represent a significant increase in energy efficiency towards ICC's goals.

Additionally, this proposal will help facilitate enforcement, in that the flexibility of this table will lead to increased use of prescriptive options over the more complicated performance path. This table is intended to list the prescriptive description for packages of energy efficiency options that are commonly desired by designers. If using this alternative approach, the builder will simply indicate which of the four paths they are using, and building official will review the prescriptive requirements for that path.

Cost Impact: The code change proposal will increase the cost of construction, but improves cost effectiveness by offering multiple paths of compliance. Alternate choices give more flexibility and competition, improving cost effectiveness.

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IECC COMMITTEE. PART II WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IECC

Add new text and table as follows:

402.1.5 Calculating opaque envelope component U-factors. When determining the U-factor of an opaque assembly as part of Sections 402.1.3, 402.1.4, or 404.5.2, Table 402.1.5 shall be used to calculate the U-factor by using a series-parallel calculation. Where actual insulation and framing fractions have been calculated for the proposed design, they shall be used; otherwise the default insulation and framing fractions in Table 402.1.5 shall be used. The *code official* may require: (1) actual insulation and framing fractions to be calculated and documented and (2) the calculated and documented values to be inspected and reviewed by an independent party *approved* by the *code official.*

TABLE 402.1.5
COMPONENT R-VALUE AND INSULATION AND FRAMING FRACTIONS BY ASSEMBLY TYPE

	Interior Air Film	Interior Layer	Cavity Insulation Layer	Insulation Fraction	Cavity Framing Layer	Framing Fraction	Insulating Sheathing Layer[c]	Structural Sheathing Layer[c]	Siding Layer	Exterior Air Film
	R-Value	R-Value	R-Values	Percent	R-Values	Percent	R-Value	R-Value	R-Value	R-Value
Wood Frame Ceiling	0.61	0.45	As Specified[a]	93%	R-1.25 per inch[b]	7%	-	-	-	0.61
Wood Frame Wall	0.68	0.45	As Specified	77%	R-1.25 per inch[b]	23%	0 or as specified	0.62	0.61	0.25
Steel Frame Wall	0.68	0.45	As Specified	-	-	-	0 or as specified	0.62	0.61	0.25
Mass Wall	0.68	0.45	As Specified	-	-	-	0 or as specified	0.62	0.61	0.25
Wood Frame Floor	0.92	1.23 + 0.94	As Specified	90%	R-1.25 per inch[b]	10%	-	-	-	0.92
Basement Wall	0.68	0.45	As Specified	-	-	-	0 or as specified	-	-	0.25
Crawlspace Wall	0.68	0.45	As Specified	-	-	-	0 or as specified	-	-	0.25

a. In the standard reference design, the depth of the insulation shall be calculated to account for limited depth at the edge of the ceiling based on a standard truss with available depth of 3.86 inches at the edge of the ceiling and a roof slope of 1 foot for every 3 feet across. In the proposed design, the ceiling insulation u-value shall be calculated with the actual insulation depths in the proposed design.

b. The depth of the wood framing shall be based on the actual depth of the wood framing. In the standard reference design, it shall be calculated as the cavity insulation R-Value divided by 4 and then rounded up to the following depths in inches: 3.5 for a 2x4 frame, 5.5 for a 2x6 frame, 7.5 for a 2x8 frame or 9.5 for a 2x10 frame.

c. If insulating sheathing is used in the standard reference design, only 80% of the net wall is assumed to be covered by the insulating sheathing. The other 20% is assumed to be covered with plywood. The proposed design shall be calculated with the actual percentage of insulating sheathing and structural sheathing.

PART II – IRC BUILDING/ENERGY

Revise as follows:

N1102.1.4 Calculating opaque envelope component U-factors. When determining the U-factor of an opaque assembly as part of Section N1102.1.2 or N1102.1.3, Table N1102.1.4 shall be used to calculate the U-factor by using a series-parallel calculation. Where actual insulation and framing fractions have been calculated for the proposed design, they shall be used; otherwise the default insulation and framing fractions in Table N1102.1.4 shall be used. The *building official* may require: (1) actual insulation and framing fractions to be calculated and documented and (2) the calculated and documented values to be inspected and reviewed by an independent party *approved* by the *building official.*

TABLE N1102.1.4
COMPONENT R-VALUE AND INSULATION AND FRAMING FRACTIONS BY ASSEMBLY TYPE

	R-Value	R-Value	R-Values	Percent	R-Values	Percent	R-Value	R-Value	R-Value	R-Value
Wood Frame Ceiling	0.61	0.45	As Specified[a]	93%	R-1.25 per inch[b]	7%	-	-	-	0.61
Wood Frame Wall	0.68	0.45	As Specified	77%	R-1.25 per inch[b]	23%	0 or as specified	0.62	0.61	0.25
Steel Frame Wall	0.68	0.45	As Specified	-	-	-	0 or as specified	0.62	0.61	0.25
Mass Wall	0.68	0.45	As Specified	-	-	-	0 or as specified	0.62	0.61	0.25
Wood Frame Floor	0.92	1.23 + 0.94	As Specified	90%	R-1.25 per inch[b]	10%	-	-	-	0.92
Basement Wall	0.68	0.45	As Specified	-	-	-	0 or as specified	-	-	0.25
Crawlspace Wall	0.68	0.45	As Specified	-	-	-	0 or as specified	-	-	0.25

a. In the standard reference design, the depth of the insulation shall be calculated to account for limited depth at the edge of the ceiling based on a standard truss with available depth of 3.86 inches at the edge of the ceiling and a roof slope of 1 foot for every 3 feet across. In the proposed design, the ceiling insulation u-value shall be calculated with the actual insulation depths in the proposed design.

b. The depth of the wood framing shall be based on the actual depth of the wood framing. In the standard reference design, it shall be calculated as the cavity insulation R-Value divided by 4 and then rounded up to the following depths in inches: 3.5 for a 2x4 frame, 5.5 for a 2x6 frame, 7.5 for a 2x8 frame or 9.5 for a 2x10 frame.

c. If insulating sheathing is used in the standard reference design, only 80% of the net wall is assumed to be covered by the insulating sheathing. The other 20% is assumed to be covered with plywood. The proposed design shall be calculated with the actual percentage of insulating sheathing and structural sheathing.

Reason: The calculations between the R-Values and U-Values for envelope components have not been available in the IECC or IRC. This proposal is intended to make the calculations within the code and the use of code consistent and transparent. The proposal does not change the insulation R-value or U-Value requirements, but rather is intended to be the means for future calculations to be consistent and for software tools to be consistent. This proposal makes the standard reference design and proposed design framing fractions explicit, along with all of the layers of the envelope components that are used in energy calculations.

Without explicit values that indicate how energy modeling tools are to model exact building envelope components, software tools have the discretion to select "appropriate" but inconsistent envelope layers. This inconsistency between modeling tools can create inconsistent results for what proposed designs comply with code. By adopting explicit component default value tables, the industry tools can increase consistency in how buildings are modeled.

This proposal offers an easy way to understand the true energy efficiency of the homes that are being constructed, by defining the home default construction values, the home building industry is encouraged to meet the standard construction techniques and improve to advanced framing construction techniques.

This proposal uses the values that are based on ASHRAE where possible and further supplemented with Rescheck, HERS and Washington State Energy code information.

This proposal also allows the code to be transparent where it is currently silent. Currently energy software and code officials do not have any official guidance from the code on the actual translation between R-Value and U-Value. This leads to confusion and lack of consistency in the implementation of code across the country.

Cost Impact: The code change proposal will not increase the cost of construction.

EC58–09/10
402.2.1, 502.2.1; IRC N1102.2.1

Proponent: Larry Wainright, Qualtim, Inc., representing the Structural Building components Industry

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IECC COMMITTEE. PART II WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IECC

Revise as follows:

402.2.1 Ceilings with attic spaces. When Section 402.1.1 would require R-38 in the ceiling, R-30 shall be deemed to satisfy the requirement for R-38 wherever the full height of uncompressed R-30 insulation extends over the wall top plate at the eaves. Similarly, R-38 shall be deemed to satisfy the requirement for R-49 wherever the full height of uncompressed R-38 insulation extends over the wall top plate at the eaves. This reduction shall not apply to the *U*-factor alternative approach in Section 402.1.3 and the total UA alternative in Section 402.1.4. Where the required insulation depth is greater than the ceiling joist depth, no storage shall be permitted.

502.2.1 Roof assembly. The minimum thermal resistance (*R*-value) of the insulating material installed either between the roof framing or continuously on the roof assembly shall be as specified in Table 502.2(1), based on construction materials used in the roof assembly.

Exception: Continuously insulated roof assemblies where the thickness of insulation varies 1 inch (25 mm) or less and where the area-weighted *U*-factor is equivalent to the same assembly with the *R*-value specified in Table 502.2(1).

Where the required insulation depth is greater than the ceiling joist depth, no storage shall be permitted. Insulation installed on a suspended ceiling with removable ceiling tiles shall not be considered part of the minimum thermal resistance of the roof insulation.

PART II – IRC BUILDING/ENERGY

Revise as follows:

N1102.2.1 Ceilings with attic spaces. When Section N1102.1 would require R-38 in the ceiling, R-30 shall be deemed to satisfy the requirement for R-38 wherever the full height of uncompressed R-30 insulation extends over the wall top plate at the eaves. Similarly R-38 shall be deemed to satisfy the requirement for R-49 wherever the full height of uncompressed R-38 insulation extends over the wall top plate at the eaves. This reduction shall not apply to the *U*-factor alternative approach in Section N1102.1.2 and the Total UA alternative in Section N1102.1.3. Where the required insulation depth is greater than the ceiling joist depth, no storage shall be permitted.

Reason: The intent of this provision is to prohibit attic spaces to be used for storage where the insulation would need to be compressed in order to accommodate the storage area, thereby rendering the insulation less effective. The insulation layer needs to be uncompressed to achieve its rated R-value. This provision will help assure the intended R-value is achieved.

Cost Impact: The code change proposal will not increase the cost of construction.

PART I – IECC

1. Add new text as follows:

402.2.2 Performance of loose fill insulation. Loose fill insulation shall provide the required performance at 75 degrees Fahrenheit mean temperature and no less than the required performance at winter design conditions. Performance of loose fill insulation at winter design conditions shall be determined in accordance with ASTM C1373-03.

Exception: Climate Zones 1 through 4.

2. Revise table as follows:

TABLE 402.4.2
AIR BARRIER AND INSULATION INSPECTION COMPONENT CRITERIA

COMPONENT	CRITERIA
Air barrier and thermal barrier	Exterior thermal envelope insulation for framed walls is installed in substantial contact and continuous alignment with building envelope air barrier. Breaks or joints in the air barrier are filled or repaired. Air permeable insulation is not used as a sealing material. Air permeable insulation is inside of an air barrier[a].

a. Air permeable insulation shall be permitted to be above the air barrier in attics in Climate Zones 1 through 4. Air permeable insulation shall be permitted to be above the air barrier in attics in Climate Zones 5 through 8 provided the exposed attic insulation meets the requirements of Section 402.2.2.

(Portions of table and footnotes not shown remain unchanged)

3. Add new standard to Chapter 6 as follows:

ASTM
C1373-03 Standard Practice for Determination of Thermal Resistance of Attic Insulation Systems Under Simulated Winter Conditions

PART II – IRC ENERGY

1. Add new text as follows:

N1102.2.2 Performance of loose fill insulation. Loose fill insulation shall provide the required performance at 75 degrees Fahrenheit mean temperature and no less than the required performance at winter design conditions. Performance of loose fill insulation at winter design conditions shall be determined in accordance with ASTM C1373-03.

Exception: Climate Zones 1 through 4.

TABLE N1102.2.2
AIR BARRIER AND INSULATION INSPECTION COMPONENT CRITERIA

COMPONENT	CRITERIA
Air barrier and thermal barrier	Exterior thermal envelope insulation for framed walls is installed in substantial contact and continuous alignment with building envelope air barrier. Breaks or joints in the air barrier are filled or repaired. Air permeable insulation is not used as a sealing material. Air permeable insulation is inside of an air barrier[a].

a. Air permeable insulation shall be permitted to be above the air barrier in attics in zones 1 to 4. Air permeable insulation shall be permitted to be above the air barrier in attics in zones 5 to 8 provided the exposed attic insulation meets the requirements of Section N1102.2.2.

(Portions of table and footnotes not shown remain unchanged)

3. Add new standard to Chapter 44 as follows:

ASTM
C1373-03 Standard Practice for Determination of Thermal Resistance of Attic Insulation Systems Under Simulated Winter Conditions

Reason: Low winter temperatures can induce convection in loose fill attic insulation, substantially degrading insulation performance. The use of products designed to perform in a cold winter alleviates this insulation performance problem. This proposed change is modeled on existing Minnesota code.

Testing has shown a significant problem with loose-fill insulation at cold temperatures due to heat loss from convection.
"*The Oak Ridge tests suggest that convection begins to occur at about 50°F mean insulation temperature; the Illinois tests showed performance degradation at about the same point. Both experiments show about 40%-50% loss of R-value at extremely cold temperatures.*"[1]

The Oak Ridge publication said
"*Testing with a loose-fill fiberglass insulation clearly showed that, under realistic cold winter conditions, thermal performance of the insulation was reduced considerably because of convective motion developing within t insulation."*[2a]

Loose-fill fiberglass is a common ceiling insulation. The same publication calls convention for most high-density fiberglass "*negligible*", so a fiberglass insulation that performs well in winter is available.

Why require a second test to demonstrate adequate winter performance in cold climates? Because the existing test does not account for convection and convection has a substantial impact in cold climate winters.

"*In particular, tests of fiberglass insulation with a small-scale heat flowmeter apparatus have never shown any evidence of convective motion. This small-scale apparatus is currently used as a standard method to test insulation, but it appears not to be sensitive to natural convection.*"[2b]

Typical uncovered low-density attic insulation, usually fiberglass, is exposed to the attic. Convention extending from the insulation into the attic space degrades the insulation on cold winter days.

"*The cold top surface of the insulation is open to the attic space. Convective motion may occur simultaneously above and within the insulation. When the top surface of the insulation is permeable, the flows in the insulation and in the attic are coupled.*"[2c]

The test proposed here measures performance when it is needed the most, at low winter temperatures in common attic construction. The figure below[2d] illustrates the dramatic effect of temperature on performance of low-density blown insulation. The typical attic is represented by the "*open with joists*" line on the figure, which loses the most performance. Note also the difference between "*closed*" (insulation covered by an air impermeable barrier) and "*open*" (insulation not covered). The figure shows performance drops off dramatically at low temperatures, especially for uncovered insulation.

Several solutions are straightforward- use insulation that is less air permeable (such as high density fiberglass or cellulose), use a greater insulation thickness, or add an air barrier over the insulation. Some fiberglass companies advertise products that meet this proposed requirement as insulation for Minnesota, where this requirement already exists. Their solution is either a higher density product or additional insulation. For example see:

http://www.idimn.com/products/insulation/blowing-wool.php?id=4

http://products.construction.com/Manufacturer/Guardian-Fiberglass-NST3447/products/Loose-Fill-Fiberglass-Insulation-NST10757-P

The use of higher density insulation seems likely to be the most common solution. This change will help ensure that insulation performs in cold Winters.

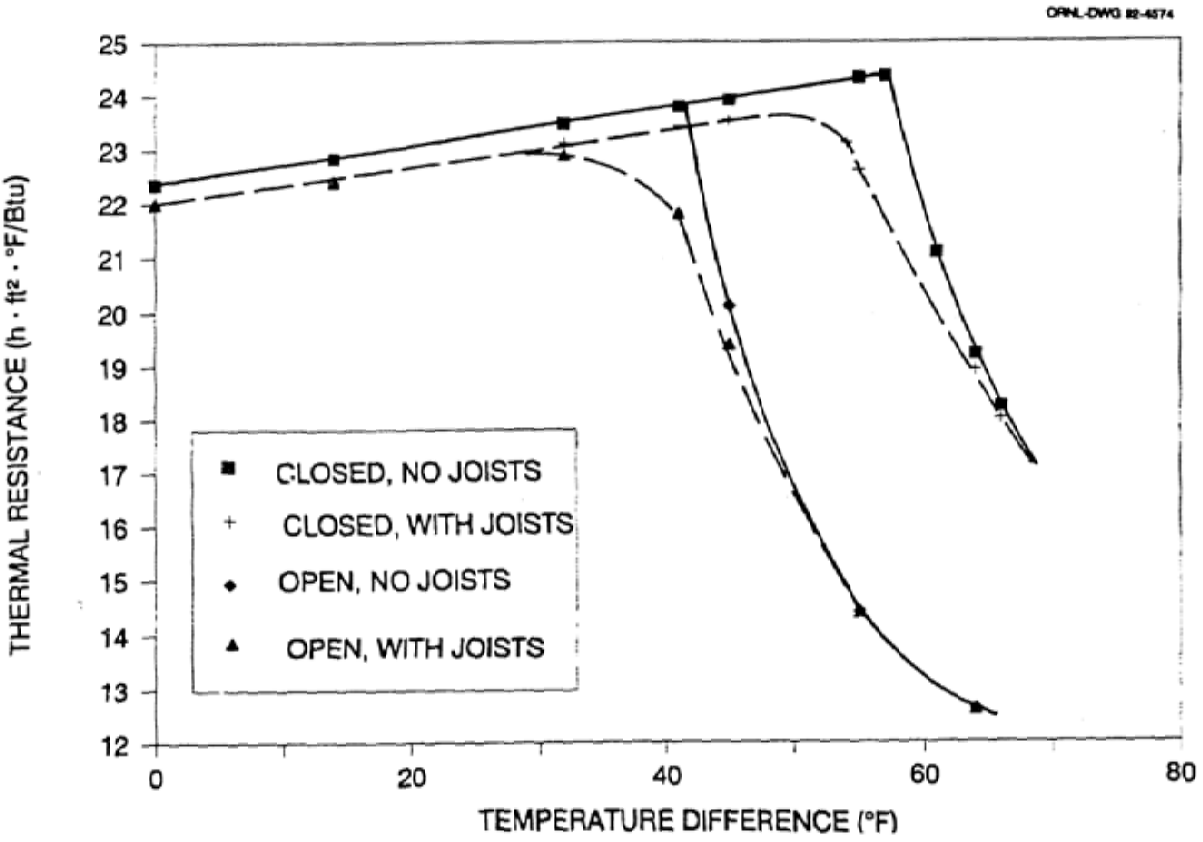

Fig. 4.3. Thermal resistance vs temperature difference in closed and open configurations with and without joists.

1 Energy Design Update, October 1991, page 1

2 Numerical Analysis of Heat Transfer by Conduction and Natural Convection in Loose-Fill Fiberglass Insulation – Effects of Convection on Thermal Performance, Agnes A. Delmas, Kenneth E. Wilkes, April 1992, ORNL/CON-338
(a) page xi, (b) page 2, (c) page 10, (d) page 31.

Cost Impact: The code change proposal will increase the cost of construction.

Analysis: A review of the standard(s) proposed for inclusion in the code, ASTM C1373-03, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

Proponent: Craig Conner, Building Quality, representing self; Shaunna Mozinga, City of Westminster, representing Colorado Chapter of ICC

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IECC COMMITTEE. PART II WILL BE HEARD BY THE IRC BUILDING/ENERGYCOMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IECC

Revise definition as follows:

CONDITIONED SPACE. ~~An area or room within a building being heated or cooled, containing annulated ducts, or with a fixed opening directly into an adjacent conditioned space.~~ For energy purposes, space within a building that is provided with equipment or systems capable of maintaining, through design or heat loss/gain, 50°F (10°C) and 85°F (29°C) during the cooling season, or communicates directly with a conditioned space. For mechanical purposes, an area, room or space being heated or cooled by any equipment or appliance.

402.2.2 Ceilings without attic spaces. Where Section 402.1.1 would require insulation levels above R-30 and the design of the roof/ceiling assembly does not allow sufficient space for the required insulation, the minimum required insulation for such roof/ceiling assemblies shall be R-30. This reduction of insulation from the requirements of Section 402.1.1 shall be limited to 500 square feet (46 m^2) ~~or 20%~~ of ~~the total insulated~~ ceiling area~~, whichever is less.~~ This reduction shall not apply to the U-factor alternative approach in Section 402.1.3 and the Total UA alternative in Section 402.1.4.

PART II – IRC ENERGY

Revise tables as follows:

TABLE N1102.4.2
AIR BARRIER AND INSULATION INSPECTION COMPONENT CRITERIA

COMPONENT	CRITERIA
Air barrier and thermal barrier	Exterior thermal envelope insulation for framed walls is installed in substantial contact and continuous alignment with building envelope air barrier. Breaks or joints in the air barrier are filled or repaired. Air permeable insulation is not used as a sealing material. Air permeable insulation is inside of an air barrier.

(Portions of table not shown remain unchanged)

Reason: This set of six changes is designed to align the IECC and IRC. Code users expect their family of I-codes to be consistent. This change corrects six inconsistencies left over from the major changes made in the energy requirements in the last code change cycle.

This change makes the IECC **definition of conditioned space** consistent with the existing IRC definition. The primary reason for preferring the IRC definition is that it is more useable.

The IECC now has **two separate limits on the ceiling area eligible for reduced R-value** due to the limited space for installing insulation (cathedral ceilings, EC46). The IRC has only one limit. The second limit could be added to the IRC or removed from the IECC. Both codes already have the simple area limit (500 ft^2). It would seem that having the simple limit of 500 ft^2 is enough; we don't need to have a "percentage of area" calculation too.

Three differences between the IECC and IRC are in R-value and U-factor tables. In each case the suggestion is to align the IRC and IECC by making in IRC consistent with what is in the IECC.

Lower southern SHGC requirements were approved in the IECC, but not the IRC. The lower SHGC from the IECC contributes significantly to limiting the cooling energy in the southern zones. This change modifies the IRC by duplicating the lower IECC SHGCs from zones 1 to 3. (Change is included in Table N1102.1.)

Basement insulation R-values in the IECC were increased in the northern zones 6 to 8. This change inserts the IECC basement insulation R-value and U-factors into the IRC. (Change is included in Tables N1102.1 and N1102.1.2.)

Floor insulation R-values in the IECC were increased to R-38 in zones 7 and 8. This change inserts the IECC floor insulation R-value and U-factors into the IRC. (Change is included in Tables N1102.1 and N1102.1.2.)

The **new "Air Barrier and Insulation Inspection Table"** was added to both the IECC and IRC. **One line was left out of the IRC** table. This adds back the missing line.

Cost Impact: The cost impact varies with the six changes.

PART I – IECC

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

PART II – IRC BUILDING/ENERGY

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: CONNER-MOZINGO-EC-1-402.2.2-T. N1102.1.DOC

EC61–09/10
402.2.2

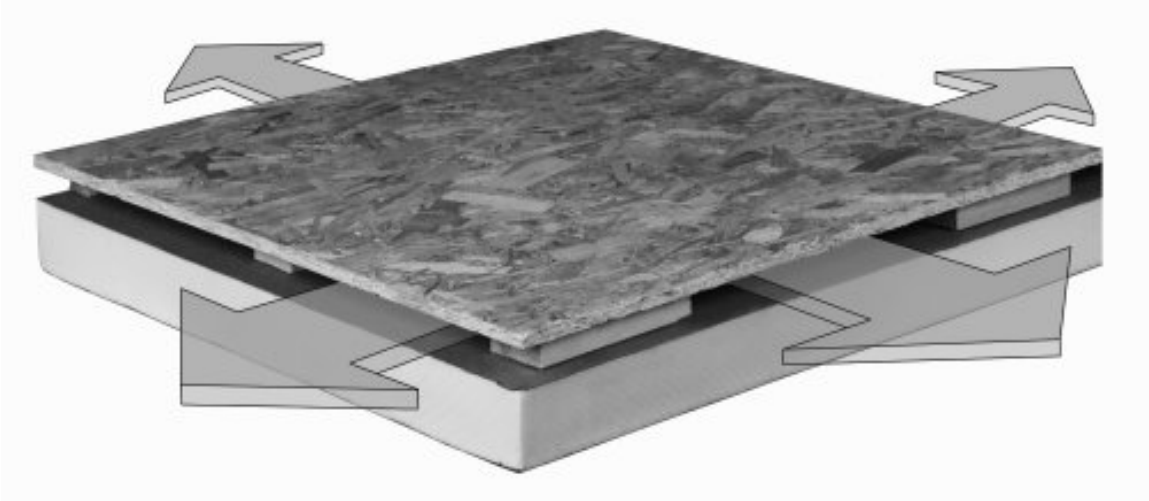
Proponent: Lorraine Ross, Intech Consulting, Inc., representing Polyiso Insulation Manufacturers Association

Revise as follows:

402.2.2 Ceilings without attic spaces. The requirements of Table 402.1.1 shall be met by a combination of insulation installed within the cavity under the roof deck and composite nailbase panels composed of rigid foam insulation that complies with Section 314, a 1, 1.5 or 2 inch airspace and a nailable wood structural panel installed on the topside of the roof deck. Composite panels shall be installed in accordance with manufacturers installation instructions. ~~based on the climate *zone* specified in Chapter 3.Where Section 402.1.1 would require insulation levels above R-30 and the design of the roof/ceiling assembly does not allow sufficient space for the required insulation, the minimum required insulation for such roof/ceiling assemblies shall be R-30.This reduction of insulation from the requirements of Section 402.1.1 shall be limited to 500 square feet (46m2) or 20 percent of the total insulated ceiling area, whichever is less. This reduction shall not apply to the *U*-factor alternative approach in Section 402.1.3 and the total UA alternative in Section 402.1.4.~~

Reason: With the widespread availability of composite nail base panels, there is no reason to underinsulate a roof without attic spaces. A combination of insulation installed in the cavity along with insulation installed above the roof deck can easily meet the thermal performance of Table 402.1.

Composite nailbase insulated panels are available in all thicknesses that easily meet the energy code and have been available for many years with proven performance. This is an example of the product. There are spacer strips separating the nailable surface from the rigid insulation.



The use of asphalt shingles and other roof coverings has been successful over these composite insulation panels and the required ventilation is maintained.

This code change proposal also provides an easily installed and inspected insulation system. The nailable surface is composed of OSB or plywood.

Cost Impact: The code change proposal will increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: ROSS-EC-1-402.2.2

EC62–09/10
402.2.2

Proponent: Ken Sagan, National Association of Home Builders (NAHB)

Revise as follows:

402.2.2 Ceilings without attic spaces. Where Section 402.1.1 would require insulation levels above R-30 and the design of the roof/ceiling assembly does not allow sufficient space for the required insulation, the minimum required insulation for such roof/ceiling assemblies shall be R-30. This reduction of insulation from the requirements of Section

402.1.1 shall be limited to 500 square feet (46 m2) ~~or 20% of the total insulated ceiling area, whichever is less~~. This reduction shall not apply to the U-factor alternative approach in Section 402.1.3 and the total UA alternative in Section 402.1.4

Reason: The purpose of this proposal is to help alleviate the confusion in the 2009 International Energy Conservation Code (IECC). Without this amendment, the IECC would limit the ceiling areas eligible due to a framing cavity restriction for reduced R-value. The IECC already has a limit (500 sq. ft) for this application. This additional limit adds a calculation to determine the second limit and therefore is more confusing than it is worth. Typically, smaller homes have smaller rafter requirements based on shorter spans. Allowing the proper sized framing material to handle the loads is not only cost-effective, but saves our natural resources. Adding insulation alone can be cost effective. Installing larger rafters in order to meet minimum insulation requirements would not be considered a justified cost and would not be conserving our natural resources.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: SAGAN-EC-2-402.2.2

EC63–09/10
402.2.3 (New); IRC N1102.2.3 (New)

Proponent: Craig Conner, Building Quality, representing self

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IECC COMMITTEE. PART II WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IECC

Add new text as follows:

402.2.3 Wind wash baffle. For air permeable insulations in vented attics, a baffle shall be installed adjacent to soffit and eave vents. Baffles shall maintain an opening equal or greater than the size of the vent. The baffle shall extend over the top of the attic insulation inward until it is at least 4 inches vertically above the insulation at full height. The baffle shall be permitted to be any solid material such as cardboard or thin rigid insulating sheathing.

PART II – IRC ENERGY

N1102.2.3 Wind wash baffle. For air permeable insulations in vented attics, a baffle shall be installed adjacent to soffit and eave vents. Baffles shall maintain an opening equal or greater than the size of the vent. The baffle shall extend over the top of the attic insulation inward until it is at least 4 inches vertically above the insulation at full height. The baffle shall be permitted to be any solid material such as cardboard or thin rigid insulating sheathing.

Reason: Inexpensive wind wash baffles prevent the wind from blowing through air permeable insulation. Wind blowing through insulation lowers the insulation's effectiveness.

The baffle also keeps the wind from blowing insulation off parts of the ceiling directly next to the vents. Areas lacking insulation can create moisture problems.

Cost Impact: The code change proposal will increase the cost of construction.

PART I – IECC

402.2.3 (New), Table 402.2.3 (New); IRC N1102.2.2.1 (New), Table N1102.2.2 (New)

Proponent: Dwight Sheldon, Demilec (USA) LLC

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IECC COMMITTEE. PART II WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IECC

Add new text and table as follows:

402.2.3 Where recessed luminaries, exhaust fans, ducts or flues are installed in a ceiling without an attic space, the roofdeck above the recessed device shall be insulated for condensation control with air impermeable insulation equal to or greater than that prescribed in Table 402.2.3.

TABLE 402.2.3
INSULATION FOR CONDENSATION CONTROL

CLIMATE ZONE	MINIMUM RIGID BOARD OR AIR-IMPERMEABLE INSULATION R-VALUE[a]
2B and 3B tile roof only	0 (none required)
1, 2A, 2B, 3A, 3B, 3C	R-5
4C	R-10
4A, 4B	R-15
5	R-20
6	R-25
7	R-30
8	R-35

a. Contributes to but does not supersede prescriptive energy requirements.

PART II – IRC BUILDING/ENERGY

Add new text and table as follows:

1102.2.2.1 Where recessed luminaries, exhaust fans, ducts or flues are installed in a ceiling without an attic space, the roofdeck above the recessed device shall be insulated for condensation control with air impermeable insulation equal to or greater than that prescribed in Table 1102.2.2

TABLE 1102.2.2
INSULATION FOR CONDENSATION CONTROL

CLIMATE ZONE	MINIMUM RIGID BOARD OR AIR-IMPERMEABLE INSULATION R-VALUE[a]
2B and 3B tile roof only	0 (none required)
1, 2A, 2B, 3A, 3B, 3C	R-5
4C	R-10
4A, 4B	R-15
5	R-20
6	R-25
7	R-30
8	R-35

Reason: Recessed luminaries, exhaust fans, ducts and flues often consume most of the space between the ceiling and the roof deck in a ceiling without an attic space (sometimes referred to as roof/ceiling combination, cathedral ceiling or vaulted ceiling), and often do not have adequate insulation between the device and the roof deck to control condensation. This lack of insulation also contributes to significant energy loss in all climates and to ice damming in colder climates. The durability of the structure is compromised if condensation forms on the roof deck which can lead to mold, mildew and rot. Ice damming can lead to bulk water intrusion and substantial damage to the roof and walls.

Cost Impact: The cost for materials for rigid insulation in a ceiling joist cavity is estimated at:
R-10 = \$0.80/ft^2
R-20 = \$1.60/ft^2
R=30 = \$2.40/ft^2

(\$15 per 32ft^2 sheet, 1" thick, R-5.9 per inch)
A typical recessed luminary should require 1.5ft^2 – 2ft^2

Labor to install the insulation is estimated at less than 5-minutes per recessed luminary or exhaust fan, and about 2 - 5 minutes per 4 lineal feet of duct or flue.

PART I – IECC

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

PART II – IRC BUILDING/ENERGY

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: SHELDON-EC-1-402.2.3-T. 402.2.3-RE-N1102.2.2.1-T. N1102.2.2

EC65–09/10
402.2.4, Chapter 6

Proponent: Rob Pickett, Rob Pickett & Associates, LLC, representing Log Homes Council

1. Revise as follows:

402.2.4 Mass walls. Mass walls for the purposes of this chapter shall be considered above-grade walls of concrete block, concrete, insulated concrete form (ICF), masonry cavity, brick (other than brick veneer), earth (adobe, compressed earth block, rammed earth) and solid timber/logs. The design and construction of log structures shall be in accordance with the provisions of ICC-400-2007 IS LOG.

2. Add new standard to Chapter 6 as follows:

ICC
400-07 IS LOG Standard on the Design and Construction of Log Structures

Reason: The purpose of this change is to direct users of the code who are evaluating log structures to the ICC consensus standard pertaining to this unique and traditional construction method.

Log structures employ alternative methods of construction that are fully covered by ICC-400 IS-LOG *Standard for the Design and Construction of Log Structures.* ICC400-2007 is an ANSI-approved document that represents industry standards and guidelines for this form of construction. It gives the code official an important tool for inspection and understanding log construction, including thermal performance. Carefully written to cover all forms of log construction, the standard explains how to respond to design conditions, but it does not establish those conditions.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: A review of the standard(s) proposed for inclusion in the code, ICC 400-07, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

ICCFILENAME: PICKETT-EC-2-402.2.4

EC66–09/10
Table 402.2.5; IRC Table N1102.2.5

Proponent: Mark Nowak, representing Steel Framing Alliance

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IECC COMMITTEE. PART II WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IECC

Revise table as follows:

TABLE 402.2.5
STEEL-FRAME CEILING, WALL AND FLOOR INSULATION (R-VALUE)

WOOD FRAME R-VALUE REQUIREMENT	COLD-FORMED STEEL EQUIVALENT R-VALUE[a]
Steel Truss Ceilings[b]	
R-30	R-38 or R-30 + 3 or R-26 + 5
R-38	R-49 or R-38 + 3
R-49	R-38 + 5
Steel Joist Ceilings[b]	
R-30	R-38 in 2 x 4 or 2 x 6 or 2 x 8 R-49 in any framing
R-38	R-49 in 2 x 4 or 2 x 6 or 2 x 8 or 2 x 10
Steel-Framed Wall	
R-13	R-13 + ~~5~~ 3.2 or ~~R-15 + 4~~ R-19 + 2.1 or R-21 + ~~3~~ 2.0 or R-0 + ~~10~~ 8.4
~~R-19~~	~~R-13 + 9 or R-19 + 8 or R-25 + 7~~
R-20	R-0 + 12.5 or R-13 + 7.3 or R-19 + 6.2 or R-21 + 5.9
R-21	R-0 + 13.0 or R-13 + ~~10~~ 7.7 or R-19 + ~~9~~ 6.6 or R-21 + 6.4 or R-25 + 8
Steel Joist Floor	
R-13	R-19 in 2 x 6 R-19 + 6 in 2 x 8 or 2 x 10
R-19	R-19 + 6 in 2 x 6 R-19 + 12 in 2 x 8 or 2 x 10

a. Cavity insulation *R*-value is listed first, followed by continuous insulation *R*-value.
b. Insulation exceeding the height of the framing shall cover the framing.

PART II – IRC Energy

Revise table as follows:

TABLE N1102.2.5
STEEL-FRAME CEILING, WALL AND FLOOR INSULATION (R-VALUE)

WOOD FRAME R-VALUE REQUIREMENT	COLD-FORMED STEEL EQUIVALENT R-VALUE[a]
Steel Truss Ceilings[b]	
R-30	R-38 or R-30 + 3 or R-26 + 5
R-38	R-49 or R-38 + 3
R-49	R-38 + 5
Steel Joist Ceilings[b]	
R-30	R-38 in 2 x 4 or 2 x 6 or 2 x 8 R-49 in any framing
R-38	R-49 in 2 x 4 or 2 x 6 or 2 x 8 or 2 x 10
Steel-Framed Wall	
R-13	R-13 + ~~5~~ 3.2 or ~~R-15 + 4~~ R-19 + 2.1 or R-21 + ~~3~~ 2.0 or R-0 + ~~10~~ 8.4
~~R-19~~	~~R-13 + 9 or R-19 + 8 or R-25 + 7~~
R-20	R-0 + 12.5 or R-13 + 7.3 or R-19 + 6.2 or R-21 + 5.9
R-21	R-0 + 13.0 or R-13 + ~~10~~ 7.7 or R-19 + ~~9~~ 6.6 or R-21 + 6.4 or R-25 + 8
Steel Joist Floor	
R-13	R-19 in 2 x 6 R-19 + 6 in 2 x 8 or 2 x 10
R-19	R-19 + 6 in 2 x 6 R-19 + 12 in 2 x 8 or 2 x 10

a. Cavity insulation *R*-value is listed first, followed by continuous insulation *R*-value.
b. Insulation exceeding the height of the framing shall cover the framing.

Reason: Currently, there are inconsistencies between ASHRAE 90.1, the IECC, and the IRC regarding determination of U-factors for steel framed walls. This proposal and its companion to the IECC serve to ensure that U-factors for steel framed walls are determined in accordance with ASHRAE 90.1 methodology across all codes. This change will remove confusion and simplify the code compliance process as well as permit greater transparency, consistency, and collaboration across codes.

ASHRAE 90.1 values should be used in this table and across the IECC and IRC for three reasons: first, because ASHRAE 90.1 is the only source of U-factors that were determined through the ANSI consensus process; second, because ASHRAE 90.1 clearly delineates their assumptions and methodology in calculating the U-factors (this is not done within the IRC or IECC); and third, because in some areas the IECC already uses the ASHRAE methodology for determining U-factors of steel framed walls (See IECC Table 502.2.1 and 502.2(1), which are sourced directly from ASHRAE 90.1-2007).

To ensure consistency with ASHRAE 90.1 and with the U-factors used in Table 502.1.2, U-factors for wood framed walls and their thermally equivalent steel framed wall counterparts were calculated based on ASHRAE 90.1 methodology as follows:

1. U-factors for wood framed walls were sourced from ASHRAE 90.1-2007, Table A 3.4 as follows: R-13 (0.089), R-20 (0.065, interpolated), R-21 (0.063). Note that IECC Table 502.1.2 uses identical U-factors where values overlap (e.g. 0.089 for R-13 wood framed wall).
2. The required cavity and continuous R-values for steel framed walls to match the U-factors for wood framed walls were then calculated based on guidance provided by ASHRAE 90.1-2007 Section A3.3.1, "Steel-Framed Walls, General", and Section A9.4, "Calculation Procedures and Assumptions." This methodology is the same calculation procedure that was used to derive Table A3.3 of ASHRAE 90.1, which provides a matrix of metal framed wall U-factors based on specified cavity and/or continuous insulation.
3. To be consistent with the formatting of prescriptive steel frame wall requirements in IECC Table 502.2(1), requirements for steel framed wall continuous insulation R-values were then rounded to the nearest 0.1.

Submitted below are ASHRAE 90.1-2007 Table A3.4 and Table A3.3, with mark-ups showing how wood framed wall U-factors were sourced and how steel framed wall equivalent R-values were sourced. Table A3.3 contains mark-ups that highlight steel framed wall insulation R-values that would result in thermal equivalence to an R-13 wood framed wall.

TABLE A3.4 Assembly U-Factors for Wood-Frame Walls

Framing Type and Spacing Width (Actual Depth)	Cavity Insulation R-Value: Rated (Effective Installed [see Table A9.4C])	Overall U-Factor for Entire Base Wall Assembly	Overall U-Factor for Assembly of Base Wall Plus Continuous Insulation — Rated R-Value of Continuous Insulation											
			R-1.00	R-2.00	R-3.00	R-4.00	R-5.00	R-6.00	R-7.00	R-8.00	R-9.00	R-10.00	R-11.00	R-12.00	R-13.00

6.0 in. depth	R-19 (7.1)	**0.109**	0.099	0.090	0.082	0.076	0.071	0.066	0.062	0.058	0.055	0.052	0.050	0.047	0.045
	R-21 (7.4)	**0.106**	0.096	0.087	0.080	0.074	0.069	0.065	0.061	0.057	0.054	0.051	0.049	0.047	0.045

R-13 + 3.2

R-19 + 2.1

R-0 + 8.4

R-21 + 2.0

Graphic B: ASHRAE 90.1-2007 Table A3.3.

Additionally, this proposal removes the reference to R-19 since there is no longer a wood frame wall R-value prescription with this value that would require a steel framed thermal equivalent. An R-20 equivalent is added to provide an equivalent path to the R-20 wood framed wall prescription that was introduced in the 2009 code.

Cost Impact: The code change proposal will not increase the cost of construction.

PART I – IECC

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

PART II – IRC BUILDING/ENERGY

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: NOWAK-EC-4-T. 402.2.5-RE-1-T. N1102.2.5

EC67–09/10
202 (New), 402.2.7 (New), 502.2.2.1, 502.2.2.2

Proponent: Ronald Majette, representing US Department of Energy

1. Revise definitions as follows:

ABOVE-GRADE WALL. ~~A wall more than 50 percent above grade and enclosing *conditioned space*. This includes between-floor spandrels, peripheral edges of floors, roof and basement knee walls, dormer walls, gable end walls, walls enclosing a mansard roof and skylight shafts.~~ See Section 402.2.7 for residential buildings and Section 502.2.3 for commercial buildings.

BASEMENT WALL. ~~A wall 50 percent or more below grade and enclosing *conditioned space*.~~ See Section 402.2.7.

2. Add new definition as follows:

BELOW-GRADE WALL. See Section 502.2.3.

3. Add new text as follows:

402.2.7 Above grade walls. Where Section 402.1.1 would require insulation on above grade walls, those walls are those more than 50 percent above grade and enclosing *conditioned space.* This includes between floor spandrels, peripheral edges of floors, roof and basement knee walls, dormer walls, gable end walls, walls enclosing a mansard roof and surfaces associated with skylight shafts. Walls not considered above grade walls shall be considered basement walls as covered in Section 402.2.8.

4. Revise as follows:

502.2.2.1 Above-grade walls. Above-grade walls are those walls covered by Section 502.2.3 on the exterior of the building ~~and completely above-grade or walls that are more than 15 percent above grade~~ that are not below-grade walls.

502.2.2.2 Below-grade walls. Below-grade walls covered by Section 502.2.4 are ~~basement or first-story walls associated with the exterior of the building that are at least 85 percent below grade~~ those portions of walls associated with the building envelope that are entirely below the finish grade and in contact with the ground.

Reason: For consistency with ASHRAE Standard 90.1. The current definitions are appropriate for application to residential buildings. The revisions related to commercial buildings make it clear which walls are above grade and below grade and most importantly eliminate what appears to be an arbitrary distinction built around a 15/85% ratio of above and below grade.

Cost Impact: The code change proposal could increase or decrease the cost of construction to the degree that the current IECC would consider some walls above or below grade while ASHRAE 90.1-07 would consider them the opposite.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

Proponent: Bill Prindle, ICF International, representing the Energy Efficient Codes Coalition; Jeff Harris, Alliance to Save Energy; Harry Misuriello, American Council for an Energy-Efficient Economy (ACEEE); Garrett Stone, Brickfield, Burchette, Ritts & Stone; Steve Rosenstock, Edison Electric Institute; Brian Dean, ICF International

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IECC COMMITTEE. PART II WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IECC

Revise as follows:

402.2.11 Thermally isolated sunroom insulation. All *sunrooms* shall meet the insulation requirements of this code.

Exception: For *sunrooms* with *thermal isolation*, the following exceptions to the insulation *requirements* of this code shall apply: (1) The minimum ceiling insulation R-values shall be R-~~19~~24 in Zones 1 through 4 and R-~~24~~30 in Zones 5 through 8~~.~~; and (2) The minimum wall R-value shall be R-13 in all zones. New wall(s) separating a *sunroom* with *thermal isolation* from *conditioned space* shall meet the *building thermal envelope* requirements of this code.

402.3.5 Thermally isolated sunroom U-factor. All *sunrooms* shall meet the fenestration requirements of this code.

Exception: For *sunrooms* with *thermal isolation* in Zones 4 through 8, the following exceptions to the fenestration requirements of this code shall apply: (1) the maximum fenestration U-factor shall be ~~0.50~~ 0.45; and (2) the maximum skylight U-factor shall be 0.70~~5~~. New ~~windows and doors~~ fenestration separating the *sunroom* with *thermal isolation* from *conditioned space* shall meet the *building thermal envelope* requirements of this code.

PART II – IRC BUILDING/ENERGY

Revise as follows:

N1102.2.11 Thermally isolated sunroom insulation. All *sunrooms* shall meet the insulation requirements of this code.

Exception: For *sunrooms* with *thermal isolation*, the following exceptions to the insulation *requirements* of this code shall apply: (1) The minimum ceiling insulation R-values shall be R-~~19~~24 in Zones 1 through 4 and R-~~24~~30 in Zones 5 through 8~~.~~; and (2). The minimum wall R-value shall be R-13 in all zones. New wall(s) separating a *sunroom* with *thermal isolation* from *conditioned space* shall meet the *building thermal envelope* requirements of this code.

N1102.3.5 Thermally isolated sunroom U-factor. All *sunrooms* shall meet the fenestration requirements of this code.

Exception: For *sunrooms* with *thermal isolation* in Zones 4 through 8, the following exceptions to the fenestration requirements of this code shall apply: (1) the maximum fenestration U-factor shall be ~~0.50~~ 0.45; and (2) the maximum skylight U-factor shall be 0.70~~5~~. New ~~windows and doors~~ fenestration separating the *sunroom* with *thermal isolation* from *conditioned space* shall meet the *building thermal envelope* requirements of this code.

Reason: This proposal editorially clarifies that the requirements for thermally isolated *sunrooms* in these sections are exceptions and only apply to *sunrooms* that have *thermal isolation* and that all other sunrooms must comply with all of the requirements of the code. The proposal also tightens the requirements in the exceptions. It is reasonable to require some improvement in *sunrooms* with *thermal isolation*, particularly given the amount of glass and the relatively minimal current requirements.

Cost Impact: The code change proposal will increase the cost of construction.

Proponent: Ronald Majette, representing US Department of Energy

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IECC COMMITTEE. PART II WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IECC

Add new text as follows:

402.2.12 Common, party, and fire walls. Whenever continuity of the *building thermal envelope* is broken at walls separating dwelling units in Group R-2 building, including common, party, and fire walls, such walls shall be insulated to a minimum of R-10 on each side of the break in insulation continuity, and the walls shall be air sealed in accordance with Section 402.4.

PART II – IRC BUILDING/ENERGY

Add new text as follows:

N1102.2.12 Common, party, and fire walls. Whenever continuity of the *building thermal envelope* is broken at walls separating dwelling units in Group R-2 building, including common, party, and fire walls, such walls shall be insulated to a minimum of R-10 on each side of the break in insulation continuity, and the walls shall be air sealed in accordance with Section N1102.4.

Reason: Feedback we have received from the field is that party/fire walls in Low-Rise Multifamily dwellings are often a source of a considerable waste of energy. The problem is that these common walls are overlooked for their lack of insulation and air sealing, as they are often not considered to be exterior walls or part of the building thermal envelope for the purposes of the codes.

We know, however, from past experience with real-time performance testing of these common walls that they are often direct connections between the outside, unconditioned crawlspaces or basement, and unconditioned attics. This results in potential air infiltration/exfiltration issues, as well as conductive heat loss, since these walls are not insulated. The end result is energy loss and appurtenant utility bill increases and major comfort issues associated with these "cold" walls. This is why the EPA and NYSERDA Energy Star Homes programs require air sealing of these walls as well.

Cost Impact: The code change proposal will increase the cost of construction to the degree that these walls which may not now be insulated and sealed with have to be insulated and sealed. Costs of operation of the building will be reduced a commensurate amount to offset any increase cost of construction.

PART I – IECC

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

PART II – IRC BUILDING/ENERGY

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: MAJETTE-EC-76-402.2.12-IRC N1102.2.12

EC70–09/10
202

Proponent: Ronald Majette, representing US Department of Energy

Revise definition as follows:

SKYLIGHT. Glass or other transparent or translucent glazing material installed at a slope of ~~15~~ less than 60 degrees (0.26 rad) ~~or more from vertical~~ from horizontal. Glazing material in skylights, including unit skylights, solariums, sunrooms, roofs and sloped walls is included in this definition.

Reason: For consistency with ASHRAE Standard 90.1. Currently ASHRAE 90.1-07 defines skylights as having a slope of less than 60 degrees from the horizontal plane. Other fenestration, even if mounted on the roof of a building, is considered *vertical fenestration*.

Cost Impact: The code change could increase or decrease the cost of construction to the degree that the current IECC would consider some glazing vertical fenestration while ASHRAE 90.1-07 would consider the same glazing a skylight. There are different thermal requirements for skylights and vertical fenestration.

Analysis: This will create a different definition than is currently in the IBC and IRC.

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IECC COMMITTEE. PART II WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

1. Add new definitions as follows:

REFLECTANCE, SOLAR. The ratio of reflected solar flux to incident solar flux.

ABSORPTANCE, SOLAR. The difference 1.0 minus the *solar reflectance*.

2. Add new text and table as follows:

402.3 Solar properties of opaque surfaces (Prescriptive).

402.3.1 Solar absorptance of roofs. Roofs in climate zones 1, 2, and 3 having a ratio of rise to run less than or equal to 2:12 (9.5 degrees from horizontal) shall be provided with roofing materials having a solar absorptance not exceeding 0.75, as tested in accordance with ASTM E1918 or C1549. For unrated roofing materials, solar absorptance values shall be taken from Table 402.3(1).

TABLE 402.3(1)
DEFAULT ROOF SOLAR ABSORPTANCE VALUES

ROOF MATERIAL	SOLAR ABSORPTANCE
White Composition Shingles	0.80
White Tile (including concrete)	0.60
White Metal	0.50
All Others	0.92

3. Add new standards to Chapter 6 as follows:

ASTM

E1918-06	Standard Test Method for Measuring Solar Reflectance of Horizontal and Low-Sloped Surfaces in the Field
C1549-04	Standard Test Method for Measuring Solar Reflectance of Horizontal and Low-Sloped Surfaces in the Field

PART II – IRC BUILDING/ENERGY

1. Add new definitions as follows:

REFLECTANCE, SOLAR. The ratio of reflected solar flux to incident solar flux.

ABSORPTANCE, SOLAR. The difference 1.0 minus the *solar reflectance*.

2. Add new text and table as follows:

N1102.3 Solar properties of opaque surfaces (Prescriptive).

N1102.3.1 Solar absorptance of roofs. Roofs in climate zones 1, 2, and 3 having a ratio of rise to run less than or equal to 2:12 (9.5 degrees from horizontal) shall be provided with roofing materials having a solar absorptance not exceeding 0.75, as tested in accordance with ASTM E1918 or C1549. For unrated roofing materials, solar absorptance values shall be taken from Table 402.3(1).

TABLE N1102.3(1)
DEFAULT ROOF SOLAR ABSORPTANCE VALUES

ROOF MATERIAL	SOLAR ABSORPTANCE
White Composition Shingles	0.80
White Tile (including concrete)	0.60
White Metal	0.50
All Others	0.92

3. Add new standards to Chapter 44 as follows:

ASTM

E1918-06	Standard Test Method for Measuring Solar Reflectance of Horizontal and Low-Sloped Surfaces in the Field
C1549-04	Standard Test Method for Measuring Solar Reflectance of Horizontal and Low-Sloped Surfaces in the Field

Reason: The U.S. Department of Energy has estimated that reducing the solar absorptivity of all buildings and roads could affect the equivalent carbon reduction of removing all automobiles in the world from the road for 11 years. This proposal extends the solar absorptance currently used in the standard reference design of the Simulated Performance Alternative to the prescriptive compliance path. Provisions for solar reflectance ratings and default values for unrated materials are consistent with the 2006 Mortgage Industry National Home Energy Rating Systems Standards (RESNET 2006).

Cost Impact: The code change proposal will increase the cost of construction.

Analysis: A review of the standard(s) proposed for inclusion in the code, ASTM E1918-06 and ASTM C1549-04, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

Proponent: Thomas D. Culp, Ph.D., Birch Point Consulting LLC, representing Aluminum Extruders Council; Vickie Lovell, InterCode Incorporated, representing Association of Industrial Metallized Coaters and Laminators

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IECC COMMITTEE. PART II WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IECC

1. Revise as follows:

103.2 Information on construction documents. Construction documents shall be drawn to scale upon suitable material. Electronic media documents are permitted to be submitted when *approved* by the *code official*. Construction documents shall be of sufficient clarity to indicate the location, nature and extent of the work proposed, and show in sufficient detail pertinent data and features of the building, systems and equipment as herein governed. Details shall include, but are not limited to, as applicable, cardinal directions; insulation materials and their R-values; fenestration U-factors and SHGCs; area-weighted U-factor and SHGC calculations; permanent shading features with projection factor calculations; mechanical system design criteria; mechanical and service water heating system and equipment types, sizes and efficiencies; economizer description; equipment and systems controls; fan motor horsepower (hp) and controls; duct sealing, duct and pipe insulation and location; lighting fixture schedule with wattage and control narrative; and air sealing details.

***2*. Add new text as follows:**

SECTION 202
GENERAL DEFINITIONS

PROJECTION FACTOR. The ratio of the horizontal depth of an overhang, eave, or permanently attached shading device, divided by the distance measured vertically from the bottom of the fenestration glazing to the underside of the overhang, eave, or permanently attached shading device.

402.3.3 Glazed fenestration SHGC exception. In Climate Zones 1 through 3, permanently shaded vertical fenestration shall be permitted to satisfy the SHGC requirements. The projection factor of an overhang, eave, or permanently attached shading device shall be greater than or equal to the value listed in table 402.3.3 for the appropriate orientation. The minimum projection shall extend beyond each side of the glazing a minimum of 12 inches (0.3 m). Each orientation shall be rounded to the nearest cardinal orientation (+/-45 degrees or 0.79 rad) for purposes of calculations and demonstrating compliance.

TABLE 402.3.3
MINIMUM PROJECTION FACTOR REQUIRED BY ORIENTATION FOR SHGC EXCEPTION

ORIENTATION	PROJECTION FACTOR
North	>=0.40[a]
South	>=0.20
East	>=0.50
West	>=0.50

a. For the north orientation, a vertical projection located on the west-edge of the fenestration with equivalent PF >= 0.15 shall also satisfy the minimum projection factor requirement.

PART II – IRC BUILDING/ENERGY

1. Revise as follows:

R106.2 Site plan or plot plan. The construction documents submitted with the application for permit shall be accompanied by a site plan showing the size and location of new construction and existing structures on the site, ~~and~~ distances from lot lines, and cardinal directions. In the case of demolition, the site plan shall show construction to be demolished and the location and size of existing structures and construction that are to remain on the site or plot. The building official is authorized to waive or modify the requirement for a site plan when the application for permit is for alteration or repair or when otherwise warranted.

2. Add new text as follows:

SECTION R202
DEFINITIONS

PROJECTION FACTOR. The ratio of the horizontal depth of an overhang, eave, or permanently attached shading device, divided by the distance measured vertically from the bottom of the fenestration glazing to the underside of the overhang, eave, or permanently attached shading device.

N1102.3.3 Glazed fenestration SHGC exception. In Climate Zones 1 through 3, permanently shaded vertical fenestration shall be permitted to satisfy the SHGC requirements. The projection factor of an overhang, eave, or permanently attached shading device shall be greater than or equal to the value listed in table N1102.3.3 for the appropriate orientation. The minimum projection shall extend beyond each side of the glazing a minimum of 12 inches (0.3 m). Each orientation shall be rounded to the nearest cardinal orientation (+/-45 degrees or 0.79 rad) for purposes of calculations and demonstrating compliance.

TABLE N1102.3.3
MINIMUM PROJECTION FACTOR REQUIRED BY ORIENTATION FOR SHGC EXCEPTION

ORIENTATION	PROJECTION FACTOR
North	>=0.40[a]
South	>=0.20
East	>=0.50
West	>=0.50

a. For the north orientation, a vertical projection located on the west-edge of the fenestration with equivalent PF >= 0.15 shall also satisfy the minimum projection factor requirement.

Reason
(Culp): This proposal would promote good shading practice through a prescriptive alternative to the SHGC requirements. The proposed requirements account for orientation differences, based on equivalent shading averaged over the relevant time period for each façade.

To aid enforcement, this proposal puts the requirement on the builder, not the code official, to substantiate projection factor calculations and indicate the cardinal directions on construction documents. Also, projection factor has already been in use for years in both the commercial chapter and ASHRAE 90.1, so this is merely an extension of current practice.

Shading has been part of good building design for millennia. The code should recognize and encourage this practice as we strive for ever increasing levels of energy efficiency.

(Lovell): The concept of using shading to reduce heat gain dates back to prehistoric times, when man and beast had the instinctive sense to seek shade during the hottest part of the day. It is integral to the architectural of some of the oldest world cultures. Shading in modern construction offers many possibilities, some yet to be fully explored.

This proposed code change allows for the use of overhangs to meet the solar heat gain coefficient requirements within the IECC. Permanent exterior shading features, such as overhangs are allowed to be used in IECC Chapter 5 as a prescriptive trade-off to meeting SHGC requirements within the code. The calculation for determining the projection factor for overhangs has been in the 2000, 2003, 2006, and 2009 IECC for commercial buildings and has been proven to be very simple to calculate, fitting well into a prescriptive approach. The use of the shading devices was previously allowed under the 2003 IECC and is currently allowed as a trade-off under the commercial provisions of the IECC.

Allowing flexibility in meeting the solar heat gain coefficient through the use of proven shading alternatives will increase the usability of the code for the building and design community while ensuring that the new fenestration is energy efficient. When credit for shading is permitted in the building code, it encourages an integrated approach to building designs, energy use, construction materials, renewable resources particularly as part of urban infrastructure, site and town planning and building design to be considered holistically. It also creates the opportunity for aesthetically pleasing and ingenious designs that might not otherwise be permitted.

Cost Impact:
(Culp)- The code change proposal will not increase the cost of construction. Wider overhangs, eaves, and shading devices will increase the cost relative to windows without shading, but this section is only a voluntary alternative.
(Lovell)-The code change proposal will not increase the cost of construction.

Proponent: Thomas D. Culp, Ph.D., Birch Point Consulting LLC, representing Quanta Technologies, Inc.

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IECC COMMITTEE. PART II WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IECC

1. Revise as follows:

103.2 Information on construction documents. Construction documents shall be drawn to scale upon suitable material. Electronic media documents are permitted to be submitted when *approved* by the *code official*. Construction documents shall be of sufficient clarity to indicate the location, nature and extent of the work proposed, and show in

sufficient detail pertinent data and features of the building, systems and equipment as herein governed. Details shall include, but are not limited to, as applicable, cardinal directions; insulation materials and their R-values; fenestration U-factors and SHGCs; area-weighted U-factor and SHGC calculations; mechanical system design criteria; mechanical and service water heating system and equipment types, sizes and efficiencies; economizer description; equipment and systems controls; fan motor horsepower (hp) and controls; duct sealing, duct and pipe insulation and location; lighting fixture schedule with wattage and control narrative; and air sealing details.

2. Add new text as follows:

402.3.3. Fenestration SHGC for south-facing glazing. In Climate Zones 5 through 8, fenestration facing within 30 degrees of south shall have a minimum SHGC of 0.30. For compliance with this section, the default SHGC for unlabeled fenestration shall be 0.27, and default SHGC values from Table 303.1.3(3) shall not be permitted.

(Renumber subsequent sections)

3. Revise table as follows:

TABLE 405.5.2(1)
SPECIFICATIONS FOR THE STANDARD REFERENCE AND PROPOSED DESIGNS

Glazing[a]	Total area[b] = (a) The proposed glazing area; where the proposed glazing area is less than 15% of the conditioned floor area (b) 15% of the conditioned floor area; where the proposed glazing area is 15% or more of the conditioned floor area	As proposed
	Orientation: equally distributed to four cardinal compass orientations (N, E, S, & W)	As proposed
	U-factor: from Table 402.1.3	
	SHGC: From Table 402.1 and Section 402.3.3 except that for climates with no requirement (NR) SHGC = 0.40 shall be used	As proposed As proposed
	Interior shade fraction: Summer (all hours when cooling is required) = 0.70 Winter (all hours when heating is required) = 0.85[c]	Same as standard reference design
	External shading: none	As proposed

(Portions of table and footnotes not shown remain unchanged)

PART II – IRC BUILDING/ENERGY

1. Revise as follows:

R106.2 Site plan or plot plan. The construction documents submitted with the application for permit shall be accompanied by a site plan showing the size and location of new construction and existing structures on the site, ~~and~~ distances from lot lines, and cardinal directions. In the case of demolition, the site plan shall show construction to be demolished and the location and size of existing structures and construction that are to remain on the site or plot. The building official is authorized to waive or modify the requirement for a site plan when the application for permit is for alteration or repair or when otherwise warranted.

2. Add new text as follows:

N1102.3.3. Fenestration SHGC for south-facing glazing. In Climate Zones 5 through 8, fenestration facing within 30 degrees of south shall have a minimum SHGC of 0.30. For compliance with this section, the default SHGC for unlabeled fenestration shall be 0.27, and default SHGC values from Table N1101.5(3) shall not be permitted.

(Renumber subsequent sections)

Reason: As the IECC and IRC move toward major increases in energy efficiency, first 30% and then 50%, we cannot continue to ignore a free source of renewable energy – the sun. Just as lower SHGC is important to reducing cooling loads in southern climates, it is equally important to use higher SHGC windows in northern climates to maximize the use of free solar energy to reduce heating loads that must otherwise be met using fossil fuels. However, there is a profound danger that this renewable energy source will be blocked from entering homes if very low SHGC windows intended for southern climates are allowed to be installed in northern homes, due to the current "No Requirement" or "NR" for northern SHGC.

This proposal would preserve solar access and ensure that northern homeowners capture solar gain all winter long, by requiring a modest minimum SHGC on south-facing exposures. Previous debates about the benefits of higher SHGC in cold climates have often centered on west-facing windows. However, there is no dispute that higher SHGC on south-facing windows saves energy, and in fact, homes have been designed for centuries to capture winter solar gains from south-facing windows. The U.S. Department of Energy has recently announced new criteria for Energy Star which reward higher SHGC in northern climates for all windows, regardless of which way they face.[1] Nonetheless, this proposal is limited to south-facing glazing, and does not change the requirements for west-facing glazing in any way.

Additionally, the minimum SHGC of 0.30 is easily achievable by products available from all of the major low-e glass producers, at the same or even lower cost. It is purposely designed to be a modest requirement which only limits the worst-performing products from being used.

The code must begin to recognize that using the same low SHGC glazing in Phoenix and Boston makes no sense. The benefits are obvious even to our best friends …

1. "ENERGY STAR Program Requirements for Residential Windows, Doors, and Skylights – Version 5.0", U.S. Department of Energy, April 7, 2009. http://www.energystar.gov/ia/partners/prod_development/archives/downloads/windows_doors/WindowsDoorsSkylightsProgRequirements7Apr09.pdf

Cost Impact: The code change proposal will not increase the cost of construction.

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IECC COMMITTEE. PART II WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IECC

Add new text and table as follows:

402.3.3 External shading. As an alternative to the SHGC requirements of Table 402.1.1, vertical glazed fenestration shall be permitted to meet the SHGC requirements of Table 402.3.3 based upon the calculated projection factor of any overhang, eave, or permanently attached shading device that covers the full width of the glazing and extends a minimum of 12 inches (0.3 m) beyond each side of thereof.

402.3.3.1 Projection factor. The projection factor shall be determined in accordance with Equation 4-1.

$$PF = A/B \qquad \textbf{(Equation 4-1)}$$

where:

PF = Projection factor (decimal).
A = Distance measured horizontally from the furthest continuous extremity of any overhang, eave, or permanently attached shading device to the vertical surface of the glazing.
B = Distance measured vertically from the bottom of the glazing to the underside of the overhang, eave, or permanently attached shading device.

402.3.3.2 Differing PF values. Where different windows or glass doors have different *PF* values, they shall each be evaluated separately, or an area-weighted *PF* value shall be calculated and used for all windows and glass doors.

TABLE 402.3.3
EQUIVALENT SHGC REQUIREMENTS FOR VERTICAL GLAZED FENESTRATION WITH EXTERNAL SHADING

CLIMATE ZONE	1	2	3[a]
SHGC: *PF* 0.25	0.30	0.30	0.30
SHGC: 0.25 ≤ *PF* < 0.50	0.36	0.36	0.36
SHGC: *PF* ≥ *0.50*	0.45	0.45	0.45

a. There are no SHGC requirements in the Marine zone.

PART II – IRC BUILDING/ENERGY

Add new text and table as follows:

N1102.3.3 External shading. As an alternative to the SHGC requirements of Table N1102.1, vertical glazed fenestration shall be permitted to meet the SHGC requirements of Table N1102.3 based upon the calculated projection factor of any overhang, eave, or permanently attached shading device that covers the full width of the glazing and extends a minimum of 12 inches (0.3 m) beyond each side thereof.

N1102.3.3.1 Projection factor. The projection factor shall be determined in accordance with Equation N1102-1.

$$PF = A/B \qquad \textbf{(Equation N1102-1)}$$

where:

PF = Projection factor (decimal).
A = Distance measured horizontally from the furthest continuous extremity of any overhang, eave, or permanently attached shading device to the vertical surface of the glazing.
B = Distance measured vertically from the bottom of the glazing to the underside of the overhang, eave, or permanently attached shading device.

N1102.3.3.2 Differing PF values. Where different windows or glass doors have different *PF* values, they shall each be evaluated separately, or an area-weighted *PF* value shall be calculated and used for all windows and glass doors.

TABLE N1102.3
EQUIVALENT SHGC REQUIREMENTS FOR VERTICAL GLAZED FENESTRATION WITH EXTERNAL SHADING

CLIMATE ZONE	1	2	3[a]
SHGC: *PF* = 0.25	0.30	0.30	0.30
SHGC: 0.25 ≤ *PF* < 0.50	0.36	0.36	0.36
SHGC: *PF* ≥ *0.50*	0.45	0.45	0.45

a. There are no SHGC requirements in the Marine zone.

Reason: Long before window makers began marketing low-SHGC windows, shading was an accepted and effective architectural method for achieving solar control. It still is. Chapter 5 recognizes the benefits of controlling solar gain through the use of shading or projection factors for commercial buildings. A similar credit should be provided for residential occupancies.

The language starting with 403.3.3.1 and N1102.3 is similar to the language in the Chapter 5. The SHGC multipliers are based on multipliers given in ASHRAE 90.1 for different projection factors. For PF = 0.25 and 0.50, the multipliers were calculated as the weighted average from the ASHRAE 90.1 multiplier for west/south/east orientation (75%) and the multiplier for northern orientation (25%). In comparison, the commercial chapter is effectively using SHGC multipliers of 0.76 and 0.62 for these PF ranges, so this proposal is more conservative.

Cost Impact: The code change proposal will not increase the cost of construction and may reduce the cost of construction by offering an alternative compliance method.

PART I – IECC

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

PART II – IRC BUILDING/ENERGY

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: ZAREMBA-EC-1-402.3.3-N1102.3.3

EC75–09/10
402.3.4

Proponent: Ron Nickson, representing the National Multi Housing Council

Revise as follows:

402.3.4 Opaque door exemption. One side-hinged opaque door assembly per dwelling unit up to 24 square feet (2.22 m^2) in area is exempted from the U-factor requirement in Section 402.1.1. This exemption shall not apply to the U-factor alternative approach in Section 402.1.3 and the total UA alternative in Section 402.1.4.

Reason: This change would allow the exemption for one door, as not having to comply to the insulation and fenestration criteria, to apply to the individual dwelling units in a multifamily structure. The change will allow the same flexibility in the design of R-2 occupancies as is now permitted in the design of R-3 occupancies.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: NICKSON-EC-2-402.3.4

EC76–09/10
402.3.4; IRC N1102.3.4

Proponent: Ken Sagan, National Association of Home Builders (NAHB)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IECC COMMITTEE. PART II WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IECC

Revise as follows:

402.3.4 Opaque door exemption. One opaque side-hinged door assembly ~~side-hinged opaque door assembly up to 24 square feet (2.22 m2) in area is~~ shall be exempted from the *U*-factor requirement in Section 402.1.1. This exemption shall not apply to the U-factor alternative approach in Section 402.1.1 and the total U-factor alternative in Section 402.1.4.

PART II – IRC BUILDING/ENERGY

Revise as follows:

N1102.3.4 Opaque door exemption. One opaque side-hinged door assembly ~~side-hinged opaque door assembly up to 24 square feet (2.22 m2) in area is~~ shall be exempted from the *U*-factor requirement in Section 402.1.1. This exemption shall not apply to the U-factor alternative approach in Section 402.1.1 and the total U-factor alternative in Section 402.1.4

Reason: The current language limits the area of the exempt door allowed in section 402.1.1. Creation of a limitation on the exemption for opaque doors to a single 24 sf. door is arbitrary and restricts options for Architectural doors.

The proposed amendment would allow the reuse of reclaimed and /or salvaged materials as listed in section 603.2 of the ICC 700 the National Green Building Standard.

Cost Impact: The code change proposal will not increase the cost of construction.

EC77–09/10

402.3.7 (New), 502.3.3 (New); IRC N1102.3.7 (New)

Proponent: Thomas D. Culp, Ph.D., Birch Point Consulting LLC, representing Aluminum Extruders Council

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IECC COMMITTEE. PART II WILL BE HEARD BY THE IRC BUILDING/ENERGYCOMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IECC

Add new text as follows:

402.3.7 Recycled content credit. Fenestration shall be allowed to have a maximum U-factor 0.05 Btu/h·ft^2·ºF (0.28 W/m2·K) greater than that specified in Table 402.1.1 provided the framing material contains at least 50% recycled content as determined by a nationally recognized certification program, such as the MBDC Cradle to Cradle Certification Program or the ICC Sustainable Attributes Verification and Evaluation Program.

502.3.3 Recycled content credit. Fenestration shall be allowed to have a maximum U-factor 0.05 Btu/h·ft^2·ºF (0.28 W/m2·K) greater than that specified in Table 502.3 provided the framing material contains at least 50% recycled content as determined by a nationally recognized certification program, such as the MBDC Cradle to Cradle Certification Program or the ICC Sustainable Attributes Verification and Evaluation Program.

PART II – IRC ENERGY

Add new text as follows:

N1102.3.7 Recycled content credit. Fenestration shall be allowed to have a maximum U-factor 0.05 Btu/h·ft^2·ºF (0.28 W/m2·K) greater than that specified in Table 402.1.1 provided the framing material contains at least 50% recycled content as determined by a nationally recognized certification program, such as the MBDC Cradle to Cradle Certification Program or the ICC Sustainable Attributes Verification and Evaluation Program.

Reason: We are proposing a new credit for recycled content, in which a credit towards meeting the fenestration U-factor criteria could be earned by using a higher amount of recycled material in the framing of the product. There has been a commendable focus on reducing energy use, but we believe the committee should look more broadly for opportunities to promote both sustainability and energy savings in materials.

More efficient use of materials reduces the ecological impact of a building. This includes reduced landfill waste, as well as reduced energy and emissions associated with manufacturing, transportation, and disposal. Additionally, for certain materials, emissions associated with incineration and/or decomposition are of particular concern.

Promoting the use of recycled materials would result in specific embodied energy savings associated with the fenestration product. This is consistent with the goals of the IECC and IRC to promote significant and measurable energy savings, while recognizing equivalent functionality and performance of different product technologies. Although the focus needs to be on overall ecological impact and not just embodied energy savings, the embodied energy savings from the use of recycled materials can by itself be as significant as the energy savings from proposed reductions in U-factor, particularly in the south.

Cost Impact: The code change proposal will not increase the cost of construction.

3	from Equation 4-1
4 except Marine	110
5 and Marine 4	110
6	110
7	110
8	110

$$WFGA_{\max} = 110 \times \left(\frac{SHGC_{ref}}{SHGC_{prop}} \right)$$ **(Equation 4-1)**

where

$WFGA_{max}$ = maximum allowable west-facing glazing area (ft^2);
$SHGC_{ref}$ = glazed fenestration SHGC from Table 402.1.1; and
$SHGC_{prop}$ = the proposed glazed fenestration SHGC.

4. Revise as follows:

TABLE 405.5.2(1)
SPECIFICATIONS FOR THE STANDARD REFERENCE AND PROPOSED DESIGNS

BUILDING COMPONENT	STANDARD REFERENCE DESIGN	PROPOSED DESIGN
Glazing[a]	Total area[b] =	As proposed
	(c) The proposed glazing area; where the proposed glazing area is less than 15% of the conditioned floor area	
	(d) 15% of the conditioned floor area; where the proposed glazing area is 15% or more of the conditioned floor area	~~As proposed~~
	~~Orientation: equally distributed to four cardinal compass orientations (N, E, S, & W)~~	As proposed
	Glazing orientation:	
	Facing the West cardinal orientation, the smaller of	
	the proposed west-facing glazing area, or 110 ft^2	
	with the remainder equally distributed to the other three cardinal orientations (N, E, & S).	As proposed As proposed
	U-factor: from Table 402.1.3	
	SHGC: From Table 402.1 except that for climates with no requirement (NR) SHGC = 0.40 shall be used	Same as standard reference design
	Interior shade fraction:	
	Summer (all hours when cooling is required) = 0.70	As proposed
	Winter (all hours when heating is required) = 0.85[c]	
	External shading: none	

(Portions of table and footnotes not shown remain unchanged)

PART II – IRC BUILDING/ENERGY

1. Revise as follows:

R106.1.1 Information on construction documents. *Construction documents* shall be drawn upon suitable material. Electronic media documents are permitted to be submitted when *approved* by the *building official*. *Construction documents* shall be of sufficient clarity to indicate the location, nature and extent of the work proposed and show in detail that it will conform to the provisions of this code and relevant laws, ordinances, rules and regulations, as determined by the *building official.* Where required by the *building official*, all braced wall lines, shall be identified on the *construction documents* and all pertinent information including, but not limited to, cardinal directions, bracing methods, location and length of braced wall panels, foundation requirements of braced wall panels at top and bottom shall be provided.

2. Add new definitions as follows:

VERTICAL GLAZING. Glazing other than skylights.

WEST-FACING GLAZING AREA. The area of vertical glazing facing between 45 degrees south of west and 30 degrees north of west, inclusive.

3. Add new text and table as follows:

N1102.3.7 West-facing glazing area. West-facing glazing area shall not exceed that specified in Table N1102.3.7. For multifamily residential buildings, compliance shall be determined on the basis of an average west-facing glazing area per dwelling unit.

TABLE N1102.3.7
MAXIMUM ALLOWABLE WEST-FACING GLAZING AREA (ft^2)

CLIMATE ZONE	MAX WEST-FACING GLAZING AREA
1	from Equation 11-1
2	from Equation 11-1
3	from Equation 11-1
4 except Marine	110
5 and Marine 4	110
6	110
7	110
8	110

$$WFGA_{\max} = 110 \times \left(\frac{SHGC_{ref}}{SHGC_{prop}} \right) \qquad \textbf{(Equation 11-1)}$$

where

$WFGA_{max}$ = maximum allowable west-facing glazing area (ft^2);
$SHGC_{ref}$ = glazed fenestration SHGC from Table N1102.1.1; and
$SHGC_{prop}$ = the proposed glazed fenestration SHGC.

Reason: The purpose of the proposed change is to reduce detrimental solar gains in IECC-compliant residences.

Currently the code's treatment of such gains is limited to a maximum allowable solar heat gain coefficient (SHGC) in climate zones 1-3. That prescriptive limit, however, applies universally to glazing on all faces of the home, and is unable to distinguish detrimental solar gains from beneficial gains. Its lack of sensitivity to orientation means it is not useful in reducing detrimental solar gains in colder climates because doing so would also reduce advantageous solar heat gains.

The Simulated Performance Alternative of the IECC currently allows a full accounting of the effects of solar gains by orientation, but establishes an atypical baseline assumption of glazing equally distributed to the four cardinal directions.

The proposed change would both establish a prescriptive specification to specifically limit detrimental solar gains and, for the IECC, establish a more typical home configuration as the baseline for simulated performance compliance. It does so by establishing a simple limit on the area of glazing on the west face of a building. Expressing the limit in terms of area (ft^2) rather than percentage (e.g., of total glazing area or floor area) avoids a number of complications in the code and its enforcement, and has the desirable effect of giving builders a great deal of flexibility in meeting the requirements without substantial--if any--additional cost.

The proposed change has the effect of encouraging builders to orient streets and lot layouts to achieve advantageous solar access while being flexible enough to allow a portion of lots to have less favorable orientation to accommodate views, terrain, and the basic necessities of street layout.

Via careful street/lot design and careful choice of home designs for the lots that cannot be advantageously oriented, builders can achieve maximum cooling energy savings at no additional cost. Indeed, because the proposed change reduces peak cooling loads, in many cases the builder may experience lower costs resulting from downsizing of air conditioning equipment.

The details behind the proposal and a thorough analysis of its energy impacts, based on more than 180,000 hourly simulations, is available at:

www.energycodes.gov/codedevelop/pdfs/west-facing-glazing-TSD.pdf

That analysis shows that, depending on the details of the home and the specific approach chosen by the builder to comply with the west-facing glazing area limit, the proposed change will reduce cooling energy consumption by anywhere from a few percent to 15% or more. Peak cooling loads are reduced by a similar amount. Furthermore, there is no detrimental impact on heating energy consumption and the proposed change introduces no perverse incentives.

Cost Impact: The code change proposal will increase the cost of construction in some homes, decrease the cost of construction in other homes, and have no impact on the cost of construction in most homes.

Proponent: Ronald Majette, representing US Department of Energy

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IECC COMMITTEE. PART II WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IECC

1. Revise as follows:

402.4 Air leakage (Mandatory).

402.4.1 Building thermal envelope. The *building thermal envelope* shall comply with Sections 402.4.1.1 and 402.4.1.2. ~~be durably sealed to limit infiltration.~~ The sealing methods between dissimilar materials shall allow for differential expansion and contraction. ~~The following shall be caulked, gasketed, weatherstripped or otherwise sealed with an air barrier material, suitable film or solid material:~~

~~1. All joints, seams and penetrations.~~
~~2. Site-built windows, doors and skylights.~~
~~3. Openings between window and door assemblies and their respective jambs and framing.~~
~~4. Utility penetrations.~~
~~5. Dropped ceilings or chases adjacent to the thermal envelope.~~
~~6. Knee walls.~~
~~7. Walls and ceilings separating a garage from conditioned spaces.~~
~~8. Behind tubs and showers on exterior walls.~~
~~9. Common walls between dwelling units.~~
~~10. Attic access openings.~~
~~11. Rim joist junction.~~
~~12. Other sources of infiltration.~~

2. Add new text as follows:

402.4.1.1 Installation. The components of the *building thermal envelope* as listed in Table 402.4.1.1 shall be installed in accordance with the manufacturer's instructions and the criteria listed in Table 402.4.1.1, as applicable to the method of construction. Where required by the *code official*, an *approved* party shall inspect all components and verify compliance.

3. Revise as follows:

TABLE ~~402.4.2~~ 402.4.1.1
AIR BARRIER AND INSULATION ~~INSPECTION COMPONENT CRITERIA~~ INSTALLATION

COMPONENT	CRITERIA
Air barrier and thermal barrier	A continuous air barrier shall be installed in the building envelope. ~~Exterior thermal envelope insulation for framed walls is installed in substantial contact and continuous alignment with building envelope air barrier.~~ Breaks or joints in the air barrier ~~are filled or repaired~~ shall be sealed. Air permeable insulation ~~is~~ shall not be used as a sealing material. Any ~~A~~air permeable insulation shall be installed ~~is~~ inside of an air barrier.
Ceiling / attic	The air barrier in any dropped ceiling / soffit ~~is substantially~~ shall be aligned with the insulation and any gaps ~~are~~ in the air barrier sealed. ~~Attic access (except unvented attic), knee wall door, or drop down stair is sealed.~~ Access openings, drop down stairs or knee wall doors to unconditioned attic spaces shall be sealed.
Walls	Corners and headers shall be ~~are~~ insulated and the~~.~~ junction of the foundation and sill plate ~~is~~ shall be sealed. The junction of the top plate and top of exterior walls shall be sealed. Exterior thermal envelope insulation for framed walls shall be installed in substantial contact and continuous alignment with the air barrier. Knee walls shall be sealed.
Windows, skylights and doors	The space between window/door jambs and framing and skylights and framing ~~is~~ shall be sealed.
Rim joists	Rim joists ~~are~~ shall be insulated and include ~~an~~ the air barrier.
Floors (including above garage and cantilevered floors)	Insulation ~~is~~ shall be installed to maintain permanent contact with underside of subfloor decking. The air barrier ~~is~~ shall be installed at any exposed edge of insulation.
Crawlspace walls	Where provided in lieu of floor insulation, insulation ~~is~~ shall be permanently attached to the crawlspace walls. Exposed earth in unvented crawlspaces ~~is~~ shall be covered with a class I vapor retarder with overlapping joints taped.
Shafts, penetrations	Duct shafts, utility penetrations, ~~knee walls,~~ and flue shafts opening to exterior or unconditioned space ~~are~~ shall be sealed.
Narrow cavities	Batts in narrow cavities ~~are~~ shall be cut to fit, or narrow cavities ~~are~~ shall be filled by ~~spayed/blown~~ insulation that on installation readily conforms to the available cavity space.
Garage separation	Air sealing ~~is~~ shall be provided between the garage and conditioned spaces.
Recessed lighting	Recessed light fixtures installed in the building thermal envelope ~~are~~ shall be airtight, IC rated, and sealed to the drywall. ~~Exception: fixtures in conditioned space.~~
Plumbing and Wiring	~~Insulation is placed between outside and pipes.~~ Batt insulation ~~is~~ shall be cut neatly to fit around wiring and plumbing in exterior walls, or ~~sprayed/blown~~ insulation that on installation readily conforms to available space shall extend~~s~~ behind piping and wiring.
Shower / tub on exterior wall	Exterior walls adjacent to showers and tubs ~~on exterior walls~~ shall be ~~have~~ insulati~~on~~ed and ~~an~~ the air barrier installed separating them from the ~~exterior wall~~ showers and tubs.
Electrical / phone box on exterior walls	The air barrier ~~extends~~ shall be installed behind electrical or communication boxes or ~~an~~ air sealed ~~type~~ boxes ~~are~~ shall be installed.
Common wall	An air barrier ~~is~~ shall be installed in the common wall between dwelling units.
HVAC register boots	HVAC register boots that penetrate building thermal envelope ~~are~~ shall be sealed to the subfloor or drywall.
Fireplace	An air barrier shall be installed on fireplace walls. ~~include an air barrier.~~ Fireplaces shall have gasketed doors.

~~**402.4.2 Air sealing and insulation.** Building envelope air tightness and insulation installation shall be demonstrated to comply with one of the following options given by Section 402.4.2.1 or 402.4.2.2.~~

~~**402.4.2.1 Testing option.** Building envelope tightness and insulation installation shall be considered acceptable when tested air leakage is less than seven air changes per hour (ACH) when tested with a blower door at a pressure of 33.5 psf (50 Pa). Testing shall occur after rough in and after installation of penetrations of the building envelope, including penetrations for utilities, plumbing, electrical, ventilation and combustion appliances.~~

402.4.1.2 Testing. The building or dwelling unit shall be tested and verified as having an air leakage rate not exceeding 7 air changes per hour (ACH50) in Climate Zones 1 and 2, and 5 air changes per hour in Climate Zones 3 through 8. Testing shall be conducted with a blower door at a pressure of 0.2 inches w.g. (50 Pascals). Where required by the *code official*, testing shall be conducted by an *approved* party. A written report of the results of the test shall be signed by the party conducting the test and provided to the *code official*. Testing shall be performed at any time after rough in and creation of all penetrations of the *building thermal envelope*

Exception: Additions less than 1000 ft^2 are exempt from testing.

During testing:

1. Exterior windows and doors, fireplace and stove doors shall be closed, but not sealed~~;~~ beyond the intended weatherstripping or other infiltration control measures;
2. Dampers including exhaust, intake, makeup air, backdraft and flue dampers shall be closed, but not sealed, ~~including exhaust, intake, makeup air, backdraft and flue dampers~~ beyond intended infiltration control measures;
3. Interior doors, if installed at the time of test, shall be open;
4. Exterior openings for continuous ventilation systems and heat recovery ventilators shall be closed and sealed;
5. Heating and cooling system(s), if installed at the time of the test, shall be turned off; and
6. ~~HVAC ducts shall not be sealed; and~~

~~7~~ 6. Supply and return registers, if installed at the time of the test, shall ~~not~~ be ~~sealed~~ fully open.

3. Add new text as follows:

402.4.1.2.1 Sampling. Where groups of seven or more buildings of similar design and construction are completed and are issued occupancy permits during a 120-day period, or where a multifamily structure contains more than four dwelling units, testing of less than 100 percent, but not less than 15 percent, of the buildings from a specific builder and/or contractor or of dwelling units in a multifamily structure shall be permitted when *approved* by the *code official*. The specific buildings or dwelling units to be tested shall be selected by the *code official*. If any tested building or dwelling unit fails to comply with the maximum air leakage requirement in Section 402.4.1.2 then all buildings or dwelling units shall be tested until a minimum of three consecutive buildings or dwelling units comply from that specific builder and/or contractor or multifamily structure before the *code official* may permit sampling to resume.

4. Delete without substitution:

~~**402.4.2.2 Visual inspection option.** Building envelope tightness and insulation installation shall be considered acceptable when the items listed in Table 402.4.2, applicable to the method of construction, are field verified. Where required by the *code official*, an *approved* party independent from the installer of the insulation shall inspect the air barrier and insulation.~~

5. Revise as follows:

402.4.3 Fireplaces. New wood-burning fireplaces shall have ~~gasketed doors and~~ outdoor combustion air.

403.5 Mechanical ventilation (Mandatory). The building shall be provided with ventilation that meets the requirements of Section M1507 of the *International Residential Code* or with other approved means of ventilation. Outdoor air intakes and exhausts shall have automatic or gravity dampers that close when the ventilation system is not operating.

TABLE 405.5.2(1)
SPECIFICATIONS FOR THE STANDARD REFERENCE AND PROPOSED DESIGNS

BUILDING COMPONENT	STANDARD REFERENCE DESIGN	PROPOSED DESIGN
Air Exchange Rate	~~Specific leakage area (SLA)[d] = 0.00036~~ Air leakage rate of 7 air changes per hour in zones 1 and 2, and 5 air changes per hour in zones 3 through 8 at a pressure of 0.2 inches w.g. (50 Pa). ~~assuming no energy recovery~~. The mechanical ventilation rate shall be in addition to the air leakage rate and the same as in the proposed design, but no greater than 0.01 x *CFA* + 7.5 x (*Nbr*+1) where: *CFA* = conditioned floor area *Nbr* = number of bedrooms Energy recovery shall not be assumed for mechanical ventilation.	For residences that are not tested, the same air leakage rate as the standard reference design. ~~For residences without mechanical ventilation that are tested in accordance with ASHRAE 119, Section 5.1, the measured air exchange rate[e] but not less than 0.35 ACH~~ For tested residences ~~with mechanical ventilation that are tested in accordance with ASHRAE 119, Section 5.1~~, the measured air exchange rate[e] ~~combined with the proposed~~ mechanical ventilation rate, *f* ~~which shall not be less than 0.01 x *CFA* + 7.5 x (*Nbr*+1)~~ ~~where:~~ ~~*CFA* = conditioned floor area~~ ~~*Nbr* = number of bedrooms~~ The mechanical ventilation rate shall be in addition to the air leakage rate and shall be as proposed.

e. Where required by the *code official*, testing shall be conducted by an *approved* party. ~~Tested envelope leakage shall be determined and documented by an independent party approved by the *code official*.~~ Hourly calculations as specified in the ~~2001~~ASHRAE *Handbook of Fundamentals*~~, Chapter 26, page 26.21, Equation 40 (Sherman-Grimsrud model)~~ or the equivalent shall be used to determine the energy loads resulting from infiltration.

(Portions of table and footnotes not shown remain unchanged)

PART II – IRC BUILDING/ENERGY

1. Revise as follows:

N1102.4 Air leakage (Mandatory).

N1102.4.1 Building thermal envelope. The *building thermal envelope* shall comply with Sections N1102.4.1.1 and N1102.4.1.2. ~~be durably sealed to limit infiltration.~~ The sealing methods between dissimilar materials shall allow for differential expansion and contraction. ~~The following shall be caulked, gasketed, weatherstripped or otherwise sealed with an air barrier material, suitable film or solid material:~~

~~1. All joints, seams and penetrations.~~
~~2. Site-built windows, doors and skylights.~~
~~3. Openings between window and door assemblies and their respective jambs and framing.~~
~~4. Utility penetrations.~~
~~5. Dropped ceilings or chases adjacent to the thermal envelope.~~
~~6. Knee walls.~~
~~7. Walls and ceilings separating a garage from conditioned spaces.~~
~~8. Behind tubs and showers on exterior walls.~~
~~9. Common walls between dwelling units.~~
~~10. Attic access openings.~~
~~11. Rim joist junction.~~
~~12. Other sources of infiltration.~~

2. Add new text as follows:

N1102.4.1.1 Installation. The components of the *building thermal envelope* as listed in Table N1102.4.1.1 shall be

installed in accordance with the manufacturer's instructions and the criteria listed in Table N1102.4.1.1, as applicable to the method of construction. Where required by the *code official*, an *approved* party shall inspect all components and verify compliance.

3. Revise as follows:

TABLE N1102.4.~~2~~.1.1
AIR BARRIER AND INSULATION ~~INSPECTION COMPONENT CRITERIA~~ INSTALLATION

COMPONENT	CRITERIA
Air barrier and thermal barrier	A continuous air barrier shall be installed in the building envelope. ~~Exterior thermal envelope insulation for framed walls is installed in substantial contact and continuous alignment with building envelope air barrier.~~ Breaks or joints in the air barrier ~~are filled or repaired~~ shall be sealed. Air permeable insulation ~~is~~ shall not be used as a sealing material. Any air permeable insulation shall be installed ~~is~~ inside of an air barrier.
Ceiling / attic	The air barrier in any dropped ceiling / soffit ~~is substantially~~ shall be aligned with the insulation and any gaps ~~are~~ in the air barrier sealed. ~~Attic access (except unvented attic), knee wall door, or drop down stair is sealed.~~ Access openings, drop down stairs or knee wall doors to unconditioned attic spaces shall be sealed.
Walls	Corners and headers shall be ~~are~~ insulated and the~~.~~ junction of the foundation and sill plate ~~is~~ shall be sealed. The junction of the top plate and top of exterior walls shall be sealed. Exterior thermal envelope insulation for framed walls shall be installed in substantial contact and continuous alignment with the air barrier. Knee walls shall be sealed.
Windows, skylights and doors	The space between window/door jambs and framing and skylights and framing ~~is~~ shall be sealed.
Rim joists	Rim joists ~~are~~ shall be insulated and include ~~an~~ the air barrier.
Floors (including above garage and cantilevered floors)	Insulation ~~is~~ shall be installed to maintain permanent contact with underside of subfloor decking. The air barrier ~~is~~ shall be installed at any exposed edge of insulation.
Crawlspace walls	Where provided in lieu of floor insulation, insulation ~~is~~ shall be permanently attached to the crawlspace walls. Exposed earth in unvented crawlspaces ~~is~~ shall be covered with a class I vapor retarder with overlapping joints taped.
Shafts, penetrations	Duct shafts, utility penetrations, ~~knee walls,~~ and flue shafts opening to exterior or unconditioned space ~~are~~ shall be sealed.
Narrow cavities	Batts in narrow cavities ~~are~~ shall be cut to fit, or narrow cavities ~~are~~ shall be filled by ~~spayed/blown~~ insulation that on installation readily conforms to the available cavity space.
Garage separation	Air sealing ~~is~~ shall be provided between the garage and conditioned spaces.
Recessed lighting	Recessed light fixtures installed in the building thermal envelope ~~are~~ shall be airtight, IC rated, and sealed to the drywall. ~~Exception: fixtures in conditioned space.~~
Plumbing and Wiring	~~Insulation is placed between outside and pipes.~~ Batt insulation ~~is~~ shall be cut neatly to fit around wiring and plumbing in exterior walls, or ~~sprayed/blown~~ insulation that on installation readily conforms to available space shall extend~~s~~ behind piping and wiring.
Shower / tub on exterior wall	Exterior walls adjacent to showers and tubs ~~on exterior walls~~ shall be ~~have~~ insulati~~on~~ed and ~~an~~ the air barrier installed separating them from the ~~exterior wall~~ showers and tubs.
Electrical / phone box on exterior walls	The air barrier ~~extends~~ shall be installed behind electrical or communication boxes or ~~an~~ air sealed ~~type~~ boxes ~~are~~ shall be installed.
Common wall	An air barrier ~~is~~ shall be installed in the common wall between dwelling units.
HVAC register boots	HVAC register boots that penetrate building thermal envelope ~~are~~ shall be sealed to the subfloor or drywall.
Fireplace	An air barrier shall be installed on fireplace walls. ~~include an air barrier.~~ Fireplaces shall have gasketed doors.

~~**N1102.4.2 Air sealing and insulation.** Building envelope air tightness and insulation installation shall be demonstrated to comply with one of the following options given by Section N1102.4.2.1 or N1102.4.2.2.~~

~~**N1102.4.2.1 Testing option.** Building envelope tightness and insulation installation shall be considered acceptable when tested air leakage is less than seven air changes per hour (ACH) when tested with a blower door at a pressure of 33.5 psf (50 Pa). Testing shall occur after rough in and after installation of penetrations of the building envelope, including penetrations for utilities, plumbing, electrical, ventilation and combustion appliances.~~

N1102.4.1.2 Testing. The building or dwelling unit shall be tested and verified as having an air leakage rate not exceeding 7 air changes per hour (ACH50) in Climate Zones 1 and 2, and 5 air changes per hour in Climate Zones 3 through 8. Testing shall be conducted with a blower door at a pressure of 0.2 inches w.g. (50 Pascals). Where required by the *code official*, testing shall be conducted by an *approved* party. A written report of the results of the test shall be signed by the party conducting the test and provided to the *code official*. Testing shall be performed at any time after rough in and creation of all penetrations of the *building thermal envelope*

Exception: Additions less than 1000 ft^2 are exempt from testing.

During testing:

1. Exterior windows and doors, fireplace and stove doors shall be closed, but not sealed~~,~~ beyond the intended weatherstripping or other infiltration control measures;
2. Dampers including exhaust, intake, makeup air, backdraft and flue dampers shall be closed, but not sealed, ~~including exhaust, intake, makeup air, backdraft and flue dampers~~ beyond intended infiltration control measures;
3. Interior doors, if installed at the time of test, shall be open;
4. Exterior openings for continuous ventilation systems and heat recovery ventilators shall be closed and sealed;
5. Heating and cooling system(s), if installed at the time of the test, shall be turned off; and
6. ~~HVAC ducts shall not be sealed; and~~

~~7~~ 6. Supply and return registers, if installed at the time of the test, shall ~~not~~ be ~~sealed~~ fully open.

4. Add new text as follows:

N1102.4.1.2.1 Sampling. Where groups of seven or more buildings of similar design and construction are completed and are issued occupancy permits during a 120-day period, or where a multifamily structure contains more than four dwelling units, testing of less than 100 percent, but not less than 15 percent, of the buildings from a specific builder and/or contractor or of dwelling units in a multifamily structure shall be permitted when *approved* by the *code official*. The specific buildings or dwelling units to be tested shall be selected by the *code official*. If any tested building or dwelling unit fails to comply with the maximum air leakage requirement in Section N1102.4.1.2 then all buildings or dwelling units shall be tested until a minimum of three consecutive buildings or dwelling units comply from that specific builder and/or contractor or multifamily structure before the *code official* may permit sampling to resume.

5. Delete without substitution:

~~**N1102.4.2.2 Visual inspection option.** Building envelope tightness and insulation installation shall be considered acceptable when the items listed in Table N1102.4.2, applicable to the method of construction, are field verified. Where required by the *code official*, an *approved* party independent from the installer of the insulation shall inspect the air barrier and insulation.~~

6. Revise as follows:

N1102.4.3 Fireplaces. New wood-burning fireplaces shall have ~~gasketed doors and~~ outdoor combustion air.

N1103.5 Mechanical ventilation (Mandatory). The building shall be provided with ventilation that meets the requirements of Section M1507 of the *International Residential Code* or with other approved means of ventilation. Outdoor air intakes and exhausts shall have automatic or gravity dampers that close when the ventilation system is not operating.

Reason: The purpose of this proposal is to substantially improve the energy performance of residential buildings by reducing air infiltration. This proposal would require testing for envelope air leakage with associated maximum allowable leakage rates. The test is based on the air leakage through the building envelope as measured by air changes per hour when the building is pressurized to 50 Pascals. This is a commonly used metric

(for example, Energy Star uses ACH at 50 Pascals), there are other metrics such as specific leakage area that are acceptable as well and give similar results for most buildings.

The IECC and IRC already require the building envelope to be carefully sealed. The proposed maximum leakage rates are intended to insure proper enforcement of these sealing requirements.

Cost Impact: The code change proposal will increase the cost of construction.

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IECC COMMITTEE. PART II WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IECC

Add new text as follows:

402.4.2.1.1 Mechanical ventilation requirement. If a dwelling unit of a one- and two-family dwellings or multiple single-family dwellings (townhouses) not more than three stories in height is determined to have an infiltration rate of less than five air changes per hour (ACH) when tested in accordance with Section 402.4.2.1, whole-house mechanical ventilation shall be provided in accordance with Section M1507 of the *International Residential Code*. Any other dwelling unit that is determined to have an infiltration rate of less than five air changes per hour (ACH) when tested in accordance with Section 402.4.2.1 shall be provided with mechanical ventilation in accordance with the *International Mechanical Code*.

PART II – IRC BUILDING/ENERGY

Add new text as follows:

1102.4.2.1.1 Mechanical ventilation requirement. If a dwelling unit of a one- and two-family dwellings or multiple single-family dwellings (townhouses) not more than three stories in height is determined to have an infiltration rate of less than five air changes per hour (ACH) when tested in accordance with Section N1102.4.2.1, whole-house mechanical ventilation shall be provided in accordance with Section M1507.

Reason: Everyone can agree that when homes become "too" tight, they need mechanical ventilation. The question is, "how tight is too tight?" This code change proposal offers five air changes per hour at 50 Pascal as the "too tight" limit, and directs builders to provide mechanical ventilation at this point.

Why is whole-house mechanical ventilation needed?

Indoor air quality has direct impact on the health of building occupants. Poor indoor air quality is listed by the EPA as being the fourth largest environmental threat to our country.[1] A 2007 California study revealed formaldehyde exposure in most new homes is beyond limits recommended by the California Air Resources Board. Multiple studies have shown that relying on window operation to provide ventilation is not sufficient in practice.[2,3] If unchecked, pollutants from cleaning chemicals, finishes, furniture, and occupant activities can cause serious health effects on building occupants. Whole-house mechanical ventilation reduces occupant exposure to such pollutants.

Why 5 ACH 50?

Traditionally, 0.35 natural air changes per hour has been the consensus ventilation rate at which it is believed that sufficient fresh air is being provided to building occupants. This ventilation rate was typically achieved without mechanical ventilation because homes were built without an effective air barrier. As building practices have improved, homes have become tighter, and as homes become tighter, mechanical ventilation must be introduced to provide sufficient levels of ventilation.

ASHRAE Standard 136 was developed to enable calculation of natural air changes per hour as a function of air changes at various pressures. By following the calculation procedures in this standard, it can be shown that a natural infiltration rate of 0.35 air changes per hour is equivalent to somewhere between 7 ACH 50 to 10 ACH 50, depending on the local climatic conditions of the home. Because most dwellings are built this tight, ASHRAE 62.2 requires mechanical ventilation for all homes, with few exceptions. However, based on ASHRAE 136, a conservative code might prescribe whole-house mechanical ventilation for any home with an infiltration leakage rate of 10 ACH 50 or less.

As a second point of reference, California's 2005 Title 24 Chapter 6 requires that, "Continuous mechanical ventilation (either exhaust or supply ventilation) must be installed when the target SLA is below 3.0". California's SLA of 3.0 is roughly equivalent to 6 ACH 50. As a third point of reference, NAHB's National Green Building Standard requires whole-house mechanical ventilation when the infiltration rate falls below 5.0 ACH 50. This requirement provides clear recognition from a consensus standard that whole-house mechanical ventilation should be provided for all homes that meet this threshold.

Based on the previous references, there is broad consensus across states and within consensus standards that whole-house mechanical ventilation should be required when a dwelling's infiltration falls below 5.0 ACH 50.

What states are now requiring whole-house mechanical ventilation?

Several states now require mechanical ventilation in dwellings, including MN, VT, WA, CA, and ME.

Offermann, F.J., et al., "Window usage, ventilation, and formaldehyde concentrations in new California homes: summer field sessions", in IAQ 2007, Healthy and Sustainable Buildings. 2007, American Society of Heating Refrigerating, and Air Conditioning Engineers, Inc.: Baltimore, MD. p. 497-526 (preprints); http://www.iee-sf.com/pdf/SummerFieldResults.pdf

Cost Impact: Where homes have infiltration rates less than 5.0 ACH 50, and those homes are not already providing whole-house mechanical ventilation, the cost of construction will increase.

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IECC COMMITTEE. PART II WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IECC

1. Add new definition as follows:

SPECIFIC LEAKAGE AREA (SLA). The air leakage area (L) per conditioned floor area (CFA) of a home (L/CFA), where leakage area (L) is defined in accordance with Section 5.1 of ASHRAE 119 and where L and CFA are in the same units.

2. Revise as follows:

402.4.1 Building thermal envelope. The *building thermal envelope* shall comply with Section 402.4.2 and be durably sealed to limit infiltration. The sealing methods between dissimilar materials shall allow for differential expansion and contraction. The following shall be caulked, gasketed, weatherstripped or otherwise sealed with an air barrier material, suitable film or solid material:

1. All joints, seams and penetrations.
2. Site-built windows, doors and skylights.
3. Openings between window and door assemblies and their respective jambs and framing.
4. Utility penetrations.
5. Dropped ceilings or chases adjacent to the thermal envelope.

6. Knee walls.
7. Walls and ceilings separating a garage from conditioned spaces.
8. Behind tubs and showers on exterior walls.
9. Common walls between dwelling units.
10. Attic access openings.
11. Rim joist junction.
12. Other sources of infiltration.

402.4.2 Air sealing and insulation. The components of the *building thermal envelope* as listed in Table 402.4.2 shall be installed in accordance with the manufacturer's instructions and the criteria listed in Table 402.4.2, as applicable to the method of construction. Building envelope air tightness and insulation installation shall be demonstrated to comply with ~~one of~~ the ~~following options given~~ requirements established by Section 402.4.2.1 ~~or~~ and 402.4.2.2:

402.4.2.1 Performance testing requirement ~~option.~~ The building shall meet the air leakage standard set forth below as demonstrated by an air leakage test conducted as specified below:

1. Building envelope tightness ~~and insulation installation~~ shall be ~~considered acceptable when~~ tested by a party *approved* by the code official. Where required by the code official, the *approved* party shall be independent from both the builder and any other entity responsible for installing the insulation and air barrier and otherwise sealing the building. A written report specifying the results of the test and attesting to the accuracy of the results shall be signed by the party conducting the testing and provided to the builder and *code official*.
2. The building shall be required to have an air leakage ~~is~~ less than 0.00030 *specific leakage area (SLA)* ~~seven air changes per hour (ACH)~~ when tested with a blower door at a pressure of 33.5 psf (50 Pa). Testing shall occur any time after rough in and after (i) installation of all penetrations of the building envelope, including penetrations for utilities, plumbing, electrical, ventilation, and combustion appliances, and (ii) completion of sealing of the *building thermal envelope* as required in section 402.4.1.
3. During testing:
    1. Exterior windows and doors, fireplace and stove doors shall be closed, but not sealed beyond the weather-stripping, caulking and other intended permanent air infiltration control measures;
    2. Dampers shall be closed, but not sealed, including exhaust, intake, makeup air, backdraft, fireplace and flue dampers beyond intended permanent air infiltration control measures;
    3. Interior doors connecting conditioned spaces shall be open, doors connecting to unconditioned spaces closed but not sealed;
    4. Exterior openings for continuous ventilation systems and heat recovery ventilators shall be closed and sealed;
    5. Heating and cooling system(s) shall be turned off;
    ~~6. HVAC ducts systems shall not be sealed; and~~
    ~~7~~ 6. Supply and return registers shall be fully open at the time of the test ~~not be sealed~~.

        Exception: Multi-family residential buildings, with more than four dwelling units per building, may be individually exempted from the testing requirement only when meeting all of the following requirements:

        1. The exemption is approved by the *code official* after inspection of the sealing of thermal envelope in accordance with Section 402.4.1 and Table 402.4.2;
        2. At least 15 percent of the units are tested to have an air leakage less than 0.00036 *specific leakage area (SLA)* when tested with a blower door at a pressure of 33.5 psf (50 Pa), with the units to be tested specified by the code official; and
        3. The tests demonstrate compliance for such units.

When any tested dwelling unit subject to this exception fails to meet the maximum air leakage requirement stated in Section 402.4.2.1, then the builder must resolve any leakage problems so that such unit passes the test and then must continue to test each additional dwelling unit in such building until a minimum of three consecutive dwelling units pass the test before the builder can return to testing as specified in subpart (ii) of this Exception.

402.4.2.2 Visual insulation inspection ~~option~~ (Mandatory). Building envelope ~~tightness and~~ insulation installation shall be ~~considered acceptable when the items listed in Table 402.4.2, applicable to the method of construction, are~~ field verified to meet the Insulation Installation Criteria in Table 402.4.2. Where required by the *code official*, an *approved* party independent from the builder and the installer of the insulation, shall inspect the ~~air barrier and~~ insulation; in such case, a written inspection report, including a checklist demonstrating compliance shall be provided to the *code official* and builder before interior finish materials are applied.

3. Add new text as follows:

402.4.2.3 Visual air barrier inspection. For any building or dwelling unit not required to be tested under section 402.4.2.1, building envelope tightness shall be field verified to meet the Air Barrier Criteria in Table 402.4.2. Where required by the *code official*, an *approved* party independent from the builder and the installer of any air barrier materials, shall inspect the air barrier; in such case, a written inspection report, including a checklist demonstrating compliance shall be provided to the *code official* and builder before interior finish materials are applied. In cases where the building or dwelling unit satisfies the testing requirement of section 402.4.2.1, the *code official* may also require field verification to show that the building meets the Air Barrier Criteria if deemed necessary.

4. Delete Table 402.4.2 and substitute as follows:

~~**TABLE 402.4.2**~~
~~**AIR BARRIER AND INSULATION INSPECTION COMPONENT CRITERIA**~~

TABLE 402.4.2
VISUAL AIR BARRIER AND INSULATION INSPECTION

COMPONENT	INSULATION INSTALLATION CRITERIA	AIR BARRIER CRITERIA
General Requirements	Exterior thermal envelope insulation for framed walls is installed in substantial contact and continuous alignment with building envelope air barrier.	A continuous air barrier is installed in the thermal envelope. Breaks or joints in the air barrier are sealed. Air permeable insulation is not used as a sealing material.
Ceiling / attic	In any dropped ceiling/soffit, the insulation is substantially aligned with the air barrier.	Air barrier in any dropped ceiling / soffit is substantially aligned with insulation and any gaps are sealed. Attic access, knee wall door or drop down stair to unconditioned attic is sealed.
Walls	All corners and headers are insulated. Insulation is in substantial contact and continuous alignment with air barrier.	Junction of foundation and sill plate is sealed. Junction of exterior wall and top plate is sealed. Junction of the exterior wall and floor sheathing is sealed. Knee wall is sealed.
Fenestration		Space between fenestration jambs and framing is sealed.
Rim joists	Rim joists are insulated.	Air barrier is installed at the rim joist.
Floors (including above garage and cantilevered floors)	Insulation is installed to maintain permanent contact with underside of subfloor decking.	Air barrier is installed at any exposed edge of insulation.
Crawl space walls	Insulation is permanently attached to walls.	Exposed earth in unvented crawlspaces is covered with Class I vapor retarder with overlapping joints taped.
Shafts, penetrations		Duct shafts, utility penetrations, knee walls, and flue shafts opening to exterior or unconditioned space are sealed.
Narrow cavities	Batts in narrow cavities are cut to fit; narrow cavities are filled by sprayed/blown insulation.	
Garage separation		Air sealing is provided between the garage and conditioned spaces.

COMPONENT	INSULATION INSTALLATION CRITERIA	AIR BARRIER CRITERIA
Recessed lighting		Recessed light fixtures installed in the building thermal envelope are airtight, IC rated, and sealed to drywall.
Plumbing and Wiring	Insulation is placed between the exterior of the wall assembly and pipes. Batt insulation is cut and fitted around wiring and plumbing, or sprayed/blown insulation extends between piping and wiring and to the exterior of the wall assembly.	All plumbing and wiring penetrations shall be sealed to the air barrier.
Shower / tub on exterior wall	Exterior walls adjacent to showers and tubs have insulation filling any gaps or voids between tub or shower walls and unconditioned space.	Exterior walls adjacent to showers and tubs have an air barrier separating the exterior wall from the shower and tubs.
Electrical / phone box on exterior walls	Insulation completely fills voids between the box and exterior sheathing	Air barrier extends behind boxes or air sealed type boxes are installed.
Common wall		Air barrier is installed in common wall between dwelling units.
HVAC register boots		HVAC register boots that penetrate building envelope are sealed to subfloor or drywall.
Fireplace		Air barrier is installed on fireplace walls. Fireplace shall have gasketed doors.

PART II – IRC BUILDING/ENERGY

1. Add new definition as follows:

SPECIFIC LEAKAGE AREA (SLA). The air leakage area (L) per conditioned floor area (CFA) of a home (L/CFA), where leakage area (L) is defined in accordance with Section 5.1 of ASHRAE 119 and where L and CFA are in the same units.

2. Revise as follows:

N1102.4.1 Building thermal envelope. The *building thermal envelope* shall comply with Section N1102.4.2 and be durably sealed to limit infiltration. The sealing methods between dissimilar materials shall allow for differential expansion and contraction. The following shall be caulked, gasketed, weatherstripped or otherwise sealed with an air barrier material, suitable film or solid material.

1. All joints, seams and penetrations.
2. Site-built windows, doors and skylights.
3. Openings between window and door assemblies and their respective jambs and framing.
4. Utility penetrations.
5. Dropped ceilings or chases adjacent to the thermal envelope.
6. Knee walls.
7. Walls and ceilings separating a garage from conditioned spaces.
8. Behind tubs and showers on exterior walls.
9. Common walls between dwelling units.
10. Attic access openings.
11. Rim joist junction.
12. Other sources of infiltration.

N1102.4.2 Air sealing and insulation. The components of the *building thermal envelope* as listed in Table N1102.4.2 shall be installed in accordance with the manufacturer's instructions and the criteria listed in Table N1102.4.2, as applicable to the method of construction. Building envelope air tightness and insulation installation shall be demonstrated to comply with ~~one of~~ the ~~following options given~~ requirements established by Section N1102.4.2.1 ~~or~~ and N1102.4.2.2.

N1102.4.2.1 Performance testing requirement ~~option~~. The building shall meet the air leakage standard set forth below as demonstrated by an air leakage test conducted as specified below:

1. Building envelope tightness shall be tested by a party *approved* by the code official. Where required by the building official, the *approved* party shall be independent from both the builder and any other entity responsible for installing the insulation and air barrier and otherwise sealing the building. A written report specifying the results of the test and attesting to the accuracy of the results shall be signed by the party conducting the testing and provided to the builder and *building official*.
2. ~~Tested~~ The building shall be required to have an air leakage ~~is~~ less than 0.00030 *specific leakage area (SLA)* ~~7 ACH~~ when tested with a blower door at a pressure of 33.5 psf (50 Pa) ~~pascals (0.007 psi)~~. Testing shall occur any time after rough in and after (i) installation of all penetrations of the building envelope, including penetrations for utilities, plumbing, electrical, ventilation, and combustion appliances, and (ii) completion of sealing of the *building thermal envelope* as required in section N1102.4.1.

3. During testing:

    1. Exterior windows and doors, fireplace and stove doors shall be closed, but not sealed beyond the weather-stripping, caulking and other intended permanent air infiltration control measures;
    2. Dampers shall be closed, but not sealed, including exhaust, intake, makeup air, backdraft, fireplace and flue dampers beyond intended permanent air infiltration control measures;
    3. Interior doors connecting conditioned spaces shall be open, doors connecting to unconditioned spaces closed but not sealed;
    4. Exterior openings for continuous ventilation systems and heat recovery ventilators shall be closed and sealed;
    5. Heating and cooling system(s) shall be turned off;
    ~~6. HVAC ducts systems shall not be sealed; and~~
    ~~7~~ 6. Supply and return registers shall be fully open at the time of the test ~~not be sealed~~.

        Exception: Multi-family residential buildings, with more than four dwelling units per building, may be individually exempted from the testing requirement only when meeting all of the following requirements:

        1. The exemption is approved by the *building official* after inspection of the sealing of thermal envelope in accordance with section N1102.4.1 and Table N1102.4.2;
        2. At least 15 percent of the units are tested to have an air leakage less than 0.00036 *specific leakage area (SLA)* when tested with a blower door at a pressure of 33.5 psf (50 Pa), with the units to be tested specified by the code official; and
        3. The tests demonstrate compliance for such units.

When any tested dwelling unit subject to this exception fails to meet the maximum air leakage requirement stated in Section N1102.4.2.1, then the builder must resolve any leakage problems so that such unit passes the test and then must continue to test each additional dwelling unit in such building until a minimum of three consecutive dwelling units pass the test before the builder can return to testing as specified in subpart (ii) of this Exception.

N1102.4.2.2 Visual insulation inspection ~~option~~. ~~The items listed in Table N1102.4.2, applicable to the method of construction, are~~ Building envelope insulation installation shall be field verified to meet the Insulation Installation Criteria in Table N1102.4.2. Where required by the building official, an *approved* party independent from the builder and the installer of the insulation, shall inspect the ~~air barrier and~~ insulation; in such case, a written inspection report, including a checklist demonstrating compliance shall be provided to the *building official* and builder before interior finish materials are applied.

3. Add new text as follows:

N1102.4.2.3 Visual air barrier inspection. For any building or dwelling unit not required to be tested under Section N1102.4.2.1, building envelope tightness shall be field verified to meet the Air Barrier Criteria in Table N1102.4.2. Where required by the *building official*, an *approved* party independent from the builder and the installer of any air barrier materials, shall inspect the air barrier; in such case, a written inspection report, including a checklist demonstrating compliance shall be provided to the *building official* and builder before interior finish materials are applied. In cases where the building or dwelling unit satisfies the testing requirement of Section N1102.4.2.1, the *building official* may also require field verification to show that the building meets the Air Barrier Criteria if deemed necessary.

4. Delete Table N1102.4.2 and substitute as follows:

~~**TABLE N1102.4.2**~~
~~**AIR BARRIER AND INSULATION INSPECTION**~~

TABLE N1102.4.2
VISUAL AIR BARRIER AND INSULATION INSPECTION

COMPONENT	INSULATION INSTALLATION CRITERIA	AIR BARRIER CRITERIA
General Requirements	Exterior thermal envelope insulation for framed walls shall be installed in substantial contact and continuous alignment with building envelope air barrier.	A continuous air barrier is installed in the thermal envelope. Breaks or joints in the air barrier are sealed. Air permeable insulation is not used as a sealing material.
Ceiling / attic	In any dropped ceiling/soffit, the insulation shall be substantially aligned with the air barrier.	Air barrier in any dropped ceiling / soffit is substantially aligned with insulation and any gaps are sealed. Attic access, knee wall door or drop down stair to unconditioned attic is sealed.
Walls	All corners and headers are insulated. Insulation shall be substantial contact and continuous alignment with air barrier.	Junction of foundation and sill plate is sealed. Junction of exterior wall and top plate is sealed. Junction of the exterior wall and floor sheathing is sealed. Knee wall is sealed.
Fenestration		Space between fenestration jambs and framing is sealed.
Rim joists	Rim joists are insulated.	Air barrier is installed at the rim joist.
Floors (including above garage and cantilevered floors)	Insulation is installed to maintain permanent contact with underside of subfloor decking.	Air barrier is installed at any exposed edge of insulation.
Crawl space walls	Insulation is permanently attached to walls.	Exposed earth in unvented crawlspaces is covered with Class I vapor retarder with overlapping joints taped.
Shafts, penetrations		Duct shafts, utility penetrations, knee walls, and flue shafts opening to exterior or unconditioned space are sealed.
Narrow cavities	Batts in narrow cavities are cut to fit; narrow cavities shall be filled by sprayed/blown insulation.	
Garage separation		Air sealing is provided between the garage and conditioned spaces.
Recessed lighting		Recessed light fixtures installed in the building thermal envelope are airtight, IC rated, and sealed to drywall.
Plumbing and Wiring	Insulation shall be placed between the exterior of the wall assembly and pipes. Batt insulation is cut and fitted around wiring and plumbing, or sprayed/blown insulation extends between piping and wiring and to the exterior of the wall assembly.	All plumbing and wiring penetrations shall be sealed to the air barrier.
Shower / tub on exterior wall	Exterior walls adjacent to showers and tubs have insulation filling any gaps or voids between tub or shower walls and unconditioned space.	Exterior walls adjacent to showers and tubs have an air barrier separating the exterior wall from the shower and tubs.
Electrical / phone box on exterior walls	Insulation completely fills voids between the box and exterior sheathing	Air barrier extends behind boxes or air sealed type boxes are installed.
Common wall		Air barrier is installed in common wall between dwelling units.
HVAC register boots		HVAC register boots that penetrate building envelope are sealed to subfloor or drywall.
Fireplace		Air barrier is installed on fireplace walls. Fireplace shall have gasketed doors.

Reason: Properly controlling air leakage and properly installing insulation are both critical to achieving additional energy savings in homes. In particular, reasonable control of air leakage can have an enormous positive effect on building energy efficiency. Since the builder is already required to properly install insulation and seal the building, the only true incremental cost is the cost of testing and inspection. This cost is fairly small compared to the benefits of proper sealing and insulation installation.

The changes approved in the 2009 *IECC* and *IRC* in this area improved existing code language by setting out clear steps for inspection and offering a testing option for air leakage. We are submitting this proposed modification because we believe that the code language and requirements can be substantially improved. For example, while the testing option as written will address air leakage (if this option is utilized), it does not address proper insulation installation. On the other hand, the inspection option does not guarantee reduced air leakage; the only way to guarantee it is to require testing.

In order to address these important issues, the proposed modification includes the following major improvements:

1. Makes both testing (with a written report) and a more limited visual inspection required;
2. Permits the code official to require independent testing and inspection with written reports;
3. Reduces the burden on code officials by reducing their inspection requirements by eliminating those requirements no longer necessary as a result of the test;
4. Replaces air changes per hour (ACH) with Specific Leakage Area (SLA), a more accurate and consistent measure, as the standard, improves the testing protocol and requires better air leakage performance; and
5. Separates the insulation installation inspection criteria from the air barrier inspection criteria to allow for each to be required or exempted based on the whether testing is conducted.

These changes will make this code change more enforceable and a substantial improvement in energy efficiency over the language in the current code. The following table portrays estimated savings from these measures:

	Climate Zone 1	Climate Zone 2	Climate Zone 3	Climate Zone 4	Climate Zone 4M	Climate Zone 5	Climate Zone 6	Climate Zone 7	Climate Zone 8
Heating, Cooling, Hot Water Purchased Energy Cost Percent Savings	2.1%	3.2%	4.0%	6.3%	6.2%	7.4%	11.7%	9.2%	8.6%
Total Purchased Energy Cost Percent Savings (also including major appliances and lighting)	1.5%	2.3%	2.9%	4.8%	4.8%	5.6%	9.3%	7.0%	6.8%

These energy savings are among the largest of the package of proposals submitted by the EECC. It is thus especially crucial to attaining the overall goal of improving the IECC by 30%.

This proposal also requires multifamily housing in excess of four units to be tested to a testing requirement. However in recognition of the differences in this type of housing, the requirement is 20% less stringent than a single family home to account for leakage to other conditioned space. The multifamily testing exemption also allows for sampling of 15% of the units similar to other sampling procedures by ENERGY STAR and RESNET due to issues related to testing larger multifamily buildings.

Cost Impact: The code change proposal will increase the cost of construction.

Proponent: Theresa Weston, PhD., representing DuPont Building Innovations

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IECC COMMITTEE. PART II WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IECC

1. Revise as follows:

402.4.1 Building thermal envelope. The *building thermal envelope* shall be durably sealed to limit infiltration. The sealing methods between dissimilar materials shall allow for differential expansion and contraction. The following shall be caulked, gasketed, weatherstripped or otherwise sealed with an air barrier material, suitable film or solid material:

1. All joints, seams and penetrations.
2. Site-built windows, doors and skylights.
3. Openings between window and door assemblies and their respective jambs and framing.
4. Utility penetrations.
5. Dropped ceilings or chases adjacent to the thermal envelope.

6. Knee walls.
7. Walls and ceilings separating a garage from conditioned spaces
8. Behind tubs and showers on exterior walls.
9. Common walls between dwelling units.
10. Attic access openings.
11. Rim joist junction.
12. Junction of the foundation and sill plate.
13. Junction of the top plate and the interior wall.
14. Any exposed edge of insulation.
15. Fireplace walls.
~~12~~.16. Other sources of infiltration.

402.4.2 Air sealing and insulation installation. The components of the *building thermal envelope* listed in Section 402.4.1 shall be installed in accordance with the manufacturer's instructions and following criteria, as applicable to the method of construction:

1. Exterior thermal envelope insulation for framed walls shall be installed in substantial contact and alignment with building envelope air barrier.
2. Breaks or joints in the air barrier shall be filled or sealed.
3. Air permeable insulation shall not be used as a sealing material.
4. Air permeable insulation shall be enclosed in an air barrier.
5. Insulation to be installed in non-standard framing cavity spaced shall be cut to fit the cavity or the cavity shall be insulated with insulation that will readily conform to the cavity.
6. Recessed light fixtures that penetrate the building envelope shall be airtight, IC rated, and sealed to the drywall.

Building envelope air tightness and insulation installation shall be demonstrated to comply with ~~one of the following options given by~~ Sections 402.4.2.1 ~~or~~ and 402.4.2.2:

402.4.2.1 Whole building testing ~~option~~. Building envelope tightness and insulation installation shall be considered acceptable when tested to have a maximum specific leakage area (SLA) = 0.00036. Testing shall be in accordance with ASHRAE 119 Section 5.1.~~air leakage is less than seven air changes per hour (ACH) when tested with a blower door at a pressure of 33.5 psf (50 Pa).~~ Testing shall occur after rough in and after installation of penetrations of the building envelope, including penetrations for utilities, plumbing, electrical, ventilation and combustion appliances.

~~During testing:~~

~~1. Exterior windows and doors, fireplace and stove doors shall be closed, but not sealed;~~
~~2. Dampers shall be closed, but not sealed, including exhaust, intake, makeup air, backdraft and flue dampers;~~
~~3. Interior doors shall be open;~~
~~4. Exterior openings for continuous ventilation systems and heat recovery ventilators shall be closed and sealed;~~
~~5. Heating and cooling system(s) shall be turned off;~~
~~6. HVAC ducts shall not be sealed; and~~
~~7. Supply and return registers shall not be sealed~~.

402.4.2.2 Visual inspection ~~option~~. Building envelope tightness and insulation installation shall be considered acceptable when the ~~items~~ areas listed in ~~Table 402.4.2~~ Section 402.4.1 are installed as described in Section 402.4.2, ~~applicable to the method of construction,~~ are field verified. Where required by the *code official*, an *approved* party independent from the installer of the insulation shall inspect the air barrier and insulation.

2. Delete table without substitution:

~~**TABLE 402.4.2**~~
~~**AIR BARRIER AND INSULATION INSPECTION COMPONENT CRITERIA**~~

~~**COMPONENT**~~	~~**CRITERIA**~~
~~Air barrier and thermal barrier~~	~~Exterior thermal envelope insulation for framed walls is installed in substantial contact and continuous alignment with building envelope air barrier. Breaks or joints in the air barrier are filled or repaired. Air-permeable insulation is not used as a sealing material. Air-permeable insulation is inside of an air barrier.~~
~~Ceiling/attic~~	~~Air barrier in any dropped ceiling/soffit is substantially aligned with insulation and any gaps are sealed. Attic access (except unvented attic), knee wall door, or drop down stair is sealed.~~
~~Walls~~	~~Corners and headers are insulated. Junction of foundation and sill plate is sealed.~~
~~Windows and doors~~	~~Space between window/door jambs and framing is sealed.~~
~~Rim joists~~	~~Rim joists are insulated and include an air barrier.~~
~~Floors (including above-garage and cantilevered floors)~~	~~Insulation is installed to maintain permanent contact with underside of subfloor decking. Air barrier is installed at any exposed edge of insulation.~~
~~Crawl space walls~~	~~Insulation is permanently attached to walls. Exposed earth in unvented crawl spaces is covered with Class I vapor retarder with overlapping joints taped.~~
~~Shafts, penetrations~~	~~Duct shafts, utility penetrations, knee walls and flue shafts opening to exterior or unconditioned space are sealed.~~
~~Narrow cavities~~	~~Batts in narrow cavities are cut to fit, or narrow cavities are filled by sprayed/blown insulation.~~
~~Garage separation~~	~~Air sealing is provided between the garage and conditioned spaces.~~
~~Recessed lighting~~	~~Recessed light fixtures are air tight, IC rated, and sealed to drywall. Exception – fixtures in conditioned space.~~
~~Plumbing and wiring~~	~~Insulation is placed between outside and pipes. Batt insulation is cut to fit around wiring and plumbing, or sprayed/blown insulation extends behind piping and wiring.~~
~~Shower/tub on exterior wall~~	~~Showers and tubs on exterior walls have insulation and an air barrier separating them from the exterior wall.~~
~~Electrical/phone box on exterior walls~~	~~Air barrier extends behind boxes or air sealed type boxes are installed.~~
~~Common wall~~	~~Air barrier is installed in common wall between dwelling units.~~
~~HVAC register boots~~	~~HVAC register boots that penetrate building envelope are sealed to subfloor or drywall.~~
~~Fireplace~~	~~Fireplace walls include an air barrier.~~

PART II – IRC BUILDING/ENERGY

1. Revise as follows:

N1102.4.1 Building thermal envelope. The *building thermal envelope* shall be durably sealed to limit infiltration. The sealing methods between dissimilar materials shall allow for differential expansion and contraction. The following shall be caulked, gasketed, weatherstripped or otherwise sealed with an air barrier material, suitable film or solid material.

1. All joints, seams and penetrations.
2. Site-built windows, doors and skylights.
3. Openings between window and door assemblies and their respective jambs and framing.
4. Utility penetrations.
5. Dropped ceilings or chases adjacent to the thermal envelope.
6. Knee walls.
7. Walls and ceilings separating the garage from *conditioned spaces*.
8. Behind tubs and showers on *exterior walls*.
9. Common walls between *dwelling units*.

10. Attic access openings.
11. Rim joists junction.
12. Junction of the foundation and sill plate.
13. Junction of the top plate and the interior wall.
14. Any exposed edge of insulation.
15. Fireplace walls.
~~12.~~16. Other sources of infiltration.

N1102.4.2 Air sealing and insulation installation. The components of the *building thermal envelope* listed in Section N1102.4.1 shall be installed in accordance with the manufacturer's instructions and following criteria, as applicable to the method of construction:

1. Exterior thermal envelope insulation for framed walls shall be installed in substantial contact and alignment with building envelope air barrier.
2. Breaks or joints in the air barrier shall be filled or sealed.
3. Air permeable insulation shall not be used as a sealing material.
4. Air permeable insulation shall be enclosed in an air barrier.
5. Insulation to be installed in non-standard framing cavity spaced shall be cut to fit the cavity or the cavity shall be insulated with insulation that will readily conform to the cavity.
6. Recessed light fixtures that penetrate the building envelope shall be airtight, IC rated, and sealed to the drywall.

Building envelope air tightness and insulation installation shall be demonstrated to comply with ~~one of the following options given by~~ Sections N1102.4.2.1 ~~or~~ and N1102.4.2.2:

N1102.4.2.1 Whole building testing ~~option~~. ~~Tested air leakage is less than 7 ACH when tested with a blower door at a pressure of 50 pascals (0.007 psi).~~ Building envelope tightness and insulation installation shall be considered acceptable when tested to have a maximum specific leakage area (SLA) = 0.00036. Testing shall be in accordance with ASHRAE 119 Section 5.1. Testing shall occur after rough in and after installation of penetrations of the building envelope, including penetrations for utilities, plumbing, electrical, ventilation and combustion appliances.

~~During testing:~~

~~1. Exterior windows and doors, fireplace and stove doors shall be closed, but not sealed;~~
~~2. Dampers shall be closed, but not sealed; including exhaust, intake, makeup air, back draft, and flue dampers;~~
~~3. Interior doors shall be open;~~
~~4. Exterior openings for continuous ventilation systems and heat recovery ventilators shall be closed and sealed;~~
~~5. Heating and cooling system(s) shall be turned off;~~
~~6. HVAC ducts shall not be sealed; and~~
~~7. Supply and return registers shall not be sealed.~~

N1102.4.2.2 Visual inspection ~~option.~~ Building envelope tightness and insulation installation shall be considered acceptable when the areas listed in Section N1102.4.1 are installed as described in Section N1102.4.2 ~~The items listed in Table N1102.4.2, applicable to the method of construction,~~ are field verified. Where required by the code official, an *approved* party independent from the installer of the insulation, shall inspect the air barrier and insulation.

2. Delete without substitution:

~~TABLE N1102.4.2~~
~~AIR BARRIER AND INSULATION INSPECTION COMPONENT CRITERIA~~

~~COMPONENT~~	~~CRITERIA~~
~~Air barrier and thermal barrier~~	~~Exterior thermal envelope insulation for framed walls is installed in substantial contact and continuous alignment with building envelope air barrier. Breaks or joints in the air barrier are filled or repaired. Air-permeable insulation is not used as a sealing material.~~
~~Ceiling/attic~~	~~Air barrier in any dropped ceiling/soffit is substantially aligned with insulation and any gaps are sealed Attic access (except unvented attic), knee wall door, or drop down stair is sealed.~~
~~Walls~~	~~Corners and headers are insulated. Junction of foundation and sill plate is sealed.~~
~~Windows and doors~~	~~Space between window/door jambs and framing is sealed.~~
~~Rim joists~~	~~Rim joists are insulated and include an air barrier.~~
~~Floors (including above garage and cantilevered floors)~~	~~Insulation is installed to maintain permanent contact with underside of subfloor decking. Air barrier is installed at any exposed edge of floor.~~
~~Crawlspace walls~~	~~Insulation is permanently attached to walls. Exposed earth in unvented crawlspaces is covered with Class I vapor retarder with overlapping joints taped.~~
~~Shafts, penetrations~~	~~Duct shafts, utility penetrations, knee walls and flue shafts opening to exterior or unconditioned space are sealed.~~
~~Narrow cavities~~	~~Batts in narrow cavities are cut to fit, or narrow cavities are filled by sprayed/blown insulation.~~
~~Garage separation~~	~~Air sealing is provided between the garage and conditioned spaces.~~
~~Recessed lighting~~	~~Recessed light fixtures are airtight, IC rated and sealed to drywall. Exception – fixtures in conditioned space.~~
~~Plumbing and wiring~~	~~Insulation is placed between outside and pipes. Batt insulation is cut to fit around wiring and plumbing, or sprayed/blown insulation extends behind piping and wiring.~~
~~Shower/tub on exterior wall~~	~~Showers and tubs on exterior walls have insulation and an air barrier separating them from the exterior wall.~~
~~Electrical/phone box on exterior wall~~	~~Air barrier extends behind boxes or air sealed type boxes are installed.~~
~~Common wall~~	~~Air barrier is installed in common wall between dwelling units.~~
~~HVAC register boots~~	~~HVAC register boots that penetrate building envelope are sealed to subfloor or drywall.~~
~~Fireplace~~	~~Fireplace walls include an air barrier.~~

Reason (Part I): This change removes options of either visual inspection or whole building testing and requires both. Air sealing cannot be accomplished without the attention to installation details that visual inspection ensures. But no list of visual inspection areas can cover all leakage points and so whole building testing is needed. This change also seeks to remove redundancies from and provide clarity to the existing code language. Table 402.4.2 which was largely redundant with the list in 402.4.1 is removed. Information in the table that was not redundant was extracted and inserted into the appropriate section of the code. The “testing option” test method and criteria were simplified to be the same those in Table 405.5.2 “air exchange rate” section.

Reason (Part II): This change removes options of either visual inspection or whole building testing and requires both. Air sealing cannot be accomplished without the attention to installation details that visual inspection ensures. But no list of visual inspection areas can cover all leakage points and so whole building testing is needed. This change also seeks to remove redundancies from and provide clarity to the existing code language. Table N1102.4.2 which was largely redundant with the list in N1102.4.1 is removed. Information in the table that was not redundant was extracted and inserted into the appropriate section of the code. The “testing option” test method and criteria were simplified to be the same those in the IECC Table 405.5.2 “air exchange rate” section.

Cost Impact (Part I): The code change proposal will increase the cost of construction.
Cost Impact (Part II): The code change proposal will not increase the cost of construction.

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IECC COMMITTEE. PART II WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IECC

1. Revise as follows:

402.4.1 Building thermal envelope. The *building thermal envelope* shall be durably sealed to limit infiltration. The sealing methods between dissimilar materials shall allow for differential expansion and contraction. The following shall be caulked, gasketed, weatherstripped or otherwise sealed with an air barrier material, suitable film or solid material:

1. All joints, seams and penetrations.
2. Site-built windows, doors and skylights.
3. Openings between window and door assemblies and their respective jambs and framing.
4. Utility penetrations.
5. Dropped ceilings or chases adjacent to the thermal envelope.
6. Knee walls.
7. Walls and ceilings separating a garage from conditioned spaces
8. Behind tubs and showers on exterior walls.
9. Common walls between dwelling units.
10. Attic access openings.
11. Rim joist junction.
12. Junction of the foundation and sill plate.
13. Junction of the top plate and the interior wall.
14. Any exposed edge of insulation.
15. Fireplace walls.

~~12~~.16. Other sources of infiltration.

402.4.2 Air sealing and insulation installation. The components of the *building thermal envelope* listed in Section 402.4.1 shall be installed in accordance with the manufacturer's instructions and following criteria, as applicable to the method of construction:

1. Exterior thermal envelope insulation for framed walls shall be installed in substantial contact and alignment with building envelope air barrier.
2. Breaks or joints in the air barrier shall be filled or sealed.
3. Air permeable insulation shall not be used as a sealing material.
4. Air permeable insulation shall be enclosed in an air barrier.
5. Insulation to be installed in non-standard framing cavity spaced shall be cut to fit the cavity or the cavity shall be insulated with insulation that will readily conform to the cavity.
6. Recessed light fixtures that penetrate the building envelope shall be airtight, IC rated, and sealed to the drywall.

Building envelope air tightness and insulation installation shall be demonstrated to comply with one of the following options given by Sections 402.4.2.1 or 402.4.2.2:

402.4.2.1 Whole building testing option. Building envelope tightness and insulation installation shall be considered acceptable when tested to have a maximum specific leakage area (SLA) = 0.00036. Testing shall be in accordance with ASHRAE 119 Section 5.1.~~air leakage is less than seven air changes per hour (ACH) when tested with a blower door at a pressure of 33.5 psf (50 Pa).~~ Testing shall occur after rough in and after installation of penetrations of the building envelope, including penetrations for utilities, plumbing, electrical, ventilation and combustion appliances.

~~During testing:~~

1. ~~Exterior windows and doors, fireplace and stove doors shall be closed, but not sealed;~~
2. ~~Dampers shall be closed, but not sealed, including exhaust, intake, makeup air, backdraft and flue dampers;~~
3. ~~Interior doors shall be open;~~
4. ~~Exterior openings for continuous ventilation systems and heat recovery ventilators shall be closed and sealed;~~
5. ~~Heating and cooling system(s) shall be turned off;~~
6. ~~HVAC ducts shall not be sealed; and~~
7. ~~Supply and return registers shall not be sealed~~.

402.4.2.2 Visual inspection option. Building envelope tightness and insulation installation shall be considered acceptable when the ~~items~~ areas listed in ~~Table 402.4.2~~ Section 402.4.1 are installed as described in Section 402.4.2, ~~applicable to the method of construction,~~ are field verified. Where required by the *code official*, an *approved* party independent from the installer of the insulation shall inspect the air barrier and insulation.

2. Delete table without substitution:

~~TABLE 402.4.2~~
~~AIR BARRIER AND INSULATION INSPECTION COMPONENT CRITERIA~~

~~COMPONENT~~	~~CRITERIA~~
~~Air barrier and thermal barrier~~	~~Exterior thermal envelope insulation for framed walls is installed in substantial contact and continuous alignment with building envelope air barrier. Breaks or joints in the air barrier are filled or repaired. Air-permeable insulation is not used as a sealing material. Air-permeable insulation is inside of an air barrier.~~
~~Ceiling/attic~~	~~Air barrier in any dropped ceiling/soffit is substantially aligned with insulation and any gaps are sealed. Attic access (except unvented attic), knee wall door, or drop down stair is sealed.~~
~~Walls~~	~~Corners and headers are insulated. Junction of foundation and sill plate is sealed.~~
~~Windows and doors~~	~~Space between window/door jambs and framing is sealed.~~
~~Rim joists~~	~~Rim joists are insulated and include an air barrier.~~
~~Floors (including above-garage and cantilevered floors)~~	~~Insulation is installed to maintain permanent contact with underside of subfloor decking. Air barrier is installed at any exposed edge of insulation.~~
~~Crawl space walls~~	~~Insulation is permanently attached to walls. Exposed earth in unvented crawl spaces is covered with Class I vapor retarder with overlapping joints taped.~~
~~Shafts, penetrations~~	~~Duct shafts, utility penetrations, knee walls and flue shafts opening to exterior or unconditioned space are sealed.~~
~~Narrow cavities~~	~~Batts in narrow cavities are cut to fit, or narrow cavities are filled by sprayed/blown insulation.~~
~~Garage separation~~	~~Air sealing is provided between the garage and conditioned spaces.~~
~~Recessed lighting~~	~~Recessed light fixtures are air tight, IC rated, and sealed to drywall. Exception—fixtures in conditioned space.~~
~~Plumbing and wiring~~	~~Insulation is placed between outside and pipes. Batt insulation is cut to fit around wiring and plumbing, or sprayed/blown insulation extends behind piping and wiring.~~
~~Shower/tub on exterior wall~~	~~Showers and tubs on exterior walls have insulation and an air barrier separating them from the exterior wall.~~
~~Electrical/phone box on exterior walls~~	~~Air barrier extends behind boxes or air-sealed-type boxes are installed.~~
~~Common wall~~	~~Air barrier is installed in common wall between dwelling units.~~
~~HVAC register boots~~	~~HVAC register boots that penetrate building envelope are sealed to subfloor or drywall.~~
~~Fireplace~~	~~Fireplace walls include an air barrier.~~

PART II – IRC BUILDING/ENERGY

1. Revise as follows:

N1102.4.1 Building thermal envelope. The *building thermal envelope* shall be durably sealed to limit infiltration. The sealing methods between dissimilar materials shall allow for differential expansion and contraction. The following shall be caulked, gasketed, weatherstripped or otherwise sealed with an air barrier material, suitable film or solid material.

1. All joints, seams and penetrations.
2. Site-built windows, doors and skylights.
3. Openings between window and door assemblies and their respective jambs and framing.
4. Utility penetrations.
5. Dropped ceilings or chases adjacent to the thermal envelope.
6. Knee walls.
7. Walls and ceilings separating the garage from *conditioned spaces*.
8. Behind tubs and showers on *exterior walls*.
9. Common walls between *dwelling units*.
10. Attic access openings.
11. Rim joists junction.
12. Junction of the foundation and sill plate.
13. Junction of the top plate and the interior wall.
14. Any exposed edge of insulation.
15. Fireplace walls.

~~12.~~16. Other sources of infiltration.

N1102.4.2 Air sealing and insulation installation. The components of the *building thermal envelope* listed in Section N1102.4.1 shall be installed in accordance with the manufacturer's instructions and following criteria, as applicable to the method of construction:

1. Exterior thermal envelope insulation for framed walls shall be installed in substantial contact and alignment with building envelope air barrier.
2. Breaks or joints in the air barrier shall be filled or sealed.
3. Air permeable insulation shall not be used as a sealing material.
4. Air permeable insulation shall be enclosed in an air barrier.
5. Insulation to be installed in non-standard framing cavity spaced shall be cut to fit the cavity or the cavity shall be insulated with insulation that will readily conform to the cavity.
6. Recessed light fixtures that penetrate the building envelope shall be airtight, IC rated, and sealed to the drywall.

Building envelope air tightness and insulation installation shall be demonstrated to comply with one of the following options given by Sections N1102.4.2.1 or N1102.4.2.2:

N1102.4.2.1 Whole building testing option. ~~Tested air leakage is less than 7 ACH when tested with a blower door at a pressure of 50 pascals (0.007 psi).~~ Building envelope tightness and insulation installation shall be considered acceptable when tested to have a maximum specific leakage area (SLA) = 0.00036. Testing shall be in accordance with ASHRAE 119 Section 5.1. Testing shall occur after rough in and after installation of penetrations of the building envelope, including penetrations for utilities, plumbing, electrical, ventilation and combustion appliances.

