[1]A flammable substance when used as a fuel or held for sale as a fuel at a retail facility is excluded from all provisions of 40CFR, Part 68.

Reason: Dalton, Georgia, April 11, 2006 - A final report issued by the U.S. Chemical Safety and Hazard Investigation Board (CSB) concluded inadequate emergency planning by the facility, city, and county contributed to the severity of a runaway chemical reaction and toxic vapor cloud release at MFG Chemical Inc. One problem is that emergency plans required under CCA 112(r) and other federal regulations do not have to be approved by the FCO and do not require periodic drills. This code change will allow the FCO to require emergency planning, training, and drills that meet the needs of the fire department for facilities with hazardous materials that exceed the threshold quantity for risk management planning found in CCA 112(r). It will also ensure that the FCO has the authority to require the plan be written and implemented before a new facility begins operation. The provision for approval by the FCO is in agreement with NFPA 600, which applies to any organized, private, industrial group of employees having fire-fighting response duties, such as emergency brigades, emergency response teams, fire teams, and plant emergency organizations. Section 1.3.2 of NFPA 600 states, " The authority having jurisdiction shall be permitted to examine and approve organization, operations, training". The 60 day notification of an upcoming drill will provide the time necessary for the fire department to include the drill in its training schedule.

Cost Impact: The code change proposal should not increase cost of construction.

Analysis: A review of the standard(s) proposed for inclusion in the code, 40 CFR, Part 68 Subparts F and G – 2000, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

Public Hearing:				
Committee:	AS	AM	D	
Assembly:	ASF	AMF	DF	

ICCFILENAME: WINSLOW-F3-408.4 (NEW)-REVISED.DOC

F15–09/10
408.7.5 (New)

Proponent: Robert E. Ellison, Jr., Detention and Correctional Inspector for the South Carolina Department of Corrections, representing self

Add new text as follows:

408.7.5 Other occupancies. Buildings or portions of buildings in Group I-3 occupancies where security operations necessitate the locking of required means of egress shall be permitted to be classified as a different occupancy. Occupancies classified as other than Group I-3 shall meet the applicable requirements of this code for that occupancy provided provisions are made for the release of occupants at all times.

Means of egress from detention and correctional occupancies that traverse other use areas shall, as a minimum, conform to requirements for detention and correctional occupancies.

> **Exception:** It shall be permissible to exit through a horizontal exit into other contiguous occupancies that do not conform to detention and correctional occupancy egress provisions but that do comply with requirements set forth in the appropriate occupancy, as long as the occupancy is not a Group H use.

Reason: To allow existing correctional facilities the same latitude in providing necessary security measures in portions of existing buildings, and separate buildings on an correctional complex (that are classified as other than I-3 occupancy) as the International Building Code does for newly constructed buildings. To be consistent with current International Building Code text and commentary that permits this application in new buildings. Current provisions of the International Fire Code do not address this issue for existing buildings.

Many existing occupancies (constructed prior to the extensive code changes for I-3 occupancies that included IBC 408.2) are still in use. Many of these existing I-3 facilities have attached occupancies or separate buildings that are designated as other than I-3 occupancy, in which there is a necessity of locking of exit doors for security purposes. The change would allow these existing occupancies the ability to secure exit doors for security purposes (if provisions for unlocking and exiting are adhered to), as provided for in the IBC for new construction..

Additional documentation: (Excerpt from IBC 2006 Commentary)

IBC 408.2

♦ In accordance with the provisions of Section 508.3, portions of an occupancy in Group I-3 may be classified as a separate occupancy and meet the provisions of the code for that occupancy. Since the area may be used by the residents, however, a need may exist for the other occupancy to also contain security provisions, such as the locking of egress doors. This section specifically permits such a condition as long as arrangements have been made for release of the occupants within these areas at any time they are occupied. Acceptable methods include having either staff operated locks or remote release of the locks, similar to that which is provided in the housing areas.

Although it is indicated that the section applies to portions of occupancies in Group 1-3, consideration should be given to allow the necessary security to be provided in separate buildings that are part of a detention or correctional facility. Applications of this section should be restricted to the buildings that must be secure because they are occupied by residents, and arrangements for quick release of the locks must be provided at all times the building is occupied. If residents are to be permitted into an area or building without staff supervision, the residents should be able to initiate their own evacuation.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: The future maintenance of the technical content of proposed IFC Section 408.7.5 will be the responsibility of the IBC-General Code Development Committee. The need for and suitability of having the new section appear in the IFC is a matter to be determined by the IFC Code Development Committee.

ICCFILENAME: ELLISON-F1-408.7.5 NEW.DOC

F16–09/10
503.2.2.1 (New)

Proponent: Carl D. Wren, Fire Department, City of Austin, TX, representing self

Add new text as follows:

503.2.2.1 Decrease in width. The fire code official shall have the authority to approve a decrease in the minimum access width. In evaluating reduced access widths, the fire code official shall consider traffic safety issues, maximum building heights, fixed fire suppression systems, the degree of street interconnections, and the adequacy of turning radii. When necessary to demonstrate compliance, the fire code official may require technical assistance provided by traffic safety professionals as well as fire safety professionals in accordance with Section 104.7.2.

Reason: For a number of years the fire service has been exploring strategic partnerships for reducing the overall risk to our communities from a variety of hazards rather than restricting its efforts to simply reducing deaths and injuries from fire related emergencies. This effort is evident in the objectives of the National Fire Academy Course "Strategies for Community Risk Reduction" and its predecessor course "Strategic Analysis of Community Risk Reduction" as well as in the NFPA "Risk Watch" program. With this general idea of overall risk to the community and a specific consideration of the potential for reducing traffic injuries and fatalities in mind, it may often be advantageous to plan for traffic calming during the site plan or subdivision design phases of a project and for the fire code official to be able to choose to accept a design with narrower but significantly interconnected streets over the potential for the jurisdiction to attempt the installation of traffic calming measures as an afterthought, or over the use of cul-de-sacs or other dead-ends with forced turnaround situations.

While the issue of environmental quality is not a goal or objective directly attributed to the fire code, environmental improvements have been a by-product of code development issues such as handling and storing hazardous materials. The EPA has also weighed in on the issue of authority to consider alternate roadway designs and has cited at least two (2) potential benefits of giving fire officials the clear authority to consider and potentially to approve narrower streets in some circumstances. First, representatives of the EPA have noted their position that interconnected narrower streets support more pedestrian friendly cities or neighborhoods and can therefore result in reduced vehicle miles traveled and an attendant reduction in carbon emissions. Second, they have noted that they support this approach as a way to give opportunity to consider and possibly use low-impact development (LID) techniques or green infrastructure for storm water treatment. They believe this will reduce the quantity and improve the quality of storm water runoff.

Finally, this proposal simply clarifies and makes explicit what the proponent considers to be a currently implied authority under IFC sections 104.8, 104.9 and 503.1.2. It affords an opportunity to give developers credit for reduced fire risks due to fire sprinkler protection and acknowledges that there is a potential for major reductions in traffic casualties for well thought out narrow street configurations. Further information on the potential impact of street widths on traffic related injuries can be obtained through a 1997 study by Peter Swift et al that is currently being peer reviewed.

Cost Impact: The code change proposal will not increase the cost of construction.

	Assembly:	ASF	AMF	DF

ICCFILENAME: WREN-F1-503.2.2.1.DOC

F17–09/10
504.3.1, 502.1

Proponent: Tom Lariviere, Chairman, Joint Fire Service Review Committee

Add new text as follows:

503.4.1. Traffic calming devices. Traffic calming devices are prohibited unless approved by the *fire code official*.

502.1 Definitions. The following words and terms shall, for the purposes of this chapter and as used elsewhere in this code, have the meanings shown herein.

TRAFFIC CALMING DEVICES. Traffic calming devices are design elements of fire apparatus access roads such as street alignment, installation of barriers, and other physical measures intended to reduce traffic and cut-through volumes, and slow vehicle speeds.

Reason: Many communities are facing increased traffic volumes. Both new and existing streets are experiencing higher vehicular volumes and speeds as drivers attempt to find "short cuts" to ease their commutes. Designers, planning departments and traffic departments are increasingly turning to traffic calming measures to preserve the quality and enjoyment of life for their citizens.

A key interest of all emergency services is to provide timely response to emergencies. Traffic calming devices can unduly delay and result in damage to emergency apparatus. This proposed language will allow fire officials to restrict traffic calming devices to those that will minimize these problems.

Standard emergency medical service response times are based on 4-6 minutes. This time frame is based on the fact that brain damage resulting from cardiac arrest typically occurs within 4-6 minutes. Delaying, or extending, these response times in any fashion places the public at greater risk.

Traffic officials and fire officials both have the responsibility to ensure that public interests are properly considered in their decision-making process. Both sets of officials have detailed regulations to provide for those interests.

This proposal requires approval of traffic calming measures by the fire code official. What it doesn't do is detail how that approval is to be made within various jurisdictions. Each jurisdiction has their own traffic pattern emergency response challenges. The purpose of this proposal is to ensure that the fire department is part of this decision-making process. This proposal requires approval of traffic calming measures in private fire access roads and public roads.

Many traffic calming designs include various road configurations that delay, or even restrict, fire apparatus access. Such items may include "round-abouts", speed humps, narrowing of streets, winding roads rather than straight roads, etc. All of these items slow the response time of any emergency response vehicle whether it be law enforcement, medical services, or fire.

The definition for traffic calming is based on the definition provided by the Institute of Transportation Engineers.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: LARIVIERE-F5-504.3.1.DOC

F18–09/10
505.1 (IBC [F] 501.2)

Proponent: Amber Anderson and Stuart Tom, representing California Fire Chief's Association

1. Revise as follows:

505.1 Address Identification. New and existing buildings shall have *approved* address numbers, building numbers or *approved* building identification placed in a position that is plainly legible and visible from the street or road fronting the property. These numbers shall contrast with their background. When required by the Fire Code Official, address numbers shall be provided in additional *approved* locations to facilitate emergency response. Address numbers shall be Arabic numbers or alphabetical letters. Numbers shall be a minimum of 4 inches (101.6 mm) high with a minimum stroke width of 0.5 inch (12.7 mm). Where access is by means of a private road and the building cannot be viewed from the *public way*, a monument, pole or other sign or means shall be used to identify the structure. Address numbers shall be maintained.

2. Revise IBC as follows:

[F] 501.2 Address identification. New and existing buildings shall be provided with *approved* address numbers or letters. Each character shall be a minimum 4 inches (102 mm) high and a minimum of 0.5 inch (12.7 mm) wide. They shall be installed on a contrasting background and be plainly visible from the street or road fronting the property. When required by the building official, address numbers shall be provided in additional *approved* locations to facilitate emergency response. Where access is by means of a private road and the building address cannot be viewed from the *public way*, a monument, pole or other *approved* sign or means shall be used to identify the structure. Address numbers shall be maintained.

Reason: The added code language provides the Fire Code Official and Building Official with the authority to require additional address locations for facilities, campuses, strip malls, business parks, residences and other properties where identification of buildings is essential to emergency responders. The additional requirements proposed by the added language will assist various emergency responders in identifying specific addresses when an emergency response from locations other than the primary access point is required.

Cost Impact: The code change proposal will increase the cost of construction

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: ANDERSON-TOM-F3-505.1~G1-501.2.doc

F19–09/10
506.1, 506.1.2 (New), Chapter 47

Proponent: Robert J Davidson, Code Consultant/Alan Shuman, President, representing the National Association of State Fire Marshals (NASFM)

1. Revise as follows:

506.1 Where required. Where access to or within a structure or an area is restricted because of secured openings or where immediate access is necessary for life-saving or fire-fighting purposes, the fire code official is authorized to require a key box to be installed in an approved location. The key box shall be of an approved type listed in accordance with UL 1037 and shall contain keys to gain necessary access as required by the fire code official.

506.1.2 Non-standardized fire service elevator keys. Key boxes provided for non-standardized fire service elevator keys shall comply with Section 506.1 and items 1 through 6 of this section.

1. The key box shall be compatible with an existing rapid entry key box system in use in the jurisdiction and approved by the fire code official.
2. The front cover shall be permanently labeled with the words "Fire Department Use Only – Elevator keys."
3. The key box shall be mounted at each elevator bank at the lobby nearest to the lowest level of fire department access.
4. The key box shall be mounted 5'6" above the finished floor to the right side of the elevator bank.
5. Contents of the key box are limited to fire service elevator keys. Additional elevator access tools, keys and information pertinent to emergency planning or elevator access shall be permitted when authorized by the fire code official.
6. In buildings with two or more elevator banks, a single key box shall be permitted to be used when such elevator banks are separated by not more than 30 feet. Additional key boxes shall be provided for each individual elevator or elevator bank separated by more than 30 feet.

   Exception: A single key box shall be permitted to be located adjacent to a fire command center or the non-standard fire service elevator key to be secured in a key box used for other purposes and located in accordance with Section 506.1 when approved by the Fire Chief.

2. Add new standard to Chapter 47 as follows:

UL

ANSI/UL 1037-99	Standard for Antitheft Alarms and Devices.

Reason: This proposal is a companion to a proposal calling for the standardization of fire service elevator keys to provide for rapid access to fire service access elevators and elevators with Phase I or Phase II emergency recall operation. That proposal includes a provision to allow placement of a non-standard fire service elevator key in a key box if there is a practical difficulty in providing a standardized key.

This proposal sets outs standards for the key boxes intended to be used for the elevator key and provides for compatibility with existing rapid entry systems; labeling of the key box; height and location of the key box(s); use of the key box for other items; and an exception to use a key box installed near a fire command center or for other purposes.

The proposal also provides for a level of security for the key box. The fire code currently provides the fire code official with the authority to require a key box within which will be keys that will provide access to secured facilities and/or locations at those facilities. There is an obligation to make sure the key box required by (or approved by) the fire code official is secure to prevent the key box from becoming a security threat.

This proposal addresses this issue of security by requiring an approved key box to be listed in accordance with UL standard 1037, The Standard for Antitheft alarms and devices. The major key box manufacturers have their rapid entry devices listed under this standard.

In preparing this proposal, statewide regulations requiring standardized fire service elevator keys (or Master Elevator Keys) from Florida, Louisiana and New Jersey were reviewed. Since some states and local jurisdictions have already begun to address this issue with the adoption of regulations and other states and jurisdictions are considering this topic it is beneficial to building owners and code officials to have a standard set of requirements contained within the model codes.

Cost Impact: The code change proposal will increase the cost of new construction.

Analysis: A review of the standard proposed for inclusion in the code, ANSI/UL 1037-99, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

F20–09/10
506.3 (New); IBC 3003.3 (New)

Proponent: Robert J Davidson, Code Consultant/Alan Shuman, President, representing the National Association of State Fire Marshals (NASFM)

THIS IS A 2 PART CODE CHANGE. BOTH PARTS WILL BE HEARD BY THE FIRE CODE COMMITTEE AS 2 SEPARATE CODE CHANGES. SEE THE TENTATIVE HEARING ORDER FOR THE FIRE CODE COMMITTEE.

PART I – IFC

Revise section title and add new text as follows:

SECTION 506
KEY BOXES AND FIRE SERVICE ELEVATOR KEYS

506.3 Standardized fire service elevator keys. All buildings with elevators equipped with Phase I Emergency Recall, Phase II emergency in-car operation, or a Fire Service Access Elevator shall be equipped to operate with a standardized fire service elevator key approved by the fire code official.

Exception: Where there is a practical difficulty to providing a standardized key the owner shall place the building's non-standardized fire service elevator keys in a key box installed in accordance with Section 506.1.

506.3.1 Requirements for standardized fire service elevator keys. Standardized fire service elevator keys shall comply with all of the following:

1. All fire service elevator keys within the jurisdiction shall be uniform and specific for the jurisdiction. Keys shall be cut to a uniform key code.
2. Fire service elevator keys shall be a patent protected design to prevent unauthorized duplication.
3. Fire service elevator keys shall be factory restricted by the manufacturer to prevent the unauthorized distribution of key blanks. No uncut key blanks shall be permitted to leave the factory
4. Fire service elevator keys subject to these rules shall be engraved with the words "DO NOT DUPLICATE".

506.3.2 Access to standardized fire service keys. Access to standardized fire service elevator keys shall be restricted to the following:

1. Elevator owners or their authorized agents;
2. Elevator contractors.
3. Elevator Inspectors of the jurisdiction.
4. Fire code officials of the jurisdiction.
5. The fire department and other emergency response agencies designated by the fire code official.

506.3.3 Duplication or distribution of keys. No person may duplicate a standardized fire service elevator key or issue, give, or sell a duplicated key unless in accordance with this code.

506.3.4 Responsibility to provide keys. The building owner shall provide up to three (3) standardized fire service elevator keys where required by the fire code official, upon installation of a standardized fire service key switch or switches in the building.

PART II – IBC GENERAL

Add new text as follows:

3003.3 Standardized fire service elevator keys. All elevators shall be equipped to operate with a standardized fire service elevator key in accordance with the *International Fire Code*.

Reason: When fire departments and other public agencies respond to emergencies the ability to quickly access the location of the emergency can be the deciding factor of a successful response. Elevators are increasingly being relied upon for emergency operations and their importance has been highlight by recent additions to the International Building Code requiring the installation of fire service access elevators and providing requirements for the installation of occupant evacuation elevators.

One of the difficulties the fire service and other emergency response agencies have when accessing facilities and attempting to use elevators is the increasing number of non-standardized keys which may not be available at the time of response. Even when emergency responders are provided the necessary keys in case of response, the correct key may have to be identified from a large collection of keys for any one building. In larger jurisdictions the sheer number of keys makes the possession of the keys unwieldy for the emergency responders.

The purpose Part1 of this proposal is to provide for a standardized fire service elevator key to reduce the number of keys necessary for accessing elevators in an emergency. As drafted this section will only apply to those buildings that have elevators with Phase I or Phase II emergency service or to those buildings with a fire service access elevator.

The proposal also provides for a level of security for the standardized key. Access to the key that can take control of an elevator is an existing area of vulnerability for buildings and one that was not addressed in the past with simple key designs being utilized. Since this proposal will create a standardized key, it also includes rules for the safeguarding of that key.

Part 2 of this proposal is included to simply place a pointer in the International Building Code should the International Fire Code Committee approve Part 1 of this proposal.

Because the International Codes are written to enable jurisdictions to adopt the codes at the State, Local or Regional levels the proposal follows that format and designated the “fire code official” as the regulating official. However, it is expected, and preferred, that a State level agency designate a standardized key for all jurisdictions to provide for a statewide standardized key.

In preparing this proposal, statewide regulations requiring standardized fire service elevator keys (or Master Elevator Keys) from Florida, Louisiana and New Jersey were reviewed. Since some states and local jurisdictions have already begun to address this issue with the adoption of regulations and other states and jurisdictions are considering this topic it is beneficial to building owners and code officials to have a standard set of requirements contained within the model codes.

Cost Impact: The code change proposal will not increase the cost of new construction.

Analysis: Similar requirements are proposed in code change proposal F40-09/10.

PART I – IFC

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

PART II – IBC GENERAL

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: DAVIDSON-SHUMAN-F5-506.3.DOC

F21–09/10
507.5.1.1 (New)

Proponent: Daniel E. Nichols, PE, New York State Department of State, Div. of Code Enforcement and Administration

Add new text as follows:

507.5.1.1 Hydrant for standpipe systems. Buildings equipped with a standpipe system installed in accordance with Section 905 shall have a fire hydrant within 100 feet of the fire department connections.

Exception: The distance shall be permitted to be greater than 100 feet when approved by the fire code official.

Reason: NFPA 14 Section 6.4.5.4 requires that a fire hydrant be placed within 100 feet from a fire department connection, unless otherwise approved by the AHJ (6.4.5.4.1). However, this section is generally missed as the site work and site approval is based on the fire apparatus access road and fire department water supply requirements in IFC Chapter 5. By placing this requirement in Section 507, the code user is better directed to this requirement during the site design and not an afterthought as it usually happens during the building permit plan review.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: NICHOLS-F3-507.5.1.1.DOC

F22–09/10
508.1.2 (IBC [F] 911.1.2)

Proponent: Lee Kranz, City of Bellevue, WA, representing The Washington Association of Building Officials (WABO), Technical Code Development Committee

Revise as follows:

508.1.2 (IBC [F] 911.1.2) Separation. The fire command center shall be separated from the remainder of the building by not less than a ~~1-hour~~ 2-hour *fire barrier* constructed in accordance with Section 707 of the International Building Code or *horizontal* assembly constructed in accordance with Section 712 of the International Building Code, or both.

Reason: Section 909.20.6.1 was changed in the 2009 IBC to require not less than 2-hour fire protection for smoke-proof enclosure pressurization fan power wiring and control wiring. Since this wiring is required to extend into the fire command room the rating of the room should be at least equal to the rating of the wiring serving it. If the fire command room is not equal to the fire-resistance rating of the wiring serving it is not possible to comply with Section 909.20.6.1 as the panel and switch gear within the panel does not permit installation of a 2 hour rated assembly to protect it.

Cost Impact: The code change proposal will increase the cost of construction.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: KRANZ-F1-911.1.2~RENAMED 508.1.2.doc

F23–09/10
508.1.5 (IBC [F] 911.1.5)

Proponent: Joe McElvaney, Phoenix, AZ, representing self

Revise as follows:

508.1.5 (IBC [F] 911.1.5) Required features. The *fire command center* shall comply with NFPA 72 and shall contain the following features:

1. The emergency voice/alarm communication system control unit.
2. The fire department communications system.
3. Fire detection and alarm system annunciator.
4. Annunciator unit visually indicating the location of the elevators and whether they are operational.
5. ~~Status indicators and controls for air distribution systems~~.
6. The fire-fighter's control panel required by Section 909.16 for smoke control systems installed in the building.
7. Controls for unlocking *stairway* doors simultaneously.
8. Sprinkler valve and water-flow detector display panels.
9. Emergency and standby power status indicators.
10. A telephone for fire department use with controlled access to the public telephone system.
11. Fire pump status indicators.
12. Schematic building plans indicating the typical floor plan and detailing the building core, *means of egress*, *fire protection systems*, fire-fighting equipment and fire department access, and the location of *fire walls*, *fire barriers*, *fire partitions*, *smoke barriers* and smoke partitions.
13. Work table.
14. Generator supervision devices, manual start and transfer features.
15. Public address system, where specifically required by other sections of this code.
16. Elevator fire recall switch in accordance with ASME A17.1.
17. Elevator emergency or standby power selector switch(es), where emergency or standby power is provided.

Reason: The IFC and IBC have smoke and fire dampers, smoke detection for the air distribution systems, automatic fire sprinkler system throughout. All these reduce and/or limit the travel of smoke. Today energy management system /computers that are used on air distribution system, turn on or off air distribution system items (i.e. fans, damper) If some that do not have knowledge of the air distribution system and start to turn on/off fan or open/close damper one can cause major damage to the air handling units and duct. If the goal of this item is to be used after a fire (to move smoke form one area to another area and to limit damage) then this can be done with energy management system with the help of the building engineer. Additional panel is not need. If the building has a smoke control system then a panel with be still require by item 6 of this section

Cost Impact: The code change proposal will not increase the cost of construction

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: MCELVANEY-F1-508.1.5.DOC

F24–09/10
508.1.5 (IBC [F] 911.1.5)

Proponent: Joe McElvaney, Phoenix, AZ, representing self

Revise as follows:

508.1.5 (IBC [F] 911.1.5) Required features. The *fire command center* shall comply with NFPA 72 and shall contain the following features:

1. The emergency voice/alarm communication system control unit.
2. The fire department communications system.
3. Fire detection and alarm system annunciator.
4. Annunciator unit visually indicating the location of the elevators and whether they are operational.
5. Status indicators and controls for air distribution systems.
6. The fire-fighter's control panel required by Section 909.16 for smoke control systems installed in the building.
7. Controls for unlocking *stairway* doors simultaneously.
8. Sprinkler valve and water-flow detector display panels.
9. Emergency and standby power status indicators.
10. A telephone for fire department use with controlled access to the public telephone system.
11. ~~Fire pump status indicators.~~
12. Schematic building plans indicating the typical floor plan and detailing the building core, *means of egress*, *fire protection systems*, fire-fighting equipment and fire department access, and the location of *fire walls*, *fire barriers*, *fire partitions*, *smoke barriers* and smoke partitions.
13. Work table.
14. Generator supervision devices, manual start and transfer features.
15. Public address system, where specifically required by other sections of this code.
16. Elevator fire recall switch in accordance with ASME A17.1.
17. Elevator emergency or standby power selector switch(es), where emergency or standby power is provided.

Reason: The current IFC and NFPA 20 do not have a list of items that shall have their status indicated. NFPA 72 does have a section that lists items that should be monitored where required by another code. If an alarm system is installed and the fire pump is monitored per NFPA 72 via the fire alarm panel, there is no need to have another panel on the wall that has the fire pump status. The fire alarm system can do all of this. Also, Section 508 does not tell us what type of fire pump status we need to have monitored.

Cost Impact: The code change proposal will not increase the cost of construction

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: MCELVANEY-F2-508.1.5-2.DOC

F25–09/10
508.1.5 (IBC [F] 911.1.5)

Proponent: Gary Lewis, Chair, ICC Ad Hoc Committee on Terrorism-Resistant Buildings

Revise as follows:

508.1.5 (IBC [F] 911.1.5) Required features. The fire command center shall comply with NFPA 72 and shall contain the following features.

1. The emergency voice/alarm communication system unit.
2. The fire department communications system.
3. Fire-detection and alarm system annunciator system.
4. Annunciator visually indicating the location of the elevators and whether they are operational.
5. Status indicators and controls for air handling systems.
6. The fire-fighters control panel required by Section 909.16 for smoke control systems installed in the building.
7. Controls for unlocking stairway doors simultaneously.
8. Sprinkler valve and water-flow detector display panels.
9. Emergency and standby power status indicators.
10. A telephone for fire department use with controlled access to the public telephone system.

11. Fire pump status indicators.
12. Schematic building plans, including a Building Information Card approved by the fire department, which shall provide building statistics including address, height, width and type of construction; stairway access, designation, floors served, pressurization, standpipe availability; elevators bank designation, car numbers, and floors served; ventilation details, including HVAC zones, location of mechanical equipment rooms, and offsite emergency phone numbers; utilities, fuel oil tank locations, gas service locations, electrical service locations; fire protection systems details, including standpipe locations, valve locations, pump room locations; hazardous materials and locations; and, contact phone numbers for building engineers, managers and fire safety directors. The Building Information Card shall also indicate ~~indicating~~ the typical floor plan and detailing the building core, means of egress, fire protection systems, elevator locations, firefighting equipment and fire department access and the location fire walls, fire barriers, fire partitions, smoke barriers and smoke partitions.
13. Work table.
14. Generator supervision devices, manual start and transfer features.
15. Public address system, where specifically required by other sections of this code.
16. Elevator fire recall switch in accordance with ASME A17.1.
17. Elevator emergency or standby power selector switch(es), where emergency or standby power is provided.

Reason: This proposal is a revised follow-up to a similar proposal defeated last cycle. It is part of a package of submittals generated by the ICC's Ad Hoc Committee on Terrorism-Resistant Buildings. The proposal seeks to slightly modify and revise an existing provision of the IBC and a parallel provision in the IFC related to fire command centers in high-rise buildings.

The scope of the proposal has been reduced to simply codifying Item #12 of the list of required fire department support features in the center. There is a need to provide complete, yet concise information to the responding fire service to assist in assessment and management of the rescue and fire fighting efforts.

The Final Report on the Collapse of the World Trade Center contained 30 key recommendations compiled by the National Institute of Standards and Technology designed to address the building vulnerabilities learned in that tragedy. Three of those thirty recommendations (Items #15, 23 and 24) embrace increasing situational awareness and emergency communications of first responders in large-scale emergencies. In fact, the command center was recently doubled in size, and now also contains additional elevator control switching, a relatively new enhancement.

The proposed Building Information Card in #12, as utilized by the NYFD, puts critical response information in a user-friendly format and medium. A simulation of the Building Information Card used in New York City follows:

Bibliography: National Institute of Standards & Technology, Final Report of the National Construction safety Team on the Collapses of the World Trade Center Towers. United States Government Printing Office: Washington, D.C. September 2005.

Cost Impact: The Ad Hoc Committee anticipates no additional cost to construction resulting from this proposal as the bulk of this information must already be provided based on the current code.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: LEWIS-F1-508.1.5.DOC

F26–09/10
509.1.1 (New)

Proponents: Amber Anderson/Stuart Tom, Cosumnes CSD Fire Department, representing California Fire Chief's Association

Add new text follows:

509.1.1 Utility identification. When required by the fire code official, gas shut off valves, electric meters, service switches and other utility equipment shall be clearly and legibly marked to identify the unit or space that it serves. Identification shall be made in an approved manner, readily visible and shall be maintained.

Reason: The current code does not require the identification of utilities at multi-unit/multi-building properties. The added code language provides the Fire Code Official authority to require utility identification for services serving multi-unit/multi-building properties including facilities, campuses, strip malls, business parks and residential properties where identification of utilities is essential to emergency responders.

Cost Impact: The code change proposal will increase the cost of construction

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: ANDERSON-TOM-F4- 509.1.1.DOC

F27–09/10
510, 502.1, Appendix J, 105.7.12 (New)

Proponent: Tom Lariviere, Chairman, Joint Fire Service Review Committee

1. Revise as follows:

SECTION 510
EMERGENCY RESPONDER RADIO COVERAGE

510.1 Emergency responder radio coverage in new buildings. All new buildings shall have *approved* radio coverage for emergency responders within the building based upon the existing coverage levels of the public safety communication systems of the jurisdiction at the exterior of the building. This section shall not require improvement of the existing public safety communication systems.

Exceptions:

1. Where *approved* by the *building code official* and the *fire code official*, a wired communication system in accordance with Section 907.2.13.2 shall be permitted to be installed or maintained in lieu of an *approved* radio coverage system.
2. Where it is determined by the *fire code official* that the radio coverage system is not needed.

~~510.3~~ **510.2 Emergency responder radio coverage in existing buildings**. Existing buildings that do not have *approved* radio coverage for emergency responders within the building shall be equipped with such coverage according to one of the following:

1. Whenever existing wired communication system cannot be repaired or is being replaced, or where not *approved* in accordance with Section 510.1 Exception 1.
2. Within a time frame established by the adopting authority.

~~J101.2~~ **510.3 Permit required.** A construction permit ~~is required~~ for installation of or modification to emergency responder radio coverage systems and related equipment is required as specified in Section 105.7.12. Maintenance performed in accordance with this code is not considered a modification and does not require a permit.

510.4 Technical requirements. Systems, components, and equipment required to provide emergency responder radio coverage system shall comply with Sections 511.4.1 through 511.4.2.5.

~~510.2~~ **510.4.1 Radio signal strength.** The building shall be considered to have acceptable emergency responder radio coverage when signal strength measurements in 95 percent of all areas on each floor of the building meet the signal strength requirements in Sections ~~510.2.1~~ 510.4.1.1 and ~~510.2.2~~ 510.4.1.2.

~~510.2.1~~ **510.4.1.1 Minimum signal strength into the building**. A minimum signal strength of -95 dBm shall be receivable within the building.

~~510.2.2~~ **510.4.1.2 Minimum signal strength out of the building**. A minimum signal strength of -100 dBm shall be received by the agency's radio system when transmitted from within the building.

~~J103.1~~ **510.4.2 System design.** The emergency responder radio coverage system shall be designed in accordance with Sections ~~510.3.2.1~~ 510.4.2.1 through ~~510.3.2.5~~ 510.4.2.5.

~~J103.1.1~~ **510.4.2.1 Amplification systems allowed.** Buildings and structures which cannot support the required level of radio coverage shall be equipped with a radiating cable system, a distributed antenna system with Federal Communications Commission (FCC)-certified signal boosters, or other system approved by the *fire code official* in order to achieve the required adequate radio coverage.

~~J103.1.2~~ **510.4.2.2 Technical criteria.** The *fire code official* shall maintain a document providing the specific technical information and requirements for the emergency responder radio coverage system. This document shall contain, but not be limited to, the various frequencies required, the location of radio sites, effective radiated power of radio sites, and other supporting technical information.

~~J103.1.3~~ **510.4.2.3 Secondary power.** Emergency responder radio coverage systems shall be provided with an *approved* secondary source of power. The secondary power supply shall be capable of operating the emergency responder radio coverage system for a period of at least 12 hours. When primary power is lost, the power supply to the emergency responder radio coverage system shall automatically transfer to the secondary power supply.

~~J103.1.4~~ **510.4.2.4 Signal booster requirements.** If used, signal boosters shall meet the following requirements:

1. All signal booster components shall be contained in a NEMA4-type water proof cabinet.
2. Battery systems used for the emergency power source shall be contained in a NEMA4-type water proof cabinet.
3. The ~~system shall include automatic alarming of malfunctions of the~~ signal booster system and battery system~~. Any resulting trouble alarm shall be automatically transmitted to an approved central station or proprietary supervising station as defined in NFPA 72~~ shall be electrically supervised and monitored by a supervisory service, or when approved by the *fire code official*, shall sound an audible signal at a constantly attended location.
4. Equipment shall have FCC Certification prior to installation.

~~J103.1.5~~ **510.4.2.5 Additional frequencies and change of frequencies.** The emergency responder radio coverage system shall be capable of modification or expansion in the event frequency changes are required by the FCC or additional frequencies are made available by the FCC.

~~J103.2~~ **510.5 Installation requirements.** The installation of the public safety radio coverage system shall be in accordance with Sections ~~J103.2.1~~ 510.5.1 through ~~J103.2.5~~ 510.5.5.

~~J103.2.1~~ **510.5.1 Approval prior to installation**. No amplification system capable of operating on frequencies licensed to any public safety agency by the FCC shall be installed without prior coordination and approval of the *fire code official*.

~~J103.2.3~~ **510.5.3 Minimum qualifications of personnel.** The minimum qualifications of the system designer and lead installation personnel shall include:

1. A Valid FCC issued General Radio Operators License, and
2. Certification of in-building system training issued by a nationally recognized organization, school or a certificate issued by the manufacturer of the equipment being installed.

The agency may waive these requirements upon successful demonstration of adequate skills and experience satisfactory to the *fire code official*.

~~J103.2.4~~ **510.5.4 Acceptance test procedure**. When an emergency responder radio coverage system is required, and upon completion of installation, the building *owner* shall have the radio system tested to ensure that two-way coverage on each floor of the building is a minimum of 90 percent. The test procedure shall be conducted as follows:

1. Each floor of the building shall be divided into a grid of 20 approximately equal areas.
2. The test shall be conducted using a calibrated portable radio of the latest brand and model used by the agency talking through the agency's radio communications system.
3. A maximum of two nonadjacent areas will be allowed to fail the test.
4. In the event that three of the areas fail the test, in order to be more statistically accurate, the floor may be divided into 40 equal areas. A maximum of four nonadjacent areas will be allowed to fail the test. If the system fails the 40-area test, the system shall be altered to meet the 90 percent coverage requirement.
5. A test location approximately in the center of each grid area will be selected for the test, then the radio will be enabled to verify two-way communications to and from the outside of the building through the public agency's radio communications system. Once the test location has been selected, that location shall represent the entire area. If the test fails in the selected test location, that grid area shall fail, and prospecting for a better spot within the grid area will not be allowed.
6. The gain values of all amplifiers shall be measured and the test measurement results shall be kept on file with the building owner so that the measurements can be verified during annual tests. In the event that the measurement results become lost, the building owner will be required to rerun the acceptance test to reestablish the gain values.
7. As part of the installation a spectrum analyzer or other suitable test equipment shall be utilized to insure spurious oscillations are not being generated by the subject signal booster. This test will be conducted at time of installation and subsequent annual inspections.

~~J103.2.5~~ 510.5.5 **FCC compliance.** The emergency responder radio coverage system installation and components shall also comply with all applicable federal regulations, including but not limited to, FCC 47 CFR 90.219.

~~J103.3~~ 510.6 **Maintenance.** The emergency responder radio coverage system shall be maintained operational at all times in accordance with Sections ~~510.5.1~~ 510.6.1 through ~~510.5.3~~ 510.6.3.

~~**J103.3.1 Maintenance.** The public radio coverage system shall be maintained operational at all times.~~

~~**J103.3.2 Permit required.** A construction permit, as required by Section 105.7.5 of the *International Fire* Code, shall be obtained prior to the modification or alteration of the emergency responder radio coverage system.~~

~~J103.3.3~~ 510.6.1 **Testing and proof of compliance**. The emergency responder radio coverage system shall be inspected and tested annually or whenever structural changes occur including additions or remodels that could materially change the original field performance tests. Testing shall consist of the following:

1. In-building coverage test as described in Section ~~J103.2.4~~ 510.5.4.
2. Signal boosters shall be tested to ensure that the gain is the same as it was upon initial installation and acceptance.
3. Backup batteries and power supplies shall be tested under load of a period of one hour to verify that they will properly operate during an actual power outage. If within the one hour test period the battery exhibits symptoms of failure, the test shall be extended for additional one hour periods until the integrity of the battery can be determined.
4. All other active components shall be checked to verify operation within the manufacturer's specifications.
5. At the conclusion of the testing a report which shall verify compliance with Section ~~J103.3.4~~ 510.5.4 be submitted to the *fire code official*.

~~J103.3.4~~ 510.6.2 **Additional frequencies.** The building *owner* shall modify or expand the emergency responder radio coverage system at their expense in the event frequency changes are required by the FCC or additional frequencies are made available by the FCC. Prior approval of a public safety radio coverage system on previous frequencies does not exempt this section.

~~J103.3.5~~ 510.6.3 **Field testing.** Agency personnel shall have the right to enter onto the property at any reasonable time to conduct field-testing to verify the required level of radio coverage.

~~**J102.1 Definitions.** For the purpose of this appendix, certain terms are defined as follows:~~

502.1 Definitions. The following words and terms shall, for the purposes of this chapter and as used elsewhere in this code, have the meanings shown herein.

AGENCY. Any emergency responder department within the jurisdiction that utilizes radio frequencies for communication. This could include, but not be limited to, various public safety agencies such as fire department, emergency medical services and law enforcement.

2. Add new text as follows:

105.7.12 Radio coverage system. A construction permit is required for installation of or modification to emergency responder radio coverage systems and related equipment. Maintenance performed in accordance with this code is not considered a modification and does not require a permit.

(Renumber subsequent sections)

3. Delete Appendix J without substitution:

~~APPENDIX J~~
~~EMERGENCY RESPONDER RADIO COVERAGE~~

Reason: This proposal takes the requirements for emergency responder radio coverage made last code cycle and finishes the process. Appendix J was included in the 2009 edition and contains the installation and testing criteria for the emergency responder radio coverage system. In this proposal, the entire appendix is relocated into the code. This action is the result of a request by the Code Development Committee last cycle and can be seen in their Reason Statement in Report on Hearings.

As the appendix is relocated into the code, some minor clarifications occurred. The following revisions are made:

1. 510.1 – the term "new" is included to clarify the difference between Section 510.1 (new construction) and 510.2 (existing construction)

2. 510.3 – this section has been relocated and includes three sections from the appendix which dealt with permits. Sections J101.2, J103.2.2 and J103.3.2 all referenced permits. This revision will provide a single section which covers permits for these systems.
3. 105.7.12 – this permit requirement is added to Chapter 1. Since the appendix is deleted, the permit requirement also needs to be located within the code. This is editorial.
4. 510.4.2.4 – Item 3 is revised to correlate with the new wording used in other sections of the code when referencing monitoring of systems. 510.6 – The two sections from the Appendix J103.3 and J103.3.1 have been combined into one section for simplicity.

Cost Impact: The code change proposal will increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: LARIVIERE-F33-510.DOC

F28–09/10

510.1, 510.3, 510.4 (New), 510.5 (New), 502.1; Appendix J103.2.3, J103.2.4

Proponent: A. Keith Brown, North Metro Fire Rescue District, representing Fire Marshal's Association of Colorado

1. Revise as follows:

510.1 Emergency responder radio coverage in buildings. All buildings shall have *approved* radio coverage for emergency responders within the building based upon the existing coverage levels of the public safety communication systems of the jurisdiction at the exterior of the building. Buildings and structures which cannot support the required level of radio coverage shall be equipped with a radiating cable system, a distributed antenna system with FCC certified signal boosters, or other system *approved* by the fire code official in order to achieve the required radio coverage. This section shall not require improvement of the existing public safety communication systems.

Exceptions:

1. Where *approved* by the building official and the *fire code official*, a wired communication system in accordance with Section 907.2.13.2 shall be permitted to be installed or maintained in lieu of an *approved* radio coverage system.
2. ~~Where it is determined by the *fire code official* that the radio coverage system is not needed.~~ One- and two-family dwellings.

510.3 Emergency responder radio coverage in existing buildings. Existing buildings that do not have approved radio coverage for emergency responders within the building shall be equipped with such coverage according to one of the following:

1. Wherever existing wired communication system cannot be repaired or is being replaced, or where not a*pproved* in accordance with Section 510.1, Exception 1.
2. Within a time frame established by the adopting authority.

Exception: One- and two-family dwellings.

2. Add new text as follows:

510.4 Inspection, testing and maintenance. Emergency responder radio communication systems shall be maintained in an operative condition at all times, and shall be replaced or repaired where defective or degraded.

510.4.1 Testing and proof of compliance. The emergency responder radio coverage system shall be inspected and tested annually or whenever structural changes occur including additions, alterations, or remodels that could materially change the original field performance tests. At the conclusion of the testing, a report verifying compliance with Sections 510.4.2 and 510.4.3, as applicable, shall be submitted to the *fire code official*.

510.4.2 Annual tests. Within one year of issuance of the certificate of occupancy, and annually thereafter, the building owner of any building for which an emergency responder communication radio system is installed shall test all active components of the system, including, but not limited to, amplifiers, power supplies, supervisory signals and backup batteries. Amplifiers shall be tested to ensure that the gain is the same as it was upon initial installation and acceptance. Backup batteries and power supplies shall be tested under load for a period of one hour to verify that they will properly operate during an actual power outage. If within the one hour test period, in the opinion of the testing technician, the battery exhibits symptoms of failure, the test shall be extended for additional one hour periods until the

testing technician confirms the integrity of the battery. All other active components shall be checked to determine that they are operating within the manufacturer's specifications for the intended purpose. If the communications appear to have degraded or if the tests fail to demonstrate adequate system performance, the owner of the building or structure is required to remedy the problem and restore the system in a manner consistent with the original approval criteria.

510.4.3 Five year tests. In addition to the annual test, the building owner shall perform a radio coverage test a minimum of once every five years to ensure that the radio system continues to meet the requirements of the original acceptance test. The procedure set forth in 510.4.2 shall apply to such tests.

510.4.4 Field testing by emergency response agencies. Emergency response agencies are authorized to conduct annual tests on all systems. If communications appear to have degraded or if the tests fail to demonstrate adequate system performance the owner of the building or structure shall remedy the problem and restore the system in a manner consistent with the original approval criteria.

510.4.5 Degradation due to building, additions, remodels or alterations. If the degradation to the system is due to building additions, remodels or alterations, the owner of the building or structure shall remedy the problem and restore the system in a manner consistent with the original approval criteria in order to obtain a final inspection for occupancy.

510.4.6 Degradation due to system failure. Any system degradation or failure not related to the performance of the owner's on site system shall be the responsibility of the appropriate emergency service agency.

510.4.7 Qualifications of testing personnel. All annual and five year tests shall be conducted, documented, and signed by a person in possession of a current FCC license, or a current technician certification issued by the Associated Public Safety Communications Officials - International or the Personal Communications Industry Association. All test records shall be retained on the inspected premises by the building owner and a copy submitted to the *fire code official*.

510.5 Additional frequencies. The building owner shall modify or expand the emergency responder radio coverage system, at no expense to the emergency response agency, in the event frequency changes are required by the FCC, additional frequencies are made available by the FCC, or frequency changes are initiated by the emergency response agency. Prior approval of a public safety radio coverage system on previous frequencies does not exempt this section.

3. Revise as follows:

502.1 ~~J102.1~~ Definitions. The following words and terms shall, for the purposes of this chapter and as used elsewhere in this code, have the meanings shown herein.

EMERGENCY RESPONSE AGENCY. Any of various public safety agencies such as fire departments, emergency medical services and law enforcement ~~emergency responder department~~ within the jurisdiction that utilizes radio frequencies for communication. ~~This could include, but not be limited to, various public safety agencies such as fire department, emergency medical services and law enforcement~~.

510.2.2 Minimum signal strength out of the building. A minimum signal strength of -100 dBm shall be received by the emergency response agency's radio system when transmitted from within the building.

J103.2.3 Minimum qualifications of personnel. The minimum qualifications of the system designer and lead installation personnel shall include:

1. A valid FCC-issued General Radio Operators License, and
2. Certification of in-building system training issued by a nationally recognized organization or school or a certificate issued by the manufacturer of the equipment being installed.

The emergency response agency may waive these requirements upon successful demonstration of adequate skills and experience satisfactory to the *fire code official*.

J103.2.4 Acceptance test procedure. When an emergency responder radio coverage system is required, and upon completion of installation, the building *owner* shall have the radio system tested to ensure that two-way coverage on each floor of the building is a minimum of 90 percent. The test procedure shall be conducted as follows:

1. Each floor of the building shall be divided into a grid of 20 approximately equal areas.

2. The test shall be conducted using a calibrated portable radio of the latest brand and model used by the emergency response agency talking through the emergency response agency's radio communications system.
3. A maximum of two nonadjacent areas shall be allowed to fail the test.
4. In the event that three of the areas fail the test, in order to be more statistically accurate, the floor may be divided into 40 equal areas. A maximum of four nonadjacent areas shall be allowed to fail the test. If the system fails the 40-area test, the system shall be altered to meet the 90-percent coverage requirement.
5. A test location approximately in the center of each grid area shall be selected for the test, then the radio shall be enabled to verify two-way communications to and from the outside of the building through the ~~public~~ emergency response agency's radio communications system. Once the test location has been selected, that location shall represent the entire area. If the test fails in the selected test location, that grid area shall fail, and prospecting for a better spot within the grid area shall not be allowed.
6. The gain values of all amplifiers shall be measured and the test measurement results shall be kept on file with the building owner so that the measurements can be verified during annual tests. In the event that the measurement results become lost, the building owner shall be required to rerun the acceptance test to reestablish the gain values.
7. As part of the installation a spectrum analyzer or other suitable test equipment shall be utilized to insure spurious oscillations are not being generated by the subject signal booster. This test shall be conducted at time of installation and subsequent annual inspections.

4. Delete without substitution:

~~J103.1.1 Amplification systems allowed.~~
~~J103.3 Maintenance.~~

Reason: The purposes of the proposed code change are:
Item 1:

1. Clarify that Section 510.1 does not require the addition of a radio-coverage system where approved radio coverage exists;
2. Delete the existing Section 510.1 Exception 2 that allows a vital requirement to be eliminated for any arbitrary and capricious reason and without providing an equivalent level of safety for emergency responders;
3. Except one- and two-family dwellings from all requirements of Section 510;
4. Ensure the continuing operability of radio coverage systems, where required, even in the event of frequency changes;
5. Establish documentation requirements for inspection and testing of radio coverage systems.

The existing, charging language of Section 510.1 implies, or could easily be construed to require, that some sort of public-safety radio-amplification system is required in all new buildings regardless of existing signal strengths, especially when Exception 1 (referencing an in-building communication system) is considered. The proposed language, which inserts Section J103.1.1, makes clear that Section 510.1 applies only to buildings and structures that do not already support the required level of radio coverage. Where acceptable emergency responder radio coverage is lacking, the new language (again from J103.1.1) identifies the allowable amplification systems that may be used to achieve required radio coverage.

The existing Exception 2 of Section 510.1 may be unique in the IFC in that no criteria or logical nexus is stated or implied to provide a reasonable basis for eliminating radio coverage for emergency responders, a fire service feature vital to firefighter safety. If Exception 2 was intended to mean that a radio coverage system is not needed when a building is shown to support acceptable radio coverage without such a system, then the language used is, at best, imprecise and, at worst, outrageously broad so as to violate the long-established principles of equivalent effectiveness elucidated in IFC Sections 104.8 and 104.9

The proposed exceptions to Section 510.1 and 510.3 for one- and two-family dwellings constructed under the IBC (e.g., where the IRC is not adopted) are intended simply to clarify that radio coverage systems will not be required in such buildings, thus preventing potential overzealous application of Section 510. Note that the proposed language references "dwellings," the definition of which (IFC Chapter 2) explicitly excludes townhouses as well as condominium/apartment buildings containing more than two dwelling units. Thus, even though each condominium in a Group R-2 high rise may itself be a single dwelling unit, the proposed exceptions for one- and two-family dwellings would not preclude requiring a radio-coverage system in said high rise. Because IFC Section 105.7 does not presently require a permit for the installation or modification of emergency responder radio coverage systems, dwellings constructed pursuant to the IRC are not impacted by the proposed change, per IFC Section 102.5 Item 1.

Item 2: The proposed Section 510.4 provides requirements for on-going maintenance and recurring testing of installed radio-coverage systems, similar to inspection, testing, and maintenance requirements for other systems (see IFC Sections 901.6, 604.3, 2703.2.6, et al.). Section 510 in the 2009 IFC lacks any such explicit requirements. Absent local adoption of Appendix J, assurance of dependable radio coverage necessary for the safety of emergency responders would appear to rest wholly on the general provisions of IFC Sections 106 and 107, which sections prescribe neither the frequency of testing (see Section 107.2) nor the qualifications of personnel competent to execute the highly technical testing of radio-amplification systems.

Section 510.5, as proposed, both mandates that radio coverage systems be upgraded as needed to accommodate frequency changes and makes such upgrades the responsibility of the building owner. The proposed language stems from Section J103.3.4.

Item 3: The purpose of this portion of the proposed code change is to define and clarify in the body of the code a foundational term used within the context of IFC Section 510 and Appendix J - Emergency Responder Radio Coverage. The proposed text stems from the definition contained in IFC Section J102.1.

Item 4: The content of the noted appendix sections was moved into Section 510. Deletion of those appendix sections eliminates the potential for conflicts between Section 510 and Appendix J.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: BROWN-F2- 510.1~REVISED.DOC

F29–09/10
510.1

Proponent: Ronald Marts, Telecordia, Qwest Communications, AT&T

Revise as follows:

510.1 Emergency responder radio coverage in buildings. All buildings shall have *approved* radio coverage for emergency responders within the building based upon the existing coverage levels of the public safety communication systems of the jurisdiction at the exterior of the building. This section shall not require improvement of the existing public safety communication systems.

Exceptions:

1. Where *approved* by the building official and the *fire code official*, a wired communication system in accordance with Section 907.2.13.2 shall be permitted to be installed or maintained in lieu of an *approved* radio coverage system.
2. Where it is determined by the *fire code official* that the radio coverage system is not needed.
3. In telecommunications buildings, where emergency responder radio coverage is required and such systems, components or equipment required may have a negative impact of radio frequency interference (RFI) on local, regional and/or national telecommunications functions of the facility, it shall be permitted to provide a function switch for the activation of the internal emergency responder radio system. The location of the function switch shall be approved by the fire code official.

Reason: This specific activation of the facilities internal emergency responder radio system will limit potential inference with the vital telecommunications operations of the facility to 24/7 exposure to these signals. The potential for interference with the operations of the telecommunications facility operations is unique to each space and operation of the facility and places in direct risk emergency services, national security and defense, and other critical telecommunications functions of the facility.

To date, studies have suggested that RFI from these transmitters may affect telecommunications equipment and thus telecommunications service.

Cost Impact: The code change proposal will have a small impact on construction cost

F30–09/10
511 (New)

Proponents: Robert J Davidson, Code Consultant/Alan Shuman, President, representing the National Association of State Fire Marshals (NASFM)

Add new section as follows:

SECTION 511
SOLAR PHOTOVOLTAIC INSTALLATIONS

511.1 General. The installation of solar photovoltaic installations shall comply with Table 601 and Chapter 16 of the *International Building Code*. The installation shall also comply with Sections 511.2 through 511.11 and NFPA 70.

511.2 Circuit marking. To facilitate identifying energized electrical lines that connect the solar panels to the inverter, to prevent these conduits from being cut when venting for smoke removal, markings shall be provided to give emergency responders appropriate warning that a solar electric system is present.

511.3 Materials. The materials used for marking shall be reflective, weather resistant and suitable for the environment.

511.4 Main service disconnect. For residential occupancies, the marking shall be placed within the main service disconnect. If the main service disconnect is operable with the service panel closed, then the marking shall be placed on the outside cover. For commercial occupancies, the marking shall be placed adjacent to the main service disconnect in a location clearly visible from the location where the lever is operated.

511.4.1. Marking content and format. The marking shall contain the words "CAUTION: SOLAR ELECTRIC CONNECTED" in capital letters a minimum of 3/8 inches in height with white letters on a red background.

511.5 DC conduit, raceways, enclosures, cable assemblies, and junction boxes. Marking shall be provided on all interior and exterior dc conduit, raceways, enclosures, cable assemblies, and junction boxes to alert the fire service to their presence. The marking shall be placed every 10 feet or fraction thereof, at turns and above and below penetrations, and on all dc combiner and junction boxes.

511.5.1 Marking content and format. The marking shall contain the words "CAUTION: SOLAR ELECTRIC CONNECTED" in capital letters a minimum of 3/8 inches in height with white letters on a red background.

511.5.2 Locations of DC conductors. Conduit, wiring systems, and raceways for photovoltaic circuits shall be located as close as possible to the ridge or hip or valley and from the hip or valley as directly as possible to an outside wall to reduce trip hazards and maximize ventilation opportunities. Conduit runs between sub arrays and to DC combiner boxes shall be installed in a manner that minimizes total amount of conduit on the roof by taking the shortest path from the array to the DC combiner box. The DC combiner boxes shall be located such that conduit runs are minimized in the pathways between arrays.

511.6 Power disconnects. A power disconnect shall be located within 3 feet of the photovoltaic array to provide for de-energizing the DC circuit(s) from the array to the inverter. The disconnect shall be label with reflective lettering.

511.7 Access, pathways for smoke ventilation. Roof access and spacing requirements shall be observed in order to ensure access to the roof; provide pathways to specific areas of the roof; provide for smoke ventilation operations; and to provide emergency egress from the roof.

511.8 Roof access points. Roof access points shall be defined as an area that does not place ground ladders over openings such as windows or doors, and are located at strong points of building construction in locations where the access point does not conflict with overhead obstructions such as tree limbs, wires, or signs.

511.9. Residential systems-One- and two-family residential dwellings. Access shall be provided in accordance with Sections 511.9.1 through 511.9.3

511.9.1 Residential buildings with hip roof layouts. Panels shall be located in a manner that provides one (1) three-foot (3') wide clear access pathway from the eave to the ridge on each roof slope where panels are located. The access pathway shall be located at a structurally strong location on the building such as along a underlying bearing wall.

511.9.2 Residential buildings with a single ridge. Panels shall be located in a manner that provides two (2) three-foot (3') wide access pathways from the eave to the ridge on each roof slope where panels are located.

511.9.3 Hips and Valleys: Panels shall be located no closer than one and one half (1.5) feet to a hip or a valley if panels are to be placed on both sides of a hip or valley. If the panels are to be located on only one side of a hip or valley that is of equal length then the panels shall be permitted to be placed directly adjacent to the hip or valley.

511.9.4 Ventilation. Panels shall be located no higher than three feet (3) below the ridge.

> **Exception:** The fire department is authorized to allow panels to be located two (2) feet below the ridge if a product or method acceptable to the fire department has been provided for ventilation.

511.10 All other occupancies. Access shall be provided in accordance with Sections 511.10.1 through 511.10.3

511.10.1 Access. There shall be a minimum six (6) foot wide clear perimeter around the edges of the roof.

> **Exception:** If either axis of the building is 250 feet or less, there shall be a minimum four feet (4') wide clear perimeter around the edges of the roof.

511.10.2 Pathways. The solar installation shall be designed to provide designated pathways. The pathways shall meet the following requirements:

1. The pathway shall be over structural members
2. The center line axis pathways shall be provided in both axis of the roof. Center line axis pathways shall run on structural members or over the next closest structural member nearest to the center lines of the roof
3. Shall be straight line not less than 4 feet clear to skylights and/or ventilation hatches

4. Shall be straight line not less than 4 feet clear to roof standpipes
5. Shall provide not less than 4 feet clear around roof access hatch with at least one not less than 4 feet clear pathway to parapet or roof edge

511.10.3 Ventilation. The solar installation shall be designed to meet the following requirements.

1. Arrays shall be no greater than 150 by 150 feet in distance in either axis
2. Ventilation options between array sections shall be either a pathway 8 feet or greater in width; a 4 feet or greater in width pathway and bordering on existing roof skylights or ventilation hatches; or a 4 feet or greater in width pathway and bordering 4' x 8' "venting cutouts" every 20 feet on alternating sides of the pathway

511.11 Ground mounted photovoltaic arrays. Ground mounted photovoltaic arrays shall comply with Sections 511.1 through 511.6 and this section. Setback requirements do not apply to ground-mounted, free standing photovoltaic arrays. A clear brush area of 10' is required for ground mounted photovoltaic arrays.

Reason: Photovoltaic arrays are increasing in popularity as an alternative energy source. These arrays, which cannot be shut down and retain electrical charges present unique hazards to firefighters operating on roofs with arrays or nearby circuits.

This proposal is intended to provide general requirements to allow for increased safety of firefighters working around and near the arrays.

These provisions were created from a "DRAFT SOLAR PHOTOVOLTAIC INSTALLATION GUIDELINE " prepared by the CAL FIRE, Office of the State Fire Marshal, local California fire departments, and the solar photovoltaic industry.

Cost Impact: The code change proposal will increase the cost of Photovoltaic installations.

Analysis: Code change proposal F238-09/10 proposes similar requirements.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: DAVIDSON-SHUMAN-F20-511.DOC

F31–09/10
602.1 [IBC [F] 2702.1 (New)]

Proponent: John England, MCO, England Enterprises Inc., representing the Cities of Beaufort and Hardeeville, SC

1. Add new definitions as follows:

602.1 Definitions. The following words and terms shall, for the purposes of this chapter, and as used elsewhere in the code, have the meanings shown herein.

EMERGENCY POWER. Electrical power provided by an automatic backup system that will energize within 10 seconds.

STANDBY POWER. Electrical power provided by an automatic backup system that will energize within 60 seconds.

2. Add new text as follows:

IBC [F] SECTION 2702
DEFINITIONS

IBC [F] 2702.1 Definitions. The following words and terms shall, for the purposes of this chapter, and as used elsewhere in this code, have the meanings shown herein.

IBC [F] EMERGENCY POWER. Electrical power provided by an automatic backup system that will energize within 10 seconds.

IBC [F] STANDBY POWER. Electrical power provided by an automatic backup system that will energize within 60 seconds.

(Renumber subsequent sections)

Reason: Many people do not understand these simple definitions.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

F32–09/10
603.3.2

Proponent: John Levey, Oilheat Associates, representing the National Oilheat Research Alliance

Revise as follows:

603.3.2 Fuel oil storage inside buildings. Fuel oil storage inside buildings shall comply with Sections 603.3.2.1 through 603.3.2.5 or Chapter 34.

> **Exception:** The storage of fuel oil used for space or water heating inside buildings in quantities exceeding 660 gallons (2498 L) shall comply with NFPA 31.

Reason: In 603.3.1 the current code refers to NFPA-31 for storage exceeding 660 gallons.

Our proposal is to use similar language in 603.3.2 for tanks that are used for space/water heating only.

Limiting the inside storage to 660 gallons will leave a large numbers of building owners with significantly less on-site storage than is acceptable. While average annual consumption of fuel oil is just under 1,000 gallons, many larger homes consume well over 2,000 gallons per year.

It is a common practice in many areas for two and three level buildings to have a separate oil furnace and tank for each floor.

The proposed change is intended to address the need for larger inside storage capacities than currently permitted, without the additional financial and logistical burdens involved with the installation of protected tanks.

"Protected" tanks (double wall, insulated tanks) are not practical for inside fuel oil storage in most locations due to size and weight constraints. A 3000 gallon "protected" tank weighs 1,874 pounds and is 52" in diameter. A typical 330 gallon tank weighs 320 pounds and is 27" wide. Installers must lift and move these tanks as access to machinery and elevators to move them is unlikely.

"Protected" tanks typically require an investment that is approximately ten times the investment for unprotected tanks. We believe this will discourage the proactive replacement of aging tanks and lead to additional releases of product and the resulting environmental consequences.

In jurisdictions that previously followed NFPA 31, four (4) 330 tanks have been allowed for a number of years. The replacement of these tanks will require that the storage capacity be downsized, providing a disincentive to proactive replacement.

Properly installed standard UL listed fuel oil storage tanks (UL 80 and UL 2258), installed in accordance with NFPA-31 have a well established safety record, merely changing the storage capacity for fuel oil should not cause additional fire hazards.

Cost Impact: The code change proposal will not increase the cost of construction

604.2.19 (New) [IBC [F] 2702.2.21 (New)]

Proponent: James Harper, City of Omaha, representing Nebraska Code Officials Association

Add new text as follows:

604.2.19 (IBC [F] 2702.2.21) Exhaust fans in shaft enclosures. Standby power shall be provided to exhaust fans installed in shaft enclosures in accordance with the *International Mechanical Code* and Section 716.5.3 of the *International Building Code*.

Reason: Section 504.8 of the IMC requires that an exhaust fan installed in a shaft enclosure in lieu of dampers be connected to standby power, however such requirement is not captured in Chapter 27 of the IBC. In addition, Exception 2 of Section 716.5.3 provides a similar exception where an exhaust fan is provided in lieu of dampers. (Sec. 716.5.3 of the IBC is repeated as Section 607.5.5 of the IMC.) It is essential that such fans be connected to standby power. Standby and emergency power requirements are also referenced in IBC Chapter 27 which provides a single convenient location in the code for determining standby and emergency power requirements. The requirements in the IMC should appear in IBC Chapter 27.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: HARPER-G1-2702.2.21~RENAMED-F1-604.2.19.doc

604.5 (New)

Proponent: Manny Muniz, California Deputy State Fire Marshal (Ret.), representing self

Add new text as follows:

604.5 Periodic testing of battery unit means of egress illumination. Required means of egress illumination utilizing battery-operated unit equipment in accordance with Section 1006.3 shall be periodically tested in accordance with Section 604.5.1, 604.5.2 or 604.5.3, as applicable.

604.5.1 Non-computer-based/non-self-testing/non-self-diagnosing battery operated unit equipment. Non-computer-based/non-self-testing/non-self-diagnosing battery operated unit equipment shall be functionally tested at 30-day intervals for not less than 30 seconds and annually for not less than 90 minutes. Throughout the duration of such tests, the equipment shall be fully operational.

604.5.1.1 Written records. A written record shall be maintained by the owner in accordance with Section 604.3.2 of functional tests.

604.5.2 Self-testing/self-diagnostic battery-operated unit equipment. Self-testing/self-diagnostic battery-operated unit equipment shall be visually inspected, automatically perform a minimum 30 second operational test and a diagnostic routine not less than once every 30 days. Failures shall be indicated by a status indicator. A full functional test shall be conducted annually for not less than 90 minutes. Throughout the duration of such tests, the equipment shall be fully operational.

604.5.2.1 Written records. A written record shall be maintained by the owner in accordance with Section 604.3.2 of visual inspections and operational tests.

604.5.3 Computer-based, self-testing/self-diagnostic battery-operated unit equipment. Computer-based, self-testing/self-diagnostic battery-operated unit equipment shall automatically perform a minimum 30 second operational test and a diagnostic routine not less than once every 30 days. The equipment shall also perform automatically a minimum 90 minute annual function test. Throughout the duration of such tests, the equipment shall be fully operational.

604.5.2.2 Test records. The computer-based, self-testing/self-diagnostic system shall have the capability to provide documentation of the tests and failures upon request of the fire code official.

(Renumber subsequent section)

Reason: IFC Section 107.1 requires that any device, equipment or system required for compliance with the provisions of the code, shall be continuously maintained in accordance with the code and applicable referenced standards. Section 604.3 requires that emergency and standby power systems be maintained in accordance with NFPA 110 and 111. The IFC does not, however, contain maintenance and testing requirements for means of egress illumination that is provided by battery-operated unit equipment as allowed by Section 1006.3. Both NFPA 110 and 111 specifically exclude such equipment from their scopes.

This proposal seeks to fill the void in the IFC by providing periodic testing requirements for the three types of battery operated unit equipment found in the field, i.e., non-computer-based/non-self-testing/non-self-diagnosing, self-testing/self-diagnostic and computer-based, self-testing/self-diagnostic . Similar provisions have been in NFPA 101 since the 2003 edition.

Cost Impact: The code change proposal will increase the cost of construction.

Analysis: Similar requirements are proposed in code change proposal F35-09/10.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: MUNIZ-F1-604.5

F35–09/10
604.5 (New)

Proponent: Daniel E. Nichols, PE, New York State Dept. of State, Div. of Code Enforcement and Administration

Add new text as follows:

604.5 Emergency lighting equipment. Emergency lighting shall be inspected and tested in accordance with Section 604.5.1 through 604.5.2.1.

604.5.1 Activation test. An activation test of the emergency lighting equipment shall be completed monthly. The activation test shall ensure the emergency lighting activates automatically upon normal electrical disconnect and stays sufficiently illuminated for a minimum of 30 seconds.

604.5.1.1 Activation test record. Records shall be maintained on the premises for a minimum of 3 years and submitted to the fire code official upon request. The record shall include the location of the emergency lighting tested, whether the unit passed or failed, the date of the test, and the person completing the test.

604.5.2 Power test. For battery powered emergency lighting, a power test of the emergency lighting equipment shall be completed annually. The power test shall operate the emergency lighting for a minimum of 90 minutes and shall remain sufficiently illuminated for the duration of the test.

604.5.2.1 Power test record. Records shall be maintained on the premises for a minimum of 3 years and submitted to the fire code official upon request. The record shall include the location of the emergency lighting tested, whether the unit passed or failed, the date of the test, and the person completing the test.

~~**604.5**~~ **604.6 Supervision of maintenance and testing.** Routine maintenance, inspection and operational testing shall be overseen by a properly instructed individual.

Reason: IBC 1006.3 permits the use of unit equipment as sufficient to provide means of egress illumination. However, NFPA 111 Section 1.1.4.1 Item 4 specifically exempts unit equipment from being covered by the maintenance standard (NFPA 110 does not apply). This provides a gap in the IFC for maintaining the most common type of emergency lighting in smaller buildings, self-contained unit lighting.

The requirements found herein are based on a combination of current State of New York provisions for maintaining lighting equipment and NFPA 101Section 7.9.3. Records retention requirements are similar to the requirements for fire protection system maintenance records in IFC Section 901.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: Similar requirements are proposed in code change proposal F34-09/10.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: NICHOLS-F2-604.5 NEW.DOC

F36–09/10
605.1

Proponent: Philip M. Chandler, representing New York State Department of State, Office of Fire Protection & Control

Revise as follows:

605.1 Abatement of electrical hazards. ~~Identified electrical hazards shall be abated. Identified hazardous electrical conditions in permanent wiring shall be brought to the attention of the responsible code official.~~ Where it is found that the electrical system in a structure constitutes a hazard to the occupants or the structure by reason of inadequate service, improper fusing, insufficient receptacle and lighting outlets, improper wiring or installation, deterioration or damage, or for similar reasons, the fire code official shall require the defects to be corrected to eliminate the hazard. Electrical wiring, devices, appliances and other equipment that is modified or damaged and constitutes an electrical shock or fire hazard shall not be used.

Reason: The proposed revision will make this section consistent with the requirements of the *International Property Maintenance* Code (IPMC), Section 604.3. The new language clearly identifies important electrical hazards that create a risk of fire and eliminates much ambiguity found in the old language.

Cost Impact: The code change proposal will not increase the cost of construction

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: CHANDLER-F1-605.1.DOC

F37–09/10
605.1.1 (New)

Proponent: Philip M. Chandler, representing New York State Department of State, Office of Fire Protection & Control

Add new text as follows:

605.1.1 Electrical inspection. In accordance with the provisions of Section 104.7.2, the fire code official is authorized to require an inspection and report on the safety of a structure's electrical system, wiring, devices, appliances and equipment. The inspection and report shall be prepared by a qualified engineer, specialist, laboratory or fire safety specialty organization acceptable to the fire code official.

Reason: The fire code official may have reason to believe that the electrical safety of a structure is compromised, yet lack the highly technical knowledge or specialized skills to make a final determination. Inasmuch as the risk of shock or hazard of fire are very real consequences of defective electrical systems and equipment, this authorization of the fire code official to obtain technical assistance is warranted.

Cost Impact: The code change proposal will not increase the cost of construction

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: CHANDLER-F2-605.1.1.DOC

F38–09/10
605.10, 605.10.1, 605.10.2 (All new)

Proponents: Robert J Davidson, Code Consultant/Alan Shuman, President, representing the National Association of State Fire Marshals (NASFM)

Add new text as follows:

605.10 Abandoned or unused wiring. Installed supply circuits and interconnecting cables that are no longer in use shall be maintained in accordance with this code and NFPA 70, or removed.

605.10.1 Abandoned wiring. Installed supply circuits and interconnecting cables that are not terminated at devices or equipment and have not been tagged for future use shall be considered abandoned.

605.10.1.1 Identification tags. Tags intended to identify supply circuits and interconnecting cable for future use shall have the following information.

1. The date the circuit or cable was tagged as intended for future use.
2. The expected date of the future use.
3. A description of what the intended future use is.

605.10.2 Removal. Accessible portions of abandoned supply circuits and interconnecting cables, including wiring tagged for future use that has not been utilized within one year of tagging, shall be removed.

(Renumber subsequent section)

Reason: A growing problem in existing buildings is the accumulation of abandoned or unused wiring. This sometimes hidden hazard provides increased fuel loads and entanglement hazards for firefighters. Though provisions for maintaining or removing such wiring are contained within NFPA 70, it is the fire code official who is responsible for maintenance inspections and the code official most likely to encounter this hazard.

This proposal takes the requirements found in the electrical code and places them directly within the fire code for direct application by the fire code official. The proposal also puts a one year limit on wiring that has been tagged for future use to eliminate a loophole in current requirements. This will increase the ability of the fire service to reduce unnecessary fuel loads and to eliminate a distinct hazard to firefighters.

Following are excerpts from the electrical code as background.

372.13 Discontinued Outlets.
When an outlet is abandoned, discontinued, or removed, the sections of circuit conductors supplying the outlet shall be removed from the raceway. No splices or reinsulated conductors, such as would be the case of abandoned outlets on loop wiring, shall be allowed in raceways.

374.7 Discontinued Outlets.
When an outlet is abandoned, discontinued, or removed, the sections of circuit conductors supplying the outlet shall be removed from the raceway. No splices or reinsulated conductors, such as would be the case with abandoned outlets on loop wiring, shall be allowed in raceways.

390.7 Discontinued Outlets.
When an outlet is abandoned, discontinued, or removed, the sections of circuit conductors supplying the outlet shall be removed from the raceway. No splices or reinsulated conductors, such as would be the case with abandoned outlets on loop wiring, shall be allowed in raceways.

640.2 Definitions.
For purposes of this article, the following definitions apply.

Abandoned Audio Distribution Cable. Installed audio distribution cable that is not terminated at equipment and not identified for future use with a tag.

(C) Abandoned Audio Distribution Cables. The accessible portion of abandoned audio distribution cables shall be removed.

645.2 Definition.
Abandoned Supply Circuits and Interconnecting Cables. Installed supply circuits and interconnecting cables that are not terminated at equipment and not identified for future use by a tag.

645.5 Supply Circuits and Interconnecting Cables.

(F) Abandoned Supply Circuits and Interconnecting Cables. The accessible portion of abandoned supply circuits and interconnecting cables shall be removed unless contained in a metal raceway.

(G) Installed Supply Circuits and Interconnecting Cables Identified for Future Use.
- *(1) Supply circuits and interconnecting cables identified for future use shall be marked with a tag of sufficient durability to withstand the environment involved.*
- *(2) Supply circuit tags and interconnecting cable tags shall have the following information:*
  - *a. Date identified for future use*
  - *b. Date of intended use*
  - *c. Information relating to the intended future use*

725.2 Definitions.
Abandoned Class 2, Class 3, and PLTC Cable. Installed Class 2, Class 3, and PLTC cable that is not terminated at equipment and not identified for future use with a tag.

725.25 Abandoned Cables.
The accessible portion of abandoned Class 2, Class 3, and PLTC cables shall be removed. Where cables are identified for future use with a tag, the tag shall be of sufficient durability to withstand the environment involved.

760.2 Definitions.
Abandoned Fire Alarm Cable. Installed fire alarm cable that is not terminated at equipment other than a connector and not identified for future use with a tag.

760.3 Other Articles.
Circuits and equipment shall comply with 760.3(A) through (G). Only those sections of Article 300 referenced in this article shall apply to fire alarm systems.
- *(A) Spread of Fire or Products of Combustion. Section 300.21. The accessible portion of abandoned fire alarm cables shall be removed.*

760.25 Abandoned Cables.
The accessible portion of abandoned fire alarm cables shall be removed. Where cables are identified for future use with a tag, the tag shall be of sufficient durability to withstand the environment involved.

770.2 Definitions.
See Article 100. For purposes of this article, the following additional definitions apply.
Abandoned Optical Fiber Cable. Installed optical fiber cable that is not terminated at equipment other than a connector and not identified for future use with a tag.

770.25 Abandoned Cables.
The accessible portion of abandoned optical fiber cables shall be removed. Where cables are identified for future use with a tag, the tag shall be of sufficient durability to withstand the environment involved.

800.2 Definitions.
See Article 100. For the purposes of this article, the following additional definitions apply.
Abandoned Communications Cable. Installed communications cable that is not terminated at both ends at a connector or other equipment and not identified for future use with a tag.

800.25 Abandoned Cables.
The accessible portion of abandoned communications cables shall be removed. Where cables are identified for future use with a tag, the tag shall be of sufficient durability to withstand the environment involved.

820.2 Definitions.
See Article 100. For the purposes of this article, the following additional definitions apply.
Abandoned Coaxial Cable. Installed coaxial cable that is not terminated at equipment other than a coaxial connector and not identified for future use with a tag.

FPN: See Article 100 for a definition of Equipment.

820.25 Abandoned Cables.
The accessible portion of abandoned coaxial cables shall be removed. Where cables are identified for future use with a tag, the tag shall be of sufficient durability to withstand the environment involved.

830.2 Definitions.
See Article 100. For purposes of this article, the following additional definitions apply.
Abandoned Network-Powered Broadband Communications Cable. Installed network-powered broadband communications cable that is not terminated at equipment other than a connector and not identified for future use with a tag.

830.25 Abandoned Cables.
The accessible portion of abandoned network-powered broadband cables shall be removed. Where cables are identified for future use with a tag, the tag shall be of sufficient durability to withstand the environment involved.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: DAVIDSON-SHUMAN-F6-605.10.DOC

F39–09/10
606.9, 606.9.1; IMC [F] 1106.5, [F] 1106.5.1

Proponent: Jeffrey M. Shapiro, P.E., International Code Consultants representing International Institute of Ammonia Refrigeration

1. Revise as follows:

606.9 Remote controls. Where flammable refrigerants are used and compliance with Section 1106 of the *International Mechanical Code* is required, remote control of the mechanical equipment and appliances located in the machinery room as required by Sections 606.9.1 and 606.9.2 shall be provided at an approved location immediately outside the machinery room and adjacent to its principal entrance.

606.9.1 Refrigeration system emergency shutoff. A clearly identified switch of the break-glass type or with an approved tamper resistant cover shall provide off-only control of refrigerant compressors, refrigerant pumps, and normally closed, automatic refrigerant valves located in the machinery room. Additionally, this equipment shall be automatically shut off whenever the refrigerant vapor concentration in the machinery room exceeds the vapor detector's upper detection limit or 25 percent of the LEL, whichever is lower.

~~**Exception:** In machinery rooms where only nonflammable refrigerants are used, only compressors are required to be stopped by vapor detection or the cut-off switch.~~

2. Revise IMC as follows:

[F] 1106.5 Remote controls. Remote control of the mechanical equipment and appliances located in the machinery room shall comply with Sections 1106.5.1 and 1106.5.2 ~~be provided as required by Section 606.9 of the *International Fire Code*~~.

[F] 1106.5.1 Refrigeration system emergency shutoff. A clearly identified switch of the break-glass type or with an approved tamper resistant cover shall provide off-only control of refrigerant compressors, refrigerant pumps, and normally closed, automatic refrigerant valves located in the machinery room. Additionally, this equipment shall be automatically shut off whenever the refrigerant vapor concentration in the machinery room exceeds the vapor detector's upper detection limit or 25 percent of the LEL, whichever is lower.

~~**Exception:** In machinery rooms where only nonflammable refrigerants are used, only compressors are required to be stopped by vapor detection or the cut-off switch.~~

Reason: The recommended revisions eliminate a conflict among the IMC, the IFC and ASHRAE 15, which is the nationally recognized standard governing refrigeration safety. The problem originates with IMC 1106.5. The exception to IMC 1106.5.1 affects nonflammable refrigerants, but because nonflammable refrigerants are excluded from Section 1106.5 as a whole [IMC Section 1106.1 states that 1106 only applies when triggered by IMC 1104.2, and the last sentence of 1104.2 only triggers 1106 when dealing with flammable refrigerants (classified as A2, A3, B2 and B3)], the exception is meaningless.

The IMC's current structure of applying Section 1106 and the remote shutoff control requirements only to flammable refrigerants is consistent with ASHRAE 15, Section 8.12. On the other hand, IFC 606.9 misses this limitation, but compensates by providing the exception to 606.9.1, which partially exempts nonflammable refrigerants. The most effective fix to all of this is to maintain the current correlation between the IMC and ASHRAE 15 and to modify the IFC to agree by placing the flammability constraint in 606.9 rather than in an exception.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: In order to maintain proper correlation of the IFC and IMC on the same subject, the changes made to IFC 606.9.1 by code change F52-06/07 should also have been applied to IMC [F] 1106.5.1 in the 2009 edition, however they were not. The ICC Code Correlation Committee (CCC), at its August 6, 2009 meeting, approved the needed revision to IMC Section [F] 1106.5.1 to read as IFC 606.9.1 in the 2012 edition. The text of Section [F] 1106.5.1, as approved by the CCC, not the current text of the 2009 IMC, is shown in Item 2 of this proposal for clarity.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: SHAPIRO-F3-606.9

F40–09/10
607.4

Proponent: Richard P. Rogozinski, New York State Office of Fire Prevention and Control

Revise as follows:

607.4 Elevator keys. Keys for the elevator car doors and firefighter service keys shall be kept in an approved location for immediate use by the fire department. Existing firefighter service elevator key switches shall be operable by a standard key as defined in section 2.27.8 of ASME A17.1-2007.

Reason: To reduce time spent by emergency response personnel looking for the right key to operate an elevator.

Example: At the Governor Nelson A Rockefeller Empire State Plaza in Albany, NY, there were no less than 4 fire service keys to operate the elevators on fire service in this large office complex before one key was chosen to operate all cars regardless of the elevator company.

2.27.8 Switch Keys:

The key switches required by 2.27.2 through 2.27.5 for all elevators in a building shall be operable by the same key. The keys shall be Group 3 Security (Group 3 covers access or operation of equipment by firefighters and emergency personnel). There shall be a key for each switch provided.

These keys shall be kept on the premises in a location readily accessible to firefighters and emergency personnel, but not where they are available to the public. This key shall be of a tubular, 7 pin, style 137 construction and shall have a bitting code of 6143521. The key shall be coded "FEO-K1." The possession of the "FEO-K1" key shall be limited to elevator personnel, emergency personnel, and elevator equipment manufacturers.

Where provided, a lock box, including its lock and other components, shall conform to the requirements of UL 1037.

Cost Impact: The code change proposal will have a cost to retro-fit the key switches.

Analysis: Similar requirements are proposed in code change proposal F20-09/10.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: ROGOZINSKI-F1-607.3.DOC

F41–09/10
608.5.2

Proponent: Stephen McCluer, APC by Schneider Electric, representing IEEE Stationary Battery Committee

Revise as follows:

608.5.2 Recombinant battery neutralization. For VRLA or other types of ~~sealed~~ batteries with immobilized electrolyte, the method and material shall be capable of neutralizing a spill of 3.0 percent of the capacity of the largest cell or block in the room to a pH between 5.0 and 9.0.

Exception: Lithium-ion and lithium metal polymer batteries shall not require neutralization.

Reason: In Section 608.5.2, delete the reference to "sealed" batteries. This term is widely misused to include valve-regulated cells which, by definition, cannot be totally sealed for escape of gas because they have a pressure relief valve, although they *are* sealed to prevent the escape of electrolyte.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: MCCLUER-F1-608.5.1

F42–09/10
608.6.1

Proponent: Stephen McCluer /APC by Schneider Electric /representing IEEE Stationary Battery Committee

Revise as follows:

608.6.1 Room ventilation. Ventilation shall be provided in accordance with the *International Mechanical Code* and the following:

1. For flooded lead-acid, flooded Ni-Cad and VRLA batteries, the ventilation system shall be designed to limit the maximum concentration of hydrogen to 1.0 percent of the total volume of the room; or
2. Continuous ventilation shall be provided at a rate of not less than 1 cubic foot per minute per square foot (1 ft_3/min/ft_2) [0.0051 m_3/s × m_2] of floor area of the room.

   Exception: Lithium-Ion and Lithium Metal Polymer batteries shall not require additional ventilation beyond what would normally be required for human occupancy of the space per the *International Mechanical Code*.

Reason: The implication of the existing text is that Li-Ion and LMP batteries do not require any ventilation. This is not correct. LI-Ion and LMP batteries do require some ventilation, but they do not require additional ventilation beyond what is required by the IMC per 608.6.1.

Cost Impact: This code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: MCCLUER-F5- 608.6.1.DOC

F43–09/10
608.6.1, 608.6.2; IMC [F] 502.4, [F] 502.5, [F] 502.5.2

Proponent: Jonathan C. Siu, City of Seattle, WA, Seattle Department of Planning & Development

1. Revise the IFC as follows:

608.6.1 Room ventilation. Ventilation shall be provided in accordance with the *International Mechanical Code* and the following:

1. For flooded lead-acid, flooded Ni-Cad and VRLA batteries, the ventilation system shall be designed to limit the maximum concentration of hydrogen to 1.0 percent of the total volume of the room; and ~~or~~
2. Continuous ventilation shall be provided at a rate of not less than 1 cubic foot per minute per square foot (1 ft3/min/ft2) [0.0051 m3/s × m2] of floor area of the room.

   Exception: Lithium-ion and lithium metal polymer batteries shall not require ventilation.

608.6.2 Cabinet ventilation. When VRLA batteries are installed inside a cabinet, the cabinet shall be *approved* for use in occupied spaces and shall be mechanically or naturally vented ~~by one of~~ in accordance with the following ~~methods~~:

1. The cabinet ventilation shall limit the maximum concentration of hydrogen to 1 percent of the total volume of the cabinet during the worst-case event of simultaneous “boost” charging of all the batteries in the cabinet; and ~~or~~
2. When calculations are not available to substantiate the ventilation rate, continuous ventilation shall be provided at a rate of not less than 1 cubic foot per minute per square foot [1 ft3/min/ft2 or 0.0051 m3/(s _m2)] of floor area covered by the cabinet. The room in which the cabinet is installed shall also be ventilated as required in Section 608.6.1.

2. Revise the IMC as follows:

[F] 502.4 Stationary storage battery systems. Stationary storage battery systems, as regulated by Section 608 of the *International Fire Code*, shall be provided with ventilation in accordance with this chapter and Sections 502.4.1 and ~~or~~ 502.4.2.

Exception: Lithium-ion batteries shall not require ventilation.

[F] 502.5 Valve-regulated lead-acid batteries in cabinets. Valve-regulated lead-acid (VRLA) batteries installed in cabinets, as regulated by Section 608.6.2 of the *International Fire Code*, shall be provided with ventilation in accordance with Sections 502.5.1 and ~~or~~ 502.5.2.

[F] 502.5.2 Ventilation rate in cabinets. Continuous cabinet ventilation shall be provided at a rate of not less than 1 cubic foot per minute per square foot (cfm/ft2) [0.00508 m3/(s ● m2)] of the floor area covered by the cabinet. The room in which the cabinet is installed shall also be ventilated as required by Sections 502.4.1 and ~~or~~ 502.4.2.

Reason: Where lead-acid batteries are stored within an enclosed space, production of hydrogen is a concern. In order to maintain the hydrogen level below the lower flammable limit (LFL), the ventilation system shall be designed such that the concentration of hydrogen is limited by Section 608.6.1(1) and 608.6.2(1) (IMC Section 502.4.1) and a minimum continuous ventilation rate is provided in accordance with Sections 608.6.1(2) and 608.6.2(2) (IMC Section 502.4.2). This proposal modifies the code language so that the criteria of both sections are to be met, rather than that of one or the other.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: SIU-F3-608.6.1-608.6.2

F44–09/10
610 (New); 601.1

Proponent: Bob Eugene/Underwriters Laboratories Inc/Underwriters Laboratories Inc

1. Add new section as follows:

SECTION 610
COMMERCIAL KITCHEN COOKING OIL
STORAGE TANK SYSTEMS

610.1 General. Storage of cooking oil (grease) in commercial cooking operations shall comply with Chapter 34. Systems used to store cooking oils in larger than 60 gallon (227 L) aboveground tanks shall also comply with Sections 610.2 through 610.5. For purposes of this section, cooking oil shall be classified as a Class IIIB liquid unless otherwise determined by testing.

610.2 Storage tanks. Cooking oil storage tanks shall be listed in accordance with UL 142 or UL 80, and shall be installed in accordance with Section 3404 and the tank manufacturer's instructions.

610.3 System components. Cooking oil storage system components, including but not limited to piping, connections, fittings, valves, tubing, and other related components used for the transfer of cooking oil from the cooking appliance to the storage tank, and from the storage tank to the discharge point, shall be installed in accordance with Section 3403.6.

610.4 Tank venting. Normal and emergency venting for cooking oil storage tanks shall terminate outside the building as specified in Sections 3404.2.7.3 and 3404.2.7.4.

610.5 Electrical equipment. Electrical equipment used for the operation and heating of the cooking grease storage system shall be listed and comply with NFPA 70.

2. Revise as follows:

601.1 Scope. The provisions of this chapter shall apply to the installation, operation and maintenance of fuel-fired appliances and heating systems, emergency and standby power systems, electrical systems and equipment, mechanical refrigeration systems, elevator recall, stationary storage battery systems and commercial kitchen ~~hoods~~ equipment.

3. Add new referenced standards to Chapter 47 as follows:

UL

80-07	Standard for Steel Tanks for Oil-Burner Fuels and Other Combustible Liquids
142-06	Standard for Steel Aboveground Tanks for Flammable and Combustible Liquids

Reason: There is a large market for collecting and recycling used cooking oil (grease) from commercial cooking operations. This is sometimes done using a system designed to store the used cooking oil on-site in an aboveground tank. These systems typically include features to assist in pumping the grease from the cooking appliance to the storage tank, and to pump the grease from the storage tank to a recovery truck. Some systems include heating elements that assist in keeping the grease in a form that is easily pumped to the truck.

This arrangement could create a problem if the system is not properly designed and installed. Without these new requirements, many installations of this product may not be installed with the safety features needed to protect employees and the public.

Last cycle a similar proposal was disapproved because, among other reasons, it would have required tank venting requirements to be applied to 55 gallon drums and smaller containers of used cooking oil. In this proposal, section 610.2 to 610.5 requirements only kick in for tanks larger than 60 gallons, which is consistent with the container size limitations specified in 3404.3.

This proposal accomplishes the following:

~~1.~~1. Clarifies that the storage of cooking oils (commonly Class IIIB combustible liquids) in any containers shall comply with Chapter 34 requirements.

~~2.~~2. Establishes requirements for cooking oil storage tank systems, including those that heat the stored liquid.

~~3.~~3. Revises the scope of 601.1 to cover these systems.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: A review of the standard proposed for inclusion in the code, UL 142-06, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009. UL 80 is currently referenced in the IRC.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: EUGENE-F2-610 sub only

F45–09/10
610 (New), 601.1

Proponent: Tom Lariviere, Chairman, Joint Fire Service Review Committee

1. Add new text as follows:

SECTION 610
EMERGENCY SHOWER AND EYE WASH STATION

610.1 Emergency shower and eye wash station required. In areas of Group I-2 and Ambulatory Health Care Facilities where chemicals are used that could necessitate the immediate flushing with water after an exposure, an emergency shower and eye wash station shall be installed and maintained in accordance with Section 411 of the *International Plumbing Code*.

2. Revise as follows:

601.1 Scope. The provisions of this chapter shall apply to the installation, operation and maintenance of fuel-fired appliances and heating systems, emergency and standby power systems, electrical systems and equipment, mechanical refrigeration systems, elevator recall, stationary storage battery systems, ~~and~~ commercial kitchen hoods, and emergency shower and eye wash stations.

Reason: This proposal will require the installation of an emergency shower and eye wash in Group I-2 occupancies and Ambulatory Surgical Centers. The eye wash and shower will be required in areas of the facility where hazardous chemicals are being used. IPC Section 411 currently has design criteria and requirements for emergency shower and eye wash stations when they are installed.

This equipment will allow for immediate treatment of chemical burns and exposures which will increase the safety of employees and occupants.

Currently, many health care facilities are constructed under the IBC and IFC. The owner can receive a Certificate of Occupancy for the new facility and then apply for approval and licensing through Federal Centers for Medicare and Medicaid Services (CMS). This requirement is in the Federal CMS regulations and must be complied with before any license is approved. By including this provision in the International Codes, the emergency shower and eye wash will be provided during construction and design under the I-Codes and eliminate frustration, delay and additional expense when the owner applies for licensing through Federal CMS. This proposal will correlate the IBC and IFC with Federal CMS Regulations for these facilities.

Cost Impact: The code change proposal will increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: LARIVIERE-F7-610 NEW.DOC

F46–09/10
703.2

Proponent: John Woestman, The Kellen Company, representing the Door Safety Council (DSC)

Revise as follows:

703.2 Opening protectives. Opening protectives shall be maintained in an operative condition in accordance with NFPA 80. Where required by the fire code official, the application of field applied labels associated with the maintenance of opening protectives shall follow the requirements of the *approved* third-party certification organization accredited for *listing* the opening protective. Fire doors and *smoke barrier* doors shall not be blocked or obstructed or otherwise made inoperable. Fusible links shall be replaced promptly whenever fused or damaged. Fire door assemblies shall not be modified.

Reason: This code proposal addresses the very real issue of maintaining labeled opening protectives by requiring field applied labels to follow the requirements of the third-party certification organization which is accredited for listing the specific opening protective. Ongoing maintenance is now an IFC requirement, and this code change provides an enforceable method of allowing maintenance of labeled protectives.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: WOESTMAN-F3-1030.2-2.DOC

F47–09/10
Table 803.3

Proponent: Tom Lariviere, Chairman, Joint Fire Service Review Committee

Revise table as follows:

TABLE 803.3
INTERIOR WALL AND CEILING FINISH REQUIREMENTS BY OCCUPANCY[k]

	Sprinklered[l]			Nonsprinklered		
Group	Exit enclosures and exit passageways[a,b]	Corridors	Rooms and enclosed spaces[c]	Exit enclosures and exit passageways[a,b]	Corridors	Rooms and enclosed spaces[c]
B, E, M, R-1, ~~R-4~~	B	C	C	A	B	C
R-4	B	C	C	A	B	B

(Portions of table and footnotes not shown remain unchanged)

Reason: Table 803.3 in the IFC governs wall and ceiling finish in existing buildings. Table 803.3 in the IBC governs wall and ceiling finish for new buildings.

Code change F116 07-08 amended IBC Table 803.3 to require interior finishes in new Group R-4 buildings to have a minimum of Class B flame-spread rating for wall coverings in "rooms and enclosed spaces".

Code Change F116 07-08 created an inconsistency between the 2009 IBC and 2009 IFC. The requirements for R-4 nonsprinklered buildings are no longer consistent in the IFC and the IBC. The IBC will require a Class B flame-spread rating, but then once the building is built and occupied, the IFC reduces the flame-spread rating to Class C for maintenance requirements of the same building and also for any new wall coverings installed after the Certificate of Occupancy is obtained.

This proposal will correlate the maintenance requirements in the IFC with the construction requirements in the IBC. The flame spread rating for interior finish in Group R-4 will be required to be Class B, the same as is required in the IBC. With this proposed change, the IFC will require that the flame-spread rating be maintained to the same level of the original required flame-spread rating.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: LARIVIERE-F30-TABLE 803.3.DOC

F48–09/10
803.5.1

Proponent: Marcelo M. Hirschler, GBH International, representing American Fire Safety Council

Revise as follows:

803.5.1 Textile wall or ceiling coverings. Textile wall or ceiling coverings shall comply with one of the following:

1. The wall or ceiling covering shall have a class A flame spread index in accordance with ASTM E 84 or UL 723 and be protected by automatic sprinklers installed in accordance with Section 903.3.1.1 or 903.3.1.2,
2. The wall covering shall meet the criteria of Sections 803.5.1.1 or 803.5.1.2 when tested in the manner intended for use in accordance with NFPA 265 using the product mounting system, including adhesive, of actual use, or
3. The wall or ceiling covering shall meet the criteria of Sections 803.1.2.1 when tested in accordance with NFPA 286 using the product mounting system, including adhesive, of actual use.

Reason: The text of Section 803.5 does not make it clear that textile ceiling coverings, just like textile wall coverings, are only permitted to be installed when tested in accordance with ASTM E 84 if the compartment is fully protected by sprinklers. The reason for this is the same reason that the requirement exists for textile wall coverings: it has long been known that the ASTM E 84 (Steiner tunnel) test can produce misleading results when applied to thin materials such as textile wall coverings. The new text also needs to make it clear that NFPA 265 is inappropriate for testing ceiling coverings since the burner flame does not reach the ceiling. This proposal is simple clarification.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: HIRSCHLER-F4-803.5.1.DOC

F49–09/10
803.5.2 (New)

Proponent: Marcelo M. Hirschler, GBH International, representing American Fire Safety Council

Add new text as follows:

803.5.2 Newly introduced textile wall and ceiling coverings. Newly introduced textile wall and ceiling coverings shall comply with one of the following:

1. The wall or ceiling covering shall have a class A flame spread index in accordance with ASTM E 84 or UL 723 and be protected by automatic sprinklers installed in accordance with Section 903.3.1.1 or 903.3.1.2. Test specimen preparation and mounting shall be in accordance with ASTM E 2404.
2. The wall covering shall meet the criteria of Section 803.5.1.2 when tested in the manner intended for use in accordance with NFPA 265 using the product mounting system (including adhesive) of actual use, or
3. The wall or ceiling covering shall meet the criteria of Sections 803.1.2.1 when tested in accordance with NFPA 286 using the product mounting system (including adhesive) of actual use.

Reason: The correct specimen preparation and mounting method for textile, paper and vinyl wall and ceiling coverings tested in accordance with ASTM E 84 (Steiner tunnel) test is ASTM E 2404. At the last cycle there was concern about the application of this requirement retroactively to existing textile wall and ceiling coverings, potentially tested before the development of ASTM E 2404. Therefore, this new text clarifies that the change applies only to newly introduced textile wall and ceiling coverings.
The new subsections address the requirements for wall and ceiling coverings, as appropriate:

1. They point out again that textile ceiling coverings, just like textile wall coverings, are only permitted to be installed when tested in accordance with ASTM E 84 if the compartment is fully protected by sprinklers. The reason for this is the same reason that the requirement exists for textile wall coverings. The reason is that it has long been known that the ASTM E 84 (Steiner tunnel) test can produce misleading results when applied to thin materials such as wall coverings.
2. The new text also makes it clear that NFPA 265 is inappropriate for testing ceiling coverings since the burner flame does not reach the ceiling.
3. The new text eliminates reference to Method A of NFPA 265 for newly introduced textile wall coverings, since this method has been eliminated from the body of the standard. Method A applies only to materials tested in the past (i.e. existing materials).

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: HIRSCHLER-F14-803.5.2.DOC

F50–09/10
803.6.1, 803.6.2

Proponent: Marcelo M. Hirschler, GBH International, representing American Fire Safety Council

Revise as follows:

803.6.1 General. Expanded vinyl wall or ceiling coverings shall comply with the requirements of Section 803.1.2 using the product mounting system (including adhesive) of actual use. Expanded vinyl wall or ceiling coverings complying with Section 803.1.2 shall not be required to comply with Section 803.1.1.

803.6.2 Compliance alternative. Expanded vinyl wall or ceiling coverings shall be allowed to comply with ~~the requirements for textile wall or ceiling coverings in Section 803.5. When tested in accordance with ASTM E 84 or UL 723, test specimen preparation shall be in accordance with ASTM E 2404~~ one of the following:

1. The wall or ceiling covering shall have a class A flame spread index in accordance with ASTM E 84 or UL 723 and be protected by automatic sprinklers installed in accordance with Section 903.3.1.1 or 903.3.1.2. Test specimen preparation and mounting shall be in accordance with ASTM E 2404.
2. The wall covering shall meet the criteria of Section 803.5.1.2 when tested in the manner intended for use in accordance with NFPA 265 using the product mounting system (including adhesive) of actual use.
3. The wall or ceiling covering shall meet the criteria of Sections 803.1.2.1 when tested in accordance with NFPA 286 using the product mounting system (including adhesive) of actual use.

Reason: Instead of sending code users to another section, it is best simply to state the requirements for expanded vinyl wall or ceiling covering materials directly. The correct specimen preparation and mounting method for textile, paper and vinyl wall and ceiling coverings tested in accordance with ASTM E 84 (Steiner tunnel) test is ASTM E 2404. The revised text addresses the requirements for wall and ceiling coverings, as appropriate:

1. They point out again that expanded vinyl wall and ceiling coverings are only permitted to be installed when tested in accordance with ASTM E 84 if the compartment is fully protected by sprinklers.
2. The new text also makes it clear that NFPA 265 is inappropriate for testing ceiling coverings since the burner flame does not reach the ceiling.
3. The new text eliminates reference to Method A of NFPA 265, which has been eliminated from the body of the standard. Method A applies only to materials tested in the past.
4. The text also clarifies that testing to NFPA 286 needs to use the correct product mounting system, including adhesive.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: HIRSCHLER-F1-803.6.1.DOC

F51–09/10
804.3 (New), Chapter 47

Proponent: Marcelo M. Hirschler, GBH International, representing American Fire Safety Council

1. Add new text as follows:

804.3 Interior floor finish Newly introduced interior floor finish and floor covering materials shall comply with Sections 804.3.1 through 804.3.3.

Exception: Floor finishes and coverings of a traditional type, such as wood, vinyl, linoleum or terrazzo, and resilient floor covering materials that are not comprised of fibers.

804.3.1 Classification. Interior floor finish and floor covering materials required by Section 804.3.3 to be of Class I or II materials shall be classified in accordance with NFPA 253. The classification referred to herein corresponds to the classifications determined by NFPA 253 as follows: Class I, 0.45 watts/cm^2 or greater; Class II, 0.22 watts/cm^2 or greater.

804.3.2 Testing and identification. Interior floor finish and floor covering materials shall be tested by an approved agency in accordance with NFPA 253 and identified by a hang tag or other suitable method so as to identify the manufacturer or supplier and style, and shall indicate the interior floor finish or floor covering classification according to Section 804.3.1. Carpet-type floor coverings shall be tested as proposed for use, including underlayment. Test reports confirming the information provided in the manufacturer's product identification shall be furnished to the building official upon request.

804.3.3 Interior floor finish requirements. Interior floor covering materials shall comply with Sections 804.3.3.1 and 804.3.3.2 and interior floor finish materials shall comply with Section 804.3.4.2.

804.3.3.1 Pill test. In all occupancies, interior floor covering materials shall comply with the requirements of the DOC FF-1 Apill test@ (CPSC 16 CFR, Part 1630) or of ASTM D 2859.

804.3.3.2 Minimum critical radiant flux. In all occupancies, interior floor finish and floor covering materials in exit enclosures, exit passageways, corridors and rooms or spaces not separated from corridors by full-height partitions extending from the floor to the underside of the ceiling shall withstand a minimum critical radiant flux. The minimum critical radiant flux shall not be less than Class I in Groups I-1, I-2 and I-3 and not less than Class II in Groups A, B, E, H, I- 4, M, R-1, R-2 and S.

> **Exception:** Where a building is equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2, Class II materials are permitted in any area where Class I materials are required and materials complying with DOC FF-1 A pill test@ (CPSC 16 CFR, Part 1630) or with ASTM D 2859 are permitted in any area where Class II materials are required.

(Renumber subsequent section)

2. Add new standard to Chapter 47 as follows:

ASTM D 2859 (2006) Standard Test Method for Ignition Characteristics of Finished Textile Floor Covering Materials

Reason: Somehow, requirements for interior floor finish are missing in the IFC, while such requirements exist in the IBC as well as in the Life Safety Code and the Uniform Fire Code. In this proposal the wording has been taken from the IBC, with four changes. The key change is that this section applies only to "newly introduced" interior floor finish materials, in view of the fact that the IFC is for existing buildings. The other changes are as shown below:

1. The "pill test" is applied to all newly introduced carpets and carpet-like floor finish materials, in view of the fact that the federal government, through CPSC, regulates all carpets and rugs based on 16 CFR 1630 since the 1970s.
2. In the IBC there is confusion because section 804.4 states that "interior floor finish and floor covering materials in exit enclosures, exit passageways, corridors and rooms or spaces not separated from corridors by full-height partitions extending from the floor to the underside of the ceiling shall withstand a minimum critical radiant flux" and then section 804.4.1 states that "interior floor finish and floor covering materials in exit enclosures, exit passageways and corridors shall not be ...". This leaves undefined what minimum critical radiant flux is required for "interior floor finish and floor covering materials in rooms or spaces not separated from corridors by full-height partitions extending from the floor to the underside of the ceiling". Since section 804.2 only distinguishes two classes for NFPA 253, the logical conclusion is that the words are missing and that these rooms or spaces have to meet the same requirements as the corridors from which they are not separated. A proposal has been submitted to the IBC to make this correction.
3. ASTM D 2859, which is equivalent to 16 CFR 1630 and is used extensively outside of the US, while 16 CFR 1630 is only a federal mandate, is added as an alternate. In fact, ASTM D 2859 is the standard that complies with the ICC policy on referenced standards. A proposal has been submitted to the IBC to allow ASTM D 2859 as an alternate test method to 16 CFR 1630.

The fire hazard of newly introduced floor coverings (which basically means carpets only) is the same in new buildings and in existing buildings. Therefore the IFC should be consistent with the IBC.

An alternate approach: If the addition of ASTM D 2859 is not desired by the committee, please use the following text:

804.3 Interior floor finish.

804.3.1 General. Newly introduced interior floor finish and floor covering materials shall comply with Sections 804.3.2 through 804.3.4.

> **Exception:** Floor finishes and coverings of a traditional type, such as wood, vinyl, linoleum or terrazzo, and resilient floor covering materials that are not comprised of fibers.

804.3.2 Classification. Interior floor finish and floor covering materials required by Section 804.3.4 to be of Class I or II materials shall be classified in accordance with NFPA 253. The classification referred to herein corresponds to the classifications determined by NFPA 253 as follows: Class I, 0.45 watts/cm^2 or greater; Class II, 0.22 watts/cm^2 or greater.

804.3.3 Testing and identification. Interior floor finish and floor covering materials shall be tested by an approved agency in accordance with NFPA 253 and identified by a hang tag or other suitable method so as to identify the manufacturer or supplier and style, and shall indicate the interior floor finish or floor covering classification according to Section 804.3.2. Carpet-type floor coverings shall be tested as proposed for use, including underlayment. Test reports confirming the information provided in the manufacturer=s product identification shall be furnished to the building official upon request.

804.3.4 Interior Floor Finish Requirements.

804.3.4.1 Pill test. In all occupancies, newly introduced floor covering materials shall comply with the requirements of the DOC FF-1 Apill test@ (CPSC 16 CFR, Part 1630).

804.3.4.2 Minimum critical radiant flux. In all occupancies, newly introduced interior floor finish and floor covering materials in exit enclosures, exit passageways, corridors and rooms or spaces not separated from corridors by full-height partitions extending from the floor to the underside of the ceiling shall withstand a minimum critical radiant flux. The minimum critical radiant flux shall not be less than Class I in Groups I-1, I-2 and I-3 and not less than Class II in Groups A, B, E, H, I- 4, M, R-1, R-2 and S.

Exception: Where a building is equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2, Class II materials are permitted in any area where Class I materials are required and materials complying with DOC FF-1 "pill test" (CPSC 16 CFR, Part 1630) are permitted in any area where Class II materials are required.

(Renumber subsequent section)

Cost Impact: The cost of carpets that meet Class I or Class II in accordance with NFPA 253 is higher than the cost of carpets that are not classified.

Analysis: A review of the standard(s) proposed for inclusion in the code, ASTM D 2859-2006, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

CPSC 16 CFR, Part 1630 is already referenced in the IBC and NFPA 253 is already referenced in the IFC.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: HIRSCHLER-F10-804.3.DOC

F52–09/10
805.1 (New)

Proponent: Marcelo M. Hirschler, GBH International

Add new text as follows:

805.1 Ignition by cigarettes. Upholstered furniture newly introduced into occupancies regulated by this code shall comply with 805.1.1. Mattresses newly introduced into occupancies regulated by this code shall comply with 805.1.2.

805.1.1 Upholstered furniture. Newly introduced upholstered furniture shall be shown to resist ignition by cigarettes as determined by tests conducted in accordance with one of the following:

1. Mocked-up composites of the upholstered furniture shall have a char length not exceeding 1.5 inches (38 mm) when tested in accordance with NFPA 261.
2. The components of the upholstered furniture shall meet the requirements for Class I when tested in accordance with NFPA 260.

805.1.2 Mattresses. Newly introduced mattresses shall be shown to resist ignition by cigarettes as determined by tests conducted in accordance with DOC 16 CFR Part 1632 and shall have a char length not exceeding 2 inches (51 mm).

(Renumber subsequent sections)

Reason: Mattresses in the United States have been required to meet 16 CFR 1632 by the Consumer Product Safety Commission since the 1970s. There are no new mattresses sold legally in the US that are not compliant with 16 CFR 1632. As an example, the web site by ISPA (International Sleep Products Association)

(http://www.sleepproducts.org/Content/NavigationMenu/Advocacy_Issues/ISPA_Position_Papers/Flammability_Position_Paper.htm) states as follows: "ISPA Position: ISPA supports the national flammability standards for mattresses codified at 16 C.F.R. Parts 1632 and 1633 promulgated by the U.S. Consumer Product Safety Commission (CPSC) [linked text]. Part 1632 requires that mattresses resist a smoldering cigarette ignition, which has been in place since the mid-1970s. Part 1633, which will become effective July 1, 2007, requires that mattresses resist an open-flame ignition. ISPA also seeks a national standard that addresses the flammability of bedclothes (top-of-the-bed products such as pillows, comforters and mattress pads), given that these are usually the first items ignited in a bedroom fire. Background: The mattress industry takes its product stewardship responsibilities seriously. For over 30 years, the mattress industry has actively supported regulatory efforts to develop flammability standards, public education initiatives and basic scientific research targeted at reducing residential fire casualties and property loss. In the early 1970s, we participated in the development of 16 C.F.R. Part 1632."

There is no mandatory federal flammability regulation for upholstered furniture in the US. However basically, manufacturers of both residential and contract upholstered furniture support the need for their products to meet cigarette ignition resistance requirements.

Residential upholstered furniture: the UFAC (Upholstered Furniture Action Council) web site (www.ufac.org) states: "The Upholstered Furniture Action Council was founded in 1978 to make upholstered furniture more resistant to ignition from smoldering cigarettes which are the leading cause of upholstery fires in the home. Household fires from smoldering ignition have been reduced substantially since its inception. According to the latest figures there has been a 79.3% decline in the number of upholstered furniture fires from cigarette ignition." The web site also states: "Background: In 1970, federal government agencies proposed mandatory safety standards to reduce the potential fire hazards posed by the cigarette ignition of mattresses, carpeting and upholstered furniture. Mandatory standards were imposed for mattresses and carpeting. When the Consumer Product Safety Commission, (CPSC) began looking at upholstered furniture, UFAC was formed to allow upholstered furniture manufacturers the opportunity to work with CPSC in a meaningful way to design safety standards which are effective, cost effective and workable from a manufacturing standpoint. The only logical course of action for the furniture industry was to create a voluntary program that would develop a better safety record for the industry, at a lower cost, than the proposed government regulations." UFAC administers the program that is responsible for the golden hangtags that are found on residential upholstered furniture and indicate that the furniture has passed the UFAC test. The UFAC web site lists the manufacturers (http://www.ufac.org/mfglist.htm) and the retailers (http://www.ufac.org/retailerslist.htm) that comply with their test. UFAC represents the major manufacturers of residential upholstered furniture. Their web site indicates that the UFAC test is identical to NFPA 260 (http://www.ufac.org/method11.htm).

Institutional upholstered furniture: The Business & Institutional Home Furnishings Alliance (BIFMA) was the developer of the standard test that became NFPA 261 (originally known as the BIFMA test). Contract or institutional upholstered furniture now meets either NFPA 260 (UFAC test) or NFPA 261 and is resistant to cigarette ignition resistance. BIFMA is listed in the UFAC web site as a UFAC supporting organization.

Therefore, all newly introduced mattresses and upholstered furniture should be required to meet the appropriate smoldering ignition resistance tests.

Cost Impact: The code change proposal will not increase the cost of construction, as this is normal use.

Analysis: Standards NFPA 260 and 261 and DOC 16 CFR Part 1632 are currently referenced in the IFC.

	Assembly:	ASF	AMF	DF

ICCFILENAME: HIRSCHLER-F17-805.1.DOC

F53–09/10
805.4

Proponent: William Freer, Fire Protection Specialist, NYS Office of Fire Prevention and Control

Revise as follows:

805.4 Group R-2 college and university dormitories. The requirements of Sections 805.4.1 through 805.4.2.3 shall apply to college and university dormitories classified in Group R-2 including decks, porches and balconies.

Reason: The purpose of this code addition is to clarify that the requirements for upholstered furniture in R-2 college and university also applies to decks, porches and balconies. The current code does not specifically state that the code is applicable to decks, porches and balconies. In March of 2009 the city of Pittsburgh, PA banned couches from porches citing them as a fire hazard. Similar laws and ordinances have been enacted in Lincoln NE, Ames IA, Boulder CO, and East Lansing MI. The Village of Brockport in New York experienced a fire about 10 years ago where a cigarette was dropped on an old sofa that sat on an open wooden porch, and several hours later the whole front of the house was ablaze trapping several persons on the second floor. Since their local law banning couches from porches was instituted in 1999 there have been no such fires in the Village of Brockport. This code change will not be as restrictive as the laws and ordinances that have banned couches from porches but will require the same level of protection as afforded inside the structure.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: FREER-F1-805.4.DOC

F54–09/10
805.5 (New)

Proponent: Carl Ogburn, Chestnut Ridge Foam

Add new text as follows:

805.5 Group A-2 occupancies intended for food or drink consumption. The requirements of Sections 805.5.1 through 805.5.1.3 shall apply to Group A-2 occupancies intended for food or drink consumption.

805.5.1 Upholstered furniture. Newly introduced upholstered furniture shall meet the requirements of Sections 805.5.1.1 through 805.5.1.3

805.5.1.1 Ignition by cigarettes. Newly introduced upholstered furniture shall be shown to resist ignition by cigarettes as determined by tests conducted in accordance with one of the following:

1. Mocked-up composites of the upholstered furniture shall have a char length not exceeding $1^1/_2$ inches (38 mm) when tested in accordance with NFPA 261, or
2. The components of the upholstered furniture shall meet the requirements for Class I when tested in accordance with NFPA 260.

805.5.1.2 Heat release rate. Newly introduced upholstered furniture shall have limited rates of heat release when tested in accordance with ASTM E 1537 or California Technical Bulletin 133, as follows:

1. The peak rate of heat release for the single upholstered furniture item shall not exceed 80 kW.

   Exception: Upholstered furniture in rooms or spaces protected by an approved automatic sprinkler system installed in accordance with Section 903.3.1.1.

2. The total energy released by the single upholstered furniture item during the first 10 minutes of the test shall not exceed 25 MJ.

   Exception: Upholstered furniture in rooms or spaces protected by an approved automatic sprinkler system installed in accordance with Section 903.3.1.1.

805.5.1.3 Identification. Upholstered furniture shall bear the label of an approved agency, confirming compliance with the requirements of Sections 805.5.1.1 and 805.5.1.2.

Reason: CA TB 133, which is referenced in the IFC, is a standard issued by the California Bureau of Home Furnishings and Thermal Insulation (CBHF) and is equivalent to ASTM E 1537, with the pass/fail criteria contained in the proposal. This proposal would make the same requirements for bars and night clubs than is now used for some other occupancies, such as Groups I-1, I-2, I-3 and R-2. Experience shows that if a bar or night club is not sprinklered the potential for big fires is large. Approval of this proposal would ensure that furniture is not the cause of a big fire with many fatalities.

Cost Impact: CA TB 133 furniture is more expensive than standard furniture.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: OGBURN-F2-805.5-2.DOC

F55–09/10
805.5 (New)

Proponent: Carl Ogburn, Chestnut Ridge Foam

Add new text as follows:

805.5 Group E Occupancies other than day care facilities. The requirements of Sections 805.5.1 through 805.5.1.3 shall apply to Group E occupancies other than Group E day care facilities.

805.5.1 Upholstered furniture. Newly introduced upholstered furniture shall meet the requirements of Sections 805.5.1.1 through 805.5.1.3

805.5.1.1 Ignition by cigarettes. Newly introduced upholstered furniture shall be shown to resist ignition by cigarettes as determined by tests conducted in accordance with one of the following:

1. Mocked-up composites of the upholstered furniture shall have a char length not exceeding $1^1/_2$ inches (38 mm) when tested in accordance with NFPA 261; or
2. The components of the upholstered furniture shall meet the requirements for Class I when tested in accordance with NFPA 260.

805.5.1.2 Heat release rate. Newly introduced upholstered furniture shall have limited rates of heat release when tested in accordance with ASTM E 1537 or California Technical Bulletin 133, as follows:

1. The peak rate of heat release for the single upholstered furniture item shall not exceed 80 kW.

   Exception: Upholstered furniture in rooms or spaces protected by an *approved automatic sprinkler system* installed in accordance with Section 903.3.1.1.

2. The total energy released by the single upholstered furniture item during the first 10 minutes of the test shall not exceed 25 MJ.

   Exception: Upholstered furniture in rooms or spaces protected by an *approved automatic sprinkler system* installed in accordance with Section 903.3.1.1.

805.5.1.3 Identification. Upholstered furniture shall bear the label of an *approved* agency, confirming compliance with the requirements of Sections 805.5.1.1 and 805.5.1.2.

Reason: CA TB 133, which is referenced in the IFC, is a standard issued by the California Bureau of Home Furnishings and Thermal Insulation (CBHF) and is equivalent to ASTM E 1537, with the pass/fail criteria contained in the proposal. This proposal would make the same requirements for educational establishments (other than day care occupancies) than is now used for some other occupancies, such as Groups I-1, I-2, I-3 and R-2. Educational facilities are ones where so many young people are potentially exposed and vulnerable. Approval of this proposal would ensure that furniture is not the cause of a big fire with many fatalities.

Cost Impact: CA TB 133 furniture is more expensive than standard furniture.

	Assembly:	ASF	AMF	DF

ICCFILENAME: OGBURN-F1-805.5.DOC

F56–09/10
806.2, Chapter 47

Proponent: Marcelo M. Hirschler, GBH International, representing American Fire Safety Council

1. Revise as follows:

806.2 Artificial vegetation. Artificial decorative vegetation shall meet the flame propagation performance criteria of NFPA 701. Meeting the flame propagation performance criteria of NFPA 701 shall be documented and certified by the manufacturer in an approved manner. Alternately, the artificial decorative vegetation item shall be tested in accordance with NFPA 289, using the 20 kW ignition source, and shall have a maximum heat release rate of 100 kW.

2. Add new standard to Chapter 47 as follows:

NFPA

289-2009 Standard Method of Fire Test for Individual Fuel Packages

Reason: The NFPA Technical Committee on Fire Tests recently developed a furniture calorimeter heat release fire test specifically for this type of product. NFPA 289 is a very versatile fire test and uses a propane gas burner as the ignition source. The 20 kW gas burner ignition source in NFPA 289 was specifically designed with the intent of being a substitute for UL 1975 and would be suitable as an ignition source for Christmas trees.
The National Institute of Standards and Technology website has the following statements: The National Fire Protection Association (NFPA) reports that there is an estimated annual average of 210 home structure fires that begin with Christmas trees. Based on data from 2002 through 2005, these fires caused an average of 24 civilian deaths, 27 civilian injuries, and $13.3 million in direct property damage per year. The NFPA analysis also shows that although the number of Christmas tree fires is low, these fires represent a higher level of hazard. On average, 1 of every 9 Christmas tree fires resulted in a fatality compared to an average of one death per 75 non-confined home structure fires overall. Further, 49 % of Christmas tree fires spread beyond the room of origin. The fires that spread beyond the room of origin caused 94 % of the associated fatalities. The percentage of trees involved in structure fires represent an extremely small portion of the total number of natural Christmas trees sold, which is estimated at 30 million trees, in the United States each year. The moisture content of each tree can play a dominant role in determining the fire hazard each tree represents. Properly maintaining a cut Christmas tree is important to retaining a high moisture content in the needles of the tree to limit accidental ignition and prevent rapid flame spread. A tree which has dry needles can readily ignite with a flaming source and generate heat release rates that are capable of causing flashover in residential scale rooms. See more information and videos at http://fire.nist.gov/tree_fire.htm .

The above statistics addressed home structure fires and natural Christmas trees, which are required by the IFC to be kept moist and fresh at all times. However, the IFC fire safety requirements for artificial vegetation, including Christmas trees, are based on testing to NFPA 701 only.
At one time UL had developed UL Subject 411, *Outline of Investigation for Artificial Christmas Trees*, now withdrawn, which used 1 lb of shredded newspaper distributed around the Christmas tree, and required the ensuing fire to meet the following three criteria: (1) To have flames that do not extend more than 3 ft (0.9 m) above the tree, (2) To have no significant lateral flame spread away from the area affected by the ignition source and (3) To have no flaming droplets that continue flaming after reaching the floor. UL 411 was withdrawn because no jurisdiction adopted it and no manufacturer was willing to have their product listed to that UL requirement.
When a natural Christmas tree is allowed to dry out it will typically generate more than 1 MW heat release. Similarly, some artificial trees have been shown to reach similar values. The Uniform Fire Code, contains recommendations (in the non mandatory Annex) for this type of fire performance by artificial vegetation and Christmas trees.

This proposal does not recommend the deletion of the use of NFPA 701 but simply offers an alternate option.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: A review of the standard proposed for inclusion in the code, NFPA 289-2009, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP28 will be posted on the ICC website on or before September 24, 2009.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: HIRSCHLER-F5-806.2.DOC

F57–09/10
807.1 (IBC [F] 806.1)

Proponent: Douglas H. Evans, PE, FSFPE, Clark County, NV, representing the Department of Development Services – Building Division

Revise as follows:

807.1 (IBC [F] 806.1) General requirements. In occupancies in Groups A, E, I and R-1 and dormitories in Group R-2, curtains, draperies, hangings and other decorative materials suspended from walls or ceilings shall meet the flame propagation performance criteria of NFPA 701 in accordance with Section 806.2 or be noncombustible.

Exceptions:

1. Curtains, draperies, hangings and other decorative materials suspended from walls of *sleeping units* and *dwelling units* in dormitories in Group R-2 protected by an *approved automatic sprinkler system* installed in accordance with Section 903.3.1 and such materials are limited to not more than 50 percent of the aggregate area of walls.
2. Decorative materials, including, but not limited to, photographs and paintings in dormitories in Group R-2 where such materials are of limited quantities such that a hazard of fire development or spread is not present.

In Groups I-1 and I-2, combustible decorative materials shall meet the flame propagation criteria of NFPA 701 unless the decorative materials, including, but not limited to, photographs and paintings, are of such limited quantities that a hazard of fire development or spread is not present. In Group I-3, combustible decorative materials are prohibited.

Fixed or movable walls and partitions, paneling, wall pads and crash pads, applied structurally or for decoration, acoustical correction, surface insulation or other purposes, shall be considered interior finish if they cover 10 percent or more of the wall or of the ceiling area, and shall not be considered decorative materials or furnishings.

In Group B and M occupancies, fabric partitions suspended from the ceiling and not supported by the floor shall meet the flame propagation performance criteria in accordance with Section 807.2 and NFPA 701 or shall be noncombustible. <u>In other than Group B and M occupancies, fabric partitions shall be in accordance with the type of construction required for the building.</u>

Reason: The purpose of this revision is to clarify intent. Designers frequently want to use draperies as room dividers. Cp 6 intends room dividers to be considered interior non-bearing partitions. There are also two instances in 806 where fabric partitions are specifically allowed in Group B and M occupancies, which indicate that fabric partitions are not intended for all occupancy uses. As a partition, there is rarely any disagreement on the type of construction required by code. In addition, NFPA 701 uses a Bunsen burner as the ignition source and if a larger ignition source can be expected, the hazard may be far in excess of what Section 807 expects.

Cost Impact: As clarification of intent, this code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: EVANS-F3-807.1.DOC

F58–09/10
807.4.2.1, 808.2, Chapter 47; IBC 402.11, 402.12.1, 402.16.5, Chapter 35

Proponent: Marcelo M. Hirschler, GBH International

THIS IS A 2 PART CODE CHANGE. BOTH PARTS WILL BE HEARD BY THE FIRE CODE COMMITTEE AS 2 SEPARATE CODE CHANGES. SEE THE TENTATIVE HEARING ORDER FOR THE FIRE CODE COMMITTEE.

PART I – IFC

1. Revise as follows:

807.4.2 Group A. The requirements in Sections 807.4.2.1 through 807.4.2.3 shall apply to occupancies in Group A.

807.4.2.1 Foam plastics. Exposed foam plastic materials and unprotected materials containing foam plastic used for decorative purposes, or stage scenery or exhibit booths shall have a maximum heat release rate of 100kW when tested in accordance with UL 1975, or when tested in accordance with NFPA 289 using the 20 kW ignition source.

Exceptions:

1. Individual foam plastic items or items containing foam plastic where the foam plastic does not exceed 1 pound (0.45 kg) in weight.
2. Cellular or foam plastic shall be allowed for trim in accordance with Section 804.2.

808.2 Signs. Foam plastic signs that are not affixed to interior building surfaces shall have a maximum heat release rate of 150 kW when tested in accordance with UL 1975, or when tested in accordance with NFPA 289 using the 20 kW ignition source.

Exception: Where the aggregate area of foam plastic signs is less than 10 percent of the floor area or wall area of the room or space in which the signs are located, whichever is less, subject to the approval of the fire code official.

2. Add new standard to Chapter 47 as follows:

NFPA

289–2009	Fire Test for Individual Fuel Packages

PART II – IBC GENERAL

1. Revise as follows:

402.11 Kiosks. Kiosks and similar structures (temporary or permanent) shall meet the following requirements:

1. Combustible kiosks or other structures shall not be located within the mall unless constructed of any of the following materials:
   1.1. Fire-retardant-treated wood complying with Section 2303.2.
   1.2. Foam plastics having a maximum heat release rate not greater than 100kW (105 Btu/h) when tested in accordance with the exhibit booth protocol in UL 1975 or when tested in accordance with NFPA 289 using the 20 kW ignition source.
   1.3. Aluminum composite material (ACM) having a flame spread index of not more than 25 and a smoke-developed index of not more than 450 when tested as an assembly in the maximum thickness intended for use in accordance with ASTM E 84 or UL 723.
2. Kiosks or similar structures located within the mall shall be provided with *approved* fire suppression detection devices.
3. The minimum horizontal separation between kiosks or groupings thereof and other structures within the mall shall be 20 feet (6096 mm).
4. Each kiosk or similar structure or groupings thereof shall have a maximum area of 300 square feet (28 m^2).

402.12.1 Materials. Children's playground structures shall be constructed of noncombustible materials or of combustible materials that comply with the following:

1. Fire-retardant-treated wood.
2. Light-transmitting plastics complying with Section 2606.
3. Foam plastics (including the pipe foam used in soft-contained play equipment structures) having a maximum heat-release rate not greater than 100 kW when tested in accordance with UL 1975 or when tested in accordance with NFPA 289 using the 20 kW ignition source.
4. Aluminum composite material (ACM) meeting the requirements of Class A interior finish in accordance with Chapter 8 when tested as an assembly in the maximum thickness intended for use.
5. Textiles and films complying with the flame propagation performance criteria contained in NFPA 701.
6. Plastic materials used to construct rigid components of soft-contained play equipment structures (such as tubes, windows, panels, junction boxes, pipes, slides and decks) exhibiting a peak rate of heat release not exceeding 400 kW/m^2 when tested in accordance with ASTM E 1354 at an incident heat flux of 50 kW/m^2 in the horizontal orientation at a thickness of 6 mm.
7. Ball pool balls, used in soft-contained play equipment structures, having a maximum heat release rate not greater than 100 kW when tested in accordance with UL 1975 or when tested in accordance with NFPA 289 using the 20 kW ignition source. The minimum specimen test size shall be 36 inches by 36 inches (914 mm by 914 mm) by an average of 21 inches (533 mm) deep, and the balls shall be held in a box constructed of galvanized steel poultry netting wire mesh.

8. Foam plastics shall be covered by a fabric, coating or film meeting the flame propagation performance criteria of NFPA 701.
9. The floor covering placed under the children's playground structure shall exhibit a Class I interior floor finish classification, as described in Section 804, when tested in accordance with NFPA 253.

402.16.5 Foam plastics. Foam plastics used in signs shall have flame-retardant characteristics such that the sign has a maximum heat-release rate of 150 kilowatts when tested in accordance with UL 1975 or when tested in accordance with NFPA 289 using the 20 kW ignition source, and the foam plastics shall have the physical characteristics specified in this section. Foam plastics used in signs installed in accordance with Section 402.14 shall not be required to comply with the flame spread and smoke-developed indexes specified in Section 2603.3.

2. Add new standard to Chapter 35 as follows:

NFPA

289 – 2009	Fire Test for Individual Fuel Packages

Reason: UL 1975 was developed in the 1970s and uses a 340 g wood crib as the ignition source. More modern technology, using a propane gas burner, has recently been developed by the NFPA Technical Committee on Fire Tests, specifically for this type of product. NFPA 289 is more versatile than UL 1975 and is also likely to offer lower variability. The 20 kW gas burner ignition source in NFPA 289 was specifically designed with the intent of being a substitute for UL 1975. This proposal does not recommend the deletion of the use of UL 1975 but simply offers a more modern alternate option.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: A review of the standard(s) proposed for inclusion in the code, NFPA 289-2009, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

PART I – IFC

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

PART II – IBC GENERAL

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: HIRSCHLER-F15-807.4.2.1-COMBINED WITH F6.DOC

F59–09/10
808.1

Proponent: Marcelo M. Hirschler, GBH International, representing American Fire Safety Council

Revise as follows:

808.1 Wastebaskets and linen containers in Group I-1, I-2 and I-3 occupancies. Wastebaskets, linen containers and other waste containers, including their lids, located in Group I-1, I-2 and I-3 occupancies shall be constructed of noncombustible materials or of materials that meet a peak rate of heat release not exceeding 300 kW/m^2 when tested in accordance with ASTM E 1354 at an incident heat flux of 50 kW/m^2 in the horizontal orientation. Metal wastebaskets and other metal waste containers with a capacity of 20 gallons (75.7 L) or more shall be *listed* in accordance with UL 1315 and shall be provided with a noncombustible lid. Portable containers exceeding 32 gallons (121 L) shall be stored in an area classified as a waste and linen collection room and constructed in accordance with Table 508.2 of the *International Building Code*.

Reason: The wastebaskets and linen containers in I-1 occupancies should meet the same requirements as those for I-2 and I-3. Most residents in these facilities have little mobility or capability of escaping a large fire. As explained in earlier cycles, most nonmetallic waste containers are manufactured from polyethylene which has a fuel value over double that of newsprint and a very high heat release in a fire. These wastebaskets and linen containers hold combustible waste (much of which is paper) and linen while having very combustible walls. This change will extend the use of more fire safe material to the I-1 occupancies. Most manufacturers of such containers can use alternate materials.

Cost Impact: The code change proposal will increase the cost of the wastebaskets and linen containers used in I-1 occupancies.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: HIRSCHLER-F12-808.1.DOC

F60–09/10
808.2 (New)

Proponent: Marcelo M. Hirschler, GBH International, representing American Fire Safety Council

Add new text as follows:

808.2 Waste containers with a capacity of 20 gallons or more in Group R-2 college and university dormitories. Waste containers, including their lids, located in Group R-2 college and university dormitories and with a capacity of 20 gallons (75.7 L) or more shall be constructed of noncombustible materials or of materials that meet a peak rate of heat release not exceeding 300 kW/m^2 when tested in accordance with ASTM E 1354 at an incident heat flux of 50 kW/m^2 in the horizontal orientation. Metal wastebaskets and other metal waste containers with a capacity of 20 gallons (75.7 L) or more shall be *listed* in accordance with UL 1315 and shall be provided with a noncombustible lid. Portable containers exceeding 32 gallons (121 L) shall be stored in an area classified as a waste and linen collection room and constructed in accordance with Table 508.2 of the *International Building Code*.

(Renumber subsequent sections)

Reason: The large waste containers in college and university dormitories should comply with the same requirements as any waste container in Group I-2 and I-3 occupancies. As explained in earlier cycles, most nonmetallic waste containers are manufactured from polyethylene which has a fuel value over double that of newsprint and a very high heat release in a fire. These waste containers hold combustible waste (much of which is paper) while having very combustible walls. This change will extend the use of more fire safe material to the larger waste containers in dormitories. Most manufacturers of such containers can use alternate materials.

Cost Impact: The code change proposal will increase the cost of the waste containers used in dormitories.

F61–09/10
808.3 (New)

Proponent: Marcelo M. Hirschler, GBH International, representing American Fire Safety Council

Add new text as follows:

808.3 Combustible lockers. Where lockers constructed of combustible materials are used, the lockers shall be considered interior finish and shall comply with Section 803.

> **Exception:** Lockers constructed entirely of wood and noncombustible materials shall be permitted to be used wherever interior finish materials are required to meet a Class C classification in accordance with 803.1.1.

Reason: Traditionally lockers, in schools (high schools, middle schools, universities), clubs, swimming pools and gymnasiums, were constructed of steel. In recent years, the use of lockers constructed of combustible materials has become prevalent. These lockers typically line an entire wall (for example a corridor in a school) and are not regulated by the fire code. Lockers are not usually considered interior finish. The only other materials regulated by the IFC at present are: interior trim, upholstered furniture, decorations, decorative vegetation, wastebaskets, linen containers and signs. Lockers do not fall into any of those categories.

Combustible lockers can present a significant fire load and, if ignited, are likely to spread fire the same way that interior finish materials spread fire. They should be considered interior finish materials and regulated like all other interior finish materials for any occupancy.

The following wording comes from an advertisement for “Rust Free Plastic Lockers”. “Our waterproof plastic lockers are convenient for many types of locations, from boat decks to pool areas. Along with their rustproof quality, they are durable for many years of use. Available as single or multiple tiered units, our plastic lockers are ideal for any area near water or humidity whether a spa, pool, shower or beach area. Plastic lockers withstand the humidity and corrosiveness of water and pool areas and last much longer than traditional metal lockers. Wet swimsuits and towels, or even sweaty clothing will never rust, corrode delaminate or crack our 100% plastic foot lockers or stand-up plastic locker solutions!” The lockers by this particular manufacturer are constructed of 3/8 inch thick solid plastic bodies and heavy duty ½ inch thick doors. Typically the “solid plastic” used is either high density polyethylene or polypropylene.

In some “high-end” environments, such as country clubs, plastic lockers are not found. Instead, lockers are made with “the highest quality materials and meticulous attention to detail. Locker sides, top and bottom are made of ¾ inch industrial grade particleboard with stain and impact resistant white melamine finish inside and out. Locker back is the same particleboard in a ½ inch thickness. All exposed edges are finished with matching edge banding. These club lockers include number plates and heavy duty keyed cam locks for security. Wooden Lockers feature highly durable ¾ inch solid wood raised panels. Wood locker surfaces are finished with 1 coat of sealer and 2 coats of lacquer for maximum durability. Laminate Lockers feature high pressure laminate doors.”

One manufacturer advertises 100% polypropylene lockers, which “will not rust, corrode, fade, or require repainting, Our plastic lockers will save you money from having to replace rusty metal lockers or warped wood and wood laminated lockers in a few short years.” This manufacturer also states that the 100% polypropylene lockers last “ten times longer than metal lockers” and last “longer than wood lockers, or plastic laminated lockers in humid environments such as in tropical climates, and where there are locker rooms near showers, saunas, pools or in facilities which require frequent sanitation. Wood lockers, in a humid environment will warp. Plastic-laminated lockers are simply particle board covered with a laminate sheet. Moisture will seep into connector and hinge screw holes in the locker and eventually will soften the particle board.” This manufacturer states that plastic lockers are impervious to moisture and will not fade, warp, or delaminate.

In other proposals I have already discussed the fire performance of polyethylene and polypropylene.

Wood interior finish corresponds typically to Class C interior finish, which is usually allowed other than in corridors and exits. Therefore, lockers made exclusively out of wood should be allowed anywhere that Class C interior finish is allowed without additional testing. If there is some doubt as to whether the material is wood or a plastic resembling wood, it would be up to the manufacturer to demonstrate that the lockers are made of wood in order to use the exception.

Cost Impact: The code change proposal will increase costs, since the fire performance of combustible lockers is not regulated at present.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: HIRSCHLER-F9-808.3.DOC

F62–09/10
901.4.5 (New) [IBC [F] 901.2.1 (New)]

Proponent: Jeff Hugo, CBO, National Fire Sprinkler Association

Add new text as follows:

901.4.5 (IBC [F] 901.2.1) Pump and riser room size. Fire pump and/or fire sprinkler system riser rooms shall be designed with adequate space for all equipment necessary for the installation as defined by the manufacturer with sufficient working room around the stationary equipment. Clearances around equipment to elements of permanent construction, including other installed equipment and appliances, shall be sufficient to allow inspection, service, repair or replacement without removing such elements of permanent construction or disabling the function of a required fire-resistance-rated assembly. Fire pump and fire sprinkler riser rooms shall be provided with a door(s) and unobstructed passageway large enough to allow removal of the largest piece of equipment.

Reason: Fire pump and fire sprinkler riser rooms require routine maintenance, repairs, and possible replacement, adequate working clearances is needed. Typically one could assume that a 36" work space in front of the piece of equipment would be adequate, but the design sizes and layout of these rooms is limitless, and thus should rely on the manufacturer to lay out specific guidelines for their equipment. This new section will relieve the workforce responsible for maintaining such equipment, provide adequate room for fire fighters, and finally giving designers and building officials some direction in this area.

The NFSA as an industry representative is constantly hearing this plea from its members throughout the country. Rooms designed or built too small, have no or little space to maneuver equipment and other unnecessary impairments to the flow of normal repair are the most common complaints. Such delays can cause more expense and in some cases personal injury, causing more expense to the building owner. OS&Y valves and backflow preventers can weigh several hundred pounds and could be several feet long, fire pump control cabinets fall into the same category. Insight to the size, weight, layout, along with the manufacturer's recommended working space can aid the designer in accomplishing this task on paper prior to the construction of the room.

This new section will also mandate such equipment to fit through the doors along with an adequate path out of the structure so that interior walls and finishes do not need to be removed and replaced after several years. Similar language can be found in the IMC, IPC, and the National Electrical Code for installed equipment and appliances.

The 07/08 IFC Code Change Committee supported this change but requested that the change be inserted in the general section of 901 Combination standpipes/sprinkler risers are common in many structures.

Cost Impact: The code change proposal will not increase the cost of construction.

F63–09/10
901.6, Table 901.6.1, Chapter 47

Proponent: Amber Anderson/Stuart Tom, Cosumnes CSD Fire Department, representing California Fire Chief's Association

1. Revise as follows:

901.6 Inspection, testing and maintenance. Fire detection, alarm, and extinguishing systems, mechanical smoke exhaust systems and smoke and heat vents shall be maintained in an operative condition at all times, and shall be replaced or repaired where defective. Nonrequired *fire protection systems* and equipment shall be inspected, tested and maintained or removed.

TABLE 901.6.1
FIRE PROTECTION SYSTEM MAINTENANCE STANDARDS

SYSTEM	STANDARD
Portable fire extinguishers	NFPA 10
Carbon Dioxide fire-extinguishing systems	NFPA 12
Halon 1301 fire-extinguishing systems	NFPA 12A
Dry-chemical extinguishing systems	NFPA 17
Wet-chemical extinguishing systems	NFPA 17A
Water based fire protection systems	NFPA 25
Fire alarm systems	NFPA 72
Mechanical smoke exhaust systems	NFPA 204
Smoke and heat vents	NFPA 204
Water-mist systems	NFPA 750
Clean-agent extinguishing systems	NFPA 2001

2. Add new standard to Chapter 47 as follows:

NFPA

204-2007 Standard for Smoke and Heat Venting

Reason: The purpose of the revision is to clarify to which standard smoke and heat vents and mechanical smoke exhaust systems should be maintained. NFPA 204 would be a new referenced standard in the IFC.

Smoke and heat vents and mechanical smoke exhaust systems are fire protection systems often required by the IFC. Fire protection systems must be maintained as indicated in IFC Section 901.4, IFC 901.4.1, 902.1 (definition of fire protection systems), and 901.6.1. However what is not clear is the standard to which to maintain such systems. IFC Section 901.4 requires maintenance to be in accordance with the original installation standard for that system. The original installation standard for smoke and heat vents would be found in IFC Section 910.3.1, UL 793 titled *Automatically Operated Roof Vents for Smoke and Heat*. UL 793, Section 18.1 indicates that the installation of the system must be in accordance with NFPA 204. However, UL 793 does not address maintenance of the system.

The next requirement for maintenance is found in IFC Section 901.4.1 which states maintenance as required by the IFC. Since the installation standard is NFPA 204 it makes sense that the maintenance standard should also be NFPA 204 as the IFC does not provide maintenance provisions for such systems.

Although NFPA 204 would be a new referenced standard in the IFC it is not a new referenced standard in practice. By modifying the table the user is provided clarity and easy reference for enforcement provision system maintenance.

A companion proposal (submitted separately by Justin Beal representing City of Fresno Fire Department) has also been submitted to include new language within IFC Section 910:

> **910.5 Maintenance.** Smoke and heat vents and mechanical smoke exhaust systems shall be maintained in an operative condition in accordance with NFPA 204. Fusible links shall be promptly replaced whenever fused, damaged or painted. Smoke and heat vents and mechanical smoke exhaust systems shall not be modified, unless approved by the fire code official.

This new section would maintain consistent formatting in the IFC as already established for the other systems listed in IFC Table 901.6.1. For example, companion code sections already in the IFC for portable fire extinguishers is 906.2; for carbon dioxide fire extinguishing systems is 904.8; for Halon 1301 fire extinguishing systems is 904.9; dry-chemical extinguishing systems 904.6; wet-chemical extinguishing systems 904.5; water based fire protection 903.5; fire alarm systems 907.9; and clean agent extinguishing systems 904.10.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: Review of proposed new standard NFPA 204-2007 indicated that, in the opinion of ICC Staff, the standard did comply with ICC standards criteria. The companion code change proposal mentioned in the proponent's reason statement is F146-09/10.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: ANDERSON-TOM-F5- 901.6.DOC

F64–09/10

901.9 (New)

Proponent: Rick Sheets, Fire Committee Chair, Brinks Home Security, representing National Burglar and Fire Alarm Association

Add new text as follows:

901.9 Discontinuation or change of service. Notice shall be made to the fire code official whenever contracted alarm services for monitoring or testing or inspection of an existing fire alarm system are terminated for any reason, or a change in alarm monitoring provider or other service provider is made. Notice shall be made in writing, to the fire code official by the building owner and where required, by the alarm service provider being terminated.

Reason: It is, and should always remain, the responsibility of the commercial property owner to maintain their building(s) to code. The code prohibits the "removal of or tampering with equipment" and "appurtenances", and in 901.4 of this code states that "fire protection systems shall be maintained in accordance with the original installation standards for that system", yet no such language is provided for non-tangible services. Any contracted services for remote station monitoring and the required testing of equipment in place at the time of acceptance, could be cancelled after the Acceptance Test without notifying the code official. This is of concern for many reasons:

1. The alarm service provider of record may be replaced with non-licensed, non-registered, non-qualified and non-approved personnel or methods.
2. Due to non-payment of fees by the property owner, the alarm service provider may have stopped (or will soon stop) monitoring, repairing and testing of the fire alarm system.
3. If an alarm service provider no longer provides monitoring, repairing or testing services due to non-payment they cannot be seen by the code official as being at fault.

Since by code, the building owner is responsible for keeping their building and fire alarm system in proper working condition, part of that responsibility lies in the fact that they are paying their bills to their alarm service provider. In any other circumstance nonpayment is merely a contract dispute between customer and provider. However, since the service being provided is mandated by code (monitoring and testing) the service provider gets caught in the middle of a complex situation. The addition of this rule will provide the proper notifications to be made before discontinuance of required services.

While the impairment coordinator should be the one to inform the fire official of these types of changes, they may be reluctant to do so because they'd be admitting that these services have been stopped as a cost cutting measure. Allowing the alarm service provider to also notify the fire code official of imminent cessation of service provides a cross-check to ensure the proper continuation of services present at the time of acceptance remain in effect. If another service provider has been procured by the building owner this notification allows the fire code official an opportunity to make sure any required licenses and permits are in place.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: SHEETS-F6-901.8.2.DOC

F65–09/10
903.1.2 (New) [IBC [F] 903.1.2 (New)]

Proponent: Lee Kranz, City of Bellevue, WA, representing The Washington Association of Building Officials (WABO), Technical Code Development Committee

Add new text as follows:

903.1.2 (IBC [F] 903.1.2) Fire walls. For the purposes of this section, each portion of a building separated by one or more fire walls complying with Section 706 of the *International Building Code* shall be considered to be a separate building.

Reason: This code change clarifies that fire walls may be used to create separate buildings for sprinkler protection requirements found in IBC, Section 903. This change is necessary to remind readers of the basic code principle that fire walls create separate buildings, even for sprinkler purposes, and ensures that the code is applied consistently throughout. The definition of "Fire Area", found in IBC Section 702 includes fire walls as an element to define the boundaries of the fire area.

IBC Sections 503.1 and 706.1 clearly indicate that portions of buildings separated by one or more fire walls shall be considered separate buildings. Section 903 contains language that appears to conflict with the fire wall provisions because there is no specific reference to fire walls creating separate buildings for sprinkler protection requirements. One example of an ambiguity may be found in Section 903.2.7 where currently, it is not clear if a fire wall creates separate buildings for sprinkler system scoping requirements. This issue is resolved by adding the proposed language.

In a mixed-use building containing an occupancy required to be provided with an approved automatic sprinkler system, a fire wall, installed per Section 706, is permitted to eliminate the need to provide sprinkler protection throughout the entire building, thereby limiting the installation to the applicable occupancy.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: KRANZ-F2-903.1.2.DOC

F66–09/10
903.2 (IBC [F] 903.2)

Proponent: David S. Collins, FAIA, The Preview Group, Inc., representing The American Institute of Architects

Revise as follows:

903.2 (IBC [F] 903.2) Where required. *Approved automatic sprinkler systems* in new buildings and structures shall be provided in the locations described in Sections 903.2.1 through 903.2.12.

Exceptions:

1. Spaces or areas in telecommunications buildings used exclusively for telecommunications equipment, associated electrical power distribution equipment, batteries and standby engines, provided those spaces or areas are equipped throughout with an automatic smoke detection system in accordance with Section 907.2 and are separated from the remainder of the building by not less than 1-hour *fire barriers* constructed in accordance with Section 707 of the *International Building Code* or not less than 2-hour *horizontal assemblies* constructed in accordance with Section 712 of the *International Building Code*, or both
2. Where fire areas exceed the limits in Sections 903.2.1 through 903.2.9, fire barriers constructed in accordance with Section 707 of the *International Building Code* or horizontal assemblies constructed in accordance with Section 712, or both, shall be permitted to create smaller fire areas, in accordance with

Section 706.3.9 of the *International Building Code*, that would not be required to be protected by an approved automatic sprinkler system. This exception shall not apply where other provisions of this code would otherwise require the installation of an approved automatic sprinkler system.

Reason: There is a lack of clear direction as to how the thresholds in 903.2 are to be applied where a fire area is created by construction of fire barriers as allowed in Assembly and other occupancies.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: COLLINS-F1-903.2.DOC

F67–09/10
903.2.1.2 (IBC [F] 903.2.1.2)

Proponent: Kelly P. Reynolds representing Chick-Fila-A and McDonald's Corporation

Revise as follows:

903.2.1.2 (IBC [F] 903.2.1.2) Group A-2. An automatic sprinkler system shall be provided for Group A-2 occupancies where one of the following conditions exists:

1. The fire area exceeds 5,000 square feet (464 m^2);
2. The fire area has an occupant load of ~~100~~ 150 or more;
3. The fire area is located on a floor other than a level of exit discharge serving such occupancies.

Reason: The three legacy codes (BOCA, ICBO & SBCCI) did not classify restaurants as A-2 (assembly) use groups, until the 2000 edition of the IBC (International Building Code). Even then, fire sprinklers were not required until the building was more than 5,000 sq. ft. or had an occupancy load of more than 300 persons. This same requirement appeared in the Life Safely Code **(**NFPA No. 101).
The sprinkler threshold dramatically changed to more than I00 persons in the 2006 IBC and 2006 IFC (International Fire Code).

Historically, the 300 person fire sprinkler threshold was based on tragic night club fires such as the Cocoanut Grove in Boston in 1942 that killed 492 persons and the Beverly fire in Kentucky in 1977 claimed 150 lives that were both over crowded beyond their legal capacity.

In 2003, The Station Nightclub fire in Rhode Island took 100 lives. It was over crowded by more than 200 persons. Through an apparent over-reaction, the code made a dramatic change of the fire sprinkler threshold for A-2 Use Groups from 300 persons down to 100 persons.

The intent of this code change proposal is to change that threshold to a more reasonable 150 persons to accommodate quick-serve restaurants. A quick-serve restaurant is "defended in place" and does not have the same conditions that these three infamous fire tragedies had. They do not have overcrowding, loud noise (music), and low lighting levels.

No alcohol or potential reaction/judgment impairing consumption's occur in quick-service restaurants, unlike nightclubs or full-service restaurants. Furthermore, they are "easy to navigate" and "well lit". The grease-laden cooking equipment is the only area of real concern and that is protected throughout by pre-engineered, self contained, approved fire suppression systems.

The 150 person threshold for fire sprinklers is more reasonable than the current 100 persons for these types of operations. Furthermore, there are no recorded fire deaths in any such type of quick-serve operations based on N FPA Fire Statistics .

Cost Impact: The code change proposal will reduce cost for A-2 uses under 150 people.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: REYNOLDS-F1-903.2.1.2

F68–09/10
903.2.2 (IBC [F] 903.2.2)

Proponent: Tom Lariviere, Chairman, Joint Fire Service Review Committee

Revise as follows:

903.2.2 (IBC [F] 903.2.2) Group B Ambulatory health care facilities. An *automatic sprinkler system* shall be installed throughout ~~all *fire areas*~~ the entire floor containing a Group B ambulatory health care facility ~~occupancy~~ and all floors between the ambulatory health care facility and the *level of exit discharge* serving such a facility, including the *level of exit discharge* serving such a facility when either of the following conditions exist at any time:

1. Four or more care recipients are incapable of self preservation.
2. One or more care recipients that are incapable of self preservation are located at other than the *level of exit discharge* serving such a~~n~~ facility ~~occupancy~~.

Reason: The current language would allow Ambulatory Surgical Centers to be placed in a high-rise structure, but would only require that the surgical center is to be sprinklered. In a fire, occupants would have to exit through spaces that lack sprinkler protection. If sprinklers are required to protect occupants in ambulatory surgical centers, it is illogical to expect them to evacuate through unprotected spaces.

Automatic sprinkler systems are required in Ambulatory Health Care Facilities because the patients could be incapable of self-preservation. When assistance is necessary for evacuation, the evacuation time increases. The current code will require sprinklers within the Ambulatory Health Care Facility, so when the employees start to evacuate the patients they are in a protected, sprinklered, environment. But as they leave the Ambulatory Health Care Facility and continue to the exit, they would be leaving the sprinklered area. This is contrary to the reasoning to provide fire sprinklers in the first place. The patients in these facilities will take longer to evacuate, and will need assistance to evacuate.

Therefore, this proposal will require that when an Ambulatory Health Care Facility is located in a multi-story building, that the entire floor is protected with fire sprinklers and every floor between that level and the level of exit discharge will also be protected with fire sprinklers. This will provide a safe route for evacuation of patients to the exterior of the building.

The term "occupancy" is deleted after "ambulatory health care facility" because it is not needed and becomes redundant when it is referred to as a "facility occupancy."

Cost Impact: The code change proposal will increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: LARIVIERE-F8-903.2.2.DOC

F69–09/10

903.2.4 (IBC [F] 903.2.4), 903.2.7 (IBC [F] 903.2.7), 903.2.9 (IBC [F] 903.2.9)

Proponent: Robert J Davidson, Code Consultant/Alan Shuman, President, representing the National Association of State Fire Marshals (NASFM)

Revise as follows:

903.2.4 (IBC [F] 903.2.4) Group F-1. An automatic sprinkler system shall be provided throughout all buildings containing a Group F-1 occupancy where one of the following conditions exists:

1. Where a Group F-1 fire area exceeds 12,000 square feet (1115 m^2);
2. Where a Group F-1 fire area is located more than three stories above grade plane; or
3. Where the combined area of all Group F-1 fire areas on all floors, including any mezzanines, exceeds 24,000 square feet (2230 m^2).
4. Where a Group F-1 occupancy is used for the manufacture of upholstered furniture or mattresses.

903.2.7 (IBC [F] 903.2.7) **Group M.** An automatic sprinkler system shall be provided throughout buildings containing a Group M occupancy where one of the following conditions exists:

1. Where a Group M fire area exceeds 12,000 square feet (1115 m^2);
2. Where a Group M fire area is located more than three stories above grade plane; or
3. Where the combined area of all Group M fire areas on all floors, including any mezzanines, exceeds 24,000 square feet (2230 m^2). ; or
4. Where a Group M occupancy is used for the display and sale of upholstered furniture or mattresses.

903.2.9 (IBC [F] 903.2.9) Group S-1. An automatic sprinkler system shall be provided throughout all buildings containing a Group S-1 occupancy where one of the following conditions exists:

1. A Group S-1 fire area exceeds 12,000 square feet (1115 m^2);
2. A Group S-1 fire area is located more than three stories above grade plane; or
3. The combined area of all Group S-1 fire areas on all floors, including any mezzanines, exceeds 24,000 square feet (2230 m^2).
4. A Group S-1 fire area used for the storage of commercial trucks or buses where the fire area exceeds 5,000 square feet (464 m^2).
5. A Group S-1 occupancy is used for the storage of upholstered furniture or mattresses.

Reason: Last cycle the upholster furniture industry submitted a proposal to require the installation of automatic sprinkler systems in mercantile occupancies that contain upholstered furniture regardless of the size of the occupancy. The committee agreed and accepted the proposal. The hazard presented by the upholstered furniture in the mercantile occupancy is greater in an F-1 occupancy where the furniture is being manufactured and in an S-1 occupancy where the fuel load contribution of the upholstered furniture is greater than in the mercantile group. For this reason both the F-1 and S-1 involving upholstered furniture should be protected with an automatic sprinkler system regardless of the size of the occupancy.

Mattresses has been added to the F-1, M and S-1 Groups requiring the automatic sprinkler systems because the polyfoam that presents the hazard in the upholstered furniture presents the same hazard in the mattresses and should have similar protection levels.

Cost Impact: The code change proposal will increase the cost of construction for occupancies containing this hazard.

	Assembly:	ASF	AMF	DF

ICCFILENAME: DAVIDSON-SHUMAN-F17-903.2.4.DOC

F70–09/10
903.2.6 (IBC [F] 903.2.6)

Proponent: Roland J. Huggins, PE, American Fire Sprinkler Association, representing self

Revise as follows:

903.2.6 Group I. An *automatic sprinkler system* shall be provided throughout buildings with a Group I *fire area*.

Exception: An *automatic sprinkler system* installed in accordance with Section 903.3.1.2 or 903.3.1.3 shall be allowed in Group I-1 facilities <u>provided that:</u>

1. <u>A hydraulic design information sign is located on the system riser</u>
2. <u>Exception 1 of Section 903.4 is not applied</u>
3. <u>Systems installed in accordance with Section 903.3.1.3 shall be maintained in accordance with the requirements of Section 903.3.1.2</u>.

Reason: This exception provides a very cost efficient system but an institutional facility is still a commercial facility and warrants a higher level of assurance that the system will work. An NFPA 13D system does not require any identification for the design basis of the system so others working on the system after installation need this information. Granted, building plans are supposed to be maintained, but often aren't and a system riser sign is often the only guidance available. Section 903.4 requires the system to be monitored so in case of fire the fire department is automatically notified. Exception #1 excludes systems in one-and two-family dwellings. Since Section 903.3.1.3 explicitly links NFPA 13D systems and one- and two-family dwellings, it is interpreted that Exception #1 applies to all 13D systems. Clarification is needed. As a final item, if the intent of the ICC is that these facilities be maintained to ensure adequate operation, guidance must be provided. Simply referencing Section 903.5 will not work since it references IFC which references NFPA 25. NFPA 13D systems are outside the scope of NFPA 25. The only maintenance and testing performed on an NFPA 13D system is provided by the homeowner.

Cost Impact: The code change proposal will have minimal impact on the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: HUGGINS-F1-903.2.5.DOC

F71–09/10
903.2.7 (IBC [F] 903.2.7)

Proponent: Michael E. Dell'Orfano, South Metro Fire Rescue Authority, representing Fire Marshal's Association of Colorado

Revise as follows:

903.2.7 (IBC [F] 903.2.7) Group M. An *automatic sprinkler system* shall be provided throughout buildings containing a Group M occupancy where one of the following conditions exists:

1. A Group M *fire area* exceeds 12,000 square feet (1115 m^2).
2. A Group M *fire area* is located more than three stories above grade plane.
3. The combined area of all Group M *fire areas* on all floors, including any mezzanines, exceeds 24,000 square feet (2230 m^2).
4. A Group M ~~occupancy is~~ <u>fire area</u> used for the display and sale of upholstered furniture <u>where the fire area exceeds 7,250 square feet (673 m^2)</u>.

Reason: When F135-07/08 was approved, a zero-square-foot sprinkler threshold was established for Group M's displaying and selling upholstered furniture. However, the code development committee recommended that a more reasonable threshold be established for the sprinkler requirement. In order to create that higher threshold, we have considered other upholstered furniture sprinkler requirements found in the IFC and recommend that the new threshold should be:

1. Greater than 0 square feet: Under the 2009 IFC, very small "boutique" stores will have to protect their buildings with sprinklers when they are only displaying a few loveseats, children's bedroom sets, etc. Most occupancies other than merchantile don't have to be sprinklered even though they may contain more upholstered furniture than these small stores.

2. Greater than 2,500 square feet: Even buildings with high-piled storage of upholstered furniture usually don't have to be protected with sprinklers until they reach this threshold.
3. Less than 12,000 square feet: All Group M fire areas already have to be sprinklered at this threshold.

The proposed threshold of 7,250 square feet was chosen through a simple method of selecting the half-way point between 2,500 and 12,000 square feet while considering the above criteria. Also, changing "occupancy" to "fire area" follows the existing format for Group M sprinkler requirements and avoids having to measure the actual area of furniture displays (which may change over time).

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: DELL'ORFANO-F1-903.2.7.DOC

F72–09/10
903.2.7 (IBC [F] 903.2.7)

Proponent: Ken Brouillette, City of Puyallup, Washington

Revise as follows:

903.2.7 (IBC [F] 903.2.7) Group M. An automatic sprinkler system shall be provided throughout buildings containing a Group M occupancy where one of the following conditions exists:

1. A Group M fire area exceeds 12,000 square feet (1115 m^2).
2. A Group M fire area is located more than three stories above grade plane.
3. The combined area of all Group M fire areas on all floors, including mezzanines, exceeds 24,000 square feet (2230 m^2).
4. ~~A Group M occupancy is used for the display and sale of upholstered furniture.~~

Reason: This addition to the 2009 code has caused an extreme hardship for business owners and an enforcement nightmare for AHJ's. One piece of furniture would create the requirement to retrofit an existing building. High hazard commodities in Chapter 23 of the IFC do not require an automatic fire sprinkler system until 501 feet of storage is required. A clear threshold is necessary for enforcement of this section.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: BROUILLETTE-F1-903.2.7.DOC

F73–09/10
903.2.11 (IBC [F] 903.2.11)

Proponent: Donald R. Monahan, PE, Walker Parking Consultants, representing the National Parking Association and the Automated & Mechanical Parking Association

Revise as follows:

903.2.11 (IBC [F] 903.2.11) Specific building areas and hazards. In all occupancies an *automatic sprinkler system* shall be installed for building design or hazards in the locations set forth in Sections 903.2.11.1 through 903.2.11.6.

Exceptions:

1. Groups R-3 and U.
2. Open parking garages

Reason: This section requires fire sprinklers in stories and basements of all occupancies without exterior wall openings meeting a minimum dimension of 30 inches totaling 20 square feet in each 50 linear feet on at least one side for fire department access. Open parking garages typically meet the opening requirements, however, there are many open parking garages that have been constructed with architectural mesh covering the exterior of the garage. The mesh has adequate openness to meet the definition of an open parking garage in 406.3 with natural ventilation, however, the mesh does not provide the openings required in this section for fire department access. Because of the many open parking garage projects that have been constructed with architectural mesh and without fire sprinklers, it appears fire departments are satisfied with firefighter access via the stairways. Further, there are not interior partitions, as with most other building types, that would restrict access to any area within the garage. Fire sprinklers should not be required in open parking structures because of their non-combustible structure design, the nature and limited amount of combustible content, alternate open egress routes, easy access via stairways for firefighting, and ample openings to allow dissipation of smoke and combustion gases. Open parking structures are recognized as a low hazard to life and property from fire. The risk of fire spread and personal injury in an open parking structure fire is extremely low.

Cost Impact: Significant cost savings not to install automatic fire sprinklers in open parking garages.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: MONAHAN-F1-903.2.11.DOC

F74–09/10
903.2.11 (IBC [F] 903.2.11)

Proponent: Tom Lariviere, Chairman, Joint Fire Service Review Committee

Revise as follows:

903.2.11 (IBC [F] 903.2.11) Specific buildings areas and hazards. In all occupancies other than Group U, an *automatic sprinkler system* shall be installed for building design or hazards in the locations set forth in Sections 903.2.11.1 through 903.2.11.6.

~~Exception:~~ ~~Group R-3 and Group U.~~

Reason: This proposal provides correlation with IFC Section 903.2.8 which requires that all Group R occupancies be equipped with fire sprinklers. Currently, Section 903.2.8 requires fire sprinklers in all Group R occupancies, but then Section 903.2.11 lists R-3 as an exception. This creates confusion and misapplication.

This proposal will provide consistency between the two sections.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: LARIVIERE-F9-903.2.11.DOC

F75–09/10
903.2.11.1 (IBC [F] 903.2.11.1)

Proponents: Tom Lariviere, Chairman, Joint Fire Service Review Committee; Alan Shuman, President, representing the National Association of State Fire Marshals (NASFM)

Revise as follows:

903.2.11.1 (IBC [F] 903.2.11.1) Stories without openings. An *automatic sprinkler system* shall be installed throughout all stories, including *basements*, of all buildings where the floor area exceeds 1,500 square feet (139.4 m^2) and where there is not provided at least one of the following types of *exterior wall* openings:

1. Openings below grade that lead directly to ground level by an exterior stairway complying with Section 1009 or an outside ramp complying with Section 1010. Openings shall be located in each 50 linear feet (15 240 mm), or fraction thereof, of *exterior wall* in the story on at least one side. The required openings shall be distributed such that the lineal distance between adjacent openings does not exceed 50 feet (15 240 mm).

2. Openings entirely above the adjoining ground level totaling at least 20 square feet (1.86 m^2) in each 50 linear feet (15 240 mm), or fraction thereof, of *exterior wall* in the story on at least one side. The required openings shall be distributed such that the lineal distance between adjacent openings does not exceed 50 feet (15 240 mm). The height of the bottom of the clear opening shall not exceed 44 inches (1118 mm) measured from the floor.

Reason: The purpose of the openings under Section 903.2.11.1 are for firefighting operations. To effectuate firefighting operations the openings need to be accessible and usable. Therefore this proposal specifies that the maximum sill height of 44" above the floor must be provided. This height is consistent with the height provided for Emergency Escape and Rescue windows in Section 1029.3.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: LARIVIERE-F10-SHUMAN-F2-903.2.11.1.DOC

F76–09/10
903.2.11.1.3 (IBC [F] 903.2.11.1.3)

Proponents: Tom Lariviere, Chairman, Joint Fire Service Review Committee; Alan Shuman, President, representing the National Association of State Fire Marshals (NASFM)

Revise as follows:

903.2.11.1.3 (IBC [F] 903.2.11.1.3) Basements. Where any portion of a *basement* is located more than 75 feet (22 860 mm) from openings required by Section 903.2.11.1, or where walls, partitions or other obstructions are installed that restrict the application of water from hose streams, the *basement* shall be equipped throughout with an *approved automatic sprinkler system*.

Reason: The purpose of the openings under Section 903.2.11.1 are for firefighting operations.

The firefighting purpose of these openings is to provide the ability to confine the fire in the basement from the exterior of the building. A basement fire can be especially dangerous to enter under fire conditions. Firefighters must be able to apply hose stream water from the exterior of the structure through these openings provided. This is particularly important in basements (below grade floors) since entry through a stairway would require firefighters to travel down into the heat and smoke that is trying to escape up and out the stairway.

When obstructions such as walls or partitions are installed in the basement, the ability to apply hose streams through these openings and reach the basement area is reduced or eliminated. The configuration and clear-opening requirements become useless when an interior wall or other obstruction is placed inside the basement. In that case, it is reasonable to require automatic fire sprinklers to provide adequate protection in the basement. This proposal requires that in the case of obstructions, the basement shall be provided with an approved automatic sprinkler system.

Cost Impact: The code change proposal will increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: LARIVIERE-F11-SHUMAN-F3-903.2.11.1.3.DOC

F77–09/10
903.2.11.2 (IBC [F] 903.2.11.2)

Proponent: Edward L. Repic, Architectural Refuse Solutions, LLC, representing self

Revise as follows:

903.2.11.2 Rubbish and linen chutes. An *automatic sprinkler system* shall be installed at the top of rubbish and linen chutes and in their terminal rooms. Chutes ~~extending through three or more floors~~ shall have additional sprinkler heads installed ~~within such chutes~~ at alternate floors and at the lowest intake. When a rubbish chute extends through a building more than one floor below the lowest intake the extension shall have sprinklers installed on the exterior of the chute at alternate floors beginning with the second level below the last intake and ending with the floor above the discharge. Chute sprinklers shall be accessible for servicing. A dry–pipe automatic sprinkler system shall be required for exterior chute extensions unless otherwise approved.

Note Regarding Reason: This submittal is part of four such proposals submitted as independent documents with the intent of adequately addressing Rubbish Chutes (which can include "recycling" chutes that simply redirect parts of the rubbish waste stream to locations other than a landfill) and Linen (or Laundry) Chutes. These proposals individually address Life Safety, Sprinkler Placement, Accessibility in new and existing facilities, and actual Chute Construction and a related component to Rubbish Chutes: Compactors (codes generally address the shaft enclosure but ignore the actual chute being enclosed or the compactor it is feeding).

Reason: Rubbish and linen chutes, typically 24" in diameter can convey a fire up a building through smoke compartments at every level due to the chimney effect generated by this large diameter feature extending from the lowest floors of the building to a point 3' to 6' above the roof, depending upon local requirements. A rubbish chute shaft enclosure usually terminates at the floor level above the discharge level. The rubbish room at the base of the chute is required to be rated the same as the chute enclosure shaft. That means, for all practical purposes, that a chute enclosure shaft, unlike any other shaft in construction, contains combustibles within the shaft enclosure: In this case, the rubbish that is collected at the base of the chute. We believe that a fire should be given the least possible opportunity to spread. The additionally recommended sprinkler heads allow one less floor to be exposed to fire when the alternate count leaves the bottom intake unprotected by a sprinkler head.

It is important to note, too, that the odorous muck and mung that builds up on the inside of a rubbish chute ... which includes cooking fats and oils ... is flammable. We have literally scraped this buildup off the inside of a chute, ignited it with a lighter, and watched it burn like a candle.

The addition of sprinkler heads on chutes that extend several stories below the lowest intake protects against the buildup igniting several floors below the lowest chute sprinkler level without control. This is particularly important when you consider that the buildup of steam pressure can be significant once the first sprinkler head is activated. That pressure can contribute to spreading the fire beyond the chute in the event that the pressure is sufficient to blow a poorly maintained intake door open, thereby exposing theretofore uninvolved floor(s) to the spread of fire

Cost Impact: The code change proposal will not increase construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: REPIC-F1-903.2.11.2.DOC

F78–09/10
903.3.1 (IBC [F] 903.3.1)

Proponent: Robert J Davidson, Code Consultant/Alan Shuman, President, representing the National Association of State Fire Marshals (NASFM)

Revise as follows:

903.3.1 (IBC [F] 903.3.1) Standards. Sprinkler systems shall be designed and installed in accordance with Section 903.3.1.1, 903.3.1.2 or 903.3.1.3 and Chapters 23 and 34 of this code, as applicable.

Reason: Both chapters 23 and 34 of the *International Fire Code* have extensive design requirements for automatic sprinklers systems that need to be applied. This added language is to serve as a pointer to those two chapters to provide needed direction to designers and code officials.

Cost Impact: The code change proposal will not increase the cost of construction.

	Assembly:	ASF	AMF	DF

ICCFILENAME: DAVIDSON-SHUMAN-F16-903.3.1.DOC

F79–09/10
903.3.1.1, 903.3.1.2 (New) [IBC [F] 903.3.1.1, [F] 903.3.1.2 (New)]

Proponent: Marshall Klein, PE, Marshall A. Klein & Associates Inc., representing National Multi Housing Council (NMHC)

1. Revise as follows:

[F] 903.3.1.1 (IBC [F] 903.3.1.1) NFPA 13 sprinkler systems. Where the provisions of this code require that a building or portion thereof be equipped throughout with an automatic sprinkler system in accordance with this section, sprinklers shall be installed throughout in accordance with NFPA 13 except as provided in Sections 903.3.1.1 and 903.3.1.2.

2. Add new text as follows:

903.3.1.2 (IBC [F] 903.3.1.2) Bathrooms. In Group R occupancies, other than Group R residential care facilities, sprinklers shall not be required in bathrooms that do not exceed 55 square feet in area and are located within individual dwelling units or sleeping units.

Reason: In the 1976 edition of the Life Safety Code, to encourage sprinklers in apartment buildings, NFPA 101 Section 11-3.8.3.4.1 Exception permitted bathrooms that did not exceed 55 sq. ft within individual dwelling units to omit sprinklers when the apartment building was sprinklered in accordance with NFPA 13. In the 1991 edition of NFPA 13, this exception was added to that Code (Section 4-4.1.7.7.1) with the understanding that the NFPA 101 codes's next edition in 1994 could then delete the exception since it was placed in the sprinkler code. In the 1994 edition of NFPA 101, the sprinkler exception was removed from Section 18-3.5 Exception because NFPA 13 picked it up.

The history of apartment unit bathroom fires is minuscule. Even according to the latest NFPA Home Structure Fire Report, January 2009, Table 9B, "Reported Apartment Structure Fires by Area of Origin 2003-2006 Annual Averages", out of 113,000 fires/year, only 1600 (1%) are in bathrooms. In comparison, according to the NFPA US Hotel & Motel Structure Fire Report, March 2008, Table 8, "Structure Fires in Hotels & Motels by Area of Origin 2002-2005 Annual Averages", out of 3900 fires/year, only 130 (3%) are in "Lavatory, bathroom, locker room or check room". The upshot is that bathroom fires in apartments, hotels or motels are not a major fire problem in sprinklered or non-sprinklered buildings and that is why the past NFPA Codes and the Model Building Codes (including the I Codes) have exempted small bathrooms from sprinklers in order to encourage these residential occupancies to be sprinklered for life safety/fire protection.

However, now in the 2009 edition of NFPA 13, that will be referenced in the 2012 I Codes, Section 8.15.8.1.1 has been revised to permit omission of sprinklers ***only*** in bathrooms in hotel/motel dwelling units. The code proposal to the 2009 NFPA 13 was first rejected by the NFPA 13 Committee during its ROP period (Code Proposal 13-202 Log #79) with the Committee Statement for rejection as "No technical data was provided supporting this change". But during the ROC period, a public comment (Comment 13-141 Log #235) was submitted by the National Fire Sprinkler Association (NFSA), and the NFPA 13 Committee accepted the Comment based not on any technical data supporting the change, but on the following substantiation:

"Substantiation for NFPA 13 Public Comment 13-141: As a rule, the traditional bathroom has changed in fire loading. Storage of combustibles in these rooms is now very common and the use of high wattage electrical devices has gained widespread acceptance. From unattended curling irons and candles to exhaust fans with exposed heating elements, there are many new sources for potential fires in today's bathrooms. The exception to this new trend would generally be the bathroom in a hotel or motel room that maintains a minimal combustible loading due to the transient nature of the occupancy. As the original submitter pointed out, the Committee has recognized this when discussing closets in these occupancies. Therefore, the sprinklers in smaller bathrooms in hotels and motels should still be permitted to be omitted. This comment created by the NFSA Engineering and Standards Committee."

Out of the 25 voting members of the NFPA 13 Committee, the 2 members that voted to reject the change and their comments were:
BAHADORI, H. (representing Hughes Associates): "This will remove the exception for all apartments and condominium buildings. No substantiation has been provided to justify this."
KEEPING, L.(representing Canadian Automatic Sprinkler Association): "I do not believe that this material should have been accepted. Prior to the 1991 edition of NFPA 13, sprinklers were only allowed to be omitted from the washrooms in hotels, but for that edition, the allowance was opened up to all dwelling units as long as they were no larger than 55 sq. ft. and enclosed within a 15 minute thermal barrier. At that time adequate technical substantiation was offered to validate the change. Since that time, no adverse fire losses have been brought to the Committee's attention that would support this backward step. Further the conditions inside the bathrooms of today are no different from those that were found in 1991, so the current submitter's substantiation is not convincing."

If apartment bathrooms are so hazardous to the occupants' safety, wouldn't one think that in the past 33 years the fire data would have reflected this major deficiency created by the NFPA 101 Subcommittee on Residential Occupancies back in 1976? Why is the multi-family industry, that has been one of the biggest supporters of residential sprinkler systems for the past 20 years, and has the ***best*** sprinkler performance records of **all** occupancy groups (From 2005 NFPA Fire Data On Sprinkler Reliability: 98% operational reliability x 98% effectiveness of sprinklers = 96% performance reliability for apartments) being singled out to provide additional sprinklers where there is no fire problem?

In summary, since the NFPA 13 Committee removed this apartment bathroom sprinkler exception from its sprinkler standard without any adequate reason that such an exception has been, or will be, a life safety/fire protection problem, it is only reasonable for the I Codes to place the exception back into its Codes to continue to encourage sprinkler installations in new, as well as existing, buildings.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: KLEIN-F2-903.1.1.1

F80–09/10
903.3.1.1.1 (IBC [F] 903.3.1.1.1)

Proponent: Dave Frable, U.S. General Services Administration

Revise as follows:

903.3.1.1.1 (IBC [F] 903.3.1.1.1) Exempt locations. Automatic sprinklers shall not be required in the following rooms or areas where such rooms or areas are protected with an approved automatic fire detection system in accordance with Section 907.2 that will respond to visible or invisible particles of combustion. Sprinklers shall not be omitted from any room merely because it is damp, of fire-resistance rated construction or contains electrical equipment.

1. Any room where the application of water, or flame and water, constitutes a serious life or fire hazard.
2. Any room or space where sprinklers are considered undesirable because of the nature of the contents, when approved by the fire code official.
3. Generator and transformer rooms separated from the remainder of the building by walls and floor/ceiling or roof/ceiling assemblies having a fire-resistance rating of not less than 2 hours.
4. Rooms or areas that are of noncombustible construction with wholly noncombustible contents.
5. Fire service access elevators machine rooms and machinery spaces.
6. Machine rooms and machinery spaces associated with occupant evacuation elevators designed in accordance with Section 3008 of the *International Building Code*.

Reason: The intent of this code change is to permit automatic sprinkler protection to be exempt in machine rooms and machinery spaces for occupant evacuation elevators. The proposal also provides consistency with the current requirements in Section 3008.6.1 of the IBC.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D

F81–09/10
903.3.1.1.2 (New) [IBC [F] 903.3.1.1.2 (New)]

Proponent: Jeff Hugo, CBO, National Fire Sprinkler Association

Add new text as follows:

903.3.1.1.2 (IBC [F] 903.3.1.1.2) Sprinkler omissions Automatic sprinklers shall not be required to be installed in locations where NFPA 13 permits sprinklers to be omitted. The building shall still be considered equipped throughout.