~~During testing:~~

1. ~~Exterior windows and doors, fireplace and stove doors shall be closed, but not sealed;~~
2. ~~Dampers shall be closed, but not sealed; including exhaust, intake, makeup air, back draft, and flue dampers;~~
3. ~~Interior doors shall be open;~~
4. ~~Exterior openings for continuous ventilation systems and heat recovery ventilators shall be closed and sealed;~~
5. ~~Heating and cooling system(s) shall be turned off;~~
6. ~~HVAC ducts shall not be sealed; and~~
7. ~~Supply and return registers shall not be sealed.~~

N1102.4.2.2 Visual inspection option. Building envelope tightness and insulation installation shall be considered acceptable when the areas listed in Section N1102.4.1 are installed as described in Section N1102.4.2 ~~The items listed in Table N1102.4.2, applicable to the method of construction,~~ are field verified. Where required by the code official, an *approved* party independent from the installer of the insulation, shall inspect the air barrier and insulation.

2. Delete table without substitution:

~~**TABLE N1102.4.2**~~
~~**AIR BARRIER AND INSULATION INSPECTION COMPONENT CRITERIA**~~

~~*COMPONENT*~~	~~*CRITERIA*~~
~~Air barrier and thermal barrier~~	~~Exterior thermal envelope insulation for framed walls is installed in substantial contact and continuous alignment with building envelope air barrier. Breaks or joints in the air barrier are filled or repaired. Air-permeable insulation is not used as a sealing material.~~
~~Ceiling/attic~~	~~Air barrier in any dropped ceiling/soffit is substantially aligned with insulation and any gaps are sealed Attic access (except unvented attic), knee wall door, or drop down stair is sealed.~~
~~Walls~~	~~Corners and headers are insulated. Junction of foundation and sill plate is sealed.~~
~~Windows and doors~~	~~Space between window/door jambs and framing is sealed.~~
~~Rim joists~~	~~Rim joists are insulated and include an air barrier.~~
~~Floors (including above garage and cantilevered floors)~~	~~Insulation is installed to maintain permanent contact with underside of subfloor decking. Air barrier is installed at any exposed edge of floor.~~
~~Crawlspace walls~~	~~Insulation is permanently attached to walls. Exposed earth in unvented crawlspaces is covered with Class I vapor retarder with overlapping joints taped.~~
~~Shafts, penetrations~~	~~Duct shafts, utility penetrations, knee walls and flue shafts opening to exterior or unconditioned space are sealed.~~
~~Narrow cavities~~	~~Batts in narrow cavities are cut to fit, or narrow cavities are filled by sprayed/blown insulation.~~
~~Garage separation~~	~~Air sealing is provided between the garage and conditioned spaces.~~
~~Recessed lighting~~	~~Recessed light fixtures are airtight, IC rated and sealed to drywall. Exception – fixtures in conditioned space.~~
~~Plumbing and wiring~~	~~Insulation is placed between outside and pipes. Batt insulation is cut to fit around wiring and plumbing, or sprayed/blown insulation extends behind piping and wiring.~~
~~Shower/tub on exterior wall~~	~~Showers and tubs on exterior walls have insulation and an air barrier separating them from the exterior wall.~~
~~Electrical/phone box on exterior wall~~	~~Air barrier extends behind boxes or air sealed type boxes are installed.~~
~~Common wall~~	~~Air barrier is installed in common wall between dwelling units.~~
~~HVAC register boots~~	~~HVAC register boots that penetrate building envelope are sealed to subfloor or drywall.~~
~~Fireplace~~	~~Fireplace walls include an air barrier.~~

Reason
(Part I)- This change seeks to remove redundancies from and provide clarity to the existing code language. Table 402.4.2 which was largely redundant with the list in 402.4.1 is removed. Information in the table that was not redundant was extracted and inserted into the appropriate section of the code. The "testing option" test method and criteria were simplified to be the same those in Table 405.5.2 "air exchange rate" section.
(Part II)- This change seeks to remove redundancies from and provide clarity to the existing code language. Table N1102.4.2 which was largely redundant with the list in N1102.4.1 is removed. Information in the table that was not redundant was extracted and inserted into the appropriate section of the code. The "testing option" test method and criteria were simplified to be the same those in the IECC Table 405.5.2 "air exchange rate" section.

Cost Impact: The code change proposal will not increase the cost of construction.

EC84–09/10
402.4.1.1; IRC N1102.4.6

Proponent: Wendy Johnson, Midway City, representing the Utah Chapter of ICC

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IECC COMMITTEE. PART II WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IECC

Add new text as follows:

402.4.1.1 Combustion air to rooms outside the thermal envelope. Where outside combustion air is supplied to liquid-, solid-, or fuel gas- burning appliances, a furnace or boiler room shall be provided to isolate the outside combustion air from the conditioned space. This room shall be insulated, isolated and sealed from the conditioned space per the requirements of this code. Supply and return ducts, and hot water lines located inside the room shall be insulated per the requirements this code. All water lines shall be protected from freezing. Outside combustion air ducts to this room, which pass through the conditioned space, shall be insulated and sealed in accordance with Section 403.2.

Exception:

1. Isolated rooms are not required where all liquid-, solid-, or fuel gas-appliances located inside the building envelope are direct vent.
2. Required combustion air for masonry fireplaces.

PART II – IRC BUILDING/ENERGY

Add new text as follows:

N 1102.4.6 Combustion air to rooms to be outside the thermal envelope. Where outside combustion air is supplied to liquid- solid-, or fuel gas- burning appliances, a furnace or boiler room shall be provided to isolate the outside combustion air from the conditioned space. This room shall be insulated, isolated and sealed from the conditioned space per the requirements of this code. Supply and return ducts, and hot water lines located inside the room shall be insulated per the requirements of this code. All water lines shall be protected from freezing. Outside combustion air ducts to this room, which pass through the conditioned space, shall be insulated and sealed in accordance with Section N1103.2.1.

Exception:

1. Isolated rooms are not required where all liquid-, solid-, or fuel-gas-appliances located inside the building envelope are direct vent.
2. Required combustion air for masonry fireplaces.

Reason: In areas where the seasonal interior/exterior temperature differential is significant, the combustion air ducts bring outside air, which is either quite cold or quite hot, into a mechanical room, crawl space, or unfinished basement. Unknowing homeowners often close off these ducts because the hot or cold air significantly impacts the temperature within the dwelling, or in extreme cases freezes water pipes. To have the 10", 11", or even 12" duct opening directly into what is then the thermal envelope of the structure is common practice, but certainly not what the energy code intends to happen. This new code section **clarifies** the intent of the code and outlines the minimum requirements for these spaces to meet the energy code.

Cost Impact: The code change proposal will increase the cost of construction, but lower energy consumption.

PART I – IECC

	Assembly:	ASF	AMF	DF

PART II – IRC Energy

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: JOHNSON(WENDY)-EC-1-402.4.1.1-RE-1-N1102.4.6

EC85–09/10
402.4.1, Table 402.4.2

Proponent: Ron Nickson, representing the National Multi Housing Council

Revise as follows:

402.4.1. Building thermal envelope. The *building thermal envelope* shall be durably sealed to limit infiltration. The sealing methods between dissimilar materials shall allow for differential expansion and contraction. The following shall be caulked, gasketed, weatherstripped or otherwise sealed with an air barrier material, suitable film or solid material:

1. All joints, seams and penetrations.
2. Site-built window, doors and skylights.
3. Openings, between window and door assemblies and their respective jambs and framing.
4. Utility penetrations.
5. Dropped ceilings or chases adjacent to the thermal envelope.
6. Knee walls.
7. Walls and ceiling separating a garage from conditioned spaces.
8. Behind tubs and showers on exterior walls.
9. ~~Common walls between dwelling units.~~
10. ~~10.~~ 9. Attic access openings.
11. ~~11.~~10. Rim joists junctions.
12. ~~12.~~11. Other sources of infiltration.

TABLE 402.4.2
AIR BARRIER AND INSULATION INSPECTION COMPONENT CRITERIA

COMPONENT	CRITERIA
Air barrier and thermal barrier	Exterior thermal envelope insulation for framed walls is installed in substantial contact and continuous alignment with building envelope air barrier. Breaks or joints in the air barrier are filled or repaired. Air-permeable insulation is not used as a sealing material. Air-permeable insulation is inside of an air barrier.
Ceiling/attic	Air barrier in any dropped ceiling/soffit is substantially aligned with insulation and any gaps are sealed. Attic access (except unvented attic), knee wall door, or drop down stair is sealed.
Walls	Corners and headers are insulated. Junction of foundation and sill plate is sealed.
Windows and doors	Space between window/door jambs and framing is sealed.
Rim joists	Rim joists are insulated and include an air barrier.
Floors (including above-garage and cantilevered floors)	Insulation is installed to maintain permanent contact with underside of subfloor decking. Air barrier is installed at any exposed edge of insulation.
Crawl space walls	Insulation is permanently attaché to walls. Exposed earth in unvented crawl spaces is covered with Class I vapor retarder with overlapping joints taped.
Shafts, penetrations	Ducts shafts, utility penetrations, knee walls and flue shafts opening to exterior or unconditioned space are sealed.
Narrow cavities	Batts in narrow cavities are cut to fit, or narrow cavities are filled by sprayed/blown insulation.
Garage separation	Air sealing is provided between the garage and conditioned space.
Recessed lighting	Recessed light fixtures are air tight, IC rated, and sealed to drywall. Exception – fixtures in conditioned spaced.
Plumbing and wiring	Insulation is placed between outside and pipes. Batt insulation is cut to fit around wiring and plumbing, or sprayed/blown insulation extends behind piping and wiring.
Shower/tub on exterior wall	Showers and tubs on exterior walls have insulation and an air barrier separating them from the exterior wall.
Electrical/phone box on exterior wall	Air barrier extends behind boxes or air sealed-type boxes are installed.
~~Common wall~~	~~Air barrier is installed in common wall between dwelling units.~~
HVAC register boots	HV AC register boots that penetrate building envelope are sealed to subfloor or drywall.
Fireplace	Fireplace walls include an air barrier.

Reason: The change would remove the requirement for an air barrier in the common wall between dwelling units. This is not an energy issue in that heat or cooling moving between units does not increase or decrease the building energy usage. The wall separating dwelling units per Section 420.2 has to be a fire partition and the installation of a foreign material into the wall to comply with the requirement for the air barrier would not be in compliance with the fire resistance rating of the fire barrier wall. The construction of a fire barrier that complies with the code will provide most of, if not all of the intent of the requirement that the common wall between dwelling units have an air barrier.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: NICKSON-EC-1-402.4.1

EC86–09/10
Table 402.4.2; IRC Table N1102.4.2

Proponent: Charles C. Cottrell, North American Insulation Manufacturers (NAIMA)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IECC COMMITTEE. PART II WILL BE HEARD BY THE IRC BUILDING/ENERGYCOMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IECC

TABLE 402.4.2
VISUAL AIR BARRIER AND INSULATION INSPECTION COMPONENT CRITERIA

COMPONENT	CRITERIA
Air barrier and thermal barrier	<u>Exterior thermal envelope contains a continuous air barrier</u> Exterior thermal envelope insulation for framed walls is installed in substantial contact and continuous alignment with building envelope air barrier. Breaks or joints in the air barrier are filled or repaired. Air permeable insulation is not used as a sealing material. ~~Air permeable insulation is inside of an air barrier.~~

(Portions of table not shown remain unchanged)

PART II – IRC ENERGY

TABLE N1102.4.2
VISUAL AIR BARRIER AND INSULATION INSPECTION COMPONENT CRITERIA

COMPONENT	CRITERIA
Air barrier and thermal barrier	<u>Exterior thermal envelope contains a continuous air barrier</u> Exterior thermal envelope insulation for framed walls is installed in substantial contact and continuous alignment with building envelope air barrier. Breaks or joints in the air barrier are filled or repaired. Air permeable insulation is not used as a sealing material. ~~Air permeable insulation is inside of an air barrier.~~

(Portions of table not shown remain unchanged)

Reason: The current language requires that air permeable insulation be installed "inside of an air barrier." This would prohibit the use of the air-tight gypsum board air barrier practice which is an effective and widely used method of sealing the building envelope. This proposal would delete the language prohibiting this practice and add language stating, "Exterior thermal envelope contains a continuous air barrier," to clarify that the building envelope must contain an air barrier.

Cost Impact: The code change proposal will not increase the cost of construction.

Proponent: Steve Ferguson, representing The American Society of Heating, Refrigerating and Air-Conditioning Engineers (ASHRAE)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IECC COMMITTEE. PART II WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IECC

1. Add new text as follows:

402.4.2.1.1 Mechanical ventilation requirement. If a dwelling unit of a one- and two-family dwelling or multiple single-family dwelling (townhouse) not more than three stories in height is determined to have an infiltration rate of less than five air changes per hour (ACH) when tested in accordance with Section 402.4.2.1, whole-house mechanical ventilation shall be provided in accordance with ASHRAE 62.2. Any other dwelling unit that is determined to have an infiltration rate of less than five air changes per hour (ACH) when tested in accordance with Section 402.4.2.1 shall be provided with mechanical ventilation in accordance with the *International Mechanical Code*.

2. Add new standard to Chapter 6 as follows:

ANSI/ASHRAE

Standard 62.2-2007 Ventilation and Acceptable Indoor Air Quality in Low-Rise Residential Buildings

PART II – IRC BUILDING/ENERGY

1. Add new text as follows:

1102.4.2.1.1 Mechanical ventilation requirement. If a dwelling unit of a one- and two-family dwelling or multiple single-family dwelling (townhouse) not more than three stories in height is determined to have an infiltration rate of less than five air changes per hour (ACH) when tested in accordance with Section N1102.4.2.1, whole-house mechanical ventilation shall be provided in accordance with ASHRAE 62.2.

2. Add new standard to Chapter 6 as follows:

ANSI/ASHRAE

Standard 62.2-2007 Ventilation and Acceptable Indoor Air Quality in Low-Rise Residential Buildings

Reason: The purpose of this proposal is to provide modest levels of continuous mechanical ventilation in detached one- and two-family houses and low-rise townhouses in order to provide minimum levels of ventilation.

For health and safety reasons, minimum ventilation is necessary to provide acceptable indoor air quality. Modern homes are much tighter than the building stock and do not provide adequate ventilation through air leakage or infiltration. Occupants do not operating windows to provide minimum ventilation levels. Providing continuous mechanical ventilation is required to provide minimum ventilation rates in current construction.

Substantiation: Ventilation is used to control pollutant concentrations in buildings. These pollutants are emitted from building materials, consumer products, and from occupants themselves. Continuous mechanical ventilation reduces these large concentrations and reduces the large exposures for building occupants.

Because of the effects it has on health, comfort, and serviceability, indoor air quality in our homes is becoming of increasing concern to many people. According to the American Lung Association elements within our homes have been increasingly recognized as threats to our respiratory health. The Environmental Protection Agency lists poor indoor air quality as the forth-largest environmental threat to our country. Asthma is leading serious chronic illness of children in the U.S. Moisture-related construction defects and damage are on the increase in new houses. A 2007 California study revealed formaldehyde exposure in most new homes is beyond limits recommended by the California Air Resources Board. Minimum residential ventilation can improve many of these indoor air quality problems.

ASHRAE Standard 62.2-2007 is the only national consensus standard on residential ventilation rates. ASHRAE, the American Society of Heating, Refrigerating and Air-conditioning Engineers, has been setting minimum ventilation rates for buildings for over 100 years in order to provide acceptable indoor air quality. The rates in this proposal are the minimum rates as incorporated in the current version of Standard 62.2. As an ANSI standard, these rates represent the consensus of a balanced committee and have undergone extensive public review.

Sherman and Hodgson (2002) have shown that the rates in this proposal are barely sufficient to dilute the typical amount of formaldehyde emitted in typical new construction. The consensus of knowledgeable and balanced experts supports the ventilation rates in Standard 62.2-2007. As of the drafting of this proposal, several states have adopted similar ventilation requirements (e.g. MN, VT, WA, CA, ME). Of these, California and Maine have now adopted ASHRAE 62.2 by reference.

Price and Sherman (2006) have shown that occupants of new homes do not operate their windows and doors sufficiently to meet minimum ventilation requirements through controlled openings. While there are 20% of the population who would manage their windows effectively during mild periods, the vast majority of occupants keep their windows closed most of the time and do not get sufficient ventilation from window and door operation.

Sherman and Chan (2006) have reviewed air tightness data. New houses are substantially tighter than the existing stock and do not get enough ventilation through air infiltration and air leakage to meet minimum rates. Walker and Sherman (2006) have shown that the energy costs of meeting ASHRAE Standard 62.2 would be substantially higher for a house that was leaky enough to meet it through infiltration.

The reference to HVI 916 is provided to ensure that fans comply with industry standards for air flow verification. As a point of reference, MN state code 7672.1000 currently references HVI 916. HVI 916 is a consensus standard that is also referenced by Energy Star's Ventilation Fan Specification for measurement and verification of fan flow rates (note that NO on-site measurement or verification is required).

Cost Impact: The code change proposal will increase the cost of construction modestly by requiring a mechanical fan system rated for continuous operation.

Analysis: A review of the standard(s) proposed for inclusion in the code, ANSI/ASHRAE 62.2-07, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

EC88–09/10
Table 402.4.2, Chapter 6

Proponent: Rob Pickett, Rob Pickett & Associates, LLC, representing Log Homes Council

1. Revise table as follows:

TABLE 402.4.2
AIR BARRIER AND INSULATION INSPECTION COMPONENT CRITERIA

COMPONENT	CRITERIA[a]

(No change to table contents)

a. Inspection of log structures shall be in accordance with the provisions of ICC-400-2007 IS LOG.

2. Add new standard to Chapter 6 as follows:

ICC
400-07 IS LOG Standard on the Design and Construction of Log Structures

Reason: The purpose of this change is to direct users of the code who are evaluating log structures to the ICC consensus standard pertaining to this unique and traditional construction method.

Log structures employ alternative methods of construction that are fully covered by ICC-400 IS-LOG *Standard for the Design and Construction of Log Structures.* ICC400-2007 is an ANSI-approved document that represents industry standards and guidelines for this form of construction. It gives the code official an important tool for inspection and understanding log construction, including thermal performance. Carefully written to cover all forms of log construction, the standard explains how to respond to design conditions, but it does not establish those conditions.

A major reason for this change is that field interpretations of the IECC requirements for log wall performance are often incorrect. ICC400-2007 addresses protection of air infiltration and vapor transfer in Section 305.1. In addition, log walls are designed to account for movement in the wall system per Section 304. These two sections combine to promote an effective air tight assembly as has been documented in many blower door tests and thermal imaging inspections. Since log walls offer an assembly that can be inspected at any stage of construction, the most crucial element of the inspection process is the assessment of settling as defined in ICC400-2007, Section 304.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: A review of the standard(s) proposed for inclusion in the code, ICC 400-07, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

402.4.3, Chapter 6; IRC N1102.4.3

Proponent: Joseph Hill, RA, representing the New York State Department of State

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IECC COMMITTEE. PART II WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IECC

1. Revise as follows:

402.4.3 Fireplaces. ~~New wood-burning fireplaces shall have gasketed doors and outdoor combustion air.~~ Tight-fitting noncombustible gasketed fireplace doors to control infiltration losses shall be installed on the following fireplace openings:

1. Masonry fireplaces or fireplace units designed to allow an open burn.
2. Decorative appliances (ANSI Standard Z21.60 gas-log style unit) installed in vented solid fuel fireplaces.
3. Vented decorative gas fireplace appliances (ANSI Standard Z21.50 unit).

Fireplaces shall be provided with a source of combustion air as required by the fireplace construction provisions of the *International Residential Code, or* the *International Building Code*

2. Add new standards to Chapter 6 as follows:

ANSI

Z21.50−03	Vented Gas Fireplaces—with Addenda Z21.50a-2003
Z21.60−03	Decorative Gas Appliances for Installation in Solid Fuel Burning Fireplaces—with Addenda Z21.60a-2003

PART II – IRC BUILDING/ENERGY

Revise as follows:

N1102.4.3 Fireplaces. ~~New wood-burning fireplaces shall have gasketed doors and outdoor combustion air.~~ Tight-fitting noncombustible gasketed fireplace doors to control infiltration losses shall be installed on the following fireplace openings:

1. Masonry fireplaces or fireplace units designed to allow an open burn.
2. Decorative appliances (ANSI Standard Z21.60 gas-log style unit) installed in vented solid fuel fireplaces.
3. Vented decorative gas fireplace appliances (ANSI Standard Z21.50 unit).

Fireplaces shall be provided with a source of combustion air as required by the fireplace construction provisions of Section R1006 of the *International Residential Code*.

Reason: For clarification and reference.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: ANSI Z21.50-03 and ANSI Z21.60-03 are currently referenced in the IRC.

PART I- IECC

EC90–09/10
402.4.4; IRC N1102.4.4

Proponent: Jeff Burton, Director of Codes and Standards Association of Millwork Distributors, representing Association of Millwork Distributors

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IECC COMMITTEE. PART II WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IECC

Revise as follows:

402.4.4 Fenestration air leakage. Windows, skylights and sliding glass doors shall have an air infiltration rate of no more than 0.3 cfm per square foot (1.5 L/s/m^2), and swinging doors no more than 0.5 cfm per square foot (2.6 L/s/m^2), when tested according to ~~NFRC400 or AAMA/WDMA/CSA101/I.S.2/A440~~ ASTM E283 by an accredited, independent laboratory, and listed and labeled by the manufacturer.

Exception: Site-built windows, skylights and doors.

PART II – IRC ENERGY

Revise as follows:

N1102.4.2 Fenestration air leakage. Windows, skylights and sliding glass doors shall have an air infiltration rate of no more than 0.3 cfm per square foot (1.5 L/s/m^2), and swinging doors no more than 0.5 cfm per square foot (2.6 L/s/m^2), when tested according to ~~NFRC400 or AAMA/WDMA/CSA101/I.S.2/A440~~ ASTM E283 by an accredited, independent laboratory, and listed and labeled by the manufacturer.

Exception: Site-built windows, skylights and doors.

Reason: This action would clarify the code by eliminating two standards and replacing with their referenced source air infiltration standard. Both the NFRC 400 and the AAMA/WDMA/CSA101.I.S.2/A440 reference the ASTM E283, Standard Test Method for Determining Rate of Air Leakage Through Exterior Windows, Curtain Walls, and Doors Under Specified Pressure Differences Across the Specimen as their method for testing air infiltration.

Cost Impact: The code change proposal will not increase the cost of construction.

PART I – IECC

EC91–09/10
402.4.4; IRC N1102.4.4

Proponent: Jeff Lowinski, Window and Door Manufacturers Association (WDMA)

THIS IS A 2 PART CODE CHANGE. PART WILL BE HEARD BY THE IECC COMMITTEE. PART II WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IECC

Revise as follows:

402.4.4 Fenestration air ~~leakage~~ infiltration. Windows, skylights and sliding glass doors shall have an air infiltration rate of no more than 0.3 cfm per square foot (1.5 L/s/m2), and swinging doors no more than 0.5 cfm per square foot (2.6 L/s/m2), when tested according to NFRC 400 or AAMA/WDMA/ CSA 101/I.S.2/A440 by an accredited, independent laboratory ~~and *listed*~~ and *labeled* by the manufacturer.

PART II – IRC BUILDING/ENERGY

Revise as follows:

N1102.4.4 Fenestration air ~~leakage~~ infiltration. Windows, skylights and sliding glass doors shall have an air infiltration rate of no more than 0.3 cubic foot per minute per square foot [1.5(L/s)/m^2], and ~~swinging~~ side-hinged doors no more than 0.5 cubic foot per minute per square foot [2.5(L/s)/m^2], when tested according to NFRC400 or AAMA/WDMA/CSA101/I.S.2/A440 by an accredited, independent laboratory, ~~and listed~~ and labeled by the manufacturer.

Reason (Part I): This proposal suggests several minor editorial revisions to make this language more consistent with other sections of the IECC. This proposal also resolves the issue that exterior fenestration are required to be labeled, but not listed, by other sections of the IECC. Exterior fenestration, for purposes of energy efficiency, is almost never listed. The exception is fire-rated exterior windows and doors which are listed for their fire rating.

Reason (Part II): This proposal suggests several minor editorial revisions to make this language more consistent with other sections of the IRC. This proposal also resolves the issue that exterior fenestration for residential applications are required to be labeled, but not listed, by other sections of the IRC. Exterior fenestration for residential applications is almost never listed. The exception may be fire-rated doors used between the attached garage and residential building.

Cost Impact: The code change proposal will not increase the cost of construction.

PART I – IECC

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

EC92–09/10
402.4.5; IRC N1102.4.5

Proponent: Ronald Majette, representing US Department of Energy

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IECC COMMITTEE. PART II WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IECC

Revise as follows:

402.4.5 Recessed lighting. Recessed luminaires installed in the *building thermal envelope* shall be sealed to limit air leakage between conditioned and unconditioned spaces. All recessed luminaires shall be IC-rated and labeled as having an air leakage rate not more than 2.0 cfm (0.944 L/s) ~~meeting ASTM E 283~~ when tested in accordance with ASTM E 283 at a 1.57 psf (75 Pa) pressure differential ~~with no more than 2.0 cfm (0.944 L/s) of air movement from the conditioned space to the ceiling cavity~~. All recessed luminaires shall be sealed with a gasket or caulk between the housing and the interior wall or ceiling covering.

PART II – IRC BUILDING/ENERGY

Revise as follows:

N1102.4.5 Recessed lighting. Recessed luminaires installed in the *building thermal envelope* shall be sealed to limit air leakage between conditioned and unconditioned spaces. All recessed luminaires shall be IC-rated and labeled as having an air leakage rate not more than 2.0 cfm (0.944 L/s) ~~meeting ASTM E 283~~ when tested in accordance with ASTM E 283 at a 1.57 psf (75 Pa) pressure differential ~~with no more than 2.0 cfm (0.944 L/s) of air movement from the conditioned space to the ceiling cavity~~. All recessed luminaires shall be sealed with a gasket or caulk between the housing and the interior wall or ceiling covering.

Reason: Clarification and consistency with other sections. It is appropriate to provide the criterion first and then the relevant test condition and reference standard. In addition it is not relevant to indicate where the air movement comes from or goes to as the issue of leakage rate is addressed in the standard. In addition the current text refers to sealing the housing and an interior wall yet the current text for testing refers only to ceiling cavity. This is inconsistent and is taken care of in the proposed text.

Cost Impact: The code change proposal will not increase the cost of construction.

PART I – IECC

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

PART II – IRC BUILDING/ENERGY

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: MAJETTE-EC-80-402.4.5-IRC N1102.4.5

EC93–09/10
402.4.5, 502.4

Proponent: Ken Sagan, representing National Association of Home Builders (NAHB)

Revise as follows:

402.4.5 Recessed lighting. Recessed luminaires ~~installed in~~ that penetrate the building thermal envelope shall be sealed to limit air leakage between conditioned and unconditioned spaces, ~~All~~ and ~~recessed luminaires~~ shall be ~~IC-rated and~~ labeled as meeting ASTM E 283 when tested at 1.57 psi (75 Pa) pressure differential with no more than 2.0 cfm (0.944 L/s) of air movement from the conditioned space to the ceiling cavity. Recessed luminaires in contact with

insulation shall be listed and labeled as IC-rated. ~~All Recessed luminaires shall be sealed with a gasket or caulk between the housing and the interior wall or ceiling covering.~~

502.4.8 Recessed lighting. Recessed luminaires ~~installed in~~ that penetrate the building thermal envelope shall be sealed to limit air leakage between conditioned and unconditioned spaces, ~~All~~ and ~~recessed luminaires~~ shall be ~~IC-rated and~~ labeled as meeting ASTM E 283 when tested at 1.57 psi (75 Pa) pressure differential with no more than 2.0 cfm (0.944 L/s) of air movement from the conditioned space to the ceiling cavity. Recessed luminaires in contact with insulation shall be listed and labeled as IC-rated. ~~All Recessed luminaires shall be sealed with a gasket or caulk between the housing and the interior wall or ceiling covering.~~

Reason: As currently written, this provision requires an IC rated fixture, even in those interior ceilings and walls where insulation contact is not a consideration. If you look closely at the changes shown in the original proposal, the installation of recessed fixtures that "penetrate" the thermal envelope will need to comply with the stated requirements of ASTM E 283, only those recessed fixtures in contact with insulation will need to be IC rated. This is the same as is required by the NEC.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: SAGAN-EC-10-402.4.5-502.4

EC94–09/10
402.5

Proponent: Craig Conner, Building Quality, representing self; Vickie Lovell, InterCode Incorporated, representing the Association of Industrial Metallized Coaters and Laminators

Delete without substitution:

~~**402.5 Maximum fenestration *U*-factor and SHGC.** (Mandatory). The area-weighted average maximum fenestration *U*-factor permitted using trade-offs from Section 402.1.4 or Section 404 shall be 0.48 in zones 4 and 5 and 0.40 in zones 6 through 8 for vertical fenestration, and 0.75 in zones 4 through 8 for skylights. The area-weighted average maximum fenestration SHGC permitted using trade-offs from Section 404 in Zones 1 through 3 shall be 0.50.~~

Reason: (**Conner)** The limits on U-factor and SHGC trade-offs reduce flexibility without any compensating energy savings. This section was removed from the IRC so its removal from the IECC aligns the two codes. The statement of a limit on trade-offs is often confused with the actual requirement itself (in Table 402.1). The "area-weighted average" calculation in this section is a complication the code does not need.

Reason: (Lovell**)** Limits on fenestration U-factor and SHGC tradeoffs do not promote flexibility and place unfair restrictions on how code compliance can be achieved. Additionally, it causes confusion to designers, code officials and all other users of the code by over-complicating it. It creates a subset of prescriptive requirements in the performance path which is inappropriate and is not consistent with the intent of the performance objectives of the code. Perhaps most importantly, the restrictions on the UA trade-off approach do not save energy. These limitations have already been removed from the IRC and therefore, should be deleted from the IECC in order to maintain consistency, reduce confusion and improve and strengthen the code as it was originally intended.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

402.5; IRC N1102.3.6 (New)

Proponent: Bill Prindle, ICF International, representing the Energy Efficient Codes Coalition; Jeff Harris, Alliance to Save Energy; Harry Misuriello, American Council for an Energy-Efficient Economy (ACEEE); Garrett Stone, Brickfield, Burchette, Ritts & Stone; Steve Rosenstock, Edison Electric Institute; Brian Dean, ICF International

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IECC COMMITTEE. PART II WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IECC

Revise as follows:

402.5 Maximum fenestration U-factor and SHGC (Mandatory). The area-weighted average ~~maximum~~ ~~fenestration~~ U-factor permitted for fenestration products when complying with this code using trade offs under ~~from~~ Section 402.1.4 or Section 405 shall not exceed ~~be 0.48 in zones 4 and 5 and~~ 0.40 in zones ~~6~~ 4 through 8 for vertical fenestration, and 0.75 in zones 4 through 8 for skylights. The area-weighted average ~~maximum fenestration~~ SHGC permitted for fenestration products when complying with this code using trade-offs from Section 405 in Zones 1 through 3 shall not exceed ~~be~~ 0.45~~0~~.

PART II – IRC BUILDING/ENERGY

Add new text as follows:

N1102.3.6 Maximum fenestration U-factor and SHGC. The area-weighted average U-factor permitted for fenestration products when complying with this code using trade offs under Section N1102.1.3 or Section 405 of the IECC shall not exceed 0.40 in zones 4 through 8 for vertical fenestration, and 0.75 in zones 4 through 8 for skylights. The area-weighted average SHGC permitted for fenestration products when complying with this code using trade-offs from Section 405 in Zones 1 through 3 shall not exceed 0.45.

Reason: This proposal updates the fenestration U-factor and SHGC trade-off limits in the *IECC* to reflect the reductions in prescriptive U-factors and SHGCs in the *2009 IECC* and *IRC* and to ensure that effective, efficient glazing is being installed in all eight climate zones. The proposal also makes editorial changes to the language of this section to clarify the operation of the caps in response to criticisms from opponents to the caps in previous code cycles that the language was difficult to understand and/or confusing. Finally, it is proposed that this provision also be added to chapter 11 of the *IRC*, making the two codes consistent in this area.

Turning to the proposed changes in the requirements, this proposal replaces the 0.48 cap for climate zones 4-5 with the same 0.40 U-factor already applicable to zones 6-8. This change reflects the prescriptive U-factor changes last cycle, where a 0.35 U-factor is now the prescriptive requirement across all of these climate zones. Similarly, following the reduction in maximum SHGC in climate zones 1-3 from 0.40 in the *2006 IECC* to 0.30 SHGC in the *2009 IECC* and 0.35 in the *2009 IRC*, this proposal reduces the maximum value from 0.50 SHGC to 0.45 SHGC.

The fenestration trade-off limits currently found in Section 402.5 of the 2009 *IECC* are simple, mandatory measures that ensure all new homes contain high-quality, cost-effective windows that save energy, provide reasonable comfort, resist condensation in colder climates and block unwanted solar gain in warmer climates. Without the protection of Section 402.5, fenestration values could be traded away to levels unacceptable in modern building practice. Given the improvements to window efficiency brought about by the *2009 IECC* and the *2009 IRC* and our nation's high priority for energy efficiency, this proposal is a common-sense update to an effective code requirement.

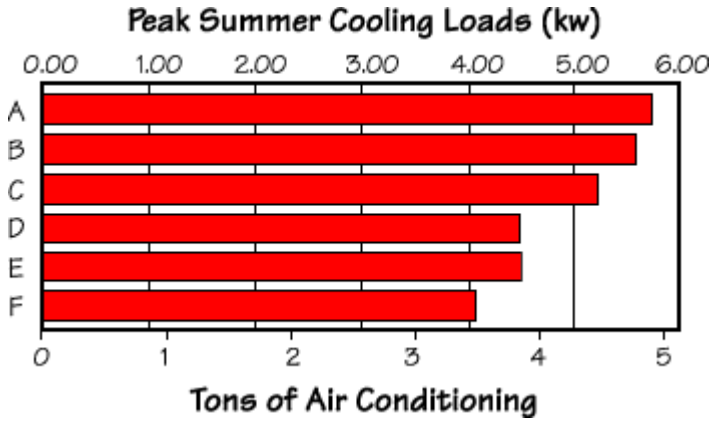
> **Compliance is simple.** The current fenestration maximums are effective and easy to understand. These requirements have been successfully applied for the past few years. All states that have already adopted the 2004, 2006, and 2009 *IECC* have adopted these maximums without amendment. They are also already seamlessly built into compliance software such as the Department of Energy's REScheck. Compliance could not be simpler.
>
> **The standard is flexible.** The area-weighted average approach embodied in Section 402.5 allows considerable flexibility for builders to install decorative glass, glass block, and other fenestration products, while maintaining a baseline performance for the home's overall glazing. In short, not all products are required to individually meet the maximum values; only the area-weighted average of all products in the home is required to meet the maximum values specified in this code provision. Thus, there is substantial room and flexibility for the builder to utilize products that are exceptions. For example, with the 0.45 proposed SHGC limit, up to half of the glass installed could be a 0.55 SHGC (perhaps for a passive solar application), so long as the remainder was at or below 0.35 (the weighted average would be 0.45). In short, the limits constitute a modest backstop that can be easily satisfied by most glazing products currently on the market in each climate zone. The codes currently employ a number of other mandatory measures (including mandatory maximum fenestration air leakage) to ensure that the minimum code house is reasonably constructed – *IECC* Section 402.5 is no different.
>
> **Maximums protect the consumer and the builder.** The maximums are a key safety net and provide important homeowner and builder protection against bad or impractical trade-offs.

Benefits of Section 402.5 Fenestration Maximums:

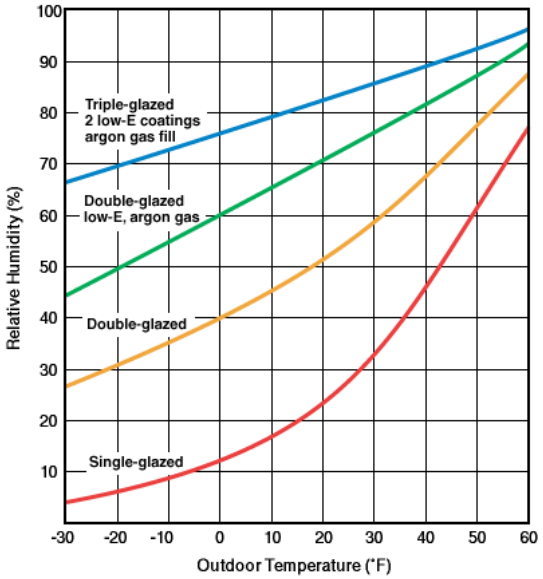
1. Quality Windows, Energy Savings and Peak Demand Savings Nationwide. The fenestration maximums encourage the use of cost-effective low-e windows nationwide. Efficient windows bring immediate cost savings to the builder who can downsize heating and cooling equipment, and bring long-term energy savings, greater comfort and reduced condensation for consumers. On a larger scale, because low-SHGC windows reduce energy consumption during the peak summer months in warmer climates, and low U-Factor windows reduce energy consumption during peak heating months in colder climates, high-quality windows can help reduce the strain on the electric grid and delay the need to build peak generation. They will also reduce the need for natural gas and help to reduce the amount of oil that is imported. Consumers also enjoy the reduced costs that come with economies of scale and market transformation. By avoiding extreme trade-offs of windows with resulting long-term detriment, fenestration maximums are a critical part of a well-functioning energy code.

The following chart, developed by the U.S. Department of Energy's Lawrence Berkley National Laboratory (LBNL), which is found on the Efficient Window Collaborative (EWC) website (www.efficientwindows.org), shows the potential for saving peak demand for different window types.

Window F is the low SHGC, low U-factor window that would satisfy the window maximums across the country (by contrast, window A is a single pane window). As is readily apparent, improved windows are crucial to lower peak cooling loads and smaller HVAC sizes (with lower costs).



2. Improved Condensation Resistance. Window condensation and the associated problems are a function of the window's U-factor, the indoor relative humidity, and the outside temperature. Glass with a lower U-factor maintains a higher room-side temperature, which means the glass can withstand lower exterior temperatures and more interior humidity without attracting condensation. Glass with a high U-factor will succumb to condensation much more easily. The following chart also provided by LBNL on the EWC website shows the condensation potential for different window types.

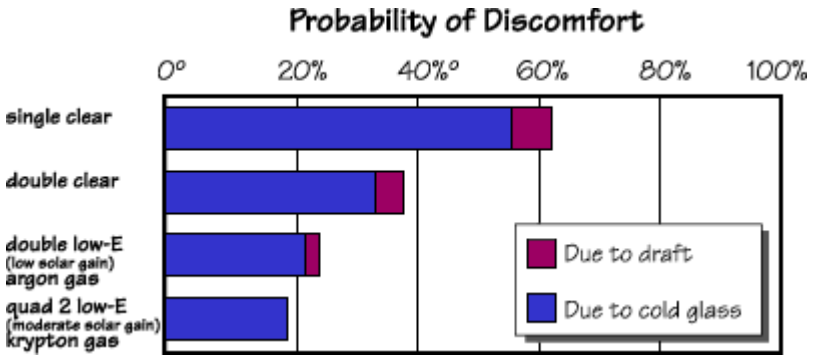


Note: Condensation occurs above the lines for each product type

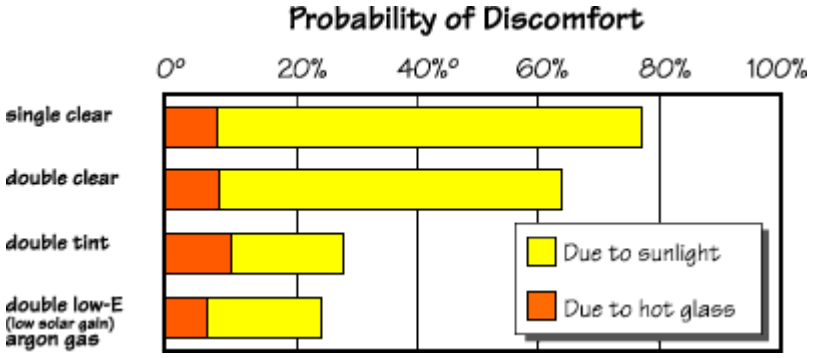
According to the chart, a typical double-glazed low-e window can withstand a 0 degree outdoor temperature and 60% relative humidity inside before condensation will begin to collect. By contrast, a regular double-glazed window can only withstand 40% humidity at the same outdoor temperature. In other words, a low-e window has a 50% more effective ability to resist condensation. A single-glazed *low-e* window is far worse – it can withstand less than 15% humidity at the same temperature – a virtual guarantee of damaging condensation. The fenestration maximums substantially reduce the likelihood of condensation in the colder months, enhancing durability and long-term benefits for the homeowner.

3. More Comfortable Homes and Less Energy Use. The energy code revolves around occupant comfort -- any perceived energy savings will be instantly lost if an occupant is uncomfortable and adjusts the thermostat. Incremental changes in window efficiency can have a disproportionate impact on occupant comfort because even the most efficient windows are, at best, still only the equivalent of an R-3 wall. Hot spots created by high solar gain in the summer and cold or drafty glass in the winter months can force an occupant to adjust the thermostat to compensate (which will increase cooling and heating bills at a time when natural gas costs about $1.20 per therm on the wholesale market and heating oil costs over $3.60 per gallon wholesale). The charts below, again produced by LBNL and displayed on the EWC website, show that occupant discomfort can double or triple, depending on the type of glass installed.

For example, the following chart shows the probability of discomfort during winter from poorer windows ranging from over 60% with single clear and almost 40% with double clear. This risk declines to almost 20% with a low-e window as specified by Section 402.5. This problem is due to the cold window -- at zero degrees outdoors, the single pane glass is less than 20 degrees on the inside surface, the double clear glass is slightly over 40 degrees, while the *low-e* glass is approaching 60 degrees. Obviously, the warmer the interior glass surface, the less likelihood of discomfort.



Similarly, the following chart shows the probability of discomfort during summer from sunlight and hot glass. The potential comfort problem from bad windows is even worse in the summer. The summertime probability of discomfort ranges from almost 80% with single clear and over 60% with double clear declining to almost 20% with windows as specified by Section 402.5.



In heating-dominated climates, a good low-e window will keep occupants more comfortable during the coldest months. In cooling-dominated climates, windows with low SHGC will protect against hot spots and occupant discomfort, and will make it less likely that occupants will need to adjust the thermostat and use more energy.

4. Conclusion. As shown above, the fenestration maximums serve an important role in ensuring residential energy efficiency. We recommend that the fenestration maximums in the *IECC* be updated to match the enhanced efficiency requirements in the 2009 *IECC* and also adopted for the *IRC*.

Cost Impact: The code change proposal will not increase the cost of construction.

EC97–09/10
402.5

Proponent: Ken Sagan, representing National Association of Home Builders (NAHB)

Delete without substitution:

~~**402.5 Maximum fenestration *U*-factor and SHGC. (Mandatory).** The area weighted average maximum fenestration *U*-factor permitted using tradeoffs from Section 402.1.4 or Section 404 shall be 0.48 in zones 4 and 5 and 0.40 in zones 6 through 8 for vertical fenestration, and 0.75 in zones 4 through 8 for skylights. The area weighted average maximum fenestration SHGC permitted using trade-offs from Section 404 in Zones 1 through 3 shall be 0.50.~~

Reason: Limits on fenestration U-factor and SHGC tradeoffs restrict ways by which code compliance can be achieved.

By definition, trade-offs are energy neutral, and do not save energy, so this section is not necessary. This requirement is difficult to explain and confuses most code users who often interpret it as another prescriptive code requirement comparable to the more stringent prescriptive U-factor in Tables 402.1.1 and 402.1.3. The code would be better if it relied only on the U-factor and SHGC requirements in the main table. As previously reported in the last code cycle, some common products, such as glass block and garden windows, never meet these "hard limits." In principle, a calculation or exemption would be required if more than a small area of these common products are used in new residences. Additions or renovations with significant areas of glass block or garden windows would be technically illegal.

Cost Impact: The code change proposal will not increase the cost of construction.

PART I – IECC

1. Revise definition as follows:

AIR BARRIER. Material(s) assembled and joined together to provide a barrier to air leakage through the building envelope. An air barrier may be a single material or a combination of materials. Air barrier materials shall have an air permeance not to exceed 0.004 cfm/ft^2 under a pressure differential of 0.3 in. water (1.57psf) (0.02 L/s.m^2 @ 75 Pa) when tested in accordance with ASTM E 2178.

2. Add new standard to Chapter 6 as follows:

ASTM

E 2178-03	Standard Test Method for Air Permeance of Building Materials

PART II – IRC BUILDING/ENERGY

1. Revise definition as follows:

AIR BARRIER. Material(s) assembled and joined together to provide a barrier to air leakage through the building envelope. An air barrier may be a single material, or a combination of materials. Air barrier materials shall have an air permeance not to exceed 0.004 cfm/ft^2 under a pressure differential of 0.3 in. water (1.57psf) (0.02 L/s.m^2 @ 75 Pa) when tested in accordance with ASTM E 2178.

2. Add new standard to Chapter 44 as follows:

ASTM

E 2178-03	Standard Test Method for Air Permeance of Building Materials

Reason: Currently *air barriers* are defined but have no quantitative criteria. The proposed criteria for air barrier materials is used widely across the industry including in ICC-ES AC38 Acceptance Criteria for Water-Resistive Barriers and the Massachusetts State Energy Code (Section 1304.3.1) It originated from the air barrier material requirements of the Canadian Construction Materials Center (CCMC), which have been in effect since 1996.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: In the opinion of ICC staff, proposed referenced standard ASTM E 2178-03 complies with the standards policy given in Section 3.6 of CP28.

Suite 214
Wauconda, IL 60084

HVI
916-09 Airflow Test Procedure

Reason: Findings from a recent LBNL study commissioned by the U.S. Department of Energy and the California Energy Commission identified that energy consumption of whole-house mechanical ventilation systems is significant.[1] Furthermore, the study revealed that large disparities exist in the energy consumption and associated operating costs of whole-house mechanical ventilation systems in cold; mild; and hot, dry climates. Within the study, exhaust only systems, balanced heat recovery systems, supply only systems, and central fan integrated systems were all modeled to assess resultant energy use and associated costs. When ventilation, distribution, and conditioning energy were taken into account, it was revealed that ventilation energy consumption for whole-house mechanical ventilation systems was between 630 kWh and 4500 kWh beyond that of a non-mechanically vented base case. Based on the graphs provided by the study, energy and cost premiums above the base case are summarized below:

Temperate climate: 900 kWh – 2100 kWh; $70 - $190
Hot dry climate: 630 kWh – 3500 kWh; $60 - $425
Cold climate: 2100 kWh – 4500 kWh; $140 - $410

The most logical way to reduce the amount of energy consumed by residential mechanical ventilation systems is to address the power consumption of the fans that are powering the system. This is especially important when fans are being used as part of a whole-house ventilation system (as opposed to simply being used for bath exhaust, for example) because these fans will now operate many hours per day instead of a few minutes per day. This proposal offers energy efficacy levels for exhaust fans and also addresses the efficacy of central fans/blowers ONLY when these fans are used within a whole-house mechanical ventilation system, as defined. The efficacy levels proposed for exhaust fans are the same as current Energy Star ventilation fan specifications, so they are very familiar to manufacturers.[2] In fact, Energy Star lists over 400 fans in its database that currently meet these efficacy levels.

Because central fan/blower efficacies are not typically listed and labeled in Watts/cfm, the efficacy threshold for central fans/blowers is satisfied by the specification of an electronically commutated motor (ECM). ECMs for residential blowers are now offered by many manufacturers and have demonstrated over 70% reduction in annual fan energy use versus a permanent split capacitor motor when operated continuously.[3] Again, this requirement only exists if the central fan/blower is used within a whole-house mechanical ventilation system. Heating and energy recovery ventilators (HRVs and ERVs) are excluded from the fan efficacy requirements because these systems typically have efficiency advantages over central-fan integrated and exhaust only systems based on their heat recovery capabilities.

Besides saving energy, high efficacy fans can also have an excellent payback when operated in a whole-house ventilation system. For example, based on first and operational cost comparisons between two market-available fans (one baseline and one that meets the proposed high efficacy requirements provided), the estimated payback of a high efficacy fan is 1.2 years. Furthermore, baseline fans are typically not rated for continuous operation, and so they will likely need to be replaced more often than high efficacy fans, making the high efficacy fan that much more affordable. Results of the payback analysis are given in the table below.

Fan Type	Example Product	Exhaust Rate (cfm)	Initial Cost	Power Draw (Watts)	Annual Energy Consumed (kWh)	Annual Operational Cost ($)	Simple Payback (years)	Annual CO2 ***Savings*** (pounds)
High Efficacy Fan	Broan QTXE050	50	$103.13	33	289	$32.84	1.2	772
Baseline Fan	NuTone 696N	50	$22.90	99	867	$98.52	N/A	N/A

Key assumptions include: U.S. average electricity rate of $0.1136/kWh (source: 2008 U.S. DOE EIA), retail costs of bath fans (www.iaqsource.com), continuous operation (a likely condition if the fan is used for whole-house ventilation), 1.336 lbs CO2/kWh (source: U.S. DOE EIA).

The reference to HVI 916 is provided to ensure that fans comply with industry standards for air flow verification. As a point of reference, Minnesota state residential energy code 7672.1000 currently references HVI 916. HVI 916 is a consensus standard that is also referenced by Energy Star's Ventilation Fan Specification for measurement and verification of fan flow rates (note that NO on-site measurement or verification is required).

Cost Impact: The code change proposal will not increase the cost of construction for a home that does not install a whole-house mechanical ventilation system. For those homes that install whole-house mechanical ventilation systems that would have otherwise installed a baseline fan, the cost of construction will increase. However, this cost is expected to be recovered by energy and cost savings.

Analysis: A review of the standard(s) proposed for inclusion in the code, HVI 916, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

PART I – IECC

1. Revise as follows:

403.1 Controls (Mandatory). At least one thermostat shall be provided for each separate heating and cooling zone as defined by Section 403.1.3 ~~system~~.

2. Add new text as follows:

403.1.3 Heating and cooling zone. Each dwelling unit shall have at least one heating and cooling zone per story or per 1000 square feet of floor space, whichever requires fewer zones. Each zone shall have a separate return and supply. Each system shall be designed to operate within the equipment manufacturer's specifications. Each heating and cooling zone shall be served by:

1. An individual system or
2. An automatic air duct damper or automatic zone valve separately controlled by a thermostat for that zone for systems serving multiple zones. Each system serving multiple zones shall be capable of reducing or increasing the delivered air or water flow with a variable-speed fan or pump, and modulating the heating or cooling equipment output, based on a signal from the thermostat that the air duct damper or zone valve is being open of closed.

PART II – IRC BUILDING/ENERGY

1. Revise as follows:

N1103.1 Controls. At least one thermostat shall be installed for each separate heating and cooling zone as defined by section N1103.1.3 ~~system~~.

2. Add new text as follows:

N1103.1.3 Heating and cooling zone. Each dwelling unit shall have at least one heating and cooling zone per story or per 1000 square feet of floor space, whichever requires fewer zones. Each zone shall have a separate return and supply. Each system shall be designed to operate within the equipment manufacturer's specifications. Each heating and cooling zone shall be served by:

1. An individual system or
2. An automatic air duct damper or automatic zone valve separately controlled by a thermostat for that zone for systems serving multiple zones. Each system serving multiple zones shall be capable of reducing or increasing the delivered air or water flow with a variable-speed fan or pump, and modulating the heating or cooling equipment output, based on a signal from the thermostat that the air duct damper or zone valve is being open of closed.

Reason: Significant energy can be wasted in buildings that have single zone conditioning. The www.energysavers.gov website from the DOE states that "zone heating can produce energy savings of more than 20% compared to heating both occupied and unoccupied areas of your house." This proposal sets a requirement to have separate HVAC zone control for homes that have combinations of floor area and building height that makes them susceptible to inefficient space conditioning.

Number of Stories:
Due to the fact that hot air rises and cool air settles to the lowest floor, conditioning multiple stories as one zoned space creates a large temperature difference between the hottest and coldest space in the home. This leads to overcooling some areas in summer and overheating some areas in winter. Zoning reduces the excess energy consumption that can result from single zoning by supplying heating or cooling to each zone on a separately-controlled basis.

Floor Area:
As homes get larger in floor area, controlling space temperatures across extensive area even on the same level becomes increasingly harder. Walls facing different directions experience solar loads that vary throughout the day and year, while other spaces experience differing internal heat gains throughout the day or year. Under such conditions, one space conditioning zone control simply cannot keep all spaces in the house comfortable without wasting energy. This proposal reduces such energy waste by requiring one zone per 1000 square feet of floor area of a given story.

Direct from www.toolbase.org:

> An HVAC "smart" zoning control system divides the home into two or three zones, with a thermostat in each zone. It works with single-stage gas, oil, heat pump or electric HVAC equipment or internally staged, multi-stage equipment. The control system includes automatic dampers that fit into the ducts and a control panel that allows for the feedback of information between the programmable thermostat, indoor climate and damper position. The drive damper actuator assembly does not use wear- and friction-producing gears for damper control. Instead, a synthetic cord transfers the motor rotation to the lever arm. Flexible-link or air-driven dampers are considered more reliable than typical gear-driven dampers for controlling HVAC system zone output. Mechanical, electric, digital, or programmable thermostats by other manufacturers or by RP can be used. It is cost-effective to install when the HVAC system is being replaced, or in new construction. Manufacturers claim that proper installation can result in 10 to 20% energy savings from thermostat setbacks that prevent over-conditioning zones. Comfort is more readily achieved in each zone, and additional, targeted thermostats are more convenient to control than those at a single location.

DOE Reference: www.energysavers.gov/your_home/space_heating_cooling/index.cfm/mytopic=12520

Cost Impact: The code change proposal will increase the cost of construction.

PART I – IECC

1. Add new definition as follows:

HEAT PUMP RECOVERY. A feature of a programmable thermostat that allows the heat pump to recover gradually from an energy-saving set point temperature to a comfort set point temperature. The heat pump recovery feature is designed to minimize the use of auxiliary heat while also minimizing the on-time of the system. This feature must prevent auxiliary or supplementary heat pump operation when the heat pump can meet the heating load.

2. Revise as follows:

403.1.1 Programmable thermostat. Where the primary heating system is a forced air furnace or forced air split system heat pump, packaged unit heat pump, water boiler, or steam boiler, at least one thermostat per dwelling unit shall be capable of controlling the heating and cooling system on a daily schedule to maintain different temperature set points at different times of the day. This thermostat shall include the capability to set back or temporarily operate the system to maintain zone temperatures down to 55ºF (13ºC) or up to 85ºF (29ºC). The thermostat shall initially be programmed with a default heating and cooling temperature set points as detailed in Table 403.1.1 ~~no higher than 70ºF (21ºC) and a cooling temperature set point no lower than 78ºF (26ºC)~~. Programmable thermostat models installed for heat pump systems shall be equipped with a heat pump recovery system.

3. Add new table as follows:

TABLE 403.1.1
PROGRAMMABLE THERMOSTAT SET POINT TIMES & TEMPERATURES

SETTING TIME	SET POINT TEMPERATURE (HEAT)	SET POINT TEMPERATURE (COOL)
Wake: 6:00 a.m.	≤ 70° F	≥ 78° F
Day: 8:00 a.m.	Setback at least 8° F	Setup at least 7° F
Evening: 6:00 p.m.	≤ 70° F	≥ 78° F
Sleep: 10:00 p.m.	Setback at least 8° F	Setup at least 4° F

PART II – IRC BUILDING/ENERGY

1. Add new definition as follows:

HEAT PUMP RECOVERY. A feature of a programmable thermostat that allows the heat pump to recover gradually from an energy-saving set point temperature to a comfort set point temperature. The heat pump recovery feature is

designed to minimize the use of auxiliary heat while also minimizing the on-time of the system. This feature must prevent auxiliary or supplementary heat pump operation when the heat pump can meet the heating load.

2. Revise as follows:

N1103.1.1 Programmable thermostat. Where the primary heating system is a forced air furnace or forced air split system heat pump, packaged unit heat pump, water boiler, or steam boiler, at least one thermostat per dwelling unit shall be capable of controlling the heating and cooling system on a daily schedule to maintain different temperature set points at different times of the day. This thermostat shall include the capability to set back or temporarily operate the system to maintain zone temperatures down to 55ºF (13ºC) or up to 85ºF (29ºC). The thermostat shall initially be programmed with a default heating and cooling temperature set points as detailed in Table N1103.1.1 ~~no higher than 70ºF (21ºC) and a cooling temperature set point no lower than 78ºF (26ºC)~~. Programmable thermostat models installed for heat pump systems shall be equipped with a heat pump recovery system.

3. Add new table as follows:

TABLE N1103.1.1
PROGRAMMABLE THERMOSTAT SET POINT TIMES & TEMPERATURES

SETTING TIME	SET POINT TEMPERATURE (HEAT)	SET POINT TEMPERATURE (COOL)
Wake: 6:00 a.m.	≤ 70° F	≥ 78° F
Day: 8:00 a.m.	Setback at least 8° F	Setup at least 7° F
Evening: 6:00 p.m.	≤ 70° F	≥ 78° F
Sleep: 10:00 p.m.	Setback at least 8° F	Setup at least 4° F

Reason: During the 2009 code cycle, the requirement for a programmable thermostat in homes with forced air furnaces was approved. This code proposal attempts to bring all equipment types that can utilize programmable thermostats into the same requirement for increased internal consistency in the code.

The language for Heat Pump Recovery is based on ENERGY STAR definition at the following website: http://www.energystar.gov/ia/partners/product_specs/eligibility/thermostats_elig.pdf and on the provisions of section IECC 503.2.4.1.1.

As noted in the ENERGY STAR document, heat pump recovery is a feature of a programmable thermostat that allows the heat pump to recover gradually from an energy-saving setpoint temperature to a comfort set-point temperature. The heat pump recovery feature is designed to minimize the use of auxiliary heat while also minimizing the on-time of the system.

The proposed change to the default heating temperature setpoints, set out in the new table is to encourage users to use the HVAC equipment at a lower setting to save energy. These default temperature setpoints, originally from the ENERGY STAR thermostat program, are consistent with commercially available product default settings today.

ENERGY STAR source: http://www.energystar.gov/index.cfm?c=thermostats.pr_thermostats

Cost Impact: The code change proposal will increase the cost of construction.

a. Nonfenestration U-factors shall be obtained from measurement, calculation or an approved source.
b. When more than half the insulation is on the interior, the mass wall U-factors shall be a maximum of 0.17 in zone 1, 0.14 in zone 2, 0.12 in zone 3, 0.10 in zone 4 except Marine, and the same as the frame wall U-factor in Marine zone 4 and zones 5 through 8.
c. Basement wall U-factor of ~~0.360~~ 0.948 in warm-humid locations as defined by Figure N1101.2 and Table N1101.2.
d. Foundation U-factor requirements include wall construction and interior air films but exclude soil conductivity and exterior air films. U-factors for determining code compliance in accordance with Section N1102.1.3 (total UA alternative) shall be modified to include soil conductivity and exterior air films.

Reason: The purpose of this code change is to remove the ground (earth) conductance from the U-factor requirements in the IECC and Chapter 11 of the IRC. The ground is not an inherent characteristic of the building and is therefore an unnecessary and confusing element to include as part of

the code's U-factor requirements. Additionally, the code gives no information about how the ground conductance effect is to be accounted for in the U-factor requirements and it is therefore difficult for code users (including code compliance software developers) to correctly and consistently match their calculations to the code requirements.

The proposed U-factors include only the foundation structure and insulation elements. They are based on the assumption of solid concrete foundation walls with an R-value of 0.375 for an assumed 6 inches of concrete. Where R-13 cavity or R-10 continuous insulation is required, the U-factor proposed here is based on the assumption of a finished framed wall with R-13 cavity insulation.

Cost Impact: The code change proposal will not increase the cost of construction.

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IECC COMMITTEE. PART II WILL BE HEARD BY THE IRC BUILDING/ENERGY CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IECC

Revise as follows:

403.2.1 Insulation (Prescriptive). Supply ducts in attics shall be insulated to a minimum of R-8. All other ducts shall be insulated to a minimum of R-6.

Exception: Where all ~~D~~ducts ~~or portions thereof~~ are located completely within *conditioned space* ~~inside the building thermal envelope~~, supply ducts shall be insulated to a minimum of R-4.

403.2.2 Sealing (Mandatory). All ducts, air handlers, and filter boxes~~, and building cavities used as ducts~~ shall be sealed. Joints and seams shall comply with Section M1601.4.1 of the *International Residential Code* or Section 603.9 of the *International Mechanical Code,* as applicable.

Duct tightness shall be verified by a test performed by a party *approved* by the *code official* after construction is completed. Where required by the code official, testing shall be conducted by an approved party independent from the builder and the installer of the ducts. ~~either of the following:~~ A written report specifying the results of the test and attesting to the accuracy of the results shall be signed by the party conducting the testing and provided to the builder and the *code official*.

1. ~~Post-construction test: L~~ As tested, total duct l~~L~~eakage ~~to outdoors~~ shall be less than ~~or equal to 8 cfm (226.5 L/min) per 100 ft^2 (9.29 m^2) of *conditioned floor area* or a total leakage less than~~ or equal to 6 ~~12~~ cfm (226.5~~12~~ L/min) per 100 square feet (9.29 m^2) of *conditioned floor area* when tested at a pressure differential of 0.1 inches w.g. (25 Pa) across the entire system, including the manufacturer's air handler enclosure. All register boots shall be taped or otherwise sealed during the test.
2. ~~Rough-in test: Total leakage shall be less than or equal to 6 cfm (169.9 L/min) per 100 ft^2 (9.29 m^2) of *conditioned floor area* when tested at a pressure differential of 0.1 inches w.g. (25 Pa) across the roughed-in system, including the manufacturer's air handler enclosure. All register boots shall be taped or otherwise sealed during the test. If the air handler is not installed at the time of the test, total leakage shall be less than or equal to 4 cfm (113.3 L/min) per 100 ft^2 (9.29 m^2) of *conditioned floor area*.~~

Exceptions~~:~~ ~~Duct tightness test is not required if~~ Where the air handler and all ducts are located within conditioned space, total duct leakage shall not exceed 12 cfm per 100 square feet of conditioned floor area when tested as specified above.

403.2.3 Building cavities (Mandatory). Building framing cavities shall not be used as ~~supply~~ ducts.

PART II – IRC BUILDING/ENERGY

Revise as follows:

N1103.2.1 Insulation. Supply ducts in attics shall be insulated to a minimum of R-8. All other ducts shall be insulated to a minimum of R-6.

Exception: Where all ducts ~~or portions thereof~~ are located completely within *conditioned space* ~~inside the building thermal envelope~~, supply ducts shall be insulated to a minimum of R-4.

N1103.2.2 Sealing. All ducts, air handlers, and filter boxes~~, and building cavities used as ducts~~ shall be sealed. Joints and seams shall comply with Section M1601.4 of the *International Residential Code.*

Duct tightness shall be verified by a test performed by a party *approved* by the *building official* after construction is completed. Where required by the building official, testing shall be conducted by an approved party independent from the builder and the installer of the ducts. ~~either of the following:~~ A written report specifying the results of the test and attesting to the accuracy of the results shall be signed by the party conducting the testing and provided to the builder and the *building official*.

1. ~~Post-construction test: L~~ As tested, total duct l~~L~~eakage ~~to outdoors~~ shall be less than ~~or equal to 8 cfm (3.78 L/S) per 100 ft^2 (9.29 m^2) of conditioned floor area or a total leakage less than~~ or equal to 6 ~~12~~ cfm (226.5 L/min ~~5.66 L/S~~) per 100 square feet (9.29 m^2) of *conditioned floor area* when tested at a pressure differential of 0.1 inch w.g. (25 Pa) across the entire system, including the manufacturer's air handler ~~end closure~~ enclosure. All register boots shall be taped or otherwise sealed during the test.
2. ~~Rough-in test: Total leakage shall be less than or equal to 6 cfm (2.83 L/S) per 100 ft^2 (9.29 m^2) of conditioned floor area when tested at a pressure differential of 0.1 inches w.g. (25 Pa) across the roughed in system, including the manufacturer's air handler enclosure. All register boots shall be taped or otherwise sealed during the test. If the air handler is not installed at the time of the test, total leakage shall be less than or equal to 4 cfm (1.89 L/S) per 100 ft$_2$ (9.29 m^2) of conditioned floor area.~~

Exceptions: ~~Duct tightness test is not required if~~ Where the air handler and all ducts are located within conditioned space, total duct leakage shall not exceed 12 cfm per 100 square feet of conditioned floor area when tested as specified above.

N1103.2.3 Building cavities. Building framing cavities shall not be used as ~~supply~~ ducts.

Reason: This proposal is intended to substantially improve the code's current duct insulation, sealing and testing requirements. It is well-recognized that properly designed, constructed, insulated and sealed ducts are crucial for an energy efficient home and occupant comfort. Among other items, this proposal:

Reduces allowed total duct leakage by 50% in homes where ducts are not located in conditioned space;
Requires a less stringent duct tightness test for ducts in conditioned space to ensure that conditioned air is delivered to its intended destination;
Requires R-4 duct insulation when ducts are located in the conditioned space to address condensation and house durability issues;
Eliminates the use of building framing cavities as ducts;
Establishes requirements for a written test report, to increase and simplify enforceability and accountability;
Creates the ability for the code official to require an independent party to conduct the test;
Simplifies and makes consistent testing requirements by reducing the four possible tests to a single post-construction test of total duct leakage;
Requires final testing of the ducts when construction is complete to ensure that the home owner is receiving a home that meets the intent of the code.

Field experience with duct sealing shows that these reduced leakage rates are attainable with today's technology and practice. It also shows that duct leakage, even when ducts are in conditioned spaces, can induce energy losses. For example, a leaky duct that does not supply sufficient airflow to a given space can create negative pressure in that space, inducing air filtration that would not otherwise occur. Such a condition would also reduce comfort, and could cause occupants to adjust thermostat settings, increasing energy use for the whole zone or house.

These changes are relatively simple and yet add significant energy savings potential and improved enforcement. The estimated savings as shown in the table below are savings from this proposal in addition to the requirements in the 2009 IECC, which first established a requirement for testing or locating the ducts in conditioned space in the code. The additional cost for achieving the tested values in this proposal are minimal compared to energy savings.

	Climate Zone 1	Climate Zone 2	Climate Zone 3	Climate Zone 4	Climate Zone 4M	Climate Zone 5	Climate Zone 6	Climate Zone 7	Climate Zone 8
Heating, Cooling, Hot Water Purchased Energy Cost Percent Savings	2.8%	2.7%	2.5%	2.6%	2.6%	2.7%	2.9%	2.7%	2.5%
Total Purchased Energy Cost Percent Savings (also including major appliances and lighting)	2.0%	1.9%	1.8%	1.9%	2.0%	2.0%	2.3%	2.1%	2.0%

Cost Impact: The code change proposal will increase the cost of construction.

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IECC COMMITTEE. PART II WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IECC

1. Add new text as follows:

403.2.2 Sealed air handler. Air handlers shall have a manufacturer's designation for an air leakage of no more than 2 percent of the design air flow rate when tested accordance with ASHRAE 193.

2. Add new standard to Chapter 6 as follows:

ASHRAE 193 Method of Test for Determining the Air Leakage Rate for HVAC Equipment

PART II – IRC ENERGY

1. Add new text as follows:

N1103.2.2 Sealed air handler. Air handlers shall have a manufacturer's designation for an air leakage of no more than 2 percent of the design air flow rate when tested accordance with ASHRAE 193.

2. Add new standard to Chapter 44 as follows:

ASHRAE 193 Method of Test for Determining the Air Leakage Rate for HVAC Equipment

Reason: The requirement to "seal" the air handler is already in the IECC/IRC. Because the air inside the handler is under high pressure, even small leaks cause considerable air loss. The manufacturer sealing and testing the air handler in the factory is very cost-effective.

A manufacturer's designation (label) that the air handler is sealed simplifies compliance. Inspection becomes the simple act of verifying that the manufacturer designation is on the air handler. Most manufacturers are already testing at least some of their air handlers for air tightness.

The ASHRAE 193 standard provides the test for the air handler. ASHRAE 193 is expected to be completed before the end of this code cycle. If the ASHRAE 193 standard is not completed before the final action hearing then the reference to that standard cannot be put into the energy code.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: A review of the standard(s) proposed for inclusion in the code, ASHRAE 193, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

EC105–09/10
403.2.2, 402.2.3, 403.6, Chapter 6

Proponent: Wesley R. Davis, Air Conditioning Contractors of America

1. Revise as follows:

403.2.2 Sealing (~~Mandatory~~ Prescriptive). All ducts, air handlers, filter boxes and building cavities used as ducts shall be sealed. Joints and seams shall comply with Section M1601.4.1 of the *International Residential Code*.

403.2.3 Sealing (Mandatory). Duct tightness shall be verified ~~by either of the following:~~ in accordance with ACCA 5 QI.

~~1. Postconstruction test: Leakage to outdoors shall be less than or equal to 8 cfm (226.5 L/min) per 100 ft^2 (9.29 m^2) of *conditioned floor area* or a total leakage less than or equal to 12 cfm (12 L/min) per 100 ft2 (9.29 m^2) of *conditioned floor area* when tested at a pressure differential of 0.1 inches w.g. (25 Pa) across the entire system, including the manufacturer's air handler enclosure. All register boots shall be taped or otherwise sealed during the test.~~

~~2. Rough-in test: Total leakage shall be less than or equal to 6 cfm (169.9 L/min) per 100 ft2 (9.29 m2) of *conditioned floor area* when tested at a pressure differential of 0.1 inches w.g. (25 Pa) across the roughed in system, including the manufacturer's air handler enclosure. All register boots shall be taped or otherwise sealed during the test. If the air handler is not installed at the time of the test, total leakage shall be less than or equal to 4 cfm (113.3 L/min) per 100 ft2 (9.29 m2) of *conditioned floor area*.~~

~~**Exception:** Duct tightness test is not required if the air handler and all ducts are located within *conditioned space*.~~

~~**403.6 Equipment sizing (Mandatory).** Heating and cooling equipment shall be sized in accordance with Section M1401.3 of the *International Residential Code*.~~

403.6 HVAC equipment performance. Equipment shall meet the minimum requirements of ACCA 5 – QI when measured in accordance with the standard's acceptable procedures.

2. Add new standard to Chapter 6 as follows:

ACCA
ANSI/ACCA QI – 2007 HVAC Quality Installation Specifications

Reason: An HVAC system is comprised of equipment, ducts and components, How they interact determines the amount of energy they will use to deliver the desired comfort level. Referencing the ANSI/ACCA QI-2007 (HVAC Quality Installation Specification) will address each element of an HVAC system installation corporately rather than individually.

The ANSI/ACCA 5 QI specification was developed by a coalition of HVAC industry stakeholders to establish the minimum performance requirements, approved test procedures and required documentation to ensure proper HVAC system design and installation. Adoption of this standard will simplify the code and point to one, unified, free (www.acca.org/quality) reference for HVAC system installation. For example, the ACCA 5 QI provides the following requirements for duct leakage tolerances (to replace Section 403.2.2) and equipment sizing (to replace Section 403.6):

COMPARISON OF REQUIREMENTS IN IECC 2009 TO ANSI/ACCA 5-QI		
HVAC system installation element	IECC 2009	ANSI/ACCA 5 – QI
Duct leakage	4, 6, 8 or 12 cfm/100 sq. ft. (depending on the application)	4 cfm/100 sq. ft.
Equipment sizing	ACCA Manual J and Manual S	ACCA Manual J and Manual S

The standard, a level of performance that, if satisfactorily achieved, serves as an indicator that sound industry practices were likely used. It is available for free download.

Promotion of high HVAC equipment efficiency ratings, tight ducts and equipment selection are meaningless if the HVAC "system" is improperly designed or installed. The ANSI/ACCA 5 QI has been implemented by HVAC contractors across America. It is also the source document for a US EPA EnergyStar program to ensure their EnergyStar rated HVAC appliances are properly installed.

Cost Impact: The code change proposal will increase the cost of construction.

Analysis: Analysis: A review of the standard(s) proposed for inclusion in the code, ANSI/ACCA QI-2007, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

Public Hearing: Committee: AS AM D

ICCFILENAME: DAVIS-EC1-403.2.2.DOC

EC106–09/10
403.2.2 (New), Chapter 6; IRC N1103.2.2.1 (New), Chapter 44

Proponent: Ronald Majette, representing US Department of Energy

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IECC COMMITTEE. PART II WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IECC

1. Add new text as follows:

403.2.2.1 Sealed air handler. Air handlers shall have a manufacturer's designation for an air leakage of no more than 2 percent of the design air flow rate when tested accordance with ASHRAE 193.

2. Add new standard to Chapter 6 as follows:

ASHRAE
193 Method of Text for Determining the Air Leakage Rate for HVAC Equipment

PART II – IRC Energy

1. Add new text as follows:

N1103.2.2.1 Sealed air handler. Air handlers shall have a manufacturer's designation for an air leakage of no more than 2 percent of the design air flow rate when tested accordance with ASHRAE 193.

2. Add new standard to Chapter 44 as follows:

ASHRAE
193 Method of Text for Determining the Air Leakage Rate for HVAC Equipment

Reason: The proposed addition above addresses the issue of air handler tightness. Currently air handlers and other portions of the duct system are to be sealed. Duct tightness is verified by one of two tests. The proposed text adds a recognized test procedure and leakage metric for air handlers, which are technically not a part of the duct but are part of the duct system. Energy conservation measures in the air conditioning industry have driven the manufacturers of systems and components to establish compliance with leakage limits in ducts and air-handling units. The standards set by American Society of Heating Refrigerating and Air-conditioning Engineers (ASHRAE) form the basis for testing. Establishing an air handler leakage rate, given the availability of a uniform test procedure is prudent as any leakage in the air-handling units contributes to wastage of energy. The magnitude of leakage has a direct bearing on energy use and indoor air quality (IAQ).

Cost Impact: The code change proposal will increase the cost of construction to the degree that air handlers not currently meeting this criterion will now have to meet this criterion.

Analysis: A review of the standard(s) proposed for inclusion in the code, ASHRAE 193, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

Proponent: Ronald Majette, US Department of Energy

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IECC COMMITTEE. PART II WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I - IECC

Revise as follows:

403.2.2 Sealing (Mandatory). All ducts, air handlers, and filter boxes ~~and building cavities used as ducts~~ shall be sealed. Joints and seams shall comply with Section M1601.4.1 of the *International Residential Code*.

Duct tightness shall be verified by either of the following:

1. Postconstruction test: Total leakage ~~to outdoors~~ shall be less than or equal to ~~8~~ 6 cfm (~~226.5~~ 113.3 L/min) per 100 ft^2 (9.29 m^2) of *conditioned floor area* ~~or a total leakage less than or equal to 12 cfm (12 L/min) per 100 ft^2 (9.29 m^2) of *conditioned floor area*~~ when tested at a pressure differential of 0.1 inches w.g. (25 Pa) across the entire system, including the manufacturer's air handler enclosure. All register boots shall be taped or otherwise sealed during the test.
2. Rough-in test: Total leakage shall be less than or equal to ~~6~~ 4 cfm (~~169.9~~ 113.3 L/min) per 100 ft^2 (9.29 m^2) of *conditioned floor area* when tested at a pressure differential of 0.1 inches w.g. (25 Pa) across the ~~roughed in~~ system, including the manufacturer's air handler enclosure. All register ~~boot~~s shall be taped or otherwise sealed during the test. If the air handler is not installed at the time of the test, total leakage shall be less than or equal to ~~4~~ 3 cfm (~~113.3~~ 85.0 L/min) per 100 ft^2 (9.29 m^2) of *conditioned floor area*.

   Exceptions: Duct tightness test is not required if the air handler and all ducts are located within *conditioned space*.

PART II – IRC BUILDING/ENERGY

Revise as follows:

N1103.2.2 Sealing (Mandatory). All ducts, air handlers, and filter boxes ~~and building cavities used as ducts~~ shall be sealed. Joints and seams shall comply with Section M1601.4. Duct tightness shall be verified by either of the following:

1. Postconstruction test: Total leakage ~~to outdoors~~ shall be less than or equal to ~~8~~ 6 cfm (~~226.5~~ 113.3 L/min) per 100 ft^2 (9.29 m^2) of *conditioned floor area* ~~or a total leakage less than or equal to 12 cfm (12 L/min) per 100 ft^2 (9.29 m^2) of *conditioned floor area*~~ when tested at a pressure differential of 0.1 inches w.g. (25 Pa) across the entire system, including the manufacturer's air handler enclosure. All register boots shall be taped or otherwise sealed during the test.
2. Rough-in test: Total leakage shall be less than or equal to ~~6~~ 4 cfm (~~169.9~~ 113.3 L/min) per 100 ft^2 (9.29 m^2) of *conditioned floor area* when tested at a pressure differential of 0.1 inches w.g. (25 Pa) across the ~~roughed in~~ system, including the manufacturer's air handler enclosure. All register ~~boot~~s shall be taped or otherwise sealed during the test. If the air handler is not installed at the time of the test, total leakage shall be less than or equal to ~~4~~ 3 cfm (~~113.3~~ 85.0 L/min) per 100 ft^2 (9.29 m^2) of *conditioned floor area*.

   Exceptions: Duct tightness test is not required if the air handler and all ducts are located within *conditioned space*.

Reason: The purpose of this proposal is to substantially reduce duct leakage rates. Requirements related to testing of duct leakages were approved in the 07/08 code cycle. While testing of ducts was widely supported, many felt that the allowable leakage rates were excessively loose. For example, the 2009 IECC allows 288 cubic feet per minute of total leakage in a 2400 ft^2 house. This permits a block of air larger than 6 feet tall, 6 feet wide, and 6 feet long to leak out of the ducts every single minute at the test pressure level. This proposal significantly reduces the allowable leakage rate. This proposal limits the leakage test to total leakage (including leaks to both the inside and outside of the building), eliminating the alternative of measuring leakage to outdoors. Limiting the test to total leakage simplifies the code and gives a clearer indication of how well sealed the ducts are.

Cost Impact: The code change proposal may slightly increase the cost of construction by requiring more attention to detail when sealing ducts.

1. Revise as follows:

403.2.2 Sealing (Mandatory). All ducts, air handlers, filter boxes and building cavities used as ducts shall be sealed. Joints and seams shall comply with ~~Section M1601.4.1 of the *International Residential Code*~~ ACCA Manual J. Duct tightness shall be verified by either of the following:

1. Post construction test: Leakage to outdoors shall be less than or equal to 8 cfm (226.5 L/min) per 100 ft^2 (9.29 m^2) of *conditioned floor area* or a total leakage less than or equal to 12 cfm (12 L/min) per 100 ft^2 (9.29 m^2) of *conditioned floor area* when tested at a pressure differential of 0.1 inches w.g. (25 Pa) across the entire system, including the manufacturer's air handler enclosure. All register boots shall be taped or otherwise sealed during the test.
2. Rough-in test: Total leakage shall be less than or equal to 6 cfm (169.9 L/min) per 100 ft2 (9.29 m2) of *conditioned floor area* when tested at a pressure differential of 0.1 inches w.g. (25 Pa) across the roughed in system, including the manufacturer's air handler enclosure. All register boots shall be taped or otherwise sealed during the test. If the air handler is not installed at the time of the test, total leakage shall be less than or equal to 4 cfm (113.3 L/min) per 100 ft^2 (9.29 m^2) of *conditioned floor area*.

   Exceptions: Duct tightness test is not required if the air handler and all ducts are located within *conditioned space*.

403.6 Equipment sizing. Heating and cooling equipment shall be sized in accordance with ACCA Manual J-02. ~~M1401.3 of the *International Residential Code*~~.

405.6.1 Minimum capabilities. Calculation procedures used to comply with this section shall be software tools capable of calculating the annual energy consumption of all building elements that differ between the *standard reference design* and the *proposed design* and shall include the following capabilities:

1. Computer generation of the *standard reference design* using only the input for the *proposed design*. The calculation procedure shall not allow the user to directly modify the building component characteristics of the *standard reference design*.
2. Calculation of whole-building (as a single *zone*) sizing for the heating and cooling equipment in the *standard reference design* residence in accordance with ~~Section M1401.3 of the *International Residential Code*~~ ACCA Manual J.
3. Calculations that account for the effects of indoor and outdoor temperatures and part-load ratios on the performance of heating, ventilating and air-conditioning equipment based on climate and equipment sizing.
4. Printed *code official* inspection checklist listing each of the *proposed design* component characteristics from Table 405.5.2(1) determined by the analysis to provide compliance, along with their respective performance ratings (e.g., *R*-value, *U*-factor, SHGC, HSPF, AFUE, SEER, EF, etc.).

TABLE 404.5.2(1)
SPECIFICATIONS FOR THE STANDARD REFERENCE AND PROPOSED DESIGNS

BUILDING COMPONENT	STANDARD REFERENCE DESIGN	PROPOSED DESIGN
Heating systems[g, h]	As proposed Capacity: sized in accordance with ~~Section M1401.3 of the *International Residential Code*~~ ACCA Manual J	As proposed
Cooling systems[g, i]	As proposed Capacity: sized in accordance with ~~Section M1401.3 of the *International Residential Code*~~ ACCA Manual J	As proposed

(Portions of table and footnotes not shown remain unchanged)

2. Add new standards organization and standard to Chapter 6 as follows:

ACCA Air Conditioning Contractors of America
2800 Shirlington Road, Suite 300
Arlington, VA 22206

ACCA
Manual J-02 Residential Load Calculations Eighth Edition

Reason: The International Residential Code is a stand-alone code with its own references, covering R-4 and limited R-3 occupancies. It was designed to be adopted without reference to any other I-Codes, since it may be the only code allowed by law for adoption in certain jurisdictions (other codes adopted by different jurisdictions, such as state or county).
Therefore, references to specific provisions within the IRC should be limited to the IRC wherever possible.
References to specific code provisions should be found within the integrated I-Codes, should reference those document sources and not reference the IRC. The document is already approved for adoption in the International Residential Code.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: A review of the standard(s) proposed for inclusion in the code, ACCA, Manual J-02, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: VIGNEAU-EC-2-403.2.2

403.2.3; IRC N1103.2.3

Proponent: Ronald Majette, representing US Department of Energy

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IECC COMMITTEE. PART II WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IECC

Revise as follows:

403.2.3 Building cavities. Building framing cavities shall not be used as ~~supply~~ ducts or plenums.

PART II – IRC BUILDING/ENERGY

Revise as follows:

N1103.2.3 Building cavities. Building framing cavities shall not be used as ~~supply~~ ducts or plenums.

Reason: It is difficult to effectively use building framing cavities within the building envelope due to insulation requirements for the ducts and the thermal envelope and the difficulty in sealing them against air leakage. This is the basis for the current requirement in the code for supply ducts. Other than a lower temperature in return ducts their negative pressure in relation to the outside environment can and will draw unconditioned air into the HVAC system, increasing loads on the HVAC equipment and inducing building infiltration/exfiltration unless the cavities can be effectively

sealed. Just as cavities are not allowed for supply due in part to the difficulty in sealing they should also be precluded from being used as part of the return air duct system.

Cost Impact: The code change proposal may increase or decrease the cost of construction depending on the builder's choices with regard to duct system design, construction and location compared to previous expenses involved with framing, enclosing, and sealing building cavities as part of the duct system.

PART I – IECC

EC110-09/10
403.3.1(New)

Proponent: Howard Ahern Plumberex, representing self

Add new text as follows:

403.3.1 Protection of piping insulation. Piping insulation exposed to weather shall be protected from damage, including that due to sunlight, moisture, equipment maintenance, and wind by means including, aluminum, sheet metal, painted canvas, or plastic cover or other protection suitable for outdoor service. Cellular foam insulation shall be protected as above or painted with a coating that is water retardant and provides shielding from solar radiation that can cause degradation of the material. Adhesives tape shall not be permitted.

Reason: Outdoor piping insulation needs to be protected from weather, physical damage or from UV deterioration. Pipe insulation in outdoor locations is typically protected by an aluminum or sheet metal jacket, painted canvas, plastic cover, or coating that is water retardant and UV resistant.

All AC units require periodic maintenance. The frequency varies with how hard the unit operates, exterior temperature, preventive maintenance program, and many others. In every occasion, every maintenance provides an excuse for the Freon line insulation to be touched and removed. Adhesives Tape is not permitted as it will limit maintenance and damage insulations permeability characteristics..Removal of tape damages the integrity of the original insulation into pieces, specially, if the insulation has reached thermo set state. Protection can also keep silted pipe insulation from commonly separating thus saving additional energy cost. This simple common sense proposal is cost-effective as it will save energy and will prolong insulation life reducing replacement.

This proposal will save residential building energy cost following the same initiative being taken by the American Society of Heating, Refrigeration and Air Conditioning Engineers (ASHRAE) to improve energy efficiency levels by 30% in the **ASHRAE 90.1 2007 Section 6.4.4.1.1** commercial building standards. It also reflects the energy efficiency improvement approved by Congress American Recovery and Reinvestment Act of 2009 (ARRA).

ASHRAE 90.1 2007 Section 6.4.4.1.1:
Piping Insulation exposed to weather shall be protected from damage, including that due to sunlight, moisture, equipment maintenance, and wind but not limited to the following

A. Piping Insulation exposed to weather shall be suitable for outdoor service e.g., protected by aluminum, sheet metal, painted canvas, or plastic cover. Cellular foam insulation shall be protected as above or painted with a coating that is water retardant and provides shielding from solar radiation that can cause degradation of the material.

Cost Impact: The code change proposal will increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

FILENAME: AHERN-EC-1-403.3.1

EC111–09/10
403.4, 403.4 (New), 504.5, 505 (New), Section 505 (New), 505.1 (New)

Proponent: Gregory A. Farmer, PE, ASPE Legislative Committee, ASPE

1. Revise as follows:

403.4 Circulating hot water systems (Mandatory). All circulating service hot water piping shall be externally insulated with material having a thermal resistance rating ~~to at least~~ of not less than R-~~2~~ 4. Circulating hot water systems shall include an automatic or readily *accessible* manual switch that can turn off the hot-water circulating pump when the system is not in use.

2. Add new text as follows:

403.4 Potable water piping insulation (Mandatory). Hot and tempered water main distribution pipes and the branches from such pipes for a developed length of ten branch pipe diameters from the main distribution pipes shall be externally insulated. Cold water pipes located in spaces where conditions could cause condensation to form on the exterior of the pipes shall be externally insulated. The pipe insulation required by this section shall have a thermal resistance rating of not less than R-4.

(Renumber subsequent sections)

3. Revise as follows:

504.5 Pipe insulation. For automatic-circulating hot water systems, piping shall be externally insulated with a material having a thermal resistance rating of not less than R-4. ~~with 1 inch (25 mm) of insulation having a conductivity not exceeding 0.27 Btu per inch/h × ft^2 × °F (1.53 W per 25 mm/m^2 × K).~~ The first 8 feet (2438 mm) of piping in noncirculating systems served by equipment without integral heat traps shall be externally insulated. ~~with 0.5 inch (12.7 mm) of material having a conductivity not exceeding 0.27 Btu per inch/h × ft^2 × °F (1.53 W per 25 mm/m^2 × K)~~. Hot and tempered water main distribution pipes and the branches from such pipes for a developed length of ten branch pipe diameters from the main distribution pipes shall be externally insulated. The pipe insulation required by this section shall have a thermal resistance rating of not less than R-4.

4. Add new text as follows:

SECTION 505
COLD WATER PIPING
(Mandatory)

505.1 Cold water piping condensation control. Cold water pipes located in spaces where conditions could cause condensation to form on the exterior of the pipes shall be externally insulated. The pipe insulation shall have a thermal resistance rating of not less than R-4.

(Renumber subsequent sections)

Reason: Hot water piping losses considerable amounts of heat and wastes energy. Insulation of hot and tempered water piping will reduce energy costs and more than pay for the initial cost of insulation. However, non-circulated branches loss the heat energy regardless of the insulation, therefore it is not necessary to insulate non circulated branch piping, except where they will affect the heat loss in the adjacent circulated main. It is generally accepted in other industries that the temperature decay in non-circulated branch piping from the system temperature to ambient is ten pipe diameters of the branch. Insulation applied to cold water piping will eliminate damage to ceilings and significantly reduce pipe system corrosion due to condensation.

Cost Impact: The code change proposal will increase the cost of construction.

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IECC COMMITTEE AND PART II WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IECC

1. Add new definition as follows:

DEMAND RECIRCULATION WATER SYSTEM. A water distribution system where pump(s) prime the service hot water piping with heated water upon demand for hot water.

2. Revise as follows:

403.4 Service hot water systems. Energy conservation measures for service hot water systems shall be in accordance with Sections 403.4.1 and 403.4.2.

403.4.1 Circulating hot water systems (Mandatory). ~~All circulating service hot water piping shall be insulated to at least R-2.~~ Circulating hot water systems shall ~~include~~ be provided with an automatic or readily *accessible* manual switch that can turn off the hot water circulating pump when not in use.

3. Add new text and table as follows:

403.4.2 Hot water pipe insulation (Prescriptive). Insulation for hot water pipe with a minimum thermal resistance (R-value) of at least R-3 shall be applied to the following:

1. Piping larger than 3/4 in. nominal diameter
2. Piping serving more than one dwelling unit
3. Piping from the water heater to kitchen outlets
4. Piping located outside the conditioned space
5. Piping from the water heater to a distribution manifold
6. Piping located under a floor slab
7. Buried piping
8. Supply and return piping in recirculation systems other than demand recirculation systems
9. Piping with run lengths greater than the maximum run lengths for the nominal pipe diameter given in Table 403.4.2.

TABLE 403.4.2
MAXIMUM RUN LENGTH (feet)[a]

Nominal Pipe Diameter of Largest Diameter Pipe in the Run (in.)	3/8	1/2	3/4	> 3/4
Maximum Run Length	30	20	10	5

a. Total length of all piping from the distribution manifold or the recirculation loop to a point of use.

PART II – IRC BUILDING/ENERGY

1. Add new definition as follows:

DEMAND RECIRCULATION WATER SYSTEM. A water distribution system where pump(s) prime the service hot water piping with heated water upon demand for hot water.

2. Revise as follows:

N1103.4 ~~Service~~ Hot water service systems. Energy conservation measures for hot water service systems shall be in accordance with Sections 403.4.1 and 403.4.2.

N1103.4.1 Circulating hot water systems (Mandatory). ~~All circulating service hot water piping shall be insulated to at least R-2.~~ Circulating hot water systems shall ~~include~~ be provided with an automatic or readily *accessible* manual switch that can turn off the hot water circulating pump when not in use.

3. Add new text and table as follows:

N1103.4.2 Hot water pipe insulation (Prescriptive). Insulation for hot water pipe with a minimum thermal resistance (R-value) of at least R-3 shall be applied to the following:

1. Piping larger than 3/4 in. nominal diameter
2. Piping serving more than one dwelling unit
3. Piping from the water heater to kitchen outlets
4. Piping located outside the conditioned space
5. Piping from the water heater to a distribution manifold
6. Piping located under a floor slab
7. Buried piping
8. Supply and return piping in recirculation systems other than demand recirculation systems
9. Piping with run lengths greater than the maximum run lengths for the nominal pipe diameter given in Table 403.4.2.

TABLE N1103.4.2
MAXIMUM RUN LENGTH (feet)[a]

Nominal Pipe Diameter of Largest Diameter Pipe in the Run (in.)	3/8	1/2	3/4	> 3/4
Maximum Run Length	30	20	10	5

a. Total length of all piping from the distribution manifold or the recirculation loop to a point of use.

Reason:
(Majette)- The purpose of this code change is to add pipe insulation requirements for domestic hot water. The IECC and IRC have minimal requirements for energy efficiency related to water heating. The proposed pipe insulation requirements represent a modest initial investment that will save energy for decade after decade. The proposed requirements are structured to allow "short and skinny" pipe runs as an alternative to pipe insulation in many cases. Either way, these requirements help save water and help limit the energy wasted when the faucet is turned off and the pipes are left full of hot water.
(Conner)- There are two parts to this proposal: insulation of hot water piping and reducing the volume of water in the hot water piping from the source of hot water to the outlets. Both parts are deemed essential because hot water piping is intended to be a long-lived subsystem of the building, lasting 50 years or more before it will be replaced and because much of the piping is not easily accessible to make modifications during this long period of time.

1. Insulation of hot water piping reduces the waste of energy, water and time during the delivery, use and cool-down phases of a hot water event. During the delivery phase, when the piping runs in unconditioned spaces, in a slab, when it is buried or when the flow rate is very low (less than 1 gpm) pipe insulation significantly reduces the heat loss and helps to ensure that hot enough water gets to the outlets. Getting the hot water to the outlets hotter, also gets it there quicker. During the use phase, the insulation keeps the water hotter by reducing the temperature drop from the source of hot water to the outlet. This saves energy by making it possible to reduce the storage temperature: every 1F reduction in storage temperature reduces standby heat losses by almost 2%. During the cool-down phase, pipe insulation increases the time it takes for the temperature of the water to cool down, roughly doubling the cool-down time for ½ inch nominal pipe and tripling it for ¾ inch nominal pipe. This saves energy, water and time for all those hot water events that are clustered between 10 and 45 minutes apart: think morning rush hour (getting ready for work and school) and evening plateau (coming home from school and work, preparing, eating and cleaning up from dinner and getting ready for bed), and of course lunch when people are home during the day.
2. Reducing the volume between the source of hot water and the outlet also saves energy, water and time. Volume is a combination of length and diameter. Less volume between the source and the outlet means less cost in hot and cold water piping and, if the floor plan is done well, in the drain lines too. In many homes today, little if any consideration is given to the layout of hot water outlets, resulting in very long waits for hot water (over 1 minute and more than 2 gallons are wasted) at the fixtures furthest from the water heater, which are often the master bathroom and the kitchen, the two most-used hot water locations in a home. Reducing the volume saves water and time during the delivery phase of a hot water event because less not-hot water needs to be cleared out when hot water is desired at the outlet. It saves energy during the use phase because for a given pipe diameter and flow rate, there is less temperature drop over a shorter distance. And during the cool-down phase, it saves energy because there is a smaller volume that that will lose its heat when the temperature of the water in the pipe cools down.

Proponents: Edward R. Osann, Potomac Resources, Inc.; Gary Klein, Affiliated International Management, LLC, Representing Alliance for Water Efficiency

1. Add new text as follows:

403.4 Service hot water piping (Mandatory). Service hot water piping shall be installed in accordance with Sections 403.4.1 through 403.4.4.

403.4.1 Pipe insulation. Service hot water piping installed below ground or in a mass floor or *mass wall* in contact with the ground shall be insulated to at least R-3.

403.4.2 Insulation protection. Insulated service hot water piping installed below ground shall be placed within a waterproof channel or conduit.

Exceptions:

1. Where pipe insulation is warranted as waterproof in underground applications in damp soil when installed according to the manufacturer's instructions.
2. Where pipe insulation is warranted as maintaining a value of R-3 in underground applications in damp soil when installed according to the manufacturer's instructions.

2. Revise as follows:

~~403.4~~ 403.4.3 Circulating hot water systems ~~(Mandatory)~~. All circulating service hot water piping shall be insulated to at least R-2. Circulating hot water systems shall include an automatic or readily *accessible* manual switch that can turn off the hot-water circulating pump when the system is not in use.

3. Add new text as follows:

403.4.4 Accommodation of pipe insulation. All hot water supply pipe to be insulated shall be strapped or affixed such that insulation is continuous. Building cavities shall be large enough to accommodate the combined diameter of the pipe plus the insulation, plus any other objects in the cavity that the piping must cross.

Reason: Roughly 1/3 of residential indoor per capita water consumption has been found to be attributable to faucets, showers, and baths – applications where warm to hot water is desirable, if not essential.[1] Hot water use represents 15 to 30% of total residential energy bills.[2] It is common practice for residents to draw water from hot water fittings without use until the hot water reaches the desired temperature. Such wait times have the effect of wasting energy and water while reducing consumer satisfaction. This proposal is needed to reduce this common waste of energy and water in residential buildings, and is most practical to achieve in new construction.

Insulation of hot water piping reduces the waste of energy, water, and time during the delivery, use, and cool-down phases of a hot water event. During the delivery phase, when the piping runs in unconditioned spaces, in a slab, when it is buried, or when the flow rate is very low (less than 1 gpm), pipe insulation significantly reduces the heat loss and helps to ensure that hot enough water gets to the outlets. Getting the hot water to the outlets hotter also gets it there quicker. During the use phase, the insulation keeps the water hotter by reducing the temperature drop from the source of hot water to the outlet. This saves energy by making it possible to reduce the storage temperature: every 1 degree F reduction in storage temperature reduces standby heat losses by almost 2%. During the cool-down phase, pipe insulation increases the time it takes for the temperature of the water to cool down, roughly doubling the cool-down time for ½ inch nominal pipe and tripling it for ¾ inch nominal pipe. This saves energy, water, and time for all those hot water events that are clustered between 10 and 45 minutes apart. These include morning "rush hour" (getting ready

for work and school) and evening plateau (coming home from school and work, preparing, eating, and cleaning up from supper, and getting ready for bed), and of course lunch when people are home during the day.[3 4]

Hot water service pipe insulation is particularly important when piping is installed in a mass floor or wall or is buried. Uninsulated pipe buried in damp conditions loses heat at 4 to nearly 9 times the rate of uninsulated pipes in room temperature air. Adding insulation to buried pipe in damp conditions reduces heat loss by about 90%.[5] Due to the inaccessibility of buried pipe once installed, care must be taken to prevent or slow the degradation of insulation value over time in damp soil conditions.

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IECC COMMITTEE. PART II WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IECC

1. Add new text as follows:

403.4 Service water heating (Mandatory). Service hot water piping shall be installed in accordance with Sections 403.4.1 through 403.4.3.

403.4.1 Pipe length and Insulation. Service hot water piping shall be no more than a total of 60 linear feet of pipe length to all fixtures being served by one service water heating unit. All service hot water piping shall be insulated to at least R-3 for pipes sized 1 inch in diameter or less and R-4 for pipes larger than 1 inch in diameter for the distance between the service water heating equipment to within 5 feet of each fixture connected to the hot water pipe. In addition, the first 5 feet of hot and cold water pipes from the storage tank for non-recirculating service water heating systems shall be insulated to at least R-3 for pipes sized 1 inch in diameter or less and R-4 for pipes larger than 1 inch in diameter.

Exception: Hot water distribution systems that supply hot water from one of the following sources (this exception does not apply to portions of hot water distribution systems located below ground or in a mass floor or mass wall in contact with the ground):

1. Condensing gas service water heating equipment,
2. Solar thermal water heating equipment that is designed to provide more than 50 percent of annual hot water requirements from solar heated water,
3. Heat pump electric service water heating equipment,
4. Tankless demand service gas water heating equipment, or
5. Tankless demand service electric heating equipment, where either:
   - 5.1. Heated water is provided through piping that is insulated to R-3 or
   - 5.2. There is no more than a total of 15 linear feet of pipe length to all fixtures being served by each unit.

2. Revise as follows:

403.4.2 ~~403.4~~ Circulating hot water systems ~~(Mandatory)~~. All circulating service hot water piping shall be insulated to at least R-3~~2~~ for pipes sized 1 inch in diameter or less and R-4 for pipes larger than 1 inch in diameter. Circulating hot water systems shall include an automatic or readily accessible manual switch that can turn off the hot water circulating pump when the system is not in use.

3. Add new text as follows:

403.4.3 Heat traps. Water heating equipment not supplied with integral heat traps and serving non-circulating systems shall be provided with heat traps on the supply and discharge piping associated with the equipment.

PART II – IRC BUILDING/ENERGY

1. Add new text as follows:

N1103.4 Service water heating. Service hot water piping shall be installed in accordance with Sections 403.4.1 through 403.4.3.

N1103.4.1 Pipe length and Insulation. Service hot water piping shall be no more than a total of 60 linear feet of pipe length to all fixtures being served by one service water heating unit. All service hot water piping shall be insulated to at least R-3 for pipes sized 1 inch in diameter or less and R-4 for pipes larger than 1 inch in diameter for the distance between the service water heating equipment to within 5 feet of each fixture connected to the hot water pipe. In addition, the first 5 feet of hot and cold water pipes from the storage tank for non-recirculating service water heating systems shall be insulated to at least R-3 for pipes sized 1 inch in diameter or less and R-4 for pipes larger than 1 inch in diameter.

Exception: Hot water distribution systems that supply hot water from one of the following sources (this exception does not apply to portions of hot water distribution systems located below ground or in a mass floor or mass wall in contact with the ground):

1. Condensing gas service water heating equipment,
2. Solar thermal water heating equipment that is designed to provide more than 50 percent of annual hot water requirements from solar heated water,
3. Heat pump electric service water heating equipment,
4. Tankless demand service gas water heating equipment, or
5. Tankless demand service electric heating equipment, where either:
   - 5.1. Heated water is provided through piping that is insulated to R-3 or
   - 5.2. There is no more than a total of 15 linear feet of pipe length to all fixtures being served by each unit.

2. Revise as follows:

N1103.4.2 ~~N1103.4~~ Circulating hot water systems. All circulating service hot water piping shall be insulated to at least ~~R-~~2 R-3 for pipes sized 1 inch in diameter or less and R-4 for pipes larger than 1 inch in diameter. Circulating hot water systems shall include an automatic or readily accessible manual switch that can turn off the hot water circulating pump when the system is not in use.

3. Add new text as follows:

N1103.4.3 Heat traps. Water heating equipment not supplied with integral heat traps and serving non-circulating systems shall be provided with heat traps on the supply and discharge piping associated with the equipment.

Reason: Water heating energy is becoming a large percentage of the overall energy use in homes due to significant improvements that have occurred to heating, cooling and lighting energy efficiency. This proposal is intended to improve hot water efficiency by requiring improvement of either the efficiency of the hot water distribution system or the water heating equipment (due to issues with federal NAECA preemption, the code cannot require an improved hot water heater, but can permit such an improvement as an exception to an alternative requirement not involving improved equipment).

The efficiency of the hot water distribution system is based on the pipe length, pipe diameter and pipe insulation. This proposal requires increased insulation as the pipe diameter increases in all homes. The proposal also requires system zoning if the distribution pipe from one system exceeds 60 linear feet. Assuming an average of 30 linear feet per 1000 SF of conditioned floor area for a typical hot water distribution system, this second requirement will promote more efficient distribution design in larger homes.

This proposal also allows high performance water heating equipment to be installed as an exception in lieu of improving the hot water distribution. The improvement in water heating equipment has a significant impact on the overall energy used for hot water in a home. The following table from ACEEE shows estimated annual energy use by equipment type, with the bold equipment selected for the exceptions.

Water Heater Type	**Efficiency (EF)**	**Yearly Energy Cost**
Conventional gas storage	0.60	$350
High-efficiency gas storage	0.65	$323
Condensing gas storage	**0.80**	**$262**
Demand gas (no pilot)	**0.82**	**$228**
Conventional oil-fired storage	0.55	$654
Minimum Efficiency electric storage	0.90	$463
High-eff. electric storage	0.95	$439
Electric heat pump water heater	**2.20**	**$190**
Solar with electric back-up	**1.20**	**$175**

source: http://www.aceee.org/consumerguide/waterheating.htm

Electric tankless demand water heating, while not analyzed by ACEEE in the study above, is also included due to increased EF ratings compared to electric storage as an exception with an additional requirement for insulation or the length of pipe serviced by the equipment. This additional requirement is meant to limit the electric demand impact and also improve the distribution efficiency for improved system performance. Literature shows that electric tankless heaters have very high efficiency ratings (around 0.98 and 0.99) and have opportunity to save significant energy when coupled with reduced distribution losses.

The US DOE (http://www.energysavers.gov/your_home/water_heating/index.cfm/mytopic=13060) states that "insulating your hot water pipes reduces heat loss and can raise water temperature 2ºF–4ºF hotter than uninsulated pipes can deliver, allowing for a lower water temperature setting". This is the main reason for having a strong focus on improving the hot water distribution which will allow for reduced energy use on the overall hot water system. The DOE also recommends insulation of all accessible hot water pipes, with the most important being within 3 feet of the water heater.

In addition to the insulation language, this proposal also adds language that requires a heat trap for systems that are not supplied with a heat trap. This language is exactly based on section 504.4 of the IECC and is being included to ensure that more energy is not lost from the hot water equipment to the piping based on the recommendation from the DOE:
http://www.energysavers.gov/your_home/water_heating/index.cfm/mytopic=13100

Cost Impact: The code change proposal will increase the cost of construction.

403.4; IRC N1103.4

Proponent: Michael Resetar, Armacell LLC; Roger Schmidt, K-Flex USA; Shawn Dunahue, Nomaco Insulation

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IECC COMMITTEE. PART II WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IECC

Revise as follows:

403.4 Circulating hot water systems. All circulating service hot water piping shall be insulated to at least ~~R-2~~ R-4. Circulating hot water systems shall include an automatic or readily accessible manual switch that can turn off the hot water circulating pump when the system is not in use.

PART II – IRC BUILDING/ENERGY

Revise as follows:

N1103.4 Circulating hot water systems. All circulating service hot water piping shall be insulated to at least ~~R-2~~ R-4. Circulating hot water systems shall include an automatic or readily accessible manual switch that can turn off the hot water circulating pump when the system is not in use.

Reason: Shifting from an R-2 requirement to an R-4 insulation requirement helps achieve 29.4% gain in performance efficiency. Focusing on all hot water piping will not only target energy efficiency but also help reduce water waste by maintaining a temperature above 105°F longer between uses. (Supporting Documents Attached)

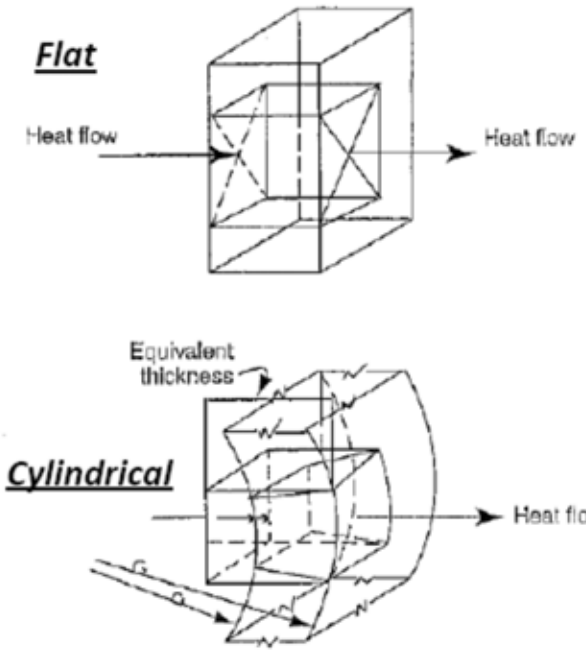
Data provided based on elastomeric pipe insulation

Don't compare typical flat sheet insulation "R" values with cylindrical pipe insulation "R" values.



Cylindrical Pipe Insulation "R" value Calculation:

$$R = \frac{r2\ln(\frac{r2}{r1})}{k}$$

Where r_1 = uninsulated pipe radius in inches
r_2 = insulated pipe radius in inches
k = thermal conductivity.

This equation yields an "R" value on a ***square foot basis***

R" value or thermal resistance is a measure of the ability of a material to retard heat flow. "R" is the numerical reciprocal of "C" (thermal conductance). Thermal resistance is used in combination with numerals to designate thermal resistance values. The higher the "R" value the higher the insulating value. This value is normally calculated on a square foot basis.

Flat Sheet Calculation Example:

$$R = \frac{\text{Thickness of Material}}{\text{Material Thermal Conductivity}}$$

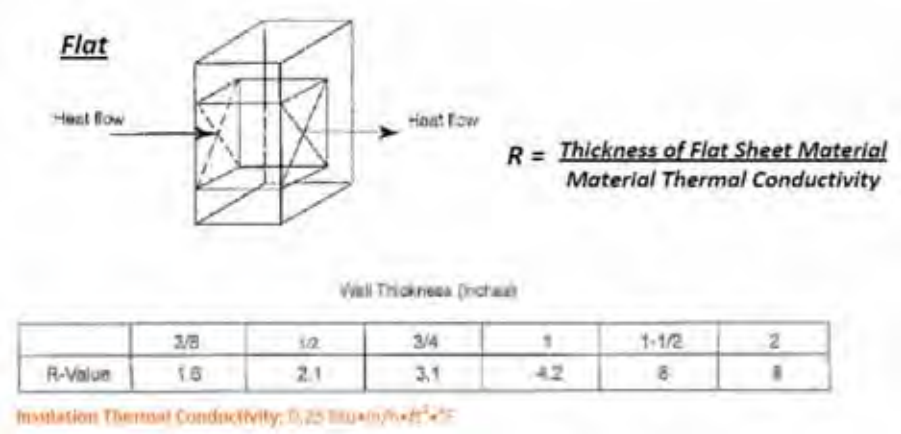
Sheet Insulation Thickness: 2"
Insulation Thermal Conductivity: 0.25 Btu•in/h•ft^2•°F
Resulting "R" Value : R-8.0 *(R-8 equals 8 resistance units)*

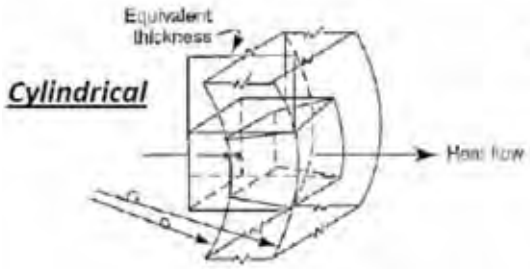
(*) It is common knowledge that with flat layer of insulation increasing the "R" value increases the thermal efficiency by the same factor.

The simple relations for flat sheet insulation do not hold true for when looking at cylindrical pipe insulations. For these materials, heat flow is not the simple straight –through heat flow found in flat surface/sheet material, but rather a radial heat flow. The reasoning is based on that fact that the inner radius surface area is much smaller than the outer radius surface area.

These differences in surface area support the need to calculate heat flow must be done using an equivalent thickness. For cylindrical pipe insulation the **Cylindrical Pipe Insulation "R" value Calculation** detailed above.

Don't compare typical flat sheet insulation "R" values with cylindrical pipe insulation "R" values.





Cylindrical Pipe Insulation "R" value Calculation:

$$R = \frac{r2\ln(\frac{r2}{r1})}{k}$$

Insulation Thermal Conductivity: 0.25 Btu•in/ft²•°F

Past History:

IRC 2000:
Had Table N1103.5

PIPING SYSTEM TYPES	FLUID TEMP RANGE (ºF)	INSULATION THICKNESS inches[b]
Heating systems		
Low pressure/temperature	201-250	1.5
Low temperature	120-200	1.0
Steam condensate (for feed water)	Any	1.5
Cooling systems		
Chilled water, refrigerant or brine	40-55	0.75
	Below 40	1.25

For SI: 1 inch = 25.4 mm, ºC = [(ºF)–32]/1.8.

a. The pipe insulation thicknesses specified in this table are based on insulation *R*-values ranging from R-4 to R-4.6 per inch of thickness. For materials with an *R*-value greater than R-4.6, the insulation thickness specified in this table may be reduced as follows:
New Minimum Thickness = 4.6 × Table Thickness / Actual R-Value
For materials with an R-value less than R-4, the minimum insulation thickness shall be increased as follows:
New Minimum Thickness = 4.0 × Table Thickness / Actual R-Value

b. For piping exposed to outdoor air, increase thickness by 0.5 inch.

Cold/Chilled Water Temperature: 40°F - 55°F (Insulation Thickness= ¾")
Low Temperature: 120°F - 200°F (Insulation Thickness= 1")

IRC 2003:
Had Table N1103.5

PIPING SYSTEM TYPES	FLUID TEMP RANGE (°F)	INSULATION THICKNESS (inches)[b]
Heating systems

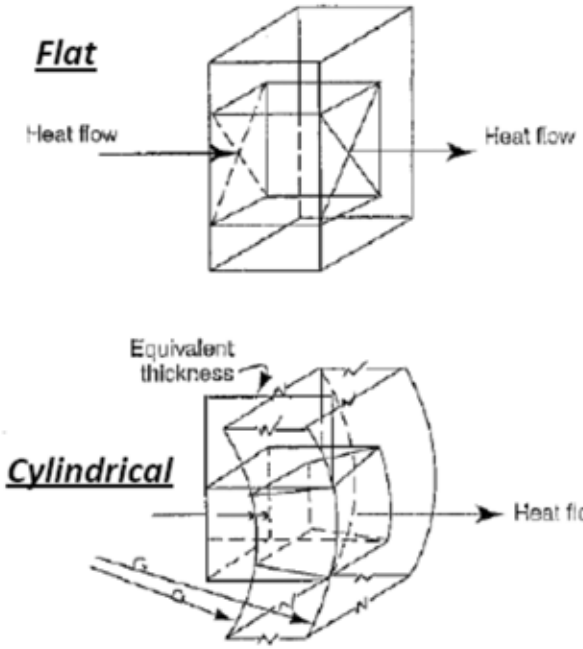
Data provided based on elastomeric pipe insulation

Don't compare typical flat sheet insulation "R" values with cylindrical pipe insulation "R" values.



Cylindrical Pipe Insulation "R" value Calculation:

$$R = \frac{r2 \ln(\frac{r2}{r1})}{k}$$

Where r_1 = uninsulated pipe radius in inches
r_2 = insulated pipe radius in inches
k = thermal conductivity.

This equation yields an "R" value on a ***square foot basis***

R" value or thermal resistance is a measure of the ability of a material to retard heat flow. "R" is the numerical reciprocal of "C" (thermal conductance). Thermal resistance is used in combination with numerals to designate thermal resistance values. The higher the "R" value the higher the insulating value. This value is normally calculated on a square foot basis.

Flat Sheet Calculation Example:

$$R = \frac{\textit{Thickness of Material}}{\textit{Material Thermal Conductivity}}$$

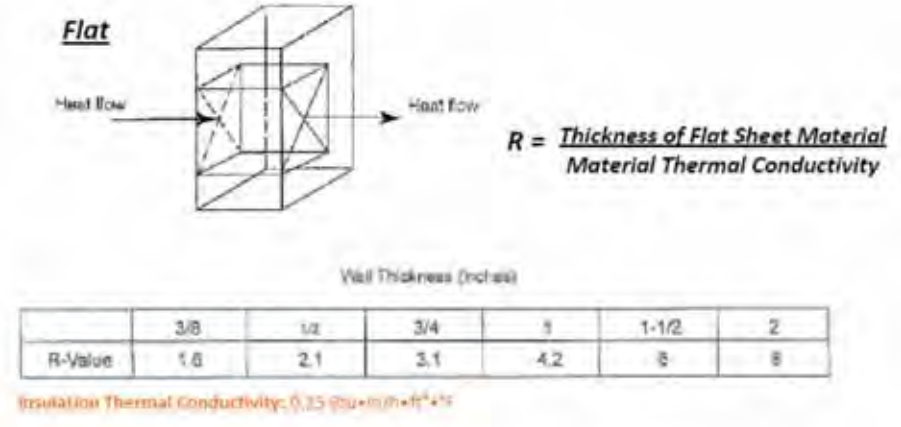
Sheet Insulation Thickness: 2"
Insulation Thermal Conductivity: 0.25 Btu•in/h•ft^2•°F
Resulting "R" Value : R-8.0 *(R-8 equals 8 resistance units)*

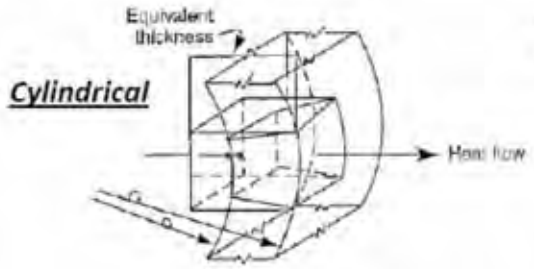
(*) It is common knowledge that with flat layer of insulation increasing the "R" value increases the thermal efficiency by the same factor.

The simple relations for flat sheet insulation do not hold true for when looking at cylindrical pipe insulations. For these materials, heat flow is not the simple straight –through heat flow found in flat surface/sheet material, but rather a radial heat flow. The reasoning is based on that fact that the inner radius surface area is much smaller than the outer radius surface area.

These differences in surface area support the need to calculate heat flow must be done using an equivalent thickness. For cylindrical pipe insulation the **Cylindrical Pipe Insulation "R" value Calculation** detailed above.

Don't compare typical flat sheet insulation "R" values with cylindrical pipe insulation "R" values.





Cylindrical Pipe Insulation "R" value Calculation:

$$R = \frac{r2\ln(\frac{r2}{r1})}{k}$$

Insulation Thermal Conductivity: 0.25 Btu•in/(ft²•°F)

Cost Impact: The material cost implications would be minimal and would be recovered (paid back) after a period of months due to system efficiency gains. Labor associated with the installation would remain constant to that of the current requirements.

Past History:

IRC 2000:
Had Table N1103.5

PIPING SYSTEM TYPES	FLUID TEMP RANGE (ºF)	INSULATION THICKNESS inches[b]
Heating systems		
Low pressure/temperature	201-250	1.5
Low temperature	120-200	1.0
Steam condensate (for feed water)	Any	1.5
Cooling systems		
Chilled water, refrigerant or brine	40-55	0.75
	Below 40	1.25

For SI: 1 inch = 25.4 mm, ºC = [(ºF)–32]/1.8.

a. The pipe insulation thicknesses specified in this table are based on insulation *R*-values ranging from R-4 to R-4.6 per inch of thickness. For materials with an *R*-value greater than R-4.6, the insulation thickness specified in this table may be reduced as follows:
New Minimum Thickness = 4.6 × Table Thickness / Actual R-Value
For materials with an R-value less than R-4, the minimum insulation thickness shall be increased as follows:
New Minimum Thickness = 4.0 × Table Thickness / Actual R-Value

b. For piping exposed to outdoor air, increase thickness by 0.5 inch.

Cold/Chilled Water Temperature: 40°F - 55°F (Insulation Thickness= ¾")
Low Temperature: 120°F - 200°F (Insulation Thickness= 1")

IRC 2003:

Had Table N1103.5

PIPING SYSTEM TYPES	FLUID TEMP RANGE (°F)	INSULATION THICKNESS (inches)[b]
Heating systems		
Low pressure/temperature	201-250	1.5
Low temperature	120-200	1.0
Steam condensate (for feed water)	Any	1.5
Cooling systems		
Chilled water, refrigerant or brine	40-55	0.75
	Below 40	1.25

For SI: 1 inch = 25.4 mm, °C =[(°F)-32]/1.8.

a. The pipe insulation thicknesses specified in this table are based on insulation *R*-values ranging from R-4 to R-4.6 per inch of thickness. For materials with an *R*-value greater than R-4.6, the insulation thickness specified in this table may be reduced as follows:

$$\text{New Minimum Thickness} = \frac{4.6 \times \text{Table Thickness}}{\text{Actual } R\text{-Value}}$$

For materials with an *R*-value less than R-4, the minimum insulation thickness shall be increased as follows:

$$\text{New Minimum Thickness} = \frac{4.0 \times \text{Table Thickness}}{\text{Actual } R\text{-Value}}$$

b. For piping exposed to outdoor air, increase thickness by 0.5 inch.

Cold/Chilled Water Temperature: 40°F - 55°F (Insulation Thickness= ¾")
Low Temperature: 120°F - 200°F (Insulation Thickness= 1")

IRC 2006:
Removed Table N1103.5
Moved all insulation to R-2
R-2 on Flat Surface calculation is equal a thickness of ½"
R-2 on Radial Surface calculation is equal a thickness of 3/8"

IRC 2007/2008:
All insulation remained at R-2
R-2 on Flat Surface calculation is equal a thickness of ½"
R-2 on Radial Surface calculation is equal a thickness of 3/8"

IRC 2009/2010: (Proposal)
Increase all insulation to R-4
R-4 on Flat Surface calculation is equal a thickness of 1"
R-4 on Radial Surface calculation is equal a thickness of ¾"

EC117–09/10
403.3; IRC N1103.3

Proponent: Michael Resetar, Armacell LLC; Roger Schmidt, K-Flex USA; Shawn Dunahue, Nomaco Insulation

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IECC COMMITTEE. PART WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IECC

Revise as follows:

403.3 Mechanical system piping insulation (Mandatory). Mechanical system piping capable of carrying fluids above 105°F (41°C) or below 55°F (13°C) shall be insulated to a minimum of ~~R-3~~ R-4.

PART II – IRC BUILDING/ENERGY

Revise as follows:

N1103.3 Mechanical system piping insulation. Mechanical system piping capable of carrying fluids above 105°F (40°C) or below 55°F (13°C) shall be insulated to a minimum of ~~R-3~~ R-4.

Reason: Shifting from an R-3 requirement to an R-4 insulation requirement in 2009/2010 helps achieve an 18.25% gain in performance efficiency and combined with the efficiency gains implemented in the 2007/2008 change from an R-2 to R-3 the combination would achieve a 29.4% gain in efficiency.

IECC 2000:
Had Table 503.3.3.1

PIPING SYSTEM TYPES	FLUID TEMPERATURE RANGE, °F	PIPE SIZES[a]					
		Run outs 2"[b]	1" and less	1¼" to 2"	2½" to 4"	5" to 6"	8" and larger

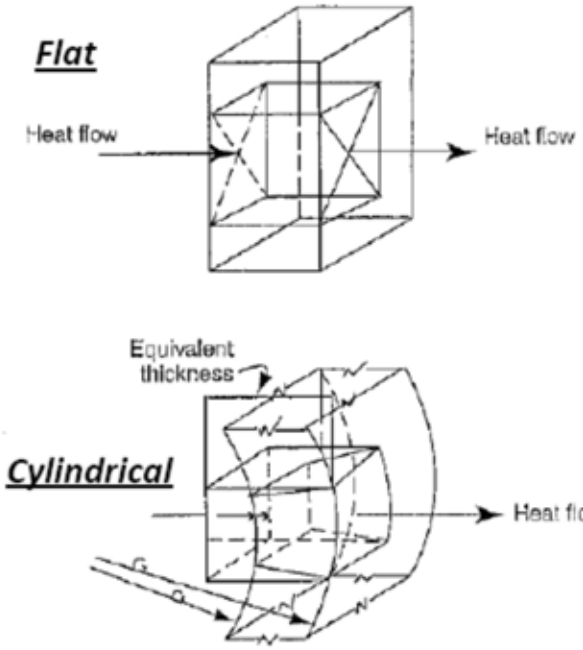
Data provided based on elastomeric pipe insulation

Don't compare typical flat sheet insulation "R" values with cylindrical pipe insulation "R" values.



Cylindrical Pipe Insulation "R" value Calculation:

$$R = \frac{r2\ln(\frac{r2}{r1})}{k}$$

Where r_1 = uninsulated pipe radius in inches
r_2 = insulated pipe radius in inches
k = thermal conductivity.

This equation yields an "R" value on a ***square foot basis***

R" value or thermal resistance is a measure of the ability of a material to retard heat flow. "R" is the numerical reciprocal of "C" (thermal conductance). Thermal resistance is used in combination with numerals to designate thermal resistance values. The higher the "R" value the higher the insulating value. This value is normally calculated on a square foot basis.

Flat Sheet Calculation Example:

$$R = \frac{\text{Thickness of Material}}{\text{Material Thermal Conductivity}}$$

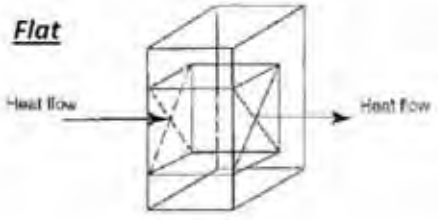
Sheet Insulation Thickness: 2"
Insulation Thermal Conductivity: 0.25 Btu•in/h•ft^2•°F
Resulting "R" Value : R-8.0 *(R-8 equals 8 resistance units)*

(*) It is common knowledge that with flat layer of insulation increasing the "R" value increases the thermal efficiency by the same factor.

The simple relations for flat sheet insulation do not hold true for when looking at cylindrical pipe insulations. For these materials, heat flow is not the simple straight –through heat flow found in flat surface/sheet material, but rather a radial heat flow. The reasoning is based on that fact that the inner radius surface area is much smaller than the outer radius surface area.

These differences in surface area support the need to calculate heat flow must be done using an equivalent thickness. For cylindrical pipe insulation the **Cylindrical Pipe Insulation "R" value Calculation** detailed above.

Don't compare typical flat sheet insulation "R" values with cylindrical pipe insulation "R" values.



$$R = \frac{\text{Thickness of Flat Sheet Material}}{\text{Material Thermal Conductivity}}$$

Insulation Thermal Conductivity: 0.25 Btu•in/(h•ft²•°F)

Cost Impact: The material cost implications would be minimal and would be recovered (paid back) after a period of months due to system efficiency gains. Labor associated with the installation would remain constant to that of the current requirements.

Past History:

IRC 2000:
Had Table N1103.5

PIPING SYSTEM TYPES	FLUID TEMP RANGE (ºF)	INSULATION THICKNESS inches[b]
Heating systems		
Low pressure/temperature	201-250	1.5
Low temperature	120-200	1.0
Steam condensate (for feed water)	Any	1.5
Cooling systems		
Chilled water, refrigerant or brine	40-55	0.75
	Below 40	1.25

For SI: 1 inch = 25.4 mm, ºC = [(ºF)–32]/1.8.

a. The pipe insulation thicknesses specified in this table are based on insulation *R*-values ranging from R-4 to R-4.6 per inch of thickness. For materials with an *R*-value greater than R-4.6, the insulation thickness specified in this table may be reduced as follows:
New Minimum Thickness = 4.6 × Table Thickness / Actual R-Value
For materials with an R-value less than R-4, the minimum insulation thickness shall be increased as follows:
New Minimum Thickness = 4.0 × Table Thickness / Actual R-Value

b. For piping exposed to outdoor air, increase thickness by 0.5 inch.

Cold/Chilled Water Temperature: 40°F - 55°F (Insulation Thickness= ¾")
Low Temperature: 120°F - 200°F (Insulation Thickness= 1")

IRC 2003:

Had Table N1103.5

PIPING SYSTEM TYPES	FLUID TEMP RANGE (°F)	INSULATION THICKNESS (inches)[b]
Heating systems		
Low pressure/temperature	201-250	1.5
Low temperature	120-200	1.0
Steam condensate (for feed water)	Any	1.5
Cooling systems		
Chilled water, refrigerant or brine	40-55	0.75
	Below 40	1.25

For SI: 1 inch = 25.4 mm, °C =[(°F)-32]/1.8.

a. The pipe insulation thicknesses specified in this table are based on insulation *R*-values ranging from R-4 to R-4.6 per inch of thickness. For materials with an *R*-value greater than R-4.6, the insulation thickness specified in this table may be reduced as follows:

$$\text{New Minimum Thickness} = \frac{4.6 \times \text{Table Thickness}}{\text{Actual } R\text{-Value}}$$

For materials with an *R*-value less than R-4, the minimum insulation thickness shall be increased as follows:

$$\text{New Minimum Thickness} = \frac{4.0 \times \text{Table Thickness}}{\text{Actual } R\text{-Value}}$$

b. For piping exposed to outdoor air, increase thickness by 0.5 inch.

Cold/Chilled Water Temperature: 40°F - 55°F (Insulation Thickness= ¾")
Low Temperature: 120°F - 200°F (Insulation Thickness= 1")

IRC 2006:
Removed Table N1103.5
Moved all insulation to R-2
R-2 on Flat Surface calculation is equal a thickness of ½"
R-2 on Radial Surface calculation is equal a thickness of 3/8"

IRC 2007/2008:
All insulation remained at R-2
R-2 on Flat Surface calculation is equal a thickness of ½"
R-2 on Radial Surface calculation is equal a thickness of 3/8"

IRC 2009/2010: (Proposal)
Increase all insulation to R-4
R-4 on Flat Surface calculation is equal a thickness of 1"
R-4 on Radial Surface calculation is equal a thickness of ¾"

TARGET:
30% Conservation Savings Achieved shifting from R-2 to R-4

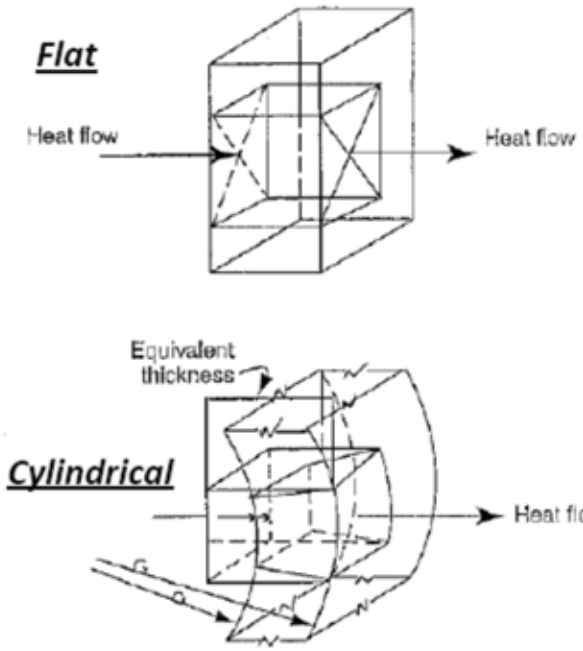
Data provided based on elastomeric pipe insulation

Don't compare typical flat sheet insulation "R" values with cylindrical pipe insulation "R" values.



Cylindrical Pipe Insulation "R" value Calculation:

$$R = \frac{r2 \ln\left(\frac{r2}{r1}\right)}{k}$$

Where r_1 = uninsulated pipe radius in inches
r_2 = insulated pipe radius in inches
k = thermal conductivity.

This equation yields an "R" value on a ***square foot basis***

R" value or thermal resistance is a measure of the ability of a material to retard heat flow. "R" is the numerical reciprocal of "C" (thermal conductance). Thermal resistance is used in combination with numerals to designate thermal resistance values. The higher the "R" value the higher the insulating value. This value is normally calculated on a square foot basis.

Flat Sheet Calculation Example:

$$R = \frac{\textit{Thickness of Material}}{\textit{Material Thermal Conductivity}}$$

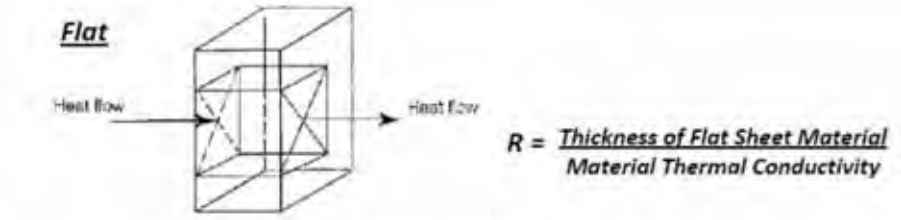
Sheet Insulation Thickness: 2"
Insulation Thermal Conductivity: 0.25 Btu•in/h•ft^2•°F
Resulting "R" Value : R-8.0 *(R-8 equals 8 resistance units)*

(*) It is common knowledge that with flat layer of insulation increasing the "R" value increases the thermal efficiency by the same factor.

The simple relations for flat sheet insulation do not hold true for when looking at cylindrical pipe insulations. For these materials, heat flow is not the simple straight –through heat flow found in flat surface/sheet material, but rather a radial heat flow. The reasoning is based on that fact that the inner radius surface area is much smaller than the outer radius surface area.

These differences in surface area support the need to calculate heat flow must be done using an equivalent thickness. For cylindrical pipe insulation the **Cylindrical Pipe Insulation "R" value Calculation** detailed above.

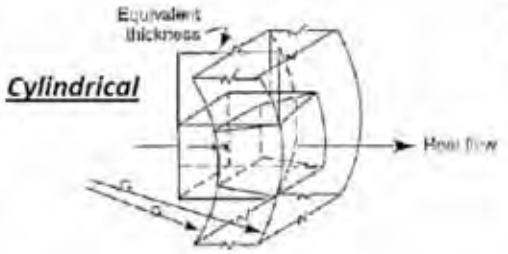
Don't compare typical flat sheet insulation "R" values with cylindrical pipe insulation "R" values.



Wall Thickness (inches)

	3/8	1/2	3/4	1	1-1/2	2
R-Value	1.9	2.1	3.1	4.2	6	8

Insulation Thermal Conductivity: 0.25 Btu•in/h•ft^2•°F



Cylindrical Pipe Insulation "R" value Calculation:

$$R = \frac{r2\ln(\frac{r2}{r1})}{k}$$

Wall Thickness

Pipe Insulation ID Size	Nom. 3/8	Nom. 1/2	Nom. 3/4	Nom. 1	Nom. 1-1/2

Part I - IECC

Add new text as follows:

403.5 Pipe insulation for direct-burial applications. Hot water distribution piping and circulating hot water system piping that is direct-buried shall be externally insulated with material having a wall thickness of not less than 1 inch (25.4mm). The insulation shall be closed cell foam plastic, closed cell foam rubber or a material or system approved

by the manufacturer for direct-burial applications. The insulating materials or systems shall be installed, joined and sealed in accordance with the manufacturer's installation instructions. Where insulated piping is located below the building site water table, the insulated piping shall be encased in a waterproof conduit. Insulating materials or systems that are recommended by the manufacturer for submerged water service applications shall not be required to be encased in a waterproof conduit. Where the total developed length of direct-buried hot water distribution and circulating hot water piping does not exceed 20 feet (6100 mm), external insulation shall not be required on direct-buried water distribution piping.

(Renumber subsequent sections)

504.5 Pipe insulation for direct-burial applications. Hot water distribution piping and circulating hot water system piping that is direct-buried shall be externally insulated with material having a wall thickness of not less than 1 inch (25.4mm). The insulation shall be closed cell foam plastic, closed cell foam rubber or a material or system approved by the manufacturer for direct-burial applications. The insulating materials or systems shall be installed, joined and sealed in accordance with the manufacturer's installation instructions. Where insulated piping is located below the building site water table, the insulated piping shall be encased in a waterproof conduit. Insulating materials or systems that are recommended by the manufacturer for submerged water service applications shall not be required to be encased in a waterproof conduit.

(Renumber subsequent sections)

PART II – IPC

Add new text as follows:

607.4 Insulation required for direct-buried piping. Direct-buried hot water distribution piping and circulating hot water piping shall be externally insulated in accordance with Section 504.5 of the *International Energy Code*.

(Renumber subsequent sections)

PART III – IRC

Add new text as follows:

N1103.4 Pipe insulation for direct-burial applications. Hot water distribution piping and circulating hot water system piping that is direct-buried shall be externally insulated with material having a wall thickness of not less than 1 inch (25.4mm). The insulation shall be closed cell foam plastic, closed cell foam rubber or a material or system approved by the manufacturer for direct-burial applications. The insulating materials or systems shall be installed, joined and sealed in accordance with the manufacturer's installation instructions. Where insulated piping is located below the building site water table, the insulated piping shall be encased in a waterproof conduit. Insulating materials or systems that are recommended by the manufacturer for submerged water service applications shall not be required to be encased in a waterproof conduit. Where the total developed length of direct-buried hot water distribution and circulating hot water piping does not exceed 20 feet (6100 mm), external insulation shall not be required on direct-buried water distribution piping.

(Renumber subsequent sections)

PART IV- IRC

P2903.11 Insulation required for direct-buried piping. Direct-buried hot water distribution piping and circulating hot water piping shall be externally insulated in accordance with Section N1103.4.

Reason: I have seen several underground piping installations where long runs of hot water distribution pipes lose significant heat to the soil. I have also seen un-insulated hot and cold water pipes that were installed next to each other in the same trench and heat transfer caused problems with both the hot and cold water systems. In long runs of underground HW piping where cold water and hot water are installed in the same trench and the hot water is circulated, the cold water pipe heats up to close to the hot water distribution temperature. This code change requires insulation for all underground hot water distribution systems and hot water circulating systems so that heat loss to the earth and heat gain by cold water piping is minimized. All types of pipe materials conveying hot water are subject to loss of heat to the soil. The pipe material type does not matter as heat transfer always occurs but the rate of heat transfer varies depending on the type of pipe material.

Cost Impact: Minimal

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IECC COMMITTEE. PART II WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IECC

Add new text as follows:

DESUPERHEATER/WATER HEATER. A factory-made assembly of elements by which the flows of refrigerant vapor and water are maintained in such heat transfer relationship that the refrigerant vapor is desuper-heated and the water is heated. A water circulating pump may be included as part of the assembly.

403.5 Desuperheater (Prescriptive). A desuperheater water heater tested and listed in accordance with ARI 470 and connected to the hot water storage tank shall be provided for a vapor compression air conditioner or heat pump with a cooling capacity of 3 tons or more installed in climate zones 1 and 2. Where multiple air conditioners or heat pumps and hot water storage tanks are installed only one of each shall be required to have a desuperheater.

Exceptions:

1. Heat pump water heaters
2. Water heaters provided with solar heating systems having a minimum Solar Fraction of 0.30 when tested in accordance with OG-300

2. Add new standards to Chapter 6 as follows:

AHRI
470-06 Performance Rating of Desuperheater/Water Heaters

SRCC
OG-300 Operating Guidelines and Minimum Standards for Certifying Solar Water Heating Systems

PART II – IRC BUILDING/ENERGY

1. Add new text as follows:

DESUPERHEATER/WATER HEATER. A factory-made assembly of elements by which the flows of refrigerant vapor and water are maintained in such heat transfer relationship that the refrigerant vapor is desuper-heated and the water is heated. A water circulating pump may be included as part of the assembly.

N1103.5 Desuperheater. A desuperheater water heater tested and listed in accordance with ARI 470 and connected to the hot water storage tank shall be provided for a vapor compression air conditioner or heat pump with a cooling capacity of 3 tons or more installed in climate zones 1 and 2. Where multiple air conditioners or heat pumps and hot water storage tanks are installed only one of each shall be required to have a desuperheater.

Exceptions:

1. Heat pump water heaters
2. Water heaters provided with solar heating systems having a minimum Solar Fraction of 0.30 when tested in accordance with OG-300

2. Add new standards to Chapter 44 as follows:

AHRI
470-06 Performance Rating of Desuperheater/Water Heaters

SRCC
OG-300 Operating Guidelines and Minimum Standards for Certifying Solar Water Heating Systems

Reason: There is considerable heat rejected in the summer by cooling equipment that can be reclaimed and used for other purposes. One such purpose that all residential buildings have is domestic hot water. Desuperheater/water heaters are simply a heat exchanger that transfers heat from the hot gas side of the cooling equipment to the hot water storage tank. Ten to 30% of the condenser heat rejected can be reclaimed and used to heat water at a rate of 5 to 8 gallons per hour per ton of cooling capacity. For a typical 3 ton central air conditioning unit, a desuperheater could provide a full tank of hot water every 3 hours.. Desuperheater savings estimates are shown in the table below *(source Energy Star*), for a typical household and an electric rate of 8¢ per kWh.

City	Annual Energy Savings From Desuperheater		
	(kWh/yr)	% of Total Hot Water Load	Cost Savings
Tampa	1910	40%	$153
Las Vegas	1410	32%	$113
Fort Worth	1210	25%	$97
Atlanta	910	18%	$73
Raleigh	820	16%	$66
Washington	790	15%	$63
Chicago	580	10%	$46

Source: Lawrence Berkeley National Laboratory. Estimates assume a family of four, 52 gallon electric water heater, and a 3 ton central air conditioner. Air conditioner efficiency is 12.5vSEER in cooling-dominant climates and 10.4 SEER in heating-dominant climates.

At the NWPPC Regional Technology Forum in August 2008 cost information for 3 systems was provided that showed installed cost from $900 to $1500. Annual electricity savings were 2053 kwh in Portland, 1903 in Seattle, 2526 in Phoenix and 1617 in Los Angeles. At $0.08 per kwh electric cost the savings for the electricity savings above would range from $129 to $202 per year. Considering the installed cost above that yields a simple payback range of 4.5 to 11.6 years.

Another study below from Technical Update Bulletin 458 by Jim Dulley (2008) addresses the issue of electricity cost, hot water usage, and other factors.

Hot Water Cost and Savings — Table 1						
Family Size	*Daily Hot Water Usage*	*Annual Water Heating Cost per Kw*				
		8.0¢	*8.5¢*	*9.0¢*	*9.5¢*	*10.0¢*
2	40 gal.	$239	$254	$269	$284	$299
3	55 gal.	$329	$350	$370	$391	$412
4	70 gal.	$419	$445	$471	$498	$524
5	85 gal.	$509	$541	$572	$604	$636
6	100 gal.	$599	$636	$673	$711	$748

The annual cost includes both heating up cold water to replace the hot water you use and the loss of heat from your water heater and piping between your uses of hot water. Calculate the savings by multiplying the annual cost figure from the table by the fraction of the year that you operate your air conditioning (i.e. 6/12 or 8/12 or 4/12 etc.)