Reason: The IBC requires that buildings using sprinklers for height/area increases and trade-offs (exceptions) to be sprinklered throughout. NFPA 13 also requires that the structure be sprinklered throughout (Section 8.1.1), unless specifically exempted by the standard. These areas that do not require sprinklers are commonly found in Chapter 8 of NFPA 13, and with these excepted areas, the building is still considered by the standard to be sprinklered throughout, which would comply with the requirements of the IBC.

One of the most common misinterpretations seen are canopies, exterior roofs and porte-cocheres being considered as a part of the main portion of the structure and therefore are being required to be sprinklered. The 2007 NFPA 13 clearly defines when sprinklers are required under the exterior roofs, canopies and porte-cocheres.

NFPA 13 (Section 8.15.7) is very specific on the sprinklering requirements in these appendages. All canopies, exterior roofs and porte-cocheres over 4' in width are required to be sprinklered unless:

- The canopy, roof, or porte-cochere is constructed with non-combustible, limited combustible, or fire retardant treated wood. (all fire retardant treated wood shall comply with NFPA 703)
- The underside (ceiling/eaves) of the canopy, roof, and porte-cochere of combustible construction provided the exposed finish material on the roof, canopy, or porte-cochere is non-combustible, limited combustible, or fire retardant treated wood, and the combustible concealed spaces (attic) is sprinklered, unless:
- The combustible concealed space is filled entirely with noncombustible insulation, or
- Ceilings that are noncombustible or limited combustible connected directly to joists with joist spaces not - exceeding 160 cubic feet, or
- If concealed spaces do not exceed 55 square feet in area.

Cost Impact: The code change proposal will not increase the cost of construction.

	Assembly:	ASF	AMF	DF

ICCFILENAME: HUGO-F3-903.3.1.1.2.DOC

F82–09/10
903.3.1.2.1 (New) [IBC [F] 903.3.1.2.1 (New)]

Proponent: Jeff Hugo, CBO, National Fire Sprinkler Association

Add new text as follows:

903.3.1.2.1 (IBC [F] 903.3.1.2.1) Sprinkler omissions Automatic sprinklers shall not be required to be installed in locations where NFPA 13R permits sprinklers to be omitted, except as specified by Section 903.3.1.2.2. The building shall still be considered equipped throughout.

(Renumber subsequent section)

Reason: The IBC requires that buildings using sprinklers for height increases and trade-offs (exceptions) to be sprinklered throughout. NFPA 13R also requires that the structure be sprinklered throughout, unless specifically exempted or not mentioned by the standard.

One of the most common misinterpretations seen are canopies, exterior roofs and porte-cocheres being considered as a part of the main portion of the structure and therefore are being required to be sprinklered. The 2007 NFPA 13 clearly defines when sprinklers are required under the exterior roofs, canopies and porte-cocheres.

This change would not affect balcony and deck requirement already in place in the IBC.

Cost Impact: The code change proposal will not increase the cost of construction.

	Assembly:	ASF	AMF	DF

ICCFILENAME: HUGO-F4-903.3.1.2.1.DOC

F83–09/10
903.3.5.2 (IBC [F] 903.3.5.2)

Proponent: Phillip A. Brown, American Fire Sprinkler Association

Revise as follows:

903.3.5.2 (IBC [F] 903.3.5.2) Secondary water supply. ~~A~~ An automatic secondary on-site water supply equal to the hydraulically calculated sprinkler demand, including the hose stream requirement, shall be provided for high-rise buildings in Seismic Design Category C, D, E or F as determined by the *International Building Code*. An additional fire pump is not required. The secondary water supply shall have a duration of not less than 30 minutes as determined by the occupancy hazard classification in accordance with NFPA 13.

Exception: Existing buildings.

Reason: A statement needs to be added to this section clarifying that the secondary water supply must be automatic and cannot be from a source that has to be manually activated. The Commentary clarification that an additional fire pump is not required should also be brought forward into this section.

Cost Impact: The code change proposal will increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: BROWNP-F1-903.3.5.2.DOC

F84–09/10
903.4 (IBC [F] 903.4)

Proponent: Roland J. Huggins, PE, American Fire Sprinkler Association, representing self

Revise as follows:

903.4 (IBC [F] 903.4) Sprinkler system supervision and alarms. All valves controlling the water supply for *automatic sprinkler systems*, pumps, tanks, water levels and temperatures, critical air pressures and water-flow switches on all sprinkler systems shall be electrically supervised by a *listed* fire alarm control unit.

Exceptions:

1. *Automatic sprinkler systems* protecting ~~one- and two-family *dwellings*~~ installed in accordance with NFPA 13D.
2. Limited area systems serving fewer than 20 sprinklers.
3. *Automatic sprinkler systems* installed in accordance with NFPA 13R where a common supply main is used to supply both domestic water and the *automatic sprinkler system*, and a separate shutoff valve for the *automatic sprinkler system* is not provided.
4. Jockey pump control valves that are sealed or locked in the open position.
5. Control valves to commercial kitchen hoods, paint spray booths or dip tanks that are sealed or locked in the open position.
6. Valves controlling the fuel supply to fire pump engines that are sealed or locked in the open position.
7. Trim valves to pressure switches in dry, preaction and deluge sprinkler systems that are sealed or locked in the open position.

Reason: This requirement should be predicated upon the type of installed system instead of naming the facility it is installed in. This change also avoids the lack of coordination for changes to other sections, such as the addition of townhouses to Section 903.3.1.3 last cycle. This format follows that used Section 903.4, exception 3.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: HUGGINS-F2-903.4.DOC

F85–09/10
903.4.2 (IBC [F] 903.4.2)

Proponent: Michael Perrino, Code Consultants, Inc.

Revise as follows:

903.4.2 (IBC [F] 903.4.2) Alarms. An *approved* audible devices , located on the exterior of the building in an approved location, shall be connected to every each automatic sprinkler system. Such sprinkler water-flow alarm devices shall be activated by water flow equivalent to the flow of a single sprinkler of the smallest orifice size installed in the system. Alarm devices shall be provided on the exterior of the building in an *approved* location. Where a fire alarm system is installed, actuation of the *automatic sprinkler system* shall actuate the building fire alarm system.

Reason: Current language can be misinterpreted to require audible devices throughout a building. This language makes it clear from the beginning of the section that the audible devices required by this section are only required on the exterior of a building.

Cost Impact: The code change proposal will decrease the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: PERRINO-F1-903.4.2.DOC

F86–09/10
903.4.2 (IBC [F] 903.4.2)

Proponent: Robert J Davidson, Code Consultant/Alan Shuman, President, representing the National Association of State Fire Marshals (NASFM)

Revise as follows:

903.4.2 Alarms. *Approved* audible audio and visual devices shall be connected to every *automatic sprinkler system*. Such sprinkler water-flow alarm devices shall be activated by water flow equivalent to the flow of a single sprinkler of the smallest orifice size installed in the system. Alarm devices shall be provided on the exterior of the building in an *approved* location. Where a fire alarm system is installed, actuation of the *automatic sprinkler system* shall actuate the building fire alarm system.

Reason: This would aid the fire service in their response to alarms by providing an outside horn strobe device. In areas with a large number of buildings that sound waves can bounce off of it is sometimes difficult to readily locate where the original sound is emanating from. Combining a visual device with the audible device will assist in quicker location identification.

An additional advantage would be that the fire code official could then require this device to be placed above the fire department connection as the "approved location" and this could then aid responding apparatus in locating the FDC especially at night or if the fire department connection is obstructed for any reason.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: DAVIDSON-SHUMAN-F12-903.4.2.DOC

F87–09/10
904.1.1 (New) [IBC [F] 904.1.1 (New)]

Proponent: Tom Lariviere, Chairman, Joint Fire Service Review Committee

Add new text as follows:

904.1.1 (IBC [F] 904.1.1) Certification of service personnel for fire extinguishing equipment. Service personnel providing or conducting maintenance on *automatic fire extinguishing systems*, other than *automatic sprinkler systems*, shall possess a valid Certificate issued by an *approved* third party certification organization, an *approved* governmental agency, or other *approved* organization for the type of system and work performed.

Reason: This proposal will allow the code official to specify a minimum level of qualifications for servicing fire extinguishing systems. Ensuring technicians are qualified will enable communities to stay in compliance with the latest code regulations for fire extinguishing systems.

This proposal allows several options for the code official. The code official could choose to accept certification from a third party organization, a governmental agency, or any other organization. Formal certification for automatic fire extinguishing system technicians provides a mechanism for the technicians to demonstrate their knowledge of codes, standards, and related practices. The code official only needs to ascertain that the service technician has the proper certification.

Third party certification programs must meet a minimum acceptable standard that ensures a proper examination preparation. Certification programs provide a mechanism for fire code officials to use to evaluate individuals for the necessary knowledge. Certification programs from third party certification agencies should comply with Regulations and National Standards, such as:

- Uniform Guidelines on Employee Selection Procedures
- US Equal Employment Opportunity Commission (EEOC)
- Standards for Educational & Psychological Testing
- National Council on Measurement in Education (NCME)
- American Educational Research Association (AERA)
- American Psychological Association (APA)

Certification by governmental agency quite often is a certificate issued by a state agency. Similar to third party certifications, governmental certification must be specific to the type of work to be performed.

Certification by other organizations could consist of manufacturer training and certification programs. These certifications typically are only valid for the products from the specific manufacturer.

The code official has the option to determine which certification methods are acceptable, or even if multiple certifications are necessary. Requiring certified technicians helps protect public safety and promotes professionalism and expertise and helps ensure the competency of those individuals involved in the service industry.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: LARIVIERE-F12-904.1.1.DOC

F88–09/10
904.3.2 (IBC [F] 904.3.2)

Proponent: Jim Tidwell, Tidwell Code Consulting, representing Fire Equipment Manufacturers Association

Revise as follows:

904.3.2 (IBC [F] 904.3.2) Actuation. Automatic fire-extinguishing systems shall be automatically activated and provided with a manual means of activation in accordance with Section 904.11.1. Where more than one hazard could be simultaneously involved in fire due to their proximity, all hazards shall be protected by a single system designed to protect all hazards that could become involved.

Exception: Multiple systems may be installed if they are designed to operate simultaneously.

Reason: To clarify that all hazards must be appropriately protected. Allowing separate systems with differing activation mechanisms presents a significant potential for fire propagation beyond the capability of the fire protection systems. A likely scenario would be that a fire occurs in one area, and spreads to an adjacent hazard before the fire protection system activates; then, after the system has exhausted all of its supply of chemical, the adjacent fire reignites the original hazard, which is no longer protected. This requirement is consistent with NFPA 17 and 17-A. This change is for clarification only.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: TIDWELL-F1-904.3.2.DOC

F89–09/10
904.5.1 (New)

Proponent: Mark Conroy, Brooks Equipment Company

Add new text as follows:

904.5.1 Technician qualifications. A service technician who performs maintenance on a wet-chemical extinguishing system shall comply with the qualification requirements of NFPA 17A.

(Renumber subsequent sections)

Reason: NFPA 17A requires certification of technicians that perform maintenance on wet chemical extinguishing systems in section 7.3. It is therefore reasonable and appropriate to reference NFPA 17A for qualification requirements for service technicians performing maintenance of these systems.

Some states have licensing programs that include a qualification test. This code change proposal allows these programs to continue, but mandates technician certification where licensing is not required.

Where licensing programs have not been developed, fire code officials are the best suited to determine appropriateness of testing programs based on test content and competitive pricing that is considered fair and reasonable at the local level.

Standardized test programs are the basis for certification. The tests are based on information available in the public domain and as a minimum include questions on the industry standard, NFPA 17A, Standard for Wet Chemical Extinguishing Systems. Where states do not have licensing programs with qualification tests, these certification programs can be used to fulfill this code change proposal for qualification of personnel servicing wet chemical extinguishing systems.

This code change proposal allows the fire code official to make the final determination of suitability based on testing programs that set a benchmark that is considered achievable, affordable, and reasonable.

Cost Impact: The cost of certification could be as high as $180 per technician. Some programs mandate periodic payments to maintain a certificate. The cost of certification could be passed along to the building owner in the form of higher fees for installing and servicing these systems. Therefore, this code change proposal could potentially increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: CONROY-F2-904.5.1

F90–09/10
904.6.1 (New)

Proponent: Mark Conroy, Brooks Equipment Company

Add new text as follows:

904.6.1 Technician qualifications. A service technician who performs maintenance on a dry extinguishing system shall comply with the qualification requirements of NFPA 17.

(Renumber subsequent sections)

Reason: NFPA 17 (2009) requires certification of technicians that perform maintenance on dry chemical extinguishing systems in section 11.1. It is therefore reasonable and appropriate to reference NFPA 17 for qualification requirements for service technicians performing maintenance of these systems.

Some states have licensing programs that include a qualification test. This code change proposal allows these programs to continue, but mandates technician certification where licensing is not required.

Where licensing programs have not been developed, fire code officials are the best suited to determine appropriateness of testing programs based on test content and competitive pricing that is considered fair and reasonable at the local level.

Standardized test programs are the basis for certification. The tests are based on information available in the public domain and as a minimum include questions on the industry standard, NFPA 17, Standard for Dry Chemical Extinguishing Systems. Where states do not have licensing programs with qualification tests, these certification programs can be used to fulfill this code change proposal for qualification of personnel servicing dry chemical extinguishing systems.

This code change proposal allows the fire code official to make the final determination of suitability based on testing programs that set a benchmark that is considered achievable, affordable, and reasonable.

Cost Impact: The code change proposal could potentially increase the cost of construction. The cost of certification could be as high as $180 per technician. Some programs mandate periodic payments to maintain a certificate. ICCFILENAME: CONROY-F3-904.6.1 (NEW)

F91–09/10
905.3.2 (IBC [F] 905.3.2)

Proponent: Tom Lariviere, Chairman, Joint Fire Service Review Committee

Delete without substitution:

~~**905.3.2 (IBC [F] 905.3.2) Group A.** Class I automatic wet standpipes shall be provided in nonsprinklered Group A buildings having an *occupant load* exceeding 1,000 *persons*.~~

~~**Exceptions:**~~

~~1. Open-air-seating spaces without enclosed spaces.~~
~~2. Class I automatic dry and semiautomatic dry standpipes or manual wet standpipes are allowed in buildings where the highest floor surface used for human occupancy is 75 feet (22 860 mm) or less above the lowest level of fire department vehicle access.~~

(Renumber subsequent sections)

Reason: The current code language requires that a standpipe system be installed in new Group A occupancies with an occupant load over 1,000 and that are not sprinklered. Groups A-1, A-3 and A-4 require sprinklers at an occupant load of 300; Group A-2 requires sprinklers at an occupant load of 100. Which leaves Group A-5 with no occupant load requirement, but it would be exempted based on Exception 1 of Section 905.3.2.

Therefore, a Group A occupancy with an occupant load over 1,000 persons is not permitted to be unsprinklered. As a result, this requirement will never be applicable.

Therefore, this section is proposed to be deleted.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: LARIVIERE-F13-905.3.2.DOC

F92–09/10
905.3.6 (IBC [F] 905.3.6), 1107.5

Proponent: Tom Lariviere, Chairman, Joint Fire Service Review Committee

Revise as follows:

905.3.6 (IBC [F] 905.3.6) Helistops and heliports. Buildings with a *helistop* or *heliport* ~~that are equipped with a standpipe shall extend the~~ shall be provided with a Class I or III standpipe system extended to the roof level on which the *helistop* or *heliport* is located in accordance with Section 1107.5.

1107.5 Standpipe systems. ~~Where a~~ A building with a rooftop *helistop* or *heliport* ~~is equipped~~ shall be provided with a Class I or III standpipe system~~, the system shall be~~ extended to the roof level on which the helistop or heliport is located. All portions of the *helistop* and *heliport* area shall be within 150 feet (45 720 mm) of a $2^1/_2$-inch (63.5 mm) outlet on ~~a Class I or III~~ the standpipe system.

Reason: Currently, Section 905.3.6 and 1107.5 require a standpipe connection to serve a heliport IF the building has a standpipe system. The hazard is not related to the existence of the standpipe system. The hazard is the existence of the helistop or heliport.

A heliport is a distinct hazard that will involve flammable fuels. In the event of an emergency, rapid deployment of hand hose lines will be necessary to attack a resulting fire, effectuate rescue and to protect exposures and the remainder of the building. This proposal will specify that when a helistop or heliport is provided on a rooftop location, then a standpipe system is required.

The requirement will be for a standpipe system throughout the building, not just a connection at the roof level. This is critical in firefighting operations because many times the connection below the rooftop level may be needed just to gain access onto the roof. If the only connection is on the roof, it is of no use if the firefighters cannot get to it.

Additionally, a heliport includes fueling operations. It is entirely possible for a spill to not only affect the rooftop, but also floors below as the liquid fuel spreads. The standpipe system will again be utilized in these situations.

Cost Impact: The code change proposal will increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

F93–09/10
905.4 (IBC [F] 905.4)

Proponent: Marshall Klein, PE, Marshall A. Klein & Associates Inc.

Revise as follows:

905.4 (IBC [F] 905.4) Location of Class I standpipe hose connections. Class I standpipe hose connections shall be provided in all of the following locations:

1. In every required *stairway*, a hose connection shall be provided for each floor level above or below grade. Hose connections shall be located at an intermediate floor level landing between floors, unless otherwise *approved* by the *fire code official*.
2. On each side of the wall adjacent to the *exit* opening of a horizontal *exit*.

   Exception: Where floor areas adjacent to a horizontal *exit* are reachable from *exit stairway* hose connections by a 30-foot (9144 mm) hose stream from a nozzle attached to 100 feet (30 480 mm) of hose, a hose connection shall not be required at the horizontal *exit*.

3. In every *exit* passageway, at the entrance from the exit passageway to other areas of a building.

   Exception: Where floor areas adjacent to an exit passageway are reachable from *exit stairway* hose connections by a 30-foot (9144 mm) hose stream from a nozzle attached to 100 feet (30 480 mm) of hose, a hose connection shall not be required at the entrance from the exit passageway to other areas of the building.

4. In covered mall buildings, adjacent to each exterior public entrance to the mall and adjacent to each entrance from an *exit* passageway or *exit corridor* to the mall.
5. Where the roof has a slope less than four units vertical in 12 units horizontal (33.3-percent slope), ~~each standpipe shall be provided with~~ a hose connection shall be located to serve ~~either on~~ the roof or at the highest landing of a stairway with stair access to the roof provided in accordance with Section 1009.13. ~~An additional hose connection shall be provided at the top of the most hydraulically remote standpipe for testing purposes.~~
6. Where the most remote portion of a nonsprinklered floor or story is more than 150 feet (45 720 mm) from a hose connection or the most remote portion of a sprinklered floor or story is more than 200 feet (60 960 mm) from a hose connection, the *fire code official* is authorized to require that additional hose connections be provided in *approved* locations.

Reason: Back during the 1999 ICC Code Cycle, Code Proposal F370-99 (which is now the existing wording in IBC/IFC Section 905.4) was approved as submitted to correlate the standpipe hose connection locations with NFPA 14.

The 2012 I Codes will reference the 2010 edition of NFPA 14 under IBC/IFC Section 905.2 This code proposal is correlating IBC/IFC hose connection requirements with the latest revisions for the location of hose connection in the 2010 edition of NFPA 14 Section 7.3.2.

The existing wording of the first sentence in Item #5 requires a hose connection at every roof location (where the roof has less than a 1 in 4 slope) above all stairways, whether or not such stairways actually have access to the roof. Since IBC/IFC Section 1009.13 does not require all stairways to have access to the roof, if additional hose connections are then placed on the roof from stairways that do not extend to the roof, such hose connections are not only a large initial expense, but also a long term maintenance expense (freezing issues). These additional roof hose connections are really not needed from a system testing or fire-fighting purpose. For fighting a roof fire, fire fighters would only hook up to a hose connection from a "protected enclosure" and enter the fire area on the roof with a charged hose line, not first go onto the roof that is on fire and then hook up to an unprotected roof hose connection. For flow/pressure standpipe testing purposes you only need one hose connection.

The ROP and ROC stages of the 2010 edition of NFPA 14 have been completed and NFPA 14 Committee Code Proposals 14-53 and 14-55 were accepted without any public comments submitted on them. Therefore, the code revisions to IBC/IFC Section 905.4(5) in this code proposal will correlate with NFPA 14.

The NFPA 14 Committee Code Proposal 14-53 added to A.7.3.2 the following sentence: "Only one standpipe is necessary to serve the roof, it is not the intent to extend each standpipe to the roof level." The substantiation by the NFPA 14 Committee was: "Clarifies the requirement for standpipes on building roofs." Therefore, the first sentence in Section 905.4(5) has been revised to correlate with NFPA 14 hose connection requirement for serving the roof.

The NFPA 14 Committee Code Proposal 14-55 deleted NFPA 14 Section 7.3.2.2 which read: "7.3.2.2 An additional 2½ in. (65 mm) hose connection shall be provided at the hydraulically most remote portion of the system to facilitate testing." The substantiation by the NFPA 14 Committee to delete this section was: "It is not the intent of the committee to require the second hose valve for testing. The topmost outlet and the outlet on the next floor below can be used for testing purposes. This better reflects the calculation requirement in Chapter 7." Therefore, the section sentence in Section 905.4(5) has been deleted to correlate with NFPA 14's deletion of this additional hose connection that is not needed to properly test the standpipe system.

The addition of the reference to IBC/IFC Section 1009.13, "Stairway to roof", in Section 905.4(5) is for user friendliness and correlation purposes with a related section of the Codes

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: KLEIN-F3-905.4

F94–09/10
906.1 (IBC [F] 906.1)

Proponent: Robert J Davidson, Code Consultant/Alan Shuman, President, representing the National Association of State Fire Marshals (NASFM)

Revise as follows:

906.1 (IBC [F] 906.1) Where required. Portable fire extinguishers shall be installed in the following locations.

1. In new and existing Group A, B, E, F, H, I , M, R-1, R-2, R-4 and S occupancies.

   ~~**Exception:** In new and existing Group A, B and E occupancies equipped throughout with quick response sprinklers, portable fire extinguishers shall be required only in locations specified in Items 2 through 6.~~

2. Within 30 feet (9144 mm) of commercial cooking equipment.
3. In areas where flammable or *combustible liquids* are stored, used or dispensed.
4. On each floor of structures under construction, except Group R-3 occupancies, in accordance with Section 1415.1.
5. Where required by the sections indicated in Table 906.1.
6. Special-hazard areas, including but not limited to laboratories, computer rooms and generator rooms, where required by the *fire code official*.

Reason: Fire extinguishers have historically been the first line of defense for small, controllable fires. They are intended to be used for fires of limited size and easily controlled. If a fire is discovered in its early stages the most effective means of protecting life and preventing property loss is to sound an alarm and then to control and/or extinguish the incipient stage fire with a portable fire extinguisher. To simply wait for the fire to grow to size large enough for a sprinkler head to activate is contrary to lessons and guidance from the fire service and fire protection professionals. Since fire extinguishers provide a first line of defense vs. sprinklers, it remains unclear as to the justification for this exception .In that light, the Exception 1 to Section 906.1 should be deleted.

This exception was not in the original draft of the International Fire Code and it did not exist in any of the legacy fire codes. It currently does not exist in NFPA 1 Uniform Fire Code, NFPA 10 Standard for Portable Fire Extinguishers or NFPA 5000 Building Construction and Safety Code. It first appeared in the Final Draft of the 2000 editions of the IFC/IBC. Since the first publication of the International Fire Code, some fire service and fire protection professionals have expressed concern over the inclusion of an exception.

As a result a number of states have deleted the exception upon adoption of the IFC/IBC.

- 12 States plus Washington D.C. and New York City have Deleted Line 1 Exception.
- 2 States have amended Section 906.1 and the exception to require more extinguishers
- 2 States use both NFPA 1 and the IFC with more stringent code applicable.
- 17 additional States have adopted NFPA 1 as their fire code instead of the IFC.

A total of 33 State jurisdictions and an unknown number of local jurisdictions have chosen to delete the exception in favor of providing the ability to control a fire at its earliest stages.

There are other issues with this exception that have arisen since states have now been adopting the IFC and enforcing it within their state. Some examples are:

- The exception is not being interpreted correctly and as a result is not being limited to occupancies with “QUICK RESPONSE” sprinklers installed. Instead, it is being applied in all cases where “REGULAR” sprinklers are installed.
- When an occupancy is being renovated and the sprinkler system is updated, presently installed extinguishers are being removed, lessening the level of protection available.
- Fire code officials do not all see hazard areas the same and as a result Section 906.1, Item 6 is not consistently applied jurisdiction to jurisdiction.
- Some officials are exempting all extinguishers from being required thereby placing the occupants in danger at the time of a fire.

An added detriment is that if a building is occupied without fire extinguishers the ability of the building owner to properly and effectively place fire extinguishers is negatively impacted by the practical difficulty of installing fire extinguisher cabinets. Walls may not be thick enough for recessing the cabinets to keep the fire extinguishers from being obstructions to travel or from being hit and damaged themselves. If the walls and partitions can handle the recessed cabinets, design drawings and permits may be required to modify the walls and partitions.

This proposal will eliminate the exception and provide for the proper placement of an important firefighting tool.

Cost Impact: The code change proposal will cause a cost increase in new construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: DAVIDSON-SHUMAN-F8-906.1.DOC

F95–09/10
906.1 (IBC [F] 906.1)

Proponent: Steven Orlowski, National Association of Home Builders

Revise as follows:

906.1 (IBC [F] 906.1) Where required. Portable fire extinguishers shall be installed in the following locations.

1. In new and existing Group A, B, E, F, H, I, M, R-1, R-2, R-4, and S Occupancies.

   Exception: In new and existing Group A, B, ~~and~~ E and R-2 occupancies equipped with quick response sprinklers, portable fire extinguishers shall be required only in locations specified in Items 2 through 6.

2. Within 30 feet (9144 mm) of commercial cooking equipment.
3. In areas where flammable or *combustible liquids* are stored, used, or dispensed.
4. On each floor of structures under construction, except R-3 occupancies, in accordance with Section 1415.1.
5. Where required by the sections indicated in Table 906.1.
6. Special-hazard areas, including but not limited to, laboratories, computer rooms and generator rooms where required by the *fire code official*.

Reason: Both the International Building Code and the International Fire Code specifically require that all new R occupancies, which are considered light hazard according to NFPA 13, are equipped with quick-response or residential type automatic sprinklers. In addition, NFPA 13 permits some R occupancies to install an automatic suppression system in accordance to NFPA 13 R, when the structure does not exceed 4 stories in height. The purpose for requiring the quick response heads in group A, B, E and R-2 occupancies is to lower the operating temperature for the suppression system to react during the incipient stage of a fire emergency. This provides additional time for the occupants to evacuate the structure and achieve the overall desire for the occupant to evacuate the structure rather than fight the fire and put themselves at unnecessary risk.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: ORLOWSKI-F1-906.1.DOC

F96–09/10
906.3 (New) [IBC [F] 906.3 (New)]

Proponent: Tom Lariviere, Chairman, Joint Fire Service Review Committee

Add new text as follows:

906.3 (IBC [F] 906.3) Certification of service personnel. Service personnel providing or conducting maintenance shall possess a valid Certificate issued by an *approved* third party certification organization, an *approved* governmental agency, or other *approved* organizations for the type of work performed.

(Renumber subsequent sections)

Reason: This proposal will allow the code official to specify a minimum level of qualifications for servicing portable fire extinguishers. Ensuring technicians are qualified will enable communities to stay in compliance with the latest code regulations for portable fire extinguishers.

This proposal allows several options for the code official. The code official could choose to accept certification from a third party organization, a governmental agency, or any other organization. Formal certification for portable fire extinguisher technicians provides a mechanism for the technicians to demonstrate their knowledge of codes, standards, and related practices. The code official only needs to ascertain that the service technician has the proper certification.

Third party certification programs must meet a minimum acceptable standard that ensures a proper examination preparation. Certification programs provide a mechanism for fire code officials to use to evaluate individuals for the necessary knowledge. Certification programs from third party certification agencies should comply with Regulations and National Standards, such as:

- Uniform Guidelines on Employee Selection Procedures
- US Equal Employment Opportunity Commission (EEOC)
- Standards for Educational & Psychological Testing
- National Council on Measurement in Education (NCME)
- American Educational Research Association (AERA)
- American Psychological Association (APA)

Certification by governmental agency quite often is a certificate issued by a state agency. Similar to third party certifications, governmental certification must be specific to the type of work to be performed.

Certification by other organizations could consist of manufacturer training and certification programs. These certifications typically are only valid for the products from the specific manufacturer.

The code official has the option to determine which certification methods are acceptable, or even if multiple certifications are necessary. Requiring certified technicians helps protect public safety and promotes professionalism and expertise and helps ensure the competency of those individuals involved in the service industry.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: LARIVIERE-F15-906.3.DOC

F97–09/10
906.3 (New) [IBC [F] 906.3 (New)]

Proponent: Mark Conroy, Brooks Equipment Company

Add new text follows:

906.3 (IBC [F] 906.3) Technician qualifications. A service technician who performs maintenance and recharging of portable fire extinguishers shall comply with the technician qualification requirements of NFPA 10.

(Renumber subsequent sections)

Reason: NFPA 10 requires certification of technicians in section 7.1.2. It is therefore reasonable and appropriate to reference NFPA 10 for qualification requirements for service technicians performing maintenance and recharging of fire extinguishers.

Some states have licensing programs that include a qualification test. This code change proposal allows these programs to continue, but mandates technician certification where licensing is not required.

Where licensing programs have not been developed, fire code officials are the best suited to determine appropriateness of testing programs based on test content and competitive pricing that is considered fair and reasonable at the local level.

Standardized test programs are the basis for certification. The tests are based on information available in the public domain and as a minimum include questions on the industry standard, NFPA 10, Standard on Portable Fire Extinguishers. Where states do not have licensing programs with qualification tests, these certification programs can be used to fulfill this code change proposal for qualification of personnel servicing fire extinguishers.

This code change proposal allows the fire code official to make the final determination of suitability based on testing programs that set a benchmark that is considered achievable, affordable, and reasonable.

Cost Impact: The cost of certification could be as high as $180 per technician. Some programs mandate periodic payments to maintain a certificate. The cost of certification could be passed along to the building owner in the form of higher fees for installing and servicing extinguishers. Therefore, this code change proposal could potentially increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: CONROY-F1-906.3 (NEW)

F98–09/10
907.1.1 (IBC [F] 907.1.1)

Proponent: Rick Sheets, Fire Committee Chair, Brinks Home Security, representing National Burglar and Fire Alarm Association

Revise as follows:

907.1.1 (IBC [F] 907.1.1) Construction documents. *Construction documents* for fire alarm systems shall be of sufficient clarity to indicate the location, nature and extent of the work proposed and show in detail that it will conform to the provisions of this code, the *International Building Code,* and relevant laws, ordinances, rules and regulations~~, as determined by the *fire code official*~~.

Reason: Rules and regulations are determined by law, not by an individual. This wording suggests that this is something that is intended to be "interpreted".

Administrative wording in chapter one states the duties and responsibilities of the code official, making this additional vague and incomplete language unnecessary.

IFC Section 106.4 *specifically* prohibits inspectors from dismissing provisions of adopted codes or ordinances.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: SHEETS-F14-907.1.1-PRIMARY.DOC

F99–09/10
907.1.1 (New) [IBC [F] 907.1.1 (New)]

Proponent: Rick Sheets, Fire Committee Chair, Brinks Home Security, representing National Burglar and Fire Alarm Association

Add new text as follows:

907.1.1 (IBC [F] 907.1.1) Non-required systems. Non-required systems shall be permitted to be installed and maintained in accordance with the applicable provisions of Sections 907.1 and 907.3 through 907.9.

(Renumber subsequent sections)

Reason: The problem is that due to misapplication or misinterpretation of these rules, often times voluntary non-required protection is being discouraged. If the code is satisfied with no protection for a particular Use Group, then only applicable requirements should be enforced for non-required systems that a building owner chooses to have installed. The person paying for the *extra* protection should be the person setting the level of protection. The extra protection must be installed properly but to be compatible with NFPA 72, 2007 5.5.2.3 "Non-Required Coverage", the amount or level of additional protection must be left up to the building owner.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: Note that if this code change proposal should be approved the IBC would reference Section 907.8 instead of 907.9.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: SHEETS-F4-907.1.1-B.DOC

F100–09/10
907.2.1 (IBC [F] 907.2.1)

Proponent: Gene Boecker, Code Consultants, Inc.

Revise as follows:

907.2.1 (IBC [F] 907.2.1) Group A. A manual fire alarm system that activates the occupant notification system in accordance with Section 907.6 shall be installed in Group A occupancies ~~having an~~ where the occupant load ~~of~~ due to the assembly occupancy is 300 or more. Group A occupancies not separated from one another in accordance with Section 707.3.9 of the *International Building Code* shall be considered as a single occupancy for the purposes of applying this section. Portions of Group E occupancies occupied for assembly purposes shall be provided with a fire alarm system as required for the Group E occupancy.

> **Exception:** Manual fire alarm boxes are not required where the building is equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1 and the occupant notification appliances will activate throughout the notification zones upon sprinkler water flow.

Reason: Section 508 of the IBC already addresses the extent of application for conditions where there are differing occupancy groups. The revised language recognizes that and makes reference back to that section of the code. There has been a question about how to apply the 300 occupants. If the 300 occupants are all in a single room, it is clear. However, it is not clear how the people in different parts of the building are combined to reach the threshold of 300.

For example: There are 150 assembly occupants in a small restaurant and another 200 occupants in another small restaurant in the same building, it is not clear from the code whether those people should be added together or not; and, if not, under what conditions. If the two restaurants are at opposite ends of a small strip retail center or on different floors of a small downtown building, the code will now be clear that the two areas must be separated using the mixed occupancy provisions if there are other occupancies between the two or by a fire barrier if the two restaurants adjoin one another.

The exception is unaffected by the proposal.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: BOECKER-F3-907.2.1.DOC

907.2.1 (IBC [F] 907.2.1), 907.2.2(IBC [F] 907.2.2), 907.2.3 (IBC [F] 907.2.3), 907.2.4 (IBC [F] 907.2.4), 907.2.7(IBC [F] 907.2.7), 907.2.9.1 (IBC [F] 907.2.9.1)

Proponent: Jeremy N. Mohler, CET, Rocky Mountain Consulting Engineers, Inc., representing self

Revise as follows:

907.2.1 (IBC [F] 907.2.1) Group A. A manual fire alarm system that activates the occupant notification system in accordance with Section 907.6 shall be installed in Group A occupancies having an occupant load of 300 or more. Portions of Group E occupancies occupied for assembly purposes shall be provided with a fire alarm system as required for the Group E occupancy.

~~**Exception:** Manual fire alarm boxes are not required where the building is equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1 and the occupant notification appliances will activate throughout the notification zones upon sprinkler water flow.~~

907.2.2 (IBC [F] 907.2.2) Group B. A manual fire alarm system shall be installed in Group B occupancies where one of the following conditions exists:

1. The combined Group B occupant load of all floors is 500 or more.
2. The Group B occupant load is more than 100 persons above or below the lowest level of exit discharge.
3. The Group Bfire area contains a Group B ambulatory health care facility.

~~**Exception:** Manual fire alarm boxes are not required where the building is equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1 and the occupant notification appliances will activate throughout the notification zones upon sprinkler water flow.~~

907.2.3 (IBC [F] 907.2.3) Group E.A manual fire alarm system that activates the occupant notification system in accordance with Section 907.6 shall be installed in Group E occupancies. When automatic sprinkler systems or smoke detectors are installed, such systems or detectors shall be connected to the building fire alarm system.

Exceptions:

1. A manual fire alarm system is not required in Group E occupancies with an occupant load of less than 50.
2. Manual fire alarm boxes are not required in Group E occupancies where all of the following apply:
   - 2.1. Interior corridors are protected by smoke detectors.
   - 2.2. Auditoriums, cafeterias, gymnasiums and similar areas are protected by heat detectors or other approved detection devices.
   - 2.3. Shops and laboratories involving dusts or vapors are protected by heat detectors or other approved detection devices.
   - 2.4. The capability to activate the evacuation signal from a central point is provided.
   - 2.5. In buildings where normally occupied spaces are provided with a two-way communication system between such spaces and a constantly attended receiving station from where a general evacuation alarm can be sounded, except in locations specifically designated by the fire code official.
3. ~~Manual fire alarm boxes shall not be required in Group E occupancies where the building is equipped throughout with an approved automatic sprinkler system installed in accordance with Section 903.3.1.1, the notification appliances will activate on sprinkler water flow and manual activation is provided from a normally occupied location.~~

907.2.4 (IBC [F] 907.2.4) Group F. A manual fire alarm system that activates the occupant notification system in accordance with Section 907.6 shall be installed in Group F occupancies where both of the following conditions exist:

1. The Group F occupancy is two or more stories in height; and
2. The Group F occupancy has a combined occupant load of 500 or more above or below the lowest level of exit discharge.

~~**Exception:** Manual fire alarm boxes are not required where the building is equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1 and the occupant notification appliances will activate throughout the notification zones upon sprinkler water flow.~~

907.2.7 (IBC [F] 907.2.7) Group M. A manual fire alarm system that activates the occupant notification system in accordance with Section 907.6 shall be installed in Group M occupancies where one of the following conditions exists:

1. The combined Group M occupant load of all floors is 500 or more persons.
2. The Group M occupant load is more than 100 persons above or below the lowest level of exit discharge.

Exceptions:

1. A manual fire alarm system is not required in covered mall buildings complying with Section 402 of the *International Building Code*.
2. ~~Manual fire alarm boxes are not required where the building is equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1 and the occupant notification appliances will automatically activate throughout the notification zones upon sprinkler water flow.~~

907.2.9.1 (IBC [F] 907.2.9.1) Manual fire alarm system. A manual fire alarm system that activates the occupant notification system in accordance with Section 907.6 shall be installed in Group R-2 occupancies where:

1. Any dwelling unit or sleeping unit is located three or more stories above the lowest level of exit discharge;
2. Any dwelling unit or sleeping unit is located more than one story below the highest level of exit discharge of exits serving the dwelling unit or sleeping unit; or
3. The building contains more than 16 dwelling units or sleeping units.

Exceptions:

1. A fire alarm system is not required in buildings not more than two stories in height where all dwelling units or sleeping units and contiguous attic and crawl spaces are separated from each other and public or common areas by at least 1-hour fire partitions and each dwelling unit or sleeping unit has an exit directly to a public way, exit court or yard.
2. ~~Manual fire alarm boxes are not required where the building is equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2 and the occupant notification appliances will automatically activate throughout the notification zones upon a sprinkler water flow.~~
3. ~~3.~~ 2. A fire alarm system is not required in buildings that do not have interior corridors serving dwelling units and are protected by an approved automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2, provided that dwelling units either have a means of egress door opening directly to an exterior exit access that leads directly to the exits or are served by open-ended corridors designed in accordance with Section 1026.6, Exception 4.

Reason: In these code sections a simple manual system is to be installed. These exceptions remove all human interface with the fire alarm system, and put the entire operation of the alarm system on a single, simple monitor module which monitors the water flow of the sprinkler system. Sprinkler systems are designed to be a fire suppression system, and not a fire extinguishing system which will allow for the accumulation of smoke throughout the building. If there is to be a voltage surge, a loose connection, conductors pulled from the monitor module for any reason, or if the fire originates within the sprinkler riser room demolishing the monitor module activating the fire alarm system, then the system would never alarm and occupants would not be notified of a life safety issue within the building. Most sprinkler heads are set to release at 150 degrees F or higher. A smoldering fire may not reach this temperature for minutes or, in some cases, hours but will produce a lot of smoke. In this case, human discovery of the fire will most likely precede the activation of a sprinkler head. Manual fire alarm pull stations have always been required and placed at most exits. People may stay within a burning building searching for a manual pull station to activate the fire alarm system, which may result in smoke inhalation and death of that person.

Cost Impact: The code change proposal will increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: MOHLER-F1-907.2.1

F102–09/10
907.2.1.1 (IBC [F] 907.2.1.1)

Proponent: Gene Boecker, Code Consultants, Inc., representing self

Revise as follows:

907.2.1.1 (IBC [F] 907.2.1.1) System initiation in Group A occupancies with an occupant load of 1,000 or more. Activation of the fire alarm in Group A occupancies ~~with an~~ where the occupant load ~~of~~ due to the assembly occupancy is 1,000 or more shall initiate a signal using an emergency voice/alarm communications system in accordance with Section 907.6.2.2. Group A occupancies not separated from one another in accordance with Section 707.3.9 of the *International Building* Code shall be considered as a single occupancy for the purposes of applying this section.

Exception: Where *approved*, the prerecorded announcement is allowed to be manually deactivated for a period of time, not to exceed 3 minutes, for the sole purpose of allowing a live voice announcement from an *approved*, constantly attended location.

Reason: Section 508 of the IBC already addresses the extent of application for conditions where there are differing occupancy groups. The revised language recognizes that and makes reference back to that section of the code. There has been a question about how to apply the 1,000 occupants. If the 1,000 occupants are all in a single room, it is clear. However, it is not clear how the people in different parts of the building are combined to reach the threshold of 1,000.

For example: There are 250 assembly occupants in a small restaurant at one end of a hotel and sports bar with an occupant load of 120 in a separate location. At the other end of the hotel is a conference center with an occupant load of 700. It is not clear from the code whether those people should be added together or not; and, if not, under what conditions. The code will now be clear that the areas must be separated using the mixed occupancy provisions if there are other occupancies between them or by a fire barrier if the areas adjoin one another.

The exception is unaffected by the proposal.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: BOECKER-F2-907.2.1.1.DOC

F103–09/10
907.2.1.1 (IBC [F] 907.2.1.1), 907.6.2.2.5 (New) [IBC [F] 907.5.2.2.5 (New)]

Proponent: Ed Roether, Populous (Formerly HOK Sport Venue Event), representing self

Revise as follows:

907.2.1.1 (IBC [F] 907.2.1.1) System initiation in Group A occupancies with an occupant load of 1,000 or more. Activation of the fire alarm in Group A occupancies with an *occupant load* of 1,000 or more shall initiate a signal using an emergency voice/alarm communications system in accordance with 907.6.2.2.

Exceptions:

1. Where approved, the prerecorded announcement is allowed to be manually deactivated for a period of time, not to exceed 3 minutes, for the sole purpose of allowing a live voice announcement from an approved, constantly attended location.
2. A public address system shall be permitted to serve as the emergency voice/alarm communication system when in compliance with Section 907.6.2.2.5.

907.6.2.2.5 (IBC [F] 907.5.2.2.5) Public address system. In Group A occupancies a public address system that is audible above the expected ambient noise level shall be permitted to serve as the emergency voice/alarm communication system. Prerecorded or live emergency voice announcements shall be from an approved location constantly attended by personnel trained to respond to an emergency.

Reason: Large assembly occupancies with large volume spaces, a large number of occupants and elevated sound levels present significant challenges in providing effective occupant notification by standard means in accordance with the NFPA 72, National Fire Alarm Code. This proposal provides an alternate approach to the NFPA 72 emergency voice alarm and communications system provisions for these unique occupancies while still maintaining those features that assure effective occupant notification in an emergency. Essentially, all recently constructed stadiums, arenas and grandstands have provided voice/alarm communication by their public address system since it provides the most effective occupant notification with intelligibility and audibility facets. These occupancies demand the routine operation of highly reliant, acoustically capable, and sufficiently

audible public address systems that can be relied upon to effect occupant evacuation, relocation, or both. NFPA 101 has historically allowed alternative occupant notification systems for these large seating areas that incorporate the public address system as conceptually comparable to a system in compliance with NFPA 72 so that a reliable and effective occupant notification system is provided.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: ROETHER-F1-907.2.1.1.DOC

F104–09/10
907.2.1.1 (New) [IBC [F] 907.2.1.1 (New)]

Proponent: Robert J Davidson, Code Consultant/Alan Shuman, President, representing the National Association of State Fire Marshals (NASFM)

Add new text as follows:

907.2.1.1 (IBC [F] 907.2.1.1) Group A-2. Where a Group A-2 occupancy is required to be equipped with an automatic sprinkler system by this code or the *International Building Code*, the sprinkler system water flow switch(es) shall be connected to an automatic fire alarm system.

(Renumber subsequent sections)

Reason: The reason for this proposal is to link a fire alarm requirement with the language requiring a sprinkler system in section 903.2.1.2 for group A-2 occupancies. In a facility with a required sprinkler system, a fire alarm panel is required by section 903.4.1of the fire code to electronically monitor the sprinkler system signals. Adding this requirement for an automatic fire alarm system in an A-2 occupancy would only require the installation of audible/visual devices throughout the facility since the exception for 907.2.1 does not require manual fire alarm boxes. This would provide early warning to those occupants in the building to ensure prompt evacuation in the event of fire sprinkler system activation.

Cost Impact: The code change proposal will increase the cost of construction of Group A-2 occupancies required to have suppression systems.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: DAVIDSON-SHUMAN-F7-907.2.1.DOC

F105–09/10
907.2.1.2 (New), 907.6.2.2.4 (New) [IBC [F] 907.2.1.2 (New), [F] 907.5.2.2.4 (New)]

Proponent: Ed Roether, Populous (Formerly HOK Sport Venue Event), representing self

Add new text as follows:

907.2.1.2 (IBC [F] 907.2.1.2) Emergency voice/alarm communication captions. Stadiums, arenas and grandstands required to caption audible public announcements shall be in accordance with Section 907.6.2.2.4.

907.6.2.2.4 (IBC [F] 907.5.2.2.4) Emergency voice/alarm communication captions. Where stadiums, arenas and grandstands are required to caption audible public announcements in accordance with Section 1108.2.7.2 of the *International Building Code*, the emergency/voice alarm communication system shall also be captioned. Prerecorded or live emergency captions shall be from an *approved* location constantly attended by personnel trained to respond to an emergency, The caption displays shall be permitted to serve as the visual notification appliances for the assembly seating area.

(Renumber subsequent section)

Reason: Large assembly occupancies with large volume spaces present significant challenges in providing effective occupant notification by standard means in accordance with NFPA 72. Captioning emergency safety information that is announced over the PA system was ruled as needed for equivalent communication with persons having a hearing impairment in a court decision over civil rights under the Americans with Disabilities Act (ADA) at Fed Ex Field, dated September 30, 2008. It was also proposed as a requirement in the Proposed Rule by the Department of Justice, dated June 17, 2008, to establish new design guidelines for the ADA. This proposal provides effective emergency communication for those with hearing impairments in the large volume spaces while still maintaining a fully compliant NFPA 72 system elsewhere. Another code change proposal establishes a simple threshold of 15,000 seats for where captioning would be required since some facilities would not have the ability to adequately caption and the current requirement in Section 1108.2.7.2 has no threshold. Currently, any grandstand with a public address system requires equivalent text and in a little league ballpark the seating would meet the definition of a grandstand and there will likely be a microphone with a loud speaker that would address the public. A stadium requires a certain amount of sophistication before captioning can be readily possible. This proposal in tandem with the other code change proposal would apply to only those stadiums, arenas and grandstands that would have adequate infrastructure to caption announcements.

This proposal provides an alternate approach to the NFPA 72, National Fire Alarm Code, emergency voice/alarm and communications system provisions for these unique occupancies while still maintaining those features that assure effective occupant notification in an emergency by appropriately trained personnel. Caption displays installed in large volume spaces, such as stadiums, arenas and grandstands, which are not listed as visible notification appliances for fire alarm systems, provide effective visual notification since the notification objective is reasonably achieved. It is the intent of this proposal to permit the omission of visible notification appliances in the seating area provided that the adjacent areas have visible notification in accordance with NFPA 72. NFPA 101 has historically allowed alternative occupant notification systems for these large seating areas that incorporate the public address system and, by changes in 2009 NFPA 101, the electronic displays or message boards as conceptually comparable to a system in compliance with NFPA 72 so that a reliable and effective occupant notification system is provided.

Finally, this proposal allows the use of either pre-recorded or real-time captions of audible announcements. It should be noted that the microphone required in the fire command center in case the fire department needs to over-ride the emergency notification system to make "live" safety and emergency announcements raises challenges when trying to caption those announcements. Providing a stenographer on-site for a potential emergency at any point in time may be difficult and providing a stenographer off-site requires further interface between a system in compliance with NFPA 72 and one that is not. So, there are some technical challenges with captioning emergency announcements that need further consideration in the building's fire safety and evacuation plans.

Cost Impact: The code change proposal will increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: ROETHER-F2-907.2.1.2.DOC

F106–09/10
907.2.2.1 (IBC [F] 907.2.2.1)

Proponent: Rick Sheets, Fire Committee Chair, Brinks Home Security, representing National Burglar and Fire Alarm Association

Revise as follows:

907.2.2.1 (IBC [F]907.2.2.1) Group B ambulatory health care facilities. *Fire areas* containing Group B ambulatory health care facilities shall be provided with an electronically supervised automatic smoke detection system installed within the ambulatory health care facility and in public use areas outside of tenant spaces, including public *corridors* and elevator lobbies.

~~**Exception:** Buildings equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1 provided the occupant notification appliances will activate throughout the notification zones upon sprinkler water flow.~~

Reason: Delete Exception.

Another new occupancy has been defined under the "B" Business category, called "Ambulatory Health Care Facilities". (304.1) These facilities are defined as buildings or portions of buildings providing medical, surgical, psychiatric or nursing care less than 24 hours a day to persons incapable of self-preservation (i.e. 'put under' for minor surgery etc.). These occupancies, covered in 907.2.2.1, need an automatic smoke detection system installed in the Ambulatory Health Care Facility plus in their public use areas, corridors and elevator lobbies including all the public areas on other floors outside the AHCF area, ...except if the building is sprinkled and its activation causes the (required) occupant notification appliances to activate.

The problem with allowing this exception is that by code, heat detectors (which is what a sprinkler head is) are not, and never have been, permitted to replace smoke detectors for protection of life. Heat detectors are not life-safety devices in any code or standard because they do not provide the early warning needed for the safe evacuation of occupants. Sprinklers have a great reputation for saving lives only when used along with early detection provided by smoke detectors.

Cost Impact: The code change proposal will increase the cost of construction $.30 per square foot.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: SHEETS-F1-907.2.2.1.DOC

F107–09/10
907.2.3 (IBC [F] 907.2.3)

Proponent: Robert J Davidson, Code Consultant/Alan Shuman, President, representing the National Association of State Fire Marshals (NASFM)

Revise as follows:

907.2.3 (IBC [F] 907.2.3) Group E. A manual fire alarm system that ~~activates~~ initiates the occupant notification signal utilizing an emergency voice/alarm communication system meeting the requirements of Section 907.6.2.2 and installed in accordance with Section 907.6 shall be installed in Group E occupancies. When automatic sprinkler systems or smoke detectors are installed, such systems or detectors shall be connected to the building fire alarm system.

Exceptions:

1. A manual fire alarm system is not required in Group E occupancies with an occupant load of ~~less than 50~~ 30 or less.
2. Manual fire alarm boxes are not required in Group E occupancies where all of the following apply:
   2.1. Interior corridors are protected by smoke detectors.
   2.2. Auditoriums, cafeterias, gymnasiums and similar areas are protected by heat detectors or other approved detection devices.
   2.3. Shops and laboratories involving dusts or vapors are protected by heat detectors or other approved detection devices.
   ~~2.4. The capability to activate the evacuation signal from a central point is provided.~~
   ~~2.5. In buildings where normally occupied spaces are provided with a two-way communication system between such spaces and a constantly attended receiving station from where a general evacuation alarm can be sounded, except in locations specifically designated by the fire code official.~~
3. Manual fire alarm boxes shall not be required in Group E occupancies where the building is equipped throughout with an approved automatic sprinkler system installed in accordance with Section 903.3.1.1, the ~~notification appliances~~ emergency voice/alarm communication system will activate on sprinkler waterflow and manual activation is provided from a normally occupied location.

Reason: Group E occupancies mix a high concentration of children with fuel loads on a daily basis. As budgets shrink, so do the number of adult supervisors. Our children are in schools because they are required to be there. We owe them a duty to ensure they are safe from the risk of fire while in school. We simply cannot wait for a catastrophe to protect children while at school.

Unfortunately the world of elementary, secondary and higher education learning has gone through tremendous changes in security measures undertaken, both operationally and hardware installations, due to the threat of violent acts committed against students and staff. Where we had educational facilities with highly effective fire drill evacuation procedures and actions during system activation, we now have written plans and training in place to ignore the activation of the fire alarm system if a "lockdown" has been declared because the activation of the fire alarm system may be a diversion to bring staff and students out into the open to serve as victims.

This is not a possible situation. This is a very real situation that occurs throughout the country in response to the acts of violence that have occurred at educational facilities. Though the exact procedure may vary site to site, the main premise of a "lockdown" is to gather staff and students into classrooms and offices and to lock the doors, preventing intruders from getting into the room and preventing staff and students from leaving the rooms until an all clear is announced. The staff and students are trained to ignore a fire alarm activation during a lockdown until they are ordered to evacuate after someone in authority, (could be a Principal or could be a Police Commander), makes a determination that the fire threat is real and that they must evacuate to survive the fire.

Once the students and staff ignore the fire alarm, there needs to be a reliable method of communicating the message that now is the time to evacuate. PA systems that do not meet appropriate standards of care for installation or maintenance related to reliability at the time of a fire emergency do not satisfy that need. To address this issue this proposal would require the installation of a emergency voice/alarm communications system installed in accordance with the code and referenced standards. Recognizing that there is a related increase in the cost of construction Section 907.5.2.2 allows that system to be used for other announcements to eliminate the need for a public address system for that purpose.

Section 907.2.3, Exception one has been modified to correlate the occupant load triggers, Items 2.4 and 2.5 would be redundant since the emergency voice/alarm communications system would meet those two requirements and Exception 3 was modified to correlate with the new language in 907.2.3.

Cost Impact: The code change proposal will increase the cost of construction.

Proponent: Roger Evans, Park City Municipal Corporation, representing Utah Chapter of ICC

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IFC COMMITTEE. PART II WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IFC

Revise as follows:

907.2.6.1.1 (IBC [F] 907.2.6.1.1) Smoke alarms and smoke detectors. Single- and multiple-station smoke alarms or smoke detectors shall be installed in accordance with Section 907.2.11.
907.2.8.3 (IBC [F] 907.2.8.3) Smoke alarms and smoke detectors. Single- and multiple-station smoke alarms or smoke detectors shall be installed in accordance with Section 907.2.11.

907.2.9.2 (IBC [F] 907.2.9.2) Smoke alarms and smoke detectors. Single- and multiple-station smoke alarms or smoke detectors shall be installed in accordance with Section 907.2.11.

907.2.10.3 (IBC [F] 907.2.10.3) Smoke alarms and smoke detectors. Single- and multiple-station smoke alarms or smoke detectors shall be installed in accordance with Section 907.2.11.

907.2.11 (IBC [F] 907.2.11) Single- and multiple-station smoke alarms and smoke detectors. Listed single- and multiple-station smoke alarms complying with ANSI/UL 217 or smoke detectors complying with ANSI/UL 268 shall be installed in accordance with Sections 907.2.11.1 through 907.2.11.4 and NFPA 72.

907.2.11.1 (IBC [F] 907.2.11.1) Group R-1. Single- or multiple-station smoke alarms or smoke detectors shall be installed in all of the following locations in Group R-1:

1. In sleeping areas.
2. In every room in the path of the means of egress from the sleeping area to the door leading from the sleeping unit.
3. In each story within the sleeping unit, including basements. For sleeping units with split levels and without an intervening door between the adjacent levels, a smoke alarm or smoke detector installed on the upper level shall suffice for the adjacent lower level provided that the lower level is less than one full story below the upper level.

907.2.11.2 (IBC [F] 907.2.11.2) Groups R-2, R-3, R-4 and I-1. Single or multiple-station smoke alarms or smoke detectors shall be installed and maintained in Groups R-2, R-3, R-4 and I-1 regardless of occupant load at all of the following locations:

1. On the ceiling or wall outside of each separate sleeping area in the immediate vicinity of bedrooms.
2. In each room used for sleeping purposes.

   Exception: Single- or multiple-station smoke alarms in Group I-1 shall not be required where smoke detectors are provided in the sleeping rooms as part of an automatic smoke detection system.

3. In each story within a dwelling unit, including basements but not including crawl spaces and uninhabitable attics. In dwellings or dwelling units with split levels and without an intervening door between the adjacent levels, a smoke alarm installed on the upper level shall suffice for the adjacent lower level provided that the lower level is less than one full story below the upper level.

907.2.11.3 (IBC [F] 907.2.11.3) Interconnection. Where more than one smoke alarm or smoke detector is required to be installed within an individual dwelling unit or sleeping unit in Group R-1, R-2, R-3 or R-4, the smoke alarms shall be interconnected in such a manner that the activation of one will activate all of the alarms in the individual unit and the activation of a smoke detector shall activate the fire alarm audible notification devices throughout the individual dwelling unit. ~~The alarm shall be clearly audible in all bedrooms over background noise levels with all intervening doors closed.~~ The required fire alarm signal shall be clearly audible in all sleeping rooms, having a sound level of at least 15 db above average ambient sound level or 5 db above the maximum sound level, or a sound level at least 75 db at the pillow.

907.2.11.4 (IBC [F] 907.2.11.4) Power source. ~~In new construction, required smoke alarms shall receive their primary power from the building wiring where such wiring is served from a commercial source and shall be equipped with a battery backup. Smoke alarms with integral strobes that are not equipped with battery back-up shall be connected to an emergency electrical system. Smoke alarms shall emit a signal when the batteries are low. Wiring shall be permanent and without a disconnecting switch other than as required for overcurrent protection.~~ Required smoke alarms or smoke detectors shall receive their power by one of the following means:

1. Listed smoke alarms shall receive their primary power from the building wiring when such wiring is served from a commercial source with secondary power backup and without a disconnecting switch other than those required for overcurrent protection. Listed smoke alarms that are battery-powered shall not be permitted in new construction.

2. Listed smoke detectors shall receive their power from the approved control panel. The approved control panel shall receive its primary power from the building wiring when such wiring is served from a commercial source and the primary power source shall not include a disconnecting switch other than those required for overcurrent protection. The control panel shall be equipped with rechargeable batteries for secondary power backup.
3. Listed low-power radio frequency (wireless) smoke detectors shall be permitted to be battery powered when the battery is electrically supervised and shall be capable of sending an alarm signal to the approved control panel for a minimum of 7 days after sending the initial battery depletion signal.

   Exception: Smoke alarms are not required to be equipped with battery backup where they are connected to an emergency electrical system.

902.1(IBC [F] 902.1) Definitions. The following words and terms shall, for the purposes of this chapter and as used elsewhere in this code, have the meanings shown herein.

SMOKE DETECTOR. A listed device intended to be connected to an approved smoke detection system for the purpose of sensing visible or invisible particles of combustion and alerting occupants by a distinct and audible signal.

PART II – IRC BUILDING/ENERGY

1. Revise IRC as follows:

R314.1 Smoke detection and notification. All smoke alarms and smoke detectors shall be listed in accordance with ANSI/UL 217 and ANSI/UL 268 respectively and shall be installed in accordance with the provisions of this code and the household fire warning equipment provisions of NFPA 72.

R314.2 Smoke detection systems. Household fire alarm systems ~~installed in accordance with NFPA 72 that include smoke alarms, or a combination of smoke detector and audible notification device installed as required by this section for smoke alarms, shall be permitted. The household fire alarm system shall provide the same level of smoke detection and alarm as required by this section for smoke alarms.~~ , including smoke alarms or a combination of smoke detectors and audible notification devices, shall be installed in accordance with NFPA 72 and as required by Sections R314.3 and R314.4. Where a household fire warning system is installed using a combination of smoke detector(s) and audible notification device(s), it shall become a permanent fixture of the occupancy and owned by the homeowner. The system shall be monitored by an approved supervising station and be maintained in accordance with NFPA 72.

~~Exception:~~ ~~Where smoke alarms are provided meeting the requirements of Section~~ R314.4~~.~~

R314.3 Location. Smoke alarms or smoke detectors shall be installed in the following locations:

1. In each sleeping room.
2. Outside each separate sleeping area in the immediate vicinity of the bedrooms.
3. On each additional story of the dwelling, including basements and habitable attics but not including crawl spaces and uninhabitable attics. In dwellings or dwelling units with split levels and without an intervening door between the adjacent levels, a smoke alarm or smoke detector installed on the upper level shall suffice for the adjacent lower level provided that the lower level is less than one full story below the upper level.

~~Exception~~ **R314.3.1 Interconnection**. ~~When~~ Where more than one smoke alarm is required to be installed within an individual dwelling unit the alarm devices shall be interconnected in such a manner that the actuation of one alarm will activate all of the alarms in the individual unit and the activation of a smoke detector shall activate the fire alarm audible notification devices throughout the individual dwelling unit. The required fire alarm signal shall be clearly audible in all sleeping rooms, having a sound level of at least 15 db above average ambient sound level or 5 db above the maximum sound level, or a sound level at least 75 db at the pillow.

Exception: The interconnection of smoke alarms or smoke detectors in existing areas shall not be required where work requiring a permit does not result in the removal of interior finishes exposing the structure which could provide access for wiring or in dwellings without attics, crawl spaces or basements.

~~R314.3.1~~ R314.3.2 Alterations, repairs and additions. When alterations, repairs or additions requiring a permit occur, or when one or more sleeping rooms are added or created in existing dwellings, the individual dwelling unit shall be equipped with smoke alarms or smoke detectors located as required for new dwellings.

Exceptions:

1. Work involving the exterior surfaces of dwellings, such as the replacement of roofing or siding, or the addition or replacement of windows or doors, or the addition of a porch or deck, are exempt from the requirements of this section.
2. Installation, alteration or repairs of plumbing or mechanical systems are exempt from the requirements of this section.
3. Smoke alarms that receive their primary power from the building wiring when such wiring is served from a commercial source or smoke detectors that receive their primary power from an approved panel shall not be required to be hard-wired in existing dwellings where work requiring a permit does not result in the removal of interior finishes exposing the structure which could provide access for wiring or in dwellings without attics, crawl spaces or basements.

R314.4 Power source. ~~Smoke alarms shall receive their primary power from the building wiring when such wiring is served from a commercial source, and when primary power is interrupted, shall receive power from a battery. Wiring shall be permanent and without a disconnecting switch other than those required for overcurrent protection. Smoke alarms shall be interconnected.~~ Required smoke alarms or smoke detectors shall receive their power by one of the following means:

1. Listed smoke alarms shall receive their primary power from the building wiring when such wiring is served from a commercial source with secondary power backup and without a disconnecting switch other than those required for overcurrent protection. Listed smoke alarms that are battery-powered shall not be permitted in new construction.
2. Listed smoke detectors shall receive their power from the approved control panel. The approved control panel shall receive its primary power from the building wiring when such wiring is served from a commercial source and the primary power source shall not include a disconnecting switch other than those required for overcurrent protection. The control panel shall be equipped with rechargeable batteries for secondary power backup.
3. Listed low-power radio frequency (wireless) smoke detectors shall be permitted to be battery powered when the battery is electrically supervised and shall be capable of sending an alarm signal to the approved control panel for a minimum of 7 days after sending the initial battery depletion signal.

Exceptions~~:~~:

~~1.~~ Smoke alarms shall be permitted to be battery operated when installed in buildings without commercial power.

~~2. Interconnection and hard-wiring of smoke alarms in existing areas shall not be required where the alterations or repairs do not result in the removal of interior wall or ceiling finishes exposing the structure, unless there is an attic, crawl space or basement available which could provide access for hard-wiring and interconnection without the removal of interior finishes.~~

2. Add new definition to Section R202 as follows:

SMOKE DETECTOR. A device intended to be connected to an approved smoke detection system for the purpose of sensing visible or invisible particles of combustion and alerting occupants by a distinct and audible signal.

3. Add new standard to Chapter 44 as follows:

ANSI/UL 268-06 Smoke Detectors for Fire Alarm Signaling Systems

Reason: As read in context the language in the 2009 IFC relating to the interconnection of smoke alarms and smoke alarm power requirements in the 2009 edition of the IRC and IFC does not call out system-connected smoke detectors. This has caused some local authorities to disallow the installation of ANSI/UL 268 system-connected smoke detectors. The performance and reliability of fire alarm systems using ANSI/UL 268 smoke detectors are extremely high if they are installed and maintained in accordance with National Fire Protection Association (NFPA) 72.

The proposed code will remove all ambiguity relating to the installation of smoke detectors and will ensure that both smoke alarms and smoke detectors may be permitted for installation.

Cost Impact: There will be no cost impact because the proposed change is not mandating the installation of smoke detectors over smoke alarms. The decision as to which type of device to install will be up the system designer and/or building owner.

Analysis: UL 217-06 is currently referenced in both the IFC and the IRC. UL 268-06 is currently referenced in the IFC and if this code change is approved UL 268 will be added to the IRC Chapter 44 as a referenced standard.

PART I – IFC

	Assembly:	ASF	AMF	DF

PART II – IRC BUILDING/ENERGY

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: EVANSR-907-F2.DOC

F109–09/10

907.2.9 (IBC [F] 907.2.9), 907.2.9.3 (New) [IBC [F] 907.2.9.3 (New)]

Proponent: William Freer, Fire Protection Specialist, NYS Office of Fire Prevention and Control

1. Revise as follows:

907.2.9 (IBC [F] 907.2.9) Group R-2. Fire alarm systems and smoke alarms shall be installed in Group R-2 occupancies as required in Section 907.2.9.1 ~~and 907.2.9.2~~ through 907.2.9.3.

907.2.9.3 ([F] 907.2.9.3) Group R-2 college and university buildings. An automatic smoke detection system that activates the occupant notification system in accordance with Section 907.6 shall be installed in Group R-2 college and university buildings in the following locations:

1. Common spaces outside of dwelling units and sleeping units
2. Laundry rooms, mechanical equipment rooms, and storage rooms
3. All interior corridors serving sleeping units or dwelling units.

Required smoke alarms in dwelling units and sleeping units in Group R-2 college and university buildings shall be interconnected with the fire alarm system in accordance with NFPA 72.

Exception: An automatic smoke detection system is not required in buildings that do not have interior corridors serving sleeping units or dwelling units and where each sleeping unit or dwelling unit either have a *means of egress* door opening directly to an exterior *exit access* that leads directly to an *exit* or a *means of egress* door opening directly to an exit.

Reason: This code change would add new requirements to the code. The current code only requires single and multiple station smoke alarms in new R-2 student housing. Single and multiple station smoke alarms are not required to be connected to a building fire alarm which would evacuate the building in event of a fire or smoke condition. They are also not required to be in all areas of the building which have been shown to be frequent areas of ignition. In a study completed by the New York State Governor's Task Force on Campus Fire Safety it was cited that 43% of fires in college dormitories are located in dorm rooms or kitchens, leaving the other 57% to be located in areas that would not require smoke detection under the current code. The study also showed that there were approximately 300 fires on college campus over a 3 year period while only 160 and were reported to the Fire Department. The Center for Campus Fire Safety reports 99 deaths have been "reported" in fires in student housing since 2000. An NFPA study on student housing showed 3,300 structural fires in Dormitories, Fraternities, Sororities and Barracks between 2002-2005. Since 1980 there has been an increase of 3% in reported fires in dormitory type occupancies, while there has been a 52% decrease in overall reported structural fires. New York State has required Fire Alarm and detection system in new dormitories since 2003 and has not had any deaths reported in these buildings since that change.

Cost Impact: The code change proposal will increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: FREER-F2-907.2.9.DOC

F110–09/10
907.2.9.2 (New) [IBC [F] 907.2.9.2 (New)]

Proponent: Ken Kraus, Los Angeles Fire Department

Add new text as follows:

907.2.9.2 (IBC [F] 907.2.9.2) Automatic smoke detection system. An automatic smoke detection system that activates the occupant notification system in accordance with Section 907.6 shall be installed through out all interior corridors serving 10 or more dwelling units.

> **Exception:** An automatic smoke detection system is not required in buildings that do not have interior *corridors* serving *dwelling units* and where each *dwelling unit* has a *means of egress* door opening directly to an *exit* or to an exterior *exit access* that leads directly to an *exit*.

Reason: Automatic fire alarm systems are currently required, with exception, within interior corridors in R-1 Occupancies, e.g., Hotels and Motels. While Apartment buildings represent, in some respects, hazards similar to those found in R-1 Occupancies, they represent distinct and extenuating conditions that warrant similar protectives. Specifically:

Non transient occupants in R-2 Occupancies utilize cooking appliances to a much greater extent than R-1 Occupants.
R-2 occupants disable smoke alarms since low voltage and false alarms represent a continual nuisance.
R-2 occupants are much more likely to prop open required fire protection assemblies (for ventilation) than occupants in hotels and motels.

Cost Impact: The code change proposal will increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: KRAUS-F1-907.2.9.2.DOC

F111–09/10
907.2.10.2 (IBC [F] 907.2.10.2)

Proponent: Rick Sheets, Fire Committee Chair, Brinks Home Security, representing National Burglar and Fire Alarm Association

Revise as follows:

907.2.10.2 (IBC [F] 907.2.10.2) Automatic smoke detection system. An automatic smoke detection system that activates the occupant notification system in accordance with Section 907.6 shall be installed in corridors, waiting areas open to corridors and habitable spaces other than sleeping units and kitchens.

Exceptions:

1. ~~Smoke detection in habitable spaces is not required where the facility is equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1.~~
2. An automatic smoke detection system is not required in buildings that do not have interior corridors serving sleeping units and where each sleeping unit has a means of egress door opening directly to an exit or to an exterior exit access that leads directly to an exit.

Reason: Exception #1 should be deleted.

Background: A new R-4 occupancy has been defined under the "B" Business category, called "Ambulatory Health Care Facilities". (AHCF, 304.1) These facilities provide medical, surgical, psychiatric or nursing care less than 24 hours a day to persons incapable of self-preservation (i.e. 'put under' for minor surgery etc.). These occupancies, covered in 907.2.2.1, need an automatic smoke detection system installed in the Ambulatory Health Care Facility area, plus in their public use areas, corridors and elevator lobbies for all the public areas located outside the AHCF area. While we see the need for a new occupancy type, we cannot see where sprinklers are permitted to replace required smoke detection.

Problem:

First, it seems that this exception doesn't simply allow smoke detection to be omitted; it seems to allow the "smoke detection" to be omitted from an "automatic smoke detection system." Doesn't this mean that virtually no system will be installed, since the manual boxes required by 907.2.10.1 are also allowed to be omitted in sprinklered buildings? Isn't this pushing the sprinkler reliance a little too far?

Secondly, sprinkler heads are essentially fixed-temperature heat detectors. Smoke detectors required in other parts of the ICC codes only permit heat detectors to be used where the environment is not suitable for the use of smoke detectors. It is not reasonable to expect the occupants and staff of these facilities to wait until a smoldering/small fire generates enough heat to activate a sprinkler head, when the environment allows early warning to be used. Section 907.2.10.1 indicates there won't even be manual pull boxes at the exits, even if the fire is soon discovered by an occupant. We are also confident most fire departments would rather be informed of smoke rather than told that a sprinkler system is currently trying to control a fire.

The fire alarm and detection community has watched as manual pull boxes are permitted to be omitted, but this is the first time automatic smoke detection is permitted to be omitted. Please stop this dangerous trend and provide the early warning needed for the safe evacuation of these occupants. Sprinkler are not perfect and they do have a great reputation for saving lives, but they provide the best chances for survival when used along with the early warning provided by smoke detectors.

Cost Impact: This code change proposal would increase the cost by $0.15 to $0.30 per square foot.

F112–09/10
907.2.11 (IBC [F] 907.2.11); IRC R314.1

Proponents: Joseph Fleming, Deputy Chief, Boston Fire Department, representing The Boston, MA Fire Department; Sean DeCrane, Cleveland Fire Department representing the Cleveland, OH Fire Department and the International Association of Fire Fighters

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IFC COMMITTEE. PART II WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IFC

Revise as follows:

907.2.11 (IBC [F] 907.2.11) Single and multiple-station smoke alarms. *Listed* single- and multiple-station photoelectric smoke alarms complying with UL 217 shall be installed in accordance Sections 907.2.11.1 through 907.2.11.4 and NFPA 72.

PART II – IRC BUILDING/ENERGY

Revise as follows:

R314.1 Smoke detection and notification. All smoke alarms installed to meet the requirements of this code shall be the photoelectric type and shall be listed in accordance with UL 217 and installed in accordance with the provisions of this code and the household fire warning equipment provisions of NFPA 72.

Reason: (**Fleming)** According to the United States Fire Administration (http://www.usfa.dhs.gov/downloads/pdf/tfrs/v5i1.pdf) 37% of fire fatalities occur with operational smoke alarms and another 21% occur with disabled alarms. The use of photoelectric alarms, as opposed to alarms using ionization technology could reduce both by ½. This would reduce fire deaths in the U.S. by approximately 25% which translates into over 750 lives saved each year. The following information supports this estimated benefit.

1. There are some fires were smoke alarms/detectors cannot provide a benefit: arson fires in egress paths, victims intimate with flaming fires, explosions, etc. In addition, it is unlikely that smoke alarms/detectors provide the critical warning to occupants who are awake. As a consequence, when discussing smoke alarms, we should focus our attention on the types of fires where the smoke alarm can provide a crucial benefit to occupants not on all the types of fires that occur. The vast majority of fires where a smoke alarm/detector can help occupants are smoldering fires started when the victim is asleep.

    - *Smoke detectors should be able to save at least 60% and possibly 75% of sleeping victims, but only 13% of victims who were awake.* (McGuire, J., Ruscoe, B., The Value of a Fire Detectors in the Home, Fire Study No. 9, National Research Council of Canada, Division of Building Research, Ottawa, Ont., Canada, December, 1962.)
    - *"Delayed discovery, typically associated with fires that occur at night when everyone is asleep, also tends to be a characteristic of the smoldering fire caused by discarded smoking material. These smoldering fires are the leading causes of US fire fatalities and detectors are ideally designed to deal with them.* ("A Decade of Detectors", Fire Journal 09/85, John Hall - NFPA.)

2. In flaming fires the ionization alarm/detector is faster than the photoelectric by 30-50 seconds. This extra time is virtually irrelevant to alert occupants. For example, in the recent smoke alarm testing involving flaming cooking fires (http://smokealarm.nist.gov/pdf_files/SmokeDetectors_Q&As_Feb2008.pdf), which is the most common type of flaming fire, although the photo was 30-50 seconds slower than the ionization it still provided on average over 10 minutes warning. It has often been said that in a fire "seconds count." However it is hard to imagine a scenario were the extra seconds provided by the ionization in the most common type of flaming fires makes a difference for life safety, when the photoelectric is already providing on average over 10 minutes of Available Safe Egress Time. As a consequence, although photoelectric alarms/detectors respond later in flaming fires this is a quantitative as opposed to a qualitative advantage. Here are some quotes from researchers.

    - *The advantage of ionization smoke detectors during flaming fires is only about a 15-20 second earlier warning. This margin will only be decisive for the loss of human life in extraordinary circumstances. In general the difference between the alarm times for the optical and the ionization detectors are reduced when the detection is made from an adjacent room. (*Meland, Oysten, and Lonuik, Lars, "Detection of Smoke - Full Scale Tests with Flaming and Smouldering Fires, "Fire Safety Science," - Proceedings of the Third International Symposium, July, 1991,)

- *Under the conditions of ignition from flames, the ionization chamber type detector exhibited a greater sensitivity to the smoke produced than the photoelectric system. However, the rate of generation of smoke was so great that the extra time given by the ionization chamber as a result may be of little practical use. (*R., (Riley, K., and Rogers, S., "A Study of the Operation and Effectiveness of Fire Detectors Installed in the Bedrooms and Corridors of Residential Institutions", Fire Research Station, Fire Research Current Paper 26/78, Borehamwood, England, April 1978.)

3. In smoldering fires the photoelectric is faster than the ionization by 30 minutes or more. This extra time is critical for sleeping occupants. If the ionization was consistently providing adequate warning, it would not matter that it was slower than the photoelectric. Unfortunately it doesn't. According to NIST's testimony to the Boston City Council), *"ionization alarms may not always alarm even when a room is filled with smoke from a smoldering fire."* In addition, according to data collected by NIST Report during smoldering fires the ionization smoke alarm often provided less than 1-2 minutes of Available Safe Egress Time. (1-2 minutes is the minimum time needed for sleeping occupants to escape.) In fact the ionization, in many cases, was providing negative available safe egress time. (http://smokealarm.nist.gov/pdf_files/StatementfortheRecordWG1finalsmokealarmstatement.pdf

   This finding has been noted by many other researchers.
   - *Ionization chamber type detectors, in the room of origin and the corridor, did not, in the smoldering fire tests, provide adequate warning that the escape route was impassable or that conditions in the room were potentially hazardous to life. (*R., Riley, K., and Rogers, etc.)
   - *"This test will show that most photoelectric detectors, operated by battery will detect smoke at about 1.5-3% smoke, which is good. The test will show that the photoelectric detectors operated by household current will activate between 2 and 4 %, which is still good. But, the test also will show that many ionization detectors will not activate until the smoke obscuration reaches 10-20 and sometimes 25%. … Therefore, because of the present state of the art in detecting smoke, the Subcommittee on Smoke Detectors can take no other course but to recommend the installation of photoelectric detectors."* ("Residential Smoke Alarm Report - Prepared by Special Automatic Detection Committee of the International Association of Fire Chiefs," The International Fire Chief, September 1980.)
   - The tests i.e. the CALCHIEFS Tests, being commented upon in the previous quote were conducted by the Los Angeles Fire Dept. They concluded that photoelectrics were the preferred smoke alarm for all hallways and bedrooms. ("An Evaluation of Fire Detectors for Residential Placement," Los Angeles City Fire Dept., Fire Prevention Bureau – Research Unit, August 1981.)
   - *"Photoelectric detectors sighted in the hallway are more effective for detecting smoldering smoke than ionization detectors, providing adequate escape time for most conditions of size and location of the smoke sources. Ionization detectors sited in the hallway generally provide inadequate escape times unless smoke movement into the hallway is slowed down by narrow door openings, causing a slower loss of visibility, or unless they are sited close to the smoke source." (* P.F. Johnson and S. K. Brown, "Smoke Detection of Smoldering Fires in a Typical Melbourne Dwelling," *Fire Technology,* Vol. 22, No. 4, 1986, pp. 295-340.)
   - *"The ionization detectors detected smoke from a smoldering fire much later than optical (photoelectric) detectors. When the particular conditions during the fire development are taken into consideration there are reasons to indicate that this detection principle would not provide adequate safety during this type of fire".* (Meland, Oysten, and Lonuik, Lars, "Detection of Smoke - Full Scale Tests with Flaming and Smouldering Fires, "Fire Safety Science," - Proceedings of the Third International Symposium, July, 1991, pp. 975-984.)

4. In addition to being inadequate at providing adequate warning in smoldering fires, several researchers have identified that the ionization smoke alarm is far more susceptible to disablement due to nuisance alarms than is the photoelectric. Here are some quotes from the recent NIST Smoke Alarm Report. http://smokealarm.nist.gov/

   Additionally a separate study of nuisance alarm sources was conducted because this was identified as an important issue in a prior study by the U.S. Consumer Product Safety Commission. It was observed that ionization alarms had a propensity to alarm when exposed to nuisance aerosols produced in the early stages of some cooking activities, prior to noticeable smoke production. This phenomenon could be particularly vexing to homeowners who experience such nuisance alarms. … While one third of the smoke detectors did not work on the initial test, half of these were made operational by restoring power. Homeowners interviewed revealed that most of these were intentionally disconnected due to nuisance alarms, mostly from cooking.

   For the Toasting Scenario the ionization located near the kitchen responded in about 130-150 seconds. The photoelectric responded in 225-300. In fact according to NIST, *"Photoelectric alarm thresholds were met only after item started to char and produce visible smoke."* So although both responded, it is much more likely that the ionization will repeatedly respond to most normal toasting and be more likely to be disabled..

   Here are some recent quotes by other researchers on nuisance alarms.
   - *"Homes with ionization alarms had more than 8 times the rate of false alarms as those with photoelectric. In small rural residences, photoelectric smoke alarms have lower rates of false alarms and disconnections." (*Perkins, M., "Ionization and photoelectric smoke alarms in rural Alaskan homes," Western Journal of Medicine, 2000;173:89-92 (Contact: Alaska Injury Prevention Center, Anchorage, AK.))
   - *"We favor photoelectric detectors to reduce rates of nuisance alarms from cooking and to provide optimal protection from cigarette related fires." (*Kuklinski, D., Berger, L., Weaver, J., "Smoke detector Nuisance Alarms: A Field Study in a Native American Community," NFPA Journal; Sept/Oct. 1995.)
   - *"On direct observation at first follow-up, ionization study alarms were more likely to be non-functional, 20% ionization vs. 5% photoelectric, with the most common reason being a disconnected or absent battery." (*Mueller, B., et al, "Randomized controlled trial of ionization and photoelectric smoke alarm functionality," Injury Prevention, 2008; 14:80-86.)

   Even smoke alarm manufacturers are aware of the benefits of photoelectric technology. (They just do a very poor job of communicating this to consumers.)
   - *"The optical smoke alarm therefore is less likely to react to the results of cooking and this makes it far more suitable for installation near kitchens or in confined spaces such as bed sits. The slight price differential between the two types of alarms can be balanced out by the elimination of false alarms being triggered by nearby kitchens and bathrooms."* "Domestic smoke alarms – a guide for specifiers," Bendall, D. (BFK Brands Europe), Fire Prevention 281 July/August 1995.

- *"Never install ionization smoke alarms in areas where cooking fumes, open fires and products of combustion are present. Where these conditions occur and a smoke alarm must be installed, a photoelectric alarm is the best option."* http://www.kidde.com.au/utcfs/kid/How+Smoke+Alarms+Work.html

5. Combination alarms/detectors have the potential to provide the quickest response to both smoldering and flaming fires but due to the excessive nuisance alarms from the ionization part of the alarm/detector, they should not be allowed near kitchens and bathrooms. In addition, the minor advantage that ionization or combination have over photoelectric in flaming fires is marginal and probably not critical.

   To quote a study (Mueller et al) cited earlier, *"An alarm containing both technologies is more expensive; it may also be more likely rendered non-functional if either technology causes frequent nuisance alarms. Our results suggest that installing photoelectric alarms on main floors of homes similar to those in our study may increase the proportion of functioning alarms and therefore provided longer term protection,"*

   Other items to consider:
   - I am not aware of any "wireless alarms" that come as combination (photo/ion).
   - Both ion and photo are sold with 10 year batteries. Are Combination (ion/photo)?
   - Combination CO/Smoke come with CO/Ion or CO/Photo. Is there a Combo Smoke Alarm/CO?
   - Why require dual in sprinkled occupancies when, according to the USFA, the only type of fire that can kill someone is a smoldering fire? "*Even though fire sprinklers are effective life safety devices you still need smoke alarms. Some fires can begin as smoldering fires that produce smoke and gases but don't generate enough heat to activate the sprinklers. Smoke alarms are needed to provide warning for these situations."* (http://www.usfa.dhs.gov/citizens/all_citizens/home_fire_prev/manufactured/sprinklers-mh.shtm)

6. I would like to mention that based on this research the Australasian Fire Authorities Council has recommended the use of photoelectric smoke alarms as opposed to ionization or combination.

   http://www.afac.com.au/__data/assets/pdf_file/0020/3674/AFACSmokeAlarmposition1June2006.pdf

7. Precedents for this action.

   a. Since 1998 the Massachusetts State Building Code has mandated photoelectric smoke alarm within 20 feet of a kitchen or bathroom due to the propensity of ionization smoke alarms to experience nuisance alarms.
   b. Since 2002 **NFPA 72 (the National Fire Alarm Code)** has only allowed ionization smoke alarms near kitchens if they were equipped with a silence button. The NFPA 72 committee has finally recognized the advantage that photoelectric smoke alarms have in regards to nuisance alarms. However I take exception to their assumption that a "hush button" neutralizes the ionizations propensity for nuisance alarms. No study has shown these to be effective at reducing disablement of ionization alarms. http://www.nfpa.org/assets/files/PDF/ROP/72-A2009-ROC.pdf (Page 72-249)
   c. **New Vermont Law** – Photoelectric-only type of smoke alarms are required to be installed in the vicinity of any bedrooms and on each level of a dwelling, for all new dwellings and dwellings that are sold or transferred, beginning January 1, 2009. http://www.dps.state.vt.us/fire/heating/photoelectric.html
   d. **Massachusetts has voted to Change the State Fire Code** so that as of January 1, 2010, smoke alarms with only ionization technology will not be allowed to meet the code. http://www.realtown.com/massachusettsrealestate/blog/massachusetts-smoke-detector-laws-changing
   e. **The 7th Edition of the Massachusetts State Building Code** was updated so that as of January 1, 2008 smoke alarms with only ionization technology will not be allowed to meet the code. http://www.ludlow.ma.us/building/permit_applications/life-safety-systems-app.pdf

Bibliography – In addition to references cited above, the following will be provided to the committee.

2. Fleming, J., *"Photoelectric vs. Ionization Detectors - A Review of the Literature, Revisited,"* (NFPRF Fire Suppression and Detection Research Symposium, Orlando, FL, 01/05. This presentation included analyses of: 1) 30 years of smoke detector studies, 2) the National Institute of Standards Smoke Detector Project, 3) statistic regarding the effectiveness of smoke detectors, ands 4) the effectiveness of Underwriter's Labs Smoke Detector Approval Standard, UL217.)
3. Fleming, J., *"Smoke Detectors and the Investigation of Fatal Fires,"* Published in May 2000 issue of "Fire & Arson Investigator", the official magazine of International Association of Arson Investigators. (Also published on Interfire.org, an Arson Resource Website – posted 02/01.)

Reason: (DeCrane) I do not want to get into me too testimony, even during the reason statement, and my colleague Joseph Fleming from the Boston Fire Department has written an extensive Reason Statement. This will make it difficult to go in depth referencing various reports as Chief Fleming has provided the technical substantiation for this code change.

As a representative of the International Association of Fire Fighters (IAFF), I represent the professional fire fighters of North America. At the IAFF's most recent convention, the Union representatives of over 280,000 professional fire fighters across the United States and Canada, with representatives from the United Kingdom, Australia and New Zealand, voted unanimously to support he requirement of photoelectric smoke detectors.

The representatives, of those who respond to difficult fire scenes involving thousands of fatalities, have determined it is time to move forward with the requirement of photoelectric smoke detectors. Countless times our members have responded to residential fires and removed victims who had disabled their detectors due to nuisance alarms. Tragically many of these families forgot to replace the batteries or reinstall the hard wire detector when they were finished cooking. Unfortunately in many incidents these occupants, or a loved one, ended up paying the ultimate price for their forgetfulness, or some may argue, the lack of the detector industry addressing the problem.

On behalf of the nation's professional fire fighters we request your support for this code change.

Cost Impact: (Fleming) The code change proposal will not increase construction costs in any meaningful manner. The cost difference between ionization and photoelectric is minimal, particularly when one considers the benefit.

Cost Impact: (DeCrane) The code change proposal will minimally increase construction costs.

PART I – IFC

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

PART II – IRC BUILDING/ENERGY

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: FLEMING-DECRANE-F1-907.2.11

F113–09/10
907.2.11.2 (IBC [F] 907.2.11.2)

Proponent: Rick Sheets, Fire Committee Chair, Brinks Home Security, representing National Burglar and Fire Alarm Association

Revise as follows:

907.2.11.2 (IBC [F] 907.2.11.1) Groups R-2, R-3, R-4 and I-1. Single- or multiple-station smoke alarms shall be installed and maintained in Groups R-2, R-3, R-4 and I-1 regardless of *occupant load* at all of the following locations:

1. On the ceiling or wall outside of each separate sleeping area in the immediate vicinity of bedrooms.
2. In each room used for sleeping purposes.

   ~~**Exception:** Single- or multiple-station smoke alarms in Group I-1 shall not be required where smoke detectors are provided in the sleeping rooms as part of an automatic smoke detection system.~~

3. In each *story* within *a dwelling unit,* including basements but not including crawl spaces and uninhabitable *attics.* In *dwellings* or *dwelling units* with split levels and without an intervening door between the adjacent levels, a smoke alarm or smoke detector installed on the upper level shall suffice for the adjacent lower level provided that the lower level is less than one full *story* below the upper level.

   Exception: Single- or multiple-station smoke alarms in Groups R-2, R-3, R-4, and I-1 shall not be required where smoke detectors are part of an automatic smoke detection system and installed in all the locations required by Section 907.2.11.2.

Reason: There is no logical reason that these other groups (R-2, R-3, R-4) should be discouraged from installing superior fire alarm and detection systems. Professional protection using system-type smoke detection, with all its associated technological features, should be allowed for all similar occupancies, not just I-1. Chapter one of this code at 104.09 states that equal or superior alternate methods are allowed.

Cost Impact: The code change proposal will not increase the cost of construction. (No increase is required, but the change allows for optional protection at additional costs.)

Proponent: Jonathan C. Siu, City of Seattle, representing the Seattle Department of Planning and Development

THIS IS A 3 PART CODE CHANGE. ALL PARTS WILL BE HEARD BY THE FIRE CODE COMMITTEE AS 3 SEPARATE CODE CHANGES. SEE THE TENTATIVE HEARING ORDER FOR THE FIRE CODE COMMITTEE.

PART I – IFC and IPMC

1. Revise IFC as follows:

907.2.11.3 (IBC [F] 907.2.11.3) Interconnection. Where more than one smoke alarm is required to be installed within an individual *dwelling unit* or *sleeping unit* in Group ~~R-1, R-2, R-3 or R-4~~ R or I-1 occupancies, the smoke alarms shall be interconnected in such a manner that the activation of one alarm will activate all of the alarms in the individual unit. The alarm shall be clearly audible in all bedrooms over background noise levels with all intervening doors closed.

4603.7 Single- and multiple-station smoke alarms. Single and multiple-station smoke alarms shall be installed in existing Group R and I-1 occupancies ~~and in *dwellings* not classified as Group R occupancies~~ in accordance with Sections 4603.7.1 through 4603.7.3.

4603.7.1 Where required. Existing Group R and I-1 occupancies ~~and in *dwellings* not classified as Group R occupancies~~ not already provided with single-station smoke alarms shall be provided with single-station smoke alarms. Installation shall be in accordance with Section 907.2.11, except as provided in Sections 4603.7.2 and 4603.7.3.

2. Revise IPMC as follows:

[F] 704.2 Smoke alarms. Single- or multiple-station smoke alarms shall be installed and maintained in Groups~~ R-2, R-3, R-4 and in dwellings not regulated in group~~ R or I-1 occupancies, regardless of *occupant* load at all of the following locations:

1. On the ceiling or wall outside of each separate sleeping area in the immediate vicinity of *bedrooms*.
2. In each room used for sleeping purposes.
3. In each story within a *dwelling unit*, including *basements* and cellars but not including crawl spaces and uninhabitable attics. In dwellings or *dwelling units* with split levels and without an intervening door between the adjacent levels, a smoke alarm installed on the upper level shall suffice for the adjacent lower level provided that the lower level is less than one full story below the upper level.

~~Single- or multiple-station smoke alarms shall be installed in other groups in accordance with the *International Fire Code*.~~

[F] 704.3 Power source. In Group R or I-1 occupancies ~~and in dwellings not regulated as Group R occupancies~~, single-station smoke alarms shall receive their primary power from the building wiring provided that such wiring is served from a commercial source and shall be equipped with a battery backup. Smoke alarms shall emit a signal when the batteries are low. Wiring shall be permanent and without a disconnecting switch other than as required for overcurrent protection.

Exception: Smoke alarms are permitted to be solely battery operated in buildings where no construction is taking place, buildings that are not served from a commercial power source and in existing areas of buildings undergoing alterations or repairs that do not result in the removal of interior wall or ceiling finishes exposing the structure, unless there is an attic, crawl space or *basement* available which could provide access for building wiring without the removal of interior finishes.

[F] 704.4 Interconnection. Where more than one smoke alarm is required to be installed within an individual *dwelling unit* in Groups~~ R-2, R-3, R-4 and in dwellings not regulated in group~~ R or I-1 occupancies, the smoke alarms shall be interconnected in such a manner that the activation of one alarm will activate all of the alarms in the individual unit. The alarm shall be clearly audible in all *bedrooms* over background noise levels with all intervening doors closed.

Exceptions:

1. Interconnection is not required in buildings which are not undergoing alterations, repairs or construction of any kind.
2. Smoke alarms in existing areas are not required to be interconnected where alterations or repairs do not result in the removal of interior wall or ceiling finishes exposing the structure, unless there is an attic, crawl space or *basement* available which could provide access for interconnection without the removal of interior finishes.

PART II – IBC GENERAL

Add new text to IBC as follows:

3403.5 (IEBC [B] 302.5) Smoke alarms in existing portions of a building. Where an *addition* is made to a building or structure of a Group R or I-1 occupancy, the *existing building* shall be provided with smoke alarms in accordance with Section 4603.7 of the *International Fire Code*.

3404.7 (IEBC [B] 303.7) Smoke alarms. Individual sleeping units and individual dwelling units in Group R and I-1 occupancies shall be provided with smoke alarms in accordance with Section 4603.7 of the *International Fire Code*.

PART III – IEBC

Revise IEBC as follows:

704.4.3 Smoke Alarms. Individual sleeping units and individual dwelling units in any *work area* in Group ~~R-1, R-2, R-3, R-4,~~ R and I-1 occupancies shall be provided with smoke alarms in accordance with the *International Fire Code*.

Exception: Interconnection of smoke alarms outside of the ~~rehabilitation~~ *work area* shall not be required.

1004.1 Smoke Alarms in existing portions of a building. ~~Whenever~~ Where an *addition* is made to a building or structure of a Group ~~R-3, or R-4~~ R or I-1 occupancy, the *existing building* shall be provided with smoke alarms as required by Section 4603.7 of the *International ~~Building~~ Fire Code* or Section R314 of the *International Residential Code* as applicable.

Reason (Part I): The purpose of this code change is to align the IFC, IBC, and IEBC requirements.

The change in Section 4607.3 clarifies what non-Group R dwellings are being referred to, and is part of an effort to align the requirements in the IFC, IBC, and IEBC.

The change to refer to Group R occupancies rather than listing them individually in Section 907.2.11.3 is strictly editorial. Addition of Group I-1 occupancies is to align this section with IFC Section 4603.7 and IEBC Section 704.4.3.

Reason (Part II): For many years, the code community has been touting the efficacy of smoke alarms in saving lives. While there are requirements in the Fire Code to provide smoke alarms in existing buildings, there is no clear path to get to the requirements from the building code. As the ICC codes currently stand, only the Existing Building Code references the Fire Code for this important requirement. This proposal adds requirements in the building code to provide smoke alarms in existing buildings with residential and supervised residential occupancies when additions or alterations are made to the building, with text that is modeled on Sections 704.4.3 and 1004.1 of the IEBC.

In some jurisdictions where the review for building code and fire code compliance are split between the building and fire departments, additions and alterations, particularly those for single family residences, are not reviewed by the fire department. Without a clear path to the requirements, it would be easy for a building code reviewer to miss that smoke alarms are indeed required in areas of dwelling or sleeping units where there may not be construction occurring. For those of us who were accustomed to finding such a requirement in a legacy building code, it is disconcerting to find that the topic is not addressed at all in the IBC, and it would be helpful to have a pointer to the provisions.

This proposal is one of 3 submitted to coordinate the IFC, IBC, and IEBC, provisions relating to smoke alarms in existing buildings.

Reason (Part III): The purposes of this code change proposal are to provide a correct cross-reference to the requirements for retrofitting smoke alarms, and to align the Existing Building Code with the Fire Code.

As currently written, the IBC does not address the issue of providing smoke alarms in the existing portion of a building in Chapter 34 or anywhere else, so the reference to the IBC in this section is confusing. Those requirements are actually contained in the Fire Code (IFC Section 4603.7). While the proponent has submitted a separate proposal to modify Chapter 34 of the IBC to provide a cross-reference to the Fire Code, a direct reference to the Fire Code from the IEBC is clearer than referring to the IBC which then refers to the IFC. Note that for alterations, IEBC Section 704.4.3 already correctly refers the user to the Fire Code, rather than the Building Code.

The extension of the requirement to all Group R occupancies and to I-1 occupancies is to align this section with IEBC Section 704.4.3 (Level 2 alterations), as well as IFC Section 903.2.11.3 (smoke alarms in new construction).

The proposed change to refer to Group R occupancies in general rather than listing them individually in Section 704.4.3 is editorial, and is one of several proposals to align the text in the Building, Fire, and Existing Building codes. The deletion of the redundant “rehabilitation” in the exception is also editorial.

Cost Impact (Parts I-III): The code change proposal will cause a decrease in cost of construction.

ICCFILENAME: SIU-F1-907.2.11.3-2.DOC

F115–09/10

907.2.11.3 (IBC [F] 907.2.11.3), 4603.7.2; IPMC [F] 704.4; IRC R314.3, R314.4, R314.5 (New)

Proponent: Jonathan C. Siu, City of Seattle, WA, representing the Seattle Department of Planning and Development

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IFC COMMITTEE. PART II WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IFC and IPMC

1. Revise IFC as follows:

907.2.11.3 (IBC [F] 907.2.11.3) Interconnection. Where more than one smoke alarm is required to be installed within an individual *dwelling unit* or *sleeping unit* in Group R-1, R-2, R-3 or R-4, the smoke alarms shall be interconnected in such a manner that the activation of one alarm will activate all of the alarms in the individual unit. Physical interconnection of smoke alarms shall not be required where listed wireless alarms are installed and all alarms sound upon activation of one alarm. The alarm shall be clearly audible in all bedrooms over background noise levels with all intervening doors closed.

4603.7.2 Interconnection. Where more than one smoke alarm is required to be installed within an individual *dwelling* or *sleeping unit,* the smoke alarms shall be interconnected in such a manner that the activation of one alarm will activate all of the alarms in the individual unit. Physical interconnection of smoke alarms shall not be required where listed wireless alarms are installed and all alarms sound upon activation of one alarm. The alarm shall be clearly audible in all bedrooms over background noise levels with all intervening doors closed.

Exceptions:

1. Interconnection is not required in buildings that are not undergoing *alterations*, repairs or construction of any kind.
2. Smoke alarms in existing areas are not required to be interconnected where *alterations* or repairs do not result in the removal of interior wall or ceiling finishes exposing the structure, unless there is an attic, crawl space or *basement* available which could provide access for interconnection without the removal of interior finishes.

2. Revise IPMC as follows:

[F] 704.4 Interconnection. Where more than one smoke alarm is required to be installed within an individual *dwelling unit* in Group R-2, R-3, R-4 and in dwellings not regulated as Group R occupancies, the smoke alarms shall be interconnected in such a manner that the activation of one alarm will activate all of the alarms in the individual unit. . Physical interconnection of smoke alarms shall not be required where listed wireless alarms are installed and all alarms sound upon activation of one alarm. The alarm shall be clearly audible in all *bedrooms* over background noise levels with all intervening doors closed.

Exceptions:

1. Interconnection is not required in buildings which are not undergoing alterations, repairs or construction of any kind.
2. Smoke alarms in existing areas are not required to be interconnected where alterations or repairs do not result in the removal of interior wall or ceiling finishes exposing the structure, unless there is an attic, crawl space or *basement* available which could provide access for interconnection without the removal of interior finishes.

PART II – IRC BUILDING/ENERGY

Revise IRC as follows:

R314.3 Location. Smoke alarms shall be installed in the following locations:

1. In each sleeping room.
2. Outside each separate sleeping area in the immediate vicinity of the bedrooms.
3. On each additional *story* of the *dwelling*, including *basements* and habitable attics but not including crawl spaces and uninhabitable *attics*. In *dwellings* or *dwelling units* with split levels and without an intervening door between the adjacent levels, a smoke alarm installed on the upper level shall suffice for the adjacent lower level provided that the lower level is less than one full *story* below the upper level.

~~When more than one smoke alarm is required to be installed within an individual *dwelling* unit the alarm devices shall be interconnected in such a manner that the actuation of one alarm will activate all of the alarms in the individual unit.~~

R314.4 Power source. Smoke alarms shall receive their primary power from the building wiring when such wiring is served from a commercial source, and when primary power is interrupted, shall receive power from a battery. Wiring shall be permanent and without a disconnecting switch other than those required for overcurrent protection. ~~Smoke alarms shall be interconnected.~~

Exceptions:

1. Smoke alarms shall be permitted to be battery operated when installed in buildings without commercial power.
2. ~~Interconnection and~~ Hard-wiring of smoke alarms in existing areas shall not be required where *alterations* or repairs do not result in removal of interior wall or ceiling finishes exposing the structure, unless there is an *attic*, crawl space or *basement* available which could provide access for hard-wiring ~~and interconnection~~ without the removal of interior finishes.

R314.5 Interconnection. Where more than one smoke alarm is required to be installed within an individual *dwelling* unit in accordance with Section R314.3, the alarm devices shall be interconnected in such a manner that the actuation of one alarm will activate all of the alarms in the individual unit. Physical interconnection of smoke alarms shall not be required where listed wireless alarms are installed and all alarms sound upon activation of one alarm.

Exception: Interconnection of smoke alarms in existing areas shall not be required where *alterations* or repairs do not result in removal of interior wall or ceiling finishes exposing the structure, unless there is an *attic*, crawl space or *basement* available which could provide access for interconnection without the removal of interior finishes.

Reason (Part I): The purpose of this proposal is to recognize listed wireless smoke alarms.

This proposal adds language that would allow listed wireless alarms to substitute for wired interconnection of the smoke alarms in both new and existing construction. While the code officials with whom we have discussed this issue would accept wireless systems as being interconnected, we have heard from other sources that some code officials do not recognize wireless interconnection as meeting the code requirement for interconnection. Adding the proposed text would make it clear that listed wireless systems comply with the code. It is the intent of this code change proposal that the new text in IFC Section 907.2.11.3 would appear in the same section in the IBC.

Reason (Part II): The requirements for interconnection of smoke alarms in the 2009 IRC are divided between two sections, neither of whose titles reflect they contain any requirements relating to interconnection. (See the second paragraph of Section R314.3, titled "Location" and Section R314.4, titled "Power Source"). This can make it difficult to find the requirements for interconnection, unless the code user already knows where to look. The editorial change being proposed creates a new section that consolidates the interconnection requirements into a new section (R314.5), separate from the other two, with an appropriate title. This format is similar to the IFC and IBC, Sections 907.2.11.3 (interconnection) and 907.2.11.4 (power source), as well as IFC Sections 4603.7.2 and 4603.7.3.

The substantive change being proposed is to add language that would allow listed wireless alarms to substitute for wired interconnection of the smoke alarms in both new and existing construction. While the code officials with whom we have discussed this issue would accept wireless systems as being interconnected, we have heard from other sources that some code officials do not recognize wireless interconnection as meeting the code requirement for interconnection. Adding the proposed text would make it clear that listed wireless systems comply with the code.

Cost Impact (Parts I-II): The code change proposal will decrease the cost of construction.

PART I – IFC

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

PART II – IRC BUILDING/ENERGY

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IFC COMMITTEE. PART II WILL BE HEARD BY THE IRC BUILDING COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

Proponent: David Fredrick Scarelli representing DBA-Sentry Signal Company

PART I – IFC

Add new text as follows:

907.2.12 (IBC [F] 907.2.12) Line type heat detection. A line type heat detection system that activates at 475°F (246°C) shall be installed in Group R Occupancies in accordance with Sections 907.2.12.1 through 907.2.12.2, NFPA 72, NFPA 70 and manufacturer's instructions.

907.2.12.1 (IBC [F] 907.2.12.1) Location. A line type heat detection shall be installed in the following locations:

1. Above all NM-B Cable
2. Above all electrical boxes
3. Above or near all raceways.

907.2.12.2 (IBC [F] 907.2.12.2) Interconnection. The line type heat detection system shall be interconnected with the smoke alarms required by Section 907.2.11 in such a manner that when the line type heat detection activates such detection shall activate the smoke alarms in all sleeping units and dwelling units.

4603.8 Line type heat detection. A line type heat detection that activates at 475° F (246°C) shall be installed in existing Group R Occupancies in accordance with Sections 4603.8.1 through 4603.8.2, NFPA 72, NFPA 70 and manufacturer's instructions.

4603.8.1 Location. Line type heat detection shall be installed in the following locations:

1. Above all exposed NM-B Cable
2. Above all electrical boxes
3. Above or near all raceways.

4603.8.2 Interconnection. The line type heat detection system shall be interconnected with the smoke alarms required by Section 907.2.11 in such a manner that when the line type heat detection activates such detection shall activate the smoke alarms in all sleeping and dwelling units.

PART II – IRC

Add new text as follows:

R314.5 Line type heat detection. A line type heat detection system that activates at 475°F(246°C) shall be installed in accordance with Sections 314.5.1 through 314.5.2, NFPA 72, NFPA 70 and manufacturer's instructions.

R314.5.1 Location. Line type heat detection shall be installed in the following locations:

1. Above all NM-B Cable
2. Above all electrical boxes
3. Above or near all raceways.

R314.5.2 Interconnection. The line type heat detection system shall be interconnected with the smoke alarms in such a manner that when the line type heat detection activates such detection shall activate all of the alarms in the dwelling unit. Where there are two dwelling units the line type heat detection shall be interconnected with the smoke alarms in both dwelling units.

Reason: According to death certificate data, 25% of fire and flame deaths in 2002 were due to smoke inhalation alone, 26% due to burns and 21% to a combination of burns and smoke inhalation. There were 517,000 structural, 3,140 civilian deaths and 17,730 civilian induries. *(page 37).

ESCAPING – all seemed savable …; SLEEPING – 1/3 estimated as savable; RESCUING OR FIREFIGHTING – ¾ estimated savable … **Reanalysis of who can be saved.** (see additional data attached)

Deterioration of electrical wiring caused by time or the environment is a predominant cause of ignition. *+ (pg. 24)

Fires in electrical distribution systems contribute significantly to the U.S. fire problem, accounting for a consistent portion of the problem year after year. *+ (page 69)

In 2006 an estimated 71,360 injuries involving electrical distribution or lighting equipment were reported to hospital emergency rooms. +

Electrical distributions and lighting equipment dwelling fires are the only type of home fires that have been shown to increase in frequency with increasing dwelling age. *+

The majority of 2002-2005 non-confined home structure fires involving electrical distribution or lighting equipment began with the ignition of products and materials often found in structural areas, including wire or cable insulation (30%), structural members or framing (12%), insulation within the structural area (5%). Pg 6#

Three-fourths (75%) of deaths in 2002-2005 home fires involving electrical distribution or lighting equipment involved victims who were outside the area of origin when the fire began. (pg 6#)

Branch circuit wiring (51%) accounted for half of the 2002-2005 non-confined home structure fires involving wiring. (pg 54 #)

Half (52%) of 2002-2005 non-confined home structure fires involving wiring began in fire areas of origin that are all concealed or exterior spaces. (pg 55 #)

The majority (57%) of 2002-2005 non-confined home structure fires involving overcurrent protection devices began with ignition wire or cable insulation. (pg 89#)

SUMMARY: Electrical distribution equipment is a highly significant contributor to the high number of civilian deaths and civilian injuries resulting year after year in home fires. Many lives can be saved and injuries prevented if earlier warning can be sounded.

CONCLUSION: The line type open switch activated by heat and/or fire is designed by earliest warning to prevent death by asphyxiation and burning.

(6b) Circuitry short circuits and overloads trip the circuit breakers when the breaker rating is reached. Lower leakage causes hot spots along the line and eventually causes fires that could be detected long before they could become autocatalytic. The line type open switch is designed to detect this hazard long before life is endangered.

Cost Impact: This code change proposal will increase the cost of construction.

PART I – IFC

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

PART II – IRC BUILDING/ENERGY

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: SCARELLI F1-907.2.12.DOC

F117–09/10
907.2.12.1 (IBC [F] 907.2.12.1)

Proponent: Rick Sheets, Fire Committee Chair, Brinks Home Security, representing National Burglar and Fire Alarm Association

Revise as follows:

907.2.12.1 (IBC [F] 907.2.12.1) Alarm. Activation of any single smoke detector, the *automatic sprinkler system* or any other automatic fire detection device shall immediately sound an alarm at ~~the building at~~ a constantly attended location from which emergency action can be initiated, including the capability of manual initiation of requirements in Section 907.2.12.2.

Reason: Deleting the words "at the building" allows for a broader interpretation of a suitable location from which to take action.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: SHEETS-F8-907.2.12.1-PRIMARY.DOC

F118–09/10
907.2.12.1 (IBC [F] 907.2.12.1)

Proponent: Rick Sheets, Fire Committee Chair, Brinks Home Security, representing National Burglar and Fire Alarm Association

Revise as follows:

907.2.12.1 (IBC [F] 907.2.12.1) Alarm. Activation of any single smoke detector, the *automatic sprinkler system* or any other automatic fire detection device shall immediately ~~sound an~~ activate an audible and visible alarm at the building at a constantly attended location from which emergency action can be initiated, including the capability of manual initiation of requirements in Section 907.2.12.2.

Reason: The confusing language contained in the existing code is the problem, as it is not consisted with NFPA 72, nor other references in this code or the IBC.

This could be resolved by using the word "activate" instead of "sound". Also, adding the words "audible and visible" is consistent with other codes and standards where private mode signaling is required or permitted.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: SHEETS-F9-907.2.12.1-SECONDARY.DOC

F119–09/10
907.2.13.1.1 (IBC [F] 907.2.13.1.1)

Proponent: Thomas P. Hammerberg, Automatic Fire Alarm Association, Inc.

Revise as follows:

907.2.13.1.1 (IBC [F] 907.2.13.1.1) Area smoke detection. Area smoke detectors shall be provided in accordance with this section. Smoke detectors shall be connected to an automatic fire alarm system. The activation of any detector required by this section shall operate the emergency voice/alarm communication system in accordance with Section 907.6.2.2. In addition to smoke detectors required by Sections 907.2.1 through 907.2.10, smoke detectors shall be located as follows:

1. In each mechanical equipment, electrical, transformer, telephone equipment or similar room which is not provided with sprinkler protection.
2. In each elevator machine room and in elevator lobbies.

Reason: This change will provide more clarity for the requirements for smoke detectors in high-rise buildings. Without this language, it is possible to interpret this to mean that the only smoke detectors required in a high-rise are as listed in this Section. It further clarifies which detectors must activate the emergency voice alarm communication system.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

907.2.13.1.2 (IBC [F] 907.2.13.1.2); IMC 606.2.1 (New), 606.2.2

Proponent: Dave Frable, U.S. General Services Administration

THIS IS A 2 PART CODE CHANGE. BOTH PARTS WILL BE HEARD BY THE FIRE CODE COMMITTEE AS 2 SEPARATE CODE CHANGES. SEE THE TENTATIVE HEARING ORDER FOR THE FIRE CODE COMMITTEE.

PART I – IFC

Revise as follows:

907.2.13.1.2 (IBC [F] 907.2.13.1.2) Duct smoke detection. Duct smoke detectors complying with Section 907.3.1 shall be located as follows:

1. In the main supply air duct of each air-handling system having a design capacity greater than 2,000 cubic feet per minute (cfm) (0.94 m^3/s), downstream of any filters.

~~1.~~ 2. In the main return ~~air and exhaust air plenum~~ of each air-~~conditioning~~ handling system having a design capacity greater than ~~2,000~~ 15,000 cubic feet per minute (cfm) ~~(0.94 m^3/s)~~(7.1 m^3/s). Such detectors shall be located in a serviceable area downstream of the last duct inlet.

3. In the supply air system where multiple air-handling systems share common or supply return air ducts or plenums with a combined design capacity greater than 2,000 cfm (0.9 m^3/s),

4. At each story in return air systems having a design capacity greater than 15,000 cfm (7.1 m^3/s), where return air risers serve two or more stories.

~~2.~~ 5. At each connection to a vertical duct or riser serving two or more stories from a return air duct or plenum of an air-conditioning system with a design capacity of greater than 15,000 cfm (7.1 m^3/s). In Group R-1 and R-2 occupancies a listed smoke detector is allowed to be used in each return air riser carrying not more than 5,000 cfm (2.4 m^3/s) and serving not more than 10 air inlet openings.

Exception: Smoke detectors are not required in the return air system where all portions of the building served by the air distribution system are protected by area smoke detectors connected to a fire alarm system in accordance with the *International Fire Code*.

PART II – IMC

Revise as follows:

606.2 Where required. Smoke detectors shall be installed where indicated in Sections 606.2.1 through ~~606.2.3~~ 606.2.4.

Exception: Smoke detectors shall not be required where air distribution systems are incapable of spreading smoke beyond the enclosing walls, floors and ceilings of the room or space in which the smoke is generated.

606.2.1 Supply air systems. Smoke detectors shall be installed in supply air systems with a design capacity greater than 2,000 cubic feet per minute (cfm) (0.94 m^3/s), in the supply air duct or plenum downstream of any filters.

~~606.2.1~~ 606.2.2 Return air systems. Smoke detectors shall be installed in return air systems with a design capacity greater than ~~2,000~~ 15,000 cfm (~~0.9~~ 7.1m^3/s), in the return air duct or plenum upstream of any filters, exhaust air connections, outdoor air connections, or decontamination equipment and appliances.

Exception: Smoke detectors are not required in the return air system where all portions of the building served by the air distribution system are protected by area smoke detectors connected to a fire alarm system in accordance with the *International Fire Cod*e. The area smoke detection system shall comply with Section 606.4.

~~**606.2.2**~~ **606.2.3 Common supply and return air systems.** Where multiple air-handling systems share common supply or return air ducts or plenums with a combined design capacity greater than 2,000 cfm (0.9 m^3/s), the supply ~~return~~ air system shall be provided with smoke detectors in accordance with Section 606.2.1.

~~**Exception:** Individual smoke detectors shall not be required for each fan-powered terminal unit, provided that such units do not have an individual design capacity greater than 2,000 cfm (0.9 m^3/s) and will be shut down by activation of one of the following:~~

~~1. Smoke detectors required by Sections 606.2.1 and 606.2.3.~~
~~2. An approved area smoke detector system located in the return air plenum serving such units.~~
~~3. An area smoke detector system as prescribed in the exception to Section 606.2.1~~.

In all cases, the smoke detectors shall comply with Sections 606.4 and 606.4.1.

Reason: The intent of this proposal is to improve the level of detection of smoke within air handling units cost effectively and to correlate smoke detector requirements in air handling systems in the IBC, IFC and IMC with the requirements currently found in NFPA 90A, *Standard for the Installation of Air-Conditioning and Ventilating Systems*.

During the 2006/2007 ICC Code Development Hearings in Orlando, both the Fire Code Committee and Mechanical Code Committee recommended approval of two similar code change proposals (F113-06/07 – Part 1& Part 2). However, at the Final Action Hearings of the ICC in May 2007, the ICC membership voted to overturn both the Fire Code Committee and the Mechanical Code Committee's recommendations and disapproved the subject code change proposals. At the hearings, no new information or technical substantiation was brought forth to substantiate overturning the two Code Committee's recommendations for approval. It should be emphasized that the main issue of contention by the opponents of this code change proposal at both the Code Committee and Final Action Hearings was that this issue had been debated many times before in the ICC Code Development Process. However, that is untrue. During the 2009 Code Hearings in Minneapolis, the only mention of this occurring was in the Commonwealth of Virginia's Mechanical Code over 10 years ago.

The technical substantiation to revise the location of smoke detectors from the return air side to the supply air side is valid; and will improve the level of detection of smoke within air-handling units. Opponents may argue that return air detectors will detect fires in a building much quicker than detectors located on the supply air side, but return air detectors are **not** a substitute for area detectors. If there is a desire for early detection of smoke, area smoke detectors should be installed. However, we contend that the detector serving the supply air detector will operate as desired once the smoke concentration levels in the supply air exceeds the alarm threshold so occupants should not be at risk should the return air fan continues to run prior to the supply air fan shutting down. In addition, return air detectors will not be able to detect smoke from a fire on the supply side of air handling units due to fan belts, motors or combustible filters so their respective fan will shut off appropriately. A smoke detector located on the supply side can also detect smoke from an exterior fire that gets pulled into the fresh air intake for the air handling system. Thus, a smoke detector located on the supply side will serve the purpose of protecting building occupants from smoke produced by air handling unit fire or smoke ingress via the fresh air intake for the air handling unit. Therefore overall detection is improved.

Correlating the IFC, IBC and IMC with NFPA 90A is also important as many jurisdictions adopt both the IFC/IMC and NFPA 90A. Accredited health care organizations are required by law to comply with NFPA 90A. Not having the subject requirements in the IBC in concert with NFPA 90A results in the unnecessary installation of smoke detectors in both the return and supply air systems. This code change proposal aims to maintain detection in air handling systems, not remove it. There should be no increase in installation costs as this code change proposal merely shifts the location of devices from the return air side to the supply air side, where air handling units are greater than 2000 cfm. In fact, changing the requirement as proposed will reduce the cost in jurisdictions that must comply with the IFC/IMC and NFPA 90A (i.e., leaving the requirements as currently stated in both the IFC and IMC already results in unnecessary additional costs).

Specific code changes are as follows:

PART I:
(New) IFC 907.2.13.1.2, paragraph 1
Over the past few years, the U.S. General Services Administration has had a number of fire incidences that did not activate the building fire alarm system because there were no smoke detectors installed in the main supply air duct of the air-handling system downstream of any filter. Conversely, GSA has no incidence of a return air duct smoke detector activating as a result of detecting smoke in the return air handling system. Installing duct smoke detectors in the supply air system would ensure that a fire within the supply air filters, in the air handling motors or originating outside near air intakes can be discovered before it spreads. Establishing a 2,000 cfm threshold for installing detectors in supply air fans appears to be an industry standard.

(New) 907.2.13.1.2, paragraphs 2 & 3 (Note: the intent is for 907.2.13.1.2 to be have similar language as 606.2.2 and 606.2.3 so the codes are coordinated). The current requirement for installing duct smoke detectors in return air systems exceeding 2,000 cfm is overly restrictive. The 15,000 cfm threshold for return air systems appears to be an industry standard, as this capacity was used in the legacy codes and is currently used by NFPA 90A. The term "air conditioning system" has been replaced with "air handling system to more accurately reflect the type of system used in buildings today.

(Deleted text) Per the commentary for Section 606.1, requiring duct smoke detectors in exhaust air plenums does not provide any protection for the fan or the building occupants, since smoke is being exhausted out of the building. In addition, return air smoke detection is not supposed to be used as a means for detecting smoke in buildings.

(New) IFC 907.2.13.1.2, paragraph 4 is material extracted from IMC existing 606.2.3 (changed to 606.2.4).
This is an editorial change to coordinate the two codes.

(Revision) 907.2.13.1.2 Paragraph No. 5 (formally Paragraph No. 2) – The purpose of this code change is to correlate this paragraph with the changes above. The code language contained in the IBC does not have a capacity threshold for return air ducts/plenum with connections to more than two stories and, therefore, all return duct/plenum system that connects more than two floors would require duct mounted smoke detectors at the connection to the riser regardless of the size of the system. This would be onerous to smaller buildings that have multi-story returns. In addition, no other code (either the legacy codes or NFPA 90A require duct smoke detectors in multi-story return air systems unless they exceed 15,000 cfm. This change also would correlate the capacity requirements currently specified in NFPA 90A - 2007 edition (NFPA 90A – 6.4.2).

(New) Exception to IFC 907.2.13.1.2 (2) through (5) is material extracted from the IMC existing exception to 606.2.1 (changed to 606.2.2) that eliminates the need for duct smoke detectors in return air systems when the entire building is protected by area smoke detectors.

PART II:
(Revision) 606.2. This is an editorial change to coordinate the two codes.

(New) IMC 606.2.1

Over the past few years, the U.S. General Services Administration has had a number of fire incidences that did not activate the building fire alarm system because there were no smoke detectors installed in the main supply air duct of the air-handling system downstream of any filter. Conversely, GSA has no incidence of a return air duct smoke detector activating as a result of detecting smoke in the return air handling system. Installing duct smoke detectors in the supply air system would ensure that a fire within the supply air filters, in the air handling motors or originating outside near air intakes can be discovered before it spreads. Establishing a 2,000 cfm threshold for installing detectors in supply air fans appears to be an industry standard.

(Revision/New) 606.2.1 and 606.2.2 (changed to 606.2.2 and 606.2.3, respectively) (Note: the intent is for 907.2.13.1.2 paragraphs 2 & 3 to have similar language as 606.2.2 and 606.2.3 so the codes are coordinated). The current requirement for installing duct smoke detectors in return air systems exceeding 2,000 cfm is overly restrictive. The 15,000 cfm threshold for return air systems appears to be an industry standard, as this capacity was used in the legacy codes and is currently used by NFPA 90A. The term "air conditioning system" has been replaced with "air handling system to more accurately reflect the type of system used in buildings today.

(Deletion) Exception to IMC 606.2.2 (changed to IMC 606.2.3):

The 2,000 cfm requirement has been applied to the supply air side. Therefore the Exception needs to be deleted given the proposed new return air threshold will be increased from 2,000 cfm to 15,000 cfm.

(Revision) IMC 606.2.3 (changed to IMC 606.2.4) editorial as a new section was inserted. Existing text unchanged.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: FRABLE-F1-907.2.13.1.2.DOC

F121–09/10

907.4, 907.4.1 (New) [IBC [F] 907.3, [F] 907.3.1 (New)]

Proponent: Rick Sheets, Fire Committee Chair, Brinks Home Security, representing National Burglar and Fire Alarm Association

Revise as follows:

907.4 (IBC [F] 907.3) Fire safety functions. Automatic fire detectors utilized for the purpose of performing fire safety functions shall be connected to the building's fire alarm control unit where a fire alarm system is required by Section 907.2. Detectors shall, upon actuation, perform the intended function and activate the alarm notification appliances or activate a visible and audible supervisory signal at *a constantly attended location.*

907.4.1 (IBC [F] 907.3.1) Power source. In buildings not equipped with a fire alarm system, the automatic fire detector shall be powered by normal electrical service and, upon actuation, perform the intended function. The detectors shall be located in accordance with NFPA 72.

Exception: Elevator recall and supervisory service detectors shall be connected to a dedicated function fire alarm control unit that shall be designated as "Elevator Recall Control & Supervisory Unit".

Reason: Including this exception means-monitoring the integrity of the initiating device circuits cannot be omitted. In the past, smoke alarms and heat detectors were directly wired in the elevator equipment without providing the required monitoring for integrity of the circuit wiring, allowing elevators to be used during a fire. The requirement for the use of a fire alarm control unit for elevator recall is also a requirement of NFPA 72, (found in Section 6.16.3 in the 2007 edition), and should be added here for conformity as well as safety.

Cost Impact: The code change proposal will not increase the cost of construction since compliance with NFPA 72 is already required by this code and elevator codes.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: SHEETS-F12-907.4.1.DOC

F122–09/10
907.5.1 (IBC [F] 907.4.1)

Proponent: Thomas P. Hammerberg, Automatic Fire Alarm Association, Inc

Revise as follows:

907.5.1 (IBC [F] 907.4.1) Protection of fire alarm control unit. In areas that are not continuously occupied, a single smoke detector shall be provided at the location of each fire alarm control unit, notification appliance circuit power extenders and supervising station transmitting equipment.

Exceptions:

1. Where ambient conditions prohibit installation of smoke detector, a *heat detector* shall be permitted.
2. The smoke detector shall not be required where the building is equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1 or 903.3.1.2.

Reason: This exception was added to this requirement during the last code cycle so the language would be consistent with NFPA 72. This exception was deleted in the 2010 edition of NFPA 72, so needs to be deleted here for consistency.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: HAMMERBERG-F2-907.5.1.DOC

F123–09/10
907.5.2.6 (New) [IBC [F] 907.4.2.6 (New)]

Proponent: Patrick D. Bradshaw, CFI-II, CFPE; Richland County Emergency Services (Fire Marshal's Office), SC, representing self

Add new text as follows:

907.5.2.6 (IBC [F] 907.4.2.6) Unobstructed and unobscured. Manual fire alarm boxes shall be accessible, unobstructed, unobscured and visible at all times

Reason: Currently there is no clear requirement in the IFC for maintaining manual fire alarm boxes clear and unobstructed. It is recommended that a minimum of 3 feet be kept clear but more may be needed. NFPA 72 does address the installation to be unobstructed in section 5.13.5 of the 2007 edition. NFPA 1 and NFPA 101 both address this requirement. For those jurisdictions adopting the ICC family of codes, this apparent common sense requirement is not found. Adding this requirement to the IFC will streamline inspections and enforcement by mandating this in the body of the code in a concise manner and not a secondary reference.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: BRADSHAW-F1-907.4.6.DOC

F124–09/10
907.6.2.1 (IBC [F] 907.5.2.1)

Proponent: Dave Frable, U.S. General Services Administration

Revise as follows:

907.6.2.1 (IBC [F] 907.5.2.1) Audible alarms. Audible alarm notification appliances shall be provided and emit a distinctive sound that is not to be used for any purpose other than that of a fire alarm.

Exceptions

1. Visible alarm notification appliances shall be allowed in lieu of audible alarm notification appliances in critical care areas of Group I-2 occupancies.
2. Where provided, audible notification appliances located in each occupant evacuation elevator lobby in accordance with Section 3008.5.1 of the *International Building Code* shall be connected to a separate notification zone for manual paging only.

Reason: The intent of this code change is to ensure that automatic emergency voice/alarm messages do not interfere with operation of the two-way communication. Ensures that live voice messages from the emergency voice/alarm communication will only transmit into the subject enclosed elevator lobby.

Cost Impact: The code change proposal will increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: FRABLE-F2-907.6.2.1.DOC

F125–09/10
907.6.2.1.1 (IBC [F] 907.5.2.1.1)

Proponent: Tom Lariviere, Chairman, Joint Fire Service Review Committee

Revise as follows:

907.6.2.1.1 (IBC [F] 907.5.2.1.1) Average sound pressure. The audible alarm notification appliances shall provide a sound pressure level of 15 decibels (dBA) above the average ambient sound level or 5 dBA above the maximum sound level having a duration of at least 60 seconds, whichever is greater, in every occupiable space within the building. ~~The minimum sound pressure levels shall be 75 dBA in occupancies in Groups R and I-1; 90 dBA in mechanical equipment rooms; and 60 dBA in other occupancies.~~

Reason: The concept of providing a minimum dBA level in the code was contained in the First Draft of the IFC/IBC. This concept can be traced back to the Legacy Codes and was added in 1990. At that time, the code requirement was consistent with, or more restrictive than, the requirements contained in NFPA 72G. NFPA 72G has since been incorporated into NFPA 72 and the sound levels have not only been relocated from the body of the standard to Annex B, but have also been revised in NFPA 72. The subsequent revisions of the sound levels in NFPA 72 occurred without a corresponding revision to the sound levels now found in the International Codes. In other words, the IFC/IBC has not kept up with these revisions in NFPA 72.

Both NFPA 72G and NFPA 72 provide guidance on the expected ambient sound level. Whereas, the IFC provides a minimum level of the notification appliance. Both IFC and NFPA 72 require 15 dBA above the ambient sound level. The required notification sound levels in NFPA 72G, NFPA 72 and IFC are shown below:

Use or Occupancy	NFPA 72G	NFPA 72	IFC/IBC
Business Occupancies	45 + 15 = **60**	55 + 15 = **70**	**60**
Educational Occupancies	45 + 15 = **60**	45 + 15 = **60**	**60**
Industrial Occupancies	80 + 15 = **95**	80 + 15 = **95**	**60**
Institutional Occupancies	50 + 15 = **65**	50 + 15 = **65**	**75**
Mercantile Occupancies	40 + 15 = **55**	40 + 15 = **55**	**60**
Piers and Water surrounded structures	40 + 15 = **55**	40 + 15 = **55**	**60**
Places of Assembly	40 + 15 = **55**	55 + 15 = **70**	**60**
Residential Occupancies	35 + 15 = **50**	35 + 15 = **50**	**75**
Residential at the pillow	Na	**75** dBA	**not specified**
Storage Occupancies	30 + 15 = **45**	30 + 15 = **45**	**60**
Thoroughfares, High Density Urban	70 + 15 = **85**	70 + 15 = **85**	**60**
Thoroughfares, Medium Density Urban	55 + 15 = **70**	55 + 15 = **70**	**60**
Thoroughfares, Rural and Suburban	40 + 15 = **55**	40 + 15 = **55**	**60**
Tower Occupancies	35 + 15 = **50**	35 + 15 = **50**	**60**
Underground Structures and Windowless Buildings	40 + 15 = **55**	40 + 15 = **55**	**60**
Vehicles and Vessels	50 + 15 = **65**	50 + 15 = **65**	**60**
Mechanical Equipment Rooms	85 + 15 = **100**	85 + 15 = **100**	**90**

The sound levels required in the IFC are not consistent with the ambient sound levels recommended for design in NFPA 72. In some cases, the IFC requirement is a higher sound level and in some cases it is lower. More importantly, the requirements in the IFC do not cover all of the possible categories or uses of the building. There is no justification to continue with the requirement in IFC and it should be deleted.

By deleting the specific sound levels specified in the IFC/IBC, the requirement then falls back to 15 dbA above the ambient sound level. This is the true test - whether or not the audibility is 15dBA over the ambient sound level. As an example, the IFC requires that the sound level for a notification device in a casino is 60 dBA; while NFPA 72 would recommend 70 dBA; while the actual ambient sound level may require devices at 95 dBA.

Therefore, these requirements in the IFC are too limited and are proposed to be deleted. Even the sound levels in NFPA 72 are only recommendations for design. The actual requirement of 15 dBA above the ambient sound level is retained in the IFC and is consistent with NFPA 72.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: LARIVIERE-F16-907.6.2.1.1.DOC

F126–09/10
907.6.2.2 (IBC [F] 907.5.2.2), 907.6.2.2.5 (New) [IBC [F] 907.5.2.2.5 (New)]

Proponent: Gene Boecker, Code Consultants, Inc.

1. Revise as follows:

907.6.2.2 (IBC [F] 907.5.2.2) Emergency voice/alarm communication systems. Emergency voice/alarm communication systems required by this code shall be designed and installed in accordance with NFPA 72. ~~The operation of any automatic fire detector, sprinkler waterflow device or manual fire alarm box shall automatically sound an alert tone followed by voice instructions giving approved information and directions for a general or staged evacuation in accordance with the building's fire safety and evacuation plans required by Section 404. In high-rise buildings, the system shall operate on a minimum of the alarming floor, the floor above and the floor below. Speakers shall be provided throughout the building by paging zones. At a minimum, paging zones shall be provided as follows:~~

~~1. Elevator groups.~~
~~2. Exit stairways.~~
~~3. Each floor.~~
~~4. Areas of refuge as defined in Section 1002.1.~~

~~**Exception:** In Group I-1 and I-2 occupancies, the alarm shall sound in a constantly attended area and a general occupant notification shall be broadcast over the overhead page.~~

2. Add new text as follows:

907.6.2.2.5 (IBC [F] 907.5.2.2.5) High-rise buildings. The operation of any automatic fire detector, sprinkler waterflow device or manual fire alarm box shall automatically sound an alert tone followed by voice instructions giving approved information and directions for a general or staged evacuation in accordance with the building's fire safety and evacuation plans required by Section 404. In high-rise buildings, the system shall operate on a minimum of the alarming floor, the floor above and the floor below. Speakers shall be provided throughout the building by paging zones. At a minimum, paging zones shall be provided as follows:

1. Elevator groups.
2. Exit stairways.
3. Each floor.
4. Areas of refuge as defined in Section 1002.1.

Exception: In Group I-1 and I-2 occupancies, the alarm shall sound in a constantly attended area and a general occupant notification shall be broadcast over the overhead page.

Reason: This code change proposal clarifies the requirements of the Code for voice/alarm communication systems. In addition to high-rise buildings, voice/alarm communications systems may also be required in assembly occupancies, buildings with an atrium, and covered mall buildings. The second, third, and fourth sentences of Section 907.6.2.2 (IBC [F] 907.5.2.2) and the associated exception have been relocated to a new Section 907.6.2.2.5 (IBC [F] 907.5.2.2.5), because these sentences refer solely to high-rise voice/alarm communication system requirements and do not apply to all voice/alarm communication systems required by other sections of the Code. The revised section clearly differentiates between requirements applicable to all voice/alarm communication systems and requirements solely applicable to voice/alarm communication systems in high-rise buildings.

Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME: BOECKER-F8-907.6.2.2.DOC

F127–09/10
907.6.2.2 (IBC [F] 907.5.2.2)

Proponent: Rick Sheets, Fire Committee Chair, Brinks Home Security, representing National Burglar and Fire Alarm Association

Revise as follows:

907.6.2.2 (IBC [F] 907.5.2.2)Emergency voice/alarm communication systems. Emergency voice/alarm communication systems required by this code shall be designed and installed in accordance with NFPA 72. The operation of any automatic fire detector, sprinkler water flow device or manual fire alarm box shall automatically sound an alert tone followed by voice instructions giving *approved* information and directions for a general or staged evacuation in accordance with the building's fire safety and evacuation plans required by Section 404. In high-rise buildings, the system shall operate on a minimum of the alarming floor, the floor above and the floor below. Speakers shall be provided throughout the building by paging zones. At a minimum, paging zones shall be provided as follows:

1. Each elevator group~~s~~.
2. Each interior exit stairway~~s~~.
3. Each floor.
4. Areas of refuge as defined in Section 1002.1

Reason: The problem is that exterior stairways that are not enclosed cannot be properly served by an Emergency Voice Alarm Communication speaker system.

The requirement for speakers as part of an EVAC system to be installed in exterior stairways should be eliminated due to fact that a voice announcement's effectiveness is lost in an open environment because of wind and street noise. The quantity and volume of speakers necessitated by this requirement would be impractical. Their use would be startling to anyone near them, and offset any perceived value.

Stairways and elevators not within a common hoistway should not be grouped together so the word "each" should be added.

Cost Impact: The code change proposal will not increase the cost of construction.

	Assembly:	ASF	AMF	DF

ICCFILENAME: SHEETS-F13-907.6.2.2.DOC

F128–09/10
907.6.2.3.4 (IBC [F] 907.5.2.3.4)

Proponent: Gene Boecker, Code Consultants, Inc.

Revise as follows:

907.6.2.3.4 (IBC [F] 907.5.2.3.4) Group R-2. In Group R-2 occupancies required by Section 907 to have a fire alarm system, all dwelling units and sleeping units shall be provided with the ~~capability~~ capacity at the fire alarm control unit to support visible alarm notification appliances in accordance with ICC A117.1.

Reason: The section indicates that all dwelling units shall be provided with the capability to support visible alarm notification appliances in accordance with ICC/ANSI A117.1. The code requires that all dwelling units be provided with the capability to support visible notification appliances, which allows for misinterpretation. The added text clarifies the intent for the dwelling units being capable of supporting visible notification appliances and provides a means of enforcing the intent of the code.

The cost of construction may or may not be increased depending on what is currently being used as the "norm" for meeting this provision. Therefore, the comment below is stating the position with regards to increase in cost. It is just as likely, however, that the cost will be reduced if there are more restrictive interpretations being used to meet the requirement.

Cost Impact: The code change proposal will increase the cost of construction.

	Assembly:	ASF	AMF	DF

ICCFILENAME: BOECKER-F5-907.6.2.3.4.DOC

F129–09/10
907.7.3 (IBC [F] 907.7.3)

Proponent: Jeff Hugo, CBO, National Fire Sprinkler Association

Revise as follows:

907.7.3 (IBC [F] 907.7.3) Zones. Each floor shall be zoned separately and a zone shall not exceed 22,500 square feet (2090 m^2). The length of any zone shall not exceed 300 feet (91 440 mm) in any direction.

Exceptions:

1. Automatic sprinkler system zones shall not exceed the area permitted by NFPA 13.
2. For buildings with one exit complying with Section 1019.2, the sprinkler system in the building shall be permitted to be a single zone.

Reason: The requirement for each floor to be a separate zone hampers innovative design of sprinkler systems. If the building is permitted to be a single zone, piping for sprinklers on the top floor can be fed through the walls from the floor below, keeping sprinkler piping out of the attic, which will eliminate concerns over pipe freezing and reduce the cost of the installation.

Typically, codes have required water flow alarms on each floor because fire fighters want to know which floor the fire is on when they arrive at the building. In a small building (so small that it complies with the rules for a single exit), you will not need a water flow alarm to tell you which floor the fire is on. You will be able to hear the water flowing from the sprinkler from the single stairwell.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: HUGO-F1-907.8.DOC

F130–09/10
907.9.4

Proponent: Thomas P. Hammerberg, Automatic Fire Alarm Association, Inc.

Revise as follows:

907.9.4 Method. To verify that each smoke detector is within its *listed* and marked sensitivity range, it shall be tested using one of the following methods:

1. A calibrated test method;
2. The manufacturer's calibrated sensitivity test instrument;
3. *Listed* control equipment arranged for the purpose;
4. A smoke detector/control unit arrangement whereby the detector causes a signal at the control unit where the detector's sensitivity is outside its acceptable sensitivity range; or
5. Another calibrated sensitivity test method acceptable to the *fire code official*.

Detectors found to have a sensitivity outside the *listed* and marked sensitivity range shall be cleaned and recalibrated or replaced.

Exceptions:

1. Detectors *listed* as field adjustable shall be permitted to be either adjusted within the *listed* and marked sensitivity range and cleaned and recalibrated or they shall be replaced.
2. This requirement shall not apply to single-station smoke alarms in one- or two-family dwellings.

Reason: This change is required for consistency with the requirements for NFPA 72. NFPA 72 presently requires sensitivity testing for all smoke detectors and smoke alarms other than those installed in one- or two-family dwellings. This is not a new requirement in NFPA 72.

Cost Impact: The code change proposal will not increase the cost of construction.

908 (New) [IBC [F] 908(New)], 902 (IBC [F] 902), Chapter 47 (IBC Chapter 35); IRC R315, R202, Chapter 44

Proponent: Roger Evans, Park City Municipal Corporation, representing Utah Chapter of ICC

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IFC COMMITTEE. PART II WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IFC

1. Add new text as follows:

SECTION 908 (IBC SECTION [F] 908)
CARBON MONOXIDE ALARMS AND
CARBON MONOXIDE DETECTION SYSTEMS

908.1 General. This section covers the application, installation, performance and maintenance of carbon monoxide alarms and carbon monoxide detection systems in new buildings and structures.

908.1.1 Carbon monoxide alarms, carbon monoxide detectors and combination smoke/carbon monoxide devices. Carbon monoxide alarms, carbon monoxide detectors and combination smoke/carbon monoxide alarms and combination smoke/carbon monoxide detectors described in sections 908.1.2 through 908.1.5 shall be installed and maintained in accordance with the provisions of this code, NFPA 72 and NFPA 720.

908.1.2 Carbon monoxide alarms. Single- or multiple-station carbon monoxide alarms shall be listed and labeled in accordance with ANSI/UL 2034.

908.1.3 Carbon monoxide detectors. Carbon monoxide detectors shall be listed and labeled in accordance with ANSI/UL 2075.

908.1.4 Combination smoke/carbon monoxide alarms. Combination smoke/carbon monoxide alarms shall be listed and labeled in accordance with ANSI/UL 217 and ANSI/UL 2034

908.1.5 Combination smoke/carbon monoxide detectors. Combination smoke/carbon monoxide detectors shall be listed and labeled in accordance with ANSI/UL 268 and ANSI/UL 2075

908.2 Power Source. Required single- or multiple-station carbon monoxide alarms, carbon monoxide detectors, combination smoke/carbon monoxide alarms or combination smoke/carbon monoxide detectors shall receive their power by one of the following means:

1. Listed carbon monoxide alarms shall receive their primary power from the building wiring when such wiring is served from a commercial source with secondary power backup and without a disconnecting switch other than those required for overcurrent protection. Listed carbon monoxide alarms that are battery-powered or plug-in with battery backup shall not be permitted in new construction.
2. Listed carbon monoxide detectors shall receive their power from the approved control panel. The approved control panel shall receive its primary power from the building wiring when such wiring is served from a commercial source and the primary power source shall not include a disconnecting switch other than those required for overcurrent protection. The control panel shall be equipped with rechargeable batteries for secondary power backup.
3. Listed low-power radio frequency (wireless) detectors shall be permitted to be battery powered when the battery is electrically supervised and shall be capable of sending an alarm signal to the approved control panel for a minimum of 7 days after sending the initial battery depletion signal.

908.2.1 Interconnection. Where more than one listed carbon monoxide alarm, or, combination smoke/carbon monoxide alarm is required to be installed within a dwelling unit they shall be interconnected in such a manner that the activation of one carbon monoxide alarm shall activate all of the carbon monoxide alarms in the dwelling unit and the activation of a carbon monoxide detector or combination smoke/carbon monoxide detector shall activate the carbon monoxide audible notification devices throughout the individual dwelling unit. The required carbon monoxide alarm signal shall be clearly audible in all sleeping rooms, having a sound level of at least 15 db above average ambient sound level or 5 db above the maximum sound level, or a sound level at least 75 db at the pillow.

Exception: Carbon monoxide alarms, carbon monoxide detectors, combination smoke/carbon monoxide alarms or combination smoke/carbon monoxide detectors installed in existing construction shall not be required to cause all carbon monoxide alarms to sound.

908.2.2 Acceptance testing. When the installation of carbon monoxide alarms, carbon monoxide detectors, combination smoke/carbon monoxide alarms or combination smoke/carbon monoxide detectors is complete, each alarm or detector and interconnecting wiring shall be tested in accordance with NFPA 72 and NFPA 720.

908.2.3 Where required. Listed single- or multiple-station carbon monoxide alarms, carbon monoxide detectors, combination smoke/carbon monoxide alarms or combination smoke/carbon monoxide detectors shall be installed in locations described in sections 908.2.4 through 908.2.5.

908.2.4 Group R-1. Group R-1 occupancies located in a buildings that contain fuel burning appliances or which have attached garages, listed multiple-station carbon monoxide alarms, carbon monoxide detectors, combination smoke/carbon monoxide alarms or combination smoke/carbon monoxide detectors shall be installed in the following locations:

1. On the ceiling or wall of the same room as permanently installed fuel burning appliances in accordance with manufacturers published instructions
2. Centrally located on every habitable level, in every HVAC zone of the building

Exception: Carbon monoxide alarms or carbon monoxide detectors shall not be required in sleeping units unless the sleeping unit contains a fuel-burning appliance.

The required carbon monoxide alarms or carbon monoxide detectors shall be annunciated at a constantly attended location

908.2.5 Groups R-2, R-3 and R-4. Group R-2, R-3 and R-4 occupancies located in buildings that contain fuel burning appliances or which have attached garages, listed multiple-station carbon monoxide alarms, carbon monoxide detectors, combination smoke/carbon monoxide alarms or combination smoke/carbon monoxide detectors shall be installed in the following:

1. Outside each separate dwelling unit sleeping area in the immediate vicinity of the bedrooms
2. On every level of a dwelling unit, including basements and in every HVAC zone of the building
3. On the ceiling or wall of the same room as permanently installed fuel burning appliances in accordance with manufacturers published instructions.

   Exception: Carbon monoxide alarms or carbon monoxide detectors shall not be required in sleeping units unless the sleeping unit contains a fuel-burning appliance.

The required carbon monoxide alarms or carbon monoxide detectors shall be annunciated at a constantly attended location

2. Add new definitions as follows:

902.1(IBC [F] 902.1) Definitions. The following words and terms shall, for the purposes of this chapter and as used elsewhere in this code, have the meanings shown herein.

CARBON MONOXIDE.

Single-Station Carbon Monoxide Alarm. A device intended for the purpose of detecting carbon monoxide gas and alerting occupants by a distinct and audible signal comprising of an assembly that incorporates a sensor, control components and an alarm notification appliance in a single unit operated from a power source either located in the unit or obtained at the point of installation.

Multiple-Station Carbon Monoxide Alarm. A carbon monoxide alarm capable of being interconnected to one or more additional carbon monoxide alarms so that the actuation of one causes the appropriate alarm signal to be annunciated in all interconnected alarms.

Carbon Monoxide Detector. A device intended to be connected to an approved carbon monoxide detection system for the purpose of detecting carbon monoxide gas and alerting occupants by a distinct and audible signal.

Carbon Monoxide Detection System. A system of devices that consists of a control panel and circuits arranged to monitor and annunciate the status of carbon monoxide detectors and to initiate the appropriate response to those signals.

Combination Smoke/Carbon Monoxide Device. A device that combines a carbon monoxide alarm or carbon monoxide detector with smoke sensing technology; provided that the combined device is listed by a nationally recognized testing laboratory (NRTL) to the applicable ANSI/ UL Standards for both smoke detection and carbon monoxide detection. Such combined alarm units or detection systems shall emit an audible alarm in a manner that clearly differentiates between the two hazards as specified in the appropriate NFPA and ANSI/UL Standard.

3. Add new standards to Chapter 47 (IBC Chapter 35) as follows:

NFPA

720-2009	Standard for the Installation of Carbon Monoxide (CO) Detection and Warning Equipment 2009 Edition

UL

2034-2008	Standard for Single and Multiple Station Carbon Monoxide Alarms, with Revisions through February 20, 2009
2075-2004	Standard for Gas and vapor Detectors and Sensors, with revisions through September 28, 2007

PART II – IRC BUILDING/ENERGY

1. Revise as follows:

R315.1. Carbon monoxide alarms, carbon monoxide detectors or combination smoke/carbon monoxide devices. Carbon monoxide alarms, carbon monoxide detectors and combination smoke/carbon monoxide devices described in sections R315.1.1 through R315.1.4 shall be installed and maintained in accordance with the provisions of this code, NFPA 72 and NFPA 720. ~~**Carbon monoxide alarms.** In new construction, dwelling units within which fuel-fired appliances are installed or have attached garages shall be provided with an approved carbon monoxide alarm installed outside of each separate sleeping area in the immediate vicinity of the bedroom(s).~~

R315.1.1 Carbon monoxide alarms. Single- or multiple-station carbon monoxide alarms shall be listed and labeled in accordance with ANSI/UL 2034.

R315.1.2 Carbon monoxide detectors. Carbon monoxide detectors shall be listed and labeled in accordance with ANSI/UL 2075.

R315.1.3 Combination smoke/carbon monoxide alarms. Combination smoke/carbon monoxide alarms shall be listed and labeled in accordance with ANSI/UL 217 and ANSI/UL 2034

R315.1.4 Combination smoke/carbon monoxide detectors. Combination smoke/carbon monoxide detectors shall be listed and labeled in accordance with ANSI/UL 268 and ANSI/UL 2075.

R315.2 Where Required in New Construction. In new construction within which fuel burning appliances exist or which have attached garages, carbon monoxide alarms, carbon monoxide detectors, combination smoke/carbon monoxide alarms or combination smoke/carbon monoxide detectors shall be installed in the following locations:

1. Outside each separate dwelling unit sleeping area in the immediate vicinity of the bedrooms.
2. On every level of a dwelling unit, including basements

~~**R315.2**~~ **R315.3 Where required in existing dwellings.** Where work requiring a permit occurs in existing dwellings that have attached garages or in existing dwellings within which fuel-fired appliances exist, carbon monoxide alarms/detectors shall be provided in accordance with Sections R315.1 and R315.2.

~~**R315.3 Alarm Requirements** Single station carbon monoxide alarms shall be listed as complying with UL 2034 and shall be installed in accordance with this code and the manufacturer's installation instructions.~~

R315.4 Carbon monoxide alarm signal requirements. Where more than one listed carbon monoxide alarm, or combination smoke/carbon monoxide is required to be installed within a dwelling unit they shall be interconnected in such a manner that the activation of one carbon monoxide alarm shall activate all of the carbon monoxide alarms in the dwelling unit and the activation of a carbon monoxide detector or combination smoke/carbon monoxide detector shall activate the carbon monoxide audible notification devices throughout the individual dwelling unit. The required carbon monoxide alarm signal shall be clearly audible in all sleeping rooms, having a sound level of at least 15 db above average ambient sound level or 5 db above the maximum sound level, or a sound level at least 75 db at the pillow.

R315.5 Power source. Required single- or multiple-station carbon monoxide alarms, carbon monoxide detectors, combination smoke/carbon monoxide alarms or combination smoke/carbon monoxide detectors shall receive their power by one of the following means:

1. Listed carbon monoxide alarms shall be battery-powered, plug-in with battery backup, or receive their primary power from the building wiring when such wiring is served from a commercial source with secondary power backup and without a disconnecting switch other than those required for overcurrent protection.Listed carbon monoxide alarms that are battery-powered or plug-in with battery backup shall not be permitted in new construction.
2. Listed carbon monoxide detectors shall receive their power from the approved control panel. The approved control panel shall receive its primary power from the building wiring when such wiring is served from a commercial source and the primary power source shall not include a disconnecting switch other than those required for overcurrent protection. The control panel shall be equipped with rechargeable batteries for secondary power backup.
3. Listed low-power radio frequency (wireless) detectors shall be permitted to be battery powered when the battery is electrically supervised and shall be capable of sending an alarm signal to the approved control panel for a minimum of 7 days after sending the initial battery depletion signal.

2. Add new definition to Section R202 as follows:

CARBON MONOXIDE.

Single-Station Carbon Monoxide Alarm. A device intended for the purpose of detecting carbon monoxide gas and alerting occupants by a distinct and audible signal comprising of an assembly that incorporates a sensor, control components and an alarm notification appliance in a single unit operated from a power source either located in the unit or obtained at the point of installation.

Multiple-Station Carbon Monoxide Alarm. A carbon monoxide alarm capable of being interconnected to one or more additional carbon monoxide alarms so that the actuation of one causes the appropriate alarm signal to be annunciated in all interconnected alarms.

Carbon Monoxide Detector. A device intended to be connected to an approved carbon monoxide detection system for the purpose of detecting carbon monoxide gas and alerting occupants by a distinct and audible signal.

Carbon Monoxide Detection System. A system of devices that consists of a control panel and circuits arranged to monitor and annunciate the status of carbon monoxide detectors and to initiate the appropriate response to those signals.

Combination Smoke/Carbon Monoxide Device. A device that combines a carbon monoxide alarm or carbon monoxide detector with smoke sensing technology; provided that the combined device is listed by a nationally recognized testing laboratory (NRTL) to the applicable ANSI/ UL Standards for both smoke detection and carbon monoxide detection. Such combined alarm units or detection systems shall emit an audible alarm in a manner that clearly differentiates between the two hazards as specified in the appropriate NFPA and ANSI/UL Standard.

3. Add new standards to Chapter 44 as follows:

NFPA

720-2009	Standard for the Installation of Carbon Monoxide (CO) Detection and Warning Equipment 2009 Edition

UL

2075-2004	First Edition of the Standard for Gas and vapor Detectors and Sensors, with revisions through September 28, 2007

Reason (Part I): The purpose for this code change is to protect people sleeping in commercial Group R occupancies such as hotels, motels, adult & child day care, apartments and dormitories from serious injury or possibly death from unintentional non-fire related carbon monoxide (CO) exposure by mandating the installation of carbon monoxide detection devices. The Centers for Disease Control and Prevention (CDC) reports that an estimated 15,000 emergency department visits and 500 unintentional deaths in the United States each year for the six year period 1999-2004. These carbon monoxide incidents were a contributing factor for 20 states enacting laws to require the installation of carbon monoxide detection devices. Of the 20 states that have adopted requirements for carbon monoxide detection, ten require the installation of carbon monoxide detectors in commercial Group R occupancies. In the absence of a national installation standard for commercial Group R occupancies each jurisdiction developed its own regulations with varying installation requirements.

We recommend that the International Fire Code develop the necessary installation requirements for CO detection devices in commercial Group R.

Cost Impact (Part I): It is estimated that the proposed code modification will have a minimal cost impact on the construction of Group R occupancies. For example in R-1 occupancies a CO alarm or detector will be installed by fuel burning appliance(s) and in each HVAC zone. In other R occupancies cost will be minimal as installation requirements are outside of each sleeping area and on each floor.

Analysis (Part I): UL 2034 is already referenced in the IRC but not currently in the IFC or IBC. If the code change is approved, UL 2034 would be added to Chapter 47 of the IFC and Chapter 35 of the IBC as a referenced standard.

UL 2075 is already referenced in the IFC but not currently in the IBC. If the code change is approved, UL 2075 would be added to Chapter 35 of the IBC as a referenced standard.

Reason (Part II): The purpose for this code change is to improve the life safety of citizens by reducing the incidence of carbon monoxide (CO) poisoning in dwellings and to revise the language in the 2009 edition of the IRC so it is consistent with nationally recognized industry consensus standards.

The CO provisions in the 2009 edition of the IRC did not include the reliable, proven and tested technologies of system-connected CO detectors even though they meet nationally recognized industry consensus standards

1. ANSI/UL 2075, *Gas and Vapor Detectors and Sensors*
2. ANSI/NFPA 720, *Standard for the Installation of Carbon Monoxide (CO) Detection and Warning Equipment*

The performance and reliability of system-connected CO detectors have shown to be extremely high if they are listed and maintained to ANSI/UL 2075 and installed in accordance with NFPA 720. System-connected CO detectors designed to be part of a carbon monoxide detection system are required to be connected to an approved panel. The panel is required to be equipped with rechargeable batteries that keep the carbon monoxide

detection system operating during a power outage and will communicate the power loss condition to the supervising station. When the primary power is restored, the control panel will fully recharge the standby batteries. An added feature of a carbon monoxide detection system is that the interconnecting wiring to system-connected CO detectors are supervised such that a wiring fault results in a trouble signal at the premises and the supervising station.

The installation provisions in the 2009 edition of the IRC seem inconsistent with NFPA 720 when two or more CO alarms are installed within a dwelling unit. Section 9.6.5 of NFPA 720 requires that when two or more carbon monoxide alarms are to be installed that they are interconnected.. The rationale for this requirement is if a CO device is activated in the basement the occupants on the second floor on the opposite end of the home is unable to hear the audible alarm if the devices are not interconnected.

The 2009 edition of the IRC requires CO alarms outside each separate dwelling unit sleeping area in the immediate vicinity of the bedrooms. However, NFPA 720 requires CO devices to be installed on every level of a dwelling unit, including basements as well as outside each separate dwelling unit sleeping area in the immediate vicinity of the bedrooms.

Cost Impact (Part II): It is estimated that the proposed code modification will have a minimal cost impact on the construction of one- and two- family dwellings and townhouses. The proposed new requirements will not require addition CO detection devices to be installed; however the proposed changes will require additional wiring. While there are many variables that affect the cost of construction, most new dwelling construction is anticipated no more than two stories in height and will require wiring between no more than three CO detection devices: one per floor and one in the basement.

Analysis (Part II): A review of the standard(s) proposed for inclusion in the code, NFPA 720-2009, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

UL 2075 is already referenced in the IFC but not currently in the IBC. If the code change is approved, UL 2075 would be added to Chapter 35 of the IBC as a referenced standard.

908.7 (New) [IBC [F] 908.7 (New)], 4606.1 (New), Chapter 47 (IBC Chapter 35)

Proponent: Robert J Davidson, Code Consultant/Alan Shuman, President, representing the National Association of State Fire Marshals (NASFM)

1. Add new text as follows:

908.7 (IBC [F] 908.7) Carbon monoxide alarms. Group I or R occupancies located in a building containing a fuel-burning appliance or a building which has an attached garage shall be provided with single station carbon monoxide alarms. The carbon monoxide alarms shall be listed as complying with UL 2034 and be installed and maintained in accordance with NFPA 720 and the manufacturer's instructions. An open parking garage, as defined in the *International Building Code*, shall not be deemed to be an attached garage.

Exception: Sleeping units or dwelling units which do not themselves contain a fuel-burning appliance or have an attached garage, but which are located in a building with a fuel-burning appliance or an attached garage, need not be provided with single station carbon monoxide alarms provided that:

1. The ~~s~~leeping unit or dwelling unit is located more than one story above or below any story which contains a fuel-burning appliance or an attached garage;
2. The sleeping unit or dwelling unit is not connected by duct work or ventilation shafts to any room containing a fuel-burning appliance or to an attached garage; and
3. The building is provided with a common area carbon monoxide alarm system.

4606.1 Carbon monoxide alarms. Existing Group I or R occupancies located in a building containing a fuel-burning appliance or a building which has an attached garage shall be provided with single station carbon monoxide alarms. The carbon monoxide alarms shall be listed as complying with UL 2034 and be installed and maintained in accordance with NFPA 720 and the manufacturer's instructions. An open parking garage, as defined in the *International Building Code*, shall not be deemed to be an attached garage.

Exception: Sleeping units or dwelling units which do not themselves contain a fuel-burning appliance or have an attached garage, but which are located in a building with a fuel-burning appliance or an attached garage, need not be provided with single station carbon monoxide alarms provided that:

1. The sleeping units or dwelling unit is located more than one story above or below any story which contains a fuel-burning appliance or an attached garage;
2. The sleeping units or dwelling unit is not connected by duct work or ventilation shafts to any room containing a fuel-burning appliance or to an attached garage; and
3. The building is provided with a common area carbon monoxide alarm system.

2. Add new standards to Chapter 47 (IBC Chapter 35) as follows:

NFPA
720-2005 Standard for the Installation of Carbon Monoxide (CO) Warning Equipment in Dwelling Units

UL
2034-2008 Standard for Single and Multiple Station Carbon Monoxide Alarms

Reason: At the final action hearings for the last code change cycle held in Minnesota the voting membership present voted overwhelmingly to add requirements for the installation of carbon monoxide alarms for dwelling units built in compliance with the International Residential Code (IRC). The threat of poisoning from exposure to carbon monoxide is not limited to dwellings regulated by the IRC, it includes other institutional and residential occupancies. This proposal is intended to provide correlation with the position the membership took on this issue and add language to the IBC/IFC requiring the installation of carbon monoxide alarms in institutional and residential group occupancies.

According to the Journal of the American Medical Association (JAMA), carbon monoxide is the leading cause of accidental poisoning deaths in America with approximately 2,100 deaths per year. http://jama.ama-assn.org/cgi/search?fulltext=Carbon+Monoxide Over 15,000 people seek medical attention due to carbon monoxide exposure each year. http://www.ul.com/newsroom/newsrel/nr012609a.html

The industry has addressed the issue of reliability by updating the requirements of the UL 2034 standard. http://www.iccsafe.org/cs/cc/ctc/CO/CO_UL2034History.pdf Underwriters Laboratories instituted a Carbon Monoxide Field Study in 1994 and completed the study in March of 2004. The report on the study includes the following summary:

"Throughout the first phase of this study, the CO alarms have performed in an effective manor. During the September 2002 tests we recorded our first false positive at 70ppm CO (94 minutes into the test, post 1998 alarm). Also during the September 2002 tests we recorded our first no response sample (pre1998 alarm). During the September 2003 we recorded a significant late response sample (pre1998 alarm). These samples have been returned and analyzed by the manufacturer and/or the UL Field Report Group has opened an investigation. Other samples in the survey of the same, or similar, models are continuing to perform as expected.

On one occasion, a field study CO sample alarmed in an employee's home after their furnace was serviced. It was confirmed that there was a high level of CO present in their home. The problem was corrected and the alarm continues to function properly during follow-up sensitivity tests. On another occasion, a field sample was activated when the damper on a fireplace closed prematurely. The damper was opened, the house vented, and the alarm returned to its normal standby condition.

Throughout the entire survey program we have experienced a few units providing early/delayed signals during the sensitivity tests, but all of these CO alarms would provide effective signaling protection to the users should there be a fatal concentration of CO.

Of the few CO alarms that did not meet the UL2034 test points, most of them alarmed early and it was determined with the Stability Test results that these samples would most likely not false alarm in the field.

It is important to note that providing effective signaling protection does not necessarily mean complying with the finite test points of UL2034. All the alarms would have sounded while a person can react and follow the recommended procedures during an alarm signal.

The data shows that these CO alarms are providing the necessary signaling protection."
http://www.iccsafe.org/cs/cc/ctc/CO/CO_UL_AlarmSurvey.doc

All carbon monoxide detectors available today meet the updated requirements of the UL standard which eliminated the false positive indications that occurred when carbon monoxide detectors were first brought to market in the 1990's. The State of New Jersey has had regulations mandating the installation of carbon monoxide alarms in all new and existing residential occupancies since 1992. The state implemented a reporting program at that time to identify reliability and false positive indication problems and there have been no problems identified in over 10 years.

Carbon monoxide poisonings leading to injury or death is well documented and the only way to protect the occupants from this odorless and tasteless product of combustion, known as the "Silent Killer" is through the installation of detectors complying with today's standards.

Cost Impact: The code change proposal will increase the cost of construction.

Analysis: A review of the standards proposed for inclusion in the code, NFPA 720-2005 and UL 2034-2008, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

Public Hearing:	Committee:	AS	AM	D

F134–09/10
909.2 (IBC [F] 909.2), 909.10.2.1 (IBC [F] 909.10.2.1)

Proponent: Tony Crimi, A.C. Consulting Solutions Inc., representing International Firestop Council

Revise as follows:

909.2 (IBC [F] 909.2) General design requirements. Buildings, structures or parts thereof required by this code to have a smoke control system or systems, or a stair pressurization system shall have such systems designed in accordance with the applicable requirements of Section 909 and the generally accepted and well-established principles of engineering relevant to the design. The construction documents shall include sufficient information and detail to adequately describe the elements of the design necessary for the proper implementation of the smoke control systems. These documents shall be accompanied by sufficient information and analysis to demonstrate compliance with these provisions.

909.20.6.1 Ventilation systems. Smokeproof enclosure and pressurized stairway ventilation systems shall be independent of other building ventilation systems. The equipment, control wiring, power wiring and ductwork shall comply with one of the following:

1. Equipment, control wiring, power wiring and ductwork shall be located exterior to the building and directly connected to the smokeproof enclosure or pressurized stairway or connected to the smokeproof enclosure or pressurized stairway by ductwork enclosed by not less than 2-hour *fire barriers* constructed in accordance with Section 707 or *horizontal assemblies* constructed in accordance with Section 712, or both.
2. Equipment, control wiring, power wiring and ductwork shall be located within the smokeproof enclosure or pressurized stairway with intake or exhaust directly from and to the outside or through ductwork enclosed by not less than 2-hour *fire barriers* constructed in accordance with Section 707 or *horizontal assemblies* constructed in accordance with Section 712, or both.
3. Equipment, control wiring, power wiring and ductwork shall be located within the building if separated from the remainder of the building, including other mechanical equipment, by not less than 2-hour *fire barriers* constructed in accordance with Section 707 or *horizontal assemblies* constructed in accordance with Section 712, or both.

Exceptions:

1. Control wiring and power wiring utilizing a 2-hour rated cable or cable system.
2. Where encased with not less than 2 inches (51 mm) of concrete.
3. Ductwork shall be permitted to be protected using an approved alternative fire-resistive duct assembly that is a *listed* and *labeled* specifically for such purpose.

Reason: This proposal would require Stair pressurization ducts installed for the purposes of stairwell pressurization to be enclosed within a shaft or protected by an equivalent tested and listed assembly or system evaluated for the purpose. Smoke control systems have been required in nearly two thirds of the United States for over a decade. High-rise buildings constructed to the requirements of International Building Code, but without any specific measures to control smoke migration, are all the more vulnerable to property damage and occupants' loss of life.

The purpose of a closed pressurization system is to provide fresh air directly to stairwells or egress areas. This design air pressures need to be sufficient to maintain closed doors while preventing smoke from entering the egress path. Several incidents in North America during the past 40 years have demonstrated that serious fires can occur in modern high-rise buildings, that these fires can generate tremendous quantities of smoke, and that smoke can spread rapidly throughout these buildings. Most notable were the 1970 One New York Plaza fire, the1973 Hyatt Regency O'Hare Hotel fire, the 1980 MGM Grand Hotel in Las Vegas, a 1981 fire in North York Ontario at the Inn on the Park Hotel, the 1983 First Canadian Place in Toronto, Ontario, One Meridian Plaza, Philadelphia, Pennsylvania and the First Interstate Bank in Los Angeles, California in the 1990's, and the 2001 World Trade Center.

There is a large body of available research that indicates the need for smoke control is more pressing in tall buildings that in any other type of construction. Pressurization results in airflows of high velocity in the gaps around closed doors and construction cracks, thereby preventing smoke from flowing back into the pressurized space through these openings. Pressurized stairwells are provided with the goal of maintaining a tenable environment within the escape routes in the event of a building fire. While the option to use stairwell pressurization exists, the IBC does not require stairwell pressurization in high-rise buildings, and only requires smoke control in underground buildings, atriums, and covered mall buildings. Section 403.13 of the 2009 IBC requires smokeproof exit enclosures for high-rise buildings in every required stairway serving floors more than 75 feet (22.86 m) above the ground. Section 909.20.5 merely permits sprinklered Buildings to use stairwell pressurization as an alternate to the smokeproof enclosures. When employed, ducts used for Stair pressurization to provide uncontaminated air within required interior exit stairwells or areas of egress need to be protected from the effect of fire, or constructed as fire resistant systems.

Particularly in the case of tall buildings, the predominant factors that cause smoke movement in tall buildings are stack effects, the affect of external wind forces, and forced air movement within the building. Smoke removal and venting practices are complicated by stack effects, which will tend to favor natural air movement vertically through the building as a result of differences in temperature and densities between the inside and outside air. [1]

Options such as the use of natural ventilation are only available where openings in exterior stairwells can be accommodated. Even then, a number of problems have been identified with this approach. Firstly, the required volume of fresh air is high. Secondly, natural supply and exhaust through vents may be subject to adverse exterior wind conditions, and even when functioning satisfactorily, would generally require vents located on different exterior walls. Thirdly, the performance of natural vents is influenced by building stack effects, which may be particularly significant on the upper or lowermost stories for tall buildings. This effect can range from either strong inflow or strong outflow from all natural vents on a given storey.[2]

The IBC needs to provide more effective means to prevent smoke from entering critical exit stairwells in high-rise buildings. Properly designed stairwell pressurization prevents smoke from flowing back into the pressurized exit stairwells and smokeproof enclosures. The goal of this proposal is maintaining a tenable environment within the escape routes in the event of a building fire.

F135–09/10

909.3 (IBC [F] 909.3, IMC [F] 513.3), 909.18.8 (IBC [F] 909.18.8), 909.18.8.1 (IBC [F] 909.18.8.1), 909.18.8.2 (IBC [F] 909.18.8.2), 909.18.8.2.1 (IBC [F] 909.18.8.2.1), 909.18.8.2.2 (IBC [F] 909.18.8.2.2), 909.18.8.2.3 (IBC [F] 909.18.8.2.3); IBC [F] 1704.16, [F] 1704.16.1, [F] 1704.16.2

Proponent: Vickie Lovell, Representing National Energy Management Institute

1. Revise as follows:

909.3 (IBC [F] 909.3, IMC [F] 513.3) Special inspection and test requirements. In addition to the ordinary inspection and test requirements to which buildings, structures and parts thereof are required to undergo, smoke control systems subject to the provisions of Section 909 shall undergo special inspections and tests sufficient to verify the proper commissioning of the smoke control design in its final installed condition. The design submission accompanying the *construction documents* shall clearly detail procedures and methods to be used and the items subject to such inspections and tests. Such commissioning shall be in accordance with generally accepted engineering practice and, where possible, based on published standards for the particular testing involved. The special inspections and tests required by this section shall be conducted under the same terms as in Section 1704 of the International Building Code and Section 909.18 of this code.

909.18.8 (IBC [F] 909.18.8) Special inspections for smoke control. Smoke control systems shall be tested by a special inspector in accordance with the requirements for special inspections in Sections 909.18 through 909.19 and Section 909.20.6.3 of the *International Building Code*.

909.18.8.1 (IBC [F] 909.18.8.1) Scope of testing. Special inspections shall be conducted in accordance with the following:

1. During erection of ductwork and prior to concealment for the purposes of leakage testing and recording of device location.
2. Prior to occupancy and after sufficient completion for the purposes of pressure-difference testing, flow measurements, and detection and control verification.

909.18.8.2 (IBC [F] 909.18.8.2) Qualifications. Special inspection agencies for smoke control shall have expertise in fire protection engineering, mechanical engineering and certification as air balancers, or be certified by a third party accreditation program for air testing, adjusting and air balancing and for inspection of smoke control systems. An approved special inspection agency shall provide all information as necessary for the building official to determine that the agency meets the applicable requirements and shall be qualified to conduct, supervise and evaluate tests and periodic inspections and maintenance.

909.18.8.2.1 (IBC [F] 909.18.8.2.1) Independence. An approved special inspection agency shall be objective, competent and independent from the contractor responsible for the work being inspected. The agency shall also disclose possible conflicts of interest so that objectivity can be confirmed.

909.18.8.2.2 (IBC [F] 909.18.8.2.2) Equipment. An approved special inspection agency shall have adequate equipment to perform required tests. The equipment shall be periodically calibrated.

909.18.8.2.3 (IBC [F] 909.18.8.2.3) Personnel. An approved special inspection agency shall employ experienced personnel educated in conducting, supervising and evaluating tests and inspections.

IBC [F] 1704.16 Special inspection for smoke control. Smoke control systems shall be tested by a special inspector in accordance with Section 909.18.8.

~~**IBC [F] 1704.16.1 Testing scope.** The test scope shall be as follows:~~

~~1. During erection of ductwork and prior to concealment for the purposes of leakage testing and recording of device location.~~
~~2. Prior to occupancy and after sufficient completion for the purposes of pressure difference testing, flow measurements and detection and control verification.~~

~~**IBC [F] 1704.16.2 Qualifications**. *Special inspection* agencies for smoke control shall have expertise in fire protection engineering, mechanical engineering and certification as air balancers.~~

Reason: The purpose of this code change is to clarify and centralize the language as it relates to the qualifications of special inspectors and special inspection agencies of smoke control systems. This ties together the IBC, IFC, and IMC with consistent language as it relates to special inspections, testing and maintenance of smoke control systems.
909.3. This is an editorial change which adds the reference of the new language in Sections 909.18.
909.18.8. The addition of the referenced sections clarifies the intent of the code's requirement of special inspections, agencies, and inspectors.
909.18.8.2. through 909.18.8.2.3. This language is derived from Chapter 1703.1.1 of the 2009 IBC.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: LOVELL-F2-909.3

F136–09/10
909.5.2 (IBC [F] 909.5.2; IMC [F] 513.5.2)

Proponent: Douglas H. Evans, PE, FSFPE, Clark County, NV, representing the Department of Development Services – Building Division

Revise as follows:

909.5.2 (IBC [F] 909.5.2; IMC [F] 513.5.2) Opening protection. Openings in smoke barriers shall be protected by automatic-closing devices actuated by the required controls for the mechanical smoke control system. Door openings shall be protected by fire door assemblies complying with Section 715.4.3.

Exceptions:

1. Passive smoke control systems with automatic-closing devices actuated by spot-type smoke detectors listed for releasing service installed in accordance with Section 907.10.
2. Fixed openings between smoke zones that are protected utilizing the airflow method.
3. In Group I-2, where such doors are installed across corridors, a pair of opposite-swinging doors without a center mullion shall be installed having vision panels with fire protection-rated glazing materials in fire protection-rated frames, the area of which shall not exceed that tested. The doors shall be close-fitting within operational tolerances and shall not have undercuts, louvers or grilles. The doors shall have head and jamb stops, astragals or rabbets at meeting edges and shall be automatic- closing by smoke detection in accordance with Section 715.4.7.3. Positive-latching devices are not required.
4. Group I-3.
5. Openings between smoke zones with clear ceiling heights of 14 feet (4267 mm) or greater and bank-down capacity of greater than 20 minutes as determined by the design fire size.
6. Door openings in smoke barriers shall be permitted to be protected by self-closing fire doors in the following locations:
   6.1. Sleeping units.
   6.2. Individual dwelling units.

6.3. Mechanical rooms.
6.4. Elevator machine rooms.
6.5. Electrical rooms used exclusively for that purpose.
6.6. Doors typically maintained in a closed position as approved by the Building Official.

Reason: Section 909.5.2 requires all doors in smoke barriers that are part of a 909 smoke control system to be automatic-closing. Section 3.3.7 of NFPA 80 (2007 edition) defines an "automatic-closing door" as "A door that normally is open but that closes when the automatic-closing device is activated."

For buildings with a substantial number of doors in smoke barriers, the IBC requirement for all such doors to be automatic-closing results in a significant, and frequently unnecessary, cost increase for the project. The proposed amendment allows normally closed doors in smoke barriers to be self-closing and can even apply to pressurized stair doors if deemed acceptable to the Building Official.

The proposed amendment has been part of the Southern Nevada Building Code for several years and has proven to be a reasonable accommodation to owners and designers without negatively impacting life safety.

Cost Impact: The code change proposal will decrease the cost of construction.

F137–09/10
909.10.2 (IBC [F] 909.10.2; IMC [F] 513.10.2)

Proponent: Eli P. Howard, III, Sheet Metal & Air Conditioning Contractors National Association, Inc. (SMACNA)

Revise as follows:

909.10.2 (IBC [F] 909.10.2; IMC [F] 513.10.2) Ducts. Duct materials and joints shall be capable of withstanding the probable temperatures and pressures to which they are exposed as determined in accordance with Section 909.10.1. Ducts shall be constructed and supported in accordance with the *International Mechanical Code*. Ducts shall be leak tested to ~~1.5 times~~ the maximum design pressure in accordance with nationally accepted practices. Measured leakage shall not exceed 5 percent of design flow. Results of such testing shall be a part of the documentation procedure. Ducts shall be supported directly from fire-resistance-rated structural elements of the building by substantial, noncombustible supports.

Exception: Flexible connections (for the purpose of vibration isolation) complying with the *International Mechanical Code* and which are constructed of *approved* fire-resistance-rated materials.

Reason: The SMACNA/ANSI HVAC Duct Construction Standards call for leakage testing when required to be performed only to the operating pressure of the system. Exceeding this requirement for leakage testing will cause sealant within the joints to be pushed beyond its design limitation and cause further air leakage within the system.

Testing of systems at 1.5 times the operating pressure is only for structural integrity and is not recommended nor mandated by the SMACNA Standards.

Cost Impact: The code change proposal will cause a reduction in costs

Public Hearing:				
	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: HOWARD-F1-909.10.2.DOC

F138–09/10
909.12 (IBC [F] 909.12; IMC [F] 513.12)

Proponent: Douglas H. Evans, PE, FSFPE, Clark County, NV, representing the Department of Development Services – Building Division

Revise as follows:

909.12 (IBC [F] 909.12; IMC [F] 513.12) Detection and control systems. Fire detection systems providing control input or output signals to mechanical smoke control systems or elements thereof shall comply with the requirements of Section 907. Such systems shall be equipped with a control unit complying with UL 864 and listed as smoke control equipment.

Control systems for mechanical smoke control systems shall include provisions for verification. Verification shall include positive confirmation of actuation, testing, manual override~~, the presence of power downstream of all disconnects~~ and, through a preprogrammed weekly test sequence, report abnormal conditions audibly, visually and by printed report.

Reason: The fire alarm system, associated initiating devices and all portions of the smoke control system that transfer fire alarm commands (e.g. BMS) meet the requirements outlined in the first paragraph of 909.12 through their UL 864 listing. This can be performed by **electrical supervision**, which verifies that the conductors are intact, but **provides no assurance that** the **monitored devices** will **function correctly**.

The second paragraph of 909.12 is intended to confirm that the mechanical components (fans, motors, belts, dampers, actuators, etc.) function properly. This is performed by verifying proper functioning through the use of position sensors for dampers and an acceptable method for confirming fan induced air movement. **Functional verification does not confirm continuity of conductors until the system is configured** (alarm condition or testing).

Both of the preceding options have advantages and disadvantages, but neither provides complete verification.

Except when the system configures (alarm or testing), there is no power supplied to the output side of smoke control components (fans and dampers). As such, it is not possible to continuously monitor power to these components and **one cannot be assured of continuity of conductors for the output side (fans and dampers) of a smoke control system** until the system configures.

The preprogrammed weekly test sequence, as required by 909.12, is intended to notify building operations of an improperly functioning system so it can be repaired when necessary. Worst case, it may not be known for one week that some portion of the distribution side of the smoke control system is not performing properly. This requirement confirms that components properly configure, as well as continuity of conductors. The weekly diagnostic provides the required level of assurance that the entire smoke control system will function within the intent of its design.

As described above, monitoring power downstream of all disconnects cannot be provided as required, is misleading and may be unnecessary.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: EVANS-F1-909.12.DOC

F139–09/10
909.12.1 (IBC [F] 909.12.1; IMC [F] 513.12.1)

Proponent: Howard Hardy, South Metro Fire Rescue Authority, representing the Fire Marshals Association of Colorado

Revise as follows:

909.12.1 (IBC [F] 909.12.1) (IMC [F] 513.12.1) Wiring. In addition to meeting requirements of NFPA 70, all wiring, regardless of voltage, shall be fully enclosed within continuous <u>metal</u> raceways.

Reason: This requirement dates back to the 1994 UBC and has not been updated. The purpose of enclosing the wiring in a raceway is to provide for survivability. There are many products available today that were not available when this section first appeared in the code. Many of the products are plastics and will not withstand the heat that may be present. We feel that clarifying the type of materials for the raceway will maintain the original code intent.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: HARDY-F1-909.12.1.DOC

F140–09/10
909.13.1 (IBC [F] 909.13.1; IMC [F] 513.13.1)

Proponent: Bob Eugene, Underwriters Laboratories, Inc.

Revise as follows:

909.13.1 (IBC [F] 909.13.1; IMC [F] 513.13.1) Materials. Control-air tubing shall be hard-drawn copper, Type L, ACR in accordance with ASTM B 42, ASTM B 43, ASTM B 68, ASTM B 88, ASTM B 251 and ASTM B 280. Fittings shall be wrought copper or brass, solder type in accordance with ASME B 16.18 or ASME B 16.22. Changes in direction shall be made with appropriate tool bends. Brass compression-type fittings shall be used at final connection to devices; other joints shall be brazed using a BCuP5 brazing alloy with solidus above 1,100ºF (593ºC) and liquids below 1,500ºF (816ºC). Brazing flux shall be used on copper-to-brass joints only.

Exception: Nonmetallic tubing used within control panels and at the final connection to devices provided all of the following conditions are met:

1. Tubing shall ~~be listed by an approved agency for flame and smoke characteristics~~ comply with the requirements of Section 602.2.1.3 of the *International Mechanical Code*.
2. Tubing and connected device shall be completely enclosed within a galvanized or paint-grade steel enclosure having a minimum thickness of 0.0296 inch (0.7534 mm) (No. 22 gage). Entry to the enclosure shall be by copper tubing with a protective grommet of Neoprene or Teflon or by suitable brass compression to male barbed adapter.
3. Tubing shall be identified by appropriately documented coding.
4. Tubing shall be neatly tied and supported within the enclosure. Tubing bridging cabinets and doors or moveable devices shall be of sufficient length to avoid tension and excessive stress. Tubing shall be protected against abrasion. Tubing serving devices on doors shall be fastened along hinges.

Reason: The code needs to provide specifics as to what surface burning characteristics the tubing needs to meet, and what test standard to use in listing the tubing. Control air tubing is similar to pneumatic tubing, whose listing requirements are specified in Section 602.2.1.3.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: EUGENE-F8-909.13.1.DOC

F141–09/10
909.19 (IBC [F] 909.19)

Proponent: Robert J Davidson, Code Consultant/Alan Shuman, President, representing the National Association of State Fire Marshals (NASFM)

Revise as follows:

909.19 (IBC [F] 909.19) System acceptance. Buildings, or portions thereof, required by this code to comply with this section shall not be issued a certificate of occupancy until such time that the fire code official determines that the provisions of this section have been fully complied with and that the fire department has received satisfactory instruction on the operation, both automatic and manual, of the system and a written maintenance program complying with the requirements of Section 909.20.1 has been submitted and approved.

> **Exception:** In buildings of phased construction, a temporary certificate of occupancy, as approved by the fire code official, shall be allowed provided that those portions of the building to be occupied meet the requirements of this section and that the remainder does not pose a significant hazard to the safety of the proposed occupants or adjacent buildings.

Reason: The maintenance requirements for a smoke control system are comprehensive and the International Fire Code specifies that:

> *909.20.1 Schedule. A routine maintenance and operational testing program shall be initiated immediately after the smoke control system has passed the acceptance tests. A written schedule for routine maintenance and operational testing shall be established..*

For this action to occur, the written schedule must be developed and approved prior to approval of the system. The coordination problem is that Section 909 matches between the two codes up to Section 909.19 and the requirement for the application of the maintenance document is only found in the fire code. Unfortunately, this causes designers and installers (and some code officials) to miss this requirement the maintenance plan that must take effect upon approval is often overlooked.

The purpose of this modification is to provide a simple pointer as a reminder.

Cost Impact: The code change proposal will not increase the cost of construction.

	Assembly:	ASF	AMF	DF

ICCFILENAME: DAVIDSON-SHUMAN-F15-909.19.DOC

F142–09/10
909.20

Proponent: Vickie Lovell, Representing National Energy Management Institute

Add new text as follows:

909.20 Maintenance. Smoke control systems shall be maintained to ensure to a reasonable degree that the system is capable of controlling smoke for the duration required. The maintenance and testing of the smoke control system shall be supervised by personnel who have expertise in fire protection engineering, mechanical engineering and certified as air balancers, or are certified by a third party accreditation program for air testing, adjusting and air balancing and for inspection of smoke control systems. The system shall be maintained in accordance with the manufacturer's instructions and Sections 909.20.1 through 909.20.5.

Reason: The purpose of this addition is to further clarify the requirements of those supervising individuals who test and maintain smoke control systems. Third-party accreditation programs provide individuals with the needed expertise in fire-protection engineering, mechanical engineering, and air adjusting and balancing.

Cost Impact: The code change proposal will not increase the cost of construction.

910 (IBC [F] 910), 604.2.19 (New), Chapter 47 (IBC Chapter 35)

Proponent: Robert J Davidson, Code Consultant/Alan Shuman, President, representing the National Association of State Fire Marshals (NASFM)

1. Revise as follows:

SECTION 910 (IBC [F] 910)
SMOKE AND HEAT VENTS

910.1 (IBC [F] 910.1) General. Where required by this code or otherwise installed, smoke and heat vents, or mechanical smoke exhaust systems, and draft curtains shall conform to the requirements of this section.

Exceptions:

1. Frozen food warehouses used solely for storage of Class I and II commodities where protected by an approved automatic sprinkler system.
2. Where areas of buildings are equipped with early suppression fast-response (ESFR) sprinklers, automatic smoke and heat vents shall not be required within these areas.
3. Where areas of buildings are equipped with ESFR sprinklers, draft curtains shall not be provided within these areas. Draft curtains shall only be provided at the separation between the ESFR sprinklers and the conventional sprinklers.

910.2 (IBC [F] 910.2) Where required. Smoke and heat vents or mechanical smoke exhaust shall be installed in the roofs of one-story buildings or portions thereof occupied for the uses set forth in Sections 910.2.1 through 910.2.2.

910.3 (IBC [F] 910.3) Design and , installation and maintenance. The design and , installation and maintenance of smoke and heat vents, and draft curtains and mechanical exhaust systems shall be as specified in Sections 910.3.1 through 910.3.5.2 and Table 910.3 in accordance with NFPA 204.

~~**910.3.1 (IBC [F] 910.3.1) Design.** Smoke and heat vents shall be *listed* and *labeled* to indicate compliance with UL 793.~~

~~**910.3.2 (IBC [F] 910.3.2) Vent operation.** Smoke and heat vents shall be capable of being operated by *approved* automatic and manual means. Automatic operation of smoke and heat vents shall conform to the provisions of Sections 910.3.2.1 through 910.3.2.3.~~

~~**910.3.2.1 (IBC [F] 910.3.2.1) Gravity-operated drop out vents.** Automatic smoke and heat vents containing heat-sensitive glazing designed to shrink and drop out of the vent opening when exposed to fire shall fully open within 5 minutes after the vent cavity is exposed to a simulated fire represented by a time-temperature gradient that reaches an air temperature of 500°F (260°C) within 5 minutes.~~

~~**910.3.2.2 (IBC [F] 910.3.2.2) Sprinklered buildings.** Where installed in buildings equipped with an *approved automatic sprinkler system*, smoke and heat vents shall be designed to operate automatically.~~

~~**910.3.2.3 (IBC [F] 910.3.2.3) Nonsprinklered buildings.** Where installed in buildings not equippedwith an *approved automatic sprinkler system*, smoke and heat vents shall operate automatically by actuation of a heat-responsive device rated at between 100°F (56°C) and 220°F (122°C) above ambient.~~

~~**Exception:** Gravity-operated drop out vents complying with Section 910.3.2.1.~~

~~**910.3.3 (IBC [F] 910.3.3) Vent dimensions.** The effective venting area shall not be less than 16 square feet (1.5 m_2) with no dimension less than 4 feet (1219 mm), excluding ribs or gutters having a total width not exceeding 6 inches (152 mm).~~

~~**910.3.4 (IBC [F] 910.3.4) Vent locations.** Smoke and heat vents shall be located 20 feet (6096 mm) or more from adjacent *lot lines* and *fire walls* and 10 feet (3048 mm) or more from *fire barriers*. Vents shall be uniformly located within the roof in the areas of the building where the vents are required to be installed by Section 910.2, with consideration given to roof pitch, draft curtain location, sprinkler location and structural members.~~
~~**910.3.5 (IBC [F] 910.3.5) Draft curtains.** Where required by Table 910.3, draft curtains shall be installed on the underside of the roof in accordance with this section.~~

~~**Exception:** Where areas of buildings are equipped with ESFR sprinklers, draft curtains shall not be provided within these areas. Draft curtains shall only be provided at the separation between the ESFR sprinklers and the non-ESFR sprinklers.~~

~~**910.3.5.1 (IBC [F] 910.3.5.1) Construction.** Draft curtains shall be constructed of sheet metal, lath and plaster, gypsum board or other *approved* materials that provide equivalent performance to resist the passage of smoke. Joints and connections shall be smoke tight.~~

~~**910.3.5.2 (IBC [F] 910.3.5.2) Location and depth.** The location and minimum depth of draft curtains shall be in accordance with Table 910.3.~~

~~**910.4 (IBC [F] 910.4) Mechanical smoke exhaust.** Where *approved* by the *fire code official*, engineered mechanical smoke exhaust shall be an acceptable alternative to smoke and heat vents.~~

~~**910.4.1 (IBC [F] 910.4.1) Location.** Exhaust fans shall be uniformly spaced within each draft-curtained area and the maximum distance between fans shall not be greater than 100 feet (30 480 mm).~~

~~**910.4.2 (IBC [F] 910.4.2) Size.** Fans shall have a maximum individual capacity of 30,000 cfm (14.2 m^3/s). The aggregate capacity of smoke exhaust fans shall be determined by the equation:~~

~~$C = A \times 300$ **(Equation 9-4)**~~

~~where:~~
~~C = Capacity of mechanical ventilation required, in cubic feet per minute (m_3/s).~~
~~A = Area of roof vents provided in square feet (m_2) in accordance with Table 910.3.~~

~~**910.4.3 Operation.** Mechanical smoke exhaust fans shall be automatically activated by the *automatic sprinkler system* or by *heat detectors* having operating characteristics equivalent to those described in Section 910.3.2. Individual manual controls for each fan unit shall also be provided.~~

~~**TABLE 910.3 (IBC TABLE [F] 910.3)**~~
~~**REQUIREMENTS FOR DRAFT CURTAINS AND SMOKE AND HEAT VENTSa**~~

910.4 (IBC [F] 910.4) Activation. Smoke and heat vents or mechanical exhaust systems shall be manually activated from a listed or approved control panel installed in a location approved by the fire department.

~~**910.4.4**~~ **910.5 (IBC ~~[F] 910.4.4~~ [F] 910.4.5) Wiring and control.** Wiring for operation and control of smoke exhaust fans and for activation of smoke and heat vents shall be ~~connected ahead of the main disconnect~~ provided with an approved standby source complying with Section 604 and protected against exposure to temperatures in excess of 1,000°F (538°C) for a period of not less than ~~15 minutes~~ 1 hour. Controls shall be located so as to be accessible to the fire service from the exterior of the building and be protected against interior fire exposure by not less than 1-hour fire barriers constructed in accordance with Section 707 or horizontal assemblies constructed in accordance with Section 712, or both

~~**910.4.5 Supply air.** Supply air for exhaust fans shall be provided at or near the floor level and shall be sized to provide a minimum of 50 percent of required exhaust. Openings for supply air shall be uniformly distributed around the periphery of the area served.~~

~~**910.4.6 Interlocks.** On combination comfort air-handling/smoke removal systems or independent comfort air-handling systems, fans shall be controlled to shut down in accordance with the *approved* smoke control sequence.~~

2. Add new text as follows:

604.2.19 Smoke exhaust and smoke and heat vents. In buildings and structures where standby power is required for the operation and control of smoke exhaust fans or for smoke and heat vents as required by Section 910.5.

3. Add new standard to Chapter 47/IBC Chapter 35 as follows:

NFPA
204-2010 Standard for Smoke and Heat Venting

Reason: Since the adoption of the 2000 International Fire and Building Codes, opponents of the Section 910 smoke and heat vents requirements have consistently submitted code change proposals to eliminate them from the code. The IFC committee has consistently turned down those submittals due to a lack of data indicating there was a reason to eliminate a necessary firefighter safety feature.

> ***IFC Fire Code Commentary:*** *The purpose of smoke and heat vents has historically been related to the needs of the fire department. More specifically, smoke and heat vents, when activated, have the potential effect of raising the height of the smoke layer and providing more tenable conditions in which to undertake fire-fighting activities.*

The original arguments against smoke and heat vents were that they interfered with the operation of the sprinkler systems. However, the reams of test report data submitted to the IFC Committee over the years did not support that position. In fact, the last full scale testing to occur, in Ghent, Belgium, documented there was a positive benefit to the use of smoke and heat vents with no negative impact on sprinkler systems performance e en when all of the smoke vents were opened simultaneously in a ganged operation or when the vents were open at the time the fire occurred.

As more and more code officials became educated on the details of the test data inaccurately being portrayed by the smoke and heat opponents over the years the argument shift to one of, “well, not all the vents open as expected after sprinkler activation so the smoke and heat vents should be removed”. This new reason ignores the fact that the smoke still needs to go somewhere and the code requires manual activation capabilities for the fire department to use to open the vents once they arrive.

It also introduces a concept that is troubling, i.e., smoke detection systems, sprinkler systems and fire hydrants, to name a few protective systems, do not always perform as expected, but we don’t simply eliminate them. Accepted practice is to identify any potential problems and if necessary improve the codes and standards to eliminate any deficiencies and to increase reliability.

The latest tactic is to misrepresent a NIOSH guidance documents addressing firefighter safety by claiming it tells fire departments to never put their personnel on the roofs of buildings. The document does not include that admonition, it advises fire scene commanders to use caution and not to risk a firefighter solely to protect property. It also makes it clear that one of the factors to include is if there is a life risk in the building.

While misapplying this NIOSH document the new argument is that when the fire service arrives at a building protected by an automatic fire suppression system they should just wait outside for 30 minutes or so and allow the sprinkler system to extinguish the fire and then they can simply perform mop up and overhaul activities. If only firefighting responsibilities were that simple. (It should be noted that in arguing this position they also intend to modify the intent of the fire code, i.e., that the smoke and heat vents are a firefighter safety feature).

We do not believe that a firefighter safety feature should be removed. Even when automatic sprinkler systems properly function a lot of heat and smoke is generated and the fire service needs a method to get that smoke and heat out to allow for safer access to the seat of the fire to complete extinguishment and then to ensure that the fire has been completely extinguished.

If there are no smoke and heat vents or a properly designed and installed smoke exhaust system, how does the fire service get the smoke out? Even using positive pressure ventilation you need to push it somewhere. Lacking smoke and heat vents or a properly designed smoke exhaust system the fire service is back to putting what limited manpower is available on the roof attempting to cut holes in it.

This code change proposal takes a different direction. Recognizing that some improvements are necessary to modernize the requirements of the International Fire and Building Codes and that the cookie cutter one size all approach is no longer the correct one based upon the advancement of design methods placed in the code for other smoke control systems. This proposal is to keep the requirements in the code for what buildings shall be provided with smoke and heat vents or mechanical exhaust and to then refer to NFPA 204 as the design, installation and maintenance standard.

This will provide a more balance approach by utilizing a much improved referenced standard to design the solution around the design of the building and the contents of the building. The same approach currently allowed for other types of smoke control systems and for the installation of automatic fire sprinkler systems protecting the same building and contents.

The NFPA 204 technical committee has faced the same arguments put forth to the IFC committee and rejected the elimination of smoke and heat vents from sprinklered buildings. Just as the IFC/IBC does for smoke control systems for high occupancy buildings, they simply advise the designer to document any reliance on sprinkler system fire control with an engineering analysis. (See Section 909.9.4 of the IFC and Chapter 11 of NFPA 204).

Another major benefit of this proposal is to take this discussion of vents versus no vents due to sprinkler system functioning off the table. It does that by switching to manual activation after fire department arrival which will be well after sprinkler system activation. It also does that by referencing a standard for the design, installation and maintenance of the smoke and heat vents or mechanical exhaust that is maintained by a balanced committee for this particular and specialized topic. If the committee that specializes in this topic does not see the need to eliminate the use of this important firefighter safety feature after looking at all of the information and issues presented to them, far more than the IFC committee has seen, why should the IFC committee see a need?

The specific changes are as follow:

910.1 was modified to add an exception 3 which simply relocates language for an exception for ESFR protected areas (See existing 910.3.5)

910.2 has been modified to identify that either smoke and heat vents or mechanical smoke exhaust shall be installed and the reference to one story buildings has been deleted. If the F or S occupancy is in a multi-story building the mechanical exhaust option can be used. The generation of smoke and heat does not have to be ignored.

910.3 was modified to add "maintenance" to ensure the smoke and heat vents or mechanical smoke exhaust is maintained and the reference to NFPA 204 as the design, installation and maintenance standard has been added.

Sections 910.3.1 through 910.4.3 have been deleted as no longer needed due to the reference to NFPA 204. This eliminates the cookie cutter approach to the installations that the IFC uses as one size fits all.

A new Section 910.4 has been added to specify that either smoke and heat vents or mechanical smoke exhaust shall be manually activated from a listed or approved control panel and the panel must be located as approved by the fire department. This eliminates any concern over smoke removal activating before the sprinkler system operates and allows the fire department to activate the smoke removal without placing manpower on the roof.

Section 910.4.4 has been renumbered as 910.5 and the requirement to connect the power ahead of the main disconnect has been deleted in favor of installing an approved standby power source as is done for ALL other fire protection systems. The protection of the wiring has been increased from 15 minutes to 1 hour to correlate to the 1 hour protection the code already provides for the location of the control panel. Why would we provide 1 hour protection for the control panel but let the wiring burn up in 15 minutes? This also correlates to the fact that we expect the smoke removal to be available to the fire department for firefighting operations which will take more than 15 minutes.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: Review of proposed new standard NFPA 204-2010 indicated that, in the opinion of ICC Staff, the standard did comply with ICC standards criteria.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: DAVIDSON-SHUMAN-F19-910.DOC

F144–09/10

910 (IBC [F] 910), 2306, Chapter 47 (IBC Chapter 35)

Proponent: Paul K. Heilstedt, PE, FAIA, Chair, representing ICC Code Technology Committee (CTC)

1. Revise as follows:

SECTION 910
SMOKE AND HEAT VENTS

910.1 (IBC [F] 910.1) General. Where required by this code ~~or otherwise installed~~, smoke and heat vents and draft curtains or mechanical smoke ~~exhaust~~ removal systems~~, and draft curtains~~ shall conform to the requirements of this section. The provisions of Section 910.3 shall only apply to buildings or portions thereof, which are not protected by an automatic sprinkler system. The provisions of Section 910.4 shall apply to buildings or portions thereof which are protected by an automatic sprinkler system in accordance with Section 903.3.1.1.

~~**Exceptions:**~~

1. ~~Frozen food warehouses used solely for storage of Class I and II commodities where protected by an approved automatic sprinkler system.~~
2. ~~Where areas of buildings are equipped with early suppression fast-response (ESFR) sprinklers, automatic smoke and heat vents shall not be required within these areas.~~

910.2 (IBC [F] 910.2) Where required. Smoke and heat vents and draft curtains or a smoke removal system shall be ~~installed in the roofs of one-story buildings or portions thereof occupied for the uses set forth in Sections 910.2.1 through 910.2.3.~~ provided as required by Sections 910.2.1 through 910.2.3

910.2.1 (IBC [F] 910.2.1) Group F-1 or S-1. ~~Buildings and portions thereof used as~~ A mechanical smoke removal system shall be installed in one story buildings or portions thereof used as a Group F-1 or S-1 occupancy exceeding 50,000 square feet. ~~having more than 50,000 square feet (4645 m^2) in undivided area.~~

~~**Exception:** Group S-1 aircraft repair hangars.~~

910.2.2 (IBC [F] 910.2.2) Nonsprinklered high-piled combustible storage. ~~.~~ Smoke and heat vents and draft curtains shall be installed in one story buildings or portions thereof containing high-piled combustible storage ~~stock~~ which is not protected by an automatic sprinkler system ~~or rack storage in any occupancy group~~ in accordance with Section 2306.7.

910.2.3 (IBC [F] 910.2.3) Sprinklered high-piled combustible storage. A mechanical smoke removal system shall be installed in one story buildings or portions thereof containing high-piled combustible storage which is protected by an automatic sprinkler system in accordance with Section 413 and the *International Fire Code*.

910.3 (IBC [F] 910.3) Design and installation. The design and installation of smoke and heat vents and draft curtains in buildings which are not protected by an automatic sprinkler system shall be as specified in Sections 910.3.1 through 910.3.5.2 and Table 910.3. in accordance with NFPA 204 and this section.

TABLE 910.3 (IBC [F] TABLE 910.3)
REQUIREMENTS FOR DRAFT CURTAINS AND SMOKE AND HEAT VENTS[a]
(Delete table and notes in their entirety)

910.3.1 (IBC [F] 910.3.1) Smoke boundary layer. Smoke and heat vents and draft curtain installations shall be designed to maintain the elevation of the smoke boundary layer as defined by NFPA 204 a minimum of 6 feet above the elevation of the means of egress for a period of 20 minutes after effective ignition.

910.3.1 (IBC [F] 910.3.1) Design. **910.3.2 (IBC [F] 910.3.2) Listing and labeling.** Smoke and heat vents shall be listed and labeled to indicate compliance with UL 793 or FM 4430..

910.3.2 (IBC [F] 910.3.2) Vent operation. Smoke and heat vents shall be capable of being operated by approved automatic and manual means. Automatic operation of smoke and heat vents shall conform to the provisions of Sections 910.3.2.1 through 910.3.2.3.

910.3.2.1 (IBC [F] 910.3.2.1) Gravity-operated drop-out vents. Automatic smoke and heat vents containing heat-sensitive glazing designed to shrink and drop out of the vent opening when exposed to fire shall fully open within 5 minutes after the vent cavity is exposed to a simulated fire, represented by a time-temperature gradient that reaches an air temperature of 500°F (260°C) within 5 minutes.

910.3.2.2 (IBC [F] 910.3.2.2) Sprinklered buildings. Where installed in buildings provided with an approved automatic sprinkler system, smoke and heat vents shall be designed to operate automatically.

910.3.2.3 (IBC [F] 910.3.2.3) Nonsprinklered buildings. Where installed in buildings not provided with an approved automatic sprinkler system, smoke and heat vents shall operate automatically by actuation of a heat-responsive device rated at between 100°F (38°C) and 220°F (104°C) above ambient.

Exception: Gravity-operated drop-out vents complying with Section 910.3.2.1

910.3.3 (IBC [F] 910.3.3) Vent dimensions. The effective venting area shall not be less than 16 square feet (1.5 m^2) with no dimension less than 4 feet (1219 mm), excluding ribs or gutters having a total width not exceeding 6 inches (152 mm).

910.3.4 (IBC [F] 910.3.4 910.3.3 (IBC [F] 910.3.3 Vent locations. Smoke and heat vents shall be located 20 feet (6096 mm) or more from adjacent lot lines and fire walls and 10 feet (3048 mm) or more from fire barriers. Vents shall be uniformly located within the roof in the areas of the building where the vents are required to be installed by Section 910.2 with consideration given to roof pitch, draft curtain location, sprinkler location and structural members.

910.3.5 (IBC [F] 910.3.5) 910.3.4 (IBC [F] 910.3.4 Draft curtains. Where required by Table 910.3 NFPA 204, draft curtains shall be installed on the underside of the roof in accordance with this section.

Exception: Where areas of buildings are equipped with ESFR sprinklers, draft curtains shall not be provided within these areas. Draft curtains shall only be provided at the separation between the ESFR sprinklers and the non ESFR sprinklers.

910.3.5.1 (IBC [F] 910.3.5.1 910.3.4.1 (IBC [F] 910.3.4.1) Construction. Draft curtains shall be constructed of sheet metal, lath and plaster, gypsum board or other approved materials which provide equivalent performance to resist the passage of smoke. Joints and connections shall be smoke tight.

910.3.5.2 (IBC [F] 910.3.5.2) Location and depth. The location and minimum depth of draft curtains shall be in accordance with Table 910.3.

910.4 (IBC [F] 910.4) Mechanical smoke exhaust. Where approved by the fire code official, engineered mechanical smoke exhaust shall be an acceptable alternate to smoke and heat vents.

[F] 910.4. Mechanical smoke removal system. Where required by Sections 910.2.1 and 910.2.3, a mechanical smoke removal system shall be provided in accordance with this section.

Exception: Buildings or portions thereof which are protected by ESFR sprinklers.

~~**910.4.1 (IBC [F] 910.4.1) Location.** Exhaust fans shall be uniformly spaced within each draft-curtained area and the maximum distance between fans shall not be greater than 100 feet (30 480 mm).~~

910.4.1 (IBC [F] 910.4.1) Exhaust fan number and spacing. A minimum of two exhaust fans shall be provided. The spacing between exhaust inlets shall be a minimum of 40 feet and not exceed 100 feet.

~~**910.4.2 (IBC [F] 910.4.2) Size.** Fans shall have a maximum individual capacity of 30,000 cfm (14.2 m3/s). The aggregate capacity of smoke exhaust fans shall be determined by the equation:~~

~~$C = A \times 300$ **(Equation 9-10)**~~

~~where:~~
~~C = Capacity of mechanical ventilation required, in cubic feet per minute (m3/s).~~
~~A = Area of roof vents provided in square feet (m2) in accordance with Table 910.3.~~

910.4.2 (IBC [F] 910.4.2) Exhaust fan construction. Exhaust fans which are part of the smoke removal system shall be rated for operation at ambient temperatures. Exhaust fan motors shall be located outside of the exhaust air stream.

910.4.2 (IBC [F] 910.4.3) System design criteria. The mechanical smoke removal system shall be sized to exhaust the building at a minimum rate of 4 air changes per hour based upon the volume of the building or portion thereof without contents. The capacity of each exhaust fan shall not exceed 30,000 cubic feet per minute. Adequate make-up air shall be available and approved.

~~**910.4.3 (IBC [F] 910.4.3) Operation.** Mechanical smoke exhaust fans shall be automatically activated by the automatic sprinkler system or by heat detectors having operating characteristics equivalent to those described in Section 910.3.2. Individual manual controls of each fan unit shall also be provided.~~

910.4.4 (IBC [F] 910.4.4) Activation. The mechanical smoke removal system shall be activated by manual controls. The mechanical smoke removal system shall not be automatically activated.

910.4.5 (IBC [F] 910.4.5) Manual control location. Manual controls shall be located so as to be accessible to the fire service from the exterior of the building and be protected against interior fire exposure by not less than 1-hour fire barriers constructed in accordance with Section 707 or horizontal assemblies constructed in accordance with Section 712, or both.

~~**[F] 910.4.4 Wiring and control.** Wiring for operation and control of smoke exhaust fans shall be connected ahead of the main disconnect and protected against exposure to temperatures in excess of 1,000°F (538°C) for a period of not less than 15 minutes. Controls shall be located so as to be immediately accessible to the fire service from the exterior of the building and protected against interior fire exposure by not less than 1-hour fire barriers constructed in accordance with Section 706 or horizontal assemblies constructed in accordance with Section 711, or both.~~

910.4.6 (IBC [F] 910.4.6) Wiring and control. Wiring for the operation and control of smoke removal system fans shall be connected ahead of the main disconnect and be protected by materials with a finish rating of 30 minutes.

~~**910.4.5 (IBC [F] 910.4.5) Supply air.** Supply air for exhaust fans shall be provided at or near the floor level and shall be sized to provide a minimum of 50 percent of required exhaust. Openings for supply air shall be uniformly distributed around the periphery of the area served.~~

~~**910.4.6 (IBC [F] 910.4.6) Interlocks.** In combination comfort air-handling/ smoke removal systems or independent comfort air-handling systems, fans shall be controlled to shut down in accordance with the approved smoke control sequence.~~

910.4.7 (IBC [F] 910.4.7) Interlocks. Where building air-handling and smoke removal systems are combined or where independent building air-handling systems are provided, fans shall automatically shut down in accordance with the *International Mechanical Code*. The manual controls provided for the smoke removal system shall have the cability to override the automatic shutdown of fans that are part of the smoke removal system.

TABLE 2306.2
GENERAL FIRE PROTECTION AND LIFE SAFETY REQUIREMENTS

(Portions of table not shown remain unchanged)

For SI: 1 foot = 304.8 mm, 1 cubic foot = 0.02832 m^3 , 1 square foot = 0.0929 m^2 .

a. When automatic sprinklers are required for reasons other than those in Chapter 23, the portion of the sprinkler system protecting the high-piled storage area shall be designed and installed in accordance with Sections 2307 and 2308.
b. For aisles, see Section 2306.9.

c. Piles shall be separated by aisles complying with Section 2306.9.
d. For storage in excess of the height indicated, and high hazard storage areas greater than 300, 000 square feet, ~~special fire protection~~ an approved engineering design such as fire protection of structural elements and enhanced fire suppression shall be provided ~~in accordance with Note g when required by the fire code official~~. See also Chapters 28 and 34 for special limitations for aerosols and flammable and combustible liquids, respectively.
e. Section 503 shall apply for fire apparatus access.
f. For storage exceeding 30 feet in height, Option 1 shall be used.
~~g. Special fire protection provisions including, but not limited to, fire protection of exposed steel columns; increased sprinkler density; additional in-rack sprinklers, without associated reductions in ceiling sprinkler density; or additional fire department hose connections shall be provided when required by the fire code official.~~
h. High-piled storage areas shall not exceed 500,000 square feet. A 2-hour fire wall constructed in accordance with the International Building Code shall be used to divide high-piled storage exceeding 500,000 square feet in area.
i. Not required when an automatic fire-extinguishing system is designed and installed to protect the high-piled storage area in accordance with Sections 2307 and 2308.
j. Smoke and heat venting shall not be ~~Not~~ required when storage areas are protected by early suppression fast response (ESFR) sprinkler systems installed in accordance with NFPA 13. Where a standard sprinkler system is installed in these locations, a mechanical smoke removal system shall be provided in accordance with Section 910.4. See Section 2306.7.

2306.7 Smoke and heat ~~removal~~ venting. Where smoke and heat ~~removal~~ venting ~~are~~ is required by Table 2306.2 in buildings not protected by an automatic sprinkler system, smoke and heat vents and draft curtains shall be provided in accordance with Section 910. Smoke and heat venting shall not be required where storage areas are protected by early suppression fast response (ESFR) sprinkler systems installed in accordance with NFPA 13. Where Table 2306.2 requires smoke and heat venting in a building with a standard sprinkler system, a mechanical smoke removal system shall be provided in accordance with Section 910.4. Where draft curtains are required by Table 2306.2, they shall be provided in accordance with Section 910.3.4.

2. Add new standards to Chapter 47 (IBC Chapter 35) as follows:

FM
4430-07 Approval Standard for Heat and Smoke Vents

NFPA
204-2010 Standard for Smoke and Heat Venting

Reason: The ICC Board established the ICC Code Technology Committee (CTC) as the venue to discuss contemporary code issues in a committee setting which provides the necessary time and flexibility to allow for full participation and input by any interested party. The code issues are assigned to the CTC by the ICC Board as "areas of study". Information on the CTC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the following website: http://www.iccsafe.org/cs/cc/ctc/index.html. Since its inception in April/2005, the CTC has held seventeen meetings - all open to the public.

This proposed change is a result of the CTC's investigation of the area of study entitled "Balanced Fire Protection – Roof vents". The scope of the activity is noted as:

Review the current IBC/IFC requirements for smoke/heat vents and draft curtains relative to balanced fire protection**.**

The purpose of this code change is to update the provisions which mandate roof vents in one-story industrial and storage buildings. The code change will delete the specification-oriented provisions for roof vents and draft curtains for unsprinklered buildings and substitute a reference to NFPA 204. The code change will further require that a manually-operated mechanical smoke removal system be provided for large one-story industrial and storage buildings protected by a sprinkler system in lieu of the requirements for roof vents and draft curtains.

The first issue assigned by the ICC Board of Directors to the Code Technology Committee (CTC) in 2005 was the issue of "balanced" fire protection. As part of the CTC's review of the "balanced" fire protection issue, the CTC formed a Study Group to review the issue of whether or not smoke/heat vents were necessary in large buildings protected by a sprinkler system.

After reviewing the available research on the interaction of standard sprinklers and roof vents (NISTIR 6196-1), it was determined that individually-activated automatic roof vents are unlikely to activate automatically in buildings protected by standard spray sprinklers (provided that the sprinkler system is adequate for the hazard protected and is operational). Given this determination, it was concluded that the performance of individually-activated automatic roof vents is essentially the same as manually-operated roof vents in buildings protected by a sprinkler system.

The explanatory information provided in NFPA 204 indicates that the capabilities of roof vents to perform their function are dependent upon the depth of the smoke layer which develops and the temperature differential between the smoke layer and ambient temperature. Given that standard spray sprinklers are highly efficient in reducing ceiling temperatures due to the finely divided water spray produced by these types of sprinklers, the ceiling temperatures produced even in "high challenges" fires are rapidly reduced and, after about 10 minutes of sprinkler discharge, return to near ambient and continue to drop with additional time. Based upon this, it can be concluded that roof vents which are manually opened 10 minutes or more after sprinkler activation will not provide effective venting for the building.

Where the smoke layer temperature differentials are less than 110^{o}C (198^{o}F), NFPA 204 recommends that a powered (mechanical) exhaust system be provided in lieu of providing roof vents. Based upon the recommendations contained in NFPA 204, the provisions for providing roof vents have been deleted and a requirement for a manually-operated mechanical smoke removal system has been substituted.

The proposal requires that the manually-operated mechanical smoke removal system be sized to provide a minimum of 6 air changes per hour. Since the use of roof vents for the purpose of providing venting in sprinklered buildings has been acceptable for over 25 years, the sizing of the mechanical smoke removal system has been determined based upon the venting capabilities of roof vents at a time equal to the typical fire department response time, 10 minutes and beyond. Given that opened roof vents will provide little actual venting capability after the sprinkler system

has been discharging water spray for 10 minutes, providing a mechanical smoke removal system which provides a minimum of 4 air changes an hour will be a substantial improvement over the presently acceptable venting capabilities for sprinklered buildings required by the IBC/IFC. The 4 air changes were viewed as a reasonable value when compared against the BOCA National Building Code which required 2 and the Uniform Building Code which required 6.

It should be noted that this code change proposal permits the mechanical smoke removal system to designed to operate at ambient temperatures. The rationale for this provision is that the ceiling temperatures throughout the building will be returned to close to ambient at between 10 and 15 minutes after the first sprinkler activates. Given that the typical response time for fire departments is roughly 10 minutes, and the ceiling temperatures expected after 10 minutes, there is no need to design the mechanical system to withstand temperatures higher than ambient.

In the opinion of the Study Group which has developed this code change proposal, the proposal is a vast improvement over the existing provisions for roof venting presently contained in the IBC/IFC.

It should be noted that simply making a reference to NFPA 204 as a substitute for the present specification-oriented provisions for roof vents/draft curtains contained in the IBC/ IFC is not an option because the current edition of NFPA 204 does not contain specific design provisions for the design of roof vent systems in buildings protected by a standard sprinkler system. Without specific provisions for roof vent system in sprinklered buildings, the requirements for roof vent systems in sprinklered buildings cannot be enforced in a uniform manner in all jurisdictions which utilize the IBC/IFC.

It should also be noted that the NFPA 204 committee is presently working developing provisions which address the design of roof venting systems in sprinklered buildings; however, these provisions have been under development for more than 30 years. It is the Study Group's opinion that the IBC/IFC should not be written based upon the assumption that the NFPA 204 committee will be able to develop provisions for the design of venting systems anytime in the near future.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: A review of the standard proposed for inclusion in the code, FM 4430-07, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009. Review of proposed new standard NFPA 204-2010 indicated that, in the opinion of ICC Staff, the standard did comply with ICC standards criteria.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: HEILSTEDT-F1-910.1.DOC

F145–09/10
910.3.5.2.1 (New) [IBC [F] 910.3.5.2.1 (New)]

Proponent: Richard Davis, FM Global

Add new text as follows:

910.3.5.2.1 (IBC [F] 910.3.5.2.1) Aisle location. Draft curtains located in high-piled storage areas classified as Class I-IV and High Hazard in sprinklered buildings shall be located over an aisle space. The distance between the face of storage and the draft curtain on both sides of the draft curtain shall not be less than 0.75 times the spacing between sprinklers in the direction perpendicular to the draft curtain.

Reason: If draft curtains are not located over sufficiently large aisle spaces, they can have a detrimental effect on fire control by sprinklers. Draft curtains can prevent pre-wetting of storage adjacent to the area of fire origin, and can delay actuation of sprinklers on the opposite side of the draft curtain with respect to the fire origin. Pre-wetting of adjacent storage is important in establishing fire control by sprinklers in storage areas. The operation of an excessive number of sprinklers, potentially depleting the water supply, can result. This has been substantiated by tests done at FM Global Research (Joan Troup). Additional discussion is provided in Annex F of NFPA 204.

Cost Impact: The code change proposal will slightly increase costs based on the current requirements of the code, because it will result in an aisle space that is likely wider than it would be otherwise

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: DAVIS-F1-910.3.5.3.DOC

F146–09/10
910.5 (New) [IBC ([F] 910.5 (New)], Chapter 47

Proponent: Justin H. Beal, representing the City of Fresno, CA, Fire Department

1. Add new text as follows:

910.5 (IBC [F] 910.5) Maintenance. Smoke and heat vents and mechanical smoke exhaust systems shall be maintained in an operative condition in accordance with NFPA 204. Fusible links shall be promptly replaced whenever fused, damaged or painted. Smoke and heat vents and mechanical smoke exhaust systems shall not be modified.

2. Add new standard to Chapter 47 as follows:

NFPA	
204-2007	Standard for Smoke and Heat Venting

Reason: The maintenance of heat and smoke vents and mechanical smoke exhaust systems is not clearly addressed within the model International Fire Code. Installation and design criteria for smoke and heat vents can be found in I.F.C. section 910.3.1 (U.L. 793), however, maintenance provisions for these systems should be included within section 910 to provide clarity for the end user of the code. This proposal incorporates National Fire Protection Association Standard 204, Standard for Smoke and Heat Venting, 2007 edition, as the referenced standard for the maintenance of smoke and heat vents and mechanical smoke exhaust systems.

Routine inspection, testing and maintenance of these devices is essential for several reasons: These devices are typically only found in the largest commercial structures, and within these structures, the amount of fire loading is usually very high, to include high piled combustible storage.

Ensuring that these devices are inspected, tested and maintained in proper working order by the building owner (as specified in the new referenced standard) will have several positive effects for firefighter safety. These benefits include: easy identification of the location of the fire within the structure, the release of excess heat within the structure decreasing fire severity, increased visibility for firefighters within the structure, and the reduction of toxic products of combustion within the structure.

Additionally, the maintenance of these devices will have a mitigating effect on damage to the structure and/or its contents should a fire occur. These include: decreased likelihood of structural failure from heat retained within the structure and reduced damage to the structure and stored materials from smoke.

Finally, these devices are considered “fire protection systems” as noted in the I.F.C. section 902.1, and as such, a provision requiring specified inspection, testing and maintenance intervals via a referenced standard should be included within the body of the code.

The language of this section has been developed to follow (and is substantially similar to, and consistent with) the format found within the International Fire Code, Section 703.2.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: Review of proposed new standard NFPA 204-2007 indicated that, in the opinion of ICC Staff, the standard did comply with ICC standards criteria.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: BEAL-F1-910.5.DOC

F147–09/10
912.4 (IBC [F] 912.4)

Proponent: Joshua D. Smith, New York State Department of State, Office of Fire Prevention and Control

Revise as follows:

912.4 ~~Signs~~ Markings. A metal sign with raised letters at least 1 inch (25 mm) in size shall be mounted on all fire department connections ~~serving automatic sprinklers, standpipes or fire pump connections~~ to indicate their function. The caps of fire department connections shall also be color-coded to indicate their function. ~~Such signs shall read: AUTOMATIC SPRINKLERS or STANDPIPES or TEST CONNECTION or a combination thereof as applicable.~~ Where the fire department connection does not serve the entire building, a sign shall be provided indicating the portions of the building served. The signs and the caps shall be marked as follows:

1. For a connection serving only a standpipe the sign shall read STANDPIPE and the cap shall be colored red.
2. For a connection serving a combination automatic sprinkler and standpipe system the sign shall read COMBINATION STANDPIPE AND SPRINKLER and the cap shall be colored yellow. If the automatic sprinkler system only covers a portion of the building the sign shall also indicate where the protected areas are located in the building.
3. For a connection serving an automatic sprinkler system only the sign shall read SPRINKLER or AUTOMATIC SPRINKLER and the cap shall be colored green. If the automatic system only covers a portion of the building the sign shall also indicate where the protected areas are located in the building.
4. For a connection serving a systems other than an automatic sprinkler system the sign shall read NON-AUTOMATIC SPRINKLER and the cap shall be colored silver.
5. Test connections shall have signs that read TEST CONNECTION and the caps shall be colored black.

Reason: There are often signs installed for fire department connections that are often a single color, such as chrome or brass signs, that are not easily read from the point where a fire apparatus will be able to first see the connection. The color coding of the caps will make identifying the function of the fire department connection more easily discernable from a greater distance for fire apparatus fire fighters.

Cost Impact: The code change proposal will increase the cost of construction.

	Assembly:	ASF	AMF	DF

ICCFILENAME: SMITHJ-F1-912.4.DOC

F148–09/10
915 (New) [IBC [F] 916 (New)]; IFGC 410.4 (New)

Proponent: Ronald Paskiewicz, President, Craft-Weld Enterprises, Inc., representing himself and Craft-Weld, for U.S. Patent No. 6,199,573 Gas Flow Arrestor (GFA) system

THIS IS A 2 PART CODE CHANGE. BOTH PARTS WILL BE HEARD BY THE FIRE CODE COMMITTEE AS 2 SEPARATE CODE CHANGES. SEE THE TENTATIVE HEARING ORDER FOR THE FIRE CODE COMMITTEE.

PART I – IFC

Add new text as follows:

SECTION 915 (IBC 916)
AUTOMATIC FUEL GAS SERVICE SHUT OFF

915.1 Automatic fuel gas shut-off. Each fuel gas service to a building shall be equipped with an approved, fire alarm activated automatic fuel gas shut-off device installed between the gas service meter and the building or, where there is no gas service meter, within 2 feet (610 mm) of where the gas service pipe enters the building. Where no fire alarm system is installed, the automatic fuel gas shut-off device shall be activated by an approved smoke detector equipped with an approved heat sensor. The device shall stop the flow of fuel gas to the building upon activation by the fire alarm system or by activation of the heat sensor in the smoke detector.

915.2 Protection of non-metered branch services. Where a metered fuel gas service serves more than one building, or a complex of buildings, or a building that is subdivided into fire areas, each of which is served by a separate branch line from the metered gas service main, each such branch line shall be protected by an approved automatic fuel gas shut-off device activated in accordance with Section 915.1and installed within 2 feet (610 mm) of the building at the fuel gas service entrance.

915.3 Protection of branch lines to mechanical and electrical equipment. Branch lines to rooftop heating, ventilating and air conditioning units, and to pad-mounted emergency generators shall be protected by heat detector actuated automatic fuel gas shut-off systems.

PART II – IFGC

Add new text as follows:

410.4 Automatic fuel gas shut-off. An automatic fuel gas shut-off device shall be provided for buildings in accordance with Section 915 of the *International Fire Code*.

Reason: These requirements introduce a requirement for fire alarm actuated automatic gas shut-off valves at all metered fuel gas services to buildings or separate subdivisions of buildings, for example, a commercial mall or plaza, or an office building where each tenant's service is separately metered, or an industrial "incubator" complex of small leased spaces on separate meters. At the same time, 915.2 provides for the many situations where a single utility company meter serves an entire complex of buildings and subdivisions of these buildings, such as office campuses, large industrial complexes, military bases, airports and college and university campuses. and branch mains and branch lines of various sizes serve each building, and separate parts of these buildings, where fire alarm actuated automatic gas shut-off valves, or gas flow arrestors, on each of the individual branch mains or branch lines will protect the building that main or branch line serves without automatically shutting off gas services to all of the other buildings.

Cost Impact: The code change will only very slightly increase the cost of construction. Protection of each service or branch service can cost as little as a few hundred dollars, but even the most complex and sophisticated systems for the largest installations will cost no more than a few thousand dollars. Any increase in cost will be recovered within one to at the most three years in the reduction of insurance premiums, this on the authority of several major insurance companies that are poised to reduce the cost of their policies to insured who have installed GFA's.

PART I – IFC

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

PART II – IFGC

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: PASKIEWICZ-F1-915

F149–09/10
1030.2

Proponent: John Woestman, The Kellen Company, representing the Door Safety Council (DSC)

Revise as follows:

1030.2 Reliability. Required exit accesses, exits ~~or~~ and exit discharges shall be continuously maintained free from obstructions or impediments to full instant use in the case of fire or other emergency when the building area~~s~~ served by ~~such exits~~ the means of egress ~~are~~ is occupied. Security devices affecting means of egress shall be subject to approval of the fire code official.

Reason: This proposal clarifies and improves enforceability of this paragraph of the code. One of the most common violations of the fire code is means of egress that have impediments to full instant use.

This proposal revises the code to more accurately reflect the intent of the code in that all three of the critical parts of the means of egress are required to meet the "full instant use" reliability requirements. Without this code change, it could be argued that this paragraph of the code may be satisfied if only one of the three separate and distinct parts of a means of egress is maintained free from obstructions and impediments to full instant use.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: WOESTMAN-F4-1030.2.DOC

F150–09/10
1030.2, 1030.2.1 (New)

Proponent: John Woestman, The Kellen Company, representing the Door Safety Council (DSC)

Revise as follows:

1030.2 Reliability. Required exit accesses, exits or exit discharges shall be continuously maintained free from obstructions or impediments to full instant use in the case of fire or other emergency when the areas served by such exits are occupied. Security devices affecting means of egress shall be subject to approval of the fire code official.

A building is regarded as occupied when it is open for use, open to the public, or when more than 10 persons are present within the building.

1030.2.1 In occupancy Groups A, B, E, and M, when the building is regarded as not occupied and means of egress doors are locked, individuals in the building shall be able to unlock means of egress doors for emergency egress.

Reason: This proposal introduces to the IFC a description of occupancy consistent with the updated NFPA 101 Life Safety Code and, for occupancy groups A, B, E, & M, adds enforceable language that addresses the challenge of ensuring reliable emergency escape while at the same time providing for occupant and property protection and security.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: WOESTMAN-F3-1030.2-2.DOC

F151–09/10
1030.2, 1030.2.1, 1030.6, 1030.9 (New)

Proponent: Robert J Davidson, Code Consultant/Alan Shuman, President, representing the National Association of State Fire Marshals (NASFM)

1. Revise as follows:

1030.2 Reliability. Required exit accesses, exits or exit discharges shall be continuously maintained free from obstructions or impediments to full instant use in the case of fire or other emergency when the areas served by such exits are occupied. An exit or exit passageway shall not be used for any purpose other than as a means of egress.

1030.2.1 Security devices and egress locks. Security devices affecting means of egress shall be subject to approval of the fire code official. Special locking arrangements including, but not limited to access-controlled egress doors, security grills, locks and latches, and delayed egress locks shall be installed and maintained as required by this chapter.

1030.6 Finishes, furnishings and decorations. Means of egress doors shall be readily maintained in such a manner as to be distinguishable from the adjacent construction and finishes such that the doors are easily recognizable as doors. Furnishings, decorations or other objects shall not be placed so as to obstruct exits, access thereto, egress therefrom, or visibility thereof. Hangings and draperies shall not be placed over exit doors or otherwise be located to conceal or obstruct an exit. Mirrors shall not be placed on exit doors. Mirrors shall not be placed in or adjacent to any exit in such a manner as to confuse the direction of exit.

2. Add new text as follows:

1030.9 Floor identification signs. The floor identification signs required by Sections 1022.8 and 4604.22 shall be maintained in an approved manner.

Reason: The proposed modification Section 1030.2 has taken language that currently exists in Sections 1020.1 and 1023.1 and added it to this section since the requirement is one that not only applies at the time of construction, but must be maintained for the life of the building or structure.

> *1020.1 General. Exits shall comply with Sections1020 through 1026 and the applicable requirements of Section1003 through 1013. An exit shall not be used for any purpose that interferes with its function as a means of egress. Once a given level of exit protection is achieved, such level of protection shall not be reduced until arrival at the exit discharge.*
>
> *1023.1 Exit passageway. Exit passageways serving as an exit component in a means of egress system shall comply with the requirements of this section. An exit passageway shall not be used for any purpose other than as a means of egress.*

The last sentence of Section 1030.2 addressing "security" is a special topic and has been separated out and designated as 1030.2.1. Language has been added to make it clear any of a number of methods used to control the use of or secure egress doors must be done in compliance with Chapter 10, which has specific provisions governing the installations when approved.

The proposed change to 1030.6 takes a restriction found in Section 1008.1 that equally applies to new construction, but also must be addressed through the life of the building or structure. It is not uncommon for a building owner to refinish the inside of an occupancy and paint or otherwise apply a matching finish to a door and the surrounding wall making the door indistinguishable. This commonly occurs with murals that are painted on walls of corridors.

> 1008.1 Doors. Means of egress doors shall meet the requirements of this section. Doors serving a means of egress system shall meet the requirements of this section and Section 1017.2. Doors provided for egress purposes in numbers greater than required by this code shall meet the requirements of this section.
>
> Means of egress doors shall be readily distinguishable from the adjacent construction and finishes such that the doors are easily recognizable as doors. Mirrors or similar reflecting materials shall not be used on means of egress doors. Means of egress doors shall not be concealed by curtains, drapes, decorations or similar materials.

A new Section 1030.9 is proposed which references the language found in existing Section 1022.8. The requirement for the maintenance of signs designating floor levels in interior stairway exit enclosures has equal importance in existing buildings.

Cost Impact: The code change proposal will not increase the cost of construction other than the signs needed for compliance with proposed Section 1028.8.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: DAVIDSON-SHUMAN-F3-1030.2.DOC

F152–09/10
1206.2, 1206.2.1 (New), 1206.3, 1206.4

Proponent: David W. Dawson, R. R. Street & Co. Inc.

1. Revise as follows:

1206.2 ~~Type~~ Class I solvents. The maximum quantity of ~~Type I~~ Class I solvents permitted at any work station shall be 1 gallon (4 L). ~~Class I solvents shall be stored in approved safety cans or in sealed DOTn-approved metal shipping containers of not more than 1-gallon (4 L) capacity. Dispensing shall be from approved safety cans.~~ Spotting or pre-spotting shall be permitted to be conducted with Class I solvents where they are stored in and dispensed from approved safety cans or in sealed DOT-approved shipping containers of not more than 1 gallon (4 L) capacity.

2. Add new text as follows:

1206.2.1 Spotting and pre-spotting. Spotting and pre-spotting shall be permitted to be conducted with Class I solvents where dispensed from plastic containers of not more than 1 pint (0.5 L) capacity.

3. Revise as follows:

1206.3 ~~Type~~ Class II and III solvents. Scouring, brushing, and spotting and pretreating shall be permitted to be conducted with Class II or III solvents. The maximum quantity of ~~Type~~ Class II or III solvents permitted at any work station shall be 1 gallon (4 L). In other than Group H-2 occupancy, the aggregate quantities of solvents shall not exceed the maximum allowable quantity per control area for use-open system.

1206.4 Type IV systems. Flammable and combustible liquids used for spotting operations shall be stored in approved safety cans or in sealed DOT~~n~~-approved ~~metal~~ shipping containers of not more than 1 gallon (4 L) in capacity. ~~Dispensing shall be from approved safety cans.~~ Aggregate amounts shall not exceed 10 gallons (38 L).

Reason: The purpose of the change is to revise outdated material. The proposed wording is intended to recognize the wide use of DOT-approved plastic containers to ship and store chemicals used in dry cleaning plants, including spotting chemicals. Use of these containers is permitted by OSHA for the storage of flammable and combustible liquids under conditions described in OSHA Directive STD 01-05-014. Equivalent changes have been made to NFPA 32.

Bibliography: 29 CFR 1910.106 Flammable and combustible liquids; OSHA Directive STD-01-05-014; NFPA 32.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: DAWSON-F2-1206.2.DOC

F153–09/10
1208.2

Proponent: David W. Dawson, R. R. Street & Co. Inc., representing Textile Care Allied Trades Association (TCATA) and Drycleaning and Laundry Institute (DLI).

Revise as follows:

1208.2 Automatic sprinkler system. An automatic sprinkler system shall be installed in accordance with Section 903.3.1.1 throughout dry cleaning plants containing Type II, Type III-A or Type III-B dry cleaning systems.

Exceptions:

1. An automatic sprinkler system shall not be required in Type III-A dry cleaning plants where the aggregate quantity of Class III-A solvent in dry cleaning machines and storage does not exceed 330 gal (1250 L) and dry cleaning machines are equipped with a feature that will accomplish any one of the following:

    1.1. Prevent oxygen concentrations from reaching 8 percent or more by volume.
    1.2. Keep the temperature of the solvent at least 30ºF (16.7ºC) below the flash point.

1.3. Maintain the solvent vapor concentration at a level lower than 25 percent of the lower explosive limit (LEL).

1.4. Utilize equipment approved for use in Class I, Division 2 hazardous locations in accordance with NFPA 70.

1.5. Utilize an integrated automatic fire-extinguishing system complying with Section 4.6 of NFPA 32.

2. An automatic sprinkler system shall not be required in Type III-B dry cleaning plants where the aggregate quantity of Class III-B solvent in dry cleaning machines and storage does not exceed 3300 gal (12,490 L).

Reason: The purpose of this proposed code change is to eliminate the overly restrictive requirements for automatic sprinkler systems in dry cleaning facilities using modern dry cleaning equipment. Modern Type IIIA dry cleaning machines have intrinsic safety features that prevent fires from starting within the dry cleaning machine. It is preferable to prevent fires from starting in the first place, rather than extinguishing ones that have already started. NFPA 32 already allows these safety features to be used in lieu of automatic sprinkler systems.

Bibliography: NFPA 32

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: The action on this proposal should be consistent with the action on Code Change F154-09/10.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: DAWSON-F1-1208.2.DOC

F154–09/10
1208.2

Proponent: Howard Hardy, South Metro Fire Rescue Authority, representing Fire Marshal's Association of Colorado

Revise as follows:

1208.2 Automatic sprinkler system. An automatic sprinkler system shall be installed in accordance with Section 903.3.1.1 throughout dry cleaning plants containing Type II, Type III-A or Type III-B dry cleaning systems.

Exception: Sprinklers shall be permitted to be omitted in dry cleaning plants complying with the exceptions in NFPA 32.

Reason: The purpose of this code change proposal is to clarify conflicting requirements between the International Fire Code and NFPA 32. The International Fire Code indicates that the installation of drycleaning systems is to be in accordance with the requirements of NFPA 32 The construction provisions of NFPA 32 addresses the installation of automatic sprinklers and allows several exceptions that would not require the installation of automatic sprinklers in type II, IIIA and IIIB drycleaning plants. The exceptions in NFPA 32 are based on providing equivalent levels of protection in drycleaning plants with limited quantities of solvents in use and storage. The International Fire Code currently allows no exception to providing automatic sprinkler systems throughout type II and III drycleaning plants. This requirement is in conflict with the requirements of NFPA 32. The exceptions in NFPA 32 are similar to provisions in the International Fire Code allowing alternative automatic fire extinguishing systems, such as for commercial cooking operations, where the specific hazard is addressed rather than requiring automatic sprinklers in the entire occupancy.
We are seeing a trend to change current type IV drycleaning plants to type III drycleaning plants to eliminate the use of existing type IV solvents that are serious health hazards. It causes extreme financial hardship to business owners when they are required to provide automatic sprinkler systems to their occupancy due to a change in the type of plant and are not allowed to utilize any of the exceptions currently allowed in NFPA 32 for alternative protection. The typical small drycleaning establishment normally has minimal equipment and chemicals and is no more and often less hazardous than other occupancies that do not require automatic sprinkler systems. It seems unreasonable to require sprinklers throughout when they change the type of plant by installing a new drycleaning machine that provides adequate safety for the drycleaning machine.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: The action on this proposal should be consistent with the action on Code Change F153-09/10.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: HARDY-F2-1208.2.DOC

F155–09/10
1501.1, 1501.2; IBC [F] 416

Proponent: Tom Lariviere, Chairman - Joint Fire Service Review Committee

1. Revise IFC as follows:

1501.1 Scope. This chapter shall apply to locations or areas where any of the following activities are conducted:

1. The application of ~~flammable or combustible paint, varnish, lacquer, stain, fiberglass resins or other flammable or combustible liquid applied~~ flammable finishes to articles or materials by means of spray apparatus ~~in continuous or intermittent processes~~.
2. ~~Dip-tank operations in which articles or materials are passed through contents of tanks, vats or containers of flammable or combustible liquids, including coating, finishing, treatment and similar processes.~~ The application of flammable finishes by dipping or immersing articles or materials into the contents of tanks, vats or containers of flammable or combustible liquids for coating, finishing, treatment or similar processes.
3. The application of flammable finishes by applying combustible powders to articles or materials utilizing ~~when applied by~~ powder spray guns, electrostatic powder spray guns, fluidized beds or electrostatic fluidized beds.
4. Floor surfacing or finishing operations using Class I or II liquids in areas exceeding 350 square feet (32.5 m^2).
5. The application of flammable finishes consisting of dual-component coatings or Class I or II liquids when applied by brush or roller in quantities exceeding 1 gallon (4 L).
6. ~~Spraying and dipping operations.~~

1502.1 Definitions. The following words and terms shall, for the purposes of this chapter and as used elsewhere in this code, have the meanings shown herein.

FLAMMABLE FINISHES. ~~Material coatings~~ Coatings to articles or materials in which the material being applied is a flammable liquid, combustible liquid, combustible powder, fiberglass resin or flammable or combustible gel coating.

2. Revise IBC as follows:

SECTION 416
SPRAY APPLICATION OF FLAMMABLE FINISHES

[F] 416.1 General. The provisions of this section shall apply to the construction, installation and use of buildings and structures, or parts thereof, for the spraying of flammable ~~paints, varnishes and lacquers~~ finishes ~~or other flammable materials or mixtures or compounds used for painting, varnishing, staining or similar purposes~~. Such construction and equipment shall comply with the International Fire Code.

[F] 416.2 Spray rooms. (No change to current text.)

[F] 416.2.1 Surfaces. (No change to current text.)

[F] 416.2.2 Ventilation. Mechanical ventilation and interlocks with the spraying operation shall be in accordance with the International Fire Code.

[F] 416.3 Spraying spaces. (No change to current text.)

[F] 416.3.1 Surfaces. (No change to current text.)

[F] 416.4 Spray booths. (No change to current text.)

[F] 416.5 Fire protection. An automatic fire-extinguishing system shall be provided in all spray~~, dip and immersing spaces and storage~~ rooms and shall be installed in accordance with Chapter 9.

Reason: Item 1 – IFC: The revisions in this section are intended to clarify the application of Chapter 15. There is no change in application of this Chapter or the requirements therein.

First, the Scope is revised using the defined term of "flammable finishes".
1. Item #1 covers spray operations
2. Item #2 covers dipping operations
3. Item #3 covers electrostatic and fluidized beds

4. Item #4 specifies the limitation of Class I or II liquids when conducting floor surfacing
5. Item #5 covers dual-component coatings
6. Item #6 is deleted since it is covered in Items #1 and #2.

Second, the definition of "flammable finishes" is revised to include the coatings that are already regulated in Chapter 15.

These revisions are essentially editorial changes that will add clarity in the application of Chapter 15.

Item 2 – IBC: This proposal is designed to correlate the requirements for spray operations found in the IBC and the IFC.

Section 416 is revised to specify spray application of materials. This is consistent with the wording in Section 416.1 which limits the application of these requirements to spray operations.

Section 416.1 is revised to provide consistency with the scope in IFC Section 1501.1. This revision will include all of the operations that would be regulated within a spray room or spray booth.

Section 416.2.2 is added to reference the IFC which contains requirements for ventilation velocities and for interlocking the ventilation system with the spraying apparatus.

Section 416.5 is revised to be consistent with IFC Section 1505.4. A fire extinguishing system is not required for all dipping operations. For example, when using dip tanks of less than 150 gallons, a fire extinguishing system is an optional method of protection.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: LARIVIERE-F17-1501.1-G2-IBC416.DOC

F156–09/10
1504.6.1.2.1

Proponent: Geoff Raifsnider, Global Finishing Solutions, representing self

Revise as follows:

1504.6.1.2.1 Interlocks. The spraying apparatus, drying apparatus and ventilating system for the spray booth or spray room shall be equipped with interlocks arranged to:

1. Prevent operation of the spraying apparatus while drying operations are in progress.
2. Prevent operation of the drying appratus until a timed purge of spray vapors from the spray booth or spray room is complete. This purge time shall be based upon introducing at least 4 standard cubic feet of fresh air per cubic foot of spray booth or spray room volume. ~~Purge spray vapors from the spray booth or spray room for a period of not less than 3 minutes before the drying apparatus is rendered operable.~~
3. Have the ventilating system maintain a safe atmosphere within the spray booth or spray room during the drying process and automatically shut off drying apparatus in the event of a failure of the ventilating system.
4. Shut off the drying apparatus automatically if the air temperature within the booth exceeds 200°F (93°C).

Reason: Although "not less than" implies that the value could be more, the current language does not state how the value is calculated. The proposed language clarifies how to calculate the purge time and bases it upon the amount of fresh air introduced. This proposal also eliminates the 3 minute minimum. There are applications where the delay in proceeding to curing can affect the quality of the product finish. In these applications the heating apparatus is often the same industrial heater that maintains the temperature during painting and the apparatus is outside the spray area and not subject to exposure to overspray. It should be acceptable to have a design where the purge time is a function of air flow.

Cost Impact: Any additional cost would be justified based upon the importance of the reduced purge time to achieve the quality of the product. This additional cost may be offset by the reduction in operating cost.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: RAIFSNIDER-F2-1504.6.1.2.1.DOC

F157–09/10
1504.7.3

Proponent: Geoff Raifsnider, Global Finishing Solutions, representing self

Revise as follows:

1504.7.3 Air velocity. Ventilation systems shall be designed, installed and maintained to be capable of confining and removing overspray and vapors. The vapor concentration in the exhaust air stream shall be less than 25 percent of the lower flammable limit. ~~such that the average air velocity over the open face of the booth, or booth cross section in the direction of airflow during spraying operations, shall not be less than 100 feet per minute (0.51 m/s).~~

Reason: This proposal eliminates the 100 fpm minimum air velocity. The proposed language removes the specific value while still stating the required performance. There are many types of booths and rooms in which the 100 fpm value would be detrimental to the quality of the product and is well in excess of the minimum dilution air needed to keep the space and exhaust below 25% of the LFL. This extra air also increases the operating costs. The air velocities for a specific spray booth or spray room should be specific to the individual design that accomplishes the desired performance (ie. 25% LFL or containment of overspray at openings). Chapter 13.75 of Industrial Ventilation – A Manual of Recommended Practice 26th Edition Published by ACGIH, lists many air velocity ranges for various painting operations, some above and some below 100 fpm. This publication could be included in the standard as reference material.

Cost Impact: The code change proposal would decrease the construction and operating costs.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: RAIFSNIDER-F1-1504.7.3.DOC

F158–09/10
1701.1, 1702.1, 1703.1, 1703.2, 1703.3, 1703.3.2, 1703.4

Proponent: Tom Lariviere, Chairman, Joint Fire Service Review Committee

Revise as follows:

CHAPTER 17
FUMIGATION AND ~~THERMAL~~ INSECTICIDAL FOGGING

1701.1 Scope. Fumigation and ~~thermal~~ insecticidal fogging operations within structures shall comply with this chapter.

1702.1 Definitions. The following words and terms shall, for the purposes of this chapter and as used elsewhere in this code, have the meanings shown herein.

~~THERMAL~~ INSECTICIDAL FOGGING. The utilization of insecticidal liquids passed through ~~thermal~~ fog-generating units where, by means of ~~heat,~~ pressure and turbulence, with or without the application of heat, such liquids are transformed and discharged in the form of fog or mist blown into an area to be treated.

1703.1 General. Structures in which fumigation and ~~thermal~~ insecticidal fogging operations are conducted shall comply with the fire protection and safety requirements of Sections 1703.2 through 1703.7.

1703.2 Sources of ignition. Fires, open flames and similar sources of ignition shall be eliminated from the space under fumigation or ~~thermal~~ insecticidal fogging. Heating, where needed, shall be of an *approved* type.

1703.3 Notification. The *fire code official* and fire chief shall be notified in writing at least 24 hours before the structure is to be closed in connection with the utilization of any toxic or flammable fumigant. Notification shall give the location of the enclosed space to be fumigated or fogged, the occupancy, the fumigants or insecticides to be utilized, the *person* or *persons* responsible for the operation, and the date and time at which the operation will begin. Notice of any fumigation or ~~thermal~~ insecticidal fogging shall be served with sufficient advance notice to the occupants of the enclosed space involved to enable the occupants to evacuate the premises.

1703.3.2 Breathing apparatus. *Persons* engaged in the business of fumigation or ~~thermal~~ insecticidal fogging shall maintain and have available *approved* protective breathing apparatus.

1703.4 ~~Thermal insecticidal~~ Insecticidal fogging liquids. ~~Thermal insecticidal~~ Insecticidal fogging liquids with a *flash point* below 100ºF (38ºC) shall not be utilized.

Reason: IFC Chapter 17 regulates fumigation and thermal insecticidal fogging, but fails to regulate insecticidal fogging operations that do not involve the application of heat, known as "cold fogging". Cold fogging is an insecticidal fogging technique in common use, and the ignitable vapors generated by the fogging operations pose explosion hazards equivalent to thermal insecticidal fogging.

The definition of "insecticidal fogging" is revised to include those operations where the product is heated and where it is not heated. In this manner, the definition will cover all insecticidal fogging operations.

The chapter title, scope, and Sections 1701.1, 1702.1, 1703.1, 1703.2, 1703.3, 1703.3.2 and 1703.3.4 of the chapter are proposed to be amended to reflect that the chapter also regulates cold fogging operations.

Cost Impact: The code change proposal will increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: LARIVIERE-F26-CHAPTER 17-2.DOC

F159–09/10

1701.1, 1703.1, 1703.2.1, 1703.2.2 (New), 1703.2.3 (New), 1703.3, 1703.3.1, 1703.3.3, 1703.3.4 (New), 1703.3.5 (New), 1703.5, 1703.5.1 (New)

Proponent: Tom Lariviere, Chairman, Joint Fire Service Review Committee

1. Revise as follows:

1701.1 Scope. Fumigation and thermal insecticidal fogging operations within buildings, structures and spaces shall comply with this chapter.

1703.1 General. ~~Structures~~ Buildings, structures and spaces in which fumigation and thermal insecticidal fogging operations are conducted shall comply with the fire protection and safety requirements of Sections 1703.2 through 1703.7.

1703.2.1 Electricity. ~~Electricity shall be shut off~~ Electricity in any part of the building, structure or space where operation of switches or electrical devices, equipment or systems could serve as a source of ignition shall be shut off.

> **Exception:** Circulating fans that have been specifically designed for utilization in hazardous atmospheres and installed in accordance with NFPA 70.

2. Add new text as follows:

1703.2.2 Electronic devices. Electronic devices, including portable equipment and cellular phones, shall be shut off. Telephone lines shall be disconnected from telephones.

1703.2.3 Duration. Sources of ignition shall be shut off during the fumigation activity and remain shut off until the ventilation required in Section 1703.6 is completed.

3. Revise as follows:

1703.3 Notification. The *fire code official* and fire chief shall be notified in writing at least ~~24~~ 48 hours before the building, structure or space is to be closed in connection with the utilization of any toxic or flammable fumigant. Notification shall give the location of the enclosed space to be fumigated or fogged, the occupancy, the fumigants or insecticides to be utilized, the *person* or *persons* responsible for the operation, and the date and time at which the operation will begin. ~~Notice~~ Written notice of any fumigation or thermal insecticidal fogging operation shall be ~~served with sufficient advance notice to the occupants of the enclosed space involved to enable the occupants to evacuate the premises~~ given to all affected occupants of the building, structure or space in which such operations are to be conducted with sufficient advance notice to allow the occupants to evacuate the building, structure or space. Such notice shall inform the occupants as to the purposes, anticipated duration and hazards associated with the fumigation or insecticidal operation.

1703.3.1 Warning signs. *Approved* warning signs indicating the danger, type of chemical involved and necessary precautions shall be posted on all doors and entrances to the ~~premises~~ affected building, structure or space and upon all gangplanks and ladders from the deck, pier or land to ~~the~~ a ship. Such notices shall be printed in red ink on a white

background. Letters in the headlines shall be at least 2 inches (51 mm) in height and shall state the date and time of the operation, the name and address of the person, the name of the operator in charge, and a warning stating that the ~~occupied premises~~ affected building, structure or space shall be vacated at least 1 hour before the operation begins and shall not be reentered until the danger signs have been removed by the proper authorities.

1703.3.3 Watch personnel. During the period fumigation is in progress, except when fumigation is conducted in a gas-tight vault or tank, a ~~capable, alert watcher~~ responsible watchperson shall remain on duty at the entrance or entrances to the enclosed fumigated space until after the fumigation is completed and the ~~premises~~ building, structure or space is properly ventilated and safe for occupancy. Sufficient watchers shall be provided to prevent *persons* from entering the enclosed space under fumigation without being observed.

4. Add new text as follows:

1703.3.4 Evacuation during fumigation. Occupants of the building, structure or space to be fumigated, except the personnel conducting the fumigation, shall be evacuated from such building, structure or space prior to commencing fumigation operations.

1703.3.5 Evacuation during insecticidal fogging operations. Occupants in the building, structure or space to be fogged, except the personnel conducting the insecticidal fogging operations, shall be evacuated from such building, structure or space prior to commencing fogging operations.

5. Revise as follows:

1703.5 Sealing of buildings, structures and spaces. Paper and other similar materials that do not meet the flame propagation performance criteria of NFPA 701 shall not be used to wrap or cover a building, structure or space in excess of that required for the sealing of cracks, casements and similar openings.

6. Add new text as follows:

1703.5.1 Maintenance of openings. All openings to the building, structure or space to be fumigated or fogged shall be kept securely closed during such operation.

Reason: Chapter 17 regulates fumigation and fogging operations. This proposal is designed to provide additional clarification for application of the requirements.

Sections 1703.2 through 1703.2.3 are amended to clarify the intent of the code requirement to "shut off electricity", and to prohibit other ignition sources associated with portable electronic devices. Additionally, the proposal will specify that the devices need to remain shut off until the ventilation operation is completed.

Section 1703.3 is amended to require that the notification to the fire code official and fire chief when toxic or flammable fumigants are to be used be made 48 hours not 24 hours prior to such operation being conducted, and that the notification given to occupants of an effected building, structure or space be in writing.

Sections 1703.3.4 and 1703.3.5 are added and intend to specify the obvious intent of the chapter, but which is not currently stated. The building, structure or space undergoing fumigation or insecticidal fogging operations must be evacuated during such operations.

Section 1703.3.1 is amended to reflect that warning signs are required to be posted at all entrances to an effected building, structure or space, and not as the code currently requires, at the entrance to the premises.

Finally, Section 1703.5.1, a proposed new section, is added to require that openings to the effected building, structure or spaces undergoing fumigation or fogging operations be maintained closed.

Cost Impact: The code change proposal will increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: LARIVIERE-F25-CHAPTER 17.DOC

F160–09/10
1803.10.1.2, Chapter 47

Proponent: Bob Eugene, Underwriters Laboratories, Inc.

1. Revise as follows:

1803.10.1.2 Combustible tools. Where the horizontal surface of a combustible tool is obstructed from ceiling sprinkler discharge, automatic sprinkler protection that covers the horizontal surface of the tool shall be provided.

Exceptions:

1. An automatic gaseous fire-extinguishing local surface application system shall be allowed as an alternative to sprinklers. Gaseous-extinguishing systems shall be actuated by infrared (IR) or ultraviolet/infrared (UVIR) optical detectors.
2. Tools constructed of materials that are listed as Class 1 or Class 2 in accordance with UL 2360 and ~~or~~ approved for use without internal fire extinguishing system protection.

2. Add new standard to Chapter 47 as follows:

UL

2360-00	Standard for Test Methods for Determining the Combustibility Characteristics of Plastics Used in Semi-Conductor Tool Construction – with revisions through June 2008

Reason: The code currently indicates that these materials need to be listed for use without internal fire extinguishing system protection, but does not describe the test standard to be used, or a specific Classification or rating that the code user can reference to easily determine compliance.

UL 2360 is an ANSI approved American national standard that includes the test methods for measuring the fire performance of sheet plastics used in semi-conductor wet bench tool construction using small scale and large scale tests. Plastic materials that are classified as Class 1 or Class 2 in accordance with UL 2360 demonstrate limited fire propagation without the use of fire sprinklers, which is the level of protection currently required in this section.

This proposal assist the code user in determining compliance with this section by identifying the nationally recognized standard used to List (Classify) these materials, and the Class ratings that correspond with materials certified for use without internal fire extinguishing system protection. Including the Class ratings in the code eliminates the need to also indicate that these materials must be approved for use without internal fire extinguishing system protection.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: A review of the standard(s) proposed for inclusion in the code, UL 2360-00, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

1803.10.4.1 (IBC [F] 415.8.11.2); IMC 510.7

Proponent: Patrick A. McLaughlin, McLaughlin & Associates, representing The Semiconductor Industry Association

THIS IS A 2 PART CODE CHANGE. BOTH PARTS WILL BE HEARD BY THE FIRE CODE COMMITTEE AS 2 SEPARATE CODE CHANGES. SEE THE TENTATIVE HEARING ORDER FOR THE FIRE CODE COMMITTEE.

PART I – IFC

Delete without substitution:

~~**1803.10.4.1 (IBC [F]415.8.11.2) Metallic and noncombustible non metallic exhaust ducts.** An approved automatic sprinkler system shall be provided in metallic and noncombustible nonmetallic exhaust ducts when all of the following conditions apply:~~

~~1. When the largest cross-sectional diameter is equal to or greater than 10 inches (254 mm).~~
~~2. The ducts are within the building.~~
~~3. The ducts are conveying flammable gases, vapors or fumes.~~

(Renumber subsequent sections)

PART II – IMC

Revise as follows:

510.7 Suppression required. Ducts shall be protected with an approved automatic fire suppression system installed in accordance with the *International Building Code*.

Exceptions:

1. An approved automatic fire suppression system shall not be required in ducts conveying materials, fumes, mists and vapors that are nonflammable and noncombustible and where flammable contaminant are diluted to below 25% of their lower flammability limit ~~under all conditions and at any concentrations~~.
2. An *approved* automatic fire suppression system shall not be required in ducts where the largest cross-sectional diameter of the duct is less than 10 inches (254 mm).
3. For laboratories, as defined in Section 510.1, automatic fire protection systems shall not be required in laboratory hoods or exhaust systems.

Reason: To clarify that automatic fire suppression is not required for diluted flammable contaminants. IMC Section 510.3 require that flammable contaminants be diluted below 25% of the lower flammability limit therefore it is not a hazardous exhaust system under Section 510.2 and a fire suppression system is not required. Even though a suppression system is not required, as presently written there has been misapplication of the provisions. The change to IFC 1803.10.4.1 is the corresponding Fire Code change.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis for Part II: Current Section 510.3 of the IMC requires hazardous exhaust systems to operate at a dilution rate of 25% of the LFL. As revised, suppression will not be required in any case because the exception will always apply.

THIS IS A 2 PART CODE CHANGE. BOTH PARTS WILL BE HEARD BY THE FIRE CODE COMMITTEE AS 2 SEPARATE CODE CHANGES. SEE THE TENTATIVE HEARING ORDER FOR THE FIRE CODE COMMITTEE.

PART I – IFC

1. Revise as follows:

1803.14.2 Penetrations. Exhaust ducts penetrating fire ~~barrier~~ resistance rated assemblies shall be contained in a ~~shaft of equivalent~~ fire-resistance rated ~~resistive construction~~ enclosure that is a construction specifically evaluated for such purpose as follows:

1. A shaft constructed in accordance with International Building Code having a fire-resistance rating equal to the fire-resistance rating of the assembly penetrated, or
2. A field-applied duct enclosure protected with a through penetration firestop system classified in accordance with ASTM E814 having an "F" and "T" rating equal to the fire-resistance rating of the assembly penetrated. The protected duct assembly shall be tested and listed in accordance with ASTM E 2336, and installed in accordance with the manufacturer's instructions .

The surface of the duct shall be continuously covered on all sides from the point at which the duct enclosure penetrates a ceiling, wall or floor to the outlet terminal.

Exhaust ducts shall not penetrate fire walls. Fire dampers shall not be installed in exhaust ducts.

2. Revise IBC as follows:

[F] 415.8.2.6 Ventilation. Mechanical exhaust ventilation at the rate of not less than 1 cubic foot per minute per square foot [0.0051m3/(s m2)] of floor area shall be provided throughout the portions of the fabrication area where HPM are used or stored. The exhaust air duct system of one fabrication area shall not connect to another duct system outside that fabrication area within the building.

A ventilation system shall be provided to capture and exhaust gases, fumes and vapors at workstations.

Two or more operations at a workstation shall not be connected to the same exhaust system where either one or the combination of the substances removed could constitute a fire, explosion or hazardous chemical reaction within the exhaust duct system.

Exhaust ducts penetrating ~~occupancy separations~~ fire resistance rated-assemblies shall be contained in a ~~shaft of equivalent~~ fire-resistance- rated ~~construction~~ enclosure that is a construction specifically evaluated for such purpose as follows:

1. A shaft constructed in accordance with International Building Code having a fire-resistance rating equal to the fire-resistance rating of the assembly penetrated, or
2. A field-applied duct enclosure protected with a through penetration firestop system classified in accordance with ASTM E814 having an "F" and "T" rating equal to the fire-resistance rating of the assembly penetrated. The protected duct assembly shall be tested and listed in accordance with ASTM E 2336, and installed in accordance with the manufacturer's instructions .

The surface of the duct shall be continuously covered on all sides from the point at which the duct enclosure penetrates a ceiling, wall or floor to the outlet terminal.

Exhaust ducts shall not penetrate fire walls.

Fire dampers shall not be installed in exhaust ducts.

3. Revise IMC as follows:

[F] 502.10.2 Penetrations. Exhaust ducts penetrating fire ~~barrier~~ resistance rated-assemblies shall be contained in a ~~shaft of equivalent~~ fire-resistance rated ~~resistive construction~~ enclosure that is a construction specifically evaluated for such purpose as follows:

1. A shaft constructed in accordance with *International Building Code* having a fire-resistance rating equal to the fire-resistance rating of the assembly penetrated, or
2. A field-applied duct enclosure protected with a through penetration firestop system classified in accordance with ASTM E814 having an "F" and "T" rating equal to the fire-resistance rating of the assembly penetrated. The protected duct assembly shall be tested and listed in accordance with ASTM E 2336, and installed in accordance with the manufacturer's instructions .

The surface of the duct shall be continuously covered on all sides from the point at which the duct enclosure penetrates a ceiling, wall or floor to the outlet terminal. Exhaust ducts shall not penetrate ~~building separation~~ fire walls. Fire dampers shall not be installed in exhaust ducts.

PART II – IBC FIRE SAFETY

1. Revise IBC as follows:

716.5.1 Fire walls. Ducts and air transfer openings permitted in fire walls in accordance with Section 706.11 of the *International Building Code* shall be protected with *listed* fire dampers installed in accordance with their listing. Exhaust ducts for hazardous production materials (HPM) shall comply with Section 415.8.2.6.

2. Revise IMC as follows:

[B] 607.5.1 Fire walls. Ducts and air transfer openings permitted in fire walls in accordance with Section 706.11 of the *International Building Code* shall be protected with *listed* fire dampers installed in accordance with their listing. Exhaust ducts for hazardous production materials (HPM) shall comply with Section 502.10.2.

Reason: This additional text is intended to clarify what types of enclosures would be appropriate for protecting ducts through fire rated assemblies. Alternative enclosure methods should be made acceptable as an alternative to a shaft when appropriate. In all cases, the duct should be protected as through penetration through rated assemblies in accordance with Chapter 7 of the IBC. The language on fire walls and the added exception are extracted from Section 706.11 of the IBC. The IMC and IBC are currently conflicted about whether penetrations are allowed in fire walls. (See 607.5.1 and 502.10.2 in IMC and 706.11 in IBC). By incorporating this new language to the IMC, the two codes are brought into agreement. 607.5.1 is an editorial change to point to the correct section of the IMC.

Cost Impact: The code change proposal will not increase the cost of construction.

PART I – IFC

ICCFILENAME: LOVELL-F1-1803.14.2

F163–09/10
1803.16 (New), 1802.1, 3704.1.2, 3704.1.3

Proponent: Ron Fuhrhop, Praxair, Inc.

1. Add new text as follows:

1803.16 Sub-atmospheric Gas Systems (SAGS) Type 1 and Type 2. The storage and use of Sub-atmospheric Gas Systems (SAGS) shall be in accordance with Sections 1803.16.1 through 1803.16.1.3.

1803.16.1 General. Sub-atmospheric Gas Systems (SAGS) gas source packages shall meet all of the requirements for compressed gases and gases except as provided for in 1803.16.1.1 through 1803.16.1.3.

1803.16.1.1 Incompatible gases. Sub-atmospheric Gas Systems (SAGS) gas source packages with a water volume of 2.64 gallons (10 L) or less containing incompatible gases shall be permitted to occupy the same gas cabinet or exhausted enclosure.

1803.16.1.2 Ventilation. For Sub-atmospheric Gas Systems (SAGS), gas source packages, ventilation in gas cabinets and exhausted enclosures shall be sufficient to maintain vapors below 25 percent of LFL and below the IDLH concentration.

1803.16.1.3 Overpressure protection. The gas distribution system to which Sub-atmospheric Gas Systems (SAGS) are connected shall be equipped with an approved method of protection against components exceeding their pressure rating in the event of a failure in a SAGS.

1802.1 Definitions. The following words and terms shall, for the purposes of this chapter and as used elsewhere in this code, have the meanings shown herein.

SUB-ATMOSPHERIC GAS SYSTEM (SAGS) Type 1. A gas source package that stores and delivers gas at sub-atmospheric pressure and includes a container (e.g., gas cylinder and outlet valve) that stores and delivers gas at a pressure of less than 14.7 psia at a package temperature of less than 110° F.

SUB-ATMOSPHERIC GAS SYSTEM (SAGS) Type 2. A gas source package that stores compressed gas and delivers gas sub-atmospherically and includes a container (e.g., gas cylinder and outlet valve) that stores gas at a pressure greater than 14.7 psia and delivers gas at a pressure of less than 14.7 psia at a package temperature of less than 110° F.

2. Revise as follows:

3704.1.2 Gas cabinets. Gas cabinets containing highly toxic or toxic *compressed gases* shall comply with Section 2703.8.6 and the following requirements:

1. The average ventilation velocity at the face of gas cabinet access ports or windows shall not be less than 200 feet per minute (1.02 m/s) with a minimum of 150 feet per minute (0.76 m/s) at any point of the access port or window.
2. Gas cabinets shall be connected to an exhaust system.
3. Gas cabinets shall not be used as the sole means of exhaust for any room or area.
4. The maximum number of cylinders located in a single gas cabinet shall not exceed three, except that cabinets containing cylinders not over 1 pound (0.454 kg) net contents are allowed to contain up to 100 cylinders.
5. Gas cabinets required by Section 3704.2 or 3704.3 shall be equipped with an *approved automatic sprinkler system* in accordance with Section 903.3.1.1. Alternative fire-extinguishing systems shall not be used.

   Exception: Sub-atmospheric Gas Systems (SAGS) Type 1 and Type 2 shall be in accordance with Section 1803.16.1.2

3704.1.3 Exhausted enclosures. 3704.1.3 Exhausted enclosures. Exhausted enclosures containing highly toxic or toxic *compressed gases* shall comply with Section 2703.8.5 and the following requirements:

1. The average ventilation velocity at the face of the enclosure shall not be less than 200 feet per minute (1.02 m/s) with a minimum of 150 feet per minute (0.76 m/s).
2. Exhausted enclosures shall be connected to an exhaust system.
3. Exhausted enclosures shall not be used as the sole means of exhaust for any room or area.
4. Exhausted enclosures required by Section 3704.2 or 3704.3 shall be equipped with an *approved automatic sprinkler system* in accordance with Section 903.3.1.1. Alternative fire-extinguishing systems shall not be used.

   Exception: Sub-atmospheric Gas Systems (SAGS) Type 1 and Type 2 shall be in accordance with Section 1803.16.1.2.

Reason: This code change proposal adds definitions and requirements to address the technology of sub-atmospheric gas systems (SAGS), which are not currently found in the code. This new language is proposed for Chapter 18, since SAGS's are exclusively used in Semiconductor Fabs.

A primary goal of SAGS is to improve safety by reducing the risk of a gas release. The risk is reduced, because SAGS only deliver gas when a vacuum is applied to the cylinder connection. In a SAGS, the cylinder valve can be opened, but no gas is released until the pressure downstream of the outlet connection is below atmospheric pressure. This is in contrast to a typical gas cylinder, which releases gas when the cylinder valve is opened. The semiconductor industry has used SAGS successfully for ten years.

1802.1: The proposed definitions are similar to the definitions in the 2009 Edition of NFPA 318, Standard for the Protection of Semiconductor Fabrication Facilities. However, one change was made (110 ^{o} F is referenced instead of NTP). To meet the SAGS definition in NFPA 318, the pressure in a SAGS container must be sub-atmospheric at or below NTP, which is a temperature of 70 ^{o} F. SAGS used in semiconductor tools are located in exhausted enclosures with internal temperatures of 86^{o} F to 104^{o} F (above 70^{o} F). SAGS stored outside may reach temperatures of 110^{o} F (above 70^{o} F). So, to meet this proposed definition for SAGS, the container pressure should be sub-atmospheric at temperatures up to 110^{o} F. If NTP is used as a reference, some Type 1 SAGS could go "above" atmospheric pressure under these normal storage and use conditions.

1803.16.1: All SAGS shall meet the requirements for gases and compressed gases set forth throughout the IFC & IBC, with the specific exceptions allowed in the new SAGS section. Treating SAGS as compressed gases or gases maintains risk-mitigating controls that are well-established in safety and fire protection standards.

1803.16.1.1: This section will allow the placement of SAGS containers with incompatible gases in the same exhausted enclosure, such as containers of arsine and boron trifluoride. IFC Section 1804.3.3 requires the separation of these containers. This separation does not reflect current industry practice and is not necessary with the enhanced safety provided by SAGS. It should be noted, this exception is limited to small cylinders of 10 L of water volume or less. This limits the quantity of material and covers current semiconductor tool applications where SAGS are used.

1803.16.1.2: Ventilation is still required for SAGS. Potential releases from SAGS are very small. For this reason lower ventilation rates are acceptable. The performance standard (maintain vapors below 25 percent of LFL and below IDLH) was used instead of velocity or other prescribed values.

1803.16.1.3: Overpressure protection is standard practice for piping systems. Since SAGS delivery piping systems normally operate in a vacuum, this requirement was added to clarify that overpressure condition could result from potential failure scenarios. There are several methods used today to address this issue. It is also a performance based requirement.

3704.1.2 and 3704.1.3: These additions eliminate a conflict in Chapter 37 that would be created by adopting the new language of 1803.16.1.2. They refer the code user back to Chapter 18 to determine exhaust requirements for SAGS.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: The action on this proposal should be consistent with the action on Code Change F164-09/10.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: FUHRHOP -F1-1802.1.DOC

F164–09/10
1803.16 (New), Chapter 47

Proponent: James McManus, ATMI, Inc.

1. **Add new text as follows:**

1803.16 Sub-atmospheric pressure gas systems. Sub-atmospheric pressure gas systems (SAGS) shall be in accordance with NFPA 318.

2. Add new standard to Chapter 47 as follows:

NFPA
318—09 Standard for the Protection of Semiconductor Fabrication Facilities

Reason: Sub-atmospheric pressure gas systems (SAGS) are the preferred method for storing and delivering the toxic and corrosive dopant gases used in ion implantation processes worldwide. Other uses include solar and electronics. SAGS operate by either removing pressure [Type 1] or internally controlling gas pressure [Type 2]. Both require a vacuum [sub-atmospheric condition, < 14.7 psia] before flow from a cylinder will occur. SAGS significantly reduce the risk associated with Hazardous Production Materials because they mitigate the likelihood and magnitude of a gas release and their use is becoming more common. As such, provisions regulating SAGS should be included in the code.

NFPA 318 already defines and addresses these systems so there is no reason to reinvent provisions for these systems. This proposal recommends that provisions for SAGS be adopted by reference as shown. It is the intent of this code change to adopt only the provisions relating to SAGS within NFPA 318. Those sections are: Section 3.3.28.5 for the definition, and Section 8.6.2 addressing uses and controls. It is not the intent of this proposal to adopt NFPA 318 in total. The charging statement of this proposal clearly indicates that only SAGS be in accordance with NFPA 318.

The definition and controls for use of SAGS are the work-product of a lengthy public debate and consensus building effort undertaken by knowledgeable ESH and risk management professionals. The NFPA 318 Technical Committee approved the language unanimously and it was adopted by a substantial majority at the NFPA annual meeting in June 2008.

Using the NFPA definition in section 3.3.28.5 incorporates language that most accurately defines SAGS and avoids possible conflicts that may be inadvertently introduced with alternative language.

Systems fitting this description include:
Sub-atmospheric Gas System. [Type 1/SAGS] A gas source container where the contents are at sub-atmospheric pressure [<14.7 psia] at NTP* [21ºC and 1 atmosphere]. Type 1/SAGS are not compressed gases.

Vacuum Initiated Gas Cylinder. [Type 2/SAGS] A compressed gas cylinder, modified internally using pressure and flow components to limit and control delivery pressure to sub-atmospheric pressure operation [<14.7 psia]. Today such systems are *designed to fail* in a closed [no-flow] position.

Section 8.6.2 contains requirements consistent with the risk reduction afforded by the SAGS technology. Local jurisdictions may, at their discretion, further modify the uses and controls based on existing ordinances or practice, or exceptions to the provisions could be added to this proposal.

Recognizing SAGS in the code helps officials and users ensure uniform application and understanding of this important risk reduction technology.

*NTP—see 2702.1

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: A review of the standard(s) proposed for inclusion in the code, NFPA 318—09, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009. The action on this proposal should be consistent with the action on Code Change F163-09/10.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: MCMANUS-F1-1803.16.DOC

1805.2.3.4, Tables 1804.2.2.1 (IBC [F] Table 415.8.2.1.1), 1805.2.2

Proponent: Patrick A. McLaughlin, McLaughlin & Associates, representing The Semiconductor Industry Association

Revise as follows:

1805.2.3.4 Pyrophoric solids, liquids and Class 3 water-reactive liquids. Pyrophoric liquids and Class 3 water-reactive liquids in containers greater than 0.5-gallon (2 L) but not exceeding 5.3-gallon (20 L) capacity and pyrophoric solids in containers greater than 4.4 lbs (2 kg) but not exceeding 44 pounds (20 kg) shall be allowed at workstations when located inside cabinets and the following conditions are met:

1. Maximum amount per cabinet: The maximum amount per cabinet shall be limited to 5.3 gallons (20L) of liquids and 44 pounds (20 kg) of total liquids and solids.
2. Cabinet construction: Cabinets shall be constructed in accordance with the following:
   2.1. Cabinets shall be constructed of not less than 0.097-inch (2.5 mm) (12 gage) steel.
   2.2. Cabinets shall be permitted to have self-closing limited access ports or noncombustible windows that provide access to equipment controls.
   2.3. Cabinets shall be provided with self- or manual-closing doors. Manual-closing doors shall be equipped with a door switch that will initiate local audible and visual alarms when the door is in the open position.
3. Cabinet exhaust ventilation system: An exhaust ventilation system shall be provided for cabinets and shall comply with the following:
   3.1. The system shall be designed to operate at a negative pressure in relation to the surrounding area.
   3.2. The system shall be equipped with a pressure monitor and a flow switch alarm monitored at the on-site *emergency control station*.
4. Cabinet spill containment: Spill containment shall be provided in each cabinet, with the spill containment capable of holding the contents of the aggregate amount of liquids in containers in each cabinet.
5. Valves: Valves in supply piping between the product containers in the cabinet and the workstation served by the containers shall fail in the closed position upon power failure, loss of exhaust ventilation and upon actuation of the fire control system.
6. Fire detection system: Each cabinet shall be equipped with an automatic fire detection system complying with the following conditions:
   6.1. Automatic detection system: UV/IR, highsensitivity smoke detection (HSSD) or other *approved d*etection systems shall be provided inside each cabinet.
   6.2. Automatic shutoff: Activation of the detection system shall automatically close the shutoff valves at the source on the liquid supply.
   6.3. Alarms and signals: Activation of the detection system shall initiate a local alarm within the *fabrication area* and transmit a signal to the *emergency control station*. The alarms and signals shall be both visual and audible.

TABLE 1804.2.2.1 (IBC [F] TABLE 415.8.2.1.1)
QUANTITY LIMITS FOR HAZARDOUS MATERIALS IN A SINGLE FABRICATION AREA IN GROUP H-5[a]

HAZARD CATEGORY	SOLIDS (pounds/square foot)	LIQUIDS (gallons/square foot)	GAS (cubic feet@NTP/square foot)
PHYSICAL-HAZARD MATERIALS			
Pyrophoric	~~Note b~~ 0.01	0.00125	Notes d and e

(Portions of table and footnotes not shown remain unchanged)

TABLE 1805.2.2
MAXIMUM QUANTITIES OF HPM AT A WORKSTATION[d]

HPM CLASSIFICATION	STATE	MAXIMUM QUANTITY
Pyrophoric	Liquid Solid	0.5 gallon [c, f] ~~See Table 1804.2.2.1~~ 4.4 pounds [c, f]

f. A maximum quantity of 5.3 gallons of liquids and 44 pounds of total liquids and solids shall be allowed at a workstation when conditions are in accordance with Section 1805.2.3.5.

(Portions of table and footnotes not shown remain unchanged)

Reason: This change would bring pyrophoric solid quantity limitations at workstations and in fabrication areas equal to equivalent mass limitations of pyrophoric liquids with the same controls. **S**olids are easier and safer to handle than a liquid because they do not have the potential to rapidly spread when a spill occurs. When this allowance was approved for liquids, solids were not included because they were not used in the process at that time.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: MCLAUGHLIN-F5-1805.2.3.4.DOC

F166–09/10
1805.2.3.4

Proponent: Patrick A. McLaughlin, McLaughlin & Associates, representing The Semiconductor Industry Association

Revise as follows:

1805.2.3.4 Pyrophoric liquids and Class 3 water-reactive liquids. Pyrophoric liquids and Class 3 water-reactive liquids in containers greater than 0.5-gallon (2 L) but not exceeding 5.3-gallon (20 L) capacity shall be allowed at workstations when located inside cabinets and the following conditions are met:

1. Maximum amount per cabinet: The maximum amount per cabinet shall be limited to 5.3 gallons (20L).
2. Cabinet construction: Cabinets shall be constructed in accordance with the following:
   2.1. Cabinets shall be constructed of not less than 0.097-inch (2.5 mm) (12 gage) steel.
   2.2. Cabinets shall be permitted to have self-closing limited access ports or noncombustible windows that provide access to equipment controls.
   2.3. Cabinets shall be provided with self- or manual-closing doors. Manual-closing doors shall be equipped with a door switch that will initiate local audible and visual alarms when the door is in the open position.
3. Cabinet exhaust ventilation system: An exhaust ventilation system shall be provided for cabinets and shall comply with the following:
   3.1. The system shall be designed to operate at a negative pressure in relation to the surrounding area.
   3.2. The system shall be equipped with ~~a pressure monitor and a flow switch alarm monitored~~ monitoring equipment to ensure exhaust flow and alarmed at the on-site *emergency control station*.
4. Cabinet spill containment: Spill containment shall be provided in each cabinet, with the spill containment capable of holding the contents of the aggregate amount of liquids in containers in each cabinet.
5. Valves: Valves in supply piping between the product containers in the cabinet and the workstation served by the containers shall fail in the closed position upon power failure, loss of exhaust ventilation and upon actuation of the fire control system.
6. Fire detection system: Each cabinet shall be equipped with an automatic fire detection system complying with the following conditions:
   6.1. Automatic detection system: UV/IR, highsensitivity smoke detection (HSSD) or other *approved d*etection systems shall be provided inside each cabinet.
   6.2. Automatic shutoff: Activation of the detection system shall automatically close the shutoff valves at the source on the liquid supply.
   6.3. Alarms and signals: Activation of the detection system shall initiate a local alarm within the *fabrication area* and transmit a signal to the *emergency control station*. The alarms and signals shall be both visual and audible.

Reason: Several commercially available bulk liquid pyrophoric cabinets are designed to meet the requirements of the IFC Chapter 18 section 1805.2.3.5 Pyrophoric Liquids and Class 3 water-reactive liquids. Typical pyrophoric cabinets are designed with nitrogen gas (N_2) fire protection systems to meet the requirements for pyrophoric liquids as outlined in Chapter 18 Table 1805.2.2 note d "Allowed only in workstations that are internally protected with an approved automatic fire-extinguishing or fire protection system complying with Chapter 9 and compatible with the reactivity of the materials in use at the workstation." In order for an N_2 fire suppression system to be effective it must displace the O_2 within the cabinet. In order to displace O_2 within the cabinet and still maintain at a negative exhaust pressure within the cabinet in relation to the surrounding area, these cabinets must be airtight. Airtight indicates that these cabinets will operate under static only, when exhaust is applied, however, there will be no exhaust flow because there is no mechanism for make-up air into the cabinet. Design criteria are currently specified for liquid pyrophoric cabinets on site to meet O_2 levels below 1% within 60 seconds during discharge of the N_2 fire suppression system, which again requires these cabinets to be airtight. The current exhaust flow within these cabinets with the doors closed is effectively zero and to low for commercially available exhaust flow meters to detect. Cabinet exhaust is monitored with an exhaust pressure switch to detect available exhaust static. Some facilities currently monitor cabinet exhaust static within cabinets with a Neo-Dyn pressure switch (part#142P80CC3443) or a Dwyer (part#1910-1) and alarm for exhaust static below 1" w.c. The installation of a flow switch in addition to the pressure switch is redundant to the pressure switch. The installation of a flow switch is also ineffective due to the zero exhaust flow condition based on the cabinet design. Therefore requirements for exhaust flow monitoring are being changed to a performance requirement.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: MCLAUGHLIN-F6-1805.2.3.4-2.DOC

F167–09/10
1805.3.1 through 1805.3.4; IBC [F] 415.8.3

Proponent: Patrick A. McLaughlin, McLaughlin & Associates, representing The Semiconductor Industry Association

1. Revise as follows:

1805.3.1 Corridors and exit enclosures. Corridors and exit enclosures in new buildings or serving new fabrication areas shall not contain HPM, in quantities greater than the maximum allowable quantity per control area, except as permitted in exit corridors by section 415.8.6.3 of the *International Building Code*.

1805.3.2 Transport in ~~existing~~ corridors. Transport in corridors shall be in accordance with Sections 1805.3.2.1 through 1805.3.3.

1805.3.2.1 Fabrication area alterations. When existing fabrication areas are altered or modified in existing buildings, HPM is allowed to be transported in existing corridors when such corridors comply with Section 415.8.3 of the *International Building Code* and Section ~~Transport in corridors shall comply with section~~ 2703.10 of this Code.

1805.3.2.2 HPM transport in corridors. HPM in quantities equal to or less than the maximum allowable quantity per control area is allowed to be transported in corridors when the transportation is in accordance with Section 2703.10.

1805.3.3 Service corridors. When a new fabrication area is constructed, a service corridor shall be provided where it is necessary to transport HPM, in quantities greater than the maximum allowable quantity per control area, from a liquid storage room, HPM room, gas room, or from the outside of a building to the perimeter wall of a fabrication areas. Service corridors shall be designed and constructed in accordance with the International Building Code.

1805.3.4 Carts and trucks. Carts and trucks used to transport HPM in corridors and exit enclosures ~~in existing buildings~~ shall comply with section 2703.10.3.

2. Revise IBC Section [F] 415.8.3 as follows:.

[F] 415.8.3 Corridors. Corridors shall comply with Chapter 10 and shall be separated from fabrication areas as specified in section 415.8.2.2. Corridors shall not contain HPM and shall not be used for transporting such materials in quantities greater than the maximum allowable quantity per control area except through closed piping systems as provided in section 415.8.6.3

Exception: Where existing fabrication areas are altered or modified, HPM is allowed to be transported in existing *corridors,* subject to the following conditions:

1. Corridors. *Corridors* adjacent to the fabrication area where the *alteration* work is to be done shall comply with Section 1018 for a length determined as follows:
   1.1. The length of the common wall of the *corridor* and the fabrication area; and
   1.2. For the distance along the *corridor* to the point of entry of HPM into the *corridor* serving that fabrication area.
2. Emergency alarm system. There shall be an emergency telephone system, a local manual alarm station or other *approved* alarm-initiating device within *corridors* at not more than 150-foot (45 720 mm) intervals and at each *exit* and doorway. The signal shall be relayed to an *approved* central, proprietary or remote station service or the emergency control station and shall also initiate a local audible alarm.
3. Pass-throughs. Self-closing doors having a *fire protection rating* of not less than 1 hour shall separate pass-throughs from existing *corridors*. Pass-throughs shall be constructed as required for the *corridors* and protected by an *approved* automatic fire-extinguishing system.

Reason: Section 1805.3 places limitations on the use of egress corridors for chemical transport that when first required, the industry was heavily utilizing and dependant on chemical transport form the HPM storage area to the fabrication area. Due to the increased scale in these operations, bulk chemical delivery is more the standard and the transport of chemicals in carts is much more infrequent and volumes are smaller. In fact, small quantities from labs are the biggest issue for the industry. The current restriction limits facilities design flexibility and costs without adding to the safety of the occupants or emergency responders. The industry feels this requirement should be reevaluated. In addition, for non-H5 occupancies, chemical transport of hazardous materials is allowed by the requirements of 2703.10 in corridors or exit enclosures. By definition, Hazardous Materials include all materials that are defined by the code in Chapter 18 as HPM's. The non-H areas allow for transport of chemistries when conditions in 2703.10 are met as well as IBC 414.7.2. Areas that are not H Occupancy do not have the requirement to use service corridor for the transport of HPM.

The proposal would align transport of HPM's in corridors to the following restrictions (Summary of IFC 2703.10 and IBC 414.7.2)

- Emergency phone system, a local manual alarm, or an approved alarm initiating device at not more than 150 foot intervals.(IBC 414.7.2)
- Valve protection. (IFC 2703)
- Limitations on volumes . (IFC 2703)
  - Liquids in containers exceeding 5 gallons (19 L) in a corridor or exit enclosure shall be transported on a cart or truck.
  - Two hazardous material liquid containers, which are hand carried in acceptable safety carriers.
  - Not more than four drums not exceeding 55 gallons transported by suitable drum trucks.
  - Containers and cylinders of compressed gases, which are transported by approved hand trucks,
  - Containers and cylinders not exceeding 25 pounds, which are hand carried.
  - Solid hazardous materials not exceeding 100 pounds transported by approved hand trucks,
  - A single container not exceeding 50 pounds, which is hand carried.

Carts and trucks shall be designed to provide a stable base for the commodities to be transported and shall have a means of restraining containers, provided with a stops or speed-reduction devices, be compatible with the material transported, and be capable of containing a spill from the largest single container transported. (IFC 2703)

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: MCLAUGHLIN-F4-1805.3.1.DOC

2205.1, 2206.2, 2206.2.3, 2206.2.5, 2206.6.2, 2206.7.6, 2206.7.6.1, Table 2206.2.3

Proponent: Lynne M. Kilpatrick, Fire Department, City of Seattle WA, representing Washington State Association of Fire Marshals

Revise as follows:

2205.1 Tank filling operations for Class I, II or ~~III~~A liquids. Delivery operations to tanks for Class I, II or ~~IIIA~~ III liquids shall comply with Sections 2205.1.1 through 2205.1.3 and the applicable requirements of Chapter 34.

2206.2 Method of storage. *Approved* methods of storage for Class I, II and ~~IIIA~~ III liquid fuels at motor fuel-dispensing facilities shall be in accordance with Sections 2206.2.1 through 2206.2.5.

2206.2.3 Above-ground tanks located outside, above grade. Above-ground tanks shall not be used for the storage of Class I, II or ~~IIIA~~ III liquid motor fuels except as provided by this section.

1. Above-ground tanks used for outside, above-grade storage of Class I liquids shall be listed and labeled as protected above-ground tanks and shall be in accordance with Chapter 34. Such tanks shall be located in accordance with Table 2206.2.3.
2. Above-ground tanks used for outside, above-grade storage of Class II or IIIA liquids ~~are allowed to~~ shall be listed and labeled as protected above-ground tanks in accordance with UL 2085 and shall be installed in accordance ~~or, when approved by the fire code official, other above-ground tanks that comply~~ with Chapter 34. Tank locations shall be in accordance with Table 2206.2.3.

   Exception: Other aboveground tanks that comply with Chapter 34 when approved by the fire code official.

3. Tanks containing fuels shall not exceed 12,000 gallons (45 420 L) in individual capacity or 48,000 gallons (181 680 L) in aggregate capacity. Installations with the maximum allowable aggregate capacity shall be separated from other such installations by not less than 100 feet (30 480 mm).
4. Tanks located at farms, construction projects, or rural areas shall comply with Section 3406.2.
5. Above-ground tanks used for outside above-grade storage of Class IIIB liquid motor fuel shall be listed and labeled in accordance with UL 142 or listed and labeled as protected aboveground tanks in accordance with UL 2085 and shall be installed in accordance with Chapter 34. Tank locations shall be in accordance with Table 2206.2.3.

2206.2.5 Portable tanks. Where approved by the fire code official, portable tanks are allowed to be temporarily used in conjunction with the dispensing of Class I, II or ~~IIIA~~ III liquids into the fuel tanks of motor vehicles or motorized equipment on premises not normally accessible to the public. The approval shall include a definite time limit.

2206.6.2 Piping, valves, fittings and ancillary equipment for above-ground tanks for Class I, II and ~~IIIA~~ III liquids. Piping, valves, fittings and ancillary equipment for above-ground tanks storing Class I, II and ~~IIIA~~ III liquids shall comply with Sections 2206.6.2.1 through 2206.6.2.6.

2206.7.6 Fuel delivery nozzles. A listed automatic-closing- type hose nozzle valve with or without a latch-open device shall be provided on island-type dispensers used for dispensing Class I, II or ~~IIIA~~ III liquids.

Overhead-type dispensing units shall be provided with a listed automatic-closing-type hose nozzle valve without a latch-open device.

Exception: A listed automatic-closing-type hose nozzle valve with latch-open device is allowed to be used on overhead-type dispensing units where the design of the system is such that the hose nozzle valve will close automatically in the event the valve is released from a fill opening or upon impact with a driveway.

2206.7.6.1 Special requirements for nozzles. Where dispensing of Class I, II or ~~IIIA~~ III liquids is performed, a listed automatic-closing-type hose nozzle valve shall be used incorporating all of the following features:

1. The hose nozzle valve shall be equipped with an integral latch-open device.
2. When the flow of product is normally controlled by devices or equipment other than the hose nozzle valve, the hose nozzle valve shall not be capable of being opened unless the delivery hose is pressurized. If pressure to the hose is lost, the nozzle shall close automatically.

   Exception: Vapor recovery nozzles incorporating insertion interlock devices designed to achieve shutoff on disconnect from the vehicle fill pipe.

3. The hose nozzle shall be designed such that the nozzle is retained in the fill pipe during the filling operation.
4. The system shall include listed equipment with a feature that causes or requires the closing of the hose nozzle valve before the product flow can be resumed or before the hose nozzle valve can be replaced in its normal position in the dispenser.

TABLE 2206.2.3
MINIMUM SEPARATION REQUIREMENTS FOR ABOVE-GROUND TANKS

CLASS OF LIQUID AND TANK TYPE	INDIVIDUAL TANK CAPACITY (gallons)	MINIMUM DISTANCE FROM NEAREST IMPORTANT BUILDING ON SAME PROPERTY (feet)	MINIMUM DISTANCE FROM NEAREST FUEL DISPENSER (feet)	MINIMUM DISTANCE FROM LOT LINE THAT IS OR CAN BE BUILT UPON, INCLUDING THE OPPOSITE SIDE OF A PUBLIC WAY (feet)	MINIMUM DISTANCE FROM NEAREST SIDE OF ANY PUBLIC WAY (feet)	MINIMUM DISTANCE BETWEEN TANKS
Class I protected above-ground tanks	Less than or equal to 6,000	5	25[a]	15	5	3
	Greater than 6,000	15	25[a]	25	15	3
Class II and III protected above-ground tanks	Same as Class I	Same as Class I	Same as Class I [c]	Same as Class I	Same as Class I	Same as Class I
Tanks in vaults	0-20,000	0[b]	0	0 [b]	0	Separate compartment required for each tank
Other tanks	All	50	50	100	50	3

a. At fleet vehicle motor fuel-dispensing facilities, no minimum separation distance is required.
b. Underground vaults shall be located such that they will not be subject to loading from nearby structures, or they shall be designed to accommodate applied loads from existing or future structures that can be built nearby.
c. For Class IIIB liquids in protected above-ground tanks, no minimum separation distance is required.

Reason: An increasing number of facilities are establishing motor vehicle fuel-dispensing stations for dispensing B100/B99 biodiesel, a Class IIIB liquid, into motor vehicles. In many cases these fueling stations are not set up as traditional gas stations but rather they consist of a small stand alone fuel dispensing operation using a 500-3,000 gallon fuel tank located near a drive-through espresso stand or mini market. Chapter 22 has only minimal requirements for the installation of tanks and fueling operations for dispensing Class IIIB liquids into motor vehicles and it does not adequately address the potential hazards associated with this increasing trend. This proposal will add the following new requirements for dispensing Class IIIB liquids into motor vehicles:

1. Tanks for dispensing Class IIIB liquids into the fuel tanks of motor vehicles will need to be listed to UL 142 or UL 2085 to eliminate the common practice of dispensing directly from plastic IBC totes,
2. The driver or operator of the fuel delivery vehicle will be required to gauge the tank to determine how much fuel is needed before filling the tank,
3. An approved method of storage will have to be provided for the Class IIIB fuel in accordance with the MAQ allowed in Chapter 27 for storage in a single control area (13,200 gallons in an unsprinklered building and unlimited in a sprinklered building) when dispensing from tanks located inside buildings,
4. Fueling Class IIIB liquids into motor vehicles from portable tanks will only be allowed on a temporary basis,
5. Piping, valves, fittings and ancillary equipment will need to comply with the same requirements that currently apply to Class I, II and IIIA liquid fuel dispensing operations, including but not limited to, proper tank fill openings and connections, approved method to prevent overfilling and anti-siphon systems, and
6. Fuel delivery nozzles will be required to be the listed automatic-closing type.

Table 2206.2.3, which appears to already regulate Class IIIB liquids even though the corresponding Section 2206.2.3 makes reference only to Class II and IIIA liquids, has also been modified by adding a new footnote c. The footnote is added to eliminate the 50 foot separation that is required between protected (UL 2085) tanks containing Class IIIB liquids and the fuel dispenser. Note that even with this change Class IIIB liquids in non-protected tanks (UL 142) will be required to comply with Table 2206.2.3 requirements for "other tanks" which still requires a 50 foot separation between that tank and the dispenser.

We believe that these proposed changes provide for prudent controls for Class IIIB tank systems at motor vehicle fueling stations which currently are largely unregulated.

Cost Impact: Costs will increase because listed tanks are being required for Class IIIB liquids but there may be a cost savings where the 25-foot separation distance between Class IIIB tank and dispenser is eliminated.

ICCFILENAME: KILPATRICK-F1-2205.1.DOC

F169–09/10
2205.2.2

Proponent: Jeffrey M. Shapiro, PE, International Code Consultants, representing National Steel Tank Institute

Revise as follows:

2205.2.2 Repairs and service. The fire code official is authorized to require damaged or unsafe containment and dispensing equipment to be repaired or serviced in an approved manner ~~including, but not limited to, equipment that shows signs of physical damage, internal and external corrosion, leakage, brittleness, aging or undue wear and tear~~.

Reason: Section 2205.2.2 was added to the IFC last cycle. The beginning of the sentence provides a valuable code requirement authorizing the fire code official to require damaged or unsafe equipment to be fixed. The end of the sentence a subjective "laundry list" of conditions that may or may not warrant concern, depending on the severity, and it is unnecessary. For example, 1) Limited surface corrosion on steel tanks and equipment is common, and it does not necessarily represent an unsafe condition, 2) Aging equipment may or may not need attention simply because it's old, and 3) The phrase "undue wear and tear" is subjective and adds nothing.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: SHAPIRO-F2-2205.2.2.DOC

F170–09/10
2206.2.2

Proponent: Lynne M. Kilpatrick, Fire Department, City of Seattle WA, representing Washington State Association of Fire Marshals

Revise as follows:

2206.2.2 Above-ground tanks located inside buildings. Above-ground tanks for the storage of Class I, II and III~~A~~ liquid fuels are allowed to be located in buildings. Such tanks shall be located in special enclosures complying with Section 2206.2.6, or in a liquid storage room or a liquid storage warehouse complying with Chapter 34~~, or shall be listed and labeled as protected above-ground tanks~~.

Exceptions:

1. Protected aboveground tanks having an aggregate capacity not exceeding 1,500 gallons (454 L) storing Class I liquids in a room or rooms protected by an approved automatic sprinkler system complying with Section 903.3.1.1.
2. Protected aboveground tanks having an aggregate capacity not exceeding 3,000 gallons (908 L) storing Class II or IIIA liquids in a room or rooms protected by an approved automatic sprinkler system complying with Section 903.3.1.1.
3. Aboveground tanks other than protected aboveground tanks storing Class II and III liquids in accordance with the maximum allowable quantity per control area set forth in Table 2703.1.1(1).

Reason: Currently Section 2206.2.2 allows an unlimited quantity of Class I, II and IIIA liquids inside buildings for fueling motor vehicles provided the fuel is stored in a protected aboveground tank listed to UL 2085. This proposal attempts to establish reasonable limits for the aggregate quantity of fuel in protected aboveground tanks that can be installed inside buildings for fueling motor vehicles. The 3,000-gallon limit for Class II and IIIA liquids in Exception 2 is consistent with the maximum quantity currently allowed in Section 603.3.2.1 for protected aboveground tanks installed inside buildings supporting fuel-burning equipment. Exception 3 limits Class II and III liquids in tanks other than protected tanks to the MAQ per control area set forth in Chapter 27. Since there is no code precedent for limiting Class I flammable liquids in protected aboveground tanks inside buildings, Exception 1 of the proposal establishes a limit of 1,500 gallons. This quantity (1500 gallons) exceeds the 120 gallon MAQ (240 gallons in sprinklered buildings) established for Class I liquids but gives some 'credit' for installing a protected tank and is one-half the already accepted limit of 3,000 gallons for Class II and III-A liquids. It is necessary to approve this code change in order to establish some quantity limits for flammable and combustible liquids in protected aboveground tanks installed inside buildings used for fueling motor vehicles. Without this change, an unlimited quantity of Class I, II and IIIA liquids is allowed inside buildings in protected tanks not confined to a Group H occupancy or special enclosure.

Cost Impact: The code change proposal will increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: KILPATRICK-F2-2206.2.2.DOC

F171–09/10
2206.2.2, 2206.2.3

Proponent: Bob Eugene, Underwriters Laboratories, Inc.

Revise as follows:

2206.2.2 Above-ground tanks located inside buildings. Above-ground tanks for the storage of Class I, II and IIIA liquid fuels are allowed to be located in buildings. Such tanks shall be located in special enclosures complying with Section 2206.2.6, in a liquid storage room or a liquid storage warehouse complying with Chapter 34, or shall be listed and labeled as protected above-ground tanks in accordance with UL 2085.

2206.2.3 Above-ground tanks located outside, above grade. Above-ground tanks shall not be used for the storage of Class I, II or IIIA liquid motor fuels except as provided by this section.

1. Above-ground tanks used for outside, above-grade storage of Class I liquids shall be listed and labeled as protected above-ground tanks in accordance with UL 2085, and be in accordance with Chapter 34. Such tanks shall be located in accordance with Table 2206.2.3.
2. Above-ground tanks used for above-grade storage of Class II or IIIA liquids are allowed to be protected above-ground tanks or, when *approved* by the *fire code official*, other above-ground tanks that comply with Chapter 34. Tank locations shall be in accordance with Table 2206.2.3.

3. Tanks containing fuels shall not exceed 12,000 gallons (45 420 L) in individual capacity or 48,000 gallons (181 680 L) in aggregate capacity. Installations with the maximum allowable aggregate capacity shall be separated from other such installations by not less than 100 feet (30 480 mm).
4. Tanks located at farms, construction projects, or rural areas shall comply with Section 3406.2.

Reason: This proposal is to provide the fire code user with an easy reference to the appropriate Standard that is already referenced in Chapter 2 definitions and as used in Chapter 34 for Protected Above-ground Tanks without having to search through the code.

Cost Impact: The code change proposal will not increase the cost of construction.

Proponent: Brian Knapp, American Petroleum Institute

Revise as follows:

2206.7.1 Listed equipment. Electrical equipments, dispensers, hose, nozzles and submersible or subsurface pumps used in fuel-dispensing systems shall be listed or certified by the manufacturer for the fuel dispensed.

2206.7.5 Dispenser hose. Dispenser hoses shall be a maximum of 18 feet (5486 mm) in length unless otherwise *approved*. Dispenser hoses shall be listed and approved or certified by the manufacturer for the fuel dispensed. When not in use, hoses shall be reeled, racked or otherwise protected from damage.

2206.7.5.1 Breakaway devices. Dispenser hoses for Class I and II liquids shall be equipped with ~~a listed~~ an emergency breakaway device that is listed or certified by the manufacturer for the fuel dispensed and designed to retain liquid on both sides of a breakaway point. Such devices shall be installed and maintained in accordance with the manufacturer's instructions. Where hoses are attached to hose-retrieving mechanisms, the emergency breakaway device shall be located between the hose nozzle and the point of attachment of the hose-retrieval mechanism to the hose.

2206.7.6 Fuel delivery nozzles. ~~A listed~~ An automatic-closing-type hose nozzle valve, that must be listed or certified by the manufacturer for the fuel dispensed, with or without a latch-open device shall be provided on island-type dispensers used for dispensing Class I, II, or IIIA liquids.

Overhead-type dispensing units shall be provided with a ~~listed~~ automatic-closing-type hose nozzle valve without a latch-open device, that must be listed or certified by the manufacturer for the fuel dispensed,

Exception: A *listed* automatic-closing-type hose nozzle valve with latch-open device is allowed to be used on overhead-type dispensing units where the design of the system is such that the hose nozzle valve will close automatically in the event the valve is released from a fill opening or upon impact with a driveway.

2206.7.7.1 Leak detection. Where remote pumps are used to supply fuel dispensers, each pump shall have installed on the discharge side a ~~*listed*~~ leak detection device, that is listed or certified by the manufacturer for the fuel used, that will detect a leak in the piping and dispensers and provide an indication. A leak detection device is not required if the piping from the pump discharge to under the dispenser is above ground and visible.

2206.7.9.1.1 Dispensing devices. Dispensing devices incorporating provisions for vapor recovery shall be listed and labeled~~.~~, or certified by the manufacturer for the fuel dispensed. When existing listed or labeled dispensing devices are modified for vapor recovery, such modifications shall be listed by report by a nationally recognized testing laboratory~~.~~, or certified by the manufacturer for the fuel dispensed. The listing by report shall contain a description of the component parts used in the modification and recommended method of installation on specific dispensers. Such report shall be made available on request of the *fire code official*.

Means shall be provided to shut down fuel dispensing in the event the vapor return line becomes blocked.

2206.7.9.2.1 Equipment. Equipment in vapor-processing systems, including hose nozzle valves, vapor pumps, flame arresters, fire checks or systems for prevention of flame propagation, controls and vapor-processing equipment, shall be individually listed, or certified by the manufacturer, for the intended use in a specified manner.

Vapor-processing systems that introduce air into the underground piping or storage tanks shall be provided with equipment for prevention of flame propagation that has been tested and listed, or certified by the manufacturer, as suitable for the intended use.

3403.6.2 Design, fabrication and installation of piping systems and components. Piping system components shall be designed and fabricated in accordance with the applicable standard listed in Table 3403.6.2 and Chapter 27 of NFPA 30, except as modified by Section 3403.6.2.1.

Exception: Where piping system components are certified by the manufacturer for the fuel stored.

3403.6.9 Flexible joints. Flexible joints shall be listed and approved, or certified by the manufacturer for the fuel used, and shall be installed on underground liquid, vapor and vent piping at all of the following locations:

1. Where piping connects to underground tanks.
2. Where piping ends at pump islands and vent risers.
3. At points where differential movement in the piping can occur.

3404.2.7 Design, construction and general installation requirements for tanks. The design, fabrication and construction of tanks shall comply with NFPA 30. Each tank shall bear a permanent nameplate or marking indicating the standard used as the basis of design.

Exception: Where tanks are certified by the manufacturer for the fuel stored.

Reason: The requirement for a listing by an "approved testing laboratory, inspection agency or other organization concerned with current product evaluation" (IFC 202) can prove a considerable hindrance to the propagation of new fuels, such as biofuels. The most often used listing laboratory, UL, requires at least 18 months of testing prior to offering a listing which may not be feasible in light of federal regulations requiring new fuels in a certain time period. Moreover, as is the case with ethanol, blend levels may be adjusted in short time periods making the ICC requirement for a listing an inflexible barrier to fuel retailers. An alternate requirement must be found that ensures the protection of public safety while requiring less time to obtain. A manufacturer's certification has been one idea that has received some support among API members, but other alternatives should also be considered. API would encourage the ICC to allow for potential modifications of this requirement after the Code Development hearings when other potential alternatives may be presented and vetted.

Cost Impact: This proposal will not increase the cost of construction.

	Assembly:	ASF	AMF	DF

ICCFILENAME: KNAPP-F2-F11-COMBINED.DOC

F173–09/10
2206.8.1, 2206.8.2 (New), 2202.1

Proponent: Ken Boyce, Underwriters Laboratories, representing Doug Horne, Clean Vehicle Education Foundation; Wendy Clark, National renewable Energy Laboratory

1. Revise as follows:

2206.8.1 Approval of equipment. Dispensers, hoses, nozzles, breakaway fittings, swivels, flexible connectors or dispenser emergency shutoff valves, vapor recovery systems, leak detection devices and pumps used in alcohol blended fuel-dispensing systems shall be listed or approved for the specific purpose.

2. Add new text as follows:

2206.8.2 Material compatibility. Tanks and fluid handling components that contact alcohol blended fuels shall be fabricated from corrosion resistant materials that mitigate galvanic action and resist corrosion from internal and external sources. Dissimilar metallic parts that promote galvanic action shall not be joined.

(Renumber subsequent sections)

3. Revise definition as follows:

2202.1 Definitions. The following words and terms shall, for the purposes of this chapter and as used elsewhere in this code, have the meanings shown herein.

ALCOHOL BLENDED FUELS. Alcohol blended fuels, including those containing nominally 85-percent ethanol 15-percent unleaded gasoline (E85), are flammable liquids consisting of ethanol or other alcohols blended greater than ~~15~~10-percent by volume.

Reason: This proposal updates E85 and other alcohol blended fuel dispensing requirements. Specifically, the proposal:

1. Revises the definition of alcohol blended fuels that was introduced into the 2006 IFC. The proposed revision clarifies that these are fuels containing between 10 and 85% ethanol by volume. Presently, gasoline blends containing up to 10% ethanol (also known as "gasohol") are permitted to be dispensed into conventional (non-flex fuel) vehicles, although there the possibility in the near-term that blends containing more that 10% ethanol may be permitted for conventional vehicles. Clarifying the limit from 15 to 10% is necessary and will help the IFC address potential near-term deployment of fuels with more ethanol.
2, Adds leak detection devices to the types of equipment specifically requiring approval for use with alcohol blended fuels. Practical experience has shown that leak detection equipment needs to be compatible for use with alcohol blended fuels or it may not be able to perform its intended function.
3. Adds a new section 2606.8.2 with requirements covering the compatibility of the fuel containment systems materials with the alcohol blended fuels. The wording for this section is similar to wording currently in Section 3403.6.5, which addresses external corrosion, not internal corrosion. Alcohols are polar compounds that exhibit increased moisture absorption, water solubility, polar solvency and solution conductivity relative to gasoline, and can cause increased corrosion.

Cost Impact: The code change proposal will increase the cost of construction.

2209

Proponents: Robert J Davidson, Code Consultant/Alan Shuman, President, representing the National Association of State Fire Marshals (NASFM)

1. Revise as follows:

2209.2.1 Approved equipment. Cylinders, containers and tanks; pressure relief devices, including pressure valves; hydrogen vaporizers; pressure regulators; and piping used for gaseous hydrogen systems shall be designed and constructed in accordance with ~~Section 3003, 3203 or NFPA 55~~ Chapters 30, 32 and 35.

2209.3 Location on property. In addition to the requirements of Section 2203.1, ~~Generation, compression, storage and~~ dispensing equipment shall be located in accordance with Sections 2209.3.1 through Section 2209.3.3.

2. Delete sections and table in their entirety without substitution:

~~**2209.3.1 Separation from outdoor exposure hazards.**~~

~~**TABLE 2209.3.1**~~
~~**MINIMUM SEPARATION FOR GASEOUS HYDROGEN**~~
~~**DISPENSERS, COMPRESSORS, GENERATORS AND STORAGE VESSELS**~~

~~**2209.3.1.1 Barrier wall construction–gaseous hydrogen.**~~
~~**2209.3.1.2 Location of equipment**~~.

3. Add new text as follows:

2209.3.1 Location of dispensing devices. Dispensing devices shall be located above ground. In addition to the requirements of Section 2203.1, dispensing shall be located in accordance with the following:

1. Ten feet (3048 mm) or more from the nearest public street or sidewalk.
2. Fifty feet (15,240 mm) from the nearest rail of any railroad main track.
3. Five feet or more from the nearest enclosing wall.

4. Dispensing equipment shall be allowed under weather protection in accordance with the requirements of Section 2704.13 and constructed in a manner that prevents the accumulation of hydrogen gas.

Exceptions:

1. Compression, storage or dispensing equipment shall be allowed in buildings in accordance with Section 2209.3.2.2.
2. Compression, storage and dispensing equipment shall be allowed in vaults in accordance with Chapter 30.

4. Revise as follows:

2209.3.2 Location of ~~dispensing~~ operations and equipment. Generation, compression, storage and dispensing equipment shall be located in accordance with Sections 2209.3.2.1 through 2209.3.2.6.3.

2209.3.2.1 Outdoors. Generation, compression, or storage ~~or dispensing~~ equipment shall be allowed outdoors in accordance with ~~Section 2209.3.1~~ Chapter 35.

5. Delete section in its entirety without substitution:

~~**2209.3.2.2 Weather protection**.~~

(Renumber remaining sections 2209.3.2.3 through 2209.3.2.4)

6. Revise as follows:

2209.3.2.~~5~~ 4 ~~Liquefied~~ Cryogenic fluid hydrogen storage. Storage of Cryogenic fluid hydrogen shall be in accordance with Chapters 32 and 35.

7. Delete sections in their entirety without substitution:

~~**2209.3.2.5.1 Location on property.**~~
~~**2209.3.2.5.1.1 Barrier wall construction–liquefied hydrogen.**~~
~~**2209.3.2.5.1.2 Location of equipment.**~~

(Renumber Sections 2209.3.2.6 through 2209.3.2.6.3)

~~**2209.5.4 Venting of hydrogen systems.**~~
~~**2209.5.4.1 Location of discharge.**~~
~~**2209.5.4.2 Pressure relief devices.**~~
~~**2209.5.4.2.1 Minimum rate of discharge.**~~
~~**2209.5.4.3 Vent pipe.**~~
~~**2209.5.4.3.1 Materials of construction.**~~
~~**2209.5.4.3.2 Structural support.**~~
~~**2209.5.4.3.3Obstructions.**~~
~~**2209.5.4.3.4 Height of vent and separation.**~~
~~**TABLE 2209.5.4.3.4**~~
~~**FIGURE 2209.5.4.3.4**~~
~~**2209.5.4.3.5 Maximum flow rate.**~~
~~**2209.5.4.3.6 Alternative venting systems.**~~
~~**TABLE 2209.5.4.3.6(1)**~~
~~**TABLE 2209.5.4.3.6(2)**~~

Reason: This proposal is intended to provide correlation with changes to Chapter 35 contained within a separate proposal that will update references to NFPA 55 to apply updated separation distances tables added to that standard. When the separation distances were added to Chapter 22 the proponents indicated in the written reason and in testimony that the distances provided were the best that could be developed at that time and that once better distances were determined through research and analysis the IFC would be updated. This proposal is one of several that fulfill that intent.

Section 2209 addresses issues specific to dispensing operations. Storage is addressed by Chapter 35 and 2209.3.2.1 and 2209.3.2.4 refers the code user to Chapters 30 and 35 for storage.

The change to 2209.2.1 eliminates an incorrect “or” phrase in applicability and replaces the language with references to the relevant chapters to correlate with references to each of the chapters found in the remaining portions of 2209.

Deleting the struck text from Section 2209.3 and 2209.5.4 clarifies applicability of Section 2209.

Replacing the current Section 2209.3.1 with the proposed text clarifies that the separation required is from the dispensing equipment and not from the storage system. The storage system separation distances are addressed in Chapter 35. The weather protection for equipment found at Section 2209.3.2.2 has been added to the new 2209.3.1 language for the dispenser.

Deleting Table 2209.3.1 and replacing it with the text proposed for 2209.3.1 correlates the IFC with NFPA 52 Table 9.3.1.4 in the 2010 edition per approved ROP-81. The two separation distances listed in the proposed text for 2209.3.1 are the only ones that need to be added to the requirements of 2203.1 in order to achieve correlation with NFPA 52 Table 9.3.1.4 (2010 edition per ROP-81). See below for an image of the draft NFPA 52 Table 9.3.1.4 for convenience. The 1st row in table establishes a separation distance requirement between dispensing equipment and buildings. This NFPA 52 requirement corresponds to the existing text in IFC 2203.1. The next two items are not currently in IFC and are added to 2209.3.1 by this proposal.

The remaining deletions are of language that is no longer required due to the application of modifications to Chapter 35 of the IFC and the updated reference to NFPA 55.

The change at 2209.3.2.5 is a terminology correlation that has already been made to Chapter 32,

Approval of this proposal will simplify the application of the IFC to the outdoor storage of hydrogen and continue the efforts of ICC to provide for improved levels of safety in the application of new hydrogen technology and hydrogen as an alternative fuel.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: The related code change proposal referred to in the first paragraph of the reason statement is F214-09/10. The action on this proposal should be consistent with the action on Code Change F176-09/10.

<u>Manually Operated Valves Used in Gaseous Hydrogen Vehicle Fueling Stations</u>	<u>CSA America HGV 4.6</u>
<u>Standard for Automatic Pressure Operated Valves for Use in Gaseous Hydrogen Vehicle Fueling Stations</u>	<u>CSA America HGV 4.7</u>
<u>Hydrogen Gas Vehicle Fueling Station Compressor</u>	<u>CSA America HGV 4.8</u>
<u>Fittings for Compressed Hydrogen Gas and Hydrogen Rich Gas Mixtures</u>	<u>CSA America HGV 4.10</u>

2. Add new standards to Chapter 47 as follows:

CSA America, Inc.
8501 E. Pleasant Valley Rd.
Cleveland, OH 44131

HGV 4.1	Compressed Hydrogen Dispensers
HGV 4.2	Hoses and Hose Assemblies for Gaseous Hydrogen Vehicles and Dispensing Systems
HGV 4.4	Breakaway Devices for Hoses Used in Compressed Hydrogen Vehicle Fueling Stations
HGV 4.5	Priority and Sequencing Equipment for Gaseous Hydrogen Dispensing Systems
HGV 4.6	Manually Operated Valves Used in Gaseous Hydrogen Vehicle Fueling Stations
HGV 4.7	Standard for Automatic Pressure Operated Valves for Use in Gaseous Hydrogen Vehicle Fueling Stations
HGV 4.8	Hydrogen Gas Vehicle Fueling Station Compressor
HGV 4.10	Fittings for Compressed Hydrogen Gas and Hydrogen Rich Gas Mixtures

Reason: The proposal is to reference CSA America documents used by industry for certification of the dispenser and related equipment.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: A review of the standard(s) proposed for inclusion in the code, CSA HGV 4.1, 4.2, 4.4, 4.5, 4.6, 4.7, 4.8 and 4.10, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

Public Hearing:				
	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: CAIRNS-F1-2209.2.2

F176–09/10

2209.3, 2209.3.1, Table 2209.3.1, 2209.3.1.1

Proponent: Robert Boyd, LINDE North America, Inc., representing Hydrogen Industry Panel on Codes (HIPOC)

1. Revise as follows:

2209.3 Location on property. In addition to the requirements of Section 2203.1, ~~generation, compression, storage and~~ dispensing equipment shall be located in accordance with Section~~s~~ 2203 and Sections 2209.3.1 through Section 2209.3.3.

2. Delete and substitute as follows:

~~**2209.3.1 Separation from outdoor exposure hazards.** Generation, compression and dispensing equipment shall be separated from other fuels or equivalent risks to life, safety and buildings or public areas in accordance with Table 2209.3.1.~~

~~**Exception:** *Closed systems* with a hydrogen capacity of 3,000 cubic feet (85 m^3) or less at NTP.~~

2209.3.1 Location of dispensing operations and equipment. Dispensing operations and equipment shall be located above ground. In addition to the requirements of Section 2203.1, the point of transfer dispensing shall be located in accordance with the following:

1. Ten feet (3048 mm) or more from the nearest public street or sidewalk.
2. Ten feet (3048 mm from the nearest rail of any railroad track.
3. Dispensing equipment shall be allowed under weather protection in accordance with the requirements of Section 2704.13 and constructed in a manner that prevents the accumulation of hydrogen gas.

3. Delete section and table in their entirety without substitution:

~~**TABLE 2209.3.1**~~
~~**MINIMUM SEPARATION FOR GASEOUS HYDDROGEN DISPENSERS, COMPRESSORS, GENERATORS AND STORAGE VESSELS**~~
(Delete entire table and notes)

~~**2209.3.1.1 Barrier wall construction—gaseous hydrogen.** The outdoor separation shall be allowed to be reduced to 5 feet (1524 mm) where a 2-hour *fire barrier* interrupts the line of sight between equipment, other than dispensers, and the exposure within the radial distance as indicated by the tabular value. The height of the barrier shall be a minimum of 6 feet (1829 mm), but not less than 1.5 times the height of the equipment, measured vertically. The length of the wall shall be not less than 1.5 times the maximum diameter or length of the tank.~~

Reason: This proposal is intended to provide correlation with changes to Chapter 35 contained within separate proposals that will update references to NFPA 55 to apply updated separation distances tables added to that standard. When the separation distances were added to Chapter 22, the proponents indicated, in the written reason and in testimony, that the distances provided were the best that could be developed at that time and that once better distances were determined through research and analysis, the IFC would be updated. This proposal is one of several which fulfills that intent.

The remaining deletions are of language that is no longer required due to the application of modifications to Chapter 35 of the IFC and the updated reference to NFPA 55. Approval of this proposal will simplify the application of the IFC to the outdoor storage of hydrogen and continue the efforts of ICC to provide for improved levels of safety in the application of new hydrogen technology and hydrogen as an alternative fuel.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: The related code change proposal referred to in the first paragraph of the reason statement is F214-09/10. The action on this proposal should be consistent with the action on Code Change F174-09/10.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: BOYD-F2-2209.3.DOC

F177–09/10
2209.3.1.2

Proponent: Robert Boyd, Linde North America, Inc.

Revise as follows:

2209.3.1.2 Location of equipment. ~~Equipment shall be located from the enclosing walls at a distance not less than one tank diameter. When horizontal tanks are used,~~ The distance from equipment to any one enclosing wall shall be not less than ~~one-half the length of the tank or a minimum of~~ 5 feet (1524 mm).

Reason: During the most recent HIPOC meeting, the need for such large setback distance between tanks and enclosing walls was reviewed. Tanks are typically 8 or 10 feet in diameter and there is no justifiable reason to have more than a 5 foot walkway between tanks and enclosing walls. The requirement to have walls be half the length of the horizontal tank to the enclosing walls is even more out of line with what is needed.

This proposal came out of a final review of Chapter 22 after HIPOC had last convened. HIPOC will review this proposal in detail and will likely speak on behalf of this proposal.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: BOYD-F1-2209.3.1.2.DOC

F178–09/10
2211.7.2.1 (IBC [F] 406.6.6.1); 2211.7.2.2 (New) [IBC [F] 406.6.6.1.1 (New)]; 3704.2.2.10.1 (New)

Proponent: Bob Eugene/Underwriters Laboratories Inc. representing Underwriters Laboratories, Inc.

1. Add new text follows:

2211.7.2.1 (IBC [F]406.6.6.1) System design. The flammable gas detection system shall be *listed* or *approved* and shall be calibrated to the types of fuels or gases used by vehicles to be repaired. ~~Gas detectors or sensors shall be *listed* in accordance with UL 2075 and shall indicate the gases they are intended to detect~~. The gas detection system shall be designed to activate when the level of flammable gas exceeds 25 percent of the lower flammable limit (LFL). Gas detection shall also be provided in lubrication or chassis service pits of repair garages used for repairing nonodorized LNG-fueled vehicles.

2211.7.2.1.1 (IBC [F] 406.6.6.1.1) Gas detection system components. Gas detection system control units shall be listed and labeled in accordance with UL 864 or UL 2017. Gas detectors shall be listed and labeled in accordance with UL 2075 for use with the gases and vapors being detected.

3704.2.2.10.1 Gas detection system components. Gas detection system control units shall be listed and labeled in accordance with UL 864 or UL 2017. Gas detectors shall be listed and labeled in accordance with UL 2075 for use with the gases and vapors being detected.

2. Add new standard to Chapter 47 (IBC Chapter 35) as follows:

UL
2017-08 Standard for General Purpose Signaling Devices and Systems

Reason: The change is designed to ensure that gas detection system components are listed in accordance with nationally recognized safety standards. These standards include a comprehensive set of construction and performance requirements that are used to evaluate and list gas detection system control units and gas detectors.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: A review of the standard(s) proposed for inclusion in the code, UL 2017-08, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

2301.5 (New), 2302 (New), 2303.2, 2303.6, 2308.2.1, Chapter 47

Proponent: Jimbo Schifiliti, Fire Safety Consultants, Inc., representing self

1. Add new text as follows:

2301.5 Pallets. All pallets shall be wooden as defined by this Chapter or shall be *listed* and *labeled* in accordance with UL 2335 or FM 4996

SECTION 2302
DEFINITIONS

2302.1 Definitions. The following words and terms shall, for the purposes of this chapter and as used elsewhere in this code, have the meanings shown herein.

WOODEN PALLET. A wooden pallet is defined as a 42 in. x 42 in., 2-way entry Stringer Pallet constructed from hardwood as described in ASME MH1.

2. Revise as follows:

2303.2 Class I commodities.Class I commodities are essentially noncombustible products ~~on wooden or nonexpanded polyethylene solid deck~~ with or without pallets , in ordinary corrugated cartons with or without single-thickness dividers, or in ordinary paper wrappings with or without pallets. Class I commodities are allowed to contain a limited amount of Group A plastics in accordance with Section 2303.7.4. Examples of Class I commodities include, but are not limited to, the following:

Alcoholic beverages not exceeding 20-percent alcohol
Appliances noncombustible, electrical
Cement in bags
Ceramics
Dairy products in nonwax-coated containers (excluding bottles)
Dry insecticides
Foods in noncombustible containers
Fresh fruits and vegetables in nonplastic trays or containers
Frozen foods
Glass
Glycol in metal cans
Gypsum board
Inert materials, bagged

Insulation, noncombustible
Noncombustible liquids in plastic containers having less than a 5-gallon (19 L) capacity
Noncombustible metal products

2303.6 High-hazard commodities. High-hazard commodities are high-hazard products presenting special fire hazards beyond those of Class I, II, III or IV. Group A plastics not otherwise classified are included in this class. Examples of high-hazard commodities include, but are not limited to, the following:

Aerosol, Level 3 (see Chapter 28)
Alcoholic beverages, exceeding 80-percent alcohol, in bottles or cartons
Commodities of any class in plastic containers in carousel storage
Flammable solids (except solid combustible metals)
Glycol in combustible containers (50 percent or greater)
Lacquers, which dry by solvent evaporation, in metal cans or cartons
Lubricating or hydraulic fluid in plastic containers
Mattresses, foam rubber or foam plastics
~~Pallets and flats which are idle combustible~~
Paper, asphalt, rolled, horizontal storage
Paper, asphalt, rolled, vertical storage
Paper and pulp, rolled, in vertical storage which is unbanded or not protected with an *approved* wrap
Pillows, foam rubber and foam plastics
Pyroxylin
Rubber tires
Vegetable oil and butter in plastic containers

2308.2.1 Plastic ~~pallets and~~ shelves. Storage on ~~plastic pallets or~~ plastic shelves shall be protected by *approved* specially engineered *fire protection systems*.

> **~~Exception:~~** ~~Plastic pallets listed and labeled in accordance with UL 2335 shall be treated as wood pallets for determining required sprinkler protection~~.

3. Add new standards to Chapter 47 as follows:

ANSI/FM 4996-2007	American National Standard for Classification of Idle Plastic Pallets as Equivalent to Wood Pallets
ASME MH1-2005	Pallets, Slip Sheets, and Other Bases for Unit Loads

Reason: Over the years the types of pallets utilized in day to day commerce has changed. When the density requirements relative to the impact pallets have on commodity classification and as idle pallet storage the standard wooden pallet was the hardwood, stringer type. Today a wooden pallet may be a 9-block, 4-way, softwood type or other variations including “one-way” pallets of a mixture of wood and composites. Some pallets are plastic, some are a combination of plastic and wood products.

NFPA 13 has undergone revisions over the last several cycles to increase density requirements based upon test data for the newer wood pallets. In addition, NFPA 13 added definitions as follows:

> “3.10.12 Wood Pallet. A wood pallet is defined as a pallet constructed entirely of wood with metal fasteners.”
>
> “3.10.13 Plastic Pallet. A plastic pallet is defined as a pallet having any portion of its construction consisting of a plastic material.”

The new definitions serve as a partial solution in that the pallet is either wood or plastic, and if classified as plastic verification of whether or not it is a listed and labeled plastic pallet can be made.

But the changes in NFPA 13 do not address the entire problem. Though the more recent additions of NFPA 13 have had increases made to density requirements to handle the challenge of some of the newer wood pallet types or new construction projects, those densities do not cover all of the newer types of materials in use in pallets and do not address the fact that the pallets are in use in facilities built under early editions of NFPA 13 and as a result do not have the needed water flow densities.

> We have an additional problem in Chapter 23. Whereas NFPA 13 addresses the impact of pallets at “5.6.2 Pallet Types”, (which may require a one or two class commodity increase or specific laboratory testing), and at “12.12 Protection of Idle Pallets” regardless or storage method, (solid pile versus rack storage), the IFC only addresses the issue in relation to rack storage and by classifying “*Pallets and flats which are idle combustible*” as a High-hazard commodities.

> “2308.2.1 Plastic pallets and shelves. Storage on plastic pallets or plastic shelves shall be protected by approved specially engineered fire protection systems.
>
> > Exception: Plastic pallets listed and labeled in accordance with UL 2335 shall be treated as wood pallets for determining required sprinkler protection”

This presents the real possibility that a building designed under the IFC did not have the correct commodity class for determining sprinkler density assigned unless the designer, plan reviewer and/or field inspector was aware of this issue and applied NFPA 13 to this topic even though classification is covered by the IFC.

In a practical sense, we cannot expect every existing building containing pallets with a fire suppression system installed prior to the 2002 edition of NFPA 13 to have the systems retroactively reassessed by a design professional and upgraded to handle the increased sprinkler demands of a violating product introduced after the building was constructed. It is easier and more cost effective to address the offending product, i.e., the unlisted or labeled pallet.

This proposal addresses the issue by requiring all pallets other than the hardwood, stringer type to be listed and labeled in accordance with the existing UL or FM standards. There is already one wood pallet provider that had their "yellow pine, 9-block" pallet tested for listed under the standards documenting that it can be done. In fact, it was some of those tests that identified the need to make changes to NFPA 13.

By requiring all pallets to be listed or labeled it will ensure that the pallets present can be handled by the existing suppression systems including those designed under the IFC where the required commodity class increase may have been missed and provide the code official with an effective tool to apply during maintenance inspections by spot checking for labels. It will also serve the building owner/operator by making it easy for him/her to verify that the pallets entering their facility do not place it at risk from a damaging fire.

Cost Impact: The code change will not increase the cost of construction.

Analysis: A review of the standard(s) proposed for inclusion in the code, ANSI/FM 4996-2007 and ASME MH1-2005, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: SCHIFILITI-F1-2301.5.DOC

F180–09/10
2302.1

Proponent: Ron Clements, Chesterfield County Virginia Building Inspection Department, representing self

Revise as follows:

2302.1 Definitions. The following words and terms shall, for the purposes of this chapter and as used elsewhere in this code, have the meanings shown herein.

HIGH-PILED STORAGE AREA. An area within a building which is designed, intended, proposed or actually used for high-piled combustible storage. <u>The area of aisles is not included in the determination of the size of the high-piled storage area.</u>

Reason: There is some ambiguity regarding if the area of aisles within high piled storage areas is to be included in the high-piled storage area value used by this chapter per this definition. Section 2306.9.1.1 bases some required aisle widths on the high-piled storage area. If the aisle widths area required to be included in the high piled storage area by definition, then it would be mathematically impossible to calculate the high-piled storage area because you cannot determine the aisle widths needed to calculate the aisle areas without the high-piled storage area. Additionally it does not make sense to include large aisles widths of 20', 30' or more between storage racks as part of the storage area. Clearly the intent is to measure the actual area of floor that is covered by the stored commodity.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: CLEMENTS-F1-2302.DOC

F181–09/10
2306.3.2.2

Proponent: Will Smith, PE, Code Consultants, Inc.

Revise as follows:

2306.3.2.2 Multiclass high piled storage areas. *High-piled storage areas* classified as Class I through IV not separated from *high-piled storage areas* classified as high hazard shall utilize the aggregate of all *high-piled storage areas* as high hazard for the purposes of the application of Table 2306.2. To be considered as separated, 1-hour *fire barrier* walls shall be constructed in accordance with the International Building Code. Openings in such walls shall be protected by opening protective assemblies having a 1-hour *fire protection rating*.

Exceptions:

1. As provided for in Section 2304.2.
2. When automatic sprinkler systems are designed for high hazard commodities throughout the high-piled storage area, the actual high-piled storage area classified as high hazard commodities and the actual high-piled storage area classified as Class I through IV commodities, individually, shall be used for the application of Table 2306.2.

Reason: The engineered solution provided in section 2304.2 allows for limiting the size of the high hazard areas to 120 sq ft and separating them by 25 ft. This exception is allowed when the sprinkler system is capable of delivering a sprinkler density that will protect high hazard commodities over a 900 sq ft area. The proposed exception provides an alternate solution when the sprinkler system is designed for high hazard commodities throughout the storage area.

Further research where the sprinkler system has been designed for the proper design density has proven that smoke and heat vents in most cases will not operate. At most, one vent will operate in the area.

This exception will allow the elimination of smoke and heat vents and building access requirements in a building when the design of the sprinkler system is for high hazard commodities, and the total amount of high-piled storage of high hazard commodities is less than 2,500 sq ft.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: SMITH-F2-2306.3.2.2.DOC

F182–09/10
2306.6.1.1

Proponent: Will Smith, PE, Code Consultants, Inc.

Revise as follows:

2306.6.1.1 Number of doors required. A minimum of one access door shall be provided in each 100 lineal feet (30 480 mm), or fraction thereof, of the exterior walls that face required fire apparatus access roads. The required access doors shall be distributed such that the lineal distance between adjacent access doors does not exceed 100 feet (30 80 mm).

Exception: Where exterior walls that face required fire apparatus access roads do not exceed a linear distance of 200 feet, two access doors shall be permitted such that the linear distance between adjacent access doors does not exceed 200 feet.

Reason: Where an exterior wall, 200 ft long, faces a required fire apparatus access road, the number of access doors required would be two. The distance between doors could be no less than 1 ft and no more than 100 ft apart. Three doors would be required if two existing doors were located more than 100 ft apart. This revision would allow a condition where the exterior wall is not greater than 200 ft, a minimum two doors would still be required, one door in each linear 100 ft. This condition still maintains a two door minimum requirement for a 200 ft long exterior wall.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: SMITH-F1-2306.6.1.1.DOC

F183–09/10
2308.2.1, Chapter 47

Proponent: Jesse J. Beitel, Hughes Associates, Inc., representing FM Approvals

1. Revise as follows:

2308.2.1 Plastic pallets and shelves. Storage on plastic pallets or plastic shelves shall be protected by approved specially engineered fire protection systems.

Exception: Plastic pallets listed and labeled in accordance with UL 2335 or ANSI/FM 4996 shall be treated as wood pallets for determining required sprinkler protection.

2. Add new standard to Chapter 47 as follows:

FM

ANSI/FM 4996-2007 American National Standard for Classification of Idle Plastic Pallets as Equivalent to Wood Pallets

Reason: The purpose of this code change is to include reference to ANSI/FM 4996 as an alternate to UL 2335 in the International Fire Code. ANSI/FM 4996 is an ANSI approved standard.

The inclusion of this alternate test method would provide the authority having jurisdiction with the flexibility to accept listed and labeled products evaluated in accordance with either UL 2335 or ANSI/FM 4996. This will also assist pallet manufacturers by providing two sources of listings and also not require pallet manufacturers currently listed with FM to have to retest and co-list with another laboratory/agency.

Both standards are similar in that they require full-scale fire tests and they address the issue of appropriate sprinkler protection for plastic pallets.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: A review of the standard proposed for inclusion in the code, ANSI/FM 4996-2007, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: BEITEL-F1-2308.2.1.DOC

F184–09/10
2308.3.1 (New)

Proponent: Amber Anderson/Stuart Tom, Cosumnes CSD Fire Department, representing California Fire Chief's Association

Add new text as follows:

2308.3.1 Flue space protection. Where required by the fire code official, flue spaces required by Table 2308.3, in single, double or multiple row rack storage installations shall be equipped with approved devices to protect the required flue spaces. Such devices shall not be removed or modified.

Reason: This proposal authorizes the enforcing agency to require devices, when appropriate, to maintain the required flue spaces in rack storage systems found in IFC Section 2308 and IFC Table 2308.3. It is not the intent of this proposal to require such devices in each instance, but rather when the business practice has established a history of poor flue space maintenance.

Approved devices to protect required flue spaces may be any of the following: brackets, cables or other elements that are securely fastened to the load bearing columns of racks, which control the depth or width to which a product, pallet or similar material can be stored in the rack system thereby preventing obstruction of the required flue space.

Once approved devices are installed, most business owner confusion regarding flue space requirements are removed. Other benefits include; property loss reduction through quick activation of the fire protection system; improved penetration of extinguishing agent through the rack system to the seat of the fire; faster activation of smoke and heat vent systems, improved employee safety, public safety and firefighter safety.

Cost Impact: The code change proposal will increase the cost of construction

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: ANDERSON-TOM-F1-2308.3.1.DOC

F185–09/10
2309.4, 2309.5 (New)

Proponent: Tom Lariviere, Chairman, Joint Fire Service Review Committee

1. Revise as follows:

2309.4 Automated rack storage. *High-piled storage areas* with more than 500 square feet (46 m^2) of automated rack storage shall be provided with automatic shutdown in accordance with the following:

1. Activation of the fire detection system or automatic fire sprinkler system required by Table 2306.2 shall sound an alarm at the operator's station and stop the automated rack storage system.

2. ~~*High-piled storage areas* with automated~~ Automated rack storage systems shall be provided with a manually activated emergency shut down switch for use by emergency personnel. The switch shall be clearly identified and shall be in a location *approved* by the fire chief.
3. The automated rack storage system shall be provided with manual override for fire department use during or after a fire incident. When the manual override is utilized, the automated rack storage system will travel at a speed *approved* by the fire chief.

2. Add new text as follows:

2309.5 Automated pallet movers. Automated pallet movers associated with *high-piled storage areas* shall be provided with automatic shutdown in accordance with the following:

1. Activation of the fire detection system or automatic fire sprinkler system required by Table 2306.2 shall sound an alarm at the operator's station and stop the automated pallet movers.
2. Automated pallet movers shall be provided with a manually activated emergency shut down switch for use by emergency personnel. The switch shall be clearly identified and shall be in a location *approved* by the fire chief.

Reason: Automated rack storage is occurring in many large warehousing operations. This proposal will add requirements specifying that if a fire occurs in an automated rack storage facility the remotely controlled pallet moving equipment will automatically shut-down. This automatic shut-down accomplishes two objectives. First, the potential to either move additional product into the fire or move burning product through the storage area via remotely controlled pallet movers is halted. Secondly, firefighting personnel cannot safely operate within the automated storage area when the system is still active. Many of these automated rack storage have equipment that moves quite fast, and there is a physical danger to the firefighters. This shut-down will eliminate this danger to firefighters.

Whether the products stored are Class I-IV commodities or High Hazard commodities, Table 2306.2 requires that any high piled storage area exceeding 500 sq.ft. will be protected with either a fire detection system or a fire sprinkler system. The activation of a fire detector, or the activation of a water flow switch will cause the remotely controlled devices to cease operation.

Additionally, Item #3 will allow the fire department to utilize the rack storage equipment after the system has been shut-down. The control of the speed at this point is critical. Since automated systems move extremely fast, it is necessary to slow the speed down while firefighting personnel are in and around this equipment.

Also, Section 2309.5 is added to require that automated pallet movers which are carrying pallets to and from the automated rack storage area shut down in addition to the automated rack storage equipment. This is just an extension of shutting down the equipment within the storage racks. This requirement will eliminate moving additional fuel load into the fire area.

Cost Impact: The code change proposal will increase the cost of construction.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: LARIVIERE-F18-2309.4.DOC

F186–09/10

Table 2703.1.1(1) [IBC [F] Table 307.1(1)]; 3302.1 (IBC [F]307.2)

Proponent: Glenn A. Dean, Virginia State Fire Marshal's Office

Revise as follows:

TABLE 2703.1.1(1) [IBC TABLE [F] 307.1(1)]
MAXIMUM ALLOWABLE QUANTITY PER CONTROL AREA OF HAZARDOUS MATERIALS POSING A PHYSICAL HAZARD[a,j,n,p]

MATERIAL	CLASS	GROUP WHEN THE MAXIMUM ALLOWABLE QUANTITY IS EXCEEDED	STORAGE[b]			USE-CLOSED SYSTEM[b]			USE-OPEN SYSTEMS	
			SOLID POUNDS (CUBIC FEET)	LIQUID GALLONS (POUNDS)	GAS (CUBIC FEET AT NTP)	SOLID POUNDS (CUBIC FEET)	LIQUID GALLONS (POUNDS)	GAS (CUBIC FEET AT NTP)	SOLID POUNDS (CUBIC FEET)	LIQUID GALLONS (POUNDS)
~~Consumer fireworks (Class C, Common)~~	~~1.4G~~	~~H-3~~	~~125[d,e,i]~~	~~N/A~~	~~N/A~~	~~N/A~~	~~N/A~~	~~N/A~~	~~N/A~~	~~N/A~~

(Portions of table and notes not shown remain unchanged)

3302.1 (IBC [F]307.2) Definitions. The following words and terms shall, for the purposes of this chapter and as used elsewhere in this code, have the meanings shown herein.

FIREWORKS, 1.4G. (Formerly known as Class C, Common Fireworks.) Small fireworks devices containing restricted amounts of pyrotechnic composition designed primarily to produce visible or audible effects by combustion or deflagration that complies~~. Such 1.4G fireworks which comply~~ with the construction, chemical composition and labeling regulations of the DOTn for Fireworks, UN 0336, and the U.S. Consumer Product Safety Commission as set forth in CPSC 16 CFR: Parts 1500 and 1507,~~ are not explosive materials for the purpose of this code~~.

(Portions of definition of "Fireworks" not shown remain unchanged)

Reason: The intent of this change is to revert to language stating consumer fireworks are explosive in nature.

The IFC definition language denoting that consumer fireworks would not be considered "explosive materials for the purpose of this code" originated through IFC code change F97-99. The proponent at the time stated the change was to "revise the definitions for consumer fireworks and display to be more closely aligned with the definitions contained in the 1997 IFCI Uniform Fire Code including 1999 Accumulative Supplement and the 1999 BOCA National Fire Prevention Code."

In looking back for the UFC and BOCA fire codes that were referenced in the F97-99 change to the IFC, code change B3-97 introduced language through the BOCA building code claiming consumer fireworks are not explosive materials and did not provide any technical substantiation to support the claim. I would accept the proponent was making the claim as a means to justify reclassifying the storage and/or sale of consumer fireworks from an H-1 to an H-3 building. For that, I would agree somewhat with the proponent in saying that it "appears reasonable" given the comparison for other H-3 commodities but that is not the issue in this proposed change.

The next BOCA cycle saw the introduction of F18-98 changing the definition of consumer fireworks, 1.4G as "not explosive materials for the purpose of this code". The committee hearing the change at the time denied the proposal with a conference action to amend. Subsequently the proponent brought the issue back in the form of an amendment. But here again, a technical substantiation was not provided.

This same F18-98 change, as amended, carved out consumer fireworks from BOCA's MAQ table to "correlate with code change B3-97 to the 1996 BOCA National Building Code" to be shown as a Group H-3 building instead of a Group H-1. The proponent also stated that it was to "correlate definitions used in the BOCA National Fire Prevention Code and Building Code with terminology used in the new DOTn/UN classifications and regulations and NFPA standards." That may be true to a point and it's that point that gets to the heart of the reason behind this proposed change, which is, DOTn 49 CFR Parts 100-178, U.S Consumer Products Safety Commission as set forth in CPSC 16 CFR, UN 0336, NFPA standards 495, 1123, 1124, and 1126 **do not** contain language saying consumer fireworks are not explosive, at least not that I found. I went so far as to check pamphlets published by the Institute of Makers of Explosives; the U.S. Department of Justice, Bureau of Alcohol, Tobacco, Firearms and Explosives, AFT Publication 5400.7; the American Pyrotechnics Association Standard 87-1, and found nothing in that respect. In fact, everything found labels fireworks as "explosive" without distinction for 1.4G "consumer fireworks" versus a 1.4G professional pyrotechnic device such as the "gerb" that was used and ignited The Station nightclub fire in Rhode Island.

It is the accumulative results of B3-97 and F18-98 that lent itself to the reference in IFC code change F97-99 supporting statement.

That portion of the proposed definition change to include "deflagration" is a resurrection of a previously used descriptor and is to more accurately reflect the functioning of some consumer fireworks. While a sparkler or fountain may operate through combustion, simple combustion does not necessarily mean enough force will be produced quickly enough for the device to function in a desired manner. If the pyrotechnic material does not deflagrate, the flaming balls of roman candles may not launch; aerial devices may not have enough expelling force to obtain the needed altitude.

The change to Table 2703.1.1(1) is a change to reflect that consumer fireworks are indeed properly classified as an Explosive 1.4G and it's not necessary to have a separate line with identical threshold values, including all footnotes, to determine at what point a building would be classified as a Group H-3. It's redundant within the same table. In reality, at the model code level, other than the deletion of language saying consumer fireworks are not explosive, the net effect of this change will be zero to what is taking place in the world of consumer fireworks manufacturing, storage, sale and use.

At the time of this submission I have not located copies of the UFC code changes referenced above but I suspect the supporting statements closely resembled those submitted to BOCA.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: DEAN-F1-TABLE 2703.1.1(1).DOC

F187–09/10

Table 2703.1.1(1) [IBC Table [F] 307.1(1)]; IBC [F] 307.4 (IFC 202)

Proponent: William Winslow, CIH, CFI, CMI, Winslow Partnership, representing himself

1. Revise table as follows:

TABLE 2703.1.1(1) [IBC [F] Table 307.1(1)]
MAXIMUM ALLOWABLE QUANTITY PER CONTROL AREA OF HAZARDOUS MATERIALS POSING A PHYSICAL HAZARD[a, j, m, n, p]

MATERIAL	CLASS	GROUP WHEN THE MAXIMUM ALLOWABLE QUANTITY IS EXCEEDED	STORAGE[b]			USE-CLOSED SYSTEMS[b]			USE-OPEN SYSTEMS[b]	
			Solid pounds (cubic feet)	Liquid gallons (pounds)	Gas cubic feet at NTP	Solid pounds (cubic feet)	Liquid gallons (pounds)	Gas cubic feet at NTP	Solid pounds (cubic feet)	Liquid gallons (pounds)
Combustible Dust	Not Applicable	H-2	See Note q	Not Applicable	Not Applicable	See Note q	Not Applicable	Not Applicable	See Note q	Not Applicable

a. through p. (No change to current text.)
q. Where manufactured, generated or used in such a manner that the concentration and conditions create a fire or explosion hazard based on information prepared in accordance with Section 104.7.2 [IBC 414.1.3] .

(Portions of table not shown do not change.)

2. Revise IBC as follows:

[F] 307.4 (IFC 202) High-hazard Group H-2. Buildings and structures containing materials that pose a deflagration hazard or a hazard from accelerated burning shall be classified as Group H-2. Such materials shall include, but not be limited to, the following:

Class I, II or IIIA flammable or combustible liquids which are used or stored in normally open containers or systems, or in closed containers or systems pressurized at more than 15 psi (103.4 kPa) gage.

Combustible dusts, where manufactured, generated or used in such a manner that the concentration and conditions create a fire or explosion hazard based on information prepared in accordance with Section 414.1.3

Cryogenic fluids, flammable
Flammable gases
Organic peroxides, Class I
Oxidizers, Class 3, that are used or stored in normally open containers or systems, or in closed containers or system pressurized at more than 15 psi (103 kPa) gage
Pyrophoric liquids, solids and gases, nondetonable
Unstable (reactive) materials, Class 3, nondetonable
Water-reactive materials, Class 3

Reason: As it stands now, an occupancy with combustible dust is classified H-2 in accordance with IBC 307.4, with the exception of certain woodworking uses classified F-1. Many spaces with combustible dust should be classified H-2. However, others may fall into the F or S category depending on the specifics of the process. Item 1 adds combustible dust to the MAQ table, so the code user will not miss this important hazard category. New Note q directs the code user to pertinent sections in the IBC and IFC to determine if a dust hazard exists. Item 2 of this code change, which was found in the UBC, establishes that a potential combustible dust hazard has to be evaluated to determine the correct occupancy classification and safety controls

Cost Impact: The code change proposal may reduce the cost of construction

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: WINSLOW-F2-T2703.1.1-REVISED

F188–09/10
2703.2.2

Proponent: William Winslow, CIH, CFI, CMI, Winslow Partnership, representing self

Revise as follows:

2703.2.2 Piping, tubing, valves and fittings.Piping, tubing, valves, and fittings conveying hazardous materials shall be designed and installed in accordance with ASME B31, Code for Pressure Piping or other approved standards and shall be in accordance with Sections 2703.2.2.1 and 2703.2.2.2

Reason: ANSI/AMSE B31 is the primary code for pressure piping. It is separated into 9 sections, each regulating a different type of piping, and it has detailed requirements for installation, inspection and testing. Including it in the general section on piping will assist designers to reference the correct standard in project specifications. To address past concerns, this change continues to allow the use of other approved piping standards.

ASME B31 is referenced in the NFPA standards that deal with piping, with the exception of the fuel gas code, which primarily covers low pressure gas supplies to appliances. ASME B31 is also referenced in ASHRAE Standard 15, Safety Standard for Refrigeration Systems, IIAR 2, Equipment, Design, and Installation of Ammonia Mechanical Refrigerating Systems, Chlorine Institute Pamphlet 6, Piping Systems for Dry Chlorine, and API 14E, Recommended Practice for Design and Installation of Offshore Production Platform Piping.

There has been a concern expressed that jurisdictions will have to purchase ASME B31 if it is referenced in the code. My experience is that AHJs do not have many standards listed in project specifications, so this proposal will not change that situation. The proposal's goal is to help ensure that designers specify the correct piping standard and that contractors install piping in accordance with the standard. It will save the designer time in that ASME B31 will not have to be approved by the FCO.

Cost Impact: The code change proposal will not increase the cost of construction

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: WINSLOW-F4-2703.2.2.DOC

F189–09/10

2703.8.3.1 (IBC [F] 414.2.1), 2703.8.3.4 (IBC [F] 414.2.4), Table 2703.8.3.2 (IBC [F] Table 414.2.2)

Proponent: Gregory R. Keith, Professional heuristic Development, representing The Boeing Company

Revise as follows:

2703.8.3.1 (IBC [F] 414.2.1) Construction ~~requirements~~. Control areas shall be separated from each other, and from other portions of the building, by fire barriers constructed in accordance with Section 707 of the *International Building Code* or horizontal assemblies constructed in accordance with Section 712 of the *International Building Code*, or both.

2703.8.3.4 (IBC [F] 414.2.4) Fire-resistance rating ~~requirements~~. The required fire-resistance rating for fire barriers and horizontal assemblies shall be in accordance with Table 2703.8.3.2 (IBC [F] Table 414.2.2). ~~The floor assembly of the control area and the construction supporting the floor of the control area shall have a minimum 2-hour fire-resistance rating.~~

Exception: The floor assembly of the *control area* and the construction supporting the floor of the *control area* is allowed to be 1-hour *fire-resistance* rated in buildings of Type IIA, IIIA and VA construction, provided that both of the following conditions exist:

1. The building is equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1; and
2. The building is three stories or less above grade plane.

TABLE 2703.8.3.2 (IBC [F] TABLE 414.2.2)
DESIGN AND NUMBER OF CONTROL AREAS

~~FLOOR~~ STORY LEVEL	PERCENTAGE OF THE MAXIMUM ALLOWABLE QUANTITY PER CONTROL AREA[a]	NUMBER OF CONTROL AREAS PER ~~FLOOR~~ STORY	FIRE-RESISTANCE RATING FOR FIRE BARRIERS AND HORIZONTAL ASSEMBLIES IN HOURS[b]

(Portions of table not shown do not change.)

a. Percentages shall be of the maximum allowable quantity per control area indicated ~~shown~~ in Tables 2703.1.1(1) and 2703.1.1(2) [IBC [F] Tables 307.1(1) and 307.1(2)], with all increases allowed in the notes to those tables.

~~b. Fire barriers shall include walls and floors as necessary to provide separation from other portions of the building.~~

b. The floor assembly of the control area and the construction supporting the floor of the control area shall have a minimum 2-hour fire-resistance rating.

Reason: This proposal is intended to clarify IBC and IFC control area construction requirements. No technical changes are intended. Currently, Section 2703.8.3.1 (IBC [F] 414.2.1) states that control areas are to be constructed as fire barriers or horizontal assemblies. Section 2703.8.3.4 (IBC [F] 414.2.4) and Table 2703.8.3.2 (IBC [F] Table 414.2.2), however, only refer to fire barriers. A reference to horizontal assemblies has been added in each location.

Additionally, two current provisions have been relocated so as to be in technical context. Although Table 2703.8.3.2 (IBC [F] Table 414.2.2) provides fire-resistance rating requirements for fire assemblies used in the construction of control areas, Footnote b currently states a general design requirement. This design requirement has been placed in context in Section 2703.8.3.1 (IBC [F] 414.2.1). Similarly, Section 2703.8.3.4 (IBC [F] 414.2.4) provides a reference to Table 2703.8.3.2 (IBC [F] Table 414.2.2) for specific fire-resistance rating requirements based on the building story level.

Section 2703.8.3.4 (IBC [F] 414.2.4) also provides a detailed rating requirement for floor assemblies. That provision has been placed in context as a footnote to Table 414.2.2. Many practitioners determine technical requirements from tables without consulting charging text. Placing all applicable fire-resistive rating requirements in the same location will reduce the possibility of oversight. Additionally, several editorial changes have been made. The word "requirements" has been removed from Sections 2703.8.3.1 (IBC [F] 414.2.1) and 2703.8.3.4 (IBC [F] 414.2.4) headings. This is to be consistent with other IFC/IBC section headings. Virtually everything in the IFC/IBC is a requirement. This does not need to be stated in section headings. The height of a building is determined based on the number of stories, not the number of floors. Therefore, Table 2703.8.3.2 (IBC [F] Table 414.2.2) column headings have been revised to be consistent with that methodology. Approval of this proposal will assist users in the proper determination of requirements applicable to the design and construction of control areas.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICC FILENAME: KEITH-F1-2703.8.3.1.DOC

F190–09/10
2703.8.3.2 (IBC [F] 414.2.2); 2702.1 (IBC [F] 307.2)

Proponent: Sarah A. Rice, CBO, representing herself

Revise as follows:

2703.8.3.2 (IBC [F] 414.2.2) Percentage of maximum allowable quantities. The percentage of maximum allowable quantities of hazardous materials per *control area* allowed at each floor level within a building hall be in accordance with Table 2703.8.3.2. Where the quantity of hazardous material stored in the building is equal to or less than the maximum allowable quantity per control area in Tables 2703.1.1(1) and 2703.1.1(2), the entire building shall be considered a single control area and the maximum allowable quantity of hazardous material shall be permitted to be located anywhere in the building subject to the per-floor limitations of Table 2703.8.3.2.

2702.1 (IBC [F] 307.2) Definitions. The following words and terms shall, for the purposes of this chapter, Chapters 28 through 44 and as used elsewhere in this code, have the meanings shown herein.

CONTROL AREA. A space or spaces within a building where quantities of hazardous materials not exceeding the maximum allowable quantities per control area are stored, dispensed, used or handled. A control area may be an entire building or a portion of a building. See also the definition of AOutdoor control area.@

Reason: The intent of this proposal is to codify IFC Committee Interpretations #51-07 and #52-07. Interpretation #51-07 states that "When the quantity of hazardous material stored in the building is equal to or less than the maximum allowable quantity per control area in Tables 2703.1.1(1) and 2703.1.1(2), the entire building would be considered the control area. When the entire building is the control area, the maximum allowable quantity of material may be located anywhere in the building subject to the per-floor limitations of Table 2703.8.3.2." Interpretation #52-07 states that "When the quantity of hazardous material being stored in each control area is equal to or less than the maximum allowable quantity per control area in Tables 2703.1.1(1) and 2703.1.1(2), the maximum allowable quantity of material per control area may be located anywhere within a multi-story control area, subject to the per-floor limitations of Table 2703.8.3.2."