Payback Example — for a family of 4 with a 3 ton A/C, 6 months of cooling and 9.0¢ per KwH electricity

Average installed cost of heat recovery	$600.00
Less: Hot water savings (6/12 x $471 = 235.50)	235.50
Less: A/C improvement savings (6 x $13 = $78.00)	78.00
Net First Year Cost	$286.50

Cost Impact: The proposed change will increase the first cost of construction but decrease operating expenses so as to reduce the overall cost of operating the subject building an amount greater than the increase in first cost.

Analysis: A review of the standard(s) proposed for inclusion in the code, AHRI 470-06 and SRCC OG-300, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

PART I – IECC

1. Add new text as follows:

403.6 Ventilation fan efficiency. Ventilation fans shall be tested and listed by an approved third party and shall meet the requirements of table 403.6.

Exception: Fans integral to tested and listed HVAC equipment.

TABLE 403.6
VENTILATION FAN EFFICIENCY

Fan location	Air flow rate (cfm)	Minimum efficiency[a]	Air flow rate (cfm)
Range hoods	any	2.8 cfm/watt	any
In-line fan	any	2.8 cfm/watt	any
Bathroom, utility room	<= 80	1.4 cfm/watt	<140 cfm
Bathroom, utility room	>80	2.8 cfm/watt	>= 140 cfm

a. When tested in accordance with HVI Standard 916

2. Add new standard to Chapter 6 as follows:

HVI Home Ventilating Institute
1000 North Rand Road
Suite 214
Wauconda, IL 60084

HVI 916-09 HVI Airflow Test Standards

PART II – IRC ENERGY

N1103.6 Ventilation fan efficiency. Ventilation fans shall be tested and listed by an approved third party and shall meet the requirements of table N1103.6.

Exception: Fans integral to tested and listed HVAC equipment.

TABLE N1103.6
VENTILATION FAN EFFICIENCY

Fan location	Air flow rate (cfm)	Minimum efficiency[a]	Air flow rate (cfm)
Range hoods	any	2.8 cfm/watt	any
In-line fan	any	2.8 cfm/watt	any
Bathroom, utility room	<= 80	1.4 cfm/watt	<140 cfm
Bathroom, utility room	>80	2.8 cfm/watt	>= 140 cfm

a. When tested in accordance with HVI Standard 916

2. Add new standard to Chapter 44 as follows:

HVI Home Ventilating Institute
1000 North Rand Road
Suite 214
Wauconda, IL 60084

HVI 916-09 HVI Airflow Test Standards

Reason: Residences continue to get tighter and therefore require more ventilation. The trend towards tighter construction and more mechanical ventilation will likely accelerate with changes made this code cycle.

The requirements in the table are the efficiency portion of the existing Energy Star ventilation fan requirements. The HVA Standard 916 defines a method for testing the efficiency with which a fan moves air. A substantial number of fans from multiple manufacturers can meet these requirements with existing products.

Cost Impact: The code change proposal will increase the cost of construction.

Analysis: A review of the standard(s) proposed for inclusion in the code, HVI-916, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

PART I – IECC

1. Revise as follows:

403.6 Equipment sizing (Mandatory). Heating and cooling equipment shall be sized in accordance with Section 503.2.1, 503.2.2 and Table 403.6 ~~M1401.3 of the *International Residential Code*~~.

2. Add new table as follows:

TABLE 403.6
HEATING AND COOLING EQUIPMENT SIZING

UNIT	MAXIMUM PERCENTAGE OVESIZING [a,b]	CLIMATE ZONE	MINIMUM EFFICIENCY & TEST PROCEDURES
Air Conditioners	15%	ALL	Air Cooled: AHRI 210/240
Multi-speed[c] Air-Source Heat Pumps and Ground-Source Heat Pumps	15%	ALL	Air Cooled: AHRI 210/240 Water or Ground: AHRA/ASHRAE 13256-1
Single -speed Air-Source Heat Pumps and Ground Source Heat Pumps	15% 25%	1-3 ---- 4-8	Air Cooled: AHRI 210/240 Water or Ground: AHRA/ASHRAE 13256-1 Packaged: AHRI 310/380
All fuel-fired heating appliances	40%	ALL	DOE 10 CFR Part 430 or: Gas Fired: ANSI Z21.47 Oil Fired: UL 727

a. Equipment shall be sized in accordance with ACCA Manual J:
   1. Indoor and outdoor coils shall be matched for size;
   2. Outdoor temperatures shall be the 99.0% and 1.0% design temperatures as published in the ASHRAE Handbook of Fundamentals for the most representative city for which design temperature data are available, or other approved source;
   3. Indoor temperatures shall be 75 F for cooling and 72 F for heating;
   4. Infiltration rate shall be assumed as 0.00036 Specific Leakage Area (SLA).

b. Once the appropriate equipment size is determined, if that specific size does not exist, the next larger size of manufactured equipment shall be acceptable, regardless of the percentage listed.

c. Multi-speed units shall be permitted to exceed the listed percentage only to the cooling capacity necessary to control humidity levels.

3. Add new standard to Chapter 6 as follows:

ACCA Manual J 2006 Residential Load Calculation

PART II – IRC BUILDING/ENERGY

1. Revise as follows:

N1103.6 Equipment sizing. Heating and cooling *equipment* shall be sized ~~as specified~~ in accordance with Section M1401.3 and Table N1103.6.

2. Add new table as follows:

TABLE N1103.6
HEATING AND COOLING EQUIPMENT SIZING

UNIT	MAXIMUM PERCENTAGE OVESIZING [a,b]	CLIMATE ZONE	MINIMUM EFFICIENCY & TEST PROCEDURES
Air Conditioners	15%	ALL	Air Cooled: AHRI 210/240
Multi-speed[c] Air-Source Heat Pumps and Ground-Source Heat Pumps	15%	ALL	Air Cooled: AHRI 210/240 Water or Ground: AHRA/ASHRAE 13256-1
Single -speed Air-Source Heat Pumps and Ground Source Heat Pumps	15% 25%	1-3 ---- 4-8	Air Cooled: AHRI 210/240 Water or Ground: AHRA/ASHRAE 13256-1 Packaged: AHRI 310/380
All fuel-fired heating appliances	40%	ALL	DOE 10 CFR Part 430 or: Gas Fired: ANSI Z21.47 Oil Fired: UL 727

a. Equipment shall be sized in accordance with ACCA Manual J:
   1. Indoor and outdoor coils shall be matched for size;

2. Outdoor temperatures shall be the 99.0% and 1.0% design temperatures as published in the ASHRAE Handbook of Fundamentals for the most representative city for which design temperature data are available, or other approved source;
3. Indoor temperatures shall be 75 F for cooling and 72 F for heating;
4. Infiltration rate shall be assumed as 0.00036 Specific Leakage Area (SLA).

b. Once the appropriate equipment size is determined, if that specific size does not exist, the next larger size of manufactured equipment shall be acceptable, regardless of the percentage listed.

c. Multi-speed units shall be permitted to exceed the listed percentage only to the cooling capacity necessary to control humidity levels.

3. Add new standards to Chapter 44 as follows:

AHRI

210/240—03 Unitary Air-Conditioning and Air-Source Heat Pump Equipment

310/380—93 Standard for Packaged Terminal Air-conditioners and Heat Pumps

AHRA/ASHRAE

13256-1 (2005) Water-source Heat Pumps—Testing and Rating for Performance—Part 1: Water-to-air and Brine-to-air Heat Pumps (ANSI/ASHRAE/IESNA 90.1-2004)

ANSI

Z21.47-03 Gas-Fired Central Furnaces

DOE

10 CFR Part 430, Subpart B,
Appendix E (1998) Uniform Test Method for Measuring the Energy Consumption of Water Heaters

UL

727—06 Oil-fired Central Furnaces

Reason: By establishing specific requirements in the IECC for proper equipment sizing, this proposal is an important part of the goal to increase the energy efficiency in the code. Equipment that is excessively oversized utilizes more energy and fails to properly condition the space. Research and survey data is limited, but typically indicates that air conditioning equipment may be over-sized by more than 50%, resulting in increased energy consumption and adverse impacts on energy use, comfort and moisture control. Moreover, oversizing of equipment can lead to unnecessary higher construction cost.

The current *IECC* and *IRC* energy chapter merely reference section M1401.3 of the IRC. Section M1401.3 then directs the user to ACCA Manual J. In response to this concern, this proposal specifically directs the user to Manual J and adds Manual J as a referenced standard to the IECC. Since Manual J is already an approved referenced standard in the *IRC*, we believe that adding the reference to a second I-code (IECC) is not an issue. Additionally, since the test procedures (AHRI 210/240, AHRI 310/380, AHRA/ASHRAE 13256-1, ANSI Z21.47, DOE 10 CFR Part 430, UL 727) are referenced standards that are used in Chapter 5 of the IECC, we believe that adding these references to a second I-code (IRC) should also not be an issue.

Current code language, in M1401.3, references ACCA Manual J for load calculation, but does not require that the installed equipment meet a required size. The new language sets a requirement and includes explicit information needed for consistent load calculations and installed equipment size. The actual installed equipment size may be oversized and installed at the next available manufactured size.

The proposed requirements are primarily based on limits that are suggested in ACCA Manual S, which states the following:

Cooling-only equipment should be sized so that the total cooling capacity does not exceed the total cooling load by more than 15%.

If heat pump equipment (air-source or water-source) is installed in a warm or moderate climate, the total cooling capacity should not exceed the total cooling load by more than 15%.

If heat pump equipment (air-source or water-source) is installed in a cold climate (where heating costs are a primary concern), the total cooling capacity can exceed the total cooling load by as much as 25%.

Furnace and boiler oversizing is not recommended because comfort may be compromised when a furnace or boiler short-cycles. The output capacity of the furnace or boiler must be greater than the design load, but no more than 40% larger than the design heating load.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: A review of the standard(s) proposed for inclusion in the code, ACCA-06, AHRI 210/240, 310/380, AHRA/ASHRAE 13256-1, ANSI Z21.47, DOE 10 CFR Part 430, UL 727, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

PART I - IECC

Add new text as follows:

403.7 Hot water circulating system required. In group R 1, R 2, R 3, and R 4 occupancies, where the furthest fixture requiring hot water is greater than 8 feet (2438 mm) in developed pipe length from the outlet of the source of hot water, a hot water circulating system shall be installed on the hot water distribution system. The circulating system shall be designed to make hot water available in the hot water distribution system at point that is not greater than 8 feet (2438 mm) in developed pipe length from the fixture requiring hot water. The circulating system pump shall be controlled by an automatic switch. Where point-of-use water heaters are provided for fixtures, a hot water circulating system shall not be required.

504.2.1 Hot water circulating system required. In group R 1, R 2, R 3, and R 4 occupancies, where the furthest fixture requiring hot water is greater than 8 feet (2438 mm) in developed pipe length from the outlet of the source of hot water, a hot water circulating system shall be installed on the hot water distribution system. The circulating system shall be designed to make hot water available in the hot water distribution system at point that is not greater than 8 feet (2438 mm) in developed pipe length from the fixture requiring hot water. The circulating system pump shall be controlled by an automatic switch. Where point-of-use water heaters are provided for fixtures, a hot water circulating system shall not be required.

PART II – IRC-P

Add new text as follows:

P2801.1.2 Hot water circulating system required. Where the furthest fixture requiring hot water is greater than 8 feet (2438 mm) in developed pipe length from the outlet of the source of hot water, a hot water circulating system shall be installed on the hot water distribution system. The circulating system shall be designed to make hot water available in the hot water distribution system at point that is not greater than 8 feet (2438 mm) in developed pipe length from the fixture requiring hot water. The circulating system pump shall be controlled by an automatic switch. Where point-of-use water heaters are provided for fixtures, a hot water circulating system shall not be required.

Reason: Water conservation and energy savings: To date studies have evaluated the water savings potential of instant hot water recirculation systems can result of water savings of up to 40 gallons per day or 15,000 gallons per year. This study utilized a set of assumptions about average plumbing layout, size and water use habits of the household. Mathematical formulas and methodologies were then applied to calculate potential water and energy savings derived from the recirculation systems.

Cost Impact: Average cost of the recirculation pump is $350.00 average water and sewer related saving in yearly cost is $400.00. Water saved 15,000 gallons per household.

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IECC COMMITTEE. PART II WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IECC

Add new text as follows:

403.7 Space heating equipment (Mandatory). Electric resistance heating shall not be used for space heating. This includes but is not limited to: electric space heaters, electric furnaces, electric baseboard heaters, electric wall heaters, and electric thermal storage.

Exceptions:

1. Electric resistance heating may be installed in dwelling units with separate zone controls for spaces not exceeding 500 square feet in area, each controlled by an individual thermostat, where:
   - 1.1. Located in a county with less than 500 heating degree days (HDD); or
   - 1.2. Located in a county with less than 1,500 HDD and containing less than 1,000 square feet total conditioned floor area; or
   - 1.3. The dwelling unit has a peak heating rate not more than 6.8 Btu/h-ft2 or 2 Watt/ft2 and is located in any climate zone.
2. Where electric resistance heating is used for air-to-air heat pump supplementary heat in climate zones 1, 2, 3 and 4, excluding 4 Marine.
3. Portable plug-in temporary heaters.

(Renumber subsequent sections)

PART II – IRC ENERGY

Add new text as follows:

N1103.3 Space heating equipment. Electric resistance heating shall not be used for space heating. This includes but is not limited to: Electric Space Heaters, electric furnaces, electric baseboard heaters, electric wall heaters, and electric thermal storage.

Exceptions:

1. Electric resistance heating may be installed in dwelling units with separate zone controls for spaces not exceeding 500 square feet in area, each controlled by an individual thermostat, where:
   - 1.1. Located in a county with less than 500 heating degree days (HDD); or
   - 1.2. Located in a county with less than 1,500 HDD and containing less than 1,000 square feet total conditioned floor area; or
   - 1.3. The dwelling unit has a peak heating rate not more than 6.8 Btu/h-ft2 or 2 Watt/ft2 and is located in any climate zone.
2. Where electric resistance heating is used for air-to-air heat pump supplementary heat in Climate Zones 1, 2, 3 and 4, excluding 4 Marine.
3. Portable plug-in temporary heaters.

Reason: Electric resistance heating is very expensive to operate for a home owner compared to other heating sources. While the DOE states that there are some climates where heat pump heating may not be preferable to electric resistance heating, analysis shows that are very few locations where the savings is less than $100 per year given recent energy prices for a 2000 SF code minimum home. In the table below, it can be seen that homes with very small heating loads with heating degree days less than 250 are the only cases where annual savings from upgrading to a heat pump are less than $100. Therefore the increased cost of heat pump equipment is well worth the investment throughout most of the country.

HDD	City	Electric Resistance	Heat Pump (7.7 HSPF)	Savings
0	Honolulu, HI	$ 0	$ 0	$ 0
0	Hilo, HI	$ 0	$ 0	$ 0
200	Key West, FL	$ 13	$ 4	$ 9
62	Miami, FL	$ 33	$ 12	$ 21
236	W. Palm Beach, FL	$ 59	$ 24	$ 35
697	Tampa, FL	$ 201	$ 82	$ 119
609	Brownsville, TX	$ 217	$ 82	$ 135
1755	Daytona Beach, FL	$ 238	$ 95	$ 142
1437	Phoenix, AZ	$ 277	$ 113	$ 164
884	Corpus Christi, TX	$ 300	$ 118	$ 182
871	Tucson, AZ	$ 388	$ 167	$ 221
1554	Jacksonville , FL	$ 443	$ 195	$ 248
2100	Tallahassee, FL	$ 571	$ 269	$ 302
1308.5	Long Beach, CA	$ 552	$ 197	$ 354
2293	Las Vegas, NV	$ 699	$ 302	$ 397

Source: ICF International analysis with Beacon powered by DOE2.1e

This chart shows the basis for an exception for electric resistance heat in Zone 1 and an exception for air-to-air heat pumps in Zones 2, 3 & 4.

http://www.energysavers.gov/your_home/space_heating_cooling/index.cfm/mytopic=12520
DOE Reference:

> "Electric resistance heating converts nearly 100% of the energy in the electricity to heat. However, most electricity is produced from oil, gas, or coal generators that convert only about 30% of the fuel's energy into electricity. Because of electricity generation and transmission losses, electric heat is often more expensive than heat produced in the home or business using combustion appliances, such as natural gas, propane, and oil furnaces. If electricity is the only choice, heat pumps are preferable in most climates, as they easily cut electricity use by 50% when compared with electric resistance heating."

Cost Impact: The code change proposal will increase the cost of construction.

Proponent: Ronald Majette, representing US Department of Energy

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IECC COMMITTEE. PART WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IECC

Revise as follows:

403.9 Pools, hot tubs and spas (Mandatory). Pools, hot tubs and spas shall ~~be provided with energy-conserving measures in accordance~~ shall comply with Sections 403.9.1 through 403.9.3.

403.9.1 ~~Pool~~ Heaters. All ~~pool~~ heaters shall be equipped with a readily *accessible* on-off switch to allow shutting off the heater without adjusting the thermostat setting. ~~Pool~~ Heaters fired by natural or LP gas shall not have continuously burning pilot lights.

403.9.2 Time switches. Time switches that can automatically turn off and on heaters and pumps according to a preset schedule shall be installed on ~~swimming pool~~ heaters and pumps.

Exceptions:

1. Where public health standards require 24-hour pump operation.
2. Where pumps are required to operate solar- and waste-heat-recovery ~~pool heating~~ systems.

403.9.3 ~~Pool~~ Covers. Heated pools, hot tubs and spas shall be ~~equipped~~ provided with a vapor-retardant ~~pool~~ cover ~~on or at the water surface~~. Pools, hot tubs and spas capable of being heated to more than 90°F (32°C) shall ~~have a pool~~ be provided with a cover ~~with~~ having a minimum insulation value of R-12.

~~**Exception:** Pools deriving over 60 percent of the energy for heating from site-recovered energy or solar energy source.~~

PART II – IRC BUILDING/ENERGY

Revise as follows:

N1103.8 Pools, hot tubs and spas (Mandatory). Pools, hot tubs and spas shall ~~be provided with energy conserving measures in accordance~~ comply with Sections N1103.8.1 through N1103.8.3.

N1103.8.1 ~~Pool~~ Heaters. All ~~pool~~ heaters shall be equipped with a readily *accessible* on-off switch to allow shutting off the heater without adjusting the thermostat setting. ~~Pool~~ Heaters fired by natural or LP gas shall not have continuously burning pilot lights.

N1103.8.2 Time switches. Time switches that can automatically turn off and on heaters and pumps according to a preset schedule shall be installed on ~~swimming pool~~ heaters and pumps.

Exceptions:

1. Where public health standards require 24-hour pump operation.
2. Where pumps are required to operate solar- and waste-heat-recovery ~~pool heating~~ systems.

N1103.8.3 ~~Pool~~ Covers. Heated pools, hot tubs and spas shall be ~~equipped~~ provided with a vapor-retardant ~~pool~~ cover ~~on or at the water surface~~. Pools, hot tubs and spas capable of being heated to more than 90°F (32°C) shall ~~have a pool~~ be provided with a cover ~~with~~ having a minimum insulation value of R-12.

~~**Exception:** Pools deriving over 60 percent of the energy for heating from site-recovered energy or solar energy source.~~

Reason: Clarification. The current text does not apply to hot tubs and spas and it should. The text has been revised to address that issue. LP gas has been added for consistency with the current text in IECC Chapter 5. The text in 403.9.3 has been revised to be applied during inspection prior to approval of the subject pool, hot tub or spa. As written one could interpret the requirements as enforceable after a use permit has been issued. It is not likely code officials could nor would want to enforce the cover provisions in a post-occupancy condition as suggested by the current text. The exception for solar or site recovered energy has been eliminated simply because there is no rationale why a pool, hot tub or spa getting 39% of its energy from non-renewables should not be exempt and one getting 41% from renewable should. Also how is this provision even determined in plan review and capable of being readily enforced.

Cost Impact: The proposed code change will not increase the cost of construction other than pools that were heated with solar or site recovered energy systems will now require the use of a pool cover.

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IECC COMMITTEE. AND PART II WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IECC

Add new text as follows:

403.10 Fireplace systems (Mandatory). Fireplace systems shall not have continuously burning pilot lights.

PART II – IRC BUILDING/ENERGY

Add new text as follows:

N1103.9 Fireplace systems. Fireplace systems shall not have continuously burning pilot lights.

Reason: This language is consistent with the ban on continuously burning pilot lights for pool heaters currently in the *IECC*. Under a recent US Department of Energy rulemaking, residential gas cooking equipment will also not be allowed to have continuously burning pilot lights.

According to the Hearth, Patio, and Barbecue Association, between 1.0 and 2.1 million gas fireplace / hearth systems are shipped to North America every year (about 54 to 69% of total hearth shipments. See http://www.hpba.org/index.php?id=238 for more details). Many of these units are shipped to new homes with pilot lights that are only capable of burning continuously, ranging from 800 to 1,200 Btu's per hour. For a fireplace that has a pilot light using 1,000 Btu/hr, and is in "standby" mode for 8000 hours per year (fireplace is used 5 hours per day for 150 days of the year), the pilot light uses 8 million Btu's, or 80 therms. At a national average cost of $1.20 per therm, the cost to a typical consumer is $96 per year.

As a reference point, according to AGA Gas Facts 2007, a typical gas range uses about 55 therms per year, and a typical clothes dryer uses about 50 therms per year (Table 10-1, page 78). In fact, according to the AGA publication, in the Pacific region of the US, residential natural gas fireplaces use almost as much energy (20.8 Mcf) as residential natural gas water heaters (21.3 Mcf).

Significant energy savings are available with current technology. With advanced controls (electronic spark ignition, for example), the standby energy losses are eliminated, and the average consumer saves at least $96, based on the example shown.

Cost Impact: The code change proposal will increase the cost of construction.

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IECC COMMITTEE. PART II WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IECC

1. Revise definition as follows:

ENERGY RECOVERY VENTILATION SYSTEM. Systems that employ air-to-air heat exchangers to recover energy from exhaust air for the purpose of preheating, precooling, humidifying or dehumidifying outdoor ventilation air prior to supplying the air to a space, either directly or as part of an HVAC system. Such systems include equipment referred to as an "energy recovery ventilator" (ERV) or as a "heat recovery ventilator" (HRV).

2. Add new definition as follows:

SPECIFIC LEAKAGE AREA (SLA). The air leakage area (L) per conditioned floor area (CFA) of a home (L/CFA), where leakage area (L) is defined in accordance with section 5.1 of ASHRAE 119 and where L and CFA are in the same units.

3. Add new text as follows:

403.11 *Energy recovery ventilation system* and air leakage supplemental requirements. The building shall meet the following the requirements:

1. An *energy recovery ventilation system* shall be installed. For warm humid counties as identified in Table 301.1, a dehumidifier with a built in humidistat shall be installed in addition to the *energy recovery ventilation system*.
2. Building air leakage shall be tested in accordance with the procedure prescribed in Section 402.4.2.1, except that the air leakage shall not exceed 0.00015 *specific leakage area (SLA)* for all buildings except multifamily, which shall not exceed 0.00018 *specific leakage area (SLA),* when tested with a blower door at a pressure of 33.5 psf (50 Pa) by an *approved* party independent of the builder and any contractors involved in any aspect of sealing the building.

   Exceptions:

   1. Buildings located in climate zones 1 or 2 with installed cooling equipment with an efficiency that exceeds prevailing federal minimum standards by at least 20% and meets or exceeds 12.5 EER.
   2. Buildings located in climate zones 3, 4 or 5 with installed heating and cooling equipment with an efficiency that exceeds prevailing federal minimum standards by at least 15% and cooling equipment that meets or exceeds 12.5 EER.
   3. Buildings located in climate zones 6, 7 or 8 with installed heating equipment with an efficiency that exceeds prevailing federal minimum standards by at least 20%.
   4. In the event the heating or cooling equipment specified in the exception applicable to a particular climate zone above is not commercially available, the equipment with the highest rated efficiency commercially available can be substituted, when *approved* by the *code official*,
   5. As an alternative to the heating equipment specified in Exceptions 2 and 3 above, a ground source heat pump with an efficiency of greater than or equal to 2.8 COP and 13 EER may be installed.

4. Revise table as follows:

TABLE 405.5.2(1)
SPECIFICATIONS FOR THE STANDARD REFERENCE AND PROPOSED DESIGNS

BUILDING COMPONENT	STANDARD REFERENCE DESIGN	PROPOSED DESIGN
Air Exchange Rate	*Specific leakage area (SLA)*[d] = 0.0001536 ~~assuming no energy recovery.~~ with a 70% efficient *energy recovery ventilation system*. Exceptions: 1. For multifamily buildings, the specific leakage area shall be 0.00018 with a 70% efficient *energy recovery ventilation system*. 2. For buildings subject to the exceptions in section 403.11, SLA = 0.00030, assuming no energy recovery.	~~For residences that are not tested, the same as the standard reference design.~~ *Specific Leakage Area (SLA)* = the tested value for the proposed home and the tested value shall be in determined accordance with the methodology set out in section 402.4.2.1 and the ASHRAE 119, Section 5.1 and the SLA shall be: 1. For residences without mechanical ventilation ~~that are tested in accordance with ASHRAE 119, Section 5.1,~~ the measured air exchange rate[e] but not less than 0.35 ACH. 2. For residences with mechanical ventilation that is not an *energy recovery ventilation system* ~~that are tested in accordance with ASHRAE 119, Section 5.1,~~ the measured air exchange rate[e] combined with the mechanical ventilation rate, *f* which shall not be less than 0.01 x *CFA* + 7.5 x (N_{br} + 1) where: *CFA* = conditioned floor area N_{br} = number of bedrooms 3. For residences with *energy recovery ventilation systems*, the efficiency of the energy or heat recovery ventilation system shall be as proposed.

~~d. Where leakage area (L) is defined in accordance with Section 5.1 of ASHRAE 119 and where:~~

~~SLA = L/CFA~~
~~where L and CFA are in the same units.~~

(Portions of table and footnotes not shown remain unchanged)

PART II – IRC BUILDING/ENERGY

1. Add new definitions as follows:

ENERGY RECOVERY VENTILATION SYSTEM. Systems that employ air-to-air heat exchangers to recover energy from exhaust air for the purpose of preheating, precooling, humidifying or dehumidifying outdoor ventilation air prior to supplying the air to a space, either directly or as part of an HVAC system. Such systems include equipment referred to as an "energy recovery ventilator" (ERV) or as a "heat recovery ventilator" (HRV).

SPECIFIC LEAKAGE AREA (SLA). The air leakage area (L) per conditioned floor area (CFA) of a home (L/CFA), where leakage area (L) is defined in accordance with Section 5.1 of ASHRAE 119 and where L and CFA are in the same units.

2. Add new text as follows:

N1103.10 *Energy recovery ventilation system* and air leakage supplemental requirements. The building shall meet the following the requirements:

1. An *energy recovery ventilation system* shall be installed. For warm humid counties as identified in table N1101.2, a dehumidifier with a built in humidistat shall be installed in addition to the *energy recovery ventilation system*.
2. Building air leakage shall be tested in accordance with the procedure prescribed in Section N1102.4.2.1, except that the air leakage shall not exceed 0.00015 *specific leakage area (SLA)* for all buildings except multifamily, which shall not exceed 0.00018 *specific leakage area (SLA),* when tested with a blower door at a pressure of 33.5 psf (50 Pa) by an *approved* party independent of the builder and any contractors involved in any aspect of sealing the building.

   Exceptions:

   1. Buildings located in climate zones 1 or 2 with installed cooling equipment with an efficiency that exceeds prevailing federal minimum standards by at least 20 percent and meets or exceeds 12.5 EER.
   2. Buildings located in climate zones 3, 4 or 5 with installed heating and cooling equipment with an efficiency that exceeds prevailing federal minimum standards by at least 15 percent and cooling equipment that meets or exceeds 12.5 EER.
   3. Buildings located in climate zones 6, 7 or 8 with installed heating equipment with an efficiency that exceeds prevailing federal minimum standards by at least 20 percent.
   4. In the event the heating or cooling equipment specified in the exception applicable to a particular climate zone above is not commercially available, the equipment with the highest rated efficiency commercially available can be substituted, when *approved* by the *building official*,
   5. As an alternative to the heating equipment specified in Exceptions 2 and 3 above, a ground source heat pump with an efficiency of greater than or equal to 2.8 COP and 13 EER may be installed.

Reason: There is significant energy savings potential in homes through tested air leakage improvements with energy recovery ventilation equipment or though having higher efficiency equipment. This proposal creates a trade-up opportunity, where a home can achieve significant savings through either the primary requirements or the exceptions. This proposal also makes necessary changes to Table 405.4.2(1) of the IECC to incorporate the effects of this proposal into the Simulated Performance Alternative in Section 405.

For the primary requirements, this proposal achieves significant savings from tested air leakage improvements with energy recovery equipment. These base requirements achieve approximately 12-17% estimated heating and cooling energy savings or approximately 5 to 12% purchased energy savings (including appliances and lighting) depending on the location and home specifications.

One of the key criteria in the primary requirements is to install an energy recovery ventilation system (either ERV or HRV). This is critical for achieving energy savings from a tight home. Without the energy recovery ventilation system, no home or program can claim energy savings credit for substantially tight homes. Therefore, by tightening the house to levels that many houses today are already tightening them (0.00015), minimal to no savings are achieved depending on the location. However, by installing the energy recovery ventilator energy savings between $100-300 per year are achieved depending on the climate. The most savings are achieved in the coldest climates due to the extreme temperature difference between the inside and outside temperatures.

The exception has reasonable and sensible equipment requirements that can achieve approximately 10-16% heating and cooling energy savings or approximately 5-11% purchased energy savings depending on location and home specifications. Example specifications for the exemption include:

>15.6 SEER and 12.5 EER AC in Climate Zone 1 & 2
with available equipment up to 23 SEER
includes 46,375 records from AHRI directory of air conditioning equipment available

>14.95 SEER and 12.5 EER AC in Climate Zone 3, 4 and 5
with available equipment up to 23 SEER
includes 101,899 records from AHRI directory of air conditioning equipment available

> 89.7 AFUE in Climate Zone 3, 4 and 5
with available equipment up to 96+ AFUE
includes 5,100 records from AHRI directory of furnace equipment available

> 93.6 AFUE in Climate Zone 6, 7 and 8
with available equipment up to 96+ AFUE
includes 1,339 records from AHRI directory of furnace equipment available

> 8.86 HSPF in Climate Zone 3, 4 and 5
with available equipment up to 11 HSPF
includes 27,310 records from AHRI directory of heat pump equipment available

> 9.24 HSPF in Climate Zone 6, 7 and 8
with available equipment up to 11 HSPF
includes 9,051 records from AHRI directory of heat pump equipment available

In addition to having the improved efficiency requirement beyond federal minimum standards, this proposal also has improved EER rating in the exception that will ensure higher performance in peak temperature hours. Per ACEEE, for utilities, reducing peak demand is worth somewhere in the range of $1000/kW. That is an estimate of the costs avoided by not building new peak generation, plus the required reinforcements of transmission and distribution. In many cases, capacity constraints for the foreseeable future make avoiding peak demand even more valuable than saving energy. For a 3-ton central air conditioner the difference between EER 11.5 and EER 12 is about 0.13 kW on a 95ºF day. This difference is much of the justification for rebates in CA, for example, since by itself a 0.13 kW peak reduction is worth roughly $130. *(source: ACEEE)*

The exception that allows for ground source heat pumps (GSHP) with efficiency greater than or equal to 2.8 COP to be installed in climates 3 through 8, is based on DOE recommendations, while FEMP recommends GSHP efficiency levels of 3.3 COP of higher. It is also important to point out that maximum efficiency for GSHP are closer to 5 COP.

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IECC COMMITTEE. PART II WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IECC

Revise as follows:

404.1 Lighting equipment (Prescriptive). A minimum of 50 percent of the ~~lamps in~~ permanently installed ~~lighting fixtures~~ luminaires shall be high-efficacy ~~lamps~~ type.

PART II – IRC BUILDING/ENERGY

1104.1 Lighting equipment. A minimum of 50 percent of the ~~lamps in~~ permanently installed ~~lighting fixtures~~ luminaires shall be high-efficacy ~~lamps~~ type.

Reason: The current provision in effect requires use of Compact Fluorescent Lamps, which are not best for all applications and, when forced, result in refit/regression and hampered consumer acceptance. Market and industry data point to the need for alternative solutions to achieve the use of high-efficiency lighting and/or lighting controls.

Codes, to be effective, must be enforceable and sustainable in the long term. The enforcement community is already understaffed and overworked, and the current national and local situation means that the situation will not improve in the foreseeable future. State, city and county building departments as well are too understaffed to take on the additional responsibilities of counting lamps.

Cost Impact: The code change proposal will increase the cost of construction

EC128–09/10
404.1

Proponent: Joseph Hill, RA, representing the New York State Department of State

Revise as follows:

404.1 Lighting equipment ~~(Prescriptive).~~ (Mandatory). A minimum of 50 percent of the lamps in permanently installed lighting fixtures shall be high-efficacy lamps.

Reason: Per Section 401, Compliance with the Energy Code is relegated to either *Prescriptive*, or *Performance* methodologies. Since there are no similar considerations within Section 405 Simulated *Performance Alternative for* high efficacy lamping, *Section 404.1 Lighting equipment,* the requirements for 50 percent high-efficacy lamps should be made mandatory for the continuity of the code.

Cost Impact: The code change proposal will not increase the cost of construction.

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IECC COMMITTEE. PART II WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IECC

Revise as follows:

404.1 Lighting equipment (Prescriptive). A minimum of ~~50~~ seventy-five percent of the lamps in permanently installed lighting fixtures shall be high efficacy lamps or a minimum of seventy-five percent of the permanently installed lighting fixtures shall contain only high efficacy lamps.

Exception: Low-voltage lighting.

PART II – IRC BUILDING/ENERGY

1. Add new definition as follows:

LOW-VOLTAGE LIGHTING. Lighting equipment powered through a transformer such as a cable conductor, a rail conductor and track lighting.

2. Revise as follows:

N1104.1 Lighting equipment. A minimum of ~~50~~ seventy-five percent of the lamps in permanently installed lighting fixtures shall be high efficacy lamps or a minimum of seventy-five percent of the permanently installed lighting fixtures shall contain only high efficacy lamps.

Exception: Low-voltage lighting.

Reason: As reported from the Partnership for Advancing Technology in Housing program high efficacy lamps (e.g., CFL's) are up to four times as efficient and last up to 10 times as long as incandescent bulbs. A 22-watt CFL has about the same light output as a 100-watt incandescent. CFL's use 50 to 80 percent less energy than incandescent bulbs. Standard incandescent bulbs have an average lifetime of 750 to 2500 hours, while CFLs last from 6,000 to 10,000 hours. Although initially more expensive, you save money in the long run because CFL's use 1/3 the electricity and last up to 10 times as long as incandescent bulbs. A single 18-watt CFL used in place of a 75-watt incandescent will save about 570 kWh over its lifetime. At 8 cents per kWh, that equates to a $45 savings for one bulb over its lifetime. Newer CFL's give a warm, inviting light instead of the "cool white" light of older fluorescents. These were reasons presented during the last code cycle for approving this requirement for 50% CFL's. The intent of this proposal is to expand the high-efficacy requirement to a larger fraction of the home's lighting, while giving additional flexibility to the builder by allowing the required high-efficacy percentage to be based on either a count of lamps or a count of fixtures.

Cost Impact: The code change proposal will increase the cost of construction to the extent that incandescent lamps are replaced with higher-cost high-efficacy lamps. However, federal law will greatly restrict the availability of incandescent lamps a short time after this code goes into effect; thereafter, this code will not increase the cost of construction.

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IECC COMMITTEE. PART II WILL BE HEARD BY THE IRC BUILDING/ENERGY CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IECC

Revise as follows:

404.1 Lighting equipment (Mandatory) ~~(Prescriptive)~~. A minimum of ~~50~~ 60 percent of the lamps in permanently installed lighting fixtures shall be high-efficacy lamps.

PART II – IRC BUILDING/ENERGY

Revise as follows:

N1104.1 Lighting equipment. A minimum of ~~50~~ 60 percent of the lamps in permanently installed lighting fixtures shall be high-efficacy lamps.

Reason: This proposal is meant to bring increased consistency between the performance and prescriptive path of compliance in the IECC, by requiring all homes no matter what compliance method, to meet this requirement. There is no reason why buildings complying under the

performance path should not meet the same requirement, since lighting is currently not included in the simulated performance alternative analysis. This minimum lighting requirement is a cost effective and smart requirement for all homes.

In addition, this proposal has modest increased requirements for the amount of high efficacy lighting that is required in a home. Under U.S. Department of Energy rulemakings and federal legislation, the efficiency standards for general service fluorescent, general service incandescent, incandescent reflector lamps, and fluorescent lamp ballasts will increase in the next few years. More types of efficient lighting technologies, such as LED's, should be available by 2012, providing more options for builders to meet a higher percentage requirement.

This proposal gives the opportunity to have homes start with efficient lighting, even if the homeowners decide to change the lighting in the future. This proposal attempts to balance advancing energy efficiency with local adoption and enforcement issues and consumer backlash from having too high of a percent requirement. In addition, this proposal recognizes that while increased energy efficiency from lighting has the opportunity to save real energy in every home, non-permanent code lighting requirements also do not create permanent long term savings due to the relatively short life of a lamp, type and life of the light fixture and questions regarding the likelihood that a home owner will retain the efficient lamps over the life of the home. In addition, the lifetime savings of this code provision are estimated to be low due, since upcoming federal requirements are expected to require more efficient lighting anyway. This code proposal is simply helping to move American homes in the right direction with more efficient lighting which is simple and cost effective.

The cost of such lighting is minimal -- estimated to be about $20 per home depending on the number of permanently installed lighting fixtures.

Cost Impact: The code change proposal will increase the cost of construction.

PART I – IECC

1. Add new definitions as follows:

DESUPERHEATER/WATER HEATER. A factory-made assembly of elements by which the flows of refrigerant vapor and water are maintained in such heat transfer relationship that the refrigerant vapor is desuper-heated and the water is heated. A water circulating pump may be included as part of the assembly.

FURNACE ELECTRICITY RATIO. The ratio of furnace electricity use to total furnace energy computed as ratio = $(3.412*E_{AE})/(1000*E_F + 3.412*E_{AE})$, where E_{AE} (average annual auxiliary electrical consumption) and E_F (average annual fuel energy consumption) are defined in Appendix N to subpart B of part 430 of title 10 of the Code of Federal Regulations and E_F is expressed in millions of Btus per year.

2. Revise as follows:

403.5 Mechanical ventilation (Mandatory). The building shall be provided with ventilation that meets the requirements of Section M1507 of the *International Residential Code* or with other approved means of ventilation. Outdoor air intakes and exhausts shall have automatic or gravity dampers that close when the ventilation system is not operating.

All combustion equipment in new residences in Climate Zones 3 to 8 shall be direct vent or sealed combustion.

Exceptions: Stoves and ovens in kitchens with vents fireplaces that meet the applicable requirements of Section 402.

3. Add new text and tables as follows:

404. Equipment efficiency.

404.1 Heating equipment. New and replacement furnaces, boilers and heat pumps shall be a minimum of the efficiencies in Table 404.1.

Exception: Replacement of non-condensing furnaces.

Ground source heat pumps shall have a least the efficiency in Table 503.2.3(2). All-electric heated buildings in Climate Zones 3 through 8 shall utilize either an air-source or ground source heat pump.

N1104.3 Water heating. New and replacement gas water heaters shall be a minimum of 0.62 EF. New and replacement electric water heaters shall be a minimum of 0.95 EF.

Water heating in new homes shall include at least one of the following:

1. Desuperheater on a vapor compression air conditioner, heat pump, or ground source heat pump. The desuperheater shall be tested and listed in accordance with ARI 470 and connected to the hot water storage tank.
2. Electric water heater with a minimum of a 2.0 EF.
3. Solar water heating system with a minimum Solar Fraction of 0.30 when tested in accordance with OG-300.
4. Gas water heater with a minimum of 0.80 EF.
5. Water heating provided by a ground source heat pump.
6. Tankless coil with a boiler with a minimum of 85 AFUE.

4. Add new standards to Chapter 44 as follows:

AHRI
470-06 Performance Rating of Desuperheater/Water Heaters

SRCC
OG-300 Operating Guidelines and Minimum Standards for Certifying Solar Water Heating Systems

Reason: Energy efficient buildings need high efficiency equipment. Inevitably the least costly and most effective designs for high efficiency buildings will include high efficiency heating, cooling, and water heating equipment, as well as insulation, air tightness, efficient windows, efficient lighting, etc. Many of the envelope measures are reaching a point of diminishing returns. The biggest group of remaining cost-effective opportunities that are in energy efficient equipment.

Historically Federal law (National Appliance Energy Conservation Act and others) has preempted any ability to specify higher efficiency for most equipment in the building codes. This change presumes the Federal restriction has been lifted as is currently proposed in congressional legislation.

Equipment efficiency affects existing residences too. Because equipment is replaced in existing residences, specifying high efficiency equipment achieves a much higher level of energy savings both on a per residence basis and in aggregate nationally. Although replacement

equipment doesn't usually involve a permit, a jurisdiction's requirement that replacement equipment have a specific level of efficiency is likely to be met by those supply and installing replacement equipment.

For heating and cooling this proposal sets levels based on the Consortium for Energy Efficiency (CEE) and Energy Star. CEE and Energy Star levels of efficiency result from substantial discussion and process. Energy Star is the best-known name in energy efficiency. CEE is a collaborative effort of utilities, environmental groups, and industry. CEE establishes energy efficiency "Tiers" after examining what is practical and available.

Equipment manufacturers do not want a patchwork of varying equipment requirements. Manufacturers legitimately desire large areas of uniform requirements. Large areas of uniform requirements are created by having multiple climate zones require the same equipment efficiency. Specifying large areas with a uniform equipment requirement results in lower cost equipment efficiency because the economics of scale in manufacturing and distributing mean lower cost efficiency is available due to large-scale production.

This change proposes a minimum gas furnace efficiency of 92 AFUE (CEE Tier II) in the northern zones and a minimum 90 AFUE (CEE Tier I, Energy Star) in zones 3 and 4.

In 2006 DOE completed an analysis of furnace efficiency options as part of a furnace rulemaking[1]. DOE's analysis determined that the higher AFUE furnaces were the most cost-effective in the mid/northern US and in new homes. Unfortunately DOE did not have the authority to set separate standards in the north or for new homes, and choose a disappointing 80 AFUE for most furnaces. Since the DOE furnace rule making natural gas prices have increased well beyond projections and the incremental cost of higher efficiency furnaces has decreased. The trends towards more expensive fuel and lower cost efficient equipment combine to make equipment efficiency more cost-effective. These same long-term trends towards higher fuel costs and lower incremental costs for efficient equipment also makes cooling and water heating efficiency more cost effective.

Condensing furnaces (90 AFUE and up) and non-condensing furnaces use significantly different venting. Condensing furnaces typically use a short horizontal plastic pipe, while non-condensing furnaces need a chimney. In new construction condensing furnaces are actually cheaper to vent than non-condensing furnaces. DOE estimated that in new homes the less expensive condensing furnace venting saves $138 (TSD, page 6-34, Table 6.5.7)[1].

The increased costs of a 90 AFUE furnace are between $500 and $1000[2,3]. After taking credit for reduced venting costs, a typical cost might be $700 to $800. The incremental cost of going from 90 to 92 AFUE is harder to estimate, but probably small since much of the equipment around 90 AFUE is actually closer to 92 AFUE.

Replacement of non-condensing furnaces with condensing furnaces can be significantly more expensive due to the need for an expensive chimney modification. Therefore, this proposal allows existing non-condensing furnaces to be replaced by non-condensing furnaces.

Gas-fired boilers requirements are set based on the Energy Star and CEE level of 85 AFUE. Oil furnaces are based on the Energy Star level of 85 AFUE. Currently there are not sufficient condensing gas boilers and oil heaters in the market to set the requirement above 85 AFUE.

This proposed change requires efficient fossil-fuel furnace fans. The fan blower motor accounts for most of fossil-fuel furnace electricity consumption, in some cases being the largest consumer of electricity in the household. Currently, no minimum efficiency requirement exists for furnace electricity use. The "furnace electricity ratio" specified in this proposal is based solely on efficiency information already provided by the manufacturers[4].

A simple payback for an efficient furnace fan motor can be estimated. Most furnace blowers use a permanent split capacitor (PSC) motor. The efficiency level proposed here is likely to be achieved using a brushless permanent magnet (BPM) motor also called an electronically commutated motor (ECM). Many furnaces with these efficient fans are available in the market today. A simple payback can be estimated from DOE's recent furnace rulemaking[1]. DOE estimated an annual energy savings of about 215 kwh per year (DOE TSD page 8.5-6), or about $21.5 per year for a BPM at $0.10/kwh. DOE estimated the cost of the new fan at about $213 (TSD page 6.4-2), perhaps decreasing by about 78% (TSD page 8.5-2) to about $166 by 2012 for a mature market costs. The simple payback would be about 8 years in a mature market. Estimated savings from other studies have been higher, as cited below[5]. Based on the cited estimates of savings the simple payback would be 3 to 8 years.

For cooling this change proposes CEE Tier III for zones 1 and 2, Tier II for zones 3 and 4, and Tier I for zones 5 and 6. The cost of a higher SEER varies, but is dropping. Some give the incremental cost of a SEER 16 as small as $500 for 13 to 16[6], although most prices would probably be closer to $1000 plus.

An EER (energy efficiency ratio) requirement is also proposed for cooling. EER is a term already used in chapter 5. The EER is a better indicator of performance in high temperatures that lead to utility peak loads. Specifying both a SEER and EER leads to equipment that performs well both seasonally and during peak loads.

Significantly increased water heating equipment efficiency is available. DOE's recent analysis of water heater options for Energy Star[7] yields favorable paybacks for many of these options. The base requirements for any new or existing water heating system have very favorable paybacks according to the DOE analysis[7]. The 0.62 gas water heater has an estimated cost increase of $70 with a payback of about 2.5 years. The 0.95 electric water heater has an estimated $50 cost with a payback of about 2 years. These two, the gas EF of 0.62 and electric EF of at least 0.95 are minimum for replacement of existing systems. For new homes one of the list of options is required. It is important that at least one of the options be cost-effective. The increased cost of the heat pump water heater is significant ($850) but the estimated payback is a quick 3 years. The gas 0.80 EF is achievable with a couple of options, a thankless water heater is the most common with an estimated cost increase of about $1100 and a payback of perhaps 10 years. The much less common condensing gas water heater was estimated at about $700 with a payback of about 7 years. Currently many major water heater manufacturers are introducing multiple new products, which will likely lower these prices and make efficient water heaters more available and more cost-effective.

Discussions with a water heater manufacturer indicated a strong request for requirements that were uniform nationally. Although the performance of some water heating options will vary with climate, these are uniform.

When the Federal restriction on equipment efficiency in the IECC is lifted, increased energy efficiency proposed here becomes the single largest source of energy efficiency available in the codes.

Service Water Heating[~~g, i, j~~, h, k]	~~As Proposed~~ Fuel type: same as proposed design for non-solar water heating. Where proposed design includes solar water heating, the standard reference shall include the equivalent capacity with fuel type same as the non-solar water heating. Efficiency: in accordance with prevailing federal minimum standards Use: gal/day=30 + (10 x *Nor*) ~~Same as proposed design~~	~~As Proposed~~ As proposed As proposed Same as standard reference ~~Use: gal/day=30 + (10 x *Nor*)~~

(No changes to portions of table and footnotes not shown.)

Reason: Energy efficient buildings need high efficiency equipment as one way to get efficiency. Changes in the last code cycle removed credit for high efficiency equipment from the performance approach. This change restores credit for high efficiency equipment.

The argument for not recognizing equipment efficiency in a performance calculation is that heating, cooling and water heating equipment does not last as long as envelop efficiency measures (insulation, air tightness, windows). Further, the relatively short-lived equipment may be used as a trade off to downgrade the envelope. The argument concludes that when the equipment wears out it may be replaced with less efficient equipment, leaving both inefficient equipment and inefficient envelopes. The argument apparently presumes the next generation of energy efficient buildings must choose either high efficiency envelopes or high efficiency equipment.

I say "no" to the argument above. More efficient and affordable buildings need high efficiency in both envelopes and equipment; therefore, the code should recognize both. Getting 30% more efficient than the 2006 IECC, the goal of many in this code cycle, is made more difficult and costly without equipment. Getting 50% more efficient (as in some draft Federal laws) is nearly impossible without high efficiency equipment.

This code cycle many will propose options for increased building efficiency that rely in part on higher equipment efficiency to get to the 30% increased efficiency goal. Ignoring equipment efficiency means those new options in the IECC would fail to comply under the IECC's own performance path, often fail by large margins.

Perhaps most important, not recognizing high efficiency equipment means treating some outstanding equipment choices as no better than minimum efficiency equipment. The code would treat a 95 AFUE condensing gas furnace as no better than a 78 AFUE furnace? A ground source heat pump is the same as an electric resistance heater? A 17 SEER air conditioner is treated the same as a 13 SEER air conditioner? Solar water heating is no better than the least efficient gas or electric water heater that can be purchased? A heat pump water heater has no advantage over an electric resistance water heater? The code needs to encourage efficient equipment by including it in the performance calculation.

Cost Impact: The code change proposal will not increase the cost of construction.

405.3, Table 405.3 (New)

Proponent: Ken Nittler, PE, Enercomp, Inc.

1. Revise as follows:

405.3 Performance-based compliance. Compliance based on simulated energy performance requires that a proposed residence (*proposed design*) be shown to have an annual energy cost that is less than or equal to the annual energy cost of the *standard reference design*. Energy prices shall be taken from a source *approved* by the *code official*, such as the Department of Energy, Energy Information Administration's *State Energy Price and Expenditure Report*. *Code officials* shall be permitted to require time-of-use pricing in energy cost calculations.

Exception: The energy use based on source energy expressed in Btu or Btu per square foot of *conditioned floor area* shall be permitted to be substituted for the energy cost~~.~~. ~~The source energy multiplier for electricity shall be 3.16. The source energy multiplier for fuels other than electricity shall be 1.1.~~ using the source energy factors specified in Table 405.3.

2. Add new table as follows:

TABLE 405.3
SOURCE ENERGY FACTORS FOR ENERGY DELIVERED TO BUILDINGS

ENERGY SOURCE	SOURCE ENERGY FACTOR
Electricity	3.365
Natural Gas	1.092
Fuel Oil/Kerosene	1.158
Gasoline	1.187
LPG	1.151

Reason: This revision updates the values introduced during the last code cycle to cover more energy sources and to be consistent with the values used in the *Building America Research Benchmark*, Updated December 19, 2008.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: NITTLER-EC-1-T. 405.3

EC134–09/10
405.3, 506.3

Proponent: James Ranfone, representing the American Gas Association

Revise as follows:

405.3 Performance-based compliance. Compliance based on simulated energy performance requires that a proposed residence (proposed design) be shown to have an annual source energy ~~cost~~ use that is less than or equal to the annual source energy ~~cost~~ use of the standard reference design. ~~Energy prices shall be taken from a source approved by the code official, such as the Department of Energy, Energy Information Administration's State Energy Price and Expenditure Report. Code officials shall be permitted to require time-of-use pricing in energy cost calculations.~~

~~Exception:~~ ~~The energy use based on~~ Source energy use shall be expressed in Btu or Btu per square foot of conditioned floor area. ~~shall be permitted to be substituted for the energy cost.~~ The source energy multiplier for electricity shall be 3.16. The source energy multiplier for fuels other than electricity shall be 1.1.

Exception: Emissions of carbon dioxide equivalents (CO_2e) used in lieu of source energy use, taken from a source approved by the code official, such as the Department of Energy, Energy Information Administration's Annual Energy Outlook.

506.3 Performance-based compliance. Compliance based total building performance requires that a proposed building (proposed design) be shown to have an annual source energy ~~cost~~ use that is less than or equal to the annual source energy ~~cost~~ use of the standard reference design. ~~Energy prices shall be taken from a source approved by the code official, such as the Department of Energy, Energy Information Administration's State Energy Price and Expenditure Report. Code officials shall be permitted to require time-of-use pricing in energy cost calculations.~~ Nondepletable energy collected off site shall be treated and ~~priced~~ calculated the same as purchased energy. Energy from nondepletable energy sources collected on site shall be omitted from the annual source energy ~~cost~~ use of the proposed design. Source energy use shall be expressed in Btu or Btu per square foot of conditioned floor area. The source energy multiplier for electricity shall be 3.16. The source energy multiplier for fuels other than electricity shall be 1.1.

Exception: ~~Jurisdictions that require site energy (1 kWh=3413 Btu) rather than energy cost as the metric of comparison.~~ Emissions of carbon dioxide equivalents (CO_2e) used in lieu of source energy use, taken from a source approved by the code official, such as the Department of Energy, Energy Information Administration's Annual Energy Outlook.

Reason: Only through source (full fuel cycle) energy measurements can the IECC accurately gauge a building's total energy footprint. Source energy is fully defined and justified within U. S. Environmental Protection Agency (EPA) procedures for assessing energy and carbon footprints of commercial buildings under its Energy Star performance path rating methodology. The best method to gauge a building's global warming impact is through source energy emissions of CO_2 and CO_2 equivalents (CO_2e). The proposed changes include both methods. Energy cost does not reflect source energy consumption or CO2 and, further, is misleading in that energy cost for electricity and other fuels often vary widely by region and season. Therefore, energy cost is not capable of truly reflecting a building's energy or global warming impact. Energy cost has served as a useful tool for many years, but the new reality demands that the IECC and other energy conservation and environmental programs move toward the use of total energy or CO_2 emissions to measure energy & emission reductions. The IECC is the nation's premier energy code and must take the lead.
As required by Section 1802 of the Energy Policy Act of 2005, the National Academy of Sciences (NAS) issued their report "Review of Site (Point-of-Use) and Full-Fuel-Cycle Measurement Approaches to DOE/EERE Building Appliance Energy-Efficiency Standards." **This free report in PDF was downloaded from: http://www.nap.edu/catalog/12670.html** . The report recommends DOE to "consider moving over time toward the use of full-fuel-cycle measure of energy consumption for assessment of national and environmental impacts." The report found that using that metric would provide the public with more comprehensive information about the impacts of energy consumption on the environment, the economy, and other national concerns. DOE/EERE's current use of site energy consumption does not account for the total consumption of energy when more than one fuel is used in an appliance or when more than one fuel can be used for the same application. For these appliances, measuring full-fuel-cycle energy consumption would provide a more complete picture of energy used, allowing comparison across many different appliances as well as an improved assessment of impacts such as effects on energy security and the environment.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: RANFONE-EC-1-405.3-506.3

EC135–09/10
405.3

Proponent: Steve Rosenstock, representing Edison Electric Institute (EEI)

Revise as follows:

405.3 Performance-based compliance. Compliance based on simulated energy performance requires that a proposed residence (*proposed design*) be shown to have an annual energy cost that is less than or equal to the annual energy cost of the *standard reference design*. Energy prices shall be taken from a source *approved* by the *code official*, such as the Department of Energy, Energy Information Administration's *State Energy Price and Expenditure Report*. *Code officials* shall be permitted to require time-of-use pricing in energy cost calculations.

~~**Exception:** The energy use based on source energy expressed in Btu or But per square foot of *conditioned floor area* shall be permitted to be substituted for the energy cost. The source energy multiplier for electricity shall be 3.16. The source energy multiplier for fuels other than electricity shall be 1.1.~~

Exceptions:

1. Jurisdictions that require site energy (1 kWh = 3,413 Btu) rather than energy cost as the metric of comparison.
2. Jurisdictions that use both site energy and source energy estimates as the metrics of comparison. All source energy estimates shall be reviewed by independent third parties for technical accuracy and to ensure market and fuel neutrality.

Reason: This revision will provide more options for code officials and provide builders transparency about why certain building design options do not meet energy efficiency codes when using source energy.

Cost Impact: Increased due to third party verification of source energy methodology and numerical estimates.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

EC137–09/10
Table 405.5.2(1)

Proponent: James Larsen, representing the Cardinal Glass Industries

Revise table as follows:

TABLE 405.5.2(1)
SPECIFICATIONS FOR THE STANDARD REFERENCE AND PROPOSED DESIGNS

BUILDING COMPONENT	STANDARD REFERENCE DESIGN	PROPOSED DESIGN
Glazing[a]	Total area[b] = (a) The proposed glazing area; where proposed glazing area is less than 15% of the conditioned floor area. (b) 15% of the conditioned floor area; where the proposed glazing area is 15% or more of the conditioned floor area. Orientation: equally distributed to four cardinal compass orientations (N, E, S & W). *U*-factor: from Table 402.1.3 SHGC: From Table 402.1.1 except that for climates with no requirement (NR) SHGC = 0.40 shall be used. Interior shade fraction: 0.92-(0.21*SHGC for the standard reference design) ~~Summer (all hours when cooling is required) = 0.70~~ ~~Winter (all hours when heating is required) = 0.85~~[c] External shading: none	As proposed As proposed As proposed As proposed 0.92-(0.21*SHGC as proposed) ~~Same as standard reference design~~ As proposed

a through b. (No change to current text)

~~c. For fenestrations facing within 15 degrees (0.26 rad) of true south that are directly coupled to thermal storage mass, the winter interior shade fraction shall be permitted to be increased to 0.95 in the proposed design.~~

d. through k. (No change to current text)

Reason: The "Interior shade fraction" in the *IECC*'s section 405 performance compliance path is used in simulating the performance of the building as a multiplier to reduce effective SHGC and its impact on the conditioned space. This approach is intended to simulate the effects of interior shades on solar heat gain transmitted through the glazing. As a result, this multiplier is important because it can affect the choice of appropriate fenestration.

The current specifications for the Standard Reference Design and the Proposed Design incorrectly treat interior shade fraction as a constant without regard to the type of shade or the type of the glass. Recently completed research shows that it is not a constant. This proposal is intended to correct this issue by providing a simplified equation for determining interior shading fraction depending on the SHGC of the glazed fenestration product (this equation is based on the assumption of a specific type of interior shade, recognizing that the code has no control over the type of shade ultimately employed). This proposal also incorporates the assumption that shades are closed 50% of the time throughout the entire year, rather than assuming twice the shade usage in the summer than the winter. This proposal would allow the performance path to provide a more precise treatment of shade fraction depending on the SHGC of the glazing product.

ASHRAE recently completed a research project - 1311 RP – and published a 95 page final report on the effects of various shading devices on the building loads resulting from solar heat gain; specifically, Wright, J., et.al., *Improved Cooling Load Calculations for Fenestration with Shading Devices* (dated January 14, 2009). This report publishes tables of modifiers for 56 glass products and 34 types of interior shading devices.

Shade combinations studied in the report included:

Louvered Shades
- 3 colors (dark, medium, light)
- 5 positions (rotated from closed down to open to closed up)

Fabric Drapes
- 3 colors
- 4 weave densities (closed, semi-open, open, sheer)

Roller Shades
- 3 colors

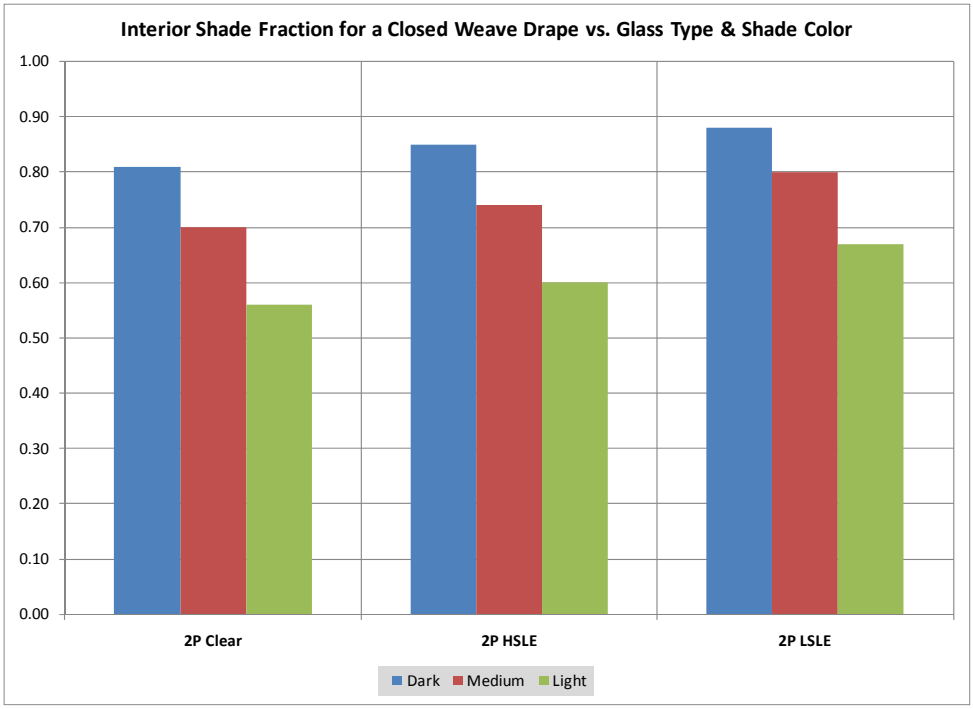
o 2 density (opaque, translucent)
Insect Screen (1)

According to the report, the shading values vary remarkably depending on the type of shade and the type of glass. In fact, one could reasonably conclude that it is impossible to set any meaningful shade fraction without reference to a specific shade and a specific window in each case. Reference to specific shades and window combinations in the code obviously would be complex at best, and would certainly be impractical, since the type of interior shades for each window is typically not controlled by the builder and would require a separate calculation for each window with a different shade. As a result, we are faced with two options – either eliminate interior shade fraction from the performance calculations, or make a simplifying assumption as to a standard shade. For this proposal, we have selected the latter course and propose to assume use of the most effective drape (from a shade fraction perspective), which is a light-colored tight-weave fabric drape.

A review and analysis of the data in the report does show, however, that for each shade type, as SHGC is reduced, the impact of the interior shade is also reduced. Intuitively this makes sense – as the glazing takes on the role of solar control, interior shades will have less impact on solar performance. In effect, what happens is that as the SHGC of the window decreases, more of the light energy that is reflected back to the window due to the interior shade is retained in the building (increasing cooling load and reducing heating load) – in other words, more light energy is trapped inside the conditioned space and prevented from retransmission to the outside by the lower SHGC. Since the builder does determine the SHGC of the window, at least this factor can be incorporated into the performance analysis. This impact is expressed in the [-0.21*SHGC] component of the proposed new shade fraction equation in Table 405.5.2(1).

The graphs below demonstrate how the interior shade fraction varies for the same light-colored, closed-weave drape with 3 common types of double glazing:

Clear
High Solar Gain Low-E (HSLE)
Low Solar Gain Low-E LSLE)



The interior shade fractions shown in the graph above are for the drape fully closed all of the time and would need to be modified by an expected shade usage pattern. We are aware of no evidence as to typical actual usage patterns by homeowners. However, reverse engineering the current summer/winter interior shade fractions in Table 405.5.2(1) suggests that the *IECC* currently assumes that the homeowner's usage pattern would be shades closed 2/3 of the time in the summer and closed 1/3 of the time in the winter (this assumes the "legacy" values were derived with clear glass and light colored tight weave drape). We do not believe that this is a valid assumption without data. As a result, the proposed 0.92/0.21 coefficients were calculated for the proposed interior shade fraction equation assuming a 50% drape closure year round. In other words, it assumes that the home owner is just as likely to open the drape as close it throughout the entire year.

Should the committee feel a different usage pattern is appropriate, for either winter, or summer, or both, the table below shows coefficients as a function of shade closure over total daylight hours. The equation form is $\mathbf{C_1}$ – ($\mathbf{C_2}$*SHGC).

Closure	C_1	C_2
25%	0.96	0.10
33%	0.95	0.14
50%	**0.92**	**0.21**
67%	0.89	0.28
75%	0.88	0.31
100%	0.84	0.42

The proposed equation was developed and these coefficient values were calculated based on the data from the report.

It is also important to ensure that the Proposed Design properly reflects the shade fraction as a result of the SHGC of the actual product used in the Proposed Design (that is, as proposed), rather than simply repeating the shade fraction based on the SHGC from the Standard Reference Design. As a result, we propose to incorporate the same equation in the Proposed Design, but using the actual product SHGC in lieu of the SHGC in the Standard Reference Design.

This proposal should be adopted to reflect more accurately the effects of the glazing SHGC on the interior shade fraction.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: LARSEN-EC-1-T. 405.5.2(1)

EC138–09/10
Table 405.5.2(1)

Proponent: Ronald Majette, representing US Department of Energy

Revise table as follows:

TABLE 405.5.2(1)
SPECIFICATIONS FOR THE STANDARD REFERENCE AND PROPOSED DESIGNS

BUILDING COMPONENT	STANDARD REFERENCE DESIGN	PROPOSED DESIGN
Heating systems [g h]	As proposed <u>for other than electric heating without a heat pump. Where the proposed design utilizes electric heating without a heat pump the standard reference design shall be an air source heat pump meeting the requirements of Section 503</u>. Capacity: sized in accordance with Section M1401.3 of the *International Residential Code*	As proposed

(Portions of table and footnotes not shown remain unchanged)

Reason: The purpose of this code change is restore language from the 2006 IECC that appears to have been inadvertently removed in the 2009 IECC. The language relates to the standard reference design assumptions when electric resistance heating systems are used in the simulated performance alternative. The 2006 IECC sets an air-source heat pump as the standard reference design heating system if electric heating was used in the proposed design. The 2009 IECC effectively reduces energy efficiency in the simulated performance alternative (section 405) compared to the 2006 IECC if electric resistance heating is used in a proposed design as a less efficient system is assumed in the standard design. This reduction in energy efficiency appears to be an unintentional oversight. This proposal does not alter the code if the proposed design has an electric heat pump or any non-electric system.

Cost Impact: The code change proposal will increase the cost of construction to the degree that it precludes the application and use of the simulated performance alternative to establish an energy performance metric that is artificially high and then use that metric as a baseline for verifying code compliance.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: MAJETTE-EC-69-T. 405.5.2(1)

EC139–09/10
Table 405.5.2(1)

Proponent: Ronald Majette, representing US Department of Energy

Revise table as follows:

TABLE 405.5.2(1)
SPECIFICATIONS FOR THE STANDARD REFERENCE AND PROPOSED DESIGNS

BUILDING COMPONENT	STANDARD REFERENCE DESIGN	PROPOSED DESIGN
Thermal distribution systems	A thermal distribution system efficiency (DSE) of 0.88 shall be applied to both the heating and cooling system efficiencies for all systems other than tested duct systems. Duct insulation: From Section 403.2.1. For tested duct systems, the leakage rate shall be the applicable maximum rate from Section 403.2.2	<u>Thermal distribution system efficiency shall be as</u> ~~As~~ tested or as specified by Table 405.5.2(2) if not tested<u>. Duct insulation shall be as proposed.</u>

(Portions of table and footnotes not shown remain unchanged)

Reason: The purpose of this code change is to clarify that the duct insulation in the proposed design is simply whatever is proposed. The proposed duct insulation is not necessarily the same as the duct insulation in the standard design, but must be at least R-6 as specified in section 405.2. This proposal is not intended to change any requirements.

Cost Impact: The code change proposal will not increase the cost of construction.

Service Water Heating [g, i, j, k]	~~As proposed~~ ~~Use: same as proposed design~~ Fuel type: same as proposed design Efficiency: in accordance with prevailing federal minimum standards Use: same as proposed design	~~As proposed~~ ~~gal/day = 30 + (10 x N_{br})~~ As Proposed Same as standard reference [l] As proposed gal/day = 30 + (10 x N_{br})

l. Proposed design shall be as proposed when the building meets minimum wall cavity insulation requirements in Section 402 or when providing a thermally equivalent wall assembly to the same.

(Portions of table and footnotes not shown remain unchanged)

Reason: The purpose of the performance path is to provide flexibility for builders as they comply with code. However, this flexibility is severely limited if increases in mechanical efficiency are not taken into account in performance path compliance. Currently the code creates a disincentive for builders to use any heating, cooling or water heating system other than code minimum, making the performance path essentially unusable.

This proposal reintroduces heating, cooling, and water heating efficiency into the performance path, offering more flexibility for code compliance, while encouraging builders to use higher than minimum efficiency mechanical equipment. It fills a hole in the 2009 IECC, which has no method to encourage energy savings through mechanical equipment.

Concerns have been raised about the ability to trade off mechanical equipment efficiency against wall cavity insulation because wall cavity insulation is difficult and expensive to access during a home renovation. Therefore increases to cavity insulation are less practical for home owners than other energy saving measures. This proposal limits mechanical tradeoffs to situations in which the builder meets the minimum cavity insulation requirement (or equivalent assembly). Therefore, builders can use heating, cooling, and water heating equipment efficiency in their performance path compliance, but only if they meet the minimum cavity insulation requirements in Section 402.

This change will increase flexibility and increase the use of high efficiency heating, cooling, and water heating equipment, while maintaining reasonable limits on wall insulation requirements.

Cost Impact: The code change proposal will not increase the cost of construction.

(Portions of table and footnotes not shown remain unchanged)

Reason: The purpose of this proposal is to retain the original equipment trade-off provisions from the 2006 *International Energy Conservation Code* (IECC) for the heating systems, cooling systems, and service water heating. By retaining these, builders have an opportunity to optimize a code-compliant house design by using energy efficient equipment.

Eliminating the ability to use equipment efficiency as a means to achieve whole-house energy conservation will discourage the use of higher efficiency equipment. Quite often, the use of this high efficiency equipment provides a more cost effective solution to achieve code compliance. Eliminating this ability discourages the concept of the “house as a system” approach which is a cornerstone of many state energy programs and the Federal Energy Star Program. In fact, without this proposal the current practice for constructing an Energy Star home in certain jurisdictions would be disallowed.

Significant improvements in the efficiency of HVAC and water heating equipment have been made in the last 20 years. With the increased emphasis on new and improved technologies, this trend will continue and will result in even higher energy savings in future years. Eliminating the ability to recognize the value of these technologies in the marketplace will prove detrimental to all builders and ultimately the homeowners.

By inserting the equipment trade-off tables, this amendment provides a reasonable cost-effective solution to achieve compliance.

Cost Impact: The code change proposal will not increase the cost of construction.

Proponent: Bill Prindle, ICF International, representing the Energy Efficient Codes Coalition; Jeff Harris, Alliance to Save Energy; Harry Misuriello, American Council for an Energy-Efficient Economy (ACEEE); Garrett Stone, Brickfield, Burchette, Ritts & Stone; Steve Rosenstock, Edison Electric Institute; Brian Dean, ICF International

Revise as follows:

TABLE 405.5.2(1)
SPECIFICATIONS FOR THE STANDARD REFERENCE AND PROPOSED DESIGNS

BUILDING COMPONENT	STANDARD REFERENCE DESIGN	PROPOSED DESIGN
~~Doors~~	~~Area: 40 ft^2~~ ~~Orientation: North~~ ~~*U* Factor: same as fenestration from Table 402.1.3~~	~~As proposed~~ ~~As proposed~~ ~~As proposed~~
~~Glazing~~[a] Fenestration	Total area[b] = (a) The proposed ~~glazing~~fenestration area; where the proposed ~~glazing~~fenestration area is less than 15% of the conditioned floor area (b) 15% of the conditioned floor area; where the proposed ~~glazing~~fenestration area is 15% or more of the conditioned floor area	As proposed
	Opaque Door: opaque door (SHGC = 0) as proposed up to 40 ft^2 shall be included in proposed total fenestration area and oriented the same as in the proposed design	As proposed
	Orientation: all fenestration other than the opaque door equally distributed to four cardinal compass orientations (N, E, S & W)	As proposed
	U-Factor: from Table 402.1.3 SHGC: from Table 402.1.1 except that for climates with no requirement (NR) SHGC = 0.40 shall be used.	As proposed As proposed
	Interior shade fraction: Summer (all hours when cooling is required) = 0.70 Winter (all hours when heating is required) = 0.85[c]	Same as standard reference design
	External shading: none	As proposed

~~a. Glazing shall be defined as sunlight transmitting fenestration, including the area of sash, curbing or other framing elements, that enclose conditioned space. Glazing includes the area of sunlight transmitting fenestration assemblies in walls bounding conditioned basements. For doors where the sunlight transmitting opening is less than 50% of the door area, the glazing area is the sunlight transmitting opening area. For all other doors, the glazing area is the rough frame opening area for the door including the door and the frame.~~

(Portions of table and footnotes not shown remain unchanged)

Reason: The IECC defines fenestration (Section 202) to include all windows, skylights and doors, whether glazed or opaque. Yet, table 404.5.2(1), treats "doors" a separate component. It is unclear how glazed and un-glazed doors are supposed to be treated under this approach (e.g., are glazed doors included in doors or glazing?). This proposal simplifies and tightens the performance path by including all fenestration—doors, vertical glazing, and skylights—in a single calculation. In order to do so, the proposal replaces the two terms "doors" and "glazing" with "fenestration," and sets an SHGC in the standard reference design for both glazed and opaque doors.

This simplification will strengthen the code by ensuring that all fenestration is properly accounted for in the proposed design. The result will also be an increase in efficiency and energy savings, since it eliminates a separate assumption of 40 square feet of opaque doors in the standard reference design, instead including such doors in fenestration area, like all other fenestration.

Cost Impact: The code change proposal will not increase the cost of construction.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: PRINDLE-EC-31-T. 405.5.2(1)

EC144–09/10
Table 405.5.2(1)

Proponent: Bill Prindle, ICF International, representing the Energy Efficient Codes Coalition; Jeff Harris, Alliance to Save Energy; Harry Misuriello, American Council for an Energy-Efficient Economy (ACEEE); Garrett Stone, Brickfield, Burchette, Ritts & Stone; Steve Rosenstock, Edison Electric Institute; Brian Dean, ICF International

Revise table as follows:

TABLE 405.5.2(1)
SPECIFICATIONS FOR THE STANDARD REFERENCE AND PROPOSED DESIGNS

BUILDING COMPONENT	STANDARD REFERENCE DESIGN	PROPOSED DESIGN
Heating systems [g, h, i]	As Proposed Capacity: sized in accordance with Section M1401.3 of the *International Residential Code*	As Proposed
Cooling systems [g, ~~i~~, J]	As Proposed Capacity: sized in accordance with Section M1401.3 of the *International Residential Code*	As Proposed
Service Water Heating [g, ~~i, j,~~ k]	As Proposed Use: Same as proposed design	As Proposed Use: gal/day=30 + (10 x N_{br})

i. For a proposed design without a proposed heating system, a heating system with the prevailing minimum efficiency shall be assumed for both the standard reference design and the proposed design. For electric resistance heating systems, the prevailing federal minimum efficiency air-source heat pump shall be used for the standard reference design.
j. For a proposed design home without a proposed cooling system, an electric air conditioner with the prevailing minimum efficiency shall be assumed for both the standard reference design and the proposed design.

(Portions of table and footnotes not shown remain unchanged)

Reason: This proposal ensures that the proper notes for the systems are connected to the proper systems. Note "i", which states that "for electric heating systems, the prevailing minimum efficiency shall be assumed for the standard reference design" is very important to ensure that consistent performance path modeling is conducted for electric heating systems. Previously this note was tied to the cooling systems, however, it should be tied to the heating system as proposed.

In addition note "i" has been modified to clarify that only electric resistance heating systems should have the standard reference design as the prevailing federal minimum efficiency air-source heat pump. This is to ensure that electric heating is not used in the standard reference design as a baseline home for achieving minimum code.

In addition, there is the deletion of footnote "i" and addition of footnote "J" to the cooling system, to clarify the intent of those two notes. The note change has been marked with the capital J to ensure that the lowercase i and j are not confused with the underline, as may have been done in previous code change cycles.

In the service water heating section there is a removal of footnotes i and j, which relate to heating and cooling only and also the addition of the word "Use:" to clarify what the gal/day equation is for.

Cost Impact: The code change proposal will not increase the cost of construction.

Revise as follows:

TABLE 405.5.2(1)
SPECIFICATIONS FOR THE STANDARD REFERENCE AND PROPOSED DESIGNS

BUILDING COMPONENT	STANDARD REFERENCE DESIGN	PROPOSED DESIGN
Glazing [a]	Total area [b] = (a) The proposed glazing area; where the proposed glazing area is less than 15% of the conditioned floor area (b) 15% of the conditioned floor area; where the proposed glazing area is 15% or more of the conditioned floor area Orientation: equally distributed to four cardinal compass orientations (N,E,S, & W) U-factor: from Table 402.1.3 SHGC: From Table 402.1.1 except that for climates with no requirement (NR) SHGC = 0.40 shall be used Interior shade fraction: Summer (all hours when cooling is required) = ~~0.70~~ 0.90 Winter (all hours when heating is required) = ~~0.85~~ 0.90 [c] Exterior shading: none	As proposed As proposed As proposed As proposed Same as standard reference design As proposed

(Portions of table and footnotes not shown remain unchanged)

Reason: This proposal corrects a long-term flaw in the performance path – an unfounded assumption that interior shades are consistently used twice as much in the summer as in the winter – by setting the interior shade fraction at the same 0.90 level for both summer and winter. Another option would be to eliminate interior shading altogether, just as the performance path already assumes no exterior shading. Either approach would allow for the energy efficiency improvements of the home to be treated consistently throughout the year without impact from occupant behavior between seasons. Because there is no valid evidence as to actual, consistent human behavior in using shades, and indeed shade use is ultimately up to each individual occupant, we propose to treat all seasons equally.

The benefits of reducing solar heat gain for homes is well-known. However, it is not so well known that the code-assumed interior shading values reduce the perceived benefits of shading windows or reducing the SHGC of windows.

This proposal makes the performance path more accurate by establishing an equal interior shade fraction in all seasons. The current standard reference design assumes a 30% reduction in the benefit of reducing solar heat gain in the hottest time of the year when the solar heat gain reduction is most important to reducing the electric grid overload during peak hours. By contrast, the standard reference design assumes only 15% is blocked in the winter. These numbers are not supported by objective data or any studies, and the imbalance between the shading fractions creates inaccuracies in modeling programs. Because the performance path assumes that interior shading is used twice as much in the summer as in the winter, the equation shows higher relative energy use in the heating months than in the cooling months. In the performance path calculation, this translates to an artificially inflated heating budget and a bias in favor of measures used to reduce heating energy. This assumption is similar to assuming that heating equipment will operate 30% more efficiently due to occupant behavior. It is not accurate and promotes less efficiency. The assumption also makes no climate zone-specific distinctions, but rather assumes that shading tendencies are static nationally. The result is that the performance path may favor compliance measures that reduce heating energy over measures that reduce cooling energy, even in cooling-dominated climates.

Because there is no data to support the currently unbalanced assumptions of interior shading fractions, this proposal neutralizes the assumptions in the standard reference design at a uniform, conservative level. It assumes that a typical occupant will not radically alter behavior with regards to interior shade operation by season. It also makes the conservative assumption that the majority of windows will not have shades drawn during daytime hours to block solar radiation. As a result, the purchased energy estimated using the performance approach will be more accurate and representative of an actual residential building.

Although it can be argued that a conscientious building occupant may reduce heating or cooling loads by operating shades to minimize sunlight during the summer and maximize sunlight during winter, there is no data to suggest that occupants actually engage in these practices for the purpose of saving energy. There are many reasons why shades are operated throughout the year, and almost all of them have nothing to do with energy use.

The *2005 ASHRAE Handbook of Fundamentals* outlines a number of variables affecting user-operated shading devices, each of which may have significant impacts on the effectiveness of the devices:

Shading devices vary in their operational effectiveness. Some devices, such as overhangs, light shelves, and tinted glazings, do not require operation, have long life expectancies, and do not degrade significantly over their effective life. **Other types of shading devices, especially operable interior shades, may have reduced effectiveness because of less than optimal operation and degradation of effectiveness over time. It is important to evaluate operational effectiveness when considering the actual heat rejection potential of shading devices**.

Handbook, at 31.54, emphasis added. The *Handbook* lists six reasons why shades are more or less effectively operated, and only one of them (radiant energy protection) has anything to do with energy use or changing seasons: Radiant Energy Protection, Outward Vision, Privacy, Brightness Control, View Modification, and Sound Control. *See Handbook* at 31.54-55.

In reality, a home's occupant will operate shades for any number of these reasons, without thinking of the potential negative energy impacts. For example, interior shades should be operated to reflect radiant energy during the hottest months of the year. However, in northern climates, because glass temperatures during winter months can drop below room temperature, it is common practice to use shades *more often* during the winter months for the perceived insulating benefits. In addition, direct sunlight or reflected light can make occupants uncomfortable, leading to more shade usage (even in winter months).

Windows are often installed for a view of particular external geographical features, such as landscape or city views. A beautiful view or day-lighting interest may induce an occupant to leave shades open year-round. In other cases, because of a home's proximity to other homes, certain windows may be shaded year-round for privacy concerns. Users may also install heavy draperies to reduce road noise or other sounds.

Every building will have unique shading characteristics based on the climate zone, shade type, window type, orientation, exterior shading, and most importantly, the occupant's priorities. Because there is no reliable data to support the current bias in the performance path, the shading fraction should be neutralized so that heating and cooling measures will be treated similarly. Moreover, given the lack of data as to actual operation,

the safer assumption is that shades are largely left open (justifying a higher fraction); after all, it is reasonable to assume that the average person buys windows for views and light. This proposal sets the assumption at a conservative 0.90, which means that the shades are blocking 10% of the solar heat gain annually. Another sensible option is to assume no interior shading, just as the standard reference design assumes no exterior shading.

Cost Impact: The code change proposal will not increase the cost of construction. This change is not intended to affect the overall stringency of the code.

1. Add new definitions as follows:

SECTION 202
GENERAL DEFINITIONS

FENESTRATION PRODUCT, FIELD-FABRICATED is a fenestration product including a exterior glass door whose frame is made at the construction site of standard dimensional lumber or other materials that were not previously cut, or otherwise formed with the specific intention of being used to fabricate a fenestration product or exterior door. Field fabricated does not include site-built fenestration with a label certificate or products required to have temporary or permanent labels.

FENESTRATION PRODUCT, SITE-BUILT is fenestration designed to be field-glazed or field assembled units using specific factory cut or otherwise factory formed framing and glazing units. Examples of site-built fenestration include storefront systems, curtain walls, and atrium roof systems.

FURNACE ELECTRICITY RATIO. The ratio of furnace electricity use to total furnace energy computed as ratio = $(3.412*E_{AE})/(1000*E_F + 3.412*E_{AE})$, where E_{AE} (average annual auxiliary electrical consumption) and E_F (average annual fuel energy consumption) are defined in Appendix N to subpart B of part 430 of title 10 of the Code of Federal Regulations and E_F is expressed in millions of Btu's per year.

ON-SITE RENEWABLE ENERGY. Energy derived from solar radiation, wind, waves, tides, landfill gas, biomass, or the internal heat of the earth. The energy system providing on-site renewable energy shall be located on or adjacent to the project site.

2. Revise as follows:

COMMERCIAL ENERGY EFFICIENCY

SECTION 501
GENERAL

501.1 Scope. The requirements contained in this chapter are applicable to commercial buildings, or portions of commercial buildings. ~~These commercial buildings shall meet either requirements of ASHRAE/IESNA Standard 90.1, *Energy Standard for Buildings Except for Low-Rise Residential Buildings*, or the requirements contained in this chapter.~~

501.2 Application. The *commercial building* project shall comply with the requirements in Sections 502 ~~(Building envelope requirements),~~ 503 ~~(Building mechanical systems)~~, 504~~(Service water heating)~~, 505 ~~(Electrical power and lighting systems)~~ in its entirety. As an alternative the *commercial building* project shall exceed by at least 25% ~~comply with~~ the requirements of ASHRAE/IESNA Standard 90.1, Energy Standard for Buildings Except for Low Rise Residential Buildings, Appendix G in its entirety.

Exceptions:

1. Buildings conforming to Section 506, provided Sections 502.4, 503.2, 504, 505.2, 505.3, 505.4, 505.6 and 505.7 are each satisfied. Building energy cost shall be equal to or less than 75% of the standard reference design building.
2. Additions, alterations and repairs shall comply with the applicable requirements in Sections 502, 503, 504, and 505 only or with ASHRAE/IESNA 90.1.

3. Revise as follows

SECTION 502
BUILDING ENVELOPE REQUIREMENTS

502.1 General (Prescriptive).

502.1.1 Insulation and fenestration criteria. The *building thermal envelope* shall meet the requirements of Tables 502.2(1) and 502.3 based on the climate *zone* specified in Chapter 3. Commercial buildings or portions of commercial buildings enclosing Group R occupancies shall use the *R*-values from the "Group R" column of Table 502.2(1). Commercial buildings or portions of commercial buildings enclosing occupancies other than Group R shall use the *R*-values from the "All other" column of Table 502.2(1). Buildings with a vertical fenestration area or skylight area that exceeds that allowed in Table 502.3 shall comply with the building envelope provisions of ASHRAE/IESNA-90.1.

For SI: 1 inch = 25.4 mm.

ci = Continuous insulation. NR = No requirement.

a. When using *R*-value compliance method, a thermal spacer block is required, otherwise use the *U*-factor compliance method. [see Tables 502.1.2 and 502.2(2)].

b. Assembly descriptions can be found in Table 502.2(2).

c. R-5.7 ci is allowed to be substituted with concrete block walls complying with ASTM C 90, ungrouted or partially grouted at 32 inches or less on center vertically and 48 inches or less on center horizontally, with ungrouted cores filled with material having a maximum thermal conductivity of 0.44 Btu-in./h-f2 F.

d. When heated slabs are placed below grade, below-grade walls must meet the exterior insulation requirements for perimeter insulation according to the heated slab-on-grade construction.

e. Steel floor joist systems shall to be R-38.

Skylights (3% maximum, 5% maximum with automatic day lighting controls[c])								
U-Factor	0.75	~~0.75~~ 0.65	~~0.65~~ 0.55	~~0.60~~ 0.50	~~0.60~~ 0.50	~~0.60~~ 0.50	~~0.60~~ 0.50	~~0.60~~ 0.50
SHGC[d]	0.35	0.35	0.35	0.40	0.40	0.40	NR	NR

NR = No requirement.
PF = Projection factor (see Section 502.3.2).
a. The first U-factor applies when impact rated glazing is installed.
b. All others includes operable windows, fixed windows, and ~~nonentrance~~ doors other than entrance doors.
c. Automatic day lighting controls shall meet the requirements of Section 505.2.2.3.1.
d. The SHGC for Climate Zones 1 – 6 can be increased to SHGC no greater than 0.60 if the Visible Transmittance (VT) is not less than 0.60 and automatic day lighting controls are installed that meet the requirements of Section 505.2.2.3.1.

502.4 Air leakage (Mandatory)

502.4.1 Air Barriers. The building envelope shall be designed and constructed with a continuous air barrier that complies with Section 502.4.1.1 and 502.4.1.2 to control air leakage into, or out of, the conditioned space. Construction documents shall identify the air barrier components for each assembly, including detailing joints, interconnections and sealing of penetrations. The opaque building envelope air barrier may be located on the inside, outside, or integral with the building envelope; or any combination thereof.

Exception: Building envelopes of buildings in climate Zones 1, 2 and 3.

Section 502.4.1.1 The *continuous air barrier* shall have the following characteristics:

1. It shall be continuous throughout the envelope (at the lowest *floor*, exterior *walls*, and ceiling or *roof*). Air barrier joints and seams shall be sealed; including sealing transitions in planes and changes in materials. Air barrier penetrations shall be sealed.

2. The air barrier component of each assembly shall be joined and sealed in a flexible manner to the air barrier component of adjacent assemblies. The joints and seals shall allow for the relative movement of the assemblies and materials without damage to the air seal.

3. The air barrier shall be installed in accordance with the *manufacturer's* instructions in a manner that achieves the performance requirements.

4. Where lighting *fixtures* with ventilation holes or other similar objects are to be installed in such a way as to penetrate the *continuous air barrier*, provisions shall be made to maintain the integrity of the *continuous air barrier*.

Exception: Buildings that comply with Section 502.4.1.2(3) below are not required to comply with either 1 or 4.

Section 502.4.1.2 Air barrier compliance options. A continuous air barrier for the opaque building envelope shall meet the requirements of at least one of the compliance options in Section 502.4.1.2(1), 502.4.1.2(2), or 502.4.1.2(3).

502.4.1.2.1 Materials. Individual materials shall have an air permeability not to exceed 0.02 L/s·m^2 under a pressure differential of 75 Pa (0.004 cfm/ft^2 under a pressure differential of 0.3 in. water (1.57 lb/ft^2)) when tested in accordance

with ASTM E2178. The following materials comply with this requirement when all joints are sealed:

1. Plywood - minimum 3/8 in (10 mm)
2. Oriented strand board - minimum 3/8 in (10 mm)
3. Extruded polystyrene insulation board - minimum 3/4 in (19 mm)
4. Foil-back urethane insulation board - minimum 3/4 in (19 mm)
5. Closed cell spray foam meeting air permeability requirement
6. Open cell spray foam meeting air permeability requirement
7. Weather resistant barrier meeting air permeability requirement
8. Exterior or interior gypsum board - minimum 1/2 in (12 mm)
9. Cement board - minimum 1/2 in (12 mm)
10. Built up roofing membrane
11. Modified bituminous roof membrane
12. Fully adhered single-ply roof membrane
13. A Portland cement/sand parge, or gypsum plaster minimum 5/8 in (16 mm) thick
14. Cast-in-place and precast concrete.
15. Fully grouted concrete block masonry.
16. Sheet steel or aluminum

502.4.1.2.2 Assemblies. The following assemblies shall comply when all joints are sealed:

1. Assemblies of materials and components that have an average air leakage not to exceed 0.2 L/s·m2 @ 75 Pa (0.04 cfm/ft2 under a pressure differential of 0.3" w.g. (1.57psf)) when tested in accordance with ASTM E2357 or ASTM E1677.

2. Provided that all joints are sealed and every characteristic in Section 502.4.4.1.1 is met, assemblies that comply with Section 502.4.1.2(2) include, but are not limited to,
   2.1. Concrete masonry walls coated with one application either of block filler and two applications of a paint or sealer coating;
   2.2. A Portland cement/sand parge, stucco or plaster minimum 1/2 in (12 mm) thick.

502.4.1.2.3 Building Test. Testing the completed building and demonstrating that the air leakage rate of the *building envelope* does not exceed 2.0 L/s·m^2 @ 75 Pa (0.40 cfm/ft^2 at a pressure differential of 0.3" w.g. (1.57 psf)) in accordance with ASTM E779 or an equivalent method approved by the code official.

502.4.2 Air Barrier Penetrations. All penetrations of the air barrier and paths of air infiltration / exfiltration shall be made air tight and shall be sealed with caulking materials or closed with gasketing systems compatible with the construction materials and location. Joints and seals shall be sealed in the same manner or taped or covered with a moisture vapor-permeable wrapping material. Sealing materials spanning joints between construction materials shall allow for expansion and contraction of the construction materials.

502.4.3 ~~502.4.1~~ Window and door assemblies. The air leakage of windows, skylights, and ~~sliding or swinging~~ door assemblies that are part of the building envelope shall be determined in accordance with AAMA/WDMA/CSA 101/I.S.2/A440, or NFRC 400 by an accredited, independent laboratory, and labeled and certified by the manufacturer. ~~and shall not exceed the values in Section 402.4.2~~ Windows and skylights shall have an air leakage rate of no more than 0.2 cfm per square foot (1.0 L/s/m2) when tested at a pressure of at least 1.57 pounds per square foot (psf) (75 Pa), or 0.3 cfm per square foot (1.5 L/S/m2) when tested at a pressure of at least 6.24 pounds per square foot (psf) (300 Pa). Door assemblies shall have an air leakage rate of no more than 0.3 cfm per square foot (1.5 L/s/m2).

Exceptions:

1. ~~Site-constructed~~ Field-fabricated fenestration products ~~windows and doors~~ that are ~~weatherstripped or~~ sealed in accordance with Section 502.4.~~3~~1
2. Commercial entrance doors covered by Section 502.4.4.
3. Garage doors shall be permitted to use air leakage determined in accordance with ANSI/ DASMA 105 at standard test conditions.

~~**502.4.3 Sealing of the building envelope.** Openings and penetrations in the building envelope shall be sealed with caulking materials or closed with gasketing systems compatible with the construction materials and location. Joints and seams shall be sealed in the same manner or taped or covered with a moisture vapor-permeable wrapping material.~~

~~Sealing materials spanning joints between construction materials shall allow for expansion and contraction of the construction materials.~~

502.4.4 ~~502.4.2~~ Curtain wall, storefront glazing and commercial entrance doors. Curtain wall, storefront glazing and commercial-glazed swinging entrance doors and revolving doors shall be tested for air leakage at a pressure of at least 1.57 pounds per square foot (psf) (75 Pa) in accordance with ASTM E 283. For curtain walls and storefront glazing, the maximum air leakage rate shall be ~~0.3~~ 0.06 cubic foot per minute per square foot (cfm/ft2) (~~5.5~~ 1.1 m3/h × m2) of fenestration area. For commercial glazed swinging entrance doors and revolving doors, the maximum air leakage rate shall be 1.00 cfm/ft2 (18.3 m3/h × m2) of door area when tested in accordance with ASTM E 283.

Exception: Site-built fenestration products that are sealed in accordance with Section 502.4.1.

502.4.5 Doors and Access Openings to Shafts, Chutes, Stairwells, and Elevator Lobbies. These doors and access openings shall either meet the requirements of 502.4.3 or shall be equipped with weather seals.

Exception: Weatherseals on elevator lobby doors are not required when a smoke control system is installed.

502.4.6 ~~502.4.4~~ Hot gas bypass limitation. (No change to current text.)

502.4.7 ~~502.4.5~~ Outdoor air intakes and exhaust openings. Stair and elevator shaft vents and other outdoor air intakes and exhaust openings ~~integral to the building envelope~~ that penetrate the air barrier shall be equipped with not less than a Class I motorized, leakage-rated damper with a maximum leakage rate of 4 cfm per square foot (6.8 L/s · C m2) at 1.0 inch water gauge (w.g.) (1250 Pa) when tested in accordance with AMCA 500D.

Such dampers shall be set in the closed position and automatically open upon:

1. The activation of any fire alarm initiating device of the building's fire alarm system;
2. The interruption of power to the damper.

Exception: Gravity (non-motorized) dampers are permitted to be used in buildings less than three stories in height above grade.

502.4.8 ~~502.4.6~~ Loading dock weatherseals. *(No change to current text)*

502.4.9 ~~502.4.7~~ Vestibules. *(No change to current text)*

502.4.10 ~~502.4.8~~ Recessed lighting. *(No change to current text)*

SECTION 503
BUILDING MECHANICAL SYSTEMS

503.2.1 Calculation of heating and cooling loads. Design loads shall be determined in accordance with the procedures described in the ASHRAE/ACCA Standard 183. The design loads shall account for the building envelope, lighting, ventilation and occupancy loads based on the project design. Heating and cooling loads shall be adjusted to account for load reductions that are achieved when energy recovery systems are utilized in the HVAC system in accordance with the ASHRAE *HVAC Systems and Equipment Handbook*. Alternatively, design loads shall be determined by an *approved* equivalent computation procedure, using the design parameters specified in Chapter 3.

Air conditioners	< 7,000 Btu / h		11.9 EER	
& Heat Pumps (Cooling Mode)	7,000 Btu / h and < 10,000 Btu / h		11.3 EER	
	10,000 Btu / h and < 13,000 Btu / h		10.7 EER	
	> 13,000 Btu / h		9.5 EER	

For SI: ºC - [(ºF) - 32]/1.8, 1 British thermal unit per hour - 0.2931 W.

db = dry-bulb temperature, ºF.
wb = wet-bulb temperature, ºF.
a. Chapter 6 contains a complete specification of the referenced test procedure, including the referenced year version of the test procedure.
b. Cap means the rated cooling capacity of the product in Btu/h. If the unit's capacity is less than 7,000 Btu/h, use 7,000 Btu/h in the calculation. If the unit's capacity is greater than 15,000 Btu/h, use 15,000 Btu/h in the calculation.
~~c. Replacement units must be factory labeled as follows: "MANUFACTURED FOR REPLACEMENT APPLICATIONS ONLY: NOT TO BE INSTALLED IN NEW CONSTRUCTION PROJECTS." Replacement efficiencies apply only to units with existing sleeves less than 16 inches (406 mm) high and less than 42 inches (1067 mm) wide.~~

TABLE 503.2.3(4)
WARM AIR FURNACES AND COMBINATION WARM AIR FURNACES/AIR-CONDITIONING UNITS, WARM AIR DUCT FURNACES AND UNIT HEATERS, MINIMUM EFFICIENCY REQUIREMENTS

EQUIPMENT TYPE	SIZE CATEGORY (INPUT)	SUBCATEGORY OR RATING CONDITION	MINIMUM EFFICIENCY[d, e]	TEST PROCEDURE[a]
Warm air furnaces, gas fired	< 225,000 Btu/h	—	~~78% AFUE~~ ~~or~~ ~~80% *Et* c~~ For zones 1 & 2, NR. For zones 3 & 4 90 AFUE or 90 Et For zones 4-8 are 92 AFUE or 92 Et	DOE 10 CFR Part 430 or ANSI Z21.47
	≥ 225,000 Btu/h	Maximum capacity[e]	~~80% *Et* f~~ 90% E[c] note h	ANSI Z21.47
Warm air furnaces, oil fired	< 225,000 Btu/h	—	~~78% AFUE~~ ~~or~~ ~~80% *Et*~~ For zones 1 & 2, NR. For zones 3 to 8 are 85 AFUE or 85 Et	DOE 10 CFR Part 430 or UL 727
	≥ 225,000 Btu/h	Maximum capacity[b]	~~81% *Et*[g]~~ 85% Et, [d]	UL 727
Warm air duct furnaces, gas fired	All capacities	Maximum capacity[b]	~~80% *Ec*~~ *90% Ec*	ANSI Z83.8
Warm air unit heaters, gas fired	All capacities	Maximum capacity[b]	~~80% *Ec*~~ *90% Ec*	ANSI Z83.8
Warm air unit heaters, oil fired	All capacities	Maximum capacity[b]	~~80% *Ec*~~ *90% Ec*	UL 731

For SI: 1 British thermal unit per hour = 0.2931 W.
a. Chapter 6 contains a complete specification of the referenced test procedure, including the referenced year version of the test procedure.
~~b. Minimum and maximum ratings as provided for and allowed by the unit's controls.~~
~~c. Combination units not covered by the National Appliance Energy Conservation Act of 1987 (NAECA) (3-phase power or cooling capacity greater than or equal to 65,000 Btu/h [19 kW]) shall comply with either rating.~~
~~d~~ b. *Et* = Thermal efficiency. See test procedure for detailed discussion.
~~e~~ c. *Ec* = Combustion efficiency (100% less flue losses). See test procedure for detailed discussion.
~~f. *Ec* = Combustion efficiency. Units must also include an IID, have jackets not exceeding 0.75 percent of the input rating, and have either power venting or a flue damper. A vent damper is an acceptable alternative to a flue damper for those furnaces where combustion air is drawn from the conditioned space.~~
~~g. *Et* = Thermal efficiency. Units must also include an IID, have jacket losses not exceeding 0.75 percent of the input rating, and have either power venting or a flue damper. A vent damper is an acceptable alternative to a flue damper for those furnaces where combustion air is drawn from the conditioned space.~~
d. Units must also include an IID (intermittent ignition device), have jackets not exceeding 0.75 percent of the input rating, and have either power venting or a flue damper. A vent damper is an acceptable alternative to a flue damper for those furnaces where combustion air is drawn from the conditioned space.
Where there two ratings units not covered by the National Appliance Energy Conservation Act of 1987 (NAECA) (3-phase power or cooling capacity greater than or equal to 65,000 Btu/h [19 kW]) shall comply with either rating.
Et = Thermal efficiency.
Ec = Combustion efficiency (100% less flue losses).
Efficient furnace fan: All fossil fuel furnaces in zones 3 to 8 shall have a furnace electricity ratio not greater than 2% and shall include a manufacturer's designation of the furnace electricity ratio.

TABLE 503.2.3(5)
BOILERS, GAS- AND OIL-FIRED, MINIMUM EFFICIENCY REQUIREMENTS

For SI: 1 ton = 907 kg, 1 British thermal unit per hour = 0.2931 W.

a. The chiller equipment requirements do not apply for chillers used in low-temperature applications where the design leaving fluid temperature is<40ºF.

b. Section 12 contains a complete specification of the referenced test procedure, including the referenced year version of the test procedure.

~~c. Compliance with this standard can be obtained by meeting the minimum requirements of Path A or B. However, both the full load and IPLV must be met to fulfill the requirements of Path A or B.~~

d. NA means that this requirement is not applicable and cannot be used for compliance.

~~e. NR means that there are no minimum requirements for this category.~~

a. Compliance with full load efficiency numbers and IPLV numbers are both required.

b. Only Chillers with Variable Speed Drives (VSD) may use the optional compliance path for chiller efficiency.
N/A – No credit can be taken for this option

503.2.5.1 Demand controlled ventilation. Demand control ventilation (DCV) is required for spaces larger than 500 ft^2 (50m^2) and with an average occupant load of ~~40~~ 25 people per 1000 ft^2 (93 m^2) of floor area (as established in Table 403.3 of the *International Mechanical Code*) and served by systems with one or more of the following:

1. An air-side economizer;
2. Automatic modulating control of the outdoor air damper; or
3. A design outdoor airflow greater than 3,000 cfm (1400 L/s).

Exceptions:

1. Systems with energy recovery complying with Section 503.2.6.
2. Multiple-zone systems without direct digital control of individual zones communicating with a central control panel.
3. System with a design outdoor airflow less than 1,200 cfm (600 L/s).
4. Spaces where the supply airflow rate minus any makeup or outgoing transfer air requirement is less than 1,200 cfm (600 L/s).
5. Building spaces where the primary ventilation needs are for process loads.

~~**503.2.9 HVAC system completion.** Prior to the issuance of a certificate of occupancy, the design professional shall provide evidence of system completion in accordance with Sections 503.2.9.1 through 503.2.9.3.~~

~~**503.2.9.1 Air system balancing.** Each supply air outlet and *zone* terminal device shall be equipped with means for air balancing in accordance with the requirements of Chapter 6 of the *International Mechanical Code*. Discharge dampers are prohibited on constant volume fans and variable volume fans with motors 10 horsepower (hp) (7.4 kW) and larger.~~

~~**503.2.9.2 Hydronic system balancing.** Individual hydronic heating and cooling coils shall be equipped with means for balancing and pressure test connections.~~

~~**503.2.9.3 Manuals.** The construction documents shall require that an operating and maintenance manual be provided to the building owner by the mechanical contractor.~~

~~The manual shall include, at least, the following:~~

1. ~~Equipment capacity (input and output) and required maintenance actions.~~
2. ~~Equipment operation and maintenance manuals.~~
3. ~~HVAC system control maintenance and calibration information, including wiring diagrams, schematics, and control sequence descriptions. Desired or field-determined setpoints shall be permanently recorded on control drawings, at control devices or, for digital control systems, in programming comments.~~
4. ~~A complete written narrative of how each system is intended to operate.~~

503.2.9 Mechanical systems commissioning and completion requirements. Mechanical systems commissioning and completion shall be in accordance with the provisions of Section 503.2.9.1 through 503.2.9.3.4.

503.2.9.1 System commissioning. Commissioning is a process that verifies and documents that the selected building systems have been designed, installed, and function according to the owner's project requirements and construction documents, and to minimum code requirements. Drawing notes shall require commissioning and completion requirements in accordance with this section. Drawing notes may refer to equipment specifications for further requirements. Copies of all documentation shall be given to the owner. The building official may request commissioning documentation for review purposes. At the time of plan submittal, the building jurisdiction shall be provided, by the submittal authority, a letter of intent to commission the building in accordance with this code.

503.2.9.1.1 Commissioning plan. A commissioning plan shall include as a minimum the following items:

1. A detailed explanation of the building's project requirements for mechanical design,
2. A narrative describing the activities that will be accomplished during each phase of commissioning, including guidance on who accomplishes the activities and how they are completed,
3. Equipment and systems to be tested, including the extent of tests,
4. Functions to be tested (for example calibration, economizer control, etc.),
5. Conditions under which the test shall be performed (for example winter and summer design conditions, full outside air, etc.), and
6. Measurable criteria for acceptable performance.

503.2.9.1.2 Systems adjusting and balancing. All HVAC systems shall be balanced in accordance with generally accepted engineering standards. Air and water flow rates shall be measured and adjusted to deliver final flow rates within 10% of design rates. Test and balance activities shall include as a minimum the following items:

1. Air systems balancing: Each supply air outlet and zone terminal device shall be equipped with means for air balancing in accordance with the requirements of Chapter 6 of the International Mechanical Code. Discharge dampers are prohibited on constant volume fans and variable volume fans with motors 10 hp (18.6 kW) and larger. Air systems shall be balanced in a manner to first minimize throttling losses then, for fans with system power of greater than 1 hp, Fan speed shall be adjusted to meet design flow conditions.

   Exception: Fan with fan motors of 1 hp or less.

2. Hydronic systems balancing: Individual hydronic heating and cooling coils shall be equipped with means for balancing and pressure test connections. Hydronic systems shall be proportionately balanced in a manner to first minimize throttling losses, then the pump impeller shall be trimmed or pump speed shall be adjusted to meet design flow conditions. Each hydronic system shall have either the ability to measure pressure across the pump, or test ports at each side of each pump.

Exceptions

1. Pumps with pump motors of 5 hp or less.
2. When throttling results in no greater than 5 percent of the nameplate horsepower draw above that required if the impeller were trimmed.

503.2.9.1.3 Functional performance testing. Equipment functional performance testing shall be in accordance with Section 503.2.9.1.3.1. Functional testing of HVAC controls shall be in accordance with Section 503.2.9.1.3.2.

503.2.9.1.3.1 Equipment functional performance testing. Equipment functional performance testing shall demonstrate the correct installation and operation of components, systems, and system-to-system interfacing relationships in accordance with approved plans and specifications. This demonstration is to prove the operation, function, and maintenance serviceability for each of the commissioned systems. Testing shall include all modes of operation, including:

1. All modes as described in the sequence of operation,
2. Redundant or automatic back-up mode,
3. Performance of alarms, and
4. Mode of operation upon a loss of power and restored power.

Exception: Unitary or packaged HVAC equipment listed in Tables 503.2.3 (1) through (3) that do not require supply air economizers.

503.2.9.1.3.2 Controls functional performance testing. HVAC control systems shall be tested to document that control devices, components, equipment, and systems are calibrated, adjusted and operate in accordance with approved plans and specifications. Sequences of operation shall be functionally tested to document they operate in accordance with approved plans and specifications.

503.2.9.1.4 Preliminary commissioning report. A preliminary report of commissioning test procedures and results shall be completed and provided to the owner. The report shall be identified as “Preliminary Commissioning Report” and shall identify:

1. Itemization of deficiencies found during testing required by this section which have not been corrected at the time of report preparation and the anticipated date of correction;
2. Deferred tests which cannot be performed at the time of report preparation due to climatic conditions; and
3. Climatic conditions required for performance of the deferred tests, and the anticipated date of each deferred test.

503.2.9.2 Acceptance. Buildings, or portions thereof, required by this code to comply with this section shall not be issued a final certificate of occupancy allowing occupation until such time that the code official has received a letter of transmittal from the building owner that states they have received the Preliminary Commissioning Report as required by Section 503.2.9.1.4. At the request of the code official, a copy of the Preliminary Commissioning Report shall be made available for review.

503.2.9.3 Completion requirements. The construction documents shall require that within 90 days after the date of final certificate of occupancy, the documents described in this section be provided to the building owner.

503.2.9.3.1 Drawings. Construction documents shall include as a minimum the location and performance data on each piece of equipment.

503.2.9.3.2 Manuals. An operating manual and a maintenance manual shall be in accordance with industry-accepted standards and shall include, at a minimum, the following:

1. Submittal data stating equipment size and selected options for each piece of equipment requiring maintenance.
2. Manufacturer’s operation manuals and maintenance manuals for each piece of equipment requiring maintenance, except equipment not furnished as part of the project. Required routine maintenance actions shall be clearly identified.
3. Names and addresses of at least one service agency.

4. HVAC controls system maintenance and calibration information, including wiring diagrams, schematics, and control sequence descriptions. Desired or field-determined setpoints shall be permanently recorded on control drawings at control devices or, for digital control systems, in programming comments.
5. A complete narrative of how each system is intended to operate, including suggested setpoints.

503.2.9.3.3 System balancing report. A written report describing the activities and measurements completed in accordance with Section 503.2.9.1.2

503.2.9.3.4 Final Commissioning Report. A complete report of test procedures and results identified as "Final Commissioning Report" shall include:

1. Results of all functional performance tests.
2. Disposition of all deficiencies found during testing, including details of corrective measures used or proposed.
3. All functional performance test procedures used during the commissioning process including measurable criteria for test acceptance, provided herein for repeatability.

   Exception: Deferred tests which cannot be performed at the time of report preparation due to climatic conditions.

503.3.1 Economizers. ~~Supply air economizers shall be provided on each cooling system as shown in Table 503.3.1(1).~~

~~Economizers shall be capable of providing 100-percent outdoor air, even if additional mechanical cooling is required to meet the cooling load of the building. Systems shall provide a means to relieve excess outdoor air during economizer operation to prevent over-pressurizing the building. The relief air outlet shall be located to avoid recirculation into the building. Where a single room or space is supplied by multiple air systems, the aggregate capacity of those systems shall be used in applying this requirement.~~

~~Exceptions:~~

1. ~~Where the cooling equipment is covered by the minimum efficiency requirements of Table 503.2.3(1) or 503.2.3(2) and meets or exceeds the minimum cooling efficiency requirement (EER) by the percentages shown in Table 503.3.1(2).~~
2. ~~Systems with air or evaporatively cooled condensers and which serve spaces with open case refrigeration or that require filtration equipment in order to meet the minimum ventilation requirements of Chapter 4 of the *International Mechanical Code*.~~

Each cooling system that has a fan shall include either an air or water economizer meeting the requirements of Sections 503.3.1.1 through 503.4.1.4.

Exceptions: Economizers are not required for the following systems:

1. Individual fan-cooling units with a supply capacity less than the minimum listed in Table 503.3.1(1).
2. Systems that require filtration equipment in order to meet the minimum ventilation requirements of Chapter 4 of the *International Mechanical Code.*
3. Where more than 25 percent of the air designed to be supplied by the system is to spaces that are designed to be humidified above 35°F dew-point temperature to satisfy process needs.
4. Systems that include a condenser heat recovery system required by Section 503.4.6.
5. Systems that serve *residential* spaces where the system capacity is less than five times the requirement listed in Table 503.3.1(1).
6. Systems that serve spaces whose sensible cooling load at design conditions, excluding transmission and infiltration loads, is less than or equal to transmission and infiltration losses at an outdoor temperature of 60°F.
7. Systems expected to operate less than 20 hours per week.
8. Where the use of *outdoor air* for cooling will affect supermarket open refrigerated casework systems.
9. Where the cooling *efficiency* meets or exceeds the *efficiency* requirements in Table 503.3.1(2).

TABLE 503.3.1(1)
ECONOMIZER REQUIREMENTS

CLIMATE ZONES	ECONOMIZER REQUIREMENT
1A, 1B, 2A, 7, 8	No requirement
2B, 3A, 3B, 3C, 4A, 4B, 4C, 5A, 5B, 5C, 6A, 6B	Economizers on all cooling systems ≥ 54,000 Btu/h[a]

For SI: 1 British thermal unit per hour = 0.293 W.

a. The total capacity of all systems without economizers shall not exceed 480,000 Btu/h per building, or 20 percent of its air economizer capacity, whichever is greater.

TABLE 503.3.1(2)
EQUIPMENT EFFICIENCY PERFORMANCE
EXCEPTION FOR ECONOMIZERS

CLIMATE ZONES	COOLING EQUIPMENT PERFORMANCE IMPROVEMENT (EER OR IPLV)
2B	10% Efficiency Improvement
3B	15% Efficiency Improvement
4B	20% Efficiency Improvement

~~**503.4.1 Economizers.** Supply air economizers shall be provided on each cooling system according to Table 503.3.1(1). Economizers shall be capable of operating at 100 percent outside air, even if additional mechanical cooling is required to meet the cooling load of the building.~~

~~**Exceptions:**~~

1. ~~Systems utilizing water economizers that are capable of cooling supply air by direct or indirect evaporation or both and providing 100 percent of the expected system cooling load at outside air temperatures of 50°F (10°C) dry bulb/45°F (7°C) wet bulb and below.~~
2. ~~Where the cooling equipment is covered by the minimum efficiency requirements of Table 503.2.3(1), 503.2.3(2), or 503.2.3(6) and meets or exceeds the minimum EER by the percentages shown in Table 503.3.1(2)~~
3. ~~Where the cooling equipment is covered by the minimum efficiency requirements of Table 503.2.3(7) and meets or exceeds the minimum integrated part load value (IPLV) by the percentages shown in Table 503.3.1(2).~~

503.3.1.1 Air Economizers. Air econimizers shall be provided for each cooling system in accordance with Sections 503.3.1.1.1 through 503.3.1.1.4.

503.3.1.1.1 Design Capacity. Air economizer systems shall be capable of modulating *outdoor air* and return air dampers to provide up to 100 percent of the design supply air quantity as *outdoor air* for cooling.

503.1.1.2 Control Signal. Economizer dampers shall be capable of being sequenced with the mechanical cooling equipment and shall not be controlled by only mixed air temperature.

Exception: The use of mixed air temperature limit control shall be permitted for systems controlled from space temperature (such as single-zone systems).

503.3.1.1.3 High-Limit Shutoff. All air economizers shall be capable of automatically reducing *outdoor air* intake to the design minimum *outdoor air* quantity when *outdoor air* intake will no longer reduce cooling energy usage. High-limit shutoff control types for specific climates shall be chosen from Table 503.3.1.1.3(1). High-limit shutoff control settings for these control types shall be those listed in Table 503.3.1.1.3(2).

TABLE 503.3.1.1.3(1)
HIGH-LIMIT SHUTOFF CONTROL OPTIONS FOR AIR ECONOMIZERS

CLIMATE ZONES	ALLOWED CONTROL TYPES	PROHIBITED CONTROL TYPES
1b, 2b, 3b, 3c, 4b, 4c, 5b, 5c, 6b, 7, 8	Fixed dry bulb Differential dry bulb Electronic enthalpy[a] Differential enthalpy Dew-point and dry-bulb temperatures	Fixed enthalpy
1a, 2a, 3a, 4a	Fixed dry bulb Fixed enthalpy Electronic enthalpy[a] Differential enthalpy Dew-point and dry-bulb temperatures	Differential dry bulb
All other climates	Fixed dry bulb Differential dry bulb Fixed enthalpy Electronic enthalpy[a] Differential enthalpy Dew-point and dry-bulb temperatures	-

a. Electronic enthalpy controllers are devices that use a combination of humidity and dry-bulb temperature in their switching algorithm.

Table 503.3.1.1.3(2)
HIGH-LIMIT SHUTOFF CONTROL SETTING FOR AIR ECONOMIZERS

DEVICE TYPE	CLIMATE	REQUIRED HIGH LIMIT (ECONOMIZER OFF WHEN):	
		EQUATION	DESCRIPTION
Fixed dry bulb	1b, 2b, 3b, 3c, 4b, 4c, 5b, 5c, 6b, 7, 8,	T_{OA}>75°F	Outdoor air temperature exceeds 75°F
	5a, 6a, 7a	T_{OA}>70°F	Outdoor air temperature exceeds 70°F
	All other zones	T_{OA}>65°F	Outdoor air temperature exceeds 65°F
Differential dry bulb	1b, 2b, 3b, 3c, 4b, 4c, 5a, 5b, 5c, 6a, 6b, 7, 8	T_{OA}>T_{RA}	Outdoor air temperature exceeds return air temperature
Fixed enthalpy	All	h_{OA}> 28 Btu/lb[a]	Outdoor air enthalpy exceeds 28 Btu/lb of dry air[a]
Electronic Enthalpy	All	(T_{OA} , RH_{OA}) > A	Outdoor air temperature/RH exceeds the "A" setpoint curve[b]
Differential enthalpy	All	h_{OA}> h_{RA}	Outdoor air enthalpy exceeds return air enthalpy
Dew-point and dry bulb temperatures	All	DP_{OA}>55°F or T_{OA}>75°F	Outdoor air dry bulb exceeds 75°F or outside dew point exceeds 55°F (65 gr/lb)

a. At altitudes substantially different than sea level, the Fixed Enthalpy limit shall be set to the enthalpy value at 75°F and 50% relative humidity. As an example, at approximately 6000 ft elevation the fixed enthalpy limit is approximately 30.7 Btu/lb.
b. Setpoint "A" corresponds to a curve on the psychometric chart that goes through a point at approximately 75°F and 40% relative humidity and is nearly parallel to dry-bulb lines at low humidity levels and nearly parallel to enthalpy lines at high humidity levels.

503.3.1.1.4 Relief of Excess Outdoor Air. Systems shall provide a means to relieve excess *outdoor air* during air economizer operation to prevent over-pressurizing the building. The relief air outlet shall be located to avoid recirculation into the building.

~~**503.4.1 Economizers**. Supply air economizers shall be provided on each cooling system according to Table 503.3.1(1). Economizers shall be capable of operating at 100 percent outside air, even if additional mechanical cooling is required to meet the cooling load of the building.~~

~~**Exceptions:**~~

1. ~~Systems utilizing water economizers that are capable of cooling supply air by direct or indirect evaporation or both and providing 100 percent of the expected system cooling load at outside air temperatures of 50°F (10°C) dry bulb/45°F (7°C) wet bulb and below.~~
2. ~~Where the cooling equipment is covered by the minimum efficiency requirements of Table 503.2.3(1), 503.2.3(2), or 503.2.3(6) and meets or exceeds the minimum EER by the percentages shown in Table 503.3.1(2)~~
3. ~~Where the cooling equipment is covered by the minimum efficiency requirements of Table 503.2.3(7) and meets or exceeds the minimum integrated part load value (IPLV) by the percentages shown in Table 503.3.1(2).~~

503.4.1 Economizers. Economizer systems for complex HVAC Equipment shall be provided for each cooling system in accordance with Sections 503.4.1.1 through 503.4.1.4.

503.4.1.1 Design Capacity. Water economizer systems shall be capable of cooling supply air by indirect evaporation and providing up to 100 percent of the expected system cooling load at *outdoor air* temperatures of 50°F dry bulb/45° wet bulb and below.

Exception: Systems in which a water economizer is used and where dehumidification requirements cannot be met using outdoor air temperatures of 50°F dry bulb/ 45°F wet bulb must satisfy 100 percent of the expected system cooling load at 45°F dry bulb/40°F wet bulb.

503.4.1.2 Maximum Pressure Drop. Pre-cooling coils and water-to-water heat exchangers used as part of a water economizer system shall either have a water-side pressure drop of less than 15 feet of water or a secondary loop shall be created so that the coil or heat exchanger pressure drop is not seen by the circulating pumps when the system is in the normal cooling (non-economizer) mode.

503.4.1.3 Integrated Economizer Control. Economizer systems shall be integrated with the mechanical cooling system and be capable of providing partial cooling even when additional mechanical cooling is required to meet the remainder of the cooling load.

Exceptions:

1. Direct expansion systems that include controls that reduce the quantity of *outdoor air* required to prevent coil frosting at the lowest step of compressor unloading, provided this lowest step is no greater than 25 percent of the total system capacity.
2. Individual direct expansion units that have a rated cooling capacity less than 54,000 Btu/h and use non-integrated economizer controls that preclude simultaneous operation of the economizer and mechanical cooling.
3. Systems in climate zones 1A, 1B, 2A, 7, 8.

503.4.1.4 Economizer Heating System Impact. HVAC system design and economizer controls shall be such that economizer operation does not increase the building heating energy use during normal operation.

Exception: Economizers on VAV systems that cause zone level heating to increase due to a reduction in supply air temperature.

503.4.2 Variable air volume (VAV) fan control. Individual VAV fans with motors of ~~10~~ 7.5 horsepower (~~7.5~~ 5.6 kW) or greater shall be:

1. Driven by a mechanical or electrical variable speed drive; or
2. The fan motor shall have controls or devices that will result in fan motor demand of no more than 30 percent of their design wattage at 50 percent of design airflow when static pressure set point equals one-third of the total design static pressure, based on manufacturer's certified fan data.

For systems with direct digital control of individual *zone* boxes reporting to the central control panel, the static pressure set point shall be reset based on the *zone* requiring the most pressure, i.e., the set point is reset lower until one *zone* damper is nearly wide open.

4. Revise as follows

SECTION 505
ELECTRICAL POWER AND LIGHTING SYSTEMS
(Mandatory)

505.2.1 Interior lighting controls. Each area enclosed by walls or floor-to-ceiling partitions shall have at least one manual control for the lighting serving that area. The required controls shall be located within the area served by the controls or be a remote switch that identifies the lights served and indicates their status.

Exceptions:

1. Areas designated as security or emergency areas that must be continuously lighted.
2. Lighting in stairways or corridors that are elements of the means of egress.

505.2.2 Additional controls. Each area that is required to have a manual control shall have additional controls that meet the requirements of Sections 505.2.2.1 and 505.2.2.2.

505.2.2.1 Light reduction controls. Each area that is required to have a manual control shall also allow the occupant to reduce the connected lighting load in a reasonably uniform illumination pattern by at least 50 percent. Lighting reduction shall be achieved by one of the following or other *approved* method:

1. Controlling all lamps or luminaires;
2. Dual switching of alternate rows of luminaires, alternate luminaires or alternate lamps;
3. Switching the middle lamp luminaires independently of the outer lamps; or
4. Switching each luminaire or each lamp.

Exceptions:

1. Areas that have only one luminaire.
2. Areas that are controlled by an occupant-sensing device.
3. Corridors, storerooms, restrooms or public lobbies.
4. *Sleeping unit* (see Section 505.2.3).
5. Spaces that use less than 0.6 watts per square foot (6.5 W/m2).
6. Daylight spaces complying with Section 505.2.2.2.3 Automatic Daylighting Controls

505.2.2.2 Automatic lighting controls. All commercial buildings shall be equipped with automatic control devices to shut off lighting in compliance with one of the following automatic control technologies:

1. Section 505.2.2.2.1 Occupancy Sensors
2. Section 505.2.2.2.2 Time Clock Controls

Exception:

1. Spaces complying with Section 505.2.2.3 Daylight Zone Control.

505.2.2.2.1 Occupancy sensors. Occupancy sensors shall be installed in all classrooms, conference/meeting rooms, employee lunch and break rooms, private offices, restrooms, storage rooms and janitorial closets, and other spaces 300 sf. or less enclosed by ceiling height partitions. These automatic control devices shall be installed to automatically turn off lights within 30 minutes of all occupants leaving the space, except spaces with multi-scene control.

505.2.2.2.2 Time Clock Controls In areas not controlled by occupancy sensors, automatic time switch control devices shall be used. It shall incorporate an override switching device that:

1. Is readily accessible.
2. Is located so that a person using the device can see the lights or the area controlled by that switch, or so that the area being lit is annunciated.

3. Is manually operated.
4. Allows the lighting to remain on for no more than 4 hours when an override is initiated.
5. Controls an area not exceeding 5,000 square feet (465 m2).

Exceptions:

1. In malls and arcades, auditoriums, single-tenant retail spaces, industrial facilities and arenas, where captive-key override is utilized, override time may exceed 2 hours.
2. In malls and arcades, auditoriums, single-tenant retail spaces, industrial facilities and arenas, the area controlled may not exceed 20,000 square feet (1860 m2).

505.2.2.3 Daylight Zone Control.

~~**505.2.2.3.1. Daylight Controls**~~ Daylight zones ~~as defined by this code,~~ shall be provided with automatic daylight controls ~~individual controls~~ that control the lights independent of general area lighting. Contiguous daylight zones adjacent to vertical fenestration are allowed to be controlled by a single controlling device provided that they do not include zones facing more than two adjacent cardinal orientations (i.e. north, east, south, west). Daylight zones under skylights more than 15 feet from the perimeter shall be controlled separately from daylight zones adjacent to vertical fenestration. The daylight controls shall meet the requirements of Section 505.2.2.3.1. and 505.2.2.3.2.

Exception: Daylight spaces enclosed by walls or ceiling height partitions and containing two or fewer light fixtures are not required to have a separate switch for general area lighting.

505.2.2.3.1 Automatic daylight controls. Automatic controls installed in daylight zones shall control lights in the daylit areas separately from the non-daylit areas. Controls for calibration adjustments to the lighting control device shall be readily accessible to authorized personnel. Each daylight control zone shall not exceed 2,500 square feet. Automatic daylighting controls must incorporate an automatic shut-off ability based on time or occupancy in addition to lighting power reduction controls.

Controls will automatically reduce lighting power in response to available daylight by either one of the following methods:

1. Continuous dimming using dimming ballasts and daylight-sensing automatic controls that are capable of reducing the power of general lighting in the daylit zone continuously to less than 35 percent of rated power at maximum light output.
2. Stepped Dimming using multi-level switching and daylight-sensing controls that are capable of reducing lighting power automatically. The system should provide a minimum of two control channels per zone and be installed in a manner such that at least one control step shall reduce power of general lighting in the daylit zone by 30 percent to 50 percent of rated power and another control step that reduces lighting power by 65 percent to 100 percent. Stepped dimming control is not allowed in continuously occupied areas with ceiling heights of 14 feet or lower.

   Exception: Daylight spaces enclosed by walls or ceiling height partitions and containing 2 or fewer luminaire are not required to have a separate switch for general area lighting.

505.2.2.3.2 Daylight controls functional performance testing. Automatic daylighting control systems shall be tested to document that control devices are calibrated and adjusted to operate in accordance with approved plans and specifications. A letter of certification of lighting calibration shall be submitted to the code official prior to issuance of the final certificate of occupancy.

~~**505.2.2.2 Automatic lighting shutoff.** Buildings larger than 5,000 square feet (465m2) shall be equipped with an automatic control device to shut off lighting in those areas. This automatic control device shall function on either:~~

~~1. A scheduled basis, using time-of-day, with an independent program schedule that controls the interior lighting in areas that do not exceed 25,000 square feet (2323 m2) and are not more than one floor; or~~
~~2. An occupant sensor that shall turn lighting off within 30 minutes of an occupant leaving a space; or~~
~~3. A signal from another control or alarm system that indicates the area is unoccupied.~~

~~**Exception:** The following shall not require an automatic control device:~~

1. ~~*Sleeping unit* (see Section 505.2.3).~~
2. ~~Lighting in spaces where patient care is directly provided.~~
3. ~~Spaces where an automatic shutoff would endanger occupant safety or security.~~

~~**505.2.2.2.1 Occupant override.** Where an automatic time switch control device is installed to comply with Section 505.2.2.2, Item 1, it shall incorporate an override switching device that:~~

1. ~~Is readily *accessible*.~~
2. ~~Is located so that a person using the device can see the lights or the area controlled by that switch, or so that the area being lit is annunciated.~~
3. ~~Is manually operated.~~
4. ~~Allows the lighting to remain on for no more than 2 hours when an override is initiated.~~
5. ~~Controls an area not exceeding 5,000 square feet (465 m2).~~

~~**Exceptions:**~~

1. ~~In malls and arcades, auditoriums, single-tenant retail spaces, industrial facilities and arenas, where captive-key override is utilized, override time shall be permitted to exceed 2 hours.~~
2. ~~In malls and arcades, auditoriums, single-tenant retail spaces, industrial facilities and arenas, the area controlled shall not exceed 20,000 square feet (1860 m2).~~

~~**505.2.2.2.2 Holiday scheduling.** If an automatic time switch control device is installed in accordance with Section 505.2.2.2, Item 1, it shall incorporate an automatic holiday scheduling feature that turns off all loads for at least 24 hours, then resumes the normally scheduled operation.~~

~~**Exception:** Retail stores and associated malls, restaurants, grocery stores, places of religious worship and theaters.~~

~~**505.2.2.3 Daylight zone control.** Daylight zones, as defined by this code, shall be provided with individual controls that control the lights independent of general area lighting. Contiguous daylight zones adjacent to vertical fenestration are allowed to be controlled by a single controlling device provided that they do not include zones facing more than two adjacent cardinal orientations (i.e., north, east, south, west). Daylight zones under skylights more than 15 feet (4572 mm) from the perimeter shall be controlled separately from daylight zones adjacent to vertical fenestration.~~

~~**Exception:** Daylight spaces enclosed by walls or ceiling height partitions and containing two or fewer light fixtures are not required to have a separate switch for general area lighting.~~

505.2.2.4 Specific Application Controls. Specific application controls shall be provided for the following:

1. Display/Accent Lighting—display or accent lighting shall have a separate control device.
2. Case Lighting—lighting in cases used for display purposes shall have a separate control device.
3. Hotel and Motel Guest Room Lighting—hotel and motel guest rooms and guest suites shall have a master control device at the main room entry that controls all permanently installed luminaires and switched receptacles.
4. Task Lighting—supplemental task lighting, including permanently installed under-shelf or under-cabinet lighting, shall have a control device integral to the luminaires or be controlled by a wall-mounted control device provided the control device is readily accessible and located so that the occupant can see the controlled lighting.
5. Non-visual Lighting—lighting for non-visual applications, such as plant growth and food warming, shall have a separate control device.
6. Demonstration Lighting—lighting equipment that is for sale or for demonstrations in lighting education shall have a separate control device.

Exception: Items 1, 2, and 4 Where LED lighting is used no additional control is required.

505.5.2 Interior lighting power. The total interior lighting power (watts) is the sum of all interior lighting powers for all areas in the building covered in this permit. The interior lighting power is the floor area for each building area type listed in Table 505.5.2 times the value from Table 505.5.2 for that area. For the purposes of this method, an “area”

shall be defined as all contiguous spaces that accommodate or are associated with a single building area type as *listed* in Table 505.5.2. When this method is used to calculate the total interior lighting power for an entire building, each building area type shall be treated as a separate area.

For SI: 1 foot = 304.8 mm, 1 watt per square foot = W/0.0929 m2.

a. In cases where both a general building area type and a more specific building area type are listed, the more specific building area type shall apply.

b. At least one half of the floor area shall be in the daylight zone. Automatic daylighting controls shall be installed in daylit zones and shall meet the requirements of Section 505.2.2.2.3.

~~b. Where lighting equipment is specified to be installed to highlight specific merchandise in addition to lighting equipment specified for general lighting and is switched or dimmed on circuits different from the circuits for general lighting, the smaller of the actual wattage of the lighting equipment installed specifically for merchandise, or additional lighting power as determined below shall be added to the interior lighting power determined in accordance with this line item.~~

~~Calculate the additional lighting power as follows:~~

~~Additional Interior Lighting Power Allowance = 1000watts + (Retail Area 1 X 0.6~~ 4W/ft2) ~~+ (Retail Area 2 X 0.6 W/ft2) + (Retail Area 3 X 1.4~~ 0.9 ~~W/ft2) + (Retail Area 4 X 2.5~~ 1.5 ~~W/ft2).~~

~~where:~~

~~Retail Area 1 = The floor area for all products not listed in Retail Area 2, 3 or 4.~~
~~Retail Area 2 = The floor area used for the sale of vehicles, sporting goods and small electronics.~~
~~Retail Area 3 = The floor area used for the sale of furniture, clothing, cosmetics and artwork.~~
~~Retail Area 4 = The floor area used for the sale of jewelry, crystal and china.~~

~~**Exception:** Other merchandise categories are permitted to be included in Retail Areas 2 through 4 above, provided that justification documenting the need for additional lighting power based on visual inspection, contrast, or other critical display is *approved* by the authority having jurisdiction.~~

Add new standards to Chapter 6 as follows:

E779-03	Standard Test Method for Determining Air Leakage Rate by Fan Pressurization
E1677-95 (2000)	Standard Specification for an Air Retarder (AR) Material or System for Low-Rise Framed Building Walls
E2178-03	Standard Test Method for Air Permeance of Building Materials
E2357-05	Standard Test Method for Determining Air Leakage of Air Barrier Assemblies

Reason: The proponents believe that the 20-30% reductions in commercial and high-rise residential building energy use based on this proposal are practical, feasible, and necessary. This proposal employs improvements to design practices and use of widely available products to improve energy efficiency. Many of the elements have been previously published in New Buildings Institute's *Core Performance Guide* and implemented in programs or codes at the local and state levels. Incorporating these enhancements in a national model code will help move building practices and markets more quickly, addressing national concerns for energy and the environment in a pragmatic and cost-effective way.

This proposal contains measures that may be dependent on the passage of federal legislation pending as of the date of submittal.

SUBSTANTIATING MATERIAL

The bibliography of substantiating material, along with the technical information and technical substantiation, can be found at www.newbuildings.org/iecc.htm.

THE PROPOSAL

This proposal substantially revises Chapter 5 of the IECC with a series of measures that are integrated to achieve significant energy savings over current national model code. The proposal builds on and updates from 2009 IECC, and introduces some new elements such as commissioning of critical systems and automatic control of daylighting. Key elements of the proposal are:

Building Envelope - Includes continuous air barriers, significant improvements in most glazing, and enhancements to opaque envelope performance.
Mechanical Systems – Improves sections regarding economizers, incorporates more use of demand controlled ventilation, includes efficiency improvements in mechanical equipment with some climate-specific flexibility, and provides additional calculation procedures for determining loads and equipment sizing.
Quality Assurance – Incorporates requirements for testing and commissioning of mechanical systems and performance testing of daylight-related controls.
Lighting - Reduces energy needed for lighting based on more efficient illuminating equipment and the use of several lighting control strategies.
Daylighting – Includes additional availability of daylight sources combined with automatic daylight controls, and comprehensive control strategy for all daylit zones.

Cost Impact: This code change proposal will increase the cost of construction.

Analysis: A review of the standard(s) proposed for inclusion in the code, ASTM E779-03, E1677-95 (00), E2178-03, and E2357-05, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

Public Hearing:				
	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Makela-Baker-Conner-EC-1-202-Ch 5-Ch 6FF

EC147–09/10
202, 101.2, Chapter 5

Proponent: David C. Hewitt, New Buildings Institute, John Loyer, American Institute of Architects, Ronald Majette, representing US Department of Energy

1. Revise as follows:

101.2 Scope. This code applies to *residential* and *commercial buildings* and the building site and associated systems and equipment.

2. Revise as follows:

BUILDING. Any structure used or intended for supporting or sheltering any use or occupancy, including any mechanical systems, service water heating systems and electric power and lighting systems located on the building site and supporting the building.

BUILDING COMMISSIONING. A process that verifies and documents that the selected building systems have been designed, installed, and function according to the owner's project requirements and construction documents, and to minimum code requirements.

BUILDING SITE. A contiguous area of land that is under the ownership or control of one entity.

BUILDING THERMAL ENVELOPE. The basement walls, exterior walls, floor, roof, and any other building element that encloses *conditioned space*. This boundary also includes the boundary between *conditioned space* and any exempt or unconditioned space or provides a boundary between *conditioned space* and exempt or unconditioned space.

CONTINUOUS AIR BARRIER. A combination of materials and assemblies that restrict or prevent the passage of air through the building thermal envelope.

FENESTRATION PRODUCT, FIELD-FABRICATED is a fenestration product including an exterior glass door whose frame is made at the construction site of standard dimensional lumber or other materials that were not previously cut, or otherwise formed with the specific intention of being used to fabricate a fenestration product or exterior door. Field fabricated does not include site-built fenestration with a label certificate or products required to have temporary or permanent labels.

FENESTRATION PRODUCT, SITE-BUILT is fenestration designed to be field-glazed or field assembled units using specific factory cut or otherwise factory formed framing and glazing units. Examples of site-built fenestration include storefront systems, curtain walls, and atrium roof systems.

FURNACE ELECTRICITY RATIO. The ratio of furnace electricity use to total furnace energy computed as ratio = $(3.412*E_{AE})/(1000*E_F + 3.412*E_{AE})$, where E_{AE} (average annual auxiliary electrical consumption) and E_F (average annual fuel energy consumption) are defined in Appendix N to subpart B of part 430 of title 10 of the Code of Federal Regulations and E_F is expressed in millions of Btu's per year.

ON-SITE RENEWABLE ENERGY. Energy derived from solar radiation, wind, waves, tides, landfill gas, biomass, or the internal heat of the earth. The energy system providing on-site renewable energy shall be located on or adjacent to the project site.

3. Revise as follows:

501.1 Scope. The requirements contained in this chapter are applicable to commercial buildings, or portions of commercial buildings. These commercial buildings shall meet either requirements of ASHRAE/IESNA Standard 90.1, *Energy Standard for Buildings Except for Low-Rise Residential Buildings*, or the requirements contained in this chapter.

4. Revise as follows:

501.2 Application. The *commercial building* project shall comply with the requirements in Sections 502 (Building envelope requirements), 503 (Building mechanical systems), 504(Service water heating), 505 (Electrical power and

~~lighting systems)~~ in its entirety, and one of the additional options as presented in Section 506. As an alternative the *commercial building* project shall exceed by at least 25% ~~comply with~~ the requirements of ASHRAE/IESNA Standard 90.1, Energy Standard for Buildings Except for Low Rise Residential Buildings, Appendix G in its entirety.

Exceptions:

1. Buildings conforming to Section 507, provided Sections 502.4, 503.2, 504, 505.2, 505.3, 505.4, 505.6 and 505.7 are each satisfied. Building energy cost shall be equal to or less than 75% of the standard reference design building.
2. Additions, alterations and repairs shall comply with the applicable requirements in Sections 502, 503, 504, and 505 only or with ASHRAE/IESNA 90.1.

5. Revise as follows:

502.2.1 Roof assembly. The minimum thermal resistance (*R*-value) of the insulating material installed either between the roof framing or continuously on the roof assembly shall be as specified in Table 502.2(1), based on construction materials used in the roof assembly. Skylight curbs shall be insulated to the level of roofs with insulation entirely above deck or R-5, whichever is less.

Exception: Continuously insulated roof assemblies where the thickness of insulation varies 1 inch (25 mm) or less and where the area-weighted *U*-factor is equivalent to the same assembly with the *R*-value specified in Table 502.2(1).

Insulation installed on a suspended ceiling with removable ceiling tiles shall not be considered part of the minimum thermal resistance of the roof insulation.

6. Add new text as follows:

502.2.1.1 Roof solar reflectance and thermal emittance. Roofs in climate zones 1 to 3 not over ventilated attics or not over cooled spaces shall have a minimum three-year aged - solar reflective index (SRI) of 64 when determined in accordance with the SRI method in ASTM E1980 using a convection coefficient of (12W/m^2·K) or a minimum three-year-aged solar reflectance of 0.55 when tested in accordance with ASTM C1549, ASTM E903 or ASTM E1918 and a minimum three-year-aged thermal emittance of at least 0.75 when testing in accordance with ASTM C1371 or ASTM E408.

Exceptions:

1. Ballasted roofs with a minimum stone ballast of 17 lbs/ft2 (74 kg/m2) or 23 lbs/ft2 pavers (117 kg/m2).
2. Roofs, where a minimum of 75% of the roof area is shaded during the peak sun angle on June 21st by permanent features of the building and/or is covered by off-set photovoltaic arrays, building-integrated photovoltaic arrays, or solar water collectors.
3. Metal building roofs or asphaltic membranes in climate zone 3.

7. Revise as follows:

502.2.6 Slabs on grade. The minimum thermal resistance (*R*-value) of the insulation around the perimeter of unheated or heated slab-on-grade floors shall be as specified in Table 502.2(1). The insulation shall be placed on the outside of the foundation or on the inside of ~~a~~ the foundation wall. The insulation shall extend downward from the top of the slab for a minimum distance as shown in the table or to the top of the footing, whichever is less, or downward to at least the bottom of the slab and then horizontally to the interior or exterior for the total distance shown in the table. Where extending outside of the foundation the insulation shall be covered by pavement or by soil a minimum of 10 in. thick. For the purposes of this section a slab on grade floor is a slab floor that is in contact with the ground and that is either above grade or less than or equal to 24 in. below the final elevation of the nearest exterior grade.

8. Revise Table as follows:

TABLE 502.3
BUILDING ENVELOPE REQUIREMENTS: FENESTRATION

CLIMATE ZONE	1	2	3	4 EXCEPT MARINE	5 AND MARINE 4	6	7	8
Vertical fenestration (~~40~~ 30% maximum of above-grade wall)								
U-factor								

(Portions of Table not shown, remain unchanged)

9. Delete and substitute as follows:

~~**502.4.1 Window and door assemblies.** The air leakage of window and sliding or swinging door assemblies that are part of the building envelope shall be determined in accordance with AAMA/WDMA/CSA 101/I.S.2/A440, or NFRC 400 by an accredited, independent laboratory, and *labeled* and certified by the manufacturer and shall not exceed the values in Section 402.4.2.~~

~~**Exception:** Site-constructed windows and doors that are weatherstripped or sealed in accordance with Section 502.4.3.~~

~~**502.4.2 Curtain wall, storefront glazing and commercial entrance doors.** Curtain wall, *storefront* glazing and commercial- glazed swinging entrance doors and revolving doors shall be tested for air leakage at 1.57 pounds per square foot (psf) (75 Pa) in accordance with ASTM E 283. For curtain walls and *storefront* glazing, the maximum air leakage rate shall be 0.3 cubic foot per minute per square foot (cfm/ft_2) (5.5 m_3/h × m_2) of fenestration area. For commercial glazed swinging entrance doors and revolving doors, the maximum air leakage rate shall be 1.00 cfm/ft_2 (18.3 m_3/h × m_2) of door area when tested in accordance with ASTM E 283.~~

~~**502.4.3 Sealing of the building envelope.** Openings and penetrations in the building envelope shall be sealed with caulking materials or closed with gasketing systems compatible with the construction materials and location. Joints and seams shall be sealed in the same manner or taped or covered with a moisture vapor-permeable wrapping material. Sealing materials spanning joints between construction materials shall allow for expansion and contraction of the construction materials.~~

502.4.1 Air Barriers. The building envelope shall be designed and constructed with a continuous air barrier that complies with Section 502.4.1.1 and 502.4.1.2 to control air leakage into, or out of, the conditioned space. Construction documents shall identify the air barrier components for each assembly, including detailing joints, interconnections and sealing of penetrations. The opaque building envelope air barrier shall be located on the inside or, outside of, or be integral with the building envelope; or any combination thereof.