This proposal revises Section 2703.8.3.2 to clarify that the provisions of Table 2703.8.3.2 are applicable to a multi-story building that is a single control area. The control area definition is also being revised to clarify that an entire building of any height or area can, in fact, be considered a control area

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: RICE-G5-414~RENAMED-F1-2703.8.2

F191–09/10
2703.8.5.2, 2703.8.6.2, 2702

Proponent: Lynne M. Kilpatrick, Fire Department, City of Seattle WA

Revise as follows:

2703.8.5.2 Ventilation. Exhausted enclosures shall be provided with an exhaust ventilation system. The ventilation system for exhausted enclosures shall be designed to operate at a negative pressure in relation to the surrounding area. Ventilation systems used for highly toxic and toxic gases shall also comply with Items 1, 2 and 3 of Section 3704.1.2. The ventilation system shall be installed in accordance with the *International Mechanical Code*.

2703.8.6.2 Ventilation. Gas cabinets shall be provided with an exhaust ventilation system. The ventilation system for gas cabinets shall be designed to operate at a negative pressure in relation to the surrounding area. Ventilation systems used for highly toxic and toxic gases shall also comply with Items 1, 2 and 3 of Section 3704.1.2. The ventilation system shall be installed in accordance with the *International Mechanical Code*.

2702.1 Definitions. The following words and terms shall, for the purposes of this chapter and as used elsewhere in this code, have the meanings shown herein.

GAS CABINET. A fully enclosed, ventilated, noncombustible enclosure used to provide an isolated environment for *compressed gas* cylinders in storage or use. Doors and access ports for exchanging cylinders and accessing pressure-regulating controls are allowed to be included.

Reason: The proposal adds a new sentence in both 2703.8.5.2 and 2703.8.6.2 mandating that an exhaust ventilation system be provided for exhausted enclosures and gas cabinets. Both sections set forth the design criteria for the ventilation systems but neither section clearly requires the ventilation system. This code change proposal also modifies the definition of gas cabinet to clearly state that a gas cabinet is ventilated.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: KILPATRICK-F7-2702.DOC

F192–09/10
2703.12

Proponent: Larry Fluer, Fluer, Inc. and Patrick McLaughlin, McLaughlin & Associates, representing the Compressed Gas Association

Revise as follows:

2703.12 Outdoor control areas. Outdoor control areas for hazardous materials in amounts not exceeding the maximum allowable quantity per outdoor control area shall be in accordance with the following:

1. Outdoor control area shall be kept free from weeds, debris and common combustible materials not necessary to the storage. The area surrounding an outdoor control area shall be kept clear of such materials for a minimum of 15 feet (4572 mm).
2. Outdoor control areas shall be located not closer than 20 feet (6096 mm) from a lot line that can be built upon, public street, public alley or public way. ~~A 2-hour fire-resistance-rated wall without openings extending not less than 30 inches (762 mm) above and to the sides of the storage area is allowed in lieu of such distance.~~

   Exceptions:

   1. For solid and liquid hazardous materials, a 2-hour fire-resistance-rated wall without openings extending not less than 30 inches (762 mm) above and to the sides of the storage area shall be allowed in lieu of such distance.
   2. For compressed gas hazardous materials, unless otherwise specified the minimum required distances shall not apply when fire barriers without openings or penetrations having a minimum fire-resistance rating of 2 hours interrupt the line of sight between the storage and the exposure. The configuration of the fire barrier shall be designed to allow natural ventilation to prevent the accumulation of hazardous gas concentrations.

3. Where a property exceeds 10,000 square feet (929 m^2), a group of two outdoor *control areas* is allowed when *approved* and when each *control area* is separated by a minimum distance of 50 feet (15 240 mm).
4. Where a property exceeds 35,000 square feet (3252 m^2), additional groups of outdoor *control areas* are allowed when approved and when each group is separated by a minimum distance of 300 feet (91 440 mm).

Reason: Correlation with requirements for separation provided for various compressed gases as found in Table 3504.2.1 note a; 3704.3.2.1.1; Table 4004.2.2 note a; Table 4104.2.1 note a; and Section 4304.2.3. The wording "unless otherwise specified is intended to recognize that there may be exceptions based on a specific application. For example, Sections 2209.3.1.1 and 2209.3.2.5.1.1 unique to fueling operations where hydrogen gas is utilized recognize the line of sight concept, but height minimums are determined based on specific items of equipment.

Acceptance of this code change will result in correlating requirements generally used for compressed gases without changing established requirements recognized for use with solids and liquids.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: FLUER-MCLAUGHLIN-F1-2703.12

F193–09/10
2704.10, 2705.1.6; IBC 901.6.3

Proponent: Tom Lariviere, Chairman, Joint Fire Service Review Committee and Alan Shuman, President, representing the National Association of State Fire Marshals (NASFM)

THIS IS A 2 PART CODE CHANGE. BOTH PARTS WILL BE HEARD BY THE FIRE CODE COMMITTEE AS 2 SEPARATE CODE CHANGES. SEE THE TENTATIVE HEARING ORDER FOR THE FIRE CODE COMMITTEE.

PART I – IFC

Revise as follows:

2704.10 Supervision and monitoring. Emergency alarm, detection and automatic fire-extinguishing systems required by Section 2704 shall be electrically supervised and monitored by an *approved* ~~central, proprietary or remote~~ supervising station ~~service~~ or, when approved, shall initiate an audible and visual signal at a constantly attended on-site location.

2705.1.6 Supervision and monitoring. Manual alarm, detection and automatic fire-extinguishing systems required by other provisions of Section 2705 shall be electrically supervised and monitored by an *approved* ~~central, proprietary or remote station~~ supervisory service or, when approved, shall initiate an audible and visual signal at a constantly attended on-site location.

PART II – IBC FIRE SAFETY

901.6.3 Group H. ~~Manual fire alarm, automatic fire-extinguishing and emergency alarm systems in Group H occupancies shall be monitored by an *approved* supervising station.~~
~~**Exception:** When *approved* by the *building official*, on-site monitoring at a *constantly attended location* shall be permitted provided that notifications to the fire department will be equal to those provided by an *approved* supervising station.~~ Supervision and monitoring of emergency alarm, detection and automatic fire-extinguishing systems in Group H occupancies shall be in accordance with the *International Fire Code*.

Reason: The purpose of this proposal is twofold. First, it will provide correlation between the fire code and the building code. Second, it will correlate the monitoring and supervision requirements in Chapter 27 and IBC 901.6.3 with the revisions that occurred in the 2007 Supplement.

Supervision is when the electrical integrity of the wiring system and device is checked and reported as a trouble when a fault occurs. Supervision is done on-site with a local control panel. Monitoring is when a fire protection system or fire alarm control panel sends a signal to another location such as to a central station.

Therefore, the following revisions occur:

1. The section title is revised to include supervision and monitoring.
2. The term “approved supervisory service” is utilized to replace “central station, proprietary station, or remote station”. This change occurred in the 2007 Supplement in Section 903.4.1. The term “approved supervisory service” includes central station, proprietary station, and remote station services.
3. Both IBC 901.6.3 and the IFC requiring monitoring, but they say it in a different fashion. IBC Section 901.6.3 is revised to make a simple reference to the IFC. This will maintain the correlation between the IBC and the requirements in IFC 2704.10.

Cost Impact: The code change proposal will increase the cost of construction.

F194–09/10
2705.1, 2705.2.1.1; IMC [F] 502.8.4

Proponent: Kenneth Kretchman, NC State University, representing the American Industrial Hygiene Association

1. Revise IFC as follows:

2705.1 General. Use, dispensing and handling of hazardous materials in amounts exceeding the *maximum allowable quantity per control area* set forth in Section 2703.1 shall be in accordance with Sections 2701, 2703 and 2705. Use, dispensing and handling of hazardous materials in amounts not exceeding the *maximum allowable quantity per control area* set forth in Section 2703.1 shall be in accordance with Sections 2701 and 2703.

Exception: Indoor dispensing and use in any amount of hazardous materials in open containers or systems shall be ventilated in accordance with Section 2705.2.1.1.

2705.2.1.1 Ventilation. Where gases, liquids or solids having a hazard ranking of 3 or 4 in accordance with NFPA 704 will be ~~are~~ dispensed or used in a manner which could result in personnel exposures in excess of levels established in DOL 29 CFR 1910.1000, Table Z-1,Z-2, and Z-3 or other regulatory airborne exposure limits established in their jurisdiction, mechanical exhaust ventilation shall be provided to capture these gases, fumes, mists or vapors at the point of generation.

Exception: Gases, liquids or solids that can be demonstrated not to create harmful gases, fumes, mists or vapors which could result in exposures in excess of levels established in DOL 29 CFR 1910.1000, Tables Z-1,Z-2, and Z-3 or other regulatory airborne exposure limits established in their jurisdiction or can demonstrate that other forms of exhaust ventilation or other control methodologies will effectively limit exposures.

2. Revise IMC as follows:

[F] 502.8.4 Indoor dispensing and use-point sources. Where gases, liquids or solids having a hazard rating of 3 or 4 in accordance with NFPA 704 will be ~~are~~ dispensed or used in a manner which may result in personnel exposures in excess of levels established in DOL 29 CFR 1910.1000, Table Z-1,Z-2, and Z-3 or other regulatory airborne exposure limits established in their jurisdiction, ~~in amounts exceeding the maximum allowable quantity per control area and having a hazard ranking of 3 or 4 in accordance with NFPA 704,~~ mechanical exhaust ventilation shall be provided to capture these gases, fumes, mists or vapors at the point of generation.

Exception: Where it can be demonstrated that the gases, liquids, or solids do not create harmful gases, fumes, mists, or vapors which may result in exposures in excess of levels established in OSHA 29 CFR 1910.1000, Tables Z-1,Z-2, and Z-3 or other regulatory airborne exposure limits established in their jurisdiction or can demonstrate that other forms of exhaust ventilation or other control methodologies will effectively limit exposures.

Reason: The limitation of applying this engineering approach to those substances rated 3 or 4 only when in amounts in excess of allowable control area storage and use limits can easily result in a final design that neglects adequate control of emissions resulting in overexposures and also can result in the need for costly retrofits to achieve safety and energy efficiency goals. Conversely, requiring point of generation exhaust for all operations within a control area where quantities are exceeded may represent the unnecessary cost of additional ventilation where not needed.

As stated in the 2006 Commentary to the International Mechanical Code, "The intent of this section is to ensure that hazardous vapors and fumes are captured and exhausted at the point where the materials are being dispensed or used rather than allowing them to disperse into the room where occupants could be exposed to the harmful effects. According to this section, this form of controls required only where the materials have an NFPA 704 hazard ranking of 3 or 4 and also exceed the maximum allowable amount for the control area." While the first sentence in this reference is well stated and addresses an important issue, employee or public overexposures to hazardous materials can readily occur in a location within a control area even though each hazardous material in that control area is within its allowable storage and use quantities. The added text referencing DOL/OSHA exposure limits is consistent with the language provided in 502.19 (Indoor firing ranges) recognizing that regulations exist which limit airborne exposures to hazardous materials.

The edit to the Exception recognizes both that very slight airborne emissions, even though class 3 or 4 rated, may not need point of generation ventilation or that other control methodologies may also be effective, leaving the registered design professional and the design team the ability to select the most appropriate control method.

Retroactive engineering efforts are in effect at many institutions to add or modify existing mechanical exhaust systems to point of generation exhaust to reduce operating costs as this method will typically utilize less exhaust than dilution ventilation. This approach has the primary safety value of capturing the contaminant before it reaches the persons breathing zone, providing both safety and energy savings benefits. (The Specific Operations section of the Industrial Ventilation Manual, published by the American Conference of Governmental Industrial Hygienists, provides examples of long established design methodologies to capture contaminants at the point of generation, customized for particular processes, and is a useful tool for designers).

Cost Impact: None and reduction in ongoing energy consumption costs in many cases.

ICCFILENAME: KRETCHMAN-F1-2705.1

F195–09/10
3006

Proponent: Lynne M. Kilpatrick, Fire Department, City of Seattle, WA

Delete section without substitution:

~~**SECTION 3006**~~
~~**MEDICAL GAS SYSTEMS**~~

Reason: Section 3006 requires confinement of compressed medical gases intended for inhalation or sedation in quantities exceeding the permit threshold to a one-hour 'med gas' room equipped with at least one sprinkler head. Further, existing text clarifies that a Group H Occupancy is required when quantities of medical gases in the one-hour 'med gas' room that are also hazardous materials exceed the MAQ set forth in Chapter 27 (e.g. 1500 cu ft oxidizing gases in unsprinklered buildings; 3000 cu ft oxidizing gases in sprinkered buildings). This proposal deletes the requirement for the special one-hour 'med gas' room in its entirety and defaults to regulation of the gases in accordance with Chapter 27 and NFPA 99.

Cost Impact: The code change proposal may decrease the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: KILPATRICK-F3-3006.DOC

F196–09/10
3301.1, 3301.1.3.1 (New), 3302.1, Chapter 47; IBC [F] 307.2, IBC Chapter 35

Proponent: Rick Thornberry, PE, The Code Consortium, Inc., representing: American Pyrotechnics Association (APA)

1. Revise the IFC as follows:

3301.1 Scope. The provisions of this chapter shall govern the possession, manufacture, storage, handling, sale and use of explosives, explosive materials, fireworks and small arms ammunition.

Exceptions:

1. The Armed Forces of the United States, Coast Guard or National Guard.
2. Explosives in forms prescribed by the official United States Pharmacopoeia.
3. The possession, storage and use of small arms ammunition when packaged in accordance with DOTn packaging requirements.
4. The possession, storage and use of not more than 1 pound (0.454 kg) of commercially manufactured sporting black powder, 20 pounds (9 kg) of smokeless powder and 10,000 small arms primers for hand loading of small arms ammunition for personal consumption.
5. The use of explosive materials by federal, state and local regulatory, law enforcement and fire agencies acting in their official capacities.
6. Special industrial explosive devices which in the aggregate contain less than 50 pounds (23 kg) of explosive materials.
7. The possession, storage and use of blank industrial power load cartridges when packaged in accordance with DOTn packaging regulations.
8. Transportation in accordance with DOTn 49 CFR Part 100-185.
9. Items preempted by federal regulations.
10. <u>Novelties.</u>

3302.1 Definitions. The following words and terms shall, for the purposes of this chapter and as used elsewhere in this code, have the meanings shown herein.

EXPLOSIVE. A chemical compound, mixture or device, the primary or common purpose of which is to function by explosion. The term includes, but is not limited to, dynamite, black powder, pellet powder, initiating explosives, detonators, safety fuses, squibs, detonating cord, igniter cord, igniters and display fireworks, 1.3G (Class B, Special).

The term "Explosive" includes any material determined to be within the scope of USC Title 18: Chapter 40 and also includes any material classified as an explosive other than consumer fireworks, 1.4G (Class C, Common) <u>and novelties, 1.4G</u> by hazardous materials regulations of DOTn 49 CFR Parts 100-185.

2. Add new text to the IFC as follows:

3301.1.3.1 Novelties, 1.4G. Novelties, 1.4G shall be regulated as fireworks, 1.4G for the purpose of this code.

3302.1 Definitions. The following words and terms shall, for the purposes of this chapter and as used elsewhere in this code, have the meanings shown herein.

NOVELTIES. Small pyrotechnic devices not requiring DOTn approval and containing small amounts of pyrotechnic or explosive composition designed to produce limited visible or audible effects and not classified as consumer fireworks, 1.4G or novelties, 1.4G. Such novelties which comply with the labeling regulations of the US Consumer Product Safety Commission as set forth in CPSC 16 CFR: Parts 1500 and 1507 are not explosive materials for the purpose of this code.

NOVELTIES, 1.4G. Small pyrotechnic devices approved by DOTn and containing small amounts of pyrotechnic or explosive composition designed to produce limited visible or audible effects and not classified as consumer fireworks, 1.4G. Such 1.4G novelties which comply with the construction, chemical composition, and labeling regulations of American Pyrotechnics Association Standard 87-1 and the US Consumer Products Safety Commission as set forth in CPSC 16 CFR: Parts 1500 and 1507 are not explosive materials for the purpose of this code.

3. Revise the IBC as follows:

IBC [F] 307.2 Definitions. The following words and terms shall, for the purposes of this section and as used elsewhere in this code, have the meanings shown herein.

EXPLOSIVE. A chemical compound, mixture or device, the primary or common purpose of which is to function by explosion. The term includes, but is not limited to, dynamite, black powder, pellet powder, initiating explosives, detonators, safety fuses, squibs, detonating cord, igniter cord, igniters and display fireworks, 1.3G (Class B, Special).

The term "Explosive" includes any material determined to be within the scope of USC Title 18: Chapter 40 and also includes any material classified as an explosive other than consumer fireworks, 1.4G (Class C, Common) and novelties, 1.4G by hazardous materials regulations of DOTn 49 CFR Parts 100-185.

4. Add new text to the IBC as follows:

IBC [F] 307.2 Definitions. The following words and terms shall, for the purposes of this section and as used elsewhere in this code, have the meanings shown herein.

NOVELTIES, 1.4G. Small pyrotechnic devices approved by DOTn and containing small amounts of pyrotechnic or explosive composition designed to produce limited visible or audible effects and not classified as consumer fireworks, 1.4G. Such 1.4G novelties which comply with the construction, chemical composition, and labeling regulations of American Pyrotechnics Association Standard 87-1 and the US Consumer Products Safety Commission as set forth in CPSC 16 CFR: Parts 1500 and 1507 are not explosive materials and shall be regulated as fireworks, 1.4G for the purpose of this code.

5. Add new referenced standard to IFC Chapter 47 and IBC Chapter 35 as follows:

APA
American Pyrotechnics Association
Post Office Box 30438
Bethesda, MD 20824

87-1 (2001)	Standard for Construction and Approval for Transportation of Fireworks, Novelties, and Theatrical Pyrotechnics

Reason: Items 1 and 2: The purpose of this proposed code change is to close a loophole in the current requirements in Chapter 33 that regulate consumer fireworks, 1.4G. There is another class of similar fireworks items with a lesser hazard that are classified as novelties, 1.4G. These items, in general, have less pyrotechnic and/or explosive composition than consumer fireworks, 1.4G so they are less of a fire and life safety hazard. However, they are still regulated by the DOTn and are also required to meet the labeling requirements of the CPSC for consumer fireworks, 1.4G. This information can be found in Section C.3.2 Novelty of American Pyrotechnics Association APA Standard 87-1 which is being proposed as a referenced standard. APA Standard 87-1 is titled "Standard for Construction and Approval for Transportation of Fireworks, Novelties, and Theatrical Pyrotechnics." APA Standard 87-1 comprises Annex C of NFPA 1124-2006, Code for the Manufacture, Transportation, Storage, and Retail Sales of Fireworks and Pyrotechnics Articles. It is also referenced by the DOTn in Title 49, CFR, 171-180 and by the CPSC in Title 16, CFR, 1000 to End. It is available from both the federal government and the APA.

This code change proposal also clarifies that novelties which are not classed as novelties, 1.4G because they do not require DOTn approval and they are not regulated as explosives by the DOTn are exempt from the requirements of Chapter 33. However, they are still required to comply with the labeling regulations of the US Consumer Products Safety Commission as set forth in CPSC 16, CFR: Parts 1500 and 1507.

New definitions have also been provided for "Novelties" and "Novelties, 1.4G" in order to help implement this code change proposal.

The proposed new definition for "Novelties" is necessary so the term can be referenced in this code change proposal in order to specifically exempt "novelties" from the requirements of Chapter 33. This will make the International Fire Code consistent with the DOTn regulations which do not require approval of novelties meeting the specific requirements of Section C.3.2 of APA Standard 87-1. In fact, such novelties are not regulated by the DOTn as explosives, although they are still required to comply with CPSC labeling requirements for consumer fireworks. Such "novelties" contain very small amounts of pyrotechnic and/or explosive compositions which for transportation purposes are not considered to be a fire or explosion hazard in their manufactured form.

The proposed new definition for "Novelties, 1.4G" is based on the definition contained in Section C.2.12 Novelty of the American Pyrotechnics Association APA Standard 87-1.

Items 3 and 4: The purpose of this proposed code change is to close a loophole in the current requirements that regulate consumer fireworks, 1.4G. There is another class of similar fireworks items with a lesser hazard that are classified as novelties, 1.4G. These items, in general, have less pyrotechnic and/or explosive composition than consumer fireworks, 1.4G so they are less of a fire and life safety hazard. However, they are still regulated by the DOTn and are also required to meet the labeling requirements of the CPSC for consumer fireworks, 1.4G.

A new definition has also been provided for "Novelties, 1.4G" in order to help implement this code change proposal. This proposed new definition for "Novelties, 1.4G" is based on the definition contained in Section C.2.12 Novelty of the American Pyrotechnics Association APA Standard 87-1, Standard for Construction and Approval for Transportation of Fireworks, Novelties, and Theatrical Pyrotechnics which is being proposed as a referenced standard. APA Standard 87-1 comprises Annex C of NFPA 1124-2006, Code for the Manufacture, Transportation, Storage, and Retail Sales of Fireworks and Pyrotechnics Articles. It is also referenced by the DOTn in Title 49, CFR, 171-180 and by the CPSC in Title 16, CFR, 1000 to End. It is available from both the federal government and the APA. Additional information can also be found in Section C.3.2 Novelty of APA Standard 87-1.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: A review of the standard(s) proposed for inclusion in the code, APA 87-1 (2001), for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: THORNBERRY-F1-3301 COMBINED W-G3-307.2

F197–09/10
Table 3301.8.1(3)

Proponent: Rick Thornberry, PE, The Code Consortium, Inc., representing American Pyrotechnics Association (APA)

Revise table note as follows:

TABLE 3301.8.1(3)
APPLICATION OF SEPARATION DISTANCE (Q-D) TABLES—DIVISION 1.4 EXPLOSIVES[a,b,c,d]

d. This table shall not apply to consumer fireworks, 1.4 G and novelties, 1.4G.

(Portions of table and notes not shown remain unchanged)

Reason: The purpose of this code change proposal is to include novelties, 1.4G in the same category of hazard as consumer fireworks, 1.4G for the purpose of exempting them from the application of this table for separation distances for Division 1.4 explosives. In general, novelties are no more of a fire and explosion hazard than consumer fireworks and in many cases are even less of a hazard if they are considered novelties exempt from DOTn approval and classification as explosives.

Novelties are classified and defined in the American Pyrotechnics Association APA Standard 87-1, Standard for Construction and Approval for Transportation of Fireworks, Novelties, and Theatrical Pyrotechnics. It can be found in Annex C of NFPA 1124-2006, Code for the Manufacture, Transportation, Storage, and Retail Sales of Fireworks and Pyrotechnic Articles. APA Standard 87-1 is also referenced by the DOTn in Title 49, CFR 171-180 and by the CPSC in Title 16, CFR 1000 to the End. It is available from the federal government, as well as the APA. A separate code change proposal has been submitted to define novelties and clarify how Chapter 33 should address them in relationship to their relative hazard compared to consumer fireworks, 1.4G.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: Code change F196-09/10 proposes to add a definition for "Novelties, 1.4G"

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

Table 3304.3

Proponent: Rick Thornberry, PE, The Code Consortium, Inc., representing American Pyrotechnics Association (APA)

Revise table note as follows:

TABLE 3304.3
STORAGE AMOUNTS AND MAGAZINE REQUIREMENTS FOR EXPLOSIVES, EXPLOSIVE MATERIALS AND FIREWORKS, 1.3G MAXIMUM ALLOWABLE QUANTITY PER CONTROL AREA

c. This table shall not apply to consumer fireworks, 1.4G and novelties, 1.4G.

(Portions of table and notes not shown remain unchanged)

Reason: The purpose of this code change proposal is to include novelties, 1.4G in the same category of hazard as consumer fireworks, 1.4G for the purpose of exempting them from the application of this table for separation distances for Division 1.4 explosives. In general, novelties are no more of a fire and explosion hazard than consumer fireworks and in many cases are even less of a hazard if they are considered novelties exempt from DOTn approval and classification as explosives.

Novelties are classified and defined in the American Pyrotechnics Association APA Standard 87-1, Standard for Construction and Approval for Transportation of Fireworks, Novelties, and Theatrical Pyrotechnics. It can be found in Annex C of NFPA 1124-2006, Code for the Manufacture, Transportation, Storage, and Retail Sales of Fireworks and Pyrotechnic Articles. APA Standard 87-1 is also referenced by the DOTn in Title 49, CFR 171-180 and by the CPSC in Title 16, CFR 1000 to the End. It is available from the federal government, as well as the APA. A separate code change proposal has been submitted to define novelties and clarify how Chapter 33 should address them in relationship to their relative hazard compared to consumer fireworks, 1.4G.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: Code change F196-09/10 proposes to add a definition for “Novelties, 1.4G”

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: THORNBERRY-F5-T3304.3.DOC

F199–09/10
Table 3304.5.2(3)

Proponent: Rick Thornberry, PE, The Code Consortium, Inc., representing American Pyrotechnics Association (APA)

Revise table note as follows:

TABLE 3304.5.2(3)
TABLE OF DISTANCES (Q-D) FOR BUILDINGS AND MAGAZINES CONTAINING EXPLOSIVES—DIVISION 1.4[c]

c. Restricted to articles, including articles packaged for shipment, that are not regulated as an explosive under Bureau of Alcohol, Tobacco and Firearms regulations, or unpacked articles used in process operations that do not propagate a detonation or deflagration between articles. This table shall not apply to consumer fireworks, 1.4G and novelties, 1.4G.

(Portions of table and notes not shown remain unchanged)

Reason: The revision to the title of the table is editorial. This correlates the title of the table with the subject of Section 3304.5.2 Outdoor Magazines that references the table.

This code change proposal also includes novelties, 1.4G in the same category of hazard as consumer fireworks, 1.4G for the purpose of exempting them from the application of this table for separation distances for Division 1.4 explosives. In general, novelties are no more of a fire and explosion hazard than consumer fireworks and in many cases are even less of a hazard if they are considered novelties exempt from DOTn approval and classification as explosives.

Novelties are classified and defined in the American Pyrotechnics Association APA Standard 87-1, Standard for Construction and Approval for Transportation of Fireworks, Novelties, and Theatrical Pyrotechnics. It can be found in Annex C of NFPA 1124-2006, Code for the Manufacture, Transportation, Storage, and Retail Sales of Fireworks and Pyrotechnic Articles. APA Standard 87-1 is also referenced by the DOTn in Title 49, CFR 171-180 and by the CPSC Title 16, CFR 1000 to the End. It is available from the federal government, as well as the APA. A separate code change proposal has been submitted to define novelties and clarify how Chapter 33 should address them in relationship to their relative hazard compared to consumer fireworks, 1.4G.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: Code change F196-09/10 proposes to add a definition for “Novelties, 1.4G”

F200–09/10
3402.1

Proponent: Jesse J. Beitel, Hughes Associates, Inc. representing Bode Chemie GmbH and Medline Industries, Inc. and Thomas W. Jaeger, PE, Jaeger & Associates, LLC, representing GOJO Industries, Inc.

Revise definition as follows:

3402.1 Definitions. The following words and terms shall, for the purposes of this chapter and as used elsewhere in this code, have the meanings shown herein.

ALCOHOL-BASED HAND RUB. An alcohol-containing preparation designed for application to the hands for reducing the number of viable microorganisms on the hands and containing ethanol or isopropanol in an amount not exceeding ~~70~~ 95 percent by volume.

Reason: Beitel: Alcohol-based hand rubs are defined in Section 3402.1 of the IFC and their use is regulated by Section 3405.5 of the IFC. This Code proposal requests that the limit for the alcohol content of these materials be increased from 70% to 95%. No changes are being requested to Section 3405.5.

This change is to recognize the necessity for higher concentrations of alcohol in Hand and Surgical Hygiene products (alcohol-based hand rubs) in order to provide much needed improved efficacy against relevant pathogens

Actions by respected world-wide health organizations are specifically calling for higher concentrations of alcohol (higher than 70% v/v limit of the IFC) in order to better combat evolving multi-drug resistant bacteria such as MRSA and VRE (so-called “super bugs’) and to have sufficient efficacy against relevant viruses like Influenza A, HIV, Hepatitis, RSV, Rhino, Rota and Adenovirus. Increasingly, we live in a world facing real dangers from potential epidemic and pandemic viruses such as norovirus, SARS, H5N1 Avian Influenza "bird flu" and H1N1 "swine flu" viruses.

Published in 1994 [1] and later reinforced by the CDC in its 2002 "Guideline for Hand Hygiene in Health-Care Settings,” [2] the FDA defined antiseptic handwash or healthcare personnel handwash active ingredients as “Alcohol 60 to 95% by volume.”

Clinical Microbiology Review [3] reports, “Higher concentrations of ethanol (e.g., 95%) generally have better virucidal activity than do lower concentrations, such as 60 to 80%...Preparations containing less than 85% ethanol are usually less effective against viruses.”

While there is some scientific debate over the upper limit for the most effective alcohol concentration (90 – 95%), there is very little question that stronger, more effective higher concentration (above 70% v/v) alcohol-based antiseptics is needed. This need is clearly recognized by the FDA, CDC and other world health organizations.

Alcohol-based hand antiseptics with concentrations above 70% and up to the FDA limit of 95% v/v will play a critical role to protect healthcare workers, hospital patients and long-term care residents against the threat of healthcare acquired infection. Emerging community-acquired strains of multi-drug resistant bacteria (ex. Ca-MRSA) and the very real threat of pandemic make development of and access to hand antiseptic products with alcohol concentrations above 70% v/v and up to 95% a healthcare necessity.

Originally, when this issue was introduced into the IFC, the fire aspect was addressed via a fire modeling study which established that the 1.2-liter size for corridors and the 2-liter size for rooms was an acceptable hazard.

Since that time additional testing and modeling have been conducted by Hughes Associates, Inc. In order to evaluate potential differences in fire characteristics, four products were evaluated based on the formation of pool fires using 1.2 L of each hand-rub. The 1.2 L volume is currently allowed by the codes for a single station of hand-rub. Calculations were performed to determine heat release and burn time for each hand-rub. The calculations were conducted using equations and formulas provided in the SFPE Handbook of Fire protection Engineering [4] and as required, data from the ASTM E1354 tests. The results are provided in Table I.

Table I. – Pool Fire Calculations

Specimen	Formula	Heat release (kW)	Burn Time (sec)
Commercial Product A	85% ETOH (w/w)	240	95
Commercial Product B	62% ETOH (v/v) plus 5% Isopropanol	146	117
Commercial Product C	70% ETOH plus 10% Isopropanol	146	119
Non-commercial test sample	95% ETOH (v/v)	282	83

As shown in Table I, there is an increase in fire size due to the increased percentage of ethanol in the hand-rubs. However, all formulations are well within the range of incidental fires associated with small portable items (trash bags, cartoned materials, cushions, etc.) that are routinely found in medical facilities and elsewhere. [5] Additionally, the hand-rubs with the higher ethanol content exhibit comparable flame heights and shorter burn times than currently allowed 60–70% hand-rubs. As a point of perspective, the increase in fire size is equivalent to approximately one 2.5 lb. trash bag.

Flame heights associated with these spills were calculated and found to be a small fraction of the spill diameter. Under these conditions, the flames break up into individual flamelets, such that flame height is not dependent upon the heat release rate as is the case with larger fires [6]. As such, the ability of the spill fire to ignite a second object is not directly impacted by the change in ethanol content. Further testing has shown that radiant heat exposures from alcohol pool fires are low. A pool fire of 95% Ethanol provided a peak radiant heat flux of 9 kW/m^2 for a short period of time. This heat flux is well below the typical minimum 12 kW/m^2 critical flux value for ignition of most materials.

In summary, fire test data shows that while there is some increase in the flammability of alcohol-based hand rubs with higher alcohol content, the increase is not a significant increase above the currently allowed materials. Based on the health benefits of the higher alcohol content hand rubs, and their limited increase to the overall fire hazard, it is recommended that this Code proposal be adopted.

Reason: Jaeger: I was the project manager for the 2003 Gage Babcock & Associates study that was the basis for the code requirements for the alcohol-based hand rubs (ABHR) in health care facilities. At the time of the study, all ABHR's were 70% or less alcohol by volume based on European studies and use in Europe for the previous 25 years. In the past 6 years the regulatory and infection control arenas for ABHR's have changed and the demand for higher levels of alcohol in the products has emerged. World-wide health organizations are now recommending higher percentages of alcohol and therefore the market is demanding ABHR's with a higher percentage of alcohol. US customers have watched the international debate and are requesting a broader variety of products at various alcohol levels including products in the 70-95% level.

The consensus of the experts in the area of infection control is that there is an upper limit on efficacy as to the percentage of alcohol, somewhere around 90-95%. There are some data to suggest that higher percentages above 70% are more effective against some important infectious organisms. In order to protect the patients and staff of health care facilities, we need to add the option of higher alcohol levels within the fire code. Infections contacted in hospital and nursing homes is one of the largest causes of patient deaths in these facilities. At the time of the 2003 study, the Center for Disease Control (CDC) data showed that in hospitals alone, 90,000 patients died per year from infections contacted within the hospital.

Additional fire testing and modeling have been conducted since the 2003 work of Gage Babcock by Hughes Associates, Inc. Please see the proposal and substantiation for revising Section 3402.1 submitted by Jesse Beitel of Hughes Associates, Inc. As expected, the increased alcohol content of the ABHR's resulted in some increase in the flammability of the ABHR's, but the increase was minor compared to the 70% currently allowed in the Code. The results of the Hughes' study are consistent with the 2003 Gage Babcock study in that the 1.2 liters of alcohol burns off quickly and has a very low potential to ignite other objects.

Health care facilities have many risks that need to be addressed other than the risk of fire, one of these being infections. In 2003, the studies showed that the hazard of installing limited quantities of ABHR's in health care facilities along with the other requirements in Section 3405.5 rightfully did not significantly increase the risk to the occupants of health care facilities. The current Hughes study again documents that even with an increase of the alcohol content from 70% to 95%, the increase in the fire risk is minimal and justified to adequately address the hazard of infections.

Cost Impact: The code change proposal will not increase the cost of construction.

	Assembly:	ASF	AMF	DF

ICCFILENAME: BEITEL-F2-3402.1.DOC

F201–09/10
Table 3403.1.1

Proponent: Tom Lariviere, Chairman, Joint Fire Service Review Committee

Revise table as follows:

TABLE 3403.1.1
CLASS I ELECTRICAL EQUIPMENT LOCATIONS[a]

LOCATION	GROUP D DIVISION	EXTENT OF CLASSIFIED AREA
Pumps, bleeders, withdrawal fittings, meters and similar devices		
Indoor	2	Within 5 feet of any edge of such devices, extending in all directions. Also up to 3 feet above floor or grade level within 25 feet horizontally from any edge of such devices.
Outdoor	2	Within 3 feet of any edge of such devices, extending in all directions. Also up to 18 inches above floor or grade level within 10 feet horizontally from an edge of such devices.
Tank vehicle and tank car[b]		
Loading through open dome	1	Within 3 feet of edge of dome, extending in all directions.
	2	Area between 3 feet and 15 feet from edge of dome, extending in all directions.
Loading through bottom connections with atmospheric venting	1	Within 3 feet of point of venting to atmosphere, extending in all directions.
	2	Area between 3 feet and 15 feet from point of venting to atmosphere, extending in all directions. Also up to 18 inches above grade within a horizontal radius of 10 feet from point of loading connection.
~~Office and restrooms~~	~~Ordinary~~	~~Where there is an opening to these rooms within the extent of an indoor classified location, the room shall be classified the same as if the wall, curb or partition did not exist.~~
Loading through closed dome with atmospheric venting	1	Within 3 feet of open end of vent, extending in all directions.
	2	Area between 3 feet and 15 feet from open end of vent, extending in all directions. Also within 3 feet of edge of dome, extending in all directions.
Loading through closed dome with vapor control	2	Within 3 feet of point of connection of both fill and vapor lines, extending in all directions.
Bottom loading with vapor control or any bottom unloading	2	Within 3 feet of point of connection, extending in all directions. Also up to 18 inches above grade within a horizontal radius of 10 feet from point of connection.
Office and restrooms	Ordinary	Where there is an opening to these rooms within the extent of an indoor classified location, the room shall be classified the same as if the wall, curb or partition did not exist.

(Portions of table and notes not shown do not change)

Reason: Revision #1 – Pumps and devices: This revision is made because the current wording does not make sense. Part of the sentence has been lost and this correction will provide the appropriate diameter to be used with the height of 18". This revision will also provide consistency with NFPA 30 Table 7.3.3.

Revision #2 – Office and restrooms: This revision moves the requirement for protecting offices and restrooms when they are part of a facility requiring classified electrical. The issue of office and restrooms is not specific to the heading of "tank cars". It is a situation that applies wherever the office space occurs. Relocating the requirement to its own line will allow offices and restrooms to be treated as ordinary electrical unless they are located within the classified area of a hazard. In that case, the office or restroom would be of the same classification as the room to which it is attached

Cost Impact: The code change proposal will increase the cost of construction.

Public Hearing: Committee: AS AM D

3403.6.5.1 (New), 3404.2.7.9.2 (New)

Proponent: Douglas Horne PE, Clean Vehicle Education Foundation, representing self

Add new text as follows:

3403.6.5.1 Protection from internal corrosion due to galvanic action. In alcohol blended fuel systems fluid–handling components shall be fabricated from materials that mitigate galvanic action. Dissimilar metallic parts that promote galvanic action shall not be joined.

3404.2.7.9.1 Protection from internal corrosion due to galvanic action. Tanks storing alcohol blended fuels shall be fabricated from materials that mitigate galvanic action. Dissimilar metallic parts that promote galvanic action shall not be joined.

Reason: Adds new Sections 3403.6.5.1 and 3404.2.7.9.1 with requirements covering the compatibility of the fuel containment systems materials with the alcohol blended fuels. The wording for this section is similar to wording currently in Sections 3403.6.5 and 3404.2.7.9, which addresses external corrosion, not internal corrosion. Alcohols are polar compounds that exhibit increased moisture absorption, water solubility, polar solvency and solution conductivity relative to gasoline. Alcohol-gasoline blended fuels have unique properties that affect material compatibility and fire response.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: HORNE-F1-F2-COMBINED-3403.6.5.1.DOC

F203–09/10
3404.2.7.3.2, 3404.2.9.7.3

Proponent: Steve M. Crothers, Seattle Fire Department, representing Washington State Association of Fire Marshals

Revise as follows:

1. Revise as follows:

3404.2.7.3.2 Vent-line flame arresters and ~~venting devices~~ pressure-vacuum vents. Listed or approved flame arresters or pressure-vacuum (PV) vents that remain closed unless venting under pressure or vacuum conditions shall be installed in normal vents of tanks containing Class IB and IC liquids.

Exception: When determined by the fire code official that the use of such devices can result in damage to the tank.

Vent-line flame arresters and venting devices shall be installed and maintained in accordance with their listings and API 2000. ~~Use of~~ In-line flame arresters in piping systems shall be installed and maintained in accordance with their listing and API 2028. Pressure vacuum vents shall be installed and maintained in accordance with API 2000.

2. Delete without substitution:

~~**3404.2.9.7.3 Flame arresters.** Approved flame arresters or pressure breather valves shall be installed in normal vents.~~

(Renumber subsequent sections)

Reason: The code currently requires that a flame arrester or pressure-vacuum (PV) vent be installed in the normal vent of all protected aboveground tanks containing flammable or combustible liquids but it does not have a similar requirement for other aboveground tanks whose design and construction provides significantly less protection and control than a protected tank. This code change accomplishes several things, it:

1. Correlates the requirement for flame arresters and PV vents so that regardless of the tank type the requirement is the same.
2. Modifies the current provision requiring a flame arrester for all flammable and combustible liquids so that a flame arrester or PV vent is only required for tanks containing Class IB and IC liquids. Because the primary function of a flame arrester is to prevent the unrestricted propagation of flame through flammable gas or vapor mixtures, it is not necessary to install a flame arrester on tanks containing combustible liquids. Additionally, because flame arresters cannot prevent detonation or control flame propagation speeds associated with a detonation (flame speeds greater than the speed of sound), flame arresters are not effective when installed on tanks containing Class IA liquids. This revision establishes a requirement for a tank vent flame arrester only when there is a sound technical reason to provide one.

3. Provides a much needed correlation between the IFC and NFPA 30, *Code for Flammable and Combustible Liquids*, for establishing when flame arresters are required on tank vents.
4. Adds a new exception that allows omitting the use of a tank vent flame arrester in situations where the properties of the liquid can cause the tank to be damaged by use of the device. Properties of some Class IB and IC liquids such as crystallization, polymerization and corrosion can present obstructions in flame arresters that may justify omitting the device.
5. Clarifies that the existing API reference document (API 2028) addresses in-line flame arresters for piping systems. An end-of-line flame arrester is a flame arrester that is mounted at the end of a pipe (flanged or threaded inlet connection) and vents directly to the atmosphere whereas an in-line flame arrester may be mounted upstream of a pressure/vacuum relief vent, or may be located upstream of a specified maximum length of vent piping to atmosphere. Both are approved devices.
6. Addresses maintenance of flame arresters and pressure vacuum vents. Not only is proper installation of these devices important but their maintenance is critical. A blocked or corroded flame arrester can render the device ineffective and lead to catastrophic results. This code change adds a new requirement to maintain flame arresters and PV devices in accordance with their listings and API 2000.

Cost Impact: Costs will decrease since currently any aboveground tank containing Class I, II or III liquids requires a flame arrestor on the normal vent and this proposal will require flame arrestors only on Class I liquid tanks. There could be some cost increase where maintenance of flame arrestors does not currently occur.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: CROTHERS-F2-3404.2.9.7.3.DOC

F204–09/10
3404.2.7.4

Proponent: Lynne M. Kilpatrick, Fire Department, City of Seattle, WA, representing Washington State Association of Fire Marshals

Revise as follows:

3404.2.7.4 Emergency venting. Stationary, aboveground tanks shall be equipped with additional venting that will relieve excessive internal pressure caused by exposure to fires. Emergency vents for Class I, II and IIIA liquids shall not discharge inside buildings. The venting shall be installed and maintained in accordance with Section 22.7 of NFPA 30.

Exception<u>s</u>:

1. <u>Tanks larger than 12,000 gallons (45 420 L) in capacity storing Class IIIB liquids which are not within the diked area or the drainage path of Class I or II liquids do not require emergency relief venting.</u>
2. <u>Emergency vents on protected aboveground tanks complying with UL 2085 containing Class II or IIIA liquids are allowed to discharge inside the building.</u>

Reason: UL 2085 protected aboveground tanks are designed and constructed to withstand a two-hour fire test of 2000°F during which no single point temperature may exceed 400°F and the average temperature rise throughout the internal tank can be no greater than 260°F. The largest quantity of Class II or IIIA liquid that can be stored indoors in a UL 2085 tank unprotected by an approved automatic sprinkler system is 660 gallons. Given the stringent testing requirement, and the required sprinkler coverage, activation of the emergency vent is likely only under extreme fire conditions over an extended period of time. Further, NFPA 30 requires that emergency vents placed on vent pipes that extend beyond twelve inches from the tank be reengineered to account for the potential back pressure and ensure activation at the appropriate pressure. It is not unusual to see vent lines extending 30 or 40 feet or more through a building in order to achieve the exterior discharge. Allowing the emergency vent to discharge inside eliminates the need to reengineer the venting and ensures proper sizing and activation of the emergency vent.

Cost Impact: There is a cost savings since emergency vent lines would not be required to extend through buildings to the exterior.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: KILPATRICK-F4-3404.2.7.4.DOC

F205–09/10
3404.2.9.5, 3404.2.9.5.1 (New), 3404.2.9.5.2 (New)

Proponent: Steve M. Crothers, Seattle Fire Department, representing Washington State Association of Fire Marshals

Revise as follows:

3404.2.9.5 Above-ground tanks inside of buildings. <u>Above-ground tanks inside of buildings shall comply with Sections 3404.2.9.5.1 and 3404.2.9.5.2.</u>

3404.2.9.5.1 Overfill prevention. Above-ground tanks storing Class I, II and IIIA liquids inside buildings shall be equipped with a device or other means to prevent overflow into the building including, but not limited to: a float valve; a preset meter on the fill line; a valve actuated by the weight of the tank's contents; a low-head pump that is incapable of producing overflow; or a liquid-tight overflow pipe at least one pipe size larger than the fill pipe and discharging by gravity back to the outside source of liquid or to an *approved* location. Tanks containing Class IIIB liquids and connected to fuel-burning equipment shall be provided with a means to prevent overflow into buildings in accordance with Section 3404.2.7.5.8.

3404.2.9.5.2 Fill pipe connections. Fill pipe connections shall be in accordance with Section 3404.2.9.7.7.

Reason: This code change requires that fill pipes on aboveground tanks located inside buildings be equipped with a means to make a direct connection with the tank vehicle's fuel delivery hose. Essentially it requires a camlock or other similar device and prohibits filling a tank located inside a building through the use of a hand held nozzle. This requirement already exists for protected aboveground tanks in Section 3404.2.9.7.7 so a reference in this section establishes parity between protected tanks and other types of tanks.

Cost Impact: Cost will increase for tanks other than protected aboveground tanks.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: CROTHERS-F1-3404.2.9.5

F206–09/10
3404.3.6, 3404.3.8.4

Proponent: Patrick A. McLaughlin, McLaughlin & Associates, representing The Sherwin Williams Company

Revise as follows:

3404.3.6 Wholesale and retail sales uses. Flammable and combustible liquids in Group M occupancy wholesale and retail sales uses shall be in accordance with Sections 3404.3.6.1 through 3404.3.6.5, or Sections 10.10.2, 12.3.8, 16.4.1 through 16.4.3, 16.5.1 through 16.5.2.12, Tables 16.5.2.1 through ~~16.5.2.6~~ 16.5.2.12, and Figures 16.4.1 (a) through (c) of NFPA 30.

3404.3.8.4 Fire-extinguishing systems. Liquid storage warehouses shall be protected by automatic sprinkler systems installed in accordance with Chapter 9 and Tables 3404.3.6.3(4) through 3404.3.6.3(7) and Table 3404.3.7.5.1, or Sections 16.4.1 through 16.4.3, 16.5.1 through 16.5.2.12, and Tables 16.5.2.1 through ~~16.5.2.6~~ 16.5.2.12 and Figures 16.4.1 (a) through (c) of NFPA 30. In-rack sprinklers shall also comply with NFPA 13.

Automatic foam-water systems and automatic AFFF water sprinkler systems shall not be used except when approved.

Protection criteria developed from fire modeling or full-scale fire testing conducted at an approved testing laboratory are allowed in lieu of the protection as shown in Tables 3404.3.6.3(2) through 3404.3.6.3(7) and Table 3404.3.7.5.1 when approved.

Reason: NFPA 30 was completely reorganized in the 2008 edition. Staff editorially updated the section but did not include all the sprinkler designs because they were not previously referenced by the IFC. This proposal adds the additional designs with protection criteria and storage arrangements for flammable and combustible liquids.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: MCLAUGHLIN-F2-3404.3.6-REVISED.DOC

F207–09/10
Table 3404.3.6.3(5)

Proponent: Patrick A. McLaughlin, McLaughlin & Associates, representing The Sherwin Williams Company

Revise table as follows:

TABLE 3404.3.6.3(5)
AUTOMATIC SPRINKLER PROTECTION REQUIREMENTS FOR RACK STORAGE OF LIQUIDS IN METAL CONTAINERS OF 5-GALLONS CAPACITY OR LESS WITH OR WITHOUT CARTONS ON COVENTIONAL WOOD PALLETS

I and II (maximum 14-foot storage height) (maximum three tiers)	0.55[c]	2000 ~~b~~[b,d]	Not Applicable	100 ft^2/head	Not Applicable None for maximum 6-foot-deep racks	Not Applicable	Not Applicable	Not Applicable	500	2

(Portions of table and notes not shown remain unchanged)

Reason: Footnote "b" allows for a maximum 30 ft. ceiling for Class I and II liquids stored up to 14 feet high with up to three tier. The large-scale fire testing conducted at Underwriters Laboratories by Sherwin-Williams supporting these storage and protection arrangements for Class I and II liquids was conducted under an 18 ft. ceiling. Therefore, the increased ceiling height (i.e. 30 ft.) option noted by footnote "b" should be deleted, subject to further research and testing.

Cost Impact: The code change proposal does not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: MCLAUGHLIN-F7-T3404.3.6.3(5)

F208–09/10
3405.2.4

Proponent: Ronald Keefer, Menlo Park Fire District, representing California Fire Chiefs Association

Revise as follows:
3405.2.4 Class I, II and III liquids. Class I liquids or <u>when heated to above their flash points</u>, Class II and Class III liquids ~~that are heated up to or above their *flash points*~~ shall be transferred by one of the following methods:

1. From safety cans complying with UL 30.
2. Through an *approved* closed piping system.
3. From containers or tanks by an *approved* pump taking suction through an opening in the top of the container or tank.
4. For Class IB, IC, II and III liquids, from containers or tanks by gravity through an *approved* self-closing or automatic-closing valve when the container or tank and dispensing operations are provided with spill control and secondary containment in accordance with Section 3403.4. Class IA liquids shall not be dispensed by gravity from tanks.
5. *Approved* engineered liquid transfer systems.

Exception: Liquids in containers not exceeding a 5.3-gallon (20 L) capacity.

Reason: The code section applies to Class I regardless of their flashpoint, and Class II and III liquids only when they have been heated to above their flashpoints. As currently written, it can be easily misinterpreted as applying to all Class I, II, or III Liquids when they have been heated to above their flashpoints during dispensing. The change is meant to provide clarity only, and is not meant to change the intent of the Code.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: KEEFER-F1-3405.2.4~REVISED.DOC

F209–09/10
3405.2.4

Proponent: Bob Eugene, Underwriters Laboratories Inc.

Revise as follows:

3405.2.4 Class I, II and III liquids. Class I liquids or Class II liquids and Class III liquids that are heated up to or above their flash points, shall be transferred by one of the following methods:

1. From listed and labeled safety cans complying with UL 30 or UL 1313.
2. Through an *approved* closed piping system.
3. From containers or tanks by an *approved* pump taking suction through an opening in the top of the container or tank.
4. For Class IB, IC, II and III liquids, from containers or tanks by gravity through an *approved* self-closing or automatic-closing valve when the container or tank and dispensing operations are provided with spill control and secondary containment in accordance with Section 3403.4. Class IA liquids shall not be dispensed by gravity from tanks.
5. Approved engineered liquid transfer systems.

Exception: Liquids in containers not exceeding a 5.3-gallon (20 L) capacity.

Reason: This proposal accomplishes two things, to clarify that safety cans shall be listed in accordance with UL 30, and to allow listed safety cans listed in accordance with UL 1313 to be used to transfer flammable and combustible liquids.

UL 1313 includes requirements for evaluating nonmetallic safety cans, while UL 30 is meant for metal containers only. The addition of the UL 1313 option is appropriate for situation when flammable and combustible liquids cannot be storage or transferred into metal containers due to corrosive or reaction nature of the metal components of the containers.
Currently, UL 1313 is referenced in Chapter 27 and this will only expand the reference to this section.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: EUGENE-F1-3405.2.4.DOC

F210–09/10
3405.2.4

Proponent: Bob Eugene, Underwriters Laboratories Inc.

Revise as follows:

3405.2.4 Class I, II and III liquids. Class I liquids or Class II liquids and Class III liquids that are heated up to or above their flash points shall be transferred by one of the following methods:

1. From safety cans with UL 30.
2. Through an *approved* closed piping system.
3. From containers or tanks by an *approved* pump taking suction through an opening in the top of the container or tank.
4. For Class IB, IC, II and III liquids, from containers or tanks by gravity through an *approved* self-closing or automatic-closing valve when the container or tank and dispensing operations are provided with spill control and secondary containment in accordance with Section 3403.4. Class IA liquids shall not be dispensed by gravity from tanks.
5. Approved engineered liquid transfer systems.

Exception: Liquids in containers not exceeding a ~~5.3-gallon (20 L)~~ 1.3-gallon (5 L) capacity.

Reason: As written, the exception to this section allows transferring from any type of container up to 5.3 gallons. This appears to be an excessive amount of liquid within any type of container, and conflicts with maximum amount of flammable liquids allowed for portable containers in NFPA 30, Table 9.4.3. By reducing the amount of liquid to a maximum of 1.3 gallons for transferring from a container, this is consistent with the NFPA 30 limits, while still allowing for smaller amounts found in laboratory glassware and other containers.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: EUGENE-F5-3405.2.4-2.DOC

F211–09/10
3405.3.6.1, Chapter 47

Proponent: Bob Eugene, Underwriters Laboratories, Inc.

1. Revise as follows:

3405.3.6.1 Cleaning operations. Class IA liquids shall not be used for cleaning. Cleaning with Class IB, IC or II liquids shall be conducted as follows:

1. In a room or building in accordance with Section 3405.3.7; or
2. In a parts cleaner ~~machine~~ listed and labeled in accordance with UL 1204 and approved for the purpose in accordance with Section 3405.3.6.2.

Exception: Materials used in commercial and industrial process-related cleaning operations in accordance with other provisions of this code and not involving facilities maintenance cleaning operations.

2. Add new standard to Chapter 47 as follows:

UL
1204-04 Outline of Investigation for Parts Cleaners

Reason: UL's Subject 1204 Outline of Investigation includes a comprehensive set of construction and performance requirements that are used to evaluate and list parts cleaners. This equipment is reviewed to ensure the use and operation of the equipment provides a safe involvement using the flammable and combustible solvents. Five companies currently have parts cleaners listed.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: A review of the standard(s) proposed for inclusion in the code, UL 1204-04, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: EUGENE-F6-3405.3.6.1.DOC

F212–09/10
3405.4.1

Proponent: Lynne M. Kilpatrick, Fire Department, City of Seattle WA, representing Washington State Association of Fire Marshals

Revise as follows:

3405.4.1 Unit with a capacity of 60 gallons or less. Solvent distillation units used to recycle Class I, II or IIIA liquids having a distillation chamber capacity of 60 gallons (227 L) or less shall be *listed*, *labeled* and installed in accordance with Section 3405.4 and UL 2208.

Exceptions:

~~1. Solvent distillation units installed in dry cleaning plants in accordance with Chapter 12.~~
~~2.~~ 1. Solvent distillation units used in continuous through-put industrial processes where the source of heat is remotely supplied using steam, hot water, oil or other heat transfer fluids, the temperature of which is below the auto-ignition point of the solvent.
~~3. Solvent distillation units *listed* for and used in laboratories.~~
~~4.~~ 2. Approved research, testing and experimental processes.

Reason: As currently written, Section 3405.4.1 Exception 1 exempts solvent distillation units installed in dry cleaning plants in accordance with Chapter 12 from meeting the UL 2208 listing standard. Likewise, exception 4 also exempts solvent distillation units listed for and used in laboratories from meeting the UL 2208 standard. The scope of UL 2208 not only covers solvent distillation units in dry cleaning plants and labs, it also states the units are intended for installation in dry cleaning plants and labs meeting NFPA 32 and NFPA 45 respectively. This proposal eliminates both exception 1 and exception 4 and thus will require solvent distillation units in dry cleaning plants and laboratories unless used for research, testing or experimentation, to meet UL 2008, consistent with units installed elsewhere and the scope of UL 2208.

Cost Impact: The code change proposal may increase the cost of construction.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: KILPATRICK-F5-3405.4.1.DOC

F213–09/10
3405.5, Chapter 47

Proponent: Thomas W. Jaeger, PE, Jaeger & Associates, LLC, representing GOJO Industries, Inc.

1. Revise as follows:

3405.5 Alcohol-based hand rubs classified as Class I or II liquids. The use of wall-mounted dispensers containing alcohol-based hand rubs classified as Class I or II liquids shall be in accordance with all of the following:

1. The maximum capacity of each dispenser shall be 68 ounces (2 L).
2. The minimum separation between dispensers shall be 48 inches (1219 mm).
3. The dispensers shall not be installed directly adjacent to, directly above or below an electrical receptacle, switch, appliance, device or other ignition source. The wall space between the dispenser and the floor shall remain clear and unobstructed.
4. Dispensers shall be mounted so that the bottom of the dispenser is a minimum of 42 inches (1067 mm) and a maximum of 48 inches (1219 mm) above the finished floor.
5. Dispensers shall not release their contents except when the dispenser is manually activated. Facilities shall be permitted to install and use automatically activated "Touch Free" alcohol based handrub dispensing devices with the following requirements:
   - 5.1. The touch free dispensing system shall be listed as being in compliance with UL/CE 60601-1 and IEC 60601-1-2 for medical devices.
   - 5.2. The facility or persons responsible for the dispensers shall test the dispensers each time a new refill is installed in accordance with the manufacturer's care and use instructions
   - 5.3. Dispensers shall be designed and must operate in a manner that ensures accidental or malicious activations of the dispensing device are minimized. At a minimum, all devices subject to or used in accordance with this section shall have the following safety features:
     - 5.3.1. Any activations of the dispenser shall only occur when an object is placed within four inches of the sensing device.
     - 5.3.2. The dispenser shall not dispense more than the amount required for hand hygiene consistent with label instructions as regulated by the Food and Drug Administration.
     - 5.3.3. An object placed within the activation zone and left in place will cause only one activation.
6. Storage and use of alcohol-based hand rubs shall be in accordance with the applicable provisions of Sections 3404 and 3405.
7. Dispensers installed in occupancies with carpeted floors shall only be allowed in smoke compartments or *fire areas* equipped throughout with an *approved* automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2.

2. Add new standards to Chapter 47 as follows:

IEC
International Electrotechnical Commission
IEC Central Office
3. ru de Varembe, P.O. Box 131,
CH-1211 GENEVA 20, Switzerland.

60601-1-2:2004 EMC Standards for Electrical Medical Equipment

UL
UL/CE 60601-1-03 Medical Electrical Equipment, Part I: General Requirements for Safety

Reason: Interpretation of the current code varies widely. Some inspectors are allowing touch free dispensing units and consider that placing the hand within the sensing area of the unit meets the intent of manual activation of this section while others have not allowed touch free systems. The proposed revised content above represents the content of a variance obtained with the State Fire Marshal in Ohio. It defines the engineering parameters required for safe operation of touch free systems while ensuring facilities have access to current touch free technologies that promote hand hygiene compliance. Touch free systems have been demonstrated to improve hand hygiene compliance by 20.8%[1]

More and more clients and users are demanding touch free dispensers so that contaminated hands never touch the dispenser and pass infections on to other users of the dispensers. When the original Alcohol-based Hand Rub study and fire modeling was done by Gage Babcock & Associates in 2003 the state of art for dispensers was solely manually operated push type dispensers and the development of the code language currently in all codes is based on the original study and state of the art in 2003. The state of art for dispensers and the demands, requirements of the users and the requirements of the infection control experts now require touch free dispensers.

GOJO Industries manufactures and sells the leading "Touch Free" alcohol based hand sanitizer dispensers in the US. GOJO has placed more than a million dispensers in the US with additional units internationally for PURELL Instant Hand Sanitizer dating back to our first touch free dispenser in 2003. There have been many hand sanitizer refills cycled through these dispensers with no reported fire incidents. This includes gel type formulations and non-aerosol foam units.

As project manager of the original Gage Babcock & Associates study, I consider the proposed change more of an editorial change to recognize current types of new dispensers than a technical change to the Fire Code.

[1]. Larson E. Albrecht S, O'Keefe M., Hand Hygiene in a Pediatric Emergency Department and a Pediatric Intensive Care Unit: Comparison of Use of 2 Dispenser Systems, American Journal of Critical Care July, 2005, Volume 14, no 1 p 304-311

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: A review of the standards proposed for inclusion in the code, IEC 60601-1-2:2004 and UL/CE 60601-1-03, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: JAEGER-F2-3404.5.DOC

F214–09/10
3501.1, 3502.1, 3504.2.1

Proponents: Robert Boyd, Linde North America, Inc., representing Hydrogen Industry Panel on Codes (HIPOC); Robert J. Davidson, Code Consultant/Alan Shuman, President, representing the National Association of State Fire Marshals (NASFM)

1. Revise as follows:

3501.1 Scope. The storage and use of flammable gases and flammable cryogenic fluids shall be in accordance with this chapter and NFPA 55. Compressed gases shall also comply with Chapter 30 and cryogenic fluids shall also comply with Chapter 32. Flammable cryogenic fluids shall comply with Section 3506. ~~Bulk hydrogen compressed gas systems and bulk liquefied hydrogen gas systems shall comply with NFPA 55~~. Hydrogen motor fuel-dispensing stations and repair garages and their associated above-ground hydrogen storage systems shall also be designed and constructed in accordance with Chapter 22.

Exceptions:

1. Gases used as refrigerants in refrigeration systems (see Section 606).
2. Liquefied petroleum gases and natural gases regulated by Chapter 38.
3. Fuel-gas systems and appliances regulated under the International Fuel Gas Code other than gaseous hydrogen systems and appliances.
4. Pyrophoric gases in accordance with Chapter 41.

2. Delete definitions without substitution:

3502.1 Definitions. The following words and terms shall, for the purposes of this chapter and as used elsewhere in this code, have the meanings shown herein.

~~**BULK HYDROGEN COMPRESSED GAS SYSTEM.** An assembly of equipment, consisting of but not limited to, storage containers, pressure regulators, pressure relief devices, vaporizers, manifolds, and piping, with a storage capacity of more than 400 ft^3 (scf) (11 m^3) of compressed hydrogen gas including unconnected reserves integral to the system. The bulk system terminates at the point where the gas supply, at service pressure, first enters the supply line. The containers are either stationary or portable, and the gas is stored as a compressed gas.~~

~~**BULK LIQUEFIED HYDROGEN GAS SYSTEM.** An assembly of equipment, consisting of but not limited to, storage containers, pressure regulators, pressure relief devices, vaporizers, manifolds, and piping, with a storage capacity of more than 39.7 gal (150 L) of liquefied hydrogen including unconnected reserves integral to the system. The bulk system terminates at the point where the gas supply, at service pressure, first enters the supply line. The containers are either stationary or portable, and the gas is stored as a cryogenic fluid.~~

3. Revise as follows:

3504.2.1 Distance limitation to exposures. Outdoor storage or use of flammable compressed gases other than hydrogen shall be located from a lot line, public street, public alley, public way, or building not associated with the manufacture or distribution of such gases in accordance with Table 3504.2.1. The outdoor storage of hydrogen compressed gas shall comply with the separation distances in NFPA 55.

Reason (Boyd): Adding the text and flammable cryogenic fluids to the 1st sentence of Section 3501.1 and the text Flammable cryogenic fluids shall comply with Section 3506. to Section 3501.1 is an editorial clarification for consistency that is proposed based upon the modification of the Chapter 35 title which was changed from "FLAMMABLE GASES" to "FLAMMABLE GASES AND FLAMMABLE CRYOGENIC FLUIDS" in the 2009 edition. The proposed changes increase clarity

Adding the text and NFPA 55 to the 1st sentence of 3501.1 requires the provisions of both Chapter 35 and NFPA 55 be applied to both flammable gases and flammable cryogenic fluids. This is a reversal of the action taken by the committee in the 2009 IFC and this proposal offers a simpler solution with the same basic intent. The term also was removed during the Final Action hearings for the 2009 IFC in order to remove any potential conflict caused by different separation distances in IFC Table 3504.2.1 and the separation distances presented in NFPA 55. The 2009 change also exempted bulk hydrogen compressed gas systems from the rest of IFC Chapter 35 as well. This was a greater effect than is considered appropriate by HIPOC. This 2009/2010 proposal clarifies that compliance with Chapter 35 requirements is required for all storage and use of flammable gases and flammable cryogenic fluids. Any conflict with NFPA 55 separation distance requirements is eliminated by the proposed revisions in Section 3504.2.1 that exclude storage or use of gaseous hydrogen from complying with the separation distances in Table 3504.2.1 and instead requires them to comply with the separation distances in NFPA 55.

The elimination of the definitions of a bulk hydrogen compressed gas system and a bulk liquefied hydrogen gas system simplifies Chapter 35 because the definitions has no other relationship to the code and the requirement to distinguish between bulk and non-bulk hydrogen systems will not be needed for proper application of Chapter 35 requirements, if the other changes in this proposal are accepted.

The Hydrogen Industry requests the IFC Code Development Committee vote in favor of this proposal.

Reason (Davidson-Shuman): Adding the text and flammable cryogenic fluids to the 1st sentence of Section 3501.1 and the text Flammable cryogenic fluids shall comply with Section 3506. to Section 3501.1 is an editorial clarification for consistency that is proposed based upon the modification of the Chapter 35 title which was changed from "FLAMMABLE GASES" to "FLAMMABLE GASES AND FLAMMABLE CRYOGENIC FLUIDS" in the 2009 edition. The proposed changes increase clarity.

Adding the text and NFPA 55 to the 1st sentence of 3501.1 requires the provisions of both Chapter 35 and NFPA 55 be applied to both flammable gases and flammable cryogenic fluids. This is a reversal of the action taken by the committee in the 2009 IFC and this proposal offers a simpler solution with the same basic intent. The term also was removed during the Final Action hearings for the 2009 IFC in order to remove any potential conflict caused by different separation distances in IFC Table 3504.2.1 and the separation distances presented in NFPA 55. However, the 2009 change also was intended to exempt bulk hydrogen compressed gas systems from the rest of IFC Chapter 35 as well, but to properly accomplish that the sentence modified should have been relocated to the exceptions list. This was a greater intended effect than is considered appropriate by HIPOC. This (2009/10) proposal clarifies that compliance with Chapter 35 requirements is required for all storage and use of flammable gases and flammable cryogenic fluids. Any conflict with NFPA 55 separation distance requirements is eliminated by the proposed revisions in Section 3504.2.1 that exclude storage or use of gaseous hydrogen from complying with the separation distances in Table 3504.2.1 and instead requires them to comply with the separation distances in NFPA 55.

The elimination of the definitions of a bulk hydrogen compressed gas system and a bulk liquefied hydrogen gas system simplifies Chapter 35 because the definitions has no other relationship to the code and the requirement to distinguish between bulk and non-bulk hydrogen systems will not be needed for proper application of Chapter 35 requirements, if the other changes in this proposal are accepted.

The approval of this code change will increase the effectiveness of the code for the safe siting of hydrogen storage installations by applying the new NFPA 55 separation distances now that the work to upgrade that standard has been completed for this cycle, and will serve as completion of a stated goal when the hydrogen motor-fueling language was first added to the IFC, i.e., a more appropriate separation distance table will be provided for based upon research and testing.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: BOYD-F3-DAVIDSON-SHUMAN-F1-3501.1-COMBINED.DOC

F215–09/10

3501.1, 3502.1, 3504.2.1, Table 3504.2.1, 3504.2.1.1, 3504.2.1.2 (New), 3504.2.1.2.1 (New)

Proponents: Larry Fluer, Fluer, Inc. and Patrick McLaughlin, McLaughlin & Associates, representing the Compressed Gas Association

1. Revise as follows:

3501.1 Scope. The storage and use of flammable gases shall be in accordance with this chapter. Compressed gases shall also comply with Chapter 30 and cryogenic fluids shall also comply with Chapter 32. Bulk hydrogen and other bulk flammable compressed gas systems and bulk liquefied hydrogen and other bulk flammable cryogenic fluid gas systems shall comply with NFPA 55. Hydrogen motor fuel-dispensing stations and repair garages and their associated aboveground hydrogen storage systems shall also be designed and constructed in accordance with Chapter 22.

2. Add new definitions as follows:

3502.1 Definitions. The following words and terms shall, for the purposes of this chapter and as used elsewhere in this code, have the meanings shown herein.

BULK FLAMMABLE COMPRESSED GAS SYSTEM. An assembly of equipment, consisting of but not limited to, storage containers, pressure regulators, pressure relief devices, vaporizers, manifolds, and piping, with a storage capacity of more than 5000 ft^3 (scf) (142 m^3) of compressed flammable gas including unconnected reserves integral to the system. The bulk system terminates at the point where the gas supply, at service pressure, first enters the supply line. The containers are either stationary or portable, and the gas is stored as a compressed gas.

BULK FLAMMABLE CRYOGENIC FLUID GAS SYSTEM. An assembly of equipment, consisting of but not limited to, storage containers, pressure regulators, pressure relief devices, vaporizers, manifolds, and piping, with a storage capacity of more than 45 gal (170 L) of flammable cryogenic fluid including unconnected reserves integral to the system. The bulk system terminates at the point where the gas supply, at service pressure, first enters the supply line. The containers are either stationary or portable, and the gas is stored as a cryogenic fluid.

3. Revise as follows:

3504.2.1 Distance limitation to exposures. Outdoor storage or use of non-bulk flammable compressed gases shall be located from ~~a lot line, public street, public alley, public way, or building~~ exposures not associated with the manufacture or distribution of such gases in accordance with Table 3504.2.1.

TABLE 3504.2.1
NON-BULK FLAMMABLE GASES – DISTANCE ~~FROM STORAGE~~ TO EXPOSURES[a]

MAXIMUM AMOUNT PER STORAGE OR USE AREA (cubic feet)	MINIMUM DISTANCE BETWEEN STORAGE OR USE AREAS (feet)[a]	MINIMUM DISTANCE TO LOT LINES OF PROPERTY THAT CAN BE BUILT UPON (feet)[a]	MINIMUM DISTANCE TO PUBLIC STREETS, PUBLIC ALLEYS OR PUBLIC WAYS (feet)	MINIMUM DISTANCE TO BUILDINGS ON THE SAME PROPERTY		
				~~Nonrated construction or openings with 25 feet~~ Less Than 2-Hour Construction	2-hour construction ~~and no openings within 25 feet~~	4-hour construction ~~and no openings within 25 feet~~
0-4,225	5	5	5	5	0	0
4,226 – 21,225	10	10	10	10	5	0
21,126-50,700	10	15	15	20	5	0
50,701 – 84,500	10	20	20	20	5	0
84,501 – ~~or greater~~ 200,000	20	25	25	20	5	0

For SI: 1 foot = 304.8 mm, 1 cubic foot = 0.02832 m^3

a. The minimum required distances shall not apply when fire barriers without openings or penetrations having a minimum fire-resistance rating of 2 hours interrupt the line of sight between the storage and the exposure. The configuration of the fire barrier shall be designed to allow natural ventilation to prevent the accumulation of hazardous gas concentrations.

3504.2.1.1 Weather protection canopies. Where weather protection is provided for sheltering outdoor non-bulk flammable gas storage or use areas, such areas shall be constructed in accordance with Section 2704.13 and the International Building Code. Outdoor storage or use of non-bulk flammable compressed gases shall be located from ~~a lot line, public street, public alley, public way~~ exposures in accordance with Table 3504.2.1 except that Note a of Table 3504.2.1 shall not apply to separation from lot lines, public streets, public alleys or public ways when storage or use areas are sheltered by weather protection.

4. Add new text as follows:

3504.2.1.2 Building openings. Outdoor storage and use of non-bulk flammable gases shall be separated from building openings by 25 feet.

3504.2.1.2.1 Fire barrier. Fire barriers as shown in Note a to Table 3504.2.1 shall be allowed to be used as a means to separate storage and use areas from openings including building exits and the exit discharge.

Reason: Section 3501.1. The section has been expanded to address bulk flammable gas systems, and two new definitions have been provided to address systems (gaseous and liquefied) of this nature. These definitions are based in part on definitions for bulk hydrogen compressed and liquefied gas systems that were added to the last edition of the code. The quantity thresholds used to define the bulk systems for hydrogen have been well established and have a long history of use. For other flammable gases such as methane the 5,000 cubic foot requirement for gaseous systems will correlate the IFC with the approach used by NFPA 55 thereby producing national harmony between the codes. The quantity used for other flammable cryogenic fluid gas systems has been provided based on an equivalent amount of gas using hydrogen as the index for comparison.

Section 3504.2.1: The intent of Section 3504.2.1 was to address non-bulk flammable gas storage. Bulk hydrogen compressed gas systems are required to be in compliance with NFPA 55 by Section 3501.1 as that section of the code was revised in the last code cycle. Section 3504.2.1 has been modified to simplify the list of exposures by the use of the term in lieu of a detailed listing while maintaining the restriction against using footnote "a" to allow encroachment by structures (weather protection) on the property line, and other elements of the public way.

Table 3504.2.1: Footnote "a" to Table 3504.2.1 has been revised to be applicable to the table as a whole as fire barriers are a recognized means to provide the required separation between exposures and non-bulk gas storage or small non-bulk systems.

A "cap" of 200,000 cubic feet has been added as a means to limit the quantity of material in a single outdoor area. Additional storage areas can either be provided by the use of separation distance as shown in column 2 or by constructing a fire barrier that separates one storage area from another. The 200,000 cubic foot limitation has been established based on the typical quantity of gas loaded onto the typical single tractor-trailer unit used throughout the industry or approximately 225 cylinders. The establishment of a quantity cap is warranted based on recent fire history involving flammable gases experienced with flammable gas fires occurring in storage areas. In terms of area or footprint when conventional cylinders are stored, 200,000 cubic feet of gas occupies an area of about 400 square feet. The 200,000 cubic foot limitation has been integrated into similar tables developed and adopted into NFPA 55 for use with non-bulk flammable gases. The overall risk embodied in terms of quantity has been determined to be equivalent of a single tractor-trailer unit which when unloaded occupies approximately 400 square feet.

The "term openings" has been removed from the heading row describing building construction and are now included in a new section (3504.2.1.2).

Section 3504.2.1.1. Modifications have been made to limit the use of the provision to non-bulk systems. The list of exposures has been simplified by the use of the term "exposures" in lieu of a detailed listing to correlate with Section 3504.2.1.

Section 3504.2.1.2 (new) and 3504.2.1.2.1 (new): This section has been developed by separating the requirements between building openings and type of construction so as not to confuse requirements for openings with those imposed by the building code. Provisions have been added to allow the use of fire barrier walls as a means to separate the area of storage or "non-bulk" use from building openings including exits. When exits are involved fire barriers can serve as an effective means to safeguard the exit as well as the discharge to the public way.

Acceptance of this code change will serve to clarify the application of the table for the use intended (non-bulk) as well as to resolve questions as to application for non-bulk systems. Importantly it will serve to further correlate the approach used with other model codes thereby promoting harmonization for code enforcement as well as the user community.

Cost Impact: The code change proposal will not increase the cost of construction.

F216–09/10
3804.3.1 (New)

Proponent: Tom Lariviere, Chairman, Joint Fire Service Review Committee

Add new text as follows:

3804.3.1 Installation on roof prohibited. The installation of LP-gas containers on the roofs of buildings is prohibited.

(Renumber subsequent sections)

Reason: Currently, Chapter 38 also refers to NFPA 58. NFPA 58 will allow the installation of LP-gas containers on rooftops. This proposal will include a specific restriction which will supersede the provisions in the referenced standard NFPA 58. As a result, propane tank installation will not be permitted on roof tops.

LP-gas is a flammable gas with a vapor density heavier than air. The heavier vapor density means that any leak from a roof mounted propane storage tank will travel down into the occupied spaces of the building where there is a very high probability of fire or explosion due to all the potential ignition sources.

Additionally, a building fire beneath the LP-gas container will impinge upon or heat the tank causing activation of the pressure relief valve. When the pressure relief valve is activated, it will release propane, which still is heavier than air, and the propane will travel downwards toward the fire and increase fire intensity. This could endanger the building or neighboring buildings and exposures.

Cost Impact: The code change proposal will increase the cost of construction.

ICCFILENAME: LARIVIERE-F20-3804.3.1.DOC

F217–09/10
3806.1

Proponent: Bruce Swiecicki, National Propane Gas Association

Revise as follows:

3806.1 Attendants. Dispensing of LP-gas shall be performed by a qualified attendant. A container installed on site shall only be filled by its owner or with the owner's authorization.

Reason: The purpose of the proposed change is to require LP-gas containers to be filled only by the owner of the container or with the owner's permission. Prior to filling a stationary propane container (one that is installed on site), the container and system must undergo a visual inspection to ensure they are suitable for continued service. It is common practice in the propane industry for ASME stationary containers to be leased to customers, rather than sold to the customer. Because the propane marketer that owns the container is responsible for ensuring that it is in suitable condition and safe to be continued in service, the proposed change will have a positive impact on the safe operation of stationary LP-gas systems.

From the earliest days of the compressed gas industry, a fundamental safety principle has been that cylinders may only be filled by the owner or his designee. This industry safety requirement is predicated on the belief that only the owner knows how the container has been used or how it will be used and is, therefore, accountable. Accountability is very important for safety. Accountability underpins industry practices, industry standards, and state and federal laws and regulations, as will be demonstrated in this substantiation for the proposed change to the IFC.

From time to time, questions have arisen regarding this principle, asking whether such a restriction is necessary for safety, or whether it constrains consumer choice. For example, in 1991 the Utah Attorney General issued a legal opinion that such a rule of the state propane regulatory authority was a violation of the antitrust laws. However, the Utah Attorney General's opinion was overturned when a U.S. District Court declared that there was no antitrust violation. In addition, earlier in 1992, the Utah state legislature amended the Utah state propane law to add a specific container law prohibition into the statutes so as to avoid any future challenges.

The purpose of this document is to explain what a container law is, the rationale behind the principle of ownership filling, and to document the many standards, laws and regulations that have codified the principle.

How does the container filling restriction work?
Simply stated, the proposed change to the IFC would restrict the filling of a propane gas storage tank, or container, to its owner or someone having the owner's written authorization.

Why is a container filling restriction needed?
The need for accountability underscores the need to restrict who can fill a container. Safety requires more than just specifying that a person be qualified or trained to fill a container. The container is an integral part of a pressurized fuel system. If it is filled improperly, becomes damaged because of the filler's negligence, or is filled with contaminated gas, an accident could occur, resulting in property damage and personal injury. By restricting filling and servicing operations to the owner or his designee, there is greater assurance that these operations are performed only by those with the greatest interest in seeing that they are performed properly.

The container's owner is in the best position to know the condition of the tank, and only the owner or the owner's authorized agent can be counted on to take the necessary safety precautions during the filling operation and to thoroughly inspect the container and its appurtenances at each filling. Moreover, both industry standards and federal rules hold a container owner responsible for ensuring the container's suitability and qualification for service. If anyone is permitted to fill a container without the owner's knowledge or authority, it would be difficult for the owner to meet these legal obligations.

Aren't many tanks owned by the consumer? How do they assure safe filling and proper maintenance?
First, it is important to distinguish between the typical propane containers used for home heating, cooking or water heating, and those portable cylinders used for outdoor barbecue grilling or recreational vehicles. A typical home propane container is either a large DOT-specification cylinder or an ASME container holding from 100 to 1000 gallons of product. A small cylinder, commonly referred to as a 20-pound cylinder, holds about 5 gallons of propane gas.

The proposed container filling restriction would apply only to larger ASME containers and not portable cylinders, and it is common industry practice for the propane retailer to retain ownership of those containers and lease them to their customers. By leasing the container, the retailer retains responsibility for its maintenance and inspection, and the container laws help to insure that he retains control over who puts product into the container.

Yet, despite this common industry practice, some consumers insist upon owning their containers and most retail propane dealers will sell the container to the consumer, usually with great reluctance. In those cases, the consumer then assumes full responsibility for the container's maintenance and it is his responsibility to insure that the retail supplier from whom he purchases propane is supplying only specification product and is safely performing all required steps in the filling process.

The propane industry views consumer-owned containers as less than an ideal situation since the consumer is not an expert on propane gas or the maintenance of propane gas systems. A random filler has no vested interest in inspecting the system each time it is filled, or to alert the consumer to a potential problem with his consumer-owned tank. Moreover, if a random filler is allowed to fill a container owned by another propane marketer and not the consumer, the marketer who owns the container will be exposed to liability for any acts or failure to act by the random filler. These situations should be avoided and discouraged in the interest of maintaining safety.

Is there a Federal law restricting the filling of containers?
The origins of restrictions on the filling of propane containers can be traced to the Interstate Commerce Commission (ICC) whose rules contained the proscription in the first publication of the Code of Federal Regulations, effective as of June 1, 1938. Industry believes this original rule dates to at least 1919. The U.S. Department of Transportation regulations, which incorporated the old ICC rules, currently provide as follows:

> "(e) *Ownership of cylinder.* A cylinder filled with a hazardous material may not be offered for transportation unless it was filled by the owner of the cylinder or with the owner's consent.

In their rules governing workplace safety, the U.S. Department of Labor's Occupational Safety & Health Administration includes the following provision:

> "(ii) Containers shall be filled or used only upon authorization of the owner."

The staff of the Federal agency dedicated to consumer safety, the U.S. Consumer Product Safety Commission, endorsed the principle of a container filling restriction law in 1991.

Why have a code provision in addition to Federal?
Federal laws and regulations generally apply only to interstate commerce. State agencies that regulate the use of propane gas typically base their regulations on industry codes and standards. While this system has generally worked well, it can leave gaps in the state's regulatory scheme if, for example, a federal law does not apply or an industry standard is modified. This was demonstrated vividly in 1991 when NFPA, out of concern about its antitrust liability exposure due to the erroneous legal opinion of the Utah Attorney General, modified NFPA-58 to remove the container filling restriction.

Is a container filling restriction in the public interest?
In the absence of a container law, anyone is free to fill any tank, regardless of ownership. This undermines accountability and renders moot all safety programs. Without a restriction on filling, there is no incentive for the propane retailer to continue to carry the responsibility for tank maintenance.

With no limitation on who may fill a container, the propane retailer who owns a leased tank could be found liable, even though blameless, if an accident occurred because of negligence on the part of the supplier who filled the tank. The likelihood is that tank leasing would cease without restrictions on who may fill containers, consumers would be forced to purchase and maintain their own tanks, and safety would be degraded.

Insurance companies are concerned about the potential for increased liability exposure. In 1991, four of the industry's major insurers wrote in opposition to removal of the ownership restrictions from NFPA-58. This increased risk exposure would force insurers to raise premiums on propane gas retailers and possibly result in some small retailers being unable to afford insurance.

Inevitably, safety will deteriorate as more and more tanks are owned by consumers who buy their fuel from small, undercapitalized and underinsured suppliers who fill tanks but provide no inspection, maintenance, or repair service.

Is a container filling restriction a restraint on trade?
A container law reflects basic property law rights. Antitrust scholars have examined this issue from many angles and concluded that the elements of an antitrust violation simply are not present.

1. Leasing tanks to consumers gives propane retailers no control over the market. Consumers can easily change gas suppliers, with only a minimal cost for switching tanks.
2. Entry into the propane gas market is relatively easy for start-up companies or for established companies expanding into new market areas. A fundamental principle of antitrust law is that absence of entry barriers into a market constrains anticompetitive conduct, irrespective of market share.
3. There is ample justification on the grounds of consumer safety, and it is clear from court cases that there is no antirust violation in adopting a policy designed to promote safety.

Summary and Conclusion
After nearly a century of industry standards and regulations restricting the filling of propane gas containers to the owner or the owner's authorized agent, this commonly accepted practice has proven its value as a safety rule. Endorsed by safety engineers, state and federal regulatory authorities, insurance companies, adopted as law by legislatures in at least 39 states and tested in court, it is a rule by which propane retailers and consumers can live, and one they should.

	Assembly:	ASF	AMF	DF

ICCFILENAME: SWIECICKI-F1-3806.1.DOC

F218–09/10
3809.14 (New)

Proponent: Tom Lariviere, Chairman, Joint Fire Service Review Committee

Add new text as follows:

3809.14 Automated LP-gas vending m**achines.** The use of automated LP-gas vending machines or racks that are not operated by an attendant to purchase or exchange LP-gas containers is prohibited.

(Renumber subsequent sections)

Reason: Over the last ten years, there has been a rapid increase in the use of automated LP-gas vending machines for consumer propane tanks. The next step of providing better accessibility to propane tanks is the introduction of automated exchange machines. An automated LP-gas vending machine requires minimal or no interaction by anyone on-site. The automated LP-gas vending machine is completely operated by just a consumer with a credit card and an empty tank.

The hazard with this operation is that the enforcement of basic safety issues are problematic with exchange racks and the removal of an attendant or knowledgeable person increases these deficiencies and hazards. It is not uncommon to see tanks stored upside down, rotted, pitted, or stored with the valve open. Tanks may also be left outside this unattended storage rack, creating security and/or vandalism related hazards for release of propane from unsecured tanks.

Automated LP-gas vending machines increase the likelihood of placing hazardous tanks in these machines that are situated in the existing locations of manual exchange racks. In addition, unattended automated racks increase the likelihood of tampering with the machine and providing access to unauthorized persons.

As a comparison, if someone brings a tank in for exchange at a conventional propane exchange rack and it starts to leak, the likelihood of someone calling it in (clerk or otherwise) is pretty good due to the odor. Conversely, a leaky tank in an unattended, automated machine outside of a closed store could leak for hours undetected.

Other issues include the absence of fire department access (i.e. cutting the lock) and the security issues regarding the access to a large quantity of flammable gas without supervision.

Cost Impact: The code change proposal will increase the cost of construction.

4601.2 through 4601.4.2, Table 4603.1, 4604.1, Table 4604.18.2

Proponent: Tom Lariviere, Chairman - Joint Fire Service Review Committee

Revise as follows:

4601.2 Intent. The intent of this chapter is to provide a minimum degree of fire and life safety to *persons* occupying existing buildings by providing minimum construction requirements when ~~for *alterations* to~~ such existing buildings ~~which~~ do not comply with the minimum requirements of the *International Building Code.*

4601.3 Permits. Permits shall be required as set forth in Sections 105.6 and 105.7 and the *International Building Code* ~~and this code~~.

4601.4 Owner notification. When a building is found to be in non-compliance with this chapter, the *fire code official* shall duly notify the *owner* of the building. Upon receipt of such notice, the *owner* shall, subject to the following time limits, take necessary actions to comply with the provisions of this chapter.

4601.4.1 Construction documents. *Construction documents* ~~for the~~ necessary ~~*alterations*~~ to comply with this chapter shall be completed and submitted within a time schedule *approved* by the *fire code official.*

4601.4.2 Completion of work. Work ~~on the required *alterations* to the building~~ necessary to comply with this chapter shall be completed within a time schedule *approved* by the *fire code official*.

TABLE 4603.1
OCCUPANCY AND USE REQUIREMENTS[a]

Section	Use			Occupancy Classification																		
	High Rise	Atrium ~~and~~ or Covered Mall	Under ground Building	A	B	E	F	H-1	H-2	H-3	H-4	H-5	I-1	I-2	I-3	I-4	M	R-1	R-2	R-3	R-4	S

a. Existing buildings shall comply with the sections identified "as Required" based on occupancy classification or use, or both, whichever is applicable.

(Portions of table not shown remain unchanged)

4604.1 General. *Means of egress* in existing buildings shall comply with the minimum egress requirements when specified in Table 4603.1 as further enumerated in Sections 4604.2 through 4604.23, and the building code that applied at the time of construction. Where the provisions of this chapter conflict with the original building code, the most restrictive provision shall apply. Existing buildings that were not required to comply with a building code at the time of construction shall comply with the minimum egress requirements when specified in Table 4603.1 as further enumerated in Sections 4604.2 through 4604.23~~, and, in addition, shall have a life safety evaluation prepared, consistent with the requirements of Section 104.7.2. The life safety evaluation shall identify any changes to the *means of egress* that are necessary to provide safe egress to occupants and shall be subject to review and approval by the *fire code official*. The building shall be modified to comply with the recommendations set forth in the *approved* evaluation~~.

TABLE 4604.18.2
COMMON PATH, DEAD-END AND TRAVEL DISTANCE LIMITS (by occupancy)

Occupancy	Common Path Limit		Dead-End Limit		Travel Distance Limit	
	Unsprinklered (feet)	Sprinklered (feet)	Unsprinklered (feet)	Sprinklered (feet)	Unsprinklered (feet)	Sprinklered (feet)
Group B	75	100	50	50	200	~~250~~ 300
Group R-2 (Apartments)	75	~~75~~ 125	50	50	200	250
Group U	75	~~75~~ 100	20	50	200	250

(Portions of table and footnotes not shown remain unchanged)

Reason: The revisions in this proposal are added to further clarify to the intent of each of the sections in the new Chapter 46. The modifications herein do not alter the requirements currently found in the IFC.

Section 4601.2 is revised to remove the word "alterations". "Alteration" is used as a trigger point for the *International Existing Building Code* and is specifically defined. The desire is to remove the potential confusion with that definition. The retroactive requirements in Chapter 46 are not triggered by "alteration". These requirements apply to all existing buildings regardless of alteration or remodel permits.

Section 4601.3: At Palm Springs, the Code Committee added the phrase "and this code" because of a desire to include other permit requirements in the IFC. There is no need to reference IFC Section 105.7 and then say the entire code, 105.7 is part of the entire code. However, this proposal takes a different approach to solve the concern for other potential permits and add a reference to Section 105.6 "Operational Permits", and the reference to the entire code is deleted. The reference to the specific sections provides the user with more guidance than just stating the entire code.

Section 4601.4 is revised to clarify that the requirement for owner notification in Section 4601.4 is specific to this chapter and not to the entire code. Violations of other code sections are already handled in Chapter 1. This provision is specific since it refers to developing a timeline for repair as stated in the Subsection 4601.4.2.

Sections 4601.4.1 and 4601.4.2 are revised to remove the term "alterations". These requirements are not triggered by alterations or remodels. These requirements are applicable as soon as the code is adopted. This provides consistency with Item #1 above.

Table 4603.1 is revised by adding Footnote A to provide direction on the application of the table. Additionally, the heading of "Atrium and Covered Mall" is revised to read "Atrium or Covered Mall" to eliminate the possible confusion that if a building does not have an atrium and a covered mall that it does not need to comply.

The 1st paragraph of Section 4604.1 is revised to clarify that the intent of the paragraph is to resolve conflicts between the original building code and this chapter, not the entire IFC.

The 2nd paragraph of Section 4604.1 is revised by deleting the requirement for a life safety evaluation. The minimum egress requirements are already established within Chapter 46. If additional egress issues exist, Section 102.1 allows for the code official to address distinct hazards. There is no need to additionally require a full life safety evaluation.

Table 4604.18.2 is revised to provide correlation with IBC requirements for new construction. If these revisions are not made, then the requirements for new buildings will be less restrictive than the requirements for existing buildings. Changes as follows:

1. For Group B, "Travel Distance Limit", "Sprinklered", 250' is revised to 300' to be consistent with IBC Table 1016.1.
2. For Group R-2, "Common Path Limit", "Sprinklered", 75' is revised to 125' to be consistent with IBC Section 1014.3 Exception #4.
3. For Group U, "Common Path Limit", "Sprinklered", 75' is revised to 100' to be consistent with IBC Section 1014.3 Exception #2.

Cost Impact: The code change proposal will not increase the cost of construction

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: LARIVIERE-F22-4601.2.DOC

F220–09/10
4603.4.3, 4603.4.4, 4603.4.5 (All New)

Proponents: Robert J Davidson, Code Consultant/Alan Shuman, President, representing the National Association of State Fire Marshals (NASFM)

Add new text as follows:

4603.4.3 Group F-1. An automatic sprinkler system shall be provided throughout all buildings containing a Group F-1 occupancy used for the manufacture of upholstered furniture or mattresses.

4603.4.4 Group M. An automatic sprinkler system shall be provided throughout all buildings containing a Group M occupancy used for the display and sale of upholstered furniture or mattresses.

4603.4.5 Group S-1. An automatic sprinkler system shall be provided throughout all buildings containing a Group S-1 occupancy used for the storage of upholstered furniture or mattresses.

Reason: This proposal adds retroactive requirements to install an automatic sprinkler system in buildings containing F-1, M and S-1 occupancies involving upholstered furniture and mattresses. The purpose is to build upon the change approved last cycle to require mercantile occupancies with any amount of upholstered furniture to be suppressed as requested by the upholstered furniture industry.

The recognized hazard by a fuel load consisting of upholstered furniture and mattresses has been as identified as requiring sprinkler protection in newly constructed buildings that would also be required to meet all other current requirements of the International Series of Codes. Most, if not all existing buildings do not meet the current requirements of the International Series of Codes. A building that existed prior to the current editions of the International Series Codes most likely has less protective features and the existence of the fuel load presented by upholstered furniture and mattress would then create a greater hazard and an increased need for automatic fire suppression.

Cost Impact: The code change proposal will increase the cost of existing occupancies containing these hazards.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

F221–09/10
4603.5, 4603.5.1 (New), 4603.5.2 (New)

Proponent: Tom Lariviere, Chairman, Joint Fire Service Review Committee

Revise as follows:

4603.5 Standpipes. Existing structures ~~with occupied floors located more than 50 feet (15 240 mm) above or below the lowest level of fire department access~~ shall be equipped with standpipes installed in accordance with Section 905 when required in Sections 4603.5.1 through 4603.5.2. ~~The standpipes shall have an *approved* fire department connection with hose connections at each floor level above or below the lowest level of fire department access.~~ The *fire code official* is authorized to approve the installation of manual standpipe systems to achieve compliance with this section where the responding fire department is capable of providing the required hose flow at the highest standpipe outlet.

4603.5.1 Existing multi-story buildings. Existing buildings with occupied floors located more than 50 feet (15 240 mm) above the lowest level of fire department access or more than 50 feet (15 240 mm) below the highest level of fire department access shall be equipped with standpipes.

4603.5.2 Existing helistops and heliports. Existing buildings with a *helistop* or *heliport* located more than 30 feet above the lowest level of fire department access to the roof level on which the *helistop* or *heliport* is located shall be equipped with standpipes in accordance with Section 1107.5.

Reason: A heliport is a distinct hazard that will involve flammable fuels. In the event of an emergency, rapid deployment of hand hose lines will be necessary to attack a resulting fire, effectuate rescue and to protect exposures and the remainder of the building. This proposal will specify that when existing buildings have a helistop or heliport on a rooftop location, then a standpipe system is required.

The current Section 4603.5 is reformatted as a general section which refers back to Section 905 for standpipe design. The sentence requiring hose connections on each floor is deleted. This sentence is deleted because the section already refers back to Section 905 for design and Section 905.4 #1 requires hose connections on each floor. So this sentence in Section 4603.5 is redundant and not necessary.

The new Section 4603.5.1 is the current requirement found in 4603.5 for buildings with an occupied floor level over 50 feet in height.

The new Section 4603.5.2 requires a standpipe system in existing buildings with a heliport or helistop. This section refers back to Section 1107.5 for design and hose connection location for the rooftop heliport.

The requirement is for a standpipe system throughout the building, not just a connection at the roof level. This is critical in firefighting operations because many times the connection below the rooftop level may be needed just to gain access onto the roof. If the only connection is on the roof, it is of no use if the firefighters cannot get to it. Additionally, a heliport includes fueling operations. It is entirely possible for a spill to not only affect the rooftop, but also floors below as the liquid fuel spreads. The standpipe system will again be utilized in these situations.

Cost Impact: The code change proposal will not increase the cost of new construction, but will affect existing buildings.

Analysis: Similar requirements are proposed in code change proposal F222-09/10.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

F222–09/10
4603.5, 4603.5.1 (New), 4603.5.2 (New)

Proponents: Robert J Davidson, Code Consultant/Alan Shuman, President, representing the National Association of State Fire Marshals (NASFM)

Revise as follows:

4603.5 Standpipes. Existing structures ~~with occupied floors located more than 50 feet (15 240 mm) above or below the lowest level of fire department access~~ shall be equipped with standpipes installed in accordance with Section 905 where required in Sections 4603.5.1 through 4603.5.2. ~~The standpipes shall have an approved fire department connection with hose connections at each floor level above or below the lowest level of fire department access.~~ The fire code official is authorized to approve the installation of manual standpipe systems to achieve compliance with this section where the responding fire department is capable of providing the required hose flow at the highest standpipe outlet.

4603.5.1 Existing multi-story buildings. Existing buildings with occupied floors located more than 50 feet (15 240 mm) above the lowest level of fire department access or more than 50 feet (15 240 mm) below the highest level of fire department access shall be equipped with standpipes.

4603.5.2 Roof gardens and landscaped roofs. Buildings or structures with roof gardens or landscaped roofs and that are equipped with a standpipe shall extend the standpipe to the roof level on which the roof garden or landscaped roof is located.

Reason: A rooftop garden or landscaped roof is a distinct hazard that adds combustible fuel loads to the roof level. In the event of a fire, rapid deployment of hand hose lines will be necessary to effect extinguishment and to protect exposures and the remainder of the building. This proposal will specify that when existing buildings have a standpipe system and a rooftop garden or landscaped roof on a rooftop location, then a standpipe system is required to be extended to the roof level with the roof garden or landscaped roof.

The current Section 4603.5 is reformatted as a general section which refers back to Section 905 for standpipe design. The sentence requiring hose connections on each floor is deleted. This sentence is deleted because the section already refers back to Section 905 for design and Section 905.4, #1 requires hose connections on each floor. So this sentence in Section 4603.5 is redundant and not necessary.

The new Section 4603.5.1 is the current requirement found in 4603.5 for buildings with an occupied floor level over 50 feet in height.

The new Section 4603.5.2 requires an existing standpipe system in existing buildings with a roof garden or landscaped roof to be extended to that roof level.

Cost Impact: The code change proposal will increase the cost of existing occupancies containing these hazards.

Analysis: Similar requirements are proposed in code change proposal F221-09/10.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: DAVIDSON-SHUMAN-F10-4603.5.DOC

F223–09/10
4603.6.6

Proponent: Gene Boecker, Code Consultants, Inc.

Revise as follows:

4603.6.6 Group R-2. ~~An automatic or~~ A manual fire alarm system that activates the occupant notification system in accordance with Section 907.6 shall be installed in existing Group R-2 occupancies more than three stories in height or with more than 16 *dwelling* or *sleeping units*.

Exceptions:

1. Where each living unit is separated from other contiguous living units by *fire barriers* having a *fire-resistance rating* of not less than 0.75 hour, and where each living unit has either its own independent *exit* or its own independent stairway or ramp discharging at grade.
2. A separate fire alarm system is not required in buildings that are equipped throughout with an *approved* supervised *automatic sprinkler system* installed in accordance with Section 903.3.1.1 or 903.3.1.2 and having a local alarm to notify all occupants.
3. A fire alarm system is not required in buildings that do not have interior *corridors* serving *dwelling units* and are protected by an *approved automatic sprinkler system* installed in accordance with Section 903.3.1.1 or 903.3.1.2, provided that *dwelling units* either have a *means of egress* door opening directly to an exterior *exit access* that leads directly to the *exits* or are served by open-ended *corridors* designed in accordance with Section 1023.6, Exception 4.

Reason: During the prior code change cycle the effort was made to clear up the confusion between whether the required system must be a manual or automatic fire alarm system. Consistently, the code changes noted that the required retrofit system must be a manual one. However, in a few instances the clarification was not addressed in a code change.

This proposal is an effort to finish up the clean-up which began with the prior code change cycles in rewriting the requirements for fire alarms in existing buildings.

Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME: BOECKER-F11-4603.6.7.DOC

F225–09/10
4603.7.1

Proponent: Jeffrey M. Shapiro, PE, International Code Consultants, representing National Multi Housing Council

Revise as follows:

4603.7.1 Where required. Existing Group R occupancies and *dwellings* not classified as Group R occupancies, which are not already provided with single-station smoke alarms complying with requirements of the code that governed at the time of construction, shall be provided with single-station smoke alarms~~. Installation shall be~~ in accordance with Section 907.2.11, except as provided in Sections 4603.7.2 and 4603.7.3.

Reason: This proposal is intended as a clarification to assist in proper application of the existing text. The key phrase that determines exactly what is required in existing Group R occupancies is "Existing Group R occupancies…not already provided with single station smoke alarms..." Although this statement appears fairly straightforward in its intended application, it is occasionally misinterpreted, perhaps because the IFC Commentary on this issue is even more misleading than the code itself. To some, the text suggests that anytime smoke alarms are not already installed throughout a Group R occupancy, located as required for new construction in accordance with Section 907.2.10, additional alarms must be installed to protect any areas, such as bedrooms, that would require protection in new construction. However, I can state with great certainty that this was never the intended application of the code.

The IFC text originated in the UFC in 1995, and it was carried directly into the IFC during the drafting process. Thereby, the intent of this section was established by the original UFC provision. The provision in question resulted from a code change proposal submitted by the Minnesota State Fire Chiefs Association in 1995 (Proposal #21, 1007-95-1). The proposal was initially disapproved by the UFC Code Development Committee, but was approved at the final action hearing after initial objections were addressed by a public comment.

Part 4 of the public comment was further revised by a floor motion at the hearing, which was when the text "not already provided with single station smoke detectors" was added to the code. This text replaced other proposed text "…in accordance with the building code under which the building was constructed. Buildings that were not constructed under the requirements of a building code shall meet the minimum requirements of Section 1007.2.9.2," which needed to be changed because it didn't require buildings that were constructed under an old building code, prior to when smoke alarms were first required, to be retrofitted. By adding "not already provided with single station smoke detectors," the intent was to retain a "grandfather" clause for existing buildings that were previously provided with smoke alarms, while adding a requirement to retrofit buildings that were not.

When the IFC was developed, it was drafted using a combination of NFPA 1 Fire Prevention Code, NFPA 101 Life Safety Code and the UFC. Documentation from the drafting committee's work on the retroactive smoke alarm section show that the committee was given a choice of accepting either the NFPA 101 provisions (Sections 19-3.4 through 19.3.4.4.2) or the UFC provisions (Sections 1007.2.9.2 through 1007.2.9.2.4) for apartments. With respect to smoke alarms in sleeping rooms, the choice made no difference because neither code required smoke alarms to be retrofitted in these areas. In fact, NFPA 101 quite clearly maintains that approach today in Section 31.3.4.5.1.

In the end, the IFC adopted the UFC text, which included the "Existing Group R occupancies not already provided with single station smoke alarms..." text that remains today. Lacking any code change that would have revised the intended application of Section 4603.7.1, I am confident that the original intent of the code, to grandfather existing buildings that had smoke alarms installed prior to adoption of the IFC, remains the proper application of the code today. Accordingly, this proposal should be approved to remove the existing ambiguity.

Cost Impact: The code change proposal will not increase the cost of construction

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: SHAPIRO-F1-4603.7.1.DOC

F226–09/10
4603.8 (New)

Proponent: A. Hal Key, P.E., Fire Department, Mesa, AZ

Add new text as follows:

4603.8 Existing fire alarm systems. When an existing fire alarm system becomes unserviceable due to non-availability of components or parts, that system shall be replaced in accordance with Section 907.2.

Reason: When a fire alarm system becomes unserviceable due to the age of the equipment, the entire system must be replaced to maintain the system in operation. In most cases, the type of system (addressable vs. analog) changes and these systems need to be installed to the latest edition of the adopted code. Where an existing system has not yet been upgraded to the latest ADA requirements, the owners of these systems are already required to upgrade the system annunciation.

Cost Impact: The code change proposal will increase the cost of maintaining the system.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: KEY-F2-4603.8.DOC

F227–09/10
4604.17.5, 4604.17.5.1 (New)

Proponent: Kathleen A. Way, Fire Protection Specialist, NYS Department of State, Office of Fire Prevention & Control; Daniel E. Nichols, PE, New York State Department of State, Div. of Code Enforcement and Administration

1. Revise as follows:

4604.17.5 Materials and strength. Components of fire escape stairs shall be constructed of noncombustible materials. Fire escape stairs and balconies shall support the dead load plus a live load of not less than 100 pounds per square foot (4.78 kN/m^2). Fire escape stairs and balconies shall be provided with a top and intermediate handrail on each side. ~~The *fire code official* is authorized to require testing or other satisfactory evidence that an existing fire escape stair meets the requirements of this section.~~

2. Add new text as follows:

4604.17.5.1 Examination. Fire escape stairs and balconies shall be examined for structural adequacy and safety, in accordance with Section 4604.17.5, by a registered design professional or others acceptable to the fire code official every five years, or as required by the fire code official. An inspection report shall be submitted to the fire code official after such examination.

Reason: Fire escapes are necessary and essential, where provided as a second means of egress for occupants. In some jurisdictions, the fire service may also utilize fire escapes for the purpose of fire suppression and rescue. Unfortunately, normal day to day maintenance of fire escapes is not sufficient enough to determine if they are truly safe for use. It would be necessary, at some interval to have a qualified person determine, structurally that the fire escape is structurally sound. Determining a set time frame is left with the fire code official due to many factors that affect the condition of fire escapes including weathering, temperatures, building condition, and previous upkeep. Currently, the States of Massachusetts and New Jersey have specific code provisions with regard to certification of fire escapes.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

F228–09/10
Table 4604.18.2

Proponent: Gene Boecker, Code Consultants, Inc.

Revise table as follows:

TABLE 4604.18.2
COMMON PATH, DEAD-END AND TRAVEL DISTANCE LIMITS (by occupancy)

OCCUPANCY	COMMON PATH LIMIT		DEAD-END LIMIT		TRAVEL DISTANCE LIMIT	
	Unsprinklered (feet)	Sprinklered (feet)	Unsprinklered (feet)	Sprinklered (feet)	Unsprinklered (feet)	Sprinklered (feet)
Group A	20/75[a]	20/75[a]	20[b]	20[b]	200	250
Group B [f]	75	100	50	50	200	250
Group E	75	75	20	20	200	250
Groups F-1, S-1[d,f]	75	75	20	20	200	250
Groups F-2, S-2[d,f]	75	100	50	50	200	250
Group H-1	25	25	0	0	75	75
Group H-2	50	100	0	0	75	100
Group H-3	50	100	20	20	100	150
Group H-4	75	75	20	20	150	175
Group H-5	75	75	20	50	150	200
Group I-1	75	75	20	20	200	250
Group I-2 (Health Care)	NR[e]	NR[e]	NR	NR	150	200[c]
Group I-3 (Detention and Correctional—Use Conditions II, III, IV, V	NR	NR	20	20	200	250
Group I-4 (Day Care Centers)	100	100	NR	NR	150[c]	200[c]
Group M (Covered Mall)	75	100	50	50	200	400
Group M (Mercantile)	75	100	50	50	200	250
Group R-1 (Hotels)	75	75	50	50	200	250
Group R-2 (Apartments)	75	75	50	50	200	250
Group R-3 (One- and Two-Family)	NR	NR	NR	NR	NR	NR
Group R-4 (Residential Care/Assisted Living)	NR	NR	NR	NR	NR	NR
Group U [f]	75	75	20	20	200	250

For SI: 1 foot = 304.8 mm.

a. 20 feet for common path serving 50 or more persons; 75 feet for common path serving less than 50 persons.
b. See Section 1025.9.5 for dead-end aisles in Group A occupancies.
c. This dimension is for the total travel distance, assuming incremental portions have fully utilized their allowable maximums. For travel distance within the room, and from the room exit access door to the exit, see the appropriate occupancy chapter.
d. See the *International Building Code* for special requirements on spacing of doors in aircraft hangars.

e. Any patient sleeping room, or any suite that includes patient sleeping rooms, of more than 1,000 square feet (93 m^2) shall have at least two exit access doors placed a distance apart equal to not less than one-third the length of the maximum overall diagonal dimension of the patient sleeping room or suite to be served, measured in a straight line between exit access doors.

f. Where a tenant space in Group B, S and U occupancies has an occupant load of not more than 30, the length of a common path of egress travel shall not be more than 100 feet (30 480 mm).

NR = No requirements.

Reason: The proposal corrects a conflict between the International Building Code and the International Fire Code. The added footnote addresses exception #2 in Section 1014.3. The code grants this allowance for new construction. It should be reflected in the table as allowable for existing conditions. Otherwise the building could be cited for non-compliance the day after it is issued a certificate of occupancy.

For clarity to the reader, because it is not easy to see superscripts in the table, this is being proposed for "B," "S-1," "S-2," and "U" occupancies; consistent with the provisions in IBC Section 1014.3; exception #2.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: BOECKER-F12-T4604.18.2.DOC

F229–09/10
Chapter 46, 102.1

Proponent: Lawrence G. Perry, AIA, representing Building Owners and Managers Association (BOMA) International

1. Revise by relocating Chapter 46 in its entirety as follows:

~~CHAPTER 46~~ APPENDIX K
CONSTRUCTION REQUIREMENTS FOR EXISTING BUILDINGS

2. Revise as follows:

102.1 Construction and design provisions. The construction and design provisions of this code shall apply to:

1. Structures, facilities and conditions arising after the adoption of this code.
2. Existing structures, facilities and conditions not legally in existence at the time of adoption of this code.
3. ~~Existing structures, facilities and conditions when required in Chapter 46.~~
4. ~~4.~~ 3. Existing structures, facilities and conditions which, in the opinion of the *fire code official*, constitute a distinct hazard to life or property.

Reason: Many jurisdictions that adopt a model fire code lack the authority to retroactively mandate construction upgrades to existing buildings without some specific 'triggering' event. Additionally, as written, the triggering language in Chapter 46 is vague, and would lead to a lack of consistency in enforcement. Section 4601.4 states "Where a building is found to be in noncompliance, the fire code official shall duly notify the owner of the building." What is the mechanism for the fire code official to 'find' the building in noncompliance? Without some specific mechanism in the code, this will lead to arbitrary application of these retroactive requirements.

By relocating Chapter 46 to an appendix Chapter, those jurisdictions that have the authority, the mechanism, and the desire to require assessment and retrofit of existing buildings will have a framework on which they can build a comprehensive package. By removing the Chapter from the body of the code, the majority of jurisdictions, who are either unauthorized or unable to assess every existing building and mandate every possible retrofit outlined in the chapter, will not need to amend these provisions out of the code, or ignore the potential impact that the breadth of this Chapter would have on some older existing buildings. Note that even with the deletion of this Chapter from the body of the code, the fire code official still has the authority to mandate that 'distinct hazards to life and property' be mitigated.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: PERRY-F1-CHAP46.DOC

F230–09/10
Appendix D103.6.1, D103.6.2

Proponent: Tom Lariviere, Chairman, Joint Fire Service Review Committee

Revise as follows:

D103.6.1 Roads 20 to 26 feet in width. Fire lane signs as specified in D103.6 shall be posted on both sides of fire apparatus access roads that are 20 to 26 feet wide (6096 to 7925 mm) ~~shall be posted on both sides as a fire lane~~.

D103.6.2 Roads more than 26 feet in width. Fire lane signs as specified in D103.6 shall be posted on one side of apparatus access roads more than 26 feet wide (7925 mm) ~~to~~ and less than 32 feet wide (9754 mm) ~~shall be posted on one side of the road as a fire lane~~.

Reason: This proposal completes the requirement in each of the sections. Currently each section states that "access road shall be posted", but gives no guidance as to what needs to be posted. This revision specifies that the posting of the access road is with the FIRE LANE sign specified in Section D103.6. This proposal provides correlation with Section D103.6.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: LARIVIERE-F27-D103.6.1.DOC

F231–09/10
Appendix D105.1, D105.2, D105.3, D105.4 (New)

Proponent: Daniel E. Nichols, PE, New York State Department of State, Div. of Code Enforcement and Administration

Revise as follows:

D105.1 Where required. Where the vertical distance between the grade plane and the highest roof surface exceeds ~~Buildings or portions of buildings or facilities exceeding~~ 30 feet (9144 mm) ~~in height above the lowest level of fire department vehicle access shall be provided with~~, *approved* ~~fire~~ aerial apparatus access roads ~~capable of accommodating fire department aerial apparatus~~ shall be provided. ~~Overhead utility and power lines shall not be located within the aerial fire apparatus access roadway.~~ For purposes of this section, the highest roof surface shall be determined by measurement to the eave of a pitched roof, the intersection of the roof to the exterior wall, or the top of parapet walls, whichever is greater.

D105.2 Width. Aerial fire apparatus access roads shall have a minimum unobstructed width of 26 feet (7925 mm), exclusive of shoulders, in the immediate vicinity of ~~any~~ the building or portion thereof. ~~of building more than 30 feet (9144 mm) in height.~~

D105.3 Proximity to building. At least one of the required access routes meeting this condition shall be located within a minimum of 15 feet (4572 mm) and a maximum of 30 feet (9144 mm) from the building, and shall be positioned parallel to one entire side of the building. The side of the building on which the aerial apparatus access road is positioned shall be approved by the fire code official.

D105.4 Obstructions. Overhead utility and power lines shall not be located over the aerial fire apparatus access road or between the road and the building. Other obstructions shall be permitted to be placed with the approval of the fire code official.

Reason: Aerial apparatus access roads are required when the fire department cannot reach the roof or upper stories with ground ladders. ISO fire suppression rating schedule requires that fire department's carry a 35' ground ladder (35' ladder is now acceptable under the alternative equipment list). When setting up a 35' ground ladder appropriately, the effective vertical reach of this ladder is approximately 30'; hence the 30' requirement within this section.

Section D105.1- The height requirement should be based on the fire department's ability to utilize a ground ladder, or lack thereof. The current language takes into account the height of the building compared to the fire apparatus access road. This is not the intent; a one story building that is on a hill above the fire apparatus access road could be subject to the aerial access road requirements when ground ladder access is provided. The proposed language takes the measurement from grade plane to the edge of the roof where the ladder would be placed. If this is greater than 30', then an aerial apparatus access road would be required. The term accessible point of the highest roof surface has been used as 'building height' would be too high for peaked roofs (midpoint measurement) and too low for flat roofs with parapet walls. The term eave is the most common term used in the IBC when describing the edge of a peaked roof, thus incorporated herein.

D105.2- The measurement of the 'height' has been removed. This removes the potential confusion between 'height' and 'height above lowest level of FD access.'

D105.3- Currently, the language allows the designer to determine the side that aerial apparatus access is provided. This has caused issues where the code provisions were met by providing aerial access on the end of a building or on the gable end of a structure. The two aforementioned situations are not beneficial to fire department operations as it hinders access to emergency escape and rescue openings (this section, if adopted, is a component of Section 503 and applicable to IRC constructed buildings by ICC interpretation) and roof surfaces for firefighting operations.

D105.4- This is a new section that has been pulled out D105.1 for better clarity. The overhead obstructions have been expanded to be prohibited between the road and the building. It also adds a statement that allows the fire code official to allow some obstructions that do not affect the aerial apparatus operation, such a portico over the road or vegetation.

Cost Impact: The code change proposal will increase the cost of construction in certain situations and not increase the cost in certain situations.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: NICHOLS-F4-D105.1.DOC

F232–09/10
Appendix D105.3

Proponent: Tom Lariviere, Chairman, Joint Fire Service Review Committee

Delete without substitution:

~~**D105.3 Proximity to building.** At least one of the required access routes meeting this condition shall be located within a minimum of 15 feet (4572 mm) and a maximum of 30 feet (9144 mm) from the building, and shall be positioned parallel to one entire side of the building.~~

Reason: The current language has created confusion and difficulty in application of these requirements as follows:

1. In many cases it has been misinterpreted to say that the entire access road must be within 15' of the building.
2. In several building designs, the distance of 15' from the building places the ladder at angle that is less than preferred. This will occur when a building has a height of less than 50'. With the access road at least 15' from the building, the ladder turntable will be approximately 23' from the exterior wall, and approximately 8' above grade. This places the ladder at less than a 30 degree climbing angle.

This proposal will delete the requirement for location of the access road and default back to Section D105.1. Section D105.1 already specifies that buildings over 30' in height must provide "approved fire apparatus access roads capable of accommodating fire department aerial apparatus".

The access road for aerial apparatus is still required, and must meet the approval of the fire code official. This will allow for the spacing from the building as may be appropriate based on the actual configuration of the building, grade, and obstructions.

Cost Impact: The code change proposal will increase the cost of construction.

	Assembly:	ASF	AMF	DF

ICCFILENAME: LARIVIERE-F28-D105.3.DOC

F233–09/10
Appendix D107.1

Proponent: Tom Lariviere, Chairman, Joint Fire Service Review Committee

Revise as follows:

D107.1 One- or two-family dwelling residential developments. Developments of one- or two-family *dwellings* where the number of *dwelling units* exceeds 30 shall be provided with <u>two</u> separate and *approved* fire apparatus access roads and shall meet the requirements of Section D104.3.

Exceptions:

1. Where there are more than 30 *dwelling units* on a single public or private fire apparatus access road and all *dwelling units* are equipped throughout with an *approved automatic sprinkler system* in accordance with Section 903.3.1.1, 903.3.1.2 or 903.3.1.3, access from two directions shall not be required.
2. The number of *dwelling units* on a single fire apparatus access road shall not be increased unless fire apparatus access roads will connect with future development, as determined by the *fire code official*.

Reason: This proposal will clarify the requirement for two separate access roads into facilities with more than 30 units. The same language appears in Sections D106.1 and D106.2 when dealing with multi-family units. The intent of this section is similar to D106.1 and D106.2. When the wording is different, the code user is wondering what else was meant to be different in this application as compared to D106.1 or D06.2. Whereas the actuality is that the requirement is meant to require two means of access to developments with more than 30 dwellings.

Cost Impact: The code change proposal will increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: LARIVIERE-F29-D107.1.DOC

F234–09/10
Appendix H101.4

Proponent: Lynne M. Kilpatrick, Fire Department, City of Seattle WA, representing Washington State Association of Fire Marshals

Delete without substitution:

~~**H101.4 HMMP short form.** Facilities with the *maximum allowable quantities or less per control area* in Tables 2703.3.3(10) through 2703.1.1(4) of the *International Fire Code* and where the threshold planning quantities at EPA 40 CFR Part 355, Sections 302 and 304 are not exceeded, shall be allowed to file a short form HMMP which shall include all of the following components:~~

~~1. General facility information.~~
~~2. A simple line drawing of the facility showing the location of storage facilities and indicating the hazard class or classes and physical state of the hazardous materials being stored.~~
~~3. Information that the hazardous materials will be stored and handled in a safe manner and will be appropriately contained, separated and monitored.~~
~~4. Assurance that security precautions have been taken, employees have been appropriately trained to handle the hazardous materials and react to emergency situations, adequate labeling and warning signs are posted, adequate emergency equipment is maintained and the disposal of hazardous materials will be in an appropriate manner.~~

~~Facilities which have prepared, filed and submitted a Tier II Inventory Report required by the U.S. Environmental Protection Agency (USEPA) or required by a state which has secured USEPA approval for a similar form shall be deemed to have complied with this section.~~

Reason: This proposal proposes to delete the new HMMP short form for the following reasons:

Item 3 is requesting information presumably attesting that the hazardous materials will be stored and handled in a safe manner and will be appropriately contained, separated and monitored. This request is ambiguous and unclear. Documents to verify compliance with the containment, separation and monitoring provisions of this Code should more appropriately be requested.

Item 4 is requesting assurance that security, training, labeling, signage, equipment and disposal will be appropriate. What does that assurance look like and what is appropriate?

Further, under this Section facilities that have submitted a Tier Two Inventory Report required by EPA are deemed to have met the HMMP short form requirements. Section 2701.5.2 states that where the fire code official requires an approved HMIS statement (format). To state that submittal of the Tier Two or other USEPA approved form meets the requirement is not appropriate. Generally the reportable quantities are 500 pounds – 10,000 pounds and do not provide a complete picture of the hazardous materials present on site.

Cost Impact: The code change proposal will not increase the cost of construction.

F235–09/10
Appendix K (New)

Proponent: Michael Jacoby, Seven Valleys, PA, representing self

Add new text as follows:

APPENDIX K
EMERGENCY COMMUNICATION SYSTEMS
(HAZARDOUS SUBSTANCE)

The provisions contained in this appendix are not mandatory unless specifically referenced in the adopting ordinance.

SECTION K101
GENERAL

K101.1 Scope. This appendix contains provisions that are available for adoption by governments, communities or tribes who will have an opportunity to use the National Fire Protection Association's (NFPA) NFPA 72 codes that just added three new chapters at the same time made a name change to the National Fire Alarm and Signaling Codes that also includes the requirements for mass notification systems that can be found in a new chapter called Emergency Communication System (ECS) in NFPA 72-2010.

By adopting the provisions within this appendix it will give governments, communities or tribes etc. who already adopted the International Code Council (ICC) Codes, the ability to enhance their emergency communication by bringing these two major code organizations together to ensure that NFPA 72/National Fire Alarm and Signaling Codes, Emergency Communication Systems (ECS) such as in one-way, two-way and mass notification systems etc. are being designed and later installed per code as desired.

These requirements/codes/specifications could then be used in such applications as for college campuses, schools, and stadiums, community centers to include even local community warning/notification systems etc. when these emergency communication systems are being upgraded or initially installed thus providing early warning messages before, during or after manmade disasters/situations/events, natural disasters such as hurricanes, tornadoes, snowstorms, blizzards, flooding, massive fires while giving instructions to the public in times of crisis etc.

This appendix will also address system upgrades or the initial requirements for fixed sites/facilities with hazardous substances.

K101.2 Emergency communication system requirements. Fire alarm system upgrades to the new National Fire Alarm and Signaling Codes can be applied to such sites that meet the requirements set forth in ICC IFC Section 2701.5.1 and 2701.5.2 or for those sites that already meet the following criteria with the focus being on outside emergency communication that is commonly known as mass notification now known as emergency communications systems while other parts of the National Fire Alarm and Signaling Codes can also be applied.

Guidelines:

1. Sites containing hazardous substances subject to **Pub.L. 109-295** that is commonly referred to by the public as the Department of Homeland Security's Chemical Facility Anti-Terrorism Standards (CFATS).
2. Sites containing hazardous substances with a federal recognized classification of **SARA Title III**, Superfund Amendments and Reauthorization Act (SARA) Title III of SARA ("SARA Title III") that is part of the Emergency Planning and Community Right-To-Know Act (EPCRA) requiring a Risk Management Plan (RMP) as part of a site's emergency response also known by the International Fire Code (IFC) as sites/facilities having a Hazardous Materials Management Plan (HMMP) sometimes referred to by federal or state governments as a Crisis Response Plan, Hazardous Material Emergency Plan or Hazardous Material Off-Site Response Plan.
3. Emergency Communication System Upgrade clarification: A site's risk analysis, being the basis of site's emergency communication design will be done by others unless the fire code official is qualified, and the future site designs of an IFC H classification site/facility/structure has a potential of reaching a DHS/CFATS, SARA Title III classification or will meet ICC IFC Section 2701.5.1 and or 2701.5.2 and the requirements when applicable for the new National Fire Alarm and Signaling Codes with their Emergency Communication System (ECS) or is already specified in the site's fire alarm system plans and a site risk analysis is already incorporated into the emergency communication design as part of their overall design is then complete.

K101.2.1 Retroactive emergency communication system upgrade requirements. The option of upgrading a Fire alarm system to the new National Fire Alarm and Signaling Codes for those sites applicable that in the past required emergency HazMat responses or activated their Hazardous Materials Management Plan (HMMP) the local authority having jurisdiction can review the present status of the site/facility with their fire code official and based on the site's risk analysis a system upgrade can be applied.

SECTION K102
REFERENCED STANDARDS

ICC IFC-06 International Fire Code K101.1, K101.2
NFPA 72-2010 National Fire Alarm Code K101.1, K101.2, K101.2.1

Commenter's Reason: This Appendix with its provisions could be a **key element** that could be used to protect millions throughout our nation by giving those governments, communities or tribes etc. who are presently **ICC compliant** the opportunity to enhance emergency communication within their communities by using these new codes.

For many years our nation waited for codes as such to catch up to the NEW state-of-the-art technology being used in emergency communication systems. Just imagine how much deliberation took place when the NFPA they decided to change the name of their new codes that now might have others confused. Within the codes you might find upgrades to one-way, two-way and mass emergency communication systems etc. that many have been waiting for, for many years. Depending on when you have the opportunity to read this proposed appendix you might discover that due to overlapping code development cycles between organizations the printed form of these new code showing you these upgrades may not yet be available so… I recommend that you use the Internet to find updated NFPA information if you would like to do some research.

Since this new terminology maybe a concern, background information is available through the internet by searching for articles such as Emergency Communications Systems and or the new NFPA 72-2010 codes. If you are interested in some detailed information, you could try to contact somebody at the NFPA that you might know who sat on the NFPA 72 development committee who is familiar with the final ratification of these new NFPA 72/National Fire Alarm and Signaling Codes, Emergency Communication Systems specifications etc. and he or she might be able to fill you in or…at least tell you where you can find these new codes changes on their website, that is if you did not already find what you were looking for.

In the past awareness about emergency communication issues were brought to the ICC IFC attention in the attempt to establish a standard within the IFC so emergency communication/notifications systems being a outside annunciator devices /speakers etc. could be installed by code, but now that the NFPA 72 committee has moved forward… in my opinion I think it does not make any sense to have duplicate codes in the IFC, so that is why this proposed appendix with these new codes I believe should now be used.

What did it take for our Federal Government to get involved? Did you know that it actually took a Presidential Executive Order 13407 followed by Congress's involvement with requirements to start to upgrade our national standards to reflect the new state-of-the-art technology in emergency communications? As an end result our Department of Homeland Security is now involved through an agency that presently falls under their umbrella that is called the Federal Emergency Management Agency (FEMA) and in layman's terms, now has a goal to provide alert and warnings throughout our infrastructure no matter what the crisis by using communication systems that could then provide life-saving information no matter where you are located or what time of the day it might be, such as during a natural or man-made disaster/ event… or in times of crisis. This federal government program is commonly known today as the Integrated Public Alert Warning System (IPAWS).

Do you agree? Washington with all of their wisdom forgot the basics, it appears that they forgot that when it comes to upgrading the alert/warning, emergency communication systems used for early warning mass notification everything starts with codes/specifications and implementation of systems with requirements at the local government level. Now do you realize why these upgraded NFPA 72/National Fire Alarm and Signaling Codes are so important?

Understanding why DHS's CFATS and the SARA Title III classifications are being used as guidelines to start a site's analysis are a very important part of this appendix. In this case you need a benchmark based on a time factor of how long it will take local first responders from the first millisecond of the event to be on scene, to then mitigate the event.

As you will discover our federal government gave an industry a wake-up call. The industry that many knew is now changing and by the time you read this proposal you might already be familiar with the following Federal Law, Pub.L.109-295 publicly known as our Department of Homeland Security's (DHS) and their Chemical Facility Anti-Terrorism Standards (CFATS). Keep in mind that DHS is a Security department and not a Code organization. I think you will quickly understand why CFATS is being used as a guideline if not simply contact the Department of Homeland Security and have them explain to you their Top Screening process that they used and how they determined their multiple tier structure to identify certain sites of concern. Once you understand their methods I feel that you will be able to see why this appendix is so important.

The short version back in 2008 after an official release the national media reported that more than 7,000 sites were chosen by using DHS's Top Screening process based on their tier structure as being sites of potential high-risk for terrorist attack. By the time code officials read this information some of the DHS security inspections at these sites that were on the schedule to start in January 2009 should already be completed. DHS should be the first to see how many of these sites with hazardous substances actually have any outside emergency communication warning devices/systems in place and operational to warn the surrounding public who could be outside exposed to the atmosphere when an event containing hazardous substances takes place at their facility that for many years others "assumed" such early warning devices were being installed. Having emergency communication notification systems in place with the ability to warn the public before exposure is one of the reasons for proposing this appendix. For too many years the mind-set has been that the general public will be sitting in their homes or have their electronic devices turned on just waiting for emergency warnings when in reality they are discovering that depending on the geographical area and the time of day that numbers will vary. Note that each geographical area of a site of interest that could be applicable is different and that is why a site analysis study is required. The most important part of our general public which are those who are less fortunate, our poor, the handicapped and those with special needs have a problem. Emergency Communication Systems used for outside early warning notification have the potential of reaching a large percentage of the affected population almost immediately unlike other means that could be subject to system loads and possible time delays. Another factor that has been increasing is the demand on our electrical grid and at times there are areas within our nation who might already be without electrical service (a major power outage), and or do not have telecom, broadcast, or cable connectivity. As the public starts to do their math and these deficiencies are known is strange how quiet it is now getting. Who was responsible for doing the math?

You probably are questioning why the terms SARA Title III is used as a guideline benchmark, it is simple many elected officials understand the term SARA Title III rather than the H classification being used in present code. Since governments, communities or tribes etc. will be involved in the decision-making on whether or not to adopt this proposed Appendix the term SARA that is an abbreviation for Superfund Amendments and Reauthorization Act, which is more universally understood by elected officials or others who participate in their (LEPC) Local Emergency Planning Committees, this terminology should make it easier for fire code officials to work with local governments to determine which sites located within their communities these upgrades and or new installation requirements will apply. Since fire code officials may not be familiar with the new technology in

the world of emergency communication, in order to relieve the fire code official of additional burdens as it pertains to the acoustical designs and decision making a site's risk analysis, being the basis of site emergency communication design will be done by others, unless the fire code official is qualified and he or she would like to get involved.

For the second part of this requirement for installation being that if the site's designer already incorporated the new NFPA 72 codes to be known as National Fire Alarm and Signaling Codes, Emergency Communication System codes in the IFC H classification of a site/facility/structure and the acoustical designs including the decision making as it pertains to a site's risk analysis is already in their site design plans, and everything has been accounted for, thus meeting local government and fire code official approval everything should be Good-To-Go.

Please note that designers have been doing acoustical studies/designs for many years and emergency communication systems are being used throughout the world. Now our fire code officials will have an opportunity to have a closer working relationship with their local governments as being the Authority Having Jurisdiction (AHJ) to ensure that all related code preparedness and public safety communication concerns are met.

As discussions at the local level will always seem to continue on how to activate the emergency communications system, being the trigger, that is why a site analysis of the facility/building/structure is done first because each site maybe unique. These are decisions that are made after the appendix is adopted.

As you consider this proposed appendix for approval please keep in mind that this appendix addresses the ability of a community to adopt the appendix so they can use these new NFPA codes to ensure that early warning emergency communication is available for those who may be outside fully exposed to the atmosphere being that of employees at a site/facility or the public in the surrounding community at site/facilities where these code requirements may apply will then be installed by code. Again in doing so this will address the larger portion of the effectiveness of the notification problem because the majority of the public depending on the geographical area and time of day could be outside of their homes and outside emergency communication early warning notification is essential so that they can protect their families by turning on their electronic devices and waiting for further instructions.

For some areas of our nation emergency communication systems as such are already installed at facilities/sites etc. and even emergency communication systems are being used for public community notification so this appendix may have little or no impact on those who choose to adopt this appendix.

Please consider this proposed Appendix with it's provisions/requirements that will give those governments, communities or tribes who are presently ICC compliant the opportunity to protect their communities, families, loved ones and especially those with special needs by using these new codes that many have been waiting for, for so many years.

Cost Impact: The cost impact of this code proposal will depend on many factors such as when this code is adopted, site inspections are done in order to determine what is required after doing a site analysis, the acoustical design and or other actions are performed in order to determine the cost of construction since the emergency communications system in some applications could also be considered an add-on, even an estimated cost of construction cannot honestly be determined at this time because each site will be different.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: JACOBY-F2-APPENDIX K.DOC

F236–09/10

Appendix K (New); IBC Appendix L (New)

Proponent: Sean DeCrane, Cleveland Fire Department, representing International Association of Fire Fighters

THIS IS A 2 PART CODE CHANGE. BOTH PARTS WILL BE HEARD BY THE FIRE CODE COMMITTEE AS 2 SEPARATE CODE CHANGES. SEE THE TENTATIVE HEARING ORDER FOR THE FIRE CODE COMMITTEE.

PART I – IFC

Add new appendix as follows:

APPENDIX K
BUILDING INFORMATION SIGN

The provisions contained in this appendix are not mandatory unless specifically referenced in the adopting ordinance.

SECTION K 101
GENERAL

K101.1 Scope New buildings shall have a building information sign(s) that shall comply with Sections 505.3.1 through 505.3.7. Existing buildings shall be brought into conformance with Sections K101.1 through K101.9 when one of the following occurs:

1. The fire department conducts an annual inspection intended to verify compliance with this section of the code, or any required inspection.
2. When a Change in Use or Occupancy has occurred.

Exceptions:

1. Utility occupancies
2. One and Two-family dwellings

K101.1.1 Sign location. The building information sign shall be placed on one of the following:

1. The entry door or sidelight at a minimum height of 42" above the walking surface on the address side of the building or structure;
2. The exterior surface of the building or structure no further than 3' from the entrance door, on either side of the entry door, at a minimum height of 42" above the walking surface on the address side of the building or structure;
3. Conspicuously placed, inside an enclosed entrance lobby, on any vertical surface within 10 feet of the entrance door at a minimum height of 42" above the walking surface;
4. Located inside the building's fire command center;
5. Located on the exterior of the fire alarm panel or immediately along side the panel door on the wall if the alarm panel is located in the enclosed main lobby.

K101.1.2 Sign features. The building information sign shall consist of:

1. White reflective background with red letters;
2. Durable material;
3. Numerals shall be Roman or Latin numerals, as required, and/or alphabet letters;
4. Permanently affixed to the building or structure in an approved manner.

K101.1.3 Sign shape. The building information sign shall be a Maltese Cross as shown in Figure K101.1.3

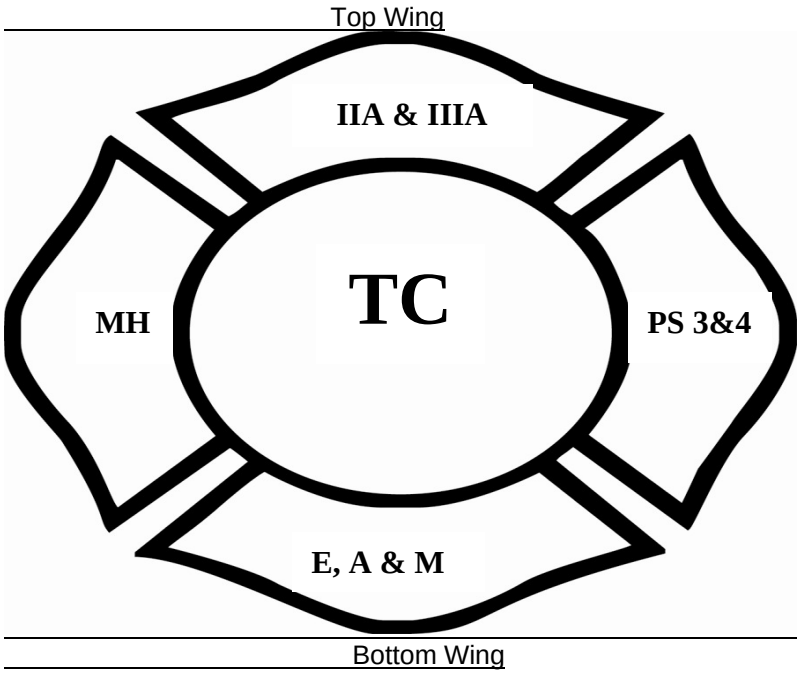

FIGURE K101.1.3
BUILDING INFORMATION SIGN

K101.1.4 Sign size and lettering. The minimum size of the building information sign and lettering shall be in accordance with the following:

1. The width and height shall be 6 inches by 6 inches
2. The height or width of each Maltese cross wing area shall be 1 1/8 inches and have a stroke width of ½ inch;
3. The center of the Maltese cross a circle of oval 3 ⅛ inches in diameter and has a stroke width of ½ inch;
4. All roman numerals and alphabetic designations, shall be 1 ¼ inch height and have a stroke width of ¼ inch.

K101.2 Sign designations. Designations shall be made based upon the construction type, content, hazard, fire protection systems, life safety and occupancy. Where multiple designations occur within a classification Category, the designation used shall be based on the greatest potential risk.

K101.3 Construction type (TOP WING). The construction types shall be designated by assigning the appropriate Roman numeral, and letter, placed inside the top wing of the Maltese cross. The hourly rating provided is for the structural framing in accordance with Table 601 of the *International Building Code*,

Construction Type	**Hourly Rating**
IA - Non-Combustible Construction -	3 Hour Rating
IB –Non-Combustible Construction -	2 Hour Rating
IIA – Non-Combustible Construction -	1 Hour Rating
IIB – Non-Combustible Construction -	0 Hour Rating
IIIA – Non-Combustible/Combustible Construction -	1 Hour Rating
IIIB – Non-Combustible/Combustible Construction -	0 Hour Rating
IV – Heavy Timber Construction -	
VA – Combustible Construction -	1 Hour Rating
VB – Combustible Construction –	0 Hour Rating

K101.4 Fire protection systems (Right Wing). The fire protection systems shall be designated by determining its level of protection and assigning the appropriate designation to the right wing of the Maltese cross. Where multiple systems are provided, all shall be listed:

AS – Automated Fire Sprinkler System installed throughout;
DS – Dry Sprinkler System and designated areas
FAS – Fire Alarm System
FP – Fire Pump
FW – Fire Wall and designated areas
PAS – Pre-Action Sprinkler System and designated floor
PS – Partial Automatic Fire Sprinkler System, and designate floor;
CES – Chemical Extinguishing System and designated area,
CS – Combination Sprinkler and Standpipe System;
S – Standpipe System;
NS – No system installed

K101.5 Occupancy type (Bottom Wing). The occupancy of a building or structure shall be designated in accordance with the occupancy classification found in Section 302.1 of the *International Building Code* and the corresponding designation shall be placed in the bottom wing of the Maltese cross. When a building or structure contains a mixture of uses and occupancies; all uses and occupancies shall be identified.

A – Assembly
B – Business
E – Educational
F – Factory or Industrial
H – High Hazard
I – Institutional
M – Mercantile
R – Residential
S – Storage

K101.6 Hazards of content (Left Wing). The hazards of building contents shall be designated by one of the following classifications as defined in NFPA 13 and the appropriate designation shall be placed inside the left wing of the Maltese cross:

LH - Light Hazard
MH - Moderate Hazard
HH - High Hazard

K101.7 Tactical Considerations (Center Circle). The Center Circle shall include the name of the local Fire Service and when required the letters TC for Tactical Considerations. When fire fighters conduct pre-plan operations, a unique situation(s) for tactical considerations shall be identified and the information provided to the fire dispatch communications center to further assist fire fighters in identifying that there is special consideration(s) for this occupancy. Special consideration designations include, but are not limited to:

1. Impact resistant drywall
2. Impact resistant glazing, such as blast or hurricane type glass
3. All types of roof and floor structural members including but not limited to post tension concrete, bar joists, solid wood joists, rafters, trusses, cold-formed galvanized steel, I-joists and I-beams; Green roof with vegetation, soil & plants
4. Hazardous materials, explosives, chemicals, plastics, etc;
5. Solar Panels and DC electrical energy
6. HVAC system; and smoke management system for pressurization and exhaust methods
7. Other unique characteristic(s) within the building that are ranked according to a potential risk to occupants and firefighters

K101.8 Sign classification maintenance, Building information sign maintenance shall comply with each of the following:

1. Fire departments in the jurisdiction shall define the designations to be placed within the sign.
2. Fire departments in the jurisdiction shall conduct annual inspections to verify compliance with this section of the code and shall notify the owner, or the owners agent, of any required updates to the sign in accordance with fire department designations and the owner, or the owner's agent, shall comply within thirty (30) days.
3. The owner of a building shall be responsible for the maintenance and updates to the sign in accordance to fire department designations.
4. The owner of a building shall notify the fire department of any changes that possibly effect the classifications, of the system, within thirty (30) days of the changes and the Fire Department shall conduct an inspection.
5. The owner of a building shall change the effected classification posted on the sign within thirty (30) days of the changes.

K101.9 Training. Jurisdictions shall train all fire department personnel on Sections K101.1 through K101.9

PART II – IBC GENERAL

Add new appendix as follows:

APPENDIX L
BUILDING INFORMATION SIGN

SECTION L101
GENERAL

L101.1 Scope New buildings shall have a building information sign(s) that shall comply with Sections 505.3.1 through 505.3.7. Existing buildings shall be brought into conformance with Sections L101.1 through L101.9 when one of the following occurs:

1. The fire department conducts an annual inspection intended to verify compliance with this section of the code, or any required inspection.
2. When a Change in Use or Occupancy has occurred.

Exceptions:

1. Utility occupancies
2. One and Two-family homes

L101.1.1 Sign location. The building information sign shall be placed on one of the following:

1. The entry door or sidelight at a minimum height of 42" above the walking surface on the address side of the building or structure;
2. The exterior surface of the building or structure no further than 3' from the entrance door, on either side of the entry door, at a minimum height of 42" above the walking surface on the address side of the building or structure;
3. Conspicuously placed, inside an enclosed entrance lobby, on any vertical surface within 10 feet of the entrance door at a minimum height of 42" above the walking surface;
4. Located inside the building's fire command center;
5. Located on the exterior of the fire alarm panel or immediately along side the panel door on the wall if the alarm panel is located in the enclosed main lobby.

L101.1.2 Sign features. The building information sign shall consist of:

1. White reflective background with red letters;
2. Durable material;
3. Numerals shall be Roman or Latin numerals, as required, and/or alphabet letters;
4. Permanently affixed to the building or structure in an approved manner.

L101.1.3 Sign shape. The building information sign shall be a Maltese Cross as shown in Figure L101.1.3

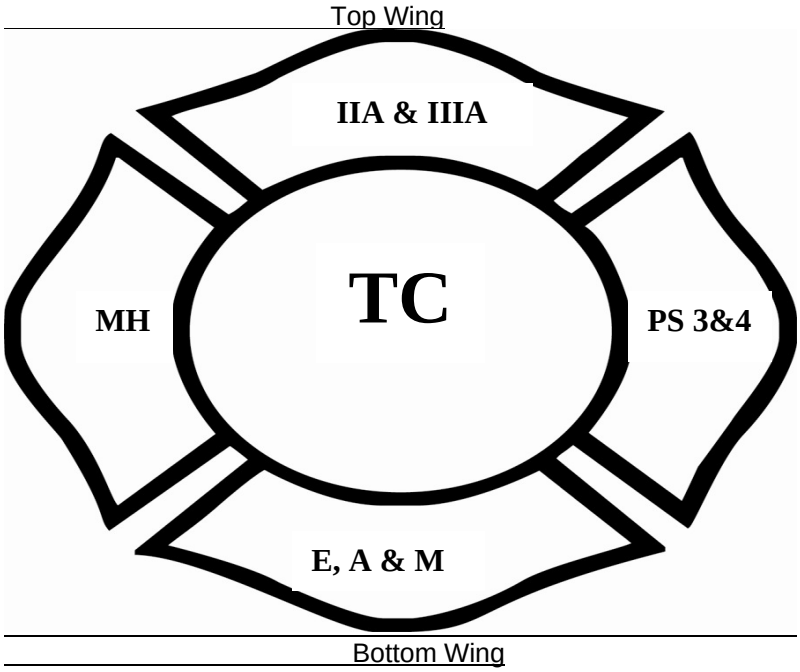

FIGURE L101.1.3
BUILDING INFORMATION SIGN

L101.1.4 Sign size and lettering. The minimum size of the building information sign and lettering shall be in accordance with the following:

1. The width and height shall be 6 inches by 6 inches
2. The height or width of each Maltese cross wing area shall be 1 1/8 inches and have a stroke width of ½ inch;
3. The center of the Maltese cross a circle of oval 3 ⅛ inches in diameter and has a stroke width of ½ inch;
4. All roman numerals and/or alphabetic designations, shall be 1 ¼ inch height and have a stroke width of ¼ inch.

L101.2 Sign designations. Designations shall be made based upon the construction type, content, hazard, fire protection systems, life safety and occupancy. Where multiple designations occur within a classification Category, the designation used shall be based on the greatest potential risk.

L101.3 Construction type (TOP WING). The construction types shall be designated by assigning the appropriate Roman numeral, and letter, placed inside the top wing of the Maltese cross. The hourly rating provided is for the structural framing in accordance with Table 601 of the *International Building Code*,

Construction Type	**Hourly Rating**
IA - Non-Combustible Construction -	3 Hour Rating
IB –Non-Combustible Construction -	2 Hour Rating
IIA – Non-Combustible Construction -	1 Hour Rating
IIB – Non-Combustible Construction -	0 Hour Rating
IIIA – Non-Combustible/Combustible Construction -	1 Hour Rating
IIIB – Non-Combustible/Combustible Construction -	0 Hour Rating
IV – Heavy Timber Construction -	
VA – Combustible Construction -	1 Hour Rating
VB – Combustible Construction –	0 Hour Rating

L101.4 Fire protection systems (RIGHT WING). The fire protection systems shall be designated by determining its level of protection and assigning the appropriate designation to the right wing of the Maltese cross. Where multiple systems are provided, all shall be listed:

AS – Automated Fire Sprinkler System installed throughout;
DS – Dry Sprinkler System and designated areas
FAS – Fire Alarm System
FP – Fire Pump
FW – Fire Wall and designated areas
PAS – Pre-Action Sprinkler System and designated floor
PS – Partial Automatic Fire Sprinkler System, and designate floor;
CES – Chemical Extinguishing System and designated area,
CS – Combination Sprinkler and Standpipe System;
S – Standpipe System;
NS – No system installed

L101.5 Occupancy type (Bottom Wing). The occupancy of a building or structure shall be designated in accordance with the occupancy classification found in Section 302.1 of the *International Building Code* and the corresponding designation shall be placed in the bottom wing of the Maltese cross. When a building or structure contains a mixture of uses and occupancies; all uses and occupancies shall be identified.

A – Assembly
B – Business
E – Educational
F – Factory or Industrial
H – High Hazard
I – Institutional
M – Mercantile
R – Residential
S – Storage

L101.6 Hazards of content (Left Wing). The hazards of building contents shall be designated by one of the following classifications as defined in NFPA 13 and the appropriate designation shall be placed inside the left wing of the Maltese cross:

LH - Light Hazard
MH - Moderate Hazard
HH - High Hazard

L101.7 Tactical considerations (Center Circle). The Center Circle shall include the name of the local Fire Service and when required the letters TC for Tactical Considerations. When fire fighters conduct pre-plan operations, a unique situation(s) for tactical considerations shall be identified and the information provided to the fire dispatch communications center to further assist fire fighters in identifying that there is special consideration(s) for this occupancy. Special consideration designations include, but are not limited to:

1. Impact resistant drywall
2. Impact resistant glazing, such as blast or hurricane type glass
3. All types of roof and floor structural members including but not limited to post tension concrete, bar joists, solid wood joists, rafters, trusses, cold-formed galvanized steel, I-joists and I-beams; Green roof with vegetation, soil & plants
4. Hazardous materials, explosives, chemicals, plastics, etc;
5. Solar Panels and DC electrical energy
6. HVAC system; and smoke management system for pressurization and exhaust methods
7. Other unique characteristic(s) within the building that are ranked according to a potential risk to occupants and firefighters

L101.8 Sign classification maintenance, Building information sign maintenance shall comply with each of the following:

1. Fire departments in the jurisdiction shall define the designations to be placed within the sign.
2. Fire departments in the jurisdiction shall conduct annual inspections to verify compliance with this section of the code and shall notify the owner, or the owners agent, of any required updates to the sign in accordance with fire department designations and the owner, or the owner's agent, shall comply within thirty (30) days.
3. The owner of a building shall be responsible for the maintenance and updates to the sign in accordance to fire department designations.
4. The owner of a building shall notify the fire department of any changes that possibly effect the classifications, of the system, within thirty (30) days of the changes and the Fire Department shall conduct an inspection.
5. The owner of a building shall change the effected classification posted on the sign within thirty (30) days of the changes.

L101.9 Training. Jurisdictions shall train all fire department personnel on Sections L101.1 through L101.9

Reason: This Building Information Sign (BIS) is designed to be utilized in the crucial initial response of fire fighters to a structure fire. Similar to the Emergency Response Guidebook, published by the Department of Transportation, the BIS placard is designed to be utilized within the initial response time frame of an incident. Firefighters are trained to size-up a situation as early as possible after notification. The outward appearances of a building can be deceiving and the type of construction may not appear to be what it really is. This is becoming a more frequent occurrence within many communities.. Having the BIS placard will allow responding fire companies to make an informed tactical decision. The responding fire company will be able to identify the type of construction, hazard level of the contents, structural framework, occupancy of the building and the building fire protection system features , as well as he extent of the protection,

In the fire service there are many times we are dispatched to a location or area without an address, I.e. A fire company is dispatched in the vicinity of: Main St. and 5th Ave.. placing this information electronically will not address those incidents. Once the fire company has located the building or structure, the company officer can relay the correct address to the Dispatching Center and exit the apparatus to begin an assessment by making tactical decisions from the BIS building placard. The company officer cannot afford to wait until Dispatch sends an electronic form of the placard to t a mobile computer unit. This sign will give the arriving fire officer information to rapidly begin his/her assessment.

Another instance where a BIS placard is valuable for a Mutual Aid response to your community. Mutual Aid fire companies do not always share the same Dispatching Centers therefore they would not have the ability to receive the electronic communication. Placing this placard in designated locations will allow arriving Mutual Aid companies to begin proper tactical assessments.

Also within the Tactical Considerations (TC) section, the BIS placard will allow fire fighters to identify additional considerations. Just by seeing that there are additional TC considerations would give firefighters pause to consider unique aspects of the situation, such as:

Are there special needs for the occupants?
Is the interior constructed of impact resistant dry wall which will make wall breeching very difficult?
Is there hurricane glazing?
Is there an above ground 1500 gallons fuel oil tank in the basement?

Does the building contain dimension lumber, trusses, I-joists, cold formed steel, etc. in the roof or floors members?

These TC concerns can be identified and placed within the Tactical Considerations section of the BIS placard. The National Institute for Occupational Safety and Health (NIOSH) released an Alert Report, 'Preventing Injuries and Deaths of Fire Fighters Due to Truss System Failures[1] and made recommendations to identifying structures by suggesting that building owners and managers "Consider placing building construction information outside the building. Include information about roof and floor type (presence of trusses, materials used), roof loads (heating, ventilation, and air conditioning (HVAC) units, sprinkler systems, utilities, hazardous materials stored on site and emergency contact numbers. Use and follow the proper building codes."

This Building Information Sign has brought many people together from various private industries and public agencies such as:

Structural Building Component,
Steel & Wood industries,
Building officials, and the
Fire Service,

So as to collaborate on a BIS system that is comprehensive and meets the need of the fire service for information that allows for a quicker building assessment on the fire ground. This addresses a key question that has been asked for quite some time -- "How do we provide building information to the fire service?". With this Building Information Sign we will be providing fire fighters crucial information at the most important time period. Fire Officers will be able to make decisions-based tactics on the knowledge provided within this building BIS placard or be prompted by other Tactical Considerations to request more information from the dispatch center.

Appendix K (New)

Proponents: Patrick Siegman, Principal, Nelson, Nygaard Consulting Associates, representing the Congress for the New Urbanism; Peter Swift, Owner, Swift and Associates, representing the Congress for the New Urbanism; John Norquist, CEO, Congress for the New Urbanism

Add new Appendix as follows:

APPENDIX K
STREET DESIGN FOR LIFE SAFETY

The provisions contained in this appendix are not mandatory unless specifically referenced in the adopting ordinance.

SECTION K101
GENERAL

K101.1 Intent. The purpose of this appendix is allow jurisdictions to adopt performance-based requirements for fire apparatus access roads, in order to achieve all of the following purposes:

1. Establish the minimum requirements consistent with nationally recognized good practice for providing a reasonable level of life safety and property protection from the hazards of fire, explosion or dangerous conditions in new and existing buildings, structures and premises and to provide safety to fire fighters and emergency responders during emergency operations.
2. On the new and existing fire apparatus access roads required by and regulated by this code, establish requirements consistent with nationally and internationally recognized good practice for achieving a reasonable level of overall life safety, by taking into account and balancing the need to prevent road traffic deaths and injuries and the need to safeguard against the hazards of fire, explosions and other dangerous conditions.

K101.2 Scope. If this appendix is adopted by a jurisdiction, then the following changes to the current provisions of the code come into effect within the jurisdiction:

101.2 Scope. This code establishes regulations affecting or relating to structures, processes, premises and safeguards regarding:

1. The hazard of fire and explosion arising from the storage, handling or use of structures, materials or devices;
2. Conditions hazardous to life, property or public welfare in the occupancy of structures or premises;
3. Conditions hazardous to life, property or public welfare on or relating to the design of fire apparatus access roads, including the hazards of traffic, fire, explosion and other dangerous conditions;
4. Fire hazards in the structure or on the premises from occupancy or operation;
5. Matters related to the construction, extension, repair, alteration or removal of fire suppression or alarm systems.
6. Conditions affecting the safety of fire fighters and emergency responders during emergency operations.

101.3 Intent. The purpose of this code is to establish the minimum requirements consistent with nationally recognized good practice for providing a reasonable level of life safety and property protection from the hazards of fire, explosion or dangerous conditions in new and existing buildings, structures and premises and to provide safety to fire fighters and emergency responders during emergency operations. Additionally, on the new and existing fire apparatus access roads required by and regulated by this code, the purpose of this code is to establish requirements consistent with nationally and internationally recognized good practice for achieving a reasonable level of overall life safety, by taking into account and balancing the need to prevent road traffic deaths and injuries and the need to safeguard against the hazards of fire, explosions and other dangerous conditions.

503.2.1 Dimensions. Fire apparatus access roads shall have an unobstructed width ~~of not less than 20 feet (6096 mm), exclusive of shoulders, except for approved security gates in accordance with Section 503.6,~~ and an unobstructed vertical clearance ~~of not less than 13 feet 6 inches (4115 mm).~~ that permits passage of the

jurisdiction's fire apparatus and, wherever necessary, provides adequate space for deploying the jurisdiction's fire apparatus and for conducting fire and rescue operations.

~~**503.2.2 Authority.** The fire code official shall have the authority to require an increase in the minimum access widths where they are inadequate for fire or rescue operations.~~

503.2.4 Turning radius. The required turning radius of a fire apparatus access road shall ~~be determined by the fire code official.~~ provide for the passage of the jurisdiction's fire apparatus.

503.2.7 Grade. The grade of the fire apparatus access road shall be ~~within the limits established by the fire code official based on the fire department's apparatus.~~ limited to grades that permit passage by, and, wherever necessary, fire and rescue operations by, the jurisdiction's fire apparatus.

503.2.8 Design for road traffic safety. Fire apparatus access roads shall be designed and maintained so as to minimize road traffic deaths and injuries, while maintaining adequate provision for the passage of fire apparatus and for fire and rescue operations. To achieve these goals, fire apparatus access roads shall be designed and maintained to both: (a) permit passage of the jurisdiction's fire apparatus and, wherever necessary, provide adequate space for deploying the jurisdiction's fire apparatus and conducting fire and rescue operations; and (b) minimize excess and inappropriate vehicle speeds.

Reason: This proposed code change provides an appendix that allows, but does not require, a jurisdiction to substitute revised material for current provisions of the code. That is, if the appendix is adopted by a jurisdiction, then the jurisdiction has elected to substitute revised materials for current provisions of the code. This appendix is intended to allow jurisdictions to take an approach to the design of fire apparatus access roads that improves overall life safety, by allowing jurisdictions to adopt roadway designs that strike the best possible balance between reducing the hazards of fire and reducing road traffic deaths and injuries, given the jurisdiction's own particular circumstances and particular choice of fire apparatus.

The text below attempts to provide clear and succinct answers to the questions asked for in the "Supporting Information" Section of the Code Change Proposal Instructions. That is, the following paragraphs state the purpose of the proposed code change, justify changing the current code provisions and seek to explain why the proposed code change is superior to the current provisions of the code.

1. What is the purpose of this proposed code change (e.g., clarify the code; revise outdated material; substitute new or revised material for current provision of the code; add new requirements to the code; delete current requirements, etc.)?

Response: This proposed code change provides an appendix that allows, but does not require, a jurisdiction to substitute revised material for current provisions of the code. That is, if the appendix is adopted by a jurisdiction, then the jurisdiction has elected to substitute revised materials for current provisions of the code. This approach will allow jurisdictions to take an approach to the design of fire apparatus access roads that we believe improves overall life safety, by allowing jurisdictions to adopt roadway designs that strike the best possible balance between reducing the hazards of fire and reducing road traffic deaths and injuries, given the jurisdiction's own particular circumstances and particular choice of fire apparatus. By allowing, but not requiring, jurisdictions to adopt this proposed appendix, the ICC will make it possible for jurisdictions to demonstrate the efficacy of this approach, without taking the more far-reaching step of simply altering the basic code.

2. What is the justification for changing the current code provisions? Why is the proposal superior to the current provisions of the code? Proposals that add or delete requirements shall be supported by a logical explanation which clearly shows why the current code provisions are inadequate or overly restrictive, specifies the shortcomings of the current code provisions and explains how such proposals will improve the code.

Response: The current International Fire Code specifies dimensions for fire apparatus access roads. Three key points about fire apparatus access roads should be noted:

1. The code requires that at least one fire apparatus access road be provided for every facility, building or a portion of the building hereafter constructed or moved into within a jurisdiction.
2. The code defines a fire apparatus access road as a road that provides fire apparatus access from a fire station to a facility, building or portion thereof.
3. The code defines fire apparatus access road as a general term inclusive of all other terms such as fire lane, public street, private street, parking lot lane and access roadway.

Therefore, since at least one fire apparatus access road must reach from a fire station to every building and facility constructed once the code is adopted, **the current International Fire Code specifies the key dimensions of many, if not most, public and private streets.** This is significant not only for fire safety, but also for road safety. A substantial body of traffic safety research literature has found conclusively that the dimensions of streets significantly affect road safety. Therefore, **the current International Fire Code sets specifications for the design of many, if not most, public and private streets, and these specifications significantly affect traffic safety.**

Since the essential purpose of the International Fire Code is to provide for a reasonable level of life safety and property protections from the hazards of fire, explosion or dangerous conditions in new and existing buildings, structures and premises and to provide safety to fire fighters and emergency responders during emergency operations, the code may not always be thought of as a code that has significant and far-reaching effects on road safety. The reality, however, is that the International Fire Code does significantly affect road design, and therefore, significantly affects road traffic deaths and injuries.

We believe that the International Code Council can substantially advance the cause of improving overall life safety by taking the following actions:

1. ***Embrace the goal of improving overall life safety***, including preventing not only the tragedies caused by fire, structural collapse and other hazards that have long been explicitly focused on by code enforcement and fire officials, but also road traffic deaths and injuries.

2. ***Dedicate itself to reducing the burden of global road traffic deaths and injuries***, by committing itself to work in partnership with a broad range of organizations and governments to develop and implement road safety strategies, plans and codes.
3. ***Work together with road safety organizations to thoroughly review the existing codes promulgated by the International Code Council to ensure that the codes embrace internationally recognized good practices for protecting life safety, including not only reducing the hazards of fire, explosion and other dangerous conditions in buildings, but also reducing road safety hazards.***

While the International Code Council may never wish to expand its mission to include the task of writing full road safety codes, the Council can and we believe should work closely with road safety organizations to ensure that building codes and regulations, such as the fire apparatus access road provisions of the International Fire Code, allow for and encourage best practices in road safety.

The attached code change proposal is submitted in the spirit of cooperation between code enforcement and fire officials and road safety professionals. It was drafted out of our concern that the current provisions of the International Fire Code for fire apparatus access roads do not strike the best possible balance between reducing the hazards of fire and other building-related hazards, and reducing road traffic deaths and injuries. This submission is intended as a first step in bringing road safety professionals and fire service professionals together to work on an area of mutual concern: fire apparatus access roads are not only the areas where firefighters must set up equipment and fight conflagrations, but also the site of innumerable traffic deaths and injuries. The design of fire apparatus access roads (that is, the design of many public and private streets) is necessarily a balancing act, where there are frequently conflicts, tensions and trade-offs between the goals of improving road safety and improving fire safety. The very best design for bringing fire engines quickly to the scene of an incident, or the very best design for providing room to deploy equipment at the scene of a fire, is often not the best design for ensuring low motor vehicle speeds and pedestrian safety at a school crosswalk, or on a quiet residential street.

In drafting this code change proposal, we sought to recognize these tensions and trade-offs regarding fire apparatus access roads, and then to draft a code change proposal that would allow jurisdictions to do a better job of overcoming these conflicts. This code change proposal is intended to allow jurisdictions to design roads for overall life safety, including both fire safety and road safety. It is based on the following principles:

1. The necessary minimum dimensions of fire apparatus access roads are driven in large part by the size, weight, configuration and capabilities of a jurisdiction's fire apparatus.
2. The necessary minimum dimensions of fire apparatus access roads also depend on the staffing, strategies and tactics employed by a jurisdiction.
3. The characteristics of fire apparatus, and the staffing, strategies, and tactics of firefighters and emergency responders, vary widely from jurisdiction to jurisdiction, both internationally and within nations.
4. Roadway dimensions and design significantly affect road safety.
5. Therefore, the roadway designs that can be used by a jurisdiction to improve road safety on fire apparatus access roads vary depending on the fire apparatus employed by that community. Designs for road safety that work well in one jurisdiction may introduce significant difficulties for fire fighting in another jurisdiction where the fire apparatus that is in use is significantly larger, less maneuverable or less capable of deploying in a smaller space.
6. Therefore, rather than employing a one-size-fits-all approach to fire apparatus access roads, which assumes that all jurisdictions around the world and across the nation employ similar fire apparatus, this proposed code change recommends a performance-based approach.
7. Employing a more performance-based approach will make it possible to better balance the goals of improving road safety and improving fire and building safety, while taking into account the major differences between jurisdictions in fire apparatus, staffing, strategies and tactics.

We note that the existing provisions for fire apparatus access roads in Section 503 contain a mix of prescriptive and performance-based requirements. This proposed code change moves further in the direction of a performance-based approach, in the interest of making it more feasible to adopt roadway design solutions that resolve conflicts between road safety and fire safety, are carefully tailored to the fire apparatus in use in a jurisdiction, and improve overall life safety.

As background, the following sections briefly review several considerations that are crucial for designing streets that improve overall life safety. These sections briefly review:

- the magnitude of road traffic deaths and injuries
- road safety risk factors
- the relationship between street design and road safety
- examples of roadway design elements that improve road safety
- the tensions and trade-offs between accommodating needed access for and operations of fire apparatus, and designing streets that improve road safety

First, what is the magnitude of the road traffic safety problem, and why should the ICC be concerned about it?

Why should the International Code Council be concerned about road safety?

The Commission for Global Road Safety succinctly describes the reasons why all citizens, and particularly those of us who dedicate their professional lives to improving public safety, should focus our attention on road safety. According to the Commission's 2006 report, *Make Roads Safe*[1]:

> *Deaths and injuries from road traffic crashes are a major and growing public health epidemic. The World Health Organization has estimated that in 2002 almost 1.2 million people died in road crashes worldwide and as many as 50 million were injured. Unless action is taken, global road deaths are forecast to double by 2020 and yet many of these deaths and injuries are known to be preventable…*
> *High income countries have developed effective road safety measures after decades of trial and error and human tragedy. While more effort is still needed in the industrialised nations the major challenge now is to ensure through early intervention that low and middle income countries do not have to experience the same bitter learning curve…*
> *The World Report on road traffic injury prevention, published by WHO and the World Bank in 2004, details the key road injury 'risk factors', the major contributing factors to road crashes and injury severity, including drink driving; lack of helmet use; seat belt non compliance; excessive speed; and poor infrastructure design and management.*

1 Commission for Global Road Safety. *Make Roads Safe*. London, United Kingdom. Commission for Global Road Safety, 2006, p. 2. [Accessed June 1, 2009]. Available at http://www.makeroadssafe.org/publications/Documents/mrs_report_2007.pdf

As a leading international organization -- if not the leading international organization -- devoted to building a safer world, the International Code Council can play an important role in solving this epidemic. At a minimum, even if it seeks no active role, the ICC will nonetheless be involved, because by specifying the key dimensions of so many public streets (i.e., the dimensions of fire apparatus access roads), the ICC's codes now play a major role in street design and therefore in road safety.

What Are Road Safety Risk Factors?
As the Commission for Global Road Safety's *Make Roads Safe* report notes, road safety specialists frequently refer to risk factors.

Primary Risk
The report notes that, "Primary risk describes the factors that contribute to the risk of occurrence of a road crash." Two of the four primary risk factors are *behavioral factors*, which are influenced by roadway dimensions and design, and the *road environment*, which is directly determined by roadway dimensions and design.[2]
According to the report, regarding behavioral factors:

> *Excessive or inappropriate speed is a key contributor to crash risk. Speed choice is influenced by the legal speed limit, but also by road layout...*

According to the report, regarding road environment:

> *Road safety engineering and traffic management make a direct contribution to reduction of crash risk. Crash risk is increased by lack of attention to safety in both planning and design of new road networks and new roads. Road design affects road user behavior and crash risk through the speed the drivers will perceive as appropriate, through detailed design factors such as curves...*
> *In modern road systems, vulnerable road users are disadvantaged because such systems are largely designed for the motor vehicle. The absence of footpath and cycle tracks, or traffic calming measures to reduce speed where pedestrians and cyclists mix with motorized traffic, increases the risk of a crash occurring and its severity.*

Secondary Risk
"Secondary risk", the report explains, "includes the likelihood of injury occurring and its severity." As with primary risk, two of the major risk factors are behavioral factors, which are influenced by roadway dimensions and design, and the road environment, which is directly determined by roadway dimensions and design. As the report explains:

> *Impact speed is a crucial determinant of injury severity for vulnerable road users. For example, 90% of pedestrian survive impacts with cars at speeds up to 30 km/hour [18 mph], but more than half will die at speeds of 45 km/hour [27 mph] or more…*
> *[F]or vehicle occupants also, injury severity increases with impact speed. The probability of fatal injury increases from close to zero to almost 100% as the change in impact speed increases from 20 km/hour to 100 km/hour…*
> *Road design can also provide protection for vulnerable road users by reducing impact speed through traffic calming measures.*

Other traffic safety research arises similar conclusions. For example, other research studies have found that when people walking are hit by a car:

- At 20 mph, only 5 percent of walkers are killed, most injuries are slight, and 30 percent suffer no injury;
- At 30 mph, 45 percent of walkers are killed, and many are seriously injured;
- At 40 mph, 85 percent of walkers are killed.[3]

Understanding the links between the dimensions of fire apparatus access roads and the likelihood of road traffic deaths and injuries on these roads
The transportation safety research literature makes clear that:

1. The behavior of motor vehicle drivers, bicyclists, pedestrians and other road users is substantially affected by the dimensions of streets.
2. Key roadway dimensions which have been found to significantly affect driver behavior include the following:

    a. roadway widths,
    b. lane widths,
    c. the presence or absence of raised medians, pedestrian refuges and similar measures (note that feasibility of including such measures in a roadway design is often dependent upon the requirements for roadway widths in the vicinity of these measures)
    d. the presence or absence of roundabouts, traffic circles, splitter islands and similar intersection design measures (again, note that feasibility of such intersection designs is highly dependent upon the requirements for roadway widths in the vicinity of these measures)
    e. turning radii (a.k.a. horizontal curvature) at curves in a roadway,
    f. turning radii (i.e., horizontal deflection) at roundabouts, traffic circles, median islands and channelized turns,
    g. curb radii at intersections,

3. The roadway dimensions and features described above affect important aspects of driver and pedestrian behavior. For example, the presence or absence of a raised median on a roadway affects the ability of drivers to make passing maneuvers, midblock turns or to drift into oncoming traffic.
4. It is particularly important to note that the key roadway dimensions mentioned above affect the speed at which motor vehicle drivers choose to drive. As described above, motor vehicle speed is a key determinant of both the likelihood of a crash occurring and crash severity.
5. Because the dimensions of streets strongly affect the behavior of motorists, bicyclists, pedestrians and other road users, the dimensions of streets significantly affect traffic safety.

Section 503.2 of the current code sets specifications for the dimensions of fire apparatus access roads, including specifying the following key dimensions:

- fire apparatus access roads shall have an unobstructed width of not less than 20 feet;
- the required turning radii of fire apparatus access roads shall be determined by the fire code official.

---

[2] Ibid. p. 60.
3 Limpert, Rudolph. *Motor Vehicle Accident Reconstruction and Cause Analysis*. Fourth Edition. Charlottesville, VA. The Michie Company, 1994, p. 663. See also *Killing Speed and Saving Lives*, United Kingdom Dept. of Transportation, London, England.

While these two specifications are brief, their effect is far-reaching. By setting specifications for the key dimensions of road width and turning radii, Section 503.2 of the code sets specifications for many of the roadway dimensions and street design features (mentioned above) which are known to significantly affect traffic safety.

The following paragraphs provide several examples of the relationship between these two crucial street dimensions (roadway width and turning radii) and the ability to include important design features for traffic safety in a roadway design. In many circumstances, an absolute requirement to provide an unobstructed width of not less than 20 feet at every point along a roadway creates significant conflicts with the need to include roadway design features that improve traffic safety.

Often, these conflicts can be and have been resolved through careful design that consciously balances the need for traffic safety and the needs of firefighters to reach incidents and conduct fire and rescue operations. For example, while particular critical points along a roadway may be intentionally designed with a width of less than 20 foot clear, in order to reduce vehicle speeds and improve traffic safety, other areas along the same block will be provided with at least 20 foot clear, in order to provide, wherever necessary, sufficient space to set up equipment and fight fires.

The proposed appendix, by creating performance-based standards for fire apparatus access roads, will assist in the process of reconciling these conflicts. It provides more flexibility for street design, while still ensuring that streets are designed to allow for the passage of fire apparatus, and space to conduct fire and rescue operations.

Street Design for Traffic Safety: Examples

A few examples of roadway designs that can significantly improve traffic safety, but that frequently require roadway designs with less than 20 foot clear (at some, though not all places along a roadway) include the following:

1. Modern roundabouts
2. Raised medians
3. Low-volume local streets

Each is described in turn below.

1. Modern Roundabouts: The California Department of Transportation recently concluded, "The modern roundabout is now recognized nationally as an intersection type and traffic control treatment capable of providing unique and significant operational and safety benefits over a wide range of traffic volume and conditions. In particular, national research has confirmed that the single-lane version is especially effective in reducing collision frequency and/or severity for all highway users."[4]

Safety of modern roundabouts: Both overseas and in the United States, modern roundabouts have achieved a 50% to 90% reduction in injury accidents compared with intersections using stop control or traffic signals. The most comprehensive survey of roundabout safety in the United States was carried out in 1997 by the Transportation Research Board, and found that at intersections which were converted to roundabouts, overall crashes were reduced by 37% and injury accidents by 51%. The study also broke the results down for large roundabouts with three-lane entries, and smaller roundabouts with one- or two-lane entries. At these smaller roundabouts, crash reductions were even more pronounced: total crashes fell by 51%, with injury crashes reduced by 73%.

Capacity: roundabouts can often offer higher traffic-moving capacity than traffic signals, which in many circumstances leads to significantly reduced delays. The Transportation Research Board survey of intersections converted to roundabouts in the United States, for example, found that in the eight cases where vehicle delays had been measured, rush hour delays had been reduced by an average of 77%.

[4] *California Department of Transportation Design Information Bulletin #80-01: Roundabouts*. October 3, 2003, p. 1. [Accessed June 1, 2009]. Available at http://www.dot.ca.gov/hq/oppd/dib/dib80-01.pdf.

A typical modern roundabout in University Place, WA. At the roundabout entry, the clear width provided is only approximately 13 feet: this is an intentional design element to keep vehicle speeds low. Photo: IMG0032.jpg

Another modern roundabout near a school in Montpelier, VT. Again, note that the entry widths are kept to no more than 13 feet, to ensure low speeds both at the pedestrian crosswalks and within the intersection. Photo: IMG0027.jpg

The conflict between the current code requirement for 20 foot clear width at all points along every fire apparatus access road and the design of roundabouts occurs primarily with the design of roundabouts with one-lane entries. Roundabouts *are* designed to ensure that the largest fire apparatus (as well as tractor-trailer trucks and other large vehicles) that will use the roundabout are accommodated. However, as explained in

Roundabouts: an Informational Guide, the Federal Highway Administration's widely-used guide to roundabout design:

> *Roundabouts operate most safely when the geometry forces traffic to enter and circulate at slow speeds. Horizontal curvature and narrow pavement widths are used to produce this reduced-speed environment.* [5]

Furthermore, the Guide explains:

> *To maximize the roundabout's safety, entry widths should be kept to a minimum..The design should provide the minimum width necessary for capacity and accommodation of the design vehicle in order to maintain the highest level of safety. Typical entry widths for single-lane entrances range from 4.3 to 4.9m (14 to 16 ft); however, values…lower than this range may be required for site-specific design vehicle and speed requirements for critical vehicle paths.*

Thus, to design safe single-lane roundabouts, it is routinely necessary that at the roundabout entries, entry widths must be kept below 20 foot clear. This particular circumstance occurs only for a short distance at the intersection entry. However, it is a critical dimension and one that constantly conflicts with a requirement of 20 foot unobstructed width at all points along fire apparatus access roads.

2. Landscaped medians: There are important advantages to raised and landscaped medians, beyond their aesthetic appeal. In general, published studies conclude that on major roadways, raised central medians provide significant safety benefits when compared to undivided roads and roads with two-way left-turn lanes.

For example, examining overall crash rates – both midblock and intersection – for suburban arterials, Bowman & Vecellio's comprehensive study[6] found a rate of 373 vehicular crashes per million vehicle miles for roadways with a raised median, versus 676 vehicular crashes per million vehicle miles (or some 80% higher) for roadways with a two-way left-turn lane. Overall rates of rear end, right angle, head-on and left-turn crashes were all significantly reduced by the use of a median. Medians also ease crossings for pedestrians, and studies have found medians to be significantly safer for them. On suburban arterials, Bowman & Vecellio found the pedestrian crash rate for suburban arterials with raised medians to be 6.3 per million vehicle miles, versus 12.9 pedestrian crashes per million vehicle miles for those with two-way left-turn lanes. The conflict that occurs here with the requirement for 20 foot clear is that many roadways only have room within the right-of-way for, and also function most safely (from the point of view of traffic safety) with one traffic lane and one bicycle lane in each direction on each side of the median. This results in a roadway cross section typically provides 17 feet of clear width on each side of the median.