Exception: Buildings in climate Zones 1, 2 and 3.

502.4.1.1 The *continuous air barrier* shall have the following characteristics:

1. It shall be continuous throughout the envelope (at the lowest *floor*, exterior *walls*, and ceiling or *roof*). Air barrier joints and seams shall be sealed; including sealing transitions in planes and changes in materials. Air barrier penetrations shall be sealed.
2. The air barrier component of each assembly shall be joined and sealed in a flexible manner to the air barrier component of adjacent assemblies. The joints and seals shall allow for the relative movement of the assemblies and materials without damage to the air seal.
3. The air barrier shall be installed in accordance with the *manufacturer's* instructions in a manner that achieves the performance requirements.
4. Where lighting *fixtures* with ventilation holes or other similar objects are to be installed in such a way as to penetrate the *continuous air barrier*, provisions shall be made to maintain the integrity of the *continuous air barrier*.

Exception: Buildings that comply with Section 502.4.1.2(3) below are not required to comply with either 1 or 4.

502.4.1.2 Air barrier compliance options. A continuous air barrier for the opaque building envelope shall meet the requirements of at least one of the compliance options in Section 502.4.1.2.1, 502.4.1.2.2, or 502.4.1.2.3

502.4.1.2.1 Materials. Individual materials shall have an air permeability not to exceed 0.02 L/s·m^2 under a pressure differential of 75 Pa (0.004 cfm/ft^2 under a pressure differential of 0.3 in. water (1.57 lb/ft^2)) when tested in accordance with ASTM E2178. The following materials comply with this requirement when all joints are sealed:

1. Plywood - minimum 3/8 in (10 mm)
2. Oriented strand board - minimum 3/8 in (10 mm)
3. Extruded polystyrene insulation board - minimum 3/4 in (19 mm)
4. Foil-back urethane insulation board - minimum 3/4 in (19 mm)
5. Closed cell spray foam meeting air permeability requirement
6. Open cell spray foam meeting air permeability requirement
7. Weather resistant barrier meeting air permeability requirement
8. Exterior or interior gypsum board - minimum 1/2 in (12 mm)
9. Cement board - minimum 1/2 in (12 mm)
10. Built up roofing membrane
11. Modified bituminous roof membrane
12. Fully adhered single-ply roof membrane
13. A Portland cement/sand parge, or gypsum plaster minimum 5/8 in (16 mm) thick
14. Cast-in-place and precast concrete.
15. Fully grouted concrete block masonry.
16. Sheet steel or aluminum

502.4.1.2.2 Assemblies. Assemblies of materials and components shall have an average air leakage not to exceed 0.2 L/s·m2 @ 75 Pa (0.04 cfm/ft2 under a pressure differential of 0.3" w.g. (1.57psf)) when tested in accordance with ASTM E2357 or ASTM E1677. The following assemblies comply with this requirement when all joints are sealed and every characteristic in Section 502.4.4.1.1 is met:,

1. Concrete masonry walls coated with one application either of block filler and two applications of a paint or sealer coating;
2. A Portland cement/sand parge, stucco or plaster minimum 1/2 in (12 mm) thick.

502.4.1.2.3 Building Test. The completed building shall be tested and the air leakage rate of the *building envelope* shall not exceed 2.0 L/s·m^2 @ 75 Pa (0.40 cfm/ft^2 at a pressure differential of 0.3" w.g. (1.57 psf)) in accordance with ASTM E779 or an equivalent method approved by the code official.

502.4.2 Air Barrier Penetrations. All penetrations of the air barrier and paths of air infiltration / exfiltration shall be made air tight and shall be sealed with caulking materials or closed with gasketing systems compatible with the construction materials and location. Joints and seals shall be sealed in the same manner or taped or covered with a moisture vapor-permeable wrapping material. Sealing materials spanning joints between construction materials shall allow for expansion and contraction of the construction materials.

502.4.3 Fenestration and doors. The air leakage of fenestration assemblies and doors shall meet the provisions of Table 502.4.3. Testing shall be performed in accordance with the applicable reference test standard by an accredited and independent testing laboratory and all fenestration assemblies *listed* and *labeled*.

Exception: Site built fenestration assemblies that are sealed in accordance with Section 502.4.1.

10. Add new Table as follows:

Table 502.4.3
Maximum Air Infiltration Rate for Fenestration Assemblies

Fenestration Assembly	Maximum Rate
Windows	0.20 [a]
Sliding Doors	0.20 [a]
Swinging Doors	0.20 [a]
Skylights	0.20 [a]
Curtain Walls	0.06 [b]
Storefront Glazing	0.06 [b]
Commercial Glazed Swinging Entrance Doors	1.00 [c]
Revolving Doors	1.00 [c]
Rolling doors	1.00 [c]

a. cfm per square foot of fenestration or door area when tested in accordance with NFRC 400 or AAMA/WDMA/CSA101/I.S.2/A440 at 1.57 psf (75 Pa). Alternatively the maximum rate is permitted to be 0.3 cfm per square foot of fenestration or door area when tested in accordance with AAMA/WDMA/CSA101/I.S.2/A440 at 6.24 psf (300 Pa)
b. cfm per square foot of fenestration area when tested in accordance with NFRC 400 or ASTM E283 at 1.57 psf (75 Pa)
c. cfm per square foot of fenestration or door area when tested in accordance with NFRC 400, AAMA/WDMA/CSA101/I.S.2/A440, or ASTM E283 at 1.57 psf (75 Pa)

11. Add new text as follows:

502.4.4 Doors and Access Openings to Shafts, Chutes, Stairwells, and Elevator Lobbies. These doors and access openings shall either meet the requirements of 502.4.3 or shall be equipped with weather seals.

Exception: Weatherseals on elevator lobby doors are not required when a smoke control system is installed.

12. Revise Section 502.4.5 as follows:

502.4.5 Outdoor air intakes and exhaust openings. Stair and elevator shaft vents and other outdoor air intakes and exhaust openings ~~integral to the building envelope shall be equipped with not less than a Class I motorized dampers, leakage- rated damper with a maximum leakage rate of 4 cfm per square foot (6.8 L/s · C m2) at 1.0 inch water gauge (w.g.) (1250 Pa) when tested in accordance with AMCA 500D~~ shall be provided with dampers in accordance with Sections 502.4.5.1 and 502.4.5.2.

Dampers shall be installed with controls so that they are capable of automatically opening upon:

1. The activation of any fire alarm initiating device of the building's fire alarm system;
2. The interruption of power to the damper.

502.4.5.1 Stair and shaft vents. Stair and shaft vents shall be provided with Class IA motorized dampers with a maximum leakage rate of 3 cfm per square foot (5.1 L/s · C m2) at 1.0 inch water gauge (w.g.) (1250 Pa) when tested in accordance with AMCA 500D.

502.4.5.2 Outdoor air intakes and exhausts. *Outdoor air* supply and exhaust openings shall be provided with Class IA motorized dampers with a maximum leakage rate of 3 cfm per square foot (5.1 L/s · C m2) at 1.0 inch water gauge (w.g.) (1250 Pa) when tested in accordance with AMCA 500D.

Exception: Gravity (nonmotorized) dampers having a maximum leakage rate of 20 cfm per square foot (34 L/s · C m2) at 1.0 inch water gauge (w.g.) (1250 Pa) when tested in accordance with AMCA 500D are permitted to be used ~~in buildings less than three stories in height above grade~~ where the design *outdoor air* intake or exhaust capacity does not exceed 300 cfm.

13. Revise Section 502.4.8 as follows:

502.4.8 Recessed lighting. Recessed luminaires installed in the *building thermal envelope* shall be sealed to limit air leakage between conditioned and unconditioned spaces. All recessed luminaires shall be IC-rated and labeled as having an air leakage rate or no more 2.0 cfm (0.944 L/s) ~~meeting ASTM E 283~~ when tested in accordance with ASTM E 283 at a 1.57 psf (75 Pa) pressure differential ~~with no more than 2.0 cfm (0.944 L/s) of air movement from the conditioned space to the ceiling cavity~~. All recessed luminaires shall be sealed with a gasket or caulk between the housing and the interior wall or ceiling covering.

14. Revise as follows:

503.2.1 Calculation of heating and cooling loads. Design loads shall be determined in accordance with the procedures described in the ASHRAE/ACCA Standard 183. The design loads shall account for the building envelope, lighting, ventilation and occupancy loads based on the project design. Heating and cooling loads shall be adjusted to account for load reductions that are achieved when energy recovery systems are utilized in the HVAC system in accordance with the ASHRAE *HVAC Systems and Equipment Handbook*. Alternatively, design loads shall be determined by an *approved* equivalent computation procedure, using the design parameters specified in Chapter 3.

15. Revise as follows:

503.2.2 Equipment and system sizing. ~~Equipment and system sizing.~~ The output capacity of ~~H~~heating and cooling equipment and systems ~~capacity~~ shall not exceed the loads calculated in accordance with Section 503.2.1. A single

piece of equipment providing both heating and cooling must satisfy this provision for one function with the capacity for the other function as small as possible, within available equipment options.

16. Add new text as follows:

503.2.4.3.3 Automatic start capabilities. Controls designed to automatically adjust the start time of an HVAC system each day to allow for automatically brining the space to desired occupied temperature levels immediately before scheduled occupancy shall be provided on each system.

17. Revise as follows:

503.2.5.1 Demand controlled ventilation. Demand control ventilation (DCV) is required for spaces larger than 500 ft^2 (50m^2) and with an average occupant load of ~~40~~ 25 people per 1000 ft^2(93 m^2) of floor area (as established in Table 403.3 of the *International Mechanical Code*) and served by systems with one or more of the following:

1. An air-side economizer;
2. Automatic modulating control of the outdoor air damper; or
3. A design outdoor airflow greater than 3,000 cfm (1400 L/s).

Exceptions:

1. Systems with energy recovery complying with Section 503.2.6.
2. Multiple-zone systems without direct digital control of individual zones communicating with a central control panel.
3. System with a design outdoor airflow less than 1,200 cfm (600 L/s).
4. Spaces where the supply airflow rate minus any makeup or outgoing transfer air requirement is less than 1,200 cfm (600 L/s).
5. Building spaces where the primary ventilation needs are for process loads.

18. Revise Section 503.2.6 as follows:

503.2.6 Energy recovery ventilation systems. ~~Individual fan systems that have both a design supply air capacity of 5,000 cfm (2.36 m3/s) or greater and a minimum outside air supply of 70 percent or greater of the design supply air quantity shall have an energy recovery system that provides a change in the enthalpy of the outdoor air supply of 50 percent or more of the difference between the outdoor air and return air at design conditions. Provision shall be made to bypass or control the energy recovery system to permit cooling with outdoor air where cooling with outdoor air is required.~~ Each fan system shall have an energy recovery system when the system's supply airflow rate exceeds the value listed in Table 503.2.6 based on the climate zone and percentage of *outdoor air* at design conditions. Required energy recovery systems shall have the capability to provide a change in the enthalpy of the *outdoor air* supply equal to at least 50% of the difference between the *outdoor air* and return air enthalpies at design conditions. Provision shall be made to bypass or control the energy recovery system to permit air economizer operation as required by Section 503.4

Exception: An energy recovery ventilation system shall not be required in any of the following conditions:

1. Where energy recovery systems are prohibited by the *International Mechanical Code*.
2. Laboratory fume hood systems that include at least one of the following features:
   2.1. Variable-air-volume hood exhaust and room supply systems capable of reducing exhaust and makeup air volume to 50 percent or less of design values.
   2.2. Direct makeup (auxiliary) air supply equal to at least 75 percent of the exhaust rate, heated no warmer than 2°F (1.1°C) above room setpoint, cooled to no cooler than 3°F (1.7°C) below room setpoint, no humidification added, and no simultaneous heating and cooling used for dehumidification control.
3. Systems serving spaces that are not cooled and are heated to less than 60°F (15.5°C).
4. Where more than 60 percent of the outdoor heating energy is provided from site-recovered or site solar energy.
5. ~~Heating systems in climates with less than 3,600 HDD.~~ Heating energy recovery in climate zones 1 and 2.
6. ~~Cooling systems in climates with a 1-percent cooling design wet-bulb temperature less than 64_F (18_C).~~
6. Cooling energy recovery in climate zones 3c, 4c, 5b, 5c, 6b, 7, and 8.
7. Systems requiring dehumidification that employ series-style energy recovery coils wrapped around the cooling coil.

Table 503.2.6 Energy Recovery Requirement

Zone	% *Outdoor* air at full design airflow rate					
	≥30% and < 40%	≥40% and < 50%	≥50% and < 60%	≥60% and < 70%	≥70% and < 80%	≥80%
	Design Supply Fan airflow rate (cfm)					
3B, 3C, 4B, 4C, 5B	NR	NR	NR	NR	≥5000	≥5000
1B, 2B,5C	NR	NR	≥26000	≥12000	≥5000	≥4000
6B	≥11000	≥5500	≥4500	≥3500	≥2500	≥1500
1A, 2A, 3A, 4A, 5A, 6A	≥5500	≥4500	≥3500	≥2000	≥1000	>0
7,8	≥2500	≥1000	>0	>0	>0	>0

19. Delete and substitute as follows:

~~**503.2.9 HVAC system completion.** Prior to the issuance of a certificate of occupancy, the design professional shall provide evidence of system completion in accordance with Sections 503.2.9.1 through 503.2.9.3.~~

~~**503.2.9.1 Air system balancing.** Each supply air outlet and *zone* terminal device shall be equipped with means for air balancing in accordance with the requirements of Chapter 6 of the *International Mechanical Code*. Discharge dampers are prohibited on constant volume fans and variable volume fans with motors 10 horsepower (hp) (7.4 kW) and larger.~~

~~**503.2.9.2 Hydronic system balancing.** Individual hydronic heating and cooling coils shall be equipped with means for balancing and pressure test connections.~~

~~**503.2.9.3 Manuals.** The construction documents shall require that an operating and maintenance manual be provided to the building owner by the mechanical contractor. The manual shall include, at least, the following:~~

1. ~~Equipment capacity (input and output) and required maintenance actions.~~
2. ~~Equipment operation and maintenance manuals.~~
3. ~~HVAC system control maintenance and calibration information, including wiring diagrams, schematics, and control sequence descriptions. Desired or field-determined setpoints shall be permanently recorded on control drawings, at control devices or, for digital control systems, in programming comments.~~
4. ~~A complete written narrative of how each system is intended to operate.~~

503.2.9 Mechanical systems commissioning and completion requirements. Mechanical systems commissioning and completion shall be in accordance with the provisions of Section 503.2.9.1 through 503.2.9.3.4.

503.2.9.1 System commissioning. The construction documents shall require commissioning and completion requirements in accordance with this section. The construction documents shall be permitted to refer to equipment specifications for further requirements. Copies of all documentation shall be given to the owner by the registered design professional. The building official may request commissioning documentation for review purposes. At the time of plan submittal, the *code official* shall be provided, by the permitee, a letter of intent to commission the building in accordance with this code.

503.2.9.1.1 Commissioning plan. A commissioning plan shall be prepared and shall include as a minimum the following items:

1. A detailed explanation of the building's project requirements for mechanical design,
2. A narrative describing the activities that will be accomplished during each phase of commissioning, including guidance on who accomplishes the activities and how they are completed,
3. Equipment and systems to be tested, including the extent of tests,
4. Functions to be tested (for example calibration, economizer control, etc.),
5. Conditions under which the test shall be performed (for example winter and summer design conditions, full outside air, etc.), and
6. Measurable criteria for acceptable performance.

503.2.9.1.2 Systems adjusting and balancing. All HVAC systems shall be balanced in accordance with generally accepted engineering standards. Air and water flow rates shall be measured and adjusted to deliver final flow rates within 10% of design rates. Test and balance activities shall include as a minimum the following items:

1. Air systems balancing: Each supply air outlet and zone terminal device shall be equipped with means for air balancing in accordance with the requirements of Chapter 6 of the International Mechanical Code. Discharge dampers are prohibited on constant volume fans and variable volume fans with motors 10 hp (18.6 kW) and larger. Air systems shall be balanced in a manner to first minimize throttling losses then, for fans with system power of greater than 1 hp, Fan speed shall be adjusted to meet design flow conditions.

   Exception: Fans with fan motors of 1 hp or less.

2. Hydronic systems balancing: Individual hydronic heating and cooling coils shall be equipped with means for balancing and pressure test connections. Hydronic systems shall be proportionately balanced in a manner to first minimize throttling losses, then the pump impeller shall be trimmed or pump speed shall be adjusted to meet design flow conditions. Each hydronic system shall have either the ability to measure pressure across the pump, or test ports at each side of each pump.

   Exceptions:

   1. Pumps with pump motors of 5 hp or less.
   2. When throttling results in no greater than 5% of the nameplate horsepower draw above that required if the impeller were trimmed.

503.2.9.1.3 Functional performance testing. Equipment functional performance testing shall be in accordance with Section 503.2.9.1.3.1. Functional testing of HVAC controls shall be in accordance with Section 503.2.9.1.3.2.

503.2.9.1.3.1 Equipment functional performance testing. Equipment functional performance testing shall demonstrate the correct installation and operation of components, systems, and system-to-system interfacing relationships in accordance with approved plans and specifications. This demonstration is to prove the operation, function, and maintenance serviceability for each of the commissioned systems. Testing shall include all modes of operation, including:

1. All modes as described in the Sequence of Operation,
2. Redundant or automatic back-up mode,
3. Performance of alarms, and
4. Mode of operation upon a loss of power and restored power.

   Exception: Unitary or packaged HVAC equipment listed in Tables 503.2.3 (1) through (3) that do not require supply air economizers.

503.2.9.1.3.2 Controls functional performance testing. HVAC control systems shall be tested to document that control devices, components, equipment, and systems are calibrated, adjusted and operate in accordance with approved plans and specifications. Sequences of operation shall be functionally tested to document they operate in accordance with approved plans and specifications.

503.2.9.1.4 Preliminary commissioning report. A preliminary report of commissioning test procedures and results shall be completed and provided to the building owner. The report shall be identified as “Preliminary Commissioning Report” and shall identify:

1. Itemization of deficiencies found during testing required by this section which have not been corrected at the time of report preparation and the anticipated date of correction.
2. Deferred tests which cannot be performed at the time of report preparation due to climatic conditions.
3. Climatic conditions required for performance of the deferred tests, and the anticipated date of each deferred test.

503.2.9.2 Acceptance. Buildings, or portions thereof, required to comply with this section shall not be issued a final certificate of occupancy until such time that the *code official* has received a letter of transmittal from the building owner that states they have received the Preliminary Commissioning Report as required by Section 503.2.9.1.4. At the request of the code official, a copy of the Preliminary Commissioning Report shall be made available for review.

503.2.9.3 Completion requirements. The construction documents shall require that within 90 days of system acceptance by the *code official*, the documents described in Section 503.2.9 .3.1 and 503.2.9.3.2 shall be provided to the building owner or their designated representative by the mechanical contractor.

503.2.9.3.1 Drawings. Construction documents shall include as a minimum the location and performance data on each piece of equipment.

503.2.9.3.2 Manuals. An operating manual and a maintenance manual shall be in accordance with industry-accepted standards and shall include, at a minimum, the following:

1. Capacity (input and output) and required maintenance actions for each piece of equipment.
2. Operation and maintenance manuals for each piece of equipment.
3. Manufacturer's operation manuals and maintenance manuals for each piece of equipment requiring maintenance, except equipment not furnished as part of the project. Required routine maintenance actions shall be clearly identified.
4. Names and addresses of at least one service agency.
5. HVAC controls system maintenance and calibration information, including wiring diagrams, schematics, and control sequence descriptions. Desired or field-determined setpoints shall be permanently recorded on control drawings at control devices or, for digital control systems, in programming comments.
6. A complete narrative of how each system is intended to operate, including ~~suggested~~ recommended setpoints.

503.2.9.3.3 System balancing report. A written report describing the activities and measurements completed in accordance with Section 503.2.9.1.2

503.2.9.3.4 Final Commissioning Report. A complete report of test procedures and results identified as "Final Commissioning Report" shall include:

1. Results of all Functional Performance Tests.
2. Disposition of all deficiencies found during testing, including details of corrective measures used or proposed.
3. All Functional Performance Test procedures used during the commissioning process including measurable criteria for test acceptance, provided herein for repeatability.

   Exception: Deferred tests which cannot be performed at the time of report preparation due to climatic conditions.

20. Revise as follows:

TABLE 503.2.10.1(1)
FAN POWER LIMITATION
(No change to Table)

where:

CFMS = The maximum design supply airflow rate to conditioned spaces served by the system in cubic feet per minute.
Hp = The maximum combined motor nameplate horsepower.
Bhp = The maximum combined fan brake horsepower.
A = Sum of [*PD* _ CFMD / 4131].

where:

PD = Each applicable pressure drop adjustment from Table 503.2.10.1(2) in. w.c.
CFM_D – The design airflow through each applicable device from Table 503.2.10.1(2) in cubic feet per minute.

21. Revise Section 503.3 as follows:

503.3 Simple HVAC systems and equipment (Prescriptive). This section applies to buildings served by unitary or packaged HVAC equipment listed in Tables 503.2.3(1) through 503.2.3(5), each serving one *zone* and controlled by a single thermostat in the zone served. It also applies to two-pipe heating systems serving one or more zones, where no cooling system is installed.

~~This section does not apply to fan systems serving multiple zones, nonunitary or nonpackaged HVAC equipment and systems or hydronic or steam heating and hydronic cooling equipment and distribution systems that provide cooling or cooling and heating which are covered by Section 503.4.~~

503.3.1 Economizers. ~~Supply air economizers shall be provided on each cooling system as shown in Table 503.3.1(1).~~

~~Economizers shall be capable of providing 100 percent outdoor air, even if additional mechanical cooling is required to meet the cooling load of the building. Systems shall provide a means to relieve excess outdoor air during economizer operation to prevent over-pressurizing the building. The relief air outlet shall be located to avoid recirculation into the building. Where a single room or space is supplied by multiple air systems, the aggregate capacity of those systems shall be used in applying this requirement.~~

~~Exceptions:~~

1. ~~Where the cooling equipment is covered by the minimum efficiency requirements of Table 503.2.3(1) or 503.2.3(2) and meets or exceeds the minimum cooling efficiency requirement (EER) by the percentages shown in Table 503.3.1(2).~~
2. ~~Systems with air or evaporatively cooled condensers and which serve spaces with open case refrigeration or that require filtration equipment in order to meet the minimum ventilation requirements of Chapter 4 of the *International Mechanical Code*.~~

Each cooling system that has a fan shall include either an air or water economizer meeting the requirements of Sections 503.3.1.1 through 503.4.1.4.

Exceptions: Economizers are not required for the systems listed below.

1. Individual fan-cooling units with a supply capacity less than the minimum listed in Table 503.3.1(1).
2. Systems that require filtration equipment in order to meet the minimum ventilation requirements of Chapter 4 of the *International Mechanical Code.*
3. Where more than 25% of the air designed to be supplied by the system is to spaces that are designed to be humidified above 35°F dew-point temperature to satisfy process needs.
4. Systems that include a condenser heat recovery system required by Section 503.4.6.
5. Systems that serve *residential* spaces where the system capacity is less than five times the requirement listed in Table 503.3.1(1).
6. Systems that serve spaces whose sensible cooling load at design conditions, excluding transmission and infiltration loads, is less than or equal to transmission and infiltration losses at an outdoor temperature of 60°F.
7. Systems expected to operate less than 20 hours per week.
8. Where the use of *outdoor air* for cooling will affect supermarket open refrigerated casework systems.
9. Where the cooling *efficiency* meets or exceeds the *efficiency* requirements in Table 503.3.1(2).

TABLE 503.3.1(1)
ECONOMIZER REQUIREMENTS

CLIMATE ZONES	ECONOMIZER REQUIREMENT
1A, 1B, 2A, 7, 8	No requirement
2B, 3A, 3B, 3C, 4A, 4B, 4C, 5A, 5B, 5C, 6A, 6B	Economizers on all cooling systems ≥ 54,000 Btu/h[a]

For SI: 1 British thermal unit per hour = 0.293 W.

a. The total capacity of all systems without economizers shall not exceed480,000 Btu/h per building, or 20 percent of its air economizer capacity, whichever is greater.

TABLE 503.3.1(2)
EQUIPMENT EFFICIENCY PERFORMANCE
EXCEPTION FOR ECONOMIZERS

CLIMATE ZONES	COOLING EQUIPMENT PERFORMANCE IMPROVEMENT (EER OR IPLV)
2B	10% Efficiency Improvement
3B	15% Efficiency Improvement
4B	20% Efficiency Improvement

~~**503.4.1 Economizers.** Supply air economizers shall be provided on each cooling system according to Table 503.3.1(1). Economizers shall be capable of operating at 100 percent outside air, even if additional mechanical cooling is required to meet the cooling load of the building.~~

~~**Exceptions:**~~

1. ~~Systems utilizing water economizers that are capable of cooling supply air by direct or indirect evaporation or both and providing 100 percent of the expected system cooling load at outside air temperatures of 50°F (10°C) dry bulb/45°F (7°C) wet bulb and below.~~
2. ~~Where the cooling equipment is covered by the minimum efficiency requirements of Table 503.2.3(1), 503.2.3(2), or 503.2.3(6) and meets or exceeds the minimum EER by the percentages shown in Table 503.3.1(2)~~
3. ~~Where the cooling equipment is covered by the minimum efficiency requirements of Table 503.2.3(7) and meets or exceeds the minimum integrated part load value (IPLV) by the percentages shown in Table 503.3.1(2).~~

503.3.1.1 Air Economizers. Air econimizers shall be designed in accordance with Sections 503.3.1.1.1 through 503.3.1.1.4**.**

503.3.1.1.1 Design Capacity. Air economizer systems shall be capable of modulating *outdoor air* and return air dampers to provide up to 100% of the design supply air quantity as *outdoor air* for cooling.

503.3.1.1.2 Control Signal. Economizer dampers shall be capable of being sequenced with the mechanical cooling equipment and shall not be controlled by only mixed air temperature.

Exception: The use of mixed air temperature limit control shall be permitted for systems controlled from space temperature (such as single-zone systems).

503.3.1.1.3 High-Limit Shutoff. All air economizers shall be capable of automatically reducing *outdoor air* intake to the design minimum *outdoor air* quantity when *outdoor air* intake will no longer reduce cooling energy usage. High-limit shutoff control types for specific climates shall be chosen from Table 503.3.1.1.3(1). High-limit shutoff control settings for these control types shall be those listed in Table 503.3.1.1.3(2).

TABLE 503.3.1.1.3(1)
HIGH-LIMIT SHUTOFF CONTROL OPTIONS FOR AIR ECONOMIZERS

CLIMATE ZONES	ALLOWED CONTROL TYPES	PROHIBITED CONTROL TYPES
1b, 2b, 3b, 3c, 4b, 4c, 5b, 5c, 6b, 7, 8	Fixed dry bulb Differential dry bulb Electronic enthalpy[a] Differential enthalpy Dew-point and dry-bulb temperatures	Fixed enthalpy
1a, 2a, 3a, 4a	Fixed dry bulb Fixed enthalpy Electronic enthalpy[a] Differential enthalpy Dew-point and dry-bulb temperatures	Differential dry bulb
All other climates	Fixed dry bulb Differential dry bulb Fixed enthalpy Electronic enthalpy[a] Differential enthalpy Dew-point and dry-bulb temperatures	-

a. Electronic enthalpy controllers are devices that use a combination of humidity and dry-bulb temperature in their switching algorithm.

TABLE 503.3.1.1.3(2)
HIGH-LIMIT SHUTOFF CONTROL SETTING FOR AIR ECONOMIZERS

DEVICE TYPE	CLIMATE	REQUIRED HIGH LIMIT (ECONOMIZER OFF WHEN):	
		EQUATION	DESCRIPTION
Fixed dry bulb	1b, 2b, 3b, 3c, 4b, 4c, 5b, 5c, 6b, 7, 8,	T_{OA}>75°F	Outdoor air temperature exceeds 75°F
	5a, 6a, 7a	T_{OA}>70°F	Outdoor air temperature exceeds 70°F
	All other zones	T_{OA}>65°F	Outdoor air temperature exceeds 65°F
Differential dry bulb	1b, 2b, 3b, 3c, 4b, 4c, 5a, 5b, 5c, 6a, 6b, 7, 8	T_{OA}>T_{RA}	Outdoor air temperature exceeds return air temperature
Fixed enthalpy	All	h_{OA}> 28 Btu/lb[a]	Outdoor air enthalpy exceeds 28 Btu/lb of dry air[a]
Electronic Enthalpy	All	(T_{OA} , RH_{OA}) > A	Outdoor air temperature/RH exceeds the "A" setpoint curve[b]
Differential enthalpy	All	h_{OA}> h_{RA}	Outdoor air enthalpy exceeds return air enthalpy
Dew-point and dry bulb temperatures	All	DP_{OA}>55°F or T_{OA}>75°F	Outdoor air dry bulb exceeds 75°F or outside dew point exceeds 55°F (65 gr/lb)

a. At altitudes substantially different than sea level, the Fixed Enthalpy limit shall be set to the enthalpy value at 75°F and 50% relative humidity. As an example, at approximately 6000 ft elevation the fixed enthalpy limit is approximately 30.7 Btu/lb.

b. Setpoint "A" corresponds to a curve on the psychometric chart that goes through a point at approximately 75°F and 40% relative humidity and is nearly parallel to dry-bulb lines at low humidity levels and nearly parallel to enthalpy lines at high humidity levels.

503.3.1.1.4 Relief of Excess Outdoor Air. Systems shall provide a means to relieve excess *outdoor air* during air economizer operation to prevent over-pressurizing the building. The relief air outlet shall be located to avoid recirculation into the building.

22. Delete and substitute as follows:

~~**503.4.1 Economizers.** Supply air economizers shall be provided on each cooling system according to Table 503.3.1(1). Economizers shall be capable of operating at 100 percent outside air, even if additional mechanical cooling is required to meet the cooling load of the building~~.

~~**Exceptions:**~~

1. ~~Systems utilizing water economizers that are capable of cooling supply air by direct or indirect evaporation or both and providing 100 percent of the expected system cooling load at outside air temperatures of 50°F (10°C) dry bulb/45°F (7°C) wet bulb and below.~~
2. ~~Where the cooling equipment is covered by the minimum efficiency requirements of Table 503.2.3(1), 503.2.3(2), or 503.2.3(6) and meets or exceeds the minimum EER by the percentages shown in Table 503.3.1(2)~~
3. ~~Where the cooling equipment is covered by the minimum efficiency requirements of Table 503.2.3(7) and meets or exceeds the minimum integrated part load value (IPLV) by the percentages shown in Table 503.3.1(2).~~

503.4.1 Economizers. Economizer systems for complex HVAC Equipment shall be designed in accordance with Sections 503.4.1.1 through 503.4.1.4.

503.4.1.1 Design Capacity. Water economizer systems shall be capable of cooling supply air by indirect evaporation and providing up to 100% of the expected system cooling load at *outdoor air* temperatures of 50°F dry bulb/45° wet bulb and below.

Exception: Systems in which a water economizer is used and where dehumidification requirements cannot be met using outdoor air temperatures of 50°F dry bulb/ 45°F wet bulb must satisfy 100% of the expected system cooling load at 45°F dry bulb/40°F wet bulb.

503.4.1.2 Maximum Pressure Drop. Pre-cooling coils and water-to-water heat exchangers used as part of a water economizer system shall either have a water-side pressure drop of less than 15 ft of water or a secondary loop shall be created so that the coil or heat exchanger pressure drop is not seen by the circulating pumps when the system is in the normal cooling (non-economizer) mode.

503.4.1.3 Integrated Economizer Control. Economizer systems shall be integrated with the mechanical cooling system and be capable of providing partial cooling even when additional mechanical cooling is required to meet the remainder of the cooling load.

Exceptions:

1. Direct expansion systems that include controls that reduce the quantity of *outdoor air* required to prevent coil frosting at the lowest step of compressor unloading, provided this lowest step is no greater than 25% of the total system capacity.
2. Individual direct expansion units that have a rated cooling capacity less than 54,000 Btu/h and use non-integrated economizer controls that preclude simultaneous operation of the economizer and mechanical cooling.
3. Systems in climate zones 1A, 1B, 2A, 7, 8.

503.4.1.4 Economizer Heating System Impact. HVAC system design and economizer controls shall be such that economizer operation does not increase the building heating energy use during normal operation.

Exception: Economizers on VAV systems that cause zone level heating to increase due to a reduction in supply air temperature.

23. Revise as follows:

503.4.2 Variable air volume (VAV) fan control. Individual VAV fans with motors of ~~10~~ 7.5 horsepower (~~7.5~~ 5.6 kW) or greater shall be:

1. Driven by a mechanical or electrical variable speed drive;
2. Driven by a vane-axial fan with variable-pitch blades; or
~~2~~3. The fan ~~motor~~ shall have controls or devices that will result in fan motor demand of no more than 30 percent of their design wattage at 50 percent of design airflow when static pressure set point equals one-third of the total design static pressure, based on manufacturer's certified fan data.

Static pressure sensors used to control VAV fans shall be placed in a position such that the controller setpoint is no greater than one-third the total design fan static pressure, except for systems with direct digital control. If this results in the sensor being located downstream of major duct splits, multiple sensors shall be installed in each major branch to ensure the static pressure can be maintained in each branch.

For systems with direct digital control of individual *zone* boxes reporting to the central control panel, the static pressure set point shall be reset based on the *zone* requiring the most pressure, i.e., the set point is reset lower until one *zone* damper is nearly wide open.

24. Revise Section 505.1 as follows:

505.1 General (Mandatory). This section covers lighting system controls, the connection of ballasts, the maximum lighting power for interior applications and minimum acceptable lighting equipment for exterior applications.

Lighting within dwelling units where ~~50~~ 75 percent or more of the permanently installed interior light fixtures are fitted with high-efficacy lamps or a minimum of 75 percent of the permanently installed lighting fixtures shall contain only high efficacy lamps.

Exception: Low-voltage lighting.

25. Revise Section 505.2 as follows:

505.2.1 Interior lighting controls. Each area enclosed by walls or floor-to-ceiling partitions shall have at least one manual control for the lighting serving that area. The required controls shall be located within the area served by the controls or be a remote switch that identifies the lights served and indicates their status.

Exceptions:

1. Areas designated as security or emergency areas that must be continuously lighted.
2. Lighting in stairways or corridors that are elements of the means of egress.

505.2.2 Additional controls. Each area that is required to have a manual control shall have additional controls that meet the requirements of Sections 505.2.2.1 and 505.2.2.2.

505.2.2.1 Light reduction controls. Each area that is required to have a manual control shall also allow the occupant to reduce the connected lighting load in a reasonably uniform illumination pattern by at least 50 percent. Lighting reduction shall be achieved by one of the following or other *approved* method:
1. Controlling all lamps or luminaires;
2. Dual switching of alternate rows of luminaires, alternate luminaires or alternate lamps;
3. Switching the middle lamp luminaires independently of the outer lamps; or
4. Switching each luminaire or each lamp.

Exceptions:

1. Areas that have only one luminaire.
2. Areas that are controlled by an occupant-sensing device.
3. Corridors, storerooms, restrooms or public lobbies.
4. *Sleeping unit* (see Section 505.2.3).
5. Spaces that use less than 0.6 watts per square foot (6.5 W/m2).
6. Daylight spaces complying with Section 505.2.2.2.3 Automatic Daylighting Controls

505.2.2.2 ~~505.2.2.3~~ Daylight Zone Control. Daylight zones shall be provided with individual controls which control the lights independent of general area lighting. Contiguous daylight zones adjacent to vertical fenestration are allowed to be controlled by a single controlling device provided that they do not include zones facing more than two adjacent cardinal orientations (i.e. north, east, south, west). Daylight zones under skylights more than 15 feet from the perimeter shall be controlled separately from daylight zones adjacent to vertical fenestration.

Exception: Daylight spaces enclosed by walls or ceiling height partitions and containing two or fewer light fixtures are not required to have a separate switch for general area lighting.

~~**505.2.2.2 Automatic lighting shutoff.** Buildings larger than 5,000 square feet (465m2) shall be equipped with an automatic control device to shut off lighting in those areas. This automatic control device shall function on either:~~

1. ~~A scheduled basis, using time-of-day, with an independent program schedule that controls the interior lighting in areas that do not exceed 25,000 square feet (2323 m2) and are not more than one floor; or~~
2. ~~An occupant sensor that shall turn lighting off within 30 minutes of an occupant leaving a space; or~~
3. ~~A signal from another control or alarm system that indicates the area is unoccupied.~~

~~**Exception:** The following shall not require an automatic control device:~~

1. ~~*Sleeping unit* (see Section 505.2.3).~~
2. ~~Lighting in spaces where patient care is directly provided.~~
3. ~~Spaces where an automatic shutoff would endanger occupant safety or security.~~

~~**505.2.2.2.1 Occupant override.** Where an automatic time switch control device is installed to comply with Section 505.2.2.2, Item 1, it shall incorporate an override switching device that:~~

1. ~~Is readily *accessible*.~~
2. ~~Is located so that a person using the device can see the lights or the area controlled by that switch, or so that the area being lit is annunciated.~~
3. ~~Is manually operated.~~
4. ~~Allows the lighting to remain on for no more than 2 hours when an override is initiated.~~
5. ~~Controls an area not exceeding 5,000 square feet (465 m2).~~

~~**Exceptions:**~~

1. ~~In malls and arcades, auditoriums, single-tenant retail spaces, industrial facilities and arenas, where captive-key override is utilized, override time shall be permitted to exceed 2 hours.~~
2. ~~In malls and arcades, auditoriums, single-tenant retail spaces, industrial facilities and arenas, the area controlled shall not exceed 20,000 square feet (1860 m2).~~

~~**505.2.2.2.2 Holiday scheduling.** If an automatic time switch control device is installed in accordance with Section 505.2.2.2, Item 1, it shall incorporate an automatic holiday scheduling feature that turns off all loads for at least 24 hours, then resumes the normally scheduled operation.~~

~~**Exception:** Retail stores and associated malls, restaurants, grocery stores, places of religious worship and theaters.~~

~~**505.2.2.3 Daylight zone control.** Daylight zones, as defined by this code, shall be provided with individual controls that control the lights independent of general area lighting. Contiguous daylight zones adjacent to vertical fenestration are allowed to be controlled by a single controlling device provided that they do not include zones facing more than two adjacent cardinal orientations (i.e., north, east, south, west). Daylight zones under skylights more than 15 feet (4572 mm) from the perimeter shall be controlled separately from daylight zones adjacent to vertical fenestration.~~

~~**Exception:** Daylight spaces enclosed by walls or ceiling height partitions and containing two or fewer light fixtures are not required to have a separate switch for general area lighting.~~

505.2.2.3 Automatic lighting controls. All commercial buildings shall be equipped with automatic control devices to shut off lighting in compliance with one of the following automatic control technologies:

1. Section 505.2.2.3.1 Occupancy Sensors

2. Section 505.2.2.3.2 Time Clock Controls
3. Section 505.2.2.3.3 Automatic Daylighting Controls

Any lighting control required in Sections 505.2.2.3.1, 505.2.2.2.3.2 and 505.2.2.3.3 shall either be manual on or shall be controlled to automatically turn the lighting on to not more than 50% power unless otherwise provided in Sections 505.2.2.3.1, 505.2.3.2 or 505.2.2.3.3.

Exception: Full automatic-on controls shall be permitted to control lighting in public corridors, stairways, restrooms, primary building entrance areas and lobbies, and areas where manual-on operation would endanger the safety or security of the room or building occupants.

505.2.2.3.1 Occupancy sensors. Occupancy sensors shall be installed in all classrooms, conference/meeting rooms, employee lunch and break rooms, private offices, restrooms, storage rooms and janitorial closets, and other spaces 300 sf. or less enclosed by ceiling height partitions. These automatic control devices shall be installed to automatically turn off lights within 30 minutes of all occupants leaving the space, except spaces with multi-scene control.

505.2.2.3.2 Time Clock Controls In areas not controlled by occupancy sensors, automatic time switch control devices shall be used. It shall incorporate an override switching device that:

1. Is readily accessible.
2. Is located so that a person using the device can see the lights or the area controlled by that switch, or so that the area being lit is annunciated.
3. Is manually operated.
4. Allows the lighting to remain on for no more than 2 hours when an override is initiated.
5. Controls an area not exceeding 5,000 square feet (465 m2).

Exceptions:

1. In malls and arcades, auditoriums, single-tenant retail spaces, industrial facilities and arenas, where captive-key override is utilized, override time may exceed 2 hours.
2. In malls and arcades, auditoriums, single-tenant retail spaces, industrial facilities and arenas, the area controlled may not exceed 20,000 square feet (1860 m2).

505.2.2.3.3 Automatic daylighting controls. Automatic controls installed in daylight zones shall control lights in the daylit areas separately from the non-daylit areas. Controls for calibration adjustments to the lighting control device shall be readily accessible to authorized personnel. Each daylight control zone shall not exceed 2,500 square feet. Automatic daylighting controls must incorporate an automatic shut-off ability based on time or occupancy in addition to lighting power reduction controls.

Controls will automatically reduce lighting power in response to available daylight by either one of the following methods:

1. Continuous dimming using dimming ballasts and daylight-sensing automatic controls that are capable of reducing the power of general lighting in the daylit zone continuously to less than 35% of rated power at maximum light output.
2. Stepped Dimming using multi-level switching and daylight-sensing controls that are capable of reducing lighting power automatically. The system should provide a minimum of two control channels per zone and be installed in a manner such that at least one control step shall reduce power of general lighting in the daylit zone by 30% to 50% of rated power and another control step that reduces lighting power by 65% to 100%. Stepped dimming control is not allowed in continuously occupied areas with ceiling heights of 14 feet or lower.

   Exception: Daylight spaces enclosed by walls or ceiling height partitions and containing 2 or fewer luminaire are not required to have a separate switch for general area lighting.

505.2.3 Specific Application Controls. Specific application controls shall be provided for the following:

1. Display/Accent Lighting—display or accent lighting shall have a separate control device.
2. Case Lighting—lighting in cases used for display purposes shall have a separate control device.
3. Hotel and Motel Guest Room Lighting—hotel and motel guest rooms and guest suites shall have a master control device at the main room entry that controls all permanently installed luminaires and switched receptacles.

4. Task Lighting—supplemental task lighting, including permanently installed under-shelf or under-cabinet lighting, shall have a control device integral to the luminaires or be controlled by a wall-mounted control device provided the control device is readily accessible and located so that the occupant can see the controlled lighting.
5. Non-visual Lighting—lighting for non-visual applications, such as plant growth and food warming, shall have a separate control device.
6. Demonstration Lighting—lighting equipment that is for sale or for demonstrations in lighting education shall have a separate control device.

Exceptions: Where LED lighting is used no additional control is required for items 1., 2. and 4.

505.2.4 Functional Testing. Controls for automatic lighting systems shall be tested prior to and as a condition for issuance of an approval under Section 104.8. Testing shall ensure that control hardware and software are calibrated, adjusted, programmed, and in proper working condition in accordance with the construction documents and manufacturer's installation instructions. The construction documents shall state the party who will conduct the required functional testing. The party responsible for the functional testing shall not be directly involved in the design or construction of the project and shall provide documentation to the *code official* certifying that the installed lighting controls meet the provisions of Section 505.

When *occupant sensors*, time switches, programmable schedule controls, *photosensors or daylighting controls* are installed, at a minimum, the following procedures shall be performed:

1. Confirm that the placement, sensitivity and time-out adjustments for *occupant sensors* yield acceptable performance, i.e. lights turn off only after space is vacated and do not turn on unless space is occupied.
2. Confirm that the time switches and programmable schedule controls are programmed to turn the lights off.
3. Confirm that photosensor controls reduce electric light based on the amount of usable daylight in the space as specified.

For SI: 1 foot = 304.8 mm, 1 watt per square foot = W/0.0929 m2~~.~~

~~a. In cases where both a general building area type and a more specific building area type are listed, the more specific building area type shall apply~~.

b. Where lighting equipment is specified to be installed to highlight specific merchandise in addition to lighting equipment specified for general lighting and is switched or dimmed on circuits different from the circuits for general lighting, the smaller of the actual wattage of the lighting equipment installed specifically for merchandise, or additional lighting power as determined below shall be added to the interior lighting power determined in accordance with this line item.

Calculate the additional lighting power as follows:

Additional Interior Lighting Power Allowance = ~~1000watts +~~ (Retail Area 1 X 0.~~6~~ 4W/ft2) + (Retail Area 2 X 0.6 W/ft2) + (Retail Area 3 X ~~1.4~~ 0.9 W/ft2) + (Retail Area 4 X ~~2.5~~ 1.5 W/ft2).

where:

Retail Area 1 = The floor area for all products not listed in Retail Area 2, 3 or 4.
Retail Area 2 = The floor area used for the sale of vehicles, sporting goods and small electronics.
Retail Area 3 = The floor area used for the sale of furniture, clothing, cosmetics and artwork.
Retail Area 4 = The floor area used for the sale of jewelry, crystal and china.

Exception: Other merchandise categories are permitted to be included in Retail Areas 2 through 4 above, provided that justification documenting the need for additional lighting power based on visual inspection, contrast, or other critical display is *approved* by the authority having jurisdiction.

27. Add new text as follows:

SECTION 506
ADDITIONAL EFFICIENCY PACKAGE OPTIONS

506.1 Requirements. Buildings shall comply with at least one of the following:

1. 506.2 Efficient HVAC Performance Requirement
2. 506.3 Efficient Lighting System Requirement
3. 506.4 On-Site Supply of Renewable Energy

At the time of plan submittal, the *code official* shall be provided, by the permittee, documentation designating the intent to comply with Section 506.2, 506.3 or 506.4 in their entirety. Individual tenant spaces must comply with either 506.2 or 506.3 in their entirety unless documentation can be provided that demonstrates compliance with Section 506.4 for the entire building.

506.2 Efficient Mechanical Equipment. Equipment shall meet the minimum efficiency requirements of Tables 506.2.(1) through 506.2(7) in addition to the requirements in Section 503. This section shall only be used where an equipment efficiency option is available.

TABLE 506.2(1)
UNITARY AIR CONDITIONERS AND CONDENSING UNITS, ELECTRICALLY OPERATED, EFFICIENCY REQUIREMENTS

EQUIPMENT TYPE	SIZE CATEGORY	SUBCATEGORY OR RATING CONDITION	REQUIRED EFFICIENCYa
Air conditioners, Air cooled	< 65,000 Btu/hd	Split system	For zones 1 to 5: 15.0 SEER, 12.5 EER For zones 6 to 8: 14 SEER, 12 EER
		Single package	For zones 1 to 5: 15.0 SEER, 12.0 EER For zones 6 to 8: 14.0 SEER 11.6 EER
	≥ 65,000 Btuh/h and < 240,000 Btu/h	Split system and single package	For zones 1 to 5: 12.0 EERb, 12.4 IPLVb For zones 6 to 8: 11.5 EERb, 11.9 IPLVb
	≥ 240,000 Btu/h and < 760,000 Btu/h	Split system and single package	For zones 1 to 5: 10.8 EERb, 12.0 IPLVb For zones 6 to 8: 10.5 EERb, 10.9 IPLVb
	≥ 760,000 Btu/h		For zones 1 to 5: 10.2 EERb, 11.0 IPLVb For zones 6 to 8: 9.7 EERb, 11.0 IPLVb
Air conditioners, Water and evaporatively cooled		Split system and single package	14.0 EER

For SI: 1 British thermal unit per hour = 0.2931 W.

a. IPLVs are only applicable to equipment with capacity modulation.

b. Deduct 0.2 from the required EERs and IPLVs for units with a heating section other than electric resistance heat.

TABLE 506.2(2)
UNITARY AND APPLIED HEAT PUMPS, ELECTRICALLY OPERATED, EFFICIENCY REQUIREMENTS

EQUIPMENT TYPE	SIZE CATEGORY	SUBCATEGORY OR RATING CONDITION	REQUIRED EFFICIENCYa
Air cooled (Cooling mode)	< 65,000 Btu/hd	Split system	For zones 1 to 5: 15.0 SEER, 12.5 EER For zones 6 to 8: 14.0 SEER, 12.0 EER
		Single package	For zones 1 to 5: 15.0 SEER, 12.0 EER For zones 6 to 8: 14.0 SEER, 11.6 EER
	≥ 65,000 Btu/h and < 240,000 Btu/h	Split system and single package	For zones 1 to 5: 12.0 SEER, 12.4 EER For zones 6 to 8: 11.5 EERb, 11.9 IPLVb
	≥ 240,000 Btu/h	Split system and single package	For zones 1 to 5: 12.0 SEER, 12.4 EER For zones 6 to 8: 10.5 EERb, 10.9 IPLVb
Water SOURCES (Cooling mode)	< 135,000 Btu/h	85°F entering water	14.0 EER
Air cooled (Heating mode)	< 65,000 Btu/hd (Cooling capacity)	Split system	For zones 1 to 5: 9.0 HSPF For zones 6 to 8: 8.5 HSPF
		Single package	For zones 1 to 5: 8.5 HSPF For zones 6 to 8: 8.0 HSPF
	≥ 65,000 Btu/h and < 135,000 Btu/h (Cooling capacity)	47°F db/43°F wb outdoor air	3.4 COP
		17°F db/15°F wb outdoor air	2.4 COP
	≥ 135,000 Btu/h (Cooling capacity)	47°F db/43°F wb outdoor air	3.2 COP
		77°F db/15°F wb outdoor air	2.1 COP
Water SOURCES (Heating mode)	< 135,000 Btu/h (Cooling capacity)	70°F entering water	4.6 COP

For SI: °C = [(°F) - 32] / 1.8, 1 British thermal unit per hour = 0.2931 W.
db = dry-bulb temperature, °F; wb = wet-bulb temperature, °F
a. IPLVs and Part load rating conditions are only applicable to equipment with capacity modulation.
b. Deduct 0.2 from the required EERs and IPLVs for units with a heating section other than electric resistance heat.

TABLE 506.2(3)
PACKAGED TERMINAL AIR CONDITIONERS AND PACKAGED TERMINALHEAT PUMPS

EQUIPMENT TYPE	SIZE CATEGORY	REQUIRED EFFICIENCYb
Air conditioners & Heat Pumps (Cooling Mode)	< 7,000 Btu / h	11.9 EER
	7,000 Btu / h and < 10,000 Btu / h	11.3 EER
	10,000 Btu / h and < 13,000 Btu / h	10.7 EER
	> 13,000 Btu / h	9.5 EER

a. Replacement units must be factory labeled as follows: "MANUFACTURED FOR REPLACEMENT APPLICATIONS ONLY: NOT TO BE INSTALLED IN NEW CONSTRUCTION PROJECTS." Replacement efficiencies apply only to units with existing sleeves less than 16 inches (406 mm) high and less than 42 inches (1067 mm) wide.

TABLE 506.2(4)
WARM AIR FURNACES AND COMBINATION WARM AIR FURNACES/AIR-CONDITIONING UNITS, WARM AIR DUCT FURNACES AND UNIT HEATERS, EFFICIENCY REQUIREMENTS

EQUIPMENT TYPE	SIZE CATEGORY (INPUT)	SUBCATEGORY OR RATING CONDITION	REQUIRED EFFICIENCY	TEST PROCEDURE
Warm air furnaces, gas fired	< 225,000 Btu/h	—	For zones 1 & 2, NR. For zones 3 & 4 90 AFUE or 90 Et For zones 4-8 are 92 AFUE or 92 Et	DOE 10 CFR Part 430 or ANSI Z21.47
	≥ 225,000 Btu/h	Maximum capacity	90% Ec note 1	ANSI Z21.47
Warm air furnaces, oil fired	< 225,000 Btu/h	—	For zones 1 & 2, NR. For zones 3 to 8 are 85 AFUE or 85 Et	DOE 10 CFR Part 430 or UL 727
	≥ 225,000 Btu/h	Maximum capacity	85% Et, Note 1	UL 727
Warm air duct furnaces, gas fired	All capacities	Maximum capacity	*90% Ec*	ANSI Z83.8
Warm air unit heaters, gas fired	All capacities	Maximum capacity	*90% Ec*	ANSI Z83.8
Warm air unit heaters, oil fired	All capacities	Maximum capacity	*90% Ec*	UL 731

For SI: 1 British thermal unit per hour = 0.2931 W.

1 Units must also include an IID (intermittent ignition device), have jackets not exceeding 0.75 percent of the input rating, and have either power venting or a flue damper. A vent damper is an acceptable alternative to a flue damper for those furnaces where combustion air is drawn from the conditioned space.
Where there two ratings units not covered by the National Appliance Energy Conservation Act of 1987 (NAECA) (3-phase power or cooling capacity greater than or equal to 65,000 Btu/h [19 kW]) shall comply with either rating.
Et = Thermal efficiency.
Ec = Combustion efficiency (100% less flue losses).
Efficient furnace fan: All fossil fuel furnaces in zones 3 to 8 shall have a furnace electricity ratio not greater than 2% and shall include a manufacturer's designation of the furnace electricity ratio.

TABLE 506.2(5)
BOILER, EFFICIENCY REQUIREMENTS

EQUIPMENT TYPE	SIZE CATEGORY	TEST PROCEEDURE	REQUIRED EFFICIENCY
Gas Hot Water	< 300,000 Btu / h	DOE 10 CFR Part 430	90% Et
	> 300,000 Btu / h and > 2.5 mBtu/h	DOE 10 CFR Part 431	89% Et
Gas Steam	< 300,000 Btu / h	DOE 10 CFR Part 430	89% Et
	> 300,000 Btu / h	DOE 10 CFR Part 431	89% Et
Oil	< 300,000 Btu / h	DOE 10 CFR Part 430	90% Et
	> 300,000 Btu / h	DOE 10 CFR Part 431	89% Et
Et = thermal efficiency			

TABLE 506.2(6)
CHILLERS - EFFICIENCY REQUIREMENTS

EQUIPMENT TYPE	SIZE CATEGORY	REQUIRED EFFICIENCY- CHILLERS		OPTIONAL COMPLIANCE PATH - REQUIRED EFFICIENCY - CHILLERS WITH VSD	
		Full Load (KW /TON)	IPLV (KW /TON)	Full Load (KW /TON)	IPLV (KW /TON)
Air Cooled w/ Condenser	All	1.2	1.0	N/A	N/A
Air Cooled w/o Condenser	All	1.08	1.08	N/A	N/A
Water Cooled, Reciprocating	All	0.840	0.630	N/A	N/A
Water Cooled, Rotary Screw and Scroll	< 90 tons	0.780	0.600	N/A	N/A
	[3]90 tons and < 150 tons	0.730	0.550	N/A	N/A
	[3]150 tons and < 300 tons	0.610	0.510	N/A	N/A
	> 300 tons	0.600	0.490	N/A	N/A
Water Cooled, Centrifugal	< 150 tons	0.610	0.620	0.630	0.400
	[3] 150 tons and < 300 tons	0.590	0.560	0.600	0.400
	300 tons and < 600 tons	0.570	0.510	0.580	0.400
	> 600 tons	0.550	0.510	0.550	0.400

a. Compliance with full load efficiency numbers and IPLV numbers are both required.
b. Only Chillers with Variable Speed Drives (VSD) may use the optional compliance path-for chiller efficiency.
N/A – No credit can be taken for this option

TABLE 506.2(7)
ABSORPTION CHILLERS - EFFICIENCY REQUIREMENTS

EQUIPMENT TYPE	REQUIRED EFFICIENCY FULL LOAD COP (IPLV)
Air Cooled, Single Effect	0.60, allowed only in heat recovery applications
Water Cooled, Single Effect	0.70, allowed only in heat recovery applications
Double Effect - Direct Fired	1.0 (1.05)
Double Effect - Indirect Fired	1.20

506.3 Efficient Lighting System. Whole Building Lighting Power Density (Watts/sf) shall meet the requirements *of Table 506.3. and automatic daylighting control requirements in Section 506.3.2.*

506.3.1 Reduced Lighting Power Density - The total interior lighting power (watts) is the sum of all interior lighting powers for all areas in the building. The interior lighting power is the floor area for the building times the value from Table 506.3.

TABLE 506.3

WORKSHOP	1.20

For SI: 1 foot = 304.8 mm, 1 watt per square foot = W/0.0929 m2.

a. In cases where both a general building area type and a more specific building area type are listed, the more specific building area type shall apply.

b. At least one half of the floor area shall be in the daylight zone. Automatic daylighting controls shall be installed in daylit zones and shall meet the requirements of Section 505.2.2.2.3.

506.3.2 Automatic Daylighting Controls. Automatic daylighting controls shall be installed in all daylight zones and shall meet the requirements of Section 505.2.2.2.

506.4 On-site Supply of Renewable Energy The building or surrounding property shall supply 3% or more of the building energy use associated with systems and equipment covered by this code through on-site renewable energy. On-site power generation using nonrenewable sources does not meet this requirement.

The *code official* shall be provided with an energy analysis as described in Section 507 that documents on-site renewable energy production is capable of providing at least 3% of the total estimated annual purchased energy for the building functions regulated by this code, or a calculation demonstrating that on-site renewable energy production has a nominal (maximum) rating of at least 1.75 BTUs or at least 0.50 watts per square foot of conditioned floor area.

28. Add new standards to Chapter 6 as follows:

ASTM

E779-03	Standard Test Method for Determining Air Leakage Rate by Fan Pressurization
E1677-95 (2000)	Standard Specification for an Air Retarder (AR) Material or System for Low-Rise Framed Building Walls
E2178-03	Standard Test Method for Air Permeance of Building Materials
E2357-05	Standard Test Method for Determining Air Leakage of Air Barrier Assemblies
C1371-04	Standard Test Method for Determination of Emittance of Materials Near Room Temperature Using Portable Emissometers
C1549	Standard Test Method for Determination of Solar Reflectance Near Ambient Temperature Using a Portable Solar Reflectometer
E408-71 (02)	Test Methods for Total Normal Emittance of Surfaces Using Inspection-Meter Techniques
E1918-97	Standard Test Method for Measuring Solar Reflectance of Horizontal or Low-Sloped Surfaces in the Field

Reason: *New Buildings Institute (NBI)-American Institute of Architects (AIA)*

NBI and AIA believe that the 20-30% reductions in commercial and high-rise residential building energy use based on this proposal are practical, feasible, and necessary. This Proposal employs improvements to design practices and use of widely available products to improve energy efficiency. Many of the elements have been previously published in NBI's *Core Performance Guide* and implemented in programs or codes at the local and state levels. Incorporating these enhancements in a national model code will help move building practices and markets more quickly, addressing national concerns for energy and the environment in a pragmatic and cost-effective way.

SUBSTANTIATING MATERIAL

The bibliography of substantiating material, along with the technical information and technical substantiation, can be found at www.newbuildings.org/iecc.htm.

THE PROPOSAL

This proposal substantially revises Chapter 5 of the IECC with a series of measures that are integrated to achieve significant energy savings over current national model code. The proposal builds on and updates from 2009 IECC, plus it introduces some new elements such as commissioning of critical systems and a section on "additional efficiency package options" to offer flexibility in achieving these significant savings. Key elements of the Proposal are:

Building Envelope - Includes continuous air barriers, significant improvements in most glazing, and enhancements to opaque envelope performance.

Mechanical Systems – Improves sections regarding economizers, incorporates more use of demand controlled ventilation, and provides additional calculation procedures for determining loads and equipment sizing.

Quality Assurance – Incorporates requirements for testing and commissioning of mechanical systems and performance testing of daylight-related controls.

Lighting - Reduces energy needed for lighting based on more efficient illuminating equipment and the use of several lighting control strategies.

Daylighting – Includes additional availability of toplight sources when combined with automatic daylight controls, and comprehensive control strategy for all daylit zones.

Advanced Efficiency Package Options - Section 506 contains three approximately energy-equivalent packages to add to the savings in this Proposal: These three options are focused on Efficient HVAC Equipment, Reduced Lighting Power Density plus Automatic Daylight Controls, or Onsite Renewable Energy Generation. These options round out the savings in the Proposal and also offer important flexibility in getting to higher levels of efficiency. As energy codes move to higher efficiency levels with new types of strategies, building flexibility into prescriptive codes will offer additional pathways to support market adoption and compliance.

Cost Impact: None given.

Public Hearing:				
Committee:	AS	AM	D	
Assembly:	ASF	AMF	DF	

ICCFILENAME: HEWLETT-LOYER-MAJETTE-EC1-202-501.2

EC148–09/10

501.1, 501.2, 502.1.1

Proponent: Mark Nowak, representing Steel Framing Alliance

Revise as follows:

501.1 Scope. The requirements contained in this chapter are applicable to commercial buildings, or portions of commercial buildings. These commercial buildings shall meet either the requirements of ASHRAE/IESNA Standard

90.1, *Energy Standard for Buildings Except for Low-Rise Residential Buildings*, or the requirements contained in this chapter.

Exception: Wall insulation requirements under ASHRAE/IESNA Standard 90.1 shall not be required to exceed the maximum thicknesses of continuous insulation specifically allowed by the exterior finish manufacturer instructions or other applicable building code requirements.

501.2 Application. The *commercial building* project shall comply with the requirements in Sections 502 (Building envelope requirements), 503 (Building mechanical systems), 504 (Service water heating) and 505 (Electrical power and lighting systems) in its entirety. As an alternative the *commercial building* project shall comply with the requirements of ASHRAE/IESNA 90.1 in its entirety.

Exception: Buildings conforming to Section 506, provided Sections 502.4, 503.2, 504, 505.2, 505.3, 505.4, 505.6 and 505.7 are each satisfied.

Exception: Wall insulation requirements under ASHRAE/IESNA Standard 90.1 shall not be required to exceed the maximum thicknesses of continuous insulation specifically allowed by the exterior finish manufacturer instructions or other applicable building code requirements.

502.1.1 Insulation and fenestration criteria. The *building thermal envelope* shall meet the requirements of Tables 502.2(1) and 502.3 based on the climate *zone* specified in Chapter 3. Commercial buildings or portions of commercial buildings enclosing Group R occupancies shall use the *R*-values from the "Group R" column of Table 502.2(1). Commercial buildings or portions of commercial buildings enclosing occupancies other than Group R shall use the *R*-values from the "All other" column of Table 502.2(1).
Buildings with a vertical fenestration area or skylight area that exceeds that allowed in Table 502.3 shall comply with the building envelope provisions of ASHRAE/IESNA90.1.

Exception: Wall insulation requirements under ASHRAE/IESNA Standard 90.1 shall not be required to exceed the maximum thicknesses of continuous insulation specifically allowed by the exterior finish manufacturer instructions or other applicable building code requirements.

Reason: This exception is intended to limit the applicability of ASHRAE/IESNA Standard 90.1 due to concerns of code conflict and liability issues.

Addendum-bb, voted out for public comment during the January 2009 meeting of ASHRAE SSPC 90.1, contains requirements for opaque wall assemblies (Tables 5.5-1 to 5.5-8) that raise concerns about code conflicts, significant departure from standard industry practice, and liability and warranty issues. Ultimately these issues, if 90.1 continues to be referenced in the IECC, will create conflicts with both the IRC and IBC.

In current versions of both the IECC and ASHRAE 90.1, the insulation requirements for light framed wall assemblies in most climates never reach beyond R13 in the cavity with R 7.5 continuous insulation (R13+R7.5). The proposed values in 90.1 Addendum-bb begin to increase to R13 cavity with R 18.8 continuous insulation (R13+R18.8) starting in climate zone 4.

Assuming ASHRAE Handbook of Fundamentals R-values for different continuous insulation materials, to reach a value of R18.8 continuous insulation, a builder would need to use 3 inches of Polyisocyanurate; over 3 inches of Extruded Polystyrene; and almost 5 inches of Expanded Polystyrene. This represents a dramatic departure from current industry practice and will cause conflicts in warranties and code enforcement as detailed below.

Warranty, liability, and code conflicts exist when using thick levels of continuous insulation due to limitations cited in manufacturer installation instructions for exterior finishes. Research into these installation requirements for exterior finishes (vinyl siding, fiber cement siding, wood siding, stucco, brick and stone veneers) installed over continuous insulation revealed that in many cases, installation instructions limit continuous insulation applications to 0.5 inches to 1.5 inches of thickness.

In situations where exterior finishes limit the amount of continuous insulation that their product can be applied over, requiring continuous insulation thicknesses beyond these limitations becomes a liability and a conflict within code. Virtually all product warranties in the building industry include a clause that voids the warranty if materials are not installed per the manufacturer's installation instructions.

Even when no direct limitation of continuous insulation thickness exists in a manufacturer's installation instructions, there is still often recommended levels of insulation. Research found no examples of recommended thicknesses of insulation above 1.5 inches. A wide variety of exterior finishes from multiple manufacturers would have their warranties voided when installed at many of the thicknesses required in Addendum-bb.

In addition, general practice in building codes is to require installation per the manufacturer's instructions. Therefore, not only would thick levels of insulation void warranties, making builders or building owners liable, it would also violate code in many cases. Specific examples of code requiring exterior finishes to be installed per manufacturer's installation instructions can be found in IBC 2009 (section 1405) and IRC 2009 (section R703). In any case where the continuous insulation has been limited by the installation instructions of the exterior finish manufacturer, installing insulation thicker than allowed would violate code.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Nowak-EC-1-501.1-501.2-502.1.1

EC149–09/10
501.1, 501.2, Chapter 6

Proponent: Ken Sagan, National Association of Home Builders (NAHB)

1. Revise as follows:

501.1 Scope. The requirements contained in this chapter are applicable to commercial buildings, or portions of commercial buildings. These commercial buildings shall meet either the requirements of ~~ASHRAE/IESNA Standard 90.1, *Energy Standard for Buildings Except for Low-Rise Residential Buildings*~~, or the requirements contained in this chapter.

501.2 Application. The requirements in Sections 502 (Building envelope), 503 (Building mechanical systems), 504 (Service water heating) and 505 (Lighting) shall each be satisfied on an individual basis. ~~Where one or more of these sections is not satisfied, compliance for that section(s) shall be demonstrated in accordance with the applicable provisions of ASHRAE/IESNA 90.1.~~
Exception: Buildings conforming to Section 506, provided Sections 502.4, 502.5, 503.2, 504, 505.2, 505.3, 505.4, 505.6 and 505.7 are each satisfied.

2. Delete standards from Chapter 6 as follows:

ASHRAE
~~90.1-2004~~ ~~Energy Standard for Buildings Except Low-rise Residential Buildings (ANSI/ASHRAE/IESAN 90.1-2004~~)

IESNA
~~90.1-2001~~ ~~Energy Standard for Buildings Except Low-rise Residential Buildings~~

Reason: The IECC is a stand-alone energy code complete with prescriptive and performance compliance paths. IECC has up-dated the code on a three-year cycle to keep current with the developments made in the energy efficiency industry and using the consensus process has optimized the provisions to require energy savings. On the other hand, ASHRAE has not kept up with the requirements on energy efficiency. ASHRAE /IESNA Standard 90.1 -2001 Section 6, is no longer current or up-to-date. The reference of outdated sections of ASHRAE 90.1 Standard is not consistent with the requirements of stringency of the IECC. The wholesale reference to ASHRAE 90.1 does not add value to the IECC. ASHRAE has been trying to impose its overly complex standard directly into the body of the commercial portion of the IECC to eliminate any reference to the IECC. Individuals electing to build to the ASHRAE Standard find difficulty in understanding and complying with the Standard.

If a state or local jurisdiction desires to have ASHRAE 90.1 as their alternative code, they are free to do this.

Cost Impact: The code change proposal will increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Sagan-EC-12-501.1-501.2

EC150–09/10
501.1, 501.2

Proponent: Larry Spielvogel, PE, Consulting Engineer

Revise as follows:

501.1 Scope. The requirements contained in this chapter are applicable to commercial buildings, or portions of commercial buildings. These commercial buildings shall meet ~~either the requirements of ASHRAE/IESNA Standard 90.1, *Energy Standard for Buildings Except for Low-Rise Residential Buildings*, or~~ the requirements contained in this chapter.

501.2 Application. The *commercial building* project shall comply with the requirements in Sections 502 (Building envelope), 503 (Building mechanical systems), 504 (Service water heating) and 505 (Lighting) in its entirety. ~~As an alternative the *commercial building* project shall comply with the requirements of ASHRAE/IESNA 90.1 in its entirety.~~

Exception: Buildings conforming to Section 506, provided Sections 502.4, 503.2, 504, 505.2, 505.3, 505.4, 505.6 and 505.7 are each satisfied.

Reason: The purpose of this code change is to delete the current option that exists to use ASHRAE 90.1 in lieu of all of the requirements in Chapter 5 of the IECC. This code change will make the IECC simpler, less expensive to use, and will prevent people from using ASHRAE 90.1 to get around the provisions of IECC Chapter 5.

1. **Circumvents IECC Requirements.** The current option to use the less stringent ASHRAE 90.1 in lieu of the requirements in IECC Chapter 5 provides the user with multiple ways to circumvent many of the IECC and other I Code requirements. Thus, compliance with ASHRAE 90.1 conserves less energy than with IECC compliance. The lighting provisions in Section 9.6 of ASHRAE 90.1 are less stringent than those in 505.5.2 of IECC. For example, office lighting in IECC Table 505.5.2 is limited to 1.0 watts per square foot, while in Table 9.6.1 of ASHRAE 90.1 the limit is 1.1 watts per square foot-10% higher. ASHRAE 90.1 also allows additional lighting power allowances in Section 9.6.2 that are much higher than those in IECC Table 505.5.2. The IECC should not allow people to circumvent adopted lighting power allowances without justification. Finally, IECC 502.4.5 requires the use of the 2007 AMCA standard 500D for dampers in Chapter 6, while ASHRAE 90.1 requires the use of the 1998 AMCA Standard 500D in Section 12. Thus, the option to use ASHRAE 90.1 circumvents the IECC required use of the current 2007 AMCA damper standard.

2. **ASHRAE 90.1 Unenforceable.** ASHRAE 90.1 is unenforceable because the requirements are so numerous and so complex that most code officials do not have and cannot readily or economically get the extensive training and experience to be able to understand and enforce the ASHRAE 90.1 requirements. There are almost no local training courses or programs on ASHRAE 90.1 for code officials. At best, there may be a dozen or so competent and comprehensive training programs on ASHRAE 90.1 each year in the entire country, mostly in a few major cities, and none of those is specifically for code officials. Learning and understanding ASHRAE 90.1 is also difficult even for most practicing architects, engineers, and contractors, making it difficult for them to comply, thus imposing an even greater burden on code officials to verify compliance. Even the ASHRAE 90.1 committee itself has difficulty writing and understanding the standard, since they issue dozens of addenda, errata, formal interpretations, and informal interpretations every single year in attempts to change or clarify their intent and rectify their own numerous errors. The current erratum for the ASHRAE 90.1 Users Manual is 12 pages long and is the fourth edition in less than a year. Thus, the criteria and requirements in ASHRAE 90.1 change almost weekly. Just the 44 addenda shown in Appendix F of ASHRAE 90.1 represent hundreds of changes from the prior 2004 edition. Nor are the changes from the prior edition marked, as they are in the IECC. Which of these many documents and provisions are to be enforced for any specific permit application on any specific day?

3. **Not Coordinated.** The IECC is coordinated with the other International Codes, and ASHRAE 90.1 is not. This results in conflicts and contradictions. For example, the IECC has at least eight references to and requirements for compliance with the International Mechanical Code, while ASHRAE 90.1 has none. While some of the provisions in IECC are similar to ASHRAE, ASHRAE 90.1 has many more requirements and exceptions that do not exist in the IECC, providing more latitude and less stringency than IECC.

4. **Not Unified.** Providing the option to use ASHRAE 90.1 in lieu of IECC Chapter 5 diverts efforts from pursuing a unified and comprehensive set of International Codes. The option to use ASHRAE 90.1 in lieu of IECC Chapter 5 provides an unsupervised and unmonitored path for special and vested interests to include their provisions in ASHRAE 90.1 that would never be accepted in the IECC. Thus, the "back door" to ASHRAE 90.1 opens wider than that for the IECC, especially since so many of the ASHRAE 90.1 voting members work for or represent special interests, so they can pursue those interests from the inside. For example, a significant percentage of the members of the ASHRAE 90.1 Mechanical Subcommittee are employed by manufacturers of heating, air conditioning, and water heating equipment, or by their trade associations. Most of the other voting members of the ASHRAE 90.1 committee do not know enough to debate and vote intelligently on those issues, which are then adopted and included in the standard. As another example, the majority of the voting members of the ASHRAE 90.1 committee know little or nothing about lighting, so there is a great tendency to "rubber stamp" recommendations that come from the Lighting Subcommittee. Accordingly, many provisions in ASHRAE 90.1 diverge substantially from those in IECC.

5. **Copies unavailable.** ASHRAE does not provide free copies of 90.1 ($119 per copy) to code officials. Very few jurisdictions have budgets to purchase copies for each plan checker and inspector, much less the estimated thousands of dollars per user to purchase the many references needed to determine compliance. Few jurisdictions, and similarly few architectural, engineering, or construction firms have the sophisticated software, training, and experience, much less the time and computers required to run the Section 11 Energy Cost Budget (ECB) Method calculations allowed by ASHRAE 90.1 for further compliance options.

6. **Use of ASHRAE 90.1 Not Precluded.** Most, if not all relevant provisions of ASHRAE 90.1 can still be used at the discretion of the user, so long as they are at least as stringent as Chapter 5 of IECC. People who wish to comply with ASHRAE 90.1 for other reasons, such as, but not limited to LEED® certification can still do so, provided they also meet the requirements of Chapter 5 of IECC.

Cost Impact: There will be a cost savings since code officials and users of the IECC will not have to buy additional standards and references or take the time and pay for additional training. The provisions proposed for deletion are simply optional.

	Assembly:	ASF	AMF	DF

ICCFILENAME: Spielvogel-EC-1-501.1

EC151–09/10
501.2

Proponent: Steve Ferguson, representing The American Society of Heating, Refrigerating and Air-Conditioning Engineers (ASHRAE)

Revise as follows:

501.2 Application. The *commercial building* project shall comply with the requirements in Sections 502 (Building envelope requirements), 503 (Building mechanical systems), 504 (Service water heating) and 505 (Electrical power and lighting systems) in its entirety. As an alternative the *commercial building* project shall comply with the requirements of ASHRAE/IESNA 90.1 in its entirety.

Exceptions:

1. Buildings conforming to Section 506, provided Sections 502.4, 503.2, 504, 505.2, 505.3, 505.4, 505.6 and 505.7 are each satisfied.
2. The use of the Space-by-Space method, ASHRAE/IES 90.1 Section 9.6, shall be permitted to determine the Interior Power Allowance in either method of compliance.

Reason: The current IECC 2009 language does not allow the use of just the 90.1 Lighting section for compliance if the IECC is used. This restricts flexibility in lighting design and compliance in many cases because lighting envelope and mechanical disciplines do not always coordinate on methods of compliance.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Ferguson-EC-1-501.2

EC152–09/10
501.2, 506

Proponent: Ronald Majette, representing US Department of Energy

1. Revise as follows:

501.2 Application. The *commercial building* project shall comply with the requirements in Sections 502 (Building envelope requirements), 503 (Building mechanical systems), 504 (Service water heating) and 505 (Electrical power and lighting systems) in its entirety. As an alternative the *commercial building* project shall comply with the requirements of ASHRAE/IESNA 90.1 in its entirety.

~~**Exception:** Buildings conforming to Section 506, provided Sections 502.4, 503.2, 504, 505.2, 505.3, 505.4, 505.6 and 505.7 are each satisfied.~~

Delete Section 506 without substitution:

~~**SECTION 506**~~
~~**TOTAL BUILDING PERFORMANCE**~~

Reason: ASHRAE Standard 90.1 has a well defined and regularly updated approach for assessing a building design on the basis of performance equivalency. The continued maintenance of Section 506 in Chapter 5 takes time and more importantly creates the opportunity for the IECC and Standard 90.1 to grow apart. The intent of Chapter 5 is to provide a simplified approach for commercial buildings that minimizes the need to consult the referenced Standard 90.1. If one cannot meet the provisions of Chapter 5 then it seems logical to refer them to Standard 90.1 to address compliance.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Majette-EC-41-501.2

EC153–09/10
501.2, 507 (New), 507.1 (New), 507.1.1 (New)

Proponent: Krista Braaksma, representing Washington State Building Code Council

Revise as follows:
501.2 Application. The *commercial building* project shall comply with the requirements in Sections 502 (Buildings envelope requirements), 503 (Building mechanical systems), 504 (Service water heating), ~~and~~ 505 (Electrical power and lighting systems), and 507 (Energy consuming mechanisms) in its entirety.

SECTION 507
ENERGY CONSUMING MECHANISMS (Mandatory)

507.1 General (Mandatory). This section establishes criteria for the control of energy consuming mechanisms other than those covered under Section 505 that serve commercial buildings.

507.1.1 Pedestrian escalators and moving pedestrian walkways. Each pedestrian escalator or moving pedestrian walkway shall be equipped with an automatic control device to prevent operation of escalators and moving walkways when the mechanisms are unoccupied.

Reason: The proposal would add a requirement for controls on escalators and moving walkways to prevent continuous operation when they are not in use. This would provide significant energy savings and would also prolong the lifetime of the equipment. These systems automatically detect approaching passengers and the equipment runs only when needed. This technology is becoming more and more common and provides a method to reduce both energy use and greenhouse gas emissions.

According to Xcel Energy, a system installed in the Denver International Airport is estimated to save 30-40% of the electrical use on escalators and moving walkways, representing a reduction of over 2.0 million kilowatt-hours (kWh) per year and will reduce carbon dioxide emissions by four million pounds per year with a 3 year payback. (http://www.powerefficiencycorp.com/article/article_25mar08.php)

Cost Impact: The code change proposal will increase the cost of construction

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

EC154–09/10
202

Proponent: Julie Ruth, JRuth Code Consulting, representing American Architectural Manufacturers Association (AAMA)

Revise definition as follows:

STOREFRONT. A non-residential ~~system of doors and windows mulled as a~~ composite fenestration structure that has been designed to resist heavy use. Storefront systems include, but are not limited to, exterior fenestration systems that span from the floor level or above to the ceiling of the same story on commercial buildings, with or without mulled windows and doors.

Reason: The purpose of this proposal is to clarify that a storefront system can consist of just windows, just doors, or a combination of the two. Some parties have interpreted the first sentence of the current definition as indicating that both doors and windows must be present in a composite fenestration structure in order for it to be considered storefront, which is not the intent of the definition.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

FILENAME: RUTH-EC-1-202

EC155–09/10
502.1.1

Proponent: James Bowman, American Forest and Paper Association

Revise as follows:

502.1.1 Insulation and fenestration criteria. The *building thermal envelope* shall meet the requirements of Tables 502.2(1) and 502.3 based on the climate *zone* specified in Chapter 3. Commercial buildings or portions of commercial buildings enclosing Group R occupancies shall use the *R*-values from the "Group R" column of Table 502.2(1). Commercial buildings or portions of commercial buildings enclosing occupancies other than Group R shall use the *R*-values from the "All other" column of Table 502.2(1). Buildings with a vertical fenestration area or skylight area that exceeds that allowed in Table 502.3 shall comply with the building envelope provisions of ASHRAE/IESNA90.1. Where required, insulation board shall be installed in compliance with its listing and not alter the approved application of wood structural panels or the lateral force resisting system of the assembly.

Reason: With the increased specification of insulation-board only options, it may make the use of WSP more problematic in high-wind and seismic zones, where compliant structural components and connections are crucial. Each of these components must be attached per their listings, engineered designs and comply with structural code provisions of the IBC. This proposal simply reinforces and provides a reference to the need to adhere to pertinent attachment requirements and not use one set of fasteners for multiple panels or otherwise use inadequate attachments.

Cost Impact: The code change proposal will not increase the cost of construction.

METAL BUILDING ASSEMBLY DESCRIPTIONS

ROOFS	DESCRIPTION
R-19+R-11 LS R-25+R-11 LS R-30+R-11 LS R-25+R-11+R-11 LS	Fiberglass liner system with thermal spacer block. A continuous membrane is installed below the purlins and uninterrupted by framing members. Uncompressed, unfaced fiberglass insulation rests on top of the membrane between the purlins. For multilayer installations, the last R-Value of insulation is for unfaced insulation draped over purlins and then compressed when the metal roof panels are attached. A minimum R-3 thermal spacer block between the purlins and the metal roof panels is required.
WALLS	
R-19	Single layer faced fiberglass insulation. The layer of R-19 faced fiberglass insulation is installed continuously perpendicular to the girts and is compressed when the metal skin is attached to the girts.
R-13ci R-19.5ci	Continuous insulation. The continuous insulation is installed on the interior plane of the girts and uninterrupted by the framing members.
R-13 + R-6.5ci R-13 + R-19.5ci	Single layer faced fiberglass insulation with continuous insulation. The first *R*-Value is for faced fiberglass insulation installed continuously perpendicular to the girts and is compressed when the metal skin is attached to the girts. The second *R*-Value is for continuous insulation installed on the interior plane of the girts and uninterrupted by the framing members.

Reason: The purpose of this proposal is to correct erroneous metal building U-Factors specified in the Code, correct an inappropriate redefinition of a metal building assembly description added in the last code cycle and to improve metal building roof and wall requirements for all climate zones, based on revised U-Factor and cost data developed by the Metal Building Task Group of the ASHRAE SSPC 90.1 Envelope Subcommittee.

Previous versions of the IECC, in addition to the DOE's COMcheck software and numerous State Codes, have relied upon the metal building assembly descriptions and U-Factors defined in Appendix A of the ASHRAE 90.1 Standard (90.1-1999 through 90.1-2007). Even before U-Factors themselves were added to the IECC in the 2009 version, the intended performance of the prescriptive R-Value requirements were based on the assumption that the prescribed R-Values achieved the level of performance claimed in the 90.1 Standard. Unfortunately, these performance claims for most of the metal building insulation assemblies were based on invalid assumptions, most significantly the geometry of the insulation as it is typically installed in a metal building roof or wall. After a tremendous amount of discussion and debate since December 2006, primarily in the ASHRAE SSPC 90.1 Envelope Subcommittee, a Metal Building Task Group was formed which reviewed available information, gathered additional data as needed, and developed more accurate U-Factors for these metal building insulation assemblies. This task group presented their findings and recommendations to the SSPC 90.1 Envelope Subcommittee in October 2008, which unanimously accepted the revised U-Factors. These revisions appear in the proposed 90.1-2007 Addendum bb. The revised U-Factors show that the previous U-Factors for metal building insulation

assemblies relied on by ASHRAE, IECC and others were overstated by nearly 40%. This has resulted in flawed economic analysis leading in most cases to less than economic criteria for metal building roofs and walls being published. Architects, engineers, contractors, owners and code compliance officials that have relied on these performance claims have unintentionally allowed buildings to be built and approved that fall far below the intended stringency of these Standards and Codes. The owners are stuck with higher energy costs for the life of their buildings as a result. This proposal addresses these issues by incorporating the opaque metal building roof and wall prescriptive criteria, the more accurate U-Factors for metal building insulation assemblies, and associated assembly descriptions proposed in ASHRAE 90.1-2007 Addendum bb.

There are numerous methods of installing insulation in metal building roofs and walls. The most commonly used is conventionally referred to as "Over-the-Purlin" or "Over-the-Girt". The double layer variation is conventionally referred to as "Sag-and-Bag". These assemblies are referred to as "Single Layer" and "Double Layer" in ASHRAE 90.1-1999 through ASHRAE 90.1-2007 and account for all but one of the metal building assemblies listed in Appendix A of the 90.1 Standards (90.1-1999 through 90.1-2007). I will refer to all of these single and double layer roof and wall assemblies collectively as "Over-the-Purlin" assemblies. This type of installation starts with a layer of faced metal building insulation which is installed perpendicular to the secondary structural members (purlins for roofs, girts for walls), pulled tight and then compressed when the metal roof or wall panels are attached. The double layer "Sag-and-Bag" variation, only used in roofs, adds an additional layer of unfaced insulation positioned above the first layer, parallel to and centered between the purlins. The compression of the insulation in both the single layer and double layer variations occurs across the entire assembly, not just at the junction between the roof or wall panels and each underlying structural member.

The problem with and subsequent discussion about the previous performance claims of these Over-the-Purlin metal building roof and wall assemblies arise from the assumptions used in the thermal modeling of the assemblies. Unfortunately, most of the technical data from the modeling was apparently destroyed in some sort of house fire. What remains is a single summary report which lacks specifics on the geometry of modeled assemblies (installed insulation thickness across each assembly). While some other problematic assumptions are listed in the modeling summary report (e.g. thermal spacer block thicknesses and insulation thickness combinations which exceed metal building manufacturers recommendations), the most significant problem appears to be the undisclosed assumed geometry. The report does contain some images of thermal models which suggest that the insulation was assumed to recover to its full nominal insulation thickness within 8 to 12 inches of the purlin and continue to span the space between the purlins maintaining this same full nominal thickness to within 8 to 12 inches of the adjacent purlin.

In the past couple years, two groups studying metal building assemblies independently arrived at the same conclusion: Over-the-Purlin metal building insulation assemblies form a parabolic thickness profile between adjacent purlins when installed. Dr. Merle McBride and others at the Owens-Corning Technical Center arrived at this conclusion when developing new thermal modeling of metal building assemblies. They noted this observation in a presentation to the ASHRAE SSPC 90.1 Envelope Subcommittee in April 2008. Dr. Les Christianson, Professor Emeritus at the University of Illinois Urbana-Champaign, also observed this in his research which looked specifically at the typical installed thicknesses of metal building assemblies. The recognition of the parabolic thicknesses profile contradicts what appears to be the assumption used in previous thermal modeling where the insulation maintains a uniform thickness across the majority of the space between adjacent purlins.

In response to concerns repeatedly raised by Thermal Design, a Metal Building Task Group was created by the ASHRAE SSPC 90.1 Envelope Subcommittee in April 2008 to review the available data from all parties and give guidance to the Envelope Subcommittee on revisions to the 90.1 Standard to address any problems identified. The task group included Dr. McBride, Dr. Christianson as well as a representative from the Metal Building Manufacturers Association (MBMA), the president-elect of the Metal Building Contractors and Erectors Association (MBCEA), a representative from our company and was chaired by an independent party from outside the metal building industry. This task group reviewed and expanded upon the previous research by Thermal Design, Dr. Christianson and Dr. McBride to produce more accurate U-Factors for the metal building assemblies listed in Appendix A of the 90.1 Standard which are intended to reflect the thermal performance of these assemblies as typically installed in the field. As indicated previously, these revised U-Factors were presented to the ASHRAE SSPC 90.1 Envelope Subcommittee at their interim meeting in October 2008 and were unanimously accepted. The work of this task group will be the subject of the "ASHRAE Standard 90.1 Metal Building U-Factors" transaction session at the ASHRAE 2010 Winter Conference in Orlando, FL.

The one other metal building assembly appearing in Appendix A of 90.1-1999 through 90.1-2007 is the "Filled Cavity" roof assembly, conventionally referred to as "long tabs" in the industry. This assembly utilizes extra long side tabs of facing that extend beyond the width of the insulation. The first layer is installed parallel with and between the purlins by attaching the long tabs to the top face of the purlin. Assuming no bracing exists between the purlins, this first layer can expand to the full depth of the insulation between the purlins. The purlins themselves, including the fasteners protruding through the top flange, are exposed to the inside conditioned space. The second layer of insulation is positioned above the first layer, either parallel to and between the purlins, or perpendicular to the purlins. The performance of this assembly also appears to have been overstated in 90.1-1999 through 90.1-2007, but appears to be a result of miscopying from the original source, rather than invalid assumptions in thermal modeling. The ASHRAE 90.1-1999 through 90.1-20007 Standards listed a U-Factor of U-0.041 for this assembly, while the source cited by ASHRAE lists a U-Factor of U-0.057.

A new "Liner System" assembly was added to Appendix A in 90.1-2007 Addendum g. This assembly separates the vapor retarder from the insulation, so that it can be spanned continuously below the structural members, isolating the highly conductive steel purlins and fasteners from the conditioned space. The continuous vapor retarder membrane is held in place by a support structure, typically a grid network of steel strapping. Unfaced insulation is installed parallel to and between the purlins. Because the vapor retarder is separate from the insulation, the insulation can be easily cut to fit around purlin bracing that are common between the purlins. The top layer of unfaced insulation can either be installed parallel to and between the purlins, or installed perpendicular to and over the top of the purlins. This assembly was also added to the IECC in the last code cycle and appears at least as the requirement for "All Other" in climate zone 8. However, the change proposal which added this assembly to the IECC inappropriately renamed it Filled Cavity, though the description in 502.2(2) and the U-Factor in 502.1.2 are for the Liner System assembly from ASHRAE 90.1-2007 Addendum g. The Filled Cavity and Liner System assemblies in ASHRAE 90.1 Addendum g are two entirely different assemblies with different thermal performance. This inappropriate renaming could likely cause confusion in the marketplace, leading to the use of an assembly that performs about 35% below the intended performance of the IECC prescriptive criteria.

The requirements set forth in this proposal are identical to those proposed in the first public review draft of ASHRAE 90.1-2007 Addendum bb and are based on the standard scalar ratio economic optimization procedure used by the ASHRAE SSPC 90.1 Envelope Subcommittee.

Proposed Addendum bb (First Public Review - March 2009) to Standard 90.1-2007, Energy Standard for Buildings Except Low-Rise Residential Buildings. American Society of Heating, Refrigerating and Air-Conditioning Engineers, Inc.

Cost Impact: This proposal will increase the cost of construction. However, it should be noted that in some cases the assemblies prescribed in this proposal may not increase the cost of construction over assemblies which actually meet the intended performance of previous versions of the IECC. For example, to meet the previously prescribed U-Factor performance of U-0.065, the revised U-Factors from the ASHRAE 90.1 Envelope Subcommittee's Metal Building Task Group show you would need an R-19+R-19 double layer (Sag-and-Bag) assembly (U-0.060). The R-19+R-11 Liner System assembly significantly exceeds this performance (U-0.035) and would likely cost less than the R-19+R-19 assembly. This proposal inherently reduces the cost of HVAC equipment and associated infrastructure and in some cases could reduce the net cost of the whole building.

Revise as follows:

SECTION 502
BUILDING ENVELOPE REQUIREMENTS

502.1 General (Prescriptive).

502.1.1 Insulation and fenestration criteria. The *building thermal envelope* shall meet the requirements of Tables 502.2(1) and 502.3 based on the climate *zone* specified in Chapter 3. Commercial buildings or portions of commercial buildings enclosing Group R occupancies shall use the *R*-values from the "Group R" column of Table 502.2(1). Commercial buildings or portions of commercial buildings enclosing occupancies other than Group R shall use the *R*-values from the "All other" column of Table 502.2(1). Buildings with a vertical fenestration area or skylight area that exceeds that allowed in Table 502.3 shall comply with the building envelope provisions of ASHRAE/IESNA-90.1.

For SI: 1 inch = 25.4 mm.

ci = Continuous insulation. NR = No requirement.

a. When using *R*-value compliance method, a thermal spacer block is required, otherwise use the *U*-factor compliance method. [see Tables 502.1.2 and 502.2(2)].

b. Assembly descriptions can be found in Table 502.2(2).

c. R-5.7 ci is allowed to be substituted with concrete block walls complying with ASTM C 90, ungrouted or partially grouted at 32 inches or less on center vertically and 48 inches or less on center horizontally, with ungrouted cores filled with material having a maximum thermal conductivity of 0.44 Btu-in./h-f2 F.

d. When heated slabs are placed below grade, below-grade walls must meet the exterior insulation requirements for perimeter insulation according to the heated slab-on-grade construction.

e. Steel floor joist systems shall to be R-38.

Reason: This Building Envelope proposal provides opaque wall tables to complement the comprehensive proposal submitted on behalf of New Buildings Institute and the American Institute of Architects. These tables provide significant reductions in thermal bridging and increases in

insulation levels for the model code. The envelope assemblies and u-values include specifications from *Core Performance Guide*, 2009 IECC and proposed ASHRAE 90.1-2010.

Cost Impact: This code change proposal will increase the cost of construction.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

Reason: For consistency with Standard 90.1. This proposal is based on ongoing analysis efforts within ASHRAE designed to create a Standard 90.1-2010 that is 30% better than Standard 90.1-2004 in response to Federal legislation. Paralleling those efforts and considering that the IECC Chapter 5 is intended to be technically compatible with that standard to facilitate adoption and implementation, DOE is interested in keeping Chapter 5 of the 2012 IECC aligned with ANSI/ASHRAE/IESNA Standard 90.1-2010. Due to the timing of the code development process and ASHRAE standards processes this proposal was submitted in anticipation that by the final action hearings the work to update the standard would be complete.

Cost Impact: The code change proposal will increase the cost of construction.

EC160–09/10
Table 502.2(1)

Proponent: James Bowman, American Forest and Paper Association

Revise table as follows:

Expand the insulation options in Climate Zones 4 through 8 by adding R-value choices that don't force the use of insulation board to the exclusion of other equally efficient products.

Table 502.2(1) (Limited to Changes)
BUILDING ENVELOPE REQUIREMENTS -- OPAQUE ASSEMBLIES

Climate Zone	1		2		3		4 Except Marine		5 and Marine 4		6		7		8	
	All Other	Group R	All Other	Group R	All Other	Group R	All Other	Group R	All Other	Group R	All Other	Group R	All Other	Group R	All Other	Group R
Walls, Above Grade																
Wood Framed and Other	R-13	R-13	R-13	R-13	R-13	R-13	R-13	R-13 + R-3.8ci or R-20	R-13 + R-3.8ci or R-20	R-13 + R-3.8ci or R-20	R-13 + R-7.5ci or R-21	R-13 + R-7.5ci or R-21	R-13 + R-7.5ci or R-21	R-13 + R-7.5ci or R-21	R-13 + ~~R-15.6ci~~ R-7.5ci or R-21	R-13 + R-15.6ci or R-25

(Portions of table and footnotes not shown unchanged)

Reason: Specifying insulation board-only prescriptive options restricts flexibility, eliminates blown-in foam options in Zones 4-6 and removes the option to choose equally efficient insulation products. Limiting compliance to insulation-board only options also may make the use of WSP more problematic in high-wind and seismic zones, where structural components and connections are crucial. Each of these components must be attached per their listings, engineered designs and comply with structural code provisions.

The insulation values for walls in Zone 8, "All Other", should never be in excess of those for steel and are erroneous. Contrary to other requirements in this table, steel wall insulation values in this Zone 8 category are now less at R13+ 7.5 than those for wood at R-13+15.6. There is no plausible justification for flipping these values.

In the interest of maintaining realistic building practices and the marginal efficiency impact in Zone 8 of added wall insulation, which is primarily in Northern Alaska, an R-25 option is proposed for residential, which still exceeds the efficiency of an equivalent steel wall.

Cost Impact: The code change proposal will not increase the cost of construction.

(No change to remainder of table or footnotes)

Reason: In climate zone 2 Group R and climate zone 3, a change was made to Table 502.2(1) to return the R-value requirements for metal framed walls to that used in the 2006 IECC. The increased stringencies for climate zones 2 and 3 that were passed in the 2009 IECC are changes that result in significant construction costs but scant energy savings. Energy conservation could be better accomplished in other areas of the building envelope where more energy could be conserved for each dollar invested. Following is an analysis of Group R construction that was conducted in two cities in climate zone 2 and three cities in climate zone 3 that shows the costs and benefits associated with specifying a metal framed wall with the 2006 IECC requirements versus the 2009 requirements. The selected cities are the representative cities developed by PNNL for these respective climate zones. Based on this analysis, which shows simple paybacks from 25 to 65 years, the Steel Framing Alliance believes that there is not sufficient justification to retain the insulation requirements at the 2009 level.

*Energy use was derived through an annual hourly-based simulation using Energy Gauge Summit Premier from Florida Solar Energy Center, which uses DOE 2.1E as the simulation engine. The building modeled was a 32 unit multifamily residential building with individual dwellings of 1,000 sqft. Federal minimum efficiency air source heat pumps were modeled to provide space heating and cooling. In all cases except the R-13 steel framed wall, the building envelope was modeled to meet minimum prescriptive requirements of the 2009 IECC. Cost of electricity was based on U.S. DOE EIA 2007 state residential average retail price. The analysis was conducted by Newport Ventures, which maintains certified HERS raters and professional engineers on staff to conduct energy analyses of residential buildings.

**Costs of continuous insulation were estimated based on RS Means; costs do not include extra charges for jamb extensions.

***Time required to recoup costs to building owner based on energy savings expected

Cost Impact: The code change proposal will not increase the cost of construction.

Remainder of table unchanged.								

NR = No requirement.
PF = Projection factor (see Section 502.3.2).
a. All others includes operable windows, fixed windows and ~~non-entrance~~ doors other than entrance doors.

Reason: This proposal seeks to address an ongoing concern of the fenestration industry that Table 502.3 of the IECC is not material neutral, by removing separation by framing material for certain end product categories. The end products addressed by this proposal, specifically curtainwall, storefront and entrance doors, are often required by other provisions of the International Codes to meet higher levels of performance than other fenestration products in commercial buildings with regards to characteristics such as structural design load, durability, compliance with ADA, fire resistance rating and noncombustibility, etc.

To allow the designer of these products, and the architect, contractor and others associated with the design and construction of a commercial building, more options to meet these other requirements in a cost effective manner, Table 502.3 allows them more lenient U-factors in some climate zones. This should be permitted regardless of the framing material used. Removing the distinction for curtainwall, storefront and entrance doors recognizes this, and would allow future focus on the more troublesome "All Others" category.

Cost Impact: This code change will not increase the cost of construction.

All other *U*-factor[a,b]								
Performance class LC, CW, AW	~~1.20~~ 0.65[c]	~~0.75~~ 0.65	~~0.65~~ 0.60	~~0.55~~ 0.50	~~0.55~~ 0.50	~~0.55~~ 0.50	0.45	0.45
Performance class R	0.57[c]	0.57	0.40	0.35	0.35	0.35	0.35	0.35

(Portions of table not shown remain unchanged)

a. All others includes operable windows, fixed windows, and ~~nonentrance~~ doors other than entrance doors.
b. Performance class determined in accordance with AAMA/WDMA/CSA 101/I.S.2/A440.
c. For impact rated fenestration complying with Section R301.2.1.2 of the *International Residential Code* or Section 1608.1.2 of the *International Building Code*, the maximum *U*-factor shall be 1.20.

Reason: In past cycles, certain groups have voiced concerns about having separate metal vs. nonmetal fenestration frame categories in Table 502.3 on the basis that they are not "material neutral". We do not agree with those statements, in that there are specific technical reasons for having separate frame categories, and there is nothing inherently wrong with having separate requirements based on material. Material-based requirements are common throughout the I-codes (e.g. wood, metal, and mass wall requirements). In previous cycles, the committee has agreed and repeatedly rejected proposals to remove the metal vs. nonmetal framing categories.

Nonetheless, in a positive effort to address these concerns, we offer this proposal which would be "material neutral", yet also preserve the original reason for having separate metal vs. nonmetal categories – structural performance. This proposal would reformat the table, putting the window requirements in terms of the AAMA/WDMA/CSA 101/I.S.2/A440 performance classes (R vs. LC, CW, AW) instead of by material type. 101/I.S.2/A440 testing is already required by the IBC, and for air leakage in the IECC. (This is just for windows and non-entrance doors. Curtain wall, storefront, and entrance doors do not require 101/I.S.2/A440 testing, and their criteria remain separate in this table.)

At the same time, we have taken the opportunity to also increase stringency, based on requirements being proposed by the New Buildings Institute.

Cost Impact: The code change proposal will increase the cost of construction. There are increased costs associated with the increased stringency in U-factor, most notably with the requirement for double glazing in zone 1 and the increased use of thermally broken frames across several zones. However, these changes are felt to be justified at the levels proposed including the allowance for single glazing for hurricane products in zone 1.

SHGC	0.35	0.35	0.35	0.40	0.40	0.40	NR	NR

NR = No requirement
PF = Projection factor (see Section 502.3.2).
~~a. All others includes operable windows, fixed windows and nonentrance doors.~~

Reason: The current prescriptive requirements in Table 502.3 give preferential treatment to particular types of products by providing different rules depending upon the frame material used. Non-metal frame windows are generally more energy efficient than aluminum and metal windows, yet their use is restricted by the imposition of the prescriptive values that discriminate against wood, vinyl, and composite windows.
This proposal removes that preferential treatment (one that conflicts with the foundational principles of the IECC as reproduced below) and uses the current prescriptive values for non-metal frames as the baseline. The use of less efficient windows should not occur without a consideration of other efficiency measures such as increased insulation. This proposal makes no change in requirements for curtainwall, storefront, entrance doors, or non-metal frames. Buildings constructed with elements such as metal framed windows perform differently, and thus should qualify using the performance path.

Cost Impact: The code change proposal will not increase the cost of construction.

NR = No requirement
PF = Projection factor (see Section 502.3.2)
~~a. All others includes operable windows, fixed windows and nonentrance doors.~~

4. Revise as follows:

502.3.2Maximum*U*-factor and SHGC. For vertical fenestration, the maximum *U*-factor and solar heat gain coefficient (SHGC) shall be as specified in Table 502.3, based on the window projection factor. For skylights, the maximum *U*-factor and solar heat gain coefficient (SHGC) shall be as specified in Table 502.3.

The window projection factor shall be determined in accordance with Equation 5-1.

$PF = A/B$ **(Equation 5-1)**

where:

PF = Projection factor (decimal).

A = Distance measured horizontally from the furthest continuous extremity of any overhang, eave, or permanently attached shading device to the vertical surface of the glazing.

B = Distance measured vertically from the bottom of the glazing to the underside of the overhang, eave, or permanently attached shading device.

Where different windows or glass doors have different *PF* values, they shall each be evaluated separately, or an area-weighted *PF* value shall be calculated and used for all windows and glass doors.

The maximum SHGC for v*ertical fenestration* specified in Table 502.3 and shaded by *opaque permanent projections* shall be permitted to be increased using the multipliers in Table 502.3(2) based on PF as determined in accordance with Equation 5-1 and the orientation of the fenestration.

All *vertical fenestration* within 45 degrees of a south orientation shall be provided with *opaque permanent projections* having a PF of a least 0.5 as determined in accordance with Equation 5-1. All *vertical fenestration* within 45 degrees of an east or west orientation shall be provided with *opaque permanent projections* having a PF of a least 0.5 as determined in accordance with Equation 5-1.

5. Add new table as follows:

TABLE 502.3(2)
VERTICAL FENESTRATION SHGC ADJUSTMENT FACTORS

PF	SHGC Multiplier (over 45 degrees from true north)	SHGC Multiplier (within 45 degrees of true north)
0 – 0.10	1.00	1.00
>0.10 – 0.20	1.10	1.05
>0.10 – 0.20	1.22	1.10
>0.20 – 0.30	1.35	1.15
>0.30 – 0.40	1.49	1.19
>0.40 – 0.50	1.64	1.23
>0.60 – 0.70	1.79	1.28
>0.70 – 0.80	1.96	1.32
>0.80 – 0.90	2.13	1.33
>0.90 – 1.00	2.27	1.37

Reason: For consistency with ASHRAE Standard 90.1-07 addenda “bb and “bm”. This proposal is based on ongoing analysis efforts within ASHRAE designed to create a Standard 90.1-2010 that is 30% better than Standard 90.1-2004 in response to Federal legislation. Paralleling those efforts and considering that the IECC Chapter 5 is intended to be technically compatible with that standard to facilitate adoption and implementation, DOE is interested in keeping Chapter 5 of the 2012 IECC aligned with ANSI/ASHRAE/IESNA Standard 90.1-2010. Due to the timing of the code development process and ASHRAE standards processes this proposal was submitted in anticipation that by the final action hearings the work to update the standard would be complete. The definition of VT is needed as it is relevant in NFRC 200, which is used for fenestration property evaluation.

Cost Impact: The code change proposal will increase the cost of construction to the degree that more efficient products will be required for vertical fenestration.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: Majette-EC-52-202-T. 502.3-

EC167–09/10
Table 502.3

Proponent: Ronald Majette, representing US Department of Energy

Revise as follows:

TABLE 502.3
BUILDING ENVELOPE REQUIREMENTS: FENESTRATION

CLIMATE ZONE	1	2	3	4 EXCEPT MARINE	5 AND MARINE 4	6	7	8
Vertical fenestration (40% maximum of above-grade wall)								
U-factor

NR = No requirement
PF = Projection factor (see Section 502.3.2).
a. All other~~s~~ U-factor includes all other vertical fenestration such as ~~including~~ operable windows, fixed windows and nonentrance doors.

Reason: This proposal eliminates separate categories of window U-factor requirements based on framing materials and combines all windows (other than curtainwall, storefront and entrance doors) under one category with one uniform set of requirements. It is unreasonable and anticompetitive that a building's energy efficiency depends on the material selected for window frames. The proposal removes the incentive to install less-efficient windows and establishes a set of U-factor requirements that, on balance, will increase energy efficiency.

Given complaints at previous code hearings that metal framed products cannot reach the values applicable to non-metal windows, this proposal uses 0.45 as the lowest U-factor for "All other U-factor," which is proposed to include all metal and nonmetal framed fenestration other than curtain wall/storefront and entrance doors. 0.45 is a reasonable U-factor for this category, because fenestration with metal frames are currently required to meet 0.45 in zones 7-8. Extending this 0.45 U-factor to more zones would be a reasonable improvement in the code in this time where energy efficiency improvements are crucial to our nation. Moreover, according to the *2005 ASHRAE Handbook of Fundamentals*, a typical operable low-e with argon, double-pane aluminum thermal break window would have a U-factor of 0.44, while the comparable fixed window would meet a 0.37. (*See* Table 4, at page 31.8.) In fact, this data suggests that an even lower U-factor than 0.45 could be set (perhaps 0.40), but in order to be conservative, this proposal uses 0.45.

Because a uniform U-factor of 0.45 is somewhat weaker than the current requirement for nonmetal framed fenestration in climate zones 4-8, this proposal extends the 0.45 down through zone 4 and then uses the more stringent U-factors from the residential side for zones 1-3 in order to obtain energy savings to offset the theoretical potential for increased energy use in the northern zones (note that in the 2006 IECC the residential values and commercial values for non-metal frames were the same, but in the 2009 IECC the residential values are more stringent in southern climates).

While some might claim this approach weakens the requirements for non-metal-framed windows, as a practical matter this is not the case. For any non-metal framed window to meet the 0.45 U-factor, as a practical matter that window will have a reasonable IG unit with low-e and likely argon. As a result, in almost all cases, it will still have a U-factor equal to or less the current 0.35 requirement. Moreover, since metal-framed windows are predominant in commercial construction, the improved requirements for these windows will save far more energy, offsetting any losses on the non-metal side.

It should be noted that in the current draft proposal under review, ASHRAE 90.1 is proposing 0.26 for metal frames for fixed windows and 0.34 for metal frames in operable windows in the coldest zones (7-8), increasing to 0.36/0.42 for zone 6 and 0.38/0.44 for zones 4-5. *See First Public Review Draft of Proposed Addendum bb to ASHRAE Standard 90.1-2007*, Tables 5.5-1 – 5.5-8. The proposal above takes a more moderate approach, implementing uniformity and more flexibility in these climate zones.

Opponents of a uniform U-factor requirement often claim that metal-framed windows are desirable because of "structural benefits," and that a reduction in energy efficiency is an appropriate trade-off. We believe that a direct trade-off between structural requirements and energy efficiency is a bad precedent for the International Codes, because structural requirements and efficiency requirements should be set at optimum levels, individually. Just as it makes no sense to reduce the structural requirements of a building because it is more energy efficient, it makes no sense to reduce efficiency requirements because of perceived "structural benefits" afforded by different window frame types. However, this proposal accomplishes both objectives by requiring more efficient windows, but still permitting metal-framed windows to participate without resort to the performance path.

Cost Impact: The code change proposal will increase the cost of construction.

a. All others includes operable windows, fixed windows and nonentrance doors.

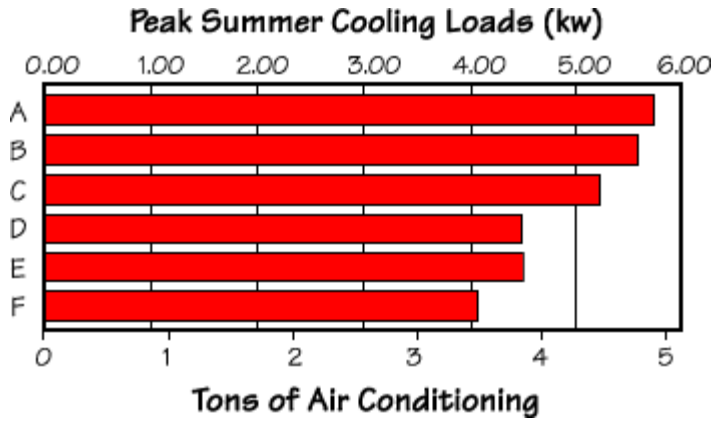
Reason: This proposal will save energy, reduce energy costs and reduce peak electricity demand with virtually no negative construction cost impact by establishing SHGC requirements for climate zones 4-6 consistent with the existing requirements for climate zones 1-3. This proposal will reduce the solar heat gain for buildings permitted in these climate zones by at least 37.5%.

The SHGC requirements for high-rise residential and commercial fenestration in the 2009 IECC and ASHRAE 90.1-2007 already recognize that SHGC should be controlled in all climate zones. (There is a maximum SHGC currently extending through climate zone 8 in both codes.) Likewise, the *Core Performance Guide* published by the New Buildings Institute sets a maximum SHGC for commercial buildings in all climate zones similar to the values proposed above, even when paired with effective shading. *See* Table 2.6.1. The current proposed revisions for ASHRAE 90.1 propose similar improvements, setting the SHGC at 0.26 in zones 4-5 and 0.35 in zone 6. *See First Public Review Draft of Proposed Addendum bb to ASHRAE Standard 90.1-2007*, Tables 5.5-1 – 5.5-8. Now is the time to improve the values in the *IECC*.

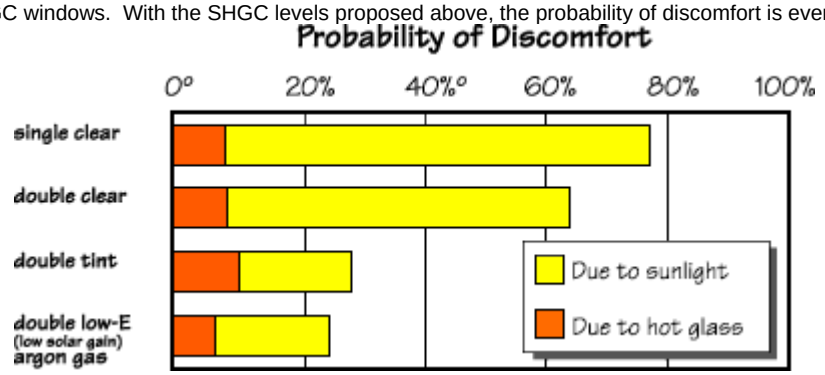
The types of buildings regulated under chapter 5 are typically internal-heat load dominated, and usually reach their maximum energy intensity during summer peak electricity times of the day and year. Despite a more northerly location, the electric utility systems of states throughout these climates zones peak in the summer, just like most of their southern counterparts, primarily due to air conditioning loads for commercial and residential buildings. As a result, demand is the highest at these times, requiring electric utilities to use expensive peaking plants or older, highly inefficient plants, to meet the demand. The result is exponentially higher cost and more pollution. Many states are currently embroiled in debates over how to meet (and pay for) rising electric peak demand and where to site new power plants.

Low SHGC fenestration is the obvious answer to this growing problem. The following chart, developed by the U.S. Department of Energy's Lawrence Berkley National Laboratory (LBNL), which is found on the Efficient Window Collaborative (EWC) website (www.efficientwindows.org), shows the potential for saving peak demand (and tons of HVAC) for different window types. While this is a residential home illustration, the point is equally valid for commercial buildings, which use basically the same glass.

Window E is a higher solar gain low-e double-pane window that meets the current U-factor requirement in climate zone 4. Window F is the low SHGC, low U-factor window that would meet the current U-factor requirement plus the SHGC maximum of this proposal. The reduction in peak cooling load is nearly half of a kW, reducing by almost a half ton the size of the air conditioning unit. As is readily apparent, improved windows will lead to smaller HVAC sizes (with lower costs to the building owner) and lower peak cooling loads (saving the state from building additional peak capacity).



Similarly, the following chart from the same source shows the probability of discomfort during summer from sunlight and hot glass. Again, this is an issue that is even more important for commercial than residential construction, since commercial buildings are more likely to be occupied during the daytime when the potential for discomfort is greatest. The summertime probability of discomfort ranges from over 60% with double pane clear glass to almost 20% with lower SHGC windows. With the SHGC levels proposed above, the probability of discomfort is even lower.



Windows with low SHGC will reduce the volatility of temperatures in the building. This will reduce occupant discomfort and make it less likely that occupants will need to adjust the thermostats down resulting in much greater energy cost.

In sum, lower SHGCs directly result in smaller electric loads, reduced HVAC sizing, greater comfort, less pollution and reduced energy use and cost in commercial buildings. Moreover, construction cost is not an issue since:

(1) the upgrade to lower SHGC comes for little or no cost since low-e fenestration is already specified by both the U-factor and SHGC requirements for these climate zones, making the SHGC merely a function of the particular version of low-e coating chosen; and

(2) far more dollars can be saved in downsizing HVAC systems.

Moreover, this result can be achieved with little impact on visible light transmission. We estimate that a 37.5% reduction in the requirement from 0.40 SHGC to 0.25 SHGC need only cost about 7-10% of the visible light (the center of glass VT of a product that would meet the 0.40 is around 70 – 72%% while there are glazing products that will meet 0.25 with center-of-glass VTs around 65%).

Studies have shown that reasonable improvements in building energy codes are some of the least expensive means of curbing electrical peak demand. The consulting firm McKinsey & Co. found in its recent report, *Reducing U.S. Greenhouse Emissions: How Much at What Cost*?, that improvements to residential and commercial buildings, including the thermal envelope, are among the most cost-effective means of reducing electric demand (and greenhouse gas emissions). *See* Pages 20, 61-62. The report also found that buildings are not currently built to optimum economic and efficiency levels. *See* Page 39.

Since lowering the SHGC to 0.25 from 0.40 (the current requirement for zones 4-6) comes at no cost and yields energy-saving and peak-reducing benefits, there is no reason not to capture the benefits of lower SHGC for these climates.

Cost Impact: The code change proposal will not increase the cost of construction.

NR = No requirement
~~PF = Projection factor (see Section 502.3.2).~~
a. All others includes operable windows, fixed windows and nonentrance doors.

502.3.2 Maximum *U*-Factor and SHGC. For vertical fenestration and skylights, the maximum *U*-factor and solar heat gain coefficient (SHGC) shall be as specified in Table 502.3~~, based on the window projection factor~~. ~~For skylights, the maximum *U*-factor and solar heat gain coefficient (SHGC) shall be as specified in Table 502.3.~~

~~The window projection factor shall be determined in accordance with Equation 5-1.~~

~~PF = A/B **(Equation 5-1)**~~

~~Where:~~

~~PF = Projection factor (decimal).~~
~~A = Distance measured horizontally from the furthest continuous extremity of any overhang, eave, or permanently attached shading device to the vertical surface of the glazing.~~
~~B = Distance measured vertically from the bottom of the glazing to the underside of the overhang, eave, or permanently attached shading device.~~

~~Where different windows or glass doors have different *PF* values, they shall be evaluated separately, or an area-weighted *PF* value shall be calculated and used for all windows and glass doors.~~

Reason: This proposal saves energy and simplifies the commercial building prescriptive path by removing inaccurate projection factor trade-offs for SHGC. Users may continue to use projection factors in the more detailed Total Building Performance compliance option in Section 506, where orientation and the specific impact of each overhang are more precisely measured and calculated.

There are more detailed and accurate methods to calculate the benefits of projection factors, such as an alternative proposal submitted in this cycle which applies a simplified version of the calculation used in ASHRAE 90.1-2007. However, by eliminating complicated calculations for overhangs, the proposal above simplifies compliance and enforcement efforts, consistent with the purpose of the simplified prescriptive path in section 502 of the IECC. In addition, the proposal ensures reduced energy cost, energy usage, peak demand, and smaller HVAC sizing.

Simpler Calculations. The current fenestration table in the IECC allows a weaker fenestration SHGC when projection factors are incorporated into the building's design. This extra set of calculations is difficult for code officials and designers alike, because (when it is done correctly) an accurate projection factor must be calculated for each window, and then worked into an area-weighted average. Similarly, the code official must inspect and measure each overhang to determine if the exception is properly applied. The proposed change is easier for a building official to enforce, and it allows more design freedom and greater certainty for the designer because it reduces the number of calculations and gives certain values for window performance. The proposal does not prevent the addition of overhangs, it simply gives no energy efficiency credit for such a design feature in the prescriptive path. This approach recognizes that given the cost differential between the cost of an overhang and improved SHGC, that no designer would add overhangs for cost reasons to meet the code.

More Uniformity. **The SHGC projection factor trade-off is irregularly applied in the table, and the values do not conform with accepted methods of calculation. The trade-off ratios change depending on climate zone for no particular reason. For example, it makes no sense in climate zones 4-6 that there is no SHGC requirement once the projection factor reaches 0.25. The effects of projection factor values recorded in Table 502.3 cannot be duplicated using the more accurate method employed in ASHRAE 90.1-2007. The prescriptive path should contain only requirements that can be consistently applied and enforced, and the end result should vary as little as possible from building to building.**

More Guaranteed Efficiency. Good solar control in windows can substantially increase comfort for the occupant and reduce electrical peak demands and HVAC sizing. However, solar control can be more or less effective, depending on the orientation of the building, climate zone, reflection, and percentage of the window exposed to the sun. Because these variables are not properly incorporated into the IECC's calculation of projection factor, the projection factor trade-off is highly inaccurate. To make matters worse, the projection factor is traded off against windows with low SHGC (as tested and certified according to objective criteria), which consistently block unwanted heat gain regardless of the building's orientation. The current method for determining projection factor in the IECC is far too inaccurate to trade away the guaranteed efficiency of an SHGC rating. To save energy and remove unnecessary complexity, this trade-off should be removed from the prescriptive path.

Cost Impact: This proposal should not add to the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Stone-EC-6-T. 502.3-502.3.2

EC171–09/10

502.3.1 (New), Chapter 6 (New)

Proponent: Craig Conner, Building Quality, representing self

1. Add new text as follows:

502.3.1 Storefront and curtain wall in commercial buildings: U-factors and SHGC for storefront and curtain wall in commercial buildings is permitted to be determined in accordance with AAMA 507. When AAMA 507 is used, the product performance shall be documented by a certificate of compliance, as described in AAMA 507, that is signed and submitted to the code official by a registered design professional. The product line testing and simulation, as described in AAMA 507, shall be conducted in accordance with NFRC 100 and NFRC 200 by an approved, accredited, independent laboratory.

(Renumber subsequent sections)

2. Add new standard to Chapter 6 as follows:

AAMA

507-07 Standard Practice for Determining the Thermal Performance Characteristics of Fenestration Systems Installed in Commercial Buildings

Reason: The IECC requires windows to be rated for energy efficiency. However, the rating procedure specified is too slow for the construction process for certain types of commercial windows. An optional alternative procedure is needed for "site built" store front and curtain wall windows. The process needs to produce a rating in time to respond to the normal commercial bid process. The time between bid and construction can be days or weeks. The NFRC web site stated, "it will take on average approximately 100 days to obtain a Label Certificate." The AAMA 507 procedure can be used to rate a window within a few days or less and produces the same rating.

Commercial window makers bid windows for a specific commercial building. Unlike residential windows, combination of glazing and frame are often produced in response to a specific commercial building design. The combinations of available glass and window frames are too numerous to rate all combinations in advance. However, the characteristics of each separate frame and glass option are known in advance. Using the AAMA 507 standard, commercial window makers can quickly and inexpensively use the frame and glass characteristics to produce a timely rating for windows tailored to the specifications for a particular building. Therefore, the AAMA 507 produces a practical window rating that can be used in the commercial site-built bid process and will further encourage energy-efficient commercial windows.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: A review of the standard(s) proposed for inclusion in the code, AAMA 507-07, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

502.3.1 (New), Chapter 6

Proponent: Julie Ruth, PE, JRuth Code Consulting; Margaret Webb, IGMA; Rand Baldwin, AEC; David Walker, NGA; Donn Harter, AGA; Kim Mann; Bill Koffel, representing American Architectural Manufacturers Association, Insulating Glass Manufacturers Alliance, Aluminum Extruders Council, National Glass Association, Americas Glass Association, Glass Association of North America, Glazing Industry Code Committee

1. Add new text as follows:

502.3.1 Storefront and curtainwall in commercial buildings. U-factors and SHGC for storefront and curtainwall in commercial buildings are permitted to be determined in accordance with AAMA 507. When AAMA 507 is used, the product performance shall be documented by a certificate of compliance, as described in AAMA 507, that is signed and submitted to the code official by a registered design professional. The product line testing and simulation, as described in AAMA 507, shall be conducted in accordance with NFRC 100 and NFRC 200 by an approved, accredited, independent laboratory.

2. Add standards to Chapter 6 as follows:

AAMA

507-07 Standard Practice for Determining the Thermal Performance Characteristics of Fenestration Systems Installed Commercial Buildings

Reason: For the last few cycles AAMA has sought approval of code change proposals that would clarify that use of AAMA 507 meets the requirements of the *International Energy Conservation Code* and therefore may be used to determine U-factor and SHGC for fenestration in commercial buildings. This code change proposal again seeks to place that clarification within the IECC by responding to the three principal concerns raised during the previous cycles in the following manner:

1. Concern that if approved, residential window manufacturers might try to use the new code text to avoid having to label their products in compliance with NFRC 100 or NFRC 200.

This proposal limits the use of AAMA 507 to curtainwall and storefront in commercial buildings in two distinct ways -- with the express language used - and with the placement of the provisions in Chapter 5 of the IECC. Placing the new text in Chapter 5 strengthens the intent of limiting the use of AAMA 507 to commercial buildings.

2. Concern that the results of AAMA 507 may not be consistent with those of NFRC 100 and NFRC 200.

Although there are provisions within AAMA 507 that permit use of other methods for product line testing and simulation when determining fenestration U-factor and SHGC, the proposal specifically limits performing product line testing and simulation: they must be done in accordance with NFRC procedures. This would include the mandatory use of NFRC stipulated sizes.

When this approach is taken, previous analysis has found and verified that the variation between AAMA 507 and NFRC 100 for U-factor and NFRC 200 for SHGC is never greater than 0.06%. A variation that is only 6/100 of 1% is not statistically significant.

3. Concern that relying upon the Certificate of Compliance, provided in accordance with AAMA 507 and this code change proposal, would result in less oversight of the final product than the current requirements of the IECC provide.

The key oversight tool within AAMA 507 is the Certificate of Compliance. It is developed using NFRC procedures, using accredited, independent laboratories and simulators, as required by NFRC. As a result, the values that are listed on the certificate are developed with the same level of oversight as any other values that would come from an NFRC accredited laboratory. Previous editions of AAMA 507 did not mandate the use of the Certificate of Compliance, but AAMA 507 was revised to mandate the use of the Certificate of Compliance, primarily to respond to concerns raised by this issue during earlier code change cycles.

Beyond that, AAMA 507 and this proposal rely upon the contractual relationship existing on all commercial jobs between the registered design professional, the general contractor and the glazing contractor to provide assurance that the actual product installed in the field is the same as that specified in the approved construction documents. This is the same relationship that is relied upon for many other aspects of commercial construction, including the structural framework of the building itself if it is constructed of structural steel.

Furthermore, this combination of the Certificate of Compliance and the contract documents, memorializing the agreement between the contractors and designers, actually provides a stronger level of oversight than what is currently required by the IECC for the determination of U-factor and SHGC. Section 303.1.3 of the 2009 *International Energy Conservation Code* requires *U*-factors of fenestration products (windows, doors and skylights) to be "determined in accordance with NFRC 100 by an accredited, independent laboratory, and labeled and certified by the manufacturer". Similarly, the same section requires the SHGC of fenestration products to be "determined in accordance with NFRC 200 by an accredited, independent laboratory, and labeled and certified by the manufacturer". Although the use of the word "labeled" in the International Codes often implies a requirement for third party certification, the ICC has issued a Formal Interpretation (ICC Committee Interpretation 18-08) stating that the text (of then Section 102.1.3 of the 2006 IECC - now of Section 303.1.3 of the 2009 IECC) does not require third party labeling of the product. The key here is the phrase "labeled and certified by the manufacturer". The Formal Interpretation then goes on to say that the process to be used to determine U-factor and SHGC in compliance with the IECC is that manufacturers "have their products rated by an accredited and independent testing laboratory. The manufacturer then labels their products demonstrating their commitment to provide accurate energy and energy-related performance information. The code does not require that the labeling be done by an approved third party agency."

This code change proposal requires, as Sec. 303.1.3 of IECC 2009 does, that the U-factor and SHGC of the product be determined by accredited and independent laboratories. Beyond the requirements of Section 303.1.3, the proposal requires that the Certificate of Compliance, signed by the registered design professional, and developed in accordance with AAMA 507, be provided to verify the performance of the actual installation. This proposed protocol actually provides a significantly greater level of oversight than what the IECC currently requires.

Therefore, permitting use of AAMA 507 to determine the U-factors and SHGC of curtainwall and storefront does not weaken the IECC. If the glazing contractor decides in favor of using this approach, they are actually engaging in a more stringent program than that currently required by the IECC.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: A review of the standard(s) proposed for inclusion in the code, AAMA 507-07, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

	Assembly:	ASF	AMF	DF

ICCFILENAME: Ruth-EC-5-502.3.1-Ch 6

EC173–09/10
502.3.2 (New), Chapter 6 (New)

Proponent: Ronald Majette, representing US Department of Energy

Add new text as follows:

502.3.2 Minimum *Skylight* Fenestration Area. In *enclosed spaces* greater than 10,000 square feet, (900 m^2), directly under a roof with ceiling heights greater than 15 feet (4.6 m), and used as an office, lobby, atrium, concourse, corridor, storage, gymnasium/exercise center, convention center, automotive service, manufacturing, non-refrigerated warehouse, retail store, distribution/sorting area, transportation, or workshop, the total *daylight zone under skylights* shall be a minimum of half the floor area and provide a minimum *skylight* area to *daylight zone under skylights* of 3 percent with a skylight VLT of at least 0.40 or provide a minimum skylight effective aperture of at least 1 percent.

Skylights shall have a glazing material or diffuser with a measured haze value greater than 90% when tested according to ASTM D1003. General lighting in the daylight area shall be controlled as described in Section 505.2.2.3.

Exceptions:

1. In climate zones 6 through 8
2. Where the designed *general lighting* power densities less than 0.5 W/ft^2 (5.4 W/m^2)
3. Areas where it is documented that existing structures or natural objects block direct beam sunlight on at least half of the roof over the enclosed area for more than 1,500 daytime hours per year between 8 am and 4 pm.
4. Where the daylight area under rooftop monitors is greater than 50% of the enclosed space floor area.

3. Add new standard to Chapter 6 as follows:

ASTM	
D 1003-07e1	Standard Test Method for Haze and Luminous Transmittance of Transparent Plastics

Reason: This proposal is based on ongoing analysis efforts within ASHRAE designed to create a Standard 90.1-2010 that is 30% better than Standard 90.1-2004 in response to Federal legislation. Paralleling those efforts and considering that the IECC Chapter 5 is intended to be technically compatible with that standard to facilitate adoption and implementation, DOE is interested in keeping Chapter 5 of the 2012 IECC aligned with ANSI/ASHRAE/IESNA Standard 90.1-2010. Due to the timing of the code development process and ASHRAE standards processes this proposal was submitted in anticipation that by the final action hearings the work to update the standard would be complete. To promote energy use reduction through daylighting. For background documentation on the analysis used to derive these proposed requirements, go to

http://www.h-m-g.com/ASHRAE_Daylighting/

Cost Impact: The code change proposal can increase or decrease the cost of construction depending on the cost of any additional skylights to be installed and the reduced cost in lighting equipment.

Analysis: A review of the standard(s) proposed for inclusion in the code, ASTM D1003-07, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

Public Hearing:	Committee:	AS	AM	D

EC174–09/10
502.3.2, Table 502.3

Proponent: Garrett Stone, Brickfield, Burchette, Ritts & Stone, representing Cardinal Glass Industries

Revise as follows:

502.3.2 Maximum *U*-Factor and SHGC. For vertical fenestration the maximum *U*-factor and solar heat gain coefficient (SHGC) shall be as specified in Table 502.3, based on the window projection factor. For skylights, the maximum *U*-factor and solar heat gain coefficient (SHGC) shall be as specified in Table 502.3.

Exception:
Where the fenestration projection factor for a specific vertical fenestration product is measured and calculated and determined to be greater than or equal to 0.2, the required SHGC from Table 502.3 shall be adjusted by multiplying the required maximum SHGC by the following multipliers corresponding with the orientation of the fenestration product and the projection factor:

Projection Factor	Oriented Within 45 Degrees of True North	All Other Orientation
0.2 ≤ PF < 0.5	1.1	1.2
PF ≥ 0.5	1.2	1.6

The window projection factor shall be determined in accordance with Equation 5-1.

PF = A/B **(Equation 5-1)**

Where:

PF = Projection Ffactor (decimal).

A = Distance measured horizontally from the furthest continuous extremity of any overhang, eave, or permanently attached shading device to the vertical surface of the glazing.

B = Distance measured vertically from the bottom of the glazing to the underside of the overhang, eave, or permanently attached shading device.

Where different windows or glass doors have different *PF* values, they shall be evaluated separately~~, or an area-weighted *PF* value shall be calculated and used for all windows and glass doors~~.

NR = No requirement

~~PF = Projection factor (see Section 502.3.2).~~

a. All others includes operable windows, fixed windows and nonentrance doors.

Reason: This proposal improves the code by:
(1) incorporating the more precise ASHRAE 90.1 projection factor adjustment methodology into the IECC;
(2) recognizing that projection factors vary by orientation;
(3) allowing the projection factor adjustment as an exception where the projection factor of each window has actually been measured; and
(4) eliminating the area-weighted average approach from this exception.

While eliminating the projection factor trade-off would be the best solution, if a projection factor trade-off is to be retained by the IECC for buildings subject to chapter 5 of the IECC, it should be developed so as to accurately establish a trade-off while maintaining reasonable simplicity for ease of application in code compliance and enforcement. This proposal meets these objectives.

Simple, But More Accurate Adjustment Multiplier. ASHRAE 90.1 provides an adjustment multiplier that must be applied individually to each window, based on projection factor and orientation. This is a more precise and accurate approach to calculate projection factor and determine its effects than the prescriptive table in the current IECC, because the current IECC does not take into account the orientation of the windows and it allows a weighted-average approach. However, the ASHRAE method requires a great deal of calculation, because the adjustment must be applied to the SHGC of each individual window to determine compliance. In contrast, the above proposal is written to overcome this hurdle – specifically, the adjustment multiplier is applied as an adjustment to the prescriptive maximum SHGC requirement, thereby eliminating the need to recalculate the value for every window – instead, the multipliers need only be applied once to the prescriptive value for each zone to determine the appropriate requirements.

To further simplify the calculation, the proposal retains only two categories, but modifies the first category from 25%-50% to 20%-50% to better match the categories in ASHRAE, and the multipliers have all been rounded off.

Orientation. For many years, ASHRAE 90.1 has recognized that projection factor is more or less effective depending on the orientation of the window. Ideally, good passive solar design should incorporate precise window orientation and window selection on all sides of the building in order to ensure proper use (and shading) of the sun throughout the year. However, ASHRAE 90.1 has simplified the calculation into two general categories: Fenestration oriented within 45 degrees of true north; and all other orientation. The above proposal has adopted these general categories to maintain consistency with ASHRAE 90.1, and to introduce a simple element of orientation into the projection factor calculation.

Measurement. In the case of projection factor trade-offs, where SHGC values (which are tested and labeled according to objective national standards) are being traded off for building components that are not objectively tested (and are typically determined in the design and permitting phase), the IECC should ensure that projection factor is being properly measured and calculated for each window taking advantage of the projection factor exception.

Area-Weighting. An area-weighted average approach does not make sense for the projection factor calculation because additional shading on some windows does not balance out the lack of shading on others, especially when those windows are oriented differently. For example, 100% shading on a north-facing window, where shading provides little benefit, cannot compensate for a west-facing window with complete sun exposure. However, an area-weighted average approach would simply average the two windows regardless of the actual shading benefits. The above proposal eliminates the area-weighting approach from the projection factor calculation and requires calculation for each window, benefiting designers who are properly orienting and shading all the windows of the home. It should be noted that current SHGC requirements for these buildings do not allow area-weighting of product SHGCs; it is inconsistent with this requirement to allow area-weighting in the case of projection factors.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Stone-EC-2-502.3.2-T. 502.3

EC175–09/10
502.3.2, Table 502.3

Proponent: Garrett Stone, Brickfield, Burchette, Ritts & Stone, representing Cardinal Glass Industries

Revise as follows:

502.3.2 Maximum *U*-Factor and SHGC. For vertical fenestration the maximum *U*-factor and solar heat gain coefficient (SHGC) shall be as specified in Table 502.3, based on the window projection factor. The applicable maximum U-factor for all vertical fenestration other than curtainwall, storefront and entrance doors shall be determined by the total vertical fenestration area as a percentage of above grade wall area as specified in Table 502.3. An area-weighted average of vertical fenestration products shall be permitted to satisfy the U-factor requirements for each category of products. For skylights, the maximum *U*-factor and solar heat gain coefficient (SHGC) shall be as specified in Table 502.3.

U-factor and solar heat gain coefficient (SHGC) shall be as specified in Table 502.3.

The window projection factor shall be determined in accordance with Equation 5-1.

$PF = A/B$ **(Equation 5-1)**

where:

PF = Projection factor (decimal).

A = Distance measured horizontally from the furthest continuous extremity of any overhang, eave, or permanently attached shading device to the vertical surface of the glazing.

B = Distance measured vertically from the bottom of the glazing to the underside of the overhang, eave, or permanently attached shading device.

Where different windows or glass doors have different *PF* values, they shall each be evaluated separately, or an area-weighted *PF* value shall be calculated and used for all windows and glass doors.

TABLE 502.3

NR = No requirement
PF = Projection factor (see Section 502.3.2).
a. Total Fenestration Area includes the area of all vertical fenestration, including curtainwall, storefront, entrance doors, etc. ~~All others includes operable windows, fixed windows and nonentrance doors.~~

Reason: This proposal is a stepped approach (based on fenestration area) to fenestration U-factor requirements that increases energy efficiency by rewarding energy efficient design choices, while reasonably increasing flexibility. The proposal eliminates the current *IECC* practice of distinguishing between fenestration requirements based on frame material type (e.g., metal v. non-metal). It is unreasonable and anti-competitive that a building's energy efficiency requirements depend on the material selected for window frames. The current practice actually creates an incentive to select much less efficient fenestration, simply on the basis of frame selection. This proposal removes this incentive while leaving options for construction with all frame types.

To fix this problem, the above proposal establishes:

(1) two levels of vertical fenestration area (40% and 25% of above-grade wall);
(2) a U-factor requirement that all of the vertical fenestration (other than curtainwall, storefront and entrance doors) must meet on a for each level of fenestration area; and
(3) an area-weighted average option for U-factor compliance.

Although the proposed U-factor requirements are more stringent on average, the combination of a weighted-average U-factor and fenestration-area-dependent requirement ensures flexibility and a wide range of choices for designers and builders.

The proposal begins with the requirements in the 2009 IECC for non-metal-framed fenestration as the baseline for 40% fenestration area. The U-factors at these levels are improved where reasonably feasible based on proposals from the 07/08 ICC cycle for residential fenestration. Using these values as a baseline, the proposal then develops an alternative set of requirements for 25% window area by using a simple, straightforward UA calculation to determine comparable values at this level. For purposes of the UA calculation, the proposal assumes the opaque wall U-factor to be equal to the highest wall U-factor from Table 502.1.2 for each climate zone.

The result is a flexible U-factor requirement that rewards designers and builders who incorporate more energy efficiency into buildings, rather than arbitrarily rewarding builders who select certain types of fenestration or framing materials (which are not always the most efficient option). The proposal will also save energy since the baseline requirements are more stringent than current code and the requirements for 25% glazing are generally comparable to current requirements for metal-framed windows.

Complaints at previous code hearings that metal-framed products cannot reach increasing energy efficient values have often stymied significant improvements in glazing requirements for commercial and high-rise residential buildings. This proposal addresses this problem squarely by offering a compliance path at 25% glazing geared to values that these products can meet. Opponents of a uniform U-factor requirement often claim that metal-framed windows are desirable because of "structural benefits," and that a reduction in energy efficiency is an appropriate trade-off. We believe that a direct trade-off between structural requirements and energy efficiency is a bad precedent for the International Codes, because structural requirements and efficiency requirements should be set at optimum levels, individually. Just as it makes no sense to reduce the structural requirements of a building because it is more energy efficient, it makes no sense to reduce efficiency requirements because of perceived "structural benefits" afforded by different window frame types. This proposal resolves these issues fairly and reasonably.

Cost Impact: The code change proposal will increase the cost of construction.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: Stone-EC-5-502.3.2-T. 502.3

EC176–09/10
502.3.3 (New)

Proponent: Thomas D. Culp, Ph.D., Birch Point Consulting LLC, representing Aluminum Extruders Council

Add new text as follows:

502.3.3 Area-weighted U-factor. An area-weighted average shall be permitted to satisfy the *U*-factor requirements for each fenestration product category listed in Table 502.3. Individual fenestration products from different fenestration product categories listed in Table 502.3 shall not be combined in calculating area-weighted average *U*-factor.

Reason: This proposal clarifies that area-weighted averages may be used to comply with the U-factor requirements in Table 502.3, similar to what is allowed in Chapter 4 and in ASHRAE 90.1. Currently, it is ambiguous whether each individual fenestration product must meet the specified requirement, or whether the overall average of all the individual products within that product type may be used.

There is a large diversity of fenestration products in commercial construction, and enforcement issues can arise where there are a small number of minority products which do not meet the prescriptive requirements, yet the overall performance of all fenestration assemblies is well below the requirement. Area-weighted averaging would alleviate this problem. Enforcement by the building official should not be a problem in that Section 103.2 already requires that area-weighted U-factor calculations be provided on construction documents.

This proposal also clarifies that different product categories (skylight, curtainwall, entrance door, etc.) may not be mixed in the area-weighted calculation, because it would then be uncertain which U-factor requirement would be used for code compliance.

A similar proposal was rejected last cycle because it also included area weighted averaging for SHGC. The committee correctly pointed out that it is not appropriate to average SHGC on different sides of the building (e.g. west and north). Therefore, this proposal does not include SHGC, and only addresses U-factor.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: CULP-EC-3-502.3.3.DOC

EC177–09/10
202 (New), 502.3.3 (New)

Proponent: Ronald Majette, representing US Department of Energy

1. Add new definition as follows:

OPAQUE PERMANENT PROJECTION. Permanent shading devices attached to the building or consisting of portions of the building such as overhangs or eaves, including open louvers that do not allow the sun to penetrate the louvers during the peak sun angle on June 21 (December 21 southern hemisphere).

2. Add new text as follows:

502.3.3. Fenestration Orientation. The *vertical fenestration area* shall meet the following requirement:

$A_S \geq A_W$ *and* $A_S \geq A_E$

where:

A_S = south oriented *vertical fenestration area* (oriented less than 45 degrees of true south)
A_n = north oriented *vertical fenestration area* (oriented less than 45 degrees of true north)
A_w = west oriented *vertical fenestration area* (oriented less than or equal to 45 degrees of true west)
A_e = east oriented *vertical fenestration area* (oriented less than or equal to 45 degrees of true east)

Exceptions:

1. *Vertical fenestration* that is shaded by *opaque permanent projections.*
2. Buildings that have an existing building or existing permanent infrastructure within 20 ft (6 m) to the south which is at least half as tall as the proposed building.
3. Buildings with shade on 75 percent of the west and east façade from existing buildings, existing permanent infrastructure, or topography at 9 AM and 3 pm on the summer solstice.
4. *Alterations* and *additions* with no increase in *vertical fenestration area*.

Reason: This proposal is based on ongoing analysis efforts within ASHRAE designed to create a Standard 90.1-2010 that is 30% better than Standard 90.1-2004 in response to Federal legislation. Paralleling those efforts and considering that the IECC Chapter 5 is intended to be technically compatible with that standard to facilitate adoption and implementation, DOE is interested in keeping Chapter 5 of the 2012 IECC aligned with ANSI/ASHRAE/IESNA Standard 90.1-2010. Due to the timing of the code development process and ASHRAE standards processes this proposal was submitted in anticipation that by the final action hearings the work to update the standard would be complete.

This proposed change is intended to limit poorly oriented fenestration. Compliance can be shown by having more south facing fenestration than west facing fenestration. For those buildings affected by this requirement, this reduces envelope loads, energy usage and thereby costs. This approach gives flexibility to building design teams to work with building sitting and fenestration orientation as well as fenestration area to comply with the requirement. This change provides exceptions for retail glass and buildings potentially shaded from the south or west. Also, an exception is provided for certain additions and alterations.

Cost Impact: The code change proposal could increase or decrease the cost of construction based on the difference in orientation and fenestration location that occurs compared to what would have occurred without this requirement. It is likely this requirement will cause some additional thinking about orientation and shape of the building that will reduce the cost of construction.

ICCFILENAME: Majette-EC-4-502.3.3

EC178–09/10

502.3.3 (New)

Proponent: Ronald Majette, representing US Department of Energy

Add new text as follows:

502.3.3 Fenestration orientation. Fenestration on walls facing directly west shall be limited to 10 percent of the total fenestration area of the building. As a wall facing within 45 degrees of west is oriented from true west toward the north the percentage shall be permitted to be increased by 1 percent for each 2.5 degrees of orientation of the wall toward the north. As a wall facing within 45 degrees of west is oriented from true west toward the south the percentage shall be permitted to be increased by 1 percent for each 5 degrees of orientation of the wall toward the south.

Reason: This proposal is based on ongoing analysis efforts within ASHRAE designed to create a Standard 90.1-2010 that is 30% better than Standard 90.1-2004 in response to Federal legislation. Paralleling those efforts and considering that the IECC Chapter 5 is intended to be technically compatible with that standard to facilitate adoption and implementation, DOE is interested in keeping Chapter 5 of the 2012 IECC aligned with ANSI/ASHRAE/IESNA Standard 90.1-2010. Due to the timing of the code development process and ASHRAE standards processes this proposal was submitted in anticipation that by the final action hearings the work to update the standard would be complete.

Cost Impact: The code change proposal could increase or decrease the cost of construction based on the difference in orientation and fenestration location that occurs compared to what would have occurred without this requirement. It is likely this requirement will cause some additional thinking about orientation and shape of the building that will reduce the cost of construction.

202 (New), 502.3.3 (New), 505.2.5 (New), Chapter 6

Proponent: Julie Ruth, PE, JRuth Code Consulting, representing American Architectural Manufacturers Association; Tom Culp, Birchpoint Consulting, representing Aluminum Extruders Council

1. Add new definitions as follows:

GENERAL LIGHTING: Lighting that provides a uniform level of illumination throughout an area. General lighting shall not include emergency lighting; decorative lighting or lighting that provides a dissimilar level of illumination to serve a specialized application or feature within such area.

MULTI-LEVEL LIGHTING CONTROLS. Systems that automatically reduce the lighting power draw in a series of at least two levels or by continuous dimming in response to availability of daylight within the interior space (sometimes referred to as “photo control”).

HAZE VALUE. The ratio of diffusely transmitted light to total light transmitted.

2. Add new text as follow:

502.3.3 Minimum daylighting. In spaces enclosed by walls or floor-to-ceiling partitions that are greater than 25,000 square feet (2000 m^2) in area and directly under a roof with ceiling heights greater than 15 feet (4.6 m), in single story buildings of Group E, F-1, F-2, M, S-1 or S-2 occupancies, a minimum of 50 percent of the floor area shall be in a daylight zone. The maximum percentage of gross roof assembly area that is permitted to be roof mounted fenestration (including but not limited to skylights, tubular daylighting devices, light-transmitting smoke vents, and roof windows) in these spaces shall be 6 percent. All lighting in this daylight zone shall be controlled by multi-level lighting controls that comply with Section 505.2.5.

Roof mounted fenestration in these spaces shall meet the following criteria:

1. The haze value of the combined glazing materials or diffuser in the assembly shall be identified by a manufacturer's designation that indicates manufacturer, testing laboratory, haze value and test method used. The haze shall be 90 percent or greater when tested according to ASTM D1003.
2. The minimum fenestration VT shall be 0.60 when determined in accordance with ASTM E972 or NFRC 200.
3. The maximum U-factor of the fenestration shall meet the requirements of Table 502.3. The maximum SHGC shall be 0.60.

Exceptions:

1. Spaces in climate zones 6 through 8.
2. Auditoriums, theaters, museums, places of worship, and refrigerated warehouses.
3. Spaces with general lighting power densities less than 0.5 W/ft2 (5.4 W/m2).

505.2.5 Multi-level lighting controls. When multi-level lighting controls are required by this code, the general lighting in the daylight zone shall be separately controlled by at least one multi-level lighting control that reduces the lighting power in response to daylight available in the space. When the daylit illuminance in the space is greater than the rated illuminance of the general lighting of daylight zones, the general lighting shall be automatically controlled so that its power draw is no greater than 35 percent of its rated power. The multi-level lighting control shall be located so that calibration and set point adjustment controls are readily accessible and separate from the light sensor.

3. Add new standards to Chapter 6 as follows:

ASTM

D1003-00	*Standard Test Method for Haze and Luminous Transmittance of Transparent Plastics*
E972-96(2002)	*Standard Test Method for Solar Photometric Transmittance of Sheet Materials Using Sunlight*

Reason: This proposal seeks to take advantage of the tremendous energy savings that can be achieved by incorporating daylighting into building design. A recent study conducted by TIAX LLC for the U.S. Department of Energy found that energy savings of between $0.10 to $0.32/sq foot /year can be achieved by incorporating skylights with lighting controls into the design of commercial buildings.

This proposal would mandate daylighting of those types of spaces for which the report predicted the shortest payback period (4 to 10 years), which are large, open spaces (in the case of this proposal > 25,000 sq. ft) with high ceilings (in the case of this proposal > 15 ft.). Also, the proposal is limited to those occupancies where manual control of daylighting for purposes of the processes that take place within the building are least likely to be needed (educational, mercantile, factory and storage).

Although previous studies have found that significant (>10%) energy savings can be achieved by incorporating skylights with automatic lighting controls with the characteristics defined in this proposal in all climate zones, the greatest savings (20 to 35%) occur in Climate zones 1 to 5. Therefore, this proposal does not require mandatory daylighting in climate zones 6 to 8.

The proposal leaves the exact distribution of skylights to the designer. Requiring the 50% threshold to be met by skylights in no more than 6% of the roof area together with vertical glazing would require the designer to distribute the skylights well over the surface of the roof.

The criteria for the skylights themselves are based either upon the criteria used in the DOE study or current requirements of the IECC. To provide meaningful reduction in lighting load the Visible Transmittance of the skylights must be 0.60 or greater, as was assumed for the study. Visible Transmittance is directly proportional to SHGC, so the lower the SHGC, the lower the VT and the less light transmitted into the interior space. A comparison of VT vs. SHGC of domed skylights listed on the NFRC database on March 30, 2009 yielded the results shown in the graph below.

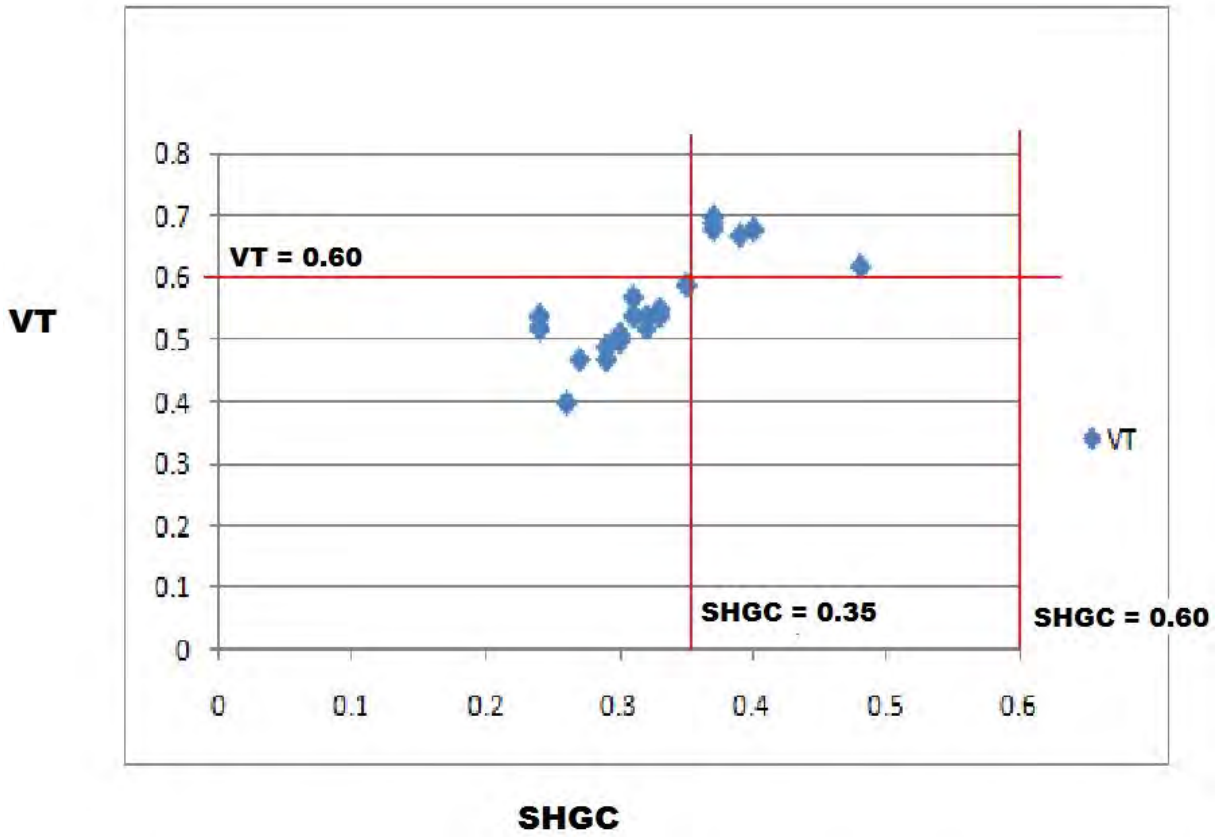

Figure 1 Comparison of VT to SHGC for domed skylights listed in NFRC Database

The TIAX/DOE study found that for skylight to roof area ratios of 6% or less, the energy savings were greater when domed skylights with SHGC of 0.53 were used than when flat skylights with SHGC = 0.35 were used.

As can be seen in the graph above, if a maximum SHGC of 0.35 is required, a domed skylight product with VT > 0.60 is not currently available. The baseline skylight used in the study had an SHGC = 0.53 and VT = 0.65. The study also found energy savings would be achieved for domed skylights with SHGC = 0.59 and VT = 0.62. As can be seen in the graph above, once the SHGC maximum limit of 0.35 is removed, domed skylights with VT > 0.60 are available. Therefore the proposal requires a minimum VT = 0.60 and a maximum SHGC = 0.60.

The proposal relies upon the current requirements of the IECC for maximum U-factor for the skylights used. These are more stringent than the study's baseline skylight U-factor of 0.81. The proposal also adds new criteria for Visible Transmittance and Diffusion of skylights to the IECC, when mandatory daylighting is required. Finally, the proposal relies upon Table 502.3 for vertical glazing, and does not modify any of those requirements for the purposes of providing daylighting to the spaces addressed by this proposal.

Copies of the study quoted "Commercial Building Toplighting: Energy Savings Potential and Potential Paths Forward" NTIS # PB2008-111197 by TIAX LCC, can be obtained from National Technical Information Service (NTIS), U.S. Department of Commerce, Springfield, VA 22161, 703-487-4650. The report has also been posted on the AAMA website, and can be accessed at http://www.aamanet.org/mp/TIAX_DOE-BT_Toplighting_Final_Report.pdf

Cost Impact: There will be some increased cost to construction due to this requirement. It is anticipated, however, that these initial costs will be offset over time by the energy cost savings. As discussed in the TIAX/DOE study, the anticipated payback period is 10 years or less. In some cases (depending upon climate zone, lighting design level, etc) the payback period will be 4 years or less.

Analysis: A review of the standard(s) proposed for inclusion in the code, ASTM D1003-003 and E972-96 (02), for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

EC180–09/10

502.3.3 (New)

Proponent: Garrett Stone, Brickfield, Burchette, Ritts & Stone, representing Cardinal Glass Industries

Add new text as follows:

502.3.3 Visible Transmittance. For all glazed fenestration products, the area-weighted average ratio of *visible transmittance / solar heat gain coefficient* shall be greater than 1.5.

Reason: The effective use of daylighting in commercial construction has long been recognized as bringing energy savings and benefits to a building's occupants. This proposal implements a standard for visible light transmittance (VT) designed to maximize useful daylighting in commercial buildings while maintaining effective control over solar heat gain. While the VT may later be combined with use of automatic lighting controls, this proposal sets a ratio of VT to SHGC acceptable for typical commercial occupancies.

Because commercial buildings are predominantly occupied during daylight hours and internal heat load dominated, building design should maximize both daylighting and appropriate solar control. Historically, designers incorporated tinted glass to control solar heat gain, but the reduced transmission of daylight required more artificial light (requiring additional energy and creating additional internal heat loads). As spectrally selective glazing technologies have been perfected, designers are increasingly using glazing that maximizes the amount of visible light entering buildings, while limiting the solar heat gain. Achieving a high VT/SHGC ratio should not add significant cost to commercial glazing since the technology (low-e coatings) is basically the same for both high and low visible light transmission glass with low SHGCs.

Recognizing the range of VT and SHGC ratings of products currently on the market, this proposal uses the "light-to-solar-gain ratio" method used in the ASHRAE Handbook. *See 2005 ASHRAE Handbook of Fundamentals*, at 31.59. This ratio simply divides the VT (expressed as a number between 0 and 1) by the SHGC (also expressed as a number between 0 and 1). This proposal adopts the VT/SHGC ratio specified in the *Core Performance Guide* (2007) published by the New Buildings Institute, which is >1.5 for all climate zones. which will allow reasonable design flexibility and product selection. *See* Table 2.6.1.

Cost Impact: The code change proposal will increase the cost of construction.

EC181–09/10

502.4.1, 502.4.2, 502.4.3, 502.4.4, 502.4.5

Proponent: Mr. Laverne Dalgleish, Building Professionals, representing Air Barrier Association of America, Inc.

Revise as follows:

502.4 Air leakage (Mandatory).

502.4.1 Air barriers. The building envelope shall be designed and constructed with a continuous air barrier to control air leakage into, or out of the conditioned space. An air barrier system shall also be provided for interior separations between conditioned space and a space designed to maintain temperature levels higher than 50 degrees for heating and less than 85 degrees for cooling or spaces that are designed to operate with humidity levels of less than 20 percent or more than 60 percent relative humidity.

The air barrier shall have the following characteristics:

1. It shall be continuous, with all joints made airtight.
2. Materials used for the air barrier system shall have an air permeability not to exceed 0.004 cfm/ft² under a pressure differential of 0.3 in. water (1.57psf) (0.02 L/s·m² @ 75 Pa) when tested in accordance with ASTM E 2178. Air barrier materials shall be taped or sealed in accordance with the manufacturer's instructions.
3. Air barrier materials shall be maintainable, or, if inaccessible, shall meet the durability requirements for the service life of the envelope assembly.
4. The air barrier material of an envelope assembly shall be joined and sealed in a flexible manner to the air barrier material of adjacent assemblies, allowing for the relative movement of assemblies due to thermal and moisture variations and creep.

Connections shall be made between:

1. Joints around *fenestration* and *door* frames.
2. Junctions between *walls* and foundations, between *walls* at building corners, between *walls* and structural. *floors* or *roofs*, and between *walls* and *roof* or *wall* panels.
3. Openings at penetrations of utility services through *roofs*, *walls*, and *floors.*
4. Site-built *fenestration* and *doors.*
5. Building assemblies used as ducts or plenums.
6. Joints, seams, and penetrations of vapor retarders.
7. All other openings in the *building envelope.*

502.4.2 Air barrier penetrations. All penetrations of the air barrier and paths of air infiltration/exfiltration shall be made air tight.

~~502.4.1~~ **502.4.3 Window and door assemblies.** The air leakage of window and sliding or swinging door assemblies that are part of the building envelope shall be determined in accordance with AAMA/WDMA/CSA 101/I.S.2/A440, or NFRC 400 by an accredited, independent laboratory, and *labeled* and certified by the manufacturer and shall not exceed the values in Section 402.4.2.

Exceptions:

1. Site-constructed windows and doors that are weatherstripped or sealed in accordance with Section 502.4.3.
2. Field-fabricated fenestration and doors that are weather stripped.
3. For garage *doors*, air leakage determined by test at standard test conditions in accordance with ANSI/ DASMA 105 shall be an acceptable alternate for compliance with air leakage requirements.

502.4.4 Doors and access openings to shafts, chutes, stairwells, and elevator lobbies. These doors and access openings shall either meet the requirements of Section 502.4.3 or shall be equipped with weather seals.

Exception: Weatherseals on elevator lobby doors are not required when a smoke control system is installed.

~~**502.4.3 Sealing of the building envelope.** Openings and penetrations in the building envelope shall be sealed with caulking materials or closed with gasketing systems compatible with the construction materials and location. Joints and seams shall be sealed in the same manner or taped or covered with a moisture vapor-permeable wrapping material. Sealing materials spanning joints between construction materials shall allow for expansion and contraction of the construction materials.~~

502.4.5 Outdoor air intakes and exhaust openings. Stair and elevator shaft vents and other outdoor air intakes and exhaust openings ~~integral to the building envelope~~ that penetrate the air barrier shall be equipped with not less than a Class I motorized, leakage-rated damper with a maximum leakage rate of 4 cfm per square foot (6.8 L/s · C m_2) at 1.0 inch water gauge (w.g.) (1250 Pa) when tested in accordance with AMCA 500D.

Such dampers shall be set in the closed position and automatically open upon:

1. The activation of any fire alarm initiating device of the building's fire alarm system;
2. The interruption of power to the damper.

Exception: Gravity (nonmotorized) dampers are permitted to be used in buildings less than three stories in height above grade.

Reason: Airtight buildings significantly contribute to the reduction of energy use of a building. By installing an air barrier in a building, the heating and cooling load of a building is reduced as air that infiltrates into a building to replace the air that has exfiltrated needs to be conditioned. Reduction in infiltrated air means a reduction in the energy used to condition it. As many existing building materials meet the requirement for air permeance, they only need to be sealed. Sealing of the building envelope was an existing requirement so no additional costs are incurred. The modifications make it easier for the authority having jurisdiction to determine compliance with this part of the IECC.

Cost Impact: The code change proposal will increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: DALGLEISH-EC-1-502.4.DOC

EC182–09/10

202 (New), 502.4, 502.8 (New)

Proponent: Ronald Majette, representing US Department of Energy

1. Add new definition as follows:

SITE. A contiguous area of land that is under the ownership or control of one entity.

2. Add new text as shown:

502.4 Building Integrated Renewable Energy System (Prescriptive). Each building shall be equipped with a renewable energy system, which has the capacity to provide 5 percent of the total energy use of the building on an

annual basis. The renewable energy system shall be permitted to be located anywhere on the *building site* and must be capable of being used during daylight hours to provide power for the systems covered in Section 505.7 before being used elsewhere in the building, stored on site and/or transferred back to the grid.

505.7 Hallway and Loading Dock Lighting (Prescriptive). All hallway and loading dock lighting shall be provided with dedicated electrical circuits powered by a renewable energy system.

Exceptions:

1. Loading dock areas for law enforcement, fire, ambulance, and other emergency service vehicles
2. Loading docks and hallways that are not intended for daytime use
3. Where approved by the code official due to building site conditions or lack of building surface areas to support the necessary renewable energy system

3. Revise as follows:

~~**505.7**~~ **505.8 Electrical energy consumption. (Mandatory).** In buildings having individual dwelling units, provisions shall be made to determine the electrical energy consumed by each tenant by separately metering individual dwelling units.

Reason: The availability of renewable energy resources to provide electric power is well known and technology exists today to provide cost effective solutions to replace power generated from non-renewables with power from renewables. This proposal requires such use where the building site or building surfaces will accommodate such installations.

Cost Impact: The code change proposal will increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Majette-EC-32-502.4-

EC183–09/10
502.4.1, 502.4.2

Proponent: Thomas D. Culp, Ph.D., Birch Point Consulting LLC, representing Aluminum Extruders Council

Revise as follows:

502.4 Air leakage (Mandatory).

502.4.1 Window and door assemblies. The air leakage of windows, skylights, and ~~sliding or swinging~~ door assemblies that are part of the building envelope shall be determined in accordance with AAMA/WDMA/CSA 101/I.S.2/A440, or NFRC 400 by an accredited, independent laboratory, and labeled and certified by the manufacturer. ~~and shall not exceed the values in Section 402.4.2.~~ Windows and skylights shall have an air leakage rate of no more than 0.2 cfm per square foot (1.0 L/s/m^2) when tested at a pressure of at least 1.57 pounds per square foot (psf) (75 Pa), or 0.3 cfm per square foot (1.5 L/S/m^2) when tested at a pressure of at least 6.24 pounds per square foot (psf) (300 Pa). Door assemblies shall have an air leakage rate of no more than 0.3 cfm per square foot (1.5 L/s/m^2).

Exception: Site-constructed windows and doors that are weatherstripped or sealed in accordance with Section 502.4.3, and commercial entrance doors covered by Section 502.4.2.

502.4.2 Curtain wall, storefront glazing and commercial entrance doors. Curtain wall, storefront glazing and commercial-glazed swinging entrance doors and revolving doors shall be tested for air leakage at a pressure of at least 1.57 pounds per square foot (psf) (75 Pa) in accordance with ASTM E 283. For curtain walls and storefront glazing, the maximum air leakage rate shall be ~~0.3~~ 0.06 cubic foot per minute per square foot (cfm/ft2) (~~5.5~~ 1.1 m3/h × m^2) of fenestration area. For commercial glazed swinging entrance doors and revolving doors, the maximum air leakage rate shall be 1.00 cfm/ft^2 (18.3 m3/h × m^2) of door area when tested in accordance with ASTM E 283.

Exception: Site-constructed fenestration and door products that are weatherstripped or sealed in accordance with Section 502.4.3.

Reason: The fenestration air leakage requirements have not been updated for many years, and there is an opportunity to increase stringency of this section. This proposal includes a significant yet realistic improvement in the air leakage for both curtainwall and commercial windows. Air leakage for both residential and commercial fenestration products are currently required to be measured in accordance with ASTM E283 at a test pressure of 1.57 psf. However, in actual practice, architectural specifications often require a higher test pressure of 6.24 psf, where commercial and architectural grade windows commonly achieve 0.3 cfm/ft2 or even 0.1 cfm/ft2 air leakage, and even lower for curtainwall. The air leakage increases with pressure by a factor of L2/L1 = (P2^n)/(P1^n) where n is between 1/2 and 1. Therefore, testing at 6.24 psf is 2-4 times more stringent than the standard testing at 1.57 psf. Put another way, these architectural grade windows would achieve an air leakage rate of between 0.08 – 0.15 cfm/ft2 at the normal test pressure – far below the current requirement.

Therefore, there is a reasonable opportunity for additional energy savings by further strengthening the air leakage requirement. The current language references the residential air leakage requirements in Section 402.4.2. This proposal is intended for commercial products, so rather than referring to the residential chapter, separate and more stringent requirements are explicitly spelled out here in the commercial chapter. We propose to moderately decrease the window and skylight requirement from 0.3 cfm/ft2 to 0.2 cfm/ft2 when being tested at the more standard 1.57 psf, but also leave the 0.3 cfm/ft2 for those products tested at the higher 6.24 psf. This is actually more stringent at the higher test pressure (equivalent to 0.08-0.15 cfm/ft2 at the lower pressure), but we did not feel comfortable lowering the corresponding air leakage at the lower 1.57 psf test pressure to below 0.2 cfm/ft2 to account for lighter products used in light commercial applications. The curtainwall value was reduced to 0.06 cfm/ft2, which our curtainwall manufacturers have confirmed as realistic and appropriate, considering the large fixed glazing area and lower ratio of perimeter frame length to glass area.

For a medium office building (3-story, 56,000 ft2, 40% WWR), the whole building energy savings are estimated to be 1-2% site energy / 0.5-1% source energy for windows, and 2-4.5% site energy / 1-2.5% source energy for curtainwall.

Cost Impact: The code change proposal will not increase the cost of construction, as current products are already achieving these performance levels.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: CULP-EC-2-502.4.1-502.4.2.DOC

EC184–09/10
502.4.1 (New), 502.4.3

Proponent: Theresa Weston, PhD., representing DuPont Building Innovations

1. Add new text as follows:

502.4.1 Air Barriers. The building envelope shall be designed and constructed with a continuous air barrier to control air leakage into, or out of the conditioned space. An air barrier system shall also be provided for interior separations between conditioned space and a space designed to maintain temperature levels higher than 50 degrees for heating and less than 85 degrees for cooling or spaces that are designed to operate with humidity levels of less than 20% or more than 60 percent relative humidity.

The air barrier shall have the following characteristics:

1. It shall be continuous, with all joints made airtight per Section 502.4.4
2. Materials used for the air barrier system shall have an air permeability not to exceed 0.004 cfm/ft2 under a pressure differential of 0.3 in. water (1.57psf) (0.02 L/s.m2 @ 75 Pa) when tested in accordance with ASTM E 2178. Air barrier materials shall be taped or sealed in accordance with the manufacturer's instructions.
3. Air barrier materials shall be maintainable, or, if inaccessible, shall meet the durability requirements for the service life of the envelope assembly.

2. Revise as follows:

~~502.4.3~~ 502.4.4 Sealing of the opaque building envelope. Openings and penetrations in the building envelope shall be sealed with caulking materials or closed with gasketing systems compatible with the construction materials and location. Joints and seams shall be sealed in the same manner or taped or covered with a moisture vapor-permeable wrapping material. Sealing materials spanning joints between construction materials shall allow for expansion and contraction of the construction materials due to thermal and moisture variations and creep. Connections shall be made between:

1. Joints around *fenestration* and *door* frames
2. Junctions between *walls* and foundations, between *walls* at building corners, between *walls* and structural *floors* or *roofs*, and between *walls* and *roof* or *wall* panels
3. Openings at penetrations of utility services through *roofs*, *walls*, and *floors*
4. Site-built *fenestration* and *doors*
5. Building assemblies used as ducts or plenums

6. All other openings in the *building envelope*

Reason: Although the code currently contains requirements parts of the building, the code lacks a comprehensive statement of how air sealing of the whole building is achieved. This proposal introduces a framework to tie together existing language on sealing individual parts of the buildings. This IECC code proposal also includes quantitative, measurable air leakage rates for air barrier materials in order to significantly improve envelope performance and reduce a building's energy consumption.

Building envelope airtightness can have a significant impact on HVAC energy use. Many references exist on the impact of air leakage on HVAC energy use. According to DOE, NRCC, and others, uncontrolled air movement through the building envelope (infiltration and exfiltration) can account for up to 50% of heating and a significant part of cooling loads, representing up to 30% of a building's annual HVAC costs [1, 2, 3, 4, 5, 6, 7].

Air Barriers are well known technologies for achieving airtightness for the opaque building envelope. The air barrier materials must have a very low air leakage rate. The National Building Code of Canada and the Massachusetts Building Code consider 0.004 cfm at 75 Pa (the air permeance of ½" unpainted gypsum board) as the maximum air leakage rate for the air barrier material as part of the opaque envelope. When essentially airtight materials are assembled together by sealing, taping, etc., the assembly will have a higher leakage than the original air barrier material, primarily due to higher leakage at the joints. Likewise, as the assemblies are joined together in a building, that building enclosure will leak more than the individual assemblies, once again primarily due to increased leakage at the joints between assemblies and at unanticipated openings. In order to achieve a reasonable whole building airtightness, the basic materials selected for the air barrier must be resistant to air leakage.

In spite of the common believe that the recent buildings are more airtight, analysis of field data show that whole building leakage rates far exceed the levels generally considered acceptable and the levels that were generally assumed were not being achieved. Clearly, the lack of quantitative air leakage rate standards has allowed very leaky buildings.

An Air Barrier proposal was developed by ASHRAE 90.1, and it is currently out for public review. This proposal requires that materials and assemblies that are acceptable as part of the continuous air barrier for the opaque building envelope shall comply with one of the following requirements (Section 5.4.3.1.3):

a. Materials air permeance not to exceed 0.004 cfm/ft2 under a pressure differential of 0.3" w.g. (1.57psf) (0.02 L/s.m2 @ 75 Pa) when tested in accordance with ASTM E 2178.

b. Assemblies average air leakage not to exceed 0.04 cfm/ft2 under a pressure differential of 0.3" w.g. (1.57psf) (0.2 L/s.m2 @ 75 Pa) when tested in accordance with ASTM E 2357 or ASTM E 1677.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Weston-EC-3-502.4.1

EC185–09/10
202 (New), 502.4.7

Proponent: Ronald Majette, representing US Department of Energy

1. Add new definition as follows:

BUILDING ENTRANCE. Any door, set of doors, doorway, or other form of portal that is used to gain access to the building from the outside by the public.

2. Revise as follows:

502.4.7 Vestibules. All *building entrances* ~~A door that separates *conditioned space* from the exterior~~ shall be protected with an enclosed vestibule, with all doors opening into and out of the vestibule equipped with self-closing devices. Vestibules shall be designed so that in passing through the vestibule it is not necessary for the interior and exterior doors to open at the same time. The installation of one or more revolving doors in the building entrance shall not eliminate the requirement that a vestibule be provided for any doors adjacent to revolving doors.

Exceptions:

1. Buildings in climate Zones 1 and 2 as indicated in Figure 301.1 and Table 301.1.
2. Doors not intended to be used ~~as a building *entrance door*~~ by the public, such as doors to mechanical or electrical equipment rooms or intended solely for employee use.
3. Doors opening directly from a *sleeping unit* or dwelling unit.
4. Doors that open directly from a space less than 3,000 square feet (298 m2) in area.
5. ~~Revolving doors.~~
6. 5. Doors used primarily to facilitate vehicular movement or material handling and adjacent personnel doors.

Reason: Currently it is unclear in the application of the IECC what door situations require vestibules. One reason for that is the term building entrance is not defined. It is defined in ASHRAE 90.1-07 and for consistency Chapter 5 should lead users to the same end point as Standard 90.1-07. Currently it does not and as a result doors that should have vestibules do not. An example are doors in large retail buildings that have adjacent but exterior sales areas that are separated by the building thermal envelope from the interior of the building and are constantly being used by customers. Application with respect to revolving doors is clarified in that the code can be interpreted that if a revolving door is in the entrance that no vestibule is needed at all.

Cost Impact: The code change will increase the cost of construction to the degree that some doors that would not otherwise have vestibules under the current IECC will now be required to provide them.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Majette-EC-44-202-502.4.7

EC186–09/10
502.9 (New)

Proponent: Ronald Majette, representing US Department of Energy

Add new text as follows:

502.9 Insulation of radiant heating systems. Radiant panels, and associated U-bends and headers, designed for sensible heating of an indoor space through heat transfer from the thermally effective panel surfaces to the occupants and/or indoor space by thermal radiation and natural convection and the bottom surfaces of floor structures incorporating radiant heating shall be insulated with a minimum of R-3.5 (0.62 m2/K*W).

Reason: For consistency with Standard 90.1. This proposal is based on ongoing analysis efforts within ASHRAE designed to create a Standard 90.1-2010 that is 30% better than Standard 90.1-2004 in response to Federal legislation. Paralleling those efforts and considering that the IECC Chapter 5 is intended to be technically compatible with that standard to facilitate adoption and implementation, DOE is interested in keeping Chapter 5 of the 2012 IECC aligned with ANSI/ASHRAE/IESNA Standard 90.1-2010. Due to the timing of the code development process and ASHRAE standards processes this proposal was submitted in anticipation that by the final action hearings the work to update the standard would be complete.

Radiant heating and radiant cooling panels transfer heat to and from occupied spaces primarily via radiation. In some applications (e.g. radiant panels in lay-in ceilings), the back sides of the panels are exposed to unconditioned, indirectly conditioned, or semiheated spaces. In these applications heat transfer from the backs of radiant panels are of less value (and in some conditions negative value). This proposal recommends adding a requirement for insulating the surfaces of radiant panels that do not face conditioned spaces because it will save energy.

Cost Impact: The code change proposal will increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Majette-EC-6-502.9

EC187–09/10
202 (New)

Proponent: Ronald Majette, representing US Department of Energy

Add new definitions as follows:

COEFFICENT OF PERFORMANCE (COP)—COOLING. The ratio of the rate of heat removal to the rate of energy input, in consistent units, for a complete refrigerating system or some specific portion of that system under designated operating conditions.

COEFFICIENT OF PERFORMANCE (COP)—HEATING. The ratio of the rate of heat removal to the rate of heat delivered to the rate of energy input, in consistent units, for a complete heat pump system, including the compressor and, if applicable, auxiliary heat, under designated operating conditions.

INTEGRATED PART LOAD VALUE (IPLV). A single-number figure of merit based on part-load EER, COP, or kW/ton expressing part-load efficiency for air-conditioning and heat pump equipment on the basis of weighted operation at various load capacities for equipment.

NONSTANDARD PART LOAD VALUE (NPLV). A single-number part-load efficiency figure of merit calculated and referenced to conditions other than IPLV conditions, for units that are not designed to operate at ARI standard rating conditions.

Reason: These terms are used in Section 503.2.3. The proposed definitions are from ASHRAE Standard 90.1.

Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME: MAJETTE-EC-31-202

EC188–09/10
503

Proponent: David Cohan, representing Northwest Energy Efficiency Alliance

Revise as follows:

SECTION 503
BUILDING MECHANICAL SYSTEMS

503.2.1 Calculation of heating and cooling loads. Design loads shall be determined in accordance with the procedures described in the ASHRAE/ACCA Standard 183. The design loads shall account for the building envelope, lighting, ventilation and occupancy loads based on the project design. Heating and cooling loads shall be adjusted to account for load reductions that are achieved when energy recovery systems are utilized in the HVAC system in accordance with the ASHRAE *HVAC Systems and Equipment Handbook*. Alternatively, design loads shall be determined by an *approved* equivalent computation procedure, using the design parameters specified in Chapter 3.

503.2.5.1 Demand controlled ventilation. Demand control ventilation (DCV) is required for spaces larger than 500 ft^2 (50m^2) and with an average occupant load of 40 25 people per 1000 ft^2(93 m^2) of floor area (as established in Table 403.3 of the *International Mechanical Code*) and served by systems with one or more of the following:

1. An air-side economizer;
2. Automatic modulating control of the outdoor air damper; or
3. A design outdoor airflow greater than 3,000 cfm (1400 L/s).

Exceptions:

1. Systems with energy recovery complying with Section 503.2.6.
2. Multiple-zone systems without direct digital control of individual zones communicating with a central control panel.
3. System with a design outdoor airflow less than 1,200 cfm (600 L/s).
4. Spaces where the supply airflow rate minus any makeup or outgoing transfer air requirement is less than 1,200 cfm (600 L/s).
5. Building spaces where the primary ventilation needs are for process loads.

~~**503.2.9 HVAC system completion.** Prior to the issuance of a certificate of occupancy, the design professional shall provide evidence of system completion in accordance with Sections 503.2.9.1 through 503.2.9.3.~~

~~**503.2.9.1 Air system balancing.** Each supply air outlet and *zone* terminal device shall be equipped with means for air balancing in accordance with the requirements of Chapter 6 of the *International Mechanical Code*. Discharge dampers are prohibited on constant volume fans and variable volume fans with motors 10 horsepower (hp) (7.4 kW) and larger.~~

~~**503.2.9.2 Hydronic system balancing.** Individual hydronic heating and cooling coils shall be equipped with means for balancing and pressure test connections.~~

~~**503.2.9.3 Manuals.** The construction documents shall require that an operating and maintenance manual be provided to the building owner by the mechanical contractor.~~

~~The manual shall include, at least, the following:~~

1. ~~Equipment capacity (input and output) and required maintenance actions.~~
2. ~~Equipment operation and maintenance manuals.~~
3. ~~HVAC system control maintenance and calibration information, including wiring diagrams, schematics, and control sequence descriptions. Desired or field-determined setpoints shall be permanently recorded on control drawings, at control devices or, for digital control systems, in programming comments.~~
4. ~~A complete written narrative of how each system is intended to operate.~~

503.2.9 Mechanical systems commissioning and completion requirements. Mechanical systems commissioning and completion shall be in accordance with the provisions of Section 503.2.9.1 through 503.2.9.3.4.

503.2.9.1 System commissioning. Commissioning is a process that verifies and documents that the selected building systems have been designed, installed, and function according to the owner's project requirements and construction documents, and to minimum code requirements. Drawing notes shall require commissioning and completion requirements in accordance with this section. Drawing notes may refer to equipment specifications for further requirements. Copies of all documentation shall be given to the owner. The building official may request commissioning documentation for review purposes. At the time of plan submittal, the building jurisdiction shall be provided, by the submittal authority, a letter of intent to commission the building in accordance with this code.

503.2.9.1.1 Commissioning plan. A commissioning plan shall include as a minimum the following items:

1. A detailed explanation of the building's project requirements for mechanical design,
2. A narrative describing the activities that will be accomplished during each phase of commissioning, including guidance on who accomplishes the activities and how they are completed,
3. Equipment and systems to be tested, including the extent of tests,
4. Functions to be tested (for example calibration, economizer control, etc.),
5. Conditions under which the test shall be performed (for example winter and summer design conditions, full outside air, etc.), and
6. Measurable criteria for acceptable performance.

503.2.9.1.2 Systems adjusting and balancing. All HVAC systems shall be balanced in accordance with generally accepted engineering standards. Air and water flow rates shall be measured and adjusted to deliver final flow rates within 10% of design rates. Test and balance activities shall include as a minimum the following items:

1. **Air systems balancing**: Each supply air outlet and zone terminal device shall be equipped with means for air balancing in accordance with the requirements of Chapter 6 of the International Mechanical Code. Discharge dampers are prohibited on constant volume fans and variable volume fans with motors 10 hp (18.6 kW) and larger. Air systems shall be balanced in a manner to first minimize throttling losses then, for fans with system power of greater than 1 hp, Fan speed shall be adjusted to meet design flow conditions.

   Exception: Fan with fan motors of 1 hp or less.

2. **Hydronic systems balancing:** Individual hydronic heating and cooling coils shall be equipped with means for balancing and pressure test connections. Hydronic systems shall be proportionately balanced in a manner to first minimize throttling losses, then the pump impeller shall be trimmed or pump speed shall be adjusted to meet design flow conditions. Each hydronic system shall have either the ability to measure pressure across the pump, or test ports at each side of each pump.

   Exceptions:

   1. Pumps with pump motors of 5 hp or less.
   2. When throttling results in no greater than 5% of the nameplate horsepower draw above that required if the impeller were trimmed.

503.2.9.1.3 Functional performance testing. Equipment functional performance testing shall be in accordance with Section 503.2.9.1.3.1. Functional testing of HVAC controls shall be in accordance with Section 503.2.9.1.3.2.

503.2.9.1.3.1 Equipment functional performance testing. Equipment functional performance testing shall demonstrate the correct installation and operation of components, systems, and system-to-system interfacing relationships in accordance with approved plans and specifications. This demonstration is to prove the operation, function, and maintenance serviceability for each of the Commissioned systems. Testing shall include all modes of operation, including:

1. All modes as described in the Sequence of Operation,
2. Redundant or automatic back-up mode,
3. Performance of alarms, and
4. Mode of operation upon a loss of power and restored power.

   Exception: Unitary or packaged HVAC equipment listed in Tables 503.2.3 (1) through (3) that do not require supply air economizers.

503.2.9.1.3.2 Controls functional performance testing. HVAC control systems shall be tested to document that control devices, components, equipment, and systems are calibrated, adjusted and operate in accordance with approved plans and specifications. Sequences of operation shall be functionally tested to document they operate in accordance with approved plans and specifications.

503.2.9.1.4 Preliminary commissioning report. A preliminary report of commissioning test procedures and results shall be completed and provided to the Owner. The report shall be identified as "Preliminary Commissioning Report" and shall identify:

1. Itemization of deficiencies found during testing required by this section which have not been corrected at the time of report preparation and the anticipated date of correction.
2. Deferred tests which cannot be performed at the time of report preparation due to climatic conditions.
3. Climatic conditions required for performance of the deferred tests, and the anticipated date of each deferred test.

503.2.9.2 Acceptance. Buildings, or portions thereof, required by this code to comply with this section shall not be issued a final certificate of occupancy allowing public or owner occupation until such time that the building official has received a letter of transmittal from the building owner that states they have received the Preliminary Commissioning Report as required by Section 503.2.9.1.4. At the request of the code official, a copy of the Preliminary Commissioning Report shall be made available for review.

503.2.9.3 Completion requirements. The construction documents shall require that within 90 days after the date of final certificate of occupancy, the documents described in this section be provided to the building owner.

503.2.9.3.1 Drawings. Construction documents shall include as a minimum the location and performance data on each piece of equipment.

503.2.9.3.2 Manuals. An operating manual and a maintenance manual shall be in accordance with industry-accepted standards and shall include, at a minimum, the following:

1. Submittal data stating equipment size and selected options for each piece of equipment requiring maintenance.
2. Manufacturer's operation manuals and maintenance manuals for each piece of equipment requiring maintenance, except equipment not furnished as part of the project. Required routine maintenance actions shall be clearly identified.
3. Names and addresses of at least one service agency.
4. HVAC controls system maintenance and calibration information, including wiring diagrams, schematics, and control sequence descriptions. Desired or field-determined setpoints shall be permanently recorded on control drawings at control devices or, for digital control systems, in programming comments.
5. A complete narrative of how each system is intended to operate, including suggested setpoints.

503.2.9.3.3 System balancing report. A written report describing the activities and measurements completed in accordance with Section 503.2.9.1.2

503.2.9.3.4 Final commissioning report. A complete report of test procedures and results identified as "Final Commissioning Report" shall include:

1. Results of all Functional Performance Tests.
2. Disposition of all deficiencies found during testing, including details of corrective measures used or proposed.
3. All Functional Performance Test procedures used during the commissioning process including measurable criteria for test acceptance, provided herein for repeatability.

   Exception: Deferred tests which cannot be performed at the time of report preparation due to climatic conditions.

Reason: This proposal takes a large step toward ensuring that the energy savings potential inherent in the IECC is actually achieved in buildings. Commissioning is a systematic process of verification and documentation that ensures that the selected building systems have been designed, installed and function properly, efficiently, and can be maintained in accordance with the contract documents in order to satisfy the building owner's design intent and operational requirements. Almost 20 years of well-documented experience show that, in the absence of commissioning, building systems commonly do not operate as designed or intended. This results in poor energy performance and uncomfortable occupants.

In 2004, Lawrence Berkeley National Laboratory published a study entitled "THE COST-EFFECTIVENESS OF COMMERCIAL-BUILDINGS COMMISSIONING, A Meta-Analysis of Energy and Non-Energy Impacts in Existing Buildings and New Construction in the United States" which analyzed results from 224 buildings across 21 states, representing 30.4 million square feet of commissioned floor area (73 percent in existing buildings and 27 percent in new construction). These projects collectively represent $17 million ($2003) of commissioning investment. The new-construction cohort represents $1.5 billion of total construction costs.

For existing buildings, they found median commissioning costs of $0.27/ft2, whole-building energy savings of 15 percent, and payback times of 0.7 years. For new construction, median commissioning costs were $1.00/ft2 (0.6 percent of total construction costs), yielding a median payback time of 4.8 years (excluding quantified non-energy impacts). These results are conservative insofar as the scope of commissioning rarely spans all fuels and building systems in which savings may be found, not all recommendations are implemented, and significant first-cost and ongoing non-energy benefits are rarely quantified.

The study notes that, "Some view commissioning as a luxury and 'added' cost, yet it is only a barometer of the cost of errors promulgated by other parties involved in the design, construction, or operation of buildings. Commissioning agents are just the 'messengers'; they are only revealing and identifying the means to address pre-existing problems". The study concludes that "commissioning is one of the most cost-effective means of improving energy efficiency in commercial buildings."

Cost Impact: The code change proposal will increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: COHAN-EC-2-503.DOC

EC189–09/10
503.2.1

Proponent: Ronald Majette, representing US Department of Energy

Revise and relocate as follows:

~~**302.1** **503.2.1 Calculation of heating and cooling loads.** Design loads shall be determined in accordance with the procedures described in the ASHRAE/ACCA Standard 183. Heating and cooling loads shall be adjusted to account for load reductions that are achieved when energy recovery systems are utilized in the HVAC system in accordance with the ASHRAE *HVAC Systems and Equipment Handbook*. Alternatively, design loads shall be determined by an *approved* equivalent computation procedure, using ~~the design parameters specified in Chapter 3.The~~ an interior design temperature~~s used for heating and cooling load calculations shall be a maximum of~~ no more than 72ºF (22ºC) for heating and ~~minimum of~~ no less than 75ºF (24ºC) for cooling.

Reason: The current title of Chapter 3 is not consistent with the content of the Chapter. The content of Section 302 is more relevant to Section 503.2.1 and is proposed to be located therein with the issue of load calculations and equipment sizing. The deletion of design conditions from Chapter 3 on climate zones eliminates the need to reference those design loads as an alternative in Section 503.2.1. The content in Section 303 is more appropriate in Chapters 4 and 5 at locations where it is relevant and is not related to climate zones.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Majette-EC-60-503.2.1

EC190–09/10
503.2.10.3 (New)

Proponent: Krista Braaksma, representing Washington State Building Code Council

Add new text as follows:

503.2.10.3 Motor efficiency. Single-speed, polyphase, 500 horsepower or less, 2, 4, and 6 pole, squirrel cage induction motors, not addressed elsewhere in this Code, shall meet or exceed the nominal energy efficiency levels of NEMA Design A or B, Premium Efficiency Motors. Evidence of compliance shall be by a visible label stating that the motor is a "NEMA Premium" product.

Reason: Electric motors have a significant impact on the total energy operating cost for industrial, institutional and commercial buildings.

Electric motors vary in terms of energy efficiency. The NEMA Premium program assists purchasers to identify higher efficient motors.

Based on U.S. Department of Energy data, it is estimated that the NEMA Premium motor program would save 5,800 gigawatts of electricity and prevent the release of nearly 80 million metric tons of carbon into the atmosphere over the next ten years. This is equivalent to keeping 16 million cars off the road.

The Federal Government has recently incentivized the purchase of NEMA Premium motors by creating a federal rebate program. The IECC should recognize the significant savings to be gained through the use of the most energy efficient technology and construction currently available for motors.

Cost Impact: The code change proposal will increase the cost of construction

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: BRAAKSMA-EC-3-503.2.10.3

EC191–09/10
503.2.3, Table 503.2.3(8) (New), Table 503.2.3(9) (New), Chapter 6

Proponent: Steve Ferguson, representing The American Society of Heating, Refrigerating and Air-Conditioning Engineers (ASHRAE)

1. Revise as follows:

503.2.3 HVAC equipment performance requirements. Equipment shall meet the minimum efficiency requirements of Tables 503.2.3(1), 503.2.3(2), 503.2.3(3), 503.2.3(4), 503.2.3(5), 503.2.3(6) ~~and~~ 503.2.3(7), and 503.2.3(8) when tested and rated in accordance with the applicable test procedure. Requirements for plate type liquid to liquid heat exchangers can be found in Table 503.2.3(9). The efficiency shall be verified through certification under an *approved* certification program or, if no certification program exists, the equipment efficiency ratings shall be supported by data furnished by the manufacturer. Where multiple rating conditions or performance requirements are provided, the equipment shall satisfy all stated requirements. Where components, such as indoor or outdoor coils, from different manufacturers are used, calculations and supporting data shall be furnished by the designer that demonstrates that the combined efficiency of the specified components meets the requirements herein.

Exception: Water-cooled centrifugal water-chilling packages listed in Table 503.2.3(7) not designed for operation at ARHI Standard 550/590 test conditions of 44°F (7°C) leaving chilled water temperature and 85°F (29°C) entering condenser water temperature with 3 gpm/ton (0.054 l/s.kW) condenser water flow shall have maximum full load and NPLV ratings adjusted using the following equations:

Adjusted maximum full load kW/ton rating = [full load kW/ton from Table 503.2.3(7)]/K_{adj}

Adjusted maximum NPLV rating = [IPLV from Table 503.2.3(7)]/K_{adj}

where:

$K_{adj} = 6.174722 - 0.303668(X) + 0.00629466(X)^2 - 0.000045780(X)^3$

$X = DT_{std} + LIFT$

DT_{std} = {24+[full load kW/ton from Table 503.2.3(7)] × 6.83}/Flow

Flow = Condenser water flow (GPM)/Cooling Full Load Capacity (tons)

LIFT = CEWT – CLWT (°F)

CEWT = Full Load Condenser Entering Water Temperature (°F)

CLWT = Full Load Leaving Chilled Water Temperature (°F)

The adjusted full load and NPLV values are only applicable over the following full-load design ranges:

Minimum Leaving Chilled Water Temperature: 38°F (3.3°C)

Maximum Condenser Entering Water Temperature: 102°F (38.9°C)

Condensing Water Flow: 1 to 6 gpm/ton 0.018 to 0.1076 l/s ◦ kW) and X ≥ 39 and ≤ 60

Chillers designed to operate outside of these ranges or applications utilizing fluids or solutions with secondary coolants (e.g., glycol solutions or brines) with a freeze point of 27°F (-2.8°C) or lower for freeze protection are not covered by this code.

2. Add new table as follows:

TABLE 503.2.3(8)
HEAT REJECTION EQUIPMENT, MINIMUM EFFICIENCY REQUIREMENTS

Equipment Type[d]	Total System Heat Rejection Capacity at Rated Conditions	Subcategory or Rating Condition	Performance Required[a,b,c]	Test Procedure[e,d]
Propeller or Axial Fan Open Circuit Cooling Towers	All	95°F Entering Water 85°F Leaving Water 75°F Entering wb	≥38.2 gpm/hp	CTI ATC-105 and CTI STD-201
Centrifugal Fan Open Circuit Cooling Towers	All	95°F Entering Water 85°F Leaving Water 75°F Entering wb	≥20.0 gpm/hp	CTI ATC-105 and CTI STD-201
Propeller or Axial Fan Closed Circuit Cooling Towers	All	102°F Entering Water 90°F Leaving Water 75°F Entering wb	≥14.0 gpm/hp	CTI ATC-105S and CTI STD-201
Centrifugal Closed Circuit Cooling Towers	All	102°F Entering Water 90°F Leaving Water 75°F Entering wb	≥ 7.0 gpm/hp	CTI ATC-105S and CTI STD-201
Air-Cooled Condensers	All	125°F Condensing Temperature R-22 Test Fluid 190°F Entering Gas Temperature 15°F Subcooling 95°F Entering db	≥176,000 Btu/h·hp	ARI 460

For SI: °C - [(°F)-32]/1.8, L/s·kW – (gpm/hp)/(11.83), COP – (Btu/h·hp)/(2550.7)
db = dry bulb temperature, °F
wb = wet bulb temperature, °F
a. For purposes of this table, *open circuit cooling tower performance* is defined as the water flow rating of the tower at the thermal rating condition listed in Table 6.8.1G divided by the fan nameplate rated motor power.
b. For purposes of this table, *closed circuit cooling tower performance* is defined as the water flow rating of the tower at the thermal rating condition listed in Table 6.8.1G divided by the sum of the fan nameplate rated motor power and the spray pump nameplate rated motor power.
c. For purposes of this table, *air-cooled condenser performance* is defined as the heat rejected from the refrigerant divided by the fan nameplate rated motor power.
d. Section 12 contains a complete specification of the referenced test procedure, including the referenced year version of the test procedure.
e. The efficiencies and test procedures for both open and closed circuit cooling towers are not applicable to hybrid cooling towers that contain a combination of wet and dry heat exchange sections.

TABLE 503.2.3(9)
HEAT TRANSFER EQUIPMENT

Equipment Type	Subcategory	Minimum Efficiency*	Test Procedure†
Liquid to Liquid Heat Exchangers	Plate Type	NR	ARI 400

***** NR = No Requirement
† Section 12 contains a complete specification of the referenced test procedure, including the referenced year version of the test procedure.

3. Add new standards as follows:

CTI Cooling Technology Institute,
2611 FM 1960 West, Suite A-101
Houston, TX 77068-3730;
P.O. Box 73383
Houston, TX 77273-3383

CTI ATC-105 (00) Acceptance Test Code for Water Cooling Towers
CTI STD-201 (04) Standard for Certification of Water Cooling Tower Thermal Performance

AHRI
ARI 400-2001 with Addendum 2 Liquid to Liquid Heat Exchangers

Reason: Adding these tables into the IECC will set minimum efficiencies for open and closed circuit cooling towers along with air cooled condensers. These tables also require the use of independently certified open circuit cooling towers, closed circuit cooling towers, and plate type liquid to liquid heat exchangers.

This proposal will make the IECC consistent with requirements published in addenda "a", "L", and "ad" to ASHRAE Standard 90.1 –2007.

Cost Impact: None. Most manufacturers already meet these requirements due to similar requirements in ASHRAE SSPC 90.1. Updating the IECC will further reinforce the use of these requirements.

Analysis: A review of the standard(s) proposed for inclusion in the code, ARI 400-01, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

Proponent: Ronald Majette, representing US Department of Energy

1. Revise as follows:

503.2.3 HVAC equipment performance requirements. Equipment shall meet the minimum efficiency requirements of Tables 503.2.3(1), 503.2.3(2), 503.2.3(3), 503.2.3(4), 503.2.3(5), 503.2.3(6) and 503.2.3(7) when tested and rated in accordance with the applicable test procedure. The efficiency shall be verified through certification under an *approved* certification program or, if no certification program exists, the equipment efficiency ratings shall be supported by data furnished by the manufacturer. Where multiple rating conditions or performance requirements are provided, the equipment shall satisfy all stated requirements. Where components, such as indoor or outdoor coils, from different manufacturers are used, calculations and supporting data shall be furnished by the designer that demonstrates that the combined efficiency of the specified components meets the requirements herein.

503.2.3.1 ~~Exception:~~ Water-cooled centrifugal chilling packages. ~~Water-cooled centrifugal water-chilling packages~~ Equipment ~~listed in Table 503.2.3(7)~~ not designed for operation at ARHI Standard 550/590 test conditions of 44°F (7°C) leaving chilled water temperature and 85°F (29°C) entering condenser water temperature with 3 gpm/ton (0.054 l/s.kW) condenser water flow, and as such whose testing results cannot be readily evaluated against the requirements in Table 503.2.3(7), shall have maximum full load and ~~N~~IPLV ratings in Table 503.2.3(7) adjusted using the following equations and the actual equipment ratings evaluated against the adjusted IPLV:

Adjusted maximum full load kW/ton rating = [full load kW/ton from Table 503.2.3(7)]/*K*adj

Adjusted maximum NPLV rating = [IPLV from Table 503.2.3(7)]/*K*adj

where:

$K\text{adj} = 6.174722 - 0.303668(X) + 0.00629466(X)^2 - 0.000045780(X)^3$
$X = DT\text{std} + \text{LIFT}$
$DT\text{std} = \{24+[\text{full load kW/ton from Table 503.2.3(7)}] \times 6.83\}/\text{Flow}$

Flow = Condenser ~~water~~ fluid flow (GPM)/Cooling Full Load Capacity (tons)
LIFT = CEWT – CLWT (_F)
CEWT = Full Load Condenser Entering ~~Water~~ Fluid Temperature (°F)
CLWT = Full Load Leaving Chilled ~~Water~~ Fluid Temperature (°F)

The adjusted full load and NPLV rating values are only applicable to centrifugal chillers meeting all of ~~over~~ the following full-load design ranges:

Minimum Leaving Chilled ~~Water~~ Fluid Temperature: 38°F (3.3°C)

Maximum Condenser Entering ~~Water~~ Fluid Temperature: 102°F (38.9°C)

Condensing ~~Water~~ Fluid Flow: 1 to 6 gpm/ton (0.018 to 0.1076 1/s · kW) and X >= 39 and <= 60

Centrifugal ~~C~~chillers designed to operate outside of these ranges ~~or applications utilizing fluids or solutions with secondary coolants (e.g., glycol solutions or brines) with a freeze point of 27°F (-2.8°C) or lower for freeze protection~~ are not covered by this code.

2. Add new text as follows:

503.2.3.2 Positive displacement (air- and water-cooled) chilling packages. Equipment with a leaving fluid temperature higher than 32°F (0°C), shall meet the requirements of Table 503.2.3(7) when tested or certified with water at standard rating conditions, per the referenced test procedure.

3. Revise table footnote as follows:

TABLE 503.2.3(7)
WATER CHILLING PACKAGES, EFFICIENCY REQUIREMENTS[a]
(No change to table content)

For SI: 1 ton = 907 kg, 1 British thermal unit per hour = 0.2931 W.

a. The centrifugal chiller equipment requirements, after adjustment in accordance with Section 503.2.3.1 or 503.2.3.2, do not apply ~~for~~ to chillers used in low-temperature applications where the design leaving fluid temperature is < ~~40~~ 38ºF. The requirements do not apply to positive displacement chillers with leaving fluid temperatures <= 32 ºF. ~~The requirements do not apply to absorption chillers with design leaving fluid temperatures < 40ºF.~~

b. through e. (No change)

Reason: This proposal is based on ongoing analysis efforts within ASHRAE designed to create a Standard 90.1-2010 that is 30% better than Standard 90.1-2004 in response to Federal legislation. Paralleling those efforts and considering that the IECC Chapter 5 is intended to be technically compatible with that standard to facilitate adoption and implementation, DOE is interested in keeping Chapter 5 of the 2012 IECC aligned with ANSI/ASHRAE/IESNA Standard 90.1-2010. Due to the timing of the code development process and ASHRAE standards processes this proposal was submitted in anticipation that by the final action hearings the work to update the standard would be complete.

It was not the intent of Standard 90.1 upon which Chapter 5 is based to exempt all chillers with secondary coolants (glycol or brine) for freeze protection from coverage by Table 503.2.3(7) with adjustments per what was the exception and is now a new Section 503.2.3.1. This proposed change corrects the intent of the 90.1 and removes ambiguity. It brings more chillers under the scope of the IECC and therefore will save energy to the degree that some equipment is currently not regulated.

For example, positive-displacement (both air- and water-cooled) chillers with glycol added for freeze protection when the unit is off or for winter operation, would likely have used a secondary coolant with a freeze point below 27°F [-.8°C]. If the positive-displacement chiller were being designed to create a cooling temperature above 32°F [0°C], there is no reason it shouldn't be expected to comply with the proposed code language at the rating conditions and fluid listed in the referenced test procedure. Below 32°F [0°C], machine changes might hinder its ability to meet the requirements.

In addition, centrifugal chillers are outside the scope of Standard 90.1 when the design leaving fluid temperature is below 38°F [3.3°C], and the intent was that they would comply with water as the tested fluid at covered temperature and flow combinations. ARI Standard 550/590 does not allow for testing with secondary coolants, and it is impractical to require it in manufacturer's test facilities used for certification and performance tests.

This proposal changes footnote a to Table 503.2.3(7) in recognition of lower practical scope limits for positive displacement (both air- and water-cooled) and corrects for the lower limit introduced in Addendum M to Standard 90.1-07 for centrifugal chillers.

Cost Impact: The code change proposal will increase the cost of construction only to the degree that equipment that was not previously regulated will now have to satisfy minimum efficiency requirements.

TABLE 503.2.3(2)
UNITARY AND APPLIED HEAT PUMPS, ELECTRICALLY OPERATED, MINIMUM EFFICIENCY REQUIREMENTS

Equipment Type	Size Category	Heating Section Type	Sub-Category or Rating Condition	Minimum Efficiency[a]	Test Procedure[b]
Air Cooled (Cooling Mode)	≥65,000 Btu/h and <135,000 Btu/h	Electric Resistance (or None)	Split System and Single Package	11.2 IEER	ARI 340/360
		All other	Split System and Single Package	11.0 IEER	
	≥135,000 Btu/h and <240,000 Btu/h	Electric Resistance (or None)	Split System and Single Package	10.7 IEER	
		All other	Split System and Single Package	10.5 IEER	
	≥240,000 Btu/h	Electric Resistance (or None)	Split System and Single Package	9.6 IEER	
		All other	Split System and Single Package	9.4 IEER	
Air Cooled (Heating Mode)	≥65,000 Btu/h and <135,000 Btu/h (Cooling Capacity)	–	47ºF db/43ºF wb Outdoor Air	3.3 COP	ARI 340/360
			17ºF db/15ºF wb Outdoor Air	2.25 COP	
	≥135,000 Btu/h (Cooling Capacity)	–	47ºF db/43ºF wb Outdoor Air	3.2 COP	
			17ºF db/15ºF wb Outdoor Air	2.05 COP	

Reason: This proposal updates Tables 503.2.3 (1) & (2) and makes them consistent with Tables 6.8.1 A & B published in the supplement to ASHRAE 90.1-2007. The new tables update the COP at 17°F efficiency levels for commercial heat pumps and introduce a new part load energy efficiency descriptor for all commercial unitary products above 65,000 Btu/h of cooling capacity. The new descriptor, called Integrated Energy Efficiency Ratio or IEER is proposed as a replacement to IPLV. The proposed IEER is a significant improvement over IPLV as it allows for uniform rating of all products including single and multi stage units. It is based on a weighted average of performance at 100%, 75%, 50% and 25% of capacity. The new part load metric is expected to more accurately rate the part load performance of commercial unitary equipment.

The new proposed IEER and COP at 17°F were derived based on the expected performance of commercial unitary products meeting the new full load EER and COP at 47°F requirements that will take effect on January 1, 2010. In addition, IEER values are now proposed for product classes with cooling capacities between 65,000 and 240,000 Btu/h, which previously had no IPLV minimums. This proposal will save energy and make the IECC consistent with the supplement to ASHRAE 90.1-2007.

Cost Impact: There are incremental cost increases based on the higher efficiency requirements. These increased efficiency requirements have been approved by ASHRAE and have been published in the supplement to ASHRAE 90.1-2007.

(No change to portions of table or footnotes not shown)

2. Add new standards to Chapter 6 as follows:

ISO International Organization for Standardization
1, rue de Varembe, Case postale 56,
CH-1211
Geneve, Switzerland

ISO 13256-2 (1998) Water-Source Heat Pumps—Testing and Rating for Performance—
Part 2: Water-to-Water and Brine-to-Water Heat Pumps

Reason: This proposal is based on ongoing analysis efforts within ASHRAE designed to create a Standard 90.1-2010 that is 30% better than Standard 90.1-2004 in response to Federal legislation. Paralleling those efforts and considering that the IECC Chapter 5 is intended to be technically compatible with that standard to facilitate adoption and implementation, DOE is interested in keeping Chapter 5 of the 2012 IECC aligned with ANSI/ASHRAE/IESNA Standard 90.1-2010. Due to the timing of the code development process and ASHRAE standards processes this proposal was submitted in anticipation that by the final action hearings the work to update the standard would be complete.

Water-to-water heat pumps are systems used in many buildings covered by the IECC and ASHRAE 90.1. These heat pumps use water to carry cooling and heating through the building. In recent years, the demand for water to water heat pumps has increased significantly. However, the IECC has no minimum energy efficiency requirements for this equipment. This proposal establishes for the first time a product class for water-to-water heat pumps. The intent is to recognize the technology by requiring minimum energy efficiency standards. Cooling EERs and heating COPs are proposed for products with cooling capacities below 135,000 Btu/h at standard rating conditions listed in ISO standard 13256-2.

Cost Impact: The code change proposal could increase the cost of construction to the degree that units of this nature previously having unregulated minimum efficiency will now have to satisfy these minimum requirements.

Analysis: A review of the standard(s) proposed for inclusion in the code, ISO 13256-2-98, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

TABLE 503.2.3(5)
BOILERS, GAS- AND OIL-FIRED, MINIMUM EFFICIENCY REQUIREMENTS

Equipment Type[a]	Subcategory or Rating Condition	Size Category (Input)	Minimum Efficiency[b,c]	Test Procedure
Boilers, hot water	Gas-fired	<300,000 Btu/h	80% AFUE	10 CFR Part 430
		≥300,000 Btu/h and ≤2,500,000 Btu/h[d]	80% E_t	10 CFR Part 431
		>2,500,000 Btu/h[a]	82% E_c	
	Oil-fired[e]	<300,000 Btu/h	80% AFUE	10 CFR Part 430
		≥300,000 Btu/h and ≤2,500,000 Btu/h[d]	82% E_t	10 CFR Part 431
		>2,500,000 Btu/h[a]	84% E_c	
Boilers, steam	Gas-fired	<300,000 Btu/h	75% AFUE	10 CFR Part 430
	Gas-fired—all, except natural draft	≥300,000 Btu/h and ≤2,500,000 Btu/h[d]	79% E_t	10 CFR Part 431
		>2,500,000 Btu/h[a]	79% E_t	
	Gas-fired—natural draft	≥300,000 Btu/h and ≤2,500,000 Btu/h[d]	77% E_t	
		>2,500,000 Btu/h[a]	77% E_t	
	Oil-fired[e]	<300,000 Btu/h	80% AFUE	10 CFR Part 430
		≥300,000 Btu/h and ≤2,500,000 Btu/h[d]	81% E_t	10 CFR Part 431
		>2,500,000 Btu/h[a]	81% E_t	

[a] These requirements apply to boilers with rated input of 8,000,000 Btu/h or less that are not packaged boilers and to all packaged boilers. Minimum efficiency requirements for boilers cover all capacities of packaged boilers.
[b] E_c = combustion efficiency (100% less flue losses). See reference document for detailed information.
[c] E_t = thermal efficiency. See reference document for detailed information.
[d] Maximum capacity – minimum and maximum ratings as provided for and allowed by the unit's controls.
[e] Includes oil-fired (residual).

Reason: For consistency with Standard 90.1.

Cost Impact: The proposal will not increase the cost of construction as the proposed requirements are consistent with minimum federal law regulating boiler efficiency.

EC197–09/10
503.2.4.4

Proponent: Randall R. Dahmen, WI Registered PE, WI Licensed Commercial Building Inspector, representing self

Revise as follows:

503.2.4.4 Shutoff damper controls. Both outdoor air supply and exhaust ducts shall be equipped with motorized dampers that will automatically shut when the systems or spaces served are not in use.

Exceptions:

1. Gravity dampers shall be permitted in buildings less than three stories in height.
2. Gravity dampers shall be permitted for buildings of any height located in Climate Zones 1, 2 and 3.
3. Gravity dampers shall be permitted for outside air intake or exhaust airflows of 300 cfm (0.14 m_3/s) or less.
4. No motorized dampers shall be installed in exhaust hoods that vent commercial cooking appliances which use fuel gas.

Reason: The 2006 IFGC, Section 505.1.1, requires that no dampers be installed in an exhaust system used to vent commercial cooking fuel gas appliances. As currently written, under IECC Section 503.2.4.4, there is no exception to the requirement of installing a motorized damper as it has to do with the limitations of IFGC Section 505.1.1.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: DAHMEN-EC3-503.2.4.4.DOC

EC198–09/10
503.2.7 (New), Table 503.2.7 (New)

Proponent: Ronald Majette, US Department of Energy

Add new text and table as follows:

503.2.7 Kitchen Exhaust Systems. Replacement air introduced directly into the exhaust hood cavity shall not exceed 10% of the hood exhaust airflow rate. Conditioned supply air delivered to any space containing a kitchen hood shall not exceed the greater of the ventilation rate required to meet the space heating or cooling load or the hood exhaust flow minus the available transfer air from adjacent space where available transfer air is considered that portion of outdoor ventilation air not required to satisfy other exhaust needs, such as restrooms, and not required to maintain pressurization of adjacent spaces

When total kitchen hood exhaust airflow rate is greater than 5,000 cfm each hood shall have a maximum exhaust rate in accordance with Table 503.2.7 and shall meet one of the following:

1. At least 50 percent of all replacement air is transfer air that would otherwise be exhausted.
2. Demand ventilation system(s) on at least 75 percent of the exhaust air that are capable of at least 50 percent reduction in exhaust and replacement air system airflow rates, including controls necessary to modulate airflow in response to appliance operation and to maintain full capture and containment of smoke, effluent and combustion products during cooking and idle.
3. Listed energy recovery devices with a sensible heat recovery effectiveness of at least 40 percent on at least 50 percent of the total exhaust airflow.

When a single hood, or hood section, is installed over appliances with different duty ratings, then the maximum allowable flow rate for the hood or hood section shall be based on the requirements for the highest appliance duty rating under the hood or hood section.

Exception: When at least 75 percent of all the replacement air is transfer air that would otherwise be exhausted

TABLE 503.2.7
MAXIMUM NET EXHAUST FLOW RATE, CFM PER LINEAR FOOT OF

Type of Hood	Light Duty Equipment	Medium Duty Equipment	Heavy Duty Equipment	Extra Heavy Duty Equipment
Wall-mounted canopy	140	210	280	385
Single island	280	350	420	490
Double island (per side)	175	210	280	385
Eyebrow	175	175	Not allowed	Not allowed
Backshelf/Pass-over	210	210	280	Not allowed

Reason: For consistency with Standard 90.1. This proposal is based on ongoing analysis efforts within ASHRAE designed to create a Standard 90.1-2010 that is 30% better than Standard 90.1-2004 in response to Federal legislation. Paralleling those efforts and considering that the IECC Chapter 5 is intended to be technically compatible with that standard to facilitate adoption and implementation, DOE is interested in keeping Chapter 5 of the 2012 IECC aligned with ANSI/ASHRAE/IESNA Standard 90.1-2010. Due to the timing of the code development process and ASHRAE standards processes this proposal was submitted in anticipation that by the final action hearings the work to update the standard would be complete.

The proposal basically outlaws "short-circuit" hoods. Research by the American Gas Association Research and California Energy Commission has shown that direct supply of makeup air, in excess of 10% of hood exhaust airflow, into the hood cavity significantly deteriorates the Capture and Containment (C&C) performance of hoods. This research has also demonstrated that short-circuit hoods waste energy and degrade kitchen environment and hygiene. If we assume a generic baseline C&C rate for a cooking process, studies show the exhaust rates for short-circuit hoods generally exceed those for exhaust-only hoods by at least the amount of air short-circuited, thus decreasing performance and increasing energy consumption.

Engineers are often in the habit of simply providing makeup air units in kitchens to provide makeup air equal to the exhaust flow rate even when "free" transfer air is available from adjacent spaces. Adding makeup air when transfer air is available is a wasteful design practice and should be prohibited. Using available transfer air saves energy and reduces the first cost of the makeup unit and exhaust system in the adjacent spaces. It simply requires some engineering and coordination to provide a path for the transfer air.

The proposed change is also intended to get rid of a wasteful common practice: specifying excessive exhaust airflow by selecting hoods that are not listed or have not been subjected to a recognized performance test. The exhaust airflow flow rates in Table 503.2.7 are 30% below the minimum airflow rates in ASHRAE Standard 154-2003.

ASHRAE Research Project 1202 shows that hoods listed per UL Standard 710 and/or are engineered and tested per ASTM/ANSI 1704 have exhaust rates that are at least 30% less than the exhaust airflow requirements for unlisted or untested hoods. The intent is to conserve energy through the use of engineered hoods or performance based hoods that have been validated based on consensus standard test methods. It should be noted that ASHRAE research has not demonstrated that exhaust rate reductions substantially beyond the 30% can or should be recommended at this time. This requirement should not increase first cost and in many cases will reduce first cost through downsizing of exhaust, supply and cooling equipment.

The 5,000 CFM threshold recognizes small restaurants. In addition, makeup air can be fully conditioned. As a result there are now cost effective opportunities to reduce energy with demand ventilation systems or energy recovery devices.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

EC199–09/10
503.2.7

Proponent: Guy McMann, Jefferson County, CO, representing the Colorado Association of Plumbing and Mechanical Officials (CAPMO)

Revise as follows:

503.2.7 Duct and plenum insulation and sealing. All supply and return air ducts and plenums shall be insulated with a minimum of ~~R-5~~ R-6 insulation when located in unconditioned spaces and with a minimum of R-8 insulation when located outside the building. When located within a building envelope assembly, the duct or plenum shall be separated from the building exterior or unconditioned or exempt spaces by a minimum of R-8 insulation.

Exceptions:

1. When located within equipment.

2. When the design temperature difference between the interior and exterior of the duct or plenum does not exceed 15°F (8°C).

Reason: This R-value is inconsistent with Section 403.2.1 which calls for R-6. R-5 isn't being manufactured in flexible duct or insulating sleeving material. R-4.6 is the lowest Flex available.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: McMann-EC-1-503.2.7

EC200–09/10
503.2.7

Proponent: Michael Resetar, Armacell LLC; Roger Schmidt, K-Flex USA; Shawn Dunahue, Nomaco Insulation

Revise as follows:

503.2.7 Duct and plenum insulation and sealing. All supply and return air ducts and plenums shall be insulated with a minimum of ~~R-5~~ R-6 insulation when located in unconditioned spaces and with a minimum of R-8 insulation when located outside the building. When located within a building envelope assembly, the duct or plenum shall be separated from the building exterior or unconditioned or exempt spaces by a minimum of R-8 insulation.

Exceptions:

1. When located within equipment.
2. When the design temperature difference between the interior and exterior of the duct or plenum does not exceed 15°F (8°C).

All ducts, air handlers and filter boxes shall be sealed. Joints and seams shall comply with Section 603.9 of the *International Mechanical Code*.

Reason: Changes in the associated R value for supply and duct and plenums for conditioned spaces should be changed from an R-5 to R-6 based to maintain consistency between IECC Section 403.2.1 and this change would also provide a 20% gain in energy efficiency.

	Summer Performance		**Winter Performance**	
Conditional Information	**R-5**	**R-6**	**R-5**	**R-6**
Line temperature °F	55	55	90	90
Ambient temperature °F	100	100	30	30
Thermal conductivity (Btu•in/h•ft^2•°F)	0.265	0.265	0.265	0.265
Surface Coeff. Internal (Btu/(ft^2-h)	5.3	5.3	1.60	1.60
Surface Coeff. External (Btu/(ft^2-h)	1.6	1.6	1.6	1.6
Required thickness of insulation (inches)	1.25	1.5	1.25	1.5
Heat Flow of Flat Surface (Btu/(ft^2-h)	8.1	6.9	10.7	9.2
Btu savings	1.2		1.5	
Saving in %	14.9%		14.1%	

Cost Impact: The material cost implications would be minimal and would be recovered (paid back) after a period of months due to system efficiency gains. Labor associated with the installation would remain constant to that of the current requirements.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Resetar-Schmidt-Dunahue-EC-3-503.2.7

EC201–09/10
503.2.7

Proponent: Michael Resetar, Armacell LLC; Roger Schmidt, K-Flex USA; Shawn Dunahue, Nomaco Insulation

Revise as follows:

503.2.7 Duct and plenum insulation and sealing. All supply and return air ducts and plenums shall be insulated with a minimum of R-5 insulation when located in unconditioned spaces and with a minimum of R-8 insulation when located outside the building. When located within a building envelope assembly, the duct or plenum shall be separated from the building exterior ~~or unconditioned or exempt spaces~~ by a minimum of R-8 insulation.

Exceptions:

1. When located within equipment.
2. When the design temperature difference between the interior and exterior of the duct or plenum does not exceed 15°F (8°C).

All ducts, air handlers and filter boxes shall be sealed. Joints and seams shall comply with Section 603.9 of the *International Mechanical Code*.

Reason: The current language is confusing. We feel the intent of the code is more clearly stated as written above with the removal of "or unconditioned or exempt spaces"

Cost Impact: The material cost implications would be minimal and would be recovered (paid back) after a period of months due to system efficiency gains. Labor associated with the installation would remain constant to that of the current requirements.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Resetar-Schmidt-Dunahue-EC-5-503.2.7

EC202–09/10
503.2.7.1.3

Proponent: Randall R. Dahmen, WI Registered PE, WI Licensed Commercial Building Inspector, representing self

Revise as follows:

503.2.7.1.3 High-pressure duct systems. Ducts designed to operate at static pressures in excess of 3 inches w.g. (746 Pa) shall be insulated and sealed in accordance with Section 503.2.7. In addition, ducts and plenums shall be leak-tested in accordance with the SMACNA *HVAC Air Duct Leakage Test Manual* with the rate of air leakage (*CL*) less than or equal to 6.0 as determined in accordance with Equation 5-2.

~~*CL* = *Fx P* $^{0.65}$~~ $CL = F/P^{0.65}$ **(Equation 5-2)**

where:

F = The measured leakage rate in cfm per 100 square feet of duct surface.
P = The static pressure of the test.

Documentation shall be furnished by the designer demonstrating that representative sections totaling at least 25 percent of the duct area have been tested and that all tested sections meet the requirements of this section.

Reason: The 2006 IECC Chapter Referenced Standards adopts SMACNA HVAC Air Duct Leakage Test Manual-1985 under Chapter 6. Equation 5-2 of the IECC is in conflict with Equation 1 of the SMACNA HVAC Air Duct Leakage Manual. This code change proposal corrects this discrepancy.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: DAHMEN-EC2-503.2.7.1.3.DOC

EC203–09/10
503.2.8 (New)

Proponent: Ronald Majette, representing US Department of Energy

Add new text as follows:

503.2.8 Laboratory Exhaust Systems. Buildings with laboratory exhaust systems having a total exhaust rate greater than 5,000 cfm shall be provided with:

1. A VAV laboratory exhaust and room supply system capable of reducing exhaust and makeup air flow rates to the minimum required in the *International Mechanical Code*
2. A heat recovery system to precondition makeup air from laboratory exhaust that has a percentage that the exhaust and makeup air flow rates can be reduced from design conditions plus a percentage *sensible recovery effectiveness* totaling at least 50 percent.
3. Direct makeup (auxiliary) air supply equal to at least 75 percent of the exhaust air flow rate capable of being heated and cooled to the design temperatures in Section 302.1.

Reason: For consistency with Standard 90.1. This proposal is based on ongoing analysis efforts within ASHRAE designed to create a Standard 90.1-2010 that is 30% better than Standard 90.1-2004 in response to Federal legislation. Paralleling those efforts and considering that the IECC Chapter 5 is intended to be technically compatible with that standard to facilitate adoption and implementation, DOE is interested in keeping Chapter 5 of the 2012 IECC aligned with ANSI/ASHRAE/IESNA Standard 90.1-2010. Due to the timing of the code development process and ASHRAE standards processes this proposal was submitted in anticipation that by the final action hearings the work to update the standard would be complete.

Cost Impact: The code change proposal will increase the cost of construction.

High Use (≥4,400 h/yr)			1.0	1.0	1.0	1.5	1.5

a. For piping smaller than 1½" and located within interior partitions, reduction of these thicknesses by 1" shall be permitted (before thickness adjustment required in footnote a) but not to thicknesses below 1".

b. For piping smaller than 1½" and located within interior partitions, reduction of these thicknesses by 1" shall be permitted (before thickness adjustment required in footnote a) but not to thicknesses below 1". For insulation outside the stated conductivity range, the minimum thickness (T) shall be determined as follows:

$$T = r\{(1 + t/r)^{K/k} - 1\}$$

where

T = minimum insulation thickness (in.),
r = actual outside radius of pipe (in.),
t = insulation thickness listed in the table for applicable fluid temperature and pipe size,
K = conductivity of alternate material at mean rating temperature indicated for the applicable fluid temperature (Btu·in./h·ft2·°F); and
k = the upper value of the conductivity range listed in the table for the applicable fluid temperature.

c. For direct-buried heating and hot water system piping, reduction of these thicknesses by 1.5" shall be permitted (before thickness adjustment required in footnote a) but not to thicknesses below 1".

Reason: This proposal is based on ongoing analysis efforts within ASHRAE designed to create a Standard 90.1-2010 that is 30% better than Standard 90.1-2004 in response to Federal legislation. Paralleling those efforts and considering that the IECC Chapter 5 is intended to be technically compatible with that standard to facilitate adoption and implementation, DOE is interested in keeping Chapter 5 of the 2012 IECC aligned with ANSI/ASHRAE/IESNA Standard 90.1-2010. Due to the timing of the code development process and ASHRAE standards processes this proposal was submitted in anticipation that by the final action hearings the work to update the standard would be complete.

Cost Impact: The code change proposal would increase or decrease the cost of construction in some but not all instances.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Majette-EC-12-503.2.8

EC205–09/10
503.2.8

Proponent: James R. Paschal, Paschal Engineering, representing Aquatherm, Inc.

Revise as follows:

503.2.8 Piping insulation. All piping serving as part of a heating or cooling system shall be thermally insulated in accordance with Table 503.2.8.

Exceptions:

1. Factory-installed piping within HVAC equipment tested and rated in accordance with a test procedure referenced by this code.
2. Factory-installed piping within room fan-coils and unit ventilators tested and rated according to AHRI 440 (except that the sampling and variation provisions of Section 6.5 shall not apply) and 840, respectively.
3. Piping that conveys fluids that have a design operating temperature range between 55°F (13°C) and 105°F (41°C).
4. Piping that conveys fluids that have not been heated or cooled through the use of fossil fuels or electric power.
5. Runout piping not exceeding 4 feet (1219 mm) in length and 1 inch (25 mm) in diameter between the control valve and HVAC coil.
6. For piping smaller than 1-1/2 inch nominal size and located within interior partitions, the thicknesses in Table 503.2.8 may be reduced by 1 inch (before any thickness adjustment made per footnote a.), but not to thicknesses below 1 inch.
7. For direct-buried cooling system piping insulation is not required..
8. For direct-buried heating and hot water system piping, these thicknesses may be reduced by 1.5 inches (before any thickness adjustment made per footnote a.) but not to thicknesses below 1 inch.

Reason: For these applications, the cost of insulation and energy required to produce the insulation is much higher than any energy savings over the expected life of the project. This proposal is also consistent with the proposed revisions to ASHRAE 90.1, *Energy Standard for Buildings Except Low-Rise Residential Buildings*. The current IECC only recognizes the use of and reference to ASHRAE 90.1 if used in its entirety, and otherwise requires compliance with Chapter 5 for commercial buildings. While there are other areas where it may make sense to not be consistent between the two, the pipe insulation requirements should be equivalent from an energy conservation perspective.

Cost Impact: The code change proposal will not increase the cost of construction.

Revise as follows:

TABLE 503.2.8
MINIMUM PIPE INSULATION[a]
~~(thickness in inches)~~

FLUID	NOMINAL PIPE DIAMETER	
	≤ 1.5"	**> 1.5"**
Steam or fluid temperatures > 200°F	~~1-1/2"~~ R-6	~~3"~~ R-12
Hot water: 105°F to 200°F	~~1-1/2"~~ R-6	~~2"~~ R-8
Chilled water, brine or refrigerant: ≤ 55°F	~~1-1/2"~~ R-6	~~1-1/2"~~ R-6

(No change to footnotes)

Reason: Converting wall thickness requirement to an "R" value to be consistent with other insulation requirements within ICC codes and the addition operational temperature ranges help define the three categories.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: Resetar-Schmidt-Dunahue-EC-4-T 503.2.8

EC207–09/10
503.2.8.1 (New)

Proponent: Howard Ahern, Plumberex, Palm Springs, CA

Add new text as follows:

503.2.8.1 Protection of piping insulation. Piping Insulation exposed to weather shall be protected from damage, including that due to sunlight, moisture, equipment maintenance, and wind by means including, aluminum, sheet metal, painted canvas, or plastic cover or other protection suitable for outdoor service. Cellular foam insulation shall be protected as above or painted with a coating that is water retardant and provides shielding from solar radiation that can cause degradation of the material. Adhesives tape shall not be permitted.

Reason: Outdoor Piping Insulation needs to be protected from weather, physical damage or from UV deterioration. Pipe insulation in outdoor locations is typically protected by an aluminum or sheet metal jacket, painted canvas, plastic cover, or coating that is water retardant and UV resistant.

All AC units require periodic maintenance. The frequency varies with how hard the unit operates, exterior temperature, preventive maintenance program, and many others. In every occasion, every maintenance provides an excuse for the Freon line insulation to be touched and removed. Adhesives Tape is not permitted as it will limit maintenance and damage insulations permeability characteristics..Removal of tape damages the integrity of the original insulation into pieces, specially, if the insulation has reached thermo set state. Protection can also keep silted pipe insulation from commonly separating thus saving additional energy cost. This simple common sense proposal is cost-effective as it will save energy and will prolong insulation life reducing replacement.

This proposal will save building energy cost following the same initiative being taken by the American Society of Heating, Refrigeration and Air Conditioning Engineers (ASHRAE) to improve energy efficiency levels by 30% in the **ASHRAE 90.1 2007 Section 6.4.4.1.1** commercial building standards. It also reflects the energy efficiency improvement approved by Congress American Recovery and Reinvestment Act of 2009 (ARRA).

ASHRAE 90.1 2007 Section 6.4.4.1.1:
Piping Insulation exposed to weather shall be protected from damage, including that due to sunlight, moisture, equipment maintenance, and wind but not limited to the following

A. Piping Insulation exposed to weather shall be suitable for outdoor service e.g., protected by aluminum, sheet metal, painted canvas, or plastic cover. Cellular foam insulation shall be protected as above or painted with a coating that is water retardant and provides shielding from solar radiation that can cause degradation of the material.

Cost Impact: The code change proposal will increase the cost of construction.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: Ahern-EC-2-503.2.8.1

EC208–09/10
Table 503.2.8

Proponent: James R. Paschal, Paschal Engineering, representing Aquatherm, Inc.

Revise as follows:

TABLE 503.2.8
MINIMUM PIPE INSULATION
(thickness in inches)
(No change to table contents)

a. and b. (No change)

c. The table is based on metal pipe. Non-metallic pipes schedule 80 thickness or less shall use the table values. For other non-metallic pipes having thermal resistance greater than that of steel or copper pipe, reduced insulation thicknesses are permitted if documentation is provided showing that the pipe with the proposed insulation has no more heat gain or loss per foot than steel or copper pipe of the same nominal size with the insulation thickness shown in the table.

Reason: Plastic pipe with a heavier wall thickness can provide a significant insulating effect, thereby reducing the amount of external insulation necessary to achieve the same thermal performance. The requirements and values in the table assume that the pipe itself does not contribute to the overall thermal performance of the pipe/insulation combination. The addition of this footnote will explicitly allow recognition of this enhanced performance, while meeting the intent of the table by requiring the same or better performance from the pipe/insulation combination. This proposal is also consistent with the recently revised ASHRAE 90.1, *Energy Standard for Buildings Except Low-Rise Residential Buildings*, which recognizes that piping materials with low thermal conductivity and sufficient wall thickness can provide an insulating effect and thereby reduce the overall insulation required to achieve equivalent performance.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Paschal-EC-2-T. 503.2.8

EC209–09/10
Table 503.2.8

Proponent: Michael Resetar, Armacell LLC; Roger Schmidt, K-Flex USA; Shawn Dunahue, Nomaco Insulation

Revise as follows:

TABLE 503.2.8
MINIMUM PIPE INSULATION[a]
~~(thickness in inches)~~

FLUID	NOMINAL PIPE DIAMETER	
	~~≤ 1.5"~~	~~> 1.5"~~
Steam or fluid temperatures > 200°F	~~1-1/2"~~ R6	~~3"~~ R12
Hot water: 105°F to 200°F	~~1-1/2"~~ R4	~~2"~~ R6
Chilled water, brine or refrigerant: ≤ 55°F	~~1-1/2"~~ R6	~~1-1/2"~~ R6

(No change to footnotes)

Reason: Converting wall thickness requirement to an "R" value to be consistent with other insulation requirements within ICC codes and the addition operational temperature ranges help define the three categories while helping to equalize BTU loss requirement between three categories. The change in hot water reflects compatibility with current requirements within IECC and ASHRAE 90.1.

PAST HISTORY

IECC 2000:
Had Table 803.3.7

FLUID	NOMINAL PIPE DIAMETER	
	≤ 1.5"	**> 1.5"**
Steam	1.5	3.0
Hot water	1.0	2.0
Chilled water, brine, or refrigerant	1.0	1.5

For **SI**: 1 inch = 25.4 mm, Btu per inch/h × ft^2 × °F = W per 25 mm/K× m^2.
a. Based on insulation having a conductivity not exceeding 0.27 Btu per inch/h × ft^2 × °F.

Steam:
1.5" wall on Flat Surface calculation is equal a "R" value of 6
1.5" wall on Radial Surface calculation is equal a "R" value of 6.4 to 11.4 *(I.D. Dependent)*
3.0" wall on Flat Surface calculation is equal a "R" value of 12
Hot and Chilled Water, brine or refrigerant:
1.0" wall on Flat Surface calculation is equal a "R" value of 4.2
1.0" wall on Radial Surface calculation is equal a "R" value of 5.5 to 7.4 *(I.D. Dependent)*
1.5" wall on Flat Surface calculation is equal a "R" value of 6
1.5" wall on Radial Surface calculation is equal a "R" value of 6.4 to 11.4 *(I.D. Dependent)*
2.0" wall on Flat Surface calculation is equal a "R" value of 8

IECC 2003:
Had Table 803.3.7

FLUID	NOMINAL PIPE DIAMETER	
	≤ 1.5"	**> 1.5"**
Steam	1½	3
Hot water	1	2
Chilled water, brine or refrigerant	1	1½

For SI: 1 inch = 25.4 mm, British thermal unit per inch/h · ft^2 ·°F = W per 25 mm/K · m^2 .
a. Based on insulation having a conductivity (k) not exceeding 0.27 Btu per inch/h · ft^2 ·°F.

Same Equivalent R Values as IECC 2000

IECC 2006:
Table 803.3.7 converted to Table 503.2.8

FLUID	NOMINAL PIPE DIAMETER	
	≤ 1.5"	**> 1.5"**
Steam	1½	3
Hot water	1	2
Chilled water, brine or refrigerant	1	1½

For SI: 1 inch = 25.4 mm, British thermal unit per inch/h ft^2 °F = W per 25 mm/K · m^2
a. Based on insulation having a conductivity (k) not exceeding 0.27 Btu per inch/h ft^2 · °F.

Same Equivalent R Values as IECC 2000

IECC 2007/2008:
Had Table 503.2.8

FLUID	NOMINAL PIPE DIAMETER	
	≤ 1.5"	**<1.5"**
Steam	11/2	3
Hot water	11/2	2
Chilled water, brine or refrigerant	11/2	11/2

For SI: 1 inch = 25.4 mm.
a. Based on insulation having a conductivity (*k*) not exceeding 0.27 Btu per inch/h · ft2 · °F.

b. For insulation with a thermal conductivity not equal to 0.27Btu · inch/h · ft2 · °F at a mean temperature of 75°F, the minimum required pipe thickness is adjusted using the following equation;

$T = r[(1+tlr)K/k-1]$

where:

T = Adjusted insulation thickness (in).
r = Actual pipe radius (in).
t = Insulation thickness from applicable cell in table (in).
K = New thermal conductivity at 75°F (Btu · in/hr · ft2 · °F).
k = 0.27 Btu · in/hr · ft2 · °F.

Steam:
1.5" wall on Flat Surface calculation is equal a "R" value of 6
1.5" wall on Radial Surface calculation is equal a "R" value of 6.4 to 11.4 *(I.D. Dependent)*
3.0" wall on Flat Surface calculation is equal a "R" value of 12
Hot and Chilled Water, brine or refrigerant:
1.0" wall on Flat Surface calculation is equal a "R" value of 4.2
1.0" wall on Radial Surface calculation is equal a "R" value of 5.5 to 7.4 *(I.D. Dependent)*
1.5" wall on Flat Surface calculation is equal a "R" value of 6
1.5" wall on Radial Surface calculation is equal a "R" value of 6.4 to 11.4 *(I.D. Dependent)*
2.0" wall on Flat Surface calculation is equal a "R" value of 8

IEEC 2009/2010: (Proposal)
Convert Insulation to "R" value by category

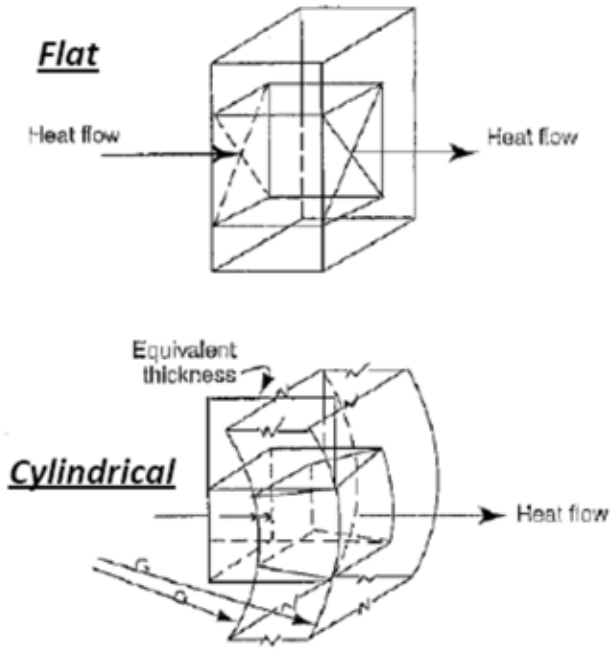
Steam:
R -12 with Flat Surface calculation is equal to a thickness of 3"
R -12 with Radial Surface calculation is equal to a thickness of 2" *(I.D. Dependent)*
Hot and Chilled Water, brine or refrigerant:
R- 6 with Flat Surface calculation is equal to a thickness of 1-1/2"
R -6 with Radial Surface calculation is equal to a thickness of 1" *(I.D. Dependent)*

BTU Loss Example based on 2009/2010 proposal:

	1" Pipe			4" Pipe		
	Temp °F	Insulation R Value	BTU Loss	Temp °F	Insulation R Value	BTU Loss
Steam or fluid temperatures > 200°F	300	R-6	-31	300	R-12	-39
Hot water: 105°F to 200°F	180	R-4	-17	180	R-6	-35
Chilled water, brine or refrigerant; < 55°F	40	R-6	-4	40	R-6	-11
Ambient Temp	75			75		

(*) Chilled water is also addressing condensation concerns with the R-6 requirement

Don't compare typical flat sheet insulation "R" values with cylindrical pipe insulation "R" values.



Cylindrical Pipe Insulation "R" value Calculation:

$$R = \frac{r2 \ln(\frac{r2}{r1})}{k}$$

Where r_1 = uninsulated pipe radius in inches
r_2 = insulated pipe radius in inches
k = thermal conductivity.

This equation yields an "R" value on a ***square foot basis***

R" value or thermal resistance is a measure of the ability of a material to retard heat flow. "R" is the numerical reciprocal of "C" (thermal conductance). Thermal resistance is used in combination with numerals to designate thermal resistance values. The higher the "R" value the higher the insulating value. This value is normally calculated on a square foot basis.

Flat Sheet Calculation Example:

$$R = \frac{\text{Thickness of Material}}{\text{Material Thermal Conductivity}}$$

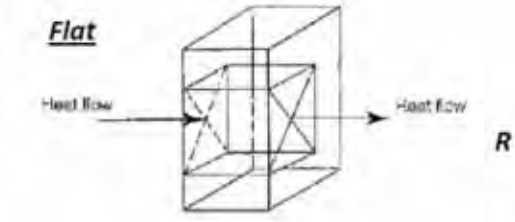
Sheet Insulation Thickness: 2"
Insulation Thermal Conductivity: 0.25 Btu•in/h•ft^2•°F
Resulting "R" Value : R-8.0 *(R-8 equals 8 resistance units)*

(*) It is common knowledge that with flat layer of insulation increasing the "R" value increases the thermal efficiency by the same factor.

The simple relations for flat sheet insulation do not hold true for when looking at cylindrical pipe insulations. For these materials, heat flow is not the simple straight –through heat flow found in flat surface/sheet material, but rather a radial heat flow. The reasoning is based on that fact that the inner radius surface area is much smaller than the outer radius surface area.

These differences in surface area support the need to calculate heat flow must be done using an equivalent thickness. For cylindrical pipe insulation the Cylindrical Pipe Insulation "R" value Calculation detailed above.

Don't compare typical flat sheet insulation "R" values with cylindrical pipe insulation "R" values.



$$R = \frac{\text{Thickness of Flat Sheet Material}}{\text{Material Thermal Conductivity}}$$

Wall Thickness (inches)

ICCFILENAME: Resetar-Schmidt-Dunahue-EC-6-T. 503.2.8

EC210–09/10
503.2.9

Proponent: Krista Braaksma, representing Washington State Building Code Council

Delete and substitute as follows:

~~**503.2.9 HVAC system completion.** Prior to the issuance of a certificate of occupancy, the design professional shall provide evidence of system completion in accordance with Sections 503.2.9.1 through 503.2.9.3.~~

~~**503.2.9.1 Air system balancing**. Each supply air outlet and zone terminal device shall be equipped with means for air balancing in accordance with the requirements of Chapter 6 of the International Mechanical Code. Discharge dampers are prohibited on constant volume fans and variable volume fans with motors 25hp (18.6kW) and larger.~~

~~**503.2.9.2 Hydronic system balancing.** Individual hydronic heating and cooling coils shall be equipped with means for balancing and pressure test connections.~~

~~**503.2.9.3 Manuals.** The construction documents shall require that an operating and maintenance manual be provided to the building owner by the mechanical contractor. The manual shall include, at least, the following:~~

1. ~~Equipment capacity (input and output) and required maintenance actions.~~
2. ~~Equipment operation and maintenance manuals.~~

3. ~~HVAC system control maintenance and calibration information, including wiring diagrams, schematics, and control sequence descriptions. Desired or field determined set points shall be permanently recorded on control drawings, at control devices or, for digital control systems, in programming comments.~~
4. ~~A complete written narrative of how each system is intended to operate.~~

503.2.9 Mechanical systems commissioning and completion requirements.

503.2.9.1 System commissioning. Commissioning is a process that verifies and documents that the selected building systems have been designed, installed, and function according to the owner's project requirements and construction documents. Drawing notes shall require commissioning and completion requirements in accordance with this section. Drawing notes may refer to specifications for further requirements. Copies of all documentation shall be given to the owner.

503.2.9.1.1 Commissioning Plan. A commissioning plan shall include as a minimum the following items:

1. A detailed explanation of the original owner's project requirements,
2. A narrative describing the activities that will be accomplished during each phase of commissioning, including guidance on who accomplishes the activities and how they are completed,
3. Equipment and systems to be tested, including the extent of tests,
4. Functions to be tested (for example calibration, economizer control),
5. Conditions under which the test shall be performed (for example winter and summer design conditions, full outside air), and
6. Measurable criteria for acceptable performance.

503.2.9.1.2 Systems Adjusting and Balancing. All HVAC systems shall be balanced in accordance with generally accepted engineering standards. Air and water flow rates shall be measured and adjusted to deliver final flow rates within 10 percent of design rates. Test and Balance activities shall include as a minimum the following items:

1. Air systems balancing: Each supply air outlet and zone terminal device shall be equipped with means for air balancing in accordance with the requirements of Chapter 6 of the *International Mechanical Code*. Discharge dampers are prohibited on constant volume fans and variable volume fans with motors 10 hp (18.6 kW) and larger. Air systems shall be balanced in a manner to first minimize throttling losses then, for fans with system power of greater than 1 hp, fan speed shall be adjusted to meet design flow conditions.

   Exception: Fan with fan motors of 1 hp or less.

2. Hydronic systems balancing: Individual hydronic heating and cooling coils shall be equipped with means for balancing and pressure test connections. Hydronic systems shall be proportionately balanced in a manner to first minimize throttling losses, then the pump impeller shall be trimmed or pump speed shall be adjusted to meet design flow conditions. Each hydronic system shall have either the ability to measure pressure across the pump, or test ports at each side of each pump.

   Exceptions:

   1. Pumps with pump motors of 5 hp or less.
   2. When throttling results in no greater than 5 percent of the nameplate horsepower draw above that required if the impeller were trimmed.

503.2.9.1.3 Functional performance testing.

1. **Equipment Functional Performance Testing** shall demonstrate the correct installation and operation of components, systems, and system-to-system interfacing relationships in accordance with approved plans and specifications. This demonstration is to prove the operation, function, and maintenance serviceability for each of the Commissioned systems. Testing shall include all modes of operation, including:
   1.1. All modes as described in the Sequence of Operation,
   1.2. Redundant or automatic back-up mode,
   1.3. Performance of alarms, and
   1.4. Mode of operation upon a loss of power and restored power.

   Exception: Unitary or packaged HVAC equipment listed in Tables 503.2.3 (1) through (3) that do not require supply air economizers.

2. **Controls functional performance testing.** HVAC control systems shall be tested to document that control devices, components, equipment, and systems are calibrated, adjusted and operate in accordance with approved plans and specifications. Sequences of operation shall be functionally tested to document they operate in accordance with approved plans and specifications.

503.2.9.1.4 Preliminary commissioning report. A preliminary report of commissioning test procedures and results shall be completed and provided to the Owner. The report shall be identified as "Preliminary Commissioning Report" and shall identify:

1. Itemization of deficiencies found during testing required by this section which have not been corrected at the time of report preparation, and the anticipated date of correction.
2. Deferred tests which cannot be performed at the time of report preparation due to climatic conditions.
3. Climatic conditions required for performance of the deferred tests, and the anticipated date of each deferred test.

503.2.9.2 Acceptance: Buildings, or portions thereof, required by this Code to comply with this section shall not be issued a final certificate of occupancy allowing public or owner occupation until such time that the building official has received a letter of transmittal from the building owner that states they have received the Preliminary Commissioning Report as required by Section 503.2.9.1.4. At the request of the building official, a copy of the Preliminary Commissioning Report shall be made available for review.

503.2.9.3 Completion requirements. The construction documents shall require that within 90 days after the date of final certificate of occupancy, the documents described in this section be provided to the building owner.

503.2.9.3.1 Drawings. Construction documents shall include as a minimum the location and performance data on each piece of equipment.

503.2.9.3.2 Manuals. An operating manual and a maintenance manual shall be in accordance with industry-accepted standards and shall include, at a minimum, the following:

1. Submittal data stating equipment size and selected options for each piece of equipment requiring maintenance.
2. Manufacturer's operation manuals and maintenance manuals for each piece of equipment requiring maintenance, except equipment not furnished as part of the project. Required routine maintenance actions shall be clearly identified.
3. Names and addresses of at least one *service agency*.
4. HVAC controls system maintenance and calibration information, including wiring diagrams, schematics, and control sequence descriptions. Desired or field-determined setpoints shall be permanently recorded on control drawings at control devices or, for digital control systems, in programming comments.
5. A complete narrative of how each system is intended to operate, including suggested setpoints.

503.2.9.3.3 System balancing report. A written report describing the activities and measurements completed in accordance with Section 503.2.9.1.2

503.2.9.3.4 Final commissioning report. A complete report of test procedures and results identified as "Final Commissioning Report" shall include:

1. Results of all Functional Performance Tests.
2. Disposition of all deficiencies found during testing, including details of corrective measures used or proposed.
3. All Functional Performance Test procedures used during the commissioning process including measurable criteria for test acceptance, provided herein for repeatability.

Exception: Deferred tests which cannot be performed at the time of report preparation due to climatic conditions.

Reason: The purpose of this code change proposal is to provide expanded direction on commissioning requirements.

Building commissioning requirements have been in place in Washington since 2000. Also, Title 24 (California's energy code) requires commissioning functional and performance testing. Commissioning is an important means of ensuring systems are installed and function as designed. Far too many buildings contain substantive defects and programming errors that impact the performance and functionality of the building. Commissioning is a means of discovering and correcting these defects. Commissioning also provides documentation of system design intent and operating sequences, and documents that building staff receive accurate operation manuals and drawings.

The cost of commissioning is a small part of the overall project (1-2% of total costs), yet can provide substantial payback in the form of reduce energy usage, better building performance, improved air quality, and higher productivity. A 2004 study by Lawrence Berkeley National Laboratory concluded that commissioning is cost-effective for both new and existing buildings of a variety of uses and sizes, not only in energy savings but also in extended equipment lifetimes and lower maintenance costs. Investigators found that the median payback of building commissioning was 4.8 years, and when non-energy impacts were factored in, the payback was considerably reduced. The average energy cost savings per year was 18 percent.

EC211–09/10
503.3.1, Table 503.3.1 (New)

Proponent: Ronald Majette, representing US Department of Energy

1. Revise as follows:

503.3.1 Economizers. Supply air economizers shall be provided on each cooling system in buildings located in climate zones 2B, 3B, 4C, 5A, 5C, 6A, 6B, and 8 having a cooling capacity of at least 54,000 Btu/h ~~as shown in Table 503.3.1(1)~~. Economizers shall be capable of providing 100-percent outdoor air, even if additional mechanical cooling is required to meet the cooling load of the building. Systems shall provide a means to relieve excess outdoor air during economizer operation to prevent over pressurizing the building. The relief air outlet shall be located to avoid recirculation into the building. Where a single room or space is supplied by multiple air systems, the aggregate capacity of those systems shall be used in applying this requirement. The aggregate cooling capacity of cooling systems without economizers shall not exceed 480,000 Btu/h or 20 percent of it air economizer capacity, whichever is greater.

Exceptions:

1. Where the cooling equipment is covered by the minimum efficiency requirements of Table 503.2.3(1) or 503.2.3(2) and meets or exceeds the minimum cooling efficiency requirement (EER) ~~by the percentages shown~~ in Table 503.3.1~~(2).~~
2. Systems with air or evaporatively cooled condensors and which serve spaces with open case refrigeration or that require filtration equipment in order to meet the minimum ventilation requirements of Chapter 4 of the *International Mechanical Code*.

2. Add new table as follows:

TABLE 503.3.1
ALTERNATE COMPLIANCE PATH TO AIRSIDE ECONOMIZERS FOR UNITARY EQUIPMENT

Reason: For consistency with Standard 90.1. This proposal is based on ongoing analysis efforts within ASHRAE designed to create a Standard 90.1-2010 that is 30% better than Standard 90.1-2004 in response to Federal legislation. Paralleling those efforts and considering that the IECC Chapter 5 is intended to be technically compatible with that standard to facilitate adoption and implementation, DOE is interested in keeping Chapter 5 of the 2012 IECC aligned with ANSI/ASHRAE/IESNA Standard 90.1-2010. Due to the timing of the code development process and ASHRAE standards processes this proposal was submitted in anticipation that by the final action hearings the work to update the standard would be complete.

Table 503.3.1(2) is an option in the current IECC that allows for the elimination of the air economizer requirement for air cooled packaged units covered by ARI 340/360 when incremental higher full load efficiencies are used as defined in Table 503.3.1(2). With the new full load and part load efficiencies that will go into effect in 2010 as approved by addendum g to the 2004 ASHRAE 90.1 and addendum s to the 2007 ASHRAE 90.1 and proposed in other changes to the IECC for the 2012 cycle this table needs to be updated as well.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: Majette-EC-13-503.3.1

EC212–09/10
504.5

Proponent: John R. Addario, PE, New York State Department of State – Division of Code Enforcement and Administration

Revise as follows:

504.5 Pipe insulation. For automatic-circulating hot water and heat traced systems, piping shall be insulated with 1 inch (25 mm) of insulation having a conductivity not exceeding 0.27 Btu per inch/h x ft^2 ' °F (1.53 W per 25 mm/m^2 x K). The first 8 feet (2438 mm) of piping in ~~noncirculating~~ non-hot-water-supply temperature maintenance systems served by equipment without integral heat traps shall be insulated with 0.5 inch (12.7 mm) of material having a conductivity not exceeding 0.27 Btu per inch/h x ft^2 ' °F (1.53 W per 25 mm/m^2 x K).

Reason: The intent of this section is to require systems that maintain hot water temperature to be properly insulated. Heat traced systems, like circulating systems, should be required to limit the amount of energy they consume by requiring a minimum amount of insulation. This proposed change includes heat trace systems within the intent of the code. This proposed change also renames the reference from *noncirculating* to *hot water supply temperature maintenance* in order to recognize heat trace systems .

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

Filename: Addario-EC-3-504.5

EC213–09/10
504.5

Proponent: James R. Paschal, Paschal Engineering, representing Aquatherm, Inc.

Revise as follows:

504.5 Pipe insulation. For automatic-circulating hot water systems, piping shall be insulated with 1 inch (25 mm) of insulation having a conductivity not exceeding 0.27 Btu per inch/h x ft^2 x °F (1.53 W per 25 mm/m^2 x K). The first 8 feet (2438 mm) of piping in noncirculating systems served by equipment without integral heat traps shall be insulated with 0.5 inch (12.7 mm) of material having a conductivity not exceeding 0.27 Btu per inch/h x ft^2 x °F (1.53 W per 25 mm/m^2 x K). For non-metallic pipes of at least schedule 80 thickness and having thermal resistance greater than that of steel or copper pipe, reduced insulation thicknesses are permitted if documentation is provided showing that the pipe with the proposed insulation has no more heat gain or loss per foot than steel or copper pipe of the same nominal size with the insulation thickness specified here.

Reason: Plastic pipe with a heavier wall thickness can provide a significant insulating effect, thereby reducing the amount of external insulation necessary to achieve the same thermal performance. The requirements and values in the table assume that the pipe itself does not contribute to the overall thermal performance of the pipe/insulation combination. The addition of this footnote will explicitly allow recognition of this enhanced performance, while meeting the intent of the table by requiring the same or better performance from the pipe/insulation combination. This proposal is also consistent with the recently revised ASHRAE 90.1, *Energy Standard for Buildings Except Low-Rise Residential Buildings*, which recognizes that piping materials with low thermal conductivity and sufficient wall thickness can provide an insulating effect and thereby reduce the overall insulation required to achieve equivalent performance.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: Paschal-EC-3-504.5

EC214–09/10
504.5

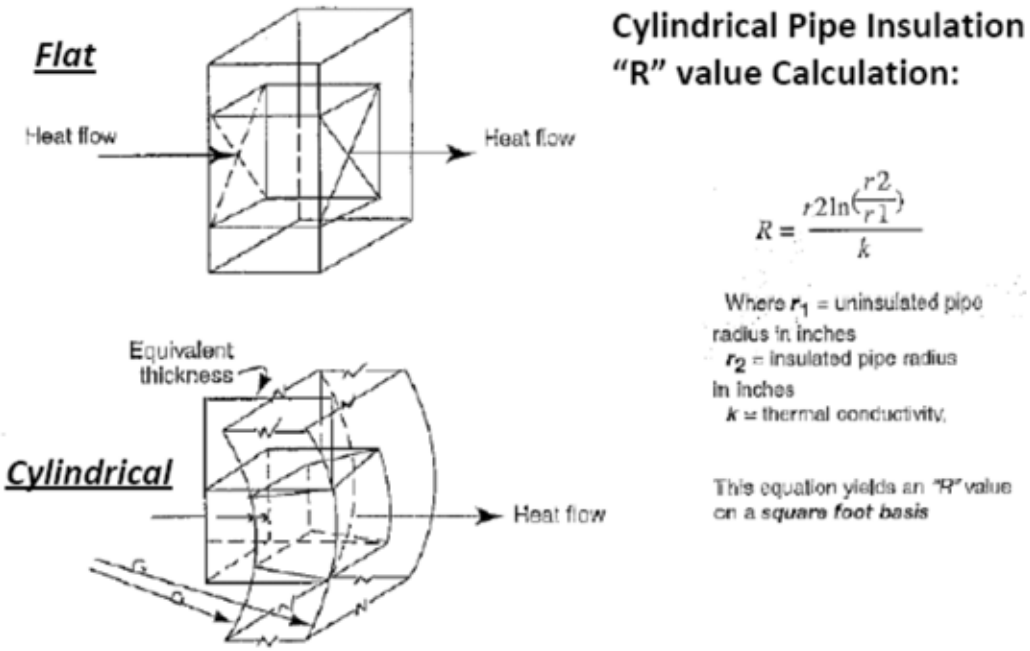
Proponent: Michael Resetar, Armacell LLC; Roger Schmidt, K-Flex USA; Shawn Dunahue, Nomaco Insulation

Revise as follows:

504.5 Pipe insulation. For ~~automatic-circulating~~ hot water delivery systems, piping shall be insulated with ~~1 inch (25 mm)~~ R-6 ~~of~~ insulation having a conductivity not exceeding 0.27 Btu per inch/h× ft2 × °F (1.53 W per 25 mm/m2 × K). ~~The first 8 feet (2438mm) of piping in noncirculating systems served by equipment without integral heat traps shall be insulated with 0.5 inch (12.7mm) of material having a conductivity not exceeding 0.27 Btu per inch/h × ft2 × °F (1.53 W per 25 mm/m2 × K).~~

Reason: Converting wall thickness requirement to an "R" value to be consistent with other insulation requirements within ICC codes and implementing pipe insulation on all hot water lines is a cost effective way to reduce energy consumption and increase water conservation within the structure by maintaining fluid temperature above 105°F longer between uses.

Don't compare typical flat sheet insulation "R" values with cylindrical pipe insulation "R" values.



Cylindrical Pipe Insulation "R" value Calculation:

$$R = \frac{r2\ln(\frac{r2}{r1})}{k}$$

Where r_1 = uninsulated pipe radius in inches
r_2 = insulated pipe radius in inches
k = thermal conductivity.

This equation yields an "R" value on a ***square foot basis***

R" value or thermal resistance is a measure of the ability of a material to retard heat flow. "R" is the numerical reciprocal of "C" (thermal conductance). Thermal resistance is used in combination with numerals to designate thermal resistance values. The higher the "R" value the higher the insulating value. This value is normally calculated on a square foot basis.

Flat Sheet Calculation Example:

$$R = \frac{\text{Thickness of Material}}{\text{Material Thermal Conductivity}}$$

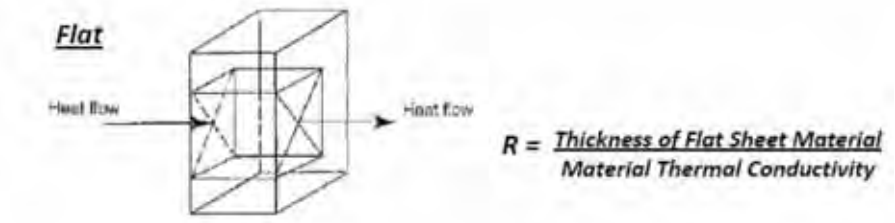
Sheet Insulation Thickness: 2"
Insulation Thermal Conductivity: 0.25 Btu•in/h•ft^2•°F
Resulting "R" Value : R-8.0 *(R-8 equals 8 resistance units)*

(*) It is common knowledge that with flat layer of insulation increasing the "R" value increases the thermal efficiency by the same factor.

The simple relations for flat sheet insulation do not hold true for when looking at cylindrical pipe insulations. For these materials, heat flow is not the simple straight –through heat flow found in flat surface/sheet material, but rather a radial heat flow. The reasoning is based on that fact that the inner radius surface area is much smaller than the outer radius surface area.

These differences in surface area support the need to calculate heat flow must be done using an equivalent thickness. For cylindrical pipe insulation the **Cylindrical Pipe Insulation "R" value Calculation** detailed above.

Don't compare typical flat sheet insulation "R" values with cylindrical pipe insulation "R" values.

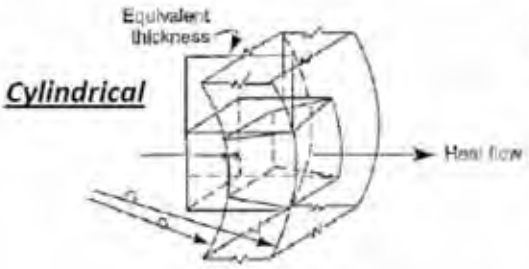


$$R = \frac{\text{Thickness of Flat Sheet Material}}{\text{Material Thermal Conductivity}}$$

Wall Thickness (inches)

	3/8	1/2	3/4	1	1-1/2	2
R-Value	1.5	2.1	3.1	4.2	6	8

Insulation Thermal Conductivity: 0.25 Btu•in/h•ft^2•°F



Cylindrical Pipe Insulation "R" value Calculation:

$$R = \frac{r2\ln(\frac{r2}{r1})}{k}$$

Wall Thickness

504.7, 504.7.1, 504.7.2, 504.7.3

Proponent: Ronald Majette, representing US Department of Energy

Revise as follows:

504.7 Pools, hot tubs and spas (Mandatory). Pools, hot tubs and spas shall ~~be provided with energy-conserving measures in accordance~~ comply with Sections 504.7.1 through 504.7.3.

504.7.1 ~~Pool h~~Heaters. All ~~pool~~ heaters shall be equipped with a readily *accessible* on-off switch to allow shutting off the heater without adjusting the thermostat setting. ~~Pool h~~ Heaters fired by natural or LP gas shall not have continuously burning pilot lights.

504.7.2 Time switches. Time switches that can automatically turn off and on heaters and pumps according to a preset schedule shall be installed on ~~swimming pool~~ heaters and pumps.

Exceptions:

1. Public health standards require 24-hour pump operation.
2. Pumps are required to operate solar- and waste-heat-recovery ~~pool heating~~ systems.

504.7.3 ~~Pool c~~Covers. Heated pools, hot tubs and spas shall be ~~equipped~~ provided with a vapor-retardant ~~pool~~ cover ~~on or at the water surface~~. Pools, hot tubs and spas capable of being heated to more than 90°F (32°C) shall ~~have a pool~~ be provided with a cover ~~with~~ having a minimum insulation value of R-12.

~~Exception:~~ ~~Pools deriving over 60 percent of the energy for heating from site-recovered energy or solar energy source.~~

Reason: Clarification. The current text does not apply to hot tubs and spas and it should. The text in 504.7.3 has been revised to be applied during inspection prior to approval of the subject pool, hot tub or spa. As currently written, one could interpret the requirements as enforceable after a use permit has been issued. It is not likely code officials could, nor would want to, enforce the cover provisions in a post-occupancy condition as suggested by the current text. The exception for solar or site recovered energy has been eliminated simply because there is no rationale why a pool, hot tub or spa getting 59% of its energy from non-renewables should not be exempt and one getting 61% from renewable should. Also, how would this last provision even be determined in plan review and capable of being readily enforced.

Cost Impact: The proposed change will not increase the cost of construction other than pools that were heated with solar or site recovered energy systems will now require the use of a pool cover.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Majette-EC-16-504.7

EC217–09/10
202 (New), 505.1, 505.2 (New), Tables 505.2(1)-(2) (New), Chapter 6 (New)

Proponent: Ronald Majette, representing US Department of Energy

1. Add new definitions as follows:

GENERAL PURPOSE ELECTRIC MOTOR (SUBTYPE I). Any electric motor that meets the definition of "general purpose" motor as codified by the Department of Energy in 10 CFR 431.

GENERAL PURPOSE ELECTRIC MOTOR (SUBTYPE II). Any electric motor incorporating the design elements of a general purpose electric motor (subtype I) that are configured as:

U-frame motor,
Design C motor,
Close-coupled pump motor,
Footless motor,
Vertical solid shaft normal thrust motor (tested in a horizontal configuration)

8 –pole motor (900 rpm), or
Poly-phase motor with voltage no more than 600 volts (other than 230 or 460 volts).

2. Revise as follows:

505.1 General (Mandatory). This section covers electric motors, lighting system controls, the connection of ballasts, the maximum lighting power for interior applications and minimum acceptable lighting equipment for exterior applications.

Exception: Lighting within dwelling units where 50 percent or more of the permanently installed interior light fixtures are fitted with high-efficacy lamps.

3. Add new text and tables as follows:

505.2 Electric motors. Electric motors manufactured alone or as a component of another piece of equipment shall comply with Table 505.2(1) for *general purpose electric motors (subtype I)* and Table 505.2(2) for *general purpose electric motors (subtype II)*.

Fire pump motors and NEMA Design B, general purpose electric motors with a power rating of more than 200 horsepower, but no more than 500 horsepower shall have a minimum nominal full load efficiency as shown in Table 505.2(2)

TABLE 505.2(1)

a. Efficiencies shall be established in accordance with NEMA Standard MG1.
b. NR = no requirement

4. Add new standard as follows:

NEMA National Electrical Manufacturers Association
1300 North 17th Street, Suite 184
Rosslyn, VA 22209

ANSI/NEMA MG 1-93 Motors and Generators

Reason: This proposal is based on ongoing analysis efforts within ASHRAE designed to create a Standard 90.1-2010 that is 30% better than Standard 90.1-2004 in response to Federal legislation. Paralleling those efforts and considering that the IECC Chapter 5 is intended to be technically compatible with that standard to facilitate adoption and implementation, DOE is interested in keeping Chapter 5 of the 2012 IECC aligned with ANSI/ASHRAE/IESNA Standard 90.1-2010. Due to the timing of the code development process and ASHRAE standards processes this proposal was submitted in anticipation that by the final action hearings the work to update the standard would be complete. Note also that motor efficiency is currently covered in Standard 90.1-07, is not included in the IECC and for consistency should be included.

Section 313 of the Energy Independence and Security Act of 2007 (EISA 2007) mandates that the efficiency of general purpose motors (manufactured or imported) that are rated at 1.0 horsepower and larger be increased for motors manufactured on or after December 19, 2010. In addition, there are new efficiency standards that are required for larger motors that may be used by commercial/ industrial customers (sized greater than 200 horsepower and less than or equal to 500 horsepower). These updated motor efficiency standards have been vetted, analyzed, and agreed to by motor manufacturers.

According to a March 21, 2007 press release by the American Council for an Energy- Efficient Economy (ACEEE) and the National Electrical Manufacturers Association (NEMA), the new motor efficiency standards will create a cumulative national energy savings of 8 quadrillion Btus over 20 years (2010 to 2030), with a net energy cost savings to commercial and industrial consumers of almost $500 million. These clarifying changes to Standard 90.1 will not affect the estimate of these savings.

Adding this clarifying information to the IECC will help designers, end-use customers, and code officials with motor specifications and verifications.

Cost Impact: The code change proposal will not increase the cost of construction as the provisions covered in the proposal are addressed in Federal rules, just as many of the HVAC equipment efficiencies are now in the IECC.

Analysis: A review of the standard(s) proposed for inclusion in the code, ANSI/NEMA MG 1-93, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: Majette-EC-22-505-

EC218–09/10
505.1, 505.5.3 (New)

Proponent: Joseph Hill, RA, representing the New York State Department of State

1. Revise as follows:

505.1 General (Mandatory). This section covers lighting system controls, the connection of ballasts, the maximum lighting power for interior applications, electrical energy consumption, and minimum acceptable lighting equipment for exterior applications.

~~**Exception:** Lighting within dwelling units where 50 percent or more of the permanently installed interior light fixtures are fitted with high-efficacy lamps.~~

Exception: Dwelling units are not required to comply with Sections 505.2 through 505.5.2

2. Add new text as follows:

505.5.3 Lighting within dwelling units. (Mandatory). Lighting within dwelling units shall have a minimum of 50 percent of the permanently installed interior light fixtures fitted with *high-efficacy lamps*.

Reason: This dwelling unit exception as existing in the Code is somewhat confusing. For dwelling units, the section essentially mixes design and installation requirements for lighting fixtures. The requirements either;
Drives the owner to *install* 50 percent or more of the interior light fixtures with high-efficacy lamps.
Or Conversely;
Requires the designer to comply with all electrical power and lighting requirements of Section 505.

It would be clearer to the code user to list a requirement for a minimum of 50 percent of the permanently installed interior light fixtures to be fitted *high-efficacy lamps*. This **requirement** is part of Chapter 4 of the Energy Code, and would create consistency with the Residential provisions (Chapter 4) of the Energy Code for dwelling units.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Hill-EC-4-505.1

EC219–09/10
101.4.3, 505.1

Proponent: Ronald Majette, representing US Department of Energy

Revise as follows:

101.4.3 Additions, alterations, renovations or repairs. Additions, alterations, renovations or repairs to an existing building, building system or portion thereof shall conform to the provisions of this code as they relate to new construction without requiring the unaltered portion(s) of the existing building or building system to comply with this code. Additions, alterations, renovations or repairs shall not create an unsafe or hazardous condition or overload existing building systems. An addition shall be deemed to comply with this code if the addition alone complies or if the existing building and addition comply with this code as a single building.

Exception: The following need not comply provided the energy use of the building is not increased:

1. Storm windows installed over existing fenestration.
2. Glass only replacements in an existing sash and frame.
3. Existing ceiling, wall or floor cavities exposed during construction provided that these cavities are filled with insulation.
4. Construction where the existing roof, wall or floor cavity is not exposed.
5. Reroofing for roofs where neither the sheathing nor the insulation is exposed. Roofs without insulation in the cavity and where the sheathing or insulation is exposed during reroofing shall be insulated either above or below the sheathing.
6. Replacement of existing doors that separate *conditioned space* from the exterior shall not require the installation of a vestibule or revolving door, provided, however, that an existing vestibule that separates a *conditioned space* from the exterior shall not be removed,
7. Alterations that replace less than 50 percent of the luminaires in a space, provided that such alterations do not increase the installed interior lighting power.
8. Alterations that replace only the bulb ~~and~~ or ballast within the existing luminaires in a space provided that the *alteration* does not increase the installed interior lighting power.

505.1 General (Mandatory). This section covers lighting system controls, the connection of ballasts, the maximum lighting power for interior applications and minimum acceptable lighting equipment for exterior applications.

Exception: Lighting within dwelling units where 50 percent or more of the permanently installed interior light fixtures are fitted with high-efficacy lamps.

The *alteration* of lighting systems in any building *space* or exterior area shall comply with the lighting power requirements of Section 505 applicable to the space or area being altered and the automatic shutoff requirements of Section 505.2.2.2. Such *alterations* shall include all luminaires that are added, replaced or removed. This requirement shall also be met for *alterations* that involve the replacement of lamps and ballast combinations.

Exception: *Alterations* that involve less than 10 percent of the connected lighting load in a *space* or area and do not increase the installed lighting power.

Reason: For consistency with Standard 90.1. This proposal is based on ongoing analysis efforts within ASHRAE designed to create a Standard 90.1-2010 that is 30% better than Standard 90.1-2004 in response to Federal legislation. Paralleling those efforts and considering that the IECC Chapter 5 is intended to be technically compatible with that standard to facilitate adoption and implementation, DOE is interested in keeping Chapter 5 of the 2012 IECC aligned with ANSI/ASHRAE/IESNA Standard 90.1-2010. Due to the timing of the code development process and ASHRAE standards processes this proposal was submitted in anticipation that by the final action hearings the work to update the standard would be complete.

These changes clarify when controls are required to comply when lighting systems are altered. The current code requires that only controls that are replaced must meet specific requirements for that type of control. The proposed change requires that controls be changed or added to meet the primary lighting control requirement of automatic control when the lighting fixtures in the space are retrofit. This is simpler, makes spaces comply more completely with the code and will save additional energy.

Cost Impact: The proposal will decrease the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Majette-EC-18-505.1

EC220–09/10
202, 505.2.2.1

Proponent: Rick Sugar, Douglas County, CO, representing Colorado Chapter of the International Code Council

1. Revise as follows:

505.2.2.1 Light reduction controls. Each area that is required to have a manual control shall also allow the occupant to reduce the connected lighting load in a reasonably uniform illumination pattern by at least 50 percent. Lighting reduction shall be achieved by one of the following or other *approved* method:

1. Controlling all lamps or luminaires;
2. Dual switching of alternate rows of luminaires, alternate luminaires or alternate lamps;
3. Switching the middle lamp luminaires independently of the outer lamps; or
4. Switching each luminaire or each lamp.

Exceptions:

1. Areas that have only one luminaire.
2. Areas that are controlled by an occupant-sensing device.
3. Corridors, equipment rooms, storerooms, restrooms or public lobbies.
4. *Sleeping unit* (see Section 505.2.3).
5. Spaces that use less than 0.6 watts per square foot (6.5 W/m2).

2. Add new definition as follows:

EQUIPMENT ROOM. A space that contains either electrical equipment, mechanical equipment, machinery, water pumps or hydraulic pumps that are a function of the buildings services.

Reason: All equipment will need to be serviced periodically. Reducing the lighting in these areas is a life safety hazard when working on or around any equipment. Set parameters on what an equipment room is, so the exception is easier to understand and enforce

Cost Impact: This code change will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Sugar-EC-1-202 - 505.2.2.1

EC221–09/10
504.6

Proponent: Guy Tomberlin, Fairfax County, Virginia, representing himself

Revise as follows:

504.6 Hot water system controls. ~~Automatic~~ Circulating hot water system pumps or heat trace shall be arranged to be ~~conveniently~~ turned off, either automatically or manually, when there is limited hot water demand. ~~system is not in operation.~~ Ready access shall be provided to the operating controls.

Reason: This proposal cleans up flawed language and does not change the intent of the section. Circulating systems are not automatic but the controls that operate recirculating systems can be automatic or manual. The term "conveniently" is not defined in the family of I-codes. The intent is better stated by requiring ready access for the controls. "Ready access" is used throughout the family of I codes with a clear definition that means access which first does not require the removal of a door panel or similar obstruction. The intent of this section is for the controls to be in a location that building maintenance people can easily get to in order to change time clock settings (automatic systems) or simply flip a switch (manual systems). The phrase "when the hot water system is not in operation" is vague and confusing. Is the intention for the circulation pumps or heat trace to operate 24 hours a day unless the water heating system is not making hot water? In other words, when the water heater is turned off? No. The intent is to stop wasting energy consumed by pumps or heat trace when the demand for hot water is limited or non-existent such as occurs during weekends and nights in most buildings.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: TOMBERLIN-EC-504.6

EC222–09/10
505.2.2.2

Proponent: Krista Braaksma, representing Washington State Building Code Council

Revise as follows:

505.2.2.2 Automatic lighting shutoff. Buildings larger than 5,000 square feet (465m^2) shall be equipped with an automatic control device to shut off lighting in normally occupied, non egress related, areas. This automatic control device in these areas shall function on either:

1. A scheduled basis, using time-of-day, with an independent program schedule that controls the interior lighting in areas that do not exceed 25,000 square feet (2323m^2) and are not more than one floor; or
2. An occupant sensor that shall turn lighting off within 30 minutes of an occupant leaving a space; or
3. A signal from another control or alarm system that indicates the area is occupied~~.~~; or
4. Automatic time switches having a minimum 7 day clock and capable of being set for 7 different day types per week and which incorporate an automatic holiday "shut-off" feature, to turn off all loads for at least 24 hours and then resume normally scheduled operations. Automatic time switches shall also have program back-up capabilities, which prevent the loss of program and time settings for at least 10 hours, if power is interrupted.

Automatic time switches shall incorporate an over-ride switching device which:

1. Is readily accessible;
2. Is located so that a person using the device can see the lights or the areas controlled by the switch, or so that the area being illuminated is annunciated;
3. Is manually operated;
4. Allows the lighting to remain on for no more than 2 hours when an over-ride is initiated; and
5. Controls an area not exceeding 5,000 square feet or 5 percent of the building footprint for footprints over 100,000 square feet, whichever is greater.

Reason: The proposal provides a cost effective method of providing lighting control overrides for after-hours work.

Cost Impact: The code change proposal will increase the cost of construction

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: BRAAKSMA-EC-4-505.2.2.2

EC223–09/10
505.2.2.2

Proponent: Randall R. Dahmen, WI Registered PE, WI Licensed Commercial Building Inspector, representing self

Revise as follows:

505.2.2.2 Automatic lighting shutoff. Buildings larger than 5,000 square feet (465m_2) shall be equipped with an automatic control device to shut off lighting in those areas. This automatic control device shall function on either:

1. A scheduled basis, using time-of-day, with an independent program schedule that controls the interior lighting in areas that do not exceed 25,000 square feet (2323 m_2) and are not more than one floor; or
2. An occupant sensor that shall turn lighting off within 30 minutes of an occupant leaving a space; or
3. A signal from another control or alarm system that indicates the area is unoccupied.

Exception: The following shall not require an automatic control device:

1. *Sleeping unit* (see Section 505.2.3).
2. Lighting in spaces where patient care is directly provided.
3. Spaces where an automatic shutoff would endanger occupant safety or security.
4. Lighting intended for continuous operation.

Reason: With rising costs, it is financially inappropriate to require automatic shutoff controls in areas which are used for 24 hour/365 day a year operations. Those spaces which have continuous use have no energy savings or operation savings advantage for installing such controls. Additionally, ASHRAE 90.1 recognizes a similar exception.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: DAHMEN-EC1-505.2.2.2.DOC

EC224–09/10
505.2.2.3

Proponent: Krista Braaksma, Washington representing Washington State Building Code Council

Revise as follows:

505.2.2.3 Daylight zone control. Daylight zones, as defined by this code, shall be provided with individual controls that control the ~~lights~~ luminaires independent of general area lighting. Contiguous daylight zones adjacent to vertical fenestration are allowed to be controlled by a single controlling device provided that they do not include zones facing more than two adjacent cardinal orientations (i.e., north, east, south, west). Daylight zones under skylights more than 15 feet (4572 mm) from the perimeter shall be controlled separately from daylight zones adjacent to vertical fenestration.

In all areas with skylights, monitors or other fenestration at or above ceiling level and in all areas with windows, all permanent luminaries in the daylighted zone shall be controlled by automatic daylight sensing controls.

Automatic daylight sensing controls shall:

1. Be capable of reducing the light output of the controlled luminaires while maintaining a uniform level of illuminance by one of the following methods:
   1.1. Continuous dimming down to at least 10% of the maximum light output; or
   1.2. Step switching of each lamp in individual luminaires (non-continuous dimming devices shall have adjustable separation [deadband] of on and off points to prevent short cycling) and provide an automatic OFF control. Switching alternate luminaires is not permitted except with single lamp luminaires; or
   1.3. Step dimming by reducing the output of all of the lamps in individual luminaires by at least 50 percent and providing an automatic OFF control.

2. Control only luminaires within the daylit area(s).
3. Incorporate time-delay circuits to prevent cycling of light level changes of less than three minutes.

Any switching devices installed to override the automatic daylighting control shall comply with the criteria in Section 505.2.2.2.

Exception: ~~Daylight spaces enclosed by walls or ceiling height partitions and containing 2 or fewer light fixtures are not required to have a separate switch for general area lighting.~~ The following are exempt from the requirements for automatic daylighting controls in Section 505.2.2.3:

1. Retail spaces adjacent to vertical glazing (retail spaces under overhead glazing are not exempt).
2. Lighting exempted by Section 505.2.2.1, 505.2.2.2, 505.2.2.2.1, or 505.2.2.2.2.
3. Display, exhibition and specialty lighting controlled independently from general area lighting.
4. Small spaces in the daylight zone that are normally unoccupied (such as a storage room with a window, or restrooms) that are controlled by an occupant sensing device:
5. Rooms less than 300 square feet.
6. Conference rooms 300 square feet and larger that have a lighting control system with at least four scene options and an occupancy sensor control.
7. HID lamps with automatic controls that are capable of reducing the power consumption by at least 50%.
8. HID lamps 100 watts or less.

Reason: This proposal provides greater consistency with ASHRAE Standard 90.1 requirements for daylight zone control. It requires automatic controls to reduce energy consumption in daylighted spaces, both under skylights and next to windows.

Cost Impact: The code change proposal will not increase the cost of construction

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: BRAAKSMA-EC-5-505.2.2.3

EC225–09/10

Tables 505.6.2(1) and 505.2(2)

Proponent: Richard Heinisch, Acuity Brands Lighting, Inc.

Revise table as follows:

TABLE 505.6.2(1)
EXTERIOR LIGHTING ZONES

Lighting Zone	Description
0	Undeveloped areas within national parks, state parks, forest land, rural areas, and other undeveloped areas as defined by the local land use planning authority
1	Developed areas of national parks, state parks, forest land, and rural areas
2	Areas predominantly consisting of residential zoning, neighborhood business districts, light industrial with limited nighttime use and residential mixed use areas
3	All other areas
4	High activity commercial districts in major metropolitan areas as designated by the local land use planning authority

TABLE 505.6.2(2)
INDIVIDUAL LIGHTING POWER ALLOWANCES FOR BUILDING EXTERIORS

		Zone 0	Zone 1	Zone 2	Zone 3	Zone 4
Base Site Allowance (base allowance may be used in tradable or non-tradable surfaces)		No Base Site in Zone 0	500 W	600 W	750 W	1300 W
	Uncovered Parking Areas					
		No Tradable Surface allowances in Zone 0				
	Parking areas and drives		0.04 W/ft^2	0.06 W/ft^2	0.10 W/ft^2	0.13 W/ft^2
	Building Grounds					
Tradable Surfaces (Lighting power densities for uncovered parking areas, building grounds, building entrances and exits, canopies and overhangs and outdoor sales areas may be traded.)	Walkways less than 10 feet wide		0.7 W/linear foot	0.7 W/linear foot	0.8 W/linear foot	1.0 W/linear foot
	Walkways 10 feet wide or greater Plaza areas Special Feature Areas		0.14 W/ft^2	0.14 W/ft^2	0.16 W/ft^2	0.2 W/ft^2
	Stairways		0.75 W/ft^2	1.0 W/ft^2	1.0 W/ft^2	1.0 W/ft^2
	Pedestrian Tunnels		0.15 W/ft^2	0.15 W/ft^2	0.2 W/ft^2	0.3 W/ft^2
	Landscaping		0.04 W/ft^2	0.05 W/ft^2	0.05 W/ft^2	0.05 W/ft^2
	Building Entrances and Exits					
	Main entries		20 W/linear foot of door width	20 W/linear foot of door width	30 W/linear foot of door width	30 W/linear foot of door width
	Other doors		20 W/linear foot of door width	20 W/linear foot of door width	20 W/linear foot of door width	20 W/linear foot of door width
	Entry Canopies		0.25 W/ft^2	0.25 W/ft^2	0.4 W/ft^2	0.4 W/ft^2
	Sales Canopies					
	free standing and attached		0.6 W/ft^2	0.6 W/ft^2	0.8 W/ft^2	1.0 W/ft^2
	Outdoor Sales					
	Open areas (including vehicle sales lots)		0.25 W/ft^2	0.25 W/ft^2	0.5 W/ft^2	0.7 W/ft^2
	Street frontage for vehicle sales lots in addition to "open area" allowance		No allowance	10 W/linear foot	10 W/linear foot	30 W/linear foot

(Remainder of table unchanged)

Reason: This change adds an exterior zone 0 to cover very low light requirement areas. This will help eliminate excessive use of light in areas where none is needed other than for location marking type. Prior to this, the choices for users were zone 1 or 3 which both have higher than needed allowances. The single 60 W luminaire per location allows the use of small HID from higher pole locations (i.e. at parking) and would allow incandescent in locations where cold weather inhibits the use of CFL technology.

Cost Impact: The code change proposal will not increase the cost of construction and will, in fact, decrease costs by keeping designers from over lighting Zone 0 sites.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

		Sales Canopies				
	Free-standing and attached		0.6 W/ft^2	0.6 W/ft^2	0.8 W/ft^2	1.0 W/ft^2
		Outdoor Sales				
	Open areas (including vehicle sales lots)		0.25 W/ft^2	0.25 W/ft^2	0.5 W/ft^2	0.7 W/ft^2

		Zone 0	Zone 1	Zone 2	Zone 3	Zone 4
	Street frontage for vehicle sales lots in addition to "open area" allowance		No allowance	10 W/linear foot	10 W/linear foot	30 W/linear foot
Nontradable Surfaces (Lighting power density calculations for the following applications can be used only for the specific application and cannot be traded between surfaces or with other exterior lighting. The following allowances are in addition to any allowance otherwise permitted in the "Tradable Surfaces" section of this table.)	Building facades		No allowance	0.1 W/ft2 for each illuminated wall or surface or 2.5 W/linear foot for each illuminated wall or surface length	0.15 W/ft2 for each illuminated wall or surface or 3.75 W/linear foot for each illuminated wall or surface length	0.2 W/ft2 for each illuminated wall or surface or 5.0 W/linear foot for each illuminated wall or surface length
	Automated teller machines and night depositories	A single luminaire of 60 watts or less may be installed for each roadway/parking entry, trail head, and toilet facility, or other locations approved by the authority having jurisdiction	270 W per location plus 90 W per additional ATM per location	270 W per location plus 90 W per additional ATM per location	270 W per location plus 90 W per additional ATM per location	270 W per location plus 90 W per additional ATM per location
	Entrances and gatehouse inspection stations at guarded facilities		0.75 W/ft^2 of covered and uncovered area	0.75 W/ft^2 of covered and uncovered area	0.75 W/ft^2 of covered and uncovered area	0.75 W/ft^2 of covered and uncovered area
	Loading areas for law enforcement, fire, ambulance and other emergency service vehicles		0.5 W/ft^2 of covered and uncovered area	0.5 W/ft^2 of covered and uncovered area	0.5 W/ft^2 of covered and uncovered area	0.5 W/ft^2 of covered and uncovered area
	Drive-up windows/doors		400 W per drive-through	400 W per drive-through	400 W per drive-through	400 W per drive-through
	Parking near 24-hour retail entrances		800 W per main entry	800 W per main entry	800 W per main entry	800 W per main entry

For SI: 1 foot = 304.8 mm, 1 watt per square foot = W/0.0929 m^2.