An example of an undivided roadway. Photo: IMG0064.jpg

An example of a roadway with a raised median and approximately 17 feet of clear width on each side of the median. Photo: median.jpg

3. Local Street Standards: Low-volume local streets are often purposefully designed to enforce low-driving speeds, obviating the need for future retrofits with speed bumps and other harsh traffic calming measures that can severely impact fire apparatus. For best traffic safety result, these minor residential streets are consciously designed to maintain average speeds of 20 mph or less. To achieve this, low-volume local streets are designed as traditional "yield streets". As the Institute of Transportation Engineers' Residential Streets, Third Edition explains:

> *Yield flow occurs when two-way traffic is impossible where parked vehicles are present. Thus, some motorists must stop and yield the right-of-way to oncoming vehicles. For decades prior to the 1960's, yield flow was the widely accepted norm for local streets. …Most local streets with low ADT [average daily traffic] may have yield-flow operation.*[7]

The AASHTO Greenbook, the standard reference on the geometric design of streets, also explicitly endorses yield streets:

> *The level of user inconvenience occasioned by the lack of two moving lanes is remarkably low in areas where single-family units prevail… In many residential areas a 26-ft.-wide roadway is typical. This curb-face-to-curb-face width provides for a 12-ft. center travel lane and two 7-ft. parking lanes. Opposing conflicting traffic will yield and pause on the parking lane area until there is sufficient width to pass*.[8]

The traffic safety research literature finds that yield streets result in a strong reduction in injury accident rates. Recent research compared injury accidents per mile per year on local streets against thirteen physical characteristics.[9] Street width was found to be significantly related to injury accidents, with the authors concluding that, "as street width widens, accidents per mile per year increases exponentially." The study's regression analysis found that a typical 36-foot wide residential street has 0.16 accidents per mile per year as opposed to 0.03 accidents per mile per year for a 24 foot wide street. This difference is about a 487 percent increase in accident rates (see figure, below). The safest streets were the narrow, 24-foot wide streets, with parking allowed on both sides, resulting in a clear width of approximately 10 feet.

Photo: 4THORDER.JPG

On low-volume local streets, providing widths of less than 20 foot clear can clearly provide numerous traffic safety benefits. The conflict between creating yield streets to meet this traffic safety goal, and the goal of ensuring safe access for fire and rescue operations, has been reconciled in numerous different ways by different jurisdictions. Frequent solutions include requiring that such streets always be through streets (rather than cul-de-sacs); requiring such streets to provide locations with 20 foot clear width at regular intervals (e.g., at all fire hydrants), so that areas exist to allow fire engines to set up and hook up hoses; and limiting building heights on such streets, so that is not necessary to deploy aerial ladders.

Cost Impact: The code change proposal will not increase the cost of construction

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: SIEGMAN-SWIFT-NORQUIST-F1-APPENDIX K.DOC

F238–09/10
Appendix K (New)

Proponent: Mark Nelson, Fire Marshal, County of Los Angeles, CA Fire Department

Add new appendix as follows:

APPENDIX K
ROOF OBSTRUCTIONS

The provisions contained in this appendix are not mandatory unless specifically referenced in the adopting ordinance.

SECTION K101
GENERAL

K101.1 Scope: This Appendix shall apply to the design, construction, and installation of solar photovoltaic systems, roof gardens and landscaped roofs on building roofs that obstruct more than 50% or 10,000 square feet of the total roof surface area.

Exception: Buildings that are four or more stories in height and protected with an approved automatic fire extinguishing system throughout.

SECTION K102
REVIEW

K102.1 Review: The fire code official shall review and approve the installation of solar photovoltaic systems, roof gardens, landscaped roofs or similar equipment or conditions as defined in the scope of this appendix prior to the building code official issuing a permit for the installation for such roof obstructions.

SECTION K103
SOLAR PHOTOVOLTAIC SYSTEMS SPECIFICATIONS

K103.1. Solar photovoltaic systems specifications: The California Office of the State Fire Marshal Solar Photovoltaic Installation Guideline, April 22, 2008, shall apply to the design, construction and installation of solar photovoltaic systems on roofs.

SECTION K104
ROOF GARDEN AND LANDSCAPED ROOFS
SPECIFICATIONS

K104.1 Roof gardens and landscaped roofs: Roof gardens and landscaped roofs shall be designed, constructed and installed in accordance with Sections J101.4.1.1 through J104.1.2.4.

K104.1.1 Single and two-unit residential dwellings: Installation of roof gardens and landscaped roofs on single and two-unit residential dwellings shall be in accordance with Sections J104.1.1.1 through J104.1.1.3.

K104.1.1.1 Hip roof design: Planted sections shall be located in a manner that provides a three (3') foot wide clear access pathway from the eave to the ridge on each roof slope where the planted sections are located. The access pathway shall be located at a structurally strong location on the building such as a bearing wall.

K104.1.1.2 Single ridge roof design: Planted sections shall be located in a manner that provides two (2) three (3') foot wide access pathways from the eave to the ridge on each roof slope where the planted sections are located.

K104.1.1.3 Hips and valleys: Planted sections shall be located no closer than one and one half (1.5') feet to a hip or a valley if planted sections are to be placed on both sides of a hip or valley. If the planted sections are to be located on only one side of a hip or valley that is of equal length then the planted sections may be placed directly adjacent to the hip or valley. Planted sections shall not be located closer than three feet (3') below the ridge.

K104.1.2 Commercial, industrial and multi-residential buildings. Installation of roof gardens and landscaped roofs on commercial, industrial and multi-residential buildings comprised of three or more dwelling units shall be in accordance with Sections J104.1.2.1 through J104.1.2.4.

> **Exception:** If the fire code official determines that the roof configuration is similar to that found in single and two-unit residential dwellings, the design requirements found in J101.3.2.1 may be utilized.

K104.1.2.1 Access: There shall be a minimum six (6') foot wide clear perimeter around the edges of the roof.

> **Exception:** If either axis of the building is 250 feet or less, there shall be a minimum four feet (4') wide clear perimeter around the edges of the roof.

K104.1.2.2 Pathways: Pathways shall be established in the design of the roof garden or landscaped roof installation. Pathways shall meet the following requirements:

K104.1.2.2.1 Location: The center line axis of pathways shall run on structural members or over the next closest structural member nearest to the center lines of the roof.

K104.1.2.2.2 Center line: The center line axis of pathways shall be provided in both axis of the roof.

K104.1.2.2.3 Alignment and Access: Pathways shall be in a straight line and provide not less than four (4') feet clear to skylights, ventilation hatches or roof standpipes.

K104.1.2.2.4 Clearance Around Roof Access Hatch: Pathways shall provide not less than four (4') feet of clearance around roof access hatch with at least one not less than four feet (4') clear pathway to parapet or roof edge.

K104.1.2.3 Size: Planted sections shall be no greater than 150 by 150 feet in distance in either axis.

K104.1.2.4 Emergency Fire Ventilation: Areas for emergency fire ventilation between planted sections shall be either:

1. A pathway that is eight (8') feet or greater in width.
2. A pathway that is four (4') feet or greater in width and bordering on existing roof skylights for ventilation hatches.
3. A pathway that is four (4') feet or greater in width with bordering four (4') feet by eight (8') feet "venting cutouts" every twenty (20') feet on alternating sides of the pathway.

SECTION K105
REFERENCED STANDARD

Reason: Unregulated installations of solar photovoltaic systems, gardens, and landscaping located on the roofs of buildings can create conditions which severely hinder firefighting ventilation operations. Firefighting ventilation allows the escape of heat, smoke, and gases from the interior compartments of a building, reduces the chances of a flashover condition, and greatly helps to restore and maintain a tenable interior environment in a building during a fire.

In many firefighting situations, roof top vertical ventilation is the only form of ventilation that can be employed to meet the need to quickly and effectively ventilate a building's interior. Rapid ventilation is often a critical element in allowing firefighters to enter a burning building to search for and rescue occupants, control the spread of fire, and create a tenable environment to extend the time a person could survive within a burning building.

In order to traverse a roof to place an effective ventilation opening near a fire, firefighters require access to the roof surface. Firefighters utilize techniques including "sounding" roofs with tools such as a rubbish hook, cutting small inspections holes with power saws in roofs to check for fire extension, and by using infrared cameras to check for heat concentrations on the surface of a roof. Installing roof obstructions without regard for firefighting ventilation operations may prevent firefighters from safely traveling along strong underlying roof structural members. Installing layers of waterproofing, building material, soil, and vegetation to the surface of a roof will very likely delay or preclude firefighting roof top ventilation operations unless consideration for ventilation operations were incorporated into the layout design of the roof obstruction.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: Code Change S10-09/10 appears on the hearing order of the IBC-Fire Safety Committee and proposes revisions to IBC Table 1505.1 and Section 1507.16 on this topic. Code changes F8-09/10 and F30-09/10 propose similar requirements. A review of the standard proposed for inclusion in the code, CSFM Solar Photovoltaic Installation Guideline, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

TENTATIVE ORDER OF DISCUSSION

2009/2010 PROPOSED CHANGES TO THE INTERNATIONAL FUEL GAS CODE

The following is the tentative order in which the proposed changes to the code will be discussed at the public hearings. Proposed changes which impact the same subject have been grouped to permit consideration in consecutive changes.

Proposed change numbers that are indented are those which are being heard out of numerical order. Indentation does **not** necessarily indicate that one change is related to another. Proposed changes may be grouped for purposes of discussion at the hearing at the discretion of the chair.

FG1 –09/10
202

Proponent: James Ranfone, representing American Gas Association

Revise definition as follows:

APPLIANCE. Any apparatus or device that utilizes ~~gas as~~ a fuel or raw material to produce light, heat, power, refrigeration or air conditioning.

Reason: The term "appliance" mainly applies to gas-fueled appliances in the IFGC but there are code requirements applying to appliances that use solid and oil fuels such as in Sections 503.5.7.1, 503.5.7.2, 503.5.7.3 and 503.5.7.4. Revising the term to become more general in nature improves the code by providing an accurate definition.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

RANFONE-FG18-202.DOC:

FG2 –09/10
202

Proponent: Guy Tomberlin, Bluemont, VA, representing self

Add new definitions follows:

COMBUSTIBLE ASSEMBLY. Wall, floor, ceiling or other assembly constructed of one or more component materials that are not defined as noncombustible.

COMBUSTIBLE MATERIAL. Any material not defined as noncombustible.

NONCOMBUSTIBLE MATERIALS. Materials that, when tested in accordance with ASTM E 136, have at least three of four specimens tested meeting all of the following criteria:

1. The recorded temperature of the surface and interior thermocouples shall not at any time during the test rise more than 54ºF (30ºC) above the furnace temperature at the beginning of the test.
2. There shall not be flaming from the specimen after the first 30 seconds.
3. If the weight loss of the specimen during testing exceeds 50 percent, the recorded temperature of the surface and interior thermocouples shall not at any time during the test rise above the furnace air temperature at the beginning of the test, and there shall not be flaming of the specimen.

Reason: These are the exact terms and definitions found in the IMC. They have been used for many years as the guiding principals for the installation of mechanical equipment. Please recall the first edition of the IMC which included fuel gas provisions, these were the definitions used. Since the IFGC fails to provide the definitions of these terms they are applied inconsistently and non-uniformly. Gypsum is a non combustible product according to the IBC however the application of gypsum in the IMC and IFGC is quite different. The IBC addresses gypsum when used to construct walls ceilings, etc.. In the IFGC, the only reference to gypsum would be when dealing with clearance to combustibles. It is common knowledge that gypsum is typically covered with a paper product which will in fact burn. It is not uncommon to see a brown or charred section of gypsum when it has been installed within the prohibited dimension of 6" for a single wall or 1" for a double wall chimney or vent (or connecter). You wouldn't want this situation any more than a wood stove installed to close to gypsum, there is no difference. Excessive heat next to paper will cause fire.

The testimony on this proposal has done nothing but create confusion in fact some actually want a third definition to be added to the IFGC. That is ridiculous. The current definition in the IMC is exactly what the IFGC needs to say. Yes, gypsum is noncombustible according to the IBC but as previously stated the reference to gypsum is entirely a different application in the IFGC. Paper burns and needs to be installed outside the allowable distances according to Section 308.

Cost Impact: This code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: TOMBERLIN-FG5-202

FG3–09/10
202

Proponent: James Ranfone, representing American Gas Association

Add new definition as follows:

EXCESS FLOW VALVE (EFV). A valve designed to activate when the fuel gas passing through it exceeds a prescribed flow rate.

Reason: AGA has proposed an extract of the EFV coverage contained in the 2009 National Fuel Gas Code. The proposed EFV definition would be needed should the extract be approved. The definition is taken from the NFGC.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

RANFONE-FG16-202.DOC:

FG4–09/10
202

Proponent: James Ranfone, representing American Gas Association

Delete definition without substitution:

~~**FUEL GAS UTILIZATION EQUIPMENT.** See "Appliance."~~

Reason: The term is no longer used in the IFGC.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

RANFONE-FG14-202.DOC:

FG5–09/10
202

Proponent: Andrew Granzow, representing Viega LLC

Revise definition as follows:

SECTION 202 (IFGC)
GENERAL DEFINITIONS

JOINT, MECHANICAL. A general form of gas-tight joints obtained by the joining of metal parts through a positive-holding mechanical construction, such as press joint, flanged joint, threaded joint, flared joint or compression joint.

Reason: The proposed change will include press joints into the appropriate general group as it pertains to general definitions. This will provide clarification to the joint referenced in section 403.10.2 of this code.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

GRANZOW-FG2-202.DOC:

FG6–09/10
202

Proponent: John England, MCO, England Enterprises Inc., representing self.

Revise definition as follows:

Oxygen depletion safety shutoff system. A system designed to act to shut off the gas supply to the main and *pilot burners* if the oxygen in the surrounding atmosphere is reduced below a predetermined level <u>not less than 18%</u>

Reason: In room heaters the predetermined level is 18% --and should be added to the definitions.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ENGLAND-FG5-202.DOC:

FG7–09/10
202

Proponent: James Ranfone, representing American Gas Association

Revise definitions as follows:

SECTION 202

POINT OF DELIVERY. For natural gas systems, point of delivery. For undiluted liquefied petroleum gas systems, the point of delivery shall be considered to be the outlet of the ~~first pressure regulator that reduces pressure to 2 psig (13.8 kPag) or less~~ <u>service pressure regulator, exclusive of line gas regulators, in the system.</u>

REGULATOR, SERVICE PRESSURE. <u>For natural gas systems,</u> a device installed by the serving gas supplier to reduce and limit the service line pressure to delivery pressure. <u>For undiluted liquefied petroleum gas systems, the regulator located upstream from all line gas pressure regulators, where installed, and downstream from any first stage or a high pressure regulator in the system.</u>

Reason: The changes to the *Point of Delivery* and the *Service Pressure Regulator* definitions are being made to eliminate a gap in coverage resulting from inconsistencies between the IFGC scope section 101.2.2, and the definition of point of delivery as they pertain to propane (liquefied petroleum gas) systems. The scope section 101.2.2 states that the code covers LP systems 20 psig or less from the "point of delivery" to the appliance shutoff valve. For LP systems, the existing definition of "Point of Delivery" limits coverage to piping systems delivering pressure at 2 psig or less. By doing so, the code inadvertently does not cover LP systems between 2 psig and 20 psig. The revisions to the POD definition will now refer to the outlet of the service pressure regulator which can be set at a supply pressure of 20 psig or less consistent with section 101.2.2. The revision to Service Pressure Regulator definition will provide two distinct definitions, one for natural gas and one for LP. A LP service pressure regulator would be defined as the regulator located between higher pressure regulator (with an outlet above 20 psig) and any line regulator (with inlet pressure varying with system design).

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

RANFONE-FG19-202.DOC:

FG8–09/10
202

Proponent: Andrew Granzow, representing Viega LLC

Add new definition as follows:

Section 202 (IFGC)
GENERAL DEFINITIONS

PRESS JOINT. A permanent irreversible mechanical joint incorporating an elastomeric seal or an elastomeric seal and corrosion-resistant grip ring. The joint is made with a pressing tool and jaw or ring approved by the fitting manufacturer.

Reason: The proposed change will assist in the clarification of the connection method identified in section 403.10.2 of this code.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

GRANZOW-FG1-202.DOC:

FG9–09/10
202

Proponents: James Ranfone, representing American Gas Association;
Don Surrena, CBO, representing National Association of Home Builders (NAHB)

Revise definition as follows:

ROOM LARGE IN COMPARISON WITH SIZE OF THE APPLIANCE. Rooms having a volume equal to at least 12 times the total volume of a furnace, ~~water heater~~ or air-conditioning appliance and at least 16 times the total volume of a boiler. Total volume of the appliance is determined from exterior dimensions and is to include fan compartments and burner vestibules, when used. When the actual ceiling height of a room is greater than 8 feet (2438 mm), the volume of the room is figured on the basis of a ceiling height of 8 feet (2438 mm).

Reason:
(RANFONE)- The definition phrase "Room Large in Comparison with Size of the Appliance" is not used in relation to the installation of water heaters and therefore the term "water heater" is not technically appropriate for the definition. The phrase is only used in section 308.3(that covers air conditioning appliances) and section 308.4 (that covers central-heating boilers and furnaces).
(SURRENA)- In the 2009 IFGC the words "water heater" were added to this definition. There already exist requirements in the IFGC to cover the issue of volume of space for fuel fired appliances. Specifically, Section 304.5 covers indoor combustion air, relating to the required volume of the room. The change to this definition does not take into consideration compensation for the use of outside air, nor does it defer to manufactures installation instructions. By adding "Water Heater" to the definition, the size of the room will increase to 12 times the volume of the water heater.

This change in the sizing of rooms for water heaters is inconsistent with conventional building practices. Sizing principles and methods for providing adequate combustion air, and clearances for appliances in closets and other rooms already exist within the IFGC. Also by the definition requiring oversized rooms for water heaters, goes directly against the instructions of many manufacturers. Requiring spaces that are current code requirements for providing combustion air and clearances are unsafe or otherwise unacceptable. Manufacturer's instructions and Section 304.5 adequately cover the installation without requiring a random volume ratio.

Cost Impact: The code change proposal will not increase the cost of construction.

	Assembly:	ASF	AMF	DF

RANFONE-FG17-202; SURRENA-FG2-202 DOC:

FG10–09/10
301.5; IMC 301.6; IRC M1303.1

Proponent: Edward A. Spiers, representing Delaware County

THIS IS A 3 PART CODE CHANGE. PART I AND II WILL BE HEARD BY THE IFGC COMMITTEE. PART III WILL BE HEARD BY THE IRC M&P COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I - IMC

Revise as follows:

301.6 Label information. A permanent factory-applied nameplate(s) shall be affixed to appliances, heat pump units and condensing units on which shall appear in legible lettering, the manufacturer's name or trademark, the model number, serial number, the energy efficiency rating and the seal or mark of the *approved* agency. A label shall also include the following:

1. Electrical *equipment* and appliances: Electrical rating in volts, amperes and motor phase; identification of individual electrical components in volts, amperes or watts, motor phase; Btu/h (W) output; and required clearances.
2. Absorption units: Hourly rating in Btu/h (W); minimum hourly rating for units having step or automatic modulating controls; type of fuel; type of refrigerant; cooling capacity in Btu/h (W); and required clearances.
3. Fuel-burning units: Hourly rating in Btu/h (W); type of fuel *approved* for use with the *appliance*; and required clearances.
4. Electric comfort heating appliances: Name and trade-mark of the manufacturer; the model number or equivalent; the electric rating in volts, ~~ampacity~~ amperes and phase; Btu/h (W) output rating; individual marking for each electrical component in amperes or watts, volts and phase; required clearances from combustibles; and a seal indicating approval of the *appliance* by an *approved* agency.

PART II – IFGC

Revise as follows:

301.5 Label information. A permanent factory-applied nameplate(s) shall be affixed to appliances, heat pump units and condensing units on which shall appear in legible lettering, the manufacturer's name or trademark, the model number, serial number, the energy efficiency rating and, for listed appliances, the seal or mark of the testing agency. A label shall also include the hourly rating in British thermal units per hour (BTU/h) (W); the type of fuel approved for use with the appliance; and the minimum clearance requirements.

PART III- IRC-M

Revise as follows:

M1303.1 Label information. A permanent factory-applied nameplate(s) shall be affixed to *appliances*, heat pump units and condensing units on which shall appear, in legible lettering, the manufacturer's name or trademark, the model number, a serial number the energy efficiency rating and the seal or *mark* of the testing agency. A *label* shall also include the following:

1. Electrical *appliances*. Electrical rating in volts, amperes and motor phase; identification of individual electrical components in volts, amperes or watts and motor phase; and in Btu/h (W) output and required clearances.
2. Absorption units. Hourly rating in Btu/h (W), minimum hourly rating for units having step or automatic modulating controls, type of fuel, type of refrigerant, cooling capacity in Btu/h (W) and required clearances.
3. Fuel-burning units. Hourly rating in Btu/h (W), type of fuel *approved* for use with the *appliance* and required clearances.
4. Electric comfort heating *appliances*. Name and trademark of the manufacturer; the model number or equivalent; the electric rating in volts, amperes and phase; Btu/h (W) output rating; individual marking for each electrical component in amperes or watts, volts and phase; required clearances from combustibles and a seal indicating approval of the *appliance* by an *approved agency*.
5. Maintenance instructions. Required regular maintenance actions and title or publication number for the operation and maintenance manual for that particular model and type of product.

Reason*:* The change is necessitated by the enforcement of the current conservation codes. We have been instructed to verify the efficiency ratings of the equipment that is used on any particular project; it must match the RES check report or the approved plans. The information in question is currently not being put on the units themselves. The problem being, that if the box that the unit has been delivered in is gone or the efficiency sticker (with the rating on it) has been removed the information is not readily available. With most heat pumps the information is hidden in the model or serial number, but that would mean that all inspectors would have to have special knowledge of every manufacturer's information coding in order to decipher the needed information. The efficiency of a gas furnace can be figured as well if one has the knowledge to do so, but becomes problematic when multistage, variable, and modulating units are employed. This leaves the inspector to have to possess special knowledge once again, and homeowners for that matter as well. It would seem a minor cost to print this information on a unit's label, rather than having code enforcement personnel calling different contractors or suppliers to find out what EER rating a heat pump might have or the rating of a geothermal unit.

It is not a problem when the minimum rating is specified on a RES check. However, when a job is only 1% or 0.6% better than required by the IECC and a 20 SEER heat pump is called for under the heating equipment. How does one find out what has been installed to verify this information. If a 13 SEER unit is installed instead, the job would then fall short of it's required RES compliance. My understanding is that with the 2006 IECC the scenario above could be quite normal. Contractors may be tempted to spec equipment with very high efficiency ratings to be able to pass the RES compliance form and then actually use the less efficient unit(s) on the job. Or, when the process of cost trade-offs begins to take place on the project it is very normal for items that are not absolutely necessary to get chopped, efficiency ratings to get dropped. Ampacity relates to wire sizing and amperes was the intended term as used in M1303.1, Item 4.

Cost Impact: The code change proposal will not increase the cost of construction.

THIS IS A 3 PART CODE CHANGE. PART I AND II WILL BE HEARD BY THE IFGC COMMITTEE. PART III WILL BE HEARD BY THE IRC M&P COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IMC

Add new text as follows:

SECTION 307
CONDENSATE DISPOSAL AND SAFETY DRAIN PANS

307.3 Leakage Safety Pans. HVAC appliances that contain water or other liquid heat transfer medium shall be provided with a safety drain pan where damage to any building component will occur as a result of leakage of water or a heat transfer medium. The safety pan shall be constructed in accordance with item 1 or 2 of Section 307.2.3. The intent of this section is satisfied where means for protection against condensate overflow or leakage is provided as required by Section 307.2.3 of this code or Section 307.5 of the *International Fuel Gas Code*.

PART II – IFGC

Add new text as follows:

SECTION 307
CONDENSATE DISPOSAL AND SAFETY DRAIN PANS

307.6 Leakage Safety Pans. HVAC appliances that contain water or other liquid heat transfer medium shall be provided with a safety drain pan where damage to any building component will occur as a result of leakage of water or a heat transfer medium. The safety pan shall be constructed in accordance with item 1 or 2 of Section 307.2.3 of the *International Mechanical Code*. The intent of this section is satisfied where means for protection against condensate overflow or leakage is provided as required by Section 307.1 or 307.5.

PART III – IRC-M

Add new text as follows:

M1411.5 Leakage Safety Pans. HVAC appliances that contain water or other liquid heat transfer medium shall be provided with a safety drain pan where damage to any building component will occur as a result of leakage of water or a heat transfer medium. The safety pan shall be constructed in accordance with item 1 or 2 of Section M1411.3.1. The intent of this section is satisfied where means for protection against condensate overflow or leakage is provided as required by Section M1411.3.1 or M1411.4.

Reason: The current code is specific to cooling or evaporator coils to protect structures. The market now offers a wide range of equipment that is being installed in areas other than the basement that contain or use water: for example, humidifiers, geothermal units, boilers, instant water heaters used as boilers and condensing furnaces. These items are being installed in attics, first and second floors often and the codes do not grant the authority to require a safety pan unless there are the prescribed coils with them. Some geothermal units always contain water, or a type of antifreeze, whether they are cooling or heating. Condensing furnaces that do not have air conditioning do not need a safety pan according to the current code, as it is not addressed. If the contractor runs a secondary line or water safety device to the evaporator coil's secondary outlet, then the current code is satisfied without providing a pan under the condensing furnace. With the increased use of radiant floor heating, more and more small boilers or water heaters are making their way from the basement to other areas of the house. And while we can't protect all of the piping or pressurized lines that burst, surely we can protect the equipment itself from small leaks that may greatly damage a property.

Cost Impact: The cost impact would be wide and varied depending on the types of materials that a contractor may choose to employ. A sheet metal pan with a drain can be fabricated with one hour of labor and one sheet of metal for most residential units. Commercial units could be a huge variation based on the size of the equipment.

Analysis: Section 307.5 of the IFGC and M1411.4 of the IRC require auxiliary drain pans for condensing appliances such as furnaces.

SPIERS-FG1-307_NEW.DOC:

FG12–09/10
308.1

Proponent: Guy Tomberlin, representing self

Revise as follows:

308.1 Scope. This section shall govern the reduction in required clearances to combustible materials, <u>including gypsum board,</u> and combustible assemblies for chimneys, vents, appliances, devices and equipment. Clearance requirements for air-conditioning equipment and central heating boilers and furnaces shall comply with Sections 308.3 and 308.4.

Reason: This adds clarification that gypsum has a combustible covering and therefore must be considered a combustible product. The clearances prescribed by manufacturers are typically directed to allow for adequate heat dissipation, and prevent potential fire. Paper coated products are a prime candidate for these clearances.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: This section is an IFGS section and IFGS sections are normally subject to the process that maintains the NFGC, ANSI Z223.1, however, the proposed revision affects only the IFGC, therefore, the proposal is subject to the ICC process that maintains the IFGC.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: TOMBERLIN-FG2-308.1

FG13–09/10
310.2 (New), Chapter 8

Proponent: James Ranfone representing American Gas Association

1. Add new text as follows:

310.2 Lightning Protection System. Where a lightning protection system is installed, the bonding of the gas piping shall be in accordance with NFPA 780.

2. Add new standard to Chapter 8 as follows:

NFPA

NFPA 780-08	Standard for the Installation of Lightning Protection Systems

Reason: Provide installation coverage for the bonding of lightning protection systems. Lightning protection systems, where installed, are required to be bonded the structure's grounding electrode system. This extract will help improve the code by adding important installation and safety requirements from the National Fuel Gas Code. The American Gas Association is asking the ICC membership whether this provision is necessary in the IFGC and to consider extracting section 7.13.4 from the 2009 National Fuel Gas Code.

Cost Impact: The code change proposal will not increase the cost of construction.

Standard: A review of the standard(s) proposed for inclusion in the code, NFPA 780-08, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

THIS IS A 3 PART CODE CHANGE. PARTS I AND II WILL BE HEARD BY THE IFGC COMMITTEE. PART III WILL BE HEARD BY THE IRC MECHANICAL COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

PART I-IFGC

1. Add new definitions as follows:

SECTION 202

THIRD-PARTY CERTIFICATION AGENCY. An approved agency operating a product or material certification system that incorporates initial product testing, assessment and surveillance of a manufacturer's quality control system.

THIRD-PARTY CERTIFIED. Certification obtained by the manufacturer indicating that the function and performance characteristics of a product or material have been determined by testing and ongoing surveillance by an approved third-party certification agency. Assertion of certification is in the form of identification in accordance with the requirements of the third-party certification agency.

THIRD-PARTY TESTED. Procedure by which an approved testing laboratory provides documentation that a product, material or system conforms to specified requirements.

2. Add new text as follows:

401.9 Identification. Each length of pipe and tubing and each pipe fitting, utilized in a fuel gas system shall bear the identification of the manufacturer.

401.10 Third-party testing and certification. All piping, tubing and fittings shall comply with the applicable referenced standards, specifications and performance criteria of this code and shall be identified in accordance with Section 401.9. Piping, tubing and fittings shall either be tested by an approved third-party testing agency or certified by an approved third-party certification agency.

404.1 Installation of materials. All materials used shall be installed in strict accordance with the standards under which the materials are accepted and approved. In the absence of such installation procedures, the manufacturer's installation instructions shall be followed. Where the requirements of referenced standards or manufacturer's installation instructions do not conform to minimum provisions of this code, the provisions of this code shall apply.

PART II - IMC

1. Add new definitions as follows:

THIRD-PARTY CERTIFICATION AGENCY. An approved agency operating a product or material certification system that incorporates initial product testing, assessment and surveillance of a manufacturer's quality control system.

THIRD-PARTY CERTIFIED. Certification obtained by the manufacturer indicating that the function and performance characteristics of a product or material have been determined by testing and ongoing surveillance by an approved third-party certification agency. Assertion of certification is in the form of identification in accordance with the requirements of the third-party certification agency.

THIRD-PARTY TESTED. Procedure by which an approved testing laboratory provides documentation that a product, material or system conforms to specified requirements.

2. Add new text as follows:

301.3 Identification. Each length of pipe and tubing and each pipe fitting, utilized in a mechanical system shall bear the identification of the manufacturer.

301.4 Plastic pipe, fittings and components. Plastic pipe, fittings and components shall be third-party certified as conforming to NSF 14.

301.5 Third-party testing and certification. Piping, tubing and fittings shall comply with the applicable referenced standards, specifications and performance criteria of this code and shall be identified in accordance with Section 301.3. Piping, tubing and fittings shall either be tested by an approved third-party testing agency or certified by an approved third-party certification agency.

PART III – IRC

1. Add new definitions as follows:

THIRD-PARTY CERTIFICATION AGENCY. An approved agency operating a product or material certification system that incorporates initial product testing, assessment and surveillance of a manufacturer's quality control system.

THIRD-PARTY CERTIFIED. Certification obtained by the manufacturer indicating that the function and performance characteristics of a product or material have been determined by testing and ongoing surveillance by an approved third-party certification agency. Assertion of certification is in the form of identification in accordance with the requirements of the third-party certification agency.

THIRD-PARTY TESTED. Procedure by which an approved testing laboratory provides documentation that a product, material or system conforms to specified requirements.

2. Add new text as follows:

M1301.2 Identification. Each length of pipe and tubing and each pipe fitting, utilized in a mechanical system shall bear the identification of the manufacturer.

M1301.3 Installation of materials. All materials used shall be installed in strict accordance with the standards under which the materials are accepted and approved. In the absence of such installation procedures, the manufacturer's installation instructions shall be followed. Where the requirements of referenced standards or manufacturer's installation instructions do not conform to minimum provisions of this code, the provisions of this code shall apply.

M1301.4 Plastic pipe, fittings and components. Plastic pipe, fittings and components shall be third-party certified as conforming to NSF 14.

M1301.5 Third-party testing and certification. Piping, tubing and fittings shall comply with the applicable referenced standards, specifications and performance criteria of this code and shall be identified in accordance with Section M1301.2. Piping, tubing and fittings shall either be tested by an approved third-party testing agency or certified by an approved third-party certification agency.

Reason:
PART I-Current IFGC contains several pipe, tube and fitting standards but never indicates how the industry must verify compliance with these standards. The proposed text is taken from the IPC and altered slightly to fit fuel gas system applications. This is the current typical industry method to demonstrate compliance with the appropriate standards. The new text provides guidance on how to achieve code compliance as intended.
PART II & III- Current IMC and IRC mechanical sections contain several pipe, tube and fitting standards but never indicates how the industry must verify compliance with these standards. The proposed text is taken from the IPC and altered slightly to fit mechanical system applications. This is the current typical industry method to demonstrate compliance with the appropriate standards. The new text provides guidance on how to achieve code compliance as intended.

Cost Impact: The code proposal will not increase the cost of construction. Tomberlin-M-5-303-RM-1-R1303

FG15–09/10
404.2 (New)

Proponent: James Ranfone representing American Gas Association

Add new text as follows:

404.2 CSST. CSST piping systems shall be installed in accordance with the terms of their approval, the conditions of listing, the manufacturer's installation instructions and this code.

Reason: The code requires that equipment and appliances be listed. Section 305.1 requires that equipment and appliances be installed by the terms of their approval, in accordance with the conditions of listing, the manufacturer's installation and this code. The terms equipment and appliance do not necessarily cover CSST which is the only gas piping system that is required to be listed to an ANSI standard. Therefore, the code is missing a specific statement regarding the installation of CSST as a listed system.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

RANFONE-FG12-404.2_NEW.DOC:

FG16–09/10
404.4

Proponents: James Ranfone, representing American Gas Association;
Don Surrena, CBO, representing National Association of Home Builders (NAHB)

Delete and substitute as follows:

~~**404.4 Underground penetrations prohibited.** Gas piping shall not penetrate building foundation walls at any point below grade. Gas piping shall enter and exit a building at a point above grade and the annular space between the pipe and the wall shall be sealed.~~

404.4 Piping through foundation wall. Underground piping, where installed below grade through the outer foundation or basement wall of a building, shall be encased in a protective pipe sleeve or shall be protected by an approved device or method. The annular space between the gas piping and the sleeve and between the sleeve and the wall shall be sealed.

Reason:
(RANFONE)- No evidence was provided during the 2007-2008 revision cycle that justified adding the prohibition of customer-owned gas piping from penetrating a foundation wall below grade. Testimony centered on the possibility that gas from an underground leak would be significant enough to cause gas migration along the buried gas piping and entry into the building. No statistics were presented and AGA does not know of any incidents of gas migrating along a customer-owned underground piping that has resulted in an explosion. Section 404.4 covers only customer-owned piping, most of which would be low pressure (the remaining would be a maximum of 2 psi) that does not result , in the event of a underground leak, in significant gas leakage and migration. The low number of incidences AGA is aware of were traced to utility-owned gas service lines that operate at much higher pressures (often up to 40 psi). The proposed language combines the 2006 IFGC language with the approved changes FG20-07/08 and FG21-07/08.
(SURRENA)- The purpose of this proposal is to allow gas piping to enter a foundation below grade as it has done in the past. Without this change, gas piping will have to come above ground before entering a building.

The conventional installation practice of allowing piping to go through foundation walls below grade should not be prohibited. This is an installation method that has been used for decades. No data was ever presented that would show a safety problem or inadequacy when a proper installation and sealing of the opening was installed in accordance with the IFGC.

Requiring above grade entry points into the foundation will require extra piping and joints, both inside and outside, exposing the piping system to physical damage and increased risk of leakage on the outside of buildings as well as within the building. This increase in outside exposure will be particularly significant in a city or at congested commercial locations where piping must come above grade at times through sidewalks at the front or rear of the building or come through the ground in public ways before turning to enter the foundation or building. This will also present practical issues of locating the exterior and interior piping system to have entry points that are compatible with the building design, i.e., doorways, loading docks, accessible entry systems (ramps) etc. There will also be additional costs in these circumstances when the underground piping must be relocated to miss one of the items just mentioned.

Accepting this change will coordinate the IFGC provisions with all other industry Fuel Gas Codes.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

RANFONE-FG13-404.4-SURRENA-FG3-404.4DOC:

FG17–09/10
404.16

Proponent: James Ranfone, representing American Gas Association

Revise as follows:

404.16 Prohibited devices. A device shall not be placed inside the piping or fittings that will reduce the cross-sectional area or otherwise obstruct the free flow of gas.

Exceptions:

1. Approved gas filters.
2. An approved fitting or device where the gas piping system has been sized to accommodate the pressure drop of the fitting or device.

Reason: Section 404.16 has been interpreted as restricting the installation of an excess flow valve. The new exception is designed to allow an approved EFV where the gas piping system has been sized to accommodate its pressure drop.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: RANFONE-FG15- 404.16

FG18–09/10
407.2

Proponent: Don Surrena, CBO, representing National Association of Home Builders (NAHB)

Revise as follows:

407.2. Design and Installation. *Piping* shall be supported with ~~metal~~ pipe hooks, ~~metal~~ pipe straps, ~~metal~~ bands, ~~metal~~ brackets, or ~~metal~~ hangers, or building structural components, suitable for the size of *piping*, of adequate strength and quality, located at intervals so as to prevent or damp out excessive vibration. *Piping* shall be anchored to prevent undue strains on connected appliances and shall not be supported by other *piping*. Pipe hangers and supports shall conform to the requirements of MSS SP-58 and shall be spaced in accordance with Section 415. Supports, hangers, and anchors shall be installed so as not to interfere with the free expansion and contraction of the *piping* between anchors. All parts of the supporting equipment shall be designed and installed so they will not be disengaged by movement of the supported *piping*.

Reason: The purpose of this proposal is to retain the provisions of the 2006 International Code (IFGC) allowing for more than just metal to be used as pipe strapping.

This change from the 2006 International Fuel Gas Code (IFGC) is clearly proprietary in nature. To disallow any other material that is proven to meet the requirements for support is contrary to the spirit of the ICC family of codes (I-Codes). Favoring one type of material without reason is unacceptable. The change to the 2009 IFGC is too restrictive and eliminates other support materials that have been used successfully for years. The 2009 change will have a significant impact on several manufacturers that have established alternate materials other than metal supports. If the structural properties of a material is tested and proven to meet the structural specifications for supporting the piping it should be accepted for use. These other materials should be eliminated and the code allowed to become exclusionary. The I-Codes have railed from the exclusivity of other codes that limit the type of materials. These other materials have proven themselves acceptable over the years and should not be eliminated to prosper one type of material.

We encourage the adoption of this proposal to allow any and all materials that meet the requirements of the code to be used, not just a proprietary product or single material.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

SURRENA_FG1-407.2.DOC:

FG19–09/10
408.4, Figure 408.4 (New)

Proponent: James Ranfone, representing American Gas Association

1. Revise as follows:

408.4 Sediment trap.-Where a sediment trap is not incorporated as part of the appliance, a sediment trap shall be installed downstream of the appliance shutoff valve as close to the inlet of the appliance as practical. The sediment trap shall be either a tee fitting having a capped nipple of any length installed vertically in the bottommost opening of the tee <u>as illustrated in Figure 408.4</u> or other device approved as and effective sediment trap. Illuminating appliances, ranges, clothes dryers, decorative vented appliances for installation in vented fireplaces, gas fireplaces, and outdoor grills need not be so equipped.

2. Add new figure as follows:

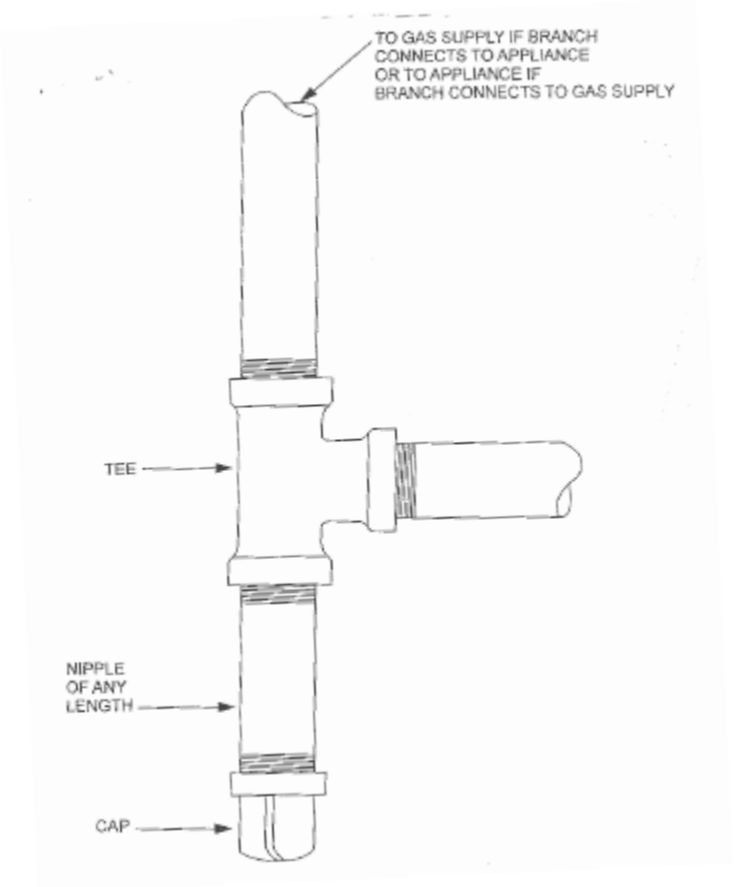

Figure 408.4
Method of Installing a tee fitting sediment trap

Reason: The figure will provide a graphic illustration of how a sediment trap should be constructed. The current verbiage, especially, "… vertically in the…" Fails to convey that for the trap to be effective, it needs to have the nipple installed nearly or at a 90 degree angle to the floor.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

RANFONE-FG7-408.4.DOC:

FG20–09/10
408.4

Proponent: James Ranfone, representing American Gas Association

Revise as follows:

408.4 Sediment trap. Where a sediment trap is not incorporated as part of the appliance, a sediment trap shall be installed downstream of the appliance shutoff valve as close to the inlet of the appliance as practical. The sediment trap shall be either a tee fitting having a capped nipple of any length installed vertically in the bottom most opening of the tee or other device approved as and effective sediment trap. Illuminating appliances, ranges, clothes dryers, decorative vented appliances for installation in vented fireplaces, gas fireplaces. and outdoor grills need not be so equipped.

Reason: Sediment traps are generally required for appliances such as furnaces, boilers and water heaters. The revision would add two types of decorative appliances to the exemption list. The revision would make the IFGC 408.4 exemption list similar to the list in the National Fuel Gas Code section 9.6.7.

Cost Impact: The code change proposal will not increase the cost of construction.

a. If labeled 2G.
b. If labeled 5G

2. Delete standard from Chapter 8 as follows:

CSA

~~CSA Requirement 3-88~~ ~~Manually Operated Gas Valves for Use in House Piping Systems~~

Reason: The CSA requirement CSA 3-88 has been withdrawn in favor of the ASME B16.44 standard.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: RANFONE-FG2-TABLE 409.1.1

FG22–09/10
409.5, 409.5.1, 409.5.2, 409.5.3

Proponent: John England, England Enterprises, Inc., representing Cities of Beaufort, Hardeeville, SC

1. Revise as follows:

409.5 Appliance shutoff valve. Each *appliance* shall be provided with a shutoff *valve* ~~in accordance with Section 409.5.1, 409.5.2 or 409.5.3.~~

409.5.1 Located within same room. The shutoff *valve* shall be located in the same room as the *appliance*. The shutoff *valve* shall be within 6 feet (1829 mm) of the *appliance*, and shall be installed upstream of the union, connector or quick disconnect device it serves. Such shutoff *valves* shall be provided with *ready* access and shall be able to be operated without leaving the room or moving the appliance. *Appliance shutoff valves* shall not be *located* in the firebox of a *fireplace* and shall be installed in accordance with the *appliance* manufacturer's instructions.

2. Delete without substitution:

~~**409.5.2 Vented decorative appliances and room heaters.** Shutoff *valves* for vented decorative *appliances*, room heaters and decorative *appliances* for installation in vented fireplaces shall be permitted to be installed in an area~~

~~remote from the *appliances* where such *valves* are provided with *ready access*. Such *valves* shall be permanently identified and shall serve no other *appliance*. The *piping* from the shutoff *valve* to within 6 feet (1829 mm) of the *appliance* shall be designed, sized and installed in accordance with Sections 401 through 408.~~

~~**409.5.3 Located at manifold.** Where the *appliance shutoff valve* is installed at a manifold, such shutoff valve shall be located within 50 feet (15 240 mm) of the *appliance* served and shall be readily accessible and permanently identified. The *piping* from the manifold to within 6 feet (1829 mm) of the *appliance* shall be designed, sized and installed in accordance with Sections 401 through 408~~

Reason: Shut off valve should be as close as possible and accessible to anyone in the room to cut off in case of a gas leak. There have been conditions where the shut off valve has been in the same room (hotel laundry) , but getting to it would require going outside of the building, finding a key and then getting back into the room to cut it off.

As with manifolds ---are the manifolds accessible or are they locked behind doors. When the appliance is removed for servicing what is to prevent someone from turning the gas back on.

For decades, we have required a gas cutoff to be in the same room (6') as the appliance –why are we changing it now. There is no savings, only the possibility of a gas explosion because we cannot find the cutoff to the appliance, because it is 50' away in another room.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ENGLAND-FG1-409.5.DOC:

FG23–09/10
409.5.3

Proponent: Brent Ursenbach, Salt Lake County, representing Utah Chapter of ICC

Revise text as follows:

409.5.3 Located at manifold. Where the *appliance* shutoff valve is installed at a manifold, such shutoff valve shall be located within 50 feet (15 240 mm) of the *appliance* served, <u>shall be located on the same building level,</u> and shall be readily accessible and permanently identified. The *piping* from the manifold to within 6 feet (1829 mm) of the *appliance* shall be designed, sized and installed in accordance with Sections 401 through 408.

Reason: It is common to have a gas manifold located in a basement level furnace room, with another furnace for an upper level of a 2 story home located in the attic. The commissioning/start-up, altitude or gas heat value adjustments that may be required on gas furnaces typically require the gas control valve and manifold to be removed from the furnace for orifice inspection and orifice changing, which requires the gas to be shut off outside the furnace. Performing an inlet gas pressure test at a furnace requires removal of a plug at the gas inlet of the gas control valve, which also requires the gas to be shut off outside the furnace to attach a test gauge adapter. It is unreasonable and may pose a safety hazard to expect a technician to make multiple trips from the upper attic mechanical room down a ladder, then down two flights of stairs to the basement furnace room where the manifold is located shut off the gas. The technician then returns to the upper furnace. Typically the gas needs to be turned on and off two, three or four times or more to complete these procedures. It is reasonable to expect a shut off valve to be located on the same level as the appliance.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: URSENBACH-FG1-409.5.3.doc

FG24–09/10
410.1

Proponent: Joe Underwood, Hugo, MN representing himself.

Revise as follows:

410.1 Pressure regulators. A line pressure regulator shall be installed where the appliance is designed to operate at a lower pressure than the supply pressure. Line gas pressure regulators shall be listed as complying with ANSI Z21.80. Access shall be provided to pressure regulators. Pressure regulators shall be protected from physical damage. Regulators installed on the exterior of the building shall be approved for outdoor installation. <u>Regulators installed outdoors shall be designed, installed or protected so that their vent will not be affected by the elements including freezing rain, sleet, snow, ice, mud and debris</u>.

Reason: The regulator vent allows the regulator to "breathe" during normal operation and functions as a pressure relief opening in an overpressure situation. It must remain free of dirt and debris for the purpose of safety. If the regulator vent becomes blocked or the airflow is restricted for any reason, the regulator may operate incorrectly and present an unsafe situation for equipment downstream from the regulator. For this reason, the vent opening must be protected so that insects, water, snow ice, debris or other elements are unable to enter the regulator vent opening. Regulator vent protection is currently required by IFGC 413.5, NFPA 58 L.P. Gas Code, NFPA 501A Standards for Fire Safety for Manufactured Home Installations Sites and Communities, 2006 Uniform Mechanical Code. This proposal simply brings the IFGC 410 in line with the industry standard for regulator vent protection. The IFGC currently requires regulator protection from the elements but only in Section 413.5. It would seem logical that regulator vent protection from the elements should also be required in Section 410 Flow Controls since this is the section that deals with the regulators. Section 410.3 addresses the protection of vents but only with regard to regulators installed indoors with an independent vent to the outside of the building. My proposal is meant to address regulator vent protection for regulators installed outdoors.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

UNDERWOOD-FG1-410.1.DOC:

FG25–09/10
202 (New), 410.4 (New)

Proponent: Sidney Cavanaugh, Cavanaugh Consulting, representing Brass Craft.

1. Add new text as follows:

410.4 Excess Flow Valve. Where automatic excess flow valves are installed, they shall be listed as complying with ANSI Z21.93/CSA 6.30 and shall be sized and installed in accordance with the manufacturer's installation instructions.

2. Add new definition as follows:

SECTION 202

EXCESS FLOW VALVE. A valve designed to activate when the fuel gas passing through it exceeds a prescribed flow rate.

3. Add new standard to Chapter 8 as follows:

ANSI/CSA

ANSI Z21.93/CSA 6.30-XX Excess Flow Valves for Natural and LP Gas Up to Pressures of 5 Psi.

Reason: These devices increase the protection of health and safety of consumers and meet appropriate standards CSA 3-92 and ANSI Z21.93-CSA 6.30. The code change provides guidance to installations that are already occurring in many local jurisdictions for EFVs which can be used on low pressure fuel lines to prevent the open flow of gas in the event of a pipe disconnect or rupture. It is a companion to other code changes. Similar wording has been adopted in the UPC, UMC and the NFGC/NFPA 42 ANSI Z223.1.

Cost Impact: Minimal.

Analysis: A review of the standard(s) proposed for inclusion in the code, ANSI Z21.93/CSA 6.30-xx, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: CAVANAUGH-FG2-202_410.4

FG26–09/10
410.4 (New)

Proponent: James Ranfone representing American Gas Association

Add new text as follows:

410.4 Excess Flow Valves. Where automatic excess flow valves are installed, they shall be listed for the application and shall be sized and installed in accordance with the manufacturers' instructions.

Reason: Provide installation coverage for excess flow valves (EFV). EFVs are being sold and installed. These devices must be sized and installed correctly for their proper functioning. This extract will help improve the code by adding important inst0allation and safety requirements from

the National Fuel Gas Code. The American Gas Association is asking the ICC membership whether this provision is necessary in the IFGC and to consider extracting section 5.13 from the 2009 National Fuel Gas Code.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

RANFONE-FG11-410.4 NEW.DOC:

FG27–09/10
410.5 (New), 202

Proponent: James Ranfone representing American Gas Association

1. Add new text as follows:

410.5 Flashback arrestor check valve. Where fuel gas is used with oxygen in any hot work operation, a listed protective device that serves as a combination flashback arrestor and backflow check valve shall be installed at an approved location on both the fuel gas and oxygen supply lines. Where the pressure of the piped fuel gas supply is insufficient to ensure such safe operation, approved equipment shall be installed between the gas meter and the appliance that increases pressure to the level required for such safe operation.

2. Add new definition as follows:

Flashback arrestor check valve. A device that will prevent the backflow of one gas into the supply system of another gas and prevent the passage of flame into the gas supply system.

Reason: When a torch flashback occurs there is a 5,000 degree flame inside the hose and pipe and it will melt right through a regular check valve. A flashback arrestor will extinguish this flame, as well as prevent oxygen from getting into the gas pipe, and thus will protect the gas meter. A flashback arrestor check valve would ensure safe operation of all devices, equipment and systems, including the utility gas meter.

Cost Impact: The code change proposal will increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

RANFONE-FG-8-410.5_NEW_202.DOC:

FG28–09/10
501.8

Proponent: John England, MCO, England Enterprises, Inc., representing himself

Revise as follows:

501.8 Appliances not required to be vented. The following *appliances* shall not be required to be vented.

1. Ranges.
2. Built-in domestic cooking units *listed* and marked for optional venting.
3. ~~Hot plates and laundry stoves.~~
4. ~~4.~~3. *Type 1 clothes dryers (Type 1 clothes dryers* shall be exhausted in accordance with the requirements of Section 614).
5. ~~5~~ 4. A single booster-type automatic instantaneous water heater, where designed and used solely for the sanitizing rinse requirements of a dishwashing machine, provided that the heater is installed in a commercial kitchen having a mechanical exhaust system. Where installed in this manner, the draft hood, if required, shall be in place and unaltered and the draft hood *outlet* shall be not less than 36 inches (914 mm) vertically and 6 inches (152 mm) horizontally from any surface other than the heater.
6. ~~6~~5. Refrigerators.
7. ~~7~~6. Counter *appliances*.
8. ~~8~~7. Room heaters *listed* for unvented use.
9. ~~9~~8. Direct-fired makeup air heaters.
10. ~~10~~9. Other *appliances listed* for unvented use and not provided with flue collars.
11. ~~11~~10. Specialized *appliances* of limited input such as laboratory burners and gas lights.

Where the *appliances* listed in Items ~~5~~ 4 through ~~11~~ 10 above are installed so that the aggregate input rating exceeds 20 British thermal units (Btu) per hour per cubic feet (207watts perm3) of volume of the room or space in which such *appliances* are installed, one or more shall be provided with venting systems or other *approved* means for conveying the vent gases to the outdoor atmosphere so that the aggregate input rating of the remaining unvented *appliances* does not exceed 20 Btu per hour per cubic foot (207 watts per m3). Where the room or space in which the *appliance* is installed is directly connected to another room or space by a doorway, archway or other opening of comparable size that cannot be closed, the volume of such adjacent room or space shall be permitted to be included in the calculations.

Reason: Gas fired hot plates and laundry stoves no longer exist.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ENGLAND-FG6-501.8.DOC:

FG29–09/10
503.7.1 (New)

Proponent: James Ranfone representing American Gas Association

Add new text as follows:

503.7.1 Prohibited use. Single-wall metal pipe shall not be used as a vent in dwellings and residential occupancies.

Reason: Venting systems for listed residential appliances cannot use single-wall metal pipe according to their listing. This prohibition applies to single-wall pipe used as a vent, not to single-wall pipe used as a vent connector. This extract from the National Fuel Gas Code will help improve the code by adding important installation and safety requirements. The American Gas Association is asking the ICC membership whether this provision is necessary in the IFGC and to consider extracting section 12.8.4.1 from the 2009 National Fuel Gas Code.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: Section 503 is an IFGS section controlled by the ANSI Z223.1 Standard Development process. The proposed text is extracted from ANSI Z223.1 and is being offered "as is" with no intent to allow modification.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

RANFONE-FG5-503.7.1.DOC:

FG30–09/10
202, 603.1, Chapter 8

Proponent: James Ranfone representing American Gas Association

1. Revise definition as follows:

SECTION 202

~~**LOG LIGHTER**~~ **FIREPLACE ACCESSORY DEVICE.** A manually operated ~~solid fuel ignition appliance~~ fireplace accessory device ~~for installation~~ installed in a vented solid fuel-burning fireplace and used to ignite the solid fuel.

2. Revise text as follows:

603.1 General. Log lighter~~s~~ fireplace accessory devices shall be approved ~~tested in accordance with CSA 8~~ and shall be installed in accordance with the manufacturer's installation instructions.

3. Delete standard in Chapter 8 as follows:

CSA

~~CSA 8-93~~ ~~Requirements for Gas-fired Log Lighters for Wood Burning Fireplaces – with Revisions through January 1999~~

Reason: The following reasons support the proposed revised coverage for log lighters:
CSA Requirement No. 8 covering log lighters was withdrawn on January 1, 2009.
The definition is being revised since a log lighter is more typically viewed as a fireplace accessory then an appliance.
The revisions to section 608.1 allows for the installation of an unlisted log lighter fireplace accessory when approved by the code official. While section 105.2 can be used to approve these accessories, specific coverage in 608.1 is being proposed since unlisted log lighters are the only types available. The accessory's inherent simplicity is the reason for the lack of listing and the withdrawal of the CSA requirement. A typical log lighter is an iron pipe with drilled holes and shut off valve. They can be constructed on site from readily available materials or are available from small fabricators as complete units or kits. There is a lack of a mass market demand and thus the market is supplied by small fabricators.

Cost Impact: The code change proposal will not increase the cost of construction.

RANFONE-FG1-618.4.DOC:

FG32–09/10
618.5; IMC 918.6; IRC M1602.2

Proponent: Guy McMann, Jefferson County, Colorado, representing Colorado Association of Plumbing and Mechanicals (CAPMO)

THIS IS A 3 PART CODE CHANGE. PART I AND II WILL BE HEARD BY THE IFGC COMMITTEE. PART III WILL BE HEARD BY THE IRC COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I- IFGC

Revise as follows:

618.5 Prohibited sources. ~~Outside~~ Outdoor or return air for a forced-air heating system shall not be taken from the following locations:

1. Closer than 10 feet (3048 mm) from an *appliance* vent outlet, a vent opening from a plumbing drainage system or the discharge outlet of an exhaust fan, unless the outlet is 3 feet (914 mm) above the outside air inlet.
2. Where there is the presence of objectionable odors, fumes or flammable vapors; or where located less than 10 feet (3048 mm)above the surface of any abutting public way or driveway; or where located at grade level by a sidewalk, street, alley or driveway.

3. A hazardous or insanitary location or a refrigeration machinery room as defined in the *International Mechanical Code*.
4. A room or space, the volume of which is less than 25 percent of the entire volume served by such system. Where connected by a permanent opening having an area sized in accordance with Section 618.2, adjoining rooms or spaces shall be considered as a single room or space for the purpose of determining the volume of such rooms or spaces.

   Exception: The minimum volume requirement shall not apply where the amount of return air taken from a room or space is less than or equal to the amount of supply air delivered to such room or space.

5. A room or space containing an *appliance* where such a room or space serves as the sole source of return air.

   Exception: This shall not apply where:

   1. The *appliance* is a direct-vent *appliance* or an *appliance* not requiring a vent in accordance with Section 501.8.
   2. The room or space complies with the following requirements:
      2.1. The return air shall be taken from a room or space having a volume exceeding 1 cubic foot for each 10 Btu/h (9.6L/W) of combined input rating of all fuel-burning appliances therein.
      2.2. The volume of supply air discharged back into the same space shall be approximately equal to the volume of return air taken from the space.
      2.3. Return-air inlets shall not be located within 10 feet (3048 mm) of a draft hood in the same room or space or the combustion chamber of any atmospheric burner *appliance* ~~firebox or draft hood~~ in the same room or space.
   3. Rooms or spaces containing solid fuel-burning appliances, provided that return-air inlets are located not less than 10 feet (3048 mm) from the firebox of such appliances.

6. A closet, bathroom, toilet room, kitchen, garage, ~~mechanical room~~, boiler room, furnace room or unconditioned attic.

   Exceptions:

   1. Where return air intakes are located not less than 10 feet (3048 mm) from cooking appliances and serve only the kitchen area, taking return air from a kitchen area shall not be prohibited.

   2. Dedicated forced air systems serving only a garage shall not be prohibited from obtaining return air from the garage.

7. A crawl space by means of direct connection to the return side of a forced-air system. Transfer openings in the crawl space enclosure shall not be prohibited.

PART II- IMC

Revise as follows:

918.6 Prohibited sources. Outdoor or return air for a forced-air heating system shall not be taken from the following locations:

1. Less than 10 feet (3048 mm) from an *appliance* vent outlet, a vent opening from a plumbing drainage system or the discharge outlet of an exhaust fan, unless the outlet is 3 feet (914 mm) above the outdoor air inlet.
2. Where there is the presence of objectionable odors, fumes or flammable vapors; or where located less than 10 feet (3048 mm)above the surface of any abutting public way or driveway; or where located at grade level by a sidewalk, street, alley or driveway.
3. A hazardous or insanitary location or a refrigeration *machinery room* as defined in this code.
4. A room or space, the volume of which is less than 25 percent of the entire volume served by such system. Where connected by a permanent opening having an area sized in accordance with Sections 918.2 and 918.3, adjoining rooms or spaces shall be considered as a single room or space for the purpose of determining the volume of such rooms or spaces.

   Exception: The minimum volume requirement shall not apply where the amount of return air taken from a room or space is less than or equal to the amount of supply air delivered to such room or space.

5. A closet, bathroom, toilet room, kitchen, garage, ~~mechanical room,~~ boiler room, furnace room or unconditioned attic.

   Exceptions:

   5.1. Where return air intakes are located not less than 10 feet (3048 mm) from cooking appliances, and serve the kitchen area only, taking return air from a kitchen shall not be prohibited.
   5.2. Dedicated forced air systems serving only a garage shall not be prohibited from obtaining return air from the garage.

6. An unconditioned crawl space by means of direct connection to the return side of a forced air system. Transfer openings in the crawl space enclosure shall not be prohibited.
7. A room or space containing a fuel-burning *appliance* where such room or space serves as the sole source of return air.

   Exceptions:

   7.1. This shall not apply where the fuel-burning *appliance* is a direct-vent *appliance*.
   7.2. This shall not apply where the room or space complies with the following requirements:
      7.2.1. The return air shall be taken from a room or space having a volume exceeding 1 cubic foot for each 10 Btu/h (9.6 L/W) of combined input rating of all fuel-burning appliances therein.
      7.2.2. The volume of supply air discharged back into the same space shall be approximately equal to the volume of return air taken from the space.
      7.2.3. Return-air inlets shall not be located within 10 feet (3048 mm) of a draft hood in the same room or space or the combustion chamber of any atmospheric burner *appliance* ~~firebox or draft hood~~ in the same room or space.
   7.3. This shall not apply to rooms or spaces containing solid-fuel-burning appliances, provided that return-air inlets are located not less than 10 feet (3048 mm) from the firebox of the appliances.

PART III- IRC

M1602.2 Prohibited sources. Outdoor and return air for a forced-air heating or cooling system shall not be taken from the following locations:

1. Closer than 10 feet (3048 mm) to an *appliance* vent outlet, a vent opening from a plumbing drainage system or the discharge outlet of an exhaust fan, unless the outlet is 3 feet (914 mm) above the outside air inlet.
2. Where flammable vapors are present; or where located less than 10 feet (3048 mm) above the surface of any abutting public way or driveway; or where located at grade level by a sidewalk, street, alley or driveway.
3. A room or space, the volume of which is less than 25 percent of the entire volume served by the system. Where connected by a permanent opening having an area sized in accordance with ACCA Manual D, adjoining rooms or spaces shall be considered as a single room or space for the purpose of determining the volume of the rooms or spaces.

   Exception: The minimum volume requirement shall not apply where the amount of return air taken from a room or space is less than or equal to the amount of supply air delivered to the room or space.

4. A closet, bathroom, toilet room, kitchen, garage, ~~mechanical room~~, boiler room, furnace room, unconditioned *attic* or other *dwelling unit*.

   Exception: Dedicated forced air systems serving only a garage shall not be prohibited from obtaining return air from the garage.

5. A room or space containing a fuel-burning *appliance* where such room or space serves as the sole source of return air.

   Exceptions:

   1. The fuel-burning *appliance* is a direct-vent *appliance* or an *appliance* not requiring a vent in accordance with Section M1801.1 or Chapter 24.

2. The room or space complies with the following requirements:
   2.1. The return air shall be taken from a room or space having a volume exceeding 1 cubic foot for each 10 Btu/h (9.6 L/W) of combined input rating of all fuel-burning *appliances* therein.
   2.2. The volume of supply air discharged back into the same space shall be approximately equal to the volume of return air taken from the space.
   2.3. Return-air inlets shall not be located within 10 feet (3048 mm) of a draft hood in the same room or space or the combustion chamber of any atmospheric burner *appliance* ~~firebox or draft hood~~ in the same room or space.
3. Rooms or spaces containing solid-fuel burning *appliances*, if return-air inlets are located not less than 10 feet (3048 mm) from the firebox of those *appliances*.

6. An unconditioned crawl space by means of direct connection to the return side of a forced air system. Transfer openings in the crawl space enclosure shall not be prohibited.

Reason: The definition of "mechanical room" states that there are no fuel fired appliances located in the space, therefore pulling air thru one should not be an issue. This section precludes pulling return air from a garage but doesn't recognize a dedicated garage system where doing so is perfectly acceptable. Adding the word "atmospheric" differentiates between open and closed combustion chambers.

Cost Impact: The code change proposal will not increase the cost of construction.

MCMANN-FG2-618.5.DOC:

FG33–09/10
621.2, 621.4

Proponent: Craig Conner, Building Quality representing self.

1. Delete without substitution.

~~**621.2 Prohibited use.** One or more unvented room heaters shall not be used as the sole source of comfort heating in a dwelling unit~~.

2. Revise as follows:

621.4 Prohibited locations. Unvented room heaters shall not be installed within occupancies in Groups A, E and I and shall not be installed within dwelling units. The location of unvented room heaters shall also comply with Section 303.3.

Reason: This proposal prohibits unvented gas room heaters in residences. Energy efficiency in buildings is becoming increasingly important. Reduced air infiltration from airtight new buildings is a key part of making buildings more energy efficient. Obviously all products of combustion from these heaters are vented directly into the building, including venting moisture and nitrous oxides. Airtight residences are not compatible with unvented room heaters.

The 2009 IRC and IECC were made significantly more energy efficient in the last code cycle. The added efficiency included a requirement for an air tightness inspection or an air tightness test (IRC N1102.4.2, IECC 402.4.2). Incoming code changes by multiple parties are likely to greatly increase residential air tightness. There may even be a Federal law requiring increased energy efficiency in energy codes, with the prospect of a "Federalized energy code" if there is not a substantial increase in IECC energy efficiency. The increased energy efficiency in the IRC and IECC is not compatible with unvented room heaters.

Manufacturers are pushing unvented heaters to provide a greater portion of the heating for residences. Unvented heaters are called the most efficient form of heating or touted as 99% efficient. Although they legalistically including the word "supplemental" in most literature, unvented heater manufacturers focus on encouraging unvented heaters as zone or room heaters. Manufacturers or their representatives, such as the Vent-

Free Alliance, even suggest lowering the thermostat of the central heating system so that more space heating is provided by the unvented heater. Greater use of unvented heaters means increased venting of combustion products directly into the living space.

The addition of vents to room heaters and fireplaces solves the problem. The most effective strategy for limiting indoor pollutants and moisture is to prevent them from being released inside in the first place, which is a key principal of indoor air quality. For room heaters and fireplaces this means exhausting the combustion products outside. Diluting the combustion products by venting the whole house is an energy-wasteful way of dealing with combustion products. Over ventilation of the residence on the possibility that an unvented heater might be in some part of the home, or might be added at a future date, is especially wasteful of energy.

So where is the evidence of a problem? The best evidence of a problem is the programs, standards, and companies "voting with their feet". ICC's new National Green Building Standard (ICC-700) outright disqualifies a residence with an unvented heater from a green designation at any level. Similarly, Energy Star, LEED and the American Lung Association's Health House outright prohibit unvented heaters in any residence in their programs. Unvented room heaters are not "green", they are "brown".

Likewise codes and standards are singling out unvented heaters. The 2009 IRC and IECC require homes with unvented heaters to state "gas-fired unvented room heater" as part of the energy certificate required to be posted on each residence (IRC N1101.9, IECC 401.3). To prevent claims of high efficiency heating, the IRC and IECC prohibit listing an efficiency for unvented heaters on the energy certificate. ASHRAE 62.2, the standard for residential indoor air quality, does not even apply in residences with unvented heaters (see scope section).

Unvented heaters are prohibited in new manufactured (HUD-code) homes by both HUD's Manufactured Home Construction and Safety Standards (Section 3280.707) and NFPA 501, the "Standard for Mobile Homes". NFPA 501, Section 10.6 states:

"Fuel-burning, heat-producing appliances and refrigeration appliances shall be of the vented type and shall vent to the outside. Exception: Ranges and ovens."

In spite of HUD and NFPA 501's regulation, unvented heaters are often sold for use in existing manufactured homes. The I-codes should not allow heating combustion products to be vented directly into an existing manufactured, as those homes were never designed to accommodate a heater's combustion products.

The trend among manufacturers is clear- several companies refuse to make unvented heaters (Hearth & Home Technologies, Jotul, Kozy Heat Fireplaces, Mendota Fireplaces, Travis Industries), including the largest maker of fireplaces and hearth products. Recently Renni went from being a Vent-Free Alliance member to not producing unvented heaters.

Unvented gas room heaters are an impediment to greater energy efficiency. Unvented gas room heaters do not belong in residences.

Cost Impact: This code change proposal will increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

CONNOR-FG1-621.2.DOC:

FG34–09/10
621.2

Proponent: Jimmy F. Stevens, Peoria, IL representing City of Peoria, IL

Delete and substitute as follows:

~~**621.2 Prohibited use.** One or more unvented room heaters shall not be used as the sole source of comfort heating in a *dwelling unit*.~~

621.2 Prohibited installation. Unvented room heaters shall not be installed in a dwelling unit that is not served by a vented fuel-fired or non-fuel-fired space heating system capable of providing for 100% of the space heating load of the dwelling unit.

Reason: As currently written, one could interpret Section 621.2 to imply that as long as there is at least one vented room heater in the dwelling the intent of the code is met. I believe the intent is that unvented heaters are not to be allowed as the primary source of comfort heating. Therefore, some other source of heating must be installed as the primary source. The revised text assures that the unvented heaters can be used as intended, as supplemental heat sources.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

STEVENS-FG1-621.2.DOC:

FG35–09/10
630.1, Chapter 8

Proponent: James Ranfone, representing American Gas Association

1. Revise as follows:

630.1 General. Infrared radiant heaters shall be tested in accordance with ANSI ~~Z83.6~~ ANSI Z83.19 or Z83.20 and shall be installed in accordance with the manufacturer's installation instructions.

2. Delete standard from Chapter 8 as follows:

~~Z83.6-90 (R1998)~~ ~~Gas-fired Infrared Heater~~

3. Add new standards to Chapter 8 as follows:

ANSI

Z83.19-01(R2005)	Gas-Fired High-Intensity Infrared Heaters
Z83.20-08	Gas-Fired Low-Intensity Infrared Heaters

Reason: The ANSI standards that cover infrared radiant heaters are now ANSI Z83.19 and ANSI Z83.20.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: A review of the standard(s) proposed for inclusion in the code, ANSI Z83.19-01 and Z83.20-08, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

RANFONE-FG3-630.1.DOC:

FG36–09/10
636.1 (New), 636.2 (New), Chapter 8

Proponent: James Ranfone, representing American Gas Association

1. Add new text as follows:

SECTION 636 (IFGC)
OUTDOOR DECORATIVE APPLIANCES

636.1 General. Permanently fixed-in-place outdoor decorative appliances shall be tested in accordance with ANSI Z21.97 and shall be installed in accordance with the manufacturer's installation instructions.

636.2 Unlisted Units. Unlisted outdoor decorative appliances shall be approved and shall be installed outdoors in accordance with the manufacturer's installation instructions, and with clearances to combustible materials of not less than 36 in. (910 mm) from the sides measured horizontally. Such appliances shall not be located under combustible construction.

2. Add standard to Chapter 8 as follows:

ANSI

ANSI Z21.97-09	Outdoor Decorative Appliances

Reason: Would add specific coverage for outdoor decorative appliances that the code is currently lacking. The new ANSI standard Z21.97 was developed to specifically address an increasing popular appliance class. Coverage for unlisted units is being added since there is likely to be a large number of unlisted appliances in the market place until the new certification standard gains traction.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: A review of the standard(s) proposed for inclusion in the code, ANSI Z21.97-09, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

RANFONE-FG4-636_NEW.DOC:

FG37–09/10
703.1 (IMC [FG] 304.5)

Proponent: Guy Tomberlin, Bluemont, VA, representing self

Revise as follows:

703.1 Hydrogen-generating and refueling operations. Hydrogen-generating and refueling appliances shall be installed and located in accordance with their listing and the manufacturer's installation instructions. Ventilation shall be required in accordance with and Section 703.1.1, 703.1.2 or 703.1.3 in public garages, private garages, repair garages, automotive motor fuel-dispensing facilities and parking garages that contain hydrogen-generating appliances or refueling systems. For the purpose of this section, rooms or spaces that are not part of the living space of a dwelling unit and that communicate directly with a private garage through openings shall be considered to be part of the private garage.

Reason: The original text attempts to cover "generic" ventilation requirements for these type appliances. However, these are not generic type appliances they are specific. The installation, location and minimum ventilation need to be prescribed by the listing of the appliance and referenced by the installation instructions the same as any other appliance.

Cost Impact: None given.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

TENTATIVE ORDER OF DISCUSSION

2009/2010 PROPOSED CHANGES TO THE INTERNATIONAL MECHANICAL CODE

The following is the tentative order in which the proposed changes to the code will be discussed at the public hearings. Proposed changes which impact the same subject have been grouped to permit consideration in consecutive changes.

Proposed change numbers that are indented are those which are being heard out of numerical order. Indentation does **not** necessarily indicate that one change is related to another. Proposed changes may be grouped for purposes of discussion at the hearing at the discretion of the chair.

M1–09/10
202 (New); IRC R202 (New)

Proponent: Guy Tomberlin, Fairfax County, VA, representing the Virginia Plumbing and Mechanical Inspectors/Virginia Building and Code Officials

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IMC COMMITTEE. PART II WILL BE HEARD BY THE IRC MECHANICAL COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IMC

Add new definitions as follows:

CONTINUOUS OPERATION. Automatically activated and operating 24 hours a day or whenever the space is occupied.

INTERMITTENT OPERATION. Manually activated.

PART II – IRC MECHANICAL

Add new definitions as follows:

CONTINUOUS OPERATION. Automatically activated and operating 24 hours a day or whenever the space is occupied.

INTERMITTENT OPERATION. Manually activated.

Reason: Currently the IMC and the IRC has several sections that require continuous or intermittent operation but never provides the guidance for how either is to be achieved. This addition to the definition section clearly provides the guidance necessary to address these specific sections.

Cost Impact: The code change proposal will not increase the cost of construction.

PART I – IMC

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

PART II – IRC MECHANICAL

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: TOMBERLIN-M-4-M-13-202-RB-3-R202

M2–09/10
202

Proponent: Lee J. Kranz, City of Bellevue, WA, representing The Washington Association of Building Officials (WABO), Technical Code Development Committee

Revise as follows:

ENVIRONMENTAL AIR. Air that is conveyed to or from occupied areas through ducts which are not part of the heating or air-conditioning system, such as ventilation for human usage, domestic kitchen range exhaust, bathroom exhaust, ~~and~~ domestic clothes dryer exhaust and parking garage exhaust.

Reason: Currently, parking garage exhaust ducts and terminals may be considered to be environmental air or product conveyance. Adding parking garage exhaust to the list of items considered to be environmental air will reduce ambiguity for enforcement of location of exhaust air outlets specified in IMC Section 501.2.1. Exhaust air conveyed from parking garages is of the same concentration or ratio as the air contained within the occupied space of the garage and should not be considered to be product conveying.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: KRANZ-M-1-202

M3–09/10
202

Proponent: Guy McMann, Jefferson County, CO, representing the Colorado Association of Plumbing and Mechanical Officials (CAPMO)

Delete definitions and substitute as follows:

~~**JOINT, MECHANICAL.** A general form of gas-tight joints obtained by the joining of metal parts through a positive-holding mechanical construction, such as flanged joint, screwed joint or flared joint.~~

~~**MECHANICAL JOINT.** A connection between pipes, fittings, or pipes and fittings, which is neither screwed, caulked, threaded, soldered, solvent cemented, brazed nor welded. Also, a joint in which compression is applied along the centerline of the pieces being joined. Some joints are part of a coupling, fitting or adapter. These joints include both the press-type and push-fit joining systems.~~

MECHANICAL JOINT.

A) A connection between pipes, fittings, or pipes and fittings that is not welded, brazed, caulked, soldered or solvent cemented.
B) A general form of gas or liquid-tight connections obtained by the joining of parts through a positive holding mechanical construction such as but not limited to flanged, screwed, clamped or flared connections.

Reason: There is no good reason to have two definitions covering the same subject matter. The “mechanical joint” definition is in direct conflict with the same definition located in the IPC. That definition excludes threaded joints and rightly so. A mechanical joint is one that can be generally disassembled. Welded, cemented, braised and solvent cemented connections cannot be separated without cutting. A little cleanup was undertaken in the form of not including the last sentence in “mechanical joint” as this is commentary and should not be included in the definition. Also, the term being defined should not be used in the definition.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: MCMANN-M-16-202

M4–09/10
202

Proponent: Bob Glaze, Chief Plumbing, Gas and Mechanical Inspector (Retired)

Delete definition without substitution:

~~**MECHANICAL JOINT.** A connection between pipes, fittings, or pipes and fittings, which is neither screwed, caulked, threaded, soldered, solvent cemented, brazed nor welded. Also, a joint in which compression is applied along the centerline of the pieces being joined. Some joints are part of a coupling, fitting or adapter. These joints include both the press-type and push-fit joining systems.~~

Reason: Definition of ‘**MECHANICAL JOINT**’ **and** ‘**JOINT, MECHANICAL**’ disagree with each other, therefore it can be confusing and contradicting. For Mechanical systems ground joints should be used where slip-joints, caulked and solvent cemented joint should not be used except in Plumbing systems.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: GLAZE-M-1-202

M5–09/10
202 (New)

Proponent: Andrew Granzow, Viega, LLC

Add new definition as follows:

PRESS JOINT. A permanent mechanical joint incorporating an elastomeric seal or an elastomeric seal and corrosion-resistant grip ring. The joint is made with a pressing tool and jaw or ring approved by the fitting manufacturer.

Reason: This change will clarify the difference between a press joint and other connection types.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: GRANZOW-M-5-202

M6–09/10
301.6; IRC M1303.1

Proponent: Bob Eugene, Underwriters Laboratories, Inc.

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IMC COMMITTEE. PART II WILL BE HEARD BY THE IRC MECHANICAL COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IMC

Revise as follows:

301.6 Label information. A permanent factory-applied name plate(s) shall be affixed to appliances on which shall appear in legible lettering, the manufacturer's name or trademark, the model number, serial number and the seal or mark of the approved agency. A label shall also include the following:

1. Electrical equipment and appliances: Electrical rating in volts, amperes and motor phase; identification of individual electrical components in volts, amperes or watts, motor phase; Btu/h (W) output; and required clearances.
2. Absorption units: Hourly rating in Btu/h (W); minimum hourly rating for units having step or automatic modulating controls; type of fuel; type of refrigerant; cooling capacity in Btu/h (W); and required clearances.
3. Fuel-burning units: Hourly rating in Btu/h (W); type of fuel approved for use with the appliance; and required clearances.
4. Electric comfort heating appliances: ~~Name and trade-mark of the manufacturer; the model number or equivalent; the~~ electric rating in volts, ~~ampacity~~ amperes and phase; Btu/h (W) output rating; individual marking for each electrical component in amperes or watts, volts and phase; and required clearances from combustibles; ~~and a seal indicating approval of the appliance by an approved agency~~.

PART II – IRC MECHANICAL

Revise as follows:

M1303.1 Label information. A permanent factory-applied nameplate(s) shall be affixed to appliances on which shall appear, in legible lettering, the manufacturer's name or trademark, the model number, a serial number and the seal or mark of the testing agency. A label shall also include the following:

1. Electrical appliances. Electrical rating in volts, amperes and motor phase; identification of individual electrical components in volts, amperes or watts and motor phase; and in Btu/h (W) output and required clearances.
2. Absorption units. Hourly rating in Btu/h (W), minimum hourly rating for units having step or automatic modulating controls, type of fuel, type of refrigerant, cooling capacity in Btu/h (W) and required clearances.
3. Fuel-burning units. Hourly rating in Btu/h (W), type of fuel approved for use with the appliance and required clearances.

4. Electric comfort heating appliances. ~~Name and trademark of the manufacturer; the model number or equivalent;~~ the electric rating in volts, amperes and phase; Btu/h (W) output rating; individual marking for each electrical component in amperes or watts, volts and phase; and required clearances from combustibles ~~and a seal indicating approval of the appliance by an approved agency~~.
5. Maintenance instructions. Required regular maintenance actions and title or publication number for the operation and maintenance manual for that particular model and type of product.

Reason: (**Part I**) The wording in Item 4 is already in the main paragraph. This proposal removes language that is redundant.

(Part II) Requirement is already covered in the main section. This proposal removes language that is redundant.

Cost Impact: The code change proposal will not increase the cost of construction.

PART I – IMC

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

PART II – IRC MECHANICAL

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: EUGENE-M-6-301.6-RM-1-M1303.1

M7–09/10
302.2

Proponent: Vickie Lovell, InterCode, Inc., representing the 3M Company

Revise as follows:

302.2 Penetrations of floor/ceiling assemblies and fire-resistance-rated assemblies. Penetrations of floor/ceiling assemblies and assemblies required to have a fire-resistance rating shall be protected in accordance with Chapter 7 of the *International Building Code*.

Reason: This change directs the code user to the specific chapter for protection of ducts.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: LOVELL-M-4-303.2

M8–09/10
202 (New), 303.3, 927 (New), 927.1 (New); IFC 603.4

Proponent: Byron "BJ" Foster, The McMullen Company, Inc., representing the Fire Company, Pty. Ltd., Warriewood, Australia

THIS IS A 2 PART CODE CHANGE. BOTH PARTS WILL BE HEARD BY THE IMC CODE COMMITTEE AS 2 SEPARATE CODE CHANGES. SEE THE TENTATIVE HEARING ORDER FOR THE IMC CODE COMMITTEE.

PART I – IMC

1. Add new definition as follows:

UNVENTED DECORATIVE APPLIANCE. An appliance designed and listed for burning alcohol or ethanol. Such appliances are not vented to the outdoors and have passed an indoor air quality test in accordance with the National Ambient Air Quality Standards as published by the Environmental Protection Agency and the Consumer Product Safety Commission standard for reportable levels of carbon monoxide.

2. Revise as follows:

303.3 Prohibited locations. Fuel-fired appliances shall not be located in, or obtain *combustion* air from, any of the following rooms or spaces:

1. Sleeping rooms.
2. Bathrooms.
3. Toilet rooms.
4. Storage closets.
5. Surgical rooms.

Exception: This section shall not apply to the following appliances:

1. *Direct-vent appliances* that obtain all *combustion air* directly from the outdoors.
2. Solid fuel-fired appliances, provided that the room is not a confined space and the building is not of unusually tight construction.
3. Appliances installed in a dedicated enclosure in which all *combustion* air is taken directly from the outdoors, in accordance with Chapter 7. *Access to* such enclosure shall be through a solid door, weather-stripped in accordance with the exterior door air leakage requirements of the *International Energy Conservation Code* and equipped with an *approved* self-closing device.
4. Unvented alcohol or ethanol burning decorative appliances that are listed and labeled for indoor applications and pass an indoor air quality test in accordance with the National Ambient Air Quality Standards as published by the Environmental Protection Agency and the Consumer Product Safety Commission standard for reportable levels of carbon monoxide.

3. Add new text as follows:

SECTION 927
UNVENTED ALCOHOL AND ETHANOL BURNING APPLIANCES

927.1 General. Unvented decorative appliances. Unvented decorative appliances shall be listed for indoor applications and pass an indoor air quality test in accordance with the National Ambient Air Quality Standards as published by the Environmental Protection Agency and the Consumer Product Safety Commission standard for reportable levels of carbon monoxide.

PART II – IFC

Revise as follows:

603.4 Portable unvented heaters. Portable unvented fuel-fired heating equipment shall be prohibited in occupancies in Groups A, E, I, R-1, R-2, R-3 and R-4.

Exceptions:

1. Listed and approved unvented fuel-fired heaters, including portable outdoor gas-fired heating appliances, in one- and two-family dwellings.
2. Portable outdoor gas-fired heating appliances shall be allowed in accordance with Section 603.4.2.
3. In other than one- and two-family dwellings, listed and approved unvented alcohol or ethanol fuel-fired decorative appliances that are listed for indoor applications and have passed an indoor air quality test in accordance with the National Ambient Air Quality Standards as published in the EPA and Consumer Products Safety Commission standard for carbon monoxide.

Reason: There is currently no category in any of the ICC codes for alcohol burning appliances. This text will allow building and fire officials to evaluate and permit the installation of unvented alcohol burning decorative appliances that are not primarily for heating purposes. This category of appliance is relatively new on the market and is considered a “green appliance”. They produce almost no detectable levels of carbon monoxide. The primary products of combustion are steam and carbon dioxide and are well below the minimum reporting levels as published by the EPA and CPSC. Even in unusually tight construction and very small spaces, these units produce less than half the reportable levels of CO over an eight (8) hour burn period.

Bibliography

UL Listing Summery and listing sheet for the EcoSmart Fire Unit

Indoor Air Quality Test Summery by Air Quality Sciences

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: The proponent did not provide Code of Federal Regulations (CFR) citations for either the "National Ambient Air Quality Standards as published in the EPA or the Consumer Products Safety Commission standard for carbon monoxide". Review copies were also not provided in accordance with Section 3.6 of ICC CP-28.

PART I – IMC

M9-09/10
304.1, Chapter 15; IRC M1401.1, Chapter 44

Proponent: Brent Ursenbach, Salt Lake County, representing the Utah Chapter of ICC

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IMC COMMITTEE. PART II WILL BE HEARD BY THE IRC MECHANICAL COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IMC

1. Revise as follows:

304.1 General. *Equipment* and appliances shall be installed as required by the terms of their approval, in accordance with the conditions of the listing, the manufacturer's installation instructions, the requirements of ANSI/ACCA 5 QI-2007 where applicable and this code. Manufacturer's installation instructions shall be available on the job site at the time of inspection.

2. Add new standard to Chapter 15 as follows:

ACCA 5 Q1-2007	HVAC Quality Installation Specification Residential and Commercial Heating, Ventilating and Air Conditioning (HVAC) Applications

PART II – IRC MECHANICAL

1. Revise as follows:

M1401.1 Installation. Heating and cooling *equipment* and *appliances* shall be installed in accordance with the manufacturer's installation instructions, the requirements of ACCA Standard 5 and the requirements of this code.

2. Add new standard to Chapter 44 as follows:

ACCA 5 Q1-2007	HVAC Quality Installation Specification Residential and Commercial Heating, Ventilating and Air Conditioning (HVAC) Applications

Reason: Maximum energy efficiency from heat and cooling equipment will not be realized until such systems are properly installed. Quoting the *Foreword of Standard 5:*

"There is a need to establish a raised bar to improve the core competencies of contractors to ensure that quality installations ensue. This is beneficial not only as a process improvement for contracting businesses, but, more importantly, for fulfilling the needs of building owners/operators in quality installations – comfortable, healthy, safe, energy-efficient indoor environments. Yet, until now, across the broad spectrum of the industry (manufacturers, distributors, contractors, user groups, customers, utilities, environmental groups, associations/professional societies, governmental agencies, etc.), there has been no universally accepted definition of a quality contractor or a quality installation. Full observance of the quality installation elements may increase the initial "cost" to the residential or commercial building owner/operator. However, the increased "value" – resulting from improved energy efficiency, better comfort, enhanced IAQ, improved equipment reliability, longer equipment life, etc. – is expected to far exceed any added upfront price. Additionally, adherence to the elements in this specification provides intangible societal benefits in the form of reduced power grid energy demand that aids in reducing pollution and dependence on foreign oil."

Cost Impact: The code change proposal will increase the cost of construction; however it will decrease the operating cost for HVAC equipment throughout the life of the appliances.

Analysis: Review of proposed new standard, ACCA 5 Q1-9-2007, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

M10–09/10
304.3; IRC M1307.3, P2801.6

Proponent: Don Surrena, CBO, representing the National Association of Home Builders (NAHB)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IMC COMMITTEE. PART II WILL BE HEARD BY THE IRC PLUMBING/MECHANICAL COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IMC

Revise as follows:

304.3 Elevation of ignition source. Equipment and appliances having an *ignition source* and located in hazardous locations and public garages, private garages, repair garages, automotive motor fuel-dispensing facilities and parking garages shall be elevated such that the source of ignition is not less than 18 inches (457 mm) above the floor surface on which the *equipment* or *appliance* rests. For the purpose of this section, rooms or spaces that are not part of the living space of a *dwelling unit* and that communicate directly with a private garage through openings shall be considered to be part of the private garage.

> **Exception:** Elevation of the ignition source is not required for appliances that are listed as flammable vapor ignition resistant.

Reason: This change provides uniformity between the IFGC the IRC and the IMC for consistence of the codes to allow "flammable vapor ignition resistant" appliances to not be required to be elevated. As currently written the provisions for elevation from ignition source is covered in the IRC Section 2408.2 and the IFGC in Section 305.3. The IMC and the IRC Section P2801.6 do not recognize the flammable vapor ignition resistant technology.

Bibliography
ANSI Z21.10.1a-2002/CSA4.1a-2002

Cost Impact: The code change proposal will not increase the cost of construction.

PART II – IRC PLUMBING/MECHANICAL

Revise as follows:

M1307.3 Elevation of ignition source. *Appliances* having an *ignition source* shall be elevated such that the source of ignition is not less than 18 inches (457 mm) above the floor in garages. For the purpose of this section, rooms or spaces that are not part of the living space of a *dwelling unit* and that communicate with a private garage through openings shall be considered to be part of the garage.

> **Exception:** Elevation of the ignition source is not required for appliances that are listed as flammable vapor ignition resistant.

P2801.6 Water heaters installed in garages. Water heaters having an ignition source shall be elevated such that the source of ignition is not less than 18 inches (457 mm) above the garage floor

> **Exception:** Elevation of the ignition source is not required for appliances that are listed as flammable vapor ignition resistant.

Reason: This change provides uniformity between the IFGC the IRC and the IMC. If adopted the requirements regarding "flammable vapor ignition resistant" appliances will be consistent throughout the codes. As currently written the provisions for elevation from ignition source is covered in the IRC Section G2408.2 and the IFGC in Section 305.3.

Bibliography
ANSI Z21.10.1a-2002/CSA4.1a-2002

Cost Impact: The code change proposal will not increase the cost of construction.

M11–09/10
306.5 (IFGC 306.5)

Proponent: Guy McMann, Jefferson County, CO, representing the Colorado Association of Plumbing and Mechanical Officials (CAPMO)

Revise as follows:

306.5 (IFGC 306.5) Equipment and appliances on roofs or elevated structures. Where equipment requiring access or appliances are located on an elevated structure or the roof of a building such that personnel will have to climb higher than 16 feet above grade to access such equipment or appliances, an interior or exterior means of access shall be provided. Such access shall not require climbing over obstructions greater than 30 inches (762 mm) high or walking on roofs having a slope greater than 4 units vertical in 12 units horizontal (33-percent slope). Such access shall not require the use of portable ladders.\

~~Where equipment requiring access and appliances are installed on roofs or elevated structures at a height exceeding 16 feet (4877 mm), such access shall be provided by a permanent approved means of access, the extent of which shall be from grade or floor level to the equipment and appliances' level service space. Such access shall not require climbing over obstructions greater than 30 inches (762 mm) high or walking on roofs having a slope greater than 4 units vertical in 12 units horizontal (33-percent slope)~~ Where access involves climbing over parapet walls, the height shall be measured to the top of the parapet wall.

Permanent ladders installed to provide the required access shall comply with the following minimum design criteria:

1. The side railing shall extend above the parapet or roof edge not less than 30 inches (762 mm).
2. Ladders shall have rung spacing not to exceed 14 inches (356 mm) on center.
3. Ladders shall have a toe spacing not less than 6 inches (152 mm) deep.
4. There shall be a minimum of 18 inches (457 mm) between rails.
5. Rungs shall have a minimum 0.75-inch (19 mm) diameter and be capable of withstanding a 300-pound (136.1 kg) load.
6. Ladders over 30 feet (9144 mm) in height shall be provided with offset sections and landings capable of with standing 100 pounds per square foot (488.2 kg/m2). Landing dimensions shall be not less than 18 inches (457 mm) and not less than the width of the ladder served. A guard rail shall be provided on all open sides of the landing.
7. Ladders shall be protected against corrosion by *approved* means.

Catwalks installed to provide the required access shall be not less than 24 inches (610 mm) wide and shall have railings as required for service platforms.

Exception: This section shall not apply to Group R-3 occupancies.

Reason: This is an effort to stream-line and simplify this section and exclude unnecessary language. This text eliminates where roofs are to be measured by prescribing that if the roof is greater than 16 feet, inside or outdoor access is required regardless of how high parapets are. Prohibiting the use of portable ladders assures that the ladders associated with access are close enough to the ground or floor to access. There is nothing new in this text.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: MCMANN-M-33-306.5

M12–09/10
306.5 (IFGC 306.5)

Proponent: Guy McMann and Troy Jones, Jefferson County, CO, representing the Colorado Association of Plumbing and Mechanical Officials (CAPMO)

Revise as follows:

306.5 (IFGC 306.5)Equipment and appliances on roofs or elevated structures. Where *equipment* requiring access and appliances are installed on roofs or elevated structures at a height exceeding 16 feet (4877 mm), such access shall be provided by a permanent *approved* means of access, the extent of which shall be from grade or floor level to the *equipment* and appliances' level service space. Such access shall not require climbing over obstructions greater than 30 inches (762 mm) high or walking on roofs having a slope greater than four units vertical in 12 units horizontal (33-percent slope). Where access involves climbing over parapet walls, the height shall be measured to the top of the parapet wall. Permanent ladders installed to provide the required access shall comply with the following minimum design criteria:

1. The side railing shall extend above the parapet or roof edge not less than 30 inches (762 mm).
2. Ladders shall have rung spacing not to exceed 14 inches (356 mm) on center. <u>The upper-most rung shall be a maximum of 24 inches (610 mm) below the upper edge of the roof hatch, roof or parapet, as applicable.</u>
3. Ladders shall have a toe spacing not less than 6 inches (152 mm) deep.
4. There shall be a minimum of 18 inches (457 mm) between rails.
5. Rungs shall have a minimum 0.75-inch (19 mm) diameter and be capable of withstanding a 300-pound (136.1 kg) load.
6. Ladders over 30 feet (9144 mm) in height shall be provided with offset sections and landings capable of withstanding 100 pounds per square foot (488.2 kg/m2). Landing dimensions shall be not less than 18 inches (457 mm) and not less than the width of the ladder served. A guard rail shall be provided on all open sides of the landing.
7. <u>Climbing clearance. The distance from the centerline of the rungs to the nearest permanent object on the climbing side of the ladder shall be a minimum of 30 inches (762 mm) measured perpendicular to the rungs. This distance shall be maintained from the point of ladder access to the bottom of the roof hatch. A minimum clear width of 15-inches (381 mm) shall be provided on both sides of the ladder measured from the midpoint of and parallel with the rungs except where cages or wells are installed.</u>
8. <u>Landing required. The ladder shall be provided with a clear and unobstructed bottom landing area having a minimum dimension of 30 inches (762 mm) by 30 inches (762 mm) centered in front of the ladder.</u>
~~7~~<u>9</u>. Ladders shall be protected against corrosion by *approved* means.
10. <u>Ladders shall be accessible at all times.</u>

Catwalks installed to provide the required access shall be not less than 24 inches (610 mm) wide and shall have railings as required for service platforms.

Exception: This section shall not apply to Group R-3 occupancies.

Reason: There can be many dangers when utilizing permanently installed ladders, most notably falling down or off for one reason or another. There needs to be clear and unobstructed passage up and down the ladder. Currently there is no guidance as to climbing clearances. These requirements come directly from *OSHA Standard 1910.27.* It's hard enough for those whom access is required to properly climb without having to dodge pipes, ducts or walls that encroach on the minimum climbing clearances established in the standard. The 30" clearance makes total sense because many times tools, parts or other items must be carried at the same time while climbing. Likewise, the bottom landing area serves as a staging point for maintenance and fire personnel. These ladders many times are located in small closets or electrical rooms with little regard to accessing or exiting the ladder. There are documented cases where switch gear has been located too close to the ladder causing tail bone and back injuries when descending the ladder. Also, there is no guidance in the code as to how far the top rung needs to be from the very top of the hatch. A rung located too far down creates a tripping hazard. These minimum requirements will help ensure a safer environment when accessing, climbing and descending these ladders.

Ladders also need to be accessible at all times. As is, there is nothing prohibiting a ladder from being installed in the middle of a building or in the middle of an upper floor during the "core and shell" portion of construction. This is ok up to the point where that portion of the floor or building becomes consumed by a tenant later on, rendering the ladder inaccessible by other tenants or fire personnel when the tenant is closed for business. For obvious security reasons only the tenant themselves should access their space. These ladders need to be placed in a neutral location that all tenants and fire personnel can access at all times. This language will provide a "trigger" for plan reviewers when evaluating core and shell plans and permitting them to require a more neutral location when the need arises.

Cost Impact: This code change will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: MCMANN-M-11-306.5

M13–09/10
306.5.1 (IFGC 306.5.1)

Proponent: Gary Buck, Salt Lake City Corporation, representing the Utah Chapter of ICC

Revise as follows:

306.5.1 (IFGC 306.5.1) Sloped roofs. Where appliances, *equipment*, fans or other components that require service are installed on a roof having a slope of ~~three~~ five units vertical in 12 units horizontal (~~25~~ 42-percent slope) or greater and having an edge more than 30 inches (762 mm) above grade at such edge, a level platform shall be provided on each side of the *appliance* or *equipment* to which access is required for service, repair or maintenance. The platform shall be not less than 30 inches (762 mm) in any dimension and shall be provided with guards. The guards shall extend not less than 42 inches (1067 mm) above the platform, shall be constructed so as to prevent the passage of a 21-inch diameter (533 mm) sphere and shall comply with the loading requirements for guards specified in the *International Building Code*. Access shall not require walking on roofs having a slope greater than four units vertical in 12 units horizontal (33-percent slope). Where access involves obstructions greater than 30 inches (762 mm) in height, such obstructions shall be provided with ladders installed in accordance with Section 306.5 or stairs installed in accordance with the requirements specified in the *International Building Code* in the path of travel to and from appliances, fans or *equipment* requiring service.

Reason: We feel that this requirement of the code for platforms on roofs is generally ignored because of the comparatively low threshold of the slope of the roof. We feel that slopes of 5:12 or less are relatively safe surfaces to maintain mechanical equipment. The platforms are rarely used and are unsightly. By increasing the slope we feel that this requirement will be less likely overlooked in review and inspections.

Cost Impact: Reduced cost.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: BUCK-M-1-306.5.1

M14–09/10
308.5, Chapter 15

Proponent: Bob Eugene, Underwriters Laboratories, Inc.

1. Revise as follows:

308.5 Labeled assemblies. The allowable clearance reduction shall be based on an approved reduced clearance protective assembly that ~~has been tested and bears the~~ is listed and labeled in accordance with UL 1618 ~~of an approved agency~~.

2. Add new standard to Chapter 15 as follows:

UL
618-09 Wall Protectors, Floor Protectors, and Hearth Extensions

Reason: The UL 1618 standard includes a comprehensive set of construction and performance requirements that are used to evaluate and list wall protectors, floor protectors, and hearth extensions that are intended for use with heat producing devices, such as fireplaces, fireplace stoves, fireplace inserts, and solid-fuel type room heaters.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: Review of proposed new standard, UL 1618-09, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

Public Hearing: Committee: AS AM D

~~31/2-inch brick wall, against the combustible wall~~	~~—~~	~~—~~	~~—~~	~~—~~	~~24~~	~~12~~	~~6~~	~~5~~

~~For SI: 1 inch = 25.4 mm, ºC = [(ºF)-32]/1.8, 1 pound per cubic foot = 16.02 kg/m3, 1.0 Btu • in/ft2 • h • ºF = 0.144 W/m2 • K.~~

~~a. Mineral wool and glass fiber batts (blanket or board) shall have a minimum density of 8 pounds per cubic foot and a minimum melting point of 1,500ºF. Insulation material utilized as part of a clearance reduction system shall have a thermal conductivity of 1.0 Btu • in/(ft2 • h • ºF) or less. Insulation board shall be formed of noncombustible material.~~

~~b. For limitations on clearance reduction for solid fuel burning appliances, masonry chimneys, connector pass-throughs, masonry fireplaces and kitchen ducts, see Sections 308.7 through 308.11.~~

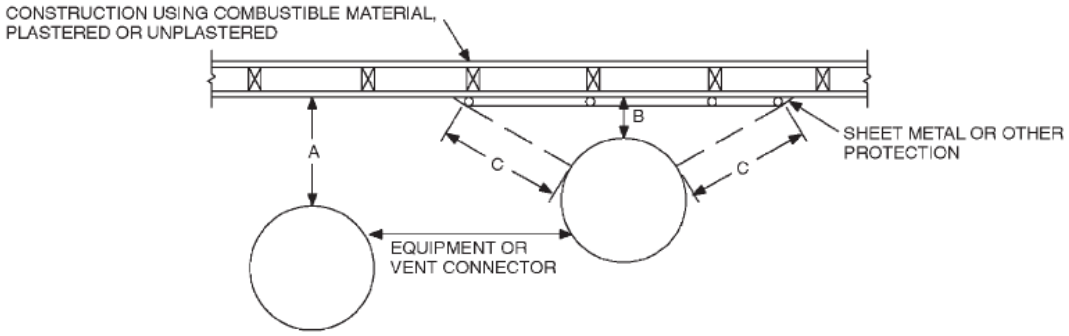
TABLE ~~M1306.2~~ 308.6
REDUCTION OF CLEARANCES WITH SPECIFIED FORMS OF PROTECTION[a, c, d, e, f, g, h, l, j, k, l]

TYPE OF PROTECTION APPLIED TO AND COVERING ALL SURFACES OF COMBUSTIBLE MATERIAL WITHIN THE DISTANCE SPECIFIED AS THE REQUIRED CLEARANCE WITH NO PROTECTION (See Figures 308.6(1) and 308.6(2)	WHERE THE REQUIRED CLEARANCE WITH NO PROTECTION FROM APPLIANCE, VENT CONNECTOR, OR SINGLE WALL METAL PIPE IS:									
	36 inches		18 inches		12 inches		9 inches		6 inches	
	Allowable clearances with specified protection (Inches)[b]									
	Use column 1 for clearances above an appliance or horizontal connector. Use column 2 for clearances from an appliance, vertical connector and single-wall metal pipe.									
	Above column 1	Sides and rear column 2	Above column 1	Sides and rear column 2	Above column 1	Sides and rear column 2	Above column 1	Sides and rear column 2	Above column 1	Sides and rear column 2
31/2-inch thick masonry wall without ventilated air space	—	24	—	12	—	9	—	6	—	5
1/2-in. insulation board over 1-inch glass fiber or mineral wool batts	24	18	12	9	9	6	6	5	4	3
Galvanized sheet steel having a minimum thickness of 0.0236-inch (No. 24 gage) over 1-inch glass fiber or mineral wool batts reinforced with wire or rear face with a ventilated air space	18	12	9	6	6	4	5	3	3	3
31/2-inch thick masonry wall with ventilated air space	—	12	—	6	—	6	—	6	—	6
Galvanized sheet steel having a minimum thickness of 0.0236-inch (No. 24 gage) with a ventilated air space 1-inch off the combustible assembly	18	12	9	6	6	4	5	3	3	2
1/2-inch thick insulation board with ventilated air space	18	12	9	6	6	4	5	3	3	3
Galvanized sheet steel having a minimum thickness of 0.0236-inch (No. 24 gage) with ventilated air space over 24 gage sheet steel with a ventilated space	18	12	9	6	6	4	5	3	3	3
1-inch glass fiber or mineral wool batts sandwiched between two sheets of galvanized sheet steel having a minimum thickness of 0.0236-inch (No. 24 gage) with a ventilated air space	18	12	9	6	6	4	5	3	3	3

For SI: 1 inch = 25.4 mm, 1 pound per cubic foot = 16.019 kg/m3, °C = [(°F)-32/1.8], 1 Btu/(h _ ft2 _ °F/in.) = 0.001442299 (W/cm2 × °C/cm).

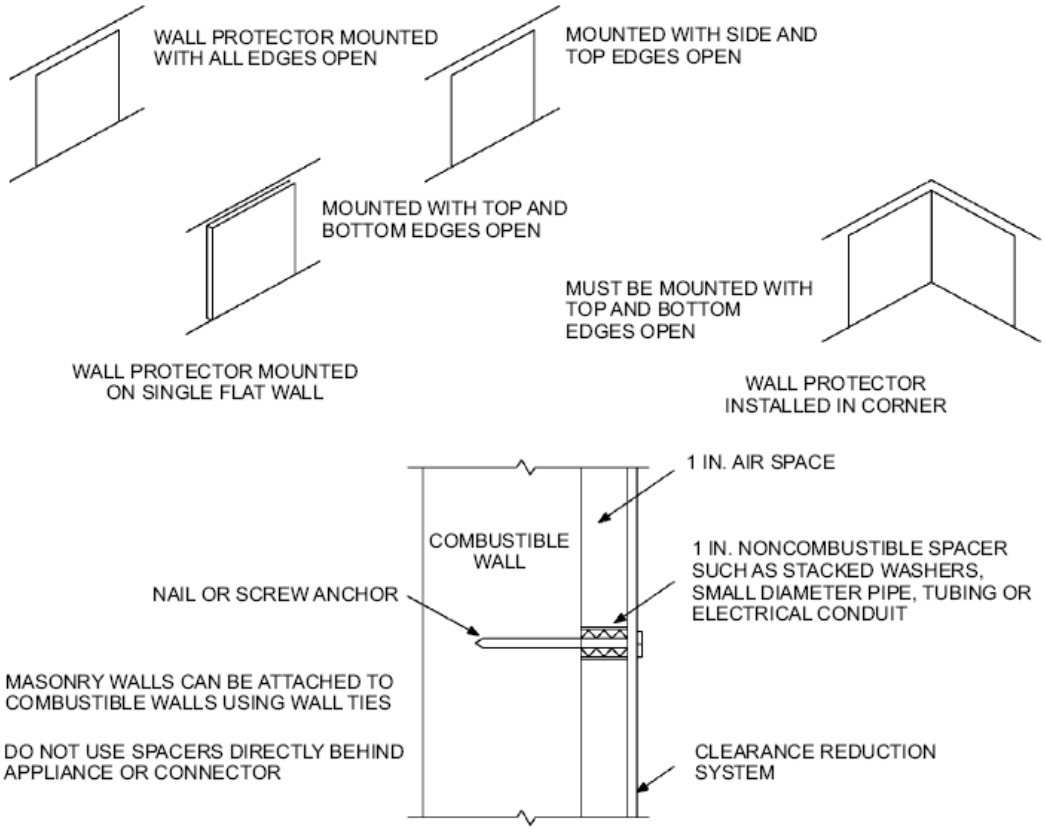
a. Reduction of clearances from combustible materials shall not interfere with combustion air, draft hood clearance and relief, and accessibility of servicing.
b. Clearances shall be measured from the surface of the heat producing appliance or equipment to the outer surface of the combustible material or combustible assembly.
c. Spacers and ties shall be of noncombustible material. No spacer or tie shall be used directly opposite appliance or connector.
d. Where all clearance reduction systems use a ventilated air space, adequate provision for air circulation shall be provided as described. [See Figures 308.6(1) and 308.6(2)]
e. There shall be at least 1 inch between clearance reduction systems and combustible walls and ceilings for reduction systems using ventilated air space.
f. If a wall protector is mounted on a single flat wall away from corners, adequate air circulation shall be permitted to be provided by leaving only the bottom and top edges or only the side and top edges open with at least a 1-inch air gap.
g. Mineral wool and glass fiber batts (blanket or board) shall have a minimum density of 8 pounds per cubic foot and a minimum melting point of1,500 °F.
h. Insulation material used as part of a clearance reduction system shall have a thermal conductivity of 1.0 Btu inch per square foot per hour °F or less. Insulation board shall be formed of noncombustible material.
i. There shall be at least 1 inch between the appliance and the protector. In no case shall the clearance between the appliance and the combustible surface be reduced below that allowed in this table.
j. All clearances and thicknesses are minimum; larger clearances and thicknesses are acceptable.
k. Listed single-wall connectors shall be permitted to be installed in accordance with the terms of their listing and the manufacturer's instructions.
l. For limitations on clearance reduction for solid-fuel-burning appliances, masonry chimneys, connector pass-throughs, masonry fireplaces and kitchen ducts, see Sections 308.7 through 308.11.

2. Add new figures as follows:



NOTE: "A" equals the required clearance with no protection. "B" equals the reduced clearance permitted in accordance with Table M1306.2. The protection applied to the construction using combustible material shall extend far enough in each direction to make "C" equal to "A."

FIGURE 308.6(1)
REDUCED CLEARANCE DIAGRAM



For SI: 1 inch = 25.4 mm.

FIGURE 308.6(2)
WALL PROTECTOR CLEARANCE REDUCTION SYSTEM

Reason: So table can be consistent with the IFGC and the mechanical and gas sections of the IRC.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: Tables M1306.2 and G2409.2 are specific to appliances, vent and chimney connectors and single-wall metal vents, whereas, Table 308.6 is applicable to any heat source.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: ENGLAND-M-5-T. 308.6

M16–09/10
401.4 (New)

Proponent: Guy Tomberlin, Fairfax County, VA, representing the Virginia Plumbing and Mechanical Inspectors/Virginia Building and Code Officials

Add new text as follows:

401.4 Exhaust required. Exhaust shall be provided as specified in Table 403.3 except as otherwise specified in this code.

Reason: There is no current text to direct the user to Table 403.3 for exhaust system design and construction. Other sections of the IMC require exhaust for specific applications such as parking garage, commercial hood system, and hazardous exhaust system. This added wording simply provides acknowledgement that exhaust is required as specified in Table 403.3 unless there is an overriding section detailing other exhaust rates and alternatives.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: T OMBERLIN-M-14-401.4

M17–09/10
401.4

Proponent: Guy McMann, Jefferson County, CO, representing the Colorado Association of Plumbing and Mechanical Officials (CAPMO)

Revise as follows:

401.4 Intake opening location. Air intake openings shall comply with all of the following:

1. Intake openings shall be located a minimum of 10 feet (3048 mm) from lot lines or buildings on the same lot. Where openings front on a street or public way, the distance shall be measured to the centerline of the street or public way.
2. Mechanical and gravity outdoor air intake openings shall be located not less than 10 feet (3048 mm) horizontally or 25 feet (7620 mm) vertically from any hazardous or noxious contaminant source, such as vents, streets, alleys, parking lots and loading docks, except as specified in Item 3 or Section 501.2.1.
3. Intake openings shall be located not less than 3 feet (914 mm) below contaminant sources where such sources are located within 10 feet (3048 mm) of the opening.
4. Intake openings on structures in flood hazard areas shall be at or above the design flood level.

Reason: Currently there is no relief provided by the code for openings located closer than 10 feet to contaminants when such openings are much higher than the contaminant source. At some point there will be little chance that anything will enter. Take an opening facing a street or alley, if the opening is located at least 25 feet above, the exhaust from a truck will disperse before being drawn in. This dimension will put an opening roughly between a 2nd and 3rd story. At some point there needs to be credit given in the code for height.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

401.4

Proponent: Guy McMann, Jefferson County, CO, representing the Colorado Association of Plumbing and Mechanical Officials (CAPMO)

Revise as follows:

401.4 Intake opening location. Air intake openings shall comply with all the following:

1. Intake openings shall be located a minimum of 10 feet (3048 mm) from lot lines or buildings on the same lot. ~~Where openings front on a street or public way, the distance shall be measured to the centerline of the street or public way~~.
2. Mechanical and gravity outdoor air intake openings shall be located not less than 10 feet (3048 mm) horizontally from any hazardous or noxious contaminant source, such as vents, streets, alleys, ~~parking lots~~ and loading docks. Where openings front on a street or public way, the distance shall be measured from the ~~centerline~~ closest edge of the street or public way.
3. Intake openings shall be located not less than 3 feet (914 mm) below contaminant sources where such sources are located within 10 feet (3048 mm) of the opening.
4. Intake openings on structures in flood hazard areas shall be at or above the design flood level.

Reason: The second sentence seems to be misplaced as the dialogue concerning streets and alleys is in item # 2. Another problem here is that most streets are 20 feet wide. Measuring from the center places an opening directly on the side of the street which defeats the purpose. The contaminant sources listed make sense due to constant vehicle movement and idling but parking lots don't fit. Parking lots generally have vehicles that are not running and are open on all sides preventing an accumulating emission problem. An occasional vehicle entering or leaving a lot should not present a significant concern.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: MCMANN-M-35-401.4

M19–09/10
401.5, Chapter 15

Proponent: Vickie Lovell, InterCode, Inc., representing the Air Movement and Control Association

1. Revise as follows:

401.5 Intake opening protection. Air intake openings that terminate outdoors shall be protected with corrosion-resistant screens, louvers or grilles. Openings in louvers, grilles and screens shall be sized in accordance with Table 401.5, and shall be protected against local weather conditions. Louvers that protect air intake openings in structures located in hurricane-prone regions, as defined in the International Building Code, shall comply with AMCA 550. Outdoor air intake openings located in exterior walls shall meet the provisions for exterior wall opening protectives in accordance with the *International Building Code.*

2. Add new standard as follows:

AMCA 550-08 Test Method for High Velocity Wind Driven Rain Resistant Louvers

Reason: AMCA Standard 550-08 *Test Method for High Velocity Wind Driven Rain Resistant Louvers* standardizes uniform laboratory test methods and minimum performance ratings for water rejection capabilities of louvers intended to be used in high velocity wind conditions.

The tests conducted in accordance with the requirements of this standard are intended to demonstrate the acceptability of the louver for installation in facilities (essential and nonessential) that will remain in operation during a high velocity wind condition and where water infiltration must be kept to manageable amounts.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: Review of proposed new standard, AMCA 550-08, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: LOVELL-M-3-401.5-CH 15

M20 –09/10
Table 403.3

Proponent: Guy Tomberlin, Fairfax County, VA, representing the Virginia Plumbing and Mechanical Inspectors/Virginia Building and Code Officials

Revise table as follows:

TABLE 403.3
MINIMUM VENTILATION RATES

OCCUPANCY CLASSIFICATION	~~PEOPLE OUTDOOR AIRFLOW RATE IN BREATHING ZONE R_P CFM/PERSON~~ DEFAULT OCCUPANT DENSITY #/1000 FT^{2a}	~~AREA OUTDOOR AIRFLOW RATE IN BREATHING ZONE R_a CFM/FT^{2a}~~ PEOPLE OUTDOOR AIRFLOW RATE IN BREATHING ZONE R_P CFM/PERSON	~~DEFAULT OCCUPANT DENSITY #/1000 FT^{2a}~~ AREA OUTDOOR AIRFLOW RATE IN BREATHING ZONE R_a CFM/FT^{2a}	EXHAUST AIRFLOW RATE CFM/FT^{2a}

(The columns in the table will shift in accordance with the shift in column titles.)

Reason: Simplified, the DEFAULT OCCUPANT DENSITY column shifts two columns left. PEOPLE and AREA OUTDOOR AIR columns both shift one column to the right. All figures contained within (below) these columns shift accordingly. This proposed change is an attempt to make the table a little more user friendly. Putting the occupant density next to the occupant outdoor air requirement will give the table better flow.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: TOMBERLIN-M-8-T. 403.3

M21–09/10
Table 403.3

Proponent: Guy Tomberlin, Fairfax County, VA, representing the Virginia Plumbing and Mechanical Inspectors/Virginia Building and Code Officials

Revise table as follows:

TABLE 403.3
MINIMUM VENTILATION RATES

OCCUPANCY CLASSIFICATION	PEOPLE OUTDOOR AIRFLOW RATE IN BREATHING ZONE CFM/PERSON	AREA OUTDOOR AIRFLOW RATE IN BREATHING ZONE R_a CFM/FT^{2a}	~~DEFAULT~~ OCCUPANT DENSITY #/1000 FT^{2a}	EXHAUST AIRFLOW RATE CFM/FT^{2a}

(Portions of table not shown remain unchanged)

Reason: The term default is unnecessary. It is simply the occupant density. By including the term default it would assume there is some other method of determining the occupant density, which there is not according to current text. The intent of this proposal is to remove any misunderstanding that may lead to any mis-application.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: TOMBERLIN-M-1-T. 403.3

M22–09/10
Table 403.3

Proponent: Guy McMann, Jefferson County, CO, representing the Colorado Association of Plumbing and Mechanical Officials (CAPMO)

Revise table as follows:

TABLE 403.3
MINIMUM VENTILATION RATES

Occupancy Classification.	People Outdoor Airflow Rate in Breathing Zone CFM/Person	Area Outdoor Airflow rate in Breathing Zone R_a CFM/FT ^{2a}	~~Default~~ Occupant Density #/1000 FT.$^{2\ a}$	Exhaust Airflow Rate CFM Ft $^{2\ a}$

(Portions of table not shown remain unchanged)

For SI: 1 cubic foot per minute = 0.0004719 m^3/s, 1 ton = 908 kg, 1 cubic foot per minute per square foot = 0.00508 $m^3/(s \_ m^2)$,
C = [(F) -32]/1.8, 1 square foot = 0.0929 m^2.

a. Based upon net occupiable floor area.
b. Mechanical exhaust is required as prescribed in Table 403.3 and the recirculation of air from such spaces is prohibited (see Section 403.2.1, Item 3).
c. Spaces unheated or maintained below 50°F are not covered by these requirements unless the occupancy is continuous.
d. Ventilation systems in enclosed parking garages shall comply with Section 404.
e. Rates are per water closet or urinal. The higher rate shall be provided where periods of heavy use are expected to occur, such as toilets in theaters, schools and sports facilities. The lower rate shall be permitted where periods of heavy use are not expected.
f. Rates are per room unless otherwise indicated. The higher rate shall be provided where the exhaust system is designed to operate intermittently. The lower rate shall be permitted where the exhaust system is designed to operate continuously during normal hours of use.
g. Mechanical exhaust is required as prescribed in Table 403.3 and recirculation is prohibited except that recirculation shall be permitted where the resulting supply airstream consists of not more than 10 percent air recirculated from these spaces (see Section 403.2.1, Items 2 and 4).
h. For nail salons, the required exhaust shall include ventilation tables or other systems that capture the contaminants and odors at their source and are capable of exhausting a minimum of 50 cfm per station.

Reason: The word "default" here is a carryover from ASHRAE 62.1 and has no meaning in the context of the IMC text.. This is the only Table to be used as charged by the 2nd sentence of 403.3. The revised notes for Table 403.3 recognize the exhaust column in the table. Currently, no text refers to this column in the table.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: MCMANN-M-29-T. 403.3

M23–09/10
Table 403.3

Proponent: Guy McMann, Jefferson County, CO, representing the Colorado Association of Plumbing and Mechanical Officials (CAPMO)

Revise table as follows:

TABLE 403.3
MINIMUM VENTILATION RATES

OCCUPANCY CLASSIFICATION	PEOPLE OUTDOOR AIRFLOW RATE IN BREATHING ZONE CFM/PERSON	AREA OUTDOOR AIRFLOW RATE IN BREATHING ZONE R_A CFM/FT$^{2\ A}$	DEFAULT OCCUPANT DENSITY #/1000 FT^{2A}	EXHAUST AIRFLOW RATE CFM/FT^{2A}
Public Spaces				
Corridors	-	0.06	-	-
Stairway enclosures [i]	-	0.06	-	-

a. through h. (No change)

i. The square footage of a stairway enclosure shall be the area of the bottom of the enclosure multiplied by the number of stories served by the stairway.

(Portions of table and notes not shown remain unchanged)

Reason: There are good reasons to ventilate a stairway enclosure and currently, there are no requirements in the IMC for such ventilation. Stairway enclosures are becoming even more occupied due to an increase in traffic by occupants who use the stairway as a means of exercise. Also, people are being encouraged to save elevator energy by choosing the stairways. A lack of ventilation could also promote an environment for mold growth. It is quite possible that in today's world, occupants could be intentionally held in a stairway enclosure by authorities as this would be considered an *area of refuge* according to IBC 1007.6, due to possible security issues that may be occurring within or outside the building. Even though IMC 601.3 calls for an independent system, this alone should not be the deciding factor for not ventilating stairway enclosures.

Cost Impact: The code change proposal will increase the cost of construction.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME MCMANN-M-36-T. 403.3

M24–09/10
Table 403.3

Proponent: Guy McMann, Jefferson County, CO, representing the Colorado Association of Plumbing and Mechanical Officials (CAPMO)

Revise table as follows:

TABLE 403.3
MINIMUM VENTILATION RATES

OCCUPANCY CLASSIFICATION	PEOPLE OUTDOOR AIRFLOW RATE IN BREATHING ZONE RP CFM/PERSON	AREA OUTDOOR AIRFLOW RATE IN BREATHING ZONE RA CFM/FT2 [A]	DEFAULT OCCUPANT DENSITY #/1000 FT2[A]	EXHAUST AIRFLOW RATE CFM/FT2[A]
Beauty and nail salons~~[b,h]~~ Nail salon stations [h]	20 -	0.12 -	25 -	0.6 50 per station[h]

h. For Nail Salons, ~~the required exhaust shall include ventilation tables or other systems that capture the contaminants and odors at their source and are capable of exhausting a minimum of 50 cfm per station~~ each nail station shall be provided with a *source capture system* capable of exhausting not less than 50 cfm per station.

(Portions of table and notes not shown remain unchanged)

Reason: Beauty and nail salons should not be combined and treated the same way as it relates to exhaust. Beauty salons in general do not use the same chemicals as found in nail stations. When a properly installed source capture system is employed, as defined in this code, recirculation of air should not be an issue. Source capture systems may take many forms and include ventilation tables and small hood arraignments that are intended to capture the contaminants at their source. This is why some of the language in the footnote has been removed because source capture systems include all these. The definition also states that the exhaust must be discharged to the outdoors. The general area of a nail salon should not be prohibited from recirculation because the source capture system has solved the concerns involving contamination associated with the use of acetone and other chemicals. The exhaust requirements in the table take care of the mild odors commonly found in these occupancies.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: MCMANN-M-24-T. 403.3

M25–09/10
Table 403.3

Proponent: Guy Tomberlin, Fairfax County, VA, representing the Virginia Plumbing and Mechanical Inspectors/Virginia Building and Code Officials

Revise as follows:

TABLE 403.3
MINIMUM VENTILATION RATES

(Portions of table not shown remain unchanged)

a. though d. (No change)

e. Rates are per water closet or urinal. ~~The higher rate shall be provided where periods of heavy use are expected to occur, such as, toilets in theaters, schools, and sports facilities. The lower rate shall be permitted where periods of heavy use are not expected.~~ The higher rate shall be provided where the exhaust system is designed to operate intermittently. The lower rate shall be permitted only where the exhaust system is designed to operate continuously during occupancy.

f. Rates are per room unless otherwise indicated. The higher rate shall be provided where the exhaust system is designed to operate intermittently. The lower rate shall be permitted only where the exhaust system is designed to operate continuously during occupancy ~~normal hours of use~~.

g. and h. (No change)

Reason: These revisions allow for consistent and uniform application. The current text is vague and ambiguous.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: TOMBERLIN-M-11-T. 403.3

M26–09/10
403.7

Proponent: Eli P. Howard, III, Sheet Metal and Air Conditioning Contractors National Association, Inc.

Revise as follows:

403.7 Balancing. The *ventilation air* distribution system shall be provided with means to adjust the system to achieve at least the minimum ventilation airflow rate as required by Sections 403.3 and 403.4. Ventilation systems shall be balanced ~~by an *approved* method~~ as specified in SMACNA *HVAC Systems Testing, Adjusting & Balancing*. Such balancing shall verify that the ventilation system is capable of supplying and exhausting the airflow rates required by Sections 403.3 and 403.4.

Reason: The current balancing requirements in the IMC does not provide for clearly defined methods or procedures for testing, adjusting, and balancing of HVAC systems. SMACNA's *HVAC Systems Testing, Adjusting & Balancing* manual provides specific methods and procedures—a complete process—that ensures all HVAC systems have been properly adjusted and balanced.

Cost Impact: Using established, time-tested procedures to correctly balance HVAC airflows the first time should have no cost impact.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: HOWARD-M-8-403.7

M27–09/10
404.1

Proponent: Donald R. Monahan, PE, Walker Parking Consultants, representing the National Parking Association and the Automated & Mechanical Parking Association

Revise as follows:

404.1 Enclosed parking garages. Mechanical ventilation systems for enclosed parking garages shall be permitted to operate intermittently where the system is arranged to operate automatically upon detection of ~~vehicle operation or the presence of occupants by approved automatic detection devices.~~carbon monoxide levels equal to or greater than 35 parts per million by approved automatic detection devices. Upon activation, such systems shall operate for a period of not less than 30 minutes.

Reason: The current language implies occupancy sensors are required to detect vehicles and/or occupants when it is the concentration of vehicle emissions that is the reason for mechanical ventilation in enclosed parking garages. Merely the presence of vehicles or occupants does not mean that there will be excessive levels of CO. Therefore, the mechanical ventilation system should operate intermittently when the carbon monoxide concentration exceeds acceptable levels. The concentration will not exceed acceptable levels if there are not moving vehicles in the garage which also indicates that there will be people going to or from those vehicles in addition to the driver being exposed to the CO levels via the vehicle's ventilation system.

References:
ANSI/ASHRAE Standard 62.1-2007, *Ventilation for Acceptable Indoor Air Quality,* Atlanta 2007
Moncef Krarti and Arselene Ayari*, CFD Analysis of Ventilation System Performance for Enclosed Parking Garages,* ASHRAE Transactions, Vol. 109, Part 2, pages 21-29, Atlanta 2003

Cost Impact: Installation cost difference is neglible as occupancy sensors are replaced by carbon monoxide detectors, however, the operating costs will be minimized as the fans will only operate when CO limits are exceeded.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: MONAHAN-M-1-404.1

M28–09/10
404.1

Proponent: Larry Lincoln, Salt Lake City Corporation, representing the Utah Chapter of ICC

Revise as follows:

404.1 Enclosed parking garages. Mechanical ventilation systems for enclosed parking garages shall be permitted to operate intermittently in accordance with Item 1, Item 2 or both. ~~where~~

1. The system ~~is~~ shall be arranged to operate automatically upon detection of vehicle operation or the presence of occupants by approved automatic detection devices.
2. The system shall be arranged to operate automatically by means of carbon monoxide detectors applied in conjunction with nitrogen dioxide detectors. Such detectors shall be installed in accordance with their manufacturers' recommendations.

Reason: Our experience on the last several projects is that the operation of motion sensors in parking garages is very costly and energy inefficient. Initially the code just required carbon monoxide detectors and there was a concern about diesel emissions which would not be detected by the carbon monoxide detectors. Since that time, nitrogen dioxide detectors have been developed which will detect diesel emissions solving the concern about the increase of diesel powered vehicles in parking garages. Using both detectors has been the preferred option as an alternate method of addressing the problem.

Cost Impact: Less overall expenses in power bills.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: LINCOLN-M-1-404.1

M29–09/10
501.2 (New), 506.4

Proponent: Guy McMann, Jefferson County, CO, representing the Colorado Association of Plumbing and Mechanical Officials (CAPMO)

1. Add new text as follows:

501.2 Independent System Required. Single or combined mechanical exhaust systems for environmental air shall be independent of all other exhaust systems. Dryer exhaust shall be independent of all other systems. Type I exhaust systems shall be independent of all other exhaust systems except as provided in Section 506.3.5. Single or combined Type II exhaust systems for food-processing operations shall be independent of all other exhaust systems. Kitchen exhaust systems shall be constructed in accordance with Section 505 for domestic equipment and Sections 506 through 509 for commercial equipment.

2. Revise as follows:

506.4 Ducts serving Type II hoods. ~~Single or combined Type II exhaust systems for food-processing operations shall be independent of all other exhaust systems.~~ Commercial kitchen exhaust systems serving Type II hoods shall comply with Sections 506.4.1 and 506.4.2.

Reason: This is an important clarification that needs to be reinstated in the code, that all exhaust systems are independent of all other exhaust systems unless the code specifically states otherwise. This was removed during the 2001 cycle but in doing so, the baby was thrown out with the bath water. There are other types of exhaust other than kitchens that this applies to. Hazardous, environmental, dryer and so forth. This will clarify, for instance, that an environmental air duct could not discharge into a kitchen exhaust duct or combine dryer exhaust with environmental exhaust and so on. Independent systems will also minimize the potential for spreading contaminants, hazard exhaust, fire and smoke to other parts of the building.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: MCMANN-M-1-501.2

M30–09/10
501.2.2, Chapter 15

Proponent: Vickie Lovell, InterCode, Inc., representing Air Movement and Control Association

1. Revise as follows:

501.2.2 Exhaust opening protection. Exhaust openings that terminate outdoors shall be protected with corrosion-resistant screens, louvers or grilles. Openings in screens, louvers and grilles shall be sized not less than ¼ inch (6 mm) and not larger than 1/2 inch (13 mm). Openings shall be protected against local weather conditions. Louvers that protect exhaust openings in structures located in hurricane-prone regions, as defined in the International Building Code, shall comply with AMCA Standard 550. Outdoor openings located in exterior walls shall meet the provisions for exterior wall opening protectives in accordance with the *International Building Code*.

2. Add new standard as follows:

AMCA 550-08 Test Method for High Velocity Wind Driven Rain Resistant Louvers

Reason: AMCA Standard 550-08 *Test Method for High Velocity Wind Driven Rain Resistant Louvers* standardizes uniform laboratory test methods and minimum performance ratings for water rejection capabilities of louvers intended to be used in high velocity wind conditions.

The tests conducted in accordance with the requirements of this standard are intended to demonstrate the acceptability of the louver for installation in facilities (essential and nonessential) that will remain in operation during a high velocity wind condition and where water infiltration must be kept to manageable amounts

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: Review of proposed new standard, AMCA 550-08, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

M31–09/10
501.5 (New); IRC M1506.1 (New)

Proponent: Guy McMann, Jefferson County, CO, representing the Colorado Association of Plumbing and Mechanical Officials (CAPMO)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IMC COMMITTEE. PART II WILL BE HEARD BY THE IRC MECHANICAL COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IMC

Add new text as follows:

501.5 Domestic exhaust fan manifolding prohibited. Domestic-type environmental air exhaust fans shall not be interconnected to a common discharge duct. Such fans shall be independently exhausted to the outdoors.

PART II – IRC MECHANICAL

Add new text as follows:

M1506.1 Exhaust fan manifolding prohibited. Exhaust fans shall not be interconnected utilizing a common discharge duct. Exhaust fans shall be independently exhausted to the outdoors.

Reason: The code does not address the manifolding of residential type exhaust fans. This practice produces poor results for venting. Air, like water, will seek the path of least resistance and the back-draft dampers are not intended to be air tight. Once the duct is pressurized, air still makes it way back into the building. The practice of combining fans and enlarging ducts produces velocity issues as the manufacturers will agree with, resulting in poor performance which is just one of the reasons this type of arrangement is not printed in any of the instructions. Conversations with engineers at Braun/Nu Tone agree, the best performance is achieved when these fans are exhausted independently. Rarely when combined is it done correctly, which would require extra back-draft dampers at wye locations and the calculations required to properly size ducts and determine maximum lengths. The practice of throwing two, three or more fans together defeats the purpose from an effective ventilation standpoint. The excuse that multiple penetrations in the building are undesirable cannot be the reason for this practice. If a single penetration is desired for multiple bathrooms, then a central exhaust system properly designed for the load is the way to achieve it.

As we can see in this poor example, the code does not address this situation. There needs to be clear guidance in order to prevent this type of installation.

Cost Impact: The code change proposal will not increase the cost of construction.

PART I – IMC

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

PART II – IRC MECHANICAL

M32–09/10
502.8.1

Proponent: Rick Thornberry, PE, The Code Consortium, Inc., representing: American Pyrotechnics Association (APA)

THIS PROPOSAL IS ON THE AGENDA OF THE IFC CODE DEVELOPMENT COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THE IFC CODE DEVELOPMENT COMMITTEE.

Revise as follows:

[F] 502.8.1 Storage in excess of the maximum allowable quantities. Indoor storage areas and storage buildings for hazardous materials in amounts exceeding the maximum allowable quantity per control area shall be provided with mechanical exhaust ventilation or natural ventilation where natural ventilation can be shown to be acceptable for the materials as stored.

Exceptions:

1. Storage areas for flammable solids complying with Section 3604 of the *International Fire Code*.
2. Storage areas and storage buildings for fireworks and explosives complying with Chapter 33 of the *International Fire Code*.

Reason: The purpose of this code change is to better correlate Section 502.8.1 requirements with the requirements in Section 2704.3 Ventilation of the 2009 International Fire Code from which this section is extracted text. Unfortunately, when this text was extracted to be incorporated into the International Mechanical Code, it was taken slightly out of context. That is because the scoping provisions of Chapter 27 of the International Fire Code in Section 2701.1 Scope has specific exceptions that indicate that certain hazardous materials are not required to be in compliance with Chapter 27. This is the case for fireworks and explosives as indicated in Exception 7 to Section 2701.1 which states: "The display, storage, sale or use of fireworks and explosives in accordance with Chapter 33." Therefore, we have added a new Exception 2 to Section 502.8.1 to correlate with Exception 7 to Section 2701.1 for the storage of fireworks and explosives.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: THORNBERRY-M-1-502.8.1

M33–09/10
[F] 502.9.1, [F] 502.9.1.1 (New), [F] 502.9.1.2 (New), [F] 502.9.1.3 (New)

Proponent: Gary Kreutziger, City of San Antonio, TX, representing the Planning and Development Services Department

THIS PROPOSAL IS ON THE AGENDA OF THE IFC CODE DEVELOPMENT COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THAT COMMITTEE.

Revise as follows:

[F] 502.9.1 Compressed gases-medical gas systems. ~~Rooms for the storage of compressed medical gases in amounts exceeding the maximum allowable exempt quantity per control area, and which do not have an exterior wall, shall be exhausted through a duct to the exterior of the building. Both separate airstreams shall be enclosed in a 1-hour-rated shaft enclosure from the room to the exterior. *Approved* mechanical ventilation shall be provided at a minimum rate of 1 cfm/ft² [0.00508 m³/(s·m²)] of the area of the room.~~ Where containers of medical gases in quantities greater than the *permit amount* in accordance with the *International Fire Code* are located inside buildings, the rooms for the storage of such compressed medical gases shall be ventilated in accordance with Sections 502.9.1.1 through 502.9.1.1.3.

[F] 502.9.1.1 Exterior room. Rooms shall have at least one exterior wall that is provided with at least two vents. Each vent shall be not less than 36 square inches (0.023 m²) in area. One vent shall be within 6 inches (152 mm) of the floor and one shall be within 6 inches (152 mm) of the ceiling.

[F] 502.9.1.2 Interior room. Where an exterior wall cannot be provided, the room shall be exhausted through a duct to the exterior. Supply and exhaust ducts shall be enclosed in a 1-hour-rated shaft enclosure from the room to the exterior. *Approved* mechanical ventilation shall be provided at a minimum rate of 1cfm/ft² [0.00508 m³/(s·m²)] of the area of the room.

[F] 502.9.1.3 Gas cabinets. Gas cabinets for the storage of compressed medical gases in amounts exceeding the maximum allowable quantity per control area shall be connected to an exhaust system. The average velocity of ventilation at the face of access ports or windows shall not be less than 200 feet per minute (1.02 m/s) with a minimum velocity of 150 feet per minute (0.76 m/s) at any point of the access port or window.

Reason: The purpose of the proposed code change is to eliminate confusion and create consistency between the International Fire Code section 3006.2 and the International Mechanical Code section 502.9.1, which both address medical gas storage room exhaust ventilation. The current text in section 502.9.1 of the IMC uses language no longer found elsewhere in the ICC family of codes. The terminology "*maximum allowable exempt quantity*" is used in the IMC while the IFC uses the common terminology "*permit amount*". The IFC includes tables that provide "*permit amounts"* and the IBC and the IFC both include tables that provide "*maximum allowable quantity*", but, there is not a table in any I-code document to provide a

"*maximum allowable exempt quantity*". The creation of sub-sections 502.9.1.1, 502.9.1.2 and 502.9.1.3 in the IMC are to provide the same format, level of detail and language found in the IFC for the three prescriptive methods for medical gas storage room ventilation as that found in the IFC.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: KREUTZIGER-M-2-502.9.1

M34–09/10
504.4

Proponent: Eli P. Howard, III, Sheet Metal and Air Conditioning Contractors National Association, Inc.

Revise as follows:

504.4 Exhaust installation. Dryer exhaust ducts for clothes dryers shall terminate on the outside of the building and shall be equipped with a backdraft damper. Screens shall not be installed at the duct termination. Ducts shall not be connected or installed with sheet metal screws or other fasteners that will obstruct the exhaust flow. Clothes dryer exhaust ducts shall not be connected to a vent connector, vent or *chimney*. Clothes dryer exhaust ducts shall not extend into or through ducts or plenums. The use of rivets shall not be prohibited.

Reason: All mechanical fasteners protrude inside duct, however rivets provide the least amount of protrusion.

Cost Impact: The code change proposal will not increase the cost of construction.

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IMC COMMITTEE. PART II WILL BE HEARD BY THE IRC MECHANICAL COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IMC

Revise as follows:

504.4 Exhaust installation. Dryer exhaust ducts for clothes dryers shall terminate on the outside of the building and shall be equipped with a back-draft damper. Screens shall not be installed at the duct termination. Ducts shall ~~not be connected or installed with sheet metal screws or other fasteners that will obstruct the exhaust flow.~~ be mechanically fastened in accordance with *SMACNA Duct Construction Standard- Metal and Flexible.* Fasteners shall not protrude into the duct more than 1/8 inch. Ducts shall be sealed in accordance with Section 603.9. Clothes dryer exhaust ducts shall not be connected to a vent connector, vent or chimney. Clothes dryer exhaust ducts shall not extend into or through ducts or plenums.

504.6.2 Duct installation. Exhaust ducts shall be supported at ~~4~~ 12 foot intervals and secured in place. The insert end of the duct shall extend into the adjoining duct or fitting in the direction of airflow. ~~Ducts shall not be joined with screws or similar fasteners that protrude into the inside of the duct.~~

PART II – IRC MECHANICAL

Revise as follows:

M1502.4.1 Material and size Exhaust ducts shall have a smooth interior finish and be constructed of metal having a minimum thickness of ~~0.016 inch (0.4 mm~~) 0.0157 inches (.3950 mm) (No. 28 gage). ~~thick~~. The duct shall be 4 inches nominal in diameter.

M1502.4.2 Duct installation. Exhaust ducts shall be supported at ~~4~~ 12 foot intervals and secured in place. The insert end of the duct shall extend into the adjoining duct or fitting in the direction of airflow. Exhaust duct joints shall be sealed in accordance with Section M1601.4.1 and shall be mechanically fastened. Ducts shall not be joined with screws or similar fasteners that protrude more than 1/8 inch (3.2 mm) into the inside of the duct.

M1502.4.4.1 Specified length. The maximum length of the exhaust duct shall be ~~25 feet (7620 mm)~~ 35 feet (1068 mm) from the connection to the transition duct from the dryer to the outlet terminal. Where fittings are used, the maximum length of the exhaust duct shall be reduced in accordance with Table M1502.4.4.1.

Reason: (PART I) 504.4 and 504.6.2 conflict with the SMACNA Standard and contain conflicting or, at least, redundant text. Tape alone is no means of correctly fastening any duct. Code Officials may certainly permit this practice if they chose to do so but the code should not direct a practice that conflicts with the Standard it condones. There is nothing wrong with small fasteners as long as they don't extend too far into the duct. A maximum penetration of 1/8 inch will assure minimum lint buildup as much more than that collects on the duct walls. Duct cleaning firms are having difficulties because the ducts are coming apart, requiring them to open up finished walls to repair them, there by creating added expenses and unhappy customers. Duct separations in any location, especially in concealed locations, could result in a fire hazard and moisture and lint accumulation. Mechanically fastened ducts can tolerate a longer interval (12 feet) between supports and the current 4 feet interval is overkill.

Reason: (PART II) The language in M1502.4.1 is consistent with language in last cycles M-16 Part II which was approved. M1502.4.2 violates the SMACNA Standard for hanger spacing and the last sentence also violates M1502.5 in that tape alone is not a means of connection for dryer vents. Duct cleaning firms are having fits because the ducts are coming apart requiring them to open up finished walls to repair them thereby creating added expense and unhappy customers. The 35-foot dimension is consistent with what is already in the IMC and IFGC.

Cost Impact: The code change proposal will not increase the cost of construction.

M36–09/10
504.6.1; IRC M1502.4.1

Proponent: John England, MCO, England Enterprises, Inc.

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IMC COMMITTEE. PART II WILL BE HEARD BY THE IRC MECHANICAL COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IMC

Revise as follows:

504.6.1 Material and size. Exhaust ducts shall have a smooth interior finish and shall be constructed of metal a minimum 0.016 inch (0.4 mm) thick. The exhaust duct size shall be 4 inches (102 mm) nominal in diameter.

Exception: Ducts for domestic dryers shall be permitted to be constructed of Schedule 40 PVC pipe and fittings provided that the installation complies with all of the following:

1. The duct is installed under a concrete slab poured on grade.
2. The underfloor trench in which the duct is installed is completely backfilled with sand or gravel.
3. The PVC duct shall extend not more than 1 inch (25 mm) above the indoor concrete floor surface.
4. The PVC duct shall extend not more than 1 inch (25 mm) above grade outside of the building.
5. The PVC ducts shall be solvent cemented.
6. Long sweep PVC fittings shall be used.
7. The PVC piping shall be reamed.

PART II – IRC MECHANICAL

Revise as follows:

M1502.4.1 Material and size. Exhaust ducts shall have a smooth interior finish and shall be constructed of metal a minimum 0.016-inch (0.4 mm) thick. The exhaust duct size shall be 4 inches (102 mm) nominal in diameter.

Exception: Ducts for domestic dryers shall be permitted to be constructed of Schedule 40 PVC pipe and fittings provided that the installation complies with all of the following:

1. The duct is installed under a concrete slab poured on grade.
2. The underfloor trench in which the duct is installed is completely backfilled with sand or gravel.
3. The PVC duct shall extend not more than 1 inch (25 mm) above the indoor concrete floor surface.
4. The PVC duct shall extend not more than 1 inch (25 mm) above grade outside of the building.
5. The PVC ducts shall be solvent cemented.
6. Long sweep PVC fittings shall be used.
7. The PVC piping shall be reamed.

Reason: These sections are taken from the down-draft ranges, Section 505.1 and Section M1503.2 of the IRC. Many times dryers can be vented in the slab to the exterior with shorter distances than are up and through the attic. I know of many building officials that have allowed this as an alternative method.

Cost Impact: The code change proposal will not increase the cost of construction.

PART I – IMC

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

PART II – IRC MECHANICAL

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

M37–09/10
504.6.2

Proponent: Eli P. Howard, III, Sheet Metal and Air Conditioning Contractors National Association, Inc.

Revise as follows:

504.6.2 Duct installation. Exhaust ducts shall be supported at 4-foot (1219 mm) intervals and secured in place. The insert end of the duct shall extend into the adjoining duct or fitting in the direction of airflow. Ducts shall not be joined with screws or similar fasteners that protrude into the inside of the duct. <u>The use of rivets shall not be prohibited.</u>

Reason: All mechanical fasteners to some degree protrude into the inside of duct when used, however the rivet has the least protrusion effect inside the duct.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: HOWARD-M-1-504.6.2

M38–09/10
504.6.4; IRC M1502.4.4, M1502.4.4.2

Proponent: John England, MCO, England Enterprises, Inc.

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IMC COMMITTEE. PART II WILL BE HEARD BY THE IRC MECHANICAL COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IMC

Revise as follows:

504.6.4 Duct length. The maximum allowable exhaust duct length shall be determined by ~~one of~~ the method~~s~~ specified in Section 504.6.4.1 or <u>for other than dwelling units, Section</u> 504.6.4.2.

PART II – IRC MECHANICAL

1. Revise as follows:

M1502.4.4 Duct length. The maximum allowable exhaust duct length shall be determined by ~~one of the methods specified in~~ Section M1502.4.4.1 ~~or M1502.4.4.2~~.

2. Delete without substitution:

~~**M1502.4.4.2 Manufacturer's instructions.** The size and maximum length of the exhaust duct shall be determined by the dryer manufacturer's installation instructions. The code official shall be provided with a copy of the installation instructions for the make and model of the dryer at the concealment inspection. In the absence of fitting equivalent length calculations from the clothes dryer manufacturer, Table M1502.4.4.1 shall be used.~~

Reason: (PART I) In R-2 apartments and single family housing the possibility of changing the dryer out every 5-7 years can create a fire hazard if an equivalent unit is not installed.

(PART II) In R-2 Dwelling units and R-3 occupancies there is a potential fire hazard if a dryer is replaced with a older unit. Since there is no annual fire inspections done in these occupancies and occupants move on average of 5 – 7 years the potential is great for a different unit to be improperly installed.

Cost Impact: The code change proposal will not increase the cost of construction.

PART I – IMC

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

PART II – IRC MECHANICAL

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

M39–09/10
504.6.4, 504.6.4.3 (New); IRC M1502.4.4, M1502.4.4.3 (New)

Proponent: Julius Ballanco, PE, JB Engineering and Code Consulting, P.C., representing the Home Ventilating Institute

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IMC COMMITTEE. PART II WILL BE HEARD BY THE IRC MECHANICAL COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IMC

1. Revise as follows:

504.6.4 Duct length. The maximum allowable exhaust duct length shall be determined by one of the methods specified in Sections 504.6.4.1 ~~or~~ through ~~504.6.4.2~~ 504.6.4.3.

2. Add new text as follows:

504.6.4.3 Dryer exhaust duct power ventilator. The maximum length of the exhaust duct shall be determined by the manufacturer's installation instructions for the dryer exhaust duct power ventilator. Dryer exhaust duct power ventilators shall be listed and labeled for use in dryer exhaust duct systems and shall be installed in accordance with the manufacturer's installation instructions.

PART II – IRC MECHANICAL

1. Revise as follows:

M1502.4.4 Duct length. The maximum allowable exhaust duct length shall be determined by one of the methods specified in Sections M1502.4.4.1 ~~or~~ through ~~M1502.4.4.2~~ M1502.4.4.3.

2. Add new text as follows:

M1502.4.4.3 Dryer exhaust duct power ventilator. The maximum length of the exhaust duct shall be determined by the manufacturer's installation instructions for the dryer exhaust duct power ventilator. Dryer exhaust duct power ventilators shall be listed and labeled for use in dryer exhaust duct systems and shall be installed in accordance with the manufacturer's installation instructions.

Reason: During the rewrite of this section, dryer exhaust duct power ventilators were originally a part of the requirements. The section was deleted when the Supplemental requirements were not completed prior to the final code change hearing. This proposed text is similar to the original language proposed during the last cycle.

Dryer exhaust duct power ventilators are now regulated by Supplemental requirements to UL 705. These supplemental requirements specify testing for ventilators used in this application. The requirements include many safety provisions for the ventilators. The ventilator manufacturer specifies the maximum length of the dryer exhaust duct. This length is used for testing and listing the ventilator, thus verifying the instructions.

Cost Impact: The code change proposal will not increase the cost of construction.

PART I – IMC

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

PART I – IRC MECHANICAL

Proponent: John England, MCO, England Enterprises, Inc.

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IMC COMMITTEE. PART II WILL BE HEARD BY THE IRC MECHANICAL COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IMC

1. Revise as follows:

504.6.4 Duct length. The maximum allowable exhaust duct length shall be determined by one of the methods specified in Section 504.6.4.1, ~~or~~ 504.6.4.2 or 504.6.4.3.

2. Add new text as follows:

504.6.4.3 Dryer exhaust duct power ventilator. Where a dryer exhaust duct power ventilator is installed, the maximum length of the exhaust duct shall be determined in accordance with the manufacturer's installation instructions for the dryer exhaust duct power ventilator. A placard with the following statement shall be placed at the location of the dryer. "IF THE DRYER'S ELECTRICAL SYSTEM IS NOT CONNECTED TO THE DRYER EXHAUST DUCT POWER VENTILATOR BEFORE THE DRYER IS USED, A FIRE IN THE DRYER EXHAUST DUCT COULD OCCUR."

PART II – IRC MECHANICAL

1. Revise as follows:

M1502.4.4 Duct length. The maximum allowable exhaust duct length shall be determined by one of the methods specified in Section M1502.4.4.1, ~~or~~ M1502.4.4.2 or M1502.4.4.3.

2. Add new text as follows:

M1502.4.4.3 Dryer exhaust duct power ventilator. Where a dryer exhaust duct power ventilator is installed, the maximum length of the exhaust duct shall be determined in accordance with the manufacturer's installation instructions for the dryer exhaust duct power ventilator. A placard with the following statement shall be placed at the location of the dryer. "IF THE DRYER'S ELECTRICAL SYSTEM IS NOT CONNECTED TO THE DRYER EXHAUST DUCT POWER VENTILATOR BEFORE THE DRYER IS USED, A FIRE IN THE DRYER EXHAUST DUCT COULD OCCUR."

Reason: Dryer boosters are common and occupants should be notified when changing dryers to hook up the dryer booster to the electrical system.

Cost Impact: The code change proposal will not increase the cost of construction.

Proponent: John England, MCO, England Enterprises, Inc.

Revise as follows:

504.6.4.1 Specified length. The maximum length of the exhaust duct shall be ~~35 feet~~ ~~(10 668 mm)~~ 25 feet (7620 mm) from the connection to the transition duct from the dryer to the outlet terminal. Where fittings are used, the maximum length of the exhaust duct shall be reduced in accordance with Table 504.6.4.1

Reason: The IRC and the IMC should be consistent with each other.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: ENGLAND-M-2-504.6.4.1

M42–09/10
202, 504.7

Proponent: Bob Eugene, representing Underwriters Laboratories, Inc.

1. Revise definition as follows:

CLOTHES DRYER. An appliance used to dry wet laundry by means of heat. ~~Dryer classifications are as follows:~~

~~**Type 1.** Factory-built package, multiple production. Primarily used in family living environment. Usually the smallest unit physically and in function output.~~

~~**Type 2.** Factory-built package, multiple production. Used in business with direct intercourse of the function with the public. Not designed for use in individual family living environment.~~

2. Revise as follows:

504.7 Commercial clothes dryers. The installation of dryer exhaust ducts serving ~~Type 2~~ commercial clothes dryers shall comply with the appliance manufacturer's installation instructions. Exhaust fan motors installed in exhaust systems shall be located outside of the airstream. In multiple installations, the fan shall operate continuously or be interlocked to operate when any individual unit is operating. Ducts shall have a minimum *clearance* of 6 inches (152 mm) to combustible materials. Clothes dryer transition ducts used to connect the *appliance* to the exhaust duct system shall be limited to single lengths not to exceed 8 feet (2438 mm) in length and shall be *listed* and *labeled* for the application. Transition ducts shall not be concealed within construction.

Reason: The dryer classifications noted in the definition only apply to gas-fired clothes dryers. Gas-fired clothes dryers are not covered by the International Mechanical Code.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: EUGENE-M-1-202-504.7

M43–09/10
504.8

Proponent: John R. Addario, PE, New York State Department of State, Division of Code Enforcement and Administration

Revise as follows:

504.8 Common exhaust systems for clothes dryers located in multistory structures. Where a common multistory duct system is designed and installed to convey exhaust from multiple clothes dryers, the construction of the system shall be in accordance with all of the following:

1. The shaft in which the duct is installed shall be constructed and fire-resistance rated as required by the *International Building Code*.
2. Dampers shall be prohibited in the exhaust duct. Penetrations of the shaft and ductwork shall be protected in accordance with Section 607.5.5, Exception 2.
3. Rigid metal ductwork shall be installed within the shaft to convey the exhaust. The ductwork shall be constructed of sheet steel having a minimum thickness of 0.0187 inch (0.4712 mm) (No. 26 gage) and in accordance with SMACNA *Duct Construction Standards*.
4. The ductwork within the shaft shall be designed and installed without offsets.
5. The exhaust fan motor design shall be in accordance with Section 503.2.
6. The exhaust fan motor shall be located outside of the airstream.
7. The exhaust fan shall run continuously, and shall be connected to a standby power source.

   Exception: Where the exhaust fan is interlocked with the dryer so as to operate when any individual dryer is operating, the exhaust fan need not run continuously or be connected to a standby power source.

8. Exhaust fan operation shall be monitored in an *approved* location and shall initiate an audible or visual signal when the fan is not in operation.
9. Makeup air shall be provided for the exhaust system.
10. A cleanout opening shall be located at the base of the shaft to provide *access* to the duct to allow for cleaning and inspection. The finished opening shall be not less than 12 inches by 12 inches (305 mm by 305 mm).
11. Screens shall not be installed at the termination.

Reason: Currently Section 504.8 Item 7 requires an exhaust fan to run continuously and be connected to standby power. In most cases, in a standby power situation the dryers themselves will be inoperable. The requirement for the exhaust fan to run continuously is to ensure that the system is drawing exhaust air from each clothes dryer unit that is in operation at any given time. Having the exhaust system interconnected with each individual unit ensures that the exhaust fan will run as needed and therefore meets the intent of the code. This proposal provides an option from the requirement of a standby power source while still meeting the original intent of the code. This proposal will also save considerable energy by allowing the exhaust fan to be shut down while not in use.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: ADDARIO-M-1-504.8

M44–09/10
504.8

Proponent: Guy Tomberlin, Fairfax County, VA, representing the Virginia Plumbing and Mechanical Inspectors/Virginia Building and Code Officials

Revise as follows:

504.8 Common exhaust systems for clothes dryers located in multistory structures. Where a common multistory duct system is designed and installed to convey exhaust from multiple clothes dryers, the construction of the system shall be in accordance with all of the following:

1. The shaft in which the duct is installed shall be constructed and fire-resistance rated as required by the *International Building Code*.

2. Dampers shall be prohibited in the exhaust duct. Penetrations of the shaft and ductwork shall be protected in accordance with Section 607.5.5, Exception 2.
3. Rigid metal ductwork shall be installed within the shaft to convey the exhaust. The ductwork shall be constructed of sheet steel having a minimum thickness of 0.0187 inch (0.4712 mm) (No. 26 gage) and in accordance with SMACNA *Duct Construction Standards*.
4. The ductwork within the shaft shall be designed and installed without offsets.
5. The exhaust fan motor design shall be in accordance with Section 503.2.
6. The exhaust fan motor shall be located outside of the airstream.
7. The exhaust fan shall run continuously, and shall be connected to a standby power source.
8. Exhaust fan operation shall be monitored in an *approved* location and shall initiate an audible or visual signal when the fan is not in operation.
9. Makeup air shall be provided for the exhaust system.
10. A cleanout opening shall be located at the base of the shaft to provide *access* to the duct to allow for cleaning and inspection. The finished opening shall be not less than 12 inches by 12 inches (305 mm by 305 mm).
11. Screens shall not be installed at the termination.
12. The common multistory duct system shall serve only clothes dryers and shall be independent of other exhaust systems.

Reason: Current text fails to prohibit the interconnection of other exhaust systems. This is providing the guidance that maintains the original intent for these systems to remain independent.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: TOMBERLIN-M-15-504.8

M45–09/10
505.1; IRC M1503.1

Proponent: Guy McMann, Jefferson County, CO, representing the Colorado Association of Plumbing and Mechanical Officials (CAPMO)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IMC COMMITTEE. PART II WILL BE HEARD BY THE IRC MECHANICAL COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IMC

Revise as follows:

505.1 Domestic systems. Where domestic range hoods and domestic appliances equipped with downdraft exhaust are located within dwelling units, such hoods and appliances shall discharge to the outdoors through sheet metal ducts constructed of galvanized steel, stainless steel, aluminum or copper. Such ducts shall have smooth inner walls, ~~and~~ shall be air tight, ~~and~~ shall be equipped with a back-draft damper, and shall be independent of all other exhaust systems.

Exceptions:

1. Where installed in accordance with the manufacturer's installation instructions and where mechanical or *natural ventilation* is otherwise provided in accordance with Chapter 4, *listed* and *labeled* ductless range hoods shall not be required to discharge to the outdoors.
2. Ducts for domestic kitchen cooking appliances equipped with downdraft exhaust systems shall be permitted to be constructed of Schedule 40 PVC pipe and fittings provided that the installation complies with all of the following:
   2.1. The duct shall be installed under a concrete slab poured on grade.
   2.2. The underfloor trench in which the duct is installed shall be completely backfilled with sand or gravel.
   2.3. The PVC duct shall extend not more than 1 inch (25 mm) above the indoor concrete floor surface.
   2.4. The PVC duct shall extend not more than 1 inch (25 mm) above grade outside of the building.
   2.5. The PVC ducts shall be solvent cemented.

PART II – IRC MECHANICAL

Revise as follows:

M1503.1 General. Range hoods shall discharge to the outdoors through a single-wall duct. The duct serving the hood shall have a smooth interior surface, shall be air tight, ~~and~~ shall be equipped with a back-draft damper, and shall be independent of all other exhaust systems. Ducts serving range hoods shall not terminate in an attic or crawl space or areas inside the building.

Exception: Where installed in accordance with the manufacturer's installation instructions, and where mechanical or natural ventilation is otherwise provided, listed and labeled ductless range hoods shall not be required to discharge to the outdoors

Reason: Range hood exhaust needs to be independent from all other exhaust systems. This is a very specific application involving much larger fans than one would find elsewhere in a typical residence. Bathroom fans should not be discharged into a range hood exhaust duct as the volume of air and the velocity at which it operates will over-power any back-draft damper on such a small fan. These fans should not be manifolded in the first place as the manufacturers will attest to.

Cost Impact: The code change proposal will not increase the cost of construction.

PART I – IMC

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

PART II – IRC MECHANICAL

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

M46–09/10
505.1; IRC M1503.2

Proponent: Guy McMann, Jefferson County, CO, representing the Colorado Association of Plumbing and Mechanical Officials (CAPMO)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IMC COMMITTEE. PART II WILL BE HEARD BY THE IRC MECHANICAL COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IMC

Revise as follows:

505.1 Domestic systems. Where domestic range hoods and domestic appliances equipped with downdraft exhaust are located within dwelling units, such hoods and appliances shall discharge to the outdoors through sheet metal ducts constructed of galvanized steel, stainless steel, aluminum or copper. Such ducts shall have smooth inner walls and shall be air tight and equipped with a back-draft damper.

Exceptions:

1. Where installed in accordance with the manufacturer's installation instructions and where mechanical or natural ventilation is otherwise provided in accordance with Chapter 4, listed and labeled ductless range hoods shall not be required to discharge to the outdoors.
2. Ducts for domestic kitchen cooking appliances equipped with downdraft exhaust systems shall be permitted to be constructed of Schedule 40 PVC pipe provided that the installation complies with all of the following:
   2.1. The duct shall be installed under a concrete slab poured on grade.
   2.2. The under-floor trench in which the duct is installed shall be completely backfilled with sand, ~~or~~ gravel or clean earth.

2.3. The ~~PVC~~ duct shall extend not greater than 1 inch (25 mm) above the indoor concrete floor surface.

2.4. ~~The PVC duct shall extend not more than 1 inch (25 mm) above grade outside of the building~~. The duct shall terminate at a tee fitting that is open on the bottom and positioned over a gravel bed that is not less than 1 foot deep and 1 cubic foot in volume. The duct shall slope toward the gravel bed at not less than 1/8 inch per foot. The riser from the top of the tee fitting shall extend above grade not less than 6 inches. Both ends of the Tee fitting shall be protected in accordance with Section 501.2.2.

2.5. The ~~PVC~~ duct~~s~~ joints shall be solvent cemented.

Reason: As currently written, Exception # 2 requires the PVC duct to be trapped. Where is the water from condensation going to go? Where is the trapped grease going to go? This proposal will eliminate the problem. A simple gravel bed will provide a reasonable place for fluids to drain. This text provides minimal guidance as to the size and depth of the gravel bed. It makes sense to terminate into a Tee fitting as it does double duty, providing a means of draining and a means of discharge for the exhaust. The requirement to extend 6 inches above grade as opposed to 1 inch ensures that debris, grass or dirt won't obstruct the opening. The opening will need to be protected with screens. The acronym PVC was deleted because it is stated in the body of the section and does not need to be constantly repeated. Since the duct is constructed of PVC, there is no reason to prohibit clean fill as a backfill material, thus cutting some cost.

Cost Impact: None, permitting earth as a backfill offsets the cost of sand or gravel backfill.

PART II – IRC MECHANICAL

Revise as follows:

M1503.2 Duct material .Single-wall ducts serving range hoods shall be constructed of galvanized steel, stainless steel or copper.

Exception: Ducts for domestic kitchen cooking appliances equipped with down-draft exhaust systems shall be permitted to be constructed of schedule 40 PVC pipe provided that the installation complies with all of the following:

1. The duct is installed under a concrete slab poured on grade~~; and~~.
2. The under-floor trench in which the duct is installed is completely backfilled with sand, ~~or~~ gravel~~; and~~ or clean earth.
3. The ~~PVC~~ duct extends not more than 1 inch (25 mm) above the indoor concrete floor surface~~; and~~.
4. ~~The PVC duct extends not more than 1 inch (25 mm) above grade outside of the building; and~~ The duct shall terminate at a tee fitting that is open on the bottom and positioned over a gravel bed that is not less than 1 foot deep and 1 cubic foot in volume. The duct shall slope toward the gravel bed at not less than 1/8 inch per foot. The riser from the top of the tee fitting shall extend above grade not less than 6 inches. Both ends of the Tee fitting shall be protected in accordance with Section R303.5
5. The ~~PVC~~ duct~~s~~ joints are solvent cemented.

Reason: As currently written, Exception # 4 unintentionally requires the PVC duct to be trapped. Where is the water from condensation going to go? Where is the trapped grease going to go? This proposal will eliminate the problem. A simple gravel bed will provide a reasonable place for fluids to drain. This text provides minimal guidance as to the size and depth of the gravel bed. It makes sense to terminate into a Tee fitting as it does double duty, providing a means of draining and a means of discharge for the exhaust. The requirement to extend 6 inches above grade as opposed to 1 inch insures that debris, grass or dirt won't obstruct the opening. The opening will need to be protected with screens. The acronym PVC was deleted because it is stated in the body of the section and does not need to be constantly repeated. Since the duct is constructed of PVC, there is no reason to prohibit clean fill as a backfill material, thus cutting some cost.

Cost Impact: NONE, permitting earth as a backfill offsets the cost of sand or gravel backfill.

PART I – IMC

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

PART II – IRC MECHANICAL

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: MCMANN-M-23-505.1-RM-1-M1503.2

M47–09/10
506.3.2.3

Proponent: Guy McMann, Jefferson County, CO, representing the Colorado Association of Plumbing and Mechanical Officials (CAPMO)

Revise as follows:

506.3.2.3 Duct-to-exhaust fan connections. Duct- to-exhaust fan connections shall be flanged and gasketed at the base of the fan for vertical discharge fans; shall be flanged, gasketed and bolted to the inlet of the fan for side-inlet utility fans; and shall be flanged, gasketed and bolted to the inlet and outlet of the fan for in-line fans. Gasket and sealing materials shall be rated for continuous duty at a temperature of not less than 1500 degrees F.(815-degree C.)

Reason: This section is silent when it comes to providing guidance as to what the gasket material and sealants used to keep them in place should be rated for as it relates to temperature. This text comes from the National Standard and makes this section consistent with Section 506.3.2.2 # 1.3

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME :MCMANN-M-3-506.3.2.3

M48–09/10
506.3.6

Proponent: Tony Crimi, A.C. Consulting Solutions, Inc., representing the International Firestop Council

Revise as follows:

506.3.6 Grease duct clearances. Where enclosures are not required, grease duct systems and exhaust *equipment* serving a Type I hood shall have a *clearance* to combustible construction of not less than 18 inches (457 mm), and shall have a *clearance* to noncombustible construction
and gypsum wallboard attached to noncombustible structures of not less than 3 inches (76 mm).

Exceptions:

1. ~~Factory-built~~ Commercial kitchen grease ducts *listed* and *labeled* in accordance with UL 1978.
2. *Listed* and *labeled* exhaust *equipment* installed in accordance with Section 304.1.
3. Where commercial kitchen grease ducts are continuously covered on all sides with a *listed* and *labeled* field-applied grease duct enclosure material, system, product or method of construction specifically evaluated for such purpose in accordance with ASTM E 2336, the required *clearance* shall be in accordance with the listing of such material, system, product or method.

Reason: The revision to exception 1 is to identify that both Factory-Built and Field-Fabricated commercial grease ducts can be fabricated, listed, and labeled in accordance with UL 1978. UL 1978 can be applied to all grease duct assemblies that are intended to be installed at reduced clearances where 18 inch (457 mm) clearance

Justification: This proposal clarifies the application of the existing provision in 506.3.6 of the Code for commercial grease ducts. The Scope of UL 1978 states the following:

1.1 These requirements cover factory-built grease ducts, and grease duct assemblies that are intended to be installed at reduced clearances where 18 inch (457 mm) clearance is specified in the Standard for Ventilation Control and Fire Protection of Commercial Cooking Operations, NFPA 96, and the International Mechanical Code.

Commercial grease ducts which are tested, listed and labeled in accordance with the requirements of UL 1978 should all be equally acceptable for clearance reductions in the IMC, given that they would be required to meet the same performance levels.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: CRIMI-M-1-506.3.6

M49–09/10
506.3.7, 506.3.7.1 (New)

Proponent: Guy McMann, Jefferson County, CO, representing the Colorado Association of Plumbing and Mechanical Officials (CAPMO)

1. Revise as follows:

506.3.7 Prevention of grease accumulation in grease ducts. Duct systems serving a Type I hood shall be constructed and installed so that grease cannot collect in any portion thereof, and the system shall slope not less than one-fourth unit vertical in 12 units horizontal (2-percent slope) toward the hood or toward a~~n approved~~ grease reservoir constructed and installed in accordance with Section 506.3.7.1. Where horizontal ducts exceed 75 feet (22 860 mm) in length, the slope shall not be less than one unit vertical in 12 units horizontal (8.3-percent slope).

2. Add new text as follows:

506.3.7.1 Grease duct reservoirs. Grease duct reservoirs shall:

1. Be constructed as required for grease ducts.
2. Be located on the bottom of the horizontal duct or duct riser.
3. Extend for the full width of the duct.
4. Have a depth equal to one-half of the smallest duct dimension.
5. Have a bottom that pitches to a point of drainage.
6. Be provided with a cleanout constructed in accordance with Section 506.3.8 and installed directly above the reservoir, on a vertical side or on top of the duct.
7. Be installed in accordance with the manufacturer's installation instructions where factory-built.

Reason: There has been much confusion over exactly what an "approved grease reservoir" really is. This is an attempt to clarify how shop-built reservoirs should be constructed and installed, such that it will capture grease in an effective way that won't promote pooling except in the trap itself. A cleanout at this point in imperative in order to determine not only when it is full, but physically to perform the function of cleaning. The term 'approved" has been removed because this text eliminates all ambiguity about what a grease reservoir really is and how it should be installed. This provides clear and concise guidance for the user and removes some guess work.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: MCMANN-M-21-506.3.7

M50–09/10
506.3.7, 506.3.7.1 (New)

Proponent: Guy Tomberlin, Fairfax County, VA, representing the Virginia Plumbing and Mechanical Inspectors/Virginia Building and Code Officials

1. Revise as follows:

506.3.7 Prevention of grease accumulation in grease ducts. Duct systems serving a Type I hood shall be constructed and installed so that grease cannot collect in any portion thereof, and the system shall slope not less than one-fourth unit vertical in 12 units horizontal (2-percent slope) toward the hood or toward ~~an approved~~ a grease reservoir designed and installed in accordance with Section 506.3.7.1. Where horizontal ducts exceed 75 feet (22 860 mm) in length, the slope shall not be less than one unit vertical in 12 units horizontal (8.3-percent slope)

2. Add new text as follows:

506.3.7.1 Grease reservoirs Grease reservoirs shall:

1. Be constructed as required for the grease duct it serves.
2. Be located on the bottom of the horizontal duct or the bottommost section of the duct riser.
3. Have a length and width of not less than 12 inches. Where the grease duct is less than 12 inches in a dimension, the reservoir shall be not less than 2 inches smaller than the duct in that dimension.

4. Have a minimum depth of not less than 1 inch.
5. Have a bottom that is sloped to a point for drainage.
6. Be provided with a cleanout opening constructed in accordance with Section 506.3.8 and installed to provide direct access to the reservoir. The cleanout opening shall be located on a side or on top of the duct so as to permit cleaning of the reservoir.
7. Be installed in accordance with the manufacturer's installation instructions where manufactured devices are utilized.

Reason: Current text allows an approved reservoir. Where the code uses the term approved it leaves the subject matter up to the interpretation of the code official and unfortunately non-uniform application can be the end result. This proposal puts any potential non-uniformity to rest. It provides clear concise guidance to the user and leaves no room for misunderstanding.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: TOMBERLIN-M-2-506.3.7

M51–09/10
506.3.8

Proponent: Guy McMann, Jefferson County, CO, representing the Colorado Association of Plumbing and Mechanical Officials (CAPMO)

Delete and substitute as follows:

~~**506.3.8 Grease duct cleanouts and other openings.** Grease duct systems shall not have openings therein other than those required for proper operation and maintenance of the system. Any portion of such system having sections not provided with access from the duct entry or discharge shall be provided with cleanout openings. Cleanout openings shall be equipped with tight-fitting doors constructed of steel having a thickness not less than that required for the duct. Doors shall be equipped with a substantial method of latching, sufficient to hold the door tightly closed. Door assemblies, including any frames and gasketing, shall be approved for the purpose, and shall not have fasteners that penetrate the duct. Listed and labeled access door assemblies shall be installed in accordance with the terms of the listing.~~

506.3.8 Grease duct cleanouts and openings. Grease duct cleanouts and openings shall comply with all of the following:

1. Grease ducts shall not have openings except where required for the operation and maintenance of the system.
2. Sections of grease ducts that are inaccessible from the hood or discharge openings shall be provided with cleanout openings.
3. Cleanouts and openings shall be equipped with tight fitting doors constructed of steel having a thickness not less than that required for the duct.
4. Cleanout doors shall be installed liquid tight.
5. Door assemblies including any frames and gaskets shall be approved for the application and shall not have fasteners that penetrate the duct.
6. Gasket and sealing materials shall be rated for not less than 1500 degrees F. (815.6 C).
7. Listed door assemblies shall be installed in accordance with the manufacturer's installation instructions.

Reason: The only new requirement is item # 6 which was taken from the national standard. The balance was reorganized in an easy to read format with some unnecessary language removed. This format seems to invite one to read the bullets as opposed to reading long paragraphs, making the text easier to comprehend.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: MCMANN-M-14-506.3.8

M52–09/10
506.3.8 (New)

Proponent: Guy McMann, Jefferson County, CO, representing the Colorado Association of Plumbing and Mechanical Officials (CAPMO)

Add new text as follows:

506.3.8 Underground Grease Duct Installation. Underground grease duct installations shall comply with all of the following:

1. Underground grease ducts shall be constructed of 304-L or 316 stainless steel having a minimum thickness of 0.0565 inch (1.435 mm) (No.16 gage).
2. The ducts shall be installed over a bed of gravel not less than 4 inches thick.
3. The ducts shall slope in accordance with Section 506.3.7 and toward a grease reservoir. The grease reservoir shall be located at the point where the duct exits the ground and shall be provided with a cleanout.
4. The grease reservoir shall be constructed in accordance with Section 506.3.7.1.
5. Cleanouts shall extend to within 6 inches of the floor level or where outdoors, shall extend to grade.
6. Cleanouts shall be installed on the top of the duct.
7. Cleanout locations shall be identified in an approved manner.

Reason: Currently there is no guidance in the code for underground grease duct installation. This is becoming a popular installation involving table top cooking where the cooking operations are being conducted in the middle of the dining area. This type of cooking produces smoke, grease laden vapors and intentional flare-ups that are handled within the tables themselves. Underground grease duct connects to the bottom of the table and proceeds to a fan at some other location. This proposal requires that all underground grease ducts be constructed of 304-L or 316 stainless steel which is recommended by SMACNA for its ability to resist corrosion. Installing the duct on gravel will aid in elevating the duct above possible moisture in the earth and provide a means for establishing pitch. Cleanouts must be installed on top of the duct for obvious reasons and needs to extend to a reasonable distance to the floor for accessibility. All requirements for protection to combustible construction apply. Cleanout locations need to be identified in a manner that is effective and practical as it pertains to the specific installation. Galvanized or black iron duct will not hold up to the normal burial process of underground duct because the cleaning process and the cleanouts themselves would prevent concrete encasement. It is unlikely that cleanouts will be installed outdoors at grade level but the text recognizes the possibility.

Cost Impact: The code change proposal may increase cost of construction.

Analysis: Item #4 is dependent upon the approval of M50-09/10 which creates the new Section 506.3.7.1.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: MCMANN-M-30-506.3.8

M53–09/10
506.3.8 (New)

Proponent: Guy Tomberlin, Fairfax County, VA, representing the Virginia Plumbing and Mechanical Inspectors/Virginia Building and Code Officials

Add new text as follows:

506.3.8 Underground grease duct installation. Underground grease duct installations shall comply with all of the following:

1. Underground grease ducts shall be constructed of steel having a minimum thickness of 0.0575 inch (1.463 mm) (No. 16 gage) and shall be coated to provide protection from corrosion or shall be constructed of stainless steel having a minimum thickness of 0.0450 inch (1.1400 mm) (No.18 gage).
2. The underground duct system shall be tested and approved in accordance with Section 506.3.2.5 prior to coating or placement in the ground.
3. The underground duct system shall be completely encased in concrete with a minimum thickness of 4 inches.
4. Ducts shall slope toward grease reservoirs.
5. A grease reservoir with a cleanout to allow cleaning of the reservoir shall be provided at the base of each vertical duct riser.
6. Cleanouts shall be provided with access to permit cleaning and inspection of the duct in accordance with Section 506.3.
7. Cleanouts in horizontal ducts shall be installed on the topside of the duct.
8. Cleanout locations shall be legibly identified at the point of access from the interior space.

Reason: Underground duct systems are becoming increasingly popular. For example, It has become a desirable application to provide cooking operations at the actual table itself in many areas of the country. Installing hoods and the associated equipment is excessively costly and often times impractical for the table type cooking establishment. Often times many tables are included, 30-50 or even more. This proposal includes the same level of safety but is an alternative that allows the modern day restaurant design to afford the established level of safety while accommodating the obstacles related to commercial down-draft appliances.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: TOMBERLIN-M-6-506.3.8

M54–09/10
506.3.9

Proponent: Guy McMann, Jefferson County, CO, representing the Colorado Association of Plumbing and Mechanical Officials (CAPMO)

Delete and substitute as follows:

506.3.9 Grease duct horizontal cleanouts~~. Cleanouts located on horizontal sections of ducts shall be spaced not more than 20 feet (6096 mm) apart. The cleanouts shall be located on the side of the duct with the opening not less than 1.5 inches (38 mm) above the bottom of the duct, and not less than 1 inch (25 mm) below the top of the duct. The opening minimum dimensions shall be 12 inches (305 mm) on each side. Where the dimensions of the side of the duct prohibit the cleanout installation prescribed herein, the openings shall be on the top of the duct or the bottom of the duct. Where located on the top of the duct, the opening edges shall be a minimum of 1 inch (25 mm) from the edges of the duct. Where located in the bottom of the duct, cleanout openings shall be designed to provide internal damming around the opening, shall be provided with gasketing to preclude grease leakage, shall provide for drainage of grease down the duct around the dam, and shall be approved for the application. Where the dimensions of the sides, top or bottom of the duct preclude the installation of the prescribed minimum-size cleanout opening, the cleanout shall be located on the duct face that affords the largest opening dimension and shall be installed with the opening edges at the prescribed distances from the duct edges as previously set forth in this section~~.

Cleanouts serving horizontal sections of grease duct shall:

1. Be spaced not more than 20 feet apart.
2. Be located not more than 10 feet from changes in direction.
3. Be located on the bottom only where no other locations are available and shall be provided with internal damming of the opening such that grease will flow past the opening without pooling. Bottom cleanouts and openings shall be approved for the application and installed liquid tight.
4. Not be closer than 1 inch from the edges of the duct.
5. Have opening dimensions of not less than 12 inches by 12 inches. Where such dimensions preclude installation, the opening shall be not less than 12 inches on one side and shall be large enough to provide access for cleaning and maintenance.
6. Shall be located at grease reservoirs.

Reason: This is a novel of a section, packed with information and in need of updating. Item # 2 is somewhat new though already implied. There is nothing prohibiting only one cleanout installed in the middle of a 24 foot section of duct as the code is silent on minimum numbers. This text would require that two cleanouts be provided. In item # 5, although the National Standard calls for 1 1/2 inches, it is an arbitrary number. This 1 inch dimension will have no effect structurally on the door installation nor will it have an effect on the duct itself and as a result, will provide a little more flexibility. Item # 6 already provides for a minimum 12 X 12 door but some flexibility is required for smaller duct sizes, but in no case should one side be less than 12 inches. Item # 7 is new. This establishes that a cleanout needs to be installed at grease reservoir locations in order to properly inspect and maintain the reservoir.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: MCMANN-M-17-506.3.9

M55–09/10
506.3.10

Proponent: Tony Crimi, A.C. Consulting Solutions, Inc., representing the International Firestop Council

Revise as follows:

506.3.10 Grease duct enclosures. A grease duct serving a Type I hood that penetrates a ceiling, wall, ~~or~~ floor or any concealed spaces shall be enclosed from the point of penetration to the outlet terminal. A duct shall penetrate exterior walls only at locations where unprotected openings are permitted by the *International Building Code*. The duct enclosure shall serve a single grease duct and shall not contain other ducts, piping or wiring systems. Duct enclosures shall be either field-applied or factory-built. Duct enclosures shall have a fire-resistance rating not less than that of the ~~floor~~ assembly penetrated and not less than 1 hour. ~~but need not exceed 2 hours~~. Duct enclosures shall be as prescribed by Section 506.3.10.1, 506.3.10.2 or 506.3.10.3.

Reason: To clarify the intent of the application of 506.3.10 in the IMC. In addition to the existing language, previous editions of National Codes and Installation Standards were more explicit in confirming that grease duct enclosures are also required where a grease duct passes through any concealed spaces. Further, the reference to the required fire resistance rating being related only to the "floor" assembly being penetrated was inadvertently added to the language in the 2009 IMC, and needs to also be corrected.

Justification: While the existing language in the IMC that describes "….Type I hood that penetrates a ceiling, wall or floor..." captures many concealed spaces (as well as other locations), it does not capture all of them. Section 717 of the IBC dealing with concealed spaces also capture areas such as concealed wall spaces of stud walls and partitions, including furred spaces, and parallel rows of studs or staggered studs, or sleeper spaces, Another area of concern relates to large open structures, where the duct does not penetrate any ceilings, walls, or floors for great distances, and may go either directly through a wall or ceiling to the outlet terminal, or to another compartment, having travelled through some concealed spaces.

In addition, the new reference to "Duct enclosures shall have a fire-resistance rating not less than that of the floor assembly penetrated, but need not exceed 2 hours" was added in the 2009 edition. The intent was to identify a trigger for the required rating. However, this language inadvertently omits the many cases were the grease ducts penetrate a fire resistance rated wall or other assembly. The Code needs to be corrected to be consistent with the original intent of this proposal, and previous editions of the IMC.

Grease ducts are clearly a building feature in which the potential hazards exist based on the function they are designed to perform. In contrast to conventional shaft requirements, the fire hazard from an operating grease duct occurs not only when the duct penetrates walls, floors, and ceilings, but also in the space between the Type 1 hood and the point of penetration. Any concealed spaces through which the grease duct travels, even within the compartment of origin, need to be protected.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: CRIMI-M-3-506.3.10

M56–09/10
506.3.10

Proponent: Vickie Lovell, InterCode, Inc., representing the 3M Company

Revise as follows:

506.3.10 Grease duct enclosures. A grease duct serving a Type I hood ~~that penetrates a ceiling, wall, or floor~~ shall be enclosed ~~from~~ in a continuous enclosure extending from the lowest point of the floor ceiling or floor above the hood, to the point of penetration to the outlet terminal. A duct shall penetrate exterior walls only at locations where unprotected openings are permitted by the *International Building Code*. The duct enclosure shall serve a single grease duct and shall not contain other ducts, piping or wiring systems. Duct enclosures shall be either field-applied or factory-built. Duct enclosures shall have a fire-resistance rating not less than that of the floor assembly penetrated, but need not exceed 2 hours. Duct enclosures shall be as prescribed by Section 506.3.10.1, 506.3.10.2 or 506.3.10.3.

Reason: This change will clarify the intent of the application of 506.3.10 in the IMC. In addition to the existing language, previous editions of National Codes and Installation Standards were more explicit in confirming that grease duct enclosures are also required where a grease duct passes through any concealed space.

The 2009 Edition of NFPA 96 The standard "Ventilation Control and Fire Protection of Cooking Operations" defines a continuous enclosure in section 3.3.22 as "a recognized architectural or mechanical component of a building having a fire resistance rating as required for the structure and whose purpose is to enclose the vapor removal duct for its full length to its termination point outside the structure without any portion of the structure having a fire-resistance rating less than the required value."

Section 7.7.1.1 of NFPA 96 goes beyond that by stating that in "all buildings where vertical fire barriers (walls) are penetrated, the (grease) ducts shall be enclosed in a continuous enclosure extending from the first penetrated fire barrier and any other subsequent fire barriers or concealed spaces, to or through the exterior, to maintain the fire resistance rating of the highest fire barrier penetrated."

7.7.1.2 of NFPA 96 also states that in "all buildings more than one story in height, and in one story buildings where the roof ceiling assembly is required to have a fire resistance rating, the (grease) ducts shall be enclosed in a continuous enclosure extending from the lowest fire rated ceiling or floor above the hood through any concealed spaces, to or through the roof, to maintain the integrity of the fire separations required by the applicable building code provisions."

Grease ducts are unlike any other exhaust duct, in that they convey highly flammable material and are clearly a building feature in which the potential hazard exists based on their intended function – in other words, the duct itself is the hazard, and should be protected from its origination to where it exits the building.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: LOVELL-M-2-506.3.10

M57–09/10
506.3.10.2

Proponent: Guy McMann, Jefferson County, CO, representing the Colorado Association of Plumbing and Mechanical Officials (CAPMO)

Revise as follows:

506.3.10.2 Field applied enclosure. Commercial kitchen grease ducts constructed in accordance with Section 506.3.1 shall be enclosed by field-applied grease duct enclosure that is a listed and labeled material, system, product, or method of construction specifically evaluated for such purpose in accordance with ASTM E2336. The surface of the duct shall be continuously covered on all sides from the point at which the duct originates to the outlet terminal. Duct penetrations shall be protected with a through-penetration fire-stop system classified in accordance with ASTM E814 or UL 1497 and having a "F" and "T" rating equal to the fire-resistance rating of the assembly being penetrated. Such systems shall be installed in accordance with the listing and the manufacturer's installation instructions. Partial application of a field-applied grease duct enclosure system shall not be installed for the sole purpose of reducing clearance to combustibles at isolated sections of grease duct except where specifically listed and labeled for such partial application. Exposed duct-wrap systems shall be protected where subject to physical damage.

Reason: The true intent of duct wrap systems is that they be applied to an *entire* system, not just a portion of one. This comes into play when Section 506.3.10.4 is employed. This section usually works up to the point where the roof must be penetrated. Most of these structures are wood construction or there is combustible material on decking and so forth, that the duct must get by. A practice has been to only wrap the duct from a point 18 inches from the bottom of the roof deck up through the curb. If this material was intended to be used this way, it would be found in Table 308.6. This material must meet all 5 tests of ASTM E 2336 which includes the internal fire test and the external full engulfment test. The material would never pass the test under partial application and has never been tested in this fashion, that is, to reduce clearances in small sections of duct. The manufacturers will be the first to explain that their product is not approved for this application. The code does not specifically address this poor practice. The intent of the exception is for the duct to be able to exit the structure on its own ability and to not come within 18 inches of combustible construction.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: MCMANN-M-28-506.3.10.2

M58–09/10
506.3.10.4

Proponent: Tony Crimi, A.C. Consulting Solutions, Inc., representing the International Firestop Council

Revise as follows:

506.3.10.4 Duct enclosure not required. A duct enclosure shall not be required for a grease duct that penetrates only a non fire-resistance-rated roof/ceiling assembly. Grease duct systems and exhaust *equipment* serving Type I hoods shall comply with the requirements of section 506.3.6.

Reason: The proposed change clarifies that while a duct enclosure is not required for a grease duct that penetrates only a non fire-resistance-rated roof/ceiling assembly, the clearances of grease duct systems and exhaust *equipment* serving a Type I hoods still need to comply with the requirements of section 506.3.6 to both combustible and non-combustible construction.

Justification: This proposal clarifies the need to apply the existing provision in 506.3.6 of the Code for a grease duct that penetrates a non-fire-resistance-rated roof/ceiling assembly.. The IMC differentiates between requirements for grease duct systems and exhaust equipment serving a Type I hoods to maintain clearances to combustible and non-combustible construction, and the requirements to provide a duct enclosure. Section 506.3.10 waives the requirement to provide a duct enclosure in this specific instance. However, it is important that users understand that the allowance to waive the enclosure does not also waive the need to maintain clearances between these grease ducts and combustible and non-combustible construction as specified in 506.3.6.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: CRIMI-M-2-506.3.10.4

M59–09/10
506.3.12.3

Proponent: John R. Addario, PE, New York State Department of State, Division of Code Enforcement and Administration

Revise as follows:

506.3.12.3 Termination location. Exhaust outlets shall be located not less than 10 feet (3048 mm) horizontally from parts of the same or contiguous buildings, adjacent buildings, adjacent property lines and shall be located not less than 10 feet (3048 mm) above the adjoining grade level. Exhaust outlets shall be located not less than 10 feet (3048 mm) horizontally from or not less than 3 feet (914 mm) above air intake openings into any building.

Exception: Exhaust outlets shall terminate not less than 5 feet (1524 mm) <u>horizontally</u> from parts of the same or contiguous building, an adjacent building, adjacent property line and air intake openings into a building where air from the exhaust outlet discharges away from such locations.

Reason: The code is very specific in that the 10 feet distance from exhaust outlets must be measured horizontally. This proposed change clarifies the intent of the code by including the horizontal requirement to the exception.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME:A DDARIO-M-2-506.3.12.3

M60–09/10
506.3.12.3

Proponent: Guy McMann, Jefferson County, CO, representing the Colorado Association of Plumbing and Mechanical Officials (CAPMO)

Revise as follows:

506.3.12.3 Termination location. Exhaust outlets shall be located not less than 10 feet (3048 mm) horizontally from parts of the same or contiguous buildings, adjacent buildings and adjacent property lines and shall be located not less than 10 feet (3048 mm) above the adjoining grade level. Exhaust outlets shall be located not less than 10 feet (3048 mm) horizontally from or not less than 3 feet (914 mm) above air intake openings into any building.

Exception: Exhaust outlets shall terminate not less than 5 feet (1524 mm) <u>horizontally</u> from parts of the same or contiguous building, an adjacent building, adjacent property line and air intake openings into a building where ~~air from~~ the exhaust outlet discharge~~s away~~ <u>is not directed at any angle toward such points</u> ~~from such locations~~.

Reason: There is some confusion as to what exactly is meant by the term “away from the building” and what it actually permits. It would seem that the side of an up blast fan whether it is a utility set or centrifugal fan would be compliant with the 5-foot exception when the closest edge of the discharge is measured horizontally and no angle short of parallel would be compliant. This is a much needed clarification.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: MCMANN-M-20-506.3.12.3

M61–09/10
507.1

Proponent: Bob Eugene, Underwriters Laboratories, Inc.

Revise as follows:

507.1 General. Commercial kitchen exhaust hoods shall comply with the requirements of this section. Hoods shall be Type I or Type II and shall be designed to capture and confine cooking vapors and residues. Commercial kitchen exhaust hood systems shall operate during the cooking operation.

Exceptions:

1. Factory-built commercial exhaust hoods that are listed and labeled ~~which are tested~~ in accordance with UL 710, ~~listed,~~ ~~labeled~~ and installed in accordance with Section 304.1 shall not be required to comply with Sections 507.4, 507.5, 507.7, 507.11, 507.12, 507.13, 507.14, and 507.15.
2. Factory-built commercial cooking recirculating systems that are listed and labeled ~~which are tested~~ in accordance with UL 710B, ~~listed, labeled~~ and installed in accordance with Section 304.1 shall not be required to comply with Sections 507.4, 507.5, 507.7, 507.11, 507.12, 507.13, 507.14, and 507.15. Spaces in which such systems are located shall be considered to be kitchens and shall be ventilated in accordance with Table 403.3. For the purpose of determining the floor area required to be ventilated, each individual appliance shall be considered as occupying not less than 100 square feet (9.3 m^2).
3. Net exhaust volumes for hoods shall be permitted to be reduced during part-load cooking conditions, where engineered or listed multispeed or variable-speed controls automatically operate the exhaust system to maintain capture and removal of cooking effluents as required by this section. Reduced volumes shall not be below that required to maintain capture and removal of effluents from the idle cooking appliances that are operating in a standby mode.

Reason: UL 710 addresses materials and thickness (IMC 507.5). UL 710B addresses grease filters (IMC 507.11).

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: EUGENE-M-30-507.1

M62–09/10
507.1

Proponent: Jayendra S. Parikh, Compliance Solutions International Inc., representing North American Association of Food Equipment Manufacturers Technical Liaison Committee

Revise as follows:

507.1 General. Commercial kitchen exhaust hoods shall comply with the requirements of this section. Hoods shall be Type I or II and shall be designed to capture and confine cooking vapors and residues. Commercial kitchen exhaust hood systems shall operate during the cooking operation.

Exceptions:

1. Factory-built commercial exhaust hoods which are tested in accordance with UL 710, *listed*, *labeled* and installed in accordance with Section 304.1 shall not be required to comply with Sections 507.4, 507.7, 507.11, 507.12, 507.13, 507.14 and 507.15.
2. Factory-built commercial cooking recirculating systems which are tested in accordance with UL 710B, *listed*, *labeled* and installed in accordance with Section 304.1 shall not be required to comply with Sections 507.4, 507.5, 507.7, 507.12, 507.13, 507.14 and 507.15. Spaces in which such systems are located shall be considered to be kitchens and shall be ventilated in accordance with Table 403.3. ~~For the purpose of determining the floor area required to be ventilated, each individual *appliance* shall be considered as occupying not less than 100 square feet (9.3 m^2).~~

3. Net exhaust volumes for hoods shall be permitted to be reduced during part-load cooking conditions, where engineered or *listed* multispeed or variable-speed controls automatically operate the exhaust system to maintain capture and removal of cooking effluents as required by this section. Reduced volumes shall not be below that required to maintain capture and removal of effluents from the idle cooking appliances that are operating in a standby mode.

Reason: The sentence that is deleted:
(1) contains requirement that seems arbitrary,
(2) consists of inappropriate requirement for listed commercial cooking recirculating systems which occupy very small floor area,
(3) requires substantially higher ventilation rates for such appliances/systems based on the minimum 100 square feet floor area required for each such appliance vs their actual area on the floor, increasing energy and other costs of HVAC or other system used for ventilating such appliances, including the system's operation and maintenance costs. As an example, 8000 cfm of outdoor ventilation air was required for one restaurant where 57 induction cookers (each with about 2 sq. ft. floor area) were used using 100 square feet of floor area for each such appliance, while the whole restaurant actually required 4500 cfm, per IMC Section 403.3,
(4) may erroneously require much higher ventilation if someone interprets the ventilation for such appliances to be in addition to the required ventilation for that area (which, in the above example, would be 8000 + 4500 = 12,500 cfm), and (5) does not represent the intent of the author who had proposed this requirement, as I understand it, with respect to such appliances/systems.

Cost Impact: The code change proposal will not increase the cost of construction. On the contrary, this proposal will decrease the cost of construction, operation, and maintenance.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: PARIKH-M-1-507.1

M63–09/10
507.2

Proponent: Guy McMann, Jefferson County, CO, representing the Colorado Association of Plumbing and Mechanical Officials (CAPMO)

Revise as follows:

507.2 Where required. A Type I or Type II hood shall be installed at or above all *commercial cooking appliances* in accordance with Sections 507.2.1 and 507.2.2. Where any cooking *appliance* under a single hood requires a Type I hood, a Type I hood shall be installed. Where a Type II hood is required, a Type I or Type II hood shall be installed.

Exception: Where cooking appliances are equipped with integral down-draft exhaust systems and such appliances and exhaust systems are listed and labeled for the application, a hood shall not be required at or above them.

Reason: This is an effort to recognize hoodless griddle type cooking appliances which are becoming more popular. Sometimes they are referred to as Hibachi Tables where generally smaller amounts of food are prepared in front of the customers directly at their table. These cooking tables have built-in downdraft exhaust systems running between 800 and 1000 cfm designed with two fans, one to push and one to draw air across the table. The cooking vapors are captured and delivered to a grease duct attached at the bottom of the table. All current IMC grease duct requirements apply at this point.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: MCMANN-M-25-507.2

M64–09/10
507.2.1, 507.2.2

Proponent: Douglas J. Horton, D.J. HORTON and Associates, Inc., representing Commercial Kitchen Ventilation Technical Interest Group

Revise as follows:

507.2.1 Type I hoods. Type I hoods shall be installed where cooking *appliances* produce grease or smoke. Type I hoods shall be installed over *medium-duty*, *heavy-duty* and *extra-heavy-duty cooking appliances*. Type I hoods shall be installed over *light-duty cooking appliances* that produce grease or smoke.

Exception: A Type I hood shall not be required for an electric cooking appliance where an approved testing agency provides documentation that the appliance effluent contains 5 mg/m^3 or less of grease when tested at an exhaust flow rate of 500 cfm (0.236 m^3/s) in accordance with Section 17 of UL 710B.

507.2.2 Type II hoods. Type II hoods shall be installed above dishwashers and ~~*light-duty appliances*~~ appliances that produce heat or moisture and do not produce grease or smoke, except where the heat and moisture loads from such appliances are incorporated into the HVAC system design or into the design of a separate removal system. Type II hoods shall be installed above all ~~*light-duty appliances*~~ appliances that produce products of *combustion* and do not produce grease or smoke. Spaces containing cooking appliances that do not require Type II hoods shall be ventilated in accordance with Section 403.3. For the purpose of determining the floor area required to be ventilated, each individual *appliance* that is not required to be installed under a Type II hood shall be considered as occupying not less than 100 square feet (9.3 m^2).

Reason: A growing issue is the proliferation of small appliances and related cooking in which little or no grease is produced, such as in convenience stores and other venues. Thus, a minimum threshold should be provided in the IMC to eliminate the expense of first cost, and energy costs of fan energy and tempering makeup air, where grease emissions are minimal or nonexistent. Such a minimum threshold already exists in codes and standards, and this proposal is provided to harmonize the IMC with NFPA Standard 96 and UL Standard 710B. NFPA 96 contains the threshold requirement and UL 710B, Section 17, contains the applicable test procedure. NFPA 96, in sections 4.1.1.2 and 4.1.1.3, exempts from exhaust systems cooking equipment that has grease discharge that does not exceed 5 mg/m^3 when tested at an exhaust airflow rate of 500 cfm (0.236 m^3/s). Note that NFPA 96 is written entirely from a fire safety point of view, so only a Type I (in IMC terms) hood requirements are included in the standard.

State jurisdictions are beginning to pick up this exception in their adoptions of the IMC. For example, both Michigan and California mechanical codes either cite the grease test requirements explicitly or cite NFPA 96 for exhaust system requirements.

Editorial Note: The 2008 NFPA 96 cites UL 197 in sections 4.1.1.2 and 4.1.1.3, though the grease emissions test has been moved to Section 17 of UL 710B. Therefore, the proposed IMC exception should cite the actual grease emissions threshold requirement rather than citing NFPA 96, which contains the outdated reference.

In relation to Section 507.2.2, if a Type I hood is not required because of low grease emissions, per the first part of this proposal, the provisions of section 507.2.2 still apply, and a Type II hood may be required. This is problematic with the existing wording because Type II hoods are currently required only for dishwashers and light-duty appliances. Yet it is well known that appliances with duty ratings higher than light-duty produce heat and moisture while not producing grease or combustion products, such as electric ranges, electric pasta cookers, electricpizza ovens, and electric tilting skillets, for example. Accordingly, Type II hoods should be required for appliances based on their actual emissions of heat and moisture, regardless of duty. Of course, per current Section 507.2.2, additional HVAC capacity is still available as an alternative to use of a Type II hood.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: HORTON-M-1-507.2

M65–09/10
507.2.1, 507.2.2

Proponent: Guy Tomberlin, Fairfax County, VA, representing the Virginia Plumbing and Mechanical Inspectors/Virginia Building and Code Officials

Revise as follows:

507.2.1 Type I hoods. Type I hoods shall be installed where cooking *appliances* produce grease or smoke as a result of the cooking process. Type I hoods shall be installed over *medium-duty*, *heavy-duty* and *extra-heavy-duty cooking appliances*. Type I hoods shall be installed over *light-duty cooking appliances* that produce grease or smoke.

507.2.2 Type II hoods. Type II hoods shall be installed above dishwashers and *light-duty appliances* that produce heat or moisture and do not produce grease or smoke as a result of the cooking process, except where the heat and moisture loads from such appliances are incorporated into the HVAC system design or into the design of a separate removal system. Type II hoods shall be installed above all *light-duty appliances* that produce products of *combustion* and do not produce grease or smoke as a result of the cooking process. Spaces containing cooking appliances that do not require Type II hoods shall be ventilated in accordance with Section 403.3. For the purpose of determining the floor area required to be ventilated, each individual *appliance* that is not required to be installed under a Type II hood shall be considered as occupying not less than 100 square feet (9.3 m2).

Reason: Words added for clarification. The requirement for hood installation should not be based on the possibility of food being burned and producing smoke. If that were the case, smoke being produced while burning toast would require a hood above a toaster.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: TOMBERLIN-M-9-507.2.1-507.2.2

M66–09/10
507.2.1.1

Proponent: Guy McMann, Jefferson County, CO, representing the Colorado Association of Plumbing and Mechanical Officials (CAPMO)

Revise as follows:

507.2.1.1 Operation. Type I hood systems shall be designed and installed to automatically activate the exhaust fan whenever cooking operations occur. The activation of the exhaust fan shall occur through an interlock with the cooking appliances, by means of heat sensors or by means of other approved methods. A method of interlock between an exhaust hood system and appliances equipped with standing pilot burners shall not cause the pilot burners to be extinguished.

Reason: This is important information from the IFGC that needs to be part of this section as it directly affects how hoods are to operate. Having it here will keep the user from having to travel to another document to find it and will eliminate a possible oversight that could prove to be costly to correct at the end of an installation.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: MCMANN-M-39-507.2.1.1

M67–09/10
507.2.1.2 (New)

Proponent: Mark Riley, City of Troy, MI, representing City of Troy and Mechanical Inspectors Association of Michigan

Add new text as follows:

507.2.1.2 Type I hoods shall bear a label indicating the minimum exhaust flow rate in CFM per linear foot of hood that provides for capture and containment of the exhaust effluent for the cooking appliances served by the hood, based on the cooking appliance duty classifications defined in this code.

Reason: There has been an enforcement nightmare with some hood companies not providing information on how many CFM is required per linear foot of hood for what type of cooking appliances. The hood manufacturer provides information based on temperature of cooking. This does not help the inspector determining compliance when the code references light, medium, heavy duty, and extra heavy duty cooking appliances. Why even have these terms for types of cooking, when the hood manufacturer's state CFM based on cooking temperature? Either rework the types of cooking to temperature or have the manufacturer state how many CFM is required per linear foot. Also note that the labeling of hoods for performance is already required for compensating hoods in Section 508.2.

Cost Impact: There may be an increase cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: RILEY-M-1-507.2.1.2

M68–09/10
507.2.2

Proponent: Russell Payzant, Engineer, American Dish Service

Revise as follows:

507.2.2 Type II hoods. Type II hoods shall be installed above dishwashers and *light-duty appliances* that produce heat or moisture and do not produce grease or smoke, except where the heat and moisture loads from such appliances are incorporated into the HVAC system design or into the design of a separate removal system. Type II hoods shall be installed above all *light-duty appliances* that produce products of *combustion* and do not produce grease or smoke. Spaces containing cooking appliances that do not require Type II hoods shall be ventilated in accordance with Section 403.3. For the purpose of determining the floor area required to be ventilated, each individual *appliance* that is not required to be installed under a Type II hood shall be considered as occupying not less than 100 square feet (9.3 m^2).

Exception: A Type II hood is not required for chemically sanitizing commercial dishwashing machines that use hot water at a temperature of 120°F (48.8°C) or less. The additional heat and moisture loads generated by such appliances shall be accounted for in the design of the HVAC systems.

Reason: We request the vapor hood language be removed and relevant industry language be added to exception #2 of 507.2.2., until there is a standard for testing such vapor hoods. Section 507 of the IMC code requiring hooding or venting for all commercial dishwashing machines, which language began in 1994, does not consider the impact of a whole generation in dish machine design. The 1954 design of chemically sanitizing "Low-temp" dish machines uses building hot water supplies at 120F degrees for rinse water, then reuses that water for the wash, then is drained away at 110 to 100F degrees. Typical batches are from 1 to 3 gallons of water. The heat and moisture loads generated by such appliances are no more than that of a hand-washing sink, steam tables, or rice cookers—which are exempted in 507.2.2.

Providing hoods and venting for such machines have a costly impact for the owners and operators of commercial kitchens—often exceeding the cost of the entire ware washing system. These "low-temp" designs have successfully been employed to avoid additional venting needs for many years.

The hood language of IMC 2006 and adoption of the code by local jurisdictions has created costly hurdles for the industry with no measurable benefit. We have attempted to contact any state or national body who tests for heat and moisture loading of the dishroom. The problem is there are no written standards to which the code can be tested or certified, to show our machine is not loading the room beyond that of steam tables, rice cookers, or hand-washing sinks. The vapor hood language is ambiguous and there is no dishroom standard to certify to.

Cost Impact: The code change proposal will not increase the cost of construction. (The proposal will avoid impending high costs to existing and new owners and operators of commercial kitchens.)

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: PAYZANT-M-1-507.2.2

M69–09/10
507.2.2

Proponent: John Wooden, VP ChefMaster Division of Mr. Bar-B-Q-Inc.

Revise as follows:

507.2.2 Type II hoods. Type II hoods shall be installed above dishwashers and *light-duty appliances* that produce heat or moisture and do not produce grease or smoke, except where the heat and moisture loads from such appliances are incorporated into the HVAC system design or into the design of a separate removal system. ~~Type II hoods shall be installed above all *light-duty appliances* that produce products of *combustion* and do not produce grease or smoke.~~ Spaces containing cooking appliances that do not require Type II hoods shall be ventilated in accordance with Section 403.3. For the purpose of determining the floor area required to be ventilated, each individual *appliance* that is not required to be installed under a Type II hood shall be considered as occupying not less than 100 square feet (9.3 m^2).

Reason: Products of combustion for portable butane burning appliances allowed for use in commercial restaurants under NFPA 58 Section 6.19.9.4 and tested and listed by UL 2191 and ANSI 21.72b with CSA 3-90 already have strict tolerances for CO/CO2 emissions to allow for tableside cooking without the use of hoods. There is a limitation of Btu/hr currently at 15,000 Btu/hr. ANSI Z83.11 is currently combining the UL and CSA standards to incorporate the tableside cooking appliances with limitations of CO/CO2 as part of a uniform standard.

Cost Impact: The code change makes it possible for appliances that use combustion as a heat source to continue in dessert carts and omelet stations which are currently the most economical and most often used method of tableside cooking. The cost impact not to make the changes to the proposal would be prohibitive.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: WOODEN-M-1-507.2.2

M70–09/10
507.2.2

Proponent: Jayendra S. Parikh, Compliance Solutions International Inc., representing North American Association of Food Equipment Manufacturers Technical Liaison Committee

Revise as follows:

507.2.2 Type II hoods. Type II hoods shall be installed above dishwashers and *light-duty appliances* that produce heat or moisture and do not produce grease or smoke, except where the heat and moisture loads from such appliances are incorporated into the HVAC system design or into the design of a separate removal system. Type II

hoods shall be installed above all *light-duty appliances* that produce products of *combustion* and do not produce grease or smoke. ~~Spaces containing cooking appliances that do not require Type II hoods shall be ventilated in accordance with Section 403.3. For the purpose of determining the floor area required to be ventilated, each individual *appliance* that is not required to be installed under a Type II hood shall be considered as occupying not less than 100 square feet (9.3 m^2).~~

Reason: The first sentence that is deleted is redundant, since the requirements in Section 403.3 will obviously be used for ventilation design of the spaces containing cooking appliances that do not require Type II hoods. The second sentence that is deleted:

(1) contains requirement that seems arbitrary,
(2) consists of inappropriate requirement for small electrically heated appliances such as toasters, counter-top steamers and steam-tables, egg cookers, rice cookers, hot dog cookers, and induction cookers, which occupy about a maximum of 3 to 4 square feet of floor area and are not required to be installed under a Type II hood,
(3) requires substantially higher ventilation rates for such small appliances based on the minimum 100 square feet floor area required for each such appliance vs their actual area on the floor which is maximum of 3 to 4 square feet, increasing energy and other costs of HVAC or other system used for ventilating such appliances, including the system's operation and maintenance costs. As an example, 8000 cfm of outdoor ventilation air was required for one restaurant where 57 small induction cookers (each with about 2 sq. ft. floor area) were used using 100 square feet of floor area for each such appliance, while the whole restaurant actually required 4500 cfm, per IMC Section 403.3,
(4) may erroneously require much higher ventilation if someone interprets the ventilation for such appliances to be in addition to the required ventilation for that area (which, in the above example, would be 8000 + 4500 = 12,500 cfm), and
(5) does not represent the intent of the author who had proposed this requirement, as I understand it, with respect to such small electrically heated appliances.

Cost Impact: The code change proposal will not increase the cost of construction. On the contrary, this proposal will decrease the cost of construction, operation, and maintenance.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: PARIKH-M-2-507.2.2

M71–09/10
507.2.2

Proponent: Sam Dardano, City of Boulder, CO, representing the Colorado Association of Plumbing and Mechanical Officials (CAPMO)

Revise as follows:

507.2.2 Type II hoods Type II hoods shall be installed above dishwashers and light duty appliances that produce heat or moisture, except where the heat or moisture loads from such appliances are incorporated into the HVAC system design or into the design of a separate removal system. Type II hoods shall be installed above all light duty appliances that produce products of combustion and do not produce grease or smoke. Spaces containing cooking appliances that do not require type II hoods shall be ~~ventilated~~ <u>provided with exhaust at a rate of 0.70 cfm per square foot</u>. ~~in accordance with Section 403.3.~~ For the purpose of determining the floor area required to be ~~ventilated~~ exhausted, each individual appliance that is not required to be installed under a type II hood shall be considered as occupying not less than 100 square feet. <u>Such additional square footage shall be provided with exhaust at a rate of 0.70 cfm per square foot.</u>

Reason: This is an informative section but the word "ventilated" could be construed as referring to outside air ventilation in which Table 403.3 has no value for outside air in kitchens, only an exhaust rate. It's easier to simply state the exhaust rate instead of referring to the Table, saving the user a little time.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: DARDANO (MCMANN) -M-10-507.2.2

M72–09/10
507.3

Proponent: Guy McMann, Jefferson County, CO, representing the Colorado Association of Plumbing and Mechanical Officials (CAPMO)

Revise as follows:

507.3 Fuel-burning appliances. ~~Where vented fuel-burning appliances are located in the same room or space as the hood, provisions shall be made to prevent the hood system from interfering with normal operation of the appliance vents.~~ Non-direct-vent appliances shall not be located in a room or space containing a Type I or Type II hood nor in a room or space that opens only into a room or space containing such hoods.

Exception: Non-direct-vent appliances shall be permitted in a room or space containing a Type I or Type II hood provided that the room or space is continuously maintained under positive pressure.

Reason: 507.3 only states that "provisions" need to be made when dealing with these types of appliances but provides no guidance as what is really required. This only creates confusion in the enforcement community as to what needs to occur. Non direct vent appliances and those with draft hoods are subject to many factors that could result in improper venting. Losses in building pressure will cause improper venting. It only takes 5 Pascal's to overcome a gravity vent. These appliances are also in competition for air with other appliances and are no match for powered exhaust equipment such as hoods. The kitchen environment lends itself to negative pressure either by design or by accident. A perfectly balanced system never lasts very long as every minute detail affects them. Even kitchens with slight positive pressure can be subject to negative building pressures simply by opening doors. If kitchen pressures are even negative in the slightest or cannot be verified, then the appliance should be isolated. This text will provide the user with guidance that is more concise.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: MCMANN-M-15-507.3

M73–09/10
507.10

Proponent: Guy McMann, Jefferson County, CO, representing the Colorado Association of Plumbing and Mechanical Officials (CAPMO)

Revise as follows:

507.10 Hoods penetrating a ceiling. Type I hoods or portions thereof penetrating a ceiling, wall or furred space shall comply with ~~all the requirements of~~ Section 506.3.10. Field-applied grease duct enclosure systems, as addressed in Section 506.3.10.2, shall not be utilized to satisfy the requirements of this section.

Reason: Hoods penetrating ceilings that are also required to have the associated ductwork protected, are required to be enclosed in a 1 or 2 hour enclosure. Field applied duct-wrap systems are listed for ducts only, not hoods. Hoods have never been tested or listed to have duct-wrap materials placed over the hood as a replacement for a 1 or 2 hour enclosure. There is no standard for installation of duct-wrap systems on hoods. Nor is there a method of fastening or method of providing access to services located on top of the hood such as lights, J-boxes etc. To permit this practice only creates a false sense of security and code compliance. The manufacturers are aware that some jurisdictions allow this application but they don't condone the practice or seek to market their product in this fashion. The best practice is to not have the hood penetrate the ceiling in the first place. As currently written, 507.10 says that **all** the requirements of 506.3.10 should be met. This is misleading because two of the exceptions cannot be applied although they are part of the section. This is a much needed clarification that will provide concise guidance as to what exactly needs to occur when hoods are required to be protected when ceilings are penetrated.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: MCMANN-M-5-507.10

M74–09/10
507.11, Chapter 15

Proponent: Bob Eugene, Underwriters Laboratories, Inc.

1. Revise as follows:

507.11 Grease filters. Type I hoods shall be equipped with ~~listed~~ grease filters listed and labeled in accordance with UL 1046 and designed for the specific purpose. Grease-collecting equipment shall be provided with access for cleaning. The lowest edge of a grease filter located above the cooking surface shall be not less than the height specified in Table 507.11.

2. Add new standard to Chapter 15 as follows:

UL
1046-00 Grease Filters for Exhaust Ducts

Reason: UL 1046 includes a comprehensive set of construction and performance requirements that are used to evaluate and list grease filters. Over 20 companies currently have grease filters listed. Only listed products that are labeled have been subjected to periodic, unannounced inspections during production.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: Review of proposed new standard, UL 1046-00, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

M75–09/10
510.6, 510.6.1, 510.6.2, 510.6.3

Proponent: Vickie Lovell, InterCode, Inc., representing the 3M Company

Revise as follows:

510.6 Penetrations. Penetrations of structural elements or a fire resistance rated assembly by a hazardous exhaust system shall conform to Sections 510.6.1 through 510.6.4.

Exceptions:

1. Duct penetrations within H-5 occupancies as allowed by the *International Building Code*.
2. Where the interior of the duct is equipped with an approved automatic fire suppression system as required by Section 510.7.

510.6.1 Fire dampers and smoke dampers. Fire dampers and smoke dampers are prohibited in hazardous exhaust ducts.

510.6.2 Floors and Floor/Ceiling Assemblies. Hazardous exhaust ~~systems~~ ducts that penetrate a floor or floor/ceiling assembly shall be enclosed from the point at which the duct enclosure penetrates a ceiling or floor to the outlet terminal in a fire-resistance rated ~~shaft constructed in accordance with the *International Building Code*.~~ construction specifically evaluated for such purpose as follows:

1. A shaft constructed in accordance with International Building Code constructed with the same fire resistance rating as the assembly penetrated, or
2. A field-applied duct enclosure protected with a through penetration firestop system classified in accordance with ASTM E814 having an "F" and "T" rating equal to the fire resistance rating of the assembly penetrated. The enclosure shall be tested and listed in accordance with ASTM E 2336, and installed in accordance with the manufacturer's instructions .

510.6.3 Wall assemblies. Hazardous exhaust ducts ~~systems~~ that penetrate fire-resistance-rated wall assemblies shall be enclosed in fire-resistance-rated construction from the point of penetration to the outlet terminal ~~except where the interior of the duct is equipped with an approved automatic fire suppression system.~~ in a construction specifically evaluated for such purpose. ~~Ducts shall be enclosed in accordance with the *International Building Code* requirements for shaft construction and such enclosure shall have a minimum fire-resistance rating of not less than the highest fire-resistance-rated wall assembly penetrated.~~

1. A shaft constructed in accordance with International Building Code constructed with the same fire resistance rating as the assembly penetrated, or
2. A field-applied duct enclosure protected with a through penetration firestop system classified in accordance with ASTM E814 having an "F" and "T" rating equal to the fire resistance rating of the assembly penetrated. The enclosure shall be tested and listed in accordance with ASTM E 2336, and installed in accordance with the manufacturer's instructions .

Reason: Hazardous exhaust ducts convey materials that are classified as creating physical or health hazards. They include, but are not limited to:

1. dust or particles sufficiently light enough to float in the air in concentrations so as to be injurious to health or safety
2. heat, odors, fumes, spray, gas, or smoke in concentrations so as to be injurious to health or safety
3. grease from commercial kitchens
4. toxic, corrosive, flammable, or explosive materials.

The IBC does not make any distinction in the requirement for protection of ducts as being limited to only ducts penetrating structural elements. In all cases, any type of duct that penetrate fire rated assemblies are required to be protected with dampers or as penetrations. Historically a shaft is used to enclose such ducts where dampers are not permitted. Where appropriate, this method would still be allowed. However, job site conditions sometimes create the need for alternate methods permitted by the code. The scope of ASTM E 2336 (already required as a method of protection for grease ducts in the IMC) is being expanded to include all types of hazardous exhaust ducts.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:				
Committee:	AS	AM	D	
Assembly:	ASF	AMF	DF	

ICCFILENAME: LOVELL-M-5-510.6

M76–09/10
510.6.2, 510.6.3

Proponent: Tony Crimi, A.C. Consulting Solutions, Inc., representing the International Firestop Council

Revise as follows:

510.6.2 Floors. Hazardous exhaust systems that penetrate a floor/ceiling assembly shall be enclosed in a fire-resistance-rated shaft constructed in accordance with the *International Building Code* requirements for shaft construction*, or an approved* alternative duct enclosure that is a *listed* and *labeled* material, system, product or method of construction specifically evaluated for such purpose.

510.6.3 Wall assemblies. Hazardous exhaust duct systems that penetrate fire-resistance-rated wall assemblies shall be enclosed in fire-resistance-rated construction from the point of penetration to the outlet terminal, except where the interior of the duct is equipped with an approved automatic fire suppression system. Ducts shall be enclosed in accordance with the *International Building Code* requirements for shaft construction *or an approved* alternative duct enclosure that is a *listed* and *labeled* material, system, product or method of construction specifically evaluated for such purpose. ~~and~~ Such enclosures shall have a minimum fire-resistance-rating of not less than the highest fire-resistance-rated wall assembly penetrated.

Reason: To introduce alternative methods for protection of ducts used to convey hazardous exhaust as required in 510.6 of the IMC. The protection of these ducts can be accomplished using *approved* alternative duct enclosures that are *listed* and *labelled* systems or product specifically evaluated for such purpose. There are alternative methods available for providing protection for hazardous exhaust duct enclosures beyond the existing shaft provisions.

Substantiation: There are parallels between the level of performance required for hazardous exhaust ducts as compared to grease ducts and other fire-resistance rated duct enclosures. As an example, the ASTM E2336 standard evaluates enclosure materials and the duct enclosure systems using the following test methods: non-combustibility, full scale fire resistance, durability, internal fire, and fire-engulfment with a through-penetration fire stop.

As an example, enclosure systems which meet the ASTM E2336 criteria demonstrate the ability to resist the passage of flames and hot gases during a standardized fire resistance test and a standardized internal fire test, as well as an ability to resist transmission of heat through the duct and the enclosure material(s). The ability of a fire stop to meet the requirements of Test Method E 814 when used with the duct enclosure system is also evaluated. The test method prescribes an ASTM E119 fire exposure for both a fire engulfment and a fire resistance wall test. The fire resistance test illustrates the ability of the enclosure material to resist the effects of fire when applied in a vertical application (i.e. as a wall assembly tested in accordance with ASTM E119).

In addition, an internal fire test uses two standardized fire exposures occurring inside the protected duct itself. Both tests illustrate the enclosure material's ability to resist thermal transmission of heat to the unexposed side in a horizontal application. The first standardized fire exposure is intended to simulate long term exposure of the enclosure material to a standardized service condition. The test simulates an internal fire within the duct by maintaining a minimum 500°F (260°C) average interior temperature for at least 4 h. The second standardized fire exposure is intended to simulate a sudden rise in the exposure conditions within the duct. Within 15 min after the end of the 4-h period, increase the average interior temperature in the duct is increased to 2000°F (1093°C). This exposure is then maintained for 30 minutes, which simulates a large fire event within the duct. The current provisions of 5.10.8.2 do not explicitly take this into account. A durability test is included for the materials, which is intended to simulate the effects of long-term exposure of typical in-service conditions on the thermal transmission qualities of the enclosure materials when subjected to a modified version of Test Method C 518.

A fire-engulfment test uses a standardized fire exposure, the time temperature curve of Test Methods E 119, to simulate a fire occurring on the outside of the grease duct, and demonstrates the ability of the duct enclosure system to remain intact without a through opening. The fire-engulfment test also tests the fastening methods used to secure the enclosure material to the grease duct and the supporting system. The fire-engulfment test also provides a means to test a through-penetration fire stop to determine its compatibility with the duct enclosure system. The fire-engulfment and vertical fire resistance tests are followed by the application of a standardized hose stream test.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: CRIMI-M-4-510.6

M77–09/10
510.7

Proponent: Patrick A. McLaughlin, McLaughlin & Associates, representing the Semiconductor Industry Association

Revise as follows:

510.7 Suppression required. Ducts shall be protected with an approved automatic fire suppression system installed in accordance with the *International Building Code*.

Exceptions:

1. An approved automatic fire suppression system shall not be required in ducts conveying materials, fumes, mists and vapors that are nonflammable and noncombustible and where flammable contaminant are diluted to below 25% of their lower flammability limit ~~under all conditions and at any concentrations~~.
2. An *approved* automatic fire suppression system shall not be required in ducts where the largest cross-sectional diameter of the duct is less than 10 inches (254 mm).
3. For laboratories, as defined in Section 510.1, automatic fire protection systems shall not be required in laboratory hoods or exhaust systems.

Reason: To clarify that automatic fire suppression is not required for diluted flammable contaminants. IMC Section 510.3 require that flammable contaminants be diluted below 25% of the lower flammability limit therefore it is not a hazardous exhaust system under section 510.2 and a fire suppression system is not required. Even though a suppression system is not required, as presently written there has been misapplication of the provisions. The change to IFC 1803.10.4.1 is the corresponding Fire Code change.

Cost Impact: The code change proposal will not increase the cost of construction.

510.8.1

Proponent: Eli P. Howard, III, Sheet Metal and Air Conditioning Contractors National Association, Inc.

Revise as follows:

510.8.1 Duct joints. Ducts shall be made tight with lap joints having a minimum lap of 1 inch (25 mm). Joints used in ANSI/SMACNA Round Industrial Duct Construction Standards and ANSI/SMACNA Rectangular Industrial Duct Construction Standards are also acceptable.

Reason: The types of joints used in either of these manuals have been used in industrial exhaust and conveyance systems for years and provide acceptable alternatives to lap joints.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: HOWARD-M-7-510.8.1

M79–09/10
512.2

Proponent: Eli P. Howard, III, Sheet Metal and Air Conditioning Contractors National Association, Inc.

Revise as follows:

512.2 Materials. Subslab soil exhaust system duct material shall be air duct material *listed* and *labeled* to the requirements of UL 181 for Class 0 air ducts, or any of the following piping materials that comply with the *International Plumbing Code* as building sanitary drainage and vent pipe: cast iron; galvanized steel; brass or copper pipe; copper tube of a weight not less than that of copper drainage tube, Type DWV; and plastic piping. PVC coated steel with a minimum thickness of 4 ml on the surface in contact with the fill material, aluminized steel and FRP are acceptable duct materials.

Reason: These materials have been used for subslab applications for years and methods on construction and installation are covered via the SMACNA HVAC Duct Construction Standards, SMACNA Thermoplastic Duct (PVC) Construction Manual and Thermoset FRP Duct Construction Manual.

Cost Impact: The code change proposal will not increase the cost of construction. These materials are typically available at comparable or lower prices to those already listed.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: HOWARD-M-9-512.2

M80–09/10
513.10.2

Proponent: Eli P. Howard, III, Sheet Metal and Air Conditioning Contractors National Association, Inc.

Revise as follows:

[F] 513.10.2 Ducts. Duct materials and joints shall be capable of withstanding the probable temperatures and pressures to which they are exposed as determined in accordance with Section 513.10.1. Ducts shall be constructed and supported in accordance with Chapter 6. Ducts shall be leak tested to the construction pressure class ~~to 1.5 times the maximum design pressure~~ in accordance with SMACNA HVAC Air Duct Leakage Test Standard ~~nationally accepted practices. Measured leakage shall not exceed 5 percent of design flow~~. Results of such testing shall be a part of the documentation procedure. Ducts shall be supported directly from fire-resistance-rated structural elements of the building by substantial, noncombustible supports.

> **Exception:** Flexible connections, for the purpose of vibration isolation, that are constructed of *approved* fire-resistance-rated materials.

Reason: Testing ductwork beyond its design maximum pressure may cause permanent deformation. Leak testing ductwork beyond the maximum design static pressure does not provide accurate leakage rates under operating conditions. Additionally the new language is totally consistent with the ANSI/HVAC Duct Construction Standards required under the IMC.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: HOWARD-M-3-513.10.2

M81–09/10
514.1, 927

Proponent: Bob Eugene, Underwriters Laboratories, Inc.

1. Delete without substitution:

~~**SECTION 927**~~
~~**HEAT RECOVERY VENTILATORS**~~

~~**927.1 Ducted heat recovery ventilators.** Ducted heat recovery ventilators shall be *listed* and *labeled* in accordance with UL 1812.~~

~~**927.2 Nonducted heat recovery ventilators.** Nonducted heat recovery ventilators shall be *listed* and *labeled* in accordance with UL 1815.~~

2. Revise as follows:

514.1 General. Energy recovery ventilation systems shall be installed in accordance with this section. Where required for purposes of energy conservation, energy recovery ventilation systems shall also comply with the *International Energy Conservation Code.* Ducted heat recovery ventilators shall be listed and labeled in accordance with UL 1812. Nonducted heat recovery ventilators shall be listed and labeled in accordance with UL 1815.

Reason: This proposal consolidates requirements for energy recovery ventilation systems into one location. UL 1812 and UL 1815 are currently referenced in Section 927.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: EUGENE-M-7-514.1

M82–09/10
514.4 (New)

Proponent: Guy Tomberlin, Fairfax County, VA, representing the Virginia Plumbing and Mechanical Inspectors/Virginia Building and Code Officials

Add new text as follows:

514.4 Recirculated air. Air conveyed within energy recovery systems shall not be considered as recirculated air where the energy recovery ventilation system is constructed to limit cross-leakage between air streams to less than 10% of the total airflow design capacity.

Reason: Currently the IMC provides guidance on the use of energy saving equipment such as heat/ entropy wheels. Unfortunately some interpret the sections that prohibit recirculation of air as prohibiting energy recovery equipment that merely attempts to harvest the heated or cooled elements from the exhausted airstream. Industry standards allow for up to 10% duct leakage in these type systems, so the 10% in the proposed wording supports the current technology utilized.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: TOMBERLIN-M-12-514.4

M83–09/10
515 (New), 515.1 (New)

Proponent: Guy McMann, Jefferson County, CO, representing the Colorado Association of Plumbing and Mechanical Officials (CAPMO)

Add new text as follows:

SECTION 515
COMMON MULTISTORY EXHAUST SYSTEMS

515.1 Common bathroom and toilet room exhaust in multistory buildings. Where a common shaft is designed and installed to convey bathroom or toilet room exhaust, or both, in multiple story buildings, the construction of such system shall be in accordance with all of the following:

1. The building shall be equipped with an automatic sprinkler system in accordance with Section 903.3.1.1 of the *International Building Code*.
2. Shaft construction shall conform to Section 708 of the *International Building Code*.
3. Volume dampers, fire dampers and smoke dampers shall be prohibited in the exhaust duct. Penetrations of the shaft be protected in accordance with Section 607.5.5, Exception 2.
4. The shaft shall be served by an exhaust fan located at the top of the shaft and such fan shall be specifically designed for the intended application.
5. The exhaust fan shall run continuously and maintain negative pressure in the shaft at all times.
6. The exhaust fan operation shall be monitored in an approved location and shall initiate an audible or visual signal when the fan is not in operation.
7. Makeup air shall be provided for the spaces served in accordance with Section 501.3.
8. A cleanout opening of an approved size shall be located at the base of the shaft to provide access for inspection.
9. Screens installed at termination points shall comply with Section 501.2.2.

Reason: This proposal provides guidance as to the correct way to construct a sub-duct system utilizing a shaft constructed in accordance with the building code as long as that building is sprinkled. This method has been around for years and is an economical way to provide a method of exhausting bathroom exhaust in multi-story buildings without having to install fire and smoke dampers in the shaft. Dryer and kitchen exhaust would be prohibited in this scenario. This method when installed correctly can be located in any occupancy. Normally this would be practical in buildings of 4 stories or more and most commonly be employed in hotels.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: MCMANN-M-26-515

M84–09/10
601.4

Proponent: Guy McMann, Jefferson County, CO, representing the Colorado Association of Plumbing and Mechanical Officials (CAPMO)

Revise as follows:

601.4 Contamination prevention. Exhaust ducts under positive pressure, chimneys and vents shall not extend into or pass through ducts or plenums.

Exceptions:

1. Exhaust systems located in ceiling return air plenums over spaces that are permitted to have 10 percent recirculation in accordance with Section 403.2.1, Item 4. The exhaust duct joints, seams and connections shall comply with Section 603.9.
2. This section shall not apply to chimneys and vents that pass through plenums where such venting systems comply with one of the following requirements:

2.1. The venting system shall be listed for positive pressure applications and shall be sealed in accordance with the vent manufacturer's installation instructions.

2.2. The venting system shall be installed such that fittings and joints between sections are not installed in the above ceiling space.

2.3. The venting system shall be installed in a conduit or enclosure with sealed joints separating the interior of the conduit or enclosure from the ceiling space.

Reason: The new exception provides the same options for vents passing through return air plenums that are found in Section 503.3.6 of the IFGC. There is no technical reason to not to allow these options for other fuel-fired appliances.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: MCMANN-M-18-601.4

M85–09/10
202, 602.1, 603.18 (New)

Proponent: Guy McMann, Jefferson County, CO, representing the Colorado Association of Plumbing and Mechanical Officials (CAPMO)

1. Delete and substitute as follows:

~~**602.1 General.** Supply, return, exhaust, relief and ventilation air plenums shall be limited to uninhabited crawl spaces, areas above a ceiling or below the floor, attic spaces and mechanical equipment rooms. Plenums shall be limited to one fire area. Fuel-fired appliances shall not be installed within a plenum.~~

602.1 General. The following shall be considered to be an air plenum:

1. Interstitial spaces above ceilings and below floors.
2. Stud wall cavities and spaces between solid floor joists utilized in accordance with Section 602.3
3. Boxes or chambers constructed to support air handlers and furnaces and to collect return air for such furnaces and air-handlers.
4. Mechanical room enclosures used to convey return air to air-handlers therein.

Plenums shall be limited to one fire area. Fuel-fired appliances shall not be installed in plenums.

2. Add new definition and text as follows:

DUCT PLENUM A box or chamber constructed of duct materials and used to collect air from or supply air to other ducts. Such plenums typically connect to the inlets and outlets of furnaces and air handlers.

603.18 Duct plenums. Duct plenums shall be constructed as required for ducts in accordance with Section 603.

Reason: This is only an attempt for the body of the code to recognize the use of various plenums found in most HVAC systems. Currently the code only speaks of plenums that take the form of structural components. The word “plenum” has been used in the trade for many years and can be most commonly found in residential applications but applies to many commercial systems as well. Sometimes large plenums are built as “fan houses” employing vane axial equipment. Plenums can be very big or small and never be part of the structure. Furnaces sometimes sit on top of plenum boxes. Many attic installations employ a plenum for flex duct distribution and so on. Using an attic or crawl space as a plenum makes little sense. Some of the problems associated with these types of designs are leakage, plenum heat loss, mold and moisture control, acceptable outlet performance, cleanliness and odor control. Verifying these issues would be very difficult for any inspector and the smallest oversight could wreak havoc for a jurisdiction. This text will solve the duct plenum recognition issue.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: MCMANN-M-34-202-602.1-603.18

M86–09/10
602.2.1

Proponent: Robert J Davidson, Code Consultant; Alan Shuman, President, representing the National Association of State Fire Marshals (NASFM)

Revise as follows:

602.2.1 Materials within plenums. Except as required by Sections 602.2.1.1 through 602.2.1.6, materials within plenums , and the exposed surfaces of the plenums containing the materials, shall be noncombustible or shall have a flame spread index of not more than 25 and a smoke-developed index of not more than 50 when tested in accordance with ASTM E 84 or UL 723.

Exceptions:

1. Rigid and flexible ducts and connectors shall conform to Section 603.
2. Duct coverings, linings, tape and connectors shall conform to Sections 603 and 604.
3. This section shall not apply to materials exposed within plenums in one- and two-family dwellings.
4. This section shall not apply to smoke detectors.
5. Combustible materials fully enclosed within continuous noncombustible raceways or enclosures, *approved* gypsum board assemblies or within materials *listed* and *labeled* for such application.

Reason: The current wording of Section 602.2 allows the air handling plenum to be constructed of materials matching the type of construction. This allows exposed plenum surfaces to be constructed of combustible materials (wood).

To control the spread of flame and smoke within an air handling plenum we mandate that the materials meet the requirements of Section 602.2.1. The conflict is that the testing of the materials to attest to meeting the requirements of the referenced standards is done in test apparatus with non-combustible surfaces. The testing is not done in a mock up of the various configurations of exposed combustible surfaces that may be found in the field.

This negates the effectiveness of the listing for the material.

The proposal will correct that by specifying that when materials are placed within the plenum that must comply with the flame spread and smoke developed index, then the exposed surface of the plenum must comply as well to ensure the testing of the materials is relevant to the installation that occurs.

Cost Impact: The code change proposal will increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: DAVIDSON-SHUMAN-M-1-602.2.1

M87–09/10
602.2.1

Proponent: Bob Eugene, Underwriters Laboratories, Inc.

Revise as follows:

602.2.1 Materials within plenums. Except as required by Sections 602.2.1.1through 602.2.1.6, materials within plenums shall be noncombustible or shall have a flame spread index of not more than 25 and a smoke-developed index of not more than 50 when tested in accordance with ASTM E 84 or UL 723.

Exceptions:

1. Rigid and flexible ducts and connectors shall conform to Section 603.
2. Duct coverings, linings, tape and connectors shall conform to Sections 603 and 604.
3. This section shall not apply to materials exposed within plenums in one- and two-family dwellings.
4. This section shall not apply to smoke detectors.
5. Combustible materials fully enclosed within one of the following:
   - 5.1. continuous noncombustible raceways or enclosures
   - 5.2. approved gypsum board assemblies
   - 5.3. ~~or within~~ materials listed and labeled ~~for such application~~ as part of a tested assembly or system.

Reason: The issue of what materials are considered acceptable for exposure in a plenum is a life safety issue. The proposed change format of Exception 5 is to clarify that any one of these three options are only permitted when the combustible material is fully enclosed. The third option in Exception 5 is not clear as to what is meant by "for such application". This "protecting" material needs to provide sufficient protection of the combustible material during the event of a fire. Thus, to determine if the "protecting" material will remain in place during the event of a fire and not expose the combustible material to the fire, then the "protecting material" and the combustible material needs to be tested as an assembly or system.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: EUGENE-M-15-602.2.1

M88–09/10
602.2.1

Proponent: Marcelo M. Hirschler, GBH International, representing the American Fire Safety Council

Revise as follows:

602.2.1 Materials within plenums. Except as required by Sections 602.2.1.1 through 602.2.1.6, materials within plenums, and the exposed surfaces of the materials of construction of the plenums containing the materials, shall be noncombustible or shall have a flame spread index of not more than 25 and a smoke-developed index of not more than 50 when tested in accordance with ASTM E 84 or UL 723.

Exceptions:

1. Rigid and flexible ducts and connectors shall conform to Section 603.
2. Duct coverings, linings, tape and connectors shall conform to Sections 603 and 604.
3. This section shall not apply to materials exposed within plenums in one- and two-family dwellings.
4. This section shall not apply to smoke detectors.
5. Combustible materials fully enclosed within continuous noncombustible raceways or enclosures, *approved* gypsum board assemblies or within materials *listed* and *labeled* for such application.

Reason: This code proposal is just clarification. Materials of construction of the plenum need to comply with the requirements to be noncombustible or to have a flame spread index of no more than 25 and a smoke developed index of no more than 50 when tested to ASTM E 84. Plenums cannot be constructed of combustible materials unless they comply with those requirements.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: HIRSCHLER-M-4-602.2.1

M89–09/10
602.2.1, 602.2.1.6

Proponent: Bob Eugene, representing Underwriter Laboratories, Inc.

1. Revise as follows:

602.2.1 Materials within plenums. Except as required by Sections 602.2.1.1through 602.2.1.~~6~~5, materials within plenums shall be noncombustible or shall be listed and labeled as having ~~have~~ a flame spread index of not more than 25 and a smoke-developed index of not more than 50 when tested in accordance with ASTM E 84 or UL 723.

Exceptions:

1. Rigid and flexible ducts and connectors shall conform to Section 603.
2. Duct coverings, linings, tape and connectors shall conform to Sections 603 and 604.
3. This section shall not apply to materials exposed within plenums in one- and two-family dwellings.
4. This section shall not apply to smoke detectors.
5. Combustible materials fully enclosed within continuous noncombustible raceways or enclosures, approved gypsum board assemblies or within materials listed and labeled for such application.
6. Materials in Group H, Division 5 fabrication areas and the areas above and below the fabrication area that share a common air recirculation path with the fabrication area.

2. Delete without substitution:

~~**602.2.1.6 Semiconductor fabrication areas.** Group H, Division 5 fabrication areas and the areas above and below the fabrication area that share a common air recirculation path with the fabrication area shall not be subject to the provisions of Section 602.2.1~~.

Reason: Section 602.2.1.6 is an exception to Section 602.2.1. The issue of what materials are considered acceptable for exposure in a plenum is a life safety issue. Other combustible products in the plenum, such as wiring, fire sprinkler piping, pneumatic tubing, and electrical equipment, are required to be listed and labeled. Only listing and labeling of a product can verify that the product installed at a jobsite is composed of the same material originally tested.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: EUGENE-M-3-602.2.1

M90–09/10
602.2.1, 602.2.1.7 (New)

Proponent: Michael Cudahy, Plastic Pipe and Fittings Association (PPFA)

1. Revise as follows:

602.2.1 Materials within plenums. Except as required by Sections 602.2.1.1 through 602.2.1.~~6~~7, materials within plenums shall be noncombustible or shall have a flame spread index of not more than 25 and a smoke-developed index of not more than 50 when tested in accordance with ASTM E 84 or UL 723.

Exceptions:

1. Rigid and flexible ducts and connectors shall conform to Section 603.
2. Duct coverings, linings, tape and connectors shall conform to Sections 603 and 604.
3. This section shall not apply to materials exposed within plenums in one- and two-family dwellings.
4. This section shall not apply to smoke detectors.
5. Combustible materials fully enclosed within continuous noncombustible raceways or enclosures, *approved* gypsum board assemblies or within materials *listed* and *labeled* for such application.

2. Add new text as follows:

602.2.1.7 Plastic plumbing pipe. Plastic drain, waste and vent piping exposed within a plenum shall comply with one or more of the following requirements:

1. The piping shall have a peak optical density not greater than 0.50, an average optical density not greater than 0.15, and a flame spread of not greater than 5 feet (1524 mm) when tested in accordance with UL 1887.
2. The piping shall have a flame spread index of not more than 25 and a smoke-developed index of not more than 50 when tested in accordance with ASTM E 84 or UL 723.

Reason: As many have noted, the current version of ASTM E-84, while having been used to evaluate plastic pipe fire related properties for use in plenums, is not an ideal test method for this use. Amongst the reasons for this are the contents of the current version of the E-84 standard which is vague as to mounting methods and other test conditions for evaluating such pipe. For that reason, UL 1887, an existing test method based on technology which has been evaluated with considerable scrutiny and was developed to test and rate combustible fire sprinkler piping systems for use in plenum spaces is recommended in this case by PPFA.

With regard to enhancing the ASTM E-84 language, the ASTM E-5 committee is currently voting on changes to the current standard which will clarify mounting methods for plastic pipe materials in the tunnel making its results more comparable between materials and from material to material within a generic group. PPFA is also supporting development of new text for the E-84 standard referring and recommending that flamespread properties of plastic pipe for plenum applications be tested according to UL – 1887. UL has been consulted on the proposed change and does not oppose it. UL 1887 is already referenced in the IMC and is not a new standard.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: CUDAHY-M-2-602.2.1

M91–09/10
602.2.1.1, Chapter 15

Proponent: Marcelo M. Hirschler, GBH International, representing the American Fire Safety Council

1. Delete and substitute as follows:

602.2.1.1 Wiring. ~~Combustible electrical or electronic wiring methods and materials, optical fiber cable, and optical fiber raceway exposed within a *plenum* shall have a peak optical density not greater than 0.50, an average optical density not greater than 0.15, and a flame spread not greater than 5 feet (1524 mm) when tested in accordance with NFPA 262. Only type OFNP (*plenum* rated nonconductive optical fiber cable) shall be installed in plenum-rated optical fiber raceways. Wiring, cable, and raceways addressed in this section shall be *listed* and *labeled* as *plenum* rated and shall be installed in accordance with NFPA 70.~~ Combustible electrical wires and cables and optical fiber cables exposed within a plenum shall be listed as having a maximum peak optical density of 0.50 or less, an average optical density of 0.15 or less, and a maximum flame spread distance of 5 feet (1524 mm) or less when tested in accordance with NFPA 262 or shall be installed in metal raceways or metal sheathed cable. Combustible optical fiber and communication raceways exposed within a plenum shall be listed as having a maximum peak optical density of 0.5 or less, an average optical density of 0.15 or less, and a maximum flame spread distance of 5 feet (1524 mm) or less when tested in accordance with ANSI/UL 2024. Only plenum-rated wires and cables shall be installed in plenum-rated raceways. Electrical wires and cables, optical fiber cables and raceways addressed in this section shall be listed and labeled and shall be installed in accordance with NFPA 70.

2. Add new standards as follows:

ANSI/UL 2024	Standard for Safety Optical-Fiber and Communications Cable Raceway
UL 2424	Outline of Investigation for Cable Marked Limited Combustible

Reason: This section needs some clarifications. The clarifications are based on the latest (2009) edition of NFPA 90A, Standard for the Installation of Air-Conditioning and Ventilating Systems, (which governs requirements for wiring in plenums in the NEC) and the requirements of NFPA 70 (NEC).

Combustible wires and cables in plenums (both electrical, optical fiber and mixed ones) must meet NFPA 262, with the pass/fail criteria of 0.50 maximum optical density, 0.50 average optical density and 5 ft maximum flame spread distance. Combustible raceways must meet UL 2024, with the same pass/fail criteria. Any plenum-rated wires and cables are permitted to be installed in plenum-rated raceways.

There is a general recognition that wires and cables marked limited combustible in accordance with UL Subject 2424, Outline of Investigation for Cable Marked Limited Combustible, will meet the requirements of wires and cables tested to NFPA 262 with the pass/fail criteria above. Therefore NFPA 90A has a provision in the annex that cables that meet UL 2424 can be used when cables that meet NFPA 262 with the pass/fail criteria above are called for. I interpret the ICC criteria on referenced standards as making UL Subject 2424, Outline of Investigation for Cable Marked Limited Combustible, a document not in compliance with the policy. For that reason, UL 2424 is not being added. If the committee believes that this can be added, for consistency with NFPA 90A, the proposal can be accepted as amended by adding the exception shown below.

Exception: Electrical wires and cables and optical fiber cables listed to UL Subject 2424, Outline of Investigation for Cable Marked Limited Combustible, are considered to be suitable for use wherever cables tested in accordance with NFPA 262 are required.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: Review of proposed new standards , UL 2024 and UL 2424, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

Public Hearing:				
Committee:	AS	AM	D	
Assembly:	ASF	AMF	DF	

ICCFILENAME: HIRSCHLER-M-1-602.2.1.1

M92–09/10
602.2.1.1

Proponent: J. Philip Simmons, representing National Armored Cable Manufacturers Association

Revise as follows:

602.2.1.1 Wiring. Combustible electrical or electronic wiring methods and materials, optical fiber cable, and optical fiber raceway exposed within a plenum shall have a peak optical density not greater than 0.50, an average optical density not greater than 0.15, and a flame spread not greater than 5 feet (1524 mm) when tested in accordance with NFPA 262. Only type OFNP (plenum rated nonconductive optical fiber cable) shall be installed in plenum-rated optical fiber raceways. Wiring, cable, and raceways addressed in this section shall be listed and labeled as plenum rated and shall be installed in accordance with NFPA 70. This section shall not apply to Type MC and Type AC cables without nonmetallic jackets.

Reason: The present text excludes a common wiring method recognized by the NEC and by the NFPA 90A Standard for Installation of Air-Conditioning and Ventilation Systems. The NEC has permitted the use of metal sheathed cables for power uses in ceiling cavity and raised floor plenums for over 30 years. NFPA 90A Section 4.3.11.2.6.1 also recognizes the use of metal sheath cable in ceiling cavity and raised floor plenums. Type MC and AC cables are installed and used in accordance with the National Electrical Code in defined quantities and for specific electrical power and lighting applications. They are not subject to technology upgrades, they are not typically abandoned, and there is no proliferation or accumulation of Type MC and AC cables in these spaces. The technical paper being provided to the committee in support of the proposal presents statistical data from NFPA indicating that Type MC and AC cable in concealed spaces are not responsible for any significant amount of fire losses. This conclusion is based on the statistics for a 24 year period showing that less than 1% of roof and floor concealed space fires involved the ignition of fixed wiring and a total of 7 fatalities and 31 injuries attributed to concealed space cable fires during the 24 year period. The NEC has permitted the use of metal sheathed cables for power uses in ceiling cavity and raised floor plenums for over 25 years. The statistics presented show that not only is there no significant amount of fire losses but that during the period of the study a three fold increase in installed metal sheathed cable was not accompanied by an increase in fire fatalities.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: SIMMONS-M-1-602.2.1.1

M93–09/10
602.2.1.2

Proponent: Michael Cudahy, Plastic Pipe and Fittings Association (PPFA)

Revise as follows:

602.2.1.2 Fire sprinkler and water distribution piping. Plastic fire sprinkler piping and water distribution piping exposed within a *plenum* shall comply with one or more of the following requirements: ~~be used only in wet pipe systems and shall have a peak optical density not greater than 0.50, an average optical density not greater than 0.15, and a flame spread of not greater than 5 feet (1524 mm) when tested in accordance with UL 1887. Piping shall be *listed* and *labeled*.~~

1. The piping shall have a peak optical density not greater than 0.50, an average optical density not greater than 0.15, and a flame spread of not greater than 5 feet (1524 mm) when tested in accordance with UL 1887.
2. The piping shall have a flame spread index of not more than 25 and a smoke-developed index of not more than 50 when tested in accordance with ASTM E 84 or UL 723.

Plastic fire sprinkler piping shall be listed and labeled. Plastic fire sprinkler piping exposed within a plenum shall be used only in wet pipe systems.

Reason: As many have noted, the current version of ASTM E-84, while having been used to evaluate plastic pipe fire related properties for use in plenums, is not an ideal test method for this use. This change addresses that situation and also extends the use of the test methods to other plastic piping materials that are currently being used in plenum spaces.

Amongst the reasons that ASTM E-84 has been criticized as a means to assess the fire performance of plastic pipe for plenum applications are the contents of the current version of the E-84 standard which are vague as to pipe mounting methods and amount of pipe exposed as well as other test conditions for evaluating plastic pipe. For that reason, UL 1887, an existing test method based on technology which has been evaluated with considerable scrutiny and was developed to test and rate combustible fire sprinkler piping systems for use in plenum spaces is recommended in this case by PPFA.

With regard to enhancing the ASTM E-84 language, the ASTM E-5 committee is currently voting on changes to the current standard which will clarify mounting methods for plastic pipe materials in the tunnel making its results more comparable between materials and from material to material within a generic group. PPFA is also supporting development of new text for the E-84 standard referring and recommending that flamespread properties of plastic pipe for plenum applications be tested according to UL – 1887. UL has been consulted on the proposed change and does not oppose it. UL 1887 is already referenced in the IMC and is not a new standard.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: CUDAHY-M-3-602.2.1

M94–09/10
602.2.1.5, 602.2.1.5.1, 602.2.1.5.2, 602.2.1.5.3

Proponent: Jesse Beitel, Hughes Associates, Inc.

Revise as follows:

602.2.1.5 Foam plastic insulation. Foam plastic insulation used as wall or ceiling finish in plenums shall ~~exhibit a flame spread index of 75 or less and a smoke-developed index of 450 or less when tested in accordance with ASTM E 84 or UL 723 and shall also~~ comply with one or more of Sections 602.2.1.5.1, 602.2.1.5.2 ~~or~~ and 602.2.1.5.3.

602.2.1.5.1 Separation required. The foam plastic insulation shall be separated from the plenum by a thermal barrier complying with Section 2603.4 of the *International Building Code*~~.~~ and shall exhibit a flame spread index of 75 or less and a smoke-developed index of 450 or less when tested in accordance with ASTM E 84 or UL 723 at the thickness and density intended for use.

602.2.1.5.2 Approval. The foam plastic insulation shall exhibit a flame spread index of 25 or less and a smoke-developed index of 50 or less when tested in accordance with ASTM E 84 or UL 723 at the thickness and density intended for use and shall be tested in accordance with and meet the criteria of Section 803.1.2 of the *International Building Code*. ~~shall be approved based on tests conducted in accordance with Section 2603.9 of the International Building Code.~~

602.2.1.5.3 Covering. The foam plastic insulation shall be covered by corrosion-resistant steel having a base metal thickness of not less than 0.0160 inch (0.4 mm) and shall exhibit a flame spread index of 75 or less and a smoke-developed index of 450 or less when tested in accordance with ASTM E 84 or UL 723 at the thickness and density intended for use.

Reason: This code proposal revises the requirements for use of foam plastics in plenums. The intent of the IMC has been to require that all materials used in plenums shall be noncombustible or exhibit a flame spread index of 25 or less and a smoke-developed index of 50. The same criteria should also be applied to foam plastics used as wall or ceiling finish in plenums. This proposal requires that if the foam plastic is left unprotected then it shall exhibit a flame spread index of 25 or less and a smoke-developed index of 50 and meet the requirements of a full-scale fire test (NFPA 286). Additionally, several alternatives are provided to protect foam plastics and thus allow them to have a greater flame spread index and smoke-developed index.

Cost Impact: The code change proposal will increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: BEITEL-M-1-602.2.1.5

M95–09/10
602.2.1.5, 602.2.1.5.1, 602.2.1.5.2, 602.2.1.5.3

Proponent: Marcelo M. Hirschler, GBH International, representing the American Fire Safety Council

Revise as follows:

602.2.1.5 Foam plastic insulation. Foam plastic insulation used as interior wall or ceiling finish, or as interior trim, in plenums shall exhibit a flame spread index of 75 or less and a smoke-developed index of 450 or less when tested in accordance with ASTM E 84 or UL 723 and shall also comply with one or more of the following Sections: 602.2.1.5.1, 602.2.1.5.2 or 602.2.1.5.3.

602.2.1.5.1 Separation required. The foam plastic insulation shall be separated from the plenum by a thermal barrier complying with Section 2603.4 of the International Building Code. and shall exhibit a flame spread index of 75 or less and a smoke developed index of 450 or less when tested in accordance with ASTM E 84 or UL 723 at the thickness and density intended for use.

602.2.1.5.2 Approval. The foam plastic insulation shall exhibit a flame spread index of 25 or less and a smoke developed index of 50 or less when tested in accordance with ASTM E 84 or UL 723 at the thickness and density intended for use and shall meet the acceptance criteria of Section 803.1.2 of the *International Building Code* when tested in accordance with NFPA 286.

The foam plastic insulation shall be approved based on tests conducted in accordance with Section 2603.9 of the *International Building Code*.

602.2.1.5.3 Covering. The foam plastic insulation shall be covered by corrosion-resistant steel having a base metal thickness of not less than 0.0160 inch (0.4 mm) and shall exhibit a flame spread index of 75 or less and a smoke developed index of 450 or less when tested in accordance with ASTM E 84 or UL 723 at the thickness and density intended for use.

Reason: This code proposal revises the requirements for use of foam plastic insulation as interior wall and ceiling finish or as interior trim in plenums. The IBC and IMC requirements for materials in plenums has always been that they be noncombustible or exhibit a flame spread index of 25 or less and a smoke developed index of 50 when tested to ASTM E 84. As presently written there is some confusion because the foam plastic insulation could be approved based on tests using any of the standards from 2603.9 (and only NFPA 286 has pass/fail criteria for smoke). This proposal requires that exposed foam plastic insulation (i.e. foam plastic left unprotected), whether used as interior finish or as interior trim, shall exhibit a flame spread index of 25 or less and a smoke developed index of 50 and meet the requirements of the full scale room-corner fire test (NFPA 286) with requirements for flame spread, heat release, no flashover and smoke release. Additionally, two alternatives continue to be provided to protect foam plastics and thus allow them even when they have a higher flame spread index and smoke developed index, namely a thermal barrier and a corrosion-resistant steel barrier. This is also consistent with the requirements of NFPA 90A, which has the same requirements for foam plastic insulation used as interior finish in plenums.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: HIRSCHLER-M-3-602.2.1.5

M96–09/10
602.2.1.7 (New)

Proponent: Bob Eugene, Underwriters Laboratories, Inc.

Add new text as follows:

602.2.1.7 Plumbing and mechanical equipment in plenums. Where discrete plumbing and mechanical equipment, appurtenances and appliances are located in a plenum and have exposed combustible material, they shall be listed and labeled for such use in accordance with UL 2043.

Reason: There are combustible plumbing and mechanical equipment, such as plumbing appurtenances, pipe and duct supports, grilles and registers that are used in plenums, that cannot be effectively tested in accordance with standards ASTM E84 or UL 723. The UL 2043 standard was developed to test products and materials not able to be tested in accordance with ASTM E84 or UL 723, and is currently adopted by reference in Section 602.2.1.4.2. These products are individual distinct pieces and non-continuous (i.e. “discrete”).
This proposal was presented last cycle and the Committee had questions about the term “discrete’. Per the dictionary, ‘discrete’ refers to products that are non-continuous, individual distinct pieces, as compared to non-discrete products such as cable or plastic pipe.
If adopted this proposal will provide consistency in how the ICC codes treat discrete components in plenums.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: EUGENE-M-11-602.2.1.7

M97–09/10
602.3; IRC M1601.1.1

Proponent: Mark Riley, City of Troy, MI, representing City of Troy and Mechanical Inspectors Association of Michigan

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IMC COMMITTEE. PART II WILL BE HEARD BY THE IRC MECHANICAL COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IMC

Revise as follows:

602.3 Stud cavity and joist space plenums. Stud wall cavities and the spaces between solid floor joists to be utilized as air plenums shall comply with the following conditions:

1. Such cavities or spaces shall not be utilized as a plenum for supply air.
2. Such cavities or spaces shall not be part of a required fire-resistance-rated assembly.

3. Stud wall cavities shall not convey air from more than one floor level.
4. Stud wall cavities and joist space plenums shall comply with the floor penetration protection requirements of the *International Building Code*.
5. Studwall cavities and joist space plenums shall be isolated from adjacent concealed spaces by approved fireblocking as required in the *International Building Code*.
6. Studwall cavities in outside walls of the building envelope shall not be utilized as air plenums.

PART II – IRC MECHANICAL

Revise as follows:

M1601.1.1 Above-ground duct systems. Above-ground *duct systems* shall conform to the following:

1. *Equipment* connected to *duct systems* shall be designed to limit discharge air temperature to a maximum of 250°F (121°C).
2. Factory-made air ducts shall be constructed of Class 0 or Class 1 materials as designated in Table M1601.1.1(1).
3. Fibrous duct construction shall conform to the SMACNA *Fibrous Glass Duct Construction Standards* or NAIMA *Fibrous Glass Duct Construction Standards*.
4. Minimum thickness of metal duct material shall be as listed in Table M1601.1.1(2). Galvanized steel shall conform to ASTM A 653.
5. Use of gypsum products to construct return air ducts or plenums is permitted, provided that the air temperature does not exceed 125°F (52°C) and exposed surfaces are not subject to condensation.
6. *Duct systems* shall be constructed of materials having a flame spread index not greater than 200.
7. Stud wall cavities and the spaces between solid floor joists to be used as air plenums shall comply with the following conditions:
   7.1. These cavities or spaces shall not be used as a plenum for supply air.
   7.2. These cavities or spaces shall not be part of a required fire-resistance-rated assembly.
   7.3. Stud wall cavities shall not convey air from more than one floor level.
   7.4. Stud wall cavities and joist-space plenums shall be isolated from adjacent concealed spaces by tight-fitting fire blocking in accordance with Section R602.8.
   7.5. Stud wall cavities in the outside walls of building envelope assemblies shall not be utilized as air plenums.

Reason: Using exterior walls for stud cavity for return air will cause several major problems in a duct system. The major concern is that it is very difficult if not impossible to seal the stud wall cavities to prevent outside air from infiltrating, which will put additional heating or cooling loads on the HVAC system.

It can also cause comfort and air quality problems, by bringing in contaminants, hot or cold air from outside into the wall stud space, and into the house.

If the installer has to run return air on an outside wall it can easily be done in sheet metal duct.

Cost Impact: The code change proposal may cause an increase in the cost of construction.

PART I – IMC

Table 603.4; IRC Table M1601.1.1(2)

Proponent: Wesley R. Davis, Air Conditioning Contractors of America

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IMC COMMITTEE. PART II WILL BE HEARD BY THE IRC MECHANICAL COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IMC

Revise table as follows:

TABLE 603.4
DUCT CONSTRUCTION MINIMUM SHEET METAL THICKNESSES FOR SINGLE DWELLING UNITS

DUCT SIZE	GALVANIZED		ALUMINUM
	Minimum thickness (in.)	Equivalent galvanized gage no.	MINIMUM THICKNESS (in.)
Round ducts and enclosed rectangular ducts			
14 inches or less	0.013 ~~0.0157~~	30 ~~28~~	~~0.0175~~
16 and 18 inches	0.0187	26	0.018
20 inches and over	0.0236	24	0.023
Exposed rectangular ducts			
14 inches or less	0.0157	28	0.0175
Over 14 inches[a]	0.0187	26	0.018

For SI: 1 inch = 25.4 mm, 1 inch water gage = 249 Pa.

a. For duct gages and reinforcement requirements at static pressures of 1/2-inch, 1-inch and 2-inch w.g., SMACNA *HVAC Duct Construction Standards*, Tables 2-1, 2-2 and 2-3, shall apply.

PART II – IRC MECHANICAL

Revise table as follows:

TABLE M1601.1.1(2)
GAGES OF METAL DUCTS AND PLENUMS USED FOR HEATING OR COOLING

DUCT SIZE	MINIMUM THICKNESS inches and (mm)	EQUIVALENT GALVANIZED SHEET NO.	MINIMUM THICKNESS (in.)
Round ducts and enclosed rectangular ducts 14 inches or less	0.013 ~~0.0157 (0.3950 mm)~~	30 ~~28~~	~~0.0175~~
16 and 18 inches	0.0187 (0.4712 mm)	26	0.018
20 inches and over	0.0236 (0.6010 mm)	24	0.023
Exposed rectangular ducts 14 inches or Over 14[a] inches	0.0157 (0.3950 mm)	28	0.0175
	0.0187 (0.4712 mm)	26	0.018

For SI: 1 inch = 25.4 mm.

a. For duct gages and reinforcement requirements at static pressures of 1/2 inch, 1 inch and 2 inches w.g., SMACNA *Duct Construction Standard*, Tables 2-1; 2-2 and 2-3 shall apply.

Reason: This unnecessary cost increase offers no justified benefit. 30 gage pipe is as structurally sound as a flexible duct and more durable. The code was modified with no substantiation.

Cost Impact: The code change proposal will not increase the cost of construction.

PART I – IMC

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

PART II – IRC MECHANICAL

M99–09/10
603.5

Proponent: Bob Eugene, Underwriters Laboratories, Inc.

Revise as follows:

603.5 Nonmetallic ducts. Nonmetallic ducts shall be constructed with Class 0 or Class 1 duct material and shall comply ~~in accordance~~ with UL 181. Fibrous duct construction shall conform to the SMACNA *Fibrous Glass Duct Construction Standards* or NAIMA *Fibrous Glass Duct Construction Standards.* The maximum air temperature within nonmetallic ducts shall not exceed 250ºF (121ºC).

Reason: UL 181 is a testing standard, not a construction standard.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: EUGENE-M-8-603.5

M100–09/10
603.5.2 (New)

Proponent: James Karnes, representing Dura Tite Systems, LLC

Add new text as follows:

603.5.2 Nonmetallic duct fittings. Non metallic forced air duct fittings that are considered discrete shall pass testing in accordance with UL 2043.

Reason: Under the current code, duct fittings are not addressed. It is assumed in most jurisdictions that a fitting is part of the duct system, and therefore nonmetallic fittings should be addressed under section 603.5 Nonmetallic Ducts. Section 603.5 states requirements for nonmetallic ducts to be constructed with Class 0 or Class 1 material as tested under UL 723 using ASTM E-84 method. This section generally pertains to duct board products, and are considered continuous building products. Fittings are not addressed, and cannot be tested using UL 723 (ASTM E-84) due to the size limitations of the test chamber. Discrete products can be alternately tested using UL2043.

Discrete is identified as a non-continuous building product, and the definition has been accepted by the IMC in the past for electrical products such as speaker boxes. The UL 2043 utilizes a test chamber that is 24 inches cubed. UL 2043 is the alternate test method to UL 723, for discrete products.

This new sub-section will address nonmetallic fittings and clarify the standards for compliance within the code.

Toxicity of smoke is not tested for under UL 2043, nor under any other test method used in the codes. Toxicity of smoke is not a required test for any building product.

This section does not address plumbing fittings, which are generally solvent welded together, creating a continuous building product.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: KARNES-M-1-603.5.2

M101–09/10
603.7

Proponent: Guy McMann, Jefferson County, CO, representing the Colorado Association of Plumbing and Mechanical Officials (CAPMO)

Revise as follows:

603.7 Rigid duct penetrations. Duct system penetrations of walls, floors, ceilings and roofs and air transfer openings in such building components shall be protected as required by Section 607~~. Ducts in a private garage and ducts~~ Ducts that penetrate~~ing the~~ a wall~~s~~ or ceiling~~s~~ that ~~separating~~ separates a dwelling from a private garage shall be continuous, ~~and~~ shall be constructed of sheet steel having a minimum thickness of ~~26 gage~~ 0.0187 inch (0.4712 mm)

(No.26 Gage) ~~galvanized sheet metal~~ and shall have no openings into the garage. Fire and smoke dampers are not required in such ducts passing through the wall or ceiling separating a dwelling from a private garage except where required by Chapter 7 of the *International Building Code*.

Reason: As currently written, this section literally says that there cannot be openings in any ducts that are located in a private garage, even those that do not penetrate walls or ceilings. Ducts that serve only the garage and do not pass through separation walls or ceilings need not be restricted to 26 gage and, of course, must have openings in order to serve their purpose. This is a simple fix that eliminates some unintended language.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: MCMANN-M-32-603.7

M102–09/10
603.7 (New); IRC M1601.1.2 (New)

Proponent: Guy Tomberlin, Fairfax County, VA, representing the Virginia Plumbing and Mechanical Inspectors/Virginia Building and Code Officials

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IMC COMMITTEE. PART II WILL BE HEARD BY THE IRC MECHANICAL COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IMC

Add new text as follows:

603.7 Above ground plastic ducts. Plastic ducts and fittings not listed in compliance with UL 181 shall be prohibited above grade.

PART II – IRC MECHANICAL

Add new text as follows:

M1601.1.2 Prohibited ducts. Plastic ducts and fittings not listed as in compliance with UL 181 shall be prohibited above grade.

Reason: (**PART I**) Current code fails to say anything about the use of plastic ducts and fittings above grade. Section 603.8 is titled "underground ducts" and that's the only place that references an approved installation for plastic duct. Unfortunately, some believe that since they are not strictly prohibited they must be permitted, even absent code guidance for the installation. Until such time as industry comes out with an accepted standard and installation criteria similar to what is required for plumbing piping and fittings, the mechanical code needs to take a position on the use of the material.

(**PART II**) Current code fails to say anything about the use of plastic ducts and fittings above grade. The only reference is existing Section 1601.1.2 titled "underground ducts," and that's the only place that references an approved installation for plastic duct. Unfortunately, some believe that since they are not strictly prohibited they must be permitted, even absent code guidance for the installation. Until such time as industry comes out with an accepted standard and installation criteria similar to what is required for plumbing piping and fittings, the mechanical code needs to take a position on the use of the material.

Cost Impact: The code change proposal will not increase the cost of construction.

M103–09/10
603.8; IRC M1601.1.2

Proponent: Larry J. Larson, representing Wheeling Service and Supply, Inc.

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IMC COMMITTEE. PART II WILL BE HEARD BY THE IRC MECHANICAL COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IMC

Revise as follows:

603.8 Underground ducts. Ducts shall be *approved* for underground installation. Metallic ducts not having an *approved* protective coating shall be completely encased in a minimum of 2 inches (51 mm) of concrete.

Factory-built PVC-coated metallic ducts constructed of hot dipped galvanized steel with a minimum coating weight of G-60 and with an exterior coating not less than 4 mils thick, shall not be required to be encased in concrete. The interior coating for PVC-coated ducts conveying corrosive fumes shall be not less than 4 mils thick. For PVC-coated ducts conveying non-corrosive fumes the interior coating shall be epoxy not less than 0.15 mils thick. PVC-coated ducts with diameters of 14 inches or larger shall be corrugated for additional strength. PVC-coated ducts shall be spirally wound with a continuous spiral lock seam joint. PVC-coated ducts shall be identified with the manufacturer's name, product name, and maximum rated positive and negative pressures. Fittings, sleeves, and connectors used with PVC-coated ducts shall be manufactured from the same material as the ducts.

PART II – IRC MECHANICAL

Revise as follows:

M1601.1.2 Underground duct systems. Underground *duct systems* shall be constructed of *approved* concrete, clay, metal or plastic. The maximum duct temperature for plastic ducts shall not be greater than 150°F (66°C). Metal ducts shall be protected from corrosion in an *approved* manner or shall be completely encased in concrete not less than 2 inches (51 mm) thick. Nonmetallic ducts shall be installed in accordance with the manufacturer's installation instructions. Plastic pipe and fitting materials shall conform to cell classification 12454-B of ASTM D 1248 or ASTM D 1784 and external loading properties of ASTM D 2412. All ducts shall slope to an accessible point for drainage. Where encased in concrete, ducts shall be sealed and secured prior to any concrete being poured. Metallic ducts having an *approved* protective coating and nonmetallic ducts shall be installed in accordance with the manufacturer's installation instructions.

Factory-built PVC-coated metallic ducts constructed of hot dipped galvanized steel with a minimum coating weight of G-60 and with an exterior coating not less than 4 mils thick, shall not be required to be encased in concrete. The interior coating for PVC-coated ducts conveying corrosive fumes shall be not less than 4 mils thick. For PVC-coated ducts conveying non-corrosive fumes the interior coating shall be epoxy not less than 0.15 mils thick. PVC-coated ducts with diameters of 14 inches or larger shall be corrugated for additional strength. PVC-coated ducts shall be spirally wound with a continuous spiral lock seam joint. PVC-coated ducts shall be identified with the manufacturer's name, product name, and maximum rated positive and negative pressures. Fittings, sleeves, and connectors used with PVC-coated ducts shall be manufactured from the same material as the ducts.

Reason: The purpose of this change is to clarify the code. Polyvinyl coated ducts have been used for underground installations for more than 40 years without concrete encasement. Solid PVC ducts and fittings are approved under 603.8.3. Metallic ducts with PVC fused to galvanized steel should also be accepted but without the need of concrete encasement. This change in the code would specify a metallic duct with an approved protective coating.

Cost Impact: The code change proposal will not increase the cost of construction.

PART I – IMC

Public Hearing:	Committee:	AS	AM	D

M104–09/10
603.8.4 (New)

Proponent: Eli P. Howard, III, Sheet Metal and Air Conditioning Contractors National Association, Inc.

Add new text as follows:

603.8.4 Metal Ducts and fittings. Metal ducts and fittings made from the following materials are allowed for underground applications: Vinyl chloride coated steel (PVC, PVS) with a minimum thickness of 4 mils on the surface in contact with the soil or fill material, aluminized steel, stainless steel and FRP.

Reason: These types of materials have been used for years for underground ductwork and other underground applications such as culvert piping. SMACNA produces standards in HVAC, PVC and FRP for the construction and installation of these materials.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: HOWARD-M-5-603.8.4

M105 –09/10
603.9; IRC M1601.4.1

Proponent: Bob Eugene, Underwriters Laboratories, Inc.

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IMC COMMITTEE. PART II WILL BE HEARD BY THE IRC MECHANICAL COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IMC

Revise as follows:

603.9 Joints, seams and connections. All longitudal and transverse joints, seams and connections in metallic and nonmetallic ducts shall be constructed as specified in SMACNA HVAC *Duct Construction Standards — Metal and Flexible* and NAIMA *Fibrous Glass Duct Construction Standards* . All joints, longitudinal and transverse seams, and connections in ductwork shall be securely fastened and sealed with welds, gaskets, mastics (adhesives), mastic-plus-embedded-fabric systems, liquid sealants or tapes. Closure systems used to seal ductwork listed and labeled in accordance with UL 181A shall be marked "181A-P" for pressure-sensitive tape, "181 A-M" for mastic or "181 A-H" for heat-sensitive tape. Closure systems used to seal flexible air ducts and flexible air connectors shall comply with UL 181B and shall be marked "181B-FX" for pressure-sensitive tape or "181B-M" for mastic. Duct connections to flanges of air distribution system equipment shall be sealed and mechanically fastened. Mechanical fasteners for use with flexible nonmetallic air ducts shall comply with UL 181B and shall be marked "181B-C". Closure systems used to seal metal ductwork shall be installed in accordance with the manufacturer's installation instructions. Unlisted duct tape is not permitted as a sealant on any ~~metal~~ duct~~s~~.

> **Exception**: Continuously welded and locking-type longitudinal joints and seams in ducts operating at static pressures less than 2 inches of water column (500 Pa) pressure classification shall not require additional closure systems.

PART II – IRC MECHANICAL

Revise as follows:

M1601.4.1 Joints and seams. Joints of *duct systems* shall be made substantially airtight by means of tapes, mastics, liquid sealants, gasketing or other *approved* closure systems. Closure systems used with rigid fibrous glass ducts shall comply with UL181A and shall be marked 181A-P for pressure-sensitive tape, 181A-M for mastic or 181 A-H for heat-sensitive tape. Closure systems used with flexible air ducts and flexible air connectors shall comply with UL 181B and shall be marked 181B-FX for pressure-sensitive tape or 181B-M for mastic. Duct connections to flanges of air distribution system *equipment* or sheet metal fittings shall be mechanically fastened. Mechanical fasteners for use with flexible nonmetallic air ducts shall comply with UL 181B and shall be marked 181B-C. Crimp joints for round metal ducts shall have a contact lap of at least 11/2 inches (38 mm) and shall be mechanically fastened by means of at least three sheet-metal screws or rivets equally spaced around the joint. Closure systems used to seal metal ductwork shall be installed in accordance with the manufacturer's installation instructions. Unlisted duct tape is not permitted as a sealant on any duct.

Exceptions:

1. Spray polyurethane foam shall be permitted to be applied without additional joint seals.
2. Where a duct connection is made that is partially inaccessible, three screws or rivets shall be equally spaced on the exposed portion of the joint so as to prevent a hinge effect.
3. Continuously welded and locking type longitudinal joints and seams in ducts operating at static pressures less than 2 inches of water column (500 Pa) pressure classification shall not require additional closure systems.

Reason: Unlisted duct tape should not be permitted as a sealant on any metallic or nonmetallic duct.

Cost Impact: The code change proposal will not increase the cost of construction.

PART I – IMC

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

PART II – IRC MECHANICAL

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: EUGENE-M-12-603.9-RM-M1601.4.1

M106–09/10
603.10

Proponent: Guy McMann, Jefferson County, CO, representing the Colorado Association of Plumbing and Mechanical Officials (CAPMO)

Delete and substitute as follows:

~~**603.10 Supports.** Ducts shall be supported with approved hangers at intervals not exceeding 10 feet (3048 mm) or by other approved duct support systems designed in accordance with the International Building Code. Flexible and other factory-made ducts shall be supported in accordance with the manufacturer's installation instructions~~.

603.10 Supports. Ducts shall be supported in accordance with Chapter 5 of the SMACNA HVAC Duct Construction Standards- Metal and Flexible or by other approved supporting systems. Flexible and other factory-made ducts shall be supported in accordance with the manufacturer's installation instructions.

Reason: The SMACNA Standard permits some sizes to be supported at intervals greater than 10 feet such as 4 inch. The IBC does not govern how ducts are to be supported, that's between the IMC and SMACNA. The code official can approve any engineered system with proper back-up.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: MCMANN-M-37-603.10

M107–09/10
603.14

Proponent: Jonathan C. Siu, City of Seattle, WA, Seattle Department of Planning & Development

Revise as follows:

603.14 Location. Ducts shall not be installed in or within 4 inches (102 mm) of the earth, except where such ducts comply with Section 603.8. Duct installations shall comply with the headroom requirements specified in the *International Building Code*.

Reason: The International Mechanical Code regulates ducts but is silent on the requirement to maintain minimum ceiling heights. This proposal adds a cross-reference to help ensure designs are compatible with the requirements of the International Building Code.

In our experience, this is mainly an issue in parking garages, where ducts may be installed across driving or walking aisles, without regard to the ceiling height requirements. As such, the proposal could be revised to more narrowly apply just to parking garages ("Duct installations in parking garages shall comply…"), but if that is done, it may imply that headroom requirements need not be met for occupied areas of a building.

Note that part of the problem may be the result of design sequencing—the building shell may be fully designed and actually under construction before the mechanical designer/contractor is brought on board. At that point, the ceiling heights have already been determined, and it may be difficult for the mechanical designer to work around them, if he/she is even aware of the requirements. While this proposal will not fix that issue, it will alert the mechanical designer that it is an issue that will need to be addressed.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: SIU-M-2-603.14

M108–09/10
603.17.3 (New), Chapter 15

Proponent: Guy Tomberlin, Fairfax County, VA, representing the Virginia Plumbing and Mechanical Inspectors/Virginia Building and Code Officials

1. Add new text as follows:

603.17.Air dispersion systems. Air dispersion systems shall:

1. Be installed entirely in exposed locations.
2. Be utilized in systems under positive pressure.
3. Not pass through or penetrate fire–resistant rated construction.
4. Be listed and labeled in compliance with UL 2518.

2. Add new standard to Chapter 15 as follows:

UL
2518–02 Air Dispersion System Materials

Reason: This system was removed from the 09 IMC because of lack of a Standard reference. Instead of industry coming back with a Standard they let the section be removed from the code. I researched the original proposal from the 07 code development cycle and found the original proposal that included a reference to UL Standard 2518–02. It was removed because the Standard's text failed to meet ICC criteria Section 3.6. Even though, the 07 Supplement still permitted this technology to be installed and many of these systems are installed today and working effectively. My position is if it's out there with no related problems and no standard then why not incorporate the product into the code and utilize the industry standard that is currently in place to specifically address this application? The term is currently defined in Chapter 2 of the 2009 IMC

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: Review of proposed new standard, UL 2518-02, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: TOMBERLIN-M-16-603.17.3

M109–09/10
603.18 (New)

Proponent: Eli P. Howard, III, Sheet Metal and Air Conditioning Contractors National Association, Inc.

Add new text as follows:

603.18 Balancing. Duct systems shall be balanced as specified in SMACNA *HVAC Systems Testing, Adjusting & Balancing*. Such balancing shall verify that the duct system and its branches is capable of supplying the airflow rates required by Section 603.2.

Reason: The current balancing requirements in the IMC does not provide for clearly defined methods or procedures for testing, adjusting, and balancing of HVAC systems. SMACNA's *HVAC Systems Testing, Adjusting & Balancing* manual provides specific methods and procedures—a complete process—that ensures all HVAC systems have been properly adjusted and balanced.

Cost Impact: Using established, time-tested procedures to correctly balance HVAC airflows the first time should have no cost impact.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: HOWARD-M-4-603.18

M110–09/10
[E] 604.2 (New); IRC M1601.4 (New)

Proponent: Guy McMann, Jefferson County, CO, representing the Colorado Association of Plumbing and Mechanical Officials (CAPMO)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IMC COMMITTEE. PART II WILL BE HEARD BY THE IRC MECHANICAL COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IMC

Add new text as follows:

[E] 604.2 Duct and plenum insulation, where required. Supply and return air ducts and plenums shall be insulated with a minimum of R-5 insulation where located in unconditioned spaces and with a minimum of R-8 insulation where located outside of the building. Where located within a building envelope assembly, the duct or plenum shall be separated from the building exterior and unconditioned or exempt spaces by a minimum of R-8 insulation.

Exceptions:

1. Where located within equipment.
2. Where the design temperature difference between the interior and exterior of the duct or plenum does not exceed 15°F (8°C).

PART II – IRC MECHANICAL

Add new text as follows:

M1601.4 Duct and plenum insulation. Supply and return air ducts and plenums shall be insulated with a minimum of R-5 insulation where located in unconditioned spaces and with a minimum of R-8 insulation where located outside of the building. Where located within a building envelope assembly, the duct or plenum shall be separated from the building exterior, unconditioned spaces and exempt spaces by a minimum of R-8 insulation.

Exceptions:

1. Where located within equipment.
2. Where the design temperature difference between the interior and exterior of the duct or plenum does not exceed 15°F (8°C).

Reason: This is last cycles M-82, extracted from IECC Section 503.2.7 and needs to be included here in the IMC. Although this is located in the commercial chapter of the Energy Code, it will still apply to residential construction as well. The duct does not know if it's in a house or a mall. There will be no confusion as to what committee will have the maintenance responsibility as this is a simple extraction. Section 604 tells us everything except where insulation is required. It would be appropriate for inspectors and installers to have this information readily available in this document and not have to locate a second code to come up with the answer. There is no new language here and this added text would make 604 more convenient and complete**.**

Cost Impact: The code change proposal will not increase the cost of construction.

Proponent: Bob Eugene, Underwriters Laboratories, Inc.

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IMC COMMITTEE. PART II WILL BE HEARD BY THE IRC MECHANICAL COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IMC

Revise as follows:

604.3 Coverings and linings. Coverings and linings, including adhesives when used, shall have a flame spread index not more than 25 and a smoke-developed index not more than 50, when tested in accordance with ASTM E 84 or UL 723, using the specimen preparation and mounting procedures of ASTM E 2231. Duct coverings and linings shall not flame, glow, smolder or smoke when tested in accordance with ASTM C 411 at the temperature to which they are exposed in service. The test temperature shall not fall below 250ºF (121ºC). Coverings and linings shall be listed and labeled.

PART II – IRC MECHANICAL

Revise as follows:

M1601.3 Duct insulation materials. Duct insulation materials shall conform to the following requirements:

1. Duct coverings and linings, including adhesives where used, shall have a flame spread index not higher than 25, and a smoke-developed index not over 50 when tested in accordance with ASTM E 84 or UL 723, using ` the specimen preparation and mounting procedures of ASTM E 2231.

   Exception: Spray application of polyurethane foam to the exterior of ducts in *attics* and crawl spaces shall be permitted subject to all of the following:

   1. The flame spread index is not greater than 25 and the smoke-developed index is not greater than 450 at the specified installed thickness.
   2. The foam plastic is protected in accordance with the ignition barrier requirements of Sections R316.5.3 and R316.5.4.
   3. The foam plastic complies with the requirements of Section R316.

2. Duct coverings and linings shall not flame, glow, smolder or smoke when tested in accordance with ASTM C 411 at the temperature to which they are exposed in service. The test temperature shall not fall below 250°F (121°C). Coverings and linings shall be listed and labeled.
3. External duct insulation and factory-insulated flexible ducts shall be legibly printed or identified at intervals not longer than 36 inches (914 mm) with the name of the manufacturer, the thermal resistance *R*-value at the specified installed thickness and the flame spread and smoke-developed indexes of the composite materials. Spray polyurethane foam manufacturers shall provide the same product information and properties, at the nominal installed thickness, to the customer in writing at the time of foam application. All duct insulation product *R*-values shall be based on insulation only, excluding air films, vapor retarders or other duct components, and shall be based on tested C-values at 75°F (24°C) mean temperature at the installed thickness, in accordance with recognized industry procedures. The installed thickness of duct insulation used to determine its *R*-value shall be determined as follows:
   3.1. For duct board, duct liner and factory-made rigid ducts not normally subjected to compression, the nominal insulation thickness shall be used.
   3.2. For ductwrap, the installed thickness shall be assumed to be 75 percent (25-percent compression) of nominal thickness.
   3.3. For factory-made flexible air ducts, The installed thickness shall be determined by dividing the difference between the actual outside diameter and nominal inside diameter by two.
   3.4. For spray polyurethane foam, the aged *R*-value per inch measured in accordance with recognized industry standards shall be provided to the customer in writing at the time of foam application. In addition, the total *R*-value for the nominal application thickness shall be provided.

Reason: Surface burning characteristics of coverings and linings is a life safety issue. Only listing and labeling of a product can verify that the product installed at a jobsite is composed of the same material originally tested.

Cost Impact: The code change proposal will not increase the cost of construction.

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IMC COMMITTEE. PART II WILL BE HEARD BY THE IRC MECHANICAL COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IMC

Add new text as follows:

604.8.1 Liner prohibition. Duct lining insulation material shall be prohibited in ducts and plenums used exclusively for evaporative cooling systems.

PART II – IRC MECHANICAL

Revise as follows:

M1601.3 Duct insulation materials. Duct insulation materials shall conform to the following requirements:

1. Duct coverings and linings, including adhesives where used, shall have a flame spread index not higher than 25, and a smoke-developed index not over 50 when tested in accordance with ASTM E 84 or UL 723, using ` the specimen preparation and mounting procedures of ASTM E 2231.

   Exception: Spray application of polyurethane foam to the exterior of ducts in *attics* and crawl spaces shall be permitted subject to all of the following:

   1. The flame spread index is not greater than 25 and the smoke-developed index is not greater than 450 at the specified installed thickness.
   2. The foam plastic is protected in accordance with the ignition barrier requirements of Sections R316.5.3 and R316.5.4.
   3. The foam plastic complies with the requirements of Section R316.

2. Duct coverings and linings shall not flame, glow, smolder or smoke when tested in accordance with ASTM C 411 at the temperature to which they are exposed in service. The test temperature shall not fall below 250°F (121°C). Duct lining insulation material shall be prohibited in ducts and plenums used exclusively for evaporative cooling systems.
3. External duct insulation and factory-insulated flexible ducts shall be legibly printed or identified at intervals not longer than 36 inches (914 mm) with the name of the manufacturer, the thermal resistance *R*-value at the specified installed thickness and the flame spread and smoke-developed indexes of the composite materials. Spray polyurethane foam manufacturers shall provide the same product information and properties, at the nominal installed thickness, to the customer in writing at the time of foam application. All duct insulation product *R*-values shall be based on insulation only, excluding air films, vapor retarders or other duct

components, and shall be based on tested C-values at 75°F (24°C) mean temperature at the installed thickness, in accordance with recognized industry procedures. The installed thickness of duct insulation used to determine its *R*-value shall be determined as follows:

3.1. For duct board, duct liner and factory-made rigid ducts not normally subjected to compression, the nominal insulation thickness shall be used.

3.2. For ductwrap, the installed thickness shall be assumed to be 75 percent (25-percent compression) of nominal thickness.

3.3. For factory-made flexible air ducts, The installed thickness shall be determined by dividing the difference between the actual outside diameter and nominal inside diameter by two.

3.4. For spray polyurethane foam, the aged *R*-value per inch measured in accordance with recognized industry standards shall be provided to the customer in writing at the time of foam application. In addition, the total *R*-value for the nominal application thickness shall be provided.

Reason: Installing liner in evaporative systems would result in a serious mold condition. This simply states the obvious, that this would not be a best practice.

Cost Impact: The code change proposal will not increase the cost of construction.

PART I – IMC

M113–09/10
606.2.1

Proponent: Robert Adkins, Prince William, VA, representing the VA Plumbing & Mechanical Inspectors Association/VA Building and Code Officials Association

Revise as follows:

606.2.1 Return air systems. Smoke detectors shall be installed in return air systems with a ~~design~~ capacity greater than 2,000 cfm (0.9 m^3/s), in the return air duct or plenum upstream of any filters, exhaust air connections, outdoor air connections, or decontamination equipment and appliances.

Exception: Smoke detectors are not required in the return air system where all portions of the building served by the air distribution system are protected by area smoke detectors connected to a fire alarm system in accordance with the *International Fire Code*. The area smoke detection system shall comply with Section 606.4.

Reason: Most air moving appliances today has variable speed fan motors. If the smoke detectors are necessary @ 2000cfm and the appliance is capable of moving that amount of air, the detector should be installed. A simple wire change could create a non-compliant situation.

Cost Impact: The code change proposal will increase the cost of construction.

M117–09/10
805.3 (New); IRC R1005.7 (New)

Proponent: Guy McMann, Jefferson County, CO, representing the Colorado Association of Plumbing and Mechanical Officials (CAPMO)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IMC COMMITTEE. PART II WILL BE HEARD BY THE IRC MECHANICAL COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IMC

Add new text as follows:

805.3 Factory built chimney offsets. Where a factory-built chimney assembly incorporates offsets, no part of the chimney shall be at an angle of more than 30 degrees from vertical at any point in the assembly and the chimney assembly shall not include more than 4 elbows.

PART II – IRC MECHANICAL

Add new text as follows:

R1005.7 Factory built chimney offsets. Where a factory-built chimney assembly incorporates offsets, no part of the chimney shall be at an angle of more than 30 degrees from vertical at any point in the assembly and the chimney assembly shall not include more than 4 elbows.

Reason: This language comes directly from UL-103, Section 7.8. This is vital information the inspection community needs to properly inspect these installations. Some of the problems in quoting standards is the pertinent information in those standards are not printed in the code. Inspectors don't carry around UL-103 and as a result, would not have any clue that these requirements even exist, resulting in approving an installation incorrectly.

Cost Impact: The code change proposal will not increase the cost of construction.

PART I – IMC

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

PART II – IRC MECHANICAL

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

M118–09/10
901.4, Chapter 15

Proponent: Bob Eugene, Underwriters Laboratories, Inc.

1. Revise as follows:

901.4 Fireplace accessories. Listed and labeled fireplace accessories shall be installed in accordance with the conditions of the listing and the manufacturer's installation instructions. Fireplace accessories shall comply with UL 907.

2. Add new standard to Chapter 15 as follows:

UL
907-94 Fireplace Accessories – with revisions through July 2006

Reason: UL 907 includes a comprehensive set of construction and performance requirements that are used to evaluate and list fireplace accessories. Eight companies currently have fireplace accessories listed. Only listed products that are labeled have been subjected to periodic, unannounced inspections during production.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: Review of proposed new standard UL 907-94, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: EUGENE-M-18-901.4-CH 15

M119–09/10
903.2, 905.3 (New), Chapter 15; IRC R1004.2, Chapter 44

Proponent: Bob Eugene, Underwriters Laboratories, Inc.

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IMC COMMITTEE. PART II WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IMC

1. Revise as follows:

903.2 Hearth extensions. Hearth extensions of approved factory-built fireplaces ~~and fireplace stoves~~ shall be installed in accordance with the listing of the fireplace. The hearth extension shall be readily distinguishable from the surrounding floor area. Listed and labeled hearth extensions shall comply with UL 1618.

2. Add new text as follows:

905.3 Hearth extensions. Hearth extensions for fireplace stoves shall be installed in accordance with the listing of the fireplace stove. The hearth extension shall be readily distinguishable from the surrounding floor area. Listed and labeled hearth extensions shall comply with UL 1618.

2. Add new standard to Chapter 15 as follows:

UL
1618-09 Wall Protectors, Floor Protectors, and Hearth Extensions

PART II – IRC BUILDING/ENERGY

1. Revise as follows:

R1004.2 Hearth extensions. Hearth extensions of *approved* factory-built fireplaces shall be installed in accordance with the *listing* of the fireplace. The hearth extension shall be readily distinguishable from the surrounding floor area. Listed and labeled hearth extensions shall comply with UL 1618.

2. Add new standard to Chapter 44 as follows:

UL
1618-09 Wall Protectors, Floor Protectors, and Hearth Extensions

Reason: The UL 1618 standard includes a comprehensive set of construction and performance requirements that are used to evaluate and list wall protectors, floor protectors, and hearth extensions that are intended for use with heat producing devices, such as fireplaces, fireplace stoves, fireplace inserts, and solid-fuel type room heaters. This proposal also provides an alternative for the use of listed hearth extensions instead of built on-site.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: Review of proposed new standard UL 1619-09, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

PART I – IMC

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

PART II – IRC BUILDING/ENERGY

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

M120–09/10
908.1

Proponent: Bob Eugene, Underwriters Laboratories, Inc.

Revise as follows:

908.1 General. A cooling tower used in conjunction with an air-conditioning appliance shall be installed in accordance with the manufacturer's installation instructions. Cooling towers shall comply with UL 1995.

Reason: UL 1995 is already referenced in Chapter 15. UL 1995 includes a comprehensive set of construction and performance requirements that are used to evaluate and list cooling towers, and is already adopted by reference in other sections of the IMC.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME:Eugene-M-22-908.1

M121–09/10
911.1, Chapter 15; IRC M1407.1, Chapter 44

Proponent: Bob Eugene, Underwriters Laboratories, Inc.

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IMC COMMITTEE. PART II WILL BE HEARD BY THE IRC MECHANICAL COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IMC

1. Revise as follows:

911.1 General. Duct furnaces shall be installed in accordance with the manufacturer's installation instructions. Electric duct furnaces shall ~~be tested in accordance~~ comply with UL ~~1995~~ 1996.

2. Add new standard to Chapter 15 as follows:

UL
1996- 04 Electric Duct Heaters – with revisions through December 2006

PART II – IRC MECHANICAL

1. Revise as follows:

M1407.1 General. Electric duct heaters shall be installed in accordance with the manufacturer's installation instructions and Chapters 34 through 43 of this code. Electric ~~furnaces~~ duct heaters shall ~~be tested in accordance~~ comply with UL ~~1995~~. 1996.

2. Add new standard to Chapter 44 as follows:

UL
1996- 04 Electric Duct Heaters – with revisions through December 2006

Reason: This proposal changes the referenced standard from the standard for heating and cooling equipment, UL 1995, to the more appropriate standard for electric duct heaters, UL 1996. UL 1996 includes a comprehensive set of construction and performance requirements that are specifically used to evaluate and list electric duct furnaces. 15 companies currently have duct furnaces listed.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: Review of proposed new standard UL 1996-04, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

PART I – IMC

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

PART II – IRC MECHANICAL

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: EUGENE-M-24-911.1-CH 15-RM-9-M1407.1-CH 44

M122–09/10
912.1, Chapter 15

Proponent: Bob Eugene, Underwriters Laboratories, Inc.

1. Revise as follows:

912.1 Support. Infrared radiant heaters shall be fixed in a position independent of fuel and electric supply lines. Hangers and brackets shall be noncombustible material. Electric infrared radiant heaters shall comply with UL 499.

2. Add new standard to Chapter 15 as follows:

UL
499-05 Electric Heating Appliances – with revisions through August 2008.

Reason: UL 499 includes a comprehensive set of construction and performance requirements that are specifically used to evaluate and list electric infrared radiant heaters.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: Review of proposed new standard UL 499-06, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: EUGENE-M-26-912.1-CH 15

M123–09/10
922.1

Proponent: Bob Eugene, Underwriters Laboratories, Inc.

Revise as follows:

922.1 General. Kerosene and oil-fired stoves shall be listed and labeled and shall be installed in accordance with the conditions of the listing and the manufacturer's installation instructions. Kerosene and oil-fired stoves shall comply with NFPA 31 and ~~Oil-fired stoves shall be tested in accordance with~~ UL 896.

Reason: UL 896 is the standard used for testing both oil-fired and kerosene-fired stoves.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: EUGENE-M-28-922.1

M124–09/10
923.1, Chapter 15

Proponent: Bob Eugene, Underwriters Laboratories, Inc.

1. Revise as follows:

923.1 General. The provisions of this section shall apply to kilns that are used for ceramics, have a maximum interior volume of 20 cubic feet (0.566 m^3) and are used for hobby and noncommercial purposes. Electric kilns shall comply with UL 499.

2. Add new standard to Chapter 15 as follows:

UL
499- 05 Electric Heating Appliances – with revisions through August 2008.

Reason: UL 499 includes a comprehensive set of construction and performance requirements that are specifically used to evaluate and list electric kilns. Seven companies currently have electric kilns listed.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: Review of proposed new standard UL 499-06, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

Public Hearing:				
	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: EUGENE-M-19-923.1-CH 15

M125–09/10
928 (New), Chapter 15

Proponent: Bob Eugene, Underwriters Laboratories, Inc.

1. Add new text as follows:

SECTION 928
RADIANT HEATING SYSTEMS

928.1 General. Electric radiant heating systems shall be installed in accordance with the manufacturer's installation instructions and shall be listed for the application. Electric radiant heating panels and heating panel sets shall comply with UL 1693. Electric space heating cables shall comply with UL 1673.

928.2 Clearances. Clearances for radiant heating panels or elements to any wiring, outlet boxes and junction boxes used for installing electrical devices or mounting luminaires shall be in accordance with NFPA 70.

928.3 Installation on wood or steel framing. Radiant panels installed on wood or steel framing shall conform to the following requirements:

1. Heating panels shall be installed parallel to framing members and secured to the surface of framing members or shall be mounted between framing members.
2. Mechanical fasteners shall penetrate only the unheated portions provided for this purpose. Panels shall not be fastened at any point closer than ¼ inch (7 mm) to an element. Other methods of attachment of the panels shall be in accordance with the panel installation instructions.
3. Unless listed and labeled for field cutting, heating panels shall be installed as complete units.

928.4 Installation in concrete or masonry. Radiant heating systems installed in concrete or masonry shall conform to the following requirements:

1. Radiant heating systems shall be identified as being suitable for the installation, and shall be secured in place as specified in the manufacturer's installation instructions.

2. Radiant heating panels and radiant heating panel sets shall not be installed where they bridge expansion joints unless protected from expansion and contraction.

928.5 Finish surfaces. Finish materials installed over radiant heating panels and systems shall be installed in accordance with the manufacturer's installation instructions. Surfaces shall be secured so that fasteners do not pierce the radiant heating elements.

2. Add new standards to Chapter 15 as follows:

UL

1673-96	Electric Space Heating Cables – with revisions through July 2003
1693-02	Electric Radiant Heating Panels and Heating Panel Sets

Reason: The requirements included in this new section cover the installation of radiant heating systems. They are based on requirements included in Section M1406 of the International Residential Code. UL 1673 and UL 1693 are the standards used to investigate and list electric space heating cables and electric radiant heating panels. Over 20 companies have listings for these products.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: Review of proposed new standards UL 1673-96 and UL 1693-02, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

Public Hearing:

ICCFILENAME: EUGENE-M-21-928-CH 15

M126–09/10
928 (New), 928.1 (New); IRC M1413.1, M1413.2

Proponent: Guy McMann, Jefferson County, CO, representing the Colorado Association of Plumbing and Mechanical Officials (CAPMO)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IMC COMMITTEE. PART II WILL BE HEARD BY THE IRC MECHANICAL COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IMC

Add new text as follows:

SECTION 928
EVAPORATIVE COOLING EQUIPMENT

928.1 General. Evaporative cooling equipment shall:

1. Be installed in accordance with the manufacturer's installation instructions.
2. Be installed on level platforms in accordance with Section 304.10.
3. Have openings in exterior walls or roofs flashed in accordance with the *International Building Code*.
4. Be provided with potable water backflow protection in accordance with Section 608 of the *International Plumbing Code*.
5. Have air intake opening locations in accordance with Section 401.4.

Reason: Evaporative coolers are currently not addressed in the IMC and are notorious for being installed too close to contaminants such as water heater vents, plumbing vents, etc. When installed incorrectly, high costs are incurred to fix the problem. This added text will provide guidance currently not covered in this code.

Cost Impact: The code change proposal will not increase the cost of construction.

PART II – IRC MECHANICAL

Delete and substitute as follows:

~~**M1413.1 General**. Cooling equipment that uses evaporation of water for cooling shall be installed in accordance with the manufacturer's installation instructions. Evaporative coolers shall be installed on a level platform or base not less than 3 inches (76 mm) above the adjoining ground and secured to prevent displacement. Openings in exterior walls shall be flashed in accordance with Section R703.8.~~

~~**M1413.2 Protection of potable water**. The potable water system shall be protected from backflow in accordance with the provisions in Section P2902.~~

M1413.1 General. Evaporative cooling equipment shall be installed:

1. according to the manufacturer's installation instructions
2. on level platforms in accordance with Section M1305.1.4.1
3. so that openings in exterior walls are flashed in accordance with Section R703.8
4. so as to protect the potable water supply in accordance with Section P2902
5. so that air intake opening locations are in accordance with Section R303.4.1

Reason: Evaporative coolers are notorious for being installed too close to contaminants such as water heater vents, plumbing vents, etc. When installed incorrectly, high costs are incurred to fix the problem. These sections have been reorganized for ease of reading and # 5 has been added to point users to the correct intake section that will avoid these costly mistakes.

Cost Impact: The code change proposal will not increase the cost of construction.

PART I – IMC

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IMC COMMITTEE. PART II WILL BE HEARD BY THE IRC MECHANICAL COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IMC

1. Revise as follows:

1002.1 General. Potable water heaters and hot water storage tanks shall be listed and labeled and installed in accordance with the manufacturer's installation instructions, the *International Plumbing Code* and this code. All water heaters shall be capable of being removed without first removing a permanent portion of the building structure. The potable water connections and relief valves for all water heaters shall conform to the requirements of the *International Plumbing Code* . Domestic electric water heaters shall comply with UL 174 or UL 1453. Commercial electric water heaters shall comply with UL 1453. Oil-fired water heaters shall comply with UL 732. Solid-fuel-fired water heaters shall comply with UL 2523. Thermal solar water heaters shall comply with Chapter 14 and UL 174 or UL 1453.

2. Add new standard to Chapter 15 as follows:

UL
2523-09 Outline of Investigation for Solid Fuel-Fired Water Heaters and Boilers

PART II – IRC MECHANICAL

1. Revise as follows:

M2005.1 General. Water heaters shall be installed in accordance with the manufacturer's installation instructions and the requirements of this code. Water heaters installed in an attic shall conform to the requirements of Section M1305.1.3. Gas-fired water heaters shall conform to the requirements in Chapter 24. Domestic electric water heaters shall conform to UL 174 or UL 1453. Commercial electric water heaters shall conform to UL 1453. Oiled-fired water heaters shall conform to UL 732. Thermal solar water heaters shall comply with Chapter 23 and UL 174. Solid-fuel-fired water heaters shall comply with UL 2523.

2. Add new standard to Chapter 44 as follows:

UL
2523-09 Outline of Investigation for Solid Fuel-Fired Water Heaters and Boilers

Reason: The UL Subject 2523 Outline of Investigation includes a comprehensive set of construction and performance requirements that are used to evaluate and list factory built manually and/or automatically fueled solid fuel-fired water heaters. UL 174 is the standard used to evaluate and list thermal solar water heaters.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: Review of proposed new standard UL 2523-09, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

PART I – IMC

1. Revise as follows:

1004.1 Standards. Oil-fired boilers and their control systems shall be listed and labeled in accordance with UL 726. Electric boilers and their control systems shall be listed and labeled in accordance with UL 834. Solid-fuel-fired boilers shall be listed and labeled in accordance with UL 2523. Boilers shall be designed and constructed in accordance with the requirements of ASME CSD-1 and as applicable, the ASME *Boiler and Pressure Vessel Code* , Sections I or IV; NFPA 8501; NFPA 8502 or NFPA 8504.

2. Add new standard to Chapter 15 as follows:

UL
2523-09 Outline of Investigation for Solid Fuel-Fired Water Heaters and Boilers

PART II – IRC MECHANICAL

1. Revise as follows:

M2001.1.1 Standards. Oil-fired boilers and their control systems shall be listed and *labeled* in accordance with UL 726. Electric boilers and their control systems shall be *listed* in accordance with UL 834. Solid-fuel-fired boilers shall be listed and labeled in accordance with UL 2523. Boilers shall be designed and constructed in accordance with the requirements of ASME CSD-1 and as applicable, the ASME *Boiler and Pressure Vessel Code*, Sections I and IV. Gas-fired boilers shall conform to the requirements listed in Chapter 24.

2. Add new standard to Chapter 44 as follows:

UL
2523-09 Outline of Investigation for Solid Fuel-Fired Water Heaters and Boilers

Reason: UL's Subject 2523 Outline of Investigation includes a comprehensive set of construction and performance requirements that are used to evaluate and list factory built manually and/or automatically fueled solid fuel-fired boilers.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: Review of proposed new standard UL 2523-09, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

1004.3.1, Table 1004.3.1 (New)

Proponent: John England, MCO, England Enterprises, Inc.

1. Delete and substitute follows:

~~**1004.3.1 Top clearance.** High-pressure steam boilers having a steam-generating capacity in excess of 5,000 pounds per hour (2268 kg/h) or having a heating surface in excess of 1,000 square feet (93 m2) or input in excess of 5,000,000 Btu/h (1465 kW) shall have a minimum clearance of 7 feet (2134 mm) from the top of the boiler to the ceiling. Steam-heating boilers and hot-water-heating boilers that exceed one of the following limits: 5,000,000 Btu/h input (1465 kW); 5,000 pounds of steam per hour (2268 kg/h) capacity or a 1,000-square-foot (93 m2) heating surface; and high-pressure steam boilers that do not exceed one of the following limits: 5,000,000 Btu/h input (1465 kW); 5,000 pounds of steam per hour (2268 kg/h) capacity or a 1,000-square-foot (93 m2) heating surface; and all boilers with manholes on top of the boiler, shall have a minimum clearance of 3 feet (914 mm) from the top of the boiler to the ceiling. Package boilers, steam-heating boilers and hot-water-heating boilers without manholes on top of the shell and not exceeding one of the limits of this section shall have a minimum clearance of 2 feet (610 mm) from the ceiling.~~ Clearances from the tops of boilers to the ceiling or other obstruction shall set out in table 1004.3.1

1004.3.1 Top clearance. Clearances from the tops of boilers to the ceiling or other overhead obstruction shall be in accordance with Table 1004.3.1.

2. Add new table as follows:

(Underlining omitted for clarity)

TABLE 1004.3.1
BOILER TOP CLEARANCES

BOILER TYPE	MINIMUM CLEARANCES FROM TOP OF BOILER TO CEILING OR OTHER OVERHEAD OBSTRUCTION (feet)
All boilers with manholes on top of the boiler except where a greater clearance is required in this table	3
All boilers without manholes on top of the boiler except high-pressure steam boilers and where a greater clearance is required in this table	2
High-pressure steam boilers with steam generating capacity not exceeding 5,000 pounds per hour	3
High-pressure steam boilers with steam generating capacity exceeding 5,000 pounds per hour	7
High-pressure steam boilers having heating surface not exceeding 1,000 square feet (93 m^2)	3
High-pressure steam boilers having heating surface in excess of 1,000 square feet (93 m^2)	7
High-pressure steam boilers with input not exceeding 5,000,000 Btu/h (1465 kW)	3
High-pressure steam boilers with input in excess of 5,000,000 Btu/h (1465 kW)	7
Steam-heating boilers and hot-water-heating boilers with input exceeding 5,000,000 Btu/h (1465 kW);	3
Steam-heating boilers exceeding 5,000 pounds of steam per hour (2268 kg/h)	3
Steam-heating boilers and hot-water-heating boilers having heating surface exceeding1,000-square-foot (93 m^2)	3

Reason: Text is converted to a table for ease of reading.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: ENGLAND-M-4-1004.3.1

M130–09/10
1101.10; IRC M1411.6

Proponent: Wesley R. Davis, Air Conditioning Contractors of America

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IMC COMMITTEE. PART II WILL BE HEARD BY THE IRC MECHANICAL COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IMC

Delete without substitution:

~~**1101.10 Locking access port caps.** Refrigerant circuit access ports located outdoors shall be fitted with locking-type tamper-resistant caps.~~

PART II – IRC

Delete without substitution:

~~**M1411.6 Locking access port caps.** Refrigerant circuit access ports located outdoors shall be fitted with locking-type tamper-resistant caps.~~

Reason: The requirement for locking caps creates an unnecessary cost. It fails to prevent the release of refrigerant, leads to uncontrolled catastrophic refrigerant release, and causes harm to the occupants by removing a heating or cooling source.

Cost Impact: The code change proposal will not increase the cost of construction.

PART I – IMC

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

PART II – IRC MECHANICAL

1101.10; IRC M1411.6

Proponent: Patrick A. McLaughlin, McLaughlin & Associates, representing the Air-Conditioning, Heating and Refrigeration Institute

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IMC COMMITTEE. PART II WILL BE HEARD BY THE IRC MECHANICAL COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IMC

Revise as follows:

1101.10 Locking access port caps. Refrigerant circuit access ports located outdoors shall be fitted with locking-type tamper-resistant caps or shall be otherwise protected from unauthorized access in an approved manner.

PART II – IRC MECHANICAL

Revise as follows:

M1411.6 Locking access port caps. Refrigerant circuit access ports located outdoors shall be fitted with locking-type tamper-resistant caps or shall be otherwise protected from unauthorized access in an approved manner.

Reason: During the last code cycle, the provision requiring locking-type tamper-resistant caps to restrict access to refrigerants was approved at the Final Action Hearings. This proposal would expand the means of restricting access to other approved methods. An example would be the placement of the equipment in inaccessible locations. Also, we are aware of only one locking-type tamper-resistant cap.

Cost Impact: The code change proposal will not increase the cost of construction.

PART I – IMC

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

PART II – IRC MECHANICAL

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

M132–09/10
1101.10

Proponent: Jeffrey M. Shapiro, PE, International Code Consultants, representing the International Institute of Ammonia Refrigeration

Revise as follows:

1101.10 Locking access port caps. Refrigerant circuit access ports located outdoors shall be fitted with locking-type tamper-resistant caps or shall be otherwise secured to prevent unauthorized access.

Reason: The intent of this change is not to diminish the barrier to "huffing" that was established by adding Section 1101.10 to the 2009 code. Instead, it is to recognize that there are other methods whereby access ports can be secured. For example, in a refrigerated warehouse, a valve inside of the building may block the flow of refrigerant to the access port located outside except when filling is taking place. With this arrangement, no refrigerant is released even when the cap is removed when the valve is closed. Likewise, ports may be located with rooftop equipment having no access except via a roof hatch from the inside. Locking, tamper-resistant caps tend to be a more suitable solution for residential-style equipment with small access ports, and the code needs to be more flexible to accommodate industrial equipment at commercial facilities.

Cost Impact: The code change proposal may increase or decrease the cost of construction depending on the selected method.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: SHAPIRO-M-2-1101.10

M133–09/10
1101.11.1 (New); IRC M1411.6.1 (New)

Proponent: Mona Casey, United Parents to Restrict Open Access to Refrigerant

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IMC COMMITTEE. PART II WILL BE HEARD BY THE IRC MECHANICAL COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IMC

Add new text as follows:

1101.11.1 Existing systems. Existing refrigerant circuit access ports that are located outdoors shall be retrofitted with locking-type tamper-resistant caps whenever the refrigerant system is modified, serviced, or repaired.

PART II – IRC MECHANICAL

Add new text as follows:

M1411.6.1 Existing HVAC systems. Existing refrigerant circuit access ports that are located outdoors shall be retrofitted with locking-type tamper-resistant caps whenever the refrigerant system is modified, serviced, or repaired.

Reason: The purpose of this code modification is to add new requirements to the Code. The existing code does not address the issue of accessibility to refrigerant from pre-existing units by unauthorized individuals. Refrigerant is extremely dangerous and potentially lethal.

Facts:

- Refrigerant "can cause death without warning".
- Refrigerant is considered a gateway drug because users often progress from refrigerant use to drug and alcohol abuse.
- Refrigerant is not a cumulative substance where chances of dying from it increase as the dosage and number of use increases. It can kill on the 1st, 10th, 100th, or any other time. 33 percent of deaths resulting from refrigerant huffing occurred on the 1st use.
- Refrigerant, like other poisons, must be kept out of reach of children.
- Refrigerant theft is increasing.
- According to Mike Opitz, Certification Manager, LEED for Existing Buildings, U.S. Green Building Council, chlorine in CFCs and HCFCs destroy the ozone and depletes the Earth's natural shield for incoming ultraviolet radiation and absorb outgoing infrared radiation from the earth, functioning as potent greenhouse gases.

National Statistics:

- The National Institute on Drug Abuse reports that one in five American teens have used Inhalants to get high.
- According to Stephen J. Pasierb, President and CEO of The Partnership for Drug-Free America, 22% of 6th and 8th graders admitted abusing inhalants and only 3% of parents think their child has ever abused inhalants.
- An analysis of 144 Texas death certificates by the Texas Commission on Alcohol and Drug Abuse involving misuse of inhalants found that the most frequently mentioned inhalant (35%) was Freon (51 deaths). Of the Freon deaths, 42 percent were students or youth with a mean age of 16.4 years.
- Suffocation, inhaling fluid or vomit into the lungs, and accidents each cause about 15% of deaths linked to inhalant abuse.
- National Institute on Drug Abuse's 'Monitoring the Future' study reveals that inhalant abuse among 8th graders is up 7.7% since 2002.
- 55% of deaths linked to inhalant abuse are caused by "Sudden Sniffing Death Syndrome." SSDS can occur on the first use or any use. The
  Inhalant causes the heart to beat rapidly and erratically, resulting in cardiac arrest.
- 22% of inhalant abusers who died of SSDS had no history of previous inhalant abuse. In other words, they were first-time users.

Collier County, FL Statistics:

- The use of inhalants in middle schools has doubled in two years
- The average age a child starts using drugs or alcohol is just 12½
- Every third day a child is taken to the hospital because of a drug overdose
- 85 percent of all juvenile criminal cases are substance related
- Deaths due solely to drug toxicity increased 76% between 1998 and 2005

The modification of this code will have an immense positive impact on the safety and health of our citizens, especially our youth. It will reduce the number of deaths associated with Inhalant abuse and the number of injuries associated with Freon accidents and leaks.

Cost Impact: The code change proposal will increase the cost of construction by $20-$25.

PART I – IMC

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

PART II – IRC MECHANICAL

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

M134–09/10
Table 1103.1

Proponent: Steve Ferguson, American Society of Heating, Refrigerating, and Air-Conditioning Engineers

Revise table as follows:

[F] TABLE 1103.1
REFRIGERANT CLASSIFICATION, Amount and OEL

Chemical Refrigerant	Formula	Chemical Name of Blend	Refrigerant Classification	Degrees of Hazard[a]	[M] Amount Of Refrigerant Per Occupied Space			
					Pound per 1,000 cubic feet	ppm	g/m^3	OEL[e]
R-E170	CH_3OCH_3	methoxymethane (dimethyl ether)	A3		1	8,500	16	1,000
R-403A	zeotrope	R-290/22/218 (5/75/20)	~~A1~~ A2	2-0-0	7.6	33,000	120	1,000
R-433B	zeotrope	R-1270/290 (5.0-95.0)	A3		0.51	4,500	8.1	950
R-433C	zeotrope	R-1270/290 (25.0/75.0)	A3		0.41	3,600	6.6	790
R-438A	zeotrope	R-32/125/134a/600/601a (8.5/45.0/44.2/1.7/0.6)	A1		4.9	19,000	79	990
R-600a	$CH(CH_3)_2$-CH_3	~~isobutane (2-methyl propane)~~ 2-methyl propane (isobutane)	A3	2-4-0	0.6	4,000	9.6	1,000
R-601a	$(CH_3)_2CHCH_2CH_3$	2-methylbutane (isopentane)	A3		0.2	1,000	2.9	600

(Portions of table and notes not shown remain unchanged)

Reason: R-433B, R-433C, R-438A were recently added to ASHRAE Standard 34.

The classification of R-403A has been changed from A1 to A2 based on data developed as part of an ASHRAE research project using the current method of measuring the LFL of refrigerants.

The chemical names of R-E170, R-600a and R-601a have been changed to be consistent with IUPAC rules for naming organic compounds. The common names are listed in parenthesis.

If approved for publication by ASHRAE prior to the code hearings, a floor modification will be brought forward to add R-1234yf to this table.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: FERGUSON-M-2-T. 1103.1

M135-09/10

1105.6, 1105.6.3 (New), 1105.6.3.1, 1105.6.3.2

Proponent: Jeffrey M. Shapiro, PE, International Code Consultants, representing the International Institute of Ammonia Refrigeration

1. Revise as follows:

1105.6 Ventilation. Machinery rooms shall be mechanically ventilated to the outdoors. ~~Mechanical ventilation shall be capable of exhausting the minimum quantity of air both at normal operating and emergency conditions. Multiple fans or multispeed fans shall be allowed in order to produce the emergency ventilation rate and to obtain a reduced airflow for normal ventilation.~~

Exception: Where a refrigerating system is located outdoors more than 20 feet (6096 mm) from any building opening and is enclosed by a penthouse, lean-to or other open structure, natural or mechanical ventilation shall be provided. Location of the openings shall be based on the relative density of the refrigerant to air. The free-aperture cross section for the ventilation of the *machinery room* shall be not less than:

$$F = \sqrt{G}$$ **(Equation 11-1)**

For SI:

$$F = 0.138\sqrt{G}$$

where:

F = The free opening area in square feet (m^2).
G = The mass of refrigerant in pounds (kg) in the largest system, any part of which is located in the *machinery room*.

2. Add new text as follows:

1105.6.3 Ventilation rate. For other than ammonia systems, the mechanical ventilation systems shall be capable of exhausting the minimum quantity of air both at normal operating and emergency conditions, as required by Sections 1105.6.3.1 and 1105.6.3.2. The minimum required ventilation rate for ammonia shall be in accordance with IIAR 2.

Multiple fans or multispeed fans shall be allowed to produce the emergency ventilation rate and to obtain a reduced airflow for normal ventilation.

3. Revise as follows:

~~1105.6.3~~ 1105.6.3.1 Quantity—normal ventilation. During occupied conditions, the mechanical ventilation system shall exhaust the larger of the following:

1. Not less than 0.5 cfm per square foot (0.0025 $m^3/s \cdot m^2$) of *machinery room* area or 20 cfm (0.009 m^3/s) per person; or
2. A volume required to limit the room temperature rise to 18°F (10°C) taking into account the ambient heating effect of all machinery in the room.

~~1105.6.4~~ **1105.6.3.2 Quantity—emergency conditions.** Upon actuation of the refrigerant detector required in Section 1105.3, the mechanical ventilation system shall *exhaust air* from the *machinery room* in the following quantity:

$$Q = 100 \, x \sqrt{G}$$ **(Equation 11-2)**

For SI: $Q = 0.07 \, x \sqrt{G}$

Where:

Q = The airflow in cubic feet per minute (m^3/s).
G = The design mass of refrigerant in pounds (kg) in the largest system, any part of which is located in the *machinery room.*

Reason: The proposed change will defer the required ventilation rate for ammonia refrigeration machinery rooms to IIAR2, which is the ANSI accredited industry standard. IIAR 2 is in the process of being revised to change the basis of calculating required ventilation to an "air changes per minute/hour" basis. There is general agreement in the industry that the minimum ventilation rate for ammonia needs to be greater than the rate calculated using the current formula, and IIAR 2 is out for public comment so that a consensus rate that is unique based on the properties of ammonia can be established. It is anticipated that the public comment period for IIAR 2 will close prior to the ICC hearing in Baltimore, and additional information on the new calculation approach will be presented at that time to support this proposal.

As part of this change, requirements related to the required ventilation rate in Section 1105.6 have been moved to Section 1105.6.3 to create a single subsection on this topic rather than the current approach of splitting related requirements between two sections. This improves the usability of the code.

Cost Impact: Larger fans to be required by IIAR 2 will slightly increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: SHAPIRO-M-1-1105.6

M136–09/10

[F] 1105.8.1 (New), [F] 1105.8.2 (New), [F] 1105.8.3 (New), [F] 1105.8.4 (New)

Proponent: Guy McMann, Jefferson County, CO, representing the Colorado Association of Plumbing and Mechanical Officials (CAPMO)

Add new text as follows:

[F] 1105.8.1 Ammonia refrigerant. Systems containing ammonia refrigerant shall discharge vapor to the atmosphere through an approved treatment system in accordance with Section 1105.8.2, a flaring system in accordance with Section 1105.8.3 or through an approved ammonia diffusion system in accordance with Section1105.8.4, or by other approved means.

Exceptions:

1. Ammonia/water absorption systems containing less than 22 pounds (10 kg) of ammonia and for which the ammonia circuit is located entirely outdoors.
2. Where the fire code official determines, on review of an engineering analysis prepared in accordance with Section 104.7.2 of the *International Fire Code*, that a fire, health or environmental hazard would not result from discharging ammonia directly to the atmosphere.

[F] 1105.8.2 Treatment systems. Treatment systems shall be designed to reduce the allowable discharge concentration of the refrigerant gas to not more than 50 percent of the IDLH at the point of exhaust. Treatment systems shall be in accordance with Chapter 37 of the *International Fire Code*

[F] 1105.8.3 Flaring systems. Flaring systems for incineration of flammable refrigerants shall be designed to incinerate the entire discharge. The products of refrigerant incineration shall not pose health or environmental hazards. Incineration shall be automatic upon initiation of discharge, shall be designed to prevent blowback, and shall not expose structures or materials to threat of fire. Standby fuel, such as LP gas, and standby power shall have the capacity to operate for one and one-half the required time for complete incineration of refrigerant in the system.

[F] 1105.8.4 Ammonia diffusion systems. Ammonia diffusion systems shall include a tank containing 1 gallon of water for each pound of ammonia (4 L of water for each 1 kg of ammonia) that will be released in 1 hour from the largest relief device connected to the discharge pipe. The water shall be prevented from freezing. The discharge pipe from the pressure relief device shall distribute ammonia in the bottom of the tank, but not lower than 33 feet (10 058 mm) below the maximum liquid level. The tank shall contain the volume of water and ammonia without overflowing.

Reason: This is an effort to make Chapter 11 a little more complete. This language is extracted from The Fire Code. There have been complaints that the I-codes in general refer to too many standards requiring many different documents to accomplish one thing. Some of the complaints have merit. The reference to ASHRAE-15 is left in tact but the Fire Code requirements satisfy the issue. Why not just say what is required for ammonia discharge rather than referring to the standard or the Fire Code. This will aid in plan review as well as field inspection because the requirements will be right there in the chapter.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: MCMANN-M-7-1105.8

M137–09/10
1106.4

Proponent: Gary Kreutziger, City of San Antonio, TX, representing the Planning and Development Services Department

Revise as follows:

1106.4 Flammable refrigerants. Where refrigerants of Groups A2, A3, B2 and B3 are used, the *machinery room* shall conform to the Class 1, Division 2, *hazardous location* classification requirements of NFPA 70.

Exception: Ammonia machinery rooms that are provided with ventilation in accordance with section 1106.3.

Reason: The purpose of the proposed code change is to eliminate confusion and create consistency between the International Fire Code Section 606.16 Exception and the International Mechanical Code Section 1106.4 Exception, without changing the intent of either. Both code sections require electrical installations in refrigeration machinery rooms to conform with Class 1, Division 2 prescriptives as per NFPA 70, however, the IMC Exception does not explicitly explain that the ammonia machinery room be ventilated in accordance with IMC Section 1106.3 to qualify for the exception as does the IFC. The proposal is to insert the same additional language as in the IFC for consistency and clarification.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

M138–09/10
1201 through 1203

Proponent: Walter Sperko, PE, Sperko Engineering, representing the Mechanical Contractors Association of America

1. Revise as follows:

1201.3 Standards. ~~As an alternative to the provisions of Sections 1202 and 1203, piping shall be designed, installed, inspected and tested in accordance with ASME B31.9.~~ Piping shall be designed, installed, inspected and tested in accordance with ASME B31.9 except as otherwise specified in this chapter.

SECTION 1202
MATERIAL

1202.1 Piping. Piping material shall conform to the standards ~~cited in this section.~~ listed in ASME B31.9.

Exception: Embedded piping regulated by Section 1209.

1202.2 Used materials. Reused pipe, fittings, valves or other materials shall be clean and free of foreign materials ~~and shall be approved by the code official for reuse~~. Reused piping components shall be identified to a specification, grade or manufacturer's identification suitable for use in the system into which they will be installed and shall be approved.

1202.3 Material rating. ~~Materials shall be rated for the operating temperature and pressure of the hydronic system.~~ Materials shall be suitable for the type of fluid in the hydronic system. The exterior of pipe shall be protected from corrosion and degradation.

1202.4 Piping materials standards. Hydronic pipe shall conform to the standards listed in Table 1202.4 in addition to those listed in ASME B31.9. ~~The exterior of the pipe shall be protected from corrosion and degradation.~~

2. Revise table as follows:

TABLE 1202.4
HYDRONIC PIPE

MATERIAL	STANDARD (see Chapter 15)
~~Acrylonitrile butadiene styrene(ABS) plastic pipe~~	~~ASTM D 1527; ASTM D 2282~~
~~Brass pipe~~	~~ASTM B 43~~
~~Brass tubing~~	~~ASTM B 135~~
~~Copper or copper-alloy pipe~~	~~ASTM B 42; ASTM B 302~~
~~Copper or copper-alloy tube (Type K, L or M)~~	~~ASTM B 75; ASTM B 88; ASTM B 251~~
~~Chlorinated polyvinyl chloride (CPVC) plastic pipe~~	~~ASTM D 2846; ASTM F 441; ASTM F 442~~
Cross-linked polyethylene/aluminum/cross-linked polyethylene (PEX-AL-PEX) pressure pipe	~~ASTM F 1281~~; CSA CAN/CSA-B-137.10
~~Cross-linked polyethylene (PEX) tubing~~	~~ASTM F 876; ASTM F 877~~
Ductile iron pipe	AWWA ~~C151/A21.51; AWWA~~ C115/A21.15
Lead pipe	FS WW-P-325B

~~Steel~~	~~ASME B16.5; ASME B16.9; ASME B16.11; ASME B16.28; ASTM A 420~~

1202.6 Valves. Valves shall be constructed of materials that are compatible with the type of piping material and fluids in the system. Valves shall be rated for the temperatures and pressures of the systems in which the valves are installed.

SECTION 1203
JOINTS AND CONNECTIONS

1203.1 Approval. Joints and connections shall be of an *approved* type. Joints and connections shall be tight for the pressure of the hydronic system.

1203.2 Preparation of pipe ends. Pipe shall be cut square, reamed and chamfered, and shall be free of burrs and obstructions. Pipe ends shall have full-bore openings and shall not be undercut.

1203.3 Joint preparation and installation. When required by Sections 1203.4 through 1203.14, the preparation and installation of brazed, mechanical, soldered, solvent-cemented, threaded and welded joints shall comply with Sections 1203.3.1 through 1203.3.7.

1203.3.1 Brazed joints. Joint surfaces shall be cleaned. An *approved* flux shall be applied where required. The joint shall be brazed with a filler metal conforming to AWS A5.8.

1203.3.2 Mechanical joints. Mechanical joints shall be installed in accordance with the manufacturer's instructions.

1203.3.3 Soldered joints. Joint surfaces shall be cleaned. A flux conforming to ASTM B 813 shall be applied. The joint shall be soldered with a solder conforming to ASTM B 32.

1203.3.4 Solvent-cemented joints. Joint surfaces shall be clean and free of moisture. An *approved* primer shall be applied to CPVC and PVC pipe-joint surfaces. Joints shall be made while the cement is wet. Solvent cement conforming to the following standards shall be applied to all joint surfaces:

1. ASTM D 2235 for ABS joints.
2. ASTM F 493 for CPVC joints.
3. ASTM D 2564 for PVC joints.

CPVC joints shall be made in accordance with ASTM D 2846.

1203.3.5 Threaded joints. Threads shall conform to ASME B1.20.1. Schedule 80 or heavier plastic pipe shall be threaded with dies specifically designed for plastic pipe. Thread lubricant, pipe-joint compound or tape shall be applied on the male threads only and shall be *approved* for application on the piping material.

1203.3.6 Welded joints. Joint surfaces shall be cleaned by an *approved* procedure. Joints shall be welded with an *approved* filler metal.

1203.3.7 Grooved and shouldered mechanical joints. Grooved and shouldered mechanical joints shall conform to the requirements of ASTM F 1476 and shall be installed in accordance with the manufacturer's installation instructions.

1203.3.8 Mechanically formed tee fittings. Mechanically extracted outlets shall have a height not less than three times the thickness of the branch tube wall.

1203.3.8.1 Full flow assurance. Branch tubes shall not restrict the flow in the run tube. A dimple/depth stop shall be formed in the branch tube to ensure that penetration into the outlet is of the correct depth. For inspection purposes, a second dimple shall be placed 1/4 inch (6.4 mm) above the first dimple. Dimples shall be aligned with the tube run.

1203.3.8.2 Brazed joints. Mechanically formed tee fittings shall be brazed in accordance with Section 1203.3.1.

1203.4 ABS plastic pipe. Joints between ABS plastic pipe or fittings shall be solvent-cemented or threaded joints conforming to Section 1203.3.

1203.5 Brass pipe. Joints between brass pipe or fittings shall be brazed, mechanical, threaded or welded joints conforming to Section 1203.3.

~~**1203.6 Brass tubing.** Joints between brass tubing or fittings shall be brazed, mechanical or soldered joints conforming to Section 1203.3.~~

~~**1203.7 Copper or copper-alloy pipe.** Joints between copper or copper-alloy pipe or fittings shall be brazed, mechanical, soldered, threaded or welded joints conforming to Section 1203.3.~~

~~**1203.8 Copper or copper-alloy tubing.** Joints between copper or copper-alloy tubing or fittings shall be brazed, mechanical or soldered joints conforming to Section 1203.3, flared joints conforming to Section 1203.8.1 or push-fit joints conforming to Section 1203.8.2.~~

~~**1203.8.1 Flared joints.** Flared joints shall be made by a tool designed for that operation.~~

~~**1203.8.2 Push-fit joints.** Push-fit joints shall be installed in accordance with the manufacturer's instructions.~~

~~**1203.9 CPVC plastic pipe.** Joints between CPVC plastic pipe or fittings shall be solvent-cemented or threaded joints conforming to Section 1203.3.~~

~~**1203.10 Polybutylene plastic pipe and tubing.** Joints between polybutylene plastic pipe and tubing or fittings shall be mechanical joints conforming to Section 1203.3 or heat-fusion joints conforming to Section 1203.10.1.~~

~~**1203.10.1 Heat-fusion joints.** Joints shall be of the socket fusion or butt-fusion type. Joint surfaces shall be clean and free of moisture. Joint surfaces shall be heated to melt temperatures and joined. The joint shall be undisturbed until cool. Joints shall be made in accordance with ASTM D 3309.~~

~~**1203.11 Cross-linked polyethylene (PEX) plastic tubing.** Joints between cross-linked polyethylene plastic tubing and fittings shall conform to Sections 1203.11.1 and 1203.11.2. Mechanical joints shall conform to Section 1203.3.~~

~~**1203.11.1 Compression-type fittings.** When compression-type fittings include inserts and ferrules or O-rings, the fittings shall be installed without omitting the inserts and ferrules or O-rings.~~

~~**1203.11.2 Plastic-to-metal connections.** Soldering on the metal portion of the system shall be performed at least 18 inches (457 mm) from a plastic-to-metal adapter in the same water line.~~

~~**1203.12 PVC plastic pipe.** Joints between PVC plastic pipe and fittings shall be solvent-cemented or threaded joints conforming to Section 1203.3.~~

~~**1203.13 Steel pipe.** Joints between steel pipe or fittings shall be mechanical joints that are made with an *approved* elastomeric seal, or shall be threaded or welded joints conforming to Section 1203.3.~~

~~**1203.14 Steel tubing.** Joints between steel tubing or fittings shall be mechanical or welded joints conforming to Section 1203.3.~~

(Remainder of Section 1203 unchanged)

Reason: While the current rules provide a respectable list of materials for hydronic piping, the design requirements are nonexistent. The present rules provide nothing that the code official can use to determine if any of the following are adequate:

1) The thickness of the pipe for the pressure and temperature; while some components are "pressure rated," ordinary pipe and fittings have no such ratings. Unless the engineer has established the minimum wall thickness of steel pipe by calculation, the code official has no way to determine if it is thick enough to sustain the pressure and temperature.
2) Thermal expansion effects: present rules provide nothing that requires the designer to consider the effects of fatigue on piping due to thermal expansion and contraction, or the effects of thermal expansion on loads on equipment or the supporting building
3) Supports; nothing in the rules gives the code official guidance on the proper distance between supports to avoid overstress.
4) Seismic: there are no provisions for support or restraint of piping due to seismic events.

B31.9 covers these shortcomings. All materials deleted by this action are permitted by B31.9 plus many other materials commonly found in hydronic piping systems (see appendix A) Some joining techniques for joining plastic and composite piping were not deleted as B31.9 only provides partial requirements for joining these materials.

Cost Impact: Reduced. Most designers of larger facilities specify ASME B31.1, *Power Piping*, rather than B31.9, *Building Services Piping*. B31.1 is written for steam piping operating at 1000F.and 3000 psi, imposing unnecessarily expensive requirements on hydronic piping systems.

Proponent: Michael Cudahy, Plastic Pipe and Fittings Association (PPFA)

1. Revise table as follows:

TABLE 1202.4
HYDRONIC PIPE

MATERIAL	STANDARD
~~Polyethylene (PE) pipe, tubing and fittings (for ground source heat pump loop systems)~~	~~ASTM D 2513; ASTM D 3035; ASTM D 2447; ASTM D 2683; ASTM F 1055; ASTM D 2837; ASTM D 3350; ASTM D 1693~~

(Portions of table not shown are unchanged)

2. Delete without substitution:

~~**1203.15 Polyethylene plastic pipe and tubing for ground source heat pump loop systems.** Joints between polyethylene plastic pipe and tubing or fittings for ground source heat pump loop systems shall be heat fusion joints conforming to Section 1203.15.1, electrofusion joints conforming to Section 1203.15.2, or stab-type insertion joints conforming to Section 1203.15.3.~~

~~**1203.15.1 Heat-fusion joints.** Joints shall be of the socket-fusion, saddle-fusion or butt-fusion type, joined in accordance with ASTM D 2657. Joint surfaces shall be clean and free of moisture. Joint surfaces shall be heated to melt temperatures and joined. The joint shall be undisturbed until cool. Fittings shall be manufactured in accordance with ASTM D 2683 or ASTM D 3261.~~

~~**1203.15.2 Electrofusion joints.** Joints shall be of the electrofusion type. Joint surfaces shall be clean and free of moisture, and scoured to expose virgin resin. Joint surfaces shall be heated to melt temperatures for the period of time specified by the manufacturer. The joint shall be undisturbed until cool. Fittings shall be manufactured in accordance with ASTM F 1055.~~

~~**1203.15.3 Stab-type insert fittings.** Joint surfaces shall be clean and free of moisture. Pipe ends shall be chamfered and inserted into the fittings to full depth. Fittings shall be manufactured in accordance with ASTM F 1924.~~

3. Revise as follows:

SECTION 1208
TESTS

1208.1 General. Hydronic piping systems ~~other than ground source heat pump loop systems~~ shall be tested hydrostatically at one and one-half times the maximum system design pressure, but not less than 100 psi (689 kPa). The duration of each test shall be not less than 15 minutes. ~~Ground-source heat pump loop systems shall be tested in accordance with Section 1208.1.1.~~

4. Delete without substitution:

~~**1208.1.1 Ground source heat pump loop systems.** Before connection (header) trenches are backfilled, the assembled loop system shall be pressure tested with water at 100 psi (689 kPa) for 30 minutes with no observed leaks. Flow and pressure loss testing shall be performed and the actual flow rates and pressure drops shall be compared to the calculated design values. If actual flow rate or pressure drop values differ from calculated design values by more than 10 percent, the problem shall be identified and corrected.~~

5. Add new text as follows:

SECTION 1210
GROUND SOURCE HEAT PUMP LOOP SYSTEMS

1210.1 General. Ground-source heat pump loop systems shall comply with this section.

1210.2 Piping material. Ground-source heat pump loop system piping material for water-based systems shall comply with Sections 1210.2.1 through 1210.2.4.

1210.2.1 Used materials. Reused piping, fittings, valves, or other materials shall not be used in ground-source heat pump loop systems.

1210.2.2 Material rating. Piping shall be rated for the operating temperature and pressure of the ground-source heat pump loop systems. Fittings shall be approved for pressure applications and recommended by the manufacturer for installation with the piping material installed. Materials installed underground shall be suitable for burial.

1210.2.3 Piping and tubing materials standards. Ground source heat pump loop system piping shall conform to the standards listed in Table 1210.2.3.

TABLE 1210.2.3
GROUND SOURCE HEAT PUMP LOOP SYSTEM PIPING

MATERIAL	STANDARD
Chlorinated polyvinyl chloride (CPVC) plastic pipe	ASTM D 2846; ASTM F 441; ASTM F 442
Cross-linked polyethylene (PEX) tubing	ASTM F 876; ASTM F 877
Polyethylene/aluminum/polyethylene (PE-AL-PE) pressure pipe	ASTM F 1282; CSA B137.9
Polyethylene (PE) pipe, tubing and fittings	ASTM D 3035; ASTM D 2447; ASTM D 2737; ASTM F 714; AWWA C901; CSA CAN/CSA-B-137.1
Polypropylene (PP-R) pipe, tubing and fittings	ASTM F 2389
Polyvinyl chloride (PVC) plastic pipe	ASTM D 1785; ASTM D 2241
Raised temperature polyethylene (PE-RT)	ASTM F 2623

1210.2.4 Fittings. Geothermal pipe fittings shall be approved for installation with the piping materials to be installed, suitable for use underground if buried, and shall conform to the standards listed in Table 1210.2.4.

TABLE 1210.2.4
GROUND SOURCE HEAT PUMP LOOP SYSTEM FITTINGS

PIPE MATERIAL	STANDARD
Chlorinated polyvinyl chloride (CPVC) plastic pipe	ASTM D 2846; ASTM F 437; ASTM F 438; ASTM F 439; CSA B137.6
Cross-linked polyethylene (PEX) tubing	ASTM F 877; ASTM F 1807; ASTM F 1960; ASTM F 2080; ASTM F 2098; ASTM F 2159; ASTM F 2434; CSA B137.5
Polyethylene/aluminum/polyethylene (PE-AL-PE) pressure pipe	ASTM D 3261; ASTM F 877; ASTM F 1807; ASTM F 2098; ASTM F 2159; ASTM F 2434; CSA B137.5, B137.1
Polyethylene (PE) pipe, tubing and fittings	ASTM D 2609; ASTM D 2683; ASTM D 3261; ASTM F 1055; CSA B137.1
Polypropylene (PP-R) pipe, tubing and fittings	ASTM F 2389; CSA B137.11
Polyvinyl chloride (PVC) plastic pipe	ASTM D 2464; ASTM D 2466; ASTM D 2467; CSA B137.2; CSA B137.3
Raised temperature polyethylene (PE-RT)	ASTM D 3261; ASTM F 877; ASTM F 1807; ASTM F 2098; ASTM F 2159; ASTM F 2434; CSA B137.5, B137.1

1210.3 Joints and connections. Joints and connections in ground source heat pump loop systems shall be of an approved type and shall comply with Sections 1210.3.1 through 1210.3.9. Joints and connections shall be leak-free for the pressure of the ground source heat pump loop systems. Joints used underground shall be approved for buried applications.

1210.3.1 Joints between different piping materials. Joints between different piping materials shall be made with approved transition fittings.

1210.3.2 Preparation of pipe ends. Piping shall be cut square, reamed, and shall be free of burrs and obstructions. CPVC, PE, and PVC pipe shall be chamfered. Pipe ends shall have full-bore openings and shall not be undercut.

1210.3.3 Joint preparation and installation. Where required by Sections 1210.3.4 through 1210.3.6, the preparation and installation of mechanical and thermoplastic-welded joints shall comply with Sections 1210.3.3.1 and 1210.3.3.2 as applicable.

1210.3.3.1 Mechanical joints. Mechanical joints shall be installed in accordance with the manufacturer's instructions.

1210.3.3.2 Thermoplastic-welded joints. Joint surfaces shall be cleaned by an approved procedure. Joints shall be welded according to the manufacturer's instructions.

1210.3.4 CPVC plastic pipe. Joints for CPVC plastic piping and fittings shall be solvent-cemented or threaded joints conforming to Section 1203.3.

1210.3.5 Cross-linked polyethylene (PEX) plastic tubing. Joints for cross-linked polyethylene plastic piping and fittings shall conform to Sections 1210.3.5.1 and 1210.3.5.2. Mechanical joints shall conform to Section 1210.3.3.

1210.3.5.1 Compression-type fittings. Where compression- type fittings include inserts and ferrules or O-rings, the fittings shall be installed without omitting the inserts and ferrules or O-rings.

1210.3.5.2 Plastic-to-metal connections. Solder joints in a metal pipe shall not occur within 18 inches (457 mm) of a transition from such metal pipe to PEX pipe.

1210.3.6 Polyethylene plastic pipe and tubing for ground source heat pump loop systems. Joints for polyethylene plastic piping and fittings for ground source heat pump loop systems shall be heat-fusion joints conforming to Section 1210.3.6.1, electrofusion joints conforming to Section 1210.3.6.2, or stab-type insertion joints conforming to Section 1210.3.6.3.

1210.3.6.1 Heat-fusion joints. Joints shall be of the socket-fusion, saddle-fusion or butt-fusion type, joined in accordance with ASTM D 2657. Joint surfaces shall be clean and free of moisture. Joint surfaces shall be heated to melt temperatures and joined. The joint shall be undisturbed until cool. Fittings shall be manufactured in accordance with ASTM D 2683 or ASTM D 3261.

1210.3.6.2 Electrofusion joints. Joints shall be of the electrofusion type. Joint surfaces shall be clean and free of moisture, and scoured to expose virgin resin. Joint surfaces shall be heated to melt temperatures for the period of time specified by the manufacturer. The joint shall be undisturbed until cool. Fittings shall be manufactured in accordance with ASTM F 1055.

1210.3.6.3 Stab-type insert fittings. Joint surfaces shall be clean and free of moisture. Pipe ends shall be chamfered and inserted into the fittings to full depth. Fittings shall be manufactured in accordance with ASTM F 1924.

1210.3.7 Polypropylene (PP) plastic. Joints for PP plastic piping and fittings shall comply with Sections 1210.3.7 and 1210.3.7.2.

1210.3.7.1 Heat-fusion joints. Heat-fusion joints for polypropylene (PP) piping joints shall be installed with socket-type heat-fused polypropylene fittings, electrofusion polypropylene fittings or by butt-fusion. Joint surfaces shall be clean and free from moisture. The joint shall be undisturbed until cool. Joints shall be made in accordance with ASTM F 2389.

1210.3.7.2 Mechanical and compression sleeve joints. Mechanical and compression sleeve joints shall be installed in accordance with the manufacturer's instructions.

1210.3.8 Raised temperature polyethylene (PE-RT) plastic tubing. Joints for raised temperature polyethylene piping and fittings shall conform to Sections 1210.3.8.1 and 1210.3.8.2. Mechanical joints shall conform to Section 1210.3.3.

1210.3.8.1 Compression-type fittings. Where compression-type fittings include inserts and ferrules or O-rings, the fittings shall be installed without omitting the inserts and ferrules or O-rings.

1210.3.8.2 PE-RT-to-metal connections. Solder joints in a metal pipe shall not occur within 18 inches (457 mm) of a transition from such metal pipe to PE-RT pipe.

1210.3.9 PVC plastic pipe. Joints for PVC plastic pipe and fittings shall be solvent-cemented or threaded joints conforming to Section 1203.3.

1210.4 Shutoff valves. Shutoff valves shall be installed in ground source heat pump loop systems in the locations indicated in Sections 1210.4.1 through 1210.4.6. Pressure relief valves shall be installed in accordance with Section 1210.4.7.

1210.4.1 Heat exchangers. Shutoff valves shall be installed on the supply and return side of a heat exchanger.

> **Exception:** Shutoff valves shall not be required where heat exchangers are integral with a boiler; or are a component of a manufacturer's boiler and heat exchanger packaged unit and are capable of being isolated from the hydronic system by the supply and return valves required by Section 1005.1.

1210.4.2 Central systems. Shutoff valves shall be installed on the building supply and return of a central utility system.

1210.4.3 Pressure vessels. Shutoff valves shall be installed on the connection to any pressure vessel.

1210.4.4 Pressure-reducing valves. Shutoff valves shall be installed on both sides of a pressure-reducing valve.

1210.4.5 Equipment and appliances. Shutoff valves shall be installed on connections to mechanical *equipment* and appliances. This requirement does not apply to components of a ground source heat pump loop system such as pumps, air separators, metering devices, and similar *equipment*.

1210.4.6 Expansion tanks. Shutoff valves shall be installed at connections to nondiaphragm-type expansion tanks.

1210.4.7 Reduced pressure. A pressure relief valve shall be installed on the low-pressure side of a hydronic piping system that has been reduced in pressure. The relief valve shall be set at the maximum pressure of the system design. The valve shall be installed in accordance with Section 1006.

1210.5 General. Piping, valves, fittings, and connections shall be installed in accordance with the conditions of approval and Sections 1210.5.1 through 1210.5.10.

1210.5.1 Protection of potable water. The potable water system shall be protected from backflow in accordance with the *International Plumbing Code*.

1210.5.2 Pipe penetrations. Openings for pipe penetrations in walls, floors and ceilings shall be larger than the penetrating pipe. Openings through concrete or masonry building elements shall be sleeved. The annular space surrounding pipe penetrations shall be protected in accordance with the *International Building Code*.

1210.5.3 Clearance to combustibles. Where the exterior temperature of piping in a geothermal piping system exceeds 250°F (121°C), such piping shall have a minimum *clearance* of 1 inch (25 mm) to combustible materials.

1210.5.4 Contact with building material. A ground source heat pump loop system shall not be in direct contact with building materials that cause the piping material to degrade or corrode, or that interfere with the operation of the system.

1210.5.5 Strains and stresses. Piping shall be installed so as to prevent detrimental strains and stresses in the pipe. Provisions shall be made to protect piping from damage resulting from expansion, contraction and structural settlement. Piping shall be installed so as to avoid structural stresses or strains within building components.

1210.5.6 Flood hazard. Piping located in a flood hazard area shall be capable of resisting hydrostatic and hydrodynamic loads and stresses, including the effects of buoyancy, during the occurrence of flooding to the *design flood elevation*.

1210.5.7 Pipe support. Pipe shall be supported in accordance with Section 305.

1210.5.8 Velocities. Flow velocities in ground source heat pump loop systems shall be designed to not exceed the maximum flow velocity recommended by the pipe and fitting manufacturer and shall be controlled to reduce the possibility of water hammer.

1210.5.9 Labeling and marking. Ground source heat pump loop system piping shall be marked with tape, metal tags or other method where it enters a building indicating "GROUND SOURCE HEAT PUMP LOOP SYSTEM". The marking shall indicate any antifreeze used in the system by name and concentration.

1210.5.10 Chemical compatibility. Antifreeze and other materials used in a ground source heat pump loop system shall be chemically compatible with the pipe, tubing, fittings, and mechanical systems.

1210.6 Makeup water. The transfer fluid used in ground source heat pump loop systems shall be compatible with the makeup water supplied to the system.

1210.7 Ground source heat pump loop systems tests. Before connection (header) trenches are backfilled, the assembled loop system shall be pressure tested with water at 100 psi (689 kPa) for 30 minutes with no observed leaks. Flow and pressure loss testing shall be performed and the actual flow rates and pressure drops shall be compared to the calculated design values. If actual flow rate or pressure drop values differ from calculated design values by more than 10 percent, the cause shall be identified and corrective action taken.

1210.7.1 Pressurizing during installation. Ground source heat pump loop piping to be embedded in concrete shall be pressure tested prior to pouring concrete. During pouring, the pipe shall be maintained at the proposed operating pressure.

6. Add new standards to Chapter 15 as follows:

ASTM

D 2464-06	Standard Specification for Threaded Poly(Vinyl Chloride) (PVC) Plastic Pipe Fittings, Schedule 80
D 2466-06	Standard Specification for Poly(Vinyl Chloride) (PVC) Plastic Pipe Fittings, Schedule 40
D 2467-06	Standard Specification for Poly(Vinyl Chloride) (PVC) Plastic Pipe Fittings, Schedule 80
D 2609-02	Standard Specification for Plastic Insert Fittings for Polyethylene (PE) Plastic Pipe
D 2737-03	Standard Specification for Polyethylene (PE) Plastic Tubing
F 437-06	Standard Specification for Threaded Chlorinated Poly(Vinyl Chloride) (CPVC) Plastic Pipe Fittings, Schedule 80
F 714-08	Standard Specification for Polyethylene (PE) Plastic Pipe (SDR-PR) Based on Outside Diameter
F 1807-08	Standard Specification for Metal Insert Fittings Utilizing a Copper Crimp Ring for SDR9 Cross-linked Polyethylene (PEX) Tubing
F1960-08	Standard Specification for Cold Expansion Fittings with PEX Reinforcing Rings for Use with Cross-linked Polyethylene (PEX) Tubing
F 2080-08	Standard Specification for Cold-Expansion Fittings with Metal Compression-Sleeves for Cross-Linked Polyethylene (PEX) Pipe
F 2098-08	Standard Specification for Stainless Steel Clamps for Securing SDR9 Cross-linked Polyethylene (PEX) Tubing to Metal Insert and Plastic Insert Fittings
F 2159-05	Standard Specification for Plastic Insert Fittings Utilizing a Copper Crimp Ring for SDR9 Cross-linked Polyethylene (PEX) Tubing
F 2434-08	Standard Specification for Metal Insert Fittings Utilizing a Copper Crimp Ring for SDR9 Cross-linked Polyethylene (PEX) Tubing and SDR9 Crosslinked Polyethylene/Aluminum/Cross-linked Polyethylene (PEX-AL-PEX) Tubing

AWWA

C901-08	Polyethylene (PE) Pressure Pipe and Tubing, ½ In. (13 mm) through 3 In. (76 mm), for Water Service

CSA

B137.1-02	Polyethylene Pipe, Tubing and Fittings for Cold Water Pressure Services
B137.2-02	PVC Injection-moulded Gasketed Fittings for Pressure Applications
B137.3-02	Rigid Poly (Vinyl Chloride) (PVC) Pipe for Pressure Applications

B137.5-02 Cross-linked Polyethylene (PEX) Tubing Systems for Pressure Applications— with Revisions through September 1992

B137.6-02 CPVC Pipe, Tubing and Fittings for Hot and Cold Water Distribution Systems— with Revisions through May 1986

B137.11-02 Polypropylene (PP-R) Pipe and Fittings for Pressure Applications

Reason: Water based ground-source heat pump loop PE piping is currently placed in the hydronics section where it doesn't quite fit. This special and growing application should have its own section, and it should cover other materials that could potentially be used. Green building rating systems are strongly promoting ground-source heat pump loop heating and cooling systems, and the code should have more information. I am introducing this proposal to accomplish that and would hope it would act to encourage further development. While HDPE dominates the technology with an expected 95% of the systems, other materials can and are be utilized in water based ground loop systems.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: Review of proposed new standard AWWA C901-08, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009. All other standards proposed for inclusion are already referenced standards of the International Plumbing Code (IPC).

HYDRONIC PIPING MATERIALS

MATERIAL	USE CODE[a]	STANDARD[b]	JOINTS	NOTES
Raised temperature polyethylene (PE-RT)	1, 2, 3	ASTM F 2623 ASTM F 2769	Copper crimp/insert fitting stainless steel clamp, insert fittings	

(Portions of table not shown remain unchanged)

2. Add new standard to Chapter 44 as follows:

ASTM

F 2769-09	Polyethylene of Raised Temperature (PE-RT) Plastic Hot and Cold-Water Tubing and Distribution Systems

Reason: This change adds a new ASTM standard F2769 for Polyethylene of Raised Temperature (PE-RT) to the IMC. This will provide manufacturers and purchasers with additional options for PE-RT tubing.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: Review of proposed new standard ASTM F 2769-09, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

M141–09/10

Table 1202.5; IRC Table M2101.1

Proponent: Andrew Granzow, Viega, LLC

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IMC COMMITTEE. PART II WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IMC

Revise table as follows:

1202.5 TABLE
HYDRONIC PIPE FITTINGS

MATERIAL	STANDARD (see Chapter 15)
Brass	ASTM F 1974
Bronze	ASME B16.24
Copper and copper alloys	ASME B16.15; ASME B16.18; ASME B16.22; ASME B16.23; ASME B16.26; ASME B16.29; ASTM F 877 ; ASTM F 1807
Ductile iron and gray iron	ANSI/AWWA C110/A21.10
Ductile iron	ANSI/AWWA C153/A21.53;
Gray iron	ASTM A 126
Malleable iron	ASME B16.3;
Plastic	ASTM D 2466; ASTM D 2467; ASTM D 2468; ASTM F 438; ASTM F 439; ASTM F 877; ASTM F 2159; ASTM F 2389
Steel	ASME B16.5; ASME B16.9; ASME B16.11; ASME B16.28 ASTM A 420

Reason: To include nationally recognized standards for piping materials currently being used for hydronic applications.

Cost Impact: The code change proposal will not increase the cost of construction.