Reason: For consistency with Standard 90.1. This proposal is based on ongoing analysis efforts within ASHRAE designed to create a Standard 90.1-2010 that is 30% better than Standard 90.1-2004 in response to Federal legislation. Paralleling those efforts and considering that the IECC Chapter 5 is intended to be technically compatible with that standard to facilitate adoption and implementation, DOE is interested in keeping Chapter 5 of the 2012 IECC aligned with ANSI/ASHRAE/IESNA Standard 90.1-2010. Due to the timing of the code development process and ASHRAE standards processes this proposal was submitted in anticipation that by the final action hearings the work to update the standard would be complete.

This change adds an exterior zone 0 to cover very low light requirement areas. This will help eliminate excessive use of light in areas where none is needed other than for location marking type. Prior to this, the choices for users were zone 1 or 3 which both have higher than needed allowances. The single 60 W luminaire per location allows the use of small HID from higher pole locations (i.e. at parking) and would allow incandescent in locations where cold weather inhibits the use of CFL technology.

Cost Impact: The code change proposal will not increase the cost of construction.

505.5.3 (New), 505.5.3.1 (New), 505.5.3.2 (New), Table 505.5.3 (New)

Proponent: Steve Ferguson, representing The American Society of Heating, Refrigerating and Air-Conditioning Engineers (ASHRAE)

Add new text and table as follows:

505.5.3 Alternative Compliance Path: Space-by-Space Method. The Space-by-Space Method as detailed in Section 505.5.3.1 and 505.5.3.2 shall be permitted for calculating lighting power allowance.

505.5.3.1 Space-by-Space Method of Calculating Interior Lighting Power Allowance. Use the following steps to determine the interior lighting power allowance by the Space-by-Space Method:

1. Determine the appropriate building type from Table 505.5.3. For building types not listed, selection of a reasonably equivalent type shall be permitted.
2. For each space enclosed by partitions 80% or greater than ceiling height, determine the gross interior floor area by measuring to the center of the partition wall. Include the floor area of balconies or other projections. Retail spaces do not have to comply with the 80% partition height requirements.
3. Determine the interior lighting power allowance by using the columns designated Space-by-Space Method in Table 505.5.3. Multiply the floor area(s) of the space(s) times the allowed LPD for the space type that most closely represents the proposed use of the space(s). The product is the lighting power allowance for the space(s). For space types not listed, selection of a reasonable equivalent category shall be permitted.
4. The interior lighting power allowance is the sum of lighting power allowances of all spaces. Trade-offs among spaces are permitted provided that the total installed interior lighting power does not exceed the interior lighting power allowance.

505.5.3.2 Additional Interior Lighting Power. When using the Space-by-Space Method, an increase in the *interior lighting power allowance* is allowed for specific lighting functions. Additional power shall be allowed only if the specified lighting is installed and automatically controlled, separately from the general lighting, to be turned off during nonbusiness hours. This additional power shall be used only for the specified *luminaires* and shall not be used for any other purpose.

An increase in the *interior lighting power allowance* is permitted in the following cases:

1. For spaces in which lighting is specified to be installed in addition to the general lighting for the purpose of decorative appearance, such as chandelier-type luminaries or sconces or for highlighting art or exhibits, provided that the additional lighting power shall not exceed 1.0 W/ft^2 of such spaces.
2. For lighting equipment installed in sales areas and specifically designed and directed to highlight merchandise, calculate the additional lighting power in accordance with Section 505.5.2:

a. In cases where both a common space type and a building-specific type are listed, the building specific space type shall apply.

Reason: The Space by Space method for lighting design in ASHRAE/IES Standard 90.1-2007 provide lighting designers more flexibility in designing the lighting systems for a building. It does allow for more innovative design that can save more energy than the current requirements in the IECC. With the approval of EC105 -07/08, lighting designers can no longer use the lighting design criteria of 90.1 if the building project is being designed in accordance with the IECC 2009.This code proposal will provide lighting designers the ability to use the Space by Space method that is currently published in 90.1-2007 when a project is being designed in accordance with the IECC.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: Ferguson-EC-3-505.6.3

EC228–09/10
505.7

Proponent: Ronald Majette, representing US Department of Energy

Revise as follows:

505.7 Electrical energy consumption. (Mandatory). In buildings having individual dwelling units, provisions shall be made to determine the electrical energy consumed by each tenant by separately metering individual dwelling units. In buildings having a floor area over 10,000 square feet, energy usage shall be monitored and reported separately for the lighting, HVAC, and Plug loads. The energy usage shall be capable of being reported in real time, 15 minute peak demand, hourly, daily, monthly and annual energy consumption and readily accessible to the building occupants.

Reason: For consistency with Standard 90.1. This proposal is based on ongoing analysis efforts within ASHRAE designed to create a Standard 90.1-2010 that is 30% better than Standard 90.1-2004 in response to Federal legislation. Paralleling those efforts and considering that the IECC Chapter 5 is intended to be technically compatible with that standard to facilitate adoption and implementation, DOE is interested in keeping Chapter 5 of the 2012 IECC aligned with ANSI/ASHRAE/IESNA Standard 90.1-2010. Due to the timing of the code development process and ASHRAE standards processes this proposal was submitted in anticipation that by the final action hearings the work to update the standard would be complete.

Cost Impact: The code change proposal will increase the cost of construction.

EC229–09/10
505.8 (New)

Proponent: Richard Heinisch, representing Acuity Brands Lighting, Inc.

Add new text as follows:

505.8 Submittals. When required by the code official, the following compliance documentation and supplemental information shall be submitted:

1. Specifications for the functionality testing of all lighting products to be included in the construction documents. This may include, as a minimum, a statement of the owner's requirements and a statement documenting how the lighting design satisfies those requirements.
2. Record drawings of the actual installation be provided to the building owner or the designated representative of the building owner. Such record drawings will include, as a minimum, the location and performance data on each piece of lighting equipment.
3. Operating manuals and a maintenance manual are to be provided to the building owner or the designated representative of the building owner. These manuals will include, at a minimum, the following:
    - 3.1. Submittal data stating all selected options for each piece of lighting equipment requiring maintenance.
    - 3.2. Operation manuals and maintenance manuals for each piece of lighting equipment requiring maintenance. Required routine maintenance actions shall be clearly identified including, as a minimum, a recommended relamping program.
    - 3.3. A complete narrative of how each lighting control system is intended to operate including suggested settings.

Reason: To clearly establish the goals and requirements of the lighting system including controls and to ensure that the owner is provided all the information necessary to best use and maintain the lighting systems.

Cost Impact: The code change proposal will increase the cost of construction.

	Assembly:	ASF	AMF	DF

ICCFILENAME: Heinisch-EC-2-505.8

EC230–09/10
506 (New)

Proponent: Steve Ferguson, representing The American Society of Heating, Refrigerating and Air-Conditioning Engineers (ASHRAE)

Add new text as follows:

SECTION 506
OTHER EQUIPMENT

506.1 General. This section covers the minimum efficiency of other equipment.

506.2 Dry-type transformer efficiency This section applies to all building power distribution *systems* and only to equipment described below.

506.2.1 New buildings Equipment installed in new buildings shall comply with the requirements of this section as shown in Table 506.2.1

506.2.2 Addition to existing buildings Equipment installed in *additions* to *existing buildings* shall comply with the requirements of this section.

506.2.3 Alterations to existing buildings Alterations to building service equipment or systems shall comply with the requirements of this section applicable to those specific portions of the building and its systems that are being altered.

506.2.3.1 New equipment with alterations. Any new equipment subject to the requirements of this section that is installed in conjunction with the *alterations*, as a direct replacement of existing equipment shall comply with the specific requirements applicable to that equipment.

Exceptions to 506.3.1.2: Compliance shall not be required for the relocation or reuse of existing equipment at the same site.

506.2.4 Low Voltage Dry-Type Distribution Transformers. Low voltage dry-type transformers shall comply with the provisions of the Energy Policy Act of 2005 where applicable, as shown in Table 506.2.4. Transformers that are not included in the scope of the Energy Policy Act of 2005 have no performance requirements in this section, and are listed for ease of reference below as exceptions.

TABLE 506.2.4
MINIMUM NOMINAL EFFICIENCY LEVELS FOR NEMA CLASS I LOW VOLTAGE DRY-TYPE DISTRIBUTION TRANSFORMERS[a]

Single Phase Transformers		Three Phase Transformers	
kVA[ab]	Efficiency (%)[bc]	kVA[ab]	Efficiency (%)[bc]
15	97.7	15	97.0
25	98.0	30	97.5
37.5	98.2	45	97.7
50	98.3	75	98.0
75	98.5	112.5	98.2
100	98.6	150	98.3
167	98.7	225	98.5
250	98.8	300	98.6
333	98.9	500	98.7
		750	98.8
		1000	98.9

a. A low voltage distribution transformer is a transformer that is air-cooled, does not use oil as a coolant, has an input voltage <= 600 Volts, and is rated for operation at a frequency of 60 Hertz.
b. kiloVolt-Amp rating.

c. Nominal efficiencies shall be established in accordance with the NEMA TP-1 2002 test procedure for low voltage dry-type transformers. Class I Low Voltage Dry-Type is a National Electrical Manufacturers Association (NEMA) design class designation.

Exceptions to Table 506.2.4:

Transformers that meet the Energy Policy Act of 2005 exclusions based on NEMA TP-1 definition:

1. Special purpose applications
2. Not likely to be used in general purpose applications
3. Transformers with multiple voltage taps where the highest tap is at least 20 percent more than the lowest tap.

Products meeting these criteria and exempted from 506.3.1 include the following: drive transformer, rectifier transformer, auto-transformer, uninterruptible power system transformer, impedance transformer, regulating transformer, sealed and nonventilating transformer, machine tool transformer, welding transformer, grounding transformer, or testing transformer.

Reason: This addition will save energy and make the IECC consistent with ASHRAE 90.1-2007. Also, it will ensure that IECC complies with the federal Energy Policy Act of 2005, which require the transformer efficiencies shown in the tables.

Transformers are an integral part of the electric distribution system. They are used to lower the voltage of electricity from utility primary circuits to customer secondary circuits. For many commercial buildings, the electricity from the local electric distribution company is provided at 277 Volts (single phase) and 480 Volts (3 phase). However, most, if not all, commercial facilities have a need for electricity to be supplied at 120 Volts (single phase) or 208 Volts (3 phase) to operate certain equipment, such as computers, printers, copiers, kitchen equipment, etc. Low voltage dry-type transformers, which are purchased by the building owner, are used for this purpose.

According to NEMA and DOE statistics, commercial facilities currently use about 11,000,000 low voltage dry-type transformers in their facilities. Annual domestic shipments are 314,000 units per year. There are other types of transformers, such as medium voltage dry-type and liquid-filled, but the medium-voltage units are far less commonly used (about 3,500 shipped per year) and the liquid-filled are predominantly used by electric distribution companies on the "utility side" of the electric meter. For the medium-voltage dry-type and liquid-filled units, the US Department of Energy (DOE) will be deciding on national energy efficiency standards by the fall of 2007.

Under the Energy Policy Act of 2005, new national minimum efficiency standards went into effect for low voltage dry-type transformers manufactured on or after January 1, 2007. The law refers to Table 4-2 of the National Electrical Manufacturers Association (NEMA) publication NEMA TP-1 Guide for Determining Energy Efficiency for Distribution Transformers (2002).

These standards will result in energy savings for commercial buildings. According to an analysis performed by DOE in 2004 and summarized in the July 29, 2004 edition of the Federal Register (Volume 69, No. 145, pages 45376-45417), the standards shown in the proposed Table 8.1, the Department estimated that national efficiency standards for low voltage dry-type transformers would save 4.74 quads of primary energy over 28 years (2007 to 2035). In terms of cumulative electric site energy savings, that is roughly equivalent to 596 Billion kWh over 28 years, or 21.3 Billion kWh per year. The value is lower in the first 10 years (under 15 Billion kWh per year) and higher in the later years (over 27 Billion kWh per year) as more older units are replaced as the years progress.

These savings are based on NEMA test conditions of 35% of nameplate loads. It should be noted that studies have shown that many dry type transformers have typical loads in the 20-30% range, or lower. The lower the % load, the lower the energy savings from higher efficiency transformers (in many cases). To account for current sales of high efficiency dry-type transformers (there are some state mandates in effect) and to account for actual loading patterns, it is safe to assume an annual average savings of 10 Billion kWh.

According to the EEI Statistical Yearbook, in 2004, the commercial sector of the US economy consumed 1,230,425 GigaWatt-hours. This is equal to 1,230,425,000 MegaWatt-hours, or 1,230,425,000,000 kWh (1.23 Trillion kWh, or 1,230 Million kWh). With savings of 10 Billion kWh per year, the national dry-type low voltage transformer energy efficiency standard will save 10/1230 or 0.8% of the electricity used at commercial facilities.

In terms of economics, in 2004, DOE calculated that the mean payback for low voltage dry-type transformers would range, based on the size of the transformer analyzed, from 0.6 to 1.7 years, with mean life cycle cost savings ranging from $1,777 to $6,761 over a 28 year estimated lifetime. It should be noted that the prices of transformers have increased quite dramatically over the past three years (nearly doubling, in some cases), but the mean paybacks should still be less than 4-5 years for most end-use customers.

Adding this information to the next version of ASHRAE 90.1 will help designers, end-use customers, and code officials with transformer specifications and verifications. These standards have been vetted and analyzed and agreed to by transformer manufacturers.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Ferguson-EC-6-506

EC231-09/10
202 (New)

Proponent: John R. Addario, PE, New York State Department of State – Division of Code Enforcement and Administration

Add new definition as follows:

THERMAL BLOCK. Total Building Performance Approach - One or more HVAC zones (not necessarily contiguous) that are modeled as a single entity. HVAC zones in a thermal block must share the same space-type classification, and must be served by the same HVAC system or by the same kind of HVAC system. All of the HVAC zones within the thermal block that are adjacent to an exterior wall must face the same orientation or their orientations must differ by less than 45°.

Reason: This proposed change adds a needed definition for a thermal block as referenced in the Total Building Performance approach. The definition is consistent with ASHRAE 90.1.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

FILENAME: ADDARIO-EC-2-202

EC232–09/10
Appendix A (New)

Proponent: R. Christopher Mathis and Jonah Butcher, representing MC2 Mathis Consulting Company

Add new Appendix as follows:

APPENDIX A
ALTERNATIVE PRESCRIPTIVE MEASURES FOR ACHIEVING INCREASED LEVELS ENERGY EFFICIENCY BEYOND IECC CODE MINIMUMS

Introduction.

The purpose of Appendix A ("Appendix") to the International Energy Conservation Code (IECC) is to provide jurisdictions with additional prescriptive energy efficiency measures that can be adopted on a voluntary basis in cases where the jurisdiction has an interest in increasing its energy conservation objectives beyond what the IECC provides as minimum code. The Appendix can also serve as a publicly available repository of building energy code "best practices" that provides innovative ways of increasing energy efficiency that have been successfully implemented in other jurisdictions. States and jurisdictions seeking additional energy efficiency options can review these alternative measures and adopt them as desired for their jurisdictions.

The measures in this Appendix provide an incremental, prescriptive improvement in residential and commercial new construction energy efficiency beyond those levels defined in the main body of the IECC.

How to use this Appendix.

The measures in this Appendix modify existing sections of the 2009 IECC or add new sections. The measures are numbered according to section numbering of the 2009 IECC.

Jurisdictions wishing to adopt some or all of these measures can replace selected sections in the 2009 IECC with the corresponding section in this Appendix through their state or local adoption or amendment processes. Instructions are provided to "revise text as follows" or to add new text or tables to incorporate the desired changes.

The alternative prescriptive measures in this Appendix include alternatives to the following sections:

Chapter 1 – ADMINISTRATION
Section 103 Construction Documents. New requirement for design intent documentation.

Chapter 2 – DEFINITIONS
Section 202 General Definitions. New Definitions needed to implement certain new measures.

Chapter 4 – RESIDENTIAL ENERGY EFFICIENCY
Section 402 Building Thermal Envelope. Improved fenestration and insulation requirements.
Section 402.4.1 Building thermal envelope. Including improved air infiltration sealing.
Section 403.6 Equipment sizing. Including certain limits on equipment over sizing.
Section 404.1 Lighting Equipment. Increased levels of high efficiency lighting.

Chapter 5 – COMMERCIAL ENERGY EFFICIENCY
Section 501.1 Scope. Revised Scope.
Section 501.2 Application. Revised Application.
Section 502.1.1 Insulation and fenestration criteria. Removed exception.
Section 502 Building Thermal Envelope. Improved fenestration and insulation requirements.
Section 502.4 Air leakage (Mandatory). Replace air leakage section.
Section 503.2.9 HVAC system completion. Replace with full commissioning requirement.
Section 505.2 Lighting controls (Mandatory). Revise with additional controls requirement.
Section 505.5.2 Interior Lighting Power. Lowered LPD allowances.

New Section 507 - ALTERNATIVE PRESCRIPTIVE COMPLIANCE PACKAGES
New Section APPENDIX X – Design Intent Form.
New Section APPENDIXY – Compliance Certification Form.

Advanced Energy Efficiency Measures Provided for Voluntary Adoption

{Topic: Certifying Design Intent and Compliance with Design Intent}

A103.2 Design Intent Certification. For all projects covered under this code, the registered design professional of record on the project shall provide a certification that key energy performance design intentions were addressed and met. Such design intent certification shall be recorded on Form (X) as shown in Appendix (X) and shall become a component of the construction documents filed with the authority having jurisdiction.

Key elements delivering design intent shall be recorded on Form (Y) as shown in Appendix (Y) and be inspected and verified as built to design by the registered design professional of record, building owner, and code official before certificate of occupancy is granted. Change orders affecting any energy related building components should be attached to this document with an explanation of impacts on energy usage.

A103.2.1 Energy Performance Certifications. The design professional of record shall certify compliance with all of the provisions of this code, including: Compliance with the building envelope, HVAC, lighting, service water heating and whole building performance requirements defined by this code. Such Energy Performance Certifications shall be recorded on Form (Y) as shown in Appendix (Y) and shall be a component of the construction documents filed with the authority having jurisdiction.

{Topic: New Definitions}

Add new text to section 202 GENERAL DEFINITIONS as follows:

FURNACE ELECTRICITY RATIO. The ratio of furnace electricity use to total furnace energy computed as ratio = (3.412*EAE)/(1000*EF + 3.412*EAE), where EAE (average annual auxiliary electrical consumption) and EF (average annual fuel energy consumption) are defined in Appendix N to subpart B of part 430 of title 10 of the Code of Federal Regulations and EF is expressed in millions of Btus per year.

ON-SITE RENEWABLE ENERGY. Includes solar photovoltaic; active solar thermal that employs collection panels, heat transfer mechanical components and a defined heat storage system; wind; small hydro; tidal; wave energy; geothermal (core earth); biomass energy systems; landfill gas and bio-fuel based electrical production, Onsite energy shall be generated on or adjacent to the project site and shall not be delivered to the project through the utility service.

SYSTEM COMMISSIONING. Commissioning is a process that verifies and documents that the selected building systems have been designed, installed, and function according to the owner's project requirements and construction documents.

{Topic: Improved Prescriptive Residential Energy Efficiency Requirements}

Revise and replace Section 401.2 in its entirety with new section A401.2 as follows:

A401.2 Compliance. Projects shall comply with Sections 401, 402.4, 402.5, 402.5, 402.6, 402.7, and (referred to as the mandatory provisions) and Sections 402.1 through 402.3, 403.2.1 and 404.1 (prescriptive);

Replace Table 402.1.1 in its entirety with the following Table A402.1.1:

TABLE A402.1.1
INSULATION AND FENESTRATION REQUIREMENTS BY COMPONENT[a]

CLIMATE ZONE	FENESTRATION U-FACTORb	SKYLIGHTb U-FACTOR	GLAZED FENESTRATION SHGCb, e	CEILING R-VALUE	WOOD FRAME WALL R-VALUE	MASS WALL R-VALUEh	FLOOR R-VALUE	BASEMENTc WALL R-VALUE	SLABd R-VALUE & DEPTH	CRAWL SPACEc WALL R-VALUE
1	0.65	0.75	0.25	30	16	3/4	13	0	0	0
2	0.50	0.75	0.25	38	16	4/6	13	10/13	0	0
3	0.35	0.65	0.25	38	19	5/8	19	10/13f	10, 2 ft	5/13
4 except Marine	0.32	0.60	0.35	49	19	5/10	19	10/13	10, 2 ft	10/13
5 and Marine 4	0.32	0.60	NR	49	22	13/17	30g	10/13	10, 2 ft	10/13
6	0.30	0.60	NR	60	22	15/19	30g	15/19	10, 4 ft	10/13
7 and 8	0.30	0.60	NR	60	25	19/21	38g	15/19	10, 4 ft	10/13

a. *R*-values are minimums. *U*-factors and SHGCs are maximums. R-19 batts compressed into a nominal 2 × 6 framing cavity such that the *R*-value is reduced by R-1 or more shall be marked with the compressed batt *R*-value in addition to the full thickness *R*-value.
b. The fenestration *U*-factor column excludes skylights. The SHGC column applies to all glazed fenestration.
c. "15 / 19" means R-15 continuous insulated sheathing on the interior or exterior of the home or R-19 cavity insulation at the interior of the basement wall. "15/19" shall be permitted to be met with R-13 cavity insulation on the interior of the basement wall plus R-5 continuous insulated sheathing on the interior or exterior of the home. "10/13" means R-10 continuous insulated sheathing on the interior or exterior of the home or R-13 cavity insulation at the interior of the basement wall.
d. R-5 shall be added to the required slab edge *R*-values for heated slabs. Insulation depth shall be the depth of the footing or 2 feet, whichever is less in Zones 1 through 3 for heated slabs.
e. There are no SHGC requirements in the Marine Zone.
f. Basement wall insulation is not required in warm-humid locations as defined by Figure 301.1 and Table 301.1.
g. Or insulation sufficient to fill the framing cavity, R-19 minimum.
h. The second *R*-value applies when more than half the insulation is on the interior of the mass wall.

Replace Table 402.1.3 in its entirety with the following Table A402.1.3:

TABLE A402.1.3
EQUIVALENT U-FACTORS a

CLIMATE ZONE	FENESTRATION U-FACTOR	SKYLIGHT U-FACTOR	CEILING U-FACTOR	FRAME WALL U-FACTOR	MASS WALL U-FACTORb	FLOOR U-FACTOR	BASEMENT WALL U-FACTORd	CRAWL SPACE WALL U-FACTORc
1	0.65	0.75	0.035	0.069	0.197	0.060	0.360	0.477
2	0.50	0.75	0.029	0.056	0.165	0.060	0.059	0.477
3	0.35	0.65	0.029	0.056	0.141	0.046	0.059	0.136
4 except Marine	0.32	0.60	0.024	0.051	0.141	0.046	0.059	0.065
5 and Marine 4	0.32	0.60	0.024	0.051	0.082	0.033	0.059	0.065
6	0.30	0.60	0.020	0.051	0.060	0.033	0.050	0.065
7 and 8	0.30	0.60	0.020	0.047	0.057	0.027	0.050	0.065

a. Nonfenestration *U*-factors shall be obtained from measurement, calculation or an approved source.
b. When more than half the insulation is on the interior, the mass wall *U*-factors shall be a maximum of 0.17 in Zone 1, 0.14 in Zone 2, 0.12 in Zone 3, 0.10 in Zone 4 except Marine, and the same as the frame wall *U*-factor in Marine Zone 4 and Zones 5 through 8.
c. Basement wall *U*-factor of 0.360 in warm-humid locations as defined by Figure 301.1 and Table 301.2.
d. Foundation *U*-factor requirements shown in Table 402.1.3 include wall construction and interior air films but exclude soil conductivity and exterior air films. *U*-factors for determining code compliance in accordance with Section 402.1.4 (total UA alternative) of Section 405 (Simulated Performance Alternative) shall be modified to include soil conductivity and exterior air films.

Replace Section 402.4.1 in its entirety with new section A402.4.1 as follows:

A402.4.1 Building thermal envelope. The building thermal envelope shall be durably sealed to limit infiltration and prevent thermal bypasses. The sealing methods between dissimilar materials shall allow for differential expansion and

contraction. The thermal envelope, including insulation and air barriers, shall be inspected in accordance with Sections 402.4.1.1 through 402.4.1.6.

A402.4.1.1 Walls adjoining exterior walls or unconditioned spaces. Fully insulated wall in substantial contact with air barrier at both interior and exterior, or for Climate Zones 1 thru 3, sealed exterior air barrier aligned with fully supported insulation. The following areas shall meet these requirements: wall behind shower/tub, wall behind fireplace, insulated attic slopes for un-vented attic spaces, attic knee walls, skylight shaft walls, wall adjoining porch roof, staircase walls, double walls.

A402.4.1.2 Floors between conditioned and exterior spaces. An air barrier shall be installed at any exposed insulation edges. Insulation shall be installed to maintain substantial contact w/ sub-floor above and air barrier below. The following areas shall meet these requirements: Insulated floor above un-conditioned and semi-conditioned space.

A402.4.1.3 Shafts. Openings and gaps to unconditioned space shall be fully sealed with an air barrier. The following areas shall meet these requirements: duct, piping and flue shafts and associated penetrations.

A402.4.1.4 Attic and ceiling interface. Attic penetrations and dropped ceilings shall include a full interior air barrier aligned with insulation with any gaps fully sealed. Insulation shall fit snugly in opening and the opening air barrier shall be fully gasketed. The following areas shall meet these requirements: attic access panel, attic drop-down stair, dropped ceiling/soffit, recessed lighting fixtures, whole-house fan.

A402.4.1.5 Common walls between dwelling units. Gap between drywall shaft wall (common wall) and structural framing between units shall be sealed at all exterior boundary conditions.

A402.4.1.6 Gaps and penetrations. Gaps and penetrations in the thermal envelope of the home shall be sealed and insulated. The following areas shall meet these requirements: the perimeters of windows, doors, skylights, and utility penetrations, hose bibs, exterior electrical outlets and light fixtures.

Revise Section 402.4.2 and replace with section A402.4.2 as follows:

A402.4.2 Air sealing and insulation. Building envelope air tightness and insulation installation shall be demonstrated to comply with the requirements of Section 402.4.2.1 and 402.4.2.2.

A402.4.2.1 Air Sealing Testing ~~option~~. Building envelope tightness ~~and insulation installation~~ shall be considered acceptable when tested air leakage is less than five air changes per hour (ACH) when tested with a blower door at a pressure of 33.5 psf (50 Pa). Testing shall occur after rough in and after installation of penetrations of the building envelope, including penetrations for utilities, plumbing, electrical, ventilation and combustion appliances.

During testing:

1. Exterior windows and doors, fireplace and stove doors shall be closed, but not sealed;
2. Dampers shall be closed, but not sealed, including exhaust, intake, makeup air, backdraft and flue dampers;
   Interior doors shall be open;
3. Exterior openings for continuous ventilation systems and heat recovery ventilators shall be closed and sealed;
4. Heating and cooling system(s) shall be turned off;
5. HVAC ducts shall not be sealed; and
6. Supply and return registers shall not be sealed.

A402.4.2.2 Insulation inspection. Building envelope insulation installation shall be considered acceptable when the insulation installation items listed in Table 402.4.2, applicable to the method of construction, are field verified. Where required by the *code official*, an *approved* party independent from the installer of the insulation shall inspect the insulation and its installation.

{Topic: IMPROVED EQUIPMENT SIZING REQUIREMENTS}

Revise Section 403.6 and replace with section A403.6 as follows:

A403.6 Equipment sizing. Heating and cooling equipment shall be sized in accordance with Section M1401.3 of the International Residential Code. The maximum oversizing limit for air conditioners and air-source and ground-source

heat pumps is 15% with the following two exceptions: single-speed air-source and ground-source heat pumps in buildings with heating loads that exceed cooling loads have a limit of 25%, and multi-stage heat pumps do not have a strict limit, but shall be sized to allow adequate humidity control in the cooling mode. The maximum oversizing limit for gas, oil or propane heating equipment is 40%.

The following operating conditions shall be used in the sizing calculations and verified where reviewed by the code official:

1. Outdoor temperatures shall be the 99.0% and 1.0% design temperatures as published in the ASHRAE Handbook of Fundamentals for the home's location or most representative city for which design temperature data are available;
2. Indoor temperatures shall be 75 F for cooling and 70 F for heating;
3. Infiltration rate shall be selected as "tight", or the equivalent term. In specifying equipment, the next available manufactured size may be used. In addition, indoor and outdoor coils shall be matched in accordance with ARI Standard 210/240.

{Topic: RESIDENTIAL LIGHTING EQUIPMENT EFFICIENCY}

Revise Section 404.1 and replace with section A404.1 as follows:

SECTION 404
ELECTRICAL POWER AND LIGHTING SYSTEMS

A404.1 Lighting equipment (Prescriptive). A minimum of 80 percent of the lamps in permanently installed lighting fixtures shall be high-efficacy lamps.

{Topic: COMMERCIAL ENERGY EFFICIENCY}

Revise Section 501.1 and replace with section A501.1 as follows:

A501.1 Scope. The requirements contained in this chapter are applicable to commercial buildings, or portions of commercial buildings

Revise Section 501.2 and replace with section A501.2 as follows:

A501.2 Application. The commercial building project shall comply with the requirements in Sections 502 (Building envelope), 503 (Building mechanical systems), 504 (Service water heating), 505 (Lighting), and A507 (Advanced Prescriptive Options) in its entirety.

Compliance with section A507 requires complying with any ONE of the following prescriptive options:

A507.2.1 Efficient Mechanical Equipment
A507.2.2 Reduced Lighting Power Density
A507.2.3 On-Site Supply of Renewable Energy

At the time of plan submittal, the building jurisdiction shall be provided, by the submittal authority, documentation designating the intent to comply with Section A507.2.1, A507.2.2, or A507.2.3 in their entirety.

{Topic: IMPROVED COMMERCIAL BUILDING ENVELOPE MEASURES}

Revise Section 502.1.1 and replace with section A502.1.1 as follows:

A502.1.1 Insulation and fenestration criteria. The *building thermal envelope* shall meet the requirements of Tables 502.2(1) and 502.3 based on the climate *zone* specified in Chapter 3. Commercial buildings or portions of commercial buildings enclosing Group R occupancies shall use the *R*-values from the "Group R" column of Table 502.2(1). Commercial buildings or portions of commercial buildings enclosing occupancies other than Group R shall use the *R*-values from the "All other" column of Table 502.2(1).

Delete Table 502.1.2 in its entirety and replace with the following table A502.1.2 and footnotes:

For SI: 1 inch = 25.4 mm.
ci = Continuous insulation. NR = No requirement.
a. When using *R*-value compliance method, a thermal spacer block is required, otherwise use the *U*-factor compliance method. [see Tables 502.1.2 and 502.2(2)].
b. Assembly descriptions can be found in Table 502.2(2).
c. R-5.7 ci is allowed to be substituted with concrete block walls complying with ASTM C 90, ungrouted or partially grouted at 32 inches or less on center vertically and 48 inches or less on center horizontally, with ungrouted cores filled with material having a maximum thermal conductivity of 0.44 Btu-in./h-f2 F.
d. When heated slabs are placed below grade, below-grade walls must meet the exterior insulation requirements for perimeter insulation according to the heated slab-on-grade construction.
e. Steel floor joist systems shall to be R-38.

a. 40% maximum of above-grade wall.
b. 3% Maximum, 5% maximum with automatic day lighting controls which must meet the requirements of Section A502.2.2.4.

Revise Section 502.4 and replace with section A502.4 as follows:

A502.4 Air leakage (Mandatory).

A502.4.1 Air Barriers. The building envelope shall be designed and constructed with a continuous air barrier to control air leakage into, or out of the conditioned space. An air barrier system shall also be provided for interior separations between conditioned space and space designed to maintain temperature or humidity levels which differ from those in the conditioned space by more than 50% of the difference between the conditioned space and design ambient conditions.

The air barrier shall have the following characteristics:

1. It must be continuous, with all joints made airtight.

2. Materials used for the air barrier system shall have an air permeability not to exceed 0.004 cfm/ft2 under a pressure differential of 0.3 in. water (1.57psf) (0.02 L/s.m2 @ 75 Pa) when tested in accordance with ASTM E 2178. Air barrier materials shall be taped or sealed in accordance with the manufacturer's instructions.
3. It shall be capable of withstanding positive and negative combined design wind, fan and stack pressures on the envelope without damage or displacement, and shall transfer the load to the structure. It shall not displace adjacent materials under full load.
4. Air barrier materials shall be maintainable, or, if inaccessible, shall meet the durability requirements for the service life of the envelope assembly.
5. The air barrier material of an envelope assembly shall be joined and sealed in a flexible manner to the air barrier material of adjacent assemblies, allowing for the relative movement of assemblies due to thermal and moisture variations and creep. Connections shall be made between:
   a. Joints around *fenestration* and *door* frames
   b. Junctions between *walls* and foundations, between *walls* at building corners, between *walls* and structural *floors* or *roofs*, and between *walls* and *roof* or *wall* panels
   c. Openings at penetrations of utility services through *roofs*, *walls*, and *floors*
   d. Site-built *fenestration* and *doors*
   e. Building assemblies used as ducts or plenums
   f. Joints, seams, and penetrations of vapor retarders
   g. All other openings in the *building envelope*

A502.4.2 Air Barrier Penetrations. All penetrations of the air barrier and paths of air infiltration/exfiltration shall be made air tight. Openings and penetrations in the building envelope shall be sealed with caulking materials or closed with gasketing systems compatible with the construction materials and location. Joints and seams shall be sealed in the same manner or taped or covered with a moisture vapor-permeable wrapping material. Sealing materials spanning joints between construction materials shall allow for expansion and contraction of the construction materials.

A502.4.3 Fenestration and Doors. Air leakage for *fenestration* and *doors* shall be determined in accordance with NFRC 400 or ASTM E 283 @ 1.57 psf (75 Pa.). Air leakage shall be determined by a laboratory accredited by a nationally recognized accreditation organization, such as the National Fenestration Rating Council, and shall be *labeled* and certified by the *manufacturer*. Air leakage shall not exceed 0.3 cfm/ft2 for glazed swinging entrance doors and for revolving doors and 0.2 cfm/ft2 for all other products under a pressure differential of 0.3 inches of water(1.57 psf).

Exceptions:

a. For garage *doors*, air leakage determined by test at standard test conditions in accordance with ANSI/ DASMA 105 shall be an acceptable alternate for compliance with air leakage requirements.

A502.4.4 Doors and Access Openings to Shafts, Chutes, Stairwells, and Elevator Lobbies: These doors and access openings shall either meet the requirements of 502.4.3 or shall be equipped with weather seals.

Exception: Weatherseals on elevator lobby doors are not required when a smoke control system is installed.

A502.4.5 Loading Dock Weatherseals. Cargo *doors* and loading dock *doors* shall be equipped with weatherseals to restrict *infiltration* when vehicles are parked in the doorway.

A502.4.6 Vestibules. Building entrances that separate *conditioned space* from the exterior shall be protected with an enclosed vestibule, with all *doors* opening into and out of the vestibule equipped with self-closing devices. Vestibules shall be designed so that in passing through the vestibule it is not necessary for the interior and exterior *doors* to open at the same time. Interior and exterior *doors* shall have a minimum distance between them of not less than 7 ft when in the closed position. The exterior envelope of conditioned vestibules shall comply with the requirements for a conditioned space. The interior and exterior envelope of unconditioned vestibules shall comply with the requirements for a semi heated space.

Exceptions:

1. *Building entrances* with revolving *doors*.
2. *Doors* not intended to be used as a *building entrance*.
3. *Doors* opening directly from a *dwelling unit*.

4. *Doors* that open directly from a *space* that is less than 3000 ft2 in area and is separate from the *building entrance*.
5. Doors used primarily to facilitate vehicular movement or material handling and adjacent personnel doors.

A502.4.7 Curtain wall, storefront glazing and commercial entrance doors. Curtain wall, *storefront* glazing and commercial-glazed swinging entrance doors and revolving doors shall be tested for air leakage at 1.57 pounds per square foot (psf) (75 Pa) in accordance with ASTM E 283. For curtain walls and *storefront* glazing, the maximum air leakage rate shall be 0.2 cubic foot per minute per square foot (cfm/ft^2) (3.7 $m^3/h \times m^2$) of fenestration area. For commercial glazed swinging entrance doors and revolving doors, the maximum air leakage rate shall be 1.00 cfm/ft^2 (18.3 $m^3/h \times m^2$) of door area when tested in accordance with ASTM E 283.

A502.4.8 Hot gas bypass limitation. Cooling systems shall not use hot gas bypass or other evaporator pressure control systems unless the system is designed with multiple steps of unloading or continuous capacity modulation. The capacity of the hot gas bypass shall be limited as indicated in Table 502.4.4.

Exception: Unitary packaged systems with cooling capacities not greater than 90,000 Btu/h (26 379 W).

TABLE A502.4.4
MAXIMUM HOT GAS BYPASS CAPACITY

RATED CAPACITY	MAXIMUM HOT GAS BYPASS CAPACITY (% of total capacity)
≤240,000 Btu/h	50%
240,000 Btu/h	25%

For SI: 1 Btu/h = 0.29 watts.

A502.4.9 Outdoor air intakes and exhaust openings. Stair and elevator shaft vents and other outdoor air intakes and exhaust openings integral to the building envelope shall be equipped with not less than a Class I motorized, leakage-rated damper with a maximum leakage rate of 4 cfm per square foot (6.8 L/s · C m2) at 1.0 inch water gauge (w.g.) (1250 Pa) when tested in accordance with AMCA 500D. These air tight, operable dampers shall be installed when the air barrier is penetrated by:

1. Fixed open louvers such as in elevator shafts and machine rooms.
2. Mechanical system components which allow infiltration or exfiltration of air when the systems are inactive, such as atrium smoke exhaust systems, elevator shaft smoke relief openings, and other similar elements.

Such dampers shall be set in the closed position and automatically open upon:

1. The activation of any fire alarm initiating device of the building's fire alarm system;
2. The interruption of power to the damper.

Exception: Gravity (nonmotorized) dampers are permitted to be used in buildings less than three stories in height above grade.

A502.4.10 Recessed lighting. Recessed luminaires installed in the *building thermal envelope* shall be sealed to limit air leakage between conditioned and unconditioned spaces. All recessed luminaires shall be IC-rated and *labeled* as meeting ASTM E 283 when tested at 1.57 psf (75 Pa) pressure differential with no more than 2.0 cfm (0.944 L/s) of air movement from the *conditioned space* to the ceiling cavity. All recessed luminaires shall be sealed with a gasket or caulk between the housing and interior wall or ceiling covering.

{Topic: BUILDING COMMISSIONING REQUIREMENTS}

Revise Section 503.2.9 and replace with section A503.2.9 as follows:

A503.2.9 Mechanical systems commissioning and completion requirements.

A503.2.9.1 System commissioning. Commissioning is a process that verifies and documents that the selected building systems have been designed, installed, and function according to the owner's project requirements and construction documents. Drawing notes shall require commissioning and completion requirements in accordance with

this section. Drawing notes may refer to specifications for further requirements. Copies of all documentation shall be given to the owner.

A503.2.9.1.1 Commissioning plan. A commissioning plan shall include as a minimum the following items:

1. A detailed explanation of the original owner's project requirements,
2. A narrative describing the activities that will be accomplished during each phase of commissioning, including guidance on who accomplishes the activities and how they are completed,
3. Equipment and systems to be tested, including the extent of tests,
4. Functions to be tested (for example calibration, economizer control, etc.),
5. Conditions under which the test shall be performed (for example winter and summer design conditions, full outside air, etc.), and
6. Measurable criteria for acceptable performance.

A503.2.9.1.2 Systems adjusting and balancing. All HVAC systems shall be balanced in accordance with generally accepted engineering standards. Air and water flow rates shall be measured and adjusted to deliver final flow rates within 10% of design rates. Test and balance activities shall include as a minimum the following items:

1. Air systems balancing: Each supply air outlet and zone terminal device shall be equipped with means for air balancing in accordance with the requirements of Chapter 6 of the International Mechanical Code. Discharge dampers are prohibited on constant volume fans and variable volume fans with motors 10 hp (18.6 kW) and larger. Air systems shall be balanced in a manner to first minimize throttling losses then, for fans with system power of greater than 1 hp, fan speed shall be adjusted to meet design flow conditions.

   Exception: Fan with fan motors of 1 hp or less.

2. Hydronic systems balancing: Individual hydronic heating and cooling coils shall be equipped with means for balancing and pressure test connections. Hydronic systems shall be proportionately balanced in a manner to first minimize throttling losses, then the pump impeller shall be trimmed or pump speed shall be adjusted to meet design flow conditions. Each hydronic system shall have either the ability to measure pressure across the pump, or test ports at each side of each pump.

   Exceptions:

   1. Pumps with pump motors of 5 hp or less.
   2. When throttling results in no greater than 5% of the nameplate horsepower draw above that required if the impeller were trimmed.

A503.2.9.1.3 Functional performance testing.

A503.2.9.1.3.1 Equipment functional performance testing. Equipment functional performance testing shall demonstrate the correct installation and operation of components, systems, and system-to-system interfacing relationships in accordance with approved plans and specifications. This demonstration is to prove the operation, function, and maintenance serviceability for each of the Commissioned systems. Testing shall include all modes of operation, including:

1. All modes as described in the Sequence of Operation,
2. Redundant or automatic back-up mode,
3. Performance of alarms, and
4. Mode of operation upon a loss of power and restored power.

   Exception: Unitary or packaged HVAC equipment listed in Tables 503.2.3 (1) through (3) that do not require supply air economizers.

A503.2.9.1.3.2 Controls functional performance testing. HVAC control systems shall be tested to document that control devices, components, equipment, and systems are calibrated, adjusted and operate in accordance with approved plans and specifications. Sequences of operation shall be functionally tested to document they operate in accordance with approved plans and specifications.

A503.2.9.1.3.3 . Testing for Common Rooftop Equipment Problems. Rooftop HVAC equipment will be evaluated to avoid the following common problems:

1. Insufficient duct insulation, or outside conditioned space.
2. Wrong refrigerant charge.
3. Economizer missing or inoperative where required.

A503.2.9.1.4 Preliminary commissioning report. A preliminary report of commissioning test procedures and results shall be completed and provided to the Owner. The report shall be identified as "Preliminary Commissioning Report" and shall identify:

1. Itemization of deficiencies found during testing required by this section which have not been corrected at the time of report preparation and the anticipated date of correction.
2. Deferred tests which cannot be performed at the time of report preparation due to climatic conditions.
3. Climatic conditions required for performance of the deferred tests, and the anticipated date of each deferred test.
4. Planned date of complete compliance.

A503.2.9.2 Acceptance. Buildings, or portions thereof, required by this code to comply with this section shall not be issued a final certificate of occupancy allowing public or owner occupation until such time that the building official has received a letter of transmittal from the building owner that states they have received the Preliminary Commissioning Report as required by Section 503.2.9.1.4. The letter will include certification by the owner of the planned date for bringing all noted deficiencies into compliance (See Section 503.2.9.3.4)

A503.2.9.3 Completion requirements. The construction documents shall require that within 90 days after the date of final certificate of occupancy, the documents described in this section be provided to the building owner.

A503.2.9.3.1 Drawings. Construction documents shall include as a minimum the location and performance data on each piece of equipment.

A503.2.9.3.2 Required Manuals. An operating manual and a maintenance manual shall be in accordance with industry-accepted standards and shall include, at a minimum, the following:

1. Submittal data stating equipment size and selected options for each piece of equipment requiring maintenance.
2. Manufacturer's operation manuals and maintenance manuals for each piece of equipment requiring maintenance, except equipment not furnished as part of the project. Required routine maintenance actions shall be clearly identified.
3. Names and addresses of at least one service agency.
4. HVAC controls system maintenance and calibration information, including wiring diagrams, schematics, and control sequence descriptions. Desired or field-determined setpoints shall be permanently recorded on control drawings at control devices or, for digital control systems, in programming comments.
5. A complete narrative of how each system is intended to operate, including suggested set points.
6. Names and addresses of designer of record, HVAC designer, contractor, and builder.

A503.2.9.3.3 System balancing report. A written report describing the activities and measurements completed in accordance with Section 503.2.9.1.2

A503.2.9.3.4 Final Commissioning Report. A complete report of test procedures and results identified as "Final Commissioning Report" shall include:

1. Results of all Functional Performance Tests.
2. Disposition of all deficiencies found during testing, including details of corrective measures used or proposed.
3. All Functional Performance Test procedures used during the commissioning process including measurable criteria for test acceptance, provided herein for repeatability.

   Exception: Deferred tests which cannot be performed at the time of report preparation due to climatic conditions.

{Topic: LIGHTING CONTROL REQUIREMENTS}

Revise Section 505.2 and replace with section A505.2 as follows:

A505.2 Lighting controls (Mandatory). Lighting systems shall be provided with controls as required in Sections 505.2.1, 505.2.2, 505.2.3, 505.2.4, and 505.2.5..

A505.2.1 Interior lighting controls. Each area enclosed by walls or floor-to-ceiling partitions shall have at least one manual control for the lighting serving that area. The required controls shall be located within the area served by the controls or be a remote switch that identifies the lights served and indicates their status.

Exceptions:

1. Areas designated as security or emergency areas that must be continuously lighted.
2. Lighting in stairways or corridors that are elements of the means of egress.

A505.2.2 Additional controls. Each area that is required to have a manual control shall have additional controls that meet the requirements of Sections A505.2.2.1 and A505.2.2.2.

A505.2.2.1 Light reduction controls. Each area that is required to have a manual control shall also allow the occupant to reduce the connected lighting load in a reasonably uniform illumination pattern by at least 50 percent. Lighting reduction shall be achieved by one of the following or other *approved* method:

1. Controlling all lamps or luminaires;
2. Dual switching of alternate rows of luminaires, alternate luminaires or alternate lamps;
3. Switching the middle lamp luminaires independently of the outer lamps; or
4. Switching each luminaire or each lamp.

Exceptions:

1. Areas that have only one luminaire.
2. Areas that are controlled by an occupant-sensing device.
3. Corridors, storerooms, restrooms or public lobbies.
4. *Sleeping unit* (see Section 505.2.3).
5. Spaces that use less than 0.6 watts per square foot (6.5 W/m2).

~~A~~**505.2.2.1.1 Daylight Zone Control.** Daylight zones shall be provided with individual controls which control the lights independent of general area lighting. Contiguous daylight zones adjacent to vertical fenestration are allowed to be controlled by a single controlling device provided that they do not include zones facing more than two adjacent cardinal orientations (i.e. north, east, south, west). Daylight zones under skylights more than 15 feet from the perimeter shall be controlled separately from daylight zones adjacent to vertical fenestration.

Exception: Daylight spaces enclosed by walls or ceiling height partitions and containing two or fewer light fixtures are not required to have a separate switch for general area lighting.

A505.2.2.2 Automatic lighting controls. All commercial buildings shall be equipped with automatic control devices to shut off lighting in compliance with one of the following automatic control technologies:

1. Section 505.2.2.2.1 Occupancy Sensors
2. Section 505.2.2.2.2 Time Clock Controls
3. Section 505.2.2.2.3 Automatic Daylighting Controls

Where an automatic time switch control device is installed to comply with Section 505.2.2.2, it shall incorporate an override switching device that:

1. Is readily *accessible*.
2. Is located so that a person using the device can see the lights or the area controlled by that switch, or so that the area being lit is annunciated.
3. Is manually operated.
4. Allows the lighting to remain on for no more than 2 hours when an override is initiated.
5. Controls an area not exceeding 5,000 square feet (465 m2).

Exceptions:

1. In malls and arcades, auditoriums, single-tenant retail spaces, industrial facilities and arenas, where captive-key override is utilized, override time shall be permitted to exceed 2 hours.
2. In malls and arcades, auditoriums, single-tenant retail spaces, industrial facilities and arenas, the area controlled shall not exceed 20,000 square feet (1860 m2).

A505.2.2.2.1 Occupancy sensors Occupancy sensors must be installed in all classrooms, conference/meeting rooms, employee lunch and break rooms, private offices, restrooms, storage rooms and janitorial closets, and other spaces 300 sf. or less enclosed by ceiling height partitions. These automatic control devices shall be installed to automatically turn off lights within 30 minutes of all occupants leaving the space, except spaces with multi-scene control. Areas where automatic daylight controls are installed are not required to have occupancy sensors in addition to the daylight controls, although integrated or dual controls may be implemented for additional energy savings.

A505.2.2.2.2 Time Clock Controls In areas not controlled by occupancy sensors, automatic time switch control devices shall be used. It shall incorporate an override switching device that:

1. Is readily accessible.
2. Is located so that a person using the device can see the lights or the area controlled by that switch, or so that the area being lit is annunciated.
3. Is manually operated.
4. Allows the lighting to remain on for no more than 4 hours when an override is initiated.
5. Controls an area not exceeding 5,000 square feet (465 m2).

Exceptions:

1. In malls and arcades, auditoriums, single-tenant retail spaces, industrial facilities and arenas, where captive-key override is utilized, override time may exceed 2 hours.
2. In malls and arcades, auditoriums, single-tenant retail spaces, industrial facilities and arenas, the area controlled may not exceed 20,000 square feet (1860 m2).

A505.2.2.2.3 Automatic daylighting controls. Automatic controls installed in daylit zones must control lights in the daylit areas separately from the non-daylit areas. Controls for calibration adjustments to the lighting control device shall be readily accessible to authorized personnel. Each daylight control zone shall not exceed 2,500 square feet. Automatic daylighting controls must incorporate an automatic shut-off ability based on time or occupancy in addition to lighting power reduction controls.

Controls will automatically reduce lighting power in response to available daylight by either one of the following methods:

1. **Continuous dimming** using dimming ballasts and daylight-sensing automatic controls that are capable of reducing the power of general lighting in the daylit zone continuously to less than 35% of rated power at maximum light output.

2. **Stepped Dimming** using multi-level switching and daylight-sensing controls that are capable of reducing lighting power automatically. The system should provide at least two control channels per zone and be installed in a manner such that at least one control step shall reduce power of general lighting in the daylit zone by 30% to 50% of rated power and another control step that reduces lighting power by 65% to 100%. Stepped dimming control is not appropriate in continuously occupied areas with ceiling heights of 14 feet or lower

A505.2.5 Additional Control.

1. Display/Accent Lighting—display or accent lighting shall have a separate control device.
2. Case Lighting—lighting in cases used for display purposes shall have a separate control device.
3. Hotel and Motel Guest Room Lighting—hotel and motel guest rooms and guest suites shall have a master control device at the main room entry that controls all permanently installed luminaires and switched receptacles.
4. Task Lighting—supplemental task lighting, including permanently installed undershelf or undercabinet lighting, shall have a control device integral to the luminaires or be controlled by a wall-mounted control device provided the control device is readily accessible and located so that the occupant can see the controlled lighting.

5. Nonvisual Lighting—lighting for nonvisual applications, such as plant growth and food warming, shall have a separate control device.
6. Demonstration Lighting—lighting equipment that is for sale or for demonstrations in lighting education shall have a separate control device.

Exception:

1. a., b. and d. Where LED lighting is used no additional control is required.

For SI: 1 foot = 304.8 mm, 1 watt per square foot = W/0.0929 m2.

a. The lighting power densities contained in this table include allowances for video-display terminals, decorative lighting and display lighting Additional lighting power is not allowed for these uses. Task lighting is not included in these connected LPD limits.

b. Where lighting equipment is specified to be installed to highlight specific merchandise in addition to lighting equipment specified for general lighting and is switched or dimmed on circuits different from the circuits for general lighting, the smaller of the actual wattage of the lighting equipment installed specifically for merchandise, or additional lighting power as determined below shall be added to the interior lighting power determined in accordance with this line item.

Calculate the additional lighting power as follows:

Additional Interior Lighting Power Allowance = (Retail Area 1 X 0.4W/ft2) + (Retail Area 2 X 0.6 W/ft2) + (Retail Area 3 X 0.9 W/ft2) + (Retail Area 4 X 1.5 W/ft2).

Where:

Retail Area 1 = The floor area for all products not listed in Retail Area 2, 3 or 4.
Retail Area 2 = The floor area used for the sale of vehicles, sporting goods and small electronics.
Retail Area 3 = The floor area used for the sale of furniture, clothing, cosmetics and artwork.
Retail Area 4 = The floor area used for the sale of jewelry, crystal and china.

Exception: Other merchandise categories are permitted to be included in Retail Areas 2 through 4 above, provided that justification documenting the need for additional lighting power based on visual inspection, contrast, or other critical display is *approved* by the authority having jurisdiction.

{Topic: ADDITIONAL REQUIREMENTS}

Add New Section A507 as follows:

SECTION A507
ALTERNATIVE PRESCRIPTIVE COMPLIANCE PACKAGES

A507.1 Requirements. Commercial buildings are required to comply with one of the following sections:

1. A507.2.1 Efficient Mechanical Equipment
2. A507.2.2 Reduced Lighting Power Density
3. A507.2.3 On-Site Supply of Renewable Energy

At the time of plan submittal, the building jurisdiction shall be provided, by the submittal authority, documentation designating the intent to comply with Section A507.2.1, A507.2.2, or A507.2.3 in their entirety.

A507.2.1 Efficient Mechanical Equipment

This mechanical alternative compliance option is intended to allow the builder to meet the requirements of section 507 by choosing to install efficient mechanical equipment. This section in no way replaces requirements in section 503, but is one of several optional compliance packages.

Mechanical equipment choices that fulfill requirements for section A507.2.1 shall comply with the following in addition to the requirements in section 503:

1. Package unitary equipment shall meet the minimum efficiency requirements in Tables A507.2.1(1) and A507.2.1(2)
2. Package Terminal Air Conditioners and Heat Pumps shall meet the minimum efficiency requirements in Table A507.2.1(3)
3. Warm air furnaces and combination warm air furnaces / air conditioning units shall meet the minimum efficiency requirements in Table A507.2.1(4)
4. Boilers shall meet the minimum efficiency requirements in Table A507.2.1(5)
5. Electric chillers shall meet the energy efficiency requirements in Table A507.2.1(6)
6. Absorption chillers shall meet the minimum efficiency requirements in Table A507.2.1(7)

TABLE A507.2.1(1)
UNITARY AIR CONDITIONERS AND CONDENSING UNITS, ELECTRICALLY OPERATED, EFFICIENCY REQUIREMENTS

EQUIPMENT TYPE	SIZE CATEGORY	SUBCATEGORY OR RATING CONDITION	REQUIRED EFFICIENCY[a]
Air conditioners, Air cooled	< 65,000 Btu/hd	Split system	15.0 SEER 12.5 EER
		Single package	15.0 SEER 12.0 EER
	≥ 65,000 Btuh/h and < 135,000 Btu/h	Split system and single package	12.0 EERb 12.4 IPLVb
	≥ 135,000 Btu/h and < 240,000 Btu/h	Split system and single package	12.0 EERb 12.4 IPLVb
	≥ 240,000 Btu/h and < 760,000 Btu/h	Split system and single package	10.8 EERb 11.0 IPLVb
	≥ 760,000 Btu/h		10.2 EERb 11.0 IPLVb
Air conditioners, Water and evaporatively cooled		Split system and single package	14.0 EER

For SI: 1 British thermal unit per hour = 0.2931 W.
a. IPLVs are only applicable to equipment with capacity modulation.
b. Deduct 0.2 from the required EERs and IPLVs for units with a heating section other than electric resistance heat.

TABLE A507.2.1(2)
UNITARY AND APPLIED HEAT PUMPS, ELECTRICALLY OPERATED, EFFICIENCY REQUIREMENTS

EQUIPMENT TYPE	SIZE CATEGORY	SUBCATEGORY OR RATING CONDITION	REQUIRED EFFICIENCY[a]
Air cooled (Cooling mode)	< 65,000 Btu/hd	Split system	15.0 SEER 12.5 EER
		Single package	15.0 SEER 12.0 EER
	≥ 65,000 Btu/h and < 135,000 Btu/h	Split system and single package	12.4 EER[b] 11.9 IPLV[b]
	≥135,000 Btu/h and < 240,000 Btu/h	Split system and single package	12.4 EER[b] 11.9 IPLV[b]
	≥ 240,000 Btu/h	Split system and single package	12.4 EER[b] 10.9 IPLV[b]
Water source (Cooling mode)	< 135,000 Btu/h	85°F entering water	14.0 EER
Air cooled (Heating mode)	< 65,000 Btu/hd (Cooling capacity)	Split system	9.0 HSPF
		Single package	8.5 HSPF
	≥ 65,000 Btu/h and < 135,000 Btu/h (Cooling capacity)	47°F db/43°F w[b] outdoor air	3.4 COP
		77°F db/15°F w[b] outdoor air	2.4 COP
	≥ 135,000 Btu/h (Cooling capacity)	47°F db/43°F w[b] outdoor air	3.2 COP
		77°F db/15°F w[b] outdoor air	2.1 COP
Water source (Heating mode)	< 135,000 Btu/h (Cooling capacity)	70°F entering water	4.6 COP

For SI: °C = [(°F) - 32] / 1.8, 1 British thermal unit per hour = 0.2931 W.
db = dry-bulb temperature, °F; wb = wet-bulb temperature, °F
a. IPLVs and Part load rating conditions are only applicable to equipment with capacity modulation.
b. Deduct 0.2 from the required EERs and IPLVs for units with a heating section other than electric resistance heat.

TABLE A507.2.1(3)
PACKAGED TERMINAL AIR CONDITIONERS AND PACKAGED TERMINALHEAT PUMPS

EQUIPMENT TYPE	SIZE CATEGORY	REQUIRED EFFICIENCY[b]
Air conditioners	< 7,000 Btu / h	11.9 EER
& Heat Pumps (Cooling Mode)	7,000 Btu / h and < 10,000 Btu / h	11.3 EER
	10,000 Btu / h and < 13,000 Btu / h	10.7 EER
	> 13,000 Btu / h	9.5 EER

a. Replacement units must be factory labeled as follows: "MANUFACTURED FOR REPLACEMENT APPLICATIONS ONLY: NOT TO BE INSTALLED IN NEW CONSTRUCTION PROJECTS." Replacement efficiencies apply only to units with existing sleeves less than 16 inches (406 mm) high and less than 42 inches (1067 mm) wide.

TABLE A506.2.1(4)
WARM AIR FURNACES AND COMBINATION WARM AIR FURNACES/AIR-CONDITIONING UNITS, WARM AIR DUCT FURNACES AND UNIT HEATERS, EFFICIENCY REQUIREMENTS

EQUIPMENT TYPE	SIZE CATEGORY (INPUT)	SUBCATEGORY OR RATING CONDITION	REQUIRED EFFICIENCY
Warm air furnaces, gas fired	< 225,000 Btu/h	—	For zones 1 & 2, NR. For zones 3 & 4 90 AFUE or 90 Et For zones 4-8 are 92 AFUE or 92 Et
	≥ 225,000 Btu/h	Maximum capacity	90% Ec note 1
Warm air furnaces, oil fired	< 225,000 Btu/h	—	For zones 1 & 2, NR. For zones 3 to 8 are 85 AFUE or 85 Et
	≥ 225,000 Btu/h	Maximum capacity	85% Et, Note 1
Warm air duct furnaces, gas fired	All capacities	Maximum capacity	*90% Ec*
Warm air unit heaters, gas fired	All capacities	Maximum capacity	*90% Ec*
Warm air unit heaters, oil fired	All capacities	Maximum capacity	*90% Ec*

For SI: 1 British thermal unit per hour = 0.2931 W.

1 Units must also include an IID (intermittent ignition device), have jackets not exceeding 0.75 percent of the input rating, and have either power venting or a flue damper. A vent damper is an acceptable alternative to a flue damper for those furnaces where combustion air is drawn from the conditioned space. Where there two ratings units not covered by the National Appliance Energy Conservation Act of 1987 (NAECA) (3-phase power or cooling capacity greater than or equal to 65,000 Btu/h [19 kW]) shall comply with either rating.

Et = Thermal efficiency.

Ec = Combustion efficiency (100% less flue losses).

Efficient furnace fan: All fossil fuel furnaces in zones 3 to 8 shall have a furnace electricity ratio not greater than 2% and shall include a manufacturer's designation of the furnace electricity ratio.

TABLE A507.2.1(5)
BOILER, EFFICIENCY REQUIREMENTS

EQUIPMENT TYPE	SIZE CATEGORY	TEST PROCEEDURE	REQUIRED EFFICIENCY
Gas Hot Water	< 300,000 Btu / h	DOE 10 CFR Part 430	90% Et
	> 300,000 Btu / h and > 2.5 mBtu/h	DOE 10 CFR Part 431	89% Et
Gas Steam	< 300,000 Btu / h	DOE 10 CFR Part 430	89% Et
	> 300,000 Btu / h	DOE 10 CFR Part 431	89% Et
Oil	< 300,000 Btu / h	DOE 10 CFR Part 430	90% Et
	> 300,000 Btu / h	DOE 10 CFR Part 431	89% Et

Et = thermal efficiency

* Systems must be designed with lower operating hot water temperatures (<150◦F) and use hot water reset to take advantage of the much higher efficiencies of condensing boilers.

TABLE A507.2.1(5)
CHILLERS - EFFICIENCY REQUIREMENTS

EQUIPMENT TYPE	SIZE CATEGORY	REQUIRED EFFICIENCY- CHILLERS		OPTIONAL COMPLIANCE PATH - REQUIRED EFFICIENCY - CHILLERS WITH VSD	
		Full Load (KW /TON)	IPLV (KW /TON)	Full Load (KW /TON)	IPLV (KW /TON)
Air Cooled w/ Condenser	All	1.2	1.0	N/A	N/A
Air Cooled w/o Condenser	All	1.08	1.08	N/A	N/A
Water Cooled, Reciprocating	All	0.840	0.630	N/A	N/A
Water Cooled, Rotary Screw and Scroll	< 90 tons	0.780	0.600	N/A	N/A
	[3]90 tons and < 150 tons	0.730	0.550	N/A	N/A
	[3]150 tons and < 300 tons	0.610	0.510	N/A	N/A
	> 300 tons	0.600	0.490	N/A	N/A
Water Cooled, Centrifugal	< 150 tons	0.610	0.620	0.630	0.400
	[3] 150 tons and < 300 tons	0.590	0.560	0.600	0.400
	300 tons and < 600 tons	0.570	0.510	0.580	0.400
	> 600 tons	0.550	0.510	0.550	0.400

a. Compliance with full load efficiency numbers and IPLV numbers are both required.
b. Only Chillers with Variable Speed Drives(VSD) may use the optional compliance path here for chiller efficiency.

TABLE A507.2.1(6)
ABSORPTION CHILLERS - EFFICIENCY REQUIREMENTS

EQUIPMENT TYPE	REQUIRED EFFICIENCY FULL LOAD COP (IPLV)
Air Cooled, Single Effect	0.60, but only allowed in heat recovery applications
Water Cooled, Single Effect	0.70, But only allowed in heat recovery applications
Double Effect - Direct Fired	1.0 (1.05)
Double Effect - Indirect Fired	1.20

A507.2.2 Reduced Lighting Power Density - Whole Building Lighting Power Density (watts/SF) must comply with table 507.2.2.

A507.2.3 On-site Supply of Renewable Energy

The building or surrounding property shall incorporate an on-site renewable energy system that supplies 3% or more of total building energy loads. On-site power generation using nonrenewable sources does not meet this requirement.

The jurisdiction shall be provided with an energy analysis as described in Section 506 that documents the renewable energy contribution to the building or a calculation demonstrating that the on-site supply of renewable energy

1. Is capable of providing at least 3% of the total energy load of the building, or
2. Provides on-site renewable energy generation with a nominal (peak) rating of 175 BTU's or 0.50 watts per square foot of building.

{Topic: DESIGN INTENT FORMS}

Add new section, Appendix X as follows:

Appendix X. Design Intent Certification Form: Building Energy
Form X:

The {insert Jurisdiction Name here}'s Energy Conservation Code recognizes the essential importance of key building design considerations in meeting the energy performance requirements of this code. In accordance with the provisions of Sections A103.2, signing this form certifies compliance with the design intent objectives of the code.

I, _____, hereby certify that the following are the energy related design intentions for this project:

1. Building Life Expectancy and Planning Cycle
   1. What is the expected lifetime (design goal) of the building? _____ years
   2. What is the life expectancy of the installed components of this building?
      - 2.1. Building envelope (insulation, fenestration, air sealing) _____ years
      - 2.2. HVAC Equipment (furnaces, boilers, air conditioners) _____ years
      - 2.3. . HVAC delivery systems (ducting, piping) _____ years
      - 2.4. Lighting systems _____ years
      - 2.5. Service water heating _____ years

2. Energy Performance Objectives
   1. Using prescribed minimum energy standards for each element of this project _____ (Y/N)
   2. If using higher-than-code levels of energy efficiency for specific elements of this project, identify the specific areas of better-than-code performance used for this project:
      - 2.1. . Building envelope (insulation, fenestration, air sealing) _____ (Y/N)
      - 2.2. . HVAC Equipment (furnaces, boilers, air conditioners) _____ (Y/N)
      - 2.3. . HVAC delivery systems (ducting, piping) _____ (Y/N)
      - 2.4. Lighting systems _____ (Y/N)
      - 2.5. Service water heating _____ (Y/N)

3. Briefly describe those areas of the project where beyond minimum code energy performance is specified. (Attach additional sheets if necessary.)

3. Building Configuration and Design Objectives
   - 3.1. Provide a short narrative explaining how building orientation will affect the energy use in the building and what design features have been tailored to respond to these conditions. (Attach additional sheets if necessary)
   - 3.2. Provide short narrative describing the building HVAC elements to be employed for the building specifically related to energy code compliance or beyond code levels of energy efficiency. (Attach additional sheets if necessary)
   - 3.3. Briefly describe how the following design decisions impacted HVAC Load Sizing:
     1. Building Orientation
     2. Window Area / Window Performance
     3. Opaque Building Envelope Decisions
4. Briefly describe any other building design elements planned for this project intended to meet or exceed the minimum energy efficiency requirements of the code. Attach additional sheets if necessary.)

Add new section, Appendix Y as follows:

Appendix Y. Certification of Energy Code Compliance
Form Y: Summary

The {insert Jurisdiction's Name here}'s Energy Conservation Code recognizes that the building energy performance objectives of a project must be delivered upon completion of the project. In accordance with the provisions of Sections A103.3, signing this form certifies compliance with meeting the energy performance objectives of this project and full compliance with the provisions of the energy efficiency code.

I, _____, hereby certify that this building meets the performance requirements defined by this code:

Certification Checklist:
note: attach additional pages for complex buildings

Reason: The purpose of the new Appendix A ("Appendix") to the International Energy Conservation Code (IECC) is to expand the code's utility to those jurisdictions seeking improved levels of energy efficiency beyond the performance defined by the minimum code.

This proposal provides such jurisdictions with an easy-to-use set of improved, prescriptive energy efficiency measures for residential and commercial buildings to directly substitute for the referenced section of the code.

The Appendix provides innovative ways of increasing energy efficiency that have been successfully demonstrated elsewhere.

The use of Appendices in other ICC codes has set a precedent for this proposal.

While the IECC addresses regional energy efficiency needs using climate zones, the energy landscape has become far more complicated. The new Appendix provides jurisdictions with more choice and flexibility in addressing local energy efficiency needs. This Appendix allows local jurisdictions to set a higher bar for building energy efficiency in response to their local or regionally-specific needs.

Concerns such as local fuel pricing, inflation, utility reliability and local peak power issues may require jurisdictions to seek building energy efficiency levels beyond those defined by the minimum code.

Generic model codes do not necessarily account for the increasingly complex and regionally specific power needs or challenges to local utility reliability. Efficiency gains for new construction can help delay the need for new peaking plant capacity, keeping the price of energy low in addition to delivering simple conservation savings.

The Appendix provides a basic set of improved prescriptive energy performance increases along with three key elements that are essential to ensuring delivered building energy performance:

1. Residential Air Leakage Testing
2. Residential Duct Leakage Testing

3. Commercial Building Commissioning Requirements

The Appendix also provides for improved efficiency options in:

1. Efficient Mechanical Equipment
2. Reduced Lighting Power Densities
3. On-Site Supply of Renewable Energy

These new sections give jurisdictions options to require better equipment, better lighting and on-site generation to meet their efficiency objectives.

Finally, two additional forms are provided as new appendices intended to help jurisdictions ensure compliance with the code provisions adopted. The first certifies that essential elements of energy efficiency and code compliance have been considered up front. This "Design Intent" certification addresses key issues of building life expectancy, energy code objectives, site considerations and other basic energy code compliance topics. The form tells the building official what elements of energy performance were considered during the planning phase. The second form provides the code official with certification that the objectives of the code and the original design intent have been met.

Credible climate change science gives us only about a decade to be well on our way to Greenhouse Gas Reductions. The Architecture 2030 goals call for drastic incremental increases towards carbon neutral buildings in 2030. Targets such as these are being taken seriously by planners, usually on a regional or municipal level. This Appendix enables the IECC to take a similar approach by providing jurisdictions the choice to take advanced steps towards higher efficiency.

The proponent recognizes the difficulty of performing an honest cost benefit analysis for any proposal at this juncture. In fact, we question any cost benefit analysis offered as justification to an IECC proposal. The number of variables and the rate of change in the energy and power landscape make such as task essentially a real-time impossibility. New power generation capacity is being priced at levels that far out-strip historical costs, so prediction based on historical trends is specious at best. Carbon emissions have yet to be given a price tag. Durability and life cycle cost are becoming more important considerations – from building planning to municipal and state energy policy planning. The time-dependent value (TDV) of electricity is becoming a critical component of efficiency policy and planning. While TDV is a common consideration in utility planning, it is (until now) generally ignored in IECC discussions and economic impact statements.

In light of this challenging and rapidly changing utility and power landscape it seems prudent to allow jurisdictions to be able to use the IECC to accomplish their locally-specific objectives for building energy efficiency. This Appendix provides a means to support these objectives within the IECC context (without creating a competing "code" in the public marketplace.)

Cost Impact: The code change proposal will increase the cost of construction locally if adopted by jurisdictions.

TENTATIVE ORDER OF DISCUSSION

2009/2010 PROPOSED CHANGES TO THE INTERNATIONAL EXISTING BUILDING CODE

The following is the tentative order in which the proposed changes to the code will be discussed at the public hearings. Proposed changes which impact the same subject have been grouped to permit consideration in consecutive changes.

Proposed change numbers that are indented are those which are being heard out of numerical order. Indentation does **not** necessarily indicate that one change is related to another. Proposed changes may be grouped for purposes of discussion at the hearing at the discretion of the chair.

101.5, Chapter 3 (New)

Proponent: David Bonowitz, SE, National Council of Structural Engineers Associations, Code Advisory Committee, Existing Buildings Subcommittee (NCSEA EBS)

Relocate current Section 101.5 to become new Chapter 3 as follows:

CHAPTER 3
COMPLIANCE METHODS

SECTION 301
COMPLIANCE METHODS

~~**101.5**~~ **301.1 General.** ~~**Compliance methods.**~~ The *repair*, *alteration*, *change of occupancy*, *addition* or relocation of all *existing buildings* shall comply with one of the methods listed in Sections ~~101.5.1~~ 301.1.1 through ~~101.5.3~~ 301.1.3 as selected by the applicant. Application of a method shall be the sole basis for assessing the compliance of work performed under a single permit unless otherwise approved by the *code official*. Sections ~~101.5.1~~ 301.1.1 through ~~101.5.3~~ 301.1.3 shall not be applied in combination with each other. Where this code requires consideration of the seismic-force-resisting system of an *existing building* subject to *repair*, *alteration*, *change of occupancy*, *addition* or relocation of *existing buildings*, the seismic evaluation and design shall be based on Section ~~101.5.4~~ 301.1.4 regardless of which compliance method is used.

Exception: Subject to the approval of the *code official*, *alterations* complying with the laws in existence at the time the building or the affected portion of the building was built shall be considered in compliance with the provisions of this code unless the building is undergoing more than a limited structural *alteration* as defined in Section 907.5.3 ~~807.5.3~~. New structural members added as part of the *alteration* shall comply with the *International Building Code*. *Alteration*s of *existing buildings* in *flood hazard areas* shall comply with Section 601.3.

~~**101.5.1**~~ **301.1.1 Prescriptive compliance method.** *Repairs*, *alterations*, *additions* and changes of occupancy complying with Chapter ~~3~~4 of this code in buildings complying with the *International Fire Code* shall be considered in compliance with the provisions of this code.

~~**101.5.2**~~ **301.1.2 Work area compliance method.** *Repairs*, *alterations*, *additions*, changes in occupancy and relocated buildings complying with the applicable requirements of Chapters ~~4~~5 through ~~12~~13 of this code shall be considered in compliance with the provisions of this code.

~~**101.5.3**~~ **301.1.3 Performance compliance method.** *Repairs*, *alterations*, *additions*, changes in occupancy and relocated buildings complying with Chapter ~~13~~14 of this code shall be considered in compliance with the provisions of this code.

~~**101.5.4**~~ **301.1.4 Evaluation and design procedures.** The seismic evaluation and design shall be based on the procedures specified in the *International Building Code*, ASCE 31 or ASCE 41. The procedures contained in Appendix A of this code shall be permitted to be used as specified in Section ~~101.5.4.2~~ 301.1.4.2.

~~**101.5.4.1**~~ **301.1.4.1 Compliance with IBC level seismic forces.** Where compliance with the seismic design provisions of the *International Building Code* is required, the procedures shall be in accordance with one of the following:

1. The *International Building Code* using 100 percent of the prescribed forces. The values of R, Ω_0 and C_d used for analysis in accordance with Chapter 16 of the *International Building Code* shall be those specified for structural systems classified as "Ordinary" in accordance with Table 12.2-1 of ASCE 7, unless it can be demonstrated that the structural system satisfies the proportioning and detailing requirements for systems classified as "Detailed," "Intermediate" or "Special."
2. Compliance with ASCE 41 using both the BSE-1 and BSE-2 earthquake hazard levels and the corresponding performance levels shown in Table ~~101.5.4.1~~ 301.1.4.1.

TABLE ~~101.5.4.1~~ 301.1.4.1
PERFORMANCE CRITERIA FOR IBC LEVEL SEISMIC FORCES OCCUPANCY

OCCUPANCY CATEGORY (Based on IBC Table 1604.5)	PERFORMANCE LEVEL FOR USE WITH ASCE 41 BSE-1 EARTHQUAKE HAZARD LEVEL	PERFORMANCE LEVEL FOR USE WITH ASCE 41 BSE-2 EARTHQUAKE HAZARD LEVEL
I	Life safety (LS)	Collapse prevention (CP)
II	Life safety (LS)	Collapse prevention (CP)
III	Note a	Note a
IV	Immediate occupancy (IO)	Life safety (LS)

a. Acceptable criteria for Occupancy Category III shall be taken as 80 percent of the acceptance criteria specified for Occupancy Category IV performance levels.

~~101.5.4.2~~ 301.1.4.2 Compliance with reduced IBC level seismic forces. Where seismic evaluation and design is permitted to meet reduced *International Building Code* seismic force levels, the procedures used shall be in accordance with one of the following:

1. The *International Building Code* using 75 percent of the prescribed forces. Values of R, Ω_0 and C_d used for analysis shall be as specified in Section ~~101.5.4.1~~ 301.1.4.1 of this code.
2. Structures or portions of structures that comply with the requirements of the applicable chapter in Appendix A as specified in Items 2.1 through 2.5 shall be deemed to comply with this section.
   2.1. The seismic evaluation and design of unreinforced masonry bearing wall buildings in Occupancy Category I or II are permitted to be based on the procedures specified in Appendix Chapter A1.
   2.2. Seismic evaluation and design of the wall anchorage system in reinforced concrete and reinforced masonry wall buildings with flexible diaphragms in Occupancy Category I or II are permitted to be based on the procedures specified in Chapter A2.
   2.3. Seismic evaluation and design of cripple walls and sill plate anchorage in residential buildings of light-frame wood construction in Occupancy Category I or II are permitted to be based on the procedures specified in Chapter A3.
   2.4. Seismic evaluation and design of soft, weak, or open-front wall conditions in multiunit residential buildings of wood construction in Occupancy Category I or II are permitted to be based on the procedures specified in Chapter A4.
   2.5. Seismic evaluation and design of concrete buildings and concrete with masonry infill buildings in all occupancy categories are permitted to be based on the procedures specified in Chapter A5.
3. Compliance with ASCE 31 based on the applicable performance level as shown in Table ~~101.5.4.2~~ 301.1.4.2. It shall be permitted to use the BSE-1 earthquake hazard level as defined in ASCE 41 and subject to the limitations in Item 4 below.
4. Compliance with ASCE 41 using the BSE-1 Earthquake Hazard Level and the performance level shown in Table ~~101.5.4.2~~ 301.1.4.2. The design spectral response acceleration parameters S_{XS} and S_{X1} specified in ASCE 41 shall not be taken less than 75 percent of the respective design spectral response acceleration parameters S_{DS} and S_{D1} defined by the *International Building Code*.

TABLE ~~101.5.4.2~~ 301.1.4.2
PERFORMANCE CRITERIA FOR REDUCED IBC LEVEL SEISMIC FORCES OCCUPANCY CATEGORY

OCCUPANCY CATEGORY (Based on IBC Table 1604.5)	PERFORMANCE LEVEL FOR USE WITH ASCE 31	PERFORMANCE LEVEL FOR USE WITH ASCE 41 BSE-1 EARTHQUAKE HAZARD LEVEL
I	Life safety (LS)	Life safety (LS)
II	Life safety (LS)	Life safety (LS)
III	Note a, b	Note a
IV	Immediate occupancy (IO)	Immediate occupancy (IO)

a. Performance levels for Occupancy Category III shall be taken as halfway between the performance levels specified for Occupancy Categories II and IV.
b. For Occupancy Category III, the ASCE 31 screening phase checklists shall be based on the life safety performance level.

(Renumber subsequent chapters)

Reason: The proposed relocation remedies the situation of having technical criteria in the administration chapter. Section 101.5, which includes the basic procedural provisions of the IEBC, as well as specific seismic evaluation and design criteria, does not belong in Chapter 1. Many jurisdictions do not adopt Chapter 1, but instead replace it with local administrative provisions. Having technical provisions in Chapter 1 makes this substitution more complicated and increases the possibility that the technical provisions of current Section 101.5 will be deleted or modified by mistake. The solution to these inconsistencies and potential problems is simply to relocate Section 101.5 in its entirety to a new chapter. (Note that Section 101.5 should not be relocated into either current Chapter 3 or Chapter 4 because the technical criteria in Section 101.5 are meant to apply to all three compliance methods per code change proposal EB1-07/08.)

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: Any references to other chapters or sections not in current Section 101.5 (new Chapter 3) will be done editorially if the proposal is approved.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

101.5, Chapter 4, Section 401, 401.1, 101.5.1, 101.5.2, 101.5.3, 101.5.4, 101.5.4.1, Table 101.5.4.1, 101.5.4.2, Table 101.5.4.2, 401.1.1, 401.2, 401.3, Section 402, 402.1, 402.2, 402.3, Section 403, 403.1, 403.2, Section 404, 404.1, 404.2, Section 405, 405.1, 405.2, Section 406, 406.1, 406.2, 407, 407.1, 407.2, 408, 408.1, 408.2, 409, 409.1, 409.2, Chapter 3, 301, 301.1, 301.1.1, 506.2.2.1, 506.2.2.3, 606.2.1, 606.3.1, 807.4.2, 807.4.3, 907.3.1, 1003.3.1, 1003.3.2, 1301.1, 1301.1.1, 1301.2

Proponent: Lawrence Brown, CBO, representing National Association of Home Builders (NAHB)

Change current Chapter 3 (Prescriptive Compliance Method) to Chapter 4, and change current Chapter 4 to Chapter 3, and incorporate current Section 101.5 provisions into the new Chapter 3 as follow:

~~**101.5 Compliance methods.** The *repair*, *alteration*, *change of occupancy*, *addition* or relocation of all *existing buildings* shall comply with one of the methods listed in Sections 101.5.1 through 101.5.3 as selected by the applicant. Application of a method shall be the sole basis for assessing the compliance of work performed under a single permit unless otherwise approved by the *code official*. Sections 101.5.1 through 101.5.3 shall not be applied in combination with each other. Where this code requires consideration of the seismic-force-resisting system of an *existing building* subject to *repair*, *alteration*, *change of occupancy*, *addition* or relocation of *existing buildings*, the seismic evaluation and design shall be based on Section 101.5.4 regardless of which compliance method is used.~~

~~**Exception:** Subject to the approval of the *code official*, *alterations* complying with the laws in existence at the time the building or the affected portion of the building was built shall be considered in compliance with the provisions of this code unless the building is undergoing more than a limited structural *alteration* as defined in Section 807.4.3. New structural members added as part of the *alteration* shall comply with the *International Building Code*. *Alterations* of *existing buildings* in *flood hazard areas* shall comply with Section 601.3.~~

CHAPTER <u>3</u> ~~4~~
CLASSIFICATION OF WORK

SECTION <u>301</u> ~~401~~
GENERAL

<u>301.1</u> ~~401.1~~ <u>Compliance methods</u> ~~Scope~~. The provisions of this chapter~~ shall be used in conjunction with Chapters 5 through 12 and~~ shall apply to the *alteration*, *repair*, *addition* and *change of occupancy* of existing structures, including historic and moved structures~~, as referenced in Section 101.5.2~~. The work performed on an *existing building* shall <u>comply with one of the methods listed in Sections 301.1.1 through 301.1.3</u>~~ be classified in accordance with this chapter~~. <u>Sections 301.1.1 through 301.1.3 shall not be applied in combination with each other. Where this code</u>

requires consideration of the seismic-force-resisting system of an *existing building* subject to *repair*, *alteration*, *change of occupancy*, *addition* or relocation of *existing buildings*, the seismic evaluation and design shall be based on Section 301.1.4 regardless of which compliance method is used.

Exception: Subject to the approval of the *code official*, *alterations* complying with the laws in existence at the time the building or the affected portion of the building was built shall be considered in compliance with the provisions of this code unless the building is undergoing more than a limited structural *alteration* as defined in Section 807.5.3. New structural members added as part of the *alteration* shall comply with the *International Building Code*. *Alterations* of *existing buildings* in *flood hazard areas* shall comply with Section 601.3.

301.1.1 ~~101.5.1~~ Prescriptive compliance method. *Repairs*, *alterations*, *additions* and changes of occupancy complying with Chapter 4~~3~~ of this code in buildings complying with the *International Fire Code* shall be considered in compliance with the provisions of this code.

301.1.2 ~~101.5.2~~ Work area compliance method. *Repairs*, *alterations*, *additions*, changes in occupancy and relocated buildings complying with the applicable requirements of Chapters 5~~4~~ through 12 of this code shall be considered in compliance with the provisions of this code. The work performed on an *existing building* shall be classified in accordance with Sections 302 through 309.

301.1.3 ~~101.5.3~~ Performance compliance method. *Repairs*, *alterations*, *additions*, changes in occupancy and relocated buildings complying with Chapter 13 of this code shall be considered in compliance with the provisions of this code.

301.1.4 ~~101.5.4~~ Evaluation and design procedures. The seismic evaluation and design shall be based on the procedures specified in the *International Building Code*, ASCE 31 or ASCE 41. The procedures contained in Appendix A of this code shall be permitted to be used as specified in Section 301.1.4.2~~101.5.4.2~~.

301.1.4.1 ~~101.5.4.1~~ Compliance with IBC level seismic forces. Where compliance with the seismic design provisions of the *International Building Code* is required, the procedures shall be in accordance with one of the following:

1. The *International Building Code* using 100 percent of the prescribed forces. The values of R, Ω_0 and C_d used for analysis in accordance with Chapter 16 of the *International Building Code* shall be those specified for structural systems classified as "Ordinary" in accordance with Table 12.2-1 of ASCE 7, unless it can be demonstrated that the structural system satisfies the proportioning and detailing requirements for systems classified as "Detailed," "Intermediate" or "Special."
2. Compliance with ASCE 41 using both the BSE-1 and BSE-2 earthquake hazard levels and the corresponding performance levels shown in Table 301.1.4.1 ~~101.5.4.1~~.

TABLE 301.1.4.1 ~~101.5.4.1~~
PERFORMANCE CRITERIA FOR IBC LEVEL SEISMIC FORCES

(No changes to table contents)

301.1.4.2 ~~101.5.4.2~~ Compliance with reduced IBC level seismic forces. Where seismic evaluation and design is permitted to meet reduced *International Building Code* seismic force levels, the procedures used shall be in accordance with one of the following:

1. The *International Building Code* using 75 percent of the prescribed forces. Values of R, Ω_0 and C_d used for analysis shall be as specified in Section 301.1.4.1 ~~101.5.4.1~~ of this code.
2. Structures or portions of structures that comply with the requirements of the applicable chapter in Appendix A as specified in Items 2.1 through 2.5 shall be deemed to comply with this section.
   2.1. The seismic evaluation and design of unreinforced masonry bearing wall buildings in Occupancy Category I or II are permitted to be based on the procedures specified in Appendix Chapter A1.
   2.2. Seismic evaluation and design of the wall anchorage system in reinforced concrete and reinforced masonry wall buildings with flexible diaphragms in Occupancy Category I or II are permitted to be based on the procedures specified in Chapter A2.
   2.3. Seismic evaluation and design of cripple walls and sill plate anchorage in residential buildings of light-frame wood construction in Occupancy Category I or II are permitted to be based on the procedures specified in Chapter A3.

2.4. Seismic evaluation and design of soft, weak, or open-front wall conditions in multiunit residential buildings of wood construction in Occupancy Category I or II are permitted to be based on the procedures specified in Chapter A4.

2.5. Seismic evaluation and design of concrete buildings and concrete with masonry infill buildings in all occupancy categories are permitted to be based on the procedures specified in Chapter A5.

3. Compliance with ASCE 31 based on the applicable performance level as shown in Table 301.1.4.2 ~~101.5.4.2~~. It shall be permitted to use the BSE-1 earthquake hazard level as defined in ASCE 41 and subject to the limitations in Item 4 below.
4. Compliance with ASCE41 using the BSE-1 Earthquake Hazard Level and the performance level shown in Table 301.1.4.2~~101.5.4.2~~. The design spectral response acceleration parameters S_{XS} and S_{X1} specified in ASCE 41 shall not be taken less than 75 percent of the respective design spectral response acceleration parameters S_{DS} and S_{D1} defined by the *International Building Code*.

TABLE 301.1.4.2 ~~101.5.4.2~~
PERFORMANCE CRITERIA FOR REDUCED IBC LEVEL SEISMIC FORCES

(No change to table contents)

~~401.1.1 Compliance with other alternatives.~~ ~~*Alterations*, *repairs*, *additions* and changes of occupancy to existing structures shall comply with the provisions of Chapters 4 through 12 or with one of the alternatives provided in Section 101.5.~~

301.2 ~~401.2~~ Work area. The *work area*, as defined in Chapter 2, shall be identified on the construction documents.

301.3 ~~401.3~~ Occupancy and use. When determining the appropriate application of the referenced sections of this code, the occupancy and use of a building shall be determined in accordance with Chapter 3 of the *International Building Code*.

SECTION 302 ~~402~~
REPAIRS

302.1 ~~402.1~~ Scope. *Repairs,* as defined in Chapter 2, include the patching or restoration or replacement of damaged materials, elements, equipment or fixtures for the purpose of maintaining such components in good or sound condition with respect to existing loads or performance requirements.

302.2 ~~402.2~~ Application. *Repairs* shall comply with the provisions of Chapter 5.

302.3 ~~402.3~~ Related work. Work on nondamaged components that is necessary for the required *repair* of damaged components shall be considered part of the *repair* and shall not be subject to the provisions of Chapter 6, 7, 8, 9 or 10.

SECTION 303 ~~403~~
ALTERATION—LEVEL 1

303.1 ~~403.1~~ Scope. Level 1 alterations include the removal and replacement or the covering of existing materials, elements, equipment, or fixtures using new materials, elements, equipment, or fixtures that serve the same purpose.

303.2 ~~403.2~~ Application. Level 1 *alterations* shall comply with the provisions of Chapter 6.

SECTION 304 ~~404~~
ALTERATION—LEVEL 2

304.1 ~~404.1~~ Scope. Level 2 *alterations* include the reconfiguration of space, the *addition* or elimination of any door or window, the reconfiguration or extension of any system, or the installation of any additional equipment.

304.2 ~~404.2~~ Application. Level 2 alterations shall comply with the provisions of Chapter 6 for Level 1 *alterations* as well as the provisions of Chapter 7.

SECTION 305 ~~405~~
ALTERATION—LEVEL 3

305.1 ~~405.1~~ Scope. Level 3 *alterations* apply where the *work area* exceeds 50 percent of the aggregate area of the building.

305.2 ~~405.2~~ Application. Level 3 alterations shall comply with the provisions of Chapters 6 and 7 for Level 1 and 2 *alterations*, respectively, as well as the provisions of Chapter 8.

SECTION 306 ~~406~~
CHANGE OF OCCUPANCY

306.1 ~~406.1~~ Scope. *Change of occupancy* provisions apply where the activity is classified as a *change of occupancy* as defined in Chapter 2.

306.2 ~~406.2~~ Application. Changes of occupancy shall comply with the provisions of Chapter 9.

SECTION 307 ~~407~~
ADDITIONS

307.1 ~~407.1~~ Scope. Provisions for *additions* shall apply where work is classified as an *addition* as defined in Chapter 2.

307.2 ~~407.2~~ Application. *Additions* to existing buildings shall comply with the provisions of Chapter 10.

SECTION 308 ~~408~~
HISTORIC BUILDINGS

308.1 ~~408.1~~ Scope. Historic buildings provisions shall apply to buildings classified as historic as defined in Chapter 2.

308.2 ~~408.2~~ Application. Except as specifically provided for in Chapter 11, historic buildings shall comply with applicable provisions of this code for the type of work being performed.

SECTION 309 ~~409~~
RELOCATED BUILDINGS

309.1 ~~409.1~~ Scope. Relocated buildings provisions shall apply to relocated or moved buildings.

309.2 ~~409.2~~ Application. Relocated buildings shall comply with the provisions of Chapter 12.

CHAPTER 4~~3~~
PRESCRIPTIVE COMPLIANCE METHOD

[B] SECTION 401 ~~301~~
GENERAL

401.1 ~~301.1~~ Scope. The provisions of this chapter shall control the *alteration*, *repair*, *addition* and *change of occupancy* of existing structures, including historic and moved structures as referenced in Section 301.1.1~~101.5.1~~.

Exception: Existing bleachers, grandstands and folding and telescopic seating shall comply with ICC 300-02.

401.1.1 ~~301.1.1~~ Compliance with other methods. Alterations, repairs, *additions* and changes of occupancy to existing structures shall comply with the provisions of this chapter or with one of the methods provided in Section 301.1~~101.5~~

(Renumber remaining Chapter 3 accordingly)

506.2.2.1 Evaluation. The building shall be evaluated by a registered design professional, and the evaluation findings shall be submitted to the *code official*. The evaluation shall establish whether the damaged building, if repaired to its predamaged state, would comply with the provisions of the *International Building Code*, except that the seismic design criteria shall be the reduced level seismic forces specified in Section 301.1.4.2 ~~101.5.4.2~~.

506.2.2.3 Extent of repair for noncompliant buildings. If the evaluation does not establish that the building in its predamage condition complies with the provisions of Section 506.2.2.1, then the building shall be rehabilitated to comply with the provisions of this section. The wind load for the *repair* and rehabilitation shall be those required by the building code in effect at the time of original construction, unless the damage was caused by wind, in which case the wind loads shall be in accordance with the *International Building Code*. The seismic loads for this rehabilitation design shall be those required by the building code in effect at the time of original construction, but not less than the reduced-level seismic forces specified in Section 301.1.4.2 ~~101.5.4.2~~.

606.2.1 Wall anchors for concrete and masonry buildings. Where a permit is issued for reroofing more than 25 percent of the roof area of a building assigned to Seismic Design Category D, E or F with a structural system consisting of concrete or reinforced masonry walls with a flexible roof diaphragm or unreinforced masonry walls with any type of roof diaphragms, the work shall include installation of wall anchors at the roof line to resist the reduced *International Building Code* level seismic forces as specified in Section 301.1.4.2 ~~101.5.4.2~~ of this code and design procedures of Section 301.1.4 ~~101.5.4~~, unless an evaluation demonstrates compliance of existing wall anchorage.

606.3.1 Bracing for unreinforced masonry bearing wall parapets. Where a permit is issued for reroofing for more than 25 percent of the roof area of a building assigned to Seismic Design Category D, E or F that has parapets constructed of unreinforced masonry, the work shall include installation of parapet bracing to resist the reduced *International Building Code* level seismic forces as specified in Section 301.1.4.2 ~~101.5.4.2~~ of this code, unless an evaluation demonstrates compliance of such items.

807.4.2 Substantial structural alteration. Where more than 30 percent of the total floor and roof areas of the building or structure have been or are proposed to be involved in structural *alteration* within a 12-month period, the evaluation and analysis shall demonstrate that the altered building or structure complies with the *International Building Code* for wind loading and with reduced *International Building Code* level seismic forces as specified in Section 301.1.4.2 ~~101.5.4.2~~ for seismic loading. For seismic considerations, the analysis shall be based on one of the procedures specified in Section 301.1.4 ~~101.5.4~~. The areas to be counted toward the 30 percent shall be those areas tributary to the vertical load-carrying components, such as joists, beams, columns, walls and other structural components that have been or will be removed, added or altered, as well as areas such as mezzanines, penthouses, roof structures and in-filled courts and shafts.

807.4.3 Limited structural alteration. Where not more than 30 percent of the total floor and roof areas of the building are involved in structural *alteration* within a 12-month period, the evaluation and analysis shall demonstrate that the altered building or structure complies with the loads applicable at the time of the original construction or of the most recent substantial structural *alteration* as defined by Section 807.4.2. Any existing structural element whose seismic demand-capacity ratio with the *alteration* considered is more than 10 percent greater than its demand-capacity ratio with the *alteration* ignored shall comply with the reduced *International Building Code* level seismic forces as specified in Section 301.1.4.2 ~~101.5.4.2~~.

907.3.1 Compliance with the International Building Code level seismic forces. Where a building or portion thereof is subject to a *change of occupancy* that results in the building being assigned to a higher occupancy category based on Table 1604.5 of the *International Building Code*; or where such *change of occupancy* results in a reclassification of a building to a higher hazard category as shown in Table 912.4; or where a change of a Group M occupancy to a Group A, E, I-1, R-1, R-2 or R-4 occupancy with two-thirds or more of the floors involved in Level 3 *alteration* work, the building shall comply with the requirements for *International Building Code* level seismic forces as specified in Section 301.1.4.1 ~~101.5.4.1~~ for the new occupancy category.

Exceptions:

1. Group Moccupancies being changed to Group A, E, I-1, R-1, R-2 or R-4 occupancies for buildings less than six stories in height and in Seismic Design Category A, B or C.
2. Where approved by the *code official*, specific detailing provisions required for a new structure are not required to be met where it can be shown that an equivalent level of performance and seismic safety is obtained for the applicable occupancy category based on the provision for reduced *International Building Code* level seismic forces as specified in Section 301.1.4.2 ~~101.5.4.2~~.
3. Where the area of the new occupancy with a higher hazard category is less than or equal to 10 percent of the total building floor area and the new occupancy is not classified as Occupancy Category IV. For the purposes of this exception, buildings occupied by two or more occupancies not included in the same occupancy category, shall be subject to the provisions of Section 1604.5.1 of the *International Building Code*. The cumulative effect of the area of occupancy changes shall be considered for the purposes of this exception.
4. Unreinforced masonry bearing wall buildings in Occupancy Category III when assigned to Seismic Design Category A or B shall be allowed to be strengthened to meet the requirements of Appendix Chapter A1 of this code [Guidelines for the Seismic Retrofit of Existing Buildings (GSREB)].

1003.3.1 Vertical addition. Any element of the lateral-force-resisting system of an *existing building* subjected to an increase in vertical or lateral loads from the vertical *addition* shall comply with the *International Building Code* wind provisions and the *International Building Code* level seismic forces specified in Section 301.1.4.1 ~~101.5.4.1~~ of this code.

1003.3.2 Horizontal addition. Where horizontal *additions* are structurally connected to an existing structure, all lateral-force-resisting elements of the existing structure affected by such *addition* shall comply with the *International Building Code* wind provisions and the *International Building Code* level seismic forces specified in Section 301.1.4.1 ~~101.5.4.1~~ of this code.

1301.1 Scope. The provisions of this chapter shall apply to the *alteration, repair, addition* and *change of occupancy* of existing structures, including historic and moved structures, as referenced in Section 301.1.3 ~~101.5.3~~. The provisions of this chapter are intended to maintain or increase the current degree of public safety, health and general welfare in existing buildings while permitting *repair, alteration, addition* and *change of occupancy* without requiring full compliance with the applicable requirements of Chapters 5 through 12 ~~Chapters 4 through 12~~, except where compliance with other provisions of this code is specifically required in this chapter.

1301.1.1 Compliance with other methods. *Alterations, repairs, additions* and *changes of occupancy* to existing structures shall comply with the provisions of this chapter or with one of the methods provided in Section 301.1 ~~101.5~~.

[**B] 1301.2 Applicability.** Structures existing prior to [DATE TO BE INSERTED BY THE JURISDICTION]. Note: it is recommended that this date coincide with the effective date of building codes within the jurisdiction], in which there is work involving additions, alterations or changes of occupancy shall be made to conform to the requirements of this chapter or the provisions of Chapters 5 through 12 ~~Chapters 4 through 12~~. The provisions of Sections 1301.2.1 through 1301.2.5 shall apply to existing occupancies that will continue to be, or are proposed to be, in Groups A, B, E, F, M, R, and S. These provisions shall not apply to buildings with occupancies in Group H or Group I.

Reason: IEBC: This proposal moves (swaps) current Chapter 3 (Prescriptive Compliance Method) to Chapter 4, and moves current Chapter 4 (Classification of Work) to Chapter 3, and expands the general language in current Section 401 (now Section 301) to cover all of the compliance methods. In addition, the appropriate language of Chapter 1, Section 101.5 is moved into the revised Chapter 3. The seismic evaluation and design requirements currently located in IEBC Section 101.5 are also brought over and placed under the expanded and re-titled Section 301.1. Thus, an appropriate location for the technical requirements is created without the need to carve out an additional chapter and renumber the entire code.

Note: The provisions for seismic evaluation and design of existing buildings were relocated last cycle from Chapter 5 to Chapter 1, for the purpose of making them available to all the compliance methods allowed under the IEBC (prescriptive method, work area method, and performance method). This relocation was approved by the IEBC committee (and upheld by the floor in Minneapolis) despite concerns that the administrative chapter is an inappropriate place for technical requirements.

Cost Impact: The code change proposal will not increase the cost of construction.

THIS IS A 2 PART CODE CHANGE. BOTH PARTS WILL BE HEARD BY THE IBC STRUCTURAL CODE COMMITTEE AS 2 SEPARATE CODE CHANGES. SEE THE TENTATIVE HEARING ORDER FOR THE IBC STRUCTURAL CODE COMMITTEE.

PART I – IEBC

Revise definition as follows:

DANGEROUS. Any building, structure or portion thereof that meets any of the conditions described below shall be deemed dangerous:

1. The building or structure has collapsed, has partially collapsed, has moved off its foundation, or lacks the necessary support of the ground ~~necessary to support it~~.
2. There exists a significant risk of collapse, detachment or dislodgement of any portion, member, appurtenance or ornamentation of the building or structure under service loads.

PART II – IBC GENERAL

Revise definition as follows:

DANGEROUS. Any building ~~or~~ , structure or portion thereof that meets any of the conditions described below shall be deemed dangerous:

1. The building or structure has collapsed, has partially collapsed, has moved off its foundation, or lacks the necessary support of the ground ~~necessary to support it~~.
2. There exists a significant risk of collapse, detachment, or dislodgment of any portion, member, appurtenance, or ornamentation of the building or structure under service loads.

Reason: This is an editorial change intended to correct awkward grammar and sentence structure. A coordinating proposal is being submitted for IBC Chapter 34.

Cost Impact: The code change proposal will not increase the cost of construction.

PART I – IEBC

EB4–09/10
Chapter 2; IBC Chapter 2

Proponent: David Bonowitz, SE, National Council of Structural Engineers Associations, Code Advisory Committee, Existing Buildings Subcommittee (NCSEA EBS)

THIS IS A 2 PART CODE CHANGE. BOTH PARTS WILL BE HEARD BY THE IBC STRUCTURAL CODE COMMITTEE AS 2 SEPARATE CODE CHANGES. SEE THE TENTATIVE HEARING ORDER FOR THE FIRE CODE COMMITTEE.

PART I – IEBC

Revise definition as follows:

SUBSTANTIAL STRUCTURAL DAMAGE. A condition where:

1. In any story, the vertical elements of the lateral force-resisting system have suffered damage such that the lateral load-carrying capacity of the structure in any horizontal direction has been reduced by more than ~~20~~ 33 percent from its pre-damage condition; or
2. The capacity of any vertical gravity load-carrying component, or any group of such components, that supports more than 30 percent of the total area of the structure's floor(s) and roof(s) has been reduced more than 20 percent from its pre-damage condition and the remaining capacity of such affected elements, with respect to all dead and live loads, is less than 75 percent of that required by this code for new buildings of similar structure, purpose and location.

PART II – IBC GENERAL

Revise definition as follows:

SUBSTANTIAL STRUCTURAL DAMAGE. A condition where:

1. In any story, the vertical elements of the lateral force-resisting system have suffered damage such that the lateral load-carrying capacity of the structure in any horizontal direction has been reduced by more than ~~20~~ 33 percent from its pre-damage condition; or
2. The capacity of any vertical gravity load-carrying component, or any group of such components, that supports more than 30 percent of the total area of the structure's floor(s) and roof(s) has been reduced more than 20 percent from its pre-damage condition and the remaining capacity of such affected elements, with respect to all dead and live loads, is less than 75 percent of that required by this code for new buildings of similar structure, purpose and location.

Reason (Part I): In the IEBC, lateral system upgrades are triggered where lateral system damage from any cause is classified as Substantial Structural Damage (SSD). The idea of repair-based upgrade triggers is well within the scope and intent of the code, as long as the triggers are not pulled too easily.

This proposal redefines SSD to help assure reasonable lateral upgrade triggers. While the proposed "33 percent" is no more and no less arbitrary than the current "20 percent" – that is, neither figure is based on theory, or analysis, or historic performance – it is felt that the proposed higher threshold is appropriate. Conceptually, the 33 percent value means that the loss of less than half of one wall line at a single story – potentially a 25 percent capacity reduction in the critical direction – would no longer be enough to trigger a full lateral assessment.

This proposal is made in coordination with a similar proposal for the IBC.

Reason (Part II): In the 2009 IBC, for the first time, lateral system upgrades are triggered where lateral system damage from any cause is classified as Substantial Structural Damage (SSD). Similar triggers have been in the IEBC for several code cycles. The idea of repair-based upgrade triggers is well within the scope and intent of both codes, as long as the triggers are not pulled too easily.

This proposal redefines SSD to help assure reasonable lateral upgrade triggers. While the proposed "33 percent" is no more and no less arbitrary than the current "20 percent" – that is, neither figure is based on theory, or analysis, or historic performance – it is felt that the proposed higher threshold is appropriate. Conceptually, the 33 percent value means that the loss of less than half of one wall line at a single story – potentially a 25 percent capacity reduction in the critical direction – would no longer be enough to trigger a full lateral assessment.

A coordination change is being submitted for IEBC Chapter 2.

Cost Impact: The code change proposal will not increase the cost of construction.

EB5–09/10

501.1, 1102.1, 1102.4, 1102.5

Proponent: David Bonowitz, SE, National Council of Structural Engineers Associations, Code Advisory Committee, Existing Buildings Subcommittee (NCSEA EBS)

THIS PROPOSAL IS ON THE AGENDA OF THE IBC STRUCTURAL CODE DEVELOPMENT COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THE IBC STRUCTURAL CODE DEVELOPMENT COMMITTEE.

Revise as follows:

501.1 Scope. Repairs as described in Section 402 shall comply with the requirements of this chapter. Repairs to historic buildings ~~shall~~ need only comply with ~~this chapter, except as modified in~~ Chapter 11.

1102.1 General. Repairs to any portion of an historic building or structure shall be permitted with original or like materials and original methods of construction, subject to the provisions of this chapter. Hazardous materials, such as asbestos and lead-based paint, shall not be used where the code for new construction would not permit their use in buildings of similar occupancy, purpose and location.

~~**1102.4 Chapter 5 compliance.** Historic buildings undergoing repairs shall comply with all of the applicable requirements of Chapter 5, except as specifically permitted in this chapter.~~

~~**1102.5**~~ **1102.4 Replacement.** Replacement of existing or missing features using original materials shall be permitted. Partial replacement for repairs that match the original in configuration, height, and size shall be permitted. ~~Such replacements shall not be required to meet the materials and methods requirements of Section 501.2.~~

~~**Exception:** Replacement glazing in hazardous locations shall comply with the safety glazing requirements of Chapter 24 of the *International Building Code*.~~

Replacement glazing in hazardous locations shall comply with the safety glazing requirements of Chapter 24 of the *International Building Code*.

Exception: Glass block walls, louvered windows, and jalousies repaired with like materials.

Reason: This is an editorial clarification. It will not change the scope or effect of the 2009 provisions. Currently, Chapters 5 and 11 refer to each other in a confusing way with respect to historic buildings. Sections 501.1 and 1102.4 both say that repairs shall be in accordance with Chapter 5 except as modified by Chapter 11, but the exceptions are not clearly stated and are thus difficult to decipher. Further, whenever Chapter 5 is revised, as it has been substantially in the 2006 and 2009 editions, Chapter 11 must be checked to see which of those revisions should apply to historic buildings.

This proposal offers a cleaner approach. It proposes a general exemption for historic buildings in Chapter 5 along with an explicit list of requirements in Chapter 11, without the need for reference back and forth between the chapters. Specifically, the proposal does the following:

- In 501.1, it sends the user to Chapter 11 for historic buildings.
- In 1102.4, it removes the circular reference back to Chapter 5.
- In 1102.5, it corrects (by deletion) the mistaken waiver of section 501.2. This waiver should be referencing 2009 section 502.2 because the provision in question was moved there with the 2009 edition; but the reference in 2009 1102.5 was not properly corrected. If the rest of this proposal is approved, this waiver is no longer needed.
- It restates all the Chapter 5 requirements for historic buildings in Chapter 11.

A study of 2009 Chapters 5 and 11 finds that the only provisions of Chapter 5 not already waived by Chapter 11 for repairs are the following:

- Per 2009 Sections 502.1 and 506.1, dangerous conditions must be eliminated. This requirement is already covered by Sections 1102.2 and 1106.2.
- Per 2009 Section 502.2, hazardous materials shall not be used for repair. This proposal restates the prohibition in Section 1102.1.
- Per 2009 Section 1102.5 and its exception, replacement glazing in hazardous locations must comply with IBC Chapter 24, but 2009 Section 502.3 makes an exception for "glass block walls, louvered windows, and jalousies repaired with like materials." This proposal brings the exception into section 1102.5, stating it in identical terms.

Thus, this proposal captures all the current requirements and exemptions for repairs of historic buildings and presents them more clearly.

Additional background. Examples of how the current provisions lead to confusion over scope and applicability for historic buildings: Section 1102.1 allows repairs with original or like materials and original methods of construction, but Section 502.2 requires materials for new construction, and Section 506.1 requires detailing as for new construction. Section 1102.5 waives Section 501.2 (mistakenly, see above) but does not explicitly mention related provisions in Sections 503 through 508. Section 1102.5 requires glazing in hazardous locations to comply with IBC Chapter 24, but it must do so through an exception to the exception in 502.3. Most significantly, Section 1102.1, regarding repairs, does not explicitly exempt the upgrades required by Section 506, but this is in conflict with the apparent intent of Sections 1102.2 and 1106.2.

Cost Impact: The code change proposal will not increase the cost of construction.

506.2.2, 506.2.2.1; IBC 3405.2 (IEBC [B] 304.2), 3405.2.1(IEBC [B] 304.2.1)

Proponent: David Bonowitz, SE, National Council of Structural Engineers Associations, Code Advisory Committee, Existing Buildings Subcommittee (NCSEA EBS)

THIS IS A 2 PART CODE CHANGE. BOTH PARTS WILL BE HEARD BY THE IBC STRUCTURAL CODE COMMITTEE AS 2 SEPARATE CODE CHANGES. SEE THE TENTATIVE HEARING ORDER FOR THE FIRE CODE COMMITTEE.

PART I – IEBC

Revise as follows:

506.2.2 Substantial structural damage to vertical elements of the lateral-force-resisting system. A building that has sustained *substantial structural damage* to the vertical elements of its lateral-force-resisting system shall be evaluated in accordance with Section 506.2.2.1, and either repaired in accordance with Section 506.2.2.2 or repaired and rehabilitated in accordance with Section 506.2.2.3, depending on the results of the evaluation.

Exceptions:

1. Buildings assigned to Seismic Design Category A, B, or C whose substantial structural damage was not caused by earthquake need not be evaluated or rehabilitated for load combinations that include earthquake effects.
2. One- and two-family dwellings need not be evaluated or rehabilitated for load combinations that include earthquake effects.

506.2.2.1 Evaluation. The building shall be evaluated by a registered design professional, and the evaluation findings shall be submitted to the *code official*. The evaluation shall establish whether the damaged building, if repaired to its predamaged state, would comply with the provisions of the *International Building Code* for load combinations that include wind or earthquake effects, except that the seismic design criteria shall be the reduced IBC-level seismic forces specified in Section 101.5.4.2.

PART II – IBC GENERAL

Revise as follows:

3405.2 (IEBC [B] 304.2) Substantial structural damage to vertical elements of the lateral-force-resisting system. A building that has sustained substantial structural damage to the vertical elements of its lateral-force-resisting system shall be evaluated and repaired in accordance with the applicable provisions of Sections 3405.2.1 through 3405.2.3.

Exceptions:

1. Buildings assigned to Seismic Design Category A, B, or C whose substantial structural damage was not caused by earthquake need not be evaluated or rehabilitated for load combinations that include earthquake effects.
2. One- and two-family dwellings need not be evaluated or rehabilitated for load combinations that include earthquake effects.

3405.2.1(IEBC [B] 304.2.1) Evaluation. The building shall be evaluated by a *registered design professional*, and the evaluation findings shall be submitted to the code official. The evaluation shall establish whether the damaged building, if repaired to its pre-damage state, would comply with the provisions of this code for wind and earthquake loads. ~~Evaluation for earthquake loads shall be required if the substantial structural damage was caused by or related to earthquake effects or if the building is in Seismic Design Category C, D, E, or F.~~

Wind loads for this evaluation shall be those prescribed in Section 1609. Earthquake loads for this evaluation, if required, shall be permitted to be 75 percent of those prescribed in Section 1613. Values of R, W_0 and C_d for the existing seismic force-resisting system shall be those specified by this code for an ordinary system unless it is demonstrated that the existing system will provide performance equivalent to that of an intermediate or special system.

Reason (Part I): The purpose of this proposal is to exempt certain combinations of buildings, seismic risk, and damage from triggered seismic upgrades. In general, seismic evaluation and possibly upgrade is triggered when damage to the lateral system, independent of cause, reaches the level defined as Substantial Structural Damage, regardless of occupancy, structure type, or seismic design category. NCSEA acknowledges that this broad applicability might be unnecessary to the general purpose of the code and could discourage or delay certain repairs by imposing the additional costs of seismic upgrade. Therefore, this proposal exempts two classes of buildings from seismic upgrades triggered by substantial structural repairs. Basic repair – that is, restoring the pre-damage condition – will still be required, and this proposal considers such repairs appropriate for the two classes in question:

- Buildings in areas of low or moderate seismicity, where the damage was caused by something other than earthquake. Where earthquakes are rare, it serves no significant public purposes to trigger seismic upgrades following damage caused by fire, collision, wind, etc.
- One- and two-family dwellings, where the public risk is especially low.

In section 506.2.2.1, the proposed language is intended to clarify, not change, the scope of the section.

This proposal is made in coordination with a similar proposal for IBC Chapter 34.

Reason (Part II): The purpose of this proposal is to exempt certain combinations of buildings, seismic risk, and damage from triggered seismic upgrades. In general, seismic evaluation and possibly upgrade is triggered when damage to the lateral system, independent of cause, reaches the level defined as Substantial Structural Damage, regardless of occupancy, structure type, or seismic design category. NCSEA acknowledges that this broad applicability might be unnecessary to the general purpose of the code and could discourage or delay certain repairs by imposing the additional costs of seismic upgrade. Therefore, this proposal exempts two classes of buildings from seismic upgrades triggered by substantial structural repairs. Basic repair – that is, restoring the pre-damage condition – will still be required, and this proposal considers such repairs appropriate for the two classes in question:

- Buildings in areas of low or moderate seismicity, where the damage was caused by something other than earthquake. Where earthquakes are rare, it serves no significant public purposes to trigger seismic upgrades following damage caused by fire, collision, wind, etc.
- One- and two-family dwellings, where the public risk is especially low.

With Exception 1 added to 3405.2, the final sentence of the first paragraph of 3405.2.1 is no longer necessary. The current sentence in 3405.2.1 says seismic evaluation is necessary wherever the damage was caused by earthquake OR the building is in SDC C-F. That is, the current provision exempts buildings in SDC A-B if the damage was not caused by earthquake. Proposed Exception 1 merely adds SDC C to the exempted cases.

A coordinating proposal is being submitted for IEBC Chapter 5.

Cost Impact: The code change proposal will not increase the cost of construction.

506.2.2.3

Proponent: Gary R. Searer, Wiss, Janney, Elstner Associates, Inc., representing self

THIS PROPOSAL IS ON THE AGENDA OF THE IBC STRUCTURAL CODE DEVELOPMENT COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THE IBC STRUCTURAL CODE DEVELOPMENT COMMITTEE.

Revise as follows:

506.2.2.3 Extent of repair for noncompliant buildings. If the evaluation does not establish that the building in its predamage condition complies with the provisions of Section 506.2.2.1, then the building shall be rehabilitated to comply with the provisions of this section. The wind load for the repair and rehabilitation shall be those required by the building code in effect at the time of original construction, unless the damage was caused by wind, in which case the wind loads shall be in accordance with the International Building Code. ~~The seismic loads for this rehabilitation design shall be those required by the building code in effect at the time of original construction, but not less than the reduced-level seismic forces specified in Section 101.5.4.2.~~ If the damage was caused by earthquake and the Instrumental Intensity of the earthquake at the site of the building as determined using data from the United States Geological Survey was VII or greater, the seismic design forces for the repair shall be those required by the building code in effect at the time of original construction. If the damage was not caused by earthquake or if the damage caused by an earthquake with an Instrumental Intensity of less than VII at the site of the building, the seismic design forces for the rehabilitation shall be those required by the building code in effect at the time of original construction, but not less than the reduced-level seismic forces specified in Section 101.5.4.2.

Reason: This change is intended to make seismic upgrades of the lateral force resisting system after a large earthquake logical. Suppose that a large, design-level earthquake (the "big one") occurs in a major city. On the basis even of today's IBC design criteria, it is reasonable to expect that large numbers of buildings will experience significant damage as a result of the earthquake, even to buildings that conform or nearly conform to current code. Yet despite these damaged buildings all performing within the expectation of the current code, the proposed upgrade triggers would require further potentially massive and costly upgrades beyond the repairs already needed, because the proposed upgrade triggers do not permit any consideration of the intensity of the earthquake shaking responsible for the damage. Why would any engineer conclude that a city full of buildings that went through a major earthquake but protected life safety should be seismically upgraded? Why would any community want to mandate those upgrades? Why should the federal government, insurance companies, building owners, or taxpayers pay for those upgrades? Regarding this scenario, in their study of upgrade triggers, SEAONC concluded, "Requirements to upgrade such a large stock of buildings could put an undue economic burden on the private sector and delay regional recovery."

What this proposal does:

This proposal requires seismic upgrades of existing structures if the damage was not the result of earthquake activity or if the damage was caused by earthquake but was disproportionate to the intensity of the earthquake (i.e. significant structural damage when the Instrumental Intensity of the earthquake at the site was less than VII, as measured by the United States Geological Survey).

If an earthquake had a moderate or heavy damage potential at a particular site (Instrumental Intensity of VII or greater) and a structure at that site experienced substantial structural damage, this would not necessarily be unexpected even for a new building and seismic upgrade of the whole building to current code (or close to current code) would generally not be warranted. If, on the other hand, the Instrumental Intensity of say V or VI (very light or light potential damage) and significant structural damage occurred, then the structure may be overly susceptible to earthquake damage and strengthening is arguably prudent.

For copies of articles dealing with the problems with the "substantial structural damage" trigger, please email me at gsearer@wje.com.

EB8–09/10
506.2.3.1; IBC 3405.3.1 (IEBC [B] 304.3.1)

Proponent: David Bonowitz, SE, National Council of Structural Engineers Associations, Code Advisory Committee, Existing Buildings Subcommittee (NCSEA EBS)

THIS IS A 2 PART CODE CHANGE. BOTH PARTS WILL BE HEARD BY THE IBC STRUCTURAL CODE COMMITTEE AS 2 SEPARATE CODE CHANGES. SEE THE TENTATIVE HEARING ORDER FOR THE FIRE CODE COMMITTEE.

PART I – IEBC

Revise as follows:

506.2.3.1 Lateral force-resisting elements. Regardless of the level of damage to gravity elements of the lateral force- resisting system, if substantial structural damage to gravity load-carrying components was caused primarily by wind or seismic effects, then the building shall be evaluated in accordance with Section 506.2.2.1 and, if noncompliant, rehabilitated in accordance with Section 506.2.2.3.

> **Exception:** One- and two-family dwellings need not be evaluated or rehabilitated for load combinations that include earthquake effects.

PART II – IBC GENERAL

Revise as follows:

3405.3.1 (IEBC [B] 304.3.1) Lateral force-resisting elements. Regardless of the level of damage to vertical elements of the lateral force-resisting system, if substantial structural damage to gravity load-carrying components was caused primarily by wind or earthquake effects, then the building shall be evaluated in accordance with Section 3405.2.1 and, if noncompliant, rehabilitated in accordance with Section 3405.2.3.

> **Exception:** One- and two-family dwellings need not be evaluated or rehabilitated for load combinations that include earthquake effects.

Reason: The purpose of this proposal is to exempt certain buildings from triggered seismic upgrades. In general, seismic evaluation and possibly upgrade is triggered when damage to the lateral system, independent of cause, reaches the level defined as Substantial Structural Damage, regardless of occupancy, structure type, or seismic design category. NCSEA acknowledges that this broad applicability might be unnecessary to the general purpose of the code and could discourage or delay certain repairs by imposing the additional costs of seismic upgrade.

Therefore, this proposal exempts 1- and 2-family dwellings, where the risk to the public of poor earthquake performance is especially low.

Basic repair – that is, restoring the pre-damage condition – will still be required, and this proposal considers such repairs appropriate for the buildings in question.

Cost Impact: The code change proposal will not increase the cost of construction.

THIS IS A 2 PART CODE CHANGE. BOTH PARTS WILL BE HEARD BY THE IBC STRUCTURAL CODE COMMITTEE AS 2 SEPARATE CODE CHANGES. SEE THE TENTATIVE HEARING ORDER FOR THE FIRE CODE COMMITTEE.

PART I – IEBC

Revise as follows:

506.2.3.1 Lateral force-resisting elements. Regardless of the level of damage to gravity elements of the lateral force- resisting system, if *substantial structural damage* to gravity load-carrying components was caused primarily by wind or seismic effects, then the building shall be evaluated in accordance with Section 506.2.2.1 and, if noncompliant, rehabilitated in accordance with Section 506.2.2.3.

> **Exception:** Buildings assigned to Seismic Design Category A, B, or C whose substantial structural damage was not caused by earthquake need not be evaluated or rehabilitated for load combinations that include earthquake effects.

PART II – IBC GENERAL

Revise as follows:

3405.3.1 (IEBC [B] 304.3.1) Lateral force-resisting elements. Regardless of the level of damage to vertical elements of the lateral force-resisting system, if *substantial structural damage* to gravity load-carrying components was caused primarily by wind or earthquake effects, then the building shall be evaluated in accordance with Section 3405.2.1 and, if noncompliant, rehabilitated in accordance with Section 3405.2.3.

> **Exception:** Buildings assigned to Seismic Design Category A, B, or C whose substantial structural damage was not caused by earthquake need not be evaluated or rehabilitated for load combinations that include earthquake effects.

Reason: The purpose of this proposal is to exempt certain buildings from triggered seismic upgrades. In general, seismic evaluation and possibly upgrade is triggered when damage to the lateral system, independent of cause, reaches the level defined as Substantial Structural Damage, regardless of occupancy, structure type, or seismic design category. NCSEA acknowledges that this broad applicability might be unnecessary to the general purpose of the code and could discourage or delay certain repairs by imposing the additional costs of seismic upgrade. Therefore, this proposal exempts buildings in areas of low or moderate seismicity, where the damage was caused by something other than earthquake. Where earthquakes are rare, it serves no significant public purposes to trigger seismic upgrades following damage caused by fire, collision, wind, etc.

Basic repair – that is, restoring the pre-damage condition – will still be required, and this proposal considers such repairs appropriate for the buildings in question.

Cost Impact: The code change proposal will not increase the cost of construction.

Proponent: Gene Boecker, Code Consultants, Inc.

THIS IS A 3 PART CODE CHANGE. ALL 3 PARTS WILL BE HEARD BY THE INTERNATIONAL EXISTING BUILDING COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THIS COMMITTEE.

PART I – IEBC

CHAPTER 5
REPAIRS

SECTION 504
MEANS OF EGRESS

504.1 General. Repairs shall be done in a manner that maintains the level of protection provided for the means of egress.

SECTION 505
ACCESSIBILITY

505.1 General. Repairs shall be done in a manner that maintains the level of accessibility provided.

CHAPTER 6
ALTERATIONS—LEVEL 1

SECTION 604
MEANS OF EGRESS

604.1 General. Repairs shall be done in a manner that maintains the level of protection provided for the means of egress.

SECTION 605
ACCESSIBILITY

605.1 General. A building, facility or element that is altered shall comply with the applicable provisions in Sections 605.1.1 through 605.1.14, Chapter 11 of the International Building Code and ICC A117.1 unless it is technically infeasible. Where compliance with this section is technically infeasible, the alteration shall provide access to the maximum extent that is technically feasible.

A building, facility or element that is constructed or altered to be accessible shall be maintained accessible during occupancy.

Exceptions:

1. The altered element or space is not required to be on an accessible route unless required by Section 605.2.
2. ~~Accessible means of egress required by Chapter 10 of the International Building Code are not required to be provided in existing buildings and facilities.~~ The altered element or space is not required to provide accessible means of egress, unless required by Section 805.4.
3. Type B dwelling or sleeping units required by Section 1107 of the *International Building Code* are not required to be provided in existing buildings and facilities.
4. The alteration to Type A individually owned dwelling units within a Group R-2 occupancy shall meet the provisions for Type B dwelling units and shall comply with the applicable provisions in Chapter 11 of the *International Building Code* and ICC A117.1.

605.2 Alterations affecting an area containing a primary function. Where an *alteration* affects the accessibility to, or contains an area of *primary function*, the route to the *primary function* area shall be *accessible*. The accessible route to the primary function area shall include toilet facilities or drinking fountains serving the area of primary function.

Exceptions:

1. The costs of providing the accessible route are not required to exceed 20 percent of the costs of the alterations affecting the area of primary function.
2. This provision does not apply to alterations limited solely to windows, hardware, operating controls, electrical outlets and signs.
3. This provision does not apply to alterations limited solely to mechanical systems, electrical systems, installation or alteration of fire protection systems and abatement of hazardous materials.
4. This provision does not apply to alterations undertaken for the primary purpose of increasing the accessibility of an existing building, facility or element.

CHAPTER 7
ALTERATIONS—LEVEL 2

SECTION 705
MEANS OF EGRESS

705.1 Scope. The requirements of this section shall be limited to work areas that include exits or corridors shared by more than one tenant within the work area in which Level 2 alterations are being performed, and where specified they shall apply throughout the floor on which the work areas are located or otherwise beyond the work area.

705.2 General. The means of egress shall comply with the requirements of this section.

Exceptions:

1. Where the work area and the means of egress serving it complies with NFPA 101.
2. Means of egress conforming to the requirements of the building code under which the building was constructed shall be considered compliant means of egress if, in the opinion of the code official, they do not constitute a distinct hazard to life.
3. The altered element or space is not required to provide accessible means of egress, unless required by Section 805.4.

705.3 Number of exits. The number of exits shall be in accordance with Sections 705.3.1 through 705.3.3.

705.3.1 Minimum number. Every story utilized for human occupancy on which there is a work area that includes exits or corridors shared by more than one tenant within the work area shall be provided with the minimum number of exits based on the occupancy and the occupant load in accordance with the *International Building Code*. In addition, the exits shall comply with Sections 705.3.1.1 and 705.3.1.2.

SECTION 706
ACCESSIBILITY

706.1 General. A building, facility, or element that is altered shall comply with Section 605 and 706.

706.2 Stairs and escalators in existing buildings. In alterations where an escalator or stair is added where none existed previously, an accessible route shall be provided in accordance with Sections 1104.4 and 1104.5 of the *International Building Code*.

706.3 Accessible dwelling units and sleeping units. Where Group I-1, I-2, I-3, R-1, R-2 or R-4 dwelling or sleeping units are being added, the requirements of Section 1107 of the *International Building Code* for accessible units and Chapter 9 of the *International Building Code* for visible alarms apply only to the quantity of spaces being added.

706.4 Type A dwelling or sleeping units. Where more than 20 Group R-2 dwelling or sleeping units are being added, the requirements of Section 1107 of the International Building Code for Type A units and Chapter 9 of the International *Building Code* for visible alarms apply only to the quantity of the spaces being added.

706.5 Type B dwelling or sleeping units. Where four or more Group I-1, I-2, R-1, R-2, R-3 or R-4 dwelling or sleeping units are being added, the requirements of Section 1107 of the *International Building Code* for Type B units and Chapter 9 of the *International Building Code* for visible alarms apply only to the quantity of the spaces being added.

CHAPTER 8
ALTERATIONS—LEVEL 3

SECTION 805
MEANS OF EGRESS

805.1 General. The means of egress shall comply with the requirements of Section 705 except as specifically required in Sections 805.2 and 805.3.

805.2 Means-of-egress lighting. Means of egress from the highest work area floor to the floor of exit discharge shall be provided with artificial lighting within the exit enclosure in accordance with the requirements of the *International Building Code*.

805.3 Exit signs. Means of egress from the highest work area floor to the floor of exit discharge shall be provided with exit signs in accordance with the requirements of the *International Building Code*.

805.4 Accessible means of egress. Additions and buildings or portions thereof undergoing a change of occupancy or alterations shall provide accessible means of egress in accordance with Section 805.4.1 and Section 1007 of the *International Building Code*.

Exceptions:

1. Accessible means of egress is not required in existing buildings where the alterations are less than Level 3.
2. Accessible means of egress is not required in existing building undergoing a change of occupancy where the change or occupancy is in conjunction with alterations that are less than Level 3.

805.4.1 Means of egress through the existing building. Where the accessible means of egress from any portion of a building being altered, undergoing a change of occupancy or addition requires occupants to egress through portions of the existing building, compliance with Section 1007 of the *International Building Code* is required, unless technically infeasible. Where compliance with this provision is *technically infeasible*, the accessible means of egress through the existing building shall provide access to the maximum extent technically feasible.

SECTION 806
ACCESSIBILITY

806.1 General. A building, facility or element that is altered shall comply with Sections 605 and 706.

CHAPTER 9
CHANGE OF OCCUPANCY

SECTION 905
MEANS OF EGRESS

905.1 General. Means of egress in portions of buildings undergoing a change of occupancy classification shall comply with Section 912.

SECTION 906
ACCESSIBILITY

906.1 General. Accessibility in portions of buildings undergoing a change of occupancy classification shall comply with Section 912.8.

SECTION 912
CHANGE OF OCCUPANCY CLASSIFICATION

912.4 Means of egress, general. Hazard categories in regard to life safety and means of egress shall be in accordance with Table 912.4.

TABLE 912.4
MEANS OF EGRESS HAZARD CATEGORIES

RELATIVE HAZARD	OCCUPANCY CLASSIFICATIONS
1 (Highest Hazard)	H
2	I-2, I-3, I-4
3	A, E, I-1, M, R-1, R-2, R-4
4	B, F-1, R-3, S-1
5 (Lowest Hazard)	F-2, S-2, U

912.4.1 Means of egress for change to higher hazard category. When a change of occupancy classification is made to a higher hazard category (lower number) as shown in Table 912.4, the means of egress shall comply with the requirements of Chapter 10 of the *International Building Code*.

Exceptions:

1. Stairways shall be enclosed in compliance with the applicable provisions of Section 803.1.
2. Existing stairways including handrails and guards complying with the requirements of Chapter 8 shall be permitted for continued use subject to approval of the code official.
3. Any stairway replacing an existing stairway within a space where the pitch or slope cannot be reduced because of existing construction shall not be required to comply with the maximum riser height and minimum tread depth requirements.
4. Existing corridor walls constructed of wood lath and plaster in good condition or 1/ 2-inch-thick (12.7 mm) gypsum wallboard shall be permitted. Such walls shall either terminate at the underside of a ceiling of equivalent construction or extend to the underside of the floor or roof next above.
5. Existing corridor doorways, transoms and other corridor openings shall comply with the requirements in Sections 705.5.1, 705.5.2 and 705.5.3.
6. Existing dead-end corridors shall comply with the requirements in Section 705.6.
7. An existing operable window with clear opening area no less than 4 square feet (0.38 m^2) and minimum opening height and width of 22 inches (559 mm) and 20 inches (508 mm), respectively, shall be accepted as an emergency escape and rescue opening.
8. Accessible means of egress is not required for areas undergoing a change of occupancy unless required by Section 805.4.

912.4.2 Means of egress for change of use to equal or lower hazard category. When a change of occupancy classification is made to an equal or lesser hazard category (higher number) as shown in Table 912.4, existing elements of the means of egress shall comply with the requirements of Section 805 for the new occupancy classification. Newly constructed or configured means of egress shall comply with the requirements of Chapter 10 of the *International Building Code*.

Exceptions:

1. Any stairway replacing an existing stairway within a space where the pitch or slope cannot be reduced because of existing construction shall not be required to comply with the maximum riser height and minimum tread depth requirements.
2. Accessible means of egress is not required for areas undergoing a change of occupancy unless required by Section 805.4.

912.4.3 Egress capacity. Egress capacity shall meet or exceed the occupant load as specified in the *International Building Code* for the new occupancy.

912.4.4 Handrails. Existing stairways shall comply with the handrail requirements of Section 705.9 in the area of the change of occupancy classification.

912.4.5 Guards. Existing guards shall comply with the requirements in Section 705.10 in the area of the change of occupancy classification.

912.8 Accessibility. Existing buildings that undergo a change of group or occupancy classification shall comply with this section.

912.8.1 Partial change in occupancy. Where a portion of the building is changed to a new occupancy classification, any alterations shall comply with Sections 605 and 706, as applicable.

912.8.2 Complete change of occupancy. Where an entire building undergoes a change of occupancy, it shall comply with Section 912.8.1 and shall have all of the following accessible features unless technically infeasible. Where compliance with this provision is technically infeasible, provide access to the maximum extent technically feasible.

1. At least one accessible building entrance.
2. At least one accessible route from an accessible building entrance to primary function areas.
3. Signage complying with Section 1110 of the *International Building Code*.
4. Accessible parking, where parking is provided.
5. At least one accessible passenger loading zone, where loading zones are provided.
6. At least one accessible route connecting accessible parking and accessible passenger loading zones to an accessible entrance.

Where it is technically infeasible to comply with the new construction standards for any of these requirements for a change of group or occupancy, the above items shall conform to the requirements to the maximum extent technically feasible.

CHAPTER 10
ADDITIONS

SECTION 1004
MEANS OF EGRESS

1004.1 General. The means of egress shall comply with the requirements of Chapter 10 of the *International Building Code*.

Exception: Accessible means of egress is not required for additions unless required by Section 805.4.

SECTION 1005
ACCESSIBILITY

1005.1 Minimum requirements. Accessibility provisions for new construction shall apply to additions. An addition that affects the accessibility to, or contains an area of, primary function shall comply with the requirements of Sections 605, ~~and~~ 706 and 806, as applicable.

CHAPTER 11
HISTORIC BUILDINGS

SECTION 1103
FIRE SAFETY

1103.1 Scope. Historic buildings undergoing alterations, changes of occupancy, or that are moved shall comply with Section 1103.

1103.2 General. Every historic building that does not conform to the construction requirements specified in this code for the occupancy or use and that constitutes a distinct fire hazard as defined herein shall be provided with an approved automatic fire-extinguishing system as determined appropriate by the code official. However, an automatic fire-extinguishing system shall not be used to substitute for, or act as an alternative to, the required number of exits from any facility.

1103.3 Means of egress. Existing door openings and corridor and stairway widths less than those specified elsewhere in this code may be approved, provided that, in the opinion of the code official, there is sufficient width and height for a person to pass through the opening or traverse the means of egress. When approved by the code official, the front or main exit doors need not swing in the direction of the path of exit travel, provided that other approved means of egress having sufficient capacity to serve the total occupant load are provided.

Exception: Accessible means of egress are not required in historic buildings being altered or undergoing a change of occupancy.

SECTION 1104
ALTERATIONS

1104.1 Accessibility requirements. The provisions of 605 and 706, as applicable, shall apply to buildings and facilities designated as historic structures that undergo alterations, unless technically infeasible. Where compliance with the requirements for accessible routes, entrances or toilet facilities would threaten or destroy the historic significance of the building or facility, as determined by the code official, the alternative requirements of Sections 1104.1.1 through 1104.1.4 for that element shall be permitted.

1104.1.1 Site arrival points. At least one main entrance shall be accessible.

1104.1.2 Multilevel buildings and facilities. An accessible route from an accessible entrance to public spaces on the level of the accessible entrance shall be provided.

1104.1.3 Entrances. At least one main entrance shall be accessible.

Exceptions:

1. If a main entrance cannot be made accessible, an accessible nonpublic entrance that is unlocked while the building is occupied shall be provided; or
2. If a main entrance cannot be made accessible, a locked accessible entrance with a notification system or remote monitoring shall be provided.

1104.1.4 Toilet and bathing facilities. Where toilet rooms are provided, at least one accessible family or assisted-use toilet room complying with Section 1109.2.1 of the *International Building Code* shall be provided.

SECTION 1105
CHANGE OF OCCUPANCY

1105.6 Means of egress. Existing door openings and corridor and stairway widths less than those that would be acceptable for nonhistoric buildings under these provisions shall be approved, provided that, in the opinion of the code official, there is sufficient width and height for a person to pass through the opening or traverse the exit and that the capacity of the exit system is adequate for the occupant load, or where other operational controls to limit occupancy are approved by the code official.

Exception: Accessible means of egress are not required in historic buildings undergoing a change of occupancy.

1105.15 Accessibility requirements. The provisions of Section 912.8 shall apply to buildings and facilities designated as historic structures that undergo a change of occupancy, unless technically infeasible. Where compliance with the requirements for accessible routes, ramps, entrances, or toilet facilities would threaten or destroy the historic significance of the building or facility, as determined by the authority having jurisdiction, the alternative requirements of Sections 1104.1.1 through 1104.1.5 for those elements shall be permitted.

PART II – IBC GENERAL

3411.4 (IEBC [B] 310.4) Change of occupancy. Existing buildings that undergo a change of group or occupancy shall comply with this section. Accessible means of egress shall be provided in accordance with Section 3411.8.

3411.4.1 (IEBC [B] 310.4.1) Partial change in occupancy. Where a portion of the building is changed to a new occupancy classification, any alterations shall comply with Sections 3411.6, 3411.7, ~~and~~ 3411.8 and 3411.9.

3411.4.2 (IEBC [B] 310.4.2) Complete change of occupancy. Where an entire building undergoes a change of occupancy, it shall comply with Section 3411.4.1 and shall have all the following accessible features unless *technically infeasible*. Where compliance with this provision is *technically infeasible*, provide access to the maximum extent technically feasible.

1. At least one accessible building entrance.
2. At least one accessible route from an accessible building entrance to primary function areas.
3. Signage complying with Section 1110.
4. Accessible parking, where parking is provided.
5. At least one accessible passenger loading zone, when loading zones are provided.
6. At least on accessible route connecting accessible parking and accessible passenger loading zones to an accessible entrance.

3411.5 (IEBC [B] 310.5) Additions. Provisions for new construction shall apply to additions. An addition that affects the accessibility to, or contains an area of, a primary function shall comply with the requirements in Section 3411.7 and 3411.8.

3411.6 (IEBC [B] 310.6) Alterations. A building, facility or element that is altered shall comply with the applicable provisions in Section 1007, Chapter 11 of this code and ICC A117.1, unless technically infeasible. Where compliance with this section is technically infeasible, the alteration shall provide access to the maximum extent technically feasible.

Exceptions:

1. The altered element or space is not required to be on an accessible route, unless required by Section 3411.7.
2. Accessible means of egress required by Chapter 10 are not required to be provided in existing buildings and facilities being altered unless required by Section 3411.8.
3. The alteration to Type A individually owned dwelling units within a Group R-2 occupancy shall meet the provision for a Type B dwelling unit and shall comply with the applicable provisions in Chapter 11 and ICC A117.1.

3411.7 (IEBC [B] 310.7) Alterations affecting an area containing a primary function. Where an alteration affects the accessibility to, or contains an area of primary function, the route to the primary function area shall be accessible. The accessible route to the primary function area shall include toilet facilities or drinking fountains serving the area of primary function.

Exceptions:

1. The costs of providing the accessible route are not required to exceed 20 percent of the costs of the alterations affecting the area of primary function.
2. This provision does not apply to alterations limited solely to windows, hardware, operating controls, electrical outlets and signs.
3. This provision does not apply to alterations limited solely to mechanical systems, electrical systems, installation or alteration of fire protection systems and abatement of hazardous materials.
4. This provision does not apply to alterations undertaken for the primary purpose of increasing the accessibility of an existing building, facility or element.

3411.8 (IEBC [B] 310.8) Accessible means of egress. Additions and buildings or portions thereof undergoing a change of occupancy or alterations shall provide accessible means of egress in accordance with Sections 1007 and 3411.8.1.

Exceptions:

1. Accessible means of egress is not required in existing buildings where the alterations are less than 50 percent of the aggregate building area.
2. Accessible means of egress is not required in existing building undergoing a change of occupancy where the change or occupancy is in conjunction with alterations that are less than 50 percent of the aggregate building area.

3411.8.1 (IEBC [B] 310.8.1) Means of egress through the existing building. Where the accessible means of egress from any portion of a building being altered, undergoing a change of occupancy or addition requires occupants to egress through portions of the existing building, compliance with Section 1007 is required, unless technically infeasible. Where compliance with this provision is technically infeasible, the accessible means of egress through the existing building shall provide access to the maximum extent technically feasible.

(Renumber subsequent sections)

~~**3411.9**~~ **3411.10 (IEBC [B] ~~310.9~~ 310.10) Historic buildings.** These provisions shall apply to buildings and facilities designated as historic structures that undergo alterations or a change of occupancy, unless *technically infeasible*. Where compliance with the requirements for *accessible* routes, entrances or toilet facilities would threaten or destroy the historic significance of the building or facility, as determined by the applicable governing authority, the alternative requirements of Sections ~~3411.9.1~~ 3411.10.1 through ~~3411.9.4~~ 3411.10.4 for that element shall be permitted.

Exception: Accessible means of egress are not required in historic buildings being altered or undergoing a change of occupancy.

(Renumber subsequent sections)

PART III – IBC MEANS OF EGRESS

Revise as follows:

1007.1 (IFC [B] 1007.1) Accessible means of egress required. Accessible means of egress shall comply with this section. Accessible spaces shall be provided with not less than one accessible means of egress. Where more than one means of egress is required by Section 1015.1 or 1021.1 from any accessible space, each accessible portion of the space shall be served by not less than two accessible means of egress.

Exceptions:

1. Accessible means of egress ~~are not required in alterations to~~ for existing buildings shall be provided as required in Section 3411.8.
2. One accessible means of egress is required from an accessible mezzanine level in accordance with Section 1007.3, 1007.4 or 1007.5.
3. In assembly areas with sloped or stepped aisles, one accessible means of egress is permitted where the common path of travel is accessible and meets the requirements in Section 1028.8.