PART II – IRC MECHANICAL

Revise table as follows:

TABLE M2101.1
HYDRONIC PIPING MATERIALS

MATERIAL	USE CODE[a]	STANDARD[b]	JOINTS	NOTES
Brass pipe	1	ASTM B 43	Brazed, welded, threaded, mechanical and flanged fittings	
Brass tubing	1	ASTM B 135	Brazed, soldered and mechanical fittings	
Chlorinated poly (vinyl chloride) (CPVC) pipe and tubing	1, 2, 3	ASTM D 2846	Solvent cement joints, compression joints and threaded adapters	
Copper pipe	1	ASTM B 42, B 302	Brazed, soldered and mechanical fittings threaded, welded and flanged	
Copper tubing (type K, L or M)	1, 2	ASTM B 75, B 88, B 251, B 306	Brazed, soldered and flared mechanical fittings	Joints embedded in concrete
Cross-linked polyethylene (PEX)	1, 2, 3	ASTM F 876, F 877	(See PEX fittings)	Install in accordance with manufacturer's instructions.
Cross-linked polyethylene/aluminum/ cross-linked polyethylene-(PEX-AL-PEX) pressure pipe	1, 2	ASTM F 1281 or CAN/ CSA B137.10	Mechanical, crimp/insert	Install in accordance with manufacturer's instructions.
PEX Fittings		ASTM F 877 ASTM F 1807 ASTM F 1960 ASTM F 2098 ASTM F 2159	Copper-crimp/insert fittings, cold expansion fittings, stainless steel clamp, insert fittings, plastic-crimp/insert fittings	Install in accordance with manufacturer's instructions
~~Plastic fittings PEX~~		~~ASTM F 1807~~		
Polybutylene (PB) pipe and tubing	1, 2, 3	ASTM D 3309	Heat-fusion, crimp/insert and compression	Joints in concrete shall be heat-fused.
Polyethylene (PE) pipe, tubing and fittings (for ground source heat pump loop systems)	1, 2, 4	ASTM D 2513; ASTM D 3350; ASTM D 2513; ASTM D 3035; ASTM D 2447; ASTM D 2683; ASTM F 1055; ASTM D 2837; ASTM D 3350; ASTM D 1693	Heat-fusion	
Polyethylene/aluminum/polyethylene (PE-AL-PE) pressure pipe	1, 2, 3	ASTM F 1282 CSA B 137.9	Mechanical, crimp/insert	
Polyproplylene (PP)	1, 2, 3	ISO 15874 ASTM F 2389	Heat-fusion joints, mechanical fittings, threaded adapters, compression joints	
Raised temperature polyethylene (PE-RT)	1, 2, 3	ASTM F 2623	Copper crimp/insert fitting stainless steel clamp, insert fittings	
Soldering fluxes	1	ASTM B 813	Copper tube joints	
Steel pipe	1, 2	ASTM A 53, A 106	Brazed, welded, threaded, flanged and mechanical fittings	Joints in concrete shall be welded. Galvanized pipe shall not be welded or brazed.
Steel tubing	1	ASTM A 254	Mechanical fittings, welded	

For SI: ºC = [(ºF)-32]/1.8.

a. Use code:
   1. Above ground.
   2. Embedded in radiant systems.
   3. Temperatures below 180°F only.
   4. Low temperature (below 130°F) applications only.

b. Standards as listed in Chapter 44.

Reason: (Row #8-PEX Fittings-ASTM F877) The added standard reference clearly identifies a nationally recognized standard for PEX fittings and allows installers the option to utilize products under this standard for use in residential PEX hydronic applications.

"ASTM F877 - 07 Standard Specification for Crosslinked Polyethylene (PEX) Plastic Hot- and Cold-Water Distribution Systems"

(Row #8-PEX Fittings-ASTM F2159) The added standard reference clearly identifies a nationally recognized standard for PEX fittings and allows installers the option to utilize products under this standard for use in residential PEX hydronic applications.

"ASTM F2159 - 05 Standard Specification for Plastic Insert Fittings Utilizing a Copper Crimp Ring for SDR9 Cross-linked Polyethylene (PEX) Tubing"

(Row #9-Plastic Fittings PEX) The standard identified above makes no reference to plastic fittings and therefore the code reference is not consistent with the intent of the standard. This proposed code change has no impact on the use of product manufactured to this standard as this standard is already referenced in the appropriate section of the table under "PEX fittings". Below is the title and scope of F1807

"ASTM F1807 - 08 Standard Specification for Metal Insert Fittings Utilizing a Copper Crimp Ring for SDR9 Cross-linked Polyethylene (PEX) Tubing"

"1. Scope
1.1 This specification covers metal insert fittings and copper crimp rings for use with cross-linked polyethylene (PEX) tubing in $^{3}/_{8}$, ½, $^{5}/_{8}$, ¾, and 1 in. and 1 $^{1}/_{4}$ nominal diameters that meet the requirements for Specifications F 876 and F 877. These fittings are intended for use in 100 psi (689.5 kPa) cold- and hot-water distribution systems operating at temperatures up to, and including, 180°F (82°C). The requirements for materials, workmanship, dimensions, and markings to be used on the fittings and rings are also included.
1.2 The values stated in inch-pound units are to be regarded as the standard. The values given in parentheses are mathematical conversions to SI units which are provided for information only and are not considered the standard.
1.3 Compliance with this specification requires that these fittings be tested and certified to Specification F 877.
1.4 This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use. "

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

PART II – IRC MECHANICAL

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: GRANZOW-M-1-T. 1202.5-RM-T. M2101.1

M142–09/10
Table 1202.5, Chapter 15; Table M2101.1, Chapter 44

Proponent: Larry Gill, IPEX, Inc.

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IMC COMMITTEE. PART II WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IMC

1. Revise table as follows:

TABLE 1202.5
HYDRONIC PIPE FITTINGS

MATERIAL	STANDARD
Plastic	ASTM D2466; ASTM D2467; ASTM D2468; ASTM F438; ASTM F439; ASTM F877; ASTM F2389; <u>ASTM F2735</u>

(Portions of table not shown remain unchanged)

2. Add new standard to Chapter 15 as follows:

ASTM
F 2735-08a Standard Specification for SDR9 Cross-linked Polyethylene (PEX) and Raised Temperature (PE-RT) Tubing

PART II – IRC MECHANICAL

1. Revise table as follows:

TABLE M2101.1
HYDRONIC PIPING MATERIALS

MATERIAL	USE CODE[a]	STANDARD[b]	JOINTS	NOTES
Plastic Fittings PEX		ASTM F 1807 ASTM F 2735		

(Portions of table not shown remain unchanged)

2. Add new standard to Chapter 44 as follows:

ASTM
F 2735-08a Standard Specification for SDR9 Cross-linked Polyethylene (PEX) and Raised Temperature (PE-RT) Tubing

Reason: This Code change will add the new ASTM F 2735 standard as a new fittings standard for plastics to the IMC. This will provide manufacturers and purchasers with additional options for PEX and PE-RT fittings.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: Review of proposed new standard ASTM F 2735-08a, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

PART I – IMC

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

PART II – IRC MECHANICAL

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

M143–09/10
1203.1.1

Proponent: Walter Sperko, PE, Sperko Engineering, representing the Mechanical Contractors Association of America

Delete without substitution:

~~**1203.1.1 Joints between different piping materials.** Joints between different piping materials shall be made with *approved* adapter fittings. Joints between different metallic piping materials shall be made with *approved* dielectric fittings or brass converter fittings.~~

Reason: When the chemical makeup of the water or steam in a hydronic system is controlled to minimize the corrosion of the materials in the piping system, that control also eliminates any selective corrosion of dissimilar metal connections. There are thousands of hydronic piping systems where copper, steel and aluminum are used successfully without dielectric fittings or brass converters, and they work fine. When failure does occur due to water chemistry excursions, failures are system-wide, not just at dissimilar metal joints.

Bibliography: "Dissimilar Metals in Heating and AC Piping" April, 2009 by Walter J. Sperko, P.E.

Cost Impact: The code change proposal will reduce construction costs by eliminating an unnecessary component and maintenance costs since dielectric couplings used in hot water systems (>170°F) will leak after several thermal cycles.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: SPERKO-M-2-1203.1.1

M144–09/10
1203.1.1

Proponent: Andrew Granzow, Viega, LLC

Revise as follows:

1203.1.1 Joints between different piping materials. Joints between different piping materials shall be made with *approved* adapter fittings. Joints between different metallic piping materials shall be made with *approved* dielectric fittings ~~or~~ brass, or bronze converter fittings.

Reason: Bronze is a proven material the same as brass for converter fittings.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: GRANZOW-M-2-1203.1.1

M145–09/10
1203.3.4

Proponent: David W. Ash, Lubrizol Advanced Materials, Inc.

Revise as follows:

1203.3.4 Solvent-cemented joints. Joint surfaces shall be clean and free of moisture. An approved primer shall be applied to CPVC and PVC pipe-joint surfaces. Joints shall be made while the cement is wet. Solvent cement conforming to the following standards shall be applied to all joint surfaces:

1. ASTM D 2235 for ABS joints.
2. ASTM F 493 for CPVC joints.
3. ASTM D 2564 for PVC joints.

CPVC joints shall be made in accordance with ASTM D 2846.

Exception: For CPVC pipe-joint connections, a primer is not required where all of the following conditions apply:

1. The solvent cement used is third-party certified as conforming to ASTM F 493.
2. The solvent cement used is yellow in color.
3. The solvent cement is used only for joining 1/2 inch (12.7 mm) through 2 inch (51 mm) diameter CPVC pipe and fittings.
4. The CPVC pipe and fittings are manufactured in accordance with ASTM D 2846.

Reason: One step CPVC solvent cement has been allowed by the International Plumbing Code for a number of years for water distribution systems. This is proven technology and should be recognized for hydronic applications as well.

There are existing one step solvent cements for CPVC that meet the requirements of ASTM D2846 and ASTM F493.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: ASH-M-1-1203.3.4

M146–09/10
1203.8

Proponent: Andrew Granzow, Viega, LLC

Revise as follows:

1203.8 Copper or copper-alloy tubing. Joints between copper or copper-alloy tubing or fittings shall be brazed, mechanical or soldered joints conforming to Section 1203.3; flared joints conforming to Section 1203.8.1, ~~or~~ push fit joints conforming to Section 1203.8.2, or press type joints conforming to Section 1203.8.3.

Reason: This code change will clarify/ confirm press type joints are to be installed in accordance with the manufacturer's instructions.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: GRANZOW-M-4-1203.8

M147–09/10
1203.8.3 (New)

Proponent: Andrew Granzow, Viega, LLC

Add new text as follows:

1203.8.3 Press joints. Press joints shall be installed in accordance with the manufacturer's installation instructions.

Reason: This code change will establish the installation requirements for press joints.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: GRANZOW-M-3-1203.8.3

M148–09/10
1203.20 (New); IRC M2104.5 (New)

Proponent: Julius Ballanco, P.E., JB Engineering and Code Consulting, P.C.

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IMC COMMITTEE. PART II WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IMC

Add new text as follows:

1203.20 Listed joints and connections. Joints and connections that are not otherwise addressed in Section 1203 shall be certified by a third party agency as acceptable for hydronic piping systems. The joints and connections shall be installed in accordance with their certification and manufacturer's installation instructions.

PART II – IRC MECHANICAL

Add new text as follows:

M2104.5 Listed joints and connections. Joints and connections that are not otherwise addressed in Section 2104 of the *International Mechanical Code* shall be certified by a third party agency as acceptable for hydronic piping systems. The joints and connections shall be installed in accordance with their certification and manufacturer's installation instructions.

Reason: There are various types of joints and connections utilized in water distribution and water supply systems that are not listed in Section 605. However, these joints or connections are listed by a third party agency as being acceptable for water distributions systems. This new section will indicate that such joints and connections are acceptable. Some examples of these types of joints and connections are unions, rolled groove fittings, and cut groove fittings.

Cost Impact: The code change proposal will not increase the cost of construction.

PART I – IMC

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

PART II – IRC MECHANICAL

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: BALLANCO-M-2-1203.20-M1204.5

M149–09/10
Table 1302.3, Chapter 15

Proponent: Bob Eugene, Underwriters Laboratories, Inc.

1. Revise table as follows:

TABLE 1302.3
FUEL OIL PIPING

PIPE OR TUBING TYPE ~~MATERIAL~~	STANDARD (see Chapter 15)
Brass pipe	ASTM B43
Brass tubing	ASTM B135
Copper or copper-alloy pipe	ASTM B42; ASTM B302
Copper or copper-alloy tubing (Type K, L or M)	ASTM B75; ASTM B88; ASTM B280
~~Labeled~~ Nonmetallic pipe	(See Section 1302.4)
~~Nonmetallic pipe~~	~~ASTM D2996~~
Steel pipe	ASTM A53; ASTM A106
Steel tubing	ASTM A254; ~~ASTM A539~~
Metallic Underground Fuel Pipe	UL 971A
Nonmetallic Underground Fuel Pipe	UL 971

2. Add new standards to Chapter 15 as follows:

UL
971-95 Nonmetallic Underground Piping For Flammable Liquids – with revisions through March 2006
971A-06 Outline of Investigation for Metallic Underground Fuel Pipe

Reason: This proposal accomplishes the following:

1. The first column of the table is not material, but specific pipe and tubing types.
2. The reference to “Labeled pipe” requirements in the table applies to ‘Nonmetallic pipe’, the title of section 1302.4.
3. ASTM D2996 is limited to only FRP pipe, so it does not reflect other forms of ‘nonmetallic pipes’ used in fuel applications today. In addition this standard does not contain any physical assembly, use/misuse tests or fuel compatibility tests, such as those found in UL971, which would make it suitable for use in fuel oil piping applications.
4. ASTM A539 was withdrawn without replacement in 1999.
5. The proposed new standard (UL 971) for nonmetallic underground fuel pipe and the Outline of Investigation (UL 971A) for metallic underground fuel pipe include a comprehensive set of construction and performance requirements, including tests to address physical abuse and misuse, and long-term compatibility with fuels and fluids.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: Review of proposed new standards, UL 971-95 and UL 971A-06, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: EUGENE-M-31-T. 1302.3-CH 15

M150–09/10
1302.4, Chapter 15

Proponent: Bob Eugene, Underwriters Laboratories, Inc.

1. Revise as follows:

1302.4 Nonmetallic pipe. All nonmetallic pipe and connectors shall be *listed* and *labeled* as being acceptable for the intended application for flammable and combustible liquids. Nonmetallic pipe shall be installed only ~~outside~~ outdoors, underground.

Exception: Nonmetallic flexible connectors listed and labeled for aboveground use in accordance with UL 2039 shall be permitted to be installed aboveground.

2. Add new standard to Chapter 15 as follows:

UL
2039-02 Outline of Investigation for Flexible Connectors for Flammable Liquids

Reason: This proposal clarifies that both nonmetallic pipe and connectors need to be listed and labeled. In addition it allows flexible nonmetallic connectors listed in accordance with UL 2039 to be installed aboveground.

The Subject 2039 Outline of Investigation includes a comprehensive set of performance requirements for evaluating metallic and nonmetallic connectors for aboveground and underground transfer of noncorrosive, stable, flammable and combustible liquids. The connectors have a maximum length of eight feet.

Connectors listed in accordance with 2039 are fabricated, inspected, and tested for leakage before shipment from the factory as completely assembled vessels.

The intended use of these connectors is for the transfer of flammable and combustible liquids in, among other applications, underground carrier piping to a dispenser, carrier piping in an open dispenser sump to a dispenser, carrier piping in an open tank sump to a tank pump, and aboveground carrier piping to an aboveground tank.

Six companies currently have listings for these products.

In the second sentence, the intent is “outdoors” and the word “outside” does not necessarily mean outdoors.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: Review of proposed new standard UL 22039-02, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

Public Hearing:				
	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: EUGENE-M-32-1302.4-CH 15

1306.4, Chapter 15; IRC M2201.5, Chapter 44

Proponent: Bob Eugene, Underwriters Laboratories, Inc.

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IMC COMMITTEE. PART II WILL BE HEARD BY THE IRC MECHANICAL COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IMC

1. Revise as follows:

1306.4 Gauging devices. Gauging devices such as liquid level indicators or signals shall be designed and installed so that oil vapor will not be discharged into a building from the liquid fuel supply system. Liquid-level indicating gauges shall comply with UL 180.

2. Add new standard to Chapter 15 as follows:

UL
180-03 Liquid-Level Indicating Gauges for Oil Burner Fuels – with revisions through March 2007

PART II – IRC MECHANICAL

1. Revise as follows:

M2201.5 Oil gauges. Inside tanks shall be provided with a device to indicate when the oil in the tank has reached a predetermined safe level. Glass gauges or a gauge subject to breakage that could result in the escape of oil from the tank shall not be used. Liquid-level indicating gauges shall comply with UL 180.

2. Add new standard to Chapter 44 as follows:

UL
180-03 Liquid-Level Indicating Gauges for Oil Burner Fuels – with revisions through March 2007

Reason: UL 180 includes a comprehensive set of construction and performance requirements that are specifically used to evaluate and list liquid level indicating gauges for oil burner fuels. Three companies currently have burner-fuel liquid level gauges listed.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: Review of proposed new standard UL 180-03, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

Proponent: Bob Eugene, Underwriters Laboratories, Inc.

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IMC COMMITTEE. PART II WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IMC

1. Revise as follows:

1307.1 Building shutoff. A shutoff valve shall be installed on the fuel-oil supply line at the entrance to the building. Inside or above-ground tanks are permitted to have valves installed at the tank. The valve shall be capable of stopping the flow of fuel oil to the building or to the appliance served where the valve is installed at a tank inside the building. Valves shall comply with UL 842.

2. Add new standard to Chapter 15 as follows:

UL
842-07 Valves for Flammable Fluids

PART II – IRC MECHANICAL

1. Revise as follows:

M2204.2 Shutoff valves. A *readily accessible* manual shutoff valve shall be installed between the oil supply tank and the burner. Where the shutoff valve is installed in the discharge line of an oil pump, a pressure-relief valve shall be incorporated to bypass or return surplus oil. Valves shall comply with UL 842.

2. Add new standard to Chapter 44 as follows:

UL
842-07 Valves for Flammable Fluids

Reason: UL 842 includes a comprehensive set of construction and performance requirements that are specifically used to evaluate and list valves that are intended to be used for the control of flammable fluids, commonly used in piping systems and in the assembly of fuel burning equipment. These valves are of the manually operated, pressure operated, or temperature operated types, or combinations of such to the exclusion of types operated wholly or partially by electricity.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: Review of proposed new standard ASTM F 842-07, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

M153–09/10
Chapter 15

Proponent: Guy Tomberlin, Fairfax County, VA, representing the Virginia Plumbing and Mechanical Inspectors/Virginia Building and Code Officials

Revise standard reference in Chapter 15 as follows:

UL

2043-~~2008~~ 96 Fire Test for Heat and Visible Smoke Release for Discrete Products and their Accessories Installed in Air-handling Spaces

Reason: This change was not just an update of the standard. The title and scope were completely overhauled and expanded to incorporate many more products than the 1996 edition addressed. The new scope expansion now incorporates plumbing and mechanical products, not just electrical, which would allow many more products to be installed within a plenum space that do not meet flame spread and smoke developed ratings of 25/50 when tested in accordance with ASTM E 84. This new edition of this Standard virtually makes ASTM E 84 void and null. ASTM E 84 has been the industry standard for many years and has assured safe plenum spaces with limited allowance for many plumbing and mechanical products that simply cannot meet its provisions by producing the results of 25/50 ratings. But now, many of these products will be acceptable in plenum spaces because they can otherwise meet the provisions of the UL 2043, 2008 edition. During the Final Action Hearings in MN, M 72 was disapproved. This was the proposal to the IMC text that would have incorporated the new provisions and the reference to this new Standard that would have allowed the expanded testing provisions of UL 2043 for plumbing and mechanical products to be installed within plenum spaces. For informational purposes, it is important to be aware that the IMC Code Development Committee disapproved the same change during the Public Comment Hearings in the first half of the last code change cycle. Based on the disapproval action of M 72 the proponent should have withdrawn their proposed reference to this new edition. Unfortunately, now we have a Standard in the 2009 IMC that includes many allowances that the code text itself does not contain provisions for. This leads to misapplication of the code provisions. Uniformity, ease of use and consistent application of the code has been the primary focus of Virginia's participation in the code development process over the years and this situation falls well beyond that philosophy.

If you look in the 2009 edition of the IMC you will find the only location that references UL 2043, is Section 602.2.1.4.2. This Section is specific to "electrical" *equipment in combustible enclosures*.

Just a side note, you will also notice that the reference to UL 2043–2008 was inadvertently omitted in the first print edition of the 2009 IMC Chapter 15 Reference Standards, altogether .

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: It is the opinion of staff that the 1996 Edition of UL 2043 does not comply with Sections 3.6.3.1 and 3.6.3.2 of CP #28 as it is no longer readily available and no longer maintained. Staff was not required to evaluate the 2008 edition of UL 2043 for compliance with CP #28 because the standard was a currently referenced standard at the time it was updated from the 1996 to 2008 edition.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: TOMBERLIN-M-17-CHAPTER 15

M154–09/10
Appendix A

Proponent: Sam Dardano, City of Boulder, CO, representing CO Association of Plumbing and Mechanical Officials (CAPMO)

Delete without substitution:

~~Figures A-1 through A-4 are illustrations of appliances located in confined spaces.~~

~~For SI: 1 square inch = 645 mm2, 1 British thermal unit per hour = 0.2931 W.~~

~~FIGURE A-1~~
~~ALL AIR FROM INSIDE THE BUILDING~~

~~NOTE: Each opening shall have a free area of not less than 1 square inch per 1,000 Btu per hour of the total input rating of all appliances in the enclosure and not less than 100 square inches.~~

~~For SI: 1 square inch = 645 mm2, 1 British thermal unit per hour = 0.2931 W.~~

~~FIGURE A-2~~
~~ALL AIR FROM OUTDOORS—INLET AIR FROM VENTILATED CRAWL SPACE AND OUTLET AIR TO VENTILATED ATTIC~~

~~NOTE: The inlet and outlet air openings shall each have a free area of not less than 1 square inch per 4,000 Btu per hour of the total input rating of all appliances in the enclosure.~~

~~For SI: 1 foot = 304.8 mm, 1 square inch = 645 mm2, 1 British thermal unit per hour = 0.2931 W.~~

~~FIGURE A-3~~
~~ALL AIR FROM OUTDOORS THROUGH VENTILATED ATTIC~~

~~NOTE: The inlet and outlet air openings shall each have a free area of not less than 1 square inch per 4,000 Btu per hour of the total input rating of all appliances in the enclosure.~~

~~For SI: 1 foot = 304.8 mm, 1 square inch = 645 mm2, 1 British thermal unit per hour = 0.2931 W.~~

~~FIGURE A-4~~
~~ALL AIR FROM OUTDOORS THROUGH HORIZONTAL DUCTS OR DIRECT OPENINGS~~

~~NOTE: Each air duct opening shall have a free area of not less than 1 square inch per 2,000 Btu per hour of the total input rating of all appliances in the enclosure. If the appliance room is located against an outside wall and the air openings communicate directly with the outdoors, each opening shall have a free area of not less than 1 square inch per 4,000 Btu per hour or the total input rating of all appliances in the enclosure.~~

(Portions of Appendix not shown remain unchanged)

Reason: As a result of Chapter 7 being re-written, there is no need for the illustrations pertaining to combustion air in Appendix-A, as it is covered under the Standard.

Cost Impact: The code change proposal will not increase the cost of construction.

TENTATIVE ORDER OF DISCUSSION

2009-2010 PROPOSED CHANGES TO THE INTERNATIONAL PLUMBING/PRIVATE SEWAGE DISPOSAL CODE

The following is the tentative order in which the proposed changes to the code will be discussed at the public hearings. Proposed changes which impact the same subject have been grouped to permit consideration in consecutive changes.

Proposed change numbers that are indented are those which are being heard out of numerical order. Indentation **does not** necessarily indicate that one change is related to another. Proposed changes may be grouped for purposes of discussion at the hearing at the discretion of the chair.

P = *International Plumbing Code*
PSD = *International Private Sewage Disposal Code*

P1–09/10

105.4, 105.4.1, 105.4.2, 105.4.3, 105.4.4, 105.4.5, 105.6, Section 315 (New); IPSDC 105.4, 105.4.1, 105.4.2, 105.4.3, 105.4.4, 105.4.5, 105.4.6, Section 304 (New)

Proponent: Lawrence Brown, CBO representing the National Association of Home Builders (NAHB)

THIS IS A 2 PART CODE CHANGE. BOTH PARTS WILL BE HEARD BY THE IPC COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THE IPC COMMITTEE.

PART I - IPC

1. Add new section as follow:

SECTION 315
ALTERNATE ENGINEERED DESIGN

2. Revise as follows:

315.1 ~~105.4~~ Alternative engineered design. The design, documentation, inspection, testing and approval of an *alternative engineered design* plumbing system shall comply with Sections ~~105.4.1~~ 315.1 through 315.6 ~~105.4.6~~.

.

315.1.1 ~~105.4.1~~ Design criteria. An *alternative engineered design* shall conform to the intent of the provisions of this code and shall provide an equivalent level of quality, strength, effectiveness, fire resistance, durability and safety. Material, equipment or components shall be designed and installed in accordance with the manufacturer's installation instructions.

315.2 ~~105.4.2~~ Submittal. The registered design professional shall indicate on the permit application that the plumbing system is an *alternative engineered design*. The permit and permanent permit records shall indicate that an *alternative engineered design* was part of the *approved* installation.

315.3 ~~105.4.3~~ Technical data. The registered design professional shall submit sufficient technical data to substantiate the proposed *alternative engineered design* and to prove that the performance meets the intent of this code.

315.4 ~~105.4.4~~ Construction documents. The registered design professional shall submit to the code official two complete sets of signed and sealed construction documents for the shall include floor plans and a riser diagram of the work. Where appropriate, the construction documents shall indicate the direction of flow, all pipe sizes, grade of horizontal piping, loading, and location of fixtures and appliances.

315.5 ~~105.4.5~~ Design approval. Where the code official determines that the *alternative engineered design* conforms to the intent of this code, the plumbing system shall be *approved*. If the *alternative engineered design* is not *approved*, the code official shall notify the registered design professional in writing, stating the reasons thereof.

315.6 ~~105.4.6~~ Inspection and testing. The *alternative engineered design* shall be tested and inspected in accordance with the requirements of Sections 107 and 312.

PART II – IPSDC

1. Add new section as follow:

SECTION 304
ALTERNATE ENGINEERED DESIGN

2. Revise as follows:

304.1 ~~105.4~~ Alternative engineered design. The design, documentation, inspection, testing and approval of an *alternative engineered design* plumbing system shall comply with Sections ~~105.4.1~~ 304.1 through 304.6 ~~105.4.6~~.

304.1.1 ~~105.4.1~~ Design criteria. An *alternative engineered design* shall conform to the intent of the provisions of this code and shall provide an equivalent level of quality, strength, effectiveness, fire resistance, durability and safety.

Material, equipment or components shall be designed and installed in accordance with the manufacturer's installation instructions.

304.2 ~~105.4.2~~ Submittal. The registered design professional shall indicate on the permit application that the plumbing system is an *alternative engineered design*. The permit and permanent permit records shall indicate that an *alternative engineered design* was part of the *approved* installation.

304.3 ~~105.4.3~~ Technical data. The registered design professional shall submit sufficient technical data to substantiate the proposed *alternative engineered design* and to prove that the performance meets the intent of this code.

304.4 ~~105.4.4~~ Construction documents. The registered design professional shall submit to the code official two complete sets of signed and sealed construction documents for the shall include floor plans and a riser diagram of the work. Where appropriate, the construction documents shall indicate the direction of flow, all pipe sizes, grade of horizontal piping, loading, and location of fixtures and appliances.

304.5 ~~105.4.5~~ Design approval. Where the code official determines that the *alternative engineered design* conforms to
the intent of this code, the plumbing system shall be *approved*. If the *alternative engineered design* is not *approved*, the code official shall notify the registered design professional in writing, stating the reasons thereof.

304.6 ~~105.4.6~~ Inspection and testing. The *alternative engineered design* shall be tested and inspected in accordance with the requirements of Sections 107 and 312.

Reason : This proposal is a companion of other proposals that coordinate the administrative provisions of Chapter 1 of all I-Codes. The provisions show above for an "alternate engineered design" are currently located in Chapter 1 of both the IPC and IPSDC. This "alternate engineered design" is a specific engineering requirement and is not an administrative-type provision. This requirement is better suited to be located in Chapter Three – General.

Cost Impact: The code change proposal will not increase the cost of construction.

PART I – IPC

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

PART II – IPSDC

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Brown-P1-105.4

P2–09/10
202; IRC 202

Proponent: James Anjam, Arlington County, Virginia Plumbing and Mechanical Inspectors Association (VPMIA)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IPC COMMITTEE. PART II WILL BE HEARD BY THE IRC PLUMBING COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I - IPC

Revise as follows:

PLUMBING FIXTURE. A receptacle or device that is ~~either permanently or temporarily~~ directly or indirectly connected to the ~~water distribution system~~ building drainage system. Such receptacles or devices typically, but do not always require a connection to a supply of water. ~~of the premises and demands a supply of water therefrom; discharges wastewater, liquid-borne waste materials or sewage either directly or indirectly to the drainage system of the premises; or requires both a water supply connection and a discharge to the drainage system of the premises~~.

PART II – IRC

Delete and substitute as follows:

~~**PLUMBING FIXTURE.** A receptor or device that requires both a water supply connection and a discharge to the drainage system, such as water closets, lavatories, bathtubs and sinks. Plumbing *appliances* as a special class of fixture are further defined.~~

PLUMBING FIXTURE. A receptacle or device that is directly or indirectly connected to the building drainage system. Such receptacles or devices typically, but do not always require a connection to a supply of water.

Reason: The current plumbing fixture definition is confusing and out of date. According to the current code, waterless urinals and floor drains are not considered to be plumbing fixtures. This proposal updates and simplifies the code.

Cost Impact: The code change proposal will not increase the cost of construction.

PART I – IPC

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

PART II – IRC

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: ANJAM-P1-202

P3–09/10
202

Proponent: Robert Burke, University of Colorado representing the Colorado Association of Plumbing and Mechanical Officials (CAPMO)

Revise as follows:

PLUMBING APPLIANCE. ~~Any one of a special class of plumbing fixtures~~ Water-connected or drain-connected devices intended to perform a special function. ~~Included are fixtures having the~~ These devices have their operation or control dependent on one or more energized components, such as motors, controls, or heating elements ~~or pressure or temperature sensing elements~~. Such ~~fixtures~~ devices are manually adjusted or controlled by the owner or operator, or are operated automatically through one or more of the following actions; a time cycle, a temperature range, a pressure range, a measured volume or weight.

Reason: We need clear distinctions between appliances and fixtures since the code responds to these two classes differently.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Burke-P4-202

P4–09/10
202

Proponent: Judson Collins, JULYCO, representing self

Revise definition as follows:

COMBINATION WASTE AND VENT SYSTEM. A specially designed system of waste piping embodying the horizontal wet venting of one or more sinks, lavatories, drinking fountains or floor drains by means of a common waste and vent pipe adequately sized to provide free movement of air above the flow line of the drain.

Reason: The title of Section 912 is "COMBINATION DRAIN AND VENT SYSTEM. The text in the sections in 912 use the term "combination drain and vent" throughout. The term "combination waste and vent system" is not used in Section 912. The definition should define the term used in 912. The current definition only identifies sinks and floor drains as fixtures that are allowed to be vented by this method. The text in 912 also allows lavatories and drinking fountains to be vented by this method. This proposal modifies the definition to properly identify the fixtures allowed to be vented by a combination drain and vent system.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: COLLINS-P5-202

P5–09/10
202

Proponent: Andrew Granzow, Viega LLC

Revise as follows:

MECHANICAL JOINT. A connection between pipes, fittings, or pipes and fittings <u>such as flanged, pressed, flared, compression, and push-fit joining systems</u> that ~~is~~ <u>are</u> not screwed, caulked, threaded, soldered, solvent cemented, brazed or welded. A joint in which compression is applied along the centerline of the pieces being joined. In some applications, the joint is a part of a coupling, fitting or adapter.

Reason: The proposed change includes text to identify types of mechanical joints.

Cost Impact: This code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: GRANZOW-P1-202

P6 –09/10
202 (New)

Proponent: Cort Strain, University of Colorado representing the Colorado Association of Plumbing and Mechanical Officials (CAPMO)

Add new definition as follows:

<u>**DEVICE.** A piece of equipment or a mechanism designed to serve a special purpose or perform a special function.</u>

Reason: Device is a code term that should be defined.

Cost Impact: There will be no cost impact to construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Strain-P5-202 DEVICE

P7–09/10
303.1, 303.4, Table 303.4; IRC P2608.1, P2608.4, Table P2608.4

Proponent: Becky Baker, Jefferson County Colorado, representing the Colorado Association of Plumbing Mechanical Officials

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IPC COMMITTEE. PART II WILL BE HEARD BY THE IRC PLUMBING COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I - IPC

1. Revise as follows:

303.1 Identification. Each length of pipe and each pipe fitting, trap, fixture, material and device utilized in a plumbing system shall bear the identification of the manufacturer and any markings required by the applicable referenced standards.

303.4 Third-party ~~testing and~~ certification. All plumbing products and materials shall ~~comply~~ be listed by a third-party certification agency as complying with the referenced standards, specifications and performance criteria of this code. ~~and shall be identified in accordance with Section 303.1. When required by Table 303.4, plumbing products and materials shall either be tested by an approved third – party testing agency or certified by an approved third – party certification agency.~~ Products and materials shall be identified in accordance with Section 303.1.

2. Delete table without substitution:

~~**TABLE 303.4**~~
~~**PRODUCTS AND MATERIALS REQUIRING THIRD-PARTY TESTING AND THIRD-PARTY CERTIFICATION**~~

~~PRODUCT OR MATERIAL~~	~~THIRD-PARTY CERTIFIED~~	~~THIRD-PARTY TESTED~~
~~Potable water supply system components and potable water fixture fittings~~	~~Required~~	~~-~~
~~Sanitary drainage and vent system components~~	~~Plastic pipe, fittings and pipe-related components~~	~~All others~~
~~Waste fixture fittings~~	~~Plastic pipe, fittings and pipe-related components~~	~~All others~~
~~Storm drainage system components~~	~~Plastic pipe, fittings and pipe-related components~~	~~All others~~
~~Plumbing fixtures~~	~~-~~	~~Required~~
~~Plumbing appliances~~	~~Required~~	~~-~~
~~Backflow prevention devices~~	~~Required~~	~~-~~
~~Water distribution system safety devices~~	~~Required~~	~~-~~
~~Special waste system components~~	~~-~~	~~Required~~
~~Subsoil drainage system components~~	~~-~~	~~Required~~

PART II - IRC

1. Revise as follows:

P2608.1 Identification. Each length of pipe and each pipe fitting, trap, fixture, material and device utilized in a plumbing system shall bear the identification of the manufacturer and any markings required by the applicable referenced standards.

P2608.4 Third-party ~~testing and~~ certification. All plumbing products and materials shall ~~comply~~ be listed by a third-party certification agency as complying with the referenced standards, specifications and performance criteria of this code. ~~and shall be identified in accordance with Section P2608.1. When required by Table P2608.4, plumbing products and materials shall either be tested by an approved third – party testing agency or certified by an approved third – party certification agency.~~ Products and materials shall be identified in accordance with Section P2608.1.

2. Delete table without substitution:

~~**TABLE P2608.4**~~
~~**PRODUCTS AND MATERIALS REQUIRING THIRD-PARTY TESTING AND THIRD-PARTY CERTIFICATION**~~

~~PRODUCT OR MATERIAL~~	~~THIRD-PARTY CERTIFIED~~	~~THIRD-PARTY TESTED~~
~~Potable water supply system components and~~	~~Required~~	~~-~~

~~potable water fixture fittings~~		
~~Sanitary drainage and vent system components~~	~~Plastic pipe, fittings and pipe-related components~~	~~All others~~
~~Waste fixture fittings~~	~~Plastic pipe, fittings and pipe-related components~~	~~All others~~
~~Storm drainage system components~~	~~Plastic pipe, fittings and pipe-related components~~	~~All others~~
~~Plumbing fixtures~~	~~-~~	~~Required~~
~~Plumbing appliances~~	~~Required~~	~~-~~
~~Backflow prevention devices~~	~~Required~~	~~-~~
~~Water distribution system safety devices~~	~~Required~~	~~-~~
~~Special waste system components~~	~~-~~	~~Required~~
~~Subsoil drainage system components~~	~~-~~	~~Required~~

Reason: The revision to IPC Section 303.1 (IRC Section P2608.1)
1. To make it clear that the code intends that the identification requirements in any referenced standard(s) be met.
2. To require that the mark of the third-party certification agencies be applied to listed products. This is needed so that the inspector knows that the product has been certified by a third party agency.

The revision to IPC Section 303.4 (IRC Section P22608.4) and the deletion of IPC Table 303.4 (IRC Table P2608.1)
1. To make the job of the easier since inspectors don't have time to review test reports and
2. To create a more uniform means to enforce code requirements among the various products governed by the code.

Cost Impact: The code change proposal will not increase the cost of construction.

PART I – IPC

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

PART II – IRC

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: BAKER-P1-303.1

P8–09/10
305.2; IRC P2603.3

Proponent: Shawn Strausbaugh, Arlington County, VA representing Virginia Plumbing and Mechanical Inspectors Association

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IPC COMMITTEE. PART II WILL BE HEARD BY THE IRC PLUMBING COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I - IPC

Delete without substitution:

~~305.2 Breakage. Pipes passing through or under walls shall be protected from breakage.~~

(Renumber subsequent sections)

PART II - IRC

Revise as follows:

P2603.3 Breakage and corrosion. ~~Pipes passing through or under walls shall be protected from breakage.~~ Pipes passing through concrete or cinder walls and floors, cold-formed steel framing or other corrosive material shall be

protected against external corrosion by a protective sheathing or wrapping or other means that will withstand any reaction from lime and acid of concrete, cinder or other corrosive material. Sheathing or wrapping shall allow for for movement including expansion and contraction of piping. Minimum wall thickness of material shall be 0.025 inch (0.64mm).

Reason
(PART I) This section appears to be unenforceable. The installation of piping per the manufacturer's installation instructions and per the code sections that follow this section such as 305.3 through 305.9 clearly state the means of protecting piping from breakage.
(PART II) The portion of the section removed appears to be unenforceable. The installation of piping per the manufacturer's installation instructions and per the code sections that follow this section such as the remainder of P2603.3 through P2603.6 clearly state the means of protecting piping from breakage. This change is also similar to the proposed change to the IPC.

Cost Impact: The code change proposal will not increase the cost of construction.

PART I – IPC

ICCFILENAME: STRAUSBAUGH-P3-305.2

P9–09/10
305.3.1 (New)

Proponent: Ronald L, George, CIPE, CPD, President of Ron George Design & Consulting Services representing himself

Add new text as follows:

305.3.1 Thermal expansion calculations. Where a piping system design has straight runs of piping exceeding 100 feet in length, the designer shall submit calculations and design drawings to the code official indicating the changes in pipe length due to the difference between installation temperatures and the anticipated hot and cold service temperature extremes. The drawings shall indicate how the changes in pipe length will be accommodated.

Reason: Thermal expansion occurred in a high rise building where the contractor made a material substitution the riser grew significantly and ripped apart several joints when the system was brought up to temperature. This code change is intended to assure that thermal expansion issues have been properly addressed by the designer and system installer.

Cost Impact: Minimal.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: GEORGE-P2-305.3.1 NEW

P10–09/10
305.5; IRC P2603.5

Proponent: Shawn Strausbaugh, Arlington County, VA representing Virginia Plumbing and Mechanical Inspectors Association

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IPC COMMITTEE. PART II WILL BE HEARD BY THE IRC PLUMBING COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I - IPC

Revise as follows:

305.5 Pipes through ~~or under footings or~~ foundation walls. Any pipe that passes ~~under a footing or~~ through a foundation wall shall be provided with a relieving arch, or a pipe sleeve pipe shall be built into the foundation wall. The sleeve shall be two pipe sizes greater than the pipe passing through the wall.

PART II - IRC

Revise as follows:

P2603.5 Pipes through ~~footings or~~ foundation walls. Any pipe that passes ~~under a footing or~~ through a foundation wall shall be provided with a relieving arch, or a pipe sleeve shall be built into the foundation wall. The sleeve shall be two pipe sizes greater than the pipe passing through the wall.

Reason: A sleeve should not be required where a pipe passes under a footing as the footing acts as a relieving arch.

Cost Impact: The code change proposal will not increase the cost of construction.

PART I – IPC

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

PART II – IRC

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: STRAUSBAUGH-P5-305.5

P11–09/10
308.9

Proponent: Gregory A. Farmer, PE representing ASPE Legislative Committee, ASPE

Revise as follows:

308.9 Parallel water distribution systems. Piping bundles for manifold systems shall be supported in accordance with Table 308.5. Support at changes in direction shall be in accordance with the manufacturer's installation instructions. ~~Hot and c~~Cold water and uninsulated hot water piping shall not be grouped in the same bundle.

Reason: The purpose of separation between the hot water and cold water piping is to prevent heat transfer. Insulation on the hot water piping accomplishes the same objective. Allowing the insulated piping to be in the same pipe bundle will reduce labor and material costs.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: FARMER-P1-308.9

P12–09/10
310.4 (New)

Proponent: Marcelo M. Hirschler (GBH International) representing the American Fire Safety Council

Add new text as follows:

310.4 Exposed insulation. Where insulating materials are installed on exposed elements within toilet rooms, the materials shall comply with Section 719 of the International Building Code.

(Renumber subsequent sections)

Reason: This proposal appears to state the obvious but there has been some discussion as to whether the IBC applies when it is not explicitly referenced in the IPC and this language will help clarify. This proposal is intended to build on the language in existing Section 310.3 of the IPC. **"310.3 Interior finish.** Interior finish surfaces of toilet rooms shall comply with the *International Building Code*."

It is my belief that Section 310.3, although it contains vague code language, is important because it directs the IPC code user to the appropriate requirements for interior finish in the IBC. This includes not only the information on the requirements in Section 1210 of the IBC (related to the use of impervious floors, walls, caulking, etc. so that sanitation can be maintained) but also the information on the fire properties of interior finish in the IBC. For example it is essential that the users of the IPC be aware that toilet partitions (or other interior finish) made of some smooth and impervious surfaces that potentially have very poor fire performance, such as HDPE (high density polyethylene), must comply with the fire safety requirements of Chapter 8 of the IBC. I have also made a proposal to the IBC in this cycle to upgrade the fire safety requirements for another material used as interior finish (often via toilet partitions) for bathrooms: polypropylene. Both HDPE and polypropylene ignite easily and generate very high heat release when they burn.

In the same way as 310.3 appropriately directs the IPC code user to the requirements of Sections 1210 and Chapter 8 of the IBC, this proposal is intended to direct the IPC code user to Section 719 of the IBC, on thermal and sound insulating materials. In particular, my concern is fire safety and the compliance with Section 719.7, to ensure that exposed insulating materials exhibit adequate fire properties.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: HIRSCHLER-P4-310.4

P13–09/10
416.6 (New), 418.4 (New)

Proponent: Marcelo M. Hirschler (GBH International) representing American Fire Safety Council

Add new text as follows:

416.6 Protective Insulation and Coverings. Where protective insulation or protective coverings are installed on exposed water and drain piping, valves, fittings and tubing located beneath lavatories required to be accessible, the materials shall comply with the flame spread index and smoke-developed index requirements of Section 719 of the International Building Code.

418.4 Protective Insulation and Coverings. Where protective insulation or protective coverings are installed on exposed water and drain piping, valves, fittings and tubing located beneath sinks required to be accessible, the materials shall comply with the flame spread index and smoke-developed index requirements of Section 719 of the International Building Code.

Reason: Compliance with ADA requires that "insulation covers" be placed under lavatories and sinks surrounding water supply and drainpipes. These products are clearly both "pipe insulation" and "thermal insulation" products and, therefore, need to comply with the requirements for insulation in the IBC. The ADA requires that exposed hot water and drainpipes under lavatories and sinks be insulated (sections 4.19.4 and 4.24.6). The ICC/ANSI A117.1/2003 Standard (Accessible and Usable Buildings and Facilities 606.6 Exposed Pipes and Surfaces) states that: "Water supply and drainpipes under lavatories and sinks shall be insulated or otherwise configured to protect against contact. There shall be no sharp or abrasive surfaces under lavatories and sinks." This indicates that we are dealing with an exposed insulation product or material.
ASTM C 168 – Standard Terminology Relating to Thermal Insulating Materials, defines as follows:

pipe insulation, n — insulation in a form suitable for application to cylindrical surfaces.

thermal insulation, n — a material or assembly of materials used to provide resistance to heat flow.

Consequently "insulation covers" are insulation and must comply with insulation requirements. Furthermore, the IBC describes, in section 603.1, the combustible materials allowed in buildings of Type I and Type II construction. These materials include "thermal and acoustic insulation" (item 2) as well as 24 other types of materials, as shown below. Section 603 of the IBC clearly states that exposed thermal and acoustic insulation shall have a flame spread index of not more than 25. Section 719 of the IBC is the section that includes all details of the requirements for "Thermal and Sound Insulating Materials".

Within 719, section 719.3 states as follows: "**719.3 Exposed installation.** Insulating materials, where exposed as installed in buildings of any type of construction, shall have a flame spread index of not more than 25 and a smoke-developed index of not more than 450.

Exception: Cellulose loose-fill insulation that is not spray applied complying with the requirements of Section 719.6 shall only be required to meet the smoke-developed index of not more than 450."

This indicates that "exposed insulating materials" must have a flame spread index of not more than 25 and a smoke developed index of not more than 450 (in accordance with ASTM E 84) unless they are cellulose loose fill insulation.

Continuing, the IBC describes the requirements for "insulation and covering on pipe and tubing" materials in section 719.7, which reads as follows: "**719.7 Insulation and covering on pipe and tubing.** Insulation and covering on pipe and tubing shall have a flame spread index of not more than 25 and a smoke-developed index of not more than 450.

Exception: Insulation and covering on pipe and tubing installed in plenums shall comply with the International Mechanical Code."

This indicates that "insulation and covering on pipe and tubing" materials must have a flame spread index of not more than 25 and a smoke developed index of not more than 450 (in accordance with ASTM E 84) unless they are installed in plenums.

This code proposal simply presents clarification, which is needed because there have been statements that these “insulation covers” either do not require to meet any fire testing or that they need to meet the requirements of ASTM D 635 instead of those of ASTM E 84.

There are no references to ASTM D 635 in the IFC, IPC or IMC. The only reference to ASTM D 635 in the IBC is in the section 2606.4 addressing light transmitting plastics, as shown below.

“2606.4 Specifications. Light-transmitting plastics, including thermoplastic, thermosetting or reinforced thermosetting plastic material, shall have a self-ignition temperature of 650°F (343°C) or greater where tested in accordance with ASTM D 1929; a smoke-developed index not greater than 450 where tested in the manner intended for use in accordance with ASTM E84, or not greater than 75 where tested in the thickness intended for use in accordance with ASTM D 2843 and shall conform to one of the following combustibility classifications:

Class CC1: Plastic materials that have a burning extent of 1 inch (25 mm) or less where tested at a nominal thickness of 0.060 inch (1.5 mm), or in the thickness intended for use, in accordance with ASTM D 635,

Class CC2: Plastic materials that have a burning rate of 2.5 inches per minute (1.06 mm/s) or less where tested at a nominal thickness of 0.060 inch (1.5 mm), or in the thickness intended for use, in accordance with ASTM D 635.”

It is clear that “insulation covers” are not made of “light transmitting plastics”. In the application of “light transmitting plastics” the fire tests (ASTM D 1929, ASTM D 2843 and ASTM D 635) are basically used as quality control tests since there is an understanding of the fire performance of these materials. Thus it does not make sense for “insulation covers”, or any insulation, to have fire safety associated with a very mild test for plastics, in devices or appliances) such as the ASTM D 635 (scope follows).

Appendix:
IBC section 603.1

603.1 Allowable materials. Combustible materials shall be permitted in buildings of Type I or Type II construction in the following applications and in accordance with Sections 603.1.1 through 603.1.3:

1. Fire-retardant treated wood ...
2. Thermal and acoustical insulation, other than foam plastics, having a flame spread index of not more than 25.
   Exceptions:
   1. Insulation placed between two layers of noncombustible materials without an intervening airspace shall be allowed to have a flame spread index of not more than 100.
   2. Insulation installed between a finished floor and solid decking without intervening airspace shall be allowed to have a flame spread index of not more than 200.
3. Foam plastics in accordance with Chapter 26.
4. Roof coverings ...
5. Interior floor finish and floor covering materials ...
6. Millwork, such as doors ...
7. Interior wall and ceiling finishes ...
8. Trim ...
9. Where not installed over 15 feet (4572 mm) above grade, show windows ...
10. Finish flooring ...
11. Partitions dividing portions of stores ...
12. Stages and platforms ...
13. Combustible exterior wall coverings, balconies ...
14. Blocking such as for handrails, millwork ...
15. Light-transmitting plastics as permitted by Chapter 26.
16. Mastics and caulking materials ...
17. Exterior plastic veneer ...
18. Nailing or furring strips as permitted by Section 803.4.
19. Heavy timber ...
20. Aggregates, component materials and admixtures ...
21. Sprayed fire-resistant materials and intumescent and mastic fire-resistant coatings, ...
22. Materials used to protect penetrations in fire-resistance-rated assemblies ...
23. Materials used to protect joints in fire-resistance-rated assemblies ...
24. Materials allowed in the concealed spaces ...
25. Materials exposed within plenums ...

“ASTM D 635: “Standard Test Method for Rate of Burning and/or Extent and Time of Burning of Plastics in a Horizontal Position”

1. Scope*

1.1 This fire-test-response test method covers a small-scale laboratory screening procedure for comparing the relative linear rate of burning or extent and time of burning, or both, of plastics in the form of bars, molded or cut from sheets, plates, or panels, and tested in the horizontal position.

NOTE 1—This test method, and test method A of IEC 60695-11-10 are technically equivalent.

NOTE 2—For additional information on materials which do not burn to the first reference mark by this test, see Test Method D 3801.

1.2 This test method was developed for polymeric materials used for parts in devices and appliances. The results are intended to serve as a preliminary indication of their acceptability with respect to flammability for a particular application. The final acceptance of the material is dependent upon its use in complete equipment that conforms with the standard applicable to such equipment.

1.3 The classification system described in Appendix X1 is intended for quality assurance and the preselection of component materials for products.

1.4 This standard is used to measure and describe the response of materials, products, or assemblies to heat and flame under controlled conditions, but does not by itself incorporate all factors required for fire hazards or fire risk assessment of materials, products, or assemblies under actual fire conditions.

1.5 This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use. For specific hazards statements, see 9.2.”

Cost Impact: None, because this is normal practice.

Analysis: See companion proposal PX-09/10 (by Hirschler for Section 605.25)

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: HIRSCHLER-P1-416.6 NEW

P14–09/10
605.25 (New), 702.7 (New)

Proponent: Marcelo M. Hirschler (GBH International) representing the American Fire Safety Council

Add new text as follows:

605.25 Protective Insulation and Coverings. Where protective insulation or protective coverings are installed on exposed water supply piping, valves and fittings located beneath lavatories and sinks required to be accessible, the materials shall comply with the flame spread index and smoke-developed index requirements of Section 719 of the International Building Code.

702.7 Protective Insulation and Coverings. Where protective insulation or protective coverings are installed on exposed drain fittings, tubing and piping located beneath lavatories and sinks required to be accessible, the materials shall comply with the flame spread index and smoke-developed index requirements of Section 719 of the International Building Code.

Reason: Compliance with ADA requires that "insulation covers" be placed under lavatories and sinks surrounding water supply and drainpipes. These products are clearly both "pipe insulation" and "thermal insulation" products and, therefore, need to comply with the requirements for insulation in the IBC.

The ADA requires that exposed hot water and drainpipes under lavatories and sinks be insulated (sections 4.19.4 and 4.24.6). The ICC/ANSI A117.1/2003 Standard (Accessible and Usable Buildings and Facilities 606.6 Exposed Pipes and Surfaces) states that: "Water supply and drainpipes under lavatories and sinks shall be insulated or otherwise configured to protect against contact. There shall be no sharp or abrasive surfaces under lavatories and sinks." This indicates that we are dealing with an exposed insulation product or material.

ASTM C 168 – Standard Terminology Relating to Thermal Insulating Materials, defines as follows:

pipe insulation, n — insulation in a form suitable for application to cylindrical surfaces.

thermal insulation, n — a material or assembly of materials used to provide resistance to heat flow.

Consequently "insulation covers" are insulation and must comply with insulation requirements. Furthermore, the IBC describes, in section 603.1, the combustible materials allowed in buildings of Type I and Type II construction. These materials include "thermal and acoustic insulation" (item 2) as well as 24 other types of materials, as shown below. Section 603 of the IBC clearly states that exposed thermal and acoustic insulation shall have a flame spread index of not more than 25. Section 719 of the IBC is the section that includes all details of the requirements for "Thermal and Sound Insulating Materials". Within 719, section 719.3 states as follows:

"**719.3 Exposed installation.** Insulating materials, where exposed as installed in buildings of any type of construction, shall have a flame spread index of not more than 25 and a smoke-developed index of not more than 450.

Exception: Cellulose loose-fill insulation that is not spray applied complying with the requirements of Section 719.6 shall only be required to meet the smoke-developed index of not more than 450."

This indicates that "exposed insulating materials" must have a flame spread index of not more than 25 and a smoke developed index of not more than 450 (in accordance with ASTM E 84) unless they are cellulose loose fill insulation. Continuing, the IBC describes the requirements for "insulation and covering on pipe and tubing" materials in section 719.7, which reads as follows:

"**719.7 Insulation and covering on pipe and tubing.** Insulation and covering on pipe and tubing shall have a flame spread index of not more than 25 and a smoke-developed index of not more than 450.

Exception: Insulation and covering on pipe and tubing installed in plenums shall comply with the International Mechanical Code."

This indicates that "insulation and covering on pipe and tubing" materials must have a flame spread index of not more than 25 and a smoke developed index of not more than 450 (in accordance with ASTM E 84) unless they are installed in plenums.

This code proposal simply presents clarification, which is needed because there have been statements that these "insulation covers" either do not require to meet any fire testing or that they need to meet the requirements of ASTM D 635 instead of those of ASTM E 84.

There are no references to ASTM D 635 in the IFC, IPC or IMC. The only reference to ASTM D 635 in the IBC is in the section 2606.4 addressing light transmitting plastics, as shown below.

"2606.4 Specifications. Light-transmitting plastics, including thermoplastic, thermosetting or reinforced thermosetting plastic material, shall have a self-ignition temperature of 650°F (343°C) or greater where tested in accordance with ASTM D 1929; a smoke-developed index not greater than 450 where tested in the manner intended for use in accordance with ASTM E84, or not greater than 75 where tested in the thickness intended for use in accordance with ASTM D 2843 and shall conform to one of the following combustibility classifications:

Class CC1: Plastic materials that have a burning extent of 1 inch (25 mm) or less where tested at a nominal thickness of 0.060 inch (1.5 mm), or in the thickness intended for use, in accordance with ASTM D 635,

Class CC2: Plastic materials that have a burning rate of 2.5 inches per minute (1.06 mm/s) or less where tested at a nominal thickness of 0.060 inch (1.5 mm), or in the thickness intended for use, in accordance with ASTM D 635."

It is clear that "insulation covers" are not made of "light transmitting plastics". In the application of "light transmitting plastics" the fire tests (ASTM D 1929, ASTM D 2843 and ASTM D 635) are basically used as quality control tests since there is an understanding of the fire performance of these materials. Thus it does not make sense for "insulation covers", or any insulation, to have fire safety associated with a very mild test for plastics, in devices or appliances) such as the ASTM D 635 (scope follows).

Appendix:
IBC section 603.1
603.1 Allowable materials. Combustible materials shall be permitted in buildings of Type I or Type II construction in the following applications and in accordance with Sections 603.1.1 through 603.1.3:
1. Fire-retardant treated wood ...
2. Thermal and acoustical insulation, other than foam plastics, having a flame spread index of not more than 25.
   Exceptions:
   1. Insulation placed between two layers of noncombustible materials without an intervening airspace shall be allowed to have a flame spread index of not more than 100.
   2. Insulation installed between a finished floor and solid decking without intervening airspace shall be allowed to have a flame spread index of not more than 200.

24. Materials allowed in the concealed spaces ...
25. Materials exposed within plenums ...

"ASTM D 635: "Standard Test Method for Rate of Burning and/or Extent and Time of Burning of Plastics in a Horizontal Position"

1. Scope*
1.1 This fire-test-response test method covers a small-scale laboratory screening procedure for comparing the relative linear rate of burning or extent and time of burning, or both, of plastics in the form of bars, molded or cut from sheets, plates, or panels, and tested in the horizontal position.
NOTE 1—This test method, and test method A of IEC 60695-11-10 are technically equivalent.
NOTE 2—For additional information on materials which do not burn to the first reference mark by this test, see Test Method D 3801.
1.2 This test method was developed for polymeric materials used for parts in devices and appliances. The results are intended to serve as a preliminary indication of their acceptability with respect to flammability for a particular application. The final acceptance of the material is dependent upon its use in complete equipment that conforms with the standard applicable to such equipment.
1.3 The classification system described in Appendix X1 is intended for quality assurance and the preselection of component materials for products.
1.4 This standard is used to measure and describe the response of materials, products, or assemblies to heat and flame under controlled conditions, but does not by itself incorporate all factors required for fire hazards or fire risk assessment of materials, products, or assemblies under actual fire conditions.
1.5 This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use. For specific hazards statements, see 9.2."

C**ost Impact:** The code change proposal will not increase the cost of construction.

Analysis: Consideration should be given to the outcome of PX-09/10. (Hirschler proposal for Section 416.6)

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: HIRSCHLER-P3-605.25 NEW

P15–09/10
404.2 (New), Chapter 13

Proponent: Sid Cavanaugh, Cavanaugh Consulting representing Truebro/IPS Corporation

1. Add new text as follows:

404.2 Waste and supply pipe protective covers. Where the waste piping and water supply piping beneath accessible lavatories and sinks are required by ICC A117.1 to be fitted with protective coverings, the products shall be

in compliance to ASME A112.18.9.

2. Add standard to Chapter 13 as follows:

ASME

A112.18.9-2010 Barrier Free Insulated Protectors for Exposed Waste and Supplies

Reason: Item #1: The code needs clarification regarding accessible fixtures which are under the jurisdiction of the plumbing code and proper protection of exposed waste and supplies that are covered under the new ANSI/ASME standard under development which should be finished by early 2010. This code change will clear up confusion over enforcement of appropriate requirements for exposed waste and supplies used with accessible fixtures.

Item #2: It is important to add this new standard for proper protection of exposed waste and supplies that are covered under the new ANSI/ASME standard under development which should be finished by early 2010. This code change will clear up confusion over enforcement of appropriate requirements for exposed waste and supplies used with accessible fixtures.

Cost Impact: None, because the code currently requires both accessible fixtures and waste/supply pipe protection for users of such fixtures.

Analysis: Review of proposed new standard, ASME A112.18.9-2010, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: CAVANAUGH-P2-404.2 NEW

P16–09/10
305.4; IRC P2603.4

Proponent: Shawn Strausbaugh, Arlington County, VA representing Virginia Plumbing and Mechanical Inspectors Association

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IPC COMMITTEE. PART II WILL BE HEARD BY THE IRC PLUMBING COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I - IPC

Revise as follows:

305.4 ~~Sleeves~~ Sealing of annular spaces. The annular space~~s~~ between the outside of a pipe and the inside of a pipe sleeve~~s~~, ~~and pipes~~ or between the outside of a pipe and an opening in a building envelope wall, floor, or ceiling assembly penetrated by a pipe shall be ~~filled or tightly caulked in an approved manner~~ sealed with caulking material or closed with a gasketing system. The caulking material or gasketing system shall be suitable for the conditions at the penetration location and shall be compatible with the pipe, sleeve and building materials in contact with the sealing materials. Annular spaces ~~between~~ created by pipes penetrating ~~sleeves and pipes in~~ fire resistance-rated assemblies or membranes of such assemblies shall be ~~filled or tightly caulked~~ sealed or closed in accordance with Section 713 of the *International Building Code*.

PART II – IRC

Revise as follows:

P2603.4 ~~Sleeves~~ Sealing of annular spaces. The annular space~~s~~ between the outside of a pipe and the inside of a pipe sleeve~~s~~, ~~and pipes~~ or between the outside of a pipe and an opening in a building envelope wall, floor, or ceiling assembly penetrated by a pipe shall be ~~filled or tightly caulked as approved by the building official.~~ sealed with caulking material or closed with a gasketing system. The caulking material or gasketing system shall be suitable for the conditions at the penetration location and shall be compatible with the pipe, sleeve and building materials in contact with the sealing materials. Annular spaces ~~between~~ created by pipes penetrating ~~sleeves and pipes in~~ fire resistance-rated assemblies or membranes of such assemblies shall be ~~filled or tightly caulked~~ sealed or closed in accordance with the building portion of this code.

Reason: This proposal addresses a number of shortcomings of the existing old and vague text. This change also better aligns the IPC with the intent of IECC Section 504.3 Sealing of building envelope, and the IRC plumbing section with IRC N1102.4.1 Air leakage.

The reasons for the changes in the first sentence of this section are: 1) Clarifies that only the ends annular spaces need to be sealed or closed. Filling of the entire annular space cavity is pointless. 2) Eliminates the term 'tightly caulked' as it is archaic language from the era of "packing and pouring" lead joints. It would be a rare situation where it would be desired to have a pipe so rigidly fixed in a through-penetration. 3) Clarifies what "sleeves" are to be considered by adding the word "pipe" in reference to the pipe sleeves as required by IPC Section 305.5 (IRC Section P2603.5) . Some inspectors have mistaken the existing language to require sealing between pipe and flexible plastic sleeving used for corrosion protection. 4) Adds the requirement that pipe penetrations of building envelope wall, floor or ceiling assemblies (as some penetrations might not require pipe sleeves) must also be sealed to reduce the loss of conditioned air as required by International Energy Conservation Code. Although this sealing requirement is energy related, it is important to have this text in this section because piping installers typically are the ones who cut holes in the building envelope for the passage of pipes and as such they should be the ones responsible for sealing or closing off annular spaces. They are already familiar with the requirement for sealing pipes in pipe sleeves. All trades must do their part for energy conservation. Otherwise, the sealing just doesn't get accomplished resulting in more leakage paths through the building envelope.

The reasons for the changes in the second sentence of this section are to add the requirements for sealing material compatibility to all items that the sealing material contacts and that the material is suitable for the weather and temperature conditions of the application. While this seems like something that should be obvious, there have been instances where solvent based caulking has affected plastic piping and where a caulking material was inappropriate for wet (outdoor) conditions resulting is rainwater damage to the building.

The last sentence was changed to stress and clarify the importance of making sure that where fire resistance rated assemblies are being penetrated by pipes, specific materials and methods in accordance with the IBC (or building portion of the IRC) must be used. Proper fire stopping methods are critical for fire safety.

Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME: STRAUSBAUGH-P4-305.4

P17–09/10
312.2, 312.3, 702.5

Proponent: Robert Burke, University of Colorado representing (CAPMO) Colorado Association of Plumbing and Mechanical Officials

1. Delete and substitute as follows:

~~**312.2 Drainage, waste and vent water test.** A water test shall be applied to the drainage system either in its entirety or in sections. If applied to the entire system, all openings in the piping shall be tightly closed, except the highest opening, and the system shall be filled with water to the point of overflow. If the system is tested in sections, each opening shall be tightly plugged except the highest openings of the section under test, and each section shall be filled with water, but no section shall be tested with less than a 10-foot (3048 mm) head of water. In testing successive sections, at least the upper 10 feet (3048 mm) of the next preceding section shall be tested so that no joint or pipe in the building, except the uppermost 10 feet (3048 mm) of the system, shall have been submitted to a test of less than a 10-foot (3048 mm) head of water. This pressure shall be held for at least 15 minutes. The system shall then be tight at all points.~~

~~**312.3 Drainage and vent air test.** An air test shall be made by forcing air into the system until there is a uniform gauge pressure of 5 psi (34.5 kPa) or sufficient to balance a 10-inch (254 mm) column of mercury. This pressure shall be held for a test period of at least 15 minutes. Any adjustments to the test pressure required because of changes in ambient temperature or the seating of gaskets shall be made prior to the beginning of the test period.~~

312.2 Water testing of drain, waste and vent piping. The design of test setups for leak testing of drain and waste piping systems shall consider the pressure requirements and limitations of Section 702.5. The test pressure for drain and waste piping systems, or portions thereof, shall not be less than the greatest possible in-service pressure or 10 feet (3048 mm) of water head (4.33 psi) (29.9 kPa), whichever is greater. Vent piping shall be tested at a pressure not less than 10 feet (3048 mm) of water head (4.33 psi) (29.9 kPa), except for vent piping sections that are within 10 feet of elevation below a vent system's final outdoor termination point. The upper 10 feet of a vent system terminating to the outdoors shall be permitted to be tested by a pressure ranging from 10 feet (3048 mm) of water head (4.33 psi) (29.9 kPa) at a point 10 feet in elevation below the outdoor termination point to zero pressure at the elevation of the outdoor termination point. Test pressures shall be developed by filling the closed piping system (or portion thereof)

completely with water and pressurizing the system to the required test pressure using a water pump or applying the required head of water above the highest elevation of the system (or portion thereof) under test. Where piping systems are tested in sections, the joints between tested sections shall be tested at a pressure not less than the required test pressures for the sections on either side of the joint. The test pressure in the system, as evidenced by a test gauge connected to the system, shall hold steady for not less than 15 minutes, without any addition of water to the system. Where the entire piping section under test can be visually observed for water leaks and the required test pressure is developed by the required head of water above the section under test, connection of a test gauge to the system shall not be required.

312.3 Air testing of drain, waste and vent piping. The design of test setups for leak testing of drain and waste piping systems shall consider the pressure requirements and limitations of Section 702.5. The test pressure for drain, waste and vent piping systems, or portions thereof, shall not be less than the greatest possible in-service pressure or 5 psi (34.5 kPa), whichever is greater. Test pressures shall be developed by forcing air into the closed piping system (or portion thereof). Where piping systems are tested in sections, the joints between tested sections shall be tested at a pressure not less than the required test pressures for the sections on either side of the joint. The test pressure in the system, as evidenced by a test gauge connected to the system, shall hold steady for not less than 15 minutes, without any addition of air to the system.

2. Add new text:

702.5 Pipe, fitting and joint selection for pressure conditions. The selection of pipe, fittings and joints of drain, waste and sewer systems shall consider the greatest internal pressure that could occur during testing or service. The allowable pressure in drain, waste and sewer piping systems that are pressurized in service by pumps or ejectors shall be the pressure rating of the system component having the lowest pressure rating. Where system pressure is created by liquid-filled vertical sections of pipe, system components shall be pressure-rated for not less than the system pressure at the component's installed elevation.

(Renumber subsequent sections)

Reason: This code change proposal was prompted by the failure of a roof drain conductor (piping) system inside of a basketball arena building here at the University of Colorado. Many 100s of thousands of dollars of water damage occurred and we were lucky that no one was hurt. An 8 inch cast iron no-hub elbow blew off the piping system due to the pressure caused by a blockage in the storm drain system outside the building. In evaluating why this particular event happened, I realized that the existing code sections concerning testing of drain and waste piping fail to properly consider building designs having drain piping systems that do not have any fixture connections for many consecutive stories in a row. Consider the following arrangement: A sports arena with sky box toilet facilities. The drain piping system serving those toilet facilities is many "stories" tall without any fixture connections between the sky box elevation and the elevation of the building drain (or the nearest level down where fixtures are connected) to relieve pressure should the system become clogged at a lower elevation. The existing code section for testing allows for such a piping system to be tested in sections as short as every 10 feet as the building construction rises from the ground. If there is a clog in the system well below sky box elevation, the drainage system could fill up to the point of overflow at the fixtures in the skybox. This creates a pressure in the lower sections of the system that is many times greater than what the piping system was tested for when 10 foot sections are tested.

Since then, I have made numerous evaluations of the drain piping systems in several multi-story buildings here at the University of Colorado and discovered that the real problem is not just in the testing but in the proper selection of piping system components for these multi-story systems that do not have fixture connections for many consecutive stories. One example of improper component selection for this type of "tall system" application could be the use of shielded couplings for no-hub cast iron pipe. ASTM standards C1540 and C1277 cover these couplings and indicate the allowable pressure ratings for different sizes. The unrestrained hydrostatic pressure for standard shielded couplings is 20 psi (46 foot of head) for 1 ½ thru 5 inch, 18 psi (42 foot of head) for 6 inch, 10 psi (23 foot of head) for 8 inch, 6 psi (14 foot of head) for 12 inch. It is obvious that the larger coupling sizes would be unsuitable for systems that are over two stories of normal height, let alone structures with tall stories. Because plastic drain, waste and vent fittings as well as "not for pressure" plastic pipe is not "pressure rated", these components could also prove to be problematic in certain applications where either testing or service conditions create pressures in excess of the component ratings.

Code officials should not have to become expert in evaluating the pressure capabilities of individual components of the drain and waste systems. This is the designer's or engineer's responsibility. However, the code requirements for design and test procedures should reflect what could be the expected actual in-service or test condition pressure, whichever is greater, in order to verify that the system has been designed properly for the intended conditions. Therefore, I have submitted new section 702.5 and re-written sections 312.2 and 312.3 to eliminate any confusion as to the pressure requirements for system components as well as the requirements for testing. The existing test sections are outdated for the type of large buildings being built today and need these changes.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Burke-P1-312.2

P18–09/10
312.9, 417.5.2; IRC P2503.6

Proponent: Don Surrena, National Association of Home Builders (NAHB)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IPC COMMITTEE. PART II WILL BE HEARD BY THE IRC PLUMBING COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

1. Delete without substitution:

~~**312.9 Shower liner test.** Where shower floors and receptors are made water tight by the application of materials required by Section 417.5.2, the completed liner installation shall be tested. The pipe from the shower drain shall be plugged water tight for the test. The floor and receptor area shall be filled with potable water to a depth of not less than 2 inches measured at the threshold. Where a threshold of at least 2 inches high does not exist, a temporary threshold shall be constructed to retain the test water in the lined floor or receptor area to a level not less than 2 inches deep measured at the threshold. The water shall be retained for a test period of not less than 15 minutes and there shall not be evidence of leakage.~~

(Renumber subsequent sections)

2. Revise as follows:

417.5.2 Shower lining. Floors under shower compartments, except where prefabricated receptors have been provided, shall be lined and made water tight utilizing material complying with Sections 417.5.2.1 through 417.5.2.4. Such liners shall turn up on all sides at least 2 inches (51 mm) above the finished threshold level. Liners shall be recessed and fastened to an approved backing so as not to occupy the space required for wall covering, and shall not be nailed or perforated at any point less than 1 inch (25 mm) above the finished threshold. Liners shall be pitched one-fourth unit vertical in 12 units horizontal (2-percent slope) and shall be sloped toward the fixture drains and be securely fastened to the waste outlet at the seepage entrance, making a water-tight joint between the liner and the outlet. ~~The completed liner shall be tested in accordance with Section 312.9.~~

> **Exception:** Floor surfaces under shower heads provided for rinsing laid directly on the ground are not required to comply with this section.

PART II - IRC

Delete without substitution as follows:

~~**P2503.6 Shower liner test.** Where shower floors and receptors are made water tight by the application of materials required by Section P709.2, the completed liner installation shall be tested. The pipe from the shower drain shall be plugged water tight for the test. The floor and receptor area shall be filled with potable water to a depth of not less than 2 inches measured at the threshold. Where a threshold of at least 2 inches high does not exist, a temporary threshold shall be constructed to retain the test water in the lined floor or receptor area to a level not less than 2 inches deep measured at the threshold. The water shall be retained for a test period of not less than 15 minutes and there shall not be evidence of leakage.~~

(Renumber subsequent sections)

Reason: Among the problems with the current change is mandating that potable water be used to fill a reservoir to test for leaks. Any available water would serve the same purpose, especially during the rough-in phase where potable water to the building may not be available. Another problem is why is there a need to construct a "temporary threshold" to construct a reservoir when the ponding effect of the reservoir will not be present during everyday use, as with an accessible shower. From past experience, leaks from the roof and flashing occur more frequently that any leaks from shower pans. Though, there is no required leak test for roof and building flashing. If the leak is discovered it is repaired. Also, the drain in a shower acts the same as a floor drain, especially is an accessible shower. Yet, there is no required test to see if the floor leaks. As was stated at the previous code hearings *"leaks from poorly constructed liners go unnoticed for long periods of time"*…A tested liner may not show any leaks at all and can leak later after it has been inspected and approved. Though there have been minor problems in the past in these application, there is no one simple solution. And, the test is not the solution. This is a feel good test that will discover the obvious and not the minor problems. The test is an inconclusive test and only gives a false sense of security.

Cost Impact: The code change proposal will not increase the cost of construction

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IPC COMMITTEE. PART II WILL BE HEARD BY THE IRC PLUMBING COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IPC

Revise as follows:

312.10.2 Testing. Reduced pressure principle ~~backflow preventer assemblies~~, double check ~~valve assemblies~~, pressure vacuum breaker ~~assemblies~~, reduced pressure detector fire protection ~~backflow prevention assemblies~~, double check detector fire protection ~~backflow preventer assemblies~~, and spill-resistant vacuum breaker backflow preventer assemblies and hose connection backflow preventers~~, and spill-proof vacuum breakers~~ shall be tested at the time of installation, immediately after repairs or relocation and at least annually. The testing procedure shall be performed in accordance with one of the following standards: ASSE 5013, ASSE 5015, ASSE 5020, ASSE 5047, ASSE 5048, ASSE 5052, ASSE 5056, CSA B64.10 or CSA B64.10.1.

PART II – IRC

Revise as follows:

P2503.8.2 Testing. Reduced pressure principle ~~backflow preventers~~, double check ~~valve assemblies~~, double ~~detector~~ check detector ~~valve assemblies~~ and pressure vacuum breaker backflow preventer assemblies shall be tested at the time of installation, immediately after repairs or relocation and at least annually.

Reason
(PART I): To maintain consistency, all assemblies should either be referred to as "backflow preventer assemblies" or just use this term once at the end of the description sentence as in this proposal. "Spill-resistant vacuum breaker" is the correct term. A spill-resistant vacuum breaker assembly is not spill proof.
(PART II): To maintain consistency, all assemblies should either be referred to as "backflow preventer assemblies" or just use this term once at the end of the description sentence as in this proposal. "Double check detector" and "Spill-resistant vacuum breaker" are the correct terms. Spill-resistant vacuum breaker assemblies are not spill proof.

Cost Impact: The code change proposal will not increase the cost of construction.

PART I – IPC

ICCFILENAME: KAPCIA-P1-312.10.2

P20–09/10
403.1 (IBC [P] 2902.1)

Proponent: Dwight Haldeman/Gilbert Architects Inc, representing himself

Revise as follows:

403.1 (IBC [P] 2902.1) Minimum number of fixtures. Plumbing fixtures shall be provided for the type of *occupancy* and in the minimum number shown in Table 403.1. Types of occupancies not shown in Table 403.1 shall be considered individually by the code official. The number of occupants to be used for calculating the number of plumbing fixtures shall be 60 percent of that determined by the *International Building Code. Occupancy* classification shall be determined in accordance with the *International Building Code.*

Reason: It is reasonable and prudent to calculate a "maximum" occupant load to determine means of egress capacities. To use this same occupant calculation to derive and size the number of toilet fixtures results in excesses that are expensive, not-"green" and unnecessary. As an Architect, it is possible to offer explanation to a school district (and to rationalize) why a building expected to educate 600 students has the capacity to egress 1500 but far more difficult to ask for an investment in plumbing fixtures based on the remote possibility that the maximum capacity of the building could sometime be reached. . IMC 403.1 already has divorced itself from the egress capacities in order to size the required ventilation. Any consequences of an incorrectly sized plumbing system would indeed be serious, but they do not rise to a level that could impact life safety. Using an occupant load calculation developed to promote life safety is inconsistent with determining the number of plumbing fixtures for a given occupancy The 60% reduction factor is adjustable at the discretion of the committee.

Cost Impact: The code change proposal will not increase the cost of construction.

Table 403.1 (IBC [P] Table 2902.1), 410.1, 419.2

Proponent: Logan G Sauter representing Salt Lake City, Utah

1. Revise table as follows:

TABLE 403.1 (IBC [P] Table 2902.1)
MINIMUM NUMBER OF REQUIRED PLUMBING FIXTURES[a]

NO.	CLASSIFICATION	OCCUPANCY	DESCRIPTION	WATER CLOSETS (URINALS[g] ~~SEE SECTION 419.2~~)				~~DRINKING~~ FOUNTAINS[e,f,h,i] (~~SEE SECTION 410.1~~)	OTHER
				MALE	FEMALE				

(Portions of table not shown remain unchanged)

a. The fixtures shown are based on one fixture being the minimum required for the number of persons indicated or any fraction of the number of persons indicated. The number of occupants shall be determined by the *International Building Code*.
b. Toilet facilities for employees shall be separate from facilities for inmates or patients.
c. A single-occupant toilet room with one water closet and one lavatory serving not more than two adjacent patient sleeping units shall be permitted where such room is provided with direct access from each patient sleeping unit and with provisions for privacy.
d. The occupant load for seasonal outdoor seating and entertainment areas shall be included when determining the minimum number of facilities required.
e. The minimum number of required drinking fountains shall comply with Table 403.1 and Chapter 11 of the *International Building Code*.
f. Drinking fountains are not required for an occupant load of 15 or fewer.
g. In each bathroom or toilet room, urinals shall not be substituted for more than 67 percent of the required water closets in assembly and educational occupancies. Urinals shall not be substituted for more than 50 percent of the required water closets in all other occupancies.
h. Where drinking fountains are required, water coolers and bottled water dispensers shall be permitted to be substituted for not more than 50 percent of the required fountains.
i. Where water is served in restaurants, drinking fountains shall not be required.

2. Delete without substitution as follows:

~~**419.2 Substitution for water closets.** In each bathroom or toilet room, urinals shall not be substituted for more than 67 percent of the required water closets in assembly and educational *occupancies*. Urinals shall not be substituted for more than 50 percent of the required water closets in all other *occupancies*.~~

(Renumber subsequent sections)

3. Revise as follows:

410.1 Approval. Drinking fountains shall conform to ASME A112.19.1M, ASME A112.19.2M or ASME A112.19.9M and water coolers shall conform to ARI 1010. Drinking fountains and water coolers shall conform to NSF 61, Section 9. ~~Where water is served in restaurants, drinking fountains shall not be required. In other occupancies, where drinking fountains are required, water coolers or bottled water dispensers shall be permitted to be substituted for not more than 50 percent of the required drinking fountains.~~

Reason: Table heading: "DRINKING FOUNTAIN": should be plural to be consistent with the other column headings and with IBC Table 2902.1. When small amounts of additional information are necessary for tables, footnotes are a quicker and much more efficient method for providing that information than directing the reader to other codes or code sections

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: SAUTER-P3-TABLE 403.1

P22–09/10
Table 403.1 (IBC [P] Table 2902.1)

Proponent: Eirene Oliphant, MCP, Building Official, City of Leawood, KS

Revise table as follows:

Table 403.1 (IBC [P] Table 2902.1)
MINIMUM NUMBER OF REQUIRED PLUMBING FIXTURES[a]

NO.	CLASSIFICATION	OCCUPANCY	DESCRIPTION	WATER CLOSETS (URINALS SEE SECTION 419.2)	
				MALE	FEMALE
2	Business	B	Buildings for the transaction of business, professional services, other services involving merchandise, office buildings, banks, light industrial and similar uses	1 per 25 for the first 50 and 1 per 50 <u>100</u> for the remainder exceeding 50	1 per 25 for the first 50 and 1 per 50 for the remainder exceeding 50

NO.	CLASSIFICATION	OCCUPANCY	DESCRIPTION	WATER CLOSETS (URINALS SEE SECTION 419.2) MALE	WATER CLOSETS (URINALS SEE SECTION 419.2) FEMALE	LAVATORIES MALE	LAVATORIES FEMALE
6	Mercantile	M	Retail stores, service stations, shops, salesroom, markets and shopping centers	1 per ~~500~~ 25 for the first 50 and 1 per 600 for the remainder exceeding 50	1 per ~~500~~ 25 for the first 50 and 1 per 400 for the remainder exceeding 50	1 per ~~750~~ 200 for the first 400 and 1 per 750 for the remainder exceeding 400	

(Portions of table note shown remain unchanged)

Reason: The purpose of the change is to substitute revised material for current provisions of the code. The IPC requires 1 WC per sex for mercantile occupancies between 51-1000. The UPC[1] requires between 2 to 6 WC per sex between 51 – 800. Based on an American Restroom Association (ARA)/Wall Street Journal investigation[2], this low IPC minimum has not caused problems because a majority of the public is not aware that they are allowed to use sanitation facilities in small to midsize mercantile establishments. Media awareness campaigns like the Wall Street Journal story and Section 403.5.1 Directional Signs (P34-06/07) will change the public's awareness.

Unlike multi-stalled toilets, single WC toilets are typically user locked and the WC is not available to the next patron until the toilet door is unlocked. While studies such as the Cohen report[4,5] have shown that the average user typically needs less then 2 minutes to use a WC, there appears to be no studies of the impact of single WC, user lockable toilets. Information is available, however, via the experience of those American cities that have installed automated public toilets (APT). Every municipality has found that for legitimate reasons (wheel chair, express breast milk, change colostomy bag, absorbent pads or a child's diaper) users occasionally have a legitimate need to be in the toilet for at least 15 minutes and at least one city now allows more then 20 minutes before an alarm sounds. This same 'occasional long use' problem occurs in buildings with user lockable toilets and the problem is exacerbated because these user lockable toilets also accommodate activities not related to sanitation. A retail store with 1000 people will sometimes include more then 15 employees. OHSA requires 2 WC for 16 on site employees[3]. It is likely that those 16 employees competing with 984 other occupants does not satisfy the intent of the OSHA requirement. In the process of reviewing the requirement for M it was noted that if adjusted for gender the increase in toilet fixtures slope for males in B (Business) could be reduced.

Bibliography:

[1]2006 Uniform Plumbing Code Table 4.1 'Retail or Wholesale Stores
[2]Wall Street Journal 'Bathroom Backlash Arrives on Main Street ' July 26, 2005
[3]29CFR1910.141(c)(1)(i) Table J-1
[4]ASPE report 95-01 Cohen 'Queuing theory approach to plumbing design research'
[5]ASPE report 92-02 Cohen 'Plumbing fixture requirements for office buildings research report'

Cost Impact: The code change proposal will increase the cost of construction at lower occupancies but may reduce cost for larger occupant loads.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: Oliphant-P1-T403.1

P23–09/10
Table 403.1 (IBC Table [P]2902.1)

Proponent: Robert J. Heil, Code Inspections, Inc. representing the Pennsylvania Association of Building Code Officials, Inc.

Revise table as follows:

TABLE 403.1 (IBC Table [P]2902.1)
MINIMUM NUMBER OF REQUIRED PLUMBING FIXTURES[a]
(See Sections 403.2 and 403.3)

NO.	CLASSIFICATION	OCCUPANCY	DESCRIPTION	OTHER
2	Business	B	Buildings for the transaction of business, professional services, other services involving merchandise, office buildings, banks, light industrial and similar uses	1 service sink[h]
6	Mercantile	M	Retail stores, service stations, shops, salesrooms, markets and shopping centers	1 service sink [h]

h. For business and mercantile occupancies an occupant load of 15 or fewer, service sinks shall not be required.

(Portions of table and footnotes not shown remain unchanged.)

Reason: In a small facility with limited occupancy, such as a retail store with a size of less than 450 square feet or an office with less than 1,500 square feet, a service sink and the associated closet occupy a disproportionate amount of floor space, with rare requirements for use by the occupants.

Note: A similar exception was added in the 2009 Code for drinking fountains, with occupancies of 15 persons or less, under Footnote "f" of the "drinking fountain" column in Table 403.1.

Cost Impact: This code change proposal will not increase the cost of construction.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

Table 403.1 (IBC [P] Table 2902.1)

Proponent: Eirene Oliphant, MCP, Building Official, City of Leawood, KS

Revise table as follows:

Table 403.1 (IBC [P] Table 2902.1)
MINIMUM NUMBER OF REQUIRED PLUMBING FIXTURES[a]

NO.	CLASSIFICATION	OCCUPANCY	DESCRIPTION	WATER CLOSETS (URINALS SEE SECTION 419.2)		LAVATORIES	
				MALE	FEMALE	MALE	FEMALE
1	Assembly	A-2[d]	Nightclubs, bars, taverns, dance halls and buildings for similar purposes	1 per ~~40~~ 25 for the first 25 and 1 per 90 for the remainder exceeding 25	1 per ~~40~~ 25 for the first 25 and 1 per 75 for the remainder exceeding 25	1 per ~~75~~ 40 for the first 40 and 1 per 200 for the remainder exceeding 40	
			Restaurants, banquet halls and food courts	1 per ~~75~~ 25 for the first 25 and 1 per 100 for the remainder exceeding 25	1 per ~~75~~ 25 for the first 25 and 1 per 80 for the remainder exceeding 25	1 per ~~200~~ 40 for the first 40 and 1 per 200 for the remainder exceeding 40	

(Portions of table not shown remain unchanged)

Reason: The purpose of the change is to substitute revised material for current provisions of the code. The American Restroom Association (ARA) is often questioned by the public and by reporters doing stories about the problems people face finding proper toilet facilities when away from home. One of the problems relates to having to wait too long for a restaurant toilet to free. To the degree that respondent recall details and also based on informal observation by ARA advocates, when more then 50 people are in a restaurant one will begin to see occasional toilet queuing when only 1 single occupant per sex toilet is available. Above 100, multiple person lines will appear. This problem is addressed in the UPC[1], which requires between 2 & 3 WC per sex between 15 – 150 occupants. The IPC requires only 1 WC per sex for A-2 restaurant occupancies between 16-150 occupants. This problem is particularly onerous in venues where people handle food. While those with an urgent need to void bowel or bladder will queue, those needing to wash their hands before eating may defer.

The low IPC A-2 minimum is made worse by the typical no-stall implementation of a single WC toilet. Unlike multi-stalled toilets, single WC toilets are typically user locked and the WC is not available to the next patron until the toilet door is unlocked. While studies such as the APSE Cohen reports[2,3] have shown that the average user typically needs less than 2 minutes to use a WC, there appears to be no studies of the impact of single WC, user lockable toilets. Information is available, however, via the logs generated by automated public toilets (APT). Every American municipality, that has installed single occupant APT's has found that for legitimate reasons (wheel chair, express breast milk, change colostomy bag, absorbent pads or a child's diaper) users occasionally have a legitimate need to be in the toilet for at least 15 minutes and one city now allows more then 20 minutes before a misuse alarm sounds. This same 'occasional long use' problem occurs in buildings with user lockable toilets and the problem is exacerbated because these lockable toilets also facilitate activities not related to sanitation. A-2 Pubs and Lounges suffers the same 1 locked toilet at lower occupancies but the attempt to address the problem by requiring 1 toilet per 40 results in excessive minimums at higher occupancies.

Bibliography:
[1]2006 Uniform Plumbing Code Table 4.1 'Retail or Wholesale Stores
[2]ASPE report 95-01 Cohen 'Queuing theory approach to plumbing design research'
[3]ASPE report 92-02 Cohen 'Plumbing fixture requirements for office buildings research report'

Cost Impact: The code change proposal will increase the cost of construction at lower occupancies but may reduce cost for larger occupant

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Oliphant-P4-T403.1

P25–09/10
403.2 (IBC [P]2902.2)

Proponent: Cindy Harvey, Kephart Community-Planning-Architecture representing herself

Revise as follows:

403.2 (IBC [P]2902.2) Separate facilities. Where plumbing fixtures are required, separate facilities shall be provided for each sex

Exceptions:

1. Separate facilities shall not be required for dwelling units and sleeping units.
2. Separate facilities shall not be required in structures or tenant spaces with a total occupant load, including both employees and customers, of 15 or less.
3. Separate facilities shall not be required in mercantile occupancies in which the maximum occupant load is ~~50~~ 100 or less.

Reason: In recent years, the industry has seen an increase in mixed-use buildings that are predominantly residential in use with a small, secondary retail component. Often, the use for this retail space is developed into neighborhood retail that is boutique in nature and classified as a Group M occupancy. The optimum size and area of the retail bays are 30 feet x 80 feet and 2,400 sf, respectively. Refer to Table IV-4A following this reason statement for a U.S. Department of Labor, Bureau of Labor Statistics summary of small retail space sizes and note the hand marked rows. Based on IBC Table 1004.1.1, and 30 sf per occupant, this 2,400 sf space at grade would have an occupant load of 80 persons. Consequently, the space does not qualify for exception number 3 of IPC Section 403.5 (IBC Section [P] 2902.2) that allows for one toilet facility to serve up to 50 occupants and therefore, the space requires separate toilet facilities for male and females. This places an undue burden on these smaller retail occupancies and often leads to the manipulation of occupancy calculation for the purpose of avoiding the additional toilet facility. Because an M use requires a second exit where the occupant load exceeds 49, the manipulation of occupant load subsequently adversely impacts the egress requirements for the space leading to compromised life/safety for the occupants.

An alternative approach is the exception in IBC Section 1004.1.1 which allows the building official to approve a smaller occupant load based on the actual number of occupants versus the design occupant load. In the example cited, it would be unrealistic to expect 80 occupants in a florist shop, dry cleaners, jewelry store, or liquor store of 2400 sf. A burden then falls on the building official to review these on a case-by-case basis for what is considered by many to be an excessive and unnecessary number of toilet rooms. Note that in IPC Table 403.1 (IBC Table [P]2902.1), M use, one water closet can serve up to 500 occupants and one lavatory can serve up to 750 occupants.

A cleaner way of resolving this disconnect is to increase the occupant load threshold in exception no. 3 to 100 persons. This proposed modification relieves the undue burden placed on the small retail space having an area within the range of 1500 sf and 3000 sf. Two accessible single user toilet facilities in a 1500 sf space occupies approximately 80 sf which is more than 5% of the total space. An increase in the occupant load threshold in exception 3 of this section would allow for the industry norm in boutique retail bay size to be accommodated with one single user toilet facility. Given that it is unlikely or at least rare that these small retail spaces would be occupied by the number persons equal to the design occupant load and that IPC Table 403.1 (IBC Table [P]2902.1) indicates that 2 water closets can serve up to 1000 persons; the provision of a single toilet facility appears to be more than adequate for the size of space and function that the proposed occupant load threshold increase would allow. The area of the space that the proposed occupant load threshold accommodates (3000 sf) would be such that neither a 500 or 300 ft travel distance limitation as required IPC Section 403.3 (IBC Section [P] 2902.3) would ever be exceeded because of the contrived dimensions this would necessitate. And finally, this change would significantly differentiate mercantile occupancy plumbing requirements (which are based primarily on convenience) from the egress requirements which are based on life/safety needs.

Table IV-4A: Characteristics of Selected Store Types Found in Neighborhood Shopping Centers (PTA Employees)

Store Type	Median Household Expenditure	Sales Per Square Foot GLA	Median Store Size (Sq. Ft.)	Threshold Household Support	Minimum Expenditure Support
Hardware and Building Materials					
Building Materials and Supplies	$411	$228.43	65,000	36,110	$14,847,950
Hardware	$293	$166.59	20,000	11,364	$3,331,800

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: HARVEY-P1-403.2

P26–09/10
403.2.1 (IBC [P] 2902.2.1) (New)

Proponent: Eirene Oliphant, MCP, Building Official, City of Leawood, KS

Add new text as follows:

403.2.1 (IBC [P]2902.2.1) Family or assisted-use toilet facilities serving as separate facilities. Where a building or tenant space requires a separate toilet facility for each sex and each toilet facility is required to have only one water closet, two family/assisted-use toilet facilities shall be permitted to serve as the required separate facilities. Family or assisted-use toilet facilities shall not be required to be identified for exclusive use by either sex as required by Section 403.4.

Reason: Family/assisted-use toilets provide inherent potty parity. Two Family/assisted-use toilets increase overall availability. A single gender based toilet can be unavailable for periods of up to 15 minutes when, for example, the current occupant is using it for companion care, to change diapers, or to change a colostomy bag. Less need for gender based cleaning staff. Less impact when one toilet room is being cleaned or serviced. For decades, males and females have used the same toilet facility on airliners.

Cost Impact: The code change will not increase the cost of construction.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: Oliphant-P2-403.2.1 NEW

P27–09/10
403.3 (IBC [P]2902.3)

Proponents: Robert J. Heil, Code Inspections, Inc. representing the Pennsylvania Association of Building Code Officials, Inc.
Kelly P. Reynolds, representing Little Caesar's Enterprises, Inc

Revise as follows:

403.3 (IBC [P]2902.3) Required public toilet facilities. Customers, patrons and visitors shall be provided with public toilet facilities in structures and tenant spaces intended for public utilization except where the area devoted to customers, patrons and visitors is less than 300 ft^2 (27.9m^2). The number of plumbing fixtures located within the required toilet facilities shall be provided in accordance with Section 403 for all users. Employees shall be provided with toilet facilities in all occupancies. Employee toilet facilities shall be either separate or combined employee and public toilet facilities.

Reason
(Heil) It is impractical to provide toilet rooms for public access for small public spaces such as the lobby for a secure ATM machine, customer pick up area at a dry cleaners, customer pick up area at a small service establishment, counter, etc. Additionally, creating a path in a small facility to a toilet room that is traditionally at the rear is impractical.
(Reynolds) Pick-up and delivery only-type food establishments are becoming more prevalent. This type of business is distinguished from restaurants in that they do not normally have provisions for patron dining. The sole intent is to prepare food on-site for consumption off-site. Depending upon the particular business, there may be a delivery service, or customers may be expected to come and pick up their food, usually pre-ordered. Customer waiting times are typically kept to less than one minute (call-aheads), and never more than 12 minutes (walk-ins). Call-ahead orders typically comprise about 85% of total business. Interior "public" areas are generally limited to small spaces where the transaction is completed at a service/cashier counter. These same conditions appear in a dry cleaners service lobby, florist shop, bank ATM lobby and similar occupancies.

Drive-in fast-food establishments of the sort where no interior public building access is anticipated or allowed have been around for decades. Publicly-available restrooms are not normally provided.

Generally, it is expected that the patrons will leave once they have completed their transaction; however, there is no mandate for them to do so many chose to eat in their automobiles, or to use one of other increasingly available picnic tables once they receive their food. It is widely held that, once the business transaction has taken place, the patron has the option to leave or stay. Given the quick transaction turn-around time, they are not "held hostage" while waiting on their food order as in a conventional restaurant scenario. As such, the need for public restrooms has not been that prevalent, as long as the relative volume of "sit-down" customers is fairly low.

Table 403.1 (IBC Table [P]2902.1) sets forth minimum requirements for plumbing fixtures (including restrooms) based on business type and occupant load, does not contain specific provisions for these relatively unique food establishments. Given established standards in the IPC, we typically try to treat these facilities as restaurant uses of less than 50 occupant load (Group **"B),** but it does not seem to be in keeping with the spirit of the code to do so. Owners of these businesses contend that providing public restroom facilities in addition to employee facilities is unnecessary and wasteful, in that the public facilities are not usually needed. Based on the metrics and statistical data provided, the owners' position makes sense.

The elimination of patron restrooms in these small public areas has been accepted by the following municipalities: Los, Angeles, CA; Detroit, MI; Chicago, IL; Houston, TX; Phoenix, AZ; Tucson, AZ; Lubbock, TX and San Jose, CA.

Cost Impact: This code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Heil_REYNOLDS-P1-403.3

P28–09/10
403.3.2 (IBC [P] 2902.4.1)

Proponent: Tim Pate, City and County of Broomfield, representing the Colorado Chapter ICC Code Change Committee

Revise as follows:

403.3.2 (IBC [P] 2902.4.1) Location of toilet facilities in occupancies other than covered malls. In occupancies other than covered malls, the require public and employee toilet facilities shall be located not more than one story above or below the space required to be provided with toilet facilities and the path of travel to such facilities shall not exceed a distance of 500 feet (152 m).

Exceptions:

1. The location and maximum travel distances to required employee facilities in factory and industrial occupancies are permitted to exceed that required by this section, provided that the location and maximum travel distance are approved.
2. Toilet facilities in structures and buildings under the same ownership, lease or control, shall not be prohibited from serving as the required toilet facilities for the employees located in the storage structures or kiosks provided that the travel distance limited by this section is not exceeded.

Reason: This code change will add back in an exception that was in the 2003 IBC. The code change proponent who modified section 2902 for the 2006 IBC did not intend to lose this exception which would deal with detached structures such as toll booths, photo processing booths, kiosks, and parking lot booths. It is not reasonable to require the one bathroom (sized for handicap accessible requirements) for these small structures.

Cost Impact: The code change proposal will increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Pate-P1-403.3.2

P 29–09/10
403.3.1 (New)

Proponent: Judson Collins, JULYCO, representing himself.

Add new text as follows:

[B] 403.3.1 Toilet room ingress and egress. Toilet rooms shall not open directly into a room used for the preparation of food for service to the public.

(Renumber subsequent sections)

Reason: This language is from Section 1210.5 of the IBC. Plumbing designers, installers and inspectors should not have to go to the building code to find this provision. Duplicating the provision from the IBC into the IPC is efficient and helpful to those mentioned previously.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: COLLINS-P8-403.3.1

P30–09/10
403.3.5 (IBC [P] 2902.3.5) (New)

Proponent: Eirene Oliphant, MCP, Building Official, City of Leawood, KS

Add new text as follows:

403.3.5 ([P]2902.3.5) Door locking. Where a toilet room is designed for multiple occupants, the egress door for the room shall not be lockable from the inside of the room. This section does not apply to family or assisted-use toilet rooms.

Reason: To prevent a toilet user from restricting access to a toilet facility intended to satisfy the sanitation needs of multiple persons. To also reduce misuse such as employee smoke breaks, drug dealing or other inappropriate activities that are more likely when an occupant can lock entry to the toilet.

Cost Impact: The code change will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Oliphant-P3-403.3.5

P31–09/10
403.5 (IBC [P]2902.5) (New)

Proponent: Don Davies representing the Utah Chapter of ICC

Add new text as follows:

403.5 (IBC [P]2902.5) Required drinking fountains. A required drinking fountain for a tenant space shall be located in the tenant space or external to the tenant space provided that the travel distance from the most remote point in the tenant space to the drinking fountain is within 500 feet or for covered malls, within 300 feet.

Reason: The sharing of public restroom facilities is currently allowed in the code in Section 403.3 (IBC Section 2902.3) but the code is silent on sharing of drinking fountains even though that is what is generally done. If employees and the public can share restroom facilities then they can certainly share drinking fountains when located within the prescribed travel distances.

Cost Impact: There will be a cost savings with shared drinking fountains.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Davies-P1-403.5 NEW

P32–09/10
405.3.1

Proponent: Robert G. Konyndyk, Chief, Plumbing Division, Bureau of Construction Codes, State of Michigan

1. Revise as follows:

405.3.1 Water closets, urinals, lavatories and bidets. A water closet, urinal, lavatory or bidet shall not be set closer than 15 inches (381 mm) from its center to any side wall, partition, vanity or other obstruction, or closer than 30 inches (762 mm) center-to-center between adjacent fixtures. There shall be at least a 21-inch (533 mm) clearance in front of the water closet, urinal, lavatory or bidet to any wall, fixture or door. Water closet compartments shall not be less than 30 inches (762 mm) wide and 60 inches (1524 mm)deep ~~(see Figure 405.3.1)~~.

2. Delete Figure 405.3.1 without substitution:

Reason: The figure which has been in the code for many years is inaccurate and misleading. For example, partitions required to ensure privacy as referenced in Section 310 of the code are nonexistent (urinals) or inconsistent (water closets). The code Commentary is an excellent place for fixture clearance information.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: KONYNDYK-P1-405.3.1

P33–09/10
405.3.1

Proponent: John T.E. Walters, Prince William County, VA, representing the Virginia Plumbing and Mechanical Inspectors Association (VPMIA)

Revise as follows:

405.3.1 Water closets, urinals lavatories and bidets. ~~A~~ Water closets, urinals, lavator~~y~~ies ~~or~~ and bidets shall ~~not~~ be set not closer than 15 inches (381 mm) from ~~its~~ their centerline to a~~ny~~ ~~side~~ wall, partition, vanity or ~~other~~ obstruction other than an adjacent water closet, urinal, lavatory or bidet. ~~, or~~ Adjacent fixtures not separated by a partition or wall shall be set not closer than 30 inches (762 mm) centerline to centerline ~~between adjacent fixtures~~. There shall be at least 21 inches (533 mm) clearance in front of ~~the~~ a water closet, urinal, lavatory or bidet to a~~ny~~ wall, fixture or door. Water closet compartments shall be not less than 30 inches (762 mm) wide and 60 inches (1524 mm) deep (see Figure 405.3.1). Where fixtures are required to be accessible, the requirements of Section 404 apply.

Reason: The current language does not reflect the requirement for privacy walls or partitions or separate water closet compartments or rooms or can be misleading for accessibility requirements. Language is added to maintain required clearances within these areas and refer the user to proper sections.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: WALTERS-P3-405.3.1

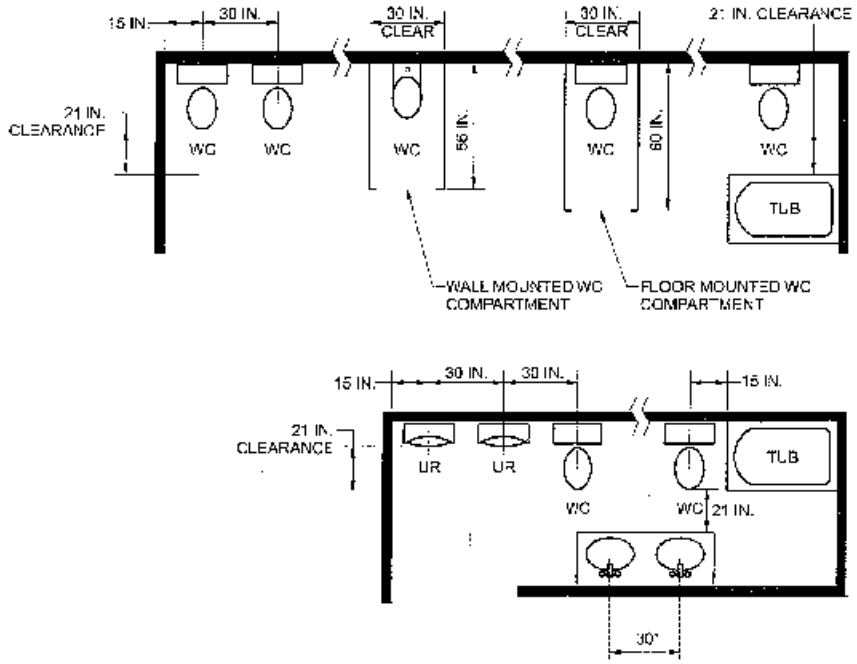
P34–09/10
405.3.1, Figure 405.3.1

Proponent: Shawn Strausbaugh – Arlington County, VA representing Virginia Plumbing and Mechanical Inspectors Association

1. Revise as follows:

405.3.1 Water closets, urinals, lavatories and bidets. A water closet, urinal, lavatory or bidet shall not be set closer than 15 inches (381 mm) from its center to any side wall, partition, vanity or other obstruction, or closer than 30 inches (762 mm) center to center between adjacent fixtures. There shall be at least a 21 – inch (533 mm) clearance in front of the water closet, urinal, lavatory or bidet to any wall, fixture or door. Water closet compartments shall be not less than 30 inches (762 mm) wide and 60 inches (1524 mm) deep <u>for floor mounted water closets and not less than 30 inches (762 mm) wide and 56 inches (1422 mm) deep for wall hung water closets</u> (see Figure 405.3.1).

2. Revise Figure 405.3.1 as follows:



For SI: 1 inch = 25.4 mm.

Reason: This compartment size is already permitted by Section 604.8.2 of ICC/ANSI A117.1-2003 for wall hung water closets in accessible water closet compartments. If an accessible wall hung water closet compartment is acceptable for accessibility at 56 inches minimum in depth, then the IPC should also allow the compartment to be no less than 56 inches in depth.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: STRAUSBAUGH-P6-405.3.1

P35–09/10
403.3.2 (IBC [P] 2902.3.2)

Proponent: Patrick Vandergriff*,* Vandergriff Code Consulting Services representing himself.

Revise as follows:

403.3.2 (IBC [P]2902.3.2) Location of toilet facilities in occupancies other than covered mall buildings. In occupancies other than *covered mall buildings,* the required public and employee toilet facilities shall be located not more than one *story* above or below the space required to be provided with toilet facilities and the path of travel to such facilities shall not exceed a distance of 500 feet (152 400 mm). Where multiple buildings on a single lot are under the same control, public and employee toilet facilities shall not be required to be located in each building provided that all other requirements of this section are met, the total number of plumbing fixtures within such buildings complies with the aggregate number of fixtures required for all buildings and the toilet facilities are available for use when any one building on the lot is occupied.

> **Exception:** The location and maximum travel distances to required employee facilities in factory and industrial occupancies are permitted to exceed that required by this section, provided that the location and maximum travel distance are *approved*.

Reason: Although this proposal is aimed at allowing the toilet facilities in a permanent school building to serve as the required toilet facilities for semi-permanent portable classroom buildings adjacent to the school but on the same property (lot), the allowance provides for reasonable accommodations at shopping centers, strip centers and individual commercial properties having multiple buildings under the same control. For example, consider a small business offices building with several separate buildings serving as warehouses for the business, all of which are on the same lot. If the travel and elevation location requirements are met, what is the harm in all of the required toilet facilities being located in the business office building? Other examples widely exist across the country as it is commonplace for strip centers and outdoor shopping centers to have central toilet facilities for the entire center. For schools that need fast expansion of classroom space, portable buildings are often brought in and used for several years or more until funds are available to build larger permanent buildings or additions. The decision to add these semi-permanent class room modules should not be required to be burdened by the expense of installing toilet facilities in each classroom module, especially where adequate toilet facilities exist within the required travel distance and elevation.

Cost Impact: Cost savings in some areas of the country.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: VANDERGRIFF-P1-403.3.2

P36–09/10
405.4; IRC P3003.19

Proponent: Shawn Martin, Plumbing Manufacturers Institute, representing the Plumbing Manufacturers Institute

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IPC COMMITTEE. PART II WILL BE HEARD BY THE IRC PLUMBING COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART – IPC

Revise as follows:

405.4 Floor and wall drainage connections. Connections between the drain and floor outlet plumbing fixtures shall be made with a floor flange or a waste connector and sealing gasket. The waste connector and sealing gasket joint shall comply with the joint tightness test of ASME A112.4.4 and shall be installed in accordance with the manufacturer's installation instructions. The flange shall be attached to the drain and anchored to the structure. Connections between the drain and wall-hung water closets shall be made with an *approved* extension nipple or horn adaptor. The water closet shall be bolted to the hanger with corrosion-resistant bolts or screws. Joints shall be sealed with an *approved* elastomeric gasket, flange-to-fixture connection complying with ASME A112.4.3 or an *approved* setting compound.

PART II - IRC

Revise as follows:

P3003.19 Joints between drainage piping and water closets. Joints between drainage piping and water closets or similar fixtures shall be made by means of a closet flange or a waste connector and sealing gasket compatible with the drainage system material, securely fastened to a structurally firm base. The inside diameter of the drainage pipe shall not be used as a socket fitting for a four by three closet flange. The joint shall be bolted, with an *approved* gasket flange to fixture connection complying with ASME A112.4.3 or setting compound between the fixture and the closet flange or waste connector and sealing gasket. The waste connector and sealing gasket joint shall comply with the joint tightness test of ASME A112.4.4 and shall be installed in accordance with the manufacturer's installation instructions.

Reason: This code section currently provides for only a "flanged" outlet connection for floor-mounted water closets. These types of connections are typical of water closets designed for the North American market. However, in the global market, there are many water closet designs that use a different type of outlet connection to the sanitary drainage system. These connection arrangements consist of a waste tube connector on the water closet which is inserted into an elastomeric gasket. The waste tube and gasket are then inserted into the drain pipe opening at the floor line, and the gasket provides the seal between the water closet's waste tube and the drain pipe. See Figure 405.4 for an example. The water closet fixture is then anchored directly to the floor using mounting brackets or fasteners. These anchors are often concealed to allow for a smooth, sanitary exterior interface to the floor.

This design is used almost exclusively in Europe and other locations worldwide, and offers many advantages over wax-ring flange seals. ASME A112.4.3, a standard already referenced in the IPC and IRC, requires that the connection be leak-tight to pressures up to 10 psi. Such water closet designs are available in a wide range of rough-in dimensions.

This code change is needed because there is an increasing number of consumer and architectural demands in the North American market for European-styled water closet designs that are only available with the gasketed waste tube outlet connection. This code section must be changed to explicitly allow these types of water closets to be installed and to clearly establish standards for their performance. As the IPC becomes more globally accepted and adopted, this revised section will be ready to accommodate this internationally accepted method of drainage system connection. European styled water closets with gasketed connections to drainage pipes are designed to meet the same performance requirements of the applicable ASME standards listed in the IPC as traditional flange-mounted designs.

Cost impact: This code change proposal will not increase the cost of construction.

Proponent: Judson Collins, JULYCO, representing self

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IPC COMMITTEE. PART II WILL BE HEARD BY THE IRC PLUMBING COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I - IPC

1. Delete without substitution:

~~**406.1 Approval.** Domestic automatic clothes washers shall conform to ASSE 1007.~~

(Renumber subsequent sections)

2. Revise as follows:

406.2 Water connection. The water supply to an automatic clothes washer shall be protected against backflow by an air gap installed integrally within the machine ~~conforming to ASSE 1007~~ or with the installation of a backflow preventer in accordance with Section 608.

409.1 Approval. ~~Domestic dishwashing machines shall conform to ASSE 1006.~~ Commercial dishwashing machines shall conform to ASSE 1004 and NSF 3.

PART II – IRC

Revise table as follows:

TABLE P2701.1
PLUMBING FIXTURES, FAUCETS AND FIXTURE FITTINGS

MATERIAL	STANDARD
~~Home laundry equipment~~	~~ASSE 1007~~
~~Household dishwashing machines~~	~~ASSE 1008~~

(Portions of table not shown remain unchanged)

Reason: For the last ?? years, there have not been any domestic clothes washers listed to ASSE 1007 and there have not been any domestic dishwashing machines listed to ASSE 1008. ASSE is in the process of putting these standards on inactive status because of that.

Cost Impact: The code change proposal will not increase the cost of construction.

PART I – IPC

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

PART II – IRC

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: COLLINS-P9-406.1

P38–09/10
406.3

Proponent: James Anjam / Arlington County/ Virginia Plumbing and Mechanical Inspectors Association (VPMIA)

Revise as follows:

406.3 Waste connection. The waste from an automatic clothes washer shall discharge through an air break into a standpipe in accordance with Section 802.4 or into a laundry sink. The trap and fixture drain for an automatic clothes washer standpipe shall be a minimum of 2 inches (51 mm) in diameter. An ~~The~~ automatic clothes washer fixture drain ~~shall connect to a branch drain or drainage stack~~ shall increase in size to at least 3 inches (76 mm) before connection to any drain pipe, other than a laundry tray fixture drain. ~~a minimum of 3 inches (76 mm) in diameter.~~ Automatic clothes washers that discharge by gravity shall be permitted to drain to a waste receptor or an approved trench drain.

Reason: The proposed change clarifies the requirement for increasing the drain pipe size to at least 3 inch where a clothes washer fixture drain connects to another drain. The 3 inch requirement was added in the 2003 plumbing code to resolve detergent suds backup problems in fixtures such as bathtubs and showers that were connected to the 2 inch drain piping in the vicinity of a clothes washer fixture drain. However, in residential applications prior to the 2003 IPC, it was common for a laundry tray to be connected to the 2 inch fixture drain piping from the clothes washer without increasing the drain size to at least 3 inch. There didn't seem to be any problems with this arrangement. Even if suds did back up in a laundry tray, what did it matter as the laundry tray is an acceptable waste receptor for a clothes washer discharge anyhow? Requiring the drain pipe size to increase to 3 inch where a laundry tray connects to the clothes washer fixture drain is just too stringent and unnecessary. We have not seen or heard of any problems with this particular connection arrangement.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: ANJAM-P2-406.3

P39–09/10
406.3

Proponent: Dustin Mclehaney, Plumbing, Mechanical Plans Review Engineer; Curt Campbell, Plumbing, Mechanical, Gas, Residential Supervisor, Virginia Plumbing and Mechanical Inspectors Association.

Revise as follows:

406.3 Waste Connection. The waste from an automatic clothes washer shall discharge through an air break into a standpipe in accordance with Section 802.4 or into a laundry sink. The ~~trap and~~ fixture drain for a standpipe serving an automatic clothes washer ~~standpipe~~ shall connect to a 3 inch or larger diameter ~~branch drain~~ fixture branch or ~~drainage~~ stack. ~~a minimum of 3 inches (76mm) in diameter~~. Automatic clothes washers that discharge by gravity shall be permitted to drain to a waste receptor or an approved trench drain.

Reason: This change is to clarify some confusion of the written code text. The term "branch drain" needs to be removed and replaced with "fixture branch" because Chapter 2 provides no straight forward definition of "branch drain". Using a term in this section that is not defined in Chapter 2 creates confusion, which is evident based on the number of questions we receive on this issue. The confusion for the contractors is "How far can I run the 2 inch fixture drain, and where do I need to transition to 3 inch?" By replacing the term "branch drain" with "fixture branch" the contractor now knows that the fixture drain can remain 2 inch until it becomes a fixture branch (defined as "A drain serving two or more fixtures that discharges to another drain or stack) or is connected to a stack. The word "trap" was removed because a trap does not connect to fixture branches or stacks; there is always a section of fixture drain downstream of the trap. The wording "minimum of" is poor code language.

Cost Impact: There would be no cost to the contractors or customers is this code change is approved

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: MCLEHANEY-CAMPBELL-P1-406.3

P40–09/10
407.2; IRC P2713.1

Proponent: Pat Clark, Colorado Association of Plumbing and Mechanical Officials (CAPMO)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IPC COMMITTEE. PART II WILL BE HEARD BY THE IRC PLUMBING COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I - IPC

Revise as follows:

407.2 Bathtub waste outlets. Bathtubs shall ~~have~~ be provided with at least one drain outlet and one waste overflow outlet~~s~~. Piping and tubing waste assemblies used to connect such outlets to drainage systems shall be not less than ~~a minimum of~~ $1^1/_2$ inches (38 mm) in diameter. ~~The waste~~ Drain outlets shall be ~~equipped~~ provided with an approved ~~stopper~~ mechanism or device to close the drain outlet.

PART II – IRC

Delete and substitute as follows:

~~**P2713.1 Bathtub waste outlets and overflows.** Bathtubs shall have outlets and overflows at least 11/2 inches (38 mm) in diameter, and the waste outlet shall be equipped with an *approved* stopper.~~

P2713.1 Bathtub waste outlets. Bathtubs shall be provided with at least one drain outlet and one waste overflow outlet~~s~~. Piping and tubing waste assemblies used to connect such outlets to drainage systems shall be not less than $1^1/_2$ inches (38 mm) in diameter. Drain outlets shall be provided with an approved mechanism or device to close the drain outlet.

Reason
(PART I) The main purpose of this proposal is to require an overflow waste outlet for a bathtub. The current code is silent on bathub overflow outlets. However, a recent Committee Interpretation (#52-08) for IRC Section P2713.1 concluded that for 1 and 2 family residential dwellings, bathtub waste overflow outlets are required to prevent accidental flooding. If the interpretation committee determined that waste overflow outlets are necessary for IRC buildings, it certainly seems logical that multi-story and multi-family structures covered by the IPC would benefit even more so by bathtubs having waste overflow outlets in order to provide the same level of protection against structural damage.
(PART II) The language of the current section was not absolutely clear about whether bathtubs required a waste overflow outlet. A recent Committee Interpretation (#52-08) for the current section concluded that bathtubs do require waste overflow outlets. In order to make the intent of this section clear and aligned with the recent committee interpretation, I am proposing the same language proposed for the corresponding section in the IPC.

Cost Impact: This code change proposal may increase the cost of construction

PART I – IPC

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

PART II – IRC

ICCFILENAME: CLARK-P1-407.2

P41–09/10
407.2: IRC P2713.1

Proponent: Richard Grace/Fairfax County/ VA Plumbing and Mechanical Inspectors/VA Building and Code Officials

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IPC COMMITTEE. PART II WILL BE HEARD BY THE IRC PLUMBING COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I - IPC

Revise as follows:

407.2 Bathtub waste outlets and overflows. Bathtubs shall ~~have~~ be equipped with a waste outlet~~s~~ and an overflow outlet. The ~~minimum~~ outlets shall ~~of~~ be connected to waste tubing or piping not less than 1 ½ inches (38 mm) in diameter. ~~, and~~ ~~t~~The waste outlet shall be equipped with a~~n approved~~ watertight stopper.

PART II - IRC

Delete and substitute as follows:

~~**P2713.1 Bathtub waste outlets and overflows.** Bathtubs shall have outlets and overflows at least 1½ inches (38 mm) in diameter and the waste outlet shall be equipped with an *approved* stopper.~~

P2713.1 Bathtub waste outlets and overflows. Bathtubs shall be equipped with a waste outlet and an overflow outlet. The outlets shall be connected to waste tubing or piping not less than 1 ½ inches (38 mm) in diameter. The waste outlet shall be equipped with a watertight stopper.

Reason
(PART I): Current text is not clear on exactly if an overflow is required to be installed or not. This proposal breaks the text up into 3 clear concise sentences with 3 separate thoughts: 1. waste and overflows are required. 2. the minimum size is 1 ½ inches. And, 3. the waste outlet must be provided with a stopper. Also, by striking the term "approved" makes this issue not subject to the code official's interpretation as to what type stopper is permitted. By inserting the term "watertight" clarifies the intent is that the "stopper" allow the tub to be filled with water and hold the water in place. This is consistent with the IRC requirements for bathtubs in which it is clear that overflows are required.
(PART II): The IRC will benefit from having clearer language for this section as some believe that the current language does not require an overflow outlet.

Cost Impact: The code change proposal will not impact the cost of construction.

PART I – IPC

ICCFILENAME: REMEDIOS-P8-408.3

P43–09/10
410.1

Proponent: Jerry L. Bowen, AIA, CP, Jerry L. Bowen -Architect, representing self

Revise follows:

410.1 Approval. Drinking fountains shall conform to ASME A112.19.1M, ASME Al12.19.2M or ASME A112.19.9M and water coolers shall conform to ARI 1010. Drinking fountains and water cooler shall conform to NSF 61, Section 9. ~~Where water is served in restaurants, drinking fountains shall not be required.~~ Restaurants and similar establishments that prepare food for consumption on site are not required to have drinking fountains provided that, upon request, both a sanitary cup of not less than eight (8) ounces liquid capacity and drinking water are provided at no cost to the person requesting it. In other occupancies, where drinking fountains are required, water coolers or bottled water dispensers shall be permitted to be substituted for not more than 50 percent of the required drinking fountains.

Reason: Around my local area and in my limited travels to other areas and states, it has become a problem in acquiring free drinking water from restaurants and fast food places of business. These places are on the increase in charging for water when they have elected not to provide drinking fountains. Charges have been for the drinking cups anywhere from 10-cents to the price of a soft drink. The intent of the code was to require free water to the customers and workers in these establishments. They do not have to provide ice or large cups for the consumer's water but they should provide the container for free and the water. I have been in larger cities where restaurants have stated they only have bottle water for the customer. Fast foods want to charge the customer for water. The problem is the Code is not specific enough to make these establishments provide water and the container free of charge. Within a year or two these establishments make enough money when charging for water to have paid for the required drinking fountain. Also, if they were required to provide the drinking fountain then they would have to provide two drinking fountains (high & low) to comply with accessibility requirements. I have had several Building Officials state to me that the businesses are out to make money and can charge for the water. That is all well and good but they elected not to provide the drinking fountain in the business but that did not mean the Code's intent was to allow them to charge for the water; after all the drinking fountain would have dispensed free water.

Cost Impact: The code change will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Bowen-P1-410.1

P44–09/10
410.1

Proponent: Ronald B Hall, Lexington, SC, representing himself

Revise as follows:

410.1 Approval. Drinking fountains shall conform to ASME A112.19.1M, ASME A112.19.2M or ASME A112.19.9M and water coolers shall conform to ARI 1010. Drinking fountains and water coolers shall conform to NSF 61, Section 9. ~~Where water is served in~~ R~~r~~estaurants~~, drinking fountains~~ shall not be required to have drinking fountains installed provided that upon customer request, drinking water and a cup are supplied to the customer at no charge. In other occupancies, where drinking fountains are required, water coolers or bottled water dispensers shall be permitted to be substituted for not more than 50 percent of the required drinking fountains.

Reason: Many building officials I have spoken with including the S.C. Building Code Council Administrator interpret "serve" not to be free. Many restaurants do not have fountains and are charging customers for a cup to get water from a fountain (soft drink/water) machine or dispenser.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME:Hall-P1-410.1

P45–09/10
410.1, 410.2 (IBC 1109.5.1)(New), 410.3 (New)

Proponent: John T.E. Walters, Prince William County. VA. representing the Virginia Plumbing and Mechanical Inspectors Association (VPMIA)

1. Revise as follows:

410.1 Approval. Drinking fountains shall conform to ASME A112.19.M, ASME A112.19.2M or ASME A112.19M and water coolers shall conform to ARI 1010. Drinking fountains and water coolers shall conform to NSF 61, Section 9. ~~Where water is served in restaurants, drinking fountains shall not be required. In other occupancies, where drinking fountains are required, water coolers or bottled water dispensers shall be permitted to be substituted for not more than 50 percent of the required drinking fountains.~~

2. Add new text as follows:

[B]410.2 (IBC 1109.5.1) Minimum number. Not fewer than two drinking fountains shall be provided. One drinking fountain shall comply with the requirements for people who use a wheelchair and one drinking fountain shall comply with the requirements for standing persons.

> **Exception:** A single drinking fountain that complies with the requirements for people who use a wheelchair and standing persons shall be permitted to be substituted for two separate drinking fountains.

410.3 Substitution. Where restaurants provide drinking water in a container free of charge, drinking fountains shall not be required in those restaurants. In other occupancies, where drinking fountains are required, water coolers or bottled water dispensers shall be permitted to be substituted for not more than 50 percent of the required number of drinking fountains.

Reason: Adding requirement per IBC Section 1109.5.1 Minimum number. IBC requires a minimum of two drinking fountains and IPC should reflect that requirement.

Also addressing that establishment serving water could charge a fee for the water or a cup to serve it in. Where drinking fountains are required it is impermissible to charge for the use of the drinking fountain.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: Section [B]410.2 is being heard by the IPC committee only for the purposes of deciding whether the section needs to be added to the IPC. Because this section is controlled by the IBC, no changes to the text can made.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: WALTERS-P4-410.1

P46–09/10
410.1, 410.2 (IBC [P]2902.1.3) (New)

Proponent: James W. McCall, AIA, Slonaker McCall Architects, representing himself

1. Revise as follows:

410.1 Approval. Drinking fountains shall conform to ASME A112.19.1M, ASME A112.19.2M or ASME A112.19.9M and water coolers shall conform to ARI 1010. Drinking fountains and water coolers shall conform to NSF 61, Section 9. ~~Where water is served in restaurants, drinking fountains shall not be required. In other occupancies, where drinking fountains are required water coolers or bottled water dispensers shall be permitted to be substituted for not more than 50 percent of the required drinking fountains.~~

2. Add new text as follows:

410.2 ([P]2902.1.3) Substitutions for drinking fountains. For an occupant load greater than 100 persons, water coolers or bottled water dispensers shall be permitted to be substituted for not more than 50 percent of the number of required drinking fountains. For an occupant load of 100 or fewer persons, or where the building water supply is considered to be undrinkable by the local inhabitants of the area, bottled water coolers or bottled water dispensers shall be permitted to be substituted for100 percent of the number of required drinking fountains. Where water is served in restaurants, drinking fountains shall not be required.

Reason: This proposal concerns 1) the code requirements for providing drinking fountains in occupancies with small occupant loads and 2) the code requirements for drinking fountains where the local residents of a community will not drink the well or public water supplies.

For occupancies other than R-1, R-2 Apartment House, R-3, restaurants that serve water, Section 410.1 currently requires at least one drinking fountain for a building or tenant space. Code enforcement is mandatory, not optional.

Drinking water delivered by drinking fountains is nearly universally considered by the public to be insanitary. In many areas, drinking well or public water is unhealthy. Small businesses and other occupancies with a minimum numbers of occupants are being forced to install unnecessary drinking fountains/electric water coolers to satisfy this requirement. Many provide bottled water in addition to drinking fountains. A recent health issue example in our area involved a municipality where a water problem occurred and the water was considered unsafe to drink. A day had passed before the public was notified and a boil water advisory issued. In the meantime, the water was dispensed in water fountains in schools, etc. that were served by the particular municipal water authority.

We believe that the requirement for providing drinking water to the public creates an unnecessary liability to most building owners. If a person becomes ill because of the water, legal action will result.

We also believe that facilities with an occupant load of 100 persons should be exempt from a requirement to provide drinking water and, that those that are required to provide drinking water for 100 or less persons, should have the option of providing bottled water. This requirement should be modified or made optional, and building owners allowed to decide for themselves whether water fountains will be used. The liability and financial burden on small facilities is not warranted.

Cost Impact: The code change proposal will not increase the cost of construction. (It will decrease for small projects.)

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: McCall-P1-410.1

P 47–09/10
413.1

Proponent: Judson Collins, JULYCO, representing himself.

Revise as follows:

413.1 Approval. Domestic food waste grinders shall conform to ASSE 1008. ~~Commercial food waste grinders shall conform to ASSE 1009.~~ Food waste grinders shall not increase the drainage fixture unit load on the sanitary drainage system.

Reason: For the last ?? years, there have not been any commercial food waste grinders listed to ASSE 1007. ASSE is in the process of putting the standard on inactive status because of that.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: COLLINS-P3-413.1

P48–09/10
412.4

Proponent: Edward L Paxton representing the Utah Chapter of ICC

Revise as follows:

412.4 Laundry room floor drain. ~~Public laundries and central washing facilities~~ . In public coin-operated laundries, ~~and~~ in central washing facilities and individual dwelling units of multiple-family dwellings, rooms containing automatic clothes washers shall be provided with floor drains located to readily drain the entire floor area. Such drains shall have an ~~minimum~~ outlet diameter ~~of~~ not less than 3 inches (76 mm) ~~diameter~~. Floors in such rooms shall slope towards the floor drain.

Reason: In a single family dwelling, the damage caused by the washer leak or hose failure is limited to one owner. In multi-family, multi story buildings, the damage that may result from a single washer leak inside an individual dwelling unit often exceeds several tens of thousands of dollars in each of the many units that may be located below the failure.

Cost Impact: The code change proposal will increase the cost of construction, however the damage that may be prevented far exceeds the minimal cost.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: PAXTON-P1-412.4

P49–09/10
413.3

Proponent: Sid Cavanaugh, Cavanaugh Consulting representing In Sink Erator

Revise as follows:

413.3 Commercial food waste grinder outlets. Commercial food waste grinders shall be connected to a drain not less than 1 ½ inches (38mm) in diameter. Commercial food waste grinders shall be connected and trapped separately from any other fixtures or sink compartments. The connection of a commercial food waste grinder to the sanitary drainage system shall be downstream of all grease interceptors unless the code official approves or requires food waste grinders to discharge into a grease interceptor.

Reason: This code change will clarify the intent of the code regarding commercial food waste grinders. Code officials have in the past and continue to allow food waste grinders to connect directly to the sanitary drainage system of buildings. Research has shown that food waste does not cause build up or blockage of sewer lines. Food waste has the same specific gravity as fecal matter and behaves similarly in the sewer system. Finally, while this code change will allow most installations to by-pass an interceptor it will still recognize Section 1003.3.2 where it can be required/allowed by a jurisdiction to connect to an interceptor.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: CAVANAUGH-P8-413.3

P50–09/10
416.5

Proponent: Judson Collins, JULYCO, representing himself.

Revise as follows:

416.5 Tempered water for public hand-washing facilities. *Tempered water* shall be delivered from *public* hand-washing facilities. *Tempered water* shall be delivered through an *approved* water-temperature limiting device that conforms to ASSE 1070 or CSA B125.3. For the purposes of this section, a public hand-washing facility shall be a plumbing fixture installation provided primarily for the purpose of washing one's hands and located in other than hotel/motel guest rooms, dwelling units, prison cells, and other private toilet rooms and bathrooms.

Reason: The existing section begs for a definition of what a public hand washing facility is. Rather than make a new definition, the intent of the section is explained by the addition of the proposed text.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: COLLINS-P6-416.5

P51–09/10
416.5

Proponent: Guy Tomberlin of Virginia representing himself.

Revise as follows:

416.5 Tempered water for public hand-washing facilities. *Tempered water* shall be delivered from lavatories and group wash fixtures located in public toilet facilities provided for customers, patrons and visitors. ~~*public* hand-washing facilities.~~ *Tempered water* shall be delivered through an *approved* water-temperature limiting device that conforms to ASSE 1070 or CSA B125.3.

Reason: This is an attempt to clarify that employee or private toilet rooms, not for public use, are not required to be supplied with tempered water. Section 403.3 clearly mandates where "public toilet facilities" are to be installed. This new definition specifically works in conjunction with the provisions of 403, so wherever facilities are installed for "public utilization" the hand washing fixtures are required to be provided with tempered water.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

417.4.2; IRC P2708.1.1

Proponent: Christopher Birch, Executive Vice President, Bath Enclosure Manufacturers Association

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IPC COMMITTEE. PART II WILL BE HEARD BY THE IRC PLUMBING COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I - IPC

Revise as follows:

417.4.2 Access. The shower compartment access and egress opening shall have a ~~minimum~~ clear and unobstructed width of not less than ~~22~~ 18 inches (~~559~~ 457 mm).

PART II - IRC

Revise as follows:

P2708.1.1 Access. The shower compartment access and egress opening shall have a ~~minimum~~ clear and unobstructed width of not less than ~~22~~ 18 inches (~~559~~ 457 mm).

Reason: In writing safety standards for the shower enclosure industry the Bath Enclosure Manufacturers Association determined that the minimum access width for shower enclosures should be 18" to accommodate shower enclosure units being manufactured. This will allow the standard bases to be fit with enclosures that are not allowed by the current code. For example, the current code does not consider overlap and jamb width in a 42 inch slider or a neo angle base with a 24 inch centerline. The 22 inch minimum has led to arbitrary and inconsistent enforcement. The industry's association has determined that 18 inches allows for functional accessibility, service and maintenance, emergency egress and response and rescue. The 18 inch minimum will be consistent with the safety and installation standards being developed by ASTM.

Cost Impact: The code change proposal will not increase the cost of construction.

PART I – IPC

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IPC COMMITTEE. PART II WILL BE HEARD BY THE IRC PLUMBING COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IPC

Add new text as follows:

417.5 Gang shower user area. The floor area for each user of a gang shower arrangement shall be not less than 1300 square inches (0.838 m^2). For a rectangular floor area, the least dimension of the user area shall be not less than 36 inches (914mm). A wall-mounted showerhead for a rectangular user area shall be located at not less than 18 inches horizontally from any other side of the user area. For wedge-shaped floor areas, as are created by arrangements having shower head columns with 3 or more equally-spaced shower heads around the column, there shall be not greater than 5 such user areas around each column. Each wedge-shaped area shall be not less than 1300 square inches (0.838 m^2) in area nor shall the horizontal distance measured perpendicular to and from the face of the column to the outer limit of the area be less than 25 inches (635mm).

417.6 Multiple water discharge devices. The maximum allowable water flow from any combination of water outlets capable of discharging simultaneously into a shower compartment shall be 2.5 gpm (9.463 l/m) for floor areas of 2600 in^2 (1.677 m^2) or less. Where a shower compartment area is greater than 2600 in^2 (1.677 m^2), the maximum allowable water flow shall be increased 2.5 gpm (9.463 l/m) for each additional 2600 in^2 (1.677 m^2) of area or portion thereof. The maximum allowable water flow from any combination of water outlets capable of discharging simultaneously into a user area of a gang shower shall be 2.5 gpm (9.463 l/m).

(Renumber subsequent sections)

PART II – IRC

Add new text as follows:

P2708.4 Multiple water discharge devices. The maximum allowable water flow from any combination of water outlets capable of discharging simultaneously into a shower compartment shall be 2.5 gpm (9.463 l/m) for floor areas of 2600 in^2 (1.677 m^2) or less. Where a shower compartment area is greater than 2600 in^2 (1.677 m^2), the maximum allowable water flow shall be increased 2.5 gpm (9.463 l/m) for each additional 2600 in^2 (1.677 m^2) of area or portion thereof.

(Renumber subsequent sections)

Reason
(Part I): This revision is necessary to clarify and improve the code regarding maintaining hygienic conditions in multiple user (gang) shower rooms and to specify a water flow rate limitations for shower compartments and gang shower user areas. This revision aligns the IPC with Federal and State health codes and water efficiency regulations.

As the Commentary of the IPC 2006 explains, a minimum of 30 inches of horizontal shower space is required to bend over and clean ones lower extremities. This minimal space very often results in body contact with shower walls of a single user in a shower compartment. In multiple user (gang) shower rooms, allotting only 900 square inches per shower results in probable body-to body contact. While it may be acceptable for body-to-wall contact in a shower compartment intended only for a single user, body-to-body contact in a gang shower environment is certainly not hygienic. The IPC already includes floor drain requirements to prevent water of one shower user from flowing across the floor area of other shower users. This proposed amendment is needed to provide adequate cross-sectional space and assures the showerheads are far enough apart to maintain hygiene in multiple user (gang) shower rooms.

Most multiple user (gang) shower rooms do not clearly define individual shower spaces. The 1300 square inches of required minimum space is not arbitrary; based on health code requirements of 36"x36" = 1296". The 1296 square inches is rounded up to 1300 for simplicity. It is consistent with the existing code language regarding irregular shaped shower compartments. Therefore, the 1300 square inches is a reasonable requirement for one user; the space is not suitable for two users unless it is 2600 sq. inches or greater.

The shower head distance requirement of at least 18" as measured to the side of a rectangular user area in a gang shower is consistent the 36" minimum shower head spacing dictated by all known public health codes regarding multiple (gang) showers; including Federal and State regulations for schools, public housing, student dormitories, worker housing, detention centers and prisons. Because shower columns are often used in gang showers, a new section defines the acceptable minimum sized user areas in those applications.

The proposal also supports the Federal mandate for shower heads to flow at rates no greater than 2.5 gpm. The advent of new water emitters for showering has caused some confusion on adherence to this Federal mandate. This proposal does not attempt to reduce shower flows; it only provides clarification and support for existing laws.
(Part II): This revision is necessary to specify a water flow rate limitations for shower compartments. This revision aligns the IPC with Federal and State water efficiency regulations for shower heads to flow at rates no greater than 2.5 gpm. The advent of new water emitters for showering has caused some confusion on adherence to this Federal mandate. This proposal does not attempt to reduce shower flows; it only provides clarification and support for existing laws.

Cost Impact: This code change proposal is concurrence to public health codes and Federal shower flow requirements; thus, will not increase the cost of construction.

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IPC COMMITTEE. PART II WILL BE HEARD BY THE IRC PLUMBING COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IPC

Revise as follows:

417.5.2.1 PVC sheets. Plasticized polyvinyl chloride (PVC) sheets ~~shall be a minimum of 0.040 inch (1.02 mm) thick, and~~ shall meet the requirements of ASTM D 4551. Sheets shall be joined by solvent welding in accordance with the manufacturer's installation instructions.

417.5.2.2 Chlorinated polyethylene (CPE) sheets. Nonplasticized chlorinated polyethylene sheet ~~shall be a minimum 0.040 inch (1.02mm) thick, and~~ shall meet the requirements of ASTM D 4068. The liner shall be joined in accordance with the manufacturer's installation instructions.

PART II – IRC

Revise as follows:

P2709.2.1 PVC sheets. Plasticized polyvinyl chloride (PVC) sheets ~~shall be a minimum of 0.040 inch (1.02 mm) thick, and~~ shall meet the requirements of ASTM D 4551. Sheets shall be joined by solvent welding in accordance with the manufacturer's installation instructions.

2709.2.2 Chlorinated polyethylene (CPE) sheets. Nonplasticized chlorinated polyethylene sheet ~~shall be a minimum 0.040 inch (1.02mm) thick, and~~ shall meet the requirements of ASTM D 4068. The liner shall be joined in accordance with the manufacturer's installation instructions.

Reason: The original concept behind specifying a minimum thickness was to prevent puncturing the shower pan during construction. With the addition of referenced standards, specifying the minimum thickness is no longer necessary. Both ASTM D4551 and D4068 have puncture test requirements. The puncture test requires a dart of a specified weight to be dropped on the membrane. If the dart impact allows water to pass through, the membrane fails.

It was originally believed that only a 40 mil thickness would prevent puncture. However, many 30 mil membranes pass the puncture test. It should be noted that not all 30 mil membranes can pass the test. It is more appropriate to allow the standard to regulate the material requirements than including an arbitrary thickness requirement.

Cost Impact: This will not increase the cost of construction.

1. Revise as follows:

419.1 Approval. Urinals shall conform to ANSI Z124.9, ASME A112.19.2M, ASME A112.19.19, CSA B45.1, ~~or~~ CSA 45.5 or IAPMO IGC 161. Urinals shall conform to the water consumption requirements of Section 604.4. Water-

supplied urinals shall conform to the hydraulic performance requirements of ASME A112.19.6, CSA 45.1 or CSA B45.5.

2. Add standard to Chapter 13 as follows:

International Association of Plumbing and Mechanical Inspectors
5001 E. Philadelphia St.
Ontario, CA 91761

IAPMO

IGC 161-2007 Guide Criteria for Waterless Urinals

Reason: The proposed IAPMO IGC (standard) provides for materials and testing requirements for waterless urinals that are not covered in the current standards. One of which is stainless steel. The purpose statement in the proposed IGC states in part "The purpose of this standard is to provide the minimum design and performance criteria for waterless urinals. This standard is not intended to be a specification guide nor is it intended to restrict design. Its purpose is to serve as a guide for producers, distributors, architects, engineers, contractors, inspectors, and users; to promote understanding regarding materials, manufacture and installation; and to provide for identifying waterless urinals that conform with this standard."

Urinals that have been evaluated to this standard are currently in use using the Waterless Urinal with Liquid Trap technology.

This standard contains requirements for a new trap sealing method that has been evaluated and products listed for use in jurisdictions around the world. Products using this technology are currently manufactured by a number of manufacturers in this and other countries around the world. Additionally, it was noted while testing products using this new technology that should a negative pressure develop in the DWV system. Air will be introduced through the device until equilibrium is established. This feature will help maintain the trap seals of liquid seal traps so that odors, vapors and possibly injurious materials will not enter the building.

Cost Impact: This code change proposal will not increase the cost of construction.

Analysis: Review of proposed new standard, IAPMO IGC 161-2007, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

425.2

Proponent: Sally Remedios, Delta Faucet Company, representing Delta Faucet Company.

Revise as follows:

425.2 Flushometer valves and tanks. Flushometer valves and tanks shall comply with ASSE 1037 or CSA B125.3. Vacuum breakers on flushometer valves shall conform to the performance requirements of ASSE 1001 or CAN/CSA B64.1.1. *Access* shall be provided to vacuum breakers. Flushometer valves shall be of the water conservation type and shall not be used where the water pressure is lower than the minimum required for normal operation. When operated the valve shall automatically complete the cycle of operation, opening fully and closing positively under the water supply pressure. Each flushometer valve shall be provided with a means for regulating the flow through the valve. The trap seal to the fixture shall be automatically refilled after each flushing cycle.

Reason: The CSA B125.3 standard has technically equivalent requirements to ASSE 1037 for flushometer valves, except it includes longer life cycle requirements.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IPC COMMITTEE. PART II WILL BE HEARD BY THE IRC PLUMBING COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IPC

Revise as follows:

613.1 Temperature-actuated mixing valves. Temperature-actuated mixing valves, which are installed to reduce water temperatures to defined limits, shall comply with ASSE 1017. Such valves shall be installed at the hot water source.

PART II – IRC

Add new text as follows:

P2724.1 Temperature-actuated mixing valves. Temperature-actuated mixing valves, which are installed to reduce water temperatures to defined limits, shall comply with ASSE 1017. Such valves shall be installed at the hot water source.

(Renumber subsequent section)

Reason: The title of ASSE 1017 is Performance Requirements for Temperature Actuated Mixing Valves for Hot Water Distribution Systems. These valves are not intended to be used for point of use temperature control mixing valves. As the title suggests they supply temperature reduced water to the hot water system.

Cost Impact: The code change proposal will not increase the cost of construction.

PART I – IPC

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

PART II – IRC

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: REMEDIOS-P6-613.1

P62–09/10
504.4.1; IRC P2803.6

Proponent: Robert G. Konyndyk, Chief, Plumbing Division, Bureau of Construction Codes, State of Michigan

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IPC COMMITTEE. PART II WILL BE HEARD BY THE IRC PLUMBING COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IPC

Revise as follows:

504.4.1 Installation. Such valves shall be installed in the shell of the water heater tank. Temperature relief valves shall be so located in the tank as to be actuated by the water in the top 6 inches (152 mm) of the tank served. For installations with separate storage tanks, the approved, self-closing (levered) pressure relief valve and temperature relief valve or combination thereof conforming to ANSI Z21.22 valves shall be installed on ~~the tank and there shall not be any type of valve installed between the water heater and the storage tank.~~ both the storage water heater and storage tank. There shall not be a check valve or shutoff valve between a relief valve and the heater or tank served**.**

PART II– IRC

Revise as follows:

P2803.6 Installation of relief valves. For installations with separate storage tanks, the approved, self-closing (levered) pressure relief valve and temperature relief valve or combination thereof conforming to ANSI Z21.22 valves shall be installed on both the storage water heater and storage tank. A check or shutoff valve shall not be installed in the following locations:

1. Between a relief valve and the termination point of the relief valve discharge pipe;
2. Between a relief valve and a tank; or
3. Between a relief valve and heating appliances or equipment.

Reason
(PART I): This proposed revision seeks to address two concerns. First, clarification is necessary that a water heater utilizing a storage tank shall have temperature and pressure protection for both the storage water heater and separate storage tank/s. Second, previous code text implied that a storage water heater having a separate storage tank could not have a valve isolating one from another. Now both devices are clarified to have the necessary safety protection and may have a valve between the units to aid in servicing for maintenance or replacement purposes.
(PART II): Clarification is necessary to indicate that a water heater utilizing a storage tank must have temperature and pressure protection for both the storage water heater and separate storage tank/s.

Cost Impact: The code change proposal will not increase the cost of construction.

PART I – IPC

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IPC COMMITTEE. PART II WILL BE HEARD BY THE IRC PLUMBING COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IPC

1. Add new text as follows:

504.6 Relief valve breakaway fitting. Pressure, temperature, or combination pressure-temperature relief valves with a threaded discharge port of 3/4 inch [19.1 mm] shall be equipped with a full size, tamperproof, break-away fitting installed in the discharge port of the valve. The break-away fitting shall comply with CSA 1-06 US.

(Renumber subsequent sections)

2. Add standard to Chapter 13 as follows:

CSA
1-06 US Safety Plug Relief Valve for use on Hot Water Supply Systems

PART II – IRC

1. Add new text as follows:

P2803.6 Relief valve breakaway fitting. Pressure, temperature, or combination pressure-temperature relief valves with a threaded discharge port of 3/4 inch [19.1 mm] shall be equipped with a full size, tamperproof, break-away fitting installed in the discharge port of the valve. The break-away fitting shall comply with CSA 1-06 US.

(Renumber subsequent sections)

2. Add standard to Chapter 44 as follows:

CSA
1-06 US Safety Plug Relief Valve for use on Hot Water Supply Systems

Reason: CSA 1-06 US was developed to address pressure relief valve and temperature relief valve (or combination thereof) discharge pipe tampering, such as improper installation, restrictions, or intentionally or accidentally plugged, causing personal injury and structural damage, which is directly contrary to this section. The addition of a CSA 1-06 US device would prevent tampered drain lines (including vertical piping and plugged relief valves) from affecting the relief valve function. When the relief valve is free to discharge, water heaters will be less likely to explode. The tamperproof feature is important to further safeguarding the water heater and relief valve. The T&P valve was invented in the 1920's and reduced water heater explosions, but inspections, warnings and education have not eliminated the dangers of tampered discharge pipes, and continue to put life and property at risk. The addition of the CSA-06-US device to the code will improve plumbing system safety by reducing personal injuries and structural damage, and ultimately, save lives. Only valves with a ¾ inch discharge are addressed as the industry has not come forth with designs for other sizes as the ¾ inch valve size is the most widely used.

The purpose of this code change is to add new requirements.

1. The justification is based on a new product standard, CSA-1-6 US, which will further reduce explosions associated with tampered relief valve drain lines.
2. This change is substantiated with the following technical information and articles:
   a. Watts Industries Five-Year Highlight Review
   b. 2001 DE Magazine article (Spokane WA survey)
   c. 2001 National Board Bulletin www.nationalboard.org
   d. Web sites & articles

ICCFILENAME: 2009-2010-ccboilerplate

P64–09/10
504.6; IRC P2803.6.1

Proponent: Tom Hedges, representing the Arizona Building Officials

Part I - IPC

Revise as follows:

504.6 Requirements for discharge piping. The discharge piping serving a pressure relief valve, temperature relief valve or combination thereof shall:

1. Not be directly connected to the drainage system.
2. Discharge through an air gap located in the same room as the water heater <u>except where the discharge is to the outdoors, not subject to freezing and the piping terminates not less than 6 inches (152mm) and not more than 12 inches (305mm) above grade.</u>
3. Not be smaller than the diameter of the outlet of the valve served and shall discharge full size to the air gap.
4. Serve a single relief device and shall not connect to piping serving any other relief device or equipment.
5. Discharge to the floor, to the pan serving the water heater or storage tank, to a waste receptor or to the outdoors.
6. Discharge in a manner that does not cause personal injury or structural damage.
7. Discharge to a termination point that is readily observable by the building occupants.
8. Not be trapped.
9. Be installed so as to flow by gravity.
10. Not terminate more than 6 inches (152 mm) above the floor or waste receptor.
11. Not have a threaded connection at the end of such piping
12. Not have valves or tee fittings.
13. Be constructed of those materials listed in Section 605.4 or materials tested, rated and approved for such use in accordance with ASME A112.4.1.
14. <u>Direct the discharge in a downward direction.</u>

Part II – IRC

Revise as follows:

P2803.6.1 Requirements for discharge piping. The discharge piping serving a pressure relief valve, temperature relief valve or combination thereof shall:

1. Not be directly connected to the drainage system.
2. Discharge through an air gap located in the same room as the water heater <u>except where the discharge is to the outdoors, not subject to freezing and the piping terminates not less than 6 inches (152mm) and not more than 12 inches (305mm) above grade.</u>

   3. Not be smaller than the diameter of the outlet of the valve served and shall discharge full size to the air gap.
4. Serve a single relief device and shall not connect to piping serving any other relief device or equipment.
5. Discharge to the floor, to the pan serving the water heater or storage tank, to a waste receptor or to the outdoors.
6. Discharge in a manner that does not cause personal injury or structural damage.
7. Discharge to a termination point that is readily observable by the building occupants.
8. Not be trapped.
9. Be installed so as to flow by gravity.
10. Not terminate more than 6 inches (152 mm) above the floor or waste receptor.
11. Not have a threaded connection at the end of such piping
12. Not have valves or tee fittings.

13. Be constructed of those materials listed in Section P2904.5 or materials tested, rated and approved for such use in accordance with ASME A112.4.1.
14. Direct the discharge in a downward direction.

Reason: This change will allow the P & T relief drain pipe to extend direct from the water heater to an exterior location where no freeze potential exists. This is consistent with the IPC Section 504.6 (IRC Section P2803.6.1), Item no. 5 which allows the discharge to go to the outdoors. The 6" minimum termination height provides the required air gap. This proposed change also establishes a maximum termination height of 12" for outdoor termination. This method of drainage and termination is very common in locations that have previously utilized the Uniform Plumbing Code for over 50 years. No data exists to suggest this method has created unsafe conditions. The Committee reason for disapproval of Item P50-07/08 clarifies that the code allows a discharge pipe to terminate over a water heater drip pan. The code currently establishes drip pan drain terminations at 6" minimum and 24" maximum termination heights in IPC Section 504.7.2 (IRC Section P2801.5.2). If it's safe to drain a discharge pipe from a drip pan using these heights, then it certainly would be no more harmful to use the similar heights for an outdoors termination.

This proposal improves the termination requirements.

This method is also more energy efficient by not creating a direct open pipe for air flow from and to the out doors as will occur where an untrapped waste receptor for the P & T relief valve discharge drains to the outdoors.

In many commercial tenant spaces it is common practice to locate a water heater above the lay-in ceiling in an attic or interstitial space. Many times these locations are above a restroom or storage room. IPC Section 802.3 prohibits a waste receptor in such locations. A drain pipe needs to extend beyond the room or space containing the water heater.

Also, IPC 802.3 prohibits waste receptors in rest rooms and IPC Section 504.6 Item no. 2 requires an air gap in the same room as the water heater, thereby prohibiting water heaters in rest rooms. This change would allow a reasonable option where the need exists.

Cost Impact: The code change proposal will not increase the cost of construction and may decrease cost.

PART I – IPC

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

PART II – IRC

Public Hearing:	Committee:	AS	AM	D

P65–09/10
504.7; IRC P2801.5

Proponent: Shawn Strausbaugh–Arlington County, VA representing Virginia Plumbing and Mechanical Inspectors Association

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IPC COMMITTEE. PART II WILL BE HEARD BY THE IRC PLUMBING COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IPC

Revise as follows:

504.7 Required pan. Where a storage tank-type water heater~~s~~ or a hot water storage tank~~s~~ ~~are~~ is installed in a location~~s~~ where water leakage from ~~of~~ the tank~~s~~ ~~or connections will~~ could cause damage, the tank ~~or water heater~~ shall be installed in a galvanized steel pan having a material thickness of not less than 0.236 inch (0.6010mm) (No. 24 gage), or other pans approved for such use.

PART II – IRC

Revise as follows:

P2801.5 Required pan. Where a storage tank-type water heater~~s~~ or a hot water storage tank~~s~~ ~~are~~ is installed in a location~~s~~ where water leakage from ~~of~~ the tank~~s~~ ~~or connections will~~ could cause damage, the tank ~~or water heater~~ shall be installed in a galvanized steel pan having a material thickness of not less than 0.236 inch (0.6010mm) (No. 24 gage), or other pans approved for such use.

Reason: The existing text is not clear about whether tankless-type water heaters require a pan. A tankless water heater does not have a storage tank and does not present any greater risk of water leakage than a water distribution piping system that has been installed and pressure tested in accordance with this code. This proposal changes the text to make the pan requirement specific to storage tank water heaters and hot water storage

tanks. This section is in the code because it is a well known fact that the majority of storage-type water heater tanks and hot water storage tanks have a relatively short life span that often ends in causing catastrophic damage to the building. Tankless water heaters are constructed of materials that are much more corrosion resistant than the materials (glass-lined carbon steel) of most water heater tanks and hot water tanks. Tankless water heaters should not be required to have drip pans installed.

The language concerning connections was removed because connections made in accordance with this code have no greater risk of leakage than any other connection in the water distribution system. Finally, the language of this section has been cleaned up to read better.

Cost Impact: The code change proposal will not increase the cost of construction.

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IPC COMMITTEE. PART II WILL BE HEARD BY THE IRC PLUMBING COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IPC

Revise as follows:

504.7 Required pan. Where water heaters or hot water storage tanks are installed in locations where leakage of the tanks or connections will cause damage, the tank or water heater shall be installed in a galvanized steel pan having a material thickness of not less than 0.0236 inch (0.6010 mm) (No 24 gage), or other pans approved for such use.

Exception: This section shall not apply to tankless water heaters.

PART II – IRC

Revise as follows:

P2801.5 Required pan. Where water heaters or hot water storage tanks are installed in locations where leakage of the tanks or connections will cause damage, the tank or water heater shall be installed in a galvanized steel pan having a material thickness of not less than 0.0236 inch (0.6010 mm) (No 24 gage), or other pans for such use. Listed pans shall comply with CSA LC3.

Exception: This section shall not apply to tankless water heaters.

Reason: It doesn't make sense to require a pan under a tankless water heater. First of all there is no storage of water. Would the pan need to be fastened to the wall in a way that would be liquid tight? Would the intent be to catch a leak? If so, all piping should have pans under them to catch a possible leak.

Cost Impact: The code change proposal will not increase the cost of construction.

504.7, 504.7.1; IRC P2801.5, P2801.5.1

Proponent: Jim Whitehead, IPS Corporation, representing self

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IPC COMMITTEE. PART II WILL BE HEARD BY THE IRC PLUMBING COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IPC

Revise as follows:

504.7 Required pan. Where water heaters or hot water storage tanks are installed in locations where leakage of the tanks or connections will cause damage, the tanks or water heaters shall be installed in a galvanized steel pan having a thickness of not less than 0.0236 inch (0.6010mm) No. 24 gage, an aluminum pan having a thickness of not less than 0.030 inch (0.8mm), a plastic pan having a bottom thickness of not less than 0.036 inch (0.9mm) or ~~other~~ pans of other materials approved for such use.

504.7.1 Pan size and drain. The pan shall be not less than 1 ½ inches (38 mm) deep and shall be ~~of sufficient size and shape to receive all dripping or condensate from the tank or water heater,~~ at least 2 inches (51mm) larger in diameter than the water heater or hot water storage tank. The pan shall be drained by an indirect waste pipe having a ~~minimum~~ diameter of not less than 3/4 inch (19 mm). Piping for safety pan drains shall be of those listed in Table 605.4.

PART II – IRC

Revise as follows:

P2801.5 Required pan. Where water heaters or hot water storage tanks are installed in locations where leakage of the tanks or connections will cause damage, the tanks or water heaters shall be installed in a galvanized steel pan having a thickness of not less than 0.0236 inch (0.6010mm) No. 24 gage, an aluminum pan having a thickness of not less than 0.030 inch (0.8mm), a plastic pan having a bottom thickness of not less than 0.036 inch (0.9mm) or ~~other~~ pans of other materials approved for such use. Listed pans shall comply with CSA LC3.

P2801.5.1 Pan size and drain. The pan shall be not less than 1 ½ inches (38 mm) deep and shall be ~~of sufficient size and shape to receive all dripping or condensate from the tank or water heater,~~ at least 2 inches (51mm) larger in diameter than the water heater or hot water storage tank. The pan shall be drained by an indirect waste pipe having a ~~minimum~~ diameter of not less than 3/4 inch (19 mm). Piping for safety pan drains shall be of those listed in Table P2905.5.

Reason: The standard materials used in construction of pans are galvanized steel, aluminum and plastic. Each of these standard materials should have a minimum thickness requirement to prevent substandard pans from being installed and causing possible damages and losses due to failure. Most water heater installation instructions require pans to be at least 2 inches in diameter larger than the tank diameter. The code should include this requirement so that it is clear that safety pans must be larger than the tank that rests in the pan.

Cost Impact: The code change proposal will not increase the cost of construction.

PART I – IPC

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

PART II – IRC

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: WHITEHEAD-P1-504.7

P68–09/10
Table 605.3, Chapter 13; IRC Table P2905.4, Chapter 44

Proponent: Michael Cudahy, Plastic Pipe and Fittings Association (PPFA) for the Plastic Pipe and Fittings Association (PPFA).

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IPC COMMITTEE. PART II WILL BE HEARD BY THE IRC PLUMBING COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IPC

1. Revise table as follows:

TABLE 605.3
WATER SERVICE PIPE

MATERIAL	STANDARD
Polyethylene (PE) plastic pipe	ASTM D 2239; ASTM D 3035; AWWA C901; CSA-B137.1
Polyethylene (PE) plastic tubing	ASTM D 2737; AWWA C901; CSA B137.1

(Portions of table not shown remain unchanged)

2. Add standard to Chapter 13 as follows:

AWWA
C901-08 Polyethylene (PE) Pressure Pipe and Tubing, ½ In. (13 mm) Through 3 In. (76 mm), for Water Service

PART II – IRC

1. Revise table as follows:

TABLE P2905.4
WATER SERVICE PIPE

MATERIAL	STANDARD
Polyethylene (PE) plastic pipe	ASTM D 2104; ASTM D 2239; AWWA C901; CSA-B137.1
Polyethylene (PE) plastic tubing	ASTM D 2737; AWWA C901; CSA B137.1

(Portions of table not shown remain unchanged)

2. Add standard to Chapter 44 as follows:

AWWA
C901-08 Polyethylene (PE) Pressure Pipe and Tubing, ½ In. (13 mm) Through 3 In. (76 mm), for Water Service

Reason: To add AWWA C901, "Polyethylene (PE) Pressure Pipe and Tubing, ½ In. (13 mm) Through 3 In. (76 mm), for Water Service", to the PE service pipe and tubing sections of IPC Table 605.3 (IRC Table P2905.4). AWWA C901 describes polyethylene (PE) pressure pipe and tubing for use primarily as service lines in the construction of underground water distribution systems for use in potable water, reclaimed water, and wastewater service.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: Review of proposed new standard, AWWA C901-08, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

PART I – IPC

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

PART II – IRC

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: CUDAHY-P3-Table 605.3

P69–09/10
Table 605.3, Chapter 13; IRC Table P2905.4, Chapter 44

Proponent: Michael Cudahy, Plastic Pipe and Fittings Association (PPFA)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IPC COMMITTEE. PART II WILL BE HEARD BY THE IRC PLUMBING COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IPC

1. Revise table as follows:

TABLE 605.3
WATER SERVICE PIPE

MATERIAL	STANDARD
Cross-linked polyethylene (PEX) plastic <u>pipe and</u> tubing	ASTM F 876; ASTM F 877; <u>AWWA C904;</u> CSA B137.5

(Portions of table not shown remain unchanged)

2. Add standard to Chapter 13 as follows:

AWWA
<u>C904-06</u> <u>Cross-Linked Polyethylene (PEX) Pressure Pipe, ½ In. (12 mm) Through 3 In. (76 mm) for Water Service</u>

PART II – IRC

1. Revise as follows:

TABLE P2905.4
WATER SERVICE PIPE

MATERIAL	STANDARD
Cross-linked polyethylene (PEX) plastic <u>pipe and</u> tubing	ASTM F 876; ASTM F 877; <u>AWWA C904;</u> CSA B137.5

(Portions of table not shown remain unchanged)

2. Add standard to Chapter 44 as follows:

AWWA
<u>C904-06</u> <u>Cross-Linked Polyethylene (PEX) Pressure Pipe, ½ In. (12 mm) Through 3 In. (76 mm) for Water Service</u>

Reason
(PART I): This proposal adds another applicable standard to the code for PEX water service piping. The standard added describes cross-linked polyethylene (PEX) pressure pipe for use primarily as service lines in the construction of underground water distribution systems. This standard describes pipe and tubing made with a materials designation code of PEX 1006 in ASTM F876. This standard describes pipe in sizes ½ in. through 3 in. (12 mm through 76 mm) with a standard dimension ratio of 9 (SDR9) and pressure class of 160 psi.
(PART II): To add AWWA C904, "Cross-Linked Polyethylene (PEX) Pressure Pipe, ½ in. (12 mm) Through 3 In. (76 mm), for Water Service", to the PEX sections of Table P2905.4 of the IRC-P. This standard describes cross-linked polyethylene (PEX) pressure pipe for use primarily as service lines in the construction of underground water distribution systems. This standard describes pipe and tubing made with a materials designation code of PEX 1006 in ASTM F876. This standard describes pipe in sizes ½ in. through 3 in. (12 mm through 76 mm) with a standard dimension ratio of 9 (SDR9) and pressure class of 160 psi.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: Review of proposed new standard, AWWA C904-06, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

PART - IPC

1. Revise tables as follows:

TABLE 308.5
HANGER SPACING

PIPING MATERIAL	MAXIMUM HORIZONTAL SPACING (feet)	MAXIMUM VERTICAL SPACING (feet)
Polyethylene of Raised Temperature (PE-RT) pipe	2.67 (32 inches)	10[b]

(Portions of table not shown remain unchanged)

TABLE 605.3
WATER SERVICE PIPE

MATERIAL	STANDARD
Polyethylene of raised temperature (PE-RT) plastic tubing	ASTM F 2769

(Portions of table not shown remain unchanged)

TABLE 605.4
WATER DISTRIBUTION PIPE

MATERIAL	STANDARD
Polyethylene of raised temperature (PE-RT) plastic tubing	ASTM F 2769

(Portions of table not shown remain unchanged)

TABLE 605.5
PIPE FITTINGS

MATERIAL	STANDARD
Fittings for polyethylene of raised temperature (PE-RT) plastic tubing	ASSE 1061; ASTM F 877; ASTM F 1807; ASTM F 2080; ASTM F2098; ASTM F 2159; ASTM F2434; ASTM F 2735; CSA B137.5

Fittings for cross-linked polyethylene (PEX) plastic tubing	ASSE 1061, ASTM F 877; ASTM F 1807; ASTM F 1960; ASTM F 2080; ASTMF2098, ASTM F 2159; ASTM F2434; ASTM F 2735; CSA B137.5

(Portions of table not shown remain unchanged)

2. Add new text as follows:

605.25 Polyethylene of raised temperature plastic. Joints between polyethylene of raised temperature plastic tubing and fittings shall be in accordance with Section 605.25.1 and Section 605.25.2

605.25.1 Flared joints. Flared pipe ends shall be made by a tool designed for that operation.

605.25.2 Mechanical joints. Mechanical joints shall be installed in accordance with the manufacturer's instructions. Fittings for polyethylene of raised temperature plastic tubing shall comply with the applicable standards listed in Table 605.5 and shall be installed in accordance with the manufacturer's installation instructions. Polyethylene of raised temperature plastic tubing shall be factory marked with the applicable standards for the fittings that the manufacturer of the tubing specifies for use with the tubing.

3. Add standards to Chapter 13 as follows:

ASTM

F 2735-09 Standard Specification for SDR9 Cross-linked Polyethylene (PEX) and Raised Temperature (PE-RT) Tubing

F 2769-09 Polyethylene of Raised Temperature (PE-RT) Plastic Hot and cold-Water Tubing and Distribution Systems

PART II - IRC

1. Revise tables as follows:

TABLE P2605.1
PIPING SUPPORT

PIPING MATERIAL	MAXIMUM HORIZONTAL SPACING (feet)	MAXIMUM VERTICAL SPACING (feet)
Polyethylene of Raised Temperature (PE-RT) pipe	2.67 (32 inches)	10[b]

(Portions of table not shown remain unchanged)

TABLE P2904.6.2(8)
ALLOWABLE PIPE LENGTH FOR $^{3}/_{4}$-INCH PEX AND PE-RT TUBING
(Portions of table not shown remain unchanged)

TABLE P2904.6.2(9)
ALLOWABLE PIPE LENGTH FOR 1-INCH PEX AND PE-RT TUBING
(Portions of table not shown remain unchanged)

TABLE P2905.4
WATER SERVICE PIPE

MATERIAL	STANDARD
Polyethylene of raised temperature (PE-RT) plastic tubing	ASTM F 2769

(Portions of table not shown remain unchanged)

TABLE P2905.5
WATER DISTRIBUTION PIPE

MATERIAL	STANDARD
Polyethylene of raised temperature (PE-RT) plastic tubing	ASTM F 2769

(Portions of table not shown remain unchanged)

TABLE P2905.6
PIPE FITTINGS

MATERIAL	STANDARD
Fittings for polyethylene of raised temperature (PE-RT) plastic tubing	ASSE 1061; ASTM F 877; ASTM F 1807; ASTM F 2080; ASTM F2098; ASTM F 2159; ASTM F2434; ASTM F 2735; CSA B137.5
Fittings for cross-linked polyethylene (PEX) plastic tubing	ASSE 1061, ASTM F 877; ASTM F 1807; ASTM F 1960; ASTM F 2080; ASTMF2098, ASTM F 2159; ASTM F2434; ASTM F 2735; CSA B137.5

(Portions of table not shown remain unchanged)

2. Revise as follows:

P2904.3.1 Nonmetallic pipe and tubing. Nonmetallic pipe and tubing, such as CPVC, ~~and~~ PEX, and PE-RT shall be listed for use in residential fire sprinkler systems.

3. Add new text as follows:

P2905.19 Polyethylene of raised temperature plastic. Joints between polyethylene of raised temperature plastic tubing and fittings shall be in accordance with Section P2905.19.1 and Section P2905.19.2

P2905.19.1 Flared joints. Flared pipe ends shall be made by a tool designed for that operation.

P2905.19.2 Mechanical joints. Mechanical joints shall be installed in accordance with the manufacturer's instructions. Fittings for polyethylene of raised temperature plastic tubing shall comply with the applicable standards listed in Table P2905.6 and shall be installed in accordance with the manufacturer's installation instructions. Polyethylene of raised temperature plastic tubing shall be factory marked with the applicable standards for the fittings that the manufacturer of the tubing specifies for use with the tubing.

3. Add standards to Chapter 44 as follows:

ASTM

F 2735-09 Standard Specification for SDR9 Cross-linked Polyethylene (PEX) and Raised Temperature (PE-RT) Tubing

F 2769-09 Polyethylene of Raised Temperature (PE-RT) Plastic Hot and cold-Water Tubing and Distribution Systems

Reason: This change adds a new standard ASTM F2769 for Polyethylene of Raised Temperature (PE-RT) Plastic Hot and Cold-Water Tubing and Distribution Systems to the IPC for water service and water distribution. The change also adds fittings for this product similar to PEX fittings standards currently listed in the Code and also adds a new fittings standard ASTM F2735 to the code. The pipe support table is amended to provide the maximum spacing for Polyethylene of Raised Temperature (PE-RT) pipe.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: Review of proposed new standards, ASTM F 2735-09 and ASTM F2769-09, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

PART I – IPC

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

PART II – IRC

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

Proponent: Mark Kuykendall, Easyflex, representing Kofulso, Co. LTD

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IPC COMMITTEE. PART II WILL BE HEARD BY THE IRC PLUMBING COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IPC

1. Revise as follows:

TABLE 605.4
WATER DISTRIBUTION PIPE

MATERIAL	STANDARD
Stainless steel pipe (type 304/304L)	ASTM A 312; ASTM A 778; ASTM A 240
Stainless steel pipe (type 316/316L)	ASTM A 312; ASTM A 778; ASTM A 240

(Portions of table not shown do not change)

2. Add standard to Chapter 13 as follows:

ASTM

A 240/A 240M-08a Chromium-Nickel Stainless Steel Plate. Sheet, and Strip for Pressure Vessels and for General Applications.

PART II – IRC

1. Revise as follows:

TABLE P2905.5
WATER DISTRIBUTION PIPE

MATERIAL	STANDARD
Stainless steel pipe (type 304/304L)	ASTM A 312; ASTM A 778; ASTM A 240
Stainless steel pipe (type 316/316L)	ASTM A 312; ASTM A 778; ASTM A 240

(Portions of table not shown do not change)

2. Add standard to Chapter 44 as follows:

ASTM

A 240/A 240M-08a Chromium-Nickel Stainless Steel Plate. Sheet, and Strip for Pressure Vessels and for General Applications.

Reason: The inclusion of this material standard will provide another option for an engineered system for hot-cold, potable water distribution. This standard has been applied to approve the system under NSF/ANSI 61 and IAPMO IGC 233 testing, and meets the requirements specified in 605.4 (committee has been sent test reports).

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: Review of proposed new standard, ASTM A240/A240M-08a, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

PART I – IPC

Proponent: Rand Ackroyd, Rand Technical Consulting, representing The Plumbing and Drainage Institute

Part I - IPC

1. Revise as follows:

604.9 Water hammer. The velocity of the water distribution system shall be controlled to reduce the possibility of water hammer. A water-hammer arrestor shall be installed where quick-closing valves are utilized. Water hammer arrestors shall be installed in accordance with the manufacturer's specifications. Water-hammer arrestors shall conform to ASSE1010 or PDI WH201.

2. Add standard to Chapter 13 as follows:

PDI
WH201-2006 Water Hammer Arrestors

PART II – IPC

1. Revise as follows:

P2903.5 Water hammer. The flow velocity of the water distribution system shall be controlled to reduce the possibility of water hammer. Water-hammer arrestors shall be installed in accordance with the manufacturer's installation instructions. Water hammer arrestors shall conform to ASSE 1010 or PDI WH201.

2. Add standard to Chapter 44 as follows:

PDI
WH201-2006 Water Hammer Arrestors

Reason: PDI WH201 is the original US standard for water hammer arrestors first published over 40 ago. With copywriter permission the PDI performance requirements were allowed to be duplicated in the equivalent standard that is currently referenced in the Code, ASSE standard 1010. PDI WH201 was updated in 2006. This standard PDI WH201 is available to the public at no cost on www.pdionline.org .

Cost Impact: The code change will not increase the cost of construction.

Analysis: Review of proposed new standard, PDI WHI201-2006, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

PART I – IPC

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

PART II – IRC

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IPC COMMITTEE. PART II WILL BE HEARD BY THE IRC PLUMBING COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I - IPC

1. Add new text as follows:

605.5 Epoxy coating. Epoxy coating used on existing water service or water distribution piping systems shall comply with NSF 61 and shall comply with ASTM F???? or AWWA C210.

(Renumber subsequent sections)

2. Add standards to Chapter 13 as follows:

ASTM
F????-?? Epoxy Lining Systems for Water Piping

AWWA
C210-03 Liquid-Epoxy Coating Systems for the Interior and Exterior of Steel Water Pipelines

PART II - IRC

1. Add new text as follows:

P2905.19 Epoxy coating. Epoxy coating used on existing water service or water distribution piping systems shall comply to NSF 61 and shall comply to ASTM F???? or AWWA C210.

(Renumber subsequent sections)

2. Add standards to Chapter 44 as follows:

ASTM
F????-?? Epoxy Lining Systems for Water Piping

AWWA
C210-03 Liquid-Epoxy Coating Systems for the Interior and Exterior of Steel Water Pipelines

Reason: While the technology is allowed by the code and various jurisdictions it needs to be recognized and accepted in the body of the code with appropriate requirements and standards to assure proper approved installation in the field.

Cost Impact: None. It will probably save money for the user in many cases.

Analysis: Review of proposed new standards, ASTM F????-?? and AWWA C210-03, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

PART I – IPC

ICCFILENAME:CAVANAUGH-P4-605.5

P74–09/10
606.7 (New)

Proponent: Gregory A. Farmer, PE, Vice President, Legislative representing ASPE

Add new text as follows:

606.7 Labeling of water distribution pipes in bundles. Where water distribution piping is bundled at installation, each pipe in the bundle shall be indentified using stenciling or commercially available pipe labels. The identification shall indicate the pipe contents and the direction of flow in the pipe. The interval of the identification markings on the pipe shall not exceed 25 feet. There shall be not less than one identification label on each pipe in each room, space or story.

Reason: Bundled piping can causes confusion as to what the content of the individual pipes. Tracing them back to the source is often difficult and time consuming. Marking piping with the identification of the content and the direction of flow will help eliminate cross connection when repairing or renovating these plumbing systems.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: FARMER-P4-606.7 NEW

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IPC COMMITTEE. PART II WILL BE HEARD BY THE IRC PLUMBING COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IPC

Add new text as follows:

607.1.1 Temperature limiting means. A thermostat control for a water heater shall not serve as the temperature limiting means for the purposes of complying with the requirements of this code for maximum allowable hot or tempered water delivery temperatures at fixtures.

PART II – IRC

Add new text as follows:

P2903.11 Temperature limiting means. A thermostat control for a water heater shall not serve as the temperature limiting means for the purposes of complying with the requirements of this code for maximum allowable hot or tempered water delivery temperatures at fixtures.

Reason: Water Heater Thermostats: I cringe every time I hear someone tell people to turn the water heater thermostat down to prevent scalding. I see the same misguided advice dispensed in newspaper columns and safety brochures or websites. Water heater thermostats cannot be relied upon to control the outlet hot water temperature of a water heater. The reason this burner “on” and Burner “off” control is being used to control how water system temperatures is there is nothing mandating thermostatic controls to be installed on hot water systems. Although water heater manufacturers are recommending that installers set thermostats at 120 to 125 degrees F, and most of them ship the water heaters at lower temperature settings.
Plumbing engineers continue to recommend hot water systems be designed with the intended storage temperatures for several reasons.
1. The water heater is sized based on 140 degrees Fahrenheit so if you turn down the temperature you will most likely run out of hot water during peak periods.
2. Higher temperatures reduce the threat of Legionellae bacteria growth in the water heater tank.
3. Using 140 degree hot water and mixing down to a safe delivery temperature around 120-125 degrees Fahrenheit allows a constant hot water delivery temperature.
4. If a water heater burner control thermostat is turned down to a lower temperature, the water heater has a reduced capacity to deliver hot water.

When users run out of hot water and the water heater thermostat is readjusted, it is often adjusted to an even higher temperature. Even if the fixtures are protected with compensating type anti-scald shower valves the maximum temperature limit stop on every valve must be readjusted. The failure to re-adjust these valves often leads to scalding incidents. When there is a master thermostatic mixing valve the hot water will be delivered at a relatively constant temperature to the fixtures.

Water Heater Burner Control Accuracy

Water heater thermostats were never intended to provide precise temperature controls for hot water system temperatures. For example: The thermostat dial calibration test of ANSI Z21.10.1-1998, which is the applicable standard for gas-fired water heaters, allows the temperature to vary 10 degrees above or below the thermostat setting. I have talked to water heater manufacturers that have indicated the controls can vary as much as 15 to 18 degrees Fahrenheit above or below the set point. The thermostat is inserted into the lower portion of a water heater tank and turns the fuel supply to the water heater “on” and “off” . There is no way to know what the temperature in the tank is with most water heater thermostat dials.