Reason: The interplay between an existing building and additions or alterations is not well defined. While the text is clear that the addition is required to meet the accessibility provisions it is not clear how the addition will impact the accessibility requirements for the existing building. Similarly, although the statement exists that alterations do not require a retroactive requirement for accessible means of egress, this statement negates the scope of the alteration. Federal Accessibility regulations and common sense dictate that where major changes occur consideration for the accessible means of egress should also occur. Additionally, the simple idea that accessibility should be intentionally denied to a segment of the population does not seem appropriate. The proposal seeks to finesse some of these issues.

It is important to remember that the requirements in the IBC only require a maximum of two accessible means of egress (based on travel distance limitations) as noted in Section 1007.1. And, an elevator can be counted as being one of the accessible means of egress. Thus, it may be easier in some cases to provide an accessible means of egress than one that fully complies with the requirements for new construction.

Some sections shown do not contain changes, but were shown for context and appropriate referencing.

IEBC:

In addition to the items noted above which relate to only Chapter 3, specific direction is provided for each condition as elaborated in the various chapters of the IEBC. Chapter 3 of the IEBC parallels Chapter 34 in the IBC. However, the IEBC also contains provisions that are more in depth than the prescriptive methods described.

The existing language is maintained that requires repairs to not reduce the level of current accessibility; but there is no additional requirement for accessibility in Chapter 5.

605.1, exception #2: Rather than refer to the IBC, specific provisions are being added to the IEBC. The wording is changed to reflect that.

705.2, exception #3: Similar to 605.1, reference to the accessible means of egress is added to allow the code user to understand where the scope of changes will require work in this area. Without this exception, it is unclear whether the reference to making the means of egress comply is intended to include the accessible means of egress as well as other aspects of egress design.

706.1: A reflective reference is added which was lacking. Compliance with another section was mandated but not the section itself.

805.4: The language and intent is the same as noted above for IEBC Section 310.8 and its two exceptions. The exceptions in this case use the language of the IEBC which define the level of work in more definitive terms – using Levels to describe the threshold rather than percentages of work.

805.4.1: This language is replicating that noted above from Section 310.8.1 relative to egress through an existing building.

912.4.1, exception #8: The added exception continues the scoping by including with the Change of Occupancy Chapter a reference back to the main section addressing when accessible means of egress must be provided – 805.4.

912.4.2, exception #2: A new exception is added to this section so that it is clear that whether the change in occupancy is to a higher category or lower category, the requirement to provide accessible means of egress is found in Section 805.4.

912.8.2: This added language does not address accessible means of egress. It addresses the consistent recognition of technical infeasibility. The language informs the code user of this application as it relates to changes in occupancy.

1004.1: Chapter 10 (Additions) does not address means of egress specifically. A reference to compliance with the means of egress provisions in Chapter 10 of the IBC is included. This is consistent with the first sentence in Section 302.1. The added language in inserted before the accessibility section in like manner to other chapters.

1004.1, exception: The exception is consistent with the other changes noted above that refer to Section 805.4 for the thresholds for compliance with the accessible means of egress requirements.

1005.1: Reference is currently provided to the sections relative to accessibility in Chapter 6 and 7 but not 8. The proposal corrects that.

1105.6: Similar to the language in 3411.10 in the IBC, this clearly indicates that accessible means of egress is not required for historic buildings.

IBC/IEBC:

1007.1: The section is changed to indicate that existing building provisions are noted in Chapter 34. This is the proper scoping location for issues dealing with existing buildings – not Chapter 10.

3411.4/310.4: A cross reference is added to direct the code user to the central location for issues relative to existing buildings and accessible means of egress; the proposed 3411.8.

3411.4.2/310.4.2: The paragraph following the text already mentions what happens when the effort is "technically infeasible" but there is no language that states that these items are limited to conditions where technical infeasibility is not a problem. The added language clarifies the intent with respect to technical infeasibility.

3411.5/310.5: A cross reference to the section addressing accessible means of egress is added.

3411.6/310.6: Where accessible means of egress are required, it is necessary to direct the code user to the proper section. The reference to 1007 does that.

3411.6/310.6, exception #2: The exception seems to imply that nothing is required for the existing building relative to accessible means of egress. However, since the addition is impacting the existing building, the egress through the existing building is more similar to an alteration of the existing egress system. The revised text points to the central section addressing what must be done.
3411.8/310.8: A new section is added to specifically address the accessible means of egress. Rather than the blanket statement in Section 1007.1 of the building code, this section will address the scope and extent of work necessary to address accessible means of egress. It directs the code user to Section 1007 for the technical requirements when an accessible means of egress is necessary as well as clearly delineate that when a change of occupancy or alteration occurs, the accessible means of egress must be provided. This is no different than the general requirements in 3404.1/303.1 and 3408.1/307.1 which require alterations and changes in occupancy to meet "new code."
3411.8/310.8, exception #1: Alterations with some magnitude should address accessible means of egress, if the alteration is relatively small then there is reason to limit the requirement. The threshold of 50% of the building area is intended to delineate the difference between IEBC Alterations – Level 2 and Alterations – Level 3
3411.8/310.8, exception #2: Similarly, if the change in occupancy is only to a portion of the building, full compliance with the accessible means of egress is not required. The position should be that if the occupancy is totally changed then the building should be made to comply with the new requirements. For "regular" egress this may mean that the occupant load changes resulting in wider or additional stairways. The least that should be done is to make an effort to provide accessible means of egress.
3411.8.1/310.8.1: If an addition is designed such that the means of egress must enter the existing building then the egress design must meet the requirements for the addition as it passes through the existing building. As this relates to egress design, it includes a continuation of the design in the addition for egress width, corridor protection, panic hardware (as applicable) and similar concerns. The same should be true for the design of the accessible means of egress. If one of the accessible egress paths leads through the existing building, it too needs to meet/continue the level of protection as designed in the addition. The limitation to this is if the effort to make the existing means of egress accessible is "technically infeasible" then work should be done to what is possible. One example of this may be making sure that the slopes along the path in the existing building's corridor are proper even if the width cannot be altered to allow the proper approach to the exit door.
3411.10: The language requires compliance with the accessible means of egress as written with the only defense being the "technically infeasible" option. The exception makes it clear that for historic buildings undergoing major alterations of a change in occupancy an accessible means of egress is not required.

A companion change is being proposed for the IEBC so that the changes here a reflected in that code as well.

While more can always be done if possible, the code identifies the minimums necessary for life safety. The proposed changes identify what is appropriate so that the disabled community has similar levels of life safety to the general public and still sets reasonable thresholds based on the extent of work for the project. The standard of "technical Infeasible" is identified clearly in new sections where it may have been interpreted previously as not applying. The "20% of the cost" criteria identified in 3411.7, exception #1 of the IBC (605.2, exception #1 of the IEBC) relative to alterations affecting the primary function is also maintained.

Cost Impact: The code change proposal will increase the cost of construction.

PART I – IEBC

Revise as follows:

CHAPTER 6
ALTERATIONS—LEVEL 1

SECTION 605
ACCESSIBILITY

605.1 General. A building, facility or element that is altered shall comply with the applicable provisions in Sections 605.1.1through ~~605.1.14~~ 605.1.15,Chapter 11 of the *International Building Code* and ICC A117.1 unless it is *technically infeasible*. Where compliance with this section is *technically infeasible*, the *alteration* shall provide access to the maximum extent that is technically feasible. A building, facility or element that is constructed or altered to be accessible shall be maintained accessible during occupancy.

Exceptions:

1. The altered element or space is not required to be on an accessible route unless required by Section 605.1.10 or 605.2.
2. Accessible means of egress required by Chapter 10 of the *International Building Code* are not required to be provided in existing buildings and facilities.
3. ~~Type B dwelling or sleeping units required by Section 1107 of the *International Building Code* are not required to be provided in existing buildings and facilities.~~
4. The *alteration* to Type A individually owned dwelling units within a Group R-2 occupancy shall meet the provisions for Type B dwelling units and shall comply with the applicable provisions in Chapter 11 of the *International Building Code* and ICC A117.1.

605.1.8 Accessible dwelling or sleeping units. Where Group I-1, I-2, I-3, R-1, R-2 or R-4 dwelling or sleeping units are being altered, the requirements of Section 1107 of the *International Building Code* for accessible units and Chapter 9 of the *International Building Code* for visible alarms apply only to the quantity of the spaces being altered.

605.1.9 Type A dwelling or sleeping units. Where more than 20 Group R-2 dwelling or sleeping units are being altered, the requirements of Section 1107 of the *International Building Code* for Type A units and Chapter 9 of the *International Building Code* for visible alarms apply only to the quantity of the spaces being altered.

605.1.10 Alterations in Group I and R, and in structures, facilities, or elements serving Groups I or R. Where four or more dwelling units or sleeping units intended to be occupied as a residence in Group I-1, I-2, and R occupancies are altered, the unit that is altered shall comply with the applicable provisions of Section 1107 of the *International Building Code* for Type B units. Additionally, where common use structures, facilities, or elements serving Type B units in Groups I-1, I-2, I-3 and R occupancies are altered, the altered structures, facilities, or elements shall comply with Section 1107 of the *International Building Code*.

Exceptions:

1. Structures built for first occupancy before March 13, 1991 are not required to provide Type B units.
2. Type B units are not required to be provided where Type B dwelling units and sleeping units were not required at the time of first occupancy in structures designed and constructed after March 13, 1991.

3. Structures that are not required to provide Type B dwelling units and structures not serving Type B dwelling units in accordance with Section 1107 of the *International Building Code* shall comply with Section 605.1.9 and 605.1.10.
4. Alterations limited to one individually owned dwelling unit or sleeping unit are not required to comply with this section.

(Renumber subsequent sections)

CHAPTER 7
ALTERATIONS—LEVEL 2

SECTION 706
ACCESSIBILITY

706.1 General. A building, facility, or element that is altered shall comply with this section and Section 605.

706.3 Accessible dwelling units and sleeping units. Where Group I-1, I-2, I-3, R-1, R-2 or R-4 dwelling or sleeping units are being added, the requirements of Section 1107 of the International Building Code for accessible units and Chapter 9 of the International Building Code for visible alarms apply only to the quantity of spaces being added.

706.4 Type A dwelling or sleeping units. Where more than 20 Group R-2 dwelling or sleeping units are being added, the requirements of Section 1107 of the International Building Code for Type A units and Chapter 9 of the International Building Code for visible alarms apply only to the quantity of the spaces being added.

706.5 Type B dwelling or sleeping units. Where four or more Group I-1, I-2, R-1, R-2, R-3 or R-4 dwelling or sleeping units are being added, the requirements of Section 1107 of the International Building Code for Type B units and Chapter 9 of the *International Building Code* for visible alarms apply only to the quantity of the spaces being added.

CHAPTER 8
ALTERATIONS—LEVEL 3

SECTION 806
ACCESSIBILITY

806.1 General. A building, facility or element that is altered shall comply with Sections 605 and 706.

CHAPTER 9
CHANGE OF OCCUPANCY

SECTION 906
ACCESSIBILITY

906.1 General. Accessibility in portions of buildings undergoing a *change of occupancy* classification shall comply with Section 912.8.

912.8 Accessibility. Existing buildings that undergo a change of group or occupancy classification shall comply with this section.

Exception: Type B dwelling or sleeping units required by Section 1107 of the *International Building Code* are not required to be provided in existing buildings and facilities undergoing a change of occupancy.

912.8.1 Partial change in occupancy. Where a portion of the building is changed to a new occupancy classification, any alterations shall comply with Sections 605 and 706, as applicable.

912.8.2 Complete change of occupancy. Where an entire building undergoes a change of occupancy, it shall comply with Section 912.8.1 and shall have all of the following accessible features:

1. At least one accessible building entrance.
2. At least one accessible route from an accessible building entrance to primary function areas.

3. Signage complying with Section 1110 of the *International Building Code*.
4. Accessible parking, where parking is provided.
5. At least one accessible passenger loading zone, where loading zones are provided.
6. At least one accessible route connecting accessible parking and accessible passenger loading zones to an accessible entrance.

Where it is technically infeasible to comply with the new construction standards for any of these requirements for a change of group or occupancy, the above items shall conform to the requirements to the maximum extent technically feasible.

CHAPTER 10
ADDITIONS

SECTION 1005
ACCESSIBILITY

1005.1 Minimum requirements. Accessibility provisions for new construction shall apply to additions. An addition that affects the accessibility to, or contains an area of, primary function shall comply with the requirements of this section and Sections 605 and 706, as applicable.

1005.2 Type B dwelling units or sleeping units. Where Group I-1, I-2, or R dwelling units or sleeping units are being added, the requirements of Section 1107 of the *International Building Code* for Type B dwelling units or sleeping units and Section 907 of the *International Building Code* for visible alarms apply only top the quantity of spaces being added.

PART II – IBC GENERAL

Revise as follows:

SECTION 3411 (IEBC [B] 310)
ACCESSIBILITY FOR EXISTING BUILDINGS

3411.1 (IEBC [B] 310.1) Scope. The provisions of Sections 3411.1 through ~~3411.9~~ 3411.10 apply to maintenance, change of occupancy, additions and alterations to existing buildings, including those identified as *historic buildings*.

~~**Exception:** Type B *dwelling* or sleeping units required by Section 1107 of this code are not required to be provided in existing buildings and facilities being altered or undergoing a change of occupancy.~~

3411.4 (IEBC [B] 310.4) Change of occupancy. Existing buildings that undergo a change of group or occupancy shall comply with this section.

Exception: Type B dwelling or sleeping units required by Section 1107 of this code are not required to be provided in existing buildings and facilities undergoing a change of occupancy.

3411.4.1 (IEBC [B] 310.4.1) Partial change in occupancy. Where a portion of the building is changed to a new occupancy classification, any alterations shall comply with Sections 3411.6, ~~3411.7~~ 3411.8 and ~~3411.8~~ 3411.9.

3411.4.2 (IEBC [B] 310.4.2) Complete change of occupancy. Where an entire building undergoes a change of occupancy, it shall comply with Section 3411.4.1 and shall have all of the following accessible features:

1. At least one accessible building entrance.
2. At least one accessible route from an accessible building entrance to primary function areas.
3. Signage complying with Section 1110.
4. Accessible parking, where parking is being provided.
5. At least one accessible passenger loading zone, when loading zones are provided.
6. At least one accessible route connecting accessible parking and accessible passenger loading zones to an accessible entrance.

Where it is technically infeasible to comply with the new construction standards for any of these requirements for a change of group or occupancy, the above items shall conform to the requirements to the maximum extent technically feasible.

3411.5 (IEBC [B] 310.5) Additions. Provisions for new construction shall apply to additions. An addition that affects the accessibility to, or contains an area of, a primary function shall comply with the requirements in Section ~~3411.7~~ 3411.8.

Exception: Where Group I-1, I-2, or R dwelling units or sleeping units are being added, the requirements of Section 1107 for Type B dwelling units or sleeping units and Section 907 for visible alarms shall apply where the quantity of units being added is four or more.

3411.6 (IEBC [B] 310.6) Alterations. A building, facility or element that is altered shall comply with the applicable provisions in Chapter 11 of this code and ICC A117.1, unless technically infeasible. Where compliance with this section is technically infeasible, the alteration shall provide access to the maximum extent technically feasible.

Exceptions:

1. The altered element or space is not required to be on an accessible route, unless required by Section ~~3411.7~~ 3411.8.
2. Accessible means of egress required by Chapter 10 are not required to be provided in existing buildings and facilities.
3. The alteration to Type A individually owned dwelling units within a Group R-2 occupancy shall meet the provision for a Type B dwelling unit and shall comply with the applicable provisions in Chapter 11 and ICC A117.1.

3411.7 (IEBC 310.7) Alterations in Group I-1, I-2 and R, and in structures, facilities, or elements serving Groups I or R. Where four or more dwelling units or sleeping units intended to be occupied as a residence in Group I-1, I-2 and R occupancies are altered the altered units shall comply with the applicable provisions of Section 1107 for Type B units. Additionally, where common use structures, facilities, or elements serving Type B units in Groups I-1, I-2 and R occupancies are altered, the altered structures, facilities or element shall comply with Section 1107.

Exceptions:

1. Structures built for first occupancy before March 13, 1991 are not required to provide Type B units.
2. Type B units are not required to be provided where Type B dwelling units and sleeping units were not required at the time of first occupancy in structures designed and constructed after March 13, 1991.
3. Structures that are not required to provide Type B dwelling units and structures not serving Type B dwelling units in accordance with Section 1107 shall comply with Section 3409.6.
4. Alterations limited to one individually owned dwelling unit or sleeping unit are not required to comply with this section.

~~3411.7~~ 3411.8 (IEBC [B] ~~310.7~~ 310.8) Alterations affecting an area containing a primary function. *(No change to text)*

~~3411.8~~ 3411.9 (IEBC [B] ~~310.8~~ 310.9) Scoping for alterations. The provisions of Sections ~~3411.8.1~~ 3411.9.1 through ~~3411.8.12~~ 3411.9.12 shall apply to alterations to existing buildings and facilities.

~~3411.8.7~~ 3411.9.7 (IEBC [B] ~~310.8.7~~ 310.9.7) Accessible dwelling or sleeping units. Where Group I-1, I-2, I-3, R-1, R-2 or R-4 dwelling or sleeping units are being altered or added, the requirements of Section 1107 for Accessible units apply only to the quantity of spaces being altered or added.

~~3411.8.8~~ 3411.9.8 (IEBC [B] ~~310.8.8~~ 310.9.8) Type A dwelling or sleeping units. Where more than 20 Group R-2 dwelling or sleeping units are being added, the requirements of Section 1107 for Type A units apply only to the quantity of the spaces being added.

~~3411.8.9~~ 3411.9.9 (IEBC [B] ~~310.8.9~~ 310.9.9) Type B dwelling or sleeping units. Where four or more Group I-1, I-2, R-1, R-2, R-3 or R-4 dwelling or sleeping units are being altered or added, the requirements Section 1107 for Type B units apply only to the quantity of the spaces being altered or added.

Reason: HUD continues to believe that it is in the public interest to ensure that buildings with 4 or more dwelling units that are covered by the Fair Housing Act's design and construction requirements (that is, were built for first occupancy after March 13, 1991) but were not built in compliance with those requirements, are in fact brought into compliance. However, rather than requiring the entire building to be brought into compliance, HUD is proposing to limit the scope of these proposed changes to only the portions of the building that are being altered. While the changes being proposed may not be sufficient for HUD to recognize Chapter 34 of the IBC and corresponding provisions in the IEBC as being consistent with the

design and construction requirements of the Fair Housing Act, we believe it will at least begin to incorporate Type B dwelling units and their related requirements into buildings that should have been built in compliance with the Fair Housing Act in the first place. It is our intention that the proposal apply only to buildings that were not built in compliance with the requirements of the Fair Housing Act and should have been built in compliance, therefore, this proposal would not apply to buildings built in compliance with those editions of the IBC that HUD has previously recognized as a safe harbor for compliance (i.e., the 2000 IBC as amended by the 2001 Supplement, the 2003 IBC and the 2006 IBC). If the code requires such buildings to come into compliance with the current edition of the code when altered, including accessibility requirements that may have changed from one edition to the next, we believe that is a standard code practice and that it should not be insurmountable with respect to accessibility any more than it is with respect to all other code matters.

Cost Impact: There will be a cost impact on buildings that were NOT built in compliance with the accessibility requirements of the Fair Housing Act, but should have been in compliance with the law, however, the cost impact will be mitigated by making the alterations to bring the building into compliance at the time those elements that are affected are altered, which will be considerably less expensive for owners of such buildings than bringing the building into compliance as a result of litigation.

IEBC 605.1, 605.1.1, 605.1.4, 605.1.14, 605.2, 1104.1, 1105.15; IBC 3402, 3411.2, 3411.3, 3411.6, 3411.7, 3411.8.1, 3411.8.5, 3411.9 (IEBC [B] 202, 310.2, 310.3, 310.6, 310.7, 310.8.1, 310.8.5, 310.9)

Proponent: Maureen Traxler, City of Seattle, WA, Seattle Dept of Planning & Development

THIS IS A 2 PART CODE CHANGE. BOTH PARTS WILL BE HEARD BY THE IEBC CODE COMMITTEE AS 2 SEPARATE CODE CHANGES. SEE THE TENTATIVE HEARING ORDER FOR THE IEBC CODE COMMITTEE.

PART I – IEBC

SECTION 605
ACCESSIBILITY

605.1 General. A ~~building,~~ facility ~~or element~~ that is altered shall comply with the applicable provisions in Sections 605.1.1 through 605.1.14, Chapter 11 of the *International Building Code* and ICC A117.1 unless it is *technically infeasible*. Where compliance with this section is *technically infeasible*, the *alteration* shall provide access to the maximum extent that is technically feasible.

A ~~building,~~ facility ~~or element~~ that is constructed or altered to be accessible shall be maintained accessible during occupancy.

Exceptions:

1. The altered element or space is not required to be on an accessible route unless required by Section 605.2.
2. Accessible means of egress required by Chapter 10 of the *International Building Code* are not required to be provided in existing ~~buildings and~~ facilities.
3. Type B dwelling or sleeping units required by Section 1107 of the *International Building Code* are not required to be provided in existing ~~buildings and~~ facilities.
4. The *alteration* to Type A individually owned dwelling units within a Group R-2 occupancy shall meet the provisions for Type B dwelling units and shall comply with the applicable provisions in Chapter 11 of the *International Building Code* and ICC A117.1.

605.1.1 Entrances. Where an *alteration* includes alterations to an entrance, and the ~~building or~~ facility has an accessible entrance on an accessible route, the altered entrance is not required to be accessible unless required by Section 605.2. Signs complying with Section 1110 of the *International Building Code* shall be provided.

605.1.4 Ramps. Where steeper slopes than allowed by Section 1010.2 of the *International Building Code* are necessitated by space limitations, the slope of ramps in or providing access to existing ~~buildings or~~ facilities shall comply with Table 605.1.4.

605.1.14 Extent of application. An *alteration* of an existing ~~element, space, or area of a building or~~ facility shall not impose a requirement for greater accessibility than that which would be required for new construction. Alterations shall not reduce or have the effect of reducing accessibility of a ~~building, portion of a building, or~~ facility or portion of a facility.

605.2 Alterations affecting an area containing a primary function. Where an *alteration* affects the accessibility to a, or contains an area of, *primary function*, the route to the *primary function* area shall be accessible. The accessible route to the *primary function* area shall include toilet facilities or drinking fountains serving the area of *primary function*.

Exceptions:

1. The costs of providing the accessible route are not required to exceed 20 percent of the costs of the alterations affecting the area of *primary function*.
2. This provision does not apply to alterations limited solely to windows, hardware, operating controls, electrical outlets and signs.
3. This provision does not apply to alterations limited solely to mechanical systems, electrical systems, installation or *alteration* of fire protection systems and abatement of hazardous materials.
4. This provision does not apply to alterations undertaken for the primary purpose of increasing the accessibility of ~~an *existing* *building*~~, a facility ~~or element~~.

1104.1 Accessibility requirements. The provisions of 605 and 706, as applicable, shall apply to ~~buildings and~~ facilities designated as historic structures that undergo alterations, unless *technically infeasible*. Where compliance with the requirements for accessible routes, entrances or toilet facilities would threaten or destroy the historic significance of the building or facility, as determined by the *code official*, the alternative requirements of Sections 1104.1.1 through 1104.1.4 for that element shall be permitted.

1105.15 Accessibility requirements. The provisions of Section 912.8 shall apply to ~~buildings and~~ facilities designated as historic structures that undergo a *change of occupancy*, unless *technically infeasible*. Where compliance with the requirements for accessible routes, ramps, entrances, or toilet facilities would threaten or destroy the historic significance of the building or facility, as determined by the authority having jurisdiction, the alternative requirements of Sections 1104.1.1 through 1104.1.5 for those elements shall be permitted.

PART II – IBC GENERAL

Revise as follows:

SECTION 3402 (IEBC [B] 202)
DEFINITIONS

TECHNICALLY INFEASIBLE. An *alteration* of a ~~building or a~~ facility that has little likelihood of being accomplished because the existing structural conditions require the removal or *alteration* of a load-bearing member that is an essential part of the structural frame, or because other existing physical or site constraints prohibit modification or addition of elements, spaces or features which are in full and strict compliance with the minimum requirements for new construction and which are necessary to provide accessibility.

3411.2 (IEBC [B] 310.2) Maintenance of facilities. A ~~building,~~ facility ~~or element~~ that is constructed or altered to be *accessible* shall be maintained *accessible* during occupancy.

3411.3 (IEBC [B] 310.3) Extent of application. An *alteration* of an existing ~~element, space or area of a building or~~ facility shall not impose a requirement for greater accessibility than that which would be required for new construction. Alterations shall not reduce or have the effect of reducing accessibility of a ~~building, portion of a building, or~~ facility or portion of a facility.

3411.6 (IEBC [B] 310.6) Alterations. A ~~building,~~ facility ~~or element~~ that is altered shall comply with the applicable provisions in Chapter 11 of this code and ICC A117.1, unless *technically infeasible*. Where compliance with this section is *technically infeasible*, the *alteration* shall provide access to the maximum extent technically feasible.

Exceptions:

1. The altered element or space is not required to be on an *accessible* route, unless required by Section 3411.7.
2. *Accessible means of egress* required by Chapter 10 are not required to be provided in existing ~~buildings and~~ facilities.
3. The *alteration* to Type A individually owned *dwelling* units within a Group R-2 occupancy shall meet the provision for a Type B *dwelling* unit and shall comply with the applicable provisions in Chapter 11 and ICC A117.1.

3411.7 (IEBC [B] 310.7) Alterations affecting an area containing a primary function. Where an *alteration* affects the accessibility to, or contains an area of *primary function*, the route to the *primary function* area shall be *accessible*. The *accessible* route to the *primary function* area shall include toilet facilities or drinking fountains serving the area of *primary function*.

Exceptions:

1. The costs of providing the *accessible* route are not required to exceed 20 percent of the costs of the *alterations* affecting the area of *primary function*.
2. This provision does not apply to *alterations* limited solely to windows, hardware, operating controls, electrical outlets and signs.
3. This provision does not apply to *alterations* limited solely to mechanical systems, electrical systems, installation or *alteration* of fire protection systems and abatement of hazardous materials.
4. This provision does not apply to *alterations* undertaken for the primary purpose of increasing the accessibility of ~~an existing building,~~ a facility ~~or element~~.

3411.8.1 (IEBC [B] 310.8.1) Entrances. *Accessible* entrances shall be provided in accordance with Section 1105.

Exception: Where an *alteration* includes alterations to an entrance, and the ~~building or~~ facility has an *accessible* entrance, the altered entrance is not required to be *accessible*, unless required by Section 3411.7. Signs complying with Section 1110 shall be provided.

3411.8.5 (IEBC [B] 310.8.5) Ramps. Where slopes steeper than allowed by Section 1010.2 are necessitated by space limitations, the slope of ramps in or providing access to existing ~~buildings or~~ facilities shall comply with Table 3411.8.5.

3411.9 (IEBC [B] 310.9) Historic buildings. These provisions shall apply to ~~buildings and~~ facilities designated as historic structures that undergo alterations or a change of occupancy, unless *technically infeasible*. Where compliance with the requirements for *accessible* routes, entrances or toilet facilities would threaten or destroy the historic significance of the ~~building or~~ facility, as determined by the applicable governing authority, the alternative requirements of Sections 3411.9.1 through 3411.9.4 for that element shall be permitted.

Reason: "Facility" is defined in Section 1102 broadly to include "all or any portion of buildings, structures, site improvements, elements and pedestrian or vehicular routes located on a site." In the above code provisions, the mention of buildings, elements, spaces and areas have been removed, as there is no need for the redundancy. There are other portions of Chapter 34 (such as 3412.5.1, 3412.5.2 and the definition of "Primary Function") which refer only to the broader term "facility" and this proposal keeps the use of the term consistent throughout the chapter.

Cost Impact: The code change proposal will not increase the cost of construction.

The following code change (EB13) is withdrawn. The Code Correlation Committee has accepted this proposal as editorial.

EB13–09/10

IEBC 605.1.10, 1104.1, 1105.15; 3411.8.11, 3411.9 (IEBC [B] 310.8.11, 310.9)

Proponent: Maureen Traxler, City of Seattle, WA, Seattle Dept of Planning & Development

THIS IS A 2 PART CODE CHANGE. BOTH PARTS WILL BE HEARD BY THE IEBC CODE COMMITTEE AS 2 SEPARATE CODE CHANGES. SEE THE TENTATIVE HEARING ORDER FOR THE IEBC CODE COMMITTEE.

PART I – IEBC

605.1.10 Toilet rooms. Where it is *technically infeasible* to alter existing toilet and bathing ~~facilities~~ rooms to be accessible, an accessible family or assisted-use toilet or bathing ~~facility~~ room constructed in accordance with Section 1109.2.1 of the *International Building Code* is permitted. The family or assisted-use ~~facility~~ toilet or bathing room shall be located on the same floor and in the same area as the existing ~~facilities~~ toilet or bathing rooms.

1104.1 Accessibility requirements. The provisions of 605 and 706, as applicable, shall apply to buildings and facilities designated as historic structures that undergo alterations, unless *technically infeasible*. Where compliance with the requirements for accessible routes, entrances or toilet ~~facilities~~ rooms would threaten or destroy the historic significance of the building or facility, as determined by the *code official*, the alternative requirements of Sections 1104.1.1 through 1104.1.4 for that element shall be permitted.

1105.15 Accessibility requirements. The provisions of Section 912.8 shall apply to buildings and facilities designated as historic structures that undergo a *change of occupancy*, unless *technically infeasible*. Where compliance with the requirements for accessible routes, ramps, entrances, or toilet ~~facilities~~ rooms would threaten or destroy the historic significance of the building or facility, as determined by the authority having jurisdiction, the alternative requirements of Sections 1104.1.1 through 1104.1.5 for those elements shall be permitted.

PART II – IBC GENERAL

Revise as follows:

3411.8.11 (IEBC [B] 310.8.11) Toilet rooms. Where it is *technically infeasible* to alter existing toilet and bathing ~~facilities~~ rooms to be *accessible*, an *accessible* family or assisted-use toilet or bathing ~~facility~~ room constructed in accordance with Section 1109.2.1 is permitted. The family or assisted-use ~~facility~~ toilet or bathing room shall be located on the same floor and in the same area as the existing ~~facilities~~ toilet or bathing rooms.

3411.9 (IEBC [B] 310.9) Historic buildings. These provisions shall apply to buildings and facilities designated as historic structures that undergo alterations or a change of occupancy, unless *technically infeasible*. Where compliance with the requirements for *accessible* routes, entrances or toilet ~~facilities~~ rooms would threaten or destroy the historic significance of the building or facility, as determined by the applicable governing authority, the alternative requirements of Sections 3411.9.1 through 3411.9.4 for that element shall be permitted.

Reason: The use of the term “facility” or “facilities” as used in this section is ambiguous. “Facility” is defined in Section 1102 broadly to include “all or any portion of buildings, structures, site improvements, elements and pedestrian or vehicular routes located on a site.” Replacing the term “facility” or “facilities” with a more meaningful term, such as “room” or “rooms,” removes the ambiguity and is consistent with the terminology used in Section 1109.

Cost Impact: The code change proposal will not increase the cost of construction.

Proponent: Dominic Marinelli, United Spinal Association

THIS IS A 2 PART CODE CHANGE. BOTH PARTS WILL BE HEARD BY THE IEBC COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THIS COMMITTEE.

PART I – IEBC

Revise as follows:

CHAPTER 6
ALTERATIONS—LEVEL 1

SECTION 605
ACCESSIBILITY

605.1 General. A building, facility or element that is altered shall comply with the applicable provisions in Sections 605.1.1 through 605.1.14, Chapter 11 of the International Building Code and ICC A117.1 unless it is technically infeasible. Where compliance with this section is technically infeasible, the alteration shall provide access to the maximum extent that is technically feasible.

A building, facility or element that is constructed or altered to be accessible shall be maintained accessible during occupancy.

Exceptions:

1. The altered element or space is not required to be on an accessible route unless required by Section 605.2.
2. Accessible means of egress required by Chapter 10 of the International Building Code are not required to be provided in existing buildings and facilities.
3. Type B dwelling or sleeping units required by Section 1107 of the International Building Code are not required to be provided in existing buildings and facilities <u>undergoing less than a Level III alteration</u>.
4. The alteration to Type A individually owned dwelling units within a Group R-2 occupancy shall meet the provisions for Type B dwelling units and shall comply with the applicable provisions in Chapter 11 of the International Building Code and ICC A117.1.

605.1.8 Accessible dwelling or sleeping units. Where Group I-1, I-2, I-3, R-1, R-2 or R-4 dwelling or sleeping units are being altered, the requirements of Section 1107 of the International Building Code for accessible units and Chapter 9 of the International Building Code for visible alarms apply only to the quantity of the spaces being altered.

605.1.9 Type A dwelling or sleeping units. Where more than 20 Group R-2 dwelling or sleeping units are being altered, the requirements of Section 1107 of the International Building Code for Type A units and Chapter 9 of the International Building Code for visible alarms apply only to the quantity of the spaces being altered.

605.2 Alterations affecting an area containing a primary function. Where an alteration affects the accessibility to a, or contains an area of, primary function, the route to the primary function area shall be accessible. The accessible route to the primary function area shall include toilet facilities or drinking fountains serving the area of primary function.

Exceptions:

1. The costs of providing the accessible route are not required to exceed 20 percent of the costs of the alterations affecting the area of primary function.
2. This provision does not apply to alterations limited solely to windows, hardware, operating controls, electrical outlets and signs.
3. This provision does not apply to alterations limited solely to mechanical systems, electrical systems, installation or alteration of fire protection systems and abatement of hazardous materials.
4. This provision does not apply to alterations undertaken for the primary purpose of increasing the accessibility of an existing building, facility or element.
5. <u>This provision does not apply to altered areas limited to Type B dwelling and sleeping units.</u>

CHAPTER 7
ALTERATIONS—LEVEL 2

SECTION 706
ACCESSIBILITY

706.1 General. A building, facility, or element that is altered shall comply with this section and Section 605.

706.3 Accessible dwelling units and sleeping units. Where Group I-1, I-2, I-3, R-1, R-2 or R-4 dwelling or sleeping units are being added, the requirements of Section 1107 of the International Building Code for accessible units and Chapter 9 of the International Building Code for visible alarms apply only to the quantity of spaces being added.

706.4 Type A dwelling or sleeping units. Where more than 20 Group R-2 dwelling or sleeping units are being added, the requirements of Section 1107 of the International Building Code for Type A units and Chapter 9 of the International Building Code for visible alarms apply only to the quantity of the spaces being added.

706.5 Type B dwelling or sleeping units. Where four or more Group I-1, I-2, R-1, R-2, R-3 or R-4 dwelling or sleeping units are being added, the requirements of Section 1107 of the International Building Code for Type B units and Chapter 9 of the International Building Code for visible alarms apply only to the quantity of the spaces being added.

CHAPTER 8
ALTERATIONS—LEVEL 3

SECTION 806
ACCESSIBILITY

806.1 General. A building, facility or element that is altered shall comply with this section and Sections 605 and 706.

806.2 Type B dwelling or sleeping units. Where four or more Group I-1, I-2, R-1, R-2, R-3 or R-4 dwelling or sleeping units are being altered or added the requirements of Section 1107 of the International Building Code for Type B units and Chapter 9 of the International Building Code for visible alarms apply only to the quantity of the spaces being altered or added.

CHAPTER 9
CHANGE OF OCCUPANCY

912.8 Accessibility. Existing buildings that undergo a change of group or occupancy classification shall comply with this section.

> **Exception:** Type B dwelling or sleeping units required by Section 1107 of the International Building Code are not required to be provided in existing buildings and facilities undergoing a change of occupancy in conjunction with less than a Level III alteration.

912.8.1 Partial change in occupancy. Where a portion of the building is changed to a new occupancy classification, any alterations shall comply with Sections 605, ~~and~~ 706 and 806, as applicable.

912.8.2 Complete change of occupancy. Where an entire building undergoes a change of occupancy, it shall comply with Section 912.8.1 and shall have all of the following accessible features:

1. At least one accessible building entrance.
2. At least one accessible route from an accessible building entrance to primary function areas.
3. Signage complying with Section 1110 of the International Building Code.
4. Accessible parking, where parking is provided.
5. At least one accessible passenger loading zone, where loading zones are provided.
6. At least one accessible route connecting accessible parking and accessible passenger loading zones to an accessible entrance.

Where it is technically infeasible to comply with the new construction standards for any of these requirements for a change of group or occupancy, the above items shall conform to the requirements to the maximum extent technically feasible.

Exception: The accessible features listed in Items 1 through 6 are not required for an accessible route to Type B units.

CHAPTER 10
ADDITIONS

SECTION 1005
ACCESSIBILITY

1005.1 Minimum requirements. Accessibility provisions for new construction shall apply to additions. An addition that affects the accessibility to, or contains an area of, primary function shall comply with the requirements of Sections 605, ~~and~~ 706 and 806, as applicable.

CHAPTER 11
HISTORIC BUILDINGS

SECTION 1104
ALTERATIONS

1104.1 Accessibility requirements. The provisions of 605, ~~and~~ 706 and 806, as applicable, shall apply to buildings and facilities designated as historic structures that undergo alterations, unless *technically infeasible*. Where compliance with the requirements for accessible routes, entrances or toilet facilities would threaten or destroy the historic significance of the building or facility, as determined by the *code official*, the alternative requirements of Sections 1104.1.1 through 1104.1.4 for that element shall be permitted.

Exception: Type B dwelling or sleeping units required by Section 1107 of the *International Building Code* are not required to be provided in historical buildings.

SECTION 1105
CHANGE OF OCCUPANCY

1105.15 Accessibility requirements. The provisions of Section 912.8 shall apply to buildings and facilities designated as historic structures that undergo a *change of occupancy*, unless *technically infeasible*. Where compliance with the requirements for accessible routes, ramps, entrances, or toilet facilities would threaten or destroy the historic significance of the building or facility, as determined by the authority having jurisdiction, the alternative requirements of Sections 1104.1.1 through 1104.1.5 for those elements shall be permitted.

Exception: Type B dwelling or sleeping units required by Section 1107 of the *International Building Code* are not required to be provided in historical buildings.

PART II – IBC GENERAL

Revise as follows:

SECTION 3411 (IEBC [B] 310)
ACCESSIBILITY FOR EXISTING BUILDINGS

3411.1 (IEBC [B] 310.1) Scope. The provisions of Sections 3411.1 through 3411.9 apply to maintenance, change of occupancy, additions and alterations to existing buildings, including those identified as *historic buildings*.

~~**Exception:** Type B *dwelling* or sleeping units required by Section 1107 of this code are not required to be provided in existing buildings and facilities being altered or undergoing a change of occupancy.~~

3411.4 (IEBC [B] 310.4) Change of occupancy. Existing buildings that undergo a change of group or occupancy shall comply with this section.

Exception: Type B dwelling or sleeping units required by Section 1107 of this code are not required to be provided in existing buildings and facilities undergoing a change of occupancy in conjunction with alterations where the work area is 50 percent or less of the aggregate area of the building.

3411.4.1 (IEBC [B] 310.4.1) Partial change in occupancy. Where a portion of the building is changed to a new occupancy classification, any alterations shall comply with Sections 3411.6, 3411.7 and 3411.8.

3411.4.2(IEBC [B] 310.4.2) Complete change of occupancy. Where an entire building undergoes a change of occupancy, it shall comply with Section 3411.4.1 and shall have all of the following accessible features:

1. At least one accessible building entrance.
2. At least one accessible route from an accessible building entrance to primary function areas.
3. Signage complying with Section 1110.
4. Accessible parking, where parking is being provided.
5. At least one accessible passenger loading zone, when loading zones are provided.
6. At least one accessible route connecting accessible parking and accessible passenger loading zones to an accessible entrance.

Where it is technically infeasible to comply with the new construction standards for any of these requirements for a change of group or occupancy, the above items shall conform to the requirements to the maximum extent technically feasible.

Exception: The accessible features listed in Items 1 through 6 are not required for an accessible route to Type B units.

3411.5 (IEBC [B] 310.5) Additions. Provisions for new construction shall apply to additions. An addition that affects the accessibility to, or contains an area of, a primary function shall comply with the requirements in Section 3411.7.

3411.6 (IEBC [B] 310.6) Alterations. A building, facility or element that is altered shall comply with the applicable provisions in Chapter 11 of this code and ICC A117.1, unless technically infeasible. Where compliance with this section is technically infeasible, the alteration shall provide access to the maximum extent technically feasible.

Exceptions:

1. The altered element or space is not required to be on an accessible route, unless required by Section 3411.7.
2. Accessible means of egress required by Chapter 10 are not required to be provided in existing buildings and facilities.
3. The alteration to Type A individually owned dwelling units within a Group R-2 occupancy shall meet the provision for a Type B dwelling unit and shall comply with the applicable provisions in Chapter 11 and ICC A117.1.
4. Type B dwelling or sleeping units required by Section 1107 of this code are not required to be provided in existing buildings and facilities undergoing a change of occupancy in conjunction with alterations where the work area is 50 percent or less of the aggregate area of the building.

3411.7 (IEBC [B] 310.7) Alterations affecting an area containing a primary function. Where an alteration affects the accessibility to, or contains an area of primary function, the route to the primary function area shall be accessible. The accessible route to the primary function area shall include toilet facilities or drinking fountains serving the area of primary function.

Exceptions:

1. The costs of providing the accessible route are not required to exceed 20 percent of the costs of the alterations affecting the area of primary function.
2. This provision does not apply to alterations limited solely to windows, hardware, operating controls, electrical outlets and signs.
3. This provision does not apply to alterations limited solely to mechanical systems, electrical systems, installation or alteration of fire protection systems and abatement of hazardous materials.
4. This provision does not apply to alterations undertaken for the primary purpose of increasing the accessibility of an existing building, facility or element.
5. This provision does not apply to altered areas limited to Type B dwelling and sleeping units.

3411.8 (IEBC [B] 310.8) Scoping for alterations. The provisions of Sections 3411.8.1 through 3411.8.12 shall apply to alterations to existing buildings and facilities.

3411.8.7 (IEBC [B] 310.8.7) Accessible dwelling or sleeping units. Where Group I-1, I-2, I-3, R-1, R-2 or R-4 dwelling or sleeping units are being altered or added, the requirements of Section 1107 for Accessible units apply only to the quantity of spaces being altered or added.

3411.8.8 (IEBC [B] 310.8.8) Type A dwelling or sleeping units. Where more than 20 Group R-2 dwelling or sleeping units are being altered or added, the requirements of Section 1107 for Type A units apply only to the quantity of the spaces being altered or added.

3411.8.9 (IEBC [B] 310.8.9) Type B dwelling or sleeping units. Where four or more Group I-1, I-2, R-1, R-2, R-3 or R-4 dwelling or sleeping units are being added, the requirements Section 1107 for Type B units apply only to the quantity of the spaces being added. Where Group I-1, I-2, R-1, R-2, R-3 or R-4 dwelling or sleeping units are being altered and where the work area is greater than 50 percent of the aggregate area of the building, the requirements Section 1107 for Type B units apply only to the quantity of the spaces being altered.

3411.9 (IEBC [B] 310.9) Historic buildings. These provisions shall apply to buildings and facilities designated as historic structures that undergo alterations or a change of occupancy, unless technically infeasible. Where compliance with the requirements for accessible routes, entrances or toilet facilities would threaten or destroy the historic significance of the building or facility, as determined by the applicable governing authority, the alternative requirements of Sections 3411.9.1 through 3411.9.4 for that element shall be permitted.

> **Exception:** Type B dwelling or sleeping units required by Section 1107 of the International *Building Code* are not required to be provided in historical buildings.

SECTION 3412 (IEBC [B] CHAPTER 13)
COMPLIANCE ALTERNATIVES

3412.2.5 (IEBC [B] 1301.2.5) Accessibility requirements. All portions of the buildings proposed for *change of occupancy* shall conform to the accessibility provisions of Section 3411 (IEBC 308).

Reason: The intent of this proposal is to take a small step towards increasing the availability of housing with minimum accessibility requirements. With the fastest grouping group in the United States being people over 65 years old, there is a definite need. The last U.S. Census information indicated that 41% of people of 65 have some level of disability.

Type of units covered under the Fair Housing Act include apartments, condominiums, dormitories, fraternities, sororities, convents, monasteries, assisted living facilities, nursing homes, group homes, etc. The Fair Housing Act is applicable to building first occupied after March 1991. While the department of Housing and Urban Development has been active in enforcement of these regulations, there are a lot of existing buildings that were constructed since 1991 that did not comply with this federal law. The legacy building codes first started requiring Type B units in apartments and condominiums in 1996/1997. With code changes that added congregate living facilities and Institutional facilities, the IBC requirements for Type B units was declared a 'safe harbor' document by HUD in 2002. Reasonably, buildings in jurisdictions that have adopted 2003 or 2006 IBC meet FHA. United Spinal's concern is the buildings that were built before that.

There are a considerable number of existing buildings that should have complied with FHA and did not. When a major alteration is being performed, there is a prime opportunity to have those buildings move towards compliance. This will not only be a benefit for people that need that housing to live in, but will also help the building owners lessen or avoid complaints filed under FHA. Also, this is the most cost effective opportunity to make these revisions.

What this proposal is asking for, is that when buildings are undergoing a Level 3 alteration, or a change of occupancy that includes a Level 3 alteration, that whatever elements are altered, those elements are brought up to meet Type B requirements. If the element is not part of the alteration, it is not required to be altered. This is consistent with current building code philosophy for alterations. There are still the allowances for technically infeasible. The exceptions for non-elevator buildings, site limitations and flood zones currently indicated in Section 1107.7 are still applicable under *Extent of Application* (IBC 3409.3, IEBC 310.3, 605.1.14). Historical buildings, by their reference back to general provisions could be affected, therefore a general exception for Type B units is proposed for historical buildings.

In addition, when the area being altered is for Type B units, there is an exception for the additional route requirements currently in IBC Sections 3411.4.2 and 3411.7 and IEBC Section 310.4.2, 310.7, 605.2 and 912.8.2. United Spinal hopes that this address the concerns of site impracticality brought up during the last hearings by the Building Owners Managers Association, the National Association of Home Builders and the National Multi-Housing Council. This also reinforces the intent that this provision is not meant to require elevators when alterations are performed on upper floors in non-elevator buildings (see exceptions in Section 1107.7). These areas would have been exempted if built new under FHA and IBC, and should continue to be exempted.

The intent is that the same requirements for housing in existing buildings are included in IBC and IEBC. The wording is slightly different because IBC does not include a definition for Level 3 alterations. The terminology used – "work areas exceeds 50 percent of the aggregate area of the building" - can be found in IEBC 405.1. Some sections included in this proposal are not revised, but are included for context.

Cost Impact: The code change proposal will increase the cost of construction

PART I – IEBC

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

PART II – IBC GENERAL

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: MARINELLI-EB1-605.2.DOC

EB15–09/10
606.2.1, 807.4.4 (New)

Proponent: David Bonowitz, SE, National Council of Structural Engineers Associations, Code Advisory Committee, Existing Buildings Subcommittee (NCSEA EBS)

THIS PROPOSAL IS ON THE AGENDA OF THE IBC STRUCTURAL CODE DEVELOPMENT COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THE IBC STRUCTURAL CODE DEVELOPMENT COMMITTEE.

1. Delete without substitution:

~~**606.2.1 Wall anchors for concrete and masonry buildings.** Where a permit is issued for reroofing more than 25 percent of the roof area of a building assigned to Seismic Design Category D, E, or F with a structural system consisting of concrete or reinforced masonry walls with a flexible roof diaphragm or unreinforced masonry walls with any type of roof diaphragms, the work shall include installation of wall anchors at the roof line to resist the reduced *International Building Code* level seismic forces as specified in Section 101.5.4.2 of this code and design procedures of Section 101.5.4, unless an evaluation demonstrates compliance of existing wall anchorage.~~

2. Add new text as follows:

807.4.4 Wall anchors for concrete and masonry buildings. For any building assigned to Seismic Design Category D, E, or F with a structural system consisting of concrete or reinforced masonry walls with a flexible roof diaphragm or unreinforced masonry walls with any type of roof diaphragm, the alteration work shall include installation of wall anchors at the roof line to resist the reduced IBC-level seismic forces, unless an evaluation demonstrates compliance of existing wall anchorage.

Reason: This proposal relocates a triggered structural improvement from Chapter 6 to Chapter 8 where it is more appropriate. In current 606.2.1, reroofing certain buildings triggers the installation of roof-to-wall anchors. While reroofing is Alteration Level 1 work, the installation of anchors is a disproportionate requirement largely unrelated to the re-roofing. Wall-o-roof anchors are most often installed from underneath the framing members, so the re-roofing does not make the anchor installation more convenient or cost-effective. In some cases, the current trigger could result in disproportionate additional costs, discouraging the rather simple but important act of maintaining the roof. This proposal therefore moves the triggered installation of roof-to-wall anchors to Chapter 8 where it makes more sense as a building improvement commensurate with Level 3 Alterations. Because Level 3 Alterations already involve substantial work, the "25% roof area" trigger, which is appropriate to Level 1 Alterations, is removed when the provision is moved to proposed Section 807.4.4.

Cost Impact: The code change proposal will not increase the cost of construction.

	Assembly:	ASF	AMF	DF

ICCFILENAME: BONOWITZ-EB25-606.2.1.DOC

EB16–09/10
606.3.2

Proponent: David Bonowitz, SE, National Council of Structural Engineers Associations, Code Advisory Committee, Existing Buildings Subcommittee (NCSEA EBS)

THIS PROPOSAL IS ON THE AGENDA OF THE IBC STRUCTURAL CODE DEVELOPMENT COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THE IBC STRUCTURAL CODE DEVELOPMENT COMMITTEE.

Revise as follows:

606.3.2 Roof diaphragms resisting wind loads in high-wind regions. Where roofing materials are removed from more than 50 percent of the roof diaphragm or section of a building located where the basic wind speed is greater than 90 mph or in a special wind region, as defined in Section 1609 of the *International Building Code*, roof diaphragms, connections of the roof diaphragm to roof framing members, and roof-to-wall connections ~~that are part of the main wind-force resisting system~~ shall be evaluated for the wind loads specified in the *International Building Code*, including wind uplift. If the diaphragms and connections in their current condition do not comply with those wind provisions~~,~~ they shall be replaced or strengthened in accordance with the loads specified in the *International Building Code*.

Reason: This proposal is an editorial clarification. The current provision, modified for the 2009 code, inadvertently suggests that all connections that might participate in resisting any wind loads would be subject to evaluation and possible upgrade. This proposal clarifies which connections are in the intended scope and reduces confusion further by deleting the ambiguous term "main wind force resisting system".

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: BONOWITZ-EB26-606.3.2.DOC

EB17–09/10
606.3.2

Proponent: David Bonowitz, SE, National Council of Structural Engineers Associations, Code Advisory Committee, Existing Buildings Subcommittee (NCSEA EBS)

THIS PROPOSAL IS ON THE AGENDA OF THE IBC STRUCTURAL CODE DEVELOPMENT COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THE IBC STRUCTURAL CODE DEVELOPMENT COMMITTEE.

Revise as follows:

606.3.2 Roof diaphragms resisting wind loads in high-wind regions. Where roofing materials are removed from more than 50 percent of the roof diaphragm or section of a building located where the basic wind speed is greater than 90 mph or in a special wind region, as defined in Section 1609 of the *International Building Code*, roof diaphragms and connections that are part of the main wind-force resisting system shall be evaluated for the wind loads specified in the *International Building Code*, including wind uplift. If the diaphragms and connections in their current condition ~~do not comply with those wind provisions,~~ are not capable of resisting at least 75% of those wind loads, they shall be replaced or strengthened in accordance with the loads specified in the *International Building Code*.

Reason: This proposal makes a reasonable allowance for "reduced" wind loads for certain triggered upgrades. Justifications and precedents include:

- For the work triggered by Section 606.3.2, the major deficiencies – lack of basic load path elements or load path continuity – will still be caught if reduced wind loads are used.
- Seismic evaluations typically use reduced loads, in part to avoid triggering upgrades to marginally overstressed elements. Wind provisions should reasonably do the same.
- The seismic 75% factor is partly based on a reasonable "grandfathering" approach. Many existing buildings were designed with a (now obsolete) 1/3 overstress allowance for wind loads. Current ASCE 7 load combinations for strength design no longer make the same allowance, so even well-designed existing buildings would unreasonably be caught by a trigger that requires 100% of current loads.
- FEMA (Disaster Assistance Policy 9527.4, available online) has stated a position that lateral force levels for new construction are generally considered unreasonable when applied to triggered repairs.
- New designs are expected to remain elastic under 100% of current wind loads. A structure that can resist at least 75% of these loads can still reasonably be expected to perform acceptably, given the differences between minimum yield and expected ultimate strengths and due to the generally conservative nature of new design.
- ASCE 7 requires a load factor of 1.6 for wind loads. Even at 75%, the effective load factor is still greater than 1.0.

- Though not based on any quantified theory, observed performance, or a "grandfathering" strategy, the proposed 75% value is consistent with the factor used to reduce seismic loads.
- The 75% value does not reach as low as past codes did when identifying dangerous conditions; buildings were deemed dangerous only if they could not resist 50% or 67% of design wind loads.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: BONOWITZ-EB27-606.3.2-2.DOC

EB18–09/10
607.1

Proponent: Lorraine Ross, Intech Consulting Inc., representing Polyiso Insulation Manufacturers Association (PIMA)

Revise as follows:

607.1 Minimum requirements. Level 1 alterations to existing buildings or structures are permitted without requiring the entire building or structure to comply with the energy requirements of the *International Energy Conservation Code* or *International Residential Code*. The alterations shall conform to the energy requirements of the *International Energy Conservation Code* or *International Residential Code* as they relate to new construction only.

Exception: Where Level 1 alterations involve addition or replacement of the roof covering, the roof assembly shall meet the energy requirements of the *International Energy Conservation Code, Chapter 5* for new construction.

Reason: A rapidly accelerating awareness of the energy and environmental challenges facing us today has spurred enhanced energy efficiency standards, stricter codes and emerging technologies in new construction. As a result, there is confidence that buildings constructed over the coming years will consume less and less energy. Unfortunately, these activities rarely impact the energy consumption levels of the more than 70 billion square feet of existing commercial building floor space in this country.

This code change proposal addresses the need to upgrade existing roofs to meet the new construction requirements of the International Energy Conservation Code, Chapter 5 for Commercial Buildings. This action is one of the most practical and economically feasible opportunities for improving the energy efficiency in existing buildings: Roof replacement of low-slope roofed buildings, i.e. replacement of waterproofing membrane. It is commonly known that a typical building requires three roof replacements during its lifetime or roughly one replacement every twenty years. Thus, routine roof replacement facilitates implementation of the long-proven energy efficiency measure of added levels of insulation.

Representing eighteen percent of all U.S. annual energy use at 91 kBtu/ft^2 based on floor area, existing commercial buildings play an important role in the challenge to achieve substantial reductions in consumption of energy and impact on the environment. A key lies in the fact that the vast majority of building stock will require roof replacement over the next fifteen to twenty five years providing a practical opportunity to improve the thermal performance of buildings. From the research conducted and the results presented in this report, the following conclusions have been established:

- One and one half billion square feet of existing floor area is a viable annual potential for installation of low-slope energy efficient roofing systems. Clearer and more stringent energy code language as well as increased enforcement specific to re-roofing projects could enhance this potential.
- After ten years, fifteen billion square feet or greater than 20 percent of today's existing floor area will be saving 6.5 percent of total site energy consumption or 118 billion Btu and 266 billion Btu of source energy annually. It is presumed that during this period, a portion of non-retrofitted buildings will be demolished, further contributing to the relative impact of energy efficient roofing systems in lowering the energy intensity level of buildings. Lastly, from a life cycle perspective, the total embodied energy involved in the insulation is recovered in the first year of its use through the energy saved.
- The economic impact includes a cumulative savings of $12.2 billion and annual savings of $2.4 billion which, of course, continues throughout the lifetime of the insulation. The total capital required (installed cost of additional insulation) over this ten year period is approximately $23 billion. Please note that the economic impact in this study is limited to the site utility costs and the installed costs of the insulation. There are other potential economic benefits associated with reductions in energy generation and use as well as reduction in emissions and other environmental impacts that are beyond the scope of this research.
- Energy savings realized with energy efficient roof systems vary significantly between climate zones and vary dramatically between building types. Of the ten building types studied, seven exhibit substantial savings in all climate zones with schools reaping the greatest benefits.
- With respect to GWP, this practical means of thermal performance improvement prevents nearly 0.2 percent of the total building stock emissions in the first year alone. The compounding impact provides a GWP emissions prevention benefit of greater than 100 million metric tons CO_2-equiv. after ten years. Again, comparing this to the life cycle emissions involved in the additional insulation shows that the net zero emissions period is roughly one year.

	Assembly:	ASF	AMF	DF

ICCFILENAME: ROSS-EB3-607.1.DOC

EB19–09/10
704.2.2

Proponent: Daniel E. Nichols, PE, New York State Dept. of State, Div. of Code Enforcement and Administration

Revise as follows:

704.2.2 Groups A, B, E, F-1, H, I, M, R-1, R-2, R-4, S-1 and S-2. In buildings with occupancies in Groups A, B, E, F-1, H, I, M, R-1, R-2, R-4, S-1 and S-2, work areas that have exits or corridors shared by more than one tenant or that have exits or corridors serving an occupant load greater than 30 shall be provided with automatic sprinkler protection where all of the following conditions occur:

1. The *work area* is required to be provided with automatic sprinkler protection in accordance with the *International Building Code* as applicable to new construction; and
2. The *work area* exceeds 50 percent of the floor area; ~~and~~
3. ~~The building has sufficient municipal water supply for design of a fire sprinkler system available to the floor without installation of a new fire pump.~~

Exceptions:

1. Work areas in Group R occupancies three stories or less in height.
2. If the building does not have sufficient municipal water supply for design of a fire sprinkler system available to the floor without installation of a new fire pump, work areas shall be protected by an automatic smoke detection system throughout all occupiable spaces other than sleeping units or individual dwelling units that activates the occupant notification system in accordance with Sections 907.4, 907.5, and 907.6 of the *International Building Code*.

Reason: Currently, the IEBC allows buildings in areas that do not have a municipal water system or have a municipal system with low pressure to be exempt from automatic sprinkler requirements. This is a all-in or all-out type of protection, with no mitigating measures taken if the fire sprinkler is exempted.

This code change provides two important features to mitigate, but not replace, the effectiveness of automatic sprinklers based on current tradeoffs in the IEBC. The first mitigation is to provide notification to occupants of a fire event, which would be provided with a sprinkler system (IBC 907.5 #2). The second mitigation would be to contact the fire department with monitoring (Section 907.6.5) and providing automatic notification.

Cost Impact: The code change proposal will increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

EB20–09/10
704.4, 704.4.1, 704.4.1.1 through 704.4.1.7, 704.4.2, 704.4.3

Proponent: Daniel E. Nichols, PE, New York State Dept. of State, Div. of Code Enforcement and Administration

1. Revise as follows:

704.4 Fire alarm and detection. An approved fire alarm system shall be installed in accordance with Sections 704.4.1 through 704.4.3. ~~Where automatic sprinkler protection is provided in accordance with Section 704.2 and is connected to the building fire alarm system, automatic heat detection shall not be required.~~

~~An approved automatic fire detection system shall be installed in accordance with the provisions of this code and NFPA 72. Devices, combinations of devices, appliances, and equipment shall be approved. The automatic fire detectors shall be smoke detectors, except that an approved alternative type of detector shall be installed in spaces such as boiler rooms, where products of combustion are present during normal operation in sufficient quantity to actuate a smoke detector.~~

704.4.1 Occupancy requirements. A fire alarm system shall be installed in work areas in accordance with Section~~s~~ ~~704.4.1.1 through 704.4.1.7~~ 907 of the *International Building Code* for new buildings. Existing alarm-notification appliances shall be automatically activated throughout the building. Where the building is not equipped with a fire alarm system, alarm-notification appliances within the work area shall be provided and automatically activated.

Exceptions~~:~~

~~1.~~ Occupancies with an existing, previously approved fire alarm system.
~~2. Where selective notification is permitted, alarm-notification appliances shall be automatically activated in the areas selected.~~

2. Delete without substitution:

~~**704.4.1.1 Group E.**~~
~~**704.4.1.2 Group I-1.**~~
~~**704.4.1.3 Group I-2.**~~
~~**704.4.1.4 Group I-3.**~~
~~**704.4.1.5 Group R-1.**~~
~~**704.4.1.6 Group R-2.**~~
~~**704.4.1.7 Group R-4.**~~

3. Revise as follows:

704.4.2 Supplemental fire alarm system requirements. Where the work area on any floor exceeds 50 percent of that floor area, Section 704.4.1 shall apply throughout the floor.

Exception: Alarm-initiating and notification appliances shall not be required to be installed in tenant spaces outside of the work area.

704.4.3 Smoke alarms. Individual sleeping units and individual dwelling units in any work area in Group R-1, R-2, R-3, R-4, and I-1 occupancies shall be provided with smoke alarms in accordance with the *International Fire Code*.

~~**Exception:** Interconnection of smoke alarms outside of the rehabilitation work area shall not be required.~~

Reason: This code section fixes a technical flaw between the International Fire Code and the International Existing Building Code. Currently, the International Existing Building Code allows for the retroactive requirements of the International Fire Code to be limited by isolating such requirements to work areas only. The structure of the International Fire Code is that the retroactive requirements applies to all buildings, not those being worked on. However, the IEBC does just that, and actually lowers the level of building fire protection than if the building was just enforced to the level of the IFC.

As an example, IFC Section 4603.6.1 requires a majority of existing Group E occupancies to be provided with a fire alarm system. IEBC Section 704.4.1.1 limits the requirement to just the work area within a Group E even though more construction work is being done in the latter condition.

The code change changes the reference to the new construction requirements for fire alarm requirements. To do so, the occupancy requirements have been directed to the IBC for new construction, a more appropriate requirement for fire alarm coverage. By referencing the new construction requirements, it adds other occupancies to the Alterations-Level 2 section, including Group A occupancies.

The remainder of the code change is mostly editorial. First, most of Section 704.4 is being removed to align with the new layout of Section 907, as approved in the 2007 supplement. Second, exception #2 of Section 704.4.1 was removed since IBC Section 907 already sets requirements for selective notification. Third, the exception of Section 704.4.3 has been removed since the retroactive smoke alarm requirements of the IFC already have requirements dealing with interconnect in existing buildings. Section 704.4.2 is shown for informational purposes only.

Cost Impact: The code change proposal will increase the cost of construction.

	Assembly:	ASF	AMF	DF

ICCFILENAME: NICHOLS-EB2-704.4.DOC

EB21–09/10
707.5, 807.4, 807.4.3

Proponent: David Bonowitz, SE, National Council of Structural Engineers Associations, Code Advisory Committee, Existing Buildings Subcommittee (NCSEA EBS)

THIS PROPOSAL IS ON THE AGENDA OF THE IBC STRUCTURAL CODE DEVELOPMENT COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THE IBC STRUCTURAL CODE DEVELOPMENT COMMITTEE.

Revise as follows:

707.5 Existing structural elements resisting lateral loads. Alterations affecting the demands or capacities of existing elements of the lateral-load-resisting system shall be evaluated using the wind provisions of the *International Building Code* and the reduced *International Building Code* level seismic forces. Any existing lateral load-resisting

structural elements whose demand-capacity ratio with the alteration considered is more than 10 percent greater than its demand-capacity ratio with the alteration ignored shall be brought into compliance with those wind and seismic provisions. ~~comply with structural requirements specified in Section 807.4. For the purposes of calculating demand-capacity ratio, the demand shall consider applicable load combinations with the design lateral loads or forces in accordance with Section 1609 and 1613 of the *International Building Code*.~~ For the purposes of this section, comparisons of demand-capacity ratios and calculation of design lateral loads, forces and capacity shall account for the cumulative effects of additions and alterations since the original construction.

807.4 Existing structural elements resisting lateral loads ~~Structural alterations~~. All ~~structural~~ existing elements of the lateral-force-resisting system ~~in buildings undergoing Level 3 structural alterations or buildings undergoing Level 2 alterations as triggered by Section 707.5~~ shall comply with this section.

Exceptions:

1. Buildings of Group R occupancy with no more than five dwelling or sleeping units used solely for residential purposes that are altered based on the conventional light-frame construction methods of the *International Building Code* or in compliance with the provisions of the *International Residential Code*.
2. Where such *alterations* involve only the lowest story of a building and the *change of occupancy* provisions of Chapter 9 do not apply, only the lateral-force-resisting components in and below that story need comply with this section.

807.4.3 Limited structural alteration. Where ~~not more than 30 percent of the total floor and roof areas of the building or structure have been or are proposed to be involved in substantial structural alteration with a 12-month period~~, the work does not involve a substantial structural alteration, the existing elements of the lateral-load resisting system shall comply with Section 707.5. ~~the evaluation and analysis shall demonstrate that the altered building or structure complies with the loads applicable at the time of the original construction or of the most recent substantial structural alteration as defined in Section 807.4.2. Any existing structural elements whose seismic demand-capacity ratio with the alteration considered is more than 10 percent greater than its demand-capacity ratio with the alteration ignored shall comply with reduced *International Building Code* level seismic forces as specified in Section 101.5.4.2.~~

Reason: This proposal is primarily editorial to clarify the cross-referencing that covers Level 2 and Level 3 alterations. The wind and seismic requirements for Level 2 alterations and Level 3 limited structural alterations are essentially the same: any elements made worse by more than 10% shall be improved, but global seismic upgrades are not triggered.

However, rather than having Level 2 alterations reference the provisions of Level 3 alterations (which are split into two classes, substantial and limited), this proposal moves the relevant wind and seismic requirements into the Level 2 provisions, in Section 707.5.

There is one substantive change to Section 707.5, but it is actually a correction: The current provision refers to IBC Section 1613 for seismic loads. This is inconsistent with IEBC provisions for Level 3 alterations and other circumstances, so the typical "reduced IBC level seismic forces" are proposed instead.

In 807.4.3, the current wind and seismic provisions can now be made by a simple reference to Section 707.5. Also, rather than repeating the criteria for a substantial structural alteration, simplified text is proposed.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: BONOWITZ-EB20-707.5.DOC

EB22–09/10
707.5

Proponent: David Bonowitz, SE, National Council of Structural Engineers Associations, Code Advisory Committee, Existing Buildings Subcommittee (NCSEA EBS)

THIS PROPOSAL IS ON THE AGENDA OF THE IBC STRUCTURAL CODE DEVELOPMENT COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THE IBC STRUCTURAL CODE DEVELOPMENT COMMITTEE.

Revise as follows:

707.5 Existing structural elements resisting lateral loads. Any existing lateral load-resisting structural elements whose demand-capacity ratio with the alteration considered is more than 10 percent greater than its demand-capacity ratio with the alteration ignored shall comply with structural requirements specified in Section 807.4. In addition, the alteration shall not create a structural irregularity prohibited by ASCE 7 unless the entire structure complies with Section 101.5.4.2. For the purposes of calculating demand-capacity ratio, the demand shall consider applicable load

combinations with the design lateral loads or forces in accordance with Section 1609 and 1613 of the *International Building Code.* For the purposes of this section, comparisons of demand-capacity ratios and calculation of design lateral loads, forces and capacity shall account for the cumulative effects of additions and alterations since the original construction.

Reason: Consistent with the IEBC philosophy to "do no harm," this proposal adds a provision that prohibits the creation of structural irregularities already prohibited for new buildings per ASCE 7. The creation of a new structural irregularity might not cause element demand-capacity ratios to increase by more than 10 percent, but those irregularities should still be avoided. (Existing irregularities need not be eliminated entirely; it is felt that they would rarely be made worse without pulling the current 10% DCR increase trigger.)

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: BONOWITZ-EB21-707.5-2.DOC

EB23–09/10
710.2 (New)

Proponent: Tom Neltner, National Center for Healthy Housing, representing National Center for Healthy Housing and Alliance for Healthy Homes

Add new text as follows:

710.2 Water heating facilities. Water heating facilities shall be properly installed, maintained and capable of providing an adequate amount of water to be drawn at every required sink, lavatory, bathtub, shower and laundry facility at a temperature of not less than 110°F (43°C).A combustion water heater shall not be located in any bathroom, toilet room, bedroom or other occupied room normally kept closed, unless adequate combustion air and exhaust ventilation are provided. An approved combination temperature and pressure-relief valve and relief valve discharge pipe shall be properly installed and maintained on water heaters. In dwelling units, the temperature of the water at the spout in a bathtub or shower shall not exceed 120°F (49°C).

Reason: The current code does not set a maximum water temperature for bathtubs and showers. However, the American Society of Sanitary Engineering recommends a maximum mixed water temperature setting of 120ºF (49ºC). This code change makes the IEBC consistent with the ASSE recommendations and the requirements of the *International Residential Code* and the *International Plumbing Code.*

According to the Consumer Products Safety Commission, "Each year, approximately 3,800 injuries and 34 deaths occur in the home due to scalding from excessively hot tap water. The majority of these injuries involve the elderly and children under the age of five. The U.S. Consumer Product Safety Commission (CPSC) urges all users to lower their water heaters to 120 degrees Fahrenheit. In addition to preventing injuries, this decrease in temperature will conserve energy and save money.

CPSC goes on to state "Most adults will suffer third-degree burns if exposed to 150 degree water for two seconds. Burns will also occur with a six-second exposure to 140 degree water or with a thirty second exposure to 130 degree water. Even if the temperature is 120 degrees, a five minute exposure could result in third-degree burns." See *www.cpsc.gov/CPSCPUB/PUBS/5098.pdf.*

In addition, in December 2007, the National Center for Healthy Housing (NCHH) and the U.S. Centers for Disease Control and Prevention (CDC) convened an Expert Panel consistent with National Institute of Health guidelines to assess the effectiveness of various interventions to make homes healthier and safer. NCHH and CDC published the report of the experts in January 2009. See www.nchh.org/LinkClick.aspx?fileticket=2lvaEDNBIdU%3d&tabid=229 for the full report.

The Expert Panel reviewed the peer-reviewed research on the issue of maximum safe water temperature. The experts found two significant studies.

- 80% of children hospitalized for scald burns lived in homes with unsafe bathtub water temperatures of 130°F or higher (Feldman K, Schaller R, Feldman J, McMillon M. 1978. Tap water scald burns in children. Pediatrics 62: 1–7.)
- Five years after a 1983 Washington State law required new water heaters to be pre-set at 120°F at the factory, 77% of homes tested had safe tap water temperatures and there was a reduction in the frequency, morbidity and mortality of tap water burn injuries in children (Erdmann TC, Feldman KW, Rivara FP, Heimbach DM, Wall HA. 1991. Tap Water Burn Prevention—The Effect of Legislation. Pediatrics 88(3): 572–577.)

Setting the water heater at 120°F raises questions about *legionnaires* disease. The ASSE approved water mixers provide the safety without raising the threat of *legionnaires* disease

Cost Impact: The code change proposal will increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: NELTNER-EB1-710.2.DOC

EB24–09/10
807.4.2

Proponent: David Bonowitz, SE, National Council of Structural Engineers Associations, Code Advisory Committee, Existing Buildings Subcommittee (NCSEA EBS)

THIS PROPOSAL IS ON THE AGENDA OF THE IBC STRUCTURAL CODE DEVELOPMENT COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THE IBC STRUCTURAL CODE DEVELOPMENT COMMITTEE.

Revise as follows:

807.4.2 Substantial structural alteration. Where more than 30 percent of the total floor and roof areas of the building or structure have been or are proposed to be involved in structural alteration within a ~~12-month~~ five-year period, the evaluation and analysis shall demonstrate that the altered building or structure complies with the *International Building Code* for wind loading and with reduced *International Building Code* level seismic forces as specified in Section 101.5.4.2 for seismic loading. For seismic considerations, the analysis shall be based on one of the procedures specified in Section 101.5.4. The areas to be counted toward the 30 percent shall be those areas tributary to the vertical load-carrying components, such as joists, beams, columns, walls and other structural components that have been or will be removed, added or altered, as well as areas such as mezzanines, penthouses, roof structures and in-filled courts and shafts.

Reason: Current Section 807.4.2 requires alterations within a 12-month period to be counted together for purposes of determining whether the project is big enough to trigger a seismic upgrade. This proposal reduces the possibility that the provisions will be gamed to avoid the trigger. Currently, for example, by phasing alteration work over 3 years, it is possible that a cumulative 89 percent of the floor and roof area could be altered in a nonconforming building, skirting the intended upgrade trigger. This proposal changes the time period from 12 months to five years, a period that (in our judgment) is appropriate to the nature of seismic upgrade. It is long enough to discourage the most blatant gaming but not so long that it prevents multiple distinct alterations or becomes an administrative record-keeping burden for building departments.

The proposal continues to allow unlimited nonstructural alteration without triggering upgrades.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: BONOWITZ-EB28-807.4.2.DOC

EB25–09/10
807.4.4 (New)

Proponent: David Bonowitz, SE, National Council of Structural Engineers Associations, Code Advisory Committee, Existing Buildings Subcommittee (NCSEA EBS)

THIS PROPOSAL IS ON THE AGENDA OF THE IBC STRUCTURAL CODE DEVELOPMENT COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THE IBC STRUCTURAL CODE DEVELOPMENT COMMITTEE.

Add new text as follows:

807.4.4 Bracing for unreinforced masonry parapets. Parapets constructed of unreinforced masonry in buildings assigned to Seismic Design Category D, E, or F shall have bracing installed as needed to resist the reduced *International Building Code* level seismic forces, unless an evaluation demonstrates compliance of such items.

Reason: Level 3 alteration requirements include those of Level 1 and Level 2, but the parapet trigger for Level 1 alteration (in 606.3.1) is based on reroofing. Thus, under the current provision, a substantial Level 3 alteration could go forward, but the simple life-saving measure of parapet bracing would not be triggered unless the project happened to include reroofing.

This proposal corrects this gap between the definitions of Alteration Levels. The proposed new section 807.4.4 (with the essential wording borrowed from 606.3.1) would require parapet bracing for the most hazardous cases regardless of whether the intended work involves reroofing.

Cost Impact: Mild cost increase, but only for Level 3 alterations in buildings with unreinforced masonry parapets assigned to SDC D-F.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: BONOWITZ-EB29-807.4.4.DOC

EB26–09/10
808.1

Proponent: Lorraine Ross, Intech Consulting Inc., representing Polyiso Insulation Manufacturers Association (PIMA)

Revise as follows:

808.1 Minimum requirements. Level 3 alterations to existing buildings or structures are permitted without requiring the entire building or structure to comply with the energy requirements of the *International Energy Conservation Code* or *InternationalResidential Code*. The alterations shall conform to the energy requirements of the *International Energy Conservation Code* or *International Residential Code* as they relate to new construction only.

Exception: Where Level 3 alterations involve addition or replacement of the roof covering, the roof assembly shall meet the energy requirements of the *International Energy Conservation Code, Chapter 5* for new construction.

Reason: A rapidly accelerating awareness of the energy and environmental challenges facing us today has spurred enhanced energy efficiency standards, stricter codes and emerging technologies in new construction. As a result, there is confidence that buildings constructed over the coming years will consume less and less energy. Unfortunately, these activities rarely impact the energy consumption levels of the more than 70 billion square feet of existing commercial building floor space in this country.

This code change proposal addresses the need to upgrade existing roofs to meet the new construction requirements of the International Energy Conservation Code, Chapter 5 for Commercial Buildings. This action is one of the most practical and economically feasible opportunities for improving the energy efficiency in existing buildings: Roof replacement of low-slope roofed buildings, i.e. replacement of waterproofing membrane. It is commonly known that a typical building requires three roof replacements during its lifetime or roughly one replacement every twenty years. Thus, routine roof replacement facilitates implementation of the long-proven energy efficiency measure of added levels of insulation.

Representing eighteen percent of all U.S. annual energy use at 91 kBtu/ft^2 based on floor area, existing commercial buildings play an important role in the challenge to achieve substantial reductions in consumption of energy and impact on the environment. A key lies in the fact that the vast majority of building stock will require roof replacement over the next fifteen to twenty five years providing a practical opportunity to improve the thermal performance of buildings. From the research conducted and the results presented in this report, the following conclusions have been established:

- One and one half billion square feet of existing floor area is a viable annual potential for installation of low-slope energy efficient roofing systems. Clearer and more stringent energy code language as well as increased enforcement specific to re-roofing projects could enhance this potential.
- After ten years, fifteen billion square feet or greater than 20 percent of today's existing floor area will be saving 6.5 percent of total site energy consumption or 118 billion Btu and 266 billion Btu of source energy annually. It is presumed that during this period, a portion of non-retrofitted buildings will be demolished, further contributing to the relative impact of energy efficient roofing systems in lowering the energy intensity level of buildings. Lastly, from a life cycle perspective, the total embodied energy involved in the insulation is recovered in the first year of its use through the energy saved.
- The economic impact includes a cumulative savings of $12.2 billion and annual savings of $2.4 billion which, of course, continues throughout the lifetime of the insulation. The total capital required (installed cost of additional insulation) over this ten year period is approximately $23 billion. Please note that the economic impact in this study is limited to the site utility costs and the installed costs of the insulation. There are other potential economic benefits associated with reductions in energy generation and use as well as reduction in emissions and other environmental impacts that are beyond the scope of this research.
- Energy savings realized with energy efficient roof systems vary significantly between climate zones and vary dramatically between building types. Of the ten building types studied, seven exhibit substantial savings in all climate zones with schools reaping the greatest benefits.
- With respect to GWP, this practical means of thermal performance improvement prevents nearly 0.2 percent of the total building stock emissions in the first year alone. The compounding impact provides a GWP emissions prevention benefit of greater than 100 million metric tons CO_2-equiv. after ten years. Again, comparing this to the life cycle emissions involved in the additional insulation shows that the net zero emissions period is roughly one year.

Phelan, J., Pavlovich, G., Ma E., Energy and Environmental Impact Reduction Opportunities for Existing Buildings with Low-Slope Roofs April 2009

Cost Impact: The code change proposal will increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: ROSS-EB2-808.1.DOC

EB27–09/10
902.1

Proponent: Tom Lariviere, Chairman, Joint Fire Service Review Committee

Revise as follows:

902.1 Compliance with the building code. Where the character or use of an existing building or part of an existing building is changed to one of the following special use or occupancy categories as defined in the *International Building Code*, the building shall comply with all of the applicable requirements of the *International Building Code*:

1. Covered mall buildings.
2. Atriums.
3. Motor vehicle-related occupancies.
4. Aircraft-related occupancies.
5. Motion picture projection rooms.
6. Stages and platforms.
7. Special amusement buildings.
8. Incidental use areas.
9. Hazardous materials.
10. Ambulatory health care facilities.

Reason: As a result of Item G23 07/08, which was approved as modified, the IBC now contains specific requirements for Ambulatory health care facilities. In an ambulatory health care facility, patients are incapacitated for various lengths of time. This creates a situation where the patients may, or may not, be able to accomplish self-preservation and self-evacuation. Patients are placed at a higher risk in these facilities.

The proposal provides a method for the code officials to mitigate the increased risk when an ambulatory health care facility is constructed in an existing building.

Cost Impact: The code change proposal will increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: LARIVIERE-EB1-902.1.DOC

EB28–09/10
909.1

Proponent: Jeffrey N. Gentile, PE, Upper Darby Township, representing Pennsylvania Association of Building Code Officials, Inc.

Revise as follows:

909.1 Mechanical requirements. Where the occupancy of an *existing building* or part of an *existing building* is changed such that the new occupancy is subject to different kitchen exhaust requirements or to increased mechanical ventilation requirements in accordance with the *International Mechanical Code*, the new occupancy shall comply with the intent of the respective *International Mechanical Code* provisions.

Exception: Changes in occupancy between office and retail store as defined in Table 403.3 of the *International Mechanical Code* for spaces under 3000 square feet are not required to increase mechanical ventilation rates.

Reason: Many tenant spaces, especially those in malls and strip centers, alternate between B and M uses. For example, a craft store may become a hair salon then later a florist shop. For small establishments, the additional restroom and ventilation requirements are burdensome – often requiring the replacement of HVAC systems. These requirements are necessary in some spaces, including specialty shops as listed in IMC table 403.3, so the exception does not just list B & M occupancy types.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: GENTILE-EB1-912.4.2.DOC

EB29–09/10
912.2.1

Proponent: Randall R. Dahmen, WI Registered PE, WI Licensed Commercial Building Inspector

Revise as follows:

912.2.1 Fire sprinkler system. Where a change in occupancy classification occurs that requires an automatic fire sprinkler system to be provided based on the new occupancy in accordance with Chapter 9 of the *International Building Code*, such system shall be provided throughout the fire area where the *change of occupancy* occurs.

Reason: The intent of the *International Building Code* requirements addressing the need for automatic sprinkler system installation as based on occupancy is to address each occupancies "fire area". This intent is not conveyed in the current *International Existing Building Code* wording. This proposed change is meant to clarify the intent of the IEBC requirement, as based on the current wording of the IBC.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: DAHMEN-EB1-912.2.1.DOC

EB30–09/10
912.4.2

Proponent: Jeffrey N. Gentile, PE, Upper Darby Township, representing Pennsylvania Association of Building Code Officials, Inc.

Revise as follows:

912.4.2 Means of egress for change of use to equal or lower hazard category. When a change of occupancy classification is made to an equal or lesser hazard category (higher number) as shown in Table 912.4, existing elements of the means of egress shall comply with the requirements of Section 805 for the new occupancy classification. When the occupant load of a building or space exceeds the provided egress capacity, then the occupant load for the building shall be determined by dividing the egress width(s) in the building by the applicable number(s) found in Section 1005.1 of the *International Building Code*. This altered occupant load is required to be clearly posted. Newly constructed or configured means of egress shall comply with the requirements of Chapter 10 of the *International Building Code*.

> **Exception:** Any stairway replacing an existing stairway within a space where the pitch or slope cannot be reduced because of existing construction shall not be required to comply with the maximum riser height and minimum tread depth requirements.

Reason: It does not make sense that the code would allow a building to be non-conformant in one of the most important life safety areas of the building code just because it is existing. The change increases the egress safety by setting a reasonable occupancy load requirement while not requiring any alterations to the building.

.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: GENTILE-EB1-912.4.2.DOC

EB31–09/10
912.5.1

Proponents: Joseph A. McGrath, PE, RA, representing New York State Dep. of State, Division of Code Enforcement and Administration

Revise as follows:

912.5.1 Height and area change to higher hazard category. When a change of occupancy classification is made to a higher hazard category as shown in Table 912.5, heights and areas of buildings and structures shall comply with the requirements of Chapter 5 of the *International Building Code* for the new occupancy classification.

Exception: In other than Groups H, F-1 and S-1, in lieu of fire walls, use of fire barriers and horizontal assemblies having a fire-resistance rating of not less than that specified in Table 706.4 of the *International Building Code*, constructed in accordance with Sections 707 and 712 of the *International Building Code*, shall be permitted to meet the area limitations required for the new occupancy in buildings protected throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 of the *International Fire Code*. The maximum allowable area between fire barriers, horizontal assemblies or any combination thereof shall not exceed the tabular area specified in Table 503 of the *International Building Code* without any area increase allowed for an automatic sprinkler system in accordance with Section 506 of the *International Building Code*. Where horizontal assemblies are used to limit the maximum allowable area, the required fire-resistance rating of the horizontal assemblies shall be permitted to be reduced by 1-hour provided the height and number of stories increases allowed by Section 504.2 for an automatic sprinkler system are not used for the building.

Reason: This proposal is a follow-up to code change EB33-06/07 that was approved as modified by Public Comment #1 submitted by the Alliance for Fire and Smoke Containment and Control (AFSCC) at the ICC Final Action Hearings in Rochester, New York in May, 2007. The reason for the original EB33 proposal is the need to reuse existing mill buildings that are sprinklered and the fact that the original code requirement for fire walls is not financially or physically practicable. This proposal will provide an additional measure of safety to the current requirements of this section.

At the 2007 hearings the AFSCC proposed that if fire barriers were used in lieu of fire walls, a significant reduction in allowable building and fire areas should occur. We agree, so this proposal reduces the allowable building area by allowing fire fighting access (open space) credits but not sprinklering credits. An example, to use the most probable application of this proposal, would be a Type IIIB construction mill building being converted from an F-1 (moderate hazard) occupancy to an R-2 (residential) occupancy. This change in occupancy would be considered a change to a higher hazard.

Under the proposed change, the mill building described above would be allowed to have a floor area of 28,000 square feet and a total maximum floor area for all stories of 84,000 square feet between fire barriers with a maximum 75% increase allowed for open space. Present requirements for a new building would allow 60,000 square feet for a single floor area and 180,000 square feet of total floor area with the additional increase allowed for an automatic sprinkler system.

The logic behind not allowing area increases for sprinklering is because under the circumstances of the substitution of fire barriers for fire walls in these buildings, the required sprinklers should not be given extra credit.

The concept of allowing horizontal assemblies to be used to subdivide the building presumes that the fire would be contained within the six sided box formed by the fire barrier walls and horizontal assemblies and/or exterior walls and roof which is limited to the area prescribed in this proposed code change. Thus, the volume of the building separated from the rest of the building by the required fire-resistance rated construction would be comparable.

The logic behind allowing a 1-hour reduction in the required fire-resistance rating for the horizontal assemblies is based on the fact that the automatic sprinkler system provided would not be used for a height increase both in number of stories and in total feet (1 story and 20 feet), yet the building will still be compartmented with fire-resistive horizontal assemblies having, in most cases, a minimum fire-resistance rating of 2-hours and, in some cases, as low as 1-hour but only 1 hour less than what would otherwise be required by Table 705.4 by this exception for the fire barriers. Thus, the sprinkler credit that would otherwise be given for the increase in height currently allowed by Chapter 5 of the International Building Code would be used for the reduction of 1-hour in the required fire- resistance rating of the horizontal assembly. We believe this provides a reasonable equivalent level of fire and life safety protection for existing buildings being converted under this exception as modified by this code change proposal.

Cost Impact: The code change proposal will result in added costs to construction if the building is over a specific size as to require more fire barriers than the present requirements. However, the cost and practicality of converting existing buildings is still greatly improved from the requirements in the 2003 IEBC.

IEBC 912.8, 912.8.1, 912.8.2; IBC 3411.4, 3411.4.1, 3411.4.2 (IEBC [B] 310.4, 310.4.1, 310.4.2)

Proponent: Maureen Traxler, City of Seattle, WA, Seattle Dept of Planning & Development

THIS IS A 2 PART CODE CHANGE. BOTH PARTS WILL BE HEARD BY THE FIRE CODE COMMITTEE AS 2 SEPARATE CODE CHANGES. SEE THE TENTATIVE HEARING ORDER FOR THE FIRE CODE COMMITTEE.

PART I – IEBC

Revise as follows:

912.8 Accessibility. ~~Existing buildings that undergo a change of group or occupancy shall comply with this section.~~

~~912.8.1 Partial change in occupancy.~~ Where ~~a~~ all or any portion of ~~the~~ a building is changed to a new occupancy classification, any alterations shall comply with Sections 605 and 706, as applicable.

~~912.8.2 Complete change of occupancy.~~ ~~Where an entire building undergoes a change of occupancy, it shall comply with Section 3411.4.1 and shall have all of the following accessible features:~~

1. ~~At least one accessible building entrance.~~
2. ~~At least one accessible route from an accessible building entrance to primary function areas.~~
3. ~~Signage complying with Section 1110.~~
4. ~~Accessible parking, where parking is being provided.~~
5. ~~At least one accessible passenger loading zone, when loading zones are provided.~~
6. ~~At least one accessible route connecting accessible parking and accessible passenger loading zones to an accessible entrance.~~

~~Where it is technically infeasible to comply with the new construction standards for any of these requirements for a change of group or occupancy, the above items shall conform to the requirements to the maximum extent technically feasible.~~

PART II – IBC GENERAL

Revise as follows:

3411.4 (IEBC [B] 310.4) Change of occupancy. ~~Existing buildings that undergo a change of group or occupancy shall comply with this section.~~

~~3411.4.1 (IEBC [B] 310.4.1) Partial change in occupancy.~~ Where ~~a~~ all or any portion of ~~the~~ a building is changed to a new occupancy classification, any alterations shall comply with Sections 3411.6, 3411.7 and 3411.8.

~~3411.4.2 (IEBC [B] 310.4.2) Complete change of occupancy.~~ ~~Where an entire building undergoes a change of occupancy, it shall comply with Section 3411.4.1 and shall have all of the following accessible features:~~

1. ~~At least one accessible building entrance.~~
2. ~~At least one accessible route from an accessible building entrance to primary function areas.~~
3. ~~Signage complying with Section 1110.~~
4. ~~Accessible parking, where parking is being provided.~~
5. ~~At least one accessible passenger loading zone, when loading zones are provided.~~
6. ~~At least one accessible route connecting accessible parking and accessible passenger loading zones to an accessible entrance.~~

~~Where it is technically infeasible to comply with the new construction standards for any of these requirements for a change of group or occupancy, the above items shall conform to the requirements to the maximum extent technically feasible.~~

Reason: When buildings are altered, required improvements in accessibility are limited to 20% of the cost of the alterations according to exception 1 to IBC Section 3411.7 and exception 1 to IEBC Section 605.2. According to the Access Board website [http://www.access-board.gov/ada%2Daba/adaag.cfm#a202], "Department of Justice ADA regulations state, 'Alterations made to provide an accessible path of travel to the altered area will be deemed disproportionate to the overall alteration when the cost exceeds 20% of the cost of the alteration to the primary function area.' (28 CFR 36.403 (f)(1)). See also Department of Transportation ADA regulations, which use similar concepts in the context of public sector transportation facilities (49 CFR 37.43 (e)(1))."

Changes of occupancy shouldn't be required to do more than alterations. Many changes of occupancy are accomplished with little or no construction work—a space may be refurnished and transformed from a Group M retail store to a Group B office. Any construction work that is done would be required to comply with IBC Section 3411.7 (IEBC Section 605.2), and would be subject to the 20% limitation.

The list of priority accessible features has been deleted because it is not necessary for correlation with the ADAAG, and because such a prescriptive requirement does not allow the flexibility to spend money improving the accessible route where it makes the most sense. It is our understanding that while the list was originally proposed for adoption in the new ADAAG, ultimately, it was decided to allow that flexibility, and the list does not appear in the updated ADAAG.

We think the proposal presented above is the most comprehensive and cleanest way to address our issues. However, if the Committee decides that keeping the priority list is a necessity, we would be open to a modification of the proposal that would retain all the existing language that is shown as being struck through in IBC Sections 3411.4, 3411.4.1, and 3411.4.2, but instead, just inserts an exception just after the list in Section 3411.4.2 as follows:

3411.4.2 Complete change of occupancy. Where an entire building undergoes a change of occupancy, it shall comply with Section 3411.4.1 and shall have all of the following *accessible* features:

1. At least one *accessible* building entrance.
2. At least one *accessible* route from an *accessible* building entrance to *primary function* areas.
3. Signage complying with Section 1110.
4. Accessible parking, where parking is being provided.
5. At least one *accessible* passenger loading zone, when loading zones are provided.
6. At least one *accessible* route connecting *accessible* parking and *accessible* passenger loading zones to an *accessible* entrance.

Exception: The costs of providing an *accessible* route or *accessible* features are not required to exceed 20 percent of the costs of the *alterations* affecting the area of *primary function*.

Where it is *technically infeasible* to comply with the new construction standards for any of these requirements for a change of group or occupancy, the above items shall conform to the requirements to the maximum extent technically feasible.

The corresponding changes would have to be made to IEBC Section 912.8 if this alternative is chosen (i.e., retain struck-through text in 912.8, 912.8.1, and 912.8.2, and add the new exception to 912.8.2). This would still address the issue capping the required costs of accessibility upgrades, without affecting the priority list.

Cost Impact: The code change proposal will not increase the cost of construction.

EB33–09/10

IEBC 912.8.2; IBC 3411.4.2 (IEBC [B] 310.4.2)

Proponent: Norman B. Clark, CBO, City of Caldwell, Department of Building Safety, representing self and the Idaho Association of Building Officials

THIS IS A 2 PART CODE CHANGE. BOTH PARTS WILL BE HEARD BY THE IEBC CODE COMMITTEE AS 2 SEPARATE CODE CHANGES. SEE THE TENTATIVE HEARING ORDER FOR THE FIRE CODE COMMITTEE.

PART I – IEBC

Revise as follows:

912.8 Accessibility. Existing buildings that undergo a change of group or occupancy classification shall comply with this section.

912.8.1 Partial change in occupancy. Where a portion of the building is changed to a new occupancy classification, any alterations shall comply with Sections 605 and 706, as applicable.

912.8.2 Complete change of occupancy. Where an entire building undergoes a *change of occupancy*, it shall comply with Section 912.8.1 and shall have all of the following accessible features:

1. At least one accessible building entrance.
2. At least one accessible route from an accessible building entrance to *primary function* areas.
3. Signage complying with Section 1110 of the *International Building Code*.
4. Accessible parking, where parking is provided.
5. At least one accessible passenger loading zone, where loading zones are provided.
6. At least one accessible route connecting *accessible* parking and accessible passenger loading zones to an accessible entrance.
7. At least one accessible toilet room for men and women or an accessible family assisted use toilet room complying with Section 1109.2 of the *International Building Code*.

Where it is *technically infeasible* to comply with the new construction standards for any of these requirements for a change of group or occupancy, the above items shall conform to the requirements to the maximum extent technically feasible.

PART II – IBC GENERAL

Revise as follows:

3411.4 (IEBC [B] 310.4) Change of occupancy. Existing buildings that undergo a change of group or occupancy shall comply with this section.

3411.4.1 (IEBC [B] 310.4.1) Partial change in occupancy. Where a portion of the building is changed to a new occupancy classification, any alterations shall comply with Sections 3411.6, 3411.7 and 3411.8.

3411.4.2 (IEBC [B] 310.4.2) Complete change of occupancy. Where an entire building undergoes a change of occupancy, it shall comply with Section 3411.4.1 and shall have all of the following *accessible* features:

1. At least one *accessible* building entrance.
2. At least one *accessible* route from an accessible building entrance to *primary function* areas.
3. Signage complying with Section 1110.
4. Accessible parking, where parking is being provided.
5. At least one *accessible* passenger loading zone, when loading zones are provided.
6. At least one *accessible* route connecting *accessible* parking and *accessible* passenger loading zones to an accessible entrance.
7. At least one accessible toilet room for men and women or an accessible family assisted use toilet room complying with Section 1109.2.

Where it is *technically infeasible* to comply with the new construction standards for any of these requirements for a change of group or occupancy, the above items shall conform to the requirements to the maximum extent technically feasible.

Reason: The intent of this proposal is to clarify the requirements for accessible toilet rooms, or a unisex (family assisted use) toilet room in a change of occupancy. For example: converting a single family dwelling to commercial use. Section 3411.4 addresses the six basic requirements for accessibility in a change of occupancy, but does not include toilet rooms. Section 3411.8.11 permits a family assisted use toilet room when it is technically infeasible to alter existing toilet rooms. This is under the scope for 'alterations' according to some ICC staff. Some look at it differently. This is the problem, wide open interpretation. There are ways to interpret the requirement through Section 3411.1, though many, including some ICC technical support staff, and architects interpret 'alterations' to be separate, as between Section 3411.1 and 3411.8. This is an example of interpretation from extreme opposite ends. This new wording under Section 3411.4 will clarify and eliminate, or extremely minimize the opportunity for misinterpretation. It has been argued that if you are not altering any part of a toilet room in a change of occupancy, then there wouldn't be any requirements to bring the toilet room(s) up to current accessibility standards, nor would there be the requirements for one family assisted use toilet room. This is simply not true, and this needs to be simplified. This proposal will not change the code requirements, only simplify the interpretation.

Cost Impact: The code change proposal will not increase the cost of construction.

PART I – IEBC

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

PART II – IBC GENERAL

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: CLARK-G1-3411.4.2

EB34–09/10
912.8.2

Proponent: Lawrence Brown, CBO, National Association of Home Builders (NAHB)

Revise as follows:

912.8.2 Complete change of occupancy. Where an entire building undergoes a *change of occupancy*, it shall comply with Section 912.8.1 and shall have all of the following accessible features:

1. At least one accessible building entrance.
2. At least one accessible route from an accessible building entrance to *primary function* areas.
3. Signage complying with Section 1110 of the *International Building Code*.
4. Accessible parking, where parking is provided.
5. At least one accessible passenger loading zone, where loading zones are provided.
6. At least one accessible route connecting accessible parking and accessible passenger loading zones to an accessible entrance.

Where it is *technically infeasible* to comply with the new construction standards for any of these requirements for a change of group or occupancy, the above items shall conform to the requirements to the maximum extent technically feasible.

Exception: Type B dwelling or sleeping units required by Section 1107 of the *International Building Code* are not required to be provided in existing buildings and facilities.

Reason: The purpose of this Proposal is to reinstate this Exception that was deleted during the 2007-08 Code Development Cycle. The deletion of the Exception is contrary to the U.S. Federal Law Fair Housing Act accessibility requirements. The Federal Fair Housing Act does not require existing buildings that are converted to residential use to comply with the Fair Housing Act accessibility requirements. The IBC does not require existing buildings with a change of occupancy to residential use to contain Type B units. In fact, with the deletion of this Exception caused an inconsistency between the IBC and the IEBC. Section 3411.1 of the IBC states:

> **3409.1 Scope.** The provisions of Sections 3411.1 through 3411.9 apply to maintenance, change of occupancy, additions and alterations to existing buildings, including those identified as historic buildings.
>
> **Exception:** Type B dwelling or sleeping units required by Section 1107 are not required to be provided in existing buildings and facilities.

Federal Law for the implementing the accessibility requirements of the Fair Housing Act only apply to new buildings as described in the HUD Fair Housing Act Design Manual as follows: *"The Fair Housing Act does not require any renovations to existing buildings. Its design requirements apply to new construction only – to covered multifamily dwellings that are built for first occupancy after March 13, 1991. First occupancy is defined as "a building that has never before been used for any purpose."*

As the Federal law states, any existing building that is converted to residential use, no matter when it was constructed, is NOT required to comply with the Fair Housing Act. It also needs to be understood that the I-Codes contain provisions The I-Codes should not contain requirements that are contrary to Federal public law.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: BROWN-EB1-912.8.2.DOC

EB35–09/10
1006 (New)

Proponent: Lorraine Ross, Intech Consulting Inc., representing Polyiso Insulation Manufacturers Association (PIMA)

Add new section as follows:

SECTION 1006
ENERGY CONSERVATION

1006.1 Minimum requirements. Additions to existing buildings shall conform to the energy requirements of the *International Energy Conservation Code* or *International Residential Code* as they relate to new construction.

(Renumber subsequent sections)

Reason: Although Section 1001.1 Scope states, **"**An *addition* to a building or structure shall comply with the *International Codes* as adopted for new construction without requiring the *existing building* or structure to comply with any requirements of those codes or of these provisions, except as required by this chapter. Where an *addition* impacts the *existing building* or structure, that portion shall comply with this code," there is no clear direction on Energy Conservation.

This code change proposal inserts a new section entitled, Energy Conservation, which clarifies that additions must meet the *International Energy Conservation Code* for new construction.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: ROSS-EB1-1006.DOC

EB36–09/10
1101.2

Proponent: David Bonowitz, SE, National Council of Structural Engineers Associations, Code Advisory Committee, Existing Buildings Subcommittee (NCSEA EBS)

THIS PROPOSAL IS ON THE AGENDA OF THE IBC STRUCTURAL CODE DEVELOPMENT COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THE IBC STRUCTURAL CODE DEVELOPMENT COMMITTEE.

Revise as follows:

1101.2 Report. A historic building undergoing repair, alteration, or change of occupancy shall be investigated and evaluated. If it is intended that the building meet the requirements of this chapter, a written report shall be prepared and filed with the code official by a registered design professional when such a report is necessary in the opinion of the code official. Such report shall be in accordance with Chapter 1 and shall identify each required safety feature that is in compliance with this chapter and where compliance with other chapters of these provisions would be damaging to the contributing historic features. For buildings assigned to Seismic Design Category D, E, or F, a structural evaluation describing, at a minimum, the vertical and horizontal elements of the lateral force resisting system and any strengths or weaknesses therein ~~a complete load path and other earthquake-resistant features~~ shall be prepared. Additionally, the report shall describe each feature that is not in compliance with these provisions and shall demonstrate how the intent of these provisions is complied with in providing an equivalent level of safety.

Reason: This is an editorial proposal. The current provision requires the engineer to describe a complete load path whether one is present or not. Further, the term "earthquake resistant features" is vague. This proposal clarifies that the provision's intent is to require some description of the designed or *de facto* lateral system and to identify its salient features. The proposed language should be clearer, more enforceable, and more effective at producing a useful report.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: BONOWITZ-EB22-1101.2.DOC

EB37–09/10
1102.2, 1106.2

Proponent: David Bonowitz, SE, National Council of Structural Engineers Associations, Code Advisory Committee, Existing Buildings Subcommittee (NCSEA EBS)

THIS PROPOSAL IS ON THE AGENDA OF THE IBC STRUCTURAL CODE DEVELOPMENT COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THE IBC STRUCTURAL CODE DEVELOPMENT COMMITTEE.

Delete and substitute as follows:

~~**1102.2 Dangerous buildings.** When an historic building is determined to be dangerous, no work shall be required except as necessary to correct identified unsafe conditions.~~

1102.2 Unsafe conditions. Conditions determined by the code official to be unsafe shall be remedied. No work shall be required beyond what is required to remedy the unsafe conditions.

~~**1106.2 Unsafe structural elements.** Where the code official determines that a component or a portion of a building or structure is dangerous as defined in this code and is in need of repair, strengthening, or replacement by provisions of this code, only that specific component or portion shall be required to be repaired, strengthened, or replaced.~~

1106.2 Dangerous conditions. Conditions determined by the code official to be dangerous shall be remedied. No work shall be required beyond what is required to remedy the dangerous condition.

Reason: This proposal is editorial. It makes the use of defined terms more consistent, while preserving the intent of the Chapter. Sections 1102.2 and 1106.2 currently use the terms "dangerous" and "unsafe" interchangeably, but the definitions in Chapter 2 are not the same.

In Section1102.2, the proposal understands that the intent of the current provision is to address unsafe conditions (as defined in Chapter 2) without triggering additional work. The proposed language is clearer and uses "unsafe" in place of "dangerous."

In Section 1106.2, which is in the Structural portion of the Chapter, the proposal deletes unnecessary language and uses the structural term "dangerous" in place of "unsafe."

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: BONOWITZ-EB23-1102.2.DOC

EB38–09/10
1202.3, 1202.4

Proponent: David Bonowitz, SE, National Council of Structural Engineers Associations, Code Advisory Committee, Existing Buildings Subcommittee (NCSEA EBS)

THIS PROPOSAL IS ON THE AGENDA OF THE IBC STRUCTURAL CODE DEVELOPMENT COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THE IBC STRUCTURAL CODE DEVELOPMENT COMMITTEE.

Revise as follows:

1202.3 Wind loads. Buildings shall comply with *International Building Code* or *International Residential Code* wind provisions as applicable.

Exceptions:

1. Detached one- and two-family dwellings and Group U occupancies where wind loads at the new location are not higher than those at the previous location.
2. Structural elements whose stress is not increased by more than ~~5~~ 10 percent.

1202.4 Seismic loads. Buildings shall comply with *International Building Code* or *International Residential Code* seismic provisions at the new location as applicable.

Exceptions:

1. Structures in Seismic Design Categories A and B and detached one- and two-family dwellings in Seismic Design Categories A, B, and C where the seismic loads at the new location are not higher than those at the previous location.
2. Structural elements whose stress is not increased by more than ~~5~~ 10 percent.

Reason: This proposal makes the wind and seismic upgrade triggers in Chapter 12 consistent with those already in Sections 302.4, 303.4, 707.5, 807.4.3, and 1003.3. Over the last several code cycles, all the lateral triggers have been increased from 5% to 10%, and Chapter 12 should be consistent.

The proposal also corrects the misspelling of the word "structural" in the exception to Section 1202.4.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: BONOWITZ-EB18-1202.3.DOC

EB39–09/10
1202.8 (New)

Proponent: Randall R. Dahmen, WI Registered PE, WI Licensed Commercial Building Inspector

Add new text as follows:

1202.8 Building envelope. A relocated or moved building shall comply with the *International Energy Conservation Code* for building envelope requirements when the building is relocated or moved to a different climate zone.

Reason: In order to create efficient building energy performance, this code change requires those buildings that change regions of climate where there are more restrictive building envelope requirements, to meet the more restrictive performance criteria of the IECC for the new location Buildings are many times relocated or moved from regions of the country which are typically warm, and which require minimal insulation at the time of original construction, to regions that are extremely cold, whose minimum requirements for building insulation are significantly greater. Similarly, buildings that are relocated or moved from a cold climate to a warm climate may find that they may need to make changes to the existing glazing in order to comply with the Solar Heat Gain Coefficient (SHGC) requirements.

At present, there are no rules requiring that the relocated building install additional insulation to the building envelope assemblies. This seems inappropriate, since the original design was intended for the original building location, not the proposed relocation.

It is the opinion of this author that this proposal is an extension of the snow load requirements already addressed under IEBC 1202.5. Clearly it has been established that when a building changes locations, it needs to be modified so as to appropriately accommodate the climatic conditions of the new site. This is a continuation of that thought process.

Cost Impact: Minimal. Exact costs would be dependent on the significance in the change in climate for the moved or relocated building.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: DAHMEN-EB2-1202.8.DOC

EB40–09/10
A102.2

Proponent: Peter Somers, Magnusson Klemencic Associates, National Council of Structural Engineers Associations/Code Advisory Committee/Existing Buildings Subcommittee

THIS PROPOSAL IS ON THE AGENDA OF THE IBC STRUCTURAL CODE DEVELOPMENT COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THE IBC STRUCTURAL CODE DEVELOPMENT COMMITTEE.

Revise as follows:

A102.2 Essential and hazardous facilities. The provisions of this chapter shall not apply to the strengthening of buildings ~~or structures~~ in Occupancy ~~Category~~ Categories III ~~when assigned to Seismic Design Category C, D, or E~~ or ~~buildings or structures in Occupancy Category~~ IV. Such buildings ~~or structures~~ shall be strengthened to meet the requirements of the *International Building Code* for new buildings of the same occupancy category or other such criteria approved by the code official. ~~that have been established by the jurisdiction.~~

Reason: It does not make any sense to allow the seismic risk reduction procedures of Appendix Chapter A1 to be used for Occupancy III buildings assigned to Seismic Design Category B, but not Seismic Design Categories C-E. The enhanced seismic performance objectives for Occupancy Category III buildings apply relatively uniformly across all seismic design categories in the IBC and ASCE 7-05. In particular, Occupancy Category III buildings in all seismic design categories are designed using a seismic Importance Factor equal to 1.25, making them stronger than Occupancy Category II buildings. The provisions of A1 do not have any reference to an importance factor (which is equal to 1.0 for Occupancy Category II buildings), and so they really should not assumed to be applicable to Occupancy Category III buildings, regardless of seismic design category.

Furthermore, the scoping of Chapter A1 in IEBC Section 101.5.4.2 excludes Occupancy Category III (and IV), so this proposal makes the appendix chapter consistent with its use as permitted in Section 101.5.4.2.

The change at the end of Section A102.2 is editorial for consistency with code terminology.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

EB41–09/10
A103

Proponent: Peter Somers, Magnusson Klemencic Associates, National Council of Structural Engineers Associations/Code Advisory Committee/Existing Buildings Subcommittee

THIS PROPOSAL IS ON THE AGENDA OF THE IBC STRUCTURAL CODE DEVELOPMENT COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THE IBC STRUCTURAL CODE DEVELOPMENT COMMITTEE.

1. Delete definitions without substitution:

SECTION A103
DEFINITIONS

~~**BUILDING CODE**. The code current adopted by the jurisdiction~~

~~**INTERNATIONAL BUILDING CODE.** The 2009 *International Building Code* (IBC)~~

2. Add new definition as follows:

FLEXIBLE DIAPHRAGM. A diaphragm of wood or untopped metal deck construction.

3. Revise definition as follows:

RIGID DIAPHRAGM. A diaphragm of ~~reinforced~~ concrete construction ~~supported by concrete beams and columns or by structural steel beams and columns.~~

Reason: The definitions for Building Code and International Building Code are unnecessary and are not included in the other appendix chapters.

The definition for flexible diaphragm is added since it is required for Section A111.1, which determines where the Special Procedure can be used.

The proposed revision to the definition rigid diaphragm is essentially editorial since a diaphragm's rigidity has no relationship to the type of framing system that supports the floors and roof, and older concrete diaphragms might not be "reinforced" based on current code definitions, yet would still be considered rigid based on stiffness.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

THIS PROPOSAL IS ON THE AGENDA OF THE IBC STRUCTURAL CODE DEVELOPMENT COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THE IBC STRUCTURAL CODE DEVELOPMENT COMMITTEE.

Revise as follows:

A110.2 Lateral forces on elements of structures. Parts and portions of a structure not covered in Sections A110.3 shall be analyzed and designed per the current building code, using force levels defined in Section A110.1.

Exceptions:

1. Unreinforced masonry walls for which height-to-thickness ratios do not exceed ratios set forth in Table A1-B need not be analyzed for out-of-plane loading. Unreinforced masonry walls that exceed the allowable *h/t* ratios of Table A1-B shall be braced according to Section A113.5.
2. Parapets complying with Section A113.6 need not be analyzed for out-of-plane loading.
3. Walls in buildings with flexible diaphragms shall be anchored to floor and roof diaphragms in accordance with Section A113.1.

Reason: The proposed change provides appropriate wall anchorage forces for buildings with rigid diaphragms. The wall anchorage force currently specified in Section A113.1.3 ($0.9S_{DS}$) is similar to the IBC wall anchorage force for new masonry construction with flexible diaphragms ($0.8S_{DS}$ per ASCE 7-05 section 12.11.2.1), but is more than twice the IBC wall anchorage force for new construction with rigid diaphragms ($0.4S_{DS}$ per ASCE 7-05 section 12.11.2).

Therefore, this proposal maintains the current Chapter A1 provisions for wall anchorage with flexible diaphragms and points the use back to the IBC for wall anchorage with rigid diaphragms (by making the exception only apply to flexible diaphragms). The wall anchorage requirements for flexible diaphragms were based on the ABK research in the 1980s, but that program did not cover buildings with rigid diaphragms, so it is appropriate to refer to the building code for wall anchorage forces consistent with other parts of this section.

Cost Impact: The code change proposal could lead to a significant reduction in cost to masonry wall anchorage in buildings with rigid diaphragm.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

EB43–09/10
A301.2

Proponent: David Bonowitz, SE, National Council of Structural Engineers Associations, Code Advisory Committee, Existing Buildings Subcommittee (NCSEA EBS)

THIS PROPOSAL IS ON THE AGENDA OF THE IBC STRUCTURAL CODE DEVELOPMENT COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THE IBC STRUCTURAL CODE DEVELOPMENT COMMITTEE.

Revise as follows:

A301.2 Scope. The provisions of this chapter apply to residential buildings of light-frame wood construction ~~assigned to Seismic Design Category C, D or E of the *International Building Code*~~ containing one or more of the structural weaknesses specified in Section A303.

Exception: The provisions of this chapter do not apply to the buildings, or elements thereof, listed below. These buildings or elements require analysis by an engineer or architect in accordance with Section A301.3 to determine appropriate strengthening:

1. Group R-1, R-2 or R-4 occupancies with more than four dwelling units.
2. Buildings with a lateral-force-resisting system using poles or columns embedded in the ground.
3. Cripple walls that exceed 4 feet (1219 mm) in height.
4. Buildings exceeding three stories in height and any three-story building with cripple wall studs exceeding 14 inches (356 mm) in height.
5. Buildings where the building official determines that conditions exist that are beyond the scope of the prescriptive requirements of this chapter.
6. Buildings or portions thereof constructed on concrete slabs on grade.

The details and prescriptive provisions herein are not intended to be the only acceptable strengthening methods permitted. Alternative details and methods may be used when approved by the building official. Approval of alternatives shall be based on test data showing that the method or material used is at least equivalent in terms of strength, deflection and capacity to that provided by the prescriptive methods and materials.

The provisions of this chapter may be used to strengthen historic structures, provided they are not in conflict with other related provisions and requirements that may apply.

Reason: This proposal clarifies the intent of the first paragraph of this section. The balance of the section, not shown, remains unchanged by this proposal.

Appendix Chapter A3 originated as stand-alone provisions in various jurisdictions in California. In those conditions, it was appropriate to include scoping provisions to indicate that retrofit was only required or advised in areas of higher seismic risk. However, with their use in the IEBC, the provisions are either used to satisfy triggered upgrades via IEBC Section 101.5.4.2 or used for a voluntary seismic upgrade (allowed under IEBC Section 707.6). For both reasons, the scoping of the appendix chapter should not restrict their use to certain seismic design categories. The sections of the IEBC where seismic upgrade triggers occur (see Sections 502.2.2, 707.5, or 807.4) do not distinguish between seismic design categories, so neither should the appendix chapter. The intent of this proposal is to permit this chapter's use at the option of the registered design professional regardless of seismic design category.

With the proposed modification, Appendix Chapter A3 could be used in all seismic design categories, although the following should be noted:

- Structures assigned to SDC A are exempt from most seismic provisions per ASCE 7-05 Section 11.7,
- Dwellings in low seismic design categories are exempt from all seismic provisions per IBC Section 1613.1, and
- Residential buildings would not be assigned to Seismic Design Category F.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

EB44–09/10
A301.2

Proponent: David Bonowitz, SE, National Council of Structural Engineers Associations, Code Advisory Committee, Existing Buildings Subcommittee (NCSEA EBS)

THIS PROPOSAL IS ON THE AGENDA OF THE IBC STRUCTURAL CODE DEVELOPMENT COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THE IBC STRUCTURAL CODE DEVELOPMENT COMMITTEE.

Revise as follows:

A301.2 Scope. The provisions of this chapter apply to residential buildings of light-frame wood construction assigned to Seismic Design Category C, D or E of the *International Building Code* containing one or more of the structural weaknesses specified in Section A303.

Exception: The provisions of this chapter do not apply to the buildings, or elements thereof, listed below. These buildings or elements require analysis by an engineer or architect in accordance with Section A301.3 to determine appropriate strengthening:

1. Group R-1, R-2 or R-4 occupancies with more than four dwelling units.
2. Buildings with a lateral-force-resisting system using poles or columns embedded in the ground.
3. Cripple walls that exceed 4 feet (1219 mm) in height.
4. Buildings exceeding three stories in height and any three-story building with cripple wall studs exceeding 14 inches (356 mm) in height.
5. Buildings where the building official determines that conditions exist that are beyond the scope of the prescriptive requirements of this chapter.
6. Buildings or portions thereof constructed on concrete slabs on grade.

The details and prescriptive provisions herein are not intended to be the only acceptable strengthening methods permitted. Alternative details and methods may be used when approved by the building official. Approval of alternatives shall be based on test data showing that the method or material used is at least equivalent in terms of strength, deflection and capacity to that provided by the prescriptive methods and materials.

~~The provisions of this chapter may be used to strengthen historic structures, provided they are not in conflict with other related provisions and requirements that may apply.~~

Reason: This sentence is unnecessary and confusing. First, it might conflict with more general provisions for historic buildings in IEBC chapter 11. Also, it seems to suggest that all the other scope limitations of A301.2 – post supports, brick footings, etc., as well as archaic existing materials or details – may be waived for any historic building. That was not the intent of the sentence. Rather, the intent was to allow the use of this chapter unless historic codes restrict certain work, but such a statement is not needed. Further, as noted in the Chapter A3 commentary, historic houses sometimes have post supports or other conditions that would make this chapter difficult to apply, and those conditions call for consultation with the building department, which is at odds with this single sentence in A301.2.

Cost Impact: The code change proposal will not increase the cost of construction.

A301.2, A301.3, A304.1.1

Proponent: David Bonowitz, SE, National Council of Structural Engineers Associations, Code Advisory Committee, Existing Buildings Subcommittee (NCSEA EBS)

THIS PROPOSAL IS ON THE AGENDA OF THE IBC STRUCTURAL CODE DEVELOPMENT COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THE IBC STRUCTURAL CODE DEVELOPMENT COMMITTEE.

Revise as follows:

A301.2 Scope. The provisions of this chapter apply to residential buildings of light-frame wood construction assigned to Seismic Design Category C, D or E of the *International Building Code* containing one or more of the structural weaknesses specified in Section A303.

Exception: The provisions of this chapter do not apply to the buildings, or elements thereof, listed below. These buildings or elements require analysis by an engineer or architect in accordance with Section A301.3 to determine appropriate strengthening:

1. Group R-1, R-2 or R-4 occupancies with more than four dwelling units.
2. Buildings with a lateral-force-resisting system using poles or columns embedded in the ground.
3. Cripple walls that exceed 4 feet (1219 mm) in height.
4. Buildings exceeding three stories in height and any three-story building with cripple wall studs exceeding 14 inches (356 mm) in height.
5. Buildings where the building official determines that conditions exist that are beyond the scope of the prescriptive requirements of this chapter.
6. Buildings or portions thereof constructed on concrete slabs on grade.

~~The details and prescriptive provisions herein are not intended to be the only acceptable strengthening methods permitted. Alternative details and methods may be used when approved by the building official. Approval of alternatives shall be based on test data showing that the method or material used is at least equivalent in terms of strength, deflection and capacity to that provided by the prescriptive methods and materials.~~

The provisions of this chapter may be used to strengthen historic structures, provided they are not in conflict with other related provisions and requirements that may apply.

A301.3 Alternative design procedures. The details and prescriptive provisions herein are not intended to be the only acceptable strengthening methods permitted. Alternative details and methods may be used where designed by a registered design professional and approved by the code official. Approval of alternatives shall be based on a demonstration that the method or material used is at least equivalent in terms of strength, deflection and capacity to that provided by the prescriptive methods and materials.

Where ~~When~~ analysis by a registered design professional ~~an engineer or architect~~ is required ~~in accordance with Section A301.2,~~ such analysis shall be in accordance with all requirements of the building code, except that the seismic forces ~~base shear~~ may be taken as 75 percent of those ~~the horizontal forces~~ specified in the building code.

A304.1.1 Scope. The structural weaknesses noted in Section A303 shall be strengthened in accordance with the requirements of this section. Strengthening work may include both new construction and alteration of existing construction. Except as provided herein, all strengthening work and materials shall comply with the applicable provisions of the building code. ~~Alternative methods of strengthening may be used provided such systems are designed by an engineer or architect and are approved by the building official.~~

Reason: This proposal is mostly editorial. It relocates three sentences from current section A301.2 to section A301.3 and makes coordinating revisions. These three sentences are clearly about alternative methods. They belong in A301.3, so this proposal moves them there, and edits them slightly for consistent terminology. The portion of current A301.2 not shown is to remain unchanged by this proposal.

Once these sentences are relocated to A301.3, the current reference to A301.2 (in A301.3) is no longer needed. The other changes shown in A301.3 are editorial, for consistent terminology. In A304.1.1, the final sentence duplicates the relocated provision above and is proposed for deletion.

There is one substantive change: In the last of the three relocated sentences, the current call for "test data" is proposed for revision. The I-codes typically allow alternatives, and test data are not always required. Reasonable alternatives can also be justified on the basis of engineering analysis, proprietary data, conventional methods, or other consensus documents derived from test data but not necessarily based on that data directly. Approval of the code official is still required, and the key issues are identified in the rest of the sentence, which remains unchanged.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: BONOWITZ-EB4-A301.2.DOC

EB46–09/10
A303

Proponent: David Bonowitz, SE, National Council of Structural Engineers Associations, Code Advisory Committee, Existing Buildings Subcommittee (NCSEA EBS)

THIS PROPOSAL IS ON THE AGENDA OF THE IBC STRUCTURAL CODE DEVELOPMENT COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THE IBC STRUCTURAL CODE DEVELOPMENT COMMITTEE.

Revise as follows:

SECTION A303
STRUCTURAL WEAKNESSES

For the purpose of this chapter, structural weaknesses shall be as specified below.

1. Sill plates or floor framing that are supported directly on the ground without a foundation system that conforms to the building code ~~an approved foundation system~~.
2. A perimeter foundation system that is constructed only of wood posts supported on isolated pad footings.
3. Perimeter foundation systems that are not continuous.

   Exceptions:

   1. Existing single-story exterior walls not exceeding 10 feet (3048 mm) in length, forming an extension of floor area beyond the line of an existing continuous perimeter foundation.
   2. Porches, storage rooms and similar spaces not containing fuel-burning appliances.

4. A perimeter foundation system that is constructed of unreinforced masonry or stone.
5. Sill plates that are not connected to the foundation or that are connected with less than what is required by the building code.

   Exception: When approved by the building official, connections of a sill plate to the foundation made with other than sill bolts may be accepted if the capacity of the connection is equivalent to that required by the building code.

6. Cripple walls that are not braced in accordance with the requirements of Section A304.4 and Table A3-A, or cripple walls not braced with diagonal sheathing or wood structural panels in accordance with the building code.

Reason: This proposal makes the provision more consistent and enforceable. The intent of this section is to identify non-conforming conditions expected to lead to deficient performance. The conditions should be objectively defined, as they are for all but item 1. This proposal therefore modifies item 1 to make it consistent with the rest of the section.

Approval of alternate conditions remains a possibility under section A301.3 but “approval” is not the subject of section A303.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

A304.1.3, A304.1.4, Figure A3-8, Figure A3-8A(New), Figure A3-8B(New), Figure A3-8C(New), Figure A3-9,

Proponent: David Bonowitz, SE, National Council of Structural Engineers Associations, Code Advisory Committee, Existing Buildings Subcommittee (NCSEA EBS)

THIS PROPOSAL IS ON THE AGENDA OF THE IBC STRUCTURAL CODE DEVELOPMENT COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THE IBC STRUCTURAL CODE DEVELOPMENT COMMITTEE.

1. Revise as follows:

A304.1.3 Floor joists not parallel to foundations. Floor joists framed perpendicular or at an angle to perimeter foundations shall be restrained either by an existing nominal 2-inch-wide (51 mm) continuous rim joist or by a nominal 2-inch-wide (51 mm) full-depth block~~ing~~ between alternate joists in one-and two-story buildings, and between each joist in three-story buildings. Existing blocking for multistory buildings must occur at each joist space above a braced cripple wall panel.

Existing connections at the top and bottom edges of an existing rim joist or blocking need not be verified in one-story buildings. In multistory buildings, the existing top edge connection need not be verified; however, the bottom edge connection to either the foundation sill plate or the top plate of a cripple wall shall be verified. The minimum existing bottom edge connection shall consist of 8d toenails spaced 6 inches (152mm) apart for a continuous rim joist, or three 8d toenails per block. When this minimum bottom edge-connection is not present or cannot be verified, a supplemental connection installed as shown in ~~Figure A3-8~~ Figure A3-8A or A3-8C shall be provided.

Where an existing continuous rim joist or the minimum existing blocking does not occur, new ¾-inch or 23/32"(19 mm) wood structural panel blocking installed tightly between floor joists and nailed as shown in Figure ~~A3-8~~ A3-9 shall be provided at the inside face of the cripple wall. In lieu of ~~3/4-inch (19 mm)~~ wood structural panel blocking, tight fitting, full-depth 2-inch (51 mm) blocking may be used. New blocking may be omitted where it will interfere with vents or plumbing that penetrates the wall.

A304.1.4 Floor joists parallel to foundations. Where existing floor joists are parallel to the perimeter foundations, the end joist shall be located over the foundation and, except for required ventilation openings, shall be continuous and in continuous contact with the foundation sill plate or the top plate of the cripple wall. Existing connections at the top and bottom edges of the end joist need not be verified in one-story buildings. In multistory buildings, the existing top edge connection of the end joist need not be verified; however, the bottom edge connection to either the foundation sill plate or the top plate of a cripple wall shall be verified. The minimum bottom edge connection shall be 8d toenails spaced 6 inches (152 mm) apart. If this minimum bottom edge connection is not present or cannot be verified, a supplemental connection installed as shown in Figure ~~A3-9~~ A3-8B, A3-8C, or A3-9 shall be provided.

2. Delete current figures and substitute as follows:

NOTES: SEE SECTION A304.4 FOR CRIPPLE WALL BRACING.

FIGURE A3–9 – ALTERNATE FLOOR FRAMING TO CRIPPLE WALL CONNECTION

Reason: This proposal updates and replaces Figures A3-8 and A3-9, and makes corresponding revisions to the text. In the last paragraph of A304.1.3, ¾" plywood is also referenced as 23/32" as this is more common at lumber yards.

The 2009 figures proposed for replacement or modification are rarely used, as they have been found to be impractical or of limited capacity. 2009 Figures A3-8 and A3-9 attempted to address the floor-to-cripple wall attachment with a plywood gusset concept for both parallel and non-parallel floor framing conditions. However, the approach was both uneconomical and of limited capacity due to a poor connection between the top of the gusset and the floor diaphragm. In 2009 figure A3-8 there is no attachment between the top of the plywood gusset and the floor diaphragm. The detail thus relies for shear transfer on compression of a plywood gusset with an unsupported top. 2009 Figure A3-9 indicates an attachment to the floor diaphragm, but this attachment would be made with shot nails or wood screws into the existing flooring, which is not recommended.

The proposed figures illustrate preferred approaches for creating a load path between the existing floor structure and either the top of the cripple wall (Figures A3-8A and A3-8B) or the sill plate (Figure A3-8C). These new Figures systematically address the four most common conditions found in houses eligible for Chapter A3 with reliable and cost effective details. Similar to portions of 2009 Figure A3-8, these new details utilize readily available and well-documented metal fasteners.

Proposed Figure A3-9 is a modification of 2009 Figure A3-8 with the upper portion of 2009 Figure A3-9 retained as an alternative for cases where the plywood gusset approach might be suitable. The 2009 details have been modified to provide a simpler and more reliable attachment to the floor diaphragm that does not risk damage to the interior flooring.

Cost Impact: The code change proposal will not increase the cost of construction.

EB48–09/10
A304.2.2

Proponent: David Bonowitz, SE, National Council of Structural Engineers Associations, Code Advisory Committee, Existing Buildings Subcommittee (NCSEA EBS)

THIS PROPOSAL IS ON THE AGENDA OF THE IBC STRUCTURAL CODE DEVELOPMENT COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THE IBC STRUCTURAL CODE DEVELOPMENT COMMITTEE.

Revise as follows:

A304.2.2 Evaluation of existing foundations ~~Foundation evaluation by an engineer or architect~~. Partial perimeter foundations or unreinforced masonry foundations shall be evaluated by a registered design professional ~~an engineer or architect~~ for the force levels specified ~~noted~~ in Section A301.3. Test reports or other substantiating data to determine existing foundation material strengths shall be submitted to the code official ~~for review~~. Where ~~When~~ approved by the code ~~building~~ official, these existing foundation systems may be strengthened in accordance with the recommendations included with the evaluation in lieu of being replaced.

Exception: In lieu of testing existing foundations to determine material strengths, and where ~~when~~ approved by the code ~~building~~ official, a new nonperimeter foundation system designed for the forces specified ~~noted~~ in Section A301.3 may be used to resist ~~all exterior~~ lateral forces from perimeter walls. A registered design professional shall confirm the ability of the existing diaphragm to transfer seismic forces to the new nonperimeter foundations.

Reason: This proposal is primarily editorial, for clarity and consistency of terminology. The exception allows interior foundation walls to resist lateral forces coming from the perimeter of the building. The design professional responsible for the new non-perimeter foundation should also check the diaphragm as part of this offset load path.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: BONOWITZ-EB9- A304.2.2.DOC

EB49–09/10
A304.2.3 through A304.2.6, A304.2.6 (New), Appendix A

Proponent: David Bonowitz, SE, National Council of Structural Engineers Associations, Code Advisory Committee, Existing Buildings Subcommittee (NCSEA EBS)

THIS PROPOSAL IS ON THE AGENDA OF THE IBC STRUCTURAL CODE DEVELOPMENT COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THE IBC STRUCTURAL CODE DEVELOPMENT COMMITTEE.

1. Revise as follows:

A304.2.3 Details for new perimeter foundations. All new perimeter foundations shall be continuous and constructed according to ~~one of the details shown in~~ either Figure A3-1 or A3-2. All new construction materials shall comply with the requirements of building code. Where approved by the code official, the existing clearance between existing floor joists or girders and existing grade below the floor need not comply with the building code.

Exception~~s~~:

1. ~~When approved by the building official, the existing clearance between existing floor joists or girders and existing grade below the floor need not comply with the building code.~~
2. ~~2.~~ Where designed by a registered design professional and ~~When~~ approved by the code ~~building~~ official, ~~and when designed by an engineer or architect,~~ partial perimeter foundations may be used in lieu of a continuous perimeter foundation.

A304.2.4 New concrete foundations ~~Required compressive strength~~. New concrete foundations shall have a minimum compressive strength of 2,500 pounds per square inch (17.24 MPa) at 28 days.

A304.2.5 New hollow-unit masonry foundations. New hollow-unit masonry foundations shall be solidly grouted. The grout shall have minimum compressive strength of 2,000 pounds per square inch (13.79 MPa). Mortar shall be Type M or S~~, and grout and masonry units shall comply with the building code~~.

~~**A304.2.6 Reinforcing steel**. Reinforcing steel shall comply with the requirements of the building code.~~

A304.2.6 New sill plates. Where new sill plates are used in conjunction with new foundations, they shall be minimum 2x nominal thickness and shall be preservative-treated wood or foundation grade redwood marked or branded by an approved agency. Nails in contact with preservative-treated wood shall be hot-dip galvanized. Metal framing anchors in contact with preservative-treated wood shall be galvanized in accordance with ASTM A153 with a G185 coating.

2. Add standard to Appendix A referenced standards:

ASTM

A153/A153M-05	Standard Specification for Zinc Coating (Hot-Dip) on Iron and Steel Hardware

Reason: This proposal addresses a series of provisions all related to new foundation elements. It proposes a number of editorial revisions for clarity and consistency of terminology, as well as a few substantive improvements, as follows:

In A304.2.3, a general reference to the building code is proposed so that subsequent sections (A304.2.5 and A304.2.6) don't each need to refer to the building code. The final sentence of the section is merely relocated from Exception 1. Since the referenced details have no provisions for minimum under-floor clearances, this allowance for code official discretion is not actually an Exception. This is an editorial change. Exception 2 is edited for consistent terminology.

A304.2.4 is merely re-titled for consistency.

A304.2.5 is clarified by the addition of a minimum grout strength consistent with the code for new construction, a reflection of standard practice that improves these prescriptive provisions.

Current A304.2.6 is proposed for deletion. References here to the building code are unnecessary if a general requirement is added per A304.2.3.

A new section (proposed A304.2.6) addresses sill plates on new foundations. The construction of new footings will likely require a new sill plate. The proposal makes requirements for this new member and connectors.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: ASTM A153/A153M-05 is currently referenced in the IBC.

	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: BONOWITZ-EB10- A304.2.3.DOC

EB50–09/10
A304.3.1, A304.3.2, A304.3.3, A304.5, A302

Proponent: David Bonowitz, SE, National Council of Structural Engineers Associations, Code Advisory Committee, Existing Buildings Subcommittee (NCSEA EBS)

THIS PROPOSAL IS ON THE AGENDA OF THE IBC STRUCTURAL CODE DEVELOPMENT COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THE IBC STRUCTURAL CODE DEVELOPMENT COMMITTEE.

Revise as follows:

A304.3.1 Existing perimeter foundations. Where ~~When~~ the building has an existing continuous perimeter foundation, all perimeter wall sill plates shall be anchored ~~bolted~~ to the foundation with adhesive ~~chemical~~ anchors or expansion anchors ~~bolts~~ in accordance with Table A3-A.

Anchors ~~or bolts~~ shall be installed in accordance with Figure A3-3, with the plate washer installed between the nut and the sill plate. The nut shall be tightened to a snug-tight condition after curing is complete for adhesive ~~chemical~~ anchors and after expansion wedge engagement for expansion ~~bolts~~ anchors. All anchors shall be installed in accordance with manufacturer's recommendations. ~~The installation of nuts on all bolts shall be subject to verification by the building official.~~ Where existing conditions prevent anchor ~~or bolt~~ installations through the sill plate, this connection may be made in accordance with Figure A3-4A, A3-4B, or A3-4C. The spacing of these alternate connections shall comply with the maximum spacing requirements of Table A3-A. Expansion anchors ~~bolts~~ shall not be used where ~~when~~ the installation causes surface cracking of the foundation wall at the locations of the bolt.

A304.3.2 Placement of ~~chemical~~ anchors ~~and expansion bolts~~. ~~Chemical anchors or expansion bolts~~ Anchors shall be placed within 12 inches (305 mm), but not less than 9 inches (229mm), from the ends of sill plates and shall be placed in the center of the stud space closest to the required spacing. New sill plates may be installed in pieces ~~when~~ where necessary because of existing conditions. For lengths of sill plate greater than 12 feet (3658mm), anchors or bolts shall be spaced along the sill plate as specified ~~noted~~ in Table A3-A. For other lengths of sill plate, ~~see~~ anchor placement shall be in accordance with Table A3-B. ~~For lengths of sill plate less than 30 inches (762mm), a minimum of one anchor or bolt shall be installed.~~

Exception: Where physical obstructions such as fireplaces, plumbing or heating ducts interfere with the placement of an anchor ~~or bolt~~, the anchor ~~or bolt~~ shall be placed as close to the obstruction as possible, but not less than 9 inches (229 mm) from the end of the plate. Center-to-center spacing of the anchors ~~or bolts~~ shall be reduced as necessary to provide the minimum total number of anchors required based on the full length of the wall. Center-to-center spacing shall not be less than 12 inches (305mm).

A304.3.3 New perimeter foundations. Sill plates for new perimeter foundations shall be ~~bolted as required by~~ anchored in accordance with Table A3-A and as shown in Figure A3-1 or A3-2.

A304.5 Quality control. All work shall be subject to inspection by the ~~building~~ code official including, but not limited to:

1. Placement and installation of new ~~chemical anchors or expansion bolts~~ adhesive or expansion anchors installed in existing foundations. Special inspection is not required for ~~chemical~~ adhesive anchors installed in existing foundations regulated by the prescriptive provisions of this chapter.
2. Installation and nailing of new cripple wall bracing.
3. Any work may be subject to special inspection when required by the ~~building~~ code official in accordance with the building code.

ADHESIVE ~~CHEMICAL~~ ANCHOR. An assembly consisting of a threaded rod, washer, nut, and chemical adhesive approved by the code building official for installation in existing concrete or masonry.

EXPANSION ~~BOLT~~ ANCHOR. ~~A single assembly approved by the building official for installation in existing concrete or masonry. For the purpose of this chapter, expansion bolts shall contain a base designed to expand when properly set, wedging the bolt in the pre-drilled hole. Assembly shall also include appropriate washer and nut.~~ An approved post-installed anchor, inserted into a pre-drilled hole in existing concrete or masonry, that transfers loads to or from the concrete or masonry by direct bearing or friction or both.

Reason: This proposal is primarily editorial. It renames and revises the definitions of the two anchor types for consistency with definitions now used in ACI 318 Appendix D and other ICC-ES resources. It also makes editorial revisions as needed to reflect the revised terminology.

In A304.3.1, the proposal adds a reference to manufacturer's recommendations, which is standard practice, especially for expansion anchors, which are typically proprietary. Verification by the code official is adequately covered in A304.5, so that sentence is proposed for deletion to avoid duplication.

In A304.3.2, the sentence about "lengths of sill plate less than 30 inches" duplicates a requirement already in Table A3-B, referenced in the previous sentence. It is proposed for deletion to avoid duplication.

Other minor revisions are editorial, for the sake of consistent terminology.

Cost Impact: The code change proposal will not increase the cost of construction.

A304.4.1, A304.4.1.1

Proponent: David Bonowitz, SE, National Council of Structural Engineers Associations, Code Advisory Committee, Existing Buildings Subcommittee (NCSEA EBS)

THIS PROPOSAL IS ON THE AGENDA OF THE IBC STRUCTURAL CODE DEVELOPMENT COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THE IBC STRUCTURAL CODE DEVELOPMENT COMMITTEE.

Revise as follows:

A304.4.1 General. Exterior cripple walls not exceeding 4 feet (1219 mm) in height shall ~~use~~ be permitted to be specified by the prescriptive bracing method in Section A304.4 ~~below~~. Cripple walls over 4 feet (1219mm) in height require analysis by a registered design professional ~~an engineer or architect~~ in accordance with Section A301.3.

A304.4.1.1 Sheathing installation requirements. Wood structural panel sheathing shall not be less than 15/32-inch (12 mm) thick and shall be installed in accordance with Figure A3-5 or A3-6. All individual pieces of wood structural panels shall be nailed with 8d common nails spaced 4 inches (102 mm) on center at all edges and 12 inches (305 mm) on center at each intermediate support with not less than two nails for each stud. Nails shall be driven so that their heads are flush with the surface of the sheathing and shall penetrate the supporting member a minimum of 1 1/2 inches (38 mm). When a nail fractures the surface, it shall be left in place and not counted as part of the required nailing. A new 8d nail shall be located within 2 inches (51 mm) of the discounted nail and be hand-driven flush with the sheathing surface. ~~All horizontal~~ Where the installation involves horizontal joints, those joints ~~must~~ shall occur over nominal 2-inch by 4-inch (51 mm by 102 mm) blocking installed with the nominal 4-inch (102 mm) dimension against the face of the plywood.

Vertical joints at adjoining pieces of wood structural panels shall be centered on ~~existing~~ studs such that there is a minimum 1/8 inch (3.2 mm) between the panels, and such that the nails are placed a minimum of ½ inch (12.7 mm) from the edges of the existing stud. Where such edge distances cannot be maintained because of the width of the existing stud, a new stud shall be added adjacent to the existing studs and connected in accordance with Figure A3-7.

Reason: This proposal is editorial, for improved clarity and consistent code language.

Cost Impact: The code change proposal will not increase the cost of construction.

A304.5.1 (New)

Proponent: David Bonowitz, SE, National Council of Structural Engineers Associations, Code Advisory Committee, Existing Buildings Subcommittee (NCSEA EBS)

THIS PROPOSAL IS ON THE AGENDA OF THE IBC STRUCTURAL CODE DEVELOPMENT COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THE IBC STRUCTURAL CODE DEVELOPMENT COMMITTEE.

Add new text as follows:

A304.5.1 Nails. All nails specified in this chapter shall be common wire nails of the following diameters and lengths: 8d nails shall be 0.131" x 2 ½". 10d nails shall be 0.148" x 3". 12d nails shall be 0.148" x 3 ¼". 16d nails shall be 0.162" x 3 ½". Nails used to attach metal framing connectors directly to wood members need only be 1 ½" long.

Reason: This proposal adds needed specificity. The chapter makes many references to nails but does not always indicate "Common Wire Nails". Many different types of nails are also sold at lumber supply yards and hardware stores, so choosing the appropriate type of nail may be confusing. Furthermore, the substitution of inadequate nails is commonplace where gage and length are not specified. This proposal clarifies what is required

Cost Impact: The code change proposal will not increase the cost of construction.

THIS PROPOSAL IS ON THE AGENDA OF THE IBC STRUCTURAL CODE DEVELOPMENT COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THE IBC STRUCTURAL CODE DEVELOPMENT COMMITTEE.

Delete without substitution:

~~**A304.6 Phasing of the strengthening work.** When approved by the building official, the strengthening work contained in this chapter may be completed in phases. The strengthening work in any phase shall be performed on two parallel sides of the structure at the same time.~~

Reason: The proposal removes an unnecessary and possibly costly provision. First, work may always be phased or sequenced at the discretion of the code official. The current provision is intended to assure that the greatest seismic risks are reduced before other work is performed. But the probability that a significant earthquake occurs during the project is extremely low, even if the work is phased. Since this chapter is triggered by other provisions in the body of the IEBC, the seismic improvements it requires will already be part of the project scope and would not inadvertently be delayed or left incomplete. By requiring a specific sequence of work, the provision could unnecessarily restrict an owner from completing work in the least disruptive or expensive way. Finally, single-family residences do not always have parallel sides, making it difficult to implement the original requirement.

Cost Impact: The code change proposal will not increase the cost of construction.

FIGURE A3–7 – PARTIAL CRIPPLE STUD WALL ELEVATION

Reason: This proposal updates Figures A3-1 through A3-7 to improve their clarity, consistency, usability, and enforceability, and to better coordinate them with the text. The major edits to each Figure, along with explanations of the few minor substantive proposals are as follows:

Proposed revision to Figure A3-1 does the following:

- Deletes nails shown at floor sill plate, as they are not required and do not apply to any work required by the sections that reference this Figure, A304.2.3 and A304.3.3.
- Corrects table to add vertical reinforcing requirements for foundations supporting one story. The 2009 table has column heading text in the wrong row and mistakenly omits data for 1-story houses.
- Requires 2 #4 continuous bars for the lower footing section in lieu of 1-#4 continuous, as well as horizontal reinforcing at 16 inches on center. This is standard practice and is more appropriate for a prescriptive detail, especially when the footing is 18" wide, to help account for expansive or otherwise marginal soil not explicitly addressed by the prescriptive retrofit design.
- Requires 3" clear dimension to the edge of the footing to ensure code compliance for footings cast against the earth.
- Adds a note clarifying sill plate may be new or existing when foundation is replaced.
- Adds a note to "clean and roughen" the footing, standard practice for foundations made with two pours.
- Corrects leader for reference to "H"
- Calls out #4 vertical bars to clarify the intent of the table. Calls for alternating hooks which is a good standard practice.
- Other editorial clarifications, including consistent terminology for "floor framing," "sill plate, "sole plate" (the horizontal plate above the floor line), and "anchors".

Proposed revision to Figure A3-2 does the following:

- Deletes nails shown at floor sill plate, as they are not required and do not apply to any work required by the sections that reference this Figure, A304.2.3 and A304.3.3.
- Corrects typo. Sill plate call-out should read "2x6".
- Corrects graphical inconsistency for depth of embedment and height above grade.
- Requires 2 #4 continuous bar for the lower footing section in lieu of 1-#4 continuous. This is standard practice and is more appropriate especially when footing is 18" wide.
- Other editorial clarifications, including consistent terminology for "code official," "floor framing," "sill plate, "sole plate" (the horizontal plate above the floor line), and "anchors".

Proposed revision to Figure A3-3 does the following:

- Deletes nails shown at floor sill plate, as they are not required and do not apply to any work required by the section that references this Figure, A304.3.1.
- Clarifies that filling oversized holes with adhesive is required only for adhesive anchors, not expansion anchors.
- Changes washer requirement and size to match current code requirements.
- Requires that new anchors be installed clear of existing reinforcing.
- Other editorial clarifications, including consistent terminology for "floor framing," "sill plate, "sole plate" (the horizontal plate above the floor line), and "anchors".

Proposed revision to Figure A3-4A does the following:

- Deletes nails shown at floor sill plate, as they are not required and do not apply to any work required by the section that references this Figure, A304.3.1.
- Adds notes regarding shims. Typical hardware (Simpson, for example) limits shim thickness to 1-1/2".
- Revises plate detail to indicate that 1/4" screws are used from the shim to the sill. Extends the leader from the 5/16" diameter holes to the center-top hole in the metal plate. Changes reference to "lag screws" in the 5/16" call out to "lag holes" since the upper in the metal plate must be 5/16" to accept a ¼" lag screw
- Adds note to isolate wood shim from the foundation with moisture barrier.
- Revises title.
- Other editorial clarifications, including consistent terminology for "floor framing," "sill plate, "sole plate" (the horizontal plate above the floor line), and "anchors".

Proposed revision to Figure A3-4B does the following:

- Deletes nails shown at floor sill plate, as they are not required and do not apply to any work required by the section that references this Figure.
- References shim requirements on Figure A3-4A.
- Revises title.

Proposed revision to Figure A3-4C does the following:

- Indicates 1½" maximum dimension for shim.
- Adds note that shim should be pressure treated or redwood as it is in contact with the ground.
- Adds note for shim to be foundation grade redwood or to be isolated from the foundation with a moisture barrier.

Proposed revision to Figure A3-5 does the following:

- Deletes nails shown at floor sill plate, as they are not required and do not apply to any work required by the section that references this Figure.
- Adds references to other Figures.
- Other editorial clarifications, including consistent terminology for "floor framing," "sill plate, "sole plate" (the horizontal plate above the floor line), and "anchors".

Proposed revision to Figure A3-6 does the following:

- Deletes nails shown at floor sill plate, as they are not required and do not apply to any work required by the section that references this Figure.
- Adds note to caution against splitting the block and to recommend pre-drilling.
- Other editorial clarifications, including consistent terminology for "floor framing," "sill plate, "sole plate" (the horizontal plate above the floor line), and "anchors".

Proposed revision to Figure A3-7 does the following:

- "Vertical splice at double stud": Changes face nail of studs to 10d @ 4" on center. 16d nails are 3 ½" thus potentially penetrating ½" past double 2x4's. 10d nails at reduced spacing will lead to less chance of splitting but give even greater capacity.
- "Vertical splice at single stud": Deletes ½" requirement for nail to edge of stud, as this is not required for new construction.
- Clarifies the requirement for stud thickness at vertical panel joints.
- Other editorial revisions, including corrections to leader lines and more accurately displayed field nail spacing.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: BONOWITZ-EB15-FIG A31-A37.DOC

EB55–09/10
A401.2

Proponent: Gary R. Searer, Wiss, Janney, Elstner Associates, Inc., representing National Council of Structural Engineers Association (NCSEA) Existing Buildings Subcommittee

THIS PROPOSAL IS ON THE AGENDA OF THE IBC STRUCTURAL CODE DEVELOPMENT COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THE IBC STRUCTURAL CODE DEVELOPMENT COMMITTEE.

Revise as follows:

A401.2 Scope. The provisions of this chapter shall apply to all existing Occupancy Group R-1 and R-2 buildings of wood construction or portions thereof where the structure has a soft, weak, or open-front wall line, and there exists one or more stories above. ~~:~~

~~1. The ground floor portion of the wood-frame structure contains parking or other similar open floor space, which causes soft, weak or open-front wall lines as defined in this chapter, and there exists one or more stories above.,or~~

~~2. The walls of any story or basement of wood construction are laterally braced with nonconforming structural materials as defined in this chapter, a soft or weak wall line exists as defined in this chapter and there exist two or more stories above.~~

~~3 The structure is assigned to Seismic Design Category C, D or E.~~

Reason: This proposal clarifies the scope by removing inapplicable and unnecessary language. Of the three conditions in the current provision, only Condition 1 is appropriate for a clear and limited scope. The proposed wording of Condition 1 removes the reference to parking and open floor space, as well as the requirement that the open floor space be on the ground floor. While these are common conditions, they are not the only ones to which this chapter is meant to apply. The descriptors proposed for removal are better suited for commentary.

Current Condition 2 recognizes the possibility of a weak or soft story condition without an open front wall line, but with the revision to Condition 1, it is no longer necessary, as soft and weak conditions are already covered.

Current Condition 3 indicates the original intent of this chapter to apply to voluntary retrofits in areas of relatively high seismicity. While the provisions were not written originally for SWOF buildings in areas of lower seismicity, they may be used for those buildings. Further, the limitation to SDC C-E no longer applies now that this chapter is referenced from the body of the IEBC as an option for buildings in any seismic design category.

Cost Impact: The code change proposal will not increase the cost of construction.

A402

Proponent: David Bonowitz, SE, National Council of Structural Engineers Associations, Code Advisory Committee, Existing Buildings Subcommittee (NCSEA EBS)

THIS PROPOSAL IS ON THE AGENDA OF THE IBC STRUCTURAL CODE DEVELOPMENT COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THE IBC STRUCTURAL CODE DEVELOPMENT COMMITTEE.

Revise definition as follows:

A402
DEFINITIONS

EXPANSION ANCHOR. ~~An approved mechanical fastener placed in hardened concrete that is designed to expand in a self-drilled or pre-drilled hole of a specified size and engage the sides of the hole in one or more locations to develop shear and/or tension resistance to applied loads without grout, adhesive, or drypack.~~ An approved post-installed anchor, inserted into a pre-drilled hole in existing concrete or masonry, that transfers loads to or from the concrete or masonry by direct bearing or friction or both.

Reason: This proposal is editorial. The proposed definition is consistent with that now used in ACI 318 Appendix D and other ICC-ES resources.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: BONOWITZ-EB12- A402-EXPANSION ANCHOR.DOC

EB57–09/10
A403.1

Proponent: Gary R. Searer, Wiss, Janney, Elstner Associates, Inc., representing National Council of Structural Engineers Association (NCSEA) Existing Buildings Subcommittee

THIS PROPOSAL IS ON THE AGENDA OF THE IBC STRUCTURAL CODE DEVELOPMENT COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THE IBC STRUCTURAL CODE DEVELOPMENT COMMITTEE.

Revise as follows:

A403.1 General. ~~Buildings within the scope of this chapter shall be analyzed, designed, and constructed in conformance with the building code, except as modified in this chapter.~~ All modifications required by the provisions in this chapter shall be designed in accordance with the International Building Code provisions for new construction, except as modified by this chapter.

Exception: Buildings for which the prescriptive measures provided in Section A405 apply and are used.

No alteration of the existing lateral-force-resisting system or vertical-load-carrying system shall reduce the strength or stiffness of the existing structure, unless the altered structure would remain in conformance with the building code and this chapter. ~~When~~ Where any portion of a building within the scope of this chapter is constructed on or into a slope steeper than one unit vertical in three units horizontal, the lateral-force-resisting system at and below the base level diaphragm shall be analyzed for the effects of concentrated lateral forces at the base caused by this hillside condition.

Reason: This proposal clarifies the intent of the section. The current wording of the first paragraph suggests improperly that whole buildings must be brought to conformance with the code for new construction, when the actual intent, as clearly stated within the chapter, is to address only the critical parts of an eligible building.

Only the modifications required by this chapter, principally the added structural elements, must be designed in accordance with IBC. (It's important to say "IBC provisions for new construction" so as not to require IBC Chapter 34, to which this IEBC Appendix Chapter is an alternate.) Existing elements are addressed in the second paragraph, which the proposal would modify to conform with the general philosophy of the IEBC regarding alterations.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: SEARER-EB9-A403.1.DOC

EB58–09/10
A403.2

Proponent: Gary R. Searer, Wiss, Janney, Elstner Associates, Inc., representing National Council of Structural Engineers Association (NCSEA) Existing Buildings Subcommittee

THIS PROPOSAL IS ON THE AGENDA OF THE IBC STRUCTURAL CODE DEVELOPMENT COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THE IBC STRUCTURAL CODE DEVELOPMENT COMMITTEE.

Revise as follows:

A403.2 Scope of analysis. This chapter requires the alteration, repair, replacement or addition of structural elements and their connections to meet the strength and stiffness requirements herein. The lateral-load-path analysis shall include the resisting elements and connections from the wood diaphragm immediately above any soft, weak or open-front wall lines to the foundation soil interface or to the uppermost story of a podium structure comprised of steel, masonry, or concrete structural systems that supports the upper, wood-framed structure. ~~floor or roof of a Type I structure below.~~ Stories above the uppermost story with a soft, weak, or open-front wall line shall be considered in the analysis but need not be modified. The lateral-load-path analysis for added structural elements shall also include evaluation of the allowable soil-bearing and lateral pressures in accordance with the building code.

Exception: When an open-front, weak or soft wall line exists because of parking at the ground floor of a two-story building and the parking area is less than 20 percent of the ground floor area, then only the wall lines in the open, weak or soft directions of the enclosed parking area need comply with the provisions of this chapter.

Reason: This proposal is editorial. The current reference to "Type 1" is unclear and somewhat illogical, since it uses a fire rating to define a type of structural system. To avoid potential confusion, the proposal replaces "Type I" with a slightly longer but clearer description using structural terms to indicate the intent of the provision (as explained in the ICC commentary). The proposed addition to the next to last sentence is a similar clarification with no substantive effect.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: SEARER-EB10-A403.2.DOC

EB59–09/10
A403.1, A403.2

Proponent: David Bonowitz, SE, National Council of Structural Engineers Associations, Code Advisory Committee, Existing Buildings Subcommittee (NCSEA EBS)

THIS PROPOSAL IS ON THE AGENDA OF THE IBC STRUCTURAL CODE DEVELOPMENT COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THE IBC STRUCTURAL CODE DEVELOPMENT COMMITTEE.

Revise as follows:

A403.1 General. Buildings within the scope of this chapter shall be analyzed, designed and constructed in conformance with the building code, except as modified in this chapter.

Exception: Buildings for which the prescriptive measures provided in Section A405 apply and are used.

No alteration of the existing lateral-force-resisting system or vertical-load-carrying system shall reduce the strength or stiffness of the existing structure. ~~When any portion of a building within the scope of this chapter is constructed on or into a slope steeper than one unit vertical in three units horizontal, the lateral-force-resisting system at and below the base level diaphragm shall be analyzed for the effects of concentrated lateral forces at the base caused by this hillside condition.~~

A403.2 Scope of analysis. This chapter requires the alteration, repair, replacement or addition of structural elements and their connections to meet the strength and stiffness requirements herein. The lateral-load-path analysis shall include the resisting elements and connections from the wood diaphragm immediately above any soft, weak or open-front wall lines to the foundation soil interface or to the uppermost floor or roof of a Type I structure below. Stories

above the uppermost story with a soft, weak, or open-front wall line need not be modified. The lateral-load-path analysis for added structural elements shall also include evaluation of the allowable soil-bearing and lateral pressures in accordance with the building code. Where any portion of a building within the scope of this chapter is constructed on or into a slope steeper than one unit vertical in three units horizontal, the lateral-force-resisting system at and below the base level diaphragm shall be analyzed for the effects of concentrated lateral forces at the base caused by this hillside condition.

Reason: This proposal is editorial. It simply moves the last sentence of current A403.1, which is about scope of analysis, to the end of A403.2, where it more properly belongs.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D

A403.3, A403.4, A403.5

Proponent: Gary R. Searer, Wiss, Janney, Elstner Associates, Inc., representing National Council of Structural Engineers Association (NCSEA) Existing Buildings Subcommittee

THIS PROPOSAL IS ON THE AGENDA OF THE IBC STRUCTURAL CODE DEVELOPMENT COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THE IBC STRUCTURAL CODE DEVELOPMENT COMMITTEE.

1. Revise as follows:

A403.3 Design base shear and design parameters. The design base shear in a given direction shall be permitted to be 75 percent of the value required for similar new construction in accordance with the building code. The value of R used in the design of the strengthening of any story shall not exceed the lowest value of R used in the same direction at any story above. The system overstrength factor, Ω_0, and the deflection amplification factor, C_d, shall not be less than the largest respective value corresponding to the R factor being used in the direction under consideration.

Exceptions:

1. For structures assigned to Seismic Design Category A or B, values of R, Ω_0, and C_d shall be permitted to be based on the seismic force-resisting system being used to achieve the required strengthening.
2. For structures assigned to Seismic Design Category C or D, values of R, Ω_0, and C_d shall be permitted to be based on the seismic force-resisting system being used to achieve the required strengthening, provided that when the strengthening is complete, the strengthened structure will not have an extreme weak story irregularity defined as Type 5b in ASCE 7 Table 12.3-2.
3. For structures assigned to Seismic Design Category E, values of R, Ω_0, and C_d shall be permitted to be based on the seismic force-resisting system being used to achieve the required strengthening, provided that when the strengthening is complete, the strengthened structure will not have an extreme soft story, a weak story, or an extreme weak story irregularity defined, respectively, as Types 1b, 5a, and 5b in ASCE 7 Table 12.3-2.

2. Delete without substitution:

~~**A403.4 Vertical distribution of forces.** The total seismic force shall be distributed over the height of the structure as for new construction in accordance with the building code. Distribution of force by story weight shall be permitted for two-story buildings. The value of R used in the design of any story shall be less than or equal to the value of R used in the given direction for the story above.~~

~~**A403.5 Weak story limitation.** Every weak story shall be strengthened to the lesser of:~~

1. ~~Ω_o times the story shear prescribed by Sections A403.3 and A403.4.~~
2. ~~In two-story buildings up to 30 feet (9144 mm) in height, 65 percent of the strength of the story above. In all other buildings, 80 percent of the strength of the story above.~~

(Renumber subsequent sections)

Reason: This proposal makes editorial clarifications and allows alternative design requirements that respond to implementation problems experienced by practitioners.

The principal editorial revision is that the limits on R values are moved from A403.4, where they are currently out of place, to A403.3.

The substantive changes address the following problem: The limits on R values (in current A403.4 and proposed A403.3), while based on rational limits for combined systems used in new construction, have had the effect of forcing an R value of 2.0 on the design of systems added for strengthening (due to the fact that the nonconforming gypsum and stucco materials on the upper floors would in effect mandate the use of an R of 2 for the lowest floor), thus requiring larger new members and longer new walls than is often necessary to achieve the risk reduction objective of this chapter. The larger and longer elements are likely also to bring additional expense, discouraging retrofit, and leading to constructability problems fitting the new elements into the existing building without affecting parking, exits, utility connections, etc.

Thus, the question is how to allow a more practical design (and R value) suited to the risk reduction retrofit of existing buildings, where new systems are typically used to supplement old ones, as opposed to new construction, where all new systems must and should comply completely with the building code. The right solution should acknowledge that no single R value can be stipulated for the design of strengthening elements, that Chapter A4 is intended as a prescriptive and somewhat simplified alternative to ASCE 41, and that the principal goal of retrofitting SWOF buildings is to eliminate their SWOF deficiency.

This proposal attempts to satisfy these constraints by allowing two options for the engineer:

- Use the low R value as a default. This maintains the requirement of the 2009 edition.
- Use a higher R value appropriate to the retrofit system as long as the designer demonstrates that critical irregularities will in fact be removed. The critical irregularities differ by Seismic Design Category as they do for new buildings. (One difference: In this proposal, SDC C is grouped with SDC D, as opposed to SDC A and B, in recognition that Chapter A4 was originally developed for voluntary work in SDC C through E, that SDC C requires some minimum story strength as contemplated by current section A403.5, and that some irregularities allowed in new SDC C buildings are inappropriate in existing buildings where other protective provisions for new construction might not be met.)

In addition, current section A403.5 is deleted because the options in proposed A403.3 will now result in adequate minimum story strengths in SDC C through E.

Finally, the last sentence of current section A403.4 is deleted because its scope is replaced by A403.3. The first part of current A403.4 is not needed because Section 12.14 of ASCE 7 already permits distribution of force by story weight. Furthermore, in any structure where the first story is the weak story, any requirement regarding vertical distribution of force is essentially superfluous, since the design force for the weak story is the same no matter what the vertical distribution is assumed to be.

Cost Impact: The code change proposal will not increase the cost of construction.

	Assembly:	ASF	AMF	DF

ICCFILENAME: SEARER-EB11-A403.3.DOC

EB61–09/10
A403.6, A403.6.1

Proponent: Gary R. Searer, Wiss, Janney, Elstner Associates, Inc., representing National Council of Structural Engineers Association (NCSEA) Existing Buildings Subcommittee

THIS PROPOSAL IS ON THE AGENDA OF THE IBC STRUCTURAL CODE DEVELOPMENT COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THE IBC STRUCTURAL CODE DEVELOPMENT COMMITTEE.

Revise as follows:

A403.6 Story drift limitations. The calculated story drift for each retrofitted story shall not exceed the allowable deformation compatible with all vertical-load-resisting elements and 0.025 times the story height. The calculated story drift shall not be reduced by the effects of horizontal diaphragm stiffness but shall be increased when these effects produce rotation. Drift calculations shall be in accordance with the building code.

A403.6.1 Pole structures. The effects of rotation and soil stiffness shall be included in the calculated story drift ~~when~~ where lateral loads are resisted by vertical elements whose required depth of embedment is determined by pole formulas. The coefficient of subgrade reaction used in deflection calculations shall be based on a geotechnical investigation conducted in accordance with the building code ~~provided from an approved geotechnical report~~ or based on other methods approved by the code official ~~methods~~.

Reason: Editorial proposal to separate current A403.6 into two parts for clarity. The first part, regarding interstory drift in the structure overall, remains unchanged. The second part, regarding deflection criteria for pole structures, is separated into a subsection for clarity. The proposal also clarifies text related to the geotechnical report requirements.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: SEARER-EB12-A403.6.DOC

A403.8.1, A402

Proponent: Gary R. Searer, Wiss, Janney, Elstner Associates, Inc., representing National Council of Structural Engineers Association (NCSEA) Existing Buildings Subcommittee

THIS PROPOSAL IS ON THE AGENDA OF THE IBC STRUCTURAL CODE DEVELOPMENT COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THE IBC STRUCTURAL CODE DEVELOPMENT COMMITTEE.

Delete without substitution:

~~**A403.8.1 Cripple walls.** Cripple walls braced with nonconforming structural materials shall be braced in accordance with this chapter. When a single top plate exists in the cripple wall, all end joints in the top plate shall be tied. Ties shall be connected to each end of the discontinuous top plate and shall be equal to one of the following:~~

1. ~~Three-inch by 6-inch (76 mm by 152 mm), 18-gage galvanized steel, nailed with six 8d common nails at each end.~~
2. ~~One and one-fourth-inch by 12-inch (32 mm by 305 mm), 18-gage galvanized steel, nailed with six 16d common nails at each end.~~
3. ~~Two-inch by 4-inch by 12-inch (51 mm by 102 mm by 305 mm) wood blocking, nailed with six 16d common nails at each end.~~

~~**CRIPPLE WALL**. A wood-frame stud wall extending from the top of the foundation wall to the underside of the lowest floor framing.~~

Reason: This provision does not belong in this chapter. Section A403.11.1 already precludes the use of gypsum or cement plaster to provide resistance in a soft or weak story or in a story with an open front wall line. Requiring that cripple walls be braced as required by this chapter doesn't make sense, because this chapter does not cover bracing of walls (Bracing of walls is covered in the conventional framing provisions of the IBC).

If an engineer decides to discount or ignore a cripple wall with non-conforming materials, he or she should not have to worry about addressing a discontinuous top plate in the wall, since the wall is nonstructural in terms of the design. If an engineer decides to add structural wood sheathing to the wall, then this chapter already requires that the wall be designed in accordance with the IBC (subject to reduced forces); the new wood structural panel design would be governed by Section 403.11.2; and the discontinuous top plate would be addressed by the engineer as necessary from an engineering perspective.

Cost Impact: The code change proposal will not increase the cost of construction.

EB63–09/10
A403.11.2.1

Proponent: Gary R. Searer, Wiss, Janney, Elstner Associates, Inc., representing National Council of Structural Engineers Association (NCSEA) Existing Buildings Subcommittee

THIS PROPOSAL IS ON THE AGENDA OF THE IBC STRUCTURAL CODE DEVELOPMENT COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THE IBC STRUCTURAL CODE DEVELOPMENT COMMITTEE.

Revise as follows:

A403.11.2.1 Drift limit. Wood structural panel shear walls shall meet the story drift limitation of Section A403.6. Conformance to the story drift limitation shall be determined by approved testing or calculation~~, not by the use of an aspect ratio. Calculated deflection shall be determined according to *International Building Code* Equation 23-1 and shall be increased by 25 percent. Contribution to the shear wall deflection from the anchor or tie-down slippage shall also be included. The slippage contribution shall include the vertical elongation of the connector metal components, the vertical slippage of the connectors to framing members, localized crushing of wood due to bearing loads and shrinkage of the wood elements because of changes in moisture content as a result of aging. The total vertical slippage shall be multiplied by the shear panel aspect ratio and added to the total horizontal deflection~~. Individual shear panels shall be permitted to exceed the maximum aspect ratio, provided the allowable story drift and allowable shear capacities are not exceeded.

Reason: The deletion in the first sentence regarding "aspect ratio" is proposed because this section already requires story drift calculation; thus a specific prohibition against the use of aspect ratio is unnecessary. The balance of the deletion is proposed because the requirements for calculating story drift should be no more stringent for existing wood-framed buildings than they are for new buildings. The requirements being deleted were part of the original Los Angeles soft/weak story strengthening ordinance and were developed in the mid-1990s when the building code didn't require much in the way of deflection calculation for wood-frame construction. Now that the IBC has requirements for calculating deflection, these requirements are superfluous, in some cases conflict with IBC requirements, and are no longer required.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

A403.11.2.3, A403.11.3

Proponent: Gary R. Searer, Wiss, Janney, Elstner Associates, Inc., representing National Council of Structural Engineers Association (NCSEA) Existing Buildings Subcommittee

THIS PROPOSAL IS ON THE AGENDA OF THE IBC STRUCTURAL CODE DEVELOPMENT COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THE IBC STRUCTURAL CODE DEVELOPMENT COMMITTEE.

Delete without substitution:

~~**A403.11.2.3 Wood species of framing members.** Allowable shear values for wood structural panels shall consider the species of the framing members. When the allowable shear values are based on Douglas fir-larch framing members, and framing members are constructed of other species of lumber, the allowable shear values shall be multiplied by the following factors: 0.82 for species with specific gravities greater than or equal to 0.42 but less than 0.49, and 0.65 for species with specific gravities less than 0.42. Redwood shall use 0.65 and hem fir shall use 0.82, unless otherwise approved.~~

~~**A403.11.3 Substitution for 3-inch (76mm) nominal width framing members.** Two 2-inch (51mm) nominal width framing members shall be permitted in lieu of any required 3-inch (76mm) nominal width framing member when the existing and new framing members are of equal dimensions, when they are connected as required to transfer the in-plane shear between them, and when the sheathing fasteners are equally divided between them.~~

(Renumber subsequent sections)

Reason: With respect to Section A403.11.2.3, this section is unnecessary as it is contained in footnote a of IBC Table 2306.4.1. Since the user has to go to that section to find shear wall design values, there is no need to repeat the modifications for framing species here.

With respect to Section A403.11.3, this section is also unnecessary as it is contained in footnote i of IBC Table 2306.4.1 which references IBC Section 2306.1. Since the user has to go to that section to find shear wall design values, there is no need to repeat the allowable substitution here.

Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME: SEARER-EB17-A403.11.2.3.DOC

EB65–09/10
A403.11.4.1, A402

Proponent: Gary R. Searer, Wiss, Janney, Elstner Associates, Inc., representing National Council of Structural Engineers Association (NCSEA) Existing Buildings Subcommittee

THIS PROPOSAL IS ON THE AGENDA OF THE IBC STRUCTURAL CODE DEVELOPMENT COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THE IBC STRUCTURAL CODE DEVELOPMENT COMMITTEE.

1. Revise as follows:

A403.11.4.1 Expansion anchors in tension. Expansion anchors that provide tension strength by friction resistance shall not be used to connect hold-down devices to existing concrete or masonry elements. ~~Expansion anchors that provide tension strength by bearing (commonly referenced as "undercut" anchors) shall be permitted.~~

2. Delete definition without substitution:

~~**EXPANSION ANCHOR.** An approved mechanical fastener placed in hardened concrete that is designed to expand in a self-drilled or pre-drilled hole of a specified size and engage the sides of the hole in one or more locations to develop shear and/or tension resistance to applied loads without grout, adhesive, or drypack.~~

Reason: This proposal eliminates redundancy and potential confusion. Expansion anchors and undercut anchors are now defined separately in ACI Appendix Chapter D, which governs the design of these anchors. In addition, the second sentence of the current provision is essentially commentary to the first sentence. By focusing on a single type of non-friction anchor, the second sentence also introduces confusion by suggesting (improperly) that other anchor types would not be allowed.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

THIS PROPOSAL IS ON THE AGENDA OF THE IBC STRUCTURAL CODE DEVELOPMENT COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THE IBC STRUCTURAL CODE DEVELOPMENT COMMITTEE.

Revise as follows:

CHAPTER A4
EARTHQUAKE ~~HAZARD~~ RISK REDUCTION IN ~~EXISTING~~ WOOD-FRAME RESIDENTIAL BUILDINGS WITH SOFT, WEAK OR OPEN FRONT WALLS

A403.11.4.2 Required depth of embedment. The required depth of embedment or edge distance for the anchor used in the hold-down connector shall be provided in the concrete or masonry below any plain concrete slab unless satisfactory evidence is submitted to the ~~building~~ code official that shows that the concrete slab and footings are of monolithic construction.

A405.1.1 Additional conditions. To qualify for these prescriptive measures, the following additional conditions need to be satisfied by the retrofitted structure:

1. Diaphragm aspect ratio L/W is less than 0.67, where W is the diaphragm dimension parallel to the soft, weak or open-front wall line and L is the distance in the ~~orthogoal~~ orthogonal direction between that wall line and the rear wall of the ground floor open area.
2. Minimum length of side shear walls = 20 feet (6096 mm).
3. Minimum length of rear shear wall = ~~three-fourth of rear wall.~~ three-fourths of the total rear wall length.
4. No plan or vertical irregularities other than a soft, weak or open-front wall line.
5. Roofing weight less than or equal to 5 pounds per square foot (240 N/m^2).
6. Aspect ratio of the full second floor diaphragm meets the requirements of the building code for new construction.

A405.2.1 Anchor ~~bolt~~ size and spacing. The anchor ~~bolt~~ size and spacing shall be a minimum of ¾ inch (19 mm) in diameter at 32 inches (813 mm) on center. Where existing ~~bolts~~ anchors are inadequate, supplemental or alternative approved connectors, such as new steel plates bolted to the side of the foundation and nailed to the sill, shall be used. ~~may be used, such as an approved connector.~~

A406.1 New materials. New materials shall meet the requirements of the *International Building Code*, except where allowed by this chapter. ~~All materials approved by the building code, including their appropriate allowable stresses and limiting aspect ratios, shall be permitted to meet the requirements of this chapter.~~

A406.3.3 Existing wood framing. Wood framing is permitted to use the design stresses specified in the building code under which the building was constructed or other stress criteria approved by the ~~building~~ code official.

A406.3.4 Existing structural steel. All existing structural steel shall be permitted to be assumed to comply with ASTM ~~use the allowable stresses for Grade~~ A36. Existing pipe or tube columns shall be assumed to be of minimum wall thickness unless verified by testing or exposure.

A406.3.5 ~~Strength of~~ Existing concrete. All existing concrete footings shall be permitted to be assumed to be plain concrete with a compressive strength of 2,000 pounds per square inch (13.8 MPa). Existing concrete compressive strength taken greater than 2,000 pounds per square inch (13.8 MPa) shall be verified by testing, record drawings or department records.

A406.3.6 Existing sill plate anchorage. The analysis of existing cast-in-place ~~anchor bolts~~ anchors shall be permitted to assume proper anchor embedment for purposes of evaluating ~~use the allowable service loads for bolts with proper embedment when used for~~ shear resistance to lateral loads.

Reason: These are all editorial clarifications or edits for consistency and clarity.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: SEARER-EB5-A403.11.4.3.DOC

EB67–09/10
A403.11.4.3

Proponent: Gary R. Searer, Wiss, Janney, Elstner Associates, Inc., representing National Council of Structural Engineers Association (NCSEA) Existing Buildings Subcommittee

THIS PROPOSAL IS ON THE AGENDA OF THE IBC STRUCTURAL CODE DEVELOPMENT COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THE IBC STRUCTURAL CODE DEVELOPMENT COMMITTEE.

Delete without substitution:

~~**A403.11.4.3 Required preload of bolted hold-down connectors.** Bolted hold-down connectors shall be preloaded to reduce slippage of the connector. Preloading shall consist of tightening the nut on the tension anchor after the placement but before the tightening of the shear bolts in the panel boundary flange member. The tension anchor shall be tightened until the shear bolts are in firm contact with the edge of the hole nearest the direction of the tension anchor. Hold-down connectors with self-jigging bolt standoffs shall be installed in a manner to permit preloading.~~

Reason: This section of Appendix A4 is not standard practice in wood construction, and is not explicitly required in new construction. It is also potentially at odds with installation instructions for proprietary hold-down hardware. As a matter of construction quality assurance, it is better suited to commentary.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: SEARER-EB4-A403.11.4.3.DOC

A402

Proponent: Gary R. Searer, Wiss, Janney, Elstner Associates, Inc., representing National Council of Structural Engineers Association (NCSEA) Existing Buildings Subcommittee

THIS PROPOSAL IS ON THE AGENDA OF THE IBC STRUCTURAL CODE DEVELOPMENT COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THE IBC STRUCTURAL CODE DEVELOPMENT COMMITTEE.

Delete without substitution:

~~**SECTION A404**~~
~~**PHASED CONSTRUCTION**~~

~~The work specified in this chapter shall be permitted to be done in the following phases. Work shall start with Phase 1 unless otherwise approved by the building official. When the building does not contain the conditions associated with the given phase, the work shall proceed to the next phase.~~

~~**Phase 1 Work.** The first phase shall include all work in the lowest story with a soft, weak or open-front wall line and all foundation work.~~

~~**Phase 2 Work.** The second phase shall include wood-framed walls in any story with two or more stories above that are laterally braced with nonconforming structural materials.~~

~~**Phase 3 Work.** The third and final phase shall include all required work not performed in Phase 1 or Phase 2.~~

(Renumber subsequent sections)

Reason: The proposal removes an unnecessary and possibly costly provision. First, work may always be phased or sequenced at the discretion of the code official. The current provision is intended to assure that the greatest seismic risks are reduced before other work is performed. But the probability that a significant earthquake occurs during the project is extremely low, even if the work is phased. Since this chapter is triggered by other provisions in the body of the IEBC, the seismic improvements it requires will already be part of the project scope and would not inadvertently be delayed or left incomplete. Finally, by requiring a specific sequence of work, the provision could unnecessarily restrict an owner from completing work in the least disruptive or expensive way.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: SEARER-EB7-A404.DOC

EB69–09/10
A406.3, A406.3.1, Table A4-A

Proponent: Gary R. Searer, Wiss, Janney, Elstner Associates, Inc., representing National Council of Structural Engineers Association (NCSEA) Existing Buildings Subcommittee

THIS PROPOSAL IS ON THE AGENDA OF THE IBC STRUCTURAL CODE DEVELOPMENT COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THE IBC STRUCTURAL CODE DEVELOPMENT COMMITTEE.

1. Revise as follows:

A406.3 Existing materials. ~~All existing materials shall be in sound condition and constructed in general conformance to the building code before they are permitted to be used to resist the lateral loads prescribed in this chapter.~~ The physical condition, strengths, and stiffnesses of existing building materials shall be taken into account in any analysis required by this chapter. The verification of existing materials conditions and their conformance to these requirements shall be made by physical observation ~~reports~~, material testing or record drawings as determined by the design professional ~~structural designer~~ ~~and as approved by~~ subject to the approval of the code ~~building~~ official.

2. Delete without substitution:

~~**A406.3.1 Horizontal wood diaphragms.** Allowable shear values for existing horizontal wood diaphragms that require analysis under Section A403.10 are permitted to be taken from TableA4-A. The values in Table A4-A shall be used for allowable stress design. Design forces based on strength design shall be reduced to allowable stress levels before comparison with the limiting values in the table.~~

(Renumber subsequent sections)

TABLE A4-A
ALLOWABLE VALUES FOR EXISTING MATERIALS

Existing Materials or Configurations of Materials[a]	Allowable Values x 14.594 for N/m
1. Horizontal diaphragms[b]	
1.1. Roofs with straight sheathing and roofing applied directly to the sheathing	100 lbs. per ft. for seismic shear
1.2. Roofs with diagonal sheathing and roofing applied directly to the sheathing	250 lbs. per ft. for seismic shear
1.3. Floors with straight tongue-and-groove sheathing	100 lbs. per ft. for seismic shear
1.4. Floors with straight sheathing and finished wood flooring with board edges offset or perpendicular	500 lbs. per ft. for seismic shear
1.5. Floors with diagonal sheathing and finished wood flooring	600 lbs. per ft. for seismic shear
2. Crosswalls[b,c]	Per side:
2.1. Plaster on wood or metal lath	200 lbs. per ft. for seismic shear
2.2. Plaster on gypsum lath	175 lbs. per ft. for seismic shear
2.3. Gypsum wallboard unblocked edges	75 lbs. per ft. for seismic shear
2.4. Gypsum wallboard, blocked edges	125 lbs. per ft. for seismic shear
3. Existing footings, wood framing, structural steel and reinforced steel	
3.1. Plain concrete footings	f'c = 1,500 psi (10.3 MPa) unless otherwise shown by tests[d]
3.2. Douglas fir wood	Allowable stress same as D.F. No. 1[d]
3.3. Reinforcing steel	fs = 18,000 psi (124 MPa) maximum[d]
3.4. Structural steel	fs = 20,000 (138 MPa) maximum[d]

For SI: 1 foot = 304.8 mm

a. Material must be sound and in good condition.

b. A one-third increase in allowable stress is not allowed.

c. Shear values of these materials may be combined, except the total combined value shall not exceed 300 pounds per foot.

d. Stresses given may be increased for combinations of loads as specified in the building code.

Reason: This proposal clarifies the intent of the provision, removes unenforceable language, and removes obsolete material values from Table A4-A.

The current first sentence in A406.3 lends itself to an improper interpretation that would impose an unreasonable mandate on a project. The proposal replaces it with a reasonable requirement for engineering judgment and accountability by the design professional.

The proposal also deletes subsection A403.6.1, which is obsolete and incomplete at best, misleading at worst. Table A4-A, derived from Chapter A1 (by dividing by a factor to obtain allowable values), continues to use terms ("crosswall") and concepts appropriate to the unreinforced masonry structures covered in Chapter A1 but not appropriate to the wood-frame structures addressed by Chapter A4. Table A4-A lacks stiffnesses for each material, thus limiting its value in the context of Chapter A4. And since the table is referenced only in A406.3.1, which deals only with horizontal wood diaphragms, most of the values in the table are not linked to the chapter's provisions for sheathed walls, footings, etc.

Table A4-A is also in conflict with other portions of Chapter A4 and with current design practices. For example, Table A4-A states that the maximum structural steel allowable stress is only 20,000 psi; however, Section A406.3.4 allows the significantly higher allowable stresses of Grade A36 steel. Similarly, Table A4-A states that existing concrete must be assumed to have an f'c of 1,500 psi, yet Section A406.3.5 states that an f'c of 2,000 psi may be used. Finally, Table A4-A states that reinforcing steel shall be assumed to have an allowable stress of 18,000 psi; however, allowable stress design of concrete has not been in common use for decades.

When Chapter A4 was first developed, strengths and stiffnesses for nonconforming materials were not widely published. Now, relevant values are provided in a number of national standards and guidance documents, including ANSI/AF&PA SDPWS-2005 (Special Design Provisions for Wind and Seismic), ASCE-31, and ASCE-41. Thus, deletion of Table A4-A does not leave the practicing engineer without guidance.

Cost Impact: The code change proposal will not increase the cost of construction.

EB70–09/10
A406.3.2.1, A406.3.2.2

Proponent: Gary R. Searer, Wiss, Janney, Elstner Associates, Inc., representing self

THIS PROPOSAL IS ON THE AGENDA OF THE IBC STRUCTURAL CODE DEVELOPMENT COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THE IBC STRUCTURAL CODE DEVELOPMENT COMMITTEE.

Revise as follows:

A406.3.2.1 Existing nails Allowable nail slip values. The use of box nails and unseasoned lumber are permitted to be assumed. When the required drift calculations of Section A403.11.2.1 rely on the slip design values for common nails or surfaced dry lumber, their use in construction shall be verified by exposure. The design value of the box nails shall be assumed to be similar to that of common nails having the same diameter. Verification of surfaced dry lumber shall be by identification conforming to the building code.

A406.3.2.2 Existing plywood ~~panel construction~~. When verification of the existing plywood ~~materials~~ is by use of record drawings alone, ~~the panel construction for~~ plywood shall be assumed to be of three plies. ~~The plywood modulus "G" shall be assumed equal to 50,000 pounds per square inch (345 MPa).~~

Reason: These are all clarifications intended to streamline these two sections of code and to preclude conflicts between other sections of code.

The presence of box nails and unseasoned lumber are always permitted to be assumed since this is a conservative assumption; there's no reason to state this.

A406.3.2.1 currently only deals with drift calculations, but the presence of box or common nails affects the strength as well; therefore any reference to drift and slip values is stricken, and the term "design values" is used.

The sentence stating that design value of box nails shall be assumed similar to that of common nails of the same diameter is not in complete agreement with AF&PA (since head size and length also play a role) and is unnecessary.

The first three changes to A406.3.2.2 are editorial. The fourth change (deletion of the last sentence) is to address the fact that shear modulus depends on the thickness of the plywood and is in conflict with AF&PA values. In addition, AF&PA now provides apparent shear stiffness, G_a, values, which are more helpful and easy to use than straight modulus, G, values; requiring "G" be used is potentially confusing to the engineer and the building official.

Cost Impact: The code change proposal will not increase the cost of construction.

Appendix C (New)

Proponent: T. Eric Stafford, PE, Institute for Business and Home Safety

THIS PROPOSAL IS ON THE AGENDA OF THE IBC STRUCTURAL CODE DEVELOPMENT COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THE IBC STRUCTURAL CODE DEVELOPMENT COMMITTEE.

Add a new appendix as follows:

APPENDIX C: GUIDELINES FOR WIND RETROFIT OF EXISTING BUILDINGS

The provisions contained in this appendix are not mandatory unless specifically referenced in the adopting ordinance.

CHAPTER C1
ROOF DECK FASTENING FOR HIGH WIND AREAS

SECTION C101
GENERAL

C101.1 Intent and purpose. The provisions of this chapter provide prescriptive methods for selected structural retrofitting of existing buildings. Compliance with these provisions will not always meet the requirements for new construction in the *International Building Code* or the *International Residential Code*. The provisions of this chapter are intended to provide methods for strengthening existing buildings to increase resistance to wind loads.

C101.2 Scope. The provisions of this chapter are a prescriptive alternative for one- and two-family dwellings to achieve compliance with Section 606.3 of the *International Existing Building Code*.

SECTION C102
ROOF DECK ATTACHMENT FOR WOOD ROOFS

C102.1 Roof decking attachment for one- and two-family dwellings. For one- and two-family dwellings, fastening shall be in accordance with section C102.1.1 or C102.1.2 as appropriate for the existing construction. The diameter of 8d nails shall be a minimum of 0.131 inches and the length shall be a minimum of 2-1/4 inches to qualify for the provisions of this section for existing nails regardless of head shape or head diameter.

C102.1.1 Sawn lumber or wood plank roofs. Roof decking consisting of sawn lumber or wood planks up to 12" wide and secured with at least two nails (minimum size 8d) to each roof framing member it crosses shall be deemed to be sufficiently connected. Sawn lumber or wood plank decking secured with smaller fasteners than 8d nails or with fewer than two nails (minimum size 8d) to each framing member it crosses shall be deemed sufficiently connected if fasteners are added such that two clipped head, round head, or ring shank nails (minimum size 8d) are in place on each framing member the nail crosses.

C102.1.2 Wood structural panel roofs. For roof decking consisting of wood structural panels, fasteners and spacings required in Table C102.1.2 are deemed to comply with the requirements of Section 606.3 of the *International Existing Building Code*.

Supplemental fasteners as required by Table C102.1.2 shall be 8d ring shank nails with round heads and the following minimum dimensions:

1. 0.113-inch nominal shank diameter
2. Ring diameter a minimum of 0.012-inch greater than shank diameter
3. 16 to 20 rings per inch
4. A minimum 0.280-inch full round head diameter
5. Ring shank to extend a minimum of 1 ½" from the tip of the nail.
6. Minimum 2-1/4 inch nail length

TABLE C102.1.2
SUPPLEMENT FASTENERS AT PANEL EDGES AND INTERMEDIATE FRAMING

Existing fasteners	Existing fastener spacing (edge or intermediate supports)	Wind speed 110 mph or less supplemental fastening shall be no greater than	Wind speed greater than 110 mph supplemental fastening for interior zone[c] locations and edge zones not covered by column to right shall be no greater than	Edge zone[d] for wind speed greater than 120 mph and Exposure C, or Wind speed greater than 140 mph and Exposure B
Staples or 6d	Any	6" o.c.[b]	6" o.c.[b]	4" o.c[b] at panel edges and 4" o.c.[b] at intermediate supports.
8d clipped head or round head smooth shank	6" o.c. or less	None necessary	None necessary along edges of panels but 6" o.c.[b] at intermediate supports of panel	4" o.c[a] at panel edges and 4" o.c.[a] at intermediate supports.
8d clipped head or round head ring shank	6" o.c. or less	None necessary	None necessary	4" o.c[a] at panel edges and 4" o.c.[a] at intermediate supports.
8d clipped head or round head smooth shank	Greater than 6" o.c.	6" o.c.[a]	6" o.c.[a] along panel edges and 6" o.c.[b] at intermediate supports of panel	4" o.c[a] at panel edges and 4" o.c.[a] at intermediate supports.
8d clipped head or round head ring shank	Greater than 6" o.c.	6" o.c.[a]	6" o.c.[a]	4" o.c[a] at panel edges and 4" o.c.[a] at intermediate supports.

a. Maximum spacing determined based on existing fasteners and supplemental fasteners.
b. Maximum spacing determined based on supplemental fasteners only.
c. Interior zone = sheathing that is not located within 4 feet of the perimeter edge of the roof or within 4 feet of each side of a ridge
d. Edge zone = sheathing that is located within 4 feet of the perimeter edge of the roof and within 4 feet of each side of a ridge

Reason: The intent of this proposal is to provide a prescriptive solution for compliance with Section 606.3. This proposal, along with a similar proposal, is requesting the creation of a new set of Appendix chapters that are intended to provide guidance for retrofitting existing structures to strengthen their resistance to wind forces. These new proposed chapters are similar in scope to Appendix A which addresses seismic retrofits for existing buildings. We anticipate that, over time, additional retrofit methods will be provided in this Appendix chapter. These retrofits are voluntary, and as such may or may not meet the requirements of new construction. However, these voluntary measures will serve to better protect the public and reduce damage from high wind events.

Section 606.3 requires the roof deck to be evaluated and remedial action when insufficient or deteriorated connections are found. However, it gives little guidance on making the required determination or providing the required corrections. Ordinarily one would to turn to the requirements for new construction. However, blindly applying the same fastening requirements where fasteners already exist could potentially compromise performance because of damage to roof panels or framing members. The assumption is that there is an optimum spacing of existing and new fasteners that is a function of the number and type of existing connectors.

Adding fasteners where fasteners already exist is different than installing fasteners in new construction because of the greater potential for damaging sheathing or framing members. To date the code only addresses nailing schedules for new installations without providing any guidance for retrofit nailing. The goal is that by the addition of additional fastener strengths will at least approach current fastening requirements in order to approach the same performance level. This code modification provides the guidance that is needed when adding fasteners where fasteners already exist.

The nail spacings shown in Table C102.1.2 are derived from research conducted in the 1990's at Clemson University tempered by the requirements for roof sheathing attachment for high winds in the Wood Frame Construction Manual and SSTD 10-99. Smaller diameter fasteners such as staples damage framing members less than larger diameter fasteners and they provide significantly lower uplift resistance. Consequently, in these situations supplemental fasteners can be installed at typical new construction spacing without concern for splitting the structural members.

Cost Impact: The code change proposal will not increase the cost of construction.

Appendix C (New)

Proponent: T. Eric Stafford, PE, Institute for Business and Home Safety

THIS PROPOSAL IS ON THE AGENDA OF THE IBC STRUCTURAL CODE DEVELOPMENT COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THE IBC STRUCTURAL CODE DEVELOPMENT COMMITTEE.

Add a new appendix as follows:

APPENDIX C
GUIDELINES FOR WIND RETROFIT OF EXISTING BUILDINGS

The provisions contained in this appendix are not mandatory unless specifically referenced in the adopting ordinance.

CHAPTER C1
GABLE END RETROFIT FOR HIGH WIND AREAS

SECTION C101
GENERAL

C101.1 Intent and purpose. The provisions of this chapter provide prescriptive methods for selected structural retrofitting of existing buildings. Compliance with these provisions will not always meet the requirements for new construction in the *International Building Code* or the *International Residential Code*. The provisions of this chapter are intended to provide methods for strengthening existing buildings to increase the building's resistance to wind loads.

C101.2 Scope. The following prescriptive methods are intended for applications where the gable end wall framing is provided by a wood gable end wall truss or a conventionally framed rafter system. The retrofits are appropriate for wall studs oriented with the wide face parallel to or perpendicular to the gable end surface. Gable ends to be strengthened shall be permitted to be retrofitted using methods prescribed by this chapter.

SECTION C102
DEFINITIONS

ANCHOR BLOCK. A piece of lumber secured to horizontal braces and filling the gap between existing framing members for the purpose of restraining horizontal braces from movement perpendicular to the framing members.

COMPRESSION BLOCK. A piece of lumber used to restrain in the compression mode (force directed towards the interior of the attic) an existing or retrofit stud. It is attached to a horizontal brace and bears directly against the existing or retrofit stud.

CONVENTIONALLY FRAMED GABLE END. A gable end framed with studs whose faces are perpendicular to the gable end wall.

HORIZONTAL BRACE. A piece of lumber used to restrain both compression and tension loads applied by a retrofit stud. It is typically installed horizontally on the top of attic floor framing members (truss bottom chords or ceiling joists) or on the bottom of pitched roof framing members (truss top chord or rafters).

HURRICANE TIES. Manufactured metal connectors designed to provide uplift and lateral restraint for roof framing members.

NAIL PLATE. A manufactured metal plate made of galvanized steel with factory punched holes for fasteners. A nail plate may have the geometry of a strap.

RETROFIT. The voluntary process of strengthening or improving buildings or structures, or individual components of buildings or structures for the purpose of making existing conditions better serve the purpose for which they were originally intended or the purpose that current building codes intend.

RETROFIT STUD. A lumber member used to structurally supplement an existing gable end wall stud.

RIGHT ANGLE BRACKET. A galvanized metal right angle bracket listed by the manufacturer for the material into which they will be attached, masonry (concrete or CMU) or wood.

STUD-TO-PLATE CONNECTOR. A manufactured metal connector designed to connect studs to plates.

TRUSS GABLE END. An engineered factory made truss or site built truss that incorporates factory installed or field installed vertical studs with their faces parallel to the plane of the truss

SECTION C103
MATERIALS OF CONSTRUCTION

C103.1 Existing materials. All existing wood materials that will be part of the retrofit work (trusses, rafters, ceiling joists, top plates, wall studs, etc.) shall be in sound condition and free from defects or damage that substantially reduces the load-carrying capacity of the member. Any wood materials found to be damaged or deteriorated shall be strengthened or replaced with new materials to provide a net dimension of sound wood equivalent to its undamaged original dimensions.

C103.2 New materials. All new materials shall comply with the requirements of the *International Building Code* or the *International Residential Code* as applicable.

C103.3. Material specifications for retrofits. Materials for retrofitting gable end walls shall comply with Sections C103.3.1 through C103.6

C103.3.1 Anchor blocks, compression blocks, and horizontal braces. Anchor blocks, compression blocks, and horizontal braces shall be lumber nominally 2 inch by at least 4 inch wide.

C103.3.2 Nail plate. Nail plates shall be of minimum 20 gauge thickness.

C103.3.3 Retrofit stud. Retrofit studs shall be made of nominal 2-inch lumber.

C103.3.4 Right angle bracket. Right angle brackets shall have a minimum capacity of 350 for uplift and lateral load conditions.

C103.3.5 Stud-to-plate connector. Stud-to-plate connectors shall have a minimum capacity of 500 pounds for uplift.

C103.3.6 Truss gable end. Gable end trusses shall be spaced no greater than 24-iches on center.

C103.4 Metal plate connectors, straps and anchors. Metal plate connectors, plates, straps and anchors shall be a product approved for connecting wood-to-wood or wood-to-concrete as appropriate. Straps and nail plates shall be manufactured from galvanized steel with a minimum thickness of 20 gauge. Nail plates shall have holes sized for a minimum of 8d nails.

C103.5 Twists in straps. Straps shall be permitted to be twisted or bent where they transition between framing members or connection points. Straps shall be bent only once at a given location though it is permissible that they be bent or twisted at multiple locations along their length.

C103.6 Fasteners. Fasteners shall meet the requirements of Sections C103.6.1 and Section C103.6.2, and shall be permitted to be screws or nails meeting the minimum length requirement shown in figures and specified in tables. Fastener spacing shall meet the requirements of Section C103.6.3.

C103.6.1 Screws. Screws shall be a minimum #8 size with head diameters no less than 0.28 inches. Screw lengths shall be no less than indicated in the Figures and in Tables. Permissible screws include deck screws and wood screws. Screws shall have at least 1 inch of thread. Fine threaded screws or drywall screws shall not be permitted. Screws shall be chosen with the appropriate diameter such that the shank adjacent to the head fits through the hole in the strap.

C103.6.2 Nails. Unless otherwise indicated in the provisions or drawings, where fastener lengths are indicated in Figures and Tables. as 1-¼ inches, 8d common nails with shank diameter 0.131 inches and head diameters no less than 0.28 inches shall be permitted. Unless otherwise indicated in the provisions or drawings, where fasteners lengths are indicated in Figures and Tables. as 3 inches, 10d common nails with shank diameter of 0.148 inches and head diameters no less than 0.28 inches shall be permitted.

C103.6.3 General fastener spacing. Fastener spacing for shear connections of lumber-to-lumber shall meet the requirements shown in Figure C103.6.3 and the following conditions.

C103.6.3.1 General fastener spacing. Fastener spacing shall meet the following conditions except as provided for in Section C103.6.3.3

The distance between fasteners and the edge of lumber that is less than 3-1/2 inches deep in the direction of the fastener length shall be a minimum of 3/4 inches.

1. The distance between fasteners and the edge of lumber that is more than 2 inches thick in the direction of the fastener length shall be a minimum of ½ inches.
2. The distance between a fastener and the end of lumber shall be a minimum of 2-½ inches.
3. The distance between fasteners parallel to the grain (center-to-center) shall be a minimum of 2-1/2 inches.
4. The distance between fasteners perpendicular to the grain (center-to-center) in lumber that is less than 3-1/2 inches deep in the direction of the fastener length shall be 1 inch.
5. The distance between fasteners perpendicular to the grain (center-to-center) in lumber that is more than 2 inches thick in the direction of the fastener length shall be ½ inch.

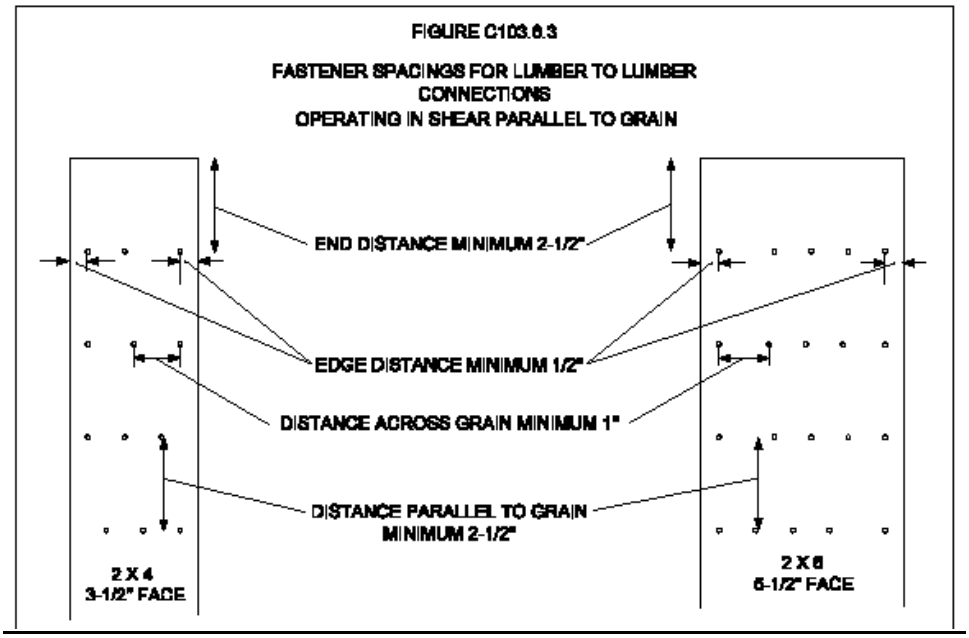
C103.6.3.2 Wood-to-wood connections of two members each 2 inch or less thick. Wood-to-wood connections fastener spacing shall meet the following conditions.

1. The distance between fasteners parallel to grain (center-to-center) shall be a minimum of 2-1/2 inches.
2. The distance between fasteners across grain (center-to-center) shall be a minimum of 1 inch.
3. For wood-to-wood connections of lumber at right angles, fasteners shall be spaced a minimum of 2-1/2 inches parallel to the grain and 1 inch perpendicular to the grain in any direction.

C103.6.3.3 Metal connectors to wood connections. Metal connectors to wood connections shall meet the following conditions.

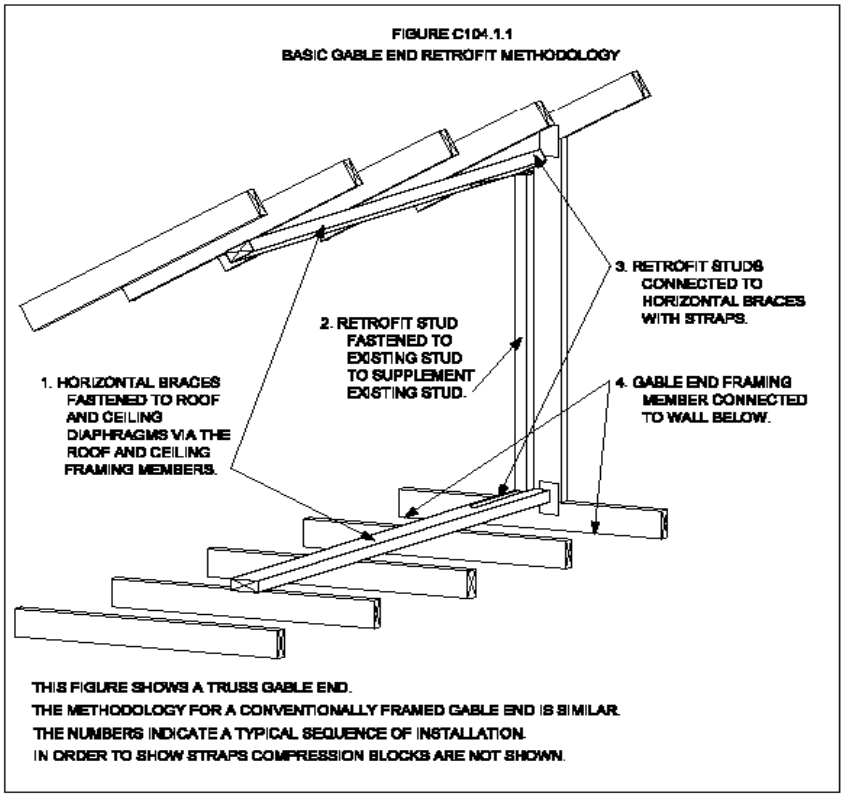
1. Fastener spacing to edge or ends of lumber shall be as dictated by the prefabricated holes in the connectors and the connectors shall be installed in accordance with the manufacturer.
2. Fasteners in 1-1/4 inch wide metal straps that are installed on the 1-1/2 inch broad face of lumber shall be a minimum 1/4 inches from either edge of the lumber. Consistent with Section C103.6.3.1 fasteners shall be allowed to be spaced according to the fastener holes fabricated into the strap.
3. Fasteners in metal nail plates shall be spaced a minimum of ½ inches across wood grain and a minimum of 1-1/2 inches parallel to wood grain.

SECTION C104
RETROFITTING GABLE END WALLS TO ENHANCE WIND RESISTANCE



SECTION C104
RETROFITTING GABLE END WALLS TO ENHANCE WIND RESISTANCE

C104.1 General. These prescriptive methods of retrofitting are intended to increase the resistance of existing gable end construction for out-of-plane wind loads resulting from high wind events. The ceiling diaphragm shall be comprised of minimum ½ inch thick drywall, minimum nominal 3/8 inch thick wood structural panels, or plaster. An overview isometric drawing of one kind of gable end retrofit to improve wind resistance is shown in Figure C104.1.1.



C104.2 Horizontal braces. Horizontal braces shall be installed approximately perpendicular to the roof and ceiling framing members at the location of each existing gable end stud greater than 3 feet in length. Unless it is adjacent to an omitted horizontal brace location, horizontal braces shall be minimum 2x4 dimensional lumber as defined in Section C103.3. A single horizontal brace is required at the top and bottom of each gable end stud for Retrofit Configuration A, B, or C and two horizontal braces are required for Retrofit Configuration D. Maximum heights of gable end wall studs and associated retrofit studs for each Retrofit Configuration shall not exceed the values listed in Table C104.2. Horizontal braces shall be oriented with their broad faces across the roof or ceiling framing members, be fastened to a minimum of three framing members, and extend at least 6 feet measured perpendicularly from the gable end plus 2-1/2 inches beyond the last top chord or bottom chord member (rafter or ceiling joist) from the gable end as shown in Figure C104.2(1), Figure C104.2(2), Figure C104.2(3), and Figure C104.2(4).

TABLE C104.2

STUD LENGTH LIMITATIONS BASED ON EXPOSURE AND DESIGN WIND SPEED

PLAN VIEWS
RETROFIT CONFIGURATIONS A, B, AND C

C104.2.1 Existing gable end studs. If the spacing of existing vertical gable end studs in conventionally framed or the truss gable ends is greater than 24 inches, a new stud and corresponding horizontal braces shall be installed such that the maximum spacing between existing and added studs shall be no greater than 24 inches. Additional gable end wall studs shall not be required at locations where their length would be 3 feet or less. Each end of each required new stud shall be attached to the existing roof framing members (truss top chord or rafter and truss bottom chord or ceiling joist) using a minimum of two 3 inch toenail fasteners (#8 wood screws or 10d nails) and a metal connector with minimum uplift capacity of 175 pounds, or nail plates with a minimum of four 1-1/4 inch long fasteners (#8 wood screws or 8d nails).

C104.2.2 Main method of installation. Each horizontal brace shall be fastened to each existing roof or ceiling member that it crosses using three 3-inch long fasteners (#8 wood screws or 10d nails) as indicated in Figure C104.2(1) and Figure C104.2(3) for trusses and Figure C104.2(2) and Figure C104.2(4) for conventionally framed gable end walls. Alternative methods for providing horizontal bracing of the gable end studs as provided in Sections C104.2.3 through C104.2.9 shall be allowed in lieu of this primary installation method.

C104.2.3 Omitted horizontal brace. Where impediments, other permanently attached obstacles or conditions exist that prevent installation in accordance with Section C104.2.2 horizontal braces may be omitted for height limitations corresponding to Retrofit Configurations A and B as defined in Table C104.2 provided installation is as indicated in Figure C104.2.3 and provided all of the following conditions are met. This method is not allowed for Retrofit Configurations C or D.

1. There shall be at least two horizontal braces on each side of an omitted horizontal brace or at least one horizontal brace if it is the end horizontal brace. Omitted horizontal braces must be separated by at least two horizontal braces even if that location is comprised of two retrofit studs and two horizontal braces.

2. Horizontal braces adjacent to the omitted horizontal brace shall be 2x6 lumber, shall butt against the existing studs, and shall be fastened to each existing roof or ceiling member that it crosses using three 3-inch long fasteners (#8 wood screws or 10d nails). For Retrofit Configuration B, 4 fasteners shall be required on at least one of the connections between the horizontal brace and the existing roof and ceiling framing members. Fasteners shall be spaced a minimum of ¾" from the edges of the horizontal braces and a minimum of 1-3/4" from adjacent fasteners.
3. Where the existing studs on each side of an omitted horizontal brace have their broad face perpendicular to the gable end wall, the retrofit studs at those locations and the retrofit stud at the omitted horizontal brace locations shall be sized such that they protrude a minimum of 3-1/2 inches beyond the interior edge of the existing studs for both Retrofit Configurations A and B. The edges of the three retrofit studs facing towards the interior of the attic shall be aligned such that they are the same distance from the gable end wall.
4, Retrofit studs shall be fastened to existing studs in accordance with Section C104.3.
5. Retrofit studs adjacent to the omitted horizontal brace shall be fastened to the horizontal brace using straps in accordance with Table C104.4.1 consistent with the size of the retrofit stud. The method applicable to Table C104.4.2 is not allowed.
6. A strong back made of minimum of 2x8 lumber shall be placed parallel to the gable end and shall be located on and span between horizontal braces on the two sides of the omitted horizontal brace and shall extend beyond each horizontal braces by a minimum of 2-1/2 inches. The strong back shall be butted to the three retrofit studs. The strong back shall be attached to each of the horizontal braces on which it rests with 5 3 inch long fasteners (#8 screws or 8d nails). Those fasteners shall be spaced a minimum of 3/4 inch from any edge of lumber and shall be spaced a minimum of 2-1/2 inch from each other. Additional compression blocks shall not be required at locations where a strong back butts against a retrofit stud.
7. The retrofit stud at the location of the omitted horizontal braces shall be fastened to the strong back using a connector with minimum uplift capacity of 800 pounds and installed such that this capacity is oriented in the direction perpendicular to the gable end wall.
8. The use of shortened horizontal braces using the alternative method of Section C104.2.5 is not allowable for horizontal braces adjacent to the omitted horizontal braces.
9. Horizontal braces shall be permitted to be interrupted in accordance with Section C104.2.8.

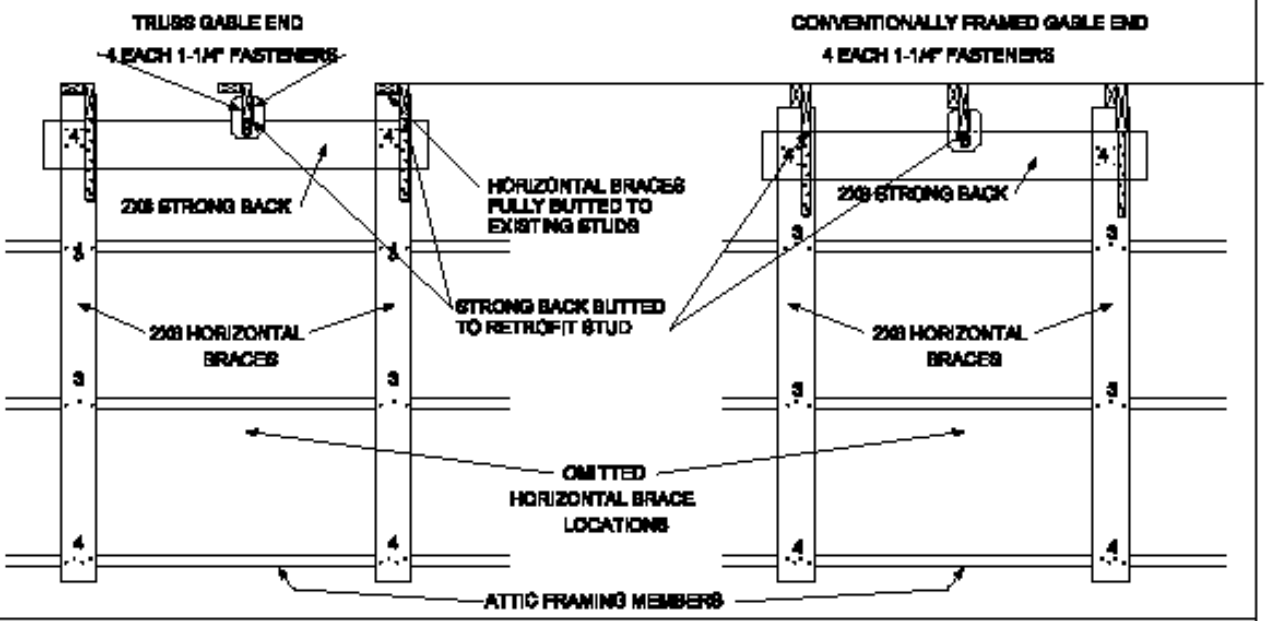
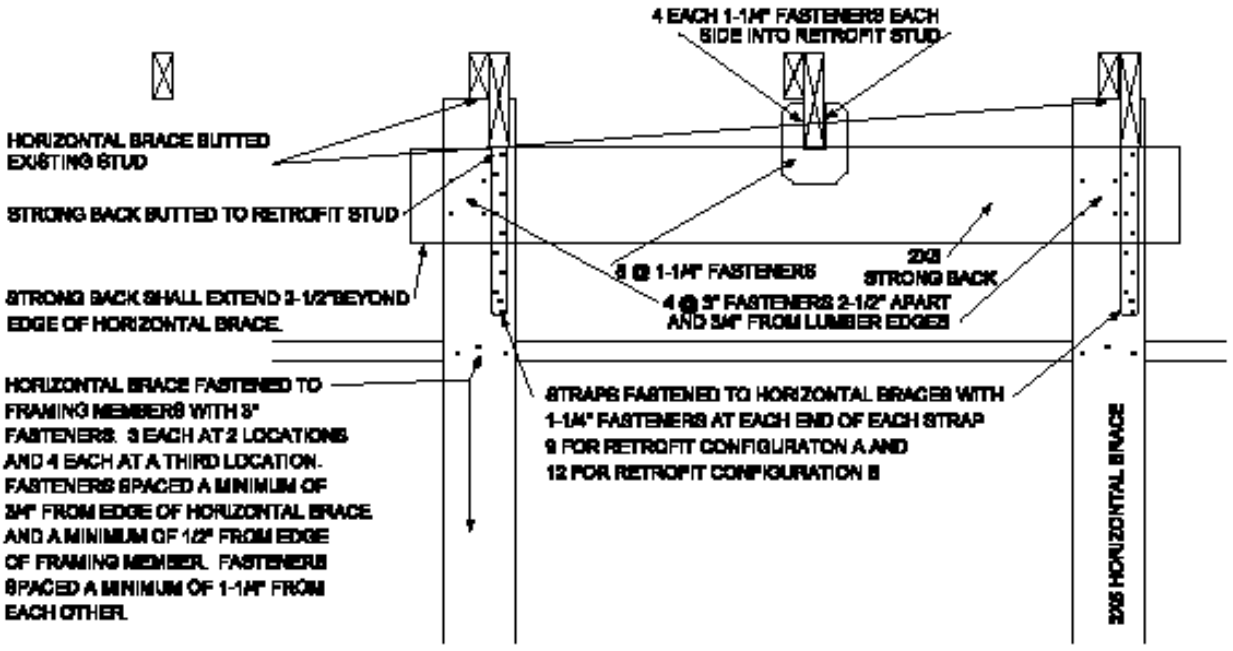
UNIDENTIFIED NUMBERS INDICATE THE NUMBER OF FASTENERS



DETAILS OF CONVENTIONALLY FRAMED GABLE



C104.2.4 Omitted horizontal brace and retrofit stud. Where impediments, other permanently attached obstacles or conditions exist that prevent installation in accordance with Section C104.2.2 or Section C104.2.3 by not permitting installation of horizontal braces, then retrofit studs and horizontal brace shall be permitted to be omitted from those locations by installation of ladder assemblies for Retrofit Configurations A and B as defined in Table C104.2 provided all of the following conditions are met**.** This method is not allowed for Retrofit Configurations C or D.

1. No more than two ladder assemblies are permitted on a single gable end.
2. There shall be at least two retrofit studs and horizontal brace assemblies on either side of the locations where the retrofit studs and horizontal bracing members are omitted (no two ladder braces bearing on a single retrofit stud).
3. Where the existing studs on each side of an omitted horizontal brace have their broad face parallel to the gable end wall the retrofit studs at those locations and the retrofit stud at the omitted horizontal brace locations shall be 2x6 lumber for Retrofit Configuration A and 2x8 lumber for Retrofit Configuration B.
4, Horizontal braces adjacent to the omitted horizontal brace shall be 2x6 lumber and be fastened to each existing roof or ceiling member crossed using three 3-inch long fasteners (#8 wood screws or 10d nails) as indicated in Figure C104.2(1) and Figure C104.2(3) for trusses and Figure C104.2(2) and Figure C104.2(4) for conventionally framed gable end wall. For Retrofit Configuration B, 4 fasteners shall be required on at least one of the connections between the horizontal brace and the existing roof and ceiling framing members.
5. Ladder rungs /shall be provided across the location of the omitted retrofit studs as indicated in Figure C104.2.4(1) for trusses and Figure C104.2.4(2) for conventionally framed gable end walls.
6. Ladder rungs shall be made of at a minimum 2x4 lumber oriented with their broad face horizontal and spaced a maximum of 16-inches on center vertically.
7. Where ladder rungs cross structural members such as the existing stud at the omitted retrofit stud location or gable end vent framing they shall be connected to each other with a metal connector with a minimum capacity of 175 pounds in the direction perpendicular to the gable end wall.
8. Notching of the ladder rungs shall not be permitted unless the net depth of the framing member is a minimum of 3-1/2 inches.

C104.2.5 Short horizontal brace. Where impediments, other permanently attached obstacles or conditions exist that prevent installation in accordance with Sections C104.2.2, C104.2.3, or C104.2.4 by not permitting extension of horizontal braces across the existing framing members such that they can be fastened to a minimum of three framing members and extend at least 6-feet from the gable end wall plus 2-1/2 inches beyond the last roof or ceiling framing member, the horizontal braces may be shortened provided installation is as indicated in Figure C104.2.5 and provided that all of the following conditions are met.

1. The horizontal brace shall be installed across a minimum of two framing spaces, extend a minimum of 4-feet from the gable end wall plus 2-1/2 inches beyond the last roof or ceiling framing member, and be fastened to each existing framing member with three 3-inch long fasteners (#8 wood screws or 10d nails),
2. An anchor block shall be fastened to the side of the horizontal brace in the second framing space from the gable end wall as shown in Figure C104.2.5. The anchor block lumber shall have a minimum edge thickness of 1-1/2 inches and the depth shall be as a minimum the depth of the existing roof or ceiling framing member. Six 3-inch long fasteners (#8 wood screws or 10d nails) shall be used to fasten the anchor block to the side of the horizontal brace.
3. The anchor block shall extend into the space between the roof or ceiling framing members a minimum of one-half the depth of the existing framing members at the location where the anchor block is installed. The anchor block shall be installed tightly between the existing framing members such that the gap at either end shall not exceed $^{1}/_{8}$ inch.
4. The use of omitted horizontal braces using the method of Section C104.2.3 adjacent to a short horizontal brace as defined in this section is not permitted.

C104.2.6 Installation of horizontal braces onto webs or vertical members of trusses. Where existing conditions preclude installation of horizontal braces on truss top or bottom chords they shall be permitted to be installed on truss webs or vertical members of trusses provided all of the following conditions are met.

1. Horizontal braces shall be installed as close to the top or bottom chords as practical without altering the truss or any of its components and not more than three times the depth of the truss member to which it would ordinarily be attached.
2. A racking block, comprised of an anchor block meeting the definition of anchor block of Section C102 or comprised of minimum 15/32 inch plywood or 7/16 inch OSB, shall be fastened to the horizontal brace in the second framing space from the gable end wall. The racking block shall extend towards the diaphragm (roof or ceiling as appropriate) so that the edge of the racking block closest to the diaphragm is within ½ the depth of

the existing framing member from the diaphragm surface. They shall be attached to horizontal braces using six fasteners (#8 wood screws or 10d nails) of sufficient length to provide 1-1/2 inches of penetration into the horizontal brace.

3. Racking blocks can be fastened to any face or edge of horizontal braces between each web or truss vertical posts to which a horizontal brace is attached. Racking blocks can be on alternate sides of horizontal braces. Racking blocks shall be installed tightly between the lumber of truss members or truss plates such that the gap at either end shall be a maximum of 1/8 inch.

C104.2.7 Alternative method of installation of horizontal braces at truss ridges. Where impediments such as truss plates or access for installation of fasteners limits or restricts installation of horizontal braces near the peak of the roof, ridge ties may be added to provide support for the required horizontal brace. The top of added ridge tie members shall be installed a maximum of 16-inches below the existing ridge line or 4 inches below impediments. The added ridge tie members shall be installed across a minimum of three bays, but no less than 6-feet from the gable end wall plus 2-1/2 inches beyond the last roof or ceiling framing member to permit fastening of the horizontal brace. A minimum of a 2x4 member shall be used for each ridge tie and fastening shall consist of two 3-inch long wood screws, four 3 inch long 10d nails or two 3-1/2 inch long 16d nails driven through and clinched at each top chord or web member intersected by the ridge tie as illustrated in Figure C104.2.7.

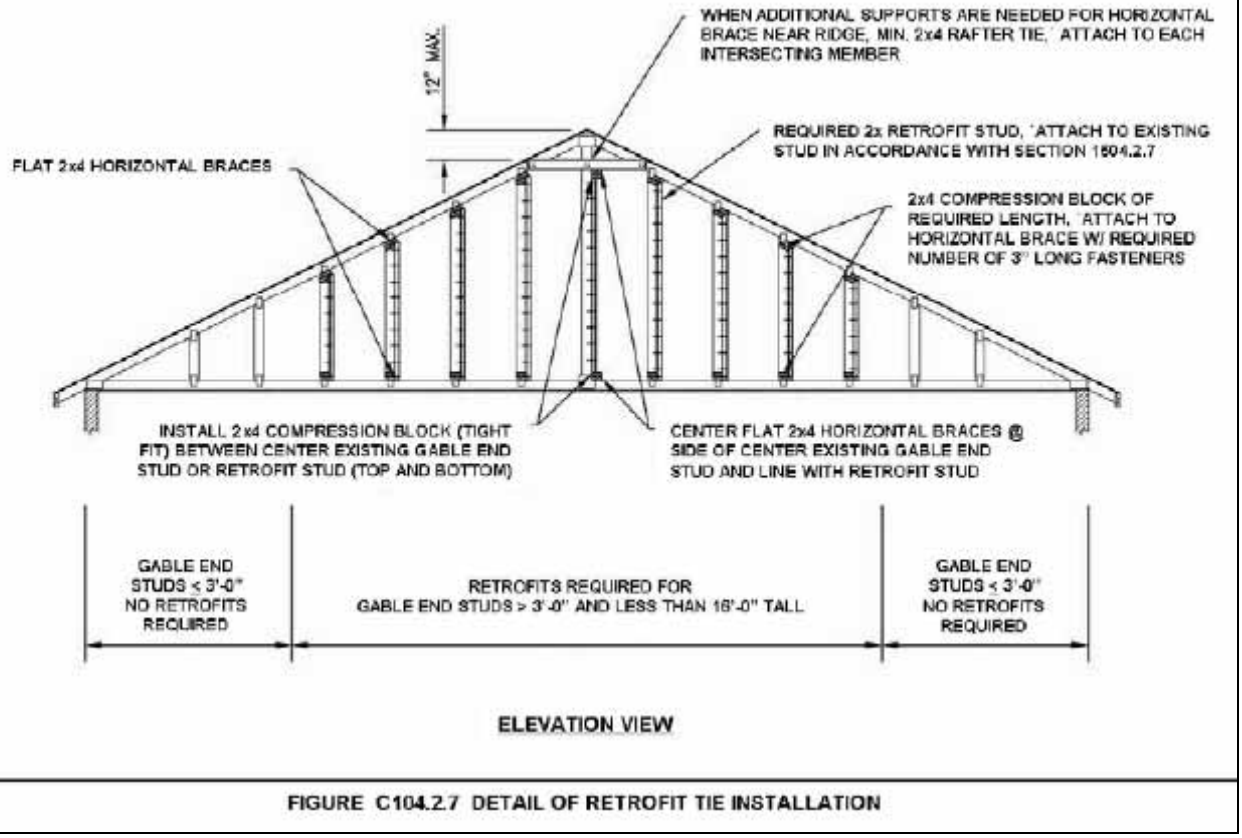


FIGURE C104.2.7 DETAIL OF RETROFIT TIE INSTALLATION

C104.2.8 Interrupted horizontal braces. Where impediments, other permanently attached obstacles or conditions exist that prevent installation of horizontal braces in accordance with Section C104.2.2 by preventing the installation of a single continuous horizontal braces then horizontal braces shall be permitted to be interrupted using the methods shown in Figure C104.2.8(1), Figure C104.2.8(2), and Figure C104.2.8(3). For interruptions that occur in the attic framing space closest to the gable end, nine 3 inch fasteners shall be used to connect each section of the interrupted horizontal braces. For interruptions that occur in the second attic space from the gable end, six 3 inch fasteners shall be used to connect each section of the interrupted horizontal braces. For interruptions that occur in the attic framing space farthest from the gable end, three 3 inch fasteners shall be used to connect each section of the interrupted horizontal braces. Horizontal braces shall be continued far enough to allow connections to three existing roof framing members as shown in Figure C104.2.8(1), Figure C104.2.8(2), or Figure C104.2.8(3). Fasteners shall be spaced in accordance with Section C103.6.3. Lumber members used to form horizontal braces shall be the same width and depth as required for an un-interrupted member.

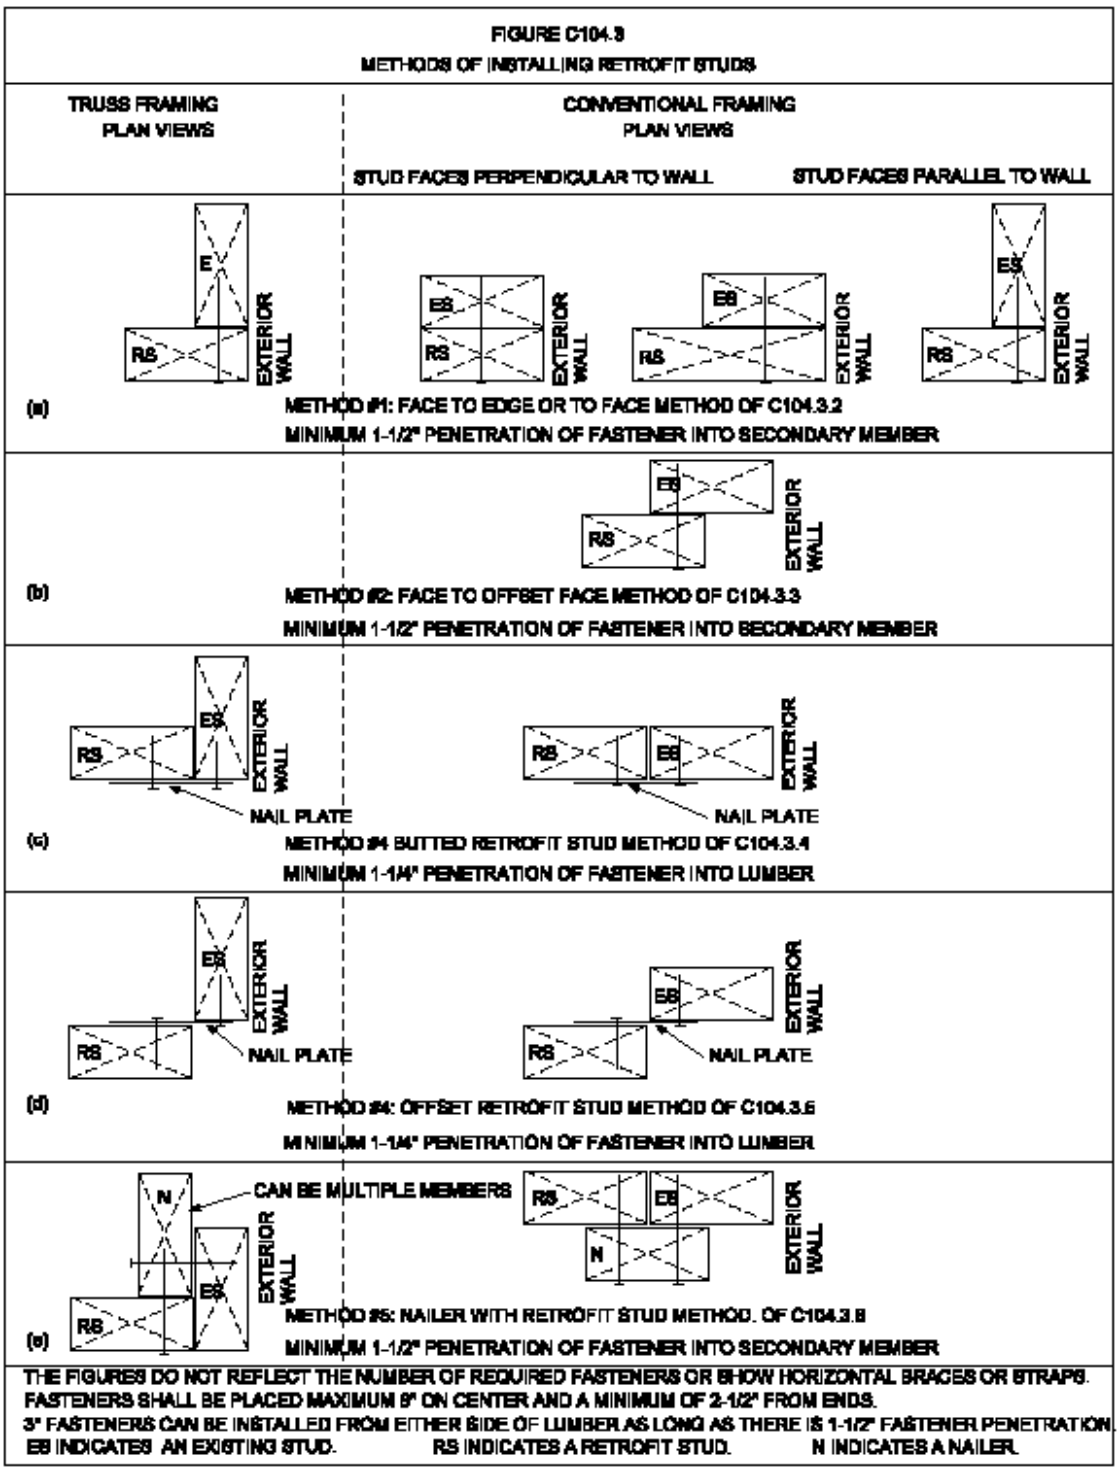
C104.2.9 Piggyback trusses. Piggyback trusses (trusses composed of two members one above the other) shall be permitted to be retrofitted if either of the following cases is true. 1. The existing studs in both the upper truss and the lower truss to which wall sheathing, panel siding, or other wall facade are attached are sufficiently in line that retrofit studs can be installed and connections made between the two with retrofit stud(s). 2. The same as condition 1 except the studs in the upper truss are not sufficiently in line with ones below and the existing studs in the upper truss are 3 feet or shorter. For condition 1 both the lower stud and the upper stud shall be retrofitted using the methods of Section C104.2. For condition two the retrofit stud shall be connected to the lower studs using the methods of Section C104.2 and be continuous from the bottom horizontal brace to the top horizontal brace. No connection is required between the retrofit stud and the upper stud. In both conditions the bottom chord of the piggy back truss section shall be fastened to each retrofit stud using a connector with minimum axial capacity of 175 pounds.

C104.3 Retrofit studs. Retrofit studs shall be installed in accordance with Section C104.3.1 and using one of the five methods of Sections C104.3.2, through C104.3.6 and as shown in Figure C104.3. For the Retrofit Configuration derived from Table C104.2 the size of retrofit studs shall be as indicated in Table C104.4.1 or Table C104.4.2. Retrofit studs shall extend from the top of the lower horizontal brace to the bottom of the upper horizontal brace except that a maximum gap of 1/8 inch is allowed at the bottom and ½ inch at the top. Where wall sheathing, panel siding, or other wall façade is fastened to gable end studs not manufactured into a truss, i.e. are field installed, retrofit studs shall be applied to those field installed studs in accordance with Section C104.2.1.

FIGURE C104.3

METHODS OF INSTALLING RETROFIT STUDS



THE FIGURES DO NOT REFLECT THE NUMBER OF REQUIRED FASTENERS OR SHOW HORIZONTAL BRACES OR STRAPS.
FASTENERS SHALL BE PLACED MAXIMUM 9" ON CENTER AND A MINIMUM OF 2-1/2" FROM ENDS.
3" FASTENERS CAN BE INSTALLED FROM EITHER SIDE OF LUMBER AS LONG AS THERE IS 1-1/2" FASTENER PENETRATION.
EB INDICATES AN EXISTING STUD. RS INDICATES A RETROFIT STUD. N INDICATES A NAILER.

C104.3.1 Fastening. Where nail plates are not used, retrofit studs shall be attached to existing studs using 3 inch fasteners at a maximum of 6 inches on center but no closer than 2-1/2 inches on center with fasteners no closer than 2-1/2 inches to the ends of members.

C104.3.2 Method #1: Face to edge or to face method. Retrofit studs shall be installed immediately adjacent to existing (Section C104.2) gable end wall studs as indicated in Figure C104.3(a). The retrofit studs shall overlap the edge or side of the existing stud by a minimum of 1-1/4 inches. Fasteners shall be installed as specified in Section C104.3.1.

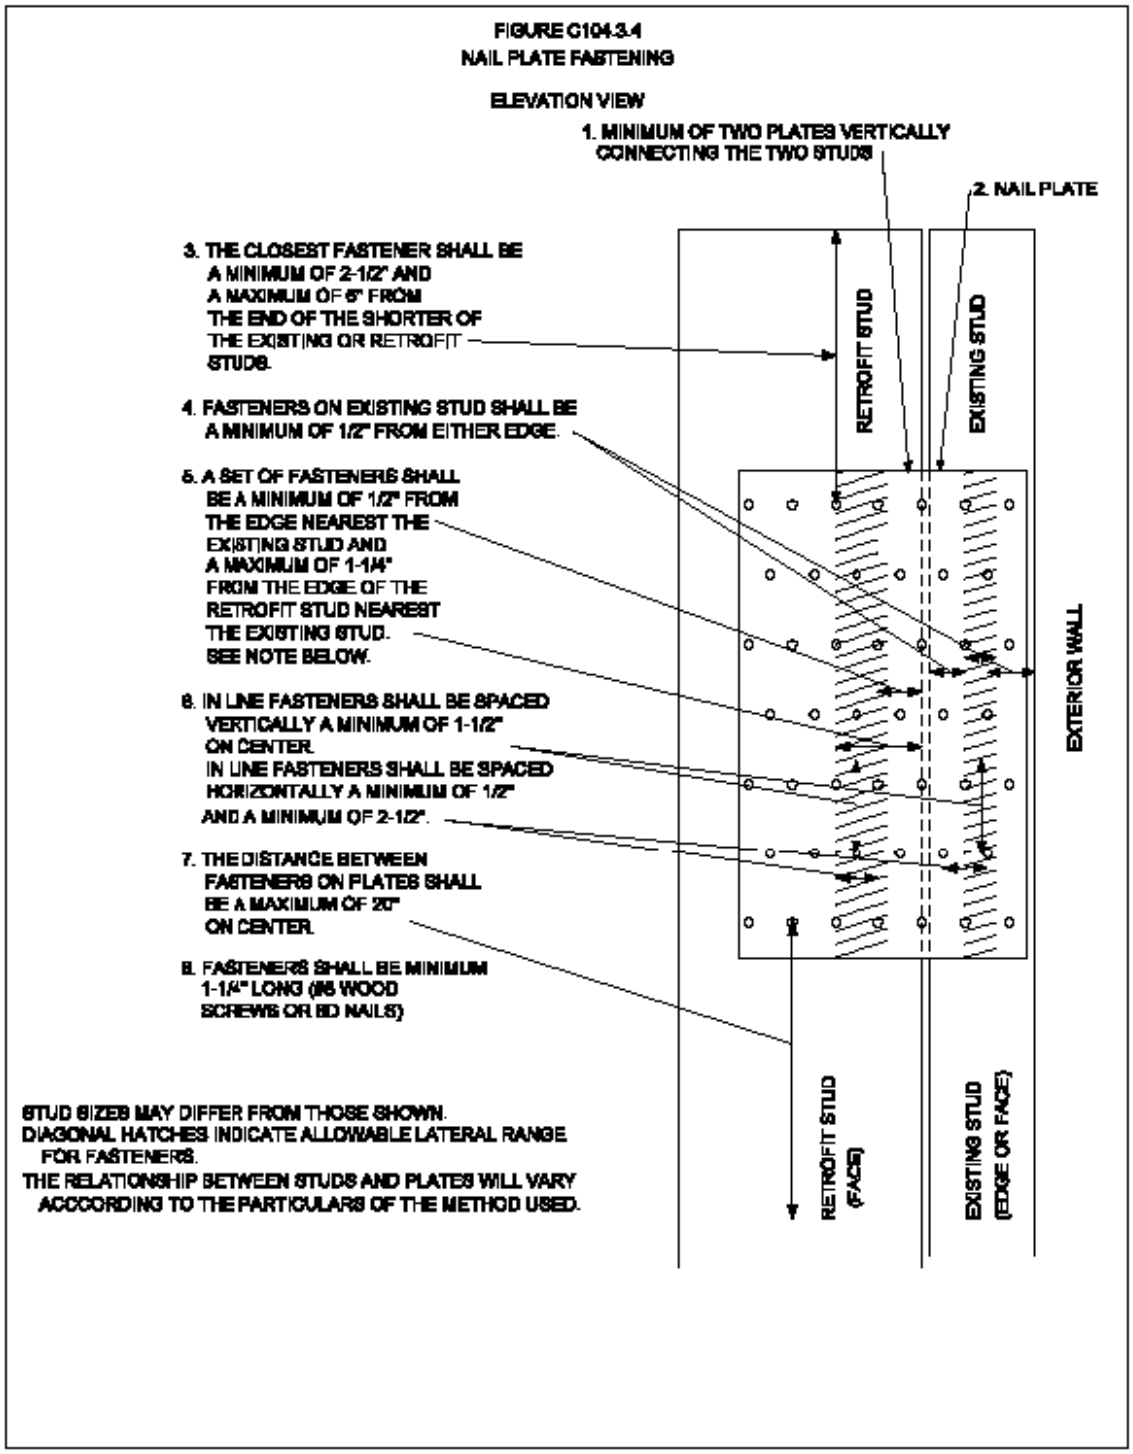
C104.3.3 Method #2: Face to face offset method. Retrofit studs shall be installed against the face of existing studs as indicated in Figure C104.3(b) such that the faces overlap a minimum of 1-1/2 inch and the edge distance to fasteners is no less than ¾ inch. Fasteners shall be installed as specified in Section C104.3.1.

C104.3.4 Method #3: Butted retrofit stud method. Provided that all of the following fastening conditions are met retrofit studs shall be permitted to be butted by their edge or face to existing studs with the addition of nail plates as indicated in Figure C104.3(c) and Figure C104.3.4.

1. The 1-1/2 inch edge of retrofit studs shall be installed against the 1-1/2 inch or the broad face of existing studs.
2. A minimum of two nail plates shall be used.
3. Fasteners used to secure nail plates to studs shall be a minimum 1-1/4 inch long (#8 wood screws or 8d nails).
4. Fasteners placed in nail plates shall be a minimum of 2-1/2 inches along the length of lumber. A fastener shall be placed in nail plates a maximum of 6 inches from the ends of the shorter stud.
5. Fasteners shall be placed a minimum of a ½ inch from the edges of the studs. Fasteners shall be placed a maximum of 1-1/2 inches from the abutting vertical edges of existing studs and retrofit studs.
6. There shall be at least 3 fasteners through nail plates into all existing and retrofit studs to which it is attached.
7. Where there are 3 fasteners through nail plates onto a single existing or retrofit stud then nail plates shall be spaced a maximum of 15 inches on center.
8. Where there are more than 3 fasteners though nail plates onto a single existing or retrofit stud then nail plates shall be spaced a maximum of 20 inches on center.
9. In line fasteners used to secure nail plates shall be spaced vertically a minimum of 1-1/2 inches on center. Staggered fasteners used to secure nail plates shall be spaced horizontally a minimum of ½ inches.

FIGURE C104.3.4
NAIL PLATE FASTENING

ELEVATION VIEW



C104.3.5 Method #4: Offset retrofit stud method. Where retrofit studs are placed as indicated in Figure C104.3(d) retrofit studs shall be permitted to be offset from existing studs by use of nail plates such that the vertical corner of a retrofit stud shall be placed at the vertical corner of an existing stud as indicated in Figure C104.3(d) and Figure C104.3.4 provided the fastening conditions of Section C104.3.4 are met.

C104.3.6 Method #5: Nailer with retrofit stud method. Retrofit studs and existing studs shall be permitted to be connected using non-continuous 2x4 nailers as indicated in Figure C104.3(e) provided the following conditions are met.

1. Both the existing stud and the retrofit stud shall be butted to nailers and both shall be fastened to the nailer with 3 inch long fasteners (#8 wood screws or 8d nails). Fasteners connecting each stud to the nailer shall be spaced 6 inches on center.
2. Fasteners into nailers from any direction shall be offset vertically by a minimum of 2-1/2 inches.
3. Fasteners into nailers shall be a minimum of 2-1/2 inches but not more than 6 inches from the end of the shorter of the existing stud and retrofit stud to which they are fastened.

C104.3.7 Reduced depth of retrofit studs. Retrofit studs may be reduced in depth by notching, tapering, or other methods at any number of locations along their length provided that all of the following conditions are met.

1. The retrofit stud to be reduced in depth shall be sized such that the remaining minimum depth of the member at the location of the notch (including cross cut kerfs) shall not be less than that required by Table C104.4.1 or Table C104.4.2.
2. The retrofit stud reduced in depth shall not be spliced within 12 inches of the location of notches. Splice members shall not be notched.
3. The vertical extent of notches shall not exceed 12 inches as measured at the depth of location of reduced depth.
4. A retrofit stud member reduced in depth shall be fastened to the side of the existing gable end wall studs in accordance with Section C104.3.1. Two additional 3 inch fasteners (#8 wood screws or 10d nails) shall be installed on each side of notches in addition to those required by Section C104.3.1.

C104.3.8 Retrofit stud splices. Retrofit studs greater than 8 feet in height may be field spliced in accordance with Figure C104.3.8.

C104.4 Connection between horizontal braces and retrofit studs. Connections between horizontal braces and retrofit studs shall comply with Section C104.4.1 or Section C104.4.2. Each retrofit stud shall be connected to the top and bottom horizontal brace members with a minimum of a 20 gauge 1-1/4 inch wide flat or coil metal strap with pre-punched holes for fasteners. Straps shall be fastened with 1-1/4 inch long fasteners (#8 wood screws or 8d nails) with the number of fasteners as indicated on Table C104.4.1 and Table C104.4.2. Fasteners shall be no closer to the end of lumber than 2-1/2 inches.

C104.4.1 L-bent strap method. Retrofit studs shall be connected to horizontal braces or to strong backs in accordance with Figure C104.2(1), Figure C104.2(2), or Figure C104.2.3, and shall comply with the following conditions.

1. A strap shall be applied to the edges of a retrofit stud nearest the gable end wall and to the face of horizontal braces using at each end of the strap the number of fasteners specified in Table C104.4.1. Straps shall be long enough so that each strap extends sufficient distance onto the vertical face of the retrofit stud that the fastener closest to the ends of the studs is a minimum of 2-1/2 inches from the end of the stud. Straps shall be allowed to be twisted to accommodate the transition between the tops of retrofit studs and horizontal bracings following roof pitches.
2. Compression blocks shall be installed on the horizontal braces directly against either the existing vertical gable end wall stud or the retrofit stud. Figure C104.2(1) (trusses) and Figure C104.2(2) (conventionally framed) show the installation of the compression block against the existing vertical gable end wall stud with the strap from the retrofit stud running beside the compression block. Compression blocks shall be allowed to be placed over straps. Compression blocks shall be fastened to the horizontal braces with at least the minimum number of 3 inch long fasteners (#8 wood screws or 10d nails) specified in Table C104.4.1. End and edge distances for fasteners shall be in accordance with Section C103.6.3.

TABLE C104.4.1
ELEMENT SIZING AND SPACING FOR L-BENT RETROFIT METHOD

	Retrofit Config.	Retrofit Config.	Retrofit Config.	Retrofit Config.
Retrofit Elements	A	B	C	D
Minimum size and number of Horizontal Braces	2x4	2x4	2x4	2 each 2x4
Minimum size and number of Retrofit Studs	2x4	2x6	2x8	2 each 2x8
Minimum number of fasteners connecting each end of straps to Retrofit Studs or to Horizontal Braces	6	9	12	8 on each strap
#8 screws or 10d nails 1-1/4" long				
Minimum number of fasteners to connect	6	8	10	12
Compression Blocks to Horizontal Braces				
#8 screws or 10d nails 3" long				

For SI: 1 Inch = 25.4mm, 1 Foot = 304.8mm

C104.4.2 U-bent strap method. Retrofit studs shall be connected to horizontal braces in accordance with Figure C104.2(3) or Figure C104.2(4), shall be limited to Retrofit Configurations A and B (Table C104.2), and shall comply with the following conditions.

1. Straps shall be of sufficient length to meet the requirements for the number of fasteners in accordance with Table C104.4.2 and to meet the end distance requirements of Section C103.6.3 shall be shaped around retrofit studs and fastened to the edges of horizontal braces. Straps shall wrap the back edge of the retrofit stud snuggly with a maximum gap of ¼ inches. Rounded bends of straps shall be allowed. One fastener shall be installed that connects each strap to the side of the associated retrofit stud.
2. The horizontal brace shall butt snugly against the retrofit stud with a maximum gap of ¼ inches.
3. Straps shall be allowed to be twisted to accommodate the transition between the tops of retrofit studs and horizontal braces that follow the roof pitch.

TABLE C104.4.2
ELEMENT SIZING AND SPACING FOR U-BENT RETROFIT METHOD

	Retrofit Config.	Retrofit Config.	Retrofit Config.	Retrofit Config.
Retrofit Elements	A	B	C	D
Minimum size and number of Horizontal Braces	2x4	2x4	2x4	2 each 2x4
Minimum size and number of Retrofit Studs	2x4	2x6	2x8	2 each 2x8
Minimum number of fasteners connecting Straps To each edge of Horizontal Braces	6	7	7	6 on side of each strap
#8 screws or 10d nails 1-1/4" long				

For SI: 1 Inch = 25.4mm, 1 Foot = 304.8mm

C104.5 Connection of gable end wall to wall below. The bottom chords or bottom members of wood framed gable end walls shall be attached to the wall below using one of the methods prescribed in Sections C104.5.1 or C104.5.2. The particular method chosen shall correspond to the framing system and type of wall construction encountered.

C104.5.1 Truss gable end wall. The bottom chords of the gable end wall in a truss gable shall be attached to the wall below using right angle brackets. A minimum of two fasteners shall be installed into the bottom chord. The right angle brackets shall be installed throughout the portion of the gable end where the gable end wall height is greater than 3 feet at the spacing specified in Table C104.5.1. Connection to the wall below shall be by one of the methods listed below:

1, For a wood frame wall below, a minimum of two fasteners shall be installed. The fasteners shall be of the same diameter and style specified by the bracket manufacturer and sufficient length to extend through the double top plate of the wall below.

2. For a concrete or masonry wall below without a sill plate, the type and number of fasteners into the wall shall be consistent with the bracket manufacturer's specifications for fasteners installed in concrete or masonry.

3. For a concrete or masonry wall below with a 2x sill plate, the fasteners into the wall below shall be of the diameter and style specified by the bracket manufacturer for concrete or masonry connections; but, long enough to pass through the wood sill plate and provide the required embedment into the concrete or masonry below. Alternatively, the bracket can be anchored to the sill plate using 4 each 1-1/2 inch long fasteners of the same type as specified by the bracket manufacturer for wood connections, provided that the sill plate is anchored to the wall on each side of the bracket by a 1/4-inch diameter masonry screw with a 2-3/4 inches of embedment into the concrete or masonry wall. A ¼ inch washer shall be placed under the heads of the masonry screws.

TABLE C104.5.1
SPACING OF RIGHT ANGLE BRACKETS

Exposure Category	Maximum 3-Sec. Gust Wind Speed – V Mph	Spacing of Right Angle Brackets [a.]
C	110	38-inches
C	120	32-inches
C	130	28-inches
C	140	24-inches
C	150	20-inches
B	110	48-inches
B	120	40-inches
B	130	36-inches
B	140	30-inches
B	150	26-inches

a. See Section C102 for definition of right angle bracket.

C104.5.2 Conventionally framed gable end wall. Each stud in a conventionally framed gable end wall, throughout the length of the gable end wall where the wall height is greater than 3 feet, shall be attached to the bottom or sill plate using a stud to plate connector with minimum uplift capacity of 175 pounds. The bottom or sill plate shall then be connected to the wall below using one of the methods listed below:

1. For a wood frame wall below, the sill or bottom plate shall be connected to the top plate of the wall below using ¼ inch diameter lag bolt fasteners of sufficient length to penetrate the bottom plate of the upper gable end wall and extend through the bottom top plate of the wall below. A washer sized for the diameter of the lag bolt shall be placed under the head of each lag bolt. The fasteners shall be installed at the spacing indicated in Table C104.5.2.

2. For a concrete or masonry wall below, the sill or bottom plate shall be connected to the concrete or masonry wall below using ¼ inch diameter concrete or masonry screws of sufficient length to provide 2-3/4 inches of embedment into the top of the concrete or masonry wall. A washer sized for the diameter of the lag bolt shall be placed under the head of each lag bolt. The fasteners shall be installed at the spacing indicated in Table C104.5.2.

TABLE C104.5.2
SPACING OF LAG OR MASONRY SCREWS USED TO
CONNECT SILL PLATE OF GABLE END WALL TO TOP OF THE WALL BELOW

C	130	14-inches
C	140	14-inches
C	150	10-inches
B	110	24-inches
B	120	20-inches
B	130	18-inches
B	140	15-inches
B	150	13-inches

Reason: This proposal, along with a similar proposal, is requesting the creation of a new set of Appendix chapters that are intended to provide guidance for retrofitting existing structures to strengthen their resistance to wind forces. These new proposed chapters are similar in scope to Appendix A which addresses seismic retrofits for existing buildings. We anticipate that, over time, additional retrofit methods will be provided in this Appendix chapter. These retrofits are voluntary, and as such may or may not meet the requirements of new construction. However, these voluntary measures will serve to better protect the public and reduce damage from high wind events.

The purpose of the proposed addition is to provide prescriptive means for retrofitting gable ends to resist high winds. This code addition will facilitate the retrofitting of gable ends without requiring site specific engineering for common applications, thus removing some of the obstacles that might impede this important retrofit in hurricane prone regions.

Reason for adding provisions for retrofitting gable ends

Gable end failures are one of the most common types of structural failures observed in hurricanes. They have been documented in most major hurricanes and in many weaker hurricanes.

The proposed code addition is intended to be a prescriptive approach to reduce retrofitting costs, facilitate retrofitting, minimize the need for engineering, and facilitate code review and inspection. The addition will provide standardized off the shelf methods that can be readily approved and easily inspected by building department personnel. Building departments can thus become creditable third party resources for authenticating retrofitting just as they do for other structural issues of buildings.

It should be recognized that almost no attempt to retrofit will actually weaken or compromise a building or subject surrounding buildings to risk, on the contrary all will benefit. The retrofitting is voluntary.

Reason for adding retrofit measures to the code

Because most America's buildings located in hurricane prone regions were not built to today's building codes standards, there is significant value added to the code if the retrofitting of buildings could be facilitated by the provision of prescriptive means. This would inherently reduce the cost of retrofitting. The need for structural retrofitting has been highlighted in the recent spate of hurricanes and the insurance crises that has developed in the coastal high wind areas of a number of states because of older buildings that do not meet current building code structural requirements. Clearly, it is in the public's health, welfare, and safety to facilitate retrofitting. Given the importance of retrofitting to the public, retrofitting of buildings should be encouraged and facilitated by removing as many impediments as possible. The code can actually facilitate and encourage retrofitting by providing prescriptive means. Such methods should encourage, facilitate, and reduce the cost of improving America's building stock.

Reason for location in code

The preferred approach is to add an appendix chapter that deals specifically with retrofitting of a voluntary nature. The advantage of this approach is that it easily allows for additional retrofit measures to be added without confusing code users by gable end retrofit being in the repair section and then changing its location to a separate chapter in a subsequent edition when more retrofit measures are added. Further by grouping retrofit measures into a separate chapter users will find them and perhaps even use the chapter as a catalog of potential retrofit measures. Additionally, grouping voluntary measures into a separate chapter, a chapter separate from mandatory measures, will make code administration less prone to confusion.

Cost Impact: The code change proposal will not increase the cost of construction.

TENTATIVE ORDER OF DISCUSSION

2009/2010 PROPOSED CHANGES TO THE INTERNATIONAL FIRE CODE AND INTERNATIONAL WILDLAND-URBAN INTERFACE CODE

The following is the tentative order in which the proposed changes to the code will be discussed at the public hearings. Proposed changes which impact the same subject have been grouped to permit consideration in consecutive changes.

Proposed change numbers that are indented are those which are being heard out of numerical order. Indentation does **not** necessarily indicate that one change is related to another. Proposed changes may be grouped for purposes of discussion at the hearing at the discretion of the chair.

F1–09/10
All Chapters

Proponent: Tom Lariviere, Chairman, Joint Fire Service Review Committee

Create "Parts" in the IFC and renumber Chapters as follows:

Part I – Administrative
Chapter 1 Scope and Administration
Chapter 2 Definitions

Part II – General Safety Provisions
Chapter 3 General Requirements
Chapter 4 Emergency Planning and Preparedness

Part III – Building and Equipment Design Features
Chapter 5 Fire Service Features
Chapter 6 Building Services and Systems
Chapter 7 Fire-Resistance-Rated Construction
Chapter 8 Interior Finish, Decorative Materials and Furnishings
Chapter 9 Fire Protection Systems
Chapter 10 Means Of Egress
Chapter ~~46~~ 11 Construction Requirements for Existing Buildings
Chapters 12 through 19 *(reserved)*

Part IV – Special Occupancies and Operations
Chapter ~~11~~ 20 Aviation Facilities
Chapter ~~12~~ 21 Dry Cleaning
Chapter ~~13~~ 22 Combustible Dust-Producing Operations
Chapter ~~22~~ 23 Motor Fuel-Dispensing Facilities and Repair Garages
Chapter ~~15~~ 24 Flammable Finishes
Chapter ~~16~~ 25 Fruit and Crop Ripening
Chapter ~~17~~ 26 Fumigation and Thermal Insecticidal Fogging
Chapter ~~18~~ 27 Semiconductor Fabrication Facilities
Chapter ~~19~~ 28 Lumber Yards and Woodworking Facilities
Chapter ~~20~~ 29 Manufacture of Organic Coatings
Chapter ~~21~~ 30 Industrial Ovens
Chapter ~~24~~ 31 Tents and Other Membrane Structures
Chapter ~~23~~ 32 High-Piled Combustible Storage
Chapter ~~14~~ 33 Fire Safety during Construction and Demolition
Chapter ~~25~~ 34 Tire Rebuilding and Tire Storage
Chapter ~~26~~ 35 Welding and Other Hot Work
Chapter ~~45~~ 36 Marinas
Chapters 37 through 49 *(reserved)*

Part V – Hazardous Materials
Chapter ~~27~~ 50 Hazardous Materials—General Provisions
Chapter ~~28~~ 51 Aerosols
Chapter ~~29~~ 52 Combustible Fibers
Chapter ~~30~~ 53 Compressed Gases
Chapter ~~31~~ 54 Corrosive Materials
Chapter ~~32~~ 55 Cryogenic Fluids
Chapter ~~33~~ 56 Explosives and Fireworks
Chapter ~~34~~ 57 Flammable and Combustible Liquids
Chapter ~~35~~ 58 Flammable Gases and Flammable Cryogenic Fluids
Chapter ~~36~~ 59 Flammable Solids
Chapter ~~37~~ 60 Highly Toxic and Toxic Materials
Chapter ~~38~~ 61 Liquefied Petroleum Gases
Chapter ~~39~~ 62 Organic Peroxides
Chapter ~~40~~ 63 Oxidizers, Oxidizing Gases and Oxidizing Cryogenic Fluids

Chapter ~~41~~ 64 Pyrophoric Materials
Chapter ~~42~~ 65 Pyroxylin (Cellulose Nitrate) Plastics
Chapter ~~43~~ 66 Unstable (Reactive) Materials
Chapter ~~44~~ 67 Water-Reactive Solids and Liquids
Chapters 68 through 79 *(reserved)*

Part VI – Referenced Standards
Chapter ~~47~~ 80 Referenced Standards

Part VII – Appendices
Appendix A Board of Appeals
Appendix B Fire-Flow Requirements for Buildings
Appendix C Fire Hydrant Locations and Distribution
Appendix D Fire Apparatus Access Roads
Appendix E Hazard Categories
Appendix F Hazard Ranking
Appendix G Cryogenic Fluids—Weight and Volume Equivalents
Appendix H Hazardous Materials Management Plan (HMMP) and Hazardous Materials Inventory Statement (HMIS) Instructions
Appendix I Fire Protection Systems – Noncompliant Conditions
Appendix J Emergency Responder Radio Coverage
Index

Reason: In the most recent code change cycle, two new chapters were added to the IFC. One Chapter addressed Marinas and the other contained Construction Requirements for Existing Buildings. Since there was no other location to place these chapters they, were added at the end of the code as Chapters 45 and 46.

Starting with original publication of the IFC in 2000, the hazardous materials provisions have been in the back portion of the code book. But now we have also included a chapter on marinas and a chapter on existing buildings. Neither of these chapters contain subject matter that is consistent with, or appropriately placed with, the concept of hazardous materials.

Therefore, this proposal will reorganize the IFC into 7 Parts. Each Part contains a subject matter and holds the chapters that logically fit under the heading of each Part. It is also foreseeable that additional chapters could be added in the future as regulation for new processes or operations are developed. Therefore, the proposal is designed to accommodate these future chapters by providing reserved (unused) chapters in several Parts. This will allow new chapters to be included into the appropriate Part as they are developed and approved.

Several concepts were used as the foundation to establish the Chapter numbers and locations as follows:

1. Chapters 1-Administration and 2-Definitions are the same subject matter in all of the ICC Codes, so they remain as 1 and 2
2. Chapters 7-Fire-Resistance-Rated Construction, 8-Interior Finish, Decorative Materials and Furnishings, 9-Fire Protection Systems, and 10-Means of Egress are the same subject matter in the IBC. These Chapters remain as 7, 8, 9, and 10 to maintain consistency with the IBC.
3. Chapter 46-Construction Requirements for Existing Buildings has been moved to Chapter 11 in Part III – Building and Equipment Design Features
4. Chapter 24-Tents and Other Membrane Structures has been moved to Chapter 31 in Part IV-Special Occupancies and Operations. This provides consistency with the IBC which has membrane structures in Chapter 31.
5. Chapter 14-Fire Safety during Construction and Demolition has been moved to Chapter 33 in Part IV-Special Occupancies and Operations. This provides consistency with the IBC which has Chapter 33-Safeguards during Construction.
6. Chapter 45-Marinas has been moved to Chapter 36 in Part IV-Special Occupancies and Operations.
7. Part V-Hazardous Materials contains all of the hazardous material regulations.

This is a different approach to the code format than the other ICC Codes utilize. But in the case of the IFC, it has been proven that there is a need to be able to expand and add new chapters that are specific to a subject matter. This proposal will allow for long-term use of the IFC by allowing the addition of new chapters, yet provide future ability to maintain chapter numbering so that the code use will know that Egress is Chapter 10, Flammable Finishes is Chapter 24, Hazardous Materials – General Provisions is Chapter 50.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: LARIVIERE-F24-ALL CHAPTERS.DOC

F2–09/10
202 (New)

Proponent: Tom Lariviere, Chairman, Joint Fire Service Review Committee

Add new definition as follows:

SECTION 202
GENERAL DEFINITIONS

FIRE HAZARD. Any thing or act which increases or could cause an increase of the hazard or threat of fire to a greater degree than that customarily recognized as normal by persons in the public service regularly engaged in preventing, suppressing or extinguishing fire or any thing or act which could obstruct, delay, hinder or interfere with the operation of the fire department or the safety of occupants in the event of fire.

Reason: The definition of "Fire Hazard" is not currently found in the IFC. The term is used 31 times in the IFC and is found in the following Chapters: 1, 2, 3, 4, 6, 9, 10, 19, 20, 21, 23, 24, 26, 33, 34 and Appendix E. However, the term is not defined in the code. The inclusion of this definition will further clarify the intent of an otherwise ambiguous term.

A similar proposal was discussed in the last code change cycle. Comments were received and have been addressed as follows:

1. "Why not use the standard Webster definition?" – the Webster Dictionary does not define "Fire Hazard"
2. "Is it better to leave as an undefined term." – The definition of "Fire Hazard" is not currently found in the IFC. The term appears in the IFC 31 times. The term is commonly used in the IFC, so it must have some intended value. For a situation to be a fire hazard it must either increase the potential of ignition, or increase the intensity of fire once it does ignite, or obstruct/hinder fire department operations, or obstruct/hinder occupant egress.
3. "What is difference of fire risk and fire hazard?" – Fire risk occurs in all locations and all situations of work, business, and just plain life. The level of fire risk varies in all situations. However when something occurs to raise or affect the normally expected level of fire risk, the potential of ignition increases and this situation then becomes classified as a fire hazard. As specified in the definition, if the situation creates an increase in the potential for fire (fire risk), it is a fire hazard.
4. "This definition would create a conflict with IFC 906.3." – This is incorrect, the words "fire hazard" are used in this section, however, they do not stand alone. The words are used as part of the term "Class A Fire Hazards". To state that the defined term "fire hazard" must be used in defining "Class A Fire Hazard" is incorrect, and is out of context. This is not the same term. The term "Class A Fire Hazard" is a specific and defined term dealing with Class A materials. This makes as little sense as assuming that Chapter 15 Flammable Finishes only applies to flammable liquids. In case you are wondering…Chapter 15 includes flammable liquids, along with combustible liquids and combustible powders, etc.

The definition of "fire hazard", although a somewhat objective definition, is needed to be able to point back to some code reference when the term is used in the code in those 31 locations.

Cost Impact: The code change proposal will increase the cost of construction.

	Assembly:	ASF	AMF	DF

ICCFILENAME: LARIVIERE-F1-202 FIRE HAZARD.DOC

F3–09/10
304.3.2

Proponent: Marcelo M. Hirschler, GBH International, representing American Fire Safety Council

Revise as follows:

304.3.2 Capacity exceeding 5.33 cubic feet. Containers with a capacity exceeding 5.33 cubic feet (40 gallons) (0.15 m^3) shall be provided with lids. Containers and lids shall be constructed of noncombustible materials or of combustible materials with a peak rate of heat release not exceeding 300 kW/m^2 when tested in accordance with ASTM E 1354 at an incident heat flux of 50 kW/m^2 in the horizontal orientation.

Exception: Wastebaskets ~~in Group I-3 occupancies shall~~ complying with Section 808.~~1~~.

Reason: This proposal makes the exception more generic and avoids the need for corrections as a function of what may change in Chapter 8. In fact, the 2009 code already has requirements for all "Wastebaskets and linen containers in Group I-2 and I-3 occupancies" in Section 808.1 and not just for wastebaskets in Group I-3 occupancies. The proposal does not introduce any new requirements.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: HIRSCHLER-F7-304.3.2.DOC

F4–09/10
307.1.1

Proponent: A. Keith Brown, North Metro Fire Rescue District, representing Fire Marshal's Association of Colorado

Revise as follows:

307.1.1 Prohibited open burning. *Open burning* shall be prohibited ~~that is offensive or objectionable because of smoke emissions or~~ when atmospheric conditions or local circumstances make such fires hazardous ~~shall be prohibited~~.

Reason: The purpose of the proposed code change is to limit the reasons for prohibiting open burning to circumstances that constitute a fire hazard.

The phrase "offensive or objectionable" in the existing code language is unreasonably subjective, making the prohibition of open burning due to smoke emissions unenforceable. The 2009 IFC does not provide a definition for "offensive or objectionable." Also, there is not a referenced standard that provides a method for measuring or otherwise determining when smoke emissions are "offensive or objectionable." In the absence of such guidance, the legal requirement for consistency of enforcement is unattainable.

Fundamentally and historically, the IFC has regulated fire hazards and not air quality due to smoke from fires. Experience strongly suggests that the present wording encourages citizens to request intervention by the fire code official to resolve neighborhood disputes regarding smoke emissions from many forms of outdoor fires that citizens correctly or incorrectly believe to be "open burning" (e.g., recreational fires, bonfires, charcoal burners, etc.); such situations should be civil matters rather than unlawful acts subject to the penalties prescribed in IFC Section 109.

The proposed wording empowers the fire code official to prohibit open burning when such fires would, in fact, be hazardous due to measurable environmental factors such as weather (e.g., wind, temperature, relative humidity) and/or fuel characteristics (e.g., fuel moisture content).

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: BROWN-F3- 307.1.1.DOC

F5–09/10
307.1.1, 307.3

Proponent: Tom Lariviere, Chairman, Joint Fire Service Review Committee

Revise as follows:

307.1.1 Prohibited open burning. *Open burning* that is offensive or objectionable because of smoke emissions or when atmospheric conditions or local circumstances make such fires hazardous shall be prohibited.

> **Exception:** Prescribed burning for the purpose of reducing the impact of wildland fire when authorized by the *fire code official*.

307.3 Extinguishment authority. ~~The~~ When open burning creates or adds to a hazardous or objectionable situation, or a required permit for *open burning* has not been obtained, the *fire code official* is authorized to order the extinguishment of the open burning operation ~~by the permit holder, another person responsible or the fire department of *open burning* that creates or adds to a hazardous or objectionable situation~~.

Reason: Section 307.1.1 is revised to allow for prescribed burning that is conducted in an effort to minimize the fuel load in wildland and interface areas. Prescribed burning is a common practice and is done with great planning and forethought. The ability for a fire agency to utilize prescribed burning operations in a season when the fire can be controlled, reduces the personnel and resources needed to control a wildland fire when it occurs, and increases the probability that fewer structures and lives are lost to wildland fire.

The current wording of Section 307.3 has a final phrase that states "or the fire department of open burning that creates or adds to a hazardous or objectionable object". This portion of the section is flawed in that either the requirement or intent is missing for this sentence to make sense. This proposal will revise Section 307.3 to simply say that the fire department can order the extinguishment of the fire.

IFC Section 109.2.2 already states "who" must comply with the order. Section 109.2.2 reads as follows:

> **109.2.2 Compliance with orders and notices.** A notice of violation issued or served as provided by this code shall be complied with by the owner, operator, occupant or other person responsible for the condition or violation to which the notice of violation pertains.

By eliminating the statement that the fire department can extinguish the fire, removes the owner's ability to say "put it out yourself" rather than complying with the order. The intent of the section is to have the owner comply, and not have the fire department handle an open burning fire which is not an emergency. The revision in Section 307.3 will allow the fire department to order that the fire be extinguished, and Section 109.2.2 specifies who must comply. This will clarify the application of this section.

Cost Impact: The code change proposal will increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: LARIVIERE-F2-307.3.DOC

F6–09/10
315

Proponent: Tom Lariviere, Chairman, Joint Fire Service Review Committee and Alan Shuman, President, representing the National Association of State Fire Marshals (NASFM)

Revise as follows:

SECTION 315
~~MISCELLANEOUS COMBUSTIBLE MATERIALS~~ GENERAL STORAGE

315.1 General. Storage~~, use and handling of miscellaneous combustible materials~~ shall be in accordance with this section.

315.2 Permit required. A permit for miscellaneous combustible storage shall be ~~obtained in accordance with~~ required as set forth in Section 105.6.

~~315.2~~ 315.3 Storage in buildings. Storage of ~~combustible~~ materials in buildings shall be orderly and stacks shall be stable. Storage of combustible materials shall be separated from heaters or heating devices by distance or shielding so that ignition cannot occur.

(Renumber subsequent sections)

Reason: This proposal will modify this section covering storage in buildings in several different ways.

This proposal is intended to clarify that this section contains requirements which apply to storage in general, not just storage of combustible materials. Specifically, Section 315.2.1 requires that a separation be maintained between the top of storage and ceilings or sprinklers. This requirement applies to all storage, whether combustible or not, and providing a clearance from sprinklers and ceilings is critical whether the materials are combustible or not.

The first sentence of Section 315.1 is revised to delete the reference to "use and handling". As stated in the title of the section, this section applies to "storage". Sections 315.1 and 315.2 deal with storage and there are no requirements for use or handling.

The second sentence of Section 315.1 is separated and creates a new Section 315.2 dealing with permits. This follows standard format throughout the rest of the IFC. The new Section 315.2 is also revised to specify that a permit is required only for storage of combustible materials. Even though this section regulates storage of both combustible and noncombustible materials, only combustible materials are required to obtain a permit when the storage exceeds 2500 cubic feet. The quantity limit is specified in the permit requirements in Section 105.6.29.

Section 315.2 is renumbered to 315.3 and revised to specify that the first sentence applies to ALL storage, and the second sentence applies to combustible storage. This will then state that all storage, whether combustible or not, is regulated and should be orderly. This means that the stored materials, whether combustible or not, are orderly, and that the stacks of stored materials need to be stable. These requirements allow for aisles being maintained, and the reduction of injury or blocking of exit during a seismic event or even when materials are hit with a hose stream during fire operations.

Hazards specific to 'combustible' materials have been more clearly identified. The second sentence in 315.3 is revised to specify that only combustible materials need to be separated from ignition sources. It is not necessary to separate non-combustible materials from ignition sources because there is no hazard.

Cost Impact: The code change proposal will increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: LARIVIERE-F3-315.DOC

F7–09/10
316.4 (New)

Proponent: Tom Lariviere, Chairman, Joint Fire Service Review Committee

Add new text as follows:

316.4 Obstructions on roofs. Installing or maintaining wires, cables, ropes, aerial antennas, or other suspended obstructions installed or maintained on the roofs of buildings having a roof slope of less than 30 degrees, shall be located to provide a vertical clearance of not less than 7 feet (2133 mm) between the roof surface and such obstruction.

Exception: Obstructions shall be permitted to be installed less than 7 feet (2133 mm) high provided they are protected in a manner to prevent injury to firefighters working on the roof.

(Renumber subsequent sections)

Reason: This proposal will increase for firefighter safety when performing fire suppression related duties on a rooftop, and will also protect maintenance workers as they are working on a rooftop.

Obstructions below 7 feet from the roof surface may be difficult or impossible to see at night or when obscured by smoke conditions. Many accidents have occurred where an obstruction was not seen and was run into by someone on the roof. In these instances, people have been injured, strangled, entangled, and fallen from rooftops.

This proposal does not prohibit the installation of these items, but it requires that they are identified or protected. For example, protection may be as simple as placing a white 2" diameter plastic pipe around the guy wire used to secure an antenna. Or be constructing an obstruction below the guy wire so that walking under the wire is not possible.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: LARIVIERE-F4-316.4.DOC

F8–09/10

316.0 (New), 905.3.8 (IBC [F] 905.3.8) (New)

Proponent: Robert J Davidson, Code Consultant/Alan Shuman, President, representing the National Association of State Fire Marshals (NASFM)

Add new text as follows:

SECTION 316.0
ROOF GARDENS AND LANDSCAPED ROOFS

316.1 General. Rooftop gardens and landscaped roofs shall be installed and maintained in accordance with this code and Sections 1505.0 and 1507.16 of the *International Building Code*.

316.2 Rooftop garden or landscaped roof size. Rooftop garden or landscaped roof areas shall not exceed 15,625 ft2 (1,450 m^2) in size for any single area with a maximum dimension of 125 ft (39 m) in length or width. A minimum 3 ft (0.9 m) wide clearance shall be provided between adjacent rooftop garden or landscaped roof areas.

316.3 Rooftop structure and equipment clearance. A minimum 3 ft (0.9 m) wide clearance shall be provided between the rooftop garden or landscaped roof and rooftop structures, including but not limited to mechanical and machine rooms, penthouses, skylights, roof vents, solar panels, antenna supports, and building service equipment.

316.4 Vegetation. Vegetation shall be maintained as described in Sections 316.4.1 and 316.4.2

316.4.1 Irrigation. Supplemental irrigation shall be provided as necessary to maintain levels of hydration necessary to keep green roof plants alive and to keep dry foliage to a minimum.

316.4.2 Dead foliage. Dead foliage and biomass shall be removed immediately.

905.3.8 (IBC [F] 905.3.8) Roof gardens and landscaped roofs. Buildings or structures with roof gardens or landscaped roofs that are equipped with a standpipe shall extend the standpipe to the roof level on which the roof garden or landscaped roof is located.

Reason: As rooftop gardens and landscaped roofs gain in acceptance and popularity reasonable requirements need to be added to the codes to address the fuel load that these additions can add to a building or structure.

New Section 316.0 is proposed to be added to the International Fire Code to manage the size of any one area utilized for these improvements, provide for a reasonable 3 foot clearance to structures and equipment that require access for maintenance and fire response purposes and to control fire exposure. A requirement that means for hydration be provided and that dead foliage and biomass be removed immediately.

A new section is proposed for the construction of buildings that have fire standpipe systems for the standpipe to be extended to the roof if a rooftop garden or landscape is proposed.

Cost Impact: These requirements will increase the cost of construction for those buildings where a roof garden or landscaped roof is proposed to be installed on the roof.

Analysis: Code Change S10-09/10 appears on the hearing order of the IBC-Fire Safety Committee and proposes revisions to IBC Table 1505.1 and Section 1507.16 on this topic. Code change F238-09/10 proposes similar requirements.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: DAVIDSON-SHUMAN-F9-316.0.DOC

F9–09/10
318 (New)

Proponent: Daniel E. Nichols, PE, New York State Department of State, Div. of Code Enforcement and Administration

Add new section as follows:

SECTION 318
VEGETATION ON ROOFS

318.1 Maintenance of vegetation. Vegetation placed upon buildings shall be maintained to prevent the accumulation of weeds, grass, vines, trees, or other growth that is capable of being ignited. All vegetation that poses a fire hazard to the building or exposure structures shall be removed from the building.

318.2 Maintenance plan. The fire code official is authorized to require a maintenance plan for vegetation placed on roofs due to the size of a roof garden, materials used, or when a fire hazard may exist to the building or exposures due to the lack of maintenance.

318.3 Maintenance equipment. Fueled equipment stored on roofs and used for the care and maintenance of vegetation on roofs shall be stored in accordance with Section 313.

Reason: A separate section is being proposed to address the placement of vegetation on roofs. It was originally considered to be a sub-section of Section 304, but vegetation on roofs does not fit within the title and is outside the scope of the Section.

Roof gardens (Green roofs) are an increasing condition and the benefits of having them are gaining popularity in protecting our environment. High-profile roof gardens, such as those seen in the Chicago area, have been thoroughly designed and are well maintained; thus seeing the benefit to our environment and energy use reduction. However, some are turning to the 'do-it-yourself' style of making a roof garden and placing vegetation on roofs for more of a feel good or aesthetic reason rather than the original purpose. The latter type of roof garden placement places a great fire risk for buildings and exposure buildings due to the possible lack of maintenance in the future. In essence, an unmaintained roof garden in similar to a brush fire being conducted on top of a building rather than on the ground. This creates an increased exposure hazard as roof covering rating requirements are based on flying embers, not falling ones.

Section 318.1 sets a basic level of maintenance, similar to that found in Section 304 for the maintenance of vegetation in and around a building. Section 318.2 gives the fire code official the ability to request a maintenance plan of the vegetation, which is beneficial to determine if the roof garden will be maintained or is just a bunch of vegetation placed on the roof. The maintenance plan is also beneficial to determine what happens to a building that goes vacant or when the building owner does not keep up with the maintenance. Section 318.3 sends the code user to 313 for appropriate storage of fueling equipment.

Due to the relatively new topic of green roofs and the increased popularity of them, it is appropriate to set basic guidelines to maintain them rather than wait for an incident.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: NICHOLS-F6-318.DOC

F10–09/10
401.6 (New)

Proponent: Michael Jacoby, Seven Valleys, PA, representing self

Add new text as follows:

401.6 Geographical locational Information. A site's geographical location being the site's latitude / longitude coordinates centered on the structure, recorded in decimal for accuracy shall be entered as part of a site's official locational records, in plans and documents.

(Renumber subsequent sections)

Reason: By having accurate geographical locational information which is essential for emergency planning and preparedness to protect those within your communities that have families or loved ones with special needs and by using latitude and longitude coordinates centered on a facility at the time of construction that over time this will eliminate the continuing locational problems being found within mapping databases combined with confusion that you may encounter when Out-Of-Area-Assistance is required for emergencies.

Simply put… State Highway Numbers, Road Names and Postal Delivery Addresses even a community for industrial park may change its name but a site's set of latitude and longitude coordinates will always stay constant.

In other words if you've ever driven to a wrong location when using address numbers and road names etc. especially when every second counts you should immediately understand why this proposed change is so important.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: JACOBY-F1-401.6.DOC

F11–09/10
403.2.1

Proponent: Amber Anderson/Stuart Tom, Cosumnes CSD Fire Department, representing California Fire Chief's Association

Revise as follows:

403.2.1 Contents. The public safety plan, where required by Section 403.2, shall address such items as emergency vehicle ingress and egress, fire protection, emergency egress or escape routes, emergency medical services, public assembly areas and the directing of both attendees and vehicles (including the parking of vehicles), vendor and food concession distribution, and the need for the presence of law enforcement, and fire and emergency medical services personnel at the event.

Reason: This code sections intent is clear with regards to additional public safety requirements that may be necessary as determined by the fire code official when certain conditions warrant. The additional proposed language for this section merely adds the ability of the fire code official to require emergency egress or escape plans to the other identified elements within the section. Including the proposed language to the existing code section will ensure that emergency egress or escape plans are included with the other requirements that the fire code official may deem necessary.

Cost Impact: The code change proposal will increase the cost of construction

	Assembly:	ASF	AMF	DF

ICCFILENAME: ANDERSON-TOM-F2-403.2.1.DOC

F12–09/10
404.3.2

Proponent: Gregory J. Cahanin, Cahanin Fire & Code Consulting, representing the Michael Minger Foundation

Revise as follows:

404.3.2 Fire safety plans. Fire safety plans shall include the following:

1. The procedure for reporting a fire or other emergency.
2. The life safety strategy and procedures for notifying, relocating or evacuating occupants, including occupants who need assistance. Emphasis shall be given to identifying individuals with mobility and cognitive disabilities and integrating their special needs into fire safety plans.
3. Site plans indicating the following:
   - 3.1. The occupancy assembly point.
   - 3.2. The locations of fire hydrants.
   - 3.3. The normal routes of fire department vehicle access.
4. Floor plans identifying the locations of the following:
   - 4.1. Exits.
   - 4.2. Primary evacuation routes.
   - 4.3. Secondary evacuation routes.
   - 4.4. Accessible egress routes.
   - 4.5. Areas of refuge.
   - 4.6. Exterior areas for assisted rescue.
   - 4.7. Manual fire alarm boxes.
   - 4.8. Portable fire extinguishers.
   - 4.9. Occupant-use hose stations.
   - 4.10. Fire alarm annunciators and controls.
5. A list of major fire hazards associated with the normal use and occupancy of the premises, including maintenance and housekeeping procedures.

6. Identification and assignment of personnel responsible for maintenance of systems and equipment installed to prevent or control fires.
7. Identification and assignment of personnel responsible for maintenance, housekeeping and controlling fuel hazard sources.

Reason: Provisions for individuals with mobility disabilities are well established in the physical environment requirements of the IBC's Accessibility chapter. Once the building is constructed with the accessibility features the maintenance codes need to have requirements in place that recognize that movement of these individuals in an emergency has to be defined, planned, and communicated. We are also at a point of recognizing that individuals with cognitive disabilities may need additional education or notice of what to do in fire emergencies. This simple addition to the IFC (and the IPMC coordination if approved here) will prompt property owners and operators to consider the sometimes unique needs of the occupants in their buildings in an emergency. This simple requirement begins the dialog between occupants and building operators to help insure that when an emergency occurs everyone will have the opportunity to move safely to the outside. Proper egress planning lessens the burden of emergency personnel in providing rescue services while the suppression effort is ongoing.

The submittal of this proposal and several others with the ICC is part of the work of the Michael H. Minger Foundation, as a result of a Department of Homeland Security Fire Prevention and Safety Grant to study how colleges and universities respond to and provide for students with physical and learning disabilities in a fire event. The study identified model practices being used by campuses regarding fire safety, housing and evacuation policies and procedures. The proposed changes to the IPMC lay the foundation for uniform fire safety planning in the campus environment in a nationally recognized document while also establishing a clear base for egress planning and performance in all types of occupancies.

The Michael H. Minger Foundation was established in 2005. The purpose of the Foundation is to improve fire safety standards and enhance fire safety systems on college and university campuses and to educate parents and students and raise awareness of the reality and risk of campus fires. This non-profit organization was founded to honor the life of Michael H. Minger, an outstanding young man, who lost his life in a college dormitory fire. The Michael Minger Act in Kentucky established a requirement for fire sprinklers in college housing. A governor's task force focusing on campus safety in Kentucky was lead by Gail Minger, the director of the Michael H. Minger Foundation.

Cost Impact: The code change proposal will not increase the cost of construction.

F13–09/10
404.6 (New)

Proponent: Gregory J. Cahanin, Cahanin Fire & Code Consulting, representing the Michael Minger Foundation

Add new text as follows:

404.6 Posting of evacuation plan. A posted evacuation plan consisting of a floor plan layout indicating the available evacuation routes with identification of key emergency components, such as areas of rescue assistance, shall be provided near the main entry to the floor or building where access by the general public occurs in Group A-3, B and R-2 occupancies .

Reason: Within ANSI A17.1 for elevators there is now a requirement for 'in case of fire use stairs' placards to be posted at elevator call buttons and this proposal is a better detailed extension of that requirement document in that the posted plan will clearly define where the stairs and areas of rescue assistance are located. A companion proposal for a new 404.5.1 requires posting of egress paths from dorm rooms and this new section is an extension into public area notice.

The information provided on the plan will communicate the available means of egress to the occupants. It is also recognized that there is no specific form of education being provided to the general population related to the provisions being provided for accessibility in buildings. The evacuation plan can begin the educational process by identifying building provisions for egress in a public area.

The submittal of this proposal and several others with the ICC is part of the work of the Michael H. Minger Foundation, as a result of a Department of Homeland Security Fire Prevention and Safety Grant to study how colleges and universities respond to and provide for students with physical and learning disabilities in a fire event. The study identified model practices being used by campuses regarding fire safety, housing and evacuation policies and procedures. The proposed changes to the IPMC lay the foundation for uniform fire safety planning in the campus environment in a nationally recognized document while also establishing a clear base for egress planning and performance in all types of occupancies.

The Michael H. Minger Foundation was established in 2005. The purpose of the Foundation is to improve fire safety standards and enhance fire safety systems on college and university campuses and to educate parents and students and raise awareness of the reality and risk of campus fires. This non-profit organization was founded to honor the life of Michael H. Minger, an outstanding young man, who lost his life in a college dormitory fire. 408.4 through 408.4.4 (New), Chapter 47, Appendix K (New)

Proponent: William Winslow, CIH, CFI, CMI, Winslow Partnership, representing self

1. Add new text as follows:

408.4 Group H occupancies and outdoor areas with hazardous materials. Group H occupancies and outdoor areas with hazardous materials shall comply with Sections 408.4.1 through 408.4.4 when such occupancies or facilities are required by 40CFR, Section 68.130 to have a Risk Management Plan (RMP). See Appendix K for further information on chemicals and threshold quantities that require a RMP.

408.4.1 Emergency response plan. An emergency response plan describing procedures for mitigating an unintentional chemical release shall be prepared prior to occupancy. A copy of the plan shall be maintained on-site, and upon request, a copy of the plan shall be provided to the fire code official for approval.

408.4.2 Training. Employees who are designated as emergency responders shall be trained to perform duties assigned in the Emergency Response Plan. Training criteria shall be provided in the Emergency Response Plan.

408.4.3 Equipment. Equipment and supplies specified in the Emergency Response Plan for use in the event of an unintentional chemical release shall be maintained on-site or shall be available for delivery to the site as specified in the plan.

408.4.4 Emergency drill. When required by the fire code official, an annual drill shall be conducted to practice the Emergency Response Plan. The fire code official shall be notified of the date and time of a scheduled drill not less than sixty days prior to the event. When an emergency drill identifies deficiencies in the Emergency Response Plan, the plan shall be updated to correct noted deficiencies.

2. Add new standard to Chapter 47 as follows:

EPA

40 CFR, Part 68 Subparts F and G – 2000	Chemical Accident Prevention Provisions - Regulated Substances for Accidental Release Prevention and Risk Management Plan

3. Add new Appendix K as follows:

(Underlining in the body of the substances tables omitted for clarity)

APPENDIX K
HAZARDOUS MATERIALS AND THRESHOLD QUANTITIES FOR EMERGENCY RESPONSE PLANNING

This appendix is for informational purposes and is not intended for adoption.

SECTION K101
GENERAL

K101.1 Scope. The *International Fire Code*, Section 408.4 establishes requirements for Group H-1, H-2, H-3 and H-4 occupancies and outdoor facilities to have an emergency response plan when threshold quantities for certain chemicals are exceeded. Section 408.4 intends for the emergency response planning requirements, including the list of applicable chemicals and threshold quantities, to:

1. Remain consistent with the U.S. Environmental Protection Agency's (EPA) Risk Management Plan (RMP) filing thresholds specified in Title 40, Section 68.130 of the Code of Federal Regulations, and
2. Remain consistent with the regulations for facilities requiring a RMP, as specified in Section 112(r) of the Clean Air Act.

Table K101(1) and Table K101(2) provide EPA's threshold quantities for regulated chemicals as of January 1, 2009. This information is provided as a reference for application of Section 408.4, but because the list of applicable chemicals and quantities under Federal law may change over time, it is recommended that the source Federal documents be consulted for the most up-to-date information when applying the code.

TABLE K101(1)
LIST OF REGULATED TOXIC SUBSTANCES AND THRESHOLD QUANTITIES FOR ACCIDENTAL RELEASE PREVENTION
(Source: 40CFR, Part 68, Sec. 68.130; Revised as of July 1, 2000)

(The font for the 2 tables was left as submitted due to technical difficulties in formatting)

Chemical name	CAS No.	Threshold quantity (lbs)
Acrolein [2-Propenal].....	107-02-8	5,000
Acrylonitrile [2-Propenenitrile].	107-13-1	20,000
Acrylyl chloride [2-Propenoyl chloride].	814-68-6	5,000
Allyl alcohol [2-Propen-l-ol]..	107-18-61	15,000
Allylamine [2-Propen-l-amine]..	107-11-9	10,000
Ammonia (anhydrous).....	7664-41-7	10,000