Theoretically, if the water heater thermostatic element is set at 120 degrees Fahrenheit, the burner would come on when the temperature at the thermostat reaches about 105 degrees Fahrenheit. The burner stays on until the water around the thermostatic element (near the bottom of the heater) reaches about 135 degrees Fahrenheit then it turns the fuel supply to the burner or heating element off. (15 degrees F above the set-point of the thermostat). The maximum temperature limit test of ANSI Z21.10.1 gas water heater standard allows the outlet water temperature of the water heater to rise about 30 degrees F above the thermostat setting. This provision accounts for the phenomenon known as "stacking" or "layering” of hot water in the top of a water heater. Stacking or layering occurs when hot water rises to the top of the water heater due to recurring short duration heating cycles caused by a frequent number of small quantity hot water uses which draws cold water into the bottom of the heater. Although the above example addresses gas water heaters, this phenomenon can also occur in other types of storage water heaters. So at the top of a water heater that is theoretically set for 120 degrees Fahrenheit, the outlet hot water temperatures can easily reach 165 degrees Fahrenheit.

This is why we should mandate a thermostatic mixing valve conforming to ASSE 1017 or CSA B-125.3 on the outlet piping of a water heater to limit the hot water distribution temperatures to a maximum safe delivery temperature of 120 to 125 degrees Fahrenheit. If high temperature hot water uses are required for a process application a thermostatic mixing valve conforming to ASSE 1070 can be installed on the local branch piping serving a fixture or group of fixtures. Additional supporting information is shown on my website at: www.rongeorgedesign.com

Cost Impact: The code change proposal will not increase the cost of construction.

P76–09/10
607.1, 607.1.1(New)

Proponent: Ronald L, George, CIPE, CPD, President of Ron George Design & Consulting Services representing himself

Revise as follows:

607.1 Where required. In residential *occupancies*, *hot water* shall be supplied to all plumbing fixtures and equipment utilized for bathing, washing, culinary purposes, cleansing, laundry or building maintenance. In nonresidential *occupancies*, *hot water* shall be supplied for culinary purposes, cleansing, laundry or building maintenance purposes. In nonresidential *occupancies*, *hot water* or *tempered water* shall be supplied for bathing and washing purposes. ~~*Tempered water* shall be supplied through a water temperature limiting device that conforms to ASSE 1070 and shall limit the *tempered water* to a maximum of 110ºF (43ºC). This provision shall not supersede the requirement for protective shower valves in accordance with Section 424.3.~~

Add new text as follows:

607.1.1 Tempered water temperature control. *Tempered water* shall be supplied through a water temperature limiting device that conforms to ASSE 1070 and shall limit the *tempered water* to a maximum of 110ºF (43ºC). This provision shall not supersede the requirement for protective shower valves in accordance with Section 424.3.

Reason: Water heater thermostats cannot be relied upon to accurately control the hot water temperature to a hot water distribution system. All water heater thermostats have an allowable tolerance plus or minus 11 to 15 degrees Fahrenheit that allows

temperature swings in the hot water distribution system of up to 30 degrees from the burner or heating element “on” temperature setting to the burner or heating element “off” temperature setting. Coupled with thermal layering (“stacking”) in un-circulated storage type water heaters, the temperature variation can be as much as 50 degrees in an un-circulated storage type heater. Instantaneous heaters have temperature fluctuations as the flow changes. A thermostatic mixing valve installed in the hot water piping downstream of the water heater will mix cold water with the varying hot water temperatures to deliver a relatively constant and safe temperature of hot water to the domestic hot water system.

Cost Impact: Minimal

ICCFILENAME: GEORGE-P7-607.1.1 NEW

P78–09/10
607.2

Proponent: Guy Tomberlin of Virginia representing himself.

Revise as follows:

607.2 Hot water supply temperature maintenance. Where the developed length of hot water piping from the source of hot water supply to the furthest fixture exceeds 100 feet (30 480 mm), the hot water supply system shall be provided with a method of maintaining the temperature of hot water to within 100 feet (30 480 mm) of the fixtures. The methods of maintaining energy efficiency shall be in accordance with the International Energy Conservation Code.

Reason: This text was contained in the 2000 IPC and stated that where the furthest fixture was 100 feet away from the hot water source, a method for maintaining hot water to the furthest fixture must be provided and then it went on to list the two options I have presented. Unfortunately, the current section no longer states the maximum distance that the hot water is required to be located within the water distribution system when you have exceeded the 100 feet. It also fails to provide the methods to maintain the hot water within a system. Now it sends you to the International Energy Conservation Code which unfortunately does not provide any methods for maintaining the hot water temperature. This has created a deadend and failed to require anything if the 100 foot distance is exceeded. The proposed change is correct these issues and re–instate the two

commonly used methods for maintaining hot water temperature back into the IPC. The IECC does not need to be mentioned in this section as the Energy Code always applies**.**

This is in attempt to provide the information on maintaining hot water in a system and delivering it to the fixtures. Energy conservation must be observed in the IPC. Hot water supply is an area where design is critical to enable huge energy and water savings. Either locate the water heating source near the utilization point, the fixtures, or install a circulating system or heat trace.

Cost Impact: This proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: TOMBERLIN-P2-607.2

P79–09/10
607.2

Proponent: Guy Tomberlin of Virginia representing himself.

Revise as follows:

607.2 Hot or tempered water supply to fixtures ~~supply temperature maintenance~~. ~~Where the developed length of hot water piping from the source of hot water supply to the furthest fixture exceeds 100 feet (30 480 mm), the hot water supply system shall be provided with a method of maintaining the temperature in accordance with the International Energy Conservation Code.~~ The developed length of hot or tempered water piping, from the source of hot water to the fixtures that require hot or tempered water, shall not exceed 40 feet (12192mm). Recirculating system piping and heat traced piping shall be considered to be sources of hot or tempered water.

Reason: Energy conservation needs to be observed in the IPC. Hot water supply is an area where design is critical. Either locate the water heating source near the fixtures or install a circulating system or heat trace system. This is in attempt to minimize the time it takes to get hot water to a fixture. I believe that 100 feet is entirely too much distance between the fixture and the water heating source. A huge amount of water and energy is wasted while running the water and waiting for the heated water to get to the outlet.

Current text in the IPC is easily manipulated to permit unwanted systems, that comply with the language as written, but that fail to serve the intended purpose. This proposal changes the text to say what it means, and maintain the original intent which is to get hot water to the fixture without wasting unnecessary energy and water.

In essence, this is in attempt to minimize the time it takes to get hot water to a fixture. Energy conservation must be observed in the IPC/IRC. Hot water supply is an area where design is critical to enable huge energy and water savings.

Cost Impact: This proposal may increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: TOMBERLIN-P3-607.2

P80–09/10
607.2

Proponent: Ronald L, George, CIPE, CPD, President of Ron George Design & Consulting Services representing himself

607.2 Hot water supply temperature maintenance. Where the *developed length* of hot water piping from the source of hot water supply to the farthest fixture exceeds ~~100~~ 50 feet (15 240mm), the hot water supply system shall be provided with a method of maintaining the temperature in accordance with the *International Energy Conservation Code*.

Reason: This proposed change is intended to address the waste of water and energy associated with systems with up to 100 feet of HW piping from the water heater to the farthest fixture. The *Domestic Water Heating Design Manual* Published by the American Society of Plumbing Engineers addresses hot water temperature maintenance in the book. Chapter 10 and 11 of the manual describes how to promptly deliver hot water to all fixtures, depending on the type of facility. The *Domestic Water Heating Design Manual* recommends a maximum of 25 feet of un-circulated pipe or 30 seconds as minimally acceptable.

The code currently states, when the distance from the water heater to the farthest outlet exceeds 100 feet, the water should be circulated. The 100-foot recommendation is subjective, as was pointed out by an engineer from ASHRAE who selected this distance many years ago when fixtures flow far more water than they do now. When the 100-foot criteria the code is followed, it creates considerable problems, such as lack of hot water at fixtures, insufficient water heater capacity and thermal temperature escalation in showers when heated hot water finally arrives many minutes after the shower comes on.

The 100-foot length criterion was developed in 1973 after the Middle East oil embargo, when energy costs were more important than water conservation. Since the energy codes now require significant insulation on circulated hot water piping the circulation of hot water causes a very minor loss of energy due to radiation and convection. In fact this heat loss into the building actually helps the building heating load in the winter months. With a timer on the circulated loop, coupled with the added insulation, the energy loss is minor when compared to the energy loss of water that was heated and poured down the drain and the lack of hot any hot water at fixtures nearly 100 feet from the water heater, especially the intermittent use fixtures such as lavatories. The previous code language arbitrarily picked the 100-foot maximum length criterion and with lower flow fixtures we may as well not have recirculation. The ultimate goal is to have hot water at the sink in a timely fashion.

Length and Time Criteria

In the latest publication of the *Domestic Water Heating Design Manual*, it recommends changes to the 100-foot length criteria. Water that is wasted because of the long delay in obtaining hot water at the fixtures has become more critical of an issue than the energy losses caused by hot water temperature maintenance systems. To significantly reduce the wasting of cooled hot water, I reevaluated the permissible distances for un-circulated, dead-end branches to periodically used plumbing fixtures. The existing 100-foot allowable distances for un-circulated, dead-end branches represent a trade-off between the energy utilized by the hot water temperature maintenance system and the cost of the insulation, on the one hand. On the other hand, with long dead end branches there is the cost of energy to heat the excess cold water makeup, the cost of wasted potable water, decreased capacity of the water heater, extra sewer surcharges added to the water meter and the loss of valuable water down the drain waiting for the hot water branch piping to drain ambient temperature water in order to get useable hot water. The International Energy Code required a timer to shut off the circulator during off hours so there would be no nighttime energy losses, when the energy to the self-regulating heater cable or circulating pump is turned off during night time hours.

Reasonable Delays

What are reasonable delays in obtaining hot water at a fixture? The *Domestic Water Heating Design Manual* describes it as follows; For anything beside very infrequently used fixtures (such as those in industrial facilities or certain fixtures in office buildings), a delay of 0 to 10 seconds is normally considered acceptable for most residential occupancies and public fixtures in office buildings. A delay of 11 to 30 seconds is marginal but possibly acceptable, and a time delay longer than 31 seconds is normally considered unacceptable and a significant waste of time, water and energy. Therefore, when designing hot water systems, it is prudent for the codes to provide some means of getting hot water to the fixtures closer to or within these acceptable time limits during peak hours. This means that there should be a maximum distance of approximately 25 feet (7.6 meters) between the hot water maintenance system and each of the plumbing fixtures requiring hot water. The distance should depend on the water flow rate of the plumbing fixture at the end of the line and the size of the line. (See Tables 3, 4, and 5.) Additional delays in getting hot water to the fixture may be caused by the rerouting of the pipes for structural conditions or other flow related problems. The tables support the 25-foot distance, although past experience shows the industry may resist such a drastic change. Therefore the I am suggesting a maximum of 50 feet because it would be a vast improvement and most homes and small businesses can deliver hot water from a centrally located water heater without having a temperature maintenance system. (See table 5)

New Low Flow Fixtures are Required by Energy Policy Act and ASHRAE 90.1

With the advent of low fixture discharge rates mandated by the Energy Policy act of 1992, a federal law, it takes considerably longer to obtain hot water from fixtures that are close to 100 feet from the hot water source. For example, a public lavatory with a half gallon per minute or a metering faucet with 0.25 gallons per minute maximum discharge rate would take an excessive amount of time to obtain hot water from 100 feet of un-circulated, un-insulated hot water branch and main piping. (See Tables 1 through 7.) These tables give conservative approximations of the amount of time it takes to obtain hot water at a fixture. The times are based on the size of the line, the fixture flow rate, and the times required to replace the cooled-off hot water, to heat the pipe, and to offset the convection energy lost by the insulated hot water line.

a. Delays longer than 30 seconds are not acceptable according to the *Domestic Water Heating Design Manual*

Results of Delays in Delivering Hot Water to Fixtures

As shown in table 6 above, when there is a long delay in obtaining hot water at the fixture, there is significant waste of potable water as the cooled hot water supply is simply discharged down the drain unused. Concerns about total life cycle costs have realized that the total cost of this previously heated water includes:

1. The original cost for obtaining potable water
2. The cost of fuel used to previously heat the water
3. The final cost of the waste treatment of this excess potable water, which results in larger sewer surcharges
4. The cost of heating the incoming cold that is replacing the wasted water to bring it up to the required temperature.
5. Increased municipal water booster pumping costs.
6. Increased wastewater treatment pumping and processing costs.

Loss of Water Heater Capacity

When there is a long delay in obtaining hot water at the fixtures, the faucets are turned on for long periods of time to draw the hot water from the water heater to the fixture to get the hot water up to the desired temperature. This is allowing cold water to flow into the water heater during this several minute delay and can cause the water heater burner to cycle longer and in some cases can cause hot water shortages. The water heater will have to heat the extra cold water brought into the system in a short period of time.

Methods of Delivering a Reasonably Prompt Hot Water Supply

Hot water maintenance systems are varied. They can be grouped into three basic categories, though any actual installation may be a combination of more than one of these types of system. The three basic categories are

1. Circulation systems.
2. Self-regulating heat trace systems.
3. Point of use water heaters (locating the water heater close to the fixtures).

Cost Impact: Minimal

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: GEORGE-P4-607.2

P81–09/10
607.2.1, 607.5 (New)

Proponent: Guy Tomberlin of Virginia representing himself.

1. Delete without substitution as follows:

~~**607.2.1 Piping insulation**. Circulating hot water system piping shall be insulated in accordance with the International Energy Conservation Code.~~

(Renumber subsequent sections)

2. Add new text as follows:

[E] 607.5 Pipe insulation. Automatic-circulating hot water system piping shall be insulated with 1 inch (25 mm) of insulation having a conductivity not exceeding 0.27 Btu per inch/h · ft^2 · °F (1.53 W per 25 mm/m^2 · K). The first 8 feet (2438 mm) of hot water piping from a hot water source that does not have heat traps shall be insulated with 0.5 inch (12.7mm) of material having a conductivity not exceeding 0.27 Btu per inch/h · ft^2 · °F (1.53 W per 25 mm/m^2 · K).

Reason: This is a simple helpful piece of information to prevent a plumbing contractor from having to purchase another document besides the IPC just to figure out what type insulation is required on a hot water piping system

Cost Impact: The proposal will increase the cost of construction.

Analysis: The new text proposed to be added is an extract word-for-word from the IECC. This proposal is being put before the IPC committee with the intent to place the section in the code without modification.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: TOMBERLIN-P4-607.2.1

P82–09/10
607.2.1

Proponent: John R. Addario, P.E., New York State Department of State - Division of Code Enforcement and Administration

Revise as follows:

607.2.1 Piping insulation. ~~Circulating~~ Hot water piping in temperature maintenance systems ~~piping that is required to have the water temperature maintained~~ shall be insulated in accordance with the *International Energy Conservation Code*.

Reason: The intent of this section is to require systems that maintain system hot water temperature to be properly insulated. Heat traced systems, like circulating systems, should be required to limit the amount of energy they consume by requiring a minimum amount of insulation. This proposed change includes heat trace systems within the intent of this section.

Cost Impact: The code change proposal will not increase the cost of construction.

2. Add standard to Chapter 44 as follows:

CSA
B64.1.3-07 Spill resistant pressure vacuum breakers (SRPVB)

Reason: The acceptance of the proposed change will enable manufacturers with products certified to CSA B64.1.3 to have their products used as options to products that meet the requirements of ASSE 1056. This change will also allow the authorities having jurisdiction to allow the use of products that meet either CSA B64.1.3 or ASSE 1056.

Cost Impact: The code change proposal will not increase the cost of production.

Analysis: Review of proposed new standard, CSA B64.1.3-07, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

PART I – IPC

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

PART II – IRC

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Murra-P4-608.13.8

P84–09/10
605.16.2; IRC P2905.9.1.2

Proponent: Paul Coble, Lewis Pipe Company, Ardmore, TN

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IPC COMMITTEE. PART II WILL BE HEARD BY THE IRC PLUMBING COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I - IPC

Revise as follows:

605.16.2 Solvent cementing. Joint surfaces shall be clean and free from moisture, and an approved primer shall be applied. Solvent cement, orange in color and conforming to ASTM F 493, shall be applied to all joint surfaces. The joint shall be made while the cement is wet, and in accordance with ASTM D 2846 or ASTM F 493. Solvent-cement joints shall be permitted above or below ground.

Exception: A primer is not required where all of the conditions apply:

1. The solvent cement is third party certified as conforming to ASTM F-493.
2. The solvent cement used is yellow or blue in color.
3. The solvent cement is used only for joining ½ (12.7 mm) inch through 2 inch (51 mm) diameter pipe and fittings.
4. The CPVC pipe and fittings are manufactured in accordance with ASTM D2846.

PART II - IRC

Revise as follows:

P2905.9 Solvent cementing. Joint surfaces shall be clean and free from moisture, and an approved primer shall be applied. Solvent cement, orange in color and conforming to ASTM F 493, shall be applied to all joint surfaces. The joint shall be made while the cement is wet, and in accordance with ASTM D 2846 or ASTM F 493. Solvent-cement joints shall be permitted above or below ground.

Exception: A primer is not required where all of the conditions apply:

1. The solvent cement is third party certified as conforming to ASTM F-493.
2. The solvent cement used is yellow or blue in color.
3. The solvent cement is used only for joining ½ (12.7 mm) inch through 2 inch (51 mm) diameter pipe and fittings.
4. The CPVC pipe and fittings are manufactured in accordance with ASTM D2846.

Reason: The yellow color indicated matches a competitor products trademark color. The blue indicated would match our trademark color. This is the only code which gives a single company or product a competitive advantage in the market. This color has actually been used against our product in the market with representatives from our competitor in at least 5 states claiming yellow one step cement would not work with a blue pipe system. The products in question are FLOWGUARD GOLD marketed by Lubrizol and Lewis Blue marketed by Lewis Pipe Company. We have developed a blue one step and would like to market this accordingly. The same standards for the cement would still apply.

Cost Impact: There will be no cost impact to builders, plumbers, or home buyers as the products will be virtually the same price and represent a very small portion of the building process.

PART I – IPC

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

PART II – IRC

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Coble-P1-605.16.2

P85–09/10
711.2, 711.3.1

Proponent: Julius Ballanco, P.E., CPD, FASPE/JB Engineering and Code Consulting, P.C. representing himself

1. Delete without substitution:

~~**711.2 Horizontal branch connections to horizontal stack offsets.** Where a horizontal stack offset is located more than four branch intervals below the top of the stack, a Horizontal branch connections shall not connect within the horizontal stack offset or within 2 feet (610 mm) above or below such offset.~~

(Renumber subsequent sections)

2. Revise as follows:

704.3 Connections to offsets and bases of stacks. Horizontal branches shall connect to the bases of stacks at a point located not less than 10 times the diameter of the drainage *stack* downstream from the *stack*. ~~Except as prohibited by Section 711.2, h~~ Horizontal branches shall connect to horizontal *stack* offsets at a point located not less than 10 times the diameter of the drainage *stack* downstream from the upper *stack*.

711.3.1 Omission of vents for horizontal stack offsets. Vents for horizontal stack offsets required by Section 711.3 shall not be required where the stack and its offset are one pipe size larger than required for a building drain [see Table 710.1(1)] and the entire stack and offset are not less in cross-sectional area than that required for a straight stack plus the area of an offset vent as provided for in Section 915. ~~Omission of offset vents in accordance with this section shall not constitute approval of horizontal branch connections within the offset or within 2 feet (610 mm) above or below the offset.~~

Reason: The current requirement connection limitations in these sections are archaic and unfounded. Research has shown that the turbulent flow in the horizontal offset occurs within the first 10 pipe (stack) diameters downstream of the stack. This is the same condition that occurs in a building drain, downstream of the base of a stack. Beyond the ten pipe diameters point downstream of a stack , the flow in the horizontal pipe becomes nonturbulent open channel flow. Any connection downstream of where turbulent action is known to occur should be permitted. The allowance for horizontal connections to a horizontal offset should mirror the requirements at the base of the stack because the concerns for avoiding connections in a turbulent zone are identical.

This modification is consistent with one of the legacy codes, See Section 604.3 of the 1993 BOCA National Plumbing Code.

Cost Impact: The code change proposal will not increase the cost of construction.

608.7, 608.15.4.2; IRC P2902.4.3, P2903.9.5

Proponent: Judson Collins, JULYCO, representing Woodford Manufacturing Co.

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IPC COMMITTEE. PART II WILL BE HEARD BY THE IRC PLUMBING COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IPC

Revise as follows:

608.7 Valves and outlets prohibited below grade. Potable water out lets and combination stop-and-waste valves shall not be installed underground or below grade. Freezeproof yard hydrants that drain the riser into the ground are considered to be stop-and-waste valves.

> **Exception:** Freezeproof yard hydrants that drain the riser into the ground shall be permitted to be installed, provided that the potable water supply to such hydrants is protected upstream of the hydrants with a field

testable backflow preventer assembly in accordance with Section 608 and the hydrants are permanently identified as nonpotable outlets by approved signage that reads as follows: “Caution, Nonpotable Water. Do Not Drink.”

608.15.4.2 Hose connections. Sillcocks, hose bibs, wall hydrants and other openings with a hose connection shall be protected by an atmospheric-type vacuum breaker, a pressure-type vacuum breaker, a two-check type backflow preventer or a permanently attached hose connection vacuum breaker. All devices used for such protection shall be field testable.

PART II – IRC

Revise as follows:

P2902.4.3 Hose connection. Sillcocks, hose bibbs, wall hydrants and other openings with a hose connection shall be protected by an atmospheric-type ~~or~~ vacuum breaker, a pressure-type vacuum breaker , a two-check type backflow preventer or a permanently attached hose connection vacuum breaker. All devices used for such protection shall be field testable.

Exceptions:

1. This section shall not apply to water heater and boiler drain valves that are provided with hose connection threads and that are intended only for tank or vessel draining.
2. This section shall not apply to water supply valves intended for connection of clothes washing machines where backflow prevention is otherwise provided or is integral with the machine.

P2903.9.5 Valves and outlets prohibited below grade. Potable water outlets and combination stop-and-waste valves shall not be installed underground or below grade. Freezeproof yard hydrants that drain the riser into the ground are considered to be stop-and-waste valves.

Exception: Installation of freezeproof yard hydrants that drain the riser into the ground shall be permitted if the potable water supply to such hydrants is protected upstream of the hydrants with a field testable backflow preventer assembly in accordance with Section P2902 and the hydrants are permanently identified as nonpotable outlets by *approved* signage that reads as follows: “Caution, Nonpotable Water. Do Not Drink.”

Reason: A study that evaluated vacuum breakers after they were installed found that the frost proof sillcocks, conforming to ASSE 1019 that had been installed for 5 or more years, have a high probability of failure of the vacuum breaker. Therefore, property owners have no guarantee of backflow protection from ASSE 1019 devices and no way of testing to determine if the devices are working properly. Requiring a field testable backflow preventer, other than atmospheric-type vacuum breakers, for protection of hose connections will allow owners to determine if proper protection is being provided.

Cost Impact: The code change proposal will not increase the cost of construction.

PART I – IPC

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

PART II – IRC

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: COLLINS-P10-608.7

P87–09/10
608.8; IRC P2901.1

Proponent: Gary Kreutziger, City of San Antonio, TX, representing the Planning and Development Services Department

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IPC COMMITTEE. PART II WILL BE HEARD BY THE IRC PLUMBING COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I - IPC

Revise as follows:

608.8 Identification of nonpotable water. ~~In buildings~~ ~~w~~Where nonpotable water systems are installed, the piping conveying the nonpotable water shall be identified either by color marking or metal tags in accordance with Sections 608.8.1 through 608.8.3. All nonpotable water outlets such as hose connections, open ended pipes, and faucets shall be identified at the point of use for each outlet with the words, "Nonpotable-not safe for drinking." The words shall be indelibly printed on a tag or sign constructed of corrosion-resistant waterproof material or shall be indelibly printed on the fixture. The letters of the words shall be not less than 0.5 inches in height and in colors in contrast to the background on which they are applied.

PART II – IRC

Revise as follows:

P2901.1 Potable water required. *Dwelling units* shall be supplied with potable water in the amounts and pressures specified in this chapter. ~~In a building~~ Where a nonpotable water-distribution system is installed, the nonpotable system shall be identified by color marking, metal tags or other appropriate method. Where color is used for marking, purple shall be used to identify municipally reclaimed water, rainwater and graywater distribution systems. Any nonpotable outlet that could inadvertently be used for drinking or domestic purposes shall be posted.

Reason: The purpose of the proposed code change is to require all nonpotable water systems to be identified, not just the systems "in buildings". As currently written section 608.8 limits the identification of nonpotable water systems to systems installed "in buildings" and creates confusion as to whether or not outlets not in buildings need to be identified. All systems and outlets for nonpotable water should be identified regardless of location. The change will provide a cost effective, minimum level of protection for the health and welfare of the public with minimal change to the code or its intent.

Cost Impact: The code change proposal will not increase the cost of construction.

Revise as follows:

608.14 Location of backflow preventers. Access shall be provided to backflow preventers as specified by the installation instructions of the ~~approved~~ manufacturer.

Reason: The code official or AHJ does not approve or disapprove manufacturers.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: GRACE-P2-608.14

P90–09/10
608.14; IRC P2902.6

Proponent: Matthew Kapcia, Michigan Code Study and Development Committee

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IPC COMMITTEE. PART II WILL BE HEARD BY THE IRC PLUMBING COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I - IPC

Revise as follows:

608.14 Location of backflow preventers. ~~*Access* shall be provided to~~ Backflow preventers shall be installed only in locations where access for testing and maintenance does not require the use of a portable ladder, step stool, or similar device. Clearances around backflow preventers shall be in accordance with the manufacturer's ~~as specified by the~~ installation instructions ~~of the *approved* manufacturer~~.

PART II – IRC

Revise as follows:

P2902.6 Location of backflow preventers. ~~*Access* shall be provided to~~ Backflow preventers shall be installed only in locations where access for testing and maintenance does not the require use of a portable ladder, step stool, or similar device. Clearances around backflow preventers shall be in accordance with ~~as specified by the~~ manufacturer's installation instructions.

Reason: Backflow preventers are required to be maintained and tested at least annually, and are routinely installed in locations that pose a hazard to test personnel as well as maintenance personnel. Such locations include ceilings, mid-air in high locations, and over equipment requiring the use of a ladder while trying to use tools and gauges. Such locations often have improper access to enable a person lift components of test equipment. This is a health and safety issue for maintenance personnel. Code officials can always grant modifications under code section 105.1 Modifications.

Cost Impact: The code change proposal will increase the cost of construction and will decrease the cost of maintenance, equipment, lost work time, and medical expenses.

PART I – IPC

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

PART II – IRC

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: KAPCIA-P2-608.14

P91–09/10
608.16.6

Proponent: Dave Watson, Dave Watson Associates representing himself

Revise as follows:

608.16.6 Connections subject to backpressure. Where a potable water connection is made to a non-potable line, fixture, tank, vat, pump or other equipment subject to high hazard back-pressure, the potable water connection shall be protected by a reduced pressure principle backflow preventer.

Reason: Section as written is vague- it could (and is) interpreted as also applying to low hazard cross connections. Table 608.1 lists numerous air gaps and backflow prevention devices for low hazard back pressure. These devices are not reduced pressure principle backflow preventers as existing 608.16.6 appears to require. Therefore, adding "high hazard" to 608.16.6 clarifies.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME:WATSON-P1-608.16.6

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IPC COMMITTEE. PART II WILL BE HEARD BY THE IRC PLUMBING COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IPC

1. Revise as follows:

BACKFLOW PREVENTER. A backflow prevention assembly, a device or other ~~means~~ methods to prevent backflow into the potable water supply.

CONTAMINATION. An impairment of the quality of potable water that creates a~~n actual hazard to the~~ public health risk through poisoning, ~~or through~~ the spread of disease ~~by~~ or contact with sewage, industrial fluids, ~~or~~ waste or radioactivity. See "*Pollution*".

POLLUTION. An impairment of the quality of potable water ~~to a degree~~ that does not create a ~~hazard to the~~ public health risk but that does adversely and unreasonably affect the aesthetic qualities of ~~such~~ potable water intended for ~~domestic use~~ drinking, bathing or culinary purposes. See "*Contamination*".

REDUCED PRESSURE PRINCIPLE BACKFLOW PREVENT~~ER~~ION ASSEMBLY. A backflow prevention ~~device~~ assembly consisting of two independently acting check valves, internally ~~force~~ loaded to a normally closed position and separated by an intermediate chamber with a ~~(or~~ zone~~)~~ of reduced pressure. ~~in which there is~~ The reduced pressure zone is provided with an automatic ~~relief~~ means of venting to the atmosphere, internally loaded to a normally

open position between two tightly closing shutoff valves and with a means for testing for tightness of the checks and opening of the relief means.

2. Add new definitions as follows:

HAZARD, DEGREE OF

High or Health. A condition or arrangement that could cause contamination of a potable water supply or system supply. See "*Contamination*".

Low or Non-health. A condition or arrangement that could cause pollution of a potable water supply or system supply. See "*Pollution*".

PART II – IRC

1. Revise as follows:

BACKFLOW PREVENTER. A backflow prevention assembly, a device or other ~~means~~ methods to prevent backflow into the potable water supply.

CONTAMINATION. An impairment of the quality of potable water that creates a~~n actual hazard to the~~ public health risk through poisoning, ~~or through~~ the spread of disease ~~by~~ or contact with sewage, industrial fluids, ~~or~~ waste or radioactivity. See "*Pollution*".

POLLUTION. An impairment of the quality of potable water ~~to a degree~~ that does not create a ~~hazard to the~~ public health risk but that does adversely and unreasonably affect the aesthetic qualities of ~~such~~ potable water intended for ~~domestic use~~ drinking, bathing or culinary purposes. See "*Contamination*".

REDUCED PRESSURE PRINCIPLE BACKFLOW PREVENT~~ER~~ION ASSEMBLY. A backflow prevention ~~device~~ assembly consisting of two independently acting check valves, internally ~~force-~~loaded to a normally closed position and separated by an intermediate chamber with a ~~(or~~ zone~~)~~ of reduced pressure. ~~in which there is~~ The reduced pressure zone is provided with an automatic ~~relief~~ means of venting to the atmosphere, internally loaded to a normally open position between two tightly closing shutoff valves and with a means for testing for tightness of the checks and opening of the relief means.

2. Add new definitions as follows:

HAZARD, DEGREE OF

High or Health. A condition or arrangement that could cause contamination of a potable water supply or system supply. See "*Contamination*".

Low or Non-health. A condition or arrangement that could cause pollution of a potable water supply or system supply. See "*Pollution*".

Reason: BACKFLOW PREVENTER: The change in this term's definition is necessary to better understand the use of Table 608.1(IRC Table P2902.3) APPLICATION OF BACKFLOW PREVENTERS. I have submitted a companion proposal for rearranging the information in Table 608.1 to show that BACKFLOW PREVENTERS are categorized in three groups: Backflow Prevention Assemblies, Backflow Devices, and Other Methods. The purpose of the three groupings is to illustrate that Backflow Prevention Assemblies are field testable (having shutoff valves and test cock fittings), Backflow Devices are not field testable; and Other Methods are not field testable but by observation, can be determined that proper backflow protection exists.

CONTAMINATION and POLLUTION: Table 608.1 (IRC Table P2902.3) has a footnote concerning the relationship between the terms "high" and "low" hazard and the defined terms of CONTAMINATION and POLLUTION, respectively. The backflow prevention community also uses the terms "health hazard" and "non-health hazard" in describing applications and connections. The proposed amendments to these definitions are necessary so that code officials, backflow prevention specialists, plumbers and plumbing system designers clearly understand the relationships between these terms and are able to properly select appropriate backflow preventers in accordance with the table.

REDUCED PRESSURE PRINCIPLE BACKFLOW PREVENTION ASSEMBLY: This definition needs changed to be in alignment with the 3 groups of Backflow Preventers that are identified in the proposed amended definition of BACKFLOW PREVENTER and the proposed rearrangement of Table 608.1. For the IRC, the term "REDUCED PRESSURE-ZONE BACKFLOW PREVENTER" is not found in the IRC text, therefore, the term is being corrected to match terminology corrections that are being proposed by companion proposals for numerous code sections.

All proposed changes in the above definitions have no technical impact. These changes, along with other proposed companion changes are necessary to provide meaningful and consistent terminology throughout the code for better understanding of the application of backflow preventers.

Cost Impact: The code change proposal will not increase the cost of construction.

PART I - IPC

1. Revise table as follows:

TABLE 608.1
APPLICATION OF BACKFLOW PREVENTERS

BACKFLOW PREVENTION ASSEMBLIES			
DEVICE	**DEGREE OF HAZARD[a]**		**APPLICABLE STANDARDS**
Double check backflow prevention assembly ~~and~~ Double check fire protection backflow prevention assembly	Low hazard		ASSE 1015, AWWA C510, CSA B64.5, CSA B64.5.1
Double check detector fire protection backflow prevention assembl~~ies~~y	Low hazard		ASSE 1048
Pressure vacuum breaker assembly	High or low hazard		ASSE 1020, CSA B64.1.2
Reduced pressure principle backflow prevent~~er~~ion assembly ~~and~~ Reduced pressure principle fire protection backflow prevent~~er~~ion assembly	High or low hazard		ASSE 1013, AWWA C511, CAN/CSA B64.4, CSA B64.4.1
Reduced pressure detector fire protection backflow prevention assembly	High or low hazard		ASSE 1047
Spill~~proof~~ –resistant vacuum breaker assembly	High or low hazard		ASSE 1056
BACKFLOW PREVENTER DEVICES			
DEVICE	**DEGREE OF HAZARD[a]**		**APPLICABLE STANDARDS**

Antisiphon~~-type~~ fill valve~~s~~ for gravity water closet flush tanks	High hazard		ASSE 1002, CSA B125.3
~~Pipe-applied~~ Atmospheric vacuum breaker	High or low hazard		ASSE 1001, CAN/CSA B64.1.1
Backflow preventer for ~~carbonated~~ beverage dispensing equipment ~~machines~~	Low hazard		ASSE 1022
Backflow preventer with intermediate atmospheric vents	Low hazard		ASSE 1012, CAN/CSA B64.3
Dual check valve type backflow preventer	Low hazard		ASSE 1024, CSA B64.6
Hose connection backflow preventer	~~High or~~ Low hazard		ASSE 1052, CSA B64.2.1.1
Hose connection vacuum breaker	~~High or~~ Low hazard		ASSE 1011, CAN/CSA B64.2, CSA B64.2.1
Laboratory faucet backflow preventer	~~High or~~ Low hazard		ASSE 1035, CSA B64.7
Vacuum breaker wall hydrant~~s~~, ~~frost~~ freeze-resistant, automatic draining type	~~High or~~ Low hazard		ASSE 1019, CAN/CSA B64.2.2
OTHER METHODS			
DEVICE	**DEGREE OF HAZARD[a]**		**APPLICABLE STANDARDS**
Air gap	High or low hazard		ASME A112.1.2
Air gap fitting~~s~~ for use with plumbing fixtures, appliances and appurtenances	High or low hazard		ASME A112.1.3
Barometric loop	High or low hazard		(See Section 608.13.4)

(Portions of table not shown remain unchanged)

2. Revise as follows:

608.13.6 Atmospheric~~-type~~ vacuum breakers. ~~Pipe-applied~~ Atmospheric~~-type~~ vacuum breakers shall conform to ASSE 1001 or CAN/CSA B64.1.1. Hose-connection vacuum breakers shall conform to ASSE 1011, ASSE 1019, ASSE 1035, ASSE 1052, CAN/CSA B64.2, CSA B64.2.1, CSA B64.2.1.1, CAN/CSA B64.2.2 or CSA B64.7. These devices shall operate under normal atmospheric pressure when the critical level is installed at the required height.

PART II – IRC

1. Revise table as follows:

TABLE P2902.3
APPLICATION OF BACKFLOW PREVENTERS

BACKFLOW PREVENTION ASSEMBLIES			
DEVICE	**DEGREE OF HAZARD[a]**		**APPLICABLE STANDARDS**
Double check backflow prevention assembly ~~and~~ Double check fire protection backflow prevention assembly	Low hazard		ASSE 1015, AWWA C510, CSA B64.5, CSA B64.5.1
Double check detector fire protection backflow prevention assembli~~es~~y	Low hazard		ASSE 1048
Pressure vacuum breaker assembly	High or low hazard		ASSE 1020, CSA B64.1.2
Reduced pressure principle backflow preventer~~er~~ion assembly ~~and~~ Reduced pressure principle fire protection backflow preventer~~er~~ion assembly	High or low hazard		ASSE 1013, AWWA C511, CAN/CSA B64.4, CSA B64.4.1

Reduced pressure detector fire protection backflow prevention assembly	High or low hazard		ASSE 1047
Spill~~proof~~ –resistant vacuum breaker assembly	High or low hazard		ASSE 1056
BACKFLOW PREVENTER DEVICES			
DEVICE	**DEGREE OF HAZARD[a]**		**APPLICABLE STANDARDS**
Antisiphon~~-type~~ fill valve~~s~~ for gravity water closet flush tanks	High hazard		ASSE 1002, CSA B125.3
~~Pipe-applied~~ Atmospheric vacuum breaker	High or low hazard		ASSE 1001, CAN/CSA B64.1.1
Backflow preventer with intermediate atmospheric vents	Low hazard		ASSE 1012, CAN/CSA B64.3
Dual check valve type backflow preventer	Low hazard		ASSE 1024, CSA B64.6
Hose connection backflow preventer	~~High or~~ Low hazard		ASSE 1052, CSA B64.2.1.1
Hose connection vacuum breaker	~~High or~~ Low hazard		ASSE 1011, CAN/CSA B64.2, CSA B64.2.1
Laboratory faucet backflow preventer	~~High or~~ Low hazard		ASSE 1035, CSA B64.7
OTHER METHODS			
DEVICE	**DEGREE OF HAZARD[a]**		**APPLICABLE STANDARDS**
Air gap	High or low hazard		ASME A112.1.2
Air gap fitting~~s~~ for use with plumbing fixtures, appliances and appurtenances	High or low hazard		ASME A112.1.3

(Portions of table not shown remain unchanged)

2. Revise as follows:

P2902.3.2 Atmospheric~~-type~~ vacuum breakers. ~~Pipe-applied~~ Atmospheric~~-type~~ vacuum breakers shall conform to ASSE 1001 or CSA B64.1.1. Hose-connection vacuum breakers shall conform to ASSE 1011, ASSE 1019, ASSE 1035, ASSE 1052, CSA B64.2, CSA B64.2.1, CSA B64.2.1.1, CSA B64.2.2 or CSA B64.7. These devices shall operate under normal atmospheric pressure when the critical level is installed at the required height.

Reason: There is much confusion concerning protection provided by any 'backflow preventer'. This table would better identify proper and correct applications by identifying the different protection methods: assemblies, plumbing devices and other methods. The existing table gives the mistaken understanding that "any of the above provides adequate protection for any job". This is not true. Adequate protection is based on hazard classification, application and proper installation. Backflow prevention assemblies are specifically recognized and accepted as separate and distinct units based on Section 312.10.2 because of their requirement for periodic testing to ensure proper and reliable operation in order to protect public health. Titles are in accordance with ASSE Standards listing from Plumbing Standards magazine January-March 2009.

No new assemblies, devices or means have been added to Table 608.1 and none have been deleted. The assemblies, devices and methods are simply grouped in 3 categories for simplicity and better understanding as to how they are to be applied. The HIGH hazard was taken off the hose connection backflow preventer, the hose connection vacuum breaker and the laboratory faucet vacuum breaker as these devices are never suitable for high hazard applications. Section 608.13.6 (IRC Section P2902.3.2) was revised to align the terminology to the standards and Table 608.1 (IRC Table P2902.3) as well as eliminate the confusing term "pipe-applied".

Cost Impact: The code change proposal will not increase the cost of construction.

Proponent: Michael S. Moss of the American Backflow Prevention Association

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IPC COMMITTEE. PART II WILL BE HEARD BY THE IRC PLUMBING COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I - IPC

Revise as follows:

608.13.7 Double check ~~-valve~~ backflow prevention assemblies. Double check ~~-valve~~ backflow prevention assemblies shall conform to ASSE 1015, CSA B64.5, CSA B64.5.1 or AWWA C510. Double ~~-detector~~ check ~~-valve~~ detector backflow prevention assemblies shall conform to ASSE 1048. These devices shall be capable of operating under continuous pressure conditions.

608.15.4.1 Deck-mounted and integral vacuum breakers. *Approved* deck-mounted or equipment-mounted vacuum breakers and faucets with integral atmospheric vacuum breakers or integral spill ~~proof~~ –resistant vacuum breaker ~~s~~ assemblies shall be installed in accordance with the manufacturer's instructions and the requirements for labeling. ~~with~~ The critical level of the breakers and assemblies shall be located at not less than 1 inch (25 mm) above the *flood level rim*.

608.15.4.2 Hose connections. Sillcocks, hose bibbs, wall hydrants and other openings with a hose connection shall be protected by an atmospheric ~~-type~~ vacuum breaker, ~~or~~ a pressure ~~-type~~ vacuum breaker assembly or a permanently attached hose connection vacuum breaker.

Exceptions:

1. This section shall not apply to water heater and boiler drain valves that are provided with hose connection threads and that are intended only for tank or vessel draining.
2. This section shall not apply to water supply valves intended for connection of clothes washing machines where backflow prevention is otherwise provided or is integral with the machine.

PART II – IRC

Revise as follows:

P2902.3.6 Double check ~~-valve~~ backflow prevention assemblies. Double check ~~-valve~~ backflow prevention assemblies shall conform to ASSE 1015, CSA B64.5, CSA B64.5.1 or AWWA C510. Double ~~-detector~~ check ~~-valve~~ detector backflow prevention assemblies shall conform to ASSE 1048. These devices shall be capable of operating under continuous pressure conditions.

P2902.4 Protection of potable water outlets. Potable water openings and outlets shall be protected by an air gap, a reduced pressure principle backflow prevent ~~er~~ion assembly ~~with atmospheric vent~~, an atmospheric ~~-type~~ vacuum breaker, a pressure ~~-type~~ vacuum breaker assembly or a hose connection backflow preventer.

P2902.4.2 Deck-mounted and integral vacuum breakers. *Approved* deck-mounted or equipment-mounted vacuum breakers and faucets with integral atmospheric vacuum breakers or integral spill ~~proof~~ –resistant vacuum breaker ~~s~~ assemblies shall be installed in accordance with the manufacturer's instructions and the requirements for labeling. ~~with~~ The critical level of the breakers and assemblies shall be located at not less than 1 inch (25 mm) above the *flood level rim*.

P2902.4.3 Hose connection s. Sillcocks, hose bibbs, wall hydrants and other openings with a hose connection threads shall be protected by an atmospheric ~~-type~~ vacuum breaker, ~~or~~ a pressure ~~-type~~ vacuum breaker assembly or a permanently attached hose connection vacuum breaker.

Exceptions:

1. This section shall not apply to water heater and boiler drain valves that are provided with hose connection threads and that are intended only for tank or vessel draining.
2. This section shall not apply to water supply valves intended for connection of clothes washing machines where backflow prevention is otherwise provided or is integral with the machine.

P2902.5.5 Solar systems. The potable water supply to a solar system shall be equipped with a backflow preventer with intermediate atmospheric vents complying with ASSE 1012 or a reduced pressure principle backflow prevent~~er~~ion assembly complying with ASSE 1013. Where chemicals are used, the potable water supply shall be protected by a reduced pressure principle backflow prevent~~er~~ion assembly.

Exception: Where all solar system piping is a part of the potable water distribution system, in accordance with the requirements of the *International Plumbing Code*, and all components of the piping system are listed for potable water use, ~~cross-connection protection measures~~ backflow protection shall not be required.

Reason: To provide consistent terminology throughout the code for reference and comparison.

Cost Impact: The code change proposal will not increase the cost of construction.

PART I – IPC

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

PART II – IRC

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: MOSS-P19-608.13.7

P95–09/10
608.13.2; IPC P2902.3.5

Proponent: Michael S. Moss of the American Backflow Prevention Association

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IPC COMMITTEE. PART II WILL BE HEARD BY THE IRC PLUMBING COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I - IPC

Revise as follows:

608.13.2 Reduced pressure principle backflow prevent~~ers~~ion assemblies. Reduced pressure principle backflow prevent~~ers~~ion assemblies and reduced pressure principle fire protection backflow prevent~~ers~~ion assemblies shall conform to ASSE 1013, AWWA C511, CSA B64.4 or CSA B64.4.1. Reduced pressure detector fire protection ~~assembly~~ backflow prevent~~ers~~ion assemblies shall conform to ASSE 1047. These devices shall be permitted to be installed where subject to continuous pressure conditions. The relief opening shall discharge by air gap and shall be prevented from being submerged.

PART II – IRC

Revise as follows:

P2902.3.5 Reduced pressure principle backflow prevent~~ers~~ion assemblies. Reduced pressure principle backflow prevent~~ers~~ion assemblies and reduced pressure principle fire protection backflow prevent~~ers~~ion assemblies shall conform to ASSE 1013, AWWA C511, CSA B64.4 or CSA B64.4.1. Reduced pressure detector fire protection ~~assembly~~ backflow prevent~~ers~~ion assemblies shall conform to ASSE 1047. These devices shall be permitted to be installed where subject to continuous pressure conditions. The relief opening shall discharge by air gap and shall be prevented from being submerged.

Reason: To provide consistent terminology throughout the code for reference and comparison.

Cost Impact: The code change proposal will not increase the cost of construction.

PART I – IPC

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

PART II – IRC

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Moss-P7-608.13.2

P96–09/10
608.13.5; IRC P2902.3.4

Proponent: Michael S. Moss of the American Backflow Prevention Association

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IPC COMMITTEE. PART II WILL BE HEARD BY THE IRC PLUMBING COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IPC

Revise as follows:

608.13.5 Pressure ~~-type~~ vacuum breaker~~s~~ assemblies. Pressure~~-type~~ vacuum breaker~~s~~ assemblies shall conform to ASSE 1020 or CSA B64.1.2. ~~and~~ Spill~~proof~~-resistant vacuum breaker assemblies shall comply with ASSE 1056. These ~~devices~~ assemblies are designed for installation under continuous pressure conditions whe~~n~~re the critical level is installed at the required height. Pressure~~-type~~ vacuum breaker~~s~~ assemblies shall not be installed in locations where spillage could cause damage to the structure.

PART II – IRC

Revise as follows:

P2902.3.4 Pressure ~~-type~~ vacuum breaker~~s~~ assemblies. Pressure~~-type~~ vacuum breaker~~s~~ assemblies shall conform to ASSE 1020 or CSA B64.1.2. ~~and~~ Spill~~proof~~-resistant vacuum breaker~~s~~ assemblies shall comply with ASSE 1056. These ~~devices~~ assemblies are designed for installation under continuous pressure conditions whe~~n~~re the critical level is installed at the required height. Pressure~~-type~~ vacuum breaker~~s~~ assemblies shall not be installed in locations where spillage could cause damage to the structure.

Reason: The purpose of this proposal is to provide consistent terminology throughout the code for reference and comparison. Reference to 608.15.4, Manufacturer's installation instructions require that the critical level of pressure vacuum breaker assemblies and spill-resistant vacuum breaker assemblies be at least 12 inches above downstream openings and outlets. Because atmospheric vacuum breakers are required to have their critical level installed at least 6 inches above downstream outlets, installers as well as code officials mistakenly assumed that PVBs and SVBs required the same installation height because these assemblies are also named "vacuum breakers". This is incorrect.

Cost Impact: The code change proposal will not increase the cost of construction.

PART I – IPC

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

PART II – IRC

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Moss-P8-608.13.5

P97–09/10
608.13.8

Proponent: Michael S. Moss of the American Backflow Prevention Association

Revise as follows:

608.13.8 Spill~~proof~~ -resistant vacuum breaker~~s~~ assemblies. Spill~~proof~~ -resistant vacuum breaker~~s~~ assemblies (~~SVB~~) shall conform to ASSE 1056. These ~~devices~~ assemblies are designed for installation under continuous-pressure conditions when~~n~~re the critical level is installed at the required height.

Reason: To provide consistent terminology throughout the code for reference and comparison. The removal of the term "(SVB)" is editorial as the use of abbreviations and acronyms do not comply with ICC rules for code language and other code sections concerning backflow protection assemblies. Reference to 608.15.4, Manufacturer's installation instructions require that the critical level of pressure vacuum breaker assemblies and spill-resistant vacuum breaker assemblies be at least 12 inches above downstream openings and outlets. Because atmospheric vacuum breakers are required to have their critical level installed at least 6 inches above downstream outlets, installers as well as code officials mistakenly assumed that PVBs and SVBs required the same installation height because these assemblies are also named "vacuum breakers". This is incorrect.

Cost Impact: The code change proposal will not increase the cost of construction.

608.16.4, 608.16.4.1; IRC P2902.5.4, P2902.5.4.1

Proponent: Michael S. Moss of the American Backflow Prevention Association

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IPC COMMITTEE. PART II WILL BE HEARD BY THE IRC PLUMBING COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IPC

Revise as follows:

608.16.4 Connections to automatic fire sprinkler systems and standpipe systems. The potable water supply to automatic fire sprinkler and standpipe systems shall be protected against backflow by a double check ~~valve~~ fire protection backflow prevention assembly or a reduced pressure principle fire protection backflow prevent~~er~~ion assembly.

Exceptions:

1. Where systems are installed as a portion of the water distribution system in accordance with the requirements of this code and are not provided with a fire department connection, isolation of the water supply system shall not be required.
2. Isolation of the water distribution system is not required for deluge, pre-reaction or dry pipe systems.

608.16.4.1 Additives or nonpotable source. Where systems under continuous pressure contain chemical additives or antifreeze, or where systems are connected to a nonpotable secondary water supply, the potable water supply shall be protected against backflow by a reduced pressure principle fire protection backflow prevent~~er~~ion assembly. Where chemical additives or antifreeze are added to only a portion of an automatic fire sprinkler or standpipe system, the reduced pressure principle fire protection backflow prevent~~er~~ion assembly shall be permitted to be located so as to isolate that portion of the system. Where systems are not under continuous pressure, the potable water supply shall be protected against backflow by an air gap or an ~~pipe applied~~ atmospheric vacuum breaker conforming to ASSE 1001 or CSA B64.1.1.

PART II – IRC

Revise as follows:

P2902.5.4 Connections to automatic fire sprinkler systems. The potable water supply to automatic fire sprinkler shall be protected against backflow by a double check ~~valve~~ fire protection backflow prevention assembly or a reduced pressure principle fire protection backflow prevent~~er~~ion assembly.

Exception: Where systems are installed as a portion of the water distribution system in accordance with the requirements of this code and are not provided with a fire department connection, ~~isolation~~ backflow protection ~~of~~ for the water supply system shall not be required.

P2902.5.4.1 Additives or nonpotable source. Where systems contain chemical additives or antifreeze, or where systems are connected to a nonpotable secondary water supply, the potable water supply shall be protected against backflow by a reduced pressure principle fire protection backflow prevent~~er~~ion assembly. Where chemical additives or antifreeze is added to only a portion of an automatic fire sprinkler or standpipe system, the reduced pressure principle fire protection backflow preventer shall be permitted to be located so as to isolate that portion of the system.

Reason: To provide consistent terminology throughout the code for reference and comparison.

Cost Impact: The code change proposal will not increase the cost of construction.

PART I – IPC

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

PART II – IRC

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IPC COMMITTEE. PART II WILL BE HEARD BY THE IRC PLUMBING COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IPC

Revise as follows:

608.16.5 Connections to lawn irrigation systems. The potable water supply to lawn irrigation systems shall be protected against backflow by an atmospheric~~-type~~ vacuum breaker, a pressure~~-type~~ vacuum breaker assembly or a reduced pressure principle backflow prevent~~er~~ion assembly. ~~A~~ Valves shall not be installed downstream from an atmospheric vacuum breaker. Where chemicals are introduced into the system, the potable water supply shall be protected against backflow by a reduced pressure principle backflow prevent~~er~~ion assembly.

PART II – IRC

Revise as follows:

P2902.5.3 Lawn irrigation systems. The potable water supply to lawn irrigation systems shall be protected against backflow by an atmospheric~~-type~~ vacuum breaker, a pressure~~-type~~ vacuum breaker assembly or a reduced pressure principle backflow prevent~~er~~ion assembly. ~~A~~ Valves shall not be installed downstream from an atmospheric vacuum breaker. Where chemicals are introduced into the system, the potable water supply shall be protected against backflow by a reduced pressure principle backflow prevent~~er~~ion assembly.

Reason: To provide consistent terminology throughout the code for reference and comparison.

Cost Impact: The code change proposal will not increase the cost of construction.

PART I – IPC

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

PART II – IRC

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Moss-P16-608.16.5

P101–09/10
608.16.6

Proponent: Michael S. Moss of the American Backflow Prevention Association

Revise as follows:

608.16.6 Connections subject to backpressure. Where a potable water connection is made to a nonpotable line, fixture, tank, vat, pump or other equipment subject to back-pressure, the potable water connection shall be protected by a reduced pressure principle backflow prevent~~er~~ion assembly.

Reason: To provide consistent terminology throughout the code for reference and comparison.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Moss-P17-608.16.6

P102–09/10
608.6; IRC P2902.1

Proponent: Michael S. Moss of the American Backflow Prevention Association

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IPC COMMITTEE. PART II WILL BE HEARD BY THE IRC PLUMBING COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I - IPC

Revise as follows:

608.6 Cross-connection control. Cross connections shall be prohibited, except where approved ~~protective~~ backflow preventers ~~devices~~ are installed to protect the potable water supply.

PART II - IRC

Revise as follows:

P2902.1 General. A potable water supply system shall be designed and installed as to prevent contamination from nonpotable liquids, solids or gases being introduced into the potable water supply. Connections shall not be made to a potable water supply in a manner that could contaminate the water supply or provide a cross-connection between the supply and a source of contamination ~~unless an *approved* backflow prevention device~~ except where approved backflow preventers are installed to protect the potable water supply. ~~is provided.~~ Cross-connections between an individual water supply and a potable public water supply shall be prohibited.

Reason: Because the term “Protective devices” is not included in the definitions, this change clarifies the intent of Section 608.6. The change for the definition of “Backflow preventer” makes the definition more descriptive and precise.

Cost Impact: The code change proposal will not increase the cost of construction.

PART I – IPC

ICCFILENAME: Moss-P2-608.6

P103–09/10
608.13.3, 608.16.2; IRC P2902.3.3, P2902.5.1

Proponent: Michael S. Moss of the American Backflow Prevention Association

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IPC COMMITTEE. PART II WILL BE HEARD BY THE IRC PLUMBING COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IPC

Revise as follows:

608.13.3 Backflow preventer with intermediate atmospheric vent. Backflow preventers with intermediate atmospheric vents shall conform to ASSE 1012 or CAN/CSA B64.3. These devices shall be permitted to be installed where subject to continuous pressure conditions. The relief opening shall discharge by air gap and shall be prevented from being submerged. Backflow preventers with intermediate atmospheric vents shall be prohibited as a means of protection for potable water connections to boilers or where chemicals are introduced downstream of the device.

608.16.2 Connections to boilers. ~~The potable supply to a boiler shall be equipped with a backflow preventer with an intermediate atmospheric vent complying with ASSE 1012 or CSA B64.3~~. ~~Where conditioning chemicals are introduced into the system,~~ The potable water connection to a boiler shall be protected by an air gap or a reduced pressure principle backflow preven~~ter~~ion assembly, complying with ASSE 1013, CSA B64.4 or AWWA C511. The use of a backflow preventer with atmospheric vents for potable water connections to a boiler shall be prohibited.

PART II – IRC

P2902.3.3 Backflow preventer with intermediate atmospheric vent. Backflow preventers with intermediate atmospheric vents shall conform to ASSE 1012 or CAN/CSA B64.3. These devices shall be permitted to be installed where subject to continuous pressure conditions. The relief opening shall discharge by air gap and shall be prevented from being submerged. Installation of this type of backflow preventer shall be prohibited where chemicals are introduced downstream of the device.

P2902.5.1 Connections to boilers. The potable water supply to the boiler shall be equipped with a backflow preventer with an intermediate atmospheric vent complying with ASSE 1012 or CSA B64.3. Where conditioning chemicals are introduced into the boiler ~~system~~, the potable water connection shall be protected by an air gap or a reduced pressure principle backflow preven~~ter~~ion assembly, complying with ASSE 1013, CSA B64.4 or AWWA C511

Reason
(Part I) These devices are designed for low or non-health hazard installations according to manufacturer specification sheets. They are inadequate for protection against chemical additions or injections downstream of the device. Buildings covered by the IPC are mostly "commercial" in nature and as such, it is difficult to know whether chemicals will be used to clean the boilers at some point during the life of the boiler unit. Based upon our experience, there is a high probability that chemical addition or injection will occur. This poses a significant risk to the building's inhabitants as well as to the public water supply. Although we have found that most boiler installers "do the right thing" and install reduced pressure principle backflow protection assemblies on these "commercial" boilers, some installers take the code minimum approach by indicating that no chemicals will be added and thus, by code, are permitted to install a backflow preventer with intermediate atmospheric vents. Unfortunately, code officials have no alterative other than to accept the installation based upon the word of the installer that chemicals will not be added. In a commercial environment, this poses a significant risk to public health. Note that the addition of the "prohibition against installation where chemicals are involved" language to this section does not introduce a new requirement. Section 608.16.2 currently requires a different type of backflow protection for boilers where chemicals are involved.
(Part II) These devices are designed for low or non-health hazard installations according to manufacturer specification sheets. They are inadequate for protection against chemical additions or injections downstream of the device. In 1 and 2 family dwellings, backflow preventers with atmospheric vents are primarily used for connecting the potable water supply to a boiler. Chemical additions or injections into the boiler are rarely, if ever, performed. These "residential" boiler systems simply do not require the cleaning or conditioning that is often necessary for a boiler in a "commercial" environment. However, in the rare event that chemicals are added to the boiler system and the backflow preventer with atmospheric vents fail is inoperative or is malfunctioning, the event would directly affect only the limited number of inhabitants usually in 1 or 2 family dwellings. Given that most boilers in one or two family dwellings operate at low pressures (15 psi or less), that the potable water system pressure is usually at least 40 psi, and that the occurrence of a complete loss of water supply pressure during a chemical cleaning event would be extremely rare, the probability of a contamination event is extremely low. Therefore, for one and two family dwellings, requiring greater protection than that provided by a backflow preventer with atmospheric vents is not required unless it evident that chemical addition or injection downstream of the device will occur. Note that the addition of language to this section does not introduce a new requirement but is only a reminder of the limits of these devices. Section P2902.5.1 currently requires a different type of backflow protection for boilers where chemicals are involved.

Cost Impact: NONE because the majority of the time, installers are doing the right thing.

PART I – IPC

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

PART II – IRC

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Moss-P3-608.13.3

P104–09/10
608.15.4; IRC P2902.3.4

Proponent: Michael S. Moss of the American Backflow Prevention Association

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IPC COMMITTEE. PART II WILL BE HEARD BY THE IRC PLUMBING COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IPC

Revise as follows:

608.15.4 Protection by a vacuum breaker or vacuum breaker assembly. Openings and outlets shall be protected by atmospheric-type vacuum breakers or pressure-type vacuum breakers assemblies. Vacuum breakers and vacuum breaker assemblies shall not be installed under exhaust hoods or in similar locations that will contain toxic fumes or vapors. The critical level of the an atmospheric vacuum breaker shall be not less than set a minimum of 6 inches (152 mm) above the flood level rim of the fixture, receptor or device served. Fill valves shall be set in accordance with Section 425.3.1. Pipe-applied vacuum breakers shall be installed not less than 6 inches (152 mm) above the flood level rim of the fixture, receptor or device served. The critical level of a pressure vacuum breaker assembly or spill-resistant vacuum breaker assembly shall be not less than 12 inches (304 mm) above the flood level rim of the fixture, receptor or device served. The critical level of anti-siphon fill valves shall be in accordance with Section 425.3.1.

PART II – IRC

Revise as follows:

P2902.3.4 Pressure-type vacuum breakers assemblies. Pressure-type vacuum breakers assemblies shall conform to ASSE 1020 or CSA B64.1.2. and Spillproof –resistant vacuum breakers assemblies shall comply with ASSE 1056. The critical level of a pressure vacuum breaker assembly or spill-resistant vacuum breaker assembly shall be not less than 12 inches (304 mm) above the flood level rim of the fixture, receptor or device served.These devices are designed for installation under continuous pressure conditions whenre the critical level is installed at the required height. Pressure-type vacuum breakers assemblies shall not be installed in locations where spillage could cause damage to the structure.

Reason
(Part I): This proposal changes terminology to align with that used by those in backflow industry, with the referenced standards and with other proposed changes to code sections concerning backflow protection. The changes help make a clear distinction between vacuum breakers and vacuum breaker assemblies so that they are installed with the critical height at the proper elevation above openings and outlets. This proposal also resolves a conflict between the code and manufacturer's installation instructions concerning the required critical level installation height for pressure vacuum breaker assemblies and spill-resistant vacuum breaker assemblies. The critical level of pressure vacuum breaker assemblies and spill-resistant vacuum breaker assemblies must be at least 12 inches above openings and outlets. The current code language implied that the critical level only needed to be 6 inches above. Installers as well as code officials are often not aware of the critical height requirements for PVBs and SVBs because installation instructions are lost or not at the jobsite. Inclusion of the critical height installation requirement(s) in the code for PVBs and SVBs will guarantee the level of backflow protection that these devices are designed to provide and to ensure protection of public health. Other changes in this section are editorial to align the language with ICC format.
(Part II): This proposal changes terminology to align with that used by those in backflow industry, with the referenced standards and with other proposed changes to code sections concerning backflow protection. Manufacturer's installation instructions require that the critical level of pressure vacuum breaker assemblies and spill-resistant vacuum breaker assemblies be at least 12 inches above downstream openings and outlets. Because atmospheric vacuum breakers are required to have their critical level installed at least 6 inches above downstream outlets, installers as well as code officials mistakenly assumed that PVBs and SVBs required the same installation height because these assemblies are also named "vacuum breakers". This is incorrect. Installers as well as code officials are typically not aware of the critical height requirements for PVBs and SVBs because installation instructions are lost or not at the jobsite. Inclusion of the critical height installation requirement(s) in the code for PVBs and SVBs will guarantee the level of backflow protection that these devices are designed to provide and to ensure protection of public health.

Cost Impact: The code change proposal will not increase the cost of construction.

ABPA
Field Test Procedures for Backflow Prevention Assemblies dated 2-24-98

PART II – IRC

1. Revise as follows:

P2503.8.2 Testing of Backflow Prevention Assemblies. Reduced pressure principle backflow preventer~~er~~ion assemblies, reduced pressure principle fire protection backflow prevention assemblies, double check ~~valve~~ backflow prevention assemblies, double ~~detector~~ check ~~valve~~ fire protection backflow prevention assemblies, reduced pressure detector fire protection backflow prevention assemblies, double check detector fire protection backflow prevention assemblies, ~~and~~ pressure vacuum breaker assemblies and spill-resistant vacuum breaker assemblies shall be tested at the time of installation, immediately after repairs or relocation and at least annually. The testing procedure shall be performed in accordance with one of the following standards:

ASSE 5013, ASSE 5015, ASSE 5020, ASSE 5047, ASSE 5048, ASSE 5056, CSA B64.10,-CSA B64.10.1 or ABPA Field Test Procedures for Backflow Prevention Assemblies.

2. Add standard to Chapter 44 as follows:

American Backflow Prevention Association
P.O. Box 3051
Bryan, TX 77805-3051

ABPA
Field Test Procedures for Backflow Prevention Assemblies dated 2-24-98

Reason
(Part I) : The proposed changes correct the terminology for the backflow protection assemblies listed so that they are in alignment with the titles of the ASSE standards, the backflow industry terminology and the terminology changes proposed in companion proposals for various code sections. The list of assemblies in the current section is incomplete as compared those listed in Table 608.1 and therefore, additional terminology is proposed for consistency. Because a hose connection vacuum breaker is not a backflow protection assembly, the term was removed from the list and ASSE 5052 was removed from the list of procedures. The ABPA Field Test Procedures for Backflow Prevention Assemblies was added to the list of procedures because the Field Test Procedures are excerpted from The Manual of Cross-Connection Control, 9th edition published by the Foundation for Cross-Connection Control and Hydraulic Research published by the University of Southern California. Many jurisdictions have used the procedures in the Manual of Cross-Connection Control since it was first published and have established those procedures as the foundation of their cross-connection control programs. The ABPA Field Test Procedures is an abbreviated form of the Manual's procedures and is frequently used in the field to meet a jurisdiction's mandate for using the Manual's procedures instead of the ASSE procedures. The addition of the ABPA Field Test Procedures will allow those jurisdictions mandating use of the Manual's procedures to be in compliance with the code.
(Part II): The proposed changes are to align the IRC text with the proposed text for the IPC. Although it might be rare for some of the assemblies listed to be used for a 1 and 2 family residential dwelling, this section covers all possible assemblies that could be used. Aligning this sections text with that used in the IPC will make it easier to maintain. Note that the changes do not require that any of the added backflow assemblies be installed. This section only requires that if those assemblies are installed for whatever reason, testing is required as indicated.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: Review of proposed new standard ABPA Field Test Procedures for Backflow Prevention Assemblies dated 2-24-98 indicated that, in the opinion of ICC staff, the standard did not comply with ICC standards criteria.

P107–09/10
608.18 (New)

Proponent: Robert Burke University of Colorado representing the Colorado Association of Plumbing and Mechanical Officials (CAPMO)

Add new text as follows:

608.18 Dead ends. Dead ends exceeding 4 feet in developed length shall be prohibited unless protected by an approved backflow preventer .

Reason: Stagnant water is unhealthy and a prime cause of Legionella disease. ASHRAE Standard 12-200 addresses this issue; minimizing the risk of Legionellosis associated with building water system.

Cost Impact: The cost impact to construction will be minimal.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Burke-P3-608.18

P108–09/10
611.1, 611.2, Chapter 13; IRC P2908.1, P2908.2, Chapter 44

Proponent: Abraham I. Murra, Canadian Standards Association, representing the Canadian Standards Association

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IPC COMMITTEE. PART II WILL BE HEARD BY THE IRC PLUMBING COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I - IPC

1. Revise as follows:

611.1 Design. Drinking water treatment units shall meet the requirements of NSF42, NSF 44, NSF 53, ~~or~~ NSF 60 or CSA B483.1.

611.2 Reverse osmosis systems. The discharge from a reverse osmosis drinking water treatment unit shall enter the drainage system through an *air gap* or an *air gap* device that meets the requirements of NSF 58 or CSA B438.1.

2. Add standard to Chapter 13 as follows:

CSA
B483.1-07 Drinking water treatment systems

PART II – IRC

1. Revise as follows:

P2908.1 Design. Drinking water treatment units shall meet the requirements of NSF42, NSF 44, NSF 53, ~~or~~ NSF 60 or CSA B483.1.

P2908.2 Reverse osmosis drinking water treatment units. Point-of-use reverse osmosis drinking water treatment units, designed for residential use, shall meet the requirements of NSF 58 or CSA B438.1. Waste or discharge from reverse osmosis drinking water treatment units shall enter the drainage system through an air gap or an air gap device that meets the requirements of NSF 58.

2. Add standard to Chapter 44 as follows:

CSA
B483.1-07 Drinking water treatment systems

Reason: Although a drinking water treatment system might comply with or be certified to the applicable NSF standard, plumbing, mechanical, and electrical requirements for components used for the installation of drinking water treatment systems are generally not covered by existing standards. CSA B483.1, which was developed to complement NSF standards, addresses such plumbing, mechanical, and electrical requirements.

Cost Impact: The code change proposal will not increase the cost of production.

Analysis: Review of proposed new standard, CSA B483.1-07, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IPC COMMITTEE. PART II WILL BE HEARD BY THE IRC PLUMBING COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I - IPC

Add next text as follows:

703.6 Tracer wire required. An electrically continuous corrosion-resistant tracer tape or wire shall be buried with building sewer pipes of plastic material. One end of the tracer tape or wire shall be brought above ground at a building wall or at a cleanout. Where tracer wire is used, the wire size shall be not smaller than 14 AWG.

PART II – IRC

Add next text as follows:

P3001.4 Tracer wire required. An electrically continuous corrosion-resistant tracer tape or wire shall be buried with building sewer pipes of plastic material. One end of the tracer tape or wire shall be brought above ground at a building wall or at a cleanout. Where tracer wire is used, the wire diameter shall be not smaller than 14 AWG.

Reason: Installing underground utilities includes a method known as directional boring. The use of directional boring equipment eliminates the need for open trench or ditch work but may have some uncertainty concerning the location of existing underground utilities. The new section will provide a method to locate building sewer and drain pipes that will help reduce the damage to such underground facilities. A similar proposal has been submitted to the IRC to add Section P3001.3 with the same language.

Cost Impact: This code change proposal will Increase the cost of construction.

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IPC COMMITTEE. PART II WILL BE HEARD BY THE IRC PLUMBING COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IPC

Revise as follows:

705.8.2 Solvent cementing. Joint surfaces shall be clean and free from moisture. A purple primer that conforms to ASTM F 656 shall be applied. Solvent cement not purple in color and conforming to ASTM D2564, CSA B137.3, CSA B181.2 or CSA B182.1 shall be applied to all joint surfaces. The joint shall be made while the cement is wet and shall be in accordance with ASTM D 2855. Solvent-cement joints shall be permitted above or below ground.

Exception: A primer is not required where all of the following conditions apply:

1. The solvent cement used is third-party certified as conforming to ASTM D 2564.
2. The materials joined are drain, waste and vent pipe and fittings installed in non-pressure service applications.
3. The pipe and fitting size does not exceed 4 inches (100 mm) in diameter.

705.14.2 Solvent cementing. Joint surfaces shall be clean and free from moisture. A purple primer that conforms to ASTM F 656 shall be applied. Solvent cement not purple in color and conforming to ASTM D2564, CSA B137.3, CSA B181.2 or CSA B182.1 shall be applied to all joint surfaces. The joint shall be made while the cement is wet and shall be in accordance with ASTM D 2855. Solvent-cement joints shall be permitted above or below ground.

Exception: A primer is not required where all of the following conditions apply:

1. The solvent cement used is third-party certified as conforming to ASTM D 2564.
2. The materials joined are drain, waste and vent pipe and fittings installed in non-pressure service applications.
3. The pipe and fitting size does not exceed 4 inches (100 mm) in diameter.

PART II – IRC

Revise as follows:

P3003.9.2 Solvent cementing. Joint surfaces shall be clean and free from moisture. A purple primer that conforms to ASTM F 656 shall be applied. Solvent cement not purple in color and conforming to ASTM D 2564, CSA B137.3 or CSA B181.2 shall be applied to all joint surfaces. The joint shall be made while the cement is wet, and shall be in accordance with ASTM D 2855. Solvent-cement joints shall be permitted above or below ground.

Exception: A primer is not required where all of the following conditions apply:

1. The solvent cement used is third-party certified as conforming to ASTM D 2564.
2. The materials joined are drain, waste and vent pipe and fittings installed in non-pressure service applications.
3. The pipe and fitting size does not exceed 4 inches (100 mm) in diameter.

P3003.14.2 Solvent cementing. Joint surfaces shall be clean and free from moisture. A purple primer that conforms to ASTM F 656 shall be applied. Solvent cement not purple in color and conforming to ASTM D 2564, CSA B137.3 or CSA B181.2 shall be applied to all joint surfaces. The joint shall be made while the cement is wet, and shall be in accordance with ASTM D 2855. Solvent-cement joints shall be permitted above or below ground.

Exception: A primer is not required where all of the following conditions apply:

1. The solvent cement used is third-party certified as conforming to ASTM D 2564.
2. The materials joined are drain, waste and vent pipe and fittings installed in non-pressure service applications.
3. The pipe and fitting size does not exceed 4 inches (100 mm) in diameter.

Reason: To introduce an exception in IPC Chapter 7 (IRC Chapter 30), Sanitary Drainage, allowing for the practice of one-step solvent cementing of non-pressure DWV systems 4" and under.

This exception allows for an optional one-step procedure for joining non-pressure DWV PVC piping systems 4" in diameter and below with solvent cement conforming to ASTM D 2564. This method is practiced, and the code should include specific language to indicate when it is acceptable.

Pressure testing completed by NSF International has shown that solvent cement conforming to ASTM D 2564, when used without primer on PVC DWV pipe and fittings, both solid wall and cell core, generates bonding forces well in excess of what is required for these systems. The strength of the joint often exceeds the pipe and fitting pressure capacity.

Bibliography: NSF International report J-00036842.can be found on the PPFA website, www.ppfahome.org//ICC09/PPFA_NSF_J-00036842.pdf

Cost Impact: The code change proposal will not increase the cost of construction.

706.2; IRC P3002.3.1

Proponent: Brian D. Havens, Front Range Refrigeration, Co., Inc., representing himself

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IPC COMMITTEE. PART II WILL BE HEARD BY THE IRC COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I - IPC

Revise as follows:

706.2 Obstructions. The fittings shall not have ledges, shoulders or reductions capable of retarding or obstructing flow in the piping. Threaded drainage pipe fittings shall be of the recessed drainage type. <u>This section shall not be applicable to tubular waste fittings used to convey vertical flow upstream of the trap seal liquid level of a fixture trap.</u>

PART II – IRC

Revise as follows:

P3002.3.1 Drainage. Drainage fittings shall have a smooth interior waterway of the same diameter as the piping served. All fittings shall conform to the type of pipe used. Drainage fittings shall have no ledges, shoulders or reductions which can retard or obstruct drainage flow in the piping. Threaded drainage pipe fittings shall be of the recessed drainage type, black or galvanized. Drainage fittings shall be designed to maintain one-fourth unit vertical in 12 units horizontal (2-percent slope) grade. <u>This section shall not be applicable to tubular waste fittings used to convey vertical flow upstream of the trap seal liquid level of a fixture trap.</u>

Reason: The proposed change clears up a conflict between the code and the accepted practices for tubular waste piping installations. The current language literally prohibits the installation of tubular “baffle tees” (needed for double bowl kitchen sink disposal installations) as well pop-drain drain assemblies and other specialized tubular fittings. This is because the internal components such as baffles, the pop-up rods, pop up stopper and internal guides could all be considered “reductions capable of retarding flow”. Where these types of tubular waste fittings have been commonly used to convey vertical waste flow, the reduced internal flow area due to baffles or other internal protrusions has not created any significant flow retarding problems. The added text in this section will allow the code to be in alignment with commonly accepted and approved practices.

The inclusion of the term “tubular waste fittings” in this section also confirms that the first two sentences of this section do apply to tubular waste fitting installations. This is valuable for enforcement by the code official where tubular waste fittings having internal components are improperly installed. For example, use of a baffle tee on its back or side would significantly restrict horizontal flow and would be an unacceptable installation practice, although currently, the code does not prohibit this.

Cost Impact: The code change will not increase the cost of construction.

PART I – IPC

ICCFILENAME: Havens-P1-706.2

P112–09/10
Table 709.1

Proponent: Richard Grace, Fairfax County, VA Plumbing and Mechanical Inspectors, VA Building and Code Officials

Revise table as follows:

TABLE 709.1
DRAINAGE FIXTURE UNITS FOR FIXTURES AND GROUPS

FIXTURE TYPE	DRAINAGE FIXTURE UNIT VALUE AS LOAD FACTORS	MINIMUM SIZE OF TRAP (inches)
Bathroom group as defined in Section 202 (1.6 gpf water closet)[f]	5	—
Bathroom group as defined in Section 202 (water closet flushing greater than 1.6 gpf)[f]	6	—

(Portions of table not shown remain unchanged)

a. For traps larger than 3 inches, use Table 709.2.
b. A showerhead over a bathtub or whirlpool bathtub attachment does not increase the drainage fixture unit value.
c. See Sections 709.2 through 709.4.1 for methods of computing unit value of fixtures not listed in this table or for rating of devices with intermittent flows.
d. Trap size shall be consistent with the fixture outlet size.
e. For the purpose of computing loads on building drains and sewers, water closets and urinals shall not be rated at a lower drainage fixture unit unless the lower values are confirmed by testing.
f. For fixtures added to a dwelling unit bathroom group, add the dfu value of those additional fixtures to the bathroom group fixture count.
g. See Section 406.3 for sizing requirements for fixture drain, branch drain, and drainage stack for an automatic clothes washer standpipe.
h. See Sections 709.4 and 709.4.1.

Reason: Bathroom groups can be found in any type of building, not just in a dwelling unit, and the footnote should not be restricted to just dwelling units.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: GRACE-P1-TABLE 709.1

P113–09/10
711.2, 711.3.1

Proponent: Julius Ballanco, P.E., CPD, FASPE/JB Engineering and Code Consulting, P.C. representing himself

1. Delete without substitution:

~~**711.2 Horizontal branch connections to horizontal stack offsets.** Where a horizontal stack offset is located more than four branch intervals below the top of the stack, a Horizontal branch connections shall not connect within the horizontal stack offset or within 2 feet (610 mm) above or below such offset.~~

(Renumber subsequent sections)

2. Revise as follows:

704.3 Connections to offsets and bases of stacks. Horizontal branches shall connect to the bases of stacks at a point located not less than 10 times the diameter of the drainage *stack* downstream from the *stack*. ~~Except as prohibited by Section 711.2, h~~ Horizontal branches shall connect to horizontal *stack* offsets at a point located not less than 10 times the diameter of the drainage *stack* downstream from the upper *stack*.

711.3.1 Omission of vents for horizontal stack offsets. Vents for horizontal stack offsets required by Section 711.3 shall not be required where the stack and its offset are one pipe size larger than required for a building drain [see Table 710.1(1)] and the entire stack and offset are not less in cross-sectional area than that required for a straight stack plus the area of an offset vent as provided for in Section 915. ~~Omission of offset vents in accordance with this section shall not constitute approval of horizontal branch connections within the offset or within 2 feet (610 mm) above or below the offset.~~

Reason: The current requirement connection limitations in these sections are archaic and unfounded. Research has shown that the turbulent flow in the horizontal offset occurs within the first 10 pipe (stack) diameters downstream of the stack. This is the same condition that occurs in a building drain, downstream of the base of a stack. Beyond the ten pipe diameters point downstream of a stack , the flow in the horizontal pipe becomes nonturbulent open channel flow. Any connection downstream of where turbulent action is known to occur should be permitted. The allowance for horizontal connections to a horizontal offset should mirror the requirements at the base of the stack because the concerns for avoiding connections in a turbulent zone are identical.

This modification is consistent with one of the legacy codes, See Section 604.3 of the 1993 BOCA National Plumbing Code.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: BALLANCO-P4-711.2

P114–09/10
712.3.2.1 (New); IRC P3007.3.2.1 (New)

Proponent: Ronald L, George, CIPE, CPD, President of Ron George Design & Consulting Services representing himself

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IPC COMMITTEE. PART II WILL BE HEARD BY THE IRC PLUMBING COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IPC

Add new text as follows:

712.3.2.1 Sump pit cover. Sump pit covers shall be pedestrian traffic rated to support a live load of 300 lbs/ft^2 (14.4 kPa) with a maximum deflection of 1/150th of the largest span dimension.

PART II – IRC

Add new text as follows:

P3007.3.2.1 Sump pit cover. Sump pit covers shall be pedestrian traffic rated to support a live load of 300 lbs/ft^2 (14.4 kPa) with a maximum deflection of 1/150th of the largest span dimension.

Reason: This proposal is a result of a recent failure of a thin wooden sump cover where a child was severely burned when he fell through the lid into heated water because the sump pump was stuck in the “on” position and had heated the water in the sump pit. The boy basically fell into a boiling sump of wastewater. The incident brought to light the fact there are no code requirements for sump basin lid material or structural requirements. Currently you can use cardboard as a sump pit cover and it would not be a code violation. The proposed code language requires the sump pit cover to be capable of handling pedestrian traffic. The weight and deflection requirements come from specifications for access hatches in floors or on roofs.

Cost Impact: Minimal

PART I – IPC

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

PART II – IRC

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

P115–09/10

712.3.3, 712.3.3.1 (New), 712.3.3.2 (New); IRC P3007.3.3 (New), P3007.3.3.1 (New), P3007.3.3.2 (New)

Proponent: Michael Cudahy, Plastic Pipe and Fittings Association (PPFA)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IPC COMMITTEE. PART II WILL BE HEARD BY THE IRC PLUMBING COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IPC

Revise as follows:

712.3.3 Discharge pip~~inge~~ and fittings. Discharge pipe and fittings serving sump pumps and ejectors shall be constructed of ~~*approved*~~ materials in accordance with Sections 712.3.3.1 and 712.3.3.2 and shall be *approved*.

712.3.3.1 Materials. Pipe and fitting materials shall be constructed of brass, copper, CPVC, ductile iron, PE, or PVC.

712.3.3.2 Ratings. Pipe and fittings shall be rated for the maximum system operating pressure and temperature. Pipe fitting materials shall be compatible with the pipe material. Where pipe and fittings are buried in the earth, they shall be approved for burial.

PART II – IRC

Revise as follows:

P3007.3.3 Discharge pip~~inge~~ and fittings. Discharge pipe and fittings serving sump pumps and ejectors shall be constructed of ~~*approved*~~ materials in accordance with Sections P3007.3.3.1 and P3007.3.3.2 and shall be *approved*.

P3007.3.3.1 Materials. Pipe and fitting materials shall be constructed of brass, copper, CPVC, ductile iron, PE, or PVC.

P3007.3.3.2 Ratings. Pipe and fittings shall be rated for the maximum system operating pressure and temperature. Pipe fitting materials shall be compatible with the pipe material. Where pipe and fittings are buried in the earth, they shall be approved for burial.

Reason: PPFA is submitting this language to expand on what materials are suitable for pressurized sewage discharge (forced main) applications.

An attempt was made to develop a table of materials by ASTM designation, size, pressure rating and other parameters, but it became overly complex. A simple listing of materials by type seems acceptable and would improve the code. Currently, there is little guidance.

Cost Impact: The code change proposal will not increase the cost of construction.

PART I – IPC

Public Hearing:	Committee:	AS	AM	D

P117–09/10
802.1.3

Proponent: Cort Strain University of Colorado representing the Colorado Association of Plumbing and Mechanical Officials (CAPMO)

Revise as follows:

802.1.3 Potable clear-water waste. Where ~~devices and equipment~~ plumbing appliances and appurtenances such as sterilizers, and relief valves, discharge potable water to the building drainage system, the discharge shall be through an indirect waste pipe by means of an air gap.

Reason: The intent is to use clearly defined terms to improve code.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Strain-P4-802.1.3

P118–09/10
802.1.5

Proponent: Cort Strain University of Colorado representing the Colorado Association of Plumbing and Mechanical Officials (CAPMO)

Revise as follows:

802.1.5 Non-potable clear-water waste. Where ~~devices and equipment~~ plumbing or mechanical appliances such as process tanks, filters, drips, and boilers discharge non-potable water to the building drainage system, the discharge shall be through an indirect waste pipe by means of an air break or an air gap.

Reason: The intent is to use clearly defined terms to improve code.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Strain-P3-802.1.5

P119–09/10
802.1.8

Proponent: Robert G. Konyndyk, Chief, Plumbing Division, Bureau of Construction Codes, State of Michigan

Revise as follows:

802.1.8 Food utensils, dishes, pots and pans sinks. Sinks used for the washing, rinsing or sanitizing of utensils, dishes, pots, pans or service ware used in the preparation, serving or eating of food shall discharge indirectly through an air gap or an air break ~~or directly connect~~ to the drainage system.

Reason: The insertion of the new section into the 09 edition of the code attempted to list the three options for connections of the named fixtures. While any one of the three options may be accepted in different jurisdictions, the lead in clarification of "indirectly" obviates the direct connection choice. If a code change was to be submitted removing the directive "indirectly" the choice of three methods would be merely a laundry list which is contrary to modern code text processes.

Cost Impact: The clarification will not increase the cost of construction from that of the present language.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: KONYNDYK-P2-802.1.8

P120–09/10
802.2

Proponent: Cort Strain University of Colorado representing (CAPMO) Colorado Association of Plumbing and Mechanical Officials

Revise as follows:

802.2 Installation. All indirect waste piping shall discharge through an air gap or air break into a waste receptor ~~or standpipe~~. Waste receptors and standpipes shall be trapped and vented and shall connect to the building drainage system. All indirect waste piping that exceeds ~~2 feet~~ 30 inches (762mm) in developed length measured horizontally, or ~~4 feet~~ 54 inches (1372mm) in total developed length, shall be trapped.

Exception: Where a waste receptor receives only clear water waste and does not directly connect to a sanitary drainage system, the receptor shall not require a trap.

Reason: Because the IPC allows 30 inches center-to-center for a combination fixture (see Section 1002.1 exception 2), horizontal continuous waste tubing of up to 30 inches in length is allowed by the code. Therefore, a horizontal indirect waste pipe should be allowed to be 30 inches long elsewhere, so as to be consistent. The 54 inch total developed length allowance is simply the 30 inches horizontal length allowance plus the 24 inches vertical distance allowed from a fixture to it's trap (see Section 1002.1) The proposed lengths seem to make a lot more sense and will be consistent with other allowances in the code. The added exception should be self evident; no traps are necessary with clear water waste in an indirect piping system.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

P121–09/10
802.3; IRC P2706.1

Proponent: Guy McMann, Jefferson County Colorado, representing the Colorado Association of Plumbing and Mechanical Officials (CAPMO)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IPC COMMITTEE. PART II WILL BE HEARD BY THE IRC PLUMBING COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I - IPC

Revise as follows:

802.3 Waste receptors. Every waste receptor shall be of an approved type. A removable strainer or basket shall cover the waste outlet of waste receptors. Waste receptors shall be installed in ventilated spaces. Waste receptors shall not be installed in bathrooms, ~~or~~ toilet rooms, plenums, crawl spaces, attics, interstitial spaces above ceilings and below floors or in any inaccessible or unventilated space such as a closet or storeroom. Ready access shall be provided to waste receptors.

PART II - IRC

Revise as follows:

P2706.1 General. Every waste receptor shall be of an approved type. Plumbing fixtures or other receptors receiving the discharge of indirect waste pipes shall be shaped and have a capacity to prevent splashing or flooding and shall be readily accessible for inspection and cleaning. Waste receptors and standpipes shall be trapped and vented and shall connect to the building drainage system. A removable strainer or basket shall cover the waste outlet of waste receptors. Waste receptors shall be installed in ventilated spaces. Waste receptors shall not be installed in bathrooms, attics, crawl spaces, interstitial spaces above ceilings and below floors or in any inaccessible or unventilated space such as a closet. Ready access shall be provided to waste receptors.

Reason: An open unattended trap located in a crawl space, attic or other unobservable location is problematic at best. This is a common practice when looking for a place to park a condensate drain. These fixtures are prone to flooding such that they are not noticed for extended periods of time resulting in damage and a severe insanitary condition. Back water valves are also problematic. They are prone to tampering and in some cases removal for maintenance operations and never reinstalled. It doesn't take much to break a backwater valve and the smallest amount of debris stops the valve from fully closing. Traps in plenums may run dry even if primers are installed as trap primers are mechanical devices that will eventually fail in time. Traps in attics are subject to freezing. Currently, the code is silent on this matter but common sense would tell us that interceptors including standpipes should not be located in these areas.

Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME: MCMANN-P3-802.3

P122–09/10
901.2.1

Proponent: Gregory A Farmer, PE, representing ASPE Legislative Committee

Revise as follows:

901.2.1 Venting Required. Every trap and trapped fixture <u>except emergency floor drains connected to a branch drain six feet or more from a building drain</u> shall be vented in accordance with one of the venting methods specified in this chapter.

Reason: These drains are installed as a convenience in case of accidental spills, overflows, snow melt, or wash down. The slated purpose of venting per 901.2 is to "…permit the admission or emission of air so that the seal of any fixture trap shall not be subjected to a pneumatic pressure differential of more than 1 inch of water column". When the drain is more than 6 feet away from the source of reduced pressure, the trap seal is not affected and therefore a vent is not necessary. Vents close to a floor drain trap increase the evaporation rate of the trap seal and degrade effectiveness by allowing lower humidity air to be introduced to the outlet side of the trap.

Introduction of water from normal activities such as mopping the floor, hose stream or from snow melt is not sufficient to fill the horizontal pipe so venting occurs in the same manner as any horizontal vent. IN the case of accidental flooding in the area, the trap seal will remain when the area is drained.

Requiring a vent in branch piping forces the piping to be installed deeper than necessary to allow for the slope of the vent piping. Increasing the depth of the drain piping sometimes forces a sump pit and pump to be installed that otherwise would not be needed.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: FARMER-P2-901.2.1

P123–09/10
901.3, 917.8, Chapter 13

Proponent: Jack Beuschel, Studor, Inc. representing himself.

1. Revise as follows:

901.3 Chemical waste vent systems. The vent system for a chemical waste system shall be independent of the sanitary vent system and shall terminate separately through the roof to the ~~open air~~ <u>outdoors or to an air admittance valve that complies with ASSE 1049. Air admittance valves for chemical waste systems shall be constructed of materials approved in accordance with Section 702.5 and shall be tested for chemical resistance in accordance with ASTM F1412.</u>

917.8 Prohibited installations. Air admittance valves shall not be installed in non-neutralized special waste systems as described in Chapter 8 except where such valves are in compliance with ASSE 1049, are constructed of materials approved in accordance with Section 702.5 and are tested for chemical resistance in accordance with ASTM F1412. Air admittance valves shall not be located in spaces utilized as supply or return air plenums.

2. Add standards to Chapter 13 as follows:

ASSE

1049-2009	Performance Requirements for Individual and Branch Type Air Admittances Valves for Chemical Waste Systems.

ASTM

F1412-01	Standard Specification for Polyolefin Pipe and Fittings for Corrosive Waste Drainage Systems.

Reason: The purpose of this code change is to add new provisions to the code to allow air admittance valves that are chemically-resistant (AAVCs) to serve as vents for a chemical waste system as an option to chemical waste vent piping terminating outdoors.

Laboratory sinks into which acids and chemicals are dumped are usually located in islands in the middle of rooms. To vent the traps for these sinks using vent piping that can only terminate outdoors requires extensive labor and material. Because acid- and chemically-resistant pipe and fittings are very costly (as compared to materials used in sanitary drainage systems), allowing the use of AAVCs will significantly reduce material costs for installing chemical waste systems. A reduction in the amount of required material vent piping material will result in reduced labor costs for installing chemical waste systems.

ASSE has recently developed ANSI/ASSE Standard 1049 - *Performance Requirements for Individual and Branch Type Air Admittance Valves for Chemical Waste Systems*. Section 702.5 of the IPC requires that drainage systems for chemical wastes and vent pipes shall be of an approved material that is resistant to corrosion and degradation for the concentrations of chemicals involved. Therefore, AAVs that comply with ANSI/ASSE 1049 and are manufactured from materials that meet recognized industry standards for chemical and acid resistant material in compliance with Section 702.5 and tested to ASTM F1412 for chemical resistance must be permitted to serve as the vent for nonneutralized special waste systems.

Referenced Standards:

ASSE 1049
ASTM F1412-01
ASTM D4104-05

Cost Impact: This code change proposal will not increase the cost of construction.

Analysis: Review of proposed new standards, ASSE 1049-2009 and ASTM F1412-01, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

ICCFILENAME: WALTERS-P2-904.4

P125–09/10
906.2

Proponent: Gregory A Farmer, PE, representing ASPE Legislative Committee

Revise as follows:

906.2 Venting of fixture drains. ~~The total fall in a fixture drain due to pipe slope shall not exceed the diameter of the fixture drain, nor shall the t~~The vent connection to ~~the~~ a fixture drain, except for water closets, shall be ~~below~~ above the weir of the trap.

Reason: The removed verbiage refers to sanitary drainage piping and therefore is in the wrong code section. It also limits the length of a 2” branch pipe to a maximum of eight feet, a 3“ pipe to 24 feet, and a 4” pipe to 48 feet. These limitations are not in the sanitary drainage section and there is no viable reason why they should be included in the vent section.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: FARMER-P6-906.2

P126–09/10
912.1

Proponent: Robert Burke, University of Colorado representing Colorado Association of Plumbing and Mechanical Officials (CAPMO)

Revise as follows:

912.1 Type of fixtures. A combination drain and vent system shall not serve fixtures other than floor drains, sinks, lavatories, and drinking fountains. Combination drain and vent systems shall not receive ~~discharge from a food waste grinder or clinical sink~~ grease laden waste or solid waste.

Reason: By design, combination drain and vent systems are intended for clear and gray water waste. See 2006 IPC code commentary.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Burke-P2-912.1

P127–09/10
912.3; IRC P3111.3

Proponent: John R. Addario, P.E., New York State Department of State - Division of Code Enforcement and Administration

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IPC COMMITTEE. PART II WILL BE HEARD BY THE IRC PLUMBING COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I - IPC

Revise as follows:

912.3 Size. The minimum size of a combination drain and vent pipe shall be in accordance with Table 912.3. The horizontal length of a combination drain and vent system shall be unlimited.

PART II- IRC

Revise as follows:

P3111.3 Size. The minimum size of a combination drain and vent pipe shall be in accordance with Table 3111.3. The horizontal length of a combination drain and vent system shall be unlimited.

Reason: This proposed change clarifies the intent of the code by adding that a combination drain and vent system, sized per code, shall be unlimited in horizontal length. Combination drain and vent systems are critical when used in piping systems serving floor drains, especially in large commercial kitchens. It is a source of confusion as to whether the length of the combination drain and vent is limited in length; this proposed change clarifies the intent of the code.

Cost Impact: The code change proposal will not increase the cost of construction.

Logan G. Sauter – Salt Lake City, Utah representing Utah Chapter of ICC

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IPC COMMITTEE. PART II WILL BE HEARD BY THE IRC PLUMBING COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IPC

1. Revise definition as follows:

COMBINATION WASTE AND VENT SYSTEM. A specially designed system of waste piping embodying the horizontal wet venting of one or more sinks, lavatories, drinking fountains, or floor drains by means of a common waste and vent pipe adequately sized to provide free movement of air above the flow line of the drain.

2. Revise as follows:

SECTION 912
COMBINATION ~~DRAIN~~ WASTE AND VENT SYSTEM

912.1 Type of fixtures. A combination ~~drain~~ waste and vent system shall not serve fixtures other than floor drains, sinks, lavatories and drinking fountains. Combination ~~drain~~ waste and vent systems shall not receive the discharge from a food waste grinder or clinical sink.

912.2 Installation. The only vertical pipe of a combination ~~drain~~ waste and vent system shall be the connection between the fixture drain and the horizontal combination ~~drain~~ waste and vent pipe. The maximum vertical distance shall be 8 feet (2438 mm).

912.2.1 Slope. The horizontal combination ~~drain~~ waste and vent pipe shall have a maximum slope of one-half unit vertical in 12 units horizontal (4-percent slope). The minimum slope shall be in accordance with Table 704.1.

912.2.2 Connection. The combination ~~drain~~ waste and vent system shall be provided with a dry vent connected at any point within the system or the system shall connect to a horizontal drain that is vented in accordance with one of the venting methods specified in this chapter. Combination ~~drain~~ waste and vent systems connecting to building drains receiving only the discharge from a stack or stacks shall be provided with a dry vent. The vent connection to the combination ~~drain~~ waste and vent pipe shall extend vertically a minimum of 6 inches (152 mm) above the flood level rim of the highest fixture being vented before offsetting horizontally.

912.2.4 Fixture branch or drain. The fixture branch or fixture drain shall connect to the combination ~~drain~~ waste and vent within a distance specified in Table 906.1. The combination ~~drain~~ waste and vent pipe shall be considered the vent for the fixture.

912.3 Size. The minimum size of a combination ~~drain~~ waste and vent pipe shall be in accordance with Table 912.3.

TABLE 912.3
SIZE OF COMBINATION ~~DRAIN~~ WASTE AND VENT PIPE
(Portions of table not shown remain unchanged)

PART II – IRC

1. Revise definition as follows:

COMBINATION WASTE AND VENT SYSTEM. A specially designed system of waste piping embodying the horizontal wet venting of one or more sinks, lavatories or floor drains by means of a common waste and vent pipe adequately sized to provide free movement of air above the flow line of the drain.

2. Revise as follows:

P3111.2 Installation. The only vertical pipe of a combination ~~drain~~ waste and vent system shall be the connection between the fixture drain and the horizontal combination waste and vent pipe. The maximum vertical distance shall be 8 feet (2438 mm).

Reason
Part I
(Grace) The definition of “drain” per chapter 2 - “Any pipe that carries wastewater or water-borne wastes in a building drainage system.” The definition of “waste” per chapter 2 - “The discharge from any fixture, appliance, area or appurtenance that does not contain fecal matter.” Section 912 specifically states that only floor drains, sinks, lavatories and drinking fountain are to be served on a combination drain and vent system. These fixtures, as specifically listed, will not have fecal matter discharged to them thus section 912 should reflect this with the correctly defined terms. Additionally, the IRC currently uses the term “combination waste and vent pipe” in all but one location of Section P3111 (there is a proposed change to correct that one location as well). This will promote consistency between the IPC and the IRC.
(Sauter) Section 202 has a definition for a Combination Waste and Vent System, not a Combination Drain and Vent System. Also, the IRC uses the term “Combination Waste and Vent System” in both Section R202 Definitions and in Section P3111. This change would bring terminology uniformity to the IPC and IRC. By definition, a “waste” pipe never carries fecal matter, where as some “drains”, such as building drains, do carry fecal matter. The intended application of a combination waste and vent system does not include fixtures handling fecal matter. The title change from “drain” to “waste” would help reinforce this application limitation.
Part II
(Grace)-The phrase “combination drain and vent” is found only once in Section P3111. All other language is “combination waste and vent”. It is my belief that this was simply an editorial error**Cost Impact:** The code change proposal will not increase the cost of construction.

PART I – IPC

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

PART II – IRC

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: GRACE-P4-912.1

P129–09/10
914 (New)

Proponent: Robert Evans, CPD/ASPE Legislative Committee/ASPE

Add new section as follows:

SECTION 914
SINGLE STACK VENT SYSTEM

914.1 Where permitted. A drainage stack shall serve as a single stack vent system where sized and installed in accordance with Sections 914.2 through 914.9. The drainage stack and branch piping shall be the vents for the drainage system. The drainage stack shall have a stack vent.

914.2 Stack size. Drainage stacks shall be sized in accordance with Table 914.2. Stacks shall be uniformly sized based on the total connected drainage fixture unit load. The stack vent shall be the same size as the drainage stack. A 3-inch stack shall serve not more than two water closets.

TABLE 914.2
SINGLE STACK SIZE

STACK SIZE (inches)	MAXIMUM CONNECTED DRAINAGE FIXTURE UNITS		
	Stacks less than 75 feet in height	Stacks 75 feet to less than 160 feet in height	Stacks 160 feet and greater in height
3	24	NP	NP
4	225	24	NP
5	480	225	24
6	1,015	480	225
8	2,320	1,015	480
10	4,500	2,320	1,015
12	8,100	4,500	2,320
15	13,600	8,100	4,500

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm.

914.3 Branch size. Horizontal branches connecting to a single stack vent system shall be sized in accordance with Table 710.1(2). Not more than one water closet shall discharge into a 3 inch (76.2 mm) horizontal branch at a point within a developed length of 18 inches (457.2 mm) measured horizontally from the stack.

Where a water closet is within 18 inches (457.2 mm) measured horizontally from the stack and not more than one fixture with a drain size of not more than 1-1/2 inch (38.1 mm) connects to a 3 inch (76.2 mm) horizontal branch, the branch drain connection to the stack shall be made with a sanitary tee.

914.4 Length of horizontal branches. The length of horizontal branches shall conform to the requirements of Sections 914.4.1 through 914.4.3.

914.4.1 Water closet connection. Water closet connections shall be not greater than 4 feet (1219 mm) in developed length measured horizontally from the stack.

Exception: Where the connection is made with a sanitary tee, the maximum developed length shall be 8 feet (2438 mm).

914.4.2 Fixture connections. Fixtures other than water closets shall be located not greater than 12 feet (3657 mm) in developed length measured horizontally from the stack.

914.4.3 Vertical piping in branch. The length of vertical piping in a fixture drain connecting to a horizontal branch shall not be considered in computing the fixture's distance in developed length measured horizontally from the stack.

914.5 Minimum vertical piping size from fixture. The vertical portion of piping in a fixture drain to a horizontal branch shall be 2 inches (50.8 mm). The minimum size of the vertical portion of piping for a water supplied urinal or standpipe shall be 3 inches (76.2 mm). The maximum vertical drop shall be 4 feet. Fixture drains that are not increased in size, or have a vertical drop in excess of 4 feet shall be individually vented.

914.6 Additional venting required. Additional venting shall be provided where more than one water closet discharges to a horizontal branch and where the distance from a fixture trap to the stack exceeds the limits in Section 914.4. Where additional venting is required, the fixture(s) shall be vented by individual vents, common vents, wet vents, circuit vents, or a combination waste and vent pipe. The dry vent extensions for the additional venting shall connect to a branch vent, vent stack, stack vent, air admittance valve, or shall terminate outdoors.

914.7 Stack offsets. Where fixture drains are not connected below a horizontal offset in a stack, a horizontal offset shall not be required to be vented. Where horizontal branches or fixture drains are connected below a horizontal offset in a stack, the offset shall be vented in accordance with Section 915. Fixture connections shall not be made to a stack within 2 feet (609.6 mm) above or below a horizontal offset.

914.8 Prohibited lower connections. Stacks greater than 2 branch intervals in height shall not receive the discharge of horizontal branches on the lower two floors. Where a separate stack is provided for the lower two floors, There shall be no connections to the stack between the lower two floors and shall connect to the building drain at a distance of not less than 10 pipe diameters downstream from the base of the connection of any single stack vented system.

914.9 Sizing building drains and sewers. The building drain and building sewer receiving the discharge of a single stack vent system shall be sized in accordance with Table 710.1(1).

Reason: Last cycle, the Plumbing Code Change Committee approved this code change. It failed at the final hearing before a small crowd at a very late hour. ASPE has long recognized this form of venting. The details are addressed in the ASPE Plumbing Engineering Design Handbook. Single stack venting is currently permitted in the UPC and NSPC. The IPC is the only model plumbing code that does not have provisions for the single stack venting system. There is no justification for not including this type of venting system.

There is over 100 years of experience with single stack venting systems. If the stack is large enough, additional venting is not required provided that the fixtures are within a limited distance to the stack. It should be noted that the single stack system is one without long horizontal branches, nor drops in piping. By limiting the length of the branch and the vertical drops into the branch, you can control the pressure excursions in the piping system.

In addition to the more than 100 years of field experience, there are computer models that verify the performance of the single stack system. If the IPC is to be an all inclusive code, then single stack venting should be a part of the code.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: In Section 914.8, it is not clear which pipe is referred to relative to the "10 pipe diameters." (The stack or the building drain diameter?)

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IPC COMMITTEE. PART II WILL BE HEARD BY THE IRC PLUMBING COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IPC

Revise as follows:

916.5.1 Sewage pumps and sewage ejectors other than pneumatic. Drainage piping below sewer level shall be vented in ~~a similar~~ the same manner ~~to~~ as that of a gravity system. Building sump vent sizes for sumps with sewage pumps or sewage ejectors, other than pneumatic, shall be determined in accordance with Table 916.5.1.

PART II – IRC

Revise as follows:

P3113.4.1 Sewage pumps and sewage ejectors other than pneumatic. Drainage piping below sewer level shall be vented in ~~a similar~~ the same manner ~~to~~ as that of a gravity system. Building sump vent sizes for sumps with sewage pumps or sewage ejectors, other than pneumatic, shall be determined in accordance with Table P3113.4.1.

Reason: The definition of **similar:** "Related in appearance or nature; alike though not identical". This change will make it a requirement that the drainage below sewer level to be vented as a gravity system, which it is until it gets to the sump.

Cost Impact: The code change will not increase the cost of construction.

PART I – IPC

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

PART II – IRC

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

P132 –09/10
917.3.1

Proponent: Richard Grace/Fairfax County/Virginia Plumbing and Mechanical Inspectors Association /VA Building and Code Officials

Delete without substitution:

~~**917.3.1 Location of branch.** The horizontal branch drain shall connect to the drainage stack or building drain a maximum of four branch intervals from the top of the stack.~~

(Renumber subsequent sections)

Reason: Section 917.3.1 says nothing because you don't have to be a maximum of 4 branch intervals from the top of a stack. You can comply with 917.3.2 instead. Current 917.3.1 says you must do something and then 917.3.2 tells you what to do when you violate 917.3.1? This is not typical format within the I codes. The main section 917.3, says you have a choice but the first choice is just the flip side of the second choice. If the branch is more than 4 branch intervals from the top, you have to install a relief vent, but if you are NOT more than 4 branch intervals from the top, nothing needs to be said.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

917.3, 917.3.1, 917.3.2, 917.3.3

Proponent: Judson Collins, JULYCO, representing self

1. Delete and substitute as follows:

~~**917.3 Where permitted.** Individual, branch and circuit vents shall be permitted to terminate with a connection to an individual or branch-type air admittance valve. Stack vents and vent stacks shall be permitted to terminate to stack-type air admittance valves. Individual and branch-type air admittance valves shall vent only fixtures that are on the same floor level and connect to a horizontal branch drain. The horizontal branch drain having individual and branch-type air admittance valves shall conform to Section 917.3.1 or 917.3.2. Stack-type air admittance valves shall conform to Section 917.3.3.~~

~~**917.3.1 Location of branch.** The horizontal branch drain shall connect to the drainage stack or building drain a maximum of four branch intervals from the top of the stack.~~

~~**917.3.2 Relief vent.** Where the horizontal branch is located more than four branch intervals from the top of the stack, the horizontal branch shall be provided with a relief vent that shall connect to a vent stack or stack vent, or extend outdoors to the open air. The relief vent shall connect to the horizontal branch drain between the stack and the most downstream fixture drain connected to the horizontal branch drain. The relief vent shall be sized in accordance with Section 916.2 and installed in accordance with Section 905. The relief vent shall be permitted to serve as the vent for other fixtures.~~

917.3 Where permitted. Individual, branch and circuit vents shall be permitted to terminate with a connection to an individual or branch-type air admittance valve in accordance with Section 917.3.1. Stack vents and vent stacks shall be permitted to terminate to stack-type air admittance valves in accordance with 917.3.2.

917.3.1 Horizontal branches. Individual and branch-type air admittance valves shall vent only fixtures that are on the same floor level and connect to a horizontal branch drain. Where the horizontal branch is located more than four branch intervals from the top of the stack, the horizontal branch shall be provided with a relief vent that shall connect to a vent stack or stack vent, or extend outdoors to the open air. The relief vent shall connect to the horizontal branch drain between the stack and the most downstream fixture drain connected to the horizontal branch drain. The relief vent shall be sized in accordance with Section 916.2 and installed in accordance with Section 905. The relief vent shall be permitted to serve as the vent for other fixtures.

(Renumber subsequent sections)

2. Revise as follows:

917.3.3 Stack. Stack-type air admittance valves shall be prohibited from serve~~e~~ing as the vent terminal for vent stacks or stack vents that serve drainage stacks exceeding six branch intervals.

Reason: There are no technical changes to the sections involved. The proposed language clarifies the intent of the current language and makes it easier to read and understand.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: COLLINS-P1-917.3

P134–09/10
1002.1

Proponent: Donald R. Monahan, PE, Walker Parking Consultants, representing the National Parking Association and the Automated & Mechanical Parking Association

Revise as follows:

1002.1 Fixture traps. Each plumbing fixture shall be separately trapped by a liquid-seal trap, except as otherwise permitted by this code. The vertical distance from the fixture outlet to the trap weir shall not exceed 24 inches (610 mm), and the horizontal distance shall not exceed 30 inches (610 mm) measured from the centerline of the fixture outlet to the centerline of the inlet of the trap. The height of a clothes washer standpipe above a trap shall conform to Section 802.4. A fixture shall not be double trapped.

Exceptions:

1. This section shall not apply to fixtures with integral traps.
2. A combination plumbing fixture is permitted to be installed on one trap, provided that one compartment is not more than 6 inches (152 mm) deeper than the other compartment and the waste outlets are not more than 30 inches (762 mm) apart.
3. A grease interceptor intended to serve as a fixture trap in accordance with the manufacturer's installation instructions shall be permitted to serve as the trap for a single fixture or a combination sink of not more than three compartments where the vertical distance from the fixture outlet to the inlet of the interceptor does not exceed 30 inches (762 mm) and the *developed length* of the waste pipe from the most upstream fixture outlet to the inlet of the interceptor does not exceed 60 inches (1524 mm).
4. Where floor drains in multi-level parking structures are required to discharge to a combined building sewer system, the floor drains shall not be required to be individually trapped provided that they are connected to a main trap in accordance with Section 1103.1.

Reason: Floor drain traps in unheated multi-level parking structures are problematic because the traps can be damaged during freezing conditions. The liquid in traps for floor drains in covered parking levels usually evaporates as there is little, if any, water runoff on the covered levels. Heat tracing and insulation are not reliable in these locations. A main trap for the parking structure floor drain system is typically required as many jurisdictions require a sand/oil separator prior to discharge to the sanitary sewer.

Cost Impact: The code change will not increase the cost of construction. There will be a construction cost savings to install only a main trap at the lowest level as opposed to traps at all floor drains on the upper levels.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: MONAHAN-P1-1002.1

P135–09/10
1002.3, Chapter 13; IRC P3201.5, Chapter 44

Proponent: Gary S. Duren, President, Code Compliance, Inc representing Code Compliance, Inc.

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IPC COMMITTEE. PART II WILL BE HEARD BY THE IRC PLUMBING COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IPC

1. Revise as follows:

1002.3 Prohibited traps. The following types of traps are prohibited:

1. Traps that depend on moving parts to maintain the seal.

   Exception: A sanitary waste valve conforming to ASME A112.18.8, installed as a substitute for 1 ¼ inch (32mm) and 1 ½ inch (38mm) tubular traps. Such valves shall be provided with ready access.

2. Bell traps.
3. Crown-vented traps.
4. Traps not integral with a fixture and that depend on interior partitions for the seal, except those traps constructed of an approved material that is resistant to corrosion and degradation.
5. "S" traps.
6. Drum traps.

   Exception: Drum traps used as solids interceptors and drum traps serving chemical waste systems shall not be prohibited.

2. Add a new standard to Chapter 13 as follows:

ASME
A112.18.8-09, In-line Sanitary Waste Valves for Plumbing Drainage Systems

PART II – IRC

1. Revise as follows:

P3201.5 Prohibited traps. The following types of traps are prohibited:

1. Traps that depend on moving parts to maintain the seal.

   Exception: A sanitary waste valve conforming to ASME A112.18.8, installed as a substitute for 1 ¼ inch (32mm) and 1 ½ inch (38mm) tubular traps. Such valves shall be provided with ready access.

2. Bell traps.
3. Crown-vented traps.
4. Traps not integral with a fixture and that depend on interior partitions for the seal, except those traps constructed of an approved material that is resistant to corrosion and degradation.
5. "S" traps.
6. Drum traps.

   Exception: Drum traps used as solids interceptors and drum traps serving chemical waste systems shall not be prohibited.

2. Add a new standard to Chapter 44 as follows:

ASME
A112.18.8-09 In-line Sanitary Waste Valves for Plumbing Drainage Systems

Reason: To add the appropriate verbiage to permit the use of sanitary waste valves and to add the appropriate new standard to specify sanitary waste valves.

Cost Impact: The adoption of this proposal will not increase costs.

Analysis: Review of proposed new standard, ASME A112.18.8-09, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

PART I – IPC

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IPC COMMITTEE. PART II WILL BE HEARD BY THE IRC PLUMBING COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I - IPC

1. Revise as follows:

1002.4 Trap seals. Each fixture trap shall have a liquid seal of not less than 2 inches (51 mm) and not more than 4 inches (102 mm), or deeper for special designs relating to accessible fixtures. Where a trap seal is subject to loss by evaporation, a trap seal primer shall be connected to the trap ~~valve~~ or a trap seal protection device shall be installed. The discharge pipe from a trap seal primer ~~valves~~ shall connect to the trap at a point above the level of the trap seal. Trap seal protection devices shall be installed in accordance with the manufacturer's installation instructions. ~~A~~ Potable water-type trap seal primers ~~valve~~ shall conform to ASSE 1018. ~~or~~ Drainage waste-type and nonpotable water-type trap seal primers shall conform to ASSE 1044. Trap seal protection devices shall conform to ASSE 1072.

2. Add standard to Chapter 13 as follows:

ASSE
1072-06 Performance Requirements for Barrier Type Floor Drain Trap Seal Protection Devices.

PART II - IRC

1. Revise as follows:

P3201.2 Trap seals and trap seal protection. Traps shall have a liquid seal of not less than 2 inches (51 mm) and not more than 4 inches (102 mm). Traps for floor drains shall be ~~fitted with~~ connected to a trap seal primer, fitted with a trap seal protection device or be of deep seal design. The discharge pipe from a trap seal primer ~~valves~~ shall connect to the trap at a point above the level of the trap seal. Trap seal protection devices shall be installed in accordance with the manufacturer's installation instructions. Trap seal protection devices shall conform to ASSE 1072.

2. Add standard to Chapter 44 as follows:

ASSE
1072-06 Performance Requirements for Barrier Type Floor Drain Trap Seal Protection Devices.

Reason:
Part I- The current code text does not distinguish between nonpotable water-type/ waste-type trap seal primers and potable water-type trap seal primers. This change will make that distinction clear. This is necessary for where municipal-reclaimed water will be used for trap seal priming. The proposed text also includes the standard for trap seal protection devices. This standard regulates a new form of trap seal protection that does not rely on water or drainage waste-type primers. Trap seal protection devices are a green design concept that provides an effective means of preventing evaporation of the trap seal without the use of water.

Part II- The proposed text includes trap seal protection devices as a means to prevent trap evaporation. The added standard regulates this new form of trap seal protection that does not rely on water or drainage waste-type primers. Trap seal protection devices are a green design concept that provides an effective means of preventing evaporation of the trap seal without the use of water.
Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: Review of proposed new standard ASSE 1072-06 indicated that, in the opinion of ICC staff, the standard did comply with ICC standards criteria.

PART I – IPC

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

PART II – IRC

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: BALLANCO-P1-1002.4

P137–09/10
1003.1

Proponent: Judson Collins, JULYCO, representing himself.

Delete and substitute as follows:

~~**1003.1 Where required.** Interceptors and separators shall be provided to prevent the discharge of oil, grease, sand and other substances harmful or hazardous to the building drainage system, the public sewer, the private sewage disposal system or the sewage treatment plant or processes.~~

1003.1 Where required. Interceptors shall be provided and installed as required by Sections 1003.3, 1003.4, 1003.6, 1003.7 and 1003.8. In other occupancies or locations where fixtures discharge substances that could be detrimental to the drainage system, the sewer system or wastewater treatment processes, an approved interceptor shall be provided and installed.

Reason: The current text says "provide interceptors and separators to prevent discharge." It does not say where the discharge is to go. The intent of the text is to keep waste that is harmful to drainage systems, sewer systems or wastewater treatment processes from reaching them. Revising the section as proposed will clarify the intent of the section, give reference to the appropriate sections and reiterate that approved interceptors are required. The word "separators" is not used in the proposed text since the definition of the word is the same as that for "interceptor". Since the two words are used interchangeably and the code only defines "interceptor", "separators" was deleted.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: COLLINS-P11-1003.1

P138–09/10
1003.1

Proponent: Richard Grace/Fairfax County/ VA Plumbing and Mechanical Inspectors/VA Building and Code Officials

Revise as follows:

1003.1 Where required. Interceptors and separators shall be provided to prevent the discharge of oil, grease, sand and other substances harmful or hazardous to the ~~building drainage system,~~ the public sewer, the private sewage system or the sewage treatment plant or processes.

Reason: With the incorporation of the new exception to Section 1003.3.4 it is abundantly clear that waste is permitted to flow within the building drainage system. This concept has always been the intent because in almost every application the waste must travel through some portion of the building drainage system in order to get to the interceptor. If the actual code text were applied literally the interceptors would need to attach directly to fixture outlets. That is not the intent. Striking this text will remove the misconception that a device is required to install adjacent to each and every fixture that discharges any liquid that may need to be separated prior to entering the public or private systems.

Cost Impact: None. There will be a cost savings.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: GRACE-P6-1003.1

P139–09/10
1003.3.1

Proponent: Sid Cavanaugh, Cavanaugh Consulting representing Thermaco

Revise as follows:

1003.3.1 Grease interceptors and automatic grease removal devices required. A grease interceptor or automatic grease removal device shall be required to receive the drainage from fixtures and equipment with grease-laden waste located in food preparation areas, such as in restaurants, hotel kitchens, hospitals, school kitchens, bars, factory cafeterias and clubs. Fixtures and equipment shall include pot sinks, prerinse sinks; soup kettles or similar devices; wok stations; floor drains or sinks into which kettles are drained; automatic hood wash units and dishwashers without prerinse sinks. Grease interceptors and automatic grease removal devices shall receive waste only from fixtures and equipment that allow fats, oils or grease to be discharged. Commercial food waste grinders shall connect to the sanitary drainage system at a point that is downstream of all grease interceptors unless the code official requires the connection point to be upstream of a grease interceptor.

Reason: This proposal addresses the issues raised by the IPC Committee during the last code cycle. This code change is important and recognizes the need for combinations of grease interceptors for renovation projects (change of occupancy) involving existing buildings where there is insufficient space or it is cost prohibitive to install a large enough in-ground interceptor (usually a gravity type) to meet local sewer ordinance requirements.

Cost Impact: None. It will probably save money for the user in many cases.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: CAVANAUGH-P1-1003.3.1

P140–09/10
1003.3.2

Proponent: Sid Cavanaugh, Cavanaugh Consulting representing In Sink Erator

Revise as follows:

1003.3.2 Food Waste Grinders. Where food waste grinders connect to grease interceptors, ~~a solids interceptor shall separate the discharge before connecting to the grease interceptor. Solids interceptor and~~ the grease interceptor shall be sized for the discharge of the food waste grinder. Emulsifiers, chemicals, enzymes and bacteria shall not discharge into the food waste grinder.

Reason: Current language implies solids interceptors are used in conjunction with the installation of all food waste grinders, but food waste grinders are connected to grease interceptors only when required by the authority having jurisdiction, and this should be the exception not the rule. Data indicates it is impractical to discharge food waste grinders into interceptors. Language that specifies using a solids interceptor upstream of all grease interceptors is illogical since none are manufactured large enough to accommodate food waste grinder

The intent of grease interceptors is to reduce the introduction of fats, oils and greases (FOG) into sewers. Sewer clogs associated with FOG are well documented, and results from a collaborative research project undertaken by the Water Environment Research Foundation published in the fall 2008 characterized the composition of sewer deposits and provided much insight on these blockages.[1] The data revealed that 84% of the FOG deposit samples analyzed contained high concentrations of saturated fatty acids and calcium, higher than normal background levels, and appeared to be metallic salts of fatty acids. One of the researchers, Dr. Kevin Keener, has reported that no food waste particles were evident in these deposits. The report suggests a chemical reaction is occurring in the sewers, saponification, with calcium chemically selected over sodium. These insoluble deposits are difficult to remove and provide significant challenges for sewage collection system managers and plumbers as well. A supplemental report to the FROG study provided additional insight on the effluent of grease interceptors. 90% of flows though interceptors are on average 1/3 the peak design flow, which equates to detention times in the order of hours, not minutes, interceptors are mainly acidic, with pH's in the range of 4-8, and dissolved oxygen concentrations are less than 0.5 mg/L.

Together, the information provided in these studies suggests FOG deposits may indeed be the result of free fatty acids from the effluent of grease interceptors reacting with calcium. If pumped and maintained infrequently, or retained solids digest anaerobically, or if interceptors are improperly sized, conditions are conducive for promoting the formation of FOG deposits. While it is inappropriate to introduce grease into sewers

without remediation through such devices as interceptors, ground food waste should only be discharged directly to sanitary sewers, bypassing interceptors.

	Assembly:	ASF	AMF	DF

ICCFILENAME: CAVANAUGH-P7-1003.3.2

P141–09/10
202 (New), 1003.3.4, Chapter 13

Proponent: Rand Ackroyd, Rand Technical Consulting, representing The Plumbing and Drainage Institute

1. Delete and substitute as follows:

~~**GREASE INTERCEPTOR.** A plumbing appurtenance that is installed in a sanitary drainage system to intercept oily and greasy wastes from a wastewater discharge. Such device has the ability to intercept free-floating fats and oils.~~

GREASE INTERCEPTOR.

HYDRO-MECHANICAL. Plumbing appurtenances that are installed in the sanitary drainage system to intercept free-floating fats, oils and grease from wastewater discharge. Continuous separation is accomplished by air entrainment, buoyancy and interior baffling.

GRAVITY. Plumbing appurtenances of not less than 500 gallons (1893 L) capacity that are installed in the sanitary drainage system to intercept free-floating fats, oils and grease from wastewater discharge. Separation is accomplished by gravity during a retention time of not less than 30 minutes.

2. Revise as follows:

1**003.3.4 Hydromechanical grease interceptors and automatic grease removal devices.** Hydromechanical grease interceptors and automatic grease removal devices shall be sized in accordance with PDI G101, ASME.14.3 Appendix A or ASME A112.14.4. Hydromechanical grease interceptors and automatic grease removal devices shall be designed and tested in accordance with PDI G101, PDI G102, ASME.14.3 Appendix A or ASME A112.14.4. Hydromechanical grease interceptors and automatic grease removal devices shall be installed in accordance with the manufacturer's instructions. The section shall not apply to gravity grease interceptors.

~~**Exception:** Interceptors that have a volume of not less than 500 gallons (1893 L) and that are located outdoors shall not be required to meet the requirements of this section.~~

3. Add standard to Chapter 13 as follows:

PDI
G102 Testing and Certification for Grease Interceptors with FOG Sensing and Alarm Devices

Reason: The industry has standardized on the terms "Hydro-Mechanical" and "Gravity" for the two general types of grease interceptors in the plumbing industry. The requirements in Section 1003.3.4 and its subsections were never intended to apply to gravity grease interceptors. The new terminology makes a clear distinction between the two types in order for the code to be clear about which type of grease interceptor the requirements apply to.

PDI G102 covers the Testing and Certification for Grease Interceptors with FOG Sensing and Alarm Devices. This standard expands on the already recognized PDI G101 by including testing and certification of alarm devices that can be provided on interceptors already complying with PDI G101. The alarm device on a hydromechanical grease interceptor monitors the level of the grease captured in the unit and provides both a loud audible signal and a visible signal when the accumulated grease (FOG) in the interceptor needs to be removed. Standard PDI G102 is available for free downloading from the PDI website www.pdionline.org.

The exception to this section that was put in last cycle by another proponent was an attempt to distinguish between the two general types of grease interceptors in order to clarity that Section 1003.3.4 did not apply to gravity grease interceptors. The new proposed terminology provides the necessary clarification and thus, the exception is no longer needed. However, in the spirit of the exception, the last line of text was added to reinforce that the reader should not try to apply the requirements of this section (including the subsections that follow) to gravity grease interceptors.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: Review of proposed new standard PDI-G102 indicated, that in the opinion of ICC staff, the standard did not comply with the ICC standards criteria (Section 3.6.2.1).

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Ackroyd-P3-1003.3.4

P142–09/10
1003.3.4, Chapter 13

Proponent: Abraham I. Murra, Canadian Standards Association, representing the Canadian Standards Association

1. Revise as follows:

1003.3.4 Grease interceptors and automatic grease removal devices. Grease interceptors and automatic grease removal devices shall be sized in accordance with PDI G101, ASME 112.14.3 Appendix A, ASME 112.14.4, or CSA B481.3. Grease interceptors and automatic grease removal devices shall be designed and tested in accordance with PDI G101, ASME A112.14.3, ~~or~~ or ASME 112.14.4 or CSA B481.1. Grease interceptors and automatic grease removal devices shall be installed in accordance with the manufacturer's installation instructions. Where manufacturer's installation instructions are not provided, grease interceptors and grease removal devices shall be installed in compliance with CSA B481.3.

2. Add standards to Chapter 13 as follows:

CSA

B481.1-07 Testing and Rating of Grease Interceptors Using Lard

B481.3-07 Sizing, Selection, Location, and Installation of Grease Interceptors

Reason: CSA B481.1 covers performance of grease interceptors in accordance with ASME A112.14.3, but it also covers other very important aspects such as materials, design, and construction requirements as well as structural integrity tests for such devices.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: Review of proposed new standard, CSA B481.1-07 and CSA B481.3-07, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Murra-P5-1003.3.4

P143–09/10
1003.4.2

Proponent: Bob Eugene/Underwriters Laboratories Inc/Underwriters Laboratories Inc

1. Revise as follows:

1003.4.2 Oil separator design. Oil separators shall be listed and labeled in accordance with UL 2215, or designed in accordance with Sections 1003.4.2.1 and 1003.4.2.2.

2. Add standards to Chapter 13 as follows:

UL

2215-00 Outline of Investigation for Oil/Water Separators

Reason: This proposal provides an alternative for the use of listed oil/water separators that are built on-site. UL's Outline of Investigation includes a comprehensive set of construction and performance requirements that are used to evaluate and list oil/water separators used in garages and service stations. These requirements cover stationary gravity or pump fed aboveground and underground, atmospheric type oil/water separator systems intended to remove oil suspended in water from rainwater runoff or normal washdown of streets, highways, and parking lots at an inlet rate not exceeding the marked maximum influent concentration and flow rate. Oil/water separator systems covered by these requirements are fabricated,

inspected, and tested for leakage before shipment from the factory as completely assembled units, or with instructions for field assembly of minor components. Over 20 companies currently have oil/water separators listed.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: Review of the proposed new requirement UL 2215-00 indicated that, in the opinion of ICC staff, the requirement did not comply with ICC standards criteria.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: EUGENE-P1-1003.4.2

P144–09/10
1003.9, 1003.10 (New)

Proponent: Cort Strain University of Colorado representing the Colorado Association of Plumbing and Mechanical Officials (CAPMO).

1. Revise as follows:

1003.9 Venting of interceptors and separators. Interceptors and separators shall be designed so as not to become air bound where tight covers are utilized. ~~Each interceptor or separator shall be vented where subject to a loss of trap seal.~~ The pipe connected to the outlet of an interceptor or separator shall be vented in accordance with the fixture trap venting requirements of Chapter 9. The invert of the outlet fitting of the interceptor or separator shall be considered as the trap weir elevation for the purposes of determining the maximum allowable distance from the outlet to the vent connection to the outlet pipe.

2. Add new text as follows:

1003.10 Cleanout for outlet pipe of interceptors or separators. A two-way cleanout arrangement shall be installed on the outlet pipe of interceptors and separators. The cleanout arrangement shall enable rodding of the outlet pipe in both the upstream and downstream directions.

(Renumber subsequent sections)

Reason: Although interceptor or separator manufacturer's installation instructions might state that a vent is not required on outlet pipe of the unit, the fact is that most instructions are silent on the issue. So how is the code official supposed to know if a particular unit in a specific installation arrangement could develop siphon action? The truth is, no one really knows. Therefore, the words in Section 1003.9 are deleted because there really isn't any way to know if siphonage will occur. In our experience, a fair number of interceptors and separators do develop siphons which result in the discharge of collected contents into drain and sewer systems. The outlet pipes of interceptors and separators should be vented to prevent siphoning from occurring. The need for outlet pipe venting is supported by Section 10.3 of standard PDI-101 (a code referenced standard) that states: "Grease interceptors shall have a vented waste on the outlet side, sized in accordance with code requirements for venting traps to retain water seal and prevent siphoning". The text added to Section 1003.9 brings this requirement to light and provides the details for properly locating and sizing the vent.

Unlike a fixture trap that can be easily removed for access to rod a fixture drain, interceptors and separators are not easily removed and rarely have the provisions necessary to gain adequate access for rodding of the pipe connected to the outlet. This is a location that can require frequent rodding especially if the interceptor or separator is not cleaned at the necessary intervals. In many cases, as a necessity, cleanouts are often added after installation. Unfortunately, many of these after-the-fact cleanout installations do not get permitted or inspected resulting problems. The new section 1003.10 adds text to require a two way cleanout arrangement on the outlet pipe of interceptors and separators.

Cost Impact: The code change proposal will increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Strain-P2-1003.9

P145–09/10
1003.9 (New)

Proponent: Bob Gardner, City of Thornton, Colorado, representing the Colorado Association of Plumbing and Mechanical Officials

Add new text as follows:

1003.9 Hair interceptors required. A fixture intended to be used exclusively for the washing or rinsing of human or animal hair shall be provided with a hair interceptor installed downstream of the fixture outlet. Hair interceptors shall be equipped with a removable wire basket or other approved device to facilitate the removal of hair from the interceptor.

(Renumber subsequent sections)

Reason: Currently the only way for a code official to enforce the use of a hair trap for businesses that deal with large amount of cut or loose hair is by referring to IPC Section 302.1 which is generic and more generally defines hazardous materials than insoluble materials that obstruct a buildings sewer or drainage system. Large amounts of hair can and do obstruct the drainage system requiring the removal of the drainage components or mechanical auguring of the system to remove these obstructions. Adding this section will eliminate the obstructions associated with large quantities of loose hair in commercial establishments.

Cost Impact: This code change will increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ASME

A112.6.4-2003 (R2008)	Roof, Deck and Balcony Drains

Reason: The reference to A112.21.2M is obsolete. The standard no longer exists nor is it in print circulation. The last print edition was 1983. The A112.6.4 2003 edition is titled: Roof, Deck and Balcony Drains and it is the most current applicable ASME printed standard to cover the roof drain application as referenced in Section 1106.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: Review of proposed new standard, ASME A112.6.4-2003 (R2008), for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: TOMBERLIN-P6-1102.6

P149–09/10
1105.1, 1105.2

Proponent: Julius Ballanco, P.E., CPD, FASPE/JB Engineering and Code Consulting, P.C. representing Froet Industries

1. Delete without substitution:

~~**1105.1 Strainers.** Roof drains shall have strainers extending not less than 4 inches (102 mm) above the surface of the roof immediately adjacent to the roof drain. Strainers shall have an available inlet area, above roof level, of not less than one and one-half times the area of the conductor or leader to which the drain is connected.~~

~~**1105.2 Flat decks.** Roof drain strainers for use on sun decks, parking decks and similar areas that are normally serviced and maintained shall comply with Section 1105.1 or shall be of the flat-surface type, installed level with the deck, with an availableinlet area not less than two times the area of the conductor or leader to which the drain is connected.~~

2. Add new text as follows:

1105.1 General. Roof drains shall be installed in accordance with the manufacturer's installation instructions. The inside opening for the roof drain shall not be obstructed by the roofing membrane material.

(Renumber subsequent sections)

Reason: The two sections proposed for deletion predate the roof drain standard. These requirements originally appeared in the ANSI A40.8-1955 standard. This was the basis of the legacy codes. With the reference to the roof drain standard, the sizing and design of the roof drain is regulated by the standard. The following table provides a comparison of the sizing of current Section 1105.1 to the ASME standard. Obviously, the existing code language does not require nearly the flow area of the strainer as compared to what the current standards require.

Pipe Size	Inside Diameter	Inside Area	Min. Dome Area Per ASME A112.6.4	IPC Minimum Dome Area
(inches)	(inches)	(sq inches)	(sq inches)	(sq inches)
2	1.96	3.02	18	4.53
3	2.96	6.88	25	10.32
4	3.94	12.19	36	18.29
5	4.94	19.17	50	28.75
6	5.94	27.71	70	41.57

With a reference to the roof drain standard in Section 1102.6, the roof drain section only has to reference the installation instructions of the manufacturer for regulating the installation. One of the common errors in a roof drain is the overlapping of the roof membrane into the roof drain. Contractors have been known to cut a smaller opening in the roof membrane than the size of the roof drain. The addition of the language in Section 1105.1 will emphasize that after installation, the inside opening of the roof drain outlet must not be blocked by roofing membrane materials.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: BALLANCO-P3-1105.1

150–09/10
1106.5

Proponent: Don Surrena, National Association of Home Builders (NAHB)

Revise as follows:

1106.5 Parapet wall scupper location. Parapet wall roof drainage scupper and overflow scupper location shall comply with the requirements of Section 1503.4 of the *International Building Code*.

Reason: The purpose of this proposal is to clarify the requirements for roof drains and the requirements for secondary emergency overflow drains, their sizing, location and quantity as well as their section reference in the IBC.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: Surrena-P3-1106.5

P151-09/10
1107 (New), 1107.1 (New), Chapter 13

Proponent: Robert Evans, CPD/ASPE Legislative Committee/ASPE

1. Add a new section as follows:

Section 1107
Siphonic Roof Drainage Systems

1107.1 General. Siphonic roof drainage systems shall be designed in accordance with ASPE 45.

2. Add standard to Chapter 13 as follows:

American Society of Plumbing Engineers
8614 Catalpa Avenue, Suite 1007
Chicago, IL 60656-1116

ASPE
45-2007 Siphonic Roof Drainage Systems

Reason: This section will add requirements for the design of siphonic roof drainage systems. ASPE developed a standard for the plumbing engineers to use when designing these systems. This is a complex design that needs to be properly addressed in the code. Without the reference to the proper standard, the plumbing official has no requirements by which to evaluate siphonic roof drainage systems.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: Review of proposed new standard, ASPE 45-2007, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: EVANS-P1-1107 NEW

P152–09/10
202 (New), 301.3, Chapter 13 (New), Appendix C; IRC R202, P2601.2, Section P3009 (New), Appendix O

Proponent: Guy Tomberlin of Fairfax County, Virginia, Virginia Plumbing and Mechanical Inspectors, Virginia Building and Code Officials and ICC Region 7.

PART I – IPC

1. Add definition as follows:

GRAY WATER. Waste discharged from lavatories, bathtubs, showers, clothes washers and laundry trays.

2. Revise as follows:

301.3 Connections to drainage system. ~~All~~ Plumbing fixtures, drains, appurtenances and appliances used to receive or discharge liquid wastes or sewage shall be directly connected to the sanitary drainage system of the building or premises, in accordance with the requirements of this code. This section shall not be construed to prevent indirect waste systems required by Chapter 8.

Exception: Bathtubs, showers, lavatories, clothes washers and laundry trays shall not be required to discharge to the sanitary drainage system where such fixtures discharge to an approved gray water system for flushing of water closets and urinals or for subsurface landscape irrigation.

3. Delete Appendix C in its entirety without substitution

(Renumber subsequent appendices)

4. Add new chapter and text as follows:

Chapter 13
Gray Water Recycling Systems

SECTION 1301
GENERAL

1301.1 Scope. The provisions of Chapter 13 shall govern the materials, design, construction and installation of gray water systems for flushing of water closets and urinals and for subsurface landscape irrigation. See Figures 1301.1(1) and 1301.1(2).

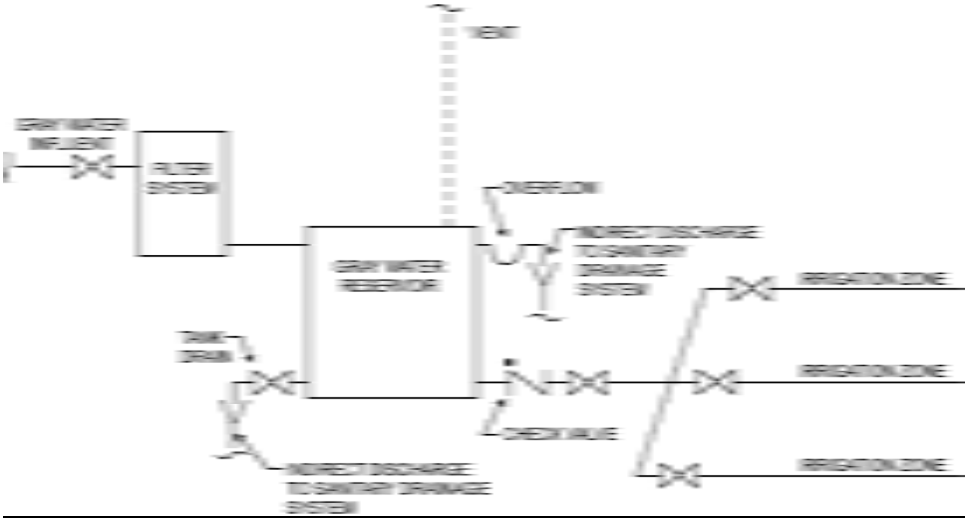

FIGURE 1301.1 (1)
GRAY WATER RECYCLING SYSTEM FOR
SUBSURFACE LANDSCAPE IRRIGATION

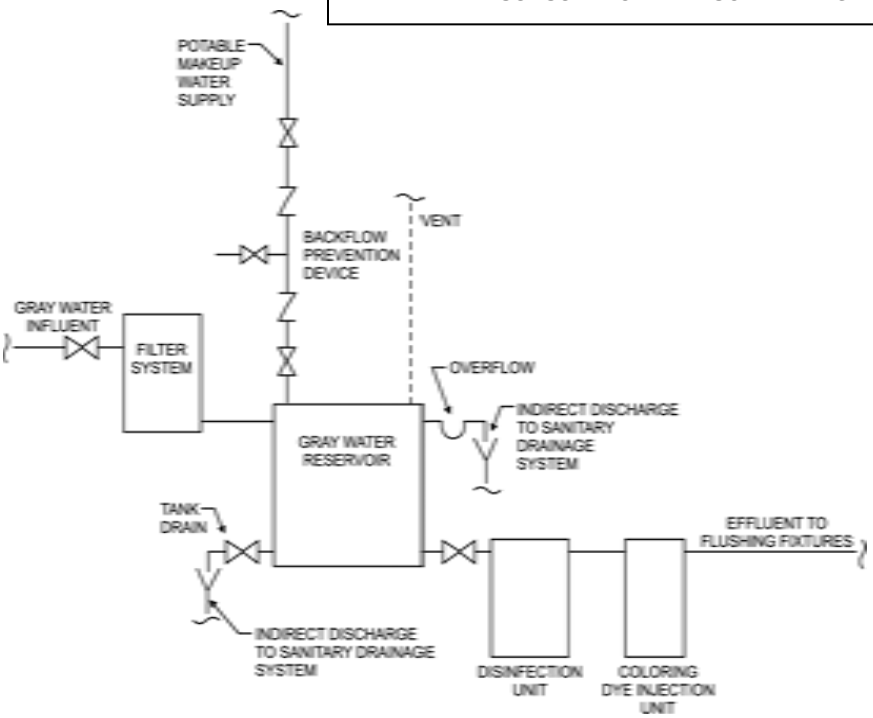

FIGURE 1301.1(2)
GRAY WATER RECYCLING SYSTEM FOR
FLUSHING WATER CLOSETS AND URINALS

1301.2 Installation. In addition to the provisions of Section 1301, systems for flushing of water closets and urinals shall comply with Section 1302 and systems for subsurface landscape irrigation shall comply with Section 1303. Except as provided for in this chapter, all systems shall comply with the provisions of the other chapters of this code.

1301.3 Materials. Above-ground drain, waste and vent piping for gray water systems shall conform to one of the standards listed in Table 702.1. Gray water underground building drainage and vent pipe shall conform to one of the standards listed in Table 702.2.

1301.4 Tests. Drain, waste and vent piping for gray water systems shall be tested in accordance with Section 312.

1301.5 Inspections. Gray water systems shall be inspected in accordance with Section 107.

1301.6 Potable water connections. Only connections in accordance with Section 1302.3 shall be made between a gray water recycling system and a potable water system.

1301.7 Waste water connections. Gray water recycling systems shall receive only the waste discharge of bathtubs, showers, lavatories, clothes washers or laundry trays.

1301.8 Collection reservoir. Gray water shall be collected in an approved reservoir constructed of durable, nonabsorbent and corrosion-resistant materials. The reservoir shall be a closed and gas-tight vessel. Access openings shall be provided to allow inspection and cleaning of the reservoir interior.

1301.9 Filtration. Gray water entering the reservoir shall pass through an approved filter such as a media, sand or diatomaceous earth filter.

1301.9.1 Required valve. A full-open valve shall be installed downstream of the last fixture connection to the gray water discharge pipe before entering the required filter.

1301.10 Overflow. The collection reservoir shall be equipped with an overflow pipe having the same or larger diameter as the influent pipe for the gray water. The overflow pipe shall be trapped and shall be indirectly connected to the sanitary drainage system.

1301.11 Drain. A drain shall be located at the lowest point of the collection reservoir and shall be indirectly connected to the sanitary drainage system. The drain shall be the same diameter as the overflow pipe required in Section 1301.10.

1301.12 Vent required. The reservoir shall be provided with a vent sized in accordance with Chapter 9 and based on the diameter of the reservoir influent pipe.

SECTION 13 02
SYSTEMS FOR FLUSHING WATER CLOSETS AND URINALS

1302.1 Collection reservoir. The holding capacity of the reservoir shall be a minimum of twice the volume of water required to meet the daily flushing requirements of the fixtures supplied with gray water, but not less than 50 gallons (189 L). The reservoir shall be sized to limit the retention time of gray water to a maximum of 72 hours.

1302.2 Disinfection. Gray water shall be disinfected by an approved method that employs one or more disinfectants such as chlorine, iodine or ozone that are recommended for use with the pipes, fittings and equipment by the manufacturer of the pipes, fittings and equipment.

1302.3 Makeup water. Potable water shall be supplied as a source of makeup water for the gray water system. The potable water supply shall be protected against backflow in accordance with Section 608. There shall be a full-open valve located on the makeup water supply line to the collection reservoir.

1302.4 Coloring. The gray water shall be dyed blue or green with a food grade vegetable dye before such water is supplied to the fixtures.

1302.5 Materials. Distribution piping shall conform to one of the standards listed in Table 605.4.

1302.6 Identification. Distribution piping and reservoirs shall be identified as containing nonpotable water. Piping identification shall be in accordance with Section 608.8.

SECTION 1303
SUBSURFACE LANDSCAPE IRRIGATION SYSTEMS

1303.1 Collection reservoir. Reservoirs shall be sized to limit the retention time of gray water to a maximum of 24 hours.

1303.1.1 Identification. The reservoir shall be identified as containing nonpotable water.

1303.2 Valves required. A check valve and a full-open valve located on the discharge side of the check valve shall be installed on the effluent pipe of the collection reservoir.

1303.3 Makeup water. Makeup water shall not be required for subsurface landscape irrigation systems. Where makeup water is provided, the installation shall be in accordance with Section 1302.3.

1303.4 Disinfection. Disinfection shall not be required for gray water used or subsurface landscape irrigation systems.

1303.5 Coloring. Gray water used for subsurface landscape irrigation systems shall not be required to be dyed.

1303.6 Estimating gray water discharge. The system shall be sized in accordance with the gallons-per-day-per-occupant number based on the type of fixtures connected to the gray water system. The discharge shall be calculated by the following equation:

$C = A \times B$

A = Number of occupants:
Residential–Number of occupants shall be determined by the actual number of occupants, but not less than two occupants for one bedroom and one occupant for each additional bedroom.
Commercial–Number of occupants shall be determined by the *International Building Code®*.

B = Estimated flow demands for each occupant:
Residential–25 gallons per day (94.6 lpd) per occupant for showers, bathtubs and lavatories and 15 gallons per day (56.7 lpd) per occupant for clothes washers or laundry trays.
Commercial–Based on type of fixture or water use records minus the discharge of fixtures other than those discharging gray water.

C = Estimated gray water discharge based on the total number of occupants.

1303.7 Percolation tests. The permeability of the soil in the proposed absorption system shall be determined by percolation tests or permeability evaluation.

1303.7.1 Percolation tests and procedures. At least three percolation tests in each system area shall be conducted. The holes shall be spaced uniformly in relation to the bottom depth of the proposed absorption system. More percolation tests shall be made where necessary, depending on system design.

1303.7.1.1 Percolation test hole. The test hole shall be dug or bored. The test hole shall have vertical sides and a horizontal dimension of 4 inches to 8 inches (102 mm to 203 mm). The bottom and sides of the hole shall be scratched with a sharp-pointed instrument to expose the natural soil. All loose material shall be removed from the hole and the bottom shall be covered with 2 inches (51 mm) of gravel or coarse sand.

1303.7.1.2 Test procedure, sandy soils. The hole shall be filled with clear water to a minimum of 12 inches (305 mm) above the bottom of the hole for tests in sandy soils. The time for this amount of water to seep away shall be determined, and this procedure shall be repeated if the water from the second filling of the hole seeps away in 10 minutes or less. The test shall proceed as follows: Water shall be added to a point not more than 6 inches (152 mm) above the gravel or coarse sand. Thereupon, from a fixed reference point, water levels shall be measured at 10-minute intervals for a period of 1 hour. Where 6 inches (152mm) of water seeps away in less than 10 minutes, a shorter interval between measurements shall be used, but in no case shall the water depth exceed 6 inches (152 mm). Where 6 inches (152 mm) of water seeps away in less than 2 minutes, the test shall be stopped and a rate of less than 3 minutes per inch (7.2 s/mm) shall be reported. The final water level drop shall be used to calculate the percolation rate. Soils not meeting the above requirements shall be tested in accordance with Section 1303.7.1.3.

1303.7.1.3 Test procedure, other soils. The hole shall be filled with clear water, and a minimum water depth of 12 inches (305mm) shall be maintained above the bottom of the hole for a 4-hour period by refilling whenever necessary or by use of an automatic siphon. Water remaining in the hole after 4 hours shall not be removed. Thereafter, the soil shall be allowed to swell not less than 16 hours or more than 30 hours. Immediately after the soil swelling period, the

measurements for determining the percolation rate shall be made as follows: Any soil sloughed into the hole shall be removed and the water level shall be adjusted to 6 inches (152 mm) above the gravel or coarse sand. Thereupon, from a fixed reference point, the water level shall be measured at 30-minute intervals for a period of 4 hours, unless two successive water level drops do not vary by more than $^{1}/_{16}$ inch (1.59 mm). At least three water level drops shall be observed and recorded. The hole shall be filled with clear water to a point not more than 6 inches (152 mm) above the gravel or coarse sand whenever it becomes nearly empty. Adjustments of the water level shall not be made during the three measurement periods except to the limits of the last measured water level drop. When the first 6 inches (152 mm) of water seeps away in less than 30 minutes, the time interval between measurements shall be 10 minutes and the test run for 1 hour. The water depth shall not exceed 5 inches (127 mm) at any time during the measurement period. The drop that occurs during the final measurement period shall be used in calculating the percolation rate.

1303.7.1.4 Mechanical test equipment. Mechanical percolation test equipment shall be of an approved type.

1303.7.2 Permeability evaluation. Soil shall be evaluated for estimated percolation based on structure and texture in accordance with accepted soil evaluation practices. Borings shall be made in accordance with Section 1303.7.1 for evaluating the soil.

1303.8 Subsurface landscape irrigation site location. The surface grade of all soil absorption systems shall be located at a point lower than the surface grade of any water well or reservoir on the same or adjoining property. Where this is not possible, the site shall be located so surface water drainage from the site is not directed toward a well or reservoir. The soil absorption system shall be located with a minimum horizontal distance between various elements as indicated in Table 1303.8. Private sewage disposal systems in compacted areas, such as parking lots and driveways, are prohibited. Surface water shall be diverted away from any soil absorption site on the same or neighboring lots.

TABLE 1303.8
LOCATION OF GRAY WATER SYSTEM

ELEMENT	MINIMUM HORIZONTAL DISTANCE	
	HOLDING TANK (feet)	IRRIGATION DISPOSAL FIELD (feet)
Buildings	5	2
Property line adjoining private property	5	5
Water wells	50	100
Streams and lakes	50	50
Seepage pits	5	5
Septic tanks	0	5
Water service	5	5
Public water main	10	10

For SI: 1 foot = 304.8 mm.

1303.9 Installation. Absorption systems shall be installed in accordance with Sections 1303.9.1 through 1303.9.5 to provide landscape irrigation without surfacing of gray water.

1303.9.1 Absorption area. The total absorption area required shall be computed from the estimated daily gray water discharge and the design-loading rate based on the percolation rate for the site. The required absorption area equals the estimated gray water discharge divided by the design-loading rate from Table 1303.9.1.

TABLE 1303.9.1
DESIGN LOADING RATE

PERCOLATION RATE (minutes per inch)	DESIGN LOADING FACTOR (gallons per square foot per day)
0 to less than 10	1.2
10 to less than 30	0.8
30 to less than 45	0.72
45 to 60	0.4

For SI: 1 minute per inch = min/25.4 mm,
1 gallon per square foot = 40.7 L/m^2.

1303.9.2 Seepage trench excavations. Seepage trench excavations shall be a minimum of 1 foot (304 mm) to a maximum of 5 feet (1524 mm) wide. Trench excavations shall be spaced a minimum of 2 feet (610 mm) apart. The soil absorption area of a seepage trench shall be computed by using the bottom of the trench area (width) multiplied by the length of pipe. Individual seepage trenches shall be a maximum of 100 feet (30 480 mm) in developed length.

1303.9.3 Seepage bed excavations. Seepage bed excavations shall be a minimum of 5 feet (1524 mm) wide and have more than one distribution pipe. The absorption area of a seepage bed shall be computed by using the bottom of the trench area. Distribution piping in a seepage bed shall be uniformly spaced a maximum of 5 feet (1524mm) and a minimum of 3 feet (914 mm) apart, and a maximum of 3 feet (914mm) and a minimum of 1 foot (305 mm) from the sidewall or headwall.

1303.9.4 Excavation and construction. The bottom of a trench or bed excavation shall be level. Seepage trenches or beds shall not be excavated where the soil is so wet that such material rolled between the hands forms a soil wire. All smeared or compacted soil surfaces in the sidewalls or bottom of seepage trench or bed excavations shall be scarified to the depth of smearing or compaction and the loose material removed. Where rain falls on an open excavation, the soil shall be left until sufficiently dry so a soil wire will not form when soil from the excavation bottom is rolled between the hands. The bottom area shall then be scarified and loose material removed.

1303.9.5 Aggregate and backfill. A minimum of 6 inches of aggregate ranging in size from $^1/_2$ to $2^1/_2$ inches (12.7 mm to 64 mm) shall be laid into the trench below the distribution piping elevation. The aggregate shall be evenly distributed a minimum of 2 inches (51 mm) over the top of the distribution pipe. The aggregate shall be covered with approved synthetic materials or 9 inches (229mm) of uncompacted marsh hay or straw. Building paper shall not be used to cover the aggregate. A minimum of 9 inches (229 mm) of soil backfill shall be provided above the covering.

1303.10 Distribution piping. Distribution piping shall be not less than 3 inches (76mm) in diameter. Materials shall comply with Table 1303.10. The top of the distribution pipe shall be not less than 8 inches (203mm) below the original surface. The slope of the distribution pipes shall be a minimum of 2 inches (51 mm) andamaximumof4inches (102 mm) per 100 feet (30 480 mm).

TABLE 1303.10
DISTRIBUTION PIPE

MATERIAL	STANDARD
Polyethylene (PE) plastic pipe	ASTM F 405
Polyvinyl chloride (PVC) plastic pipe	ASTM D 2729
Polyvinyl chloride (PVC) plastic pipe with a 3.5 inch O.D. and solid celluar core or composite wall.	ASTM F 1488

1303.11 Joints. Joints in distribution pipe shall be made in accordance with Section 705 of this code.

(Renumber subsequent chapters and sections)

PART II - IRC

1. Add definition as follows:

GRAY WATER. Waste discharged from lavatories, bathtubs, showers, clothes washers and laundry trays.

2. Revise as follows:

P2601.2 Connections to drainage system. Plumbing fixtures, drains, appurtenances and appliances used to receive or discharge liquid wastes or sewage shall be directly connected to the sanitary drainage system of the building or premises, in accordance with the requirements of this code. This section shall not be construed to prevent indirect waste systems.

> **Exception:** Bathtubs, showers, lavatories, clothes washers and laundry trays shall not be required to discharge to the sanitary drainage system where such fixtures discharge to an approved gray water system for flushing of water closets and urinals or for subsurface landscape irrigation.

3. Delete Appendix O in its entirety without substitution

(Renumber subsequent appendices)

4. Add new section and text as follows:

SECTION P3009
GRAY WATER RECYCLING SYSTEMS

P3009.1 Scope. The provisions of Section P3009 shall govern the materials, design, construction and installation of gray water systems for flushing of water closets and urinals and for subsurface landscape irrigation. See Figures P3009.1(1) and P3009.1(2).

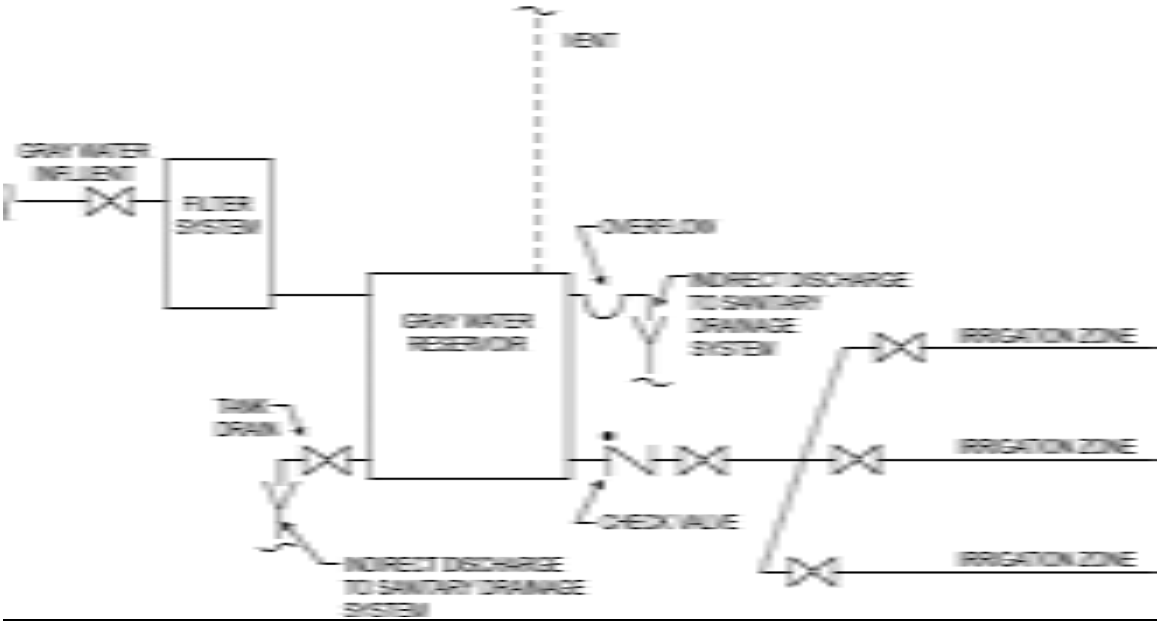

FIGURE P3009.1(1)
GRAY WATER RECYCLING SYSTEM FOR SUBSURFACE LANDSCAPE IRRIGATION

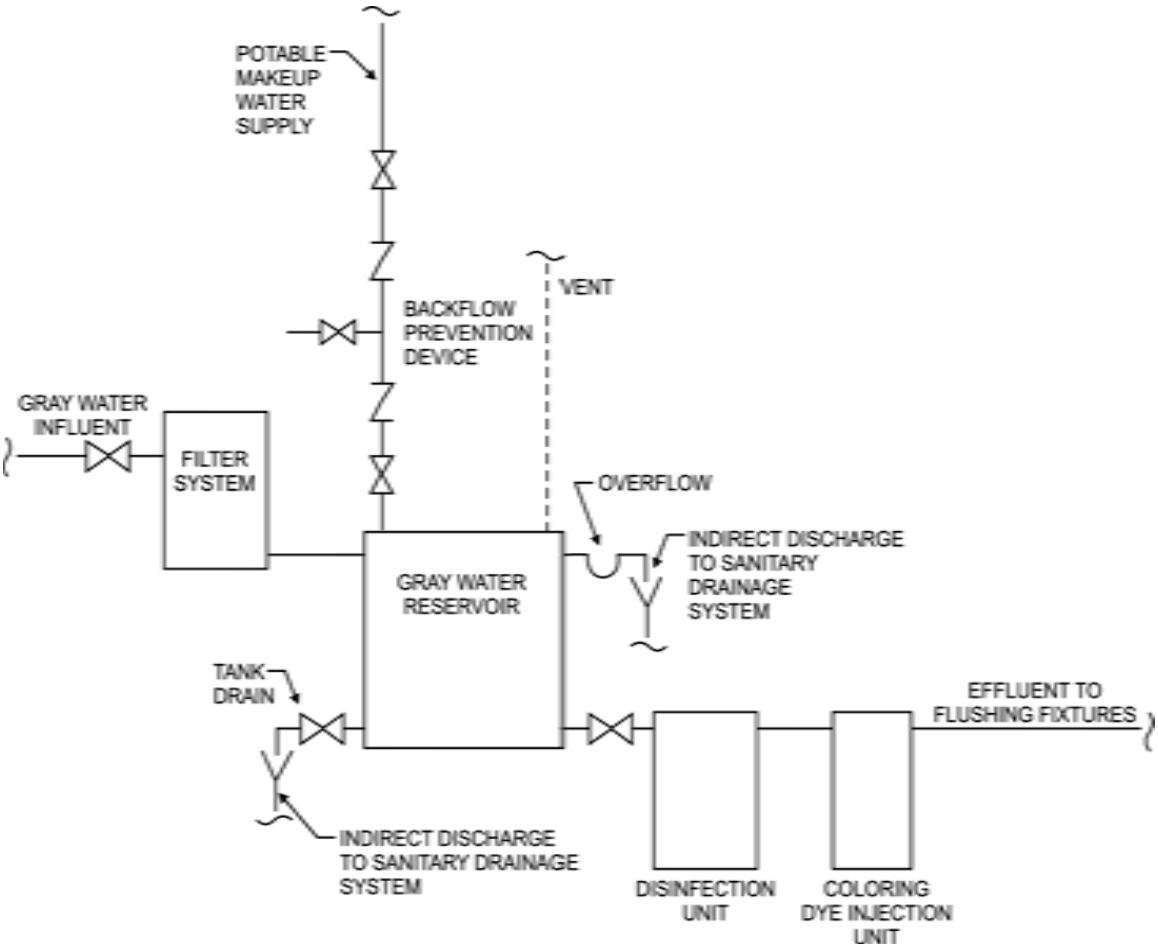

FIGURE P3009.1(2)
GRAY WATER RECYCLING SYSTEM FOR FLUSHING WATER CLOSETS AND URINALS

P3009.2 Installation. In addition to the provisions of Section P3009, systems for flushing of water closets and urinals shall comply with Section P3009.13 and systems for subsurface landscape irrigation shall comply with Section P3009.14. Except as provided for in Section P3009, all systems shall comply with the provisions of the other sections of this code.

P3009.3 Materials. Above-ground drain, waste and vent piping for gray water systems shall conform to one of the standards listed in Table P3002.1(1). Gray water underground building drainage and vent pipe shall conform to one of the standards listed in Table P3002.1(2).

P3009.4 Tests. Drain, waste and vent piping for gray water systems shall be tested in accordance with Section P2503.

P3009.5 Inspections. Gray water systems shall be inspected in accordance with Section P2503.

P3009.6 Potable water connections. Only connections in accordance with Section 3009.13.1 shall be made between a gray water recycling system and a potable water system.

P3009.7 Waste water connections. Gray water recycling systems shall receive only the waste discharge of bathtubs, showers, lavatories, clothes washers or laundry trays.

P3009.8 Collection reservoir. Gray water shall be collected in an approved reservoir constructed of durable, nonabsorbent and corrosion-resistant materials. The reservoir shall be a closed and gas-tight vessel. Access openings shall be provided to allow inspection and cleaning of the reservoir interior.

P3009.9 Filtration. Gray water entering the reservoir shall pass through an approved filter such as a media, sand or diatomaceous earth filter.

P3009.9.1 Required valve. A full-open valve shall be installed downstream of the last fixture connection to the gray water discharge pipe before entering the required filter.

P3009.10 Overflow. The collection reservoir shall be equipped with an overflow pipe having the same or larger diameter as the influent pipe for the gray water. The overflow pipe shall be trapped and shall be indirectly connected to the sanitary drainage system.

P3009.11 Drain. A drain shall be located at the lowest point of the collection reservoir and shall be indirectly connected to the sanitary drainage system. The drain shall be the same diameter as the overflow pipe required in Section P3009.10.

P3009.12 Vent required. The reservoir shall be provided with a vent sized in accordance with Chapter 31 and based on the diameter of the reservoir influent pipe.

P3009.13 Flushing water systems. Systems for flushing water closets and urinals shall comply with Sections P3009.13.1 through P3009.13.6

P3009.13.1 Collection reservoir. The holding capacity of the reservoir shall be a minimum of twice the volume of water required to meet the daily flushing requirements of the fixtures supplied with gray water, but not less than 50 gallons (189 L). The reservoir shall be sized to limit the retention time of gray water to a maximum of 72 hours.

P3009.13.2 Disinfection. Gray water shall be disinfected by an approved method that employs one or more disinfectants such as chlorine, iodine or ozone that are recommended for use with the pipes, fittings and equipment by the manufacturer of the pipes, fittings and equipment.

P3009.13.3 Makeup water. Potable water shall be supplied as a source of makeup water for the gray water system. The potable water supply shall be protected against backflow in accordance with Section P2902. There shall be a full-open valve located on the makeup water supply line to the collection reservoir.

P3009.13.4 Coloring. The gray water shall be dyed blue or green with a food grade vegetable dye before such water is supplied to the fixtures.

P3009.13.5 Materials. Distribution piping shall conform to one of the standards listed in Table P2905.4.

P3009.13.6 Identification. Distribution piping and reservoirs shall be identified as containing nonpotable water. Piping identification shall be in accordance with Section P2901.1.

P3009.14 Landscape irrigation systems. Subsurface landscape irrigation systems shall comply with Sections P3009.14.1 through P3009.14.11

P3009.14.1 Collection reservoir. Reservoirs shall be sized to limit the retention time of gray water to a maximum of 24 hours.

P3009.14.1.1 Identification. The reservoir shall be identified as containing nonpotable water.

P3009.14.2 Valves required. A check valve and a full-open valve located on the discharge side of the check valve shall be installed on the effluent pipe of the collection reservoir.

P3009.14.3 Makeup water. Makeup water shall not be required for subsurface landscape irrigation systems. Where makeup water is provided, the installation shall be in accordance with Section 3009.13.3.

P3009.14.4 Disinfection. Disinfection shall not be required for gray water used or subsurface landscape irrigation systems.

P3009.14.5 Coloring. Gray water used for subsurface landscape irrigation systems shall not be required to be dyed.

P3009.14.6 Estimating gray water discharge. The system shall be sized in accordance with the gallons-per-day-per-occupant number based on the type of fixtures connected to the gray water system. The discharge shall be calculated by the following equation:

$C = A \times B$

A = Number of occupants:

Number of occupants shall be determined by the actual number of occupants, but not less than two occupants for one bedroom and one occupant for each additional bedroom.

B = Estimated flow demands for each occupant:
Residential–25 gallons per day (94.6 lpd) per occupant for showers, bathtubs and lavatories and 15 gallons per day (56.7 lpd) per occupant for clothes washers or laundry trays.

C = Estimated gray water discharge based on the total number of occupants.

P3009.14.7 Percolation tests. The permeability of the soil in the proposed absorption system shall be determined by percolation tests or permeability evaluation.

P3009.14.7.1 Percolation tests and procedures. At least three percolation tests in each system area shall be conducted. The holes shall be spaced uniformly in relation to the bottom depth of the proposed absorption system. More percolation tests shall be made where necessary, depending on system design.

P3009.14.7.1.1 Percolation test hole. The test hole shall be dug or bored. The test hole shall have vertical sides and a horizontal dimension of 4 inches to 8 inches (102 mm to 203 mm). The bottom and sides of the hole shall be scratched with a sharp-pointed instrument to expose the natural soil. All loose material shall be removed from the hole and the bottom shall be covered with 2 inches (51 mm) of gravel or coarse sand.

P3009.14.7.1.2 Test procedure, sandy soils. The hole shall be filled with clear water to a minimum of 12 inches (305 mm) above the bottom of the hole for tests in sandy soils. The time for this amount of water to seep away shall be determined, and this procedure shall be repeated if the water from the second filling of the hole seeps away in 10 minutes or less. The test shall proceed as follows: Water shall be added to a point not more than 6 inches (152 mm) above the gravel or coarse sand. Thereupon, from a fixed reference point, water levels shall be measured at 10-minute intervals for a period of 1 hour. Where 6 inches (152mm) of water seeps away in less than 10 minutes, a shorter interval between measurements shall be used, but in no case shall the water depth exceed 6 inches (152 mm). Where 6 inches (152 mm) of water seeps away in less than 2 minutes, the test shall be stopped and a rate of less than 3 minutes per inch (7.2 s/mm) shall be reported. The final water level drop shall be used to calculate the percolation rate. Soils not meeting the above requirements shall be tested in accordance with Section 3009.14.7.1.3.

P3009.14.7.1.3 Test procedure, other soils. The hole shall be filled with clear water, and a minimum water depth of 12 inches (305mm) shall be maintained above the bottom of the hole for a 4-hour period by refilling whenever necessary or by use of an automatic siphon. Water remaining in the hole after 4 hours shall not be removed. Thereafter, the soil shall be allowed to swell not less than 16 hours or more than 30 hours. Immediately after the soil swelling period, the measurements for determining the percolation rate shall be made as follows: Any soil sloughed into the hole shall be removed and the water level shall be adjusted to 6 inches (152 mm) above the gravel or coarse sand. Thereupon, from a fixed reference point, the water level shall be measured at 30-minute intervals for a period of 4 hours, unless two successive water level drops do not vary by more than $^{1}/_{16}$ inch (1.59 mm). At least three water level drops shall be observed and recorded. The hole shall be filled with clear water to a point not more than 6 inches (152 mm) above the gravel or coarse sand whenever it becomes nearly empty. Adjustments of the water level shall not be made during the three measurement periods except to the limits of the last measured water level drop. When the first 6 inches (152 mm) of water seeps away in less than 30 minutes, the time interval between measurements shall be 10 minutes and the test run for 1 hour. The water depth shall not exceed 5 inches (127 mm) at any time during the measurement period. The drop that occurs during the final measurement period shall be used in calculating the percolation rate.

P3009.14.7.1.4 Mechanical test equipment. Mechanical percolation test equipment shall be of an approved type.

P3009.14.7.2 Permeability evaluation. Soil shall be evaluated for estimated percolation based on structure and texture in accordance with accepted soil evaluation practices. Borings shall be made in accordance with Section P3009.14.7.1 for evaluating the soil.

P3009.14.8 Subsurface landscape irrigation site location. The surface grade of all soil absorption systems shall be located at a point lower than the surface grade of any water well or reservoir on the same or adjoining property. Where this is not possible, the site shall be located so surface water drainage from the site is not directed toward a well or reservoir. The soil absorption system shall be located with a minimum horizontal distance between various elements as indicated in Table P3009.14.8. Private sewage disposal systems in compacted areas, such as parking lots and driveways, are prohibited. Surface water shall be diverted away from any soil absorption site on the same or neighboring lots.

TABLE P3009.14.8
LOCATION OF GRAY WATER SYSTEM

ELEMENT	MINIMUM HORIZONTAL DISTANCE	
	HOLDING TANK (feet)	IRRIGATION DISPOSAL FIELD (feet)
Buildings	5	2
Property line adjoining private property	5	5
Water wells	50	100
Streams and lakes	50	50
Seepage pits	5	5
Septic tanks	0	5
Water service	5	5
Public water main	10	10

For SI: 1 foot = 304.8 mm.

P3009.14.9 Installation. Absorption systems shall be installed in accordance with Sections P3009.14.9.1 through P3009.14.9.5 to provide landscape irrigation without surfacing of gray water.

P3009.14.9.1 Absorption area. The total absorption area required shall be computed from the estimated daily gray water discharge and the design-loading rate based on the percolation rate for the site. The required absorption area equals the estimated gray water discharge divided by the design-loading rate from Table P3009.14.9.1.

TABLE P3009.14.9.1
DESIGN LOADING RATE

PERCOLATION RATE (minutes per inch)	DESIGN LOADING FACTOR (gallons per square foot per day)
0 to less than 10	1.2
10 to less than 30	0.8
30 to less than 45	0.72
45 to 60	0.4

For SI: 1 minute per inch = min/25.4 mm,
1 gallon per square foot = 40.7 L/m^2.

P3009.14.9.2 Seepage trench excavations. Seepage trench excavations shall be a minimum of 1 foot (304 mm) to a maximum of 5 feet (1524 mm) wide. Trench excavations shall be spaced a minimum of 2 feet (610 mm) apart. The soil absorption area of a seepage trench shall be computed by using the bottom of the trench area (width) multiplied by the length of pipe. Individual seepage trenches shall be a maximum of 100 feet (30 480 mm) in developed length.

P3009.14.9.3 Seepage bed excavations. Seepage bed excavations shall be a minimum of 5 feet (1524 mm) wide and have more than one distribution pipe. The absorption area of a seepage bed shall be computed by using the bottom of the trench area. Distribution piping in a seepage bed shall be uniformly spaced a maximum of 5 feet (1524mm) and a minimum of 3 feet (914 mm) apart, and a maximum of 3 feet (914mm) and a minimum of 1 foot (305 mm) from the sidewall or headwall.

P3009.14.9.4 Excavation and construction. The bottom of a trench or bed excavation shall be level. Seepage trenches or beds shall not be excavated where the soil is so wet that such material rolled between the hands forms a soil wire. All smeared or compacted soil surfaces in the sidewalls or bottom of seepage trench or bed excavations shall be scarified to the depth of smearing or compaction and the loose material removed. Where rain falls on an open excavation, the

soil shall be left until sufficiently dry so a soil wire will not form when soil from the excavation bottom is rolled between the hands. The bottom area shall then be scarified and loose material removed.

P3009.14.9.5 Aggregate and backfill. A minimum of 6 inches of aggregate ranging in size from $^1/_2$ to $2^1/_2$ inches (12.7 mm to 64 mm) shall be laid into the trench below the distribution piping elevation. The aggregate shall be evenly distributed a minimum of 2 inches (51 mm) over the top of the distribution pipe. The aggregate shall be covered with approved synthetic materials or 9 inches (229mm) of uncompacted marsh hay or straw. Building paper shall not be used to cover the aggregate. A minimum of 9 inches (229 mm) of soil backfill shall be provided above the covering.

P3009.14.10 Distribution piping. Distribution piping shall be not less than 3 inches (76mm) in diameter. Materials shall comply with Table P3009.14.10. The top of the distribution pipe shall be not less than 8 inches (203mm) below the original surface. The slope of the distribution pipes shall be a minimum of 2 inches (51 mm) andamaximumof4inches (102 mm) per 100 feet (30 480 mm).

TABLE P3009.14.10
DISTRIBUTION PIPE

MATERIAL	STANDARD
Polyethylene (PE) plastic pipe	ASTM F 405
Polyvinyl chloride (PVC) plastic pipe	ASTM D 2729
Polyvinyl chloride (PVC) plastic pipe with a 3.5 inch O.D. and solid celluar core or composite wall.	ASTM F 1488

P3009.14.11 Joints. Joints in distribution pipe shall be made in accordance with Section P3003.

(Renumber subsequent chapters and sections)

Reason: The purpose of this proposal is to bring the gray water recycling systems information in the appendix of the code out of obscurity so the technology can be implemented. The use of gray water as an alternative water source is becoming highly desirable and popular due to the water huge water savings and the shortage of potable water supplies in some areas of the country. This new chapter will promote the reuse of gray water for subsurface irrigation use and the flushing of water closets and urinals. Utilizing the provisions contained within this new chapter will advance the LEED point system for the owners benefit. The unfortunate reality is where provisions are located within an Appendix they are typically subject to adoption at the local level. Moving the current provisions to be included in the body of the code will eliminate the undesirable situation where a locality my not promote this “Green” concept based on the fact that is not code, only an Appendix.

Cost Impact: The code change proposal will not increase the cost of construction.

P153–09/10
Table E103.3(3); IRC Table P2903.6(1)

Proponent: Logan G. Sauter – Salt Lake City, Utah representing the Utah Chapter of ICC

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IPC COMMITTEE. PART II WILL BE HEARD BY THE IRC PLUMBING COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IPC

Revise as follows:

TABLE E103.3(3)
TABLE FOR ESTIMATING DEMAND

SUPPLY SYSTEMS PREDOMINANTLY FOR FLUSH TANKS			SUPPLY SYSTEM<u>S</u> PREDOMINANTLY FOR FLUSH<u>OMETER</u> VALVES		
Load	**Demand**		**Load**	**Demand**	

(Portions of table not shown remain unchanged)

PART II - IRC

Revise as follows:

TABLE P2903.6(1)
CONVERSIONS FROM WATER SUPPLY FIXTURE UNIT TO GALLON PER MINUTE FLOW RATES

SUPPLY SYSTEMS PREDOMINANTLY FOR FLUSH TANKS			SUPPLY SYSTEM<u>S</u> PREDOMINANTLY FOR FLUSH<u>OMETER</u> VALVES		
Load	**Demand**		**Load**	**Demand**	

(Portions of table not shown remain unchanged)

Reason: "SYSTEM" should be plural to match the title of the left side of the table. A flush valve and a flushometer valve are not the same plumbing device. A flush valve (Douglas valve) is located in the bottom of a flush tank and, when actuated by the tank trip lever, controls the flushing action of that tank. A flushometer valve, on the other hand, is a valve that, when activated, dispenses a predetermined amount of water to flush a water closet, urinal, bedpan washer, and other fixtures designed for flushometer controlled flushing. Please note IRC R202 definition for a flush valve, "A device located at the bottom of a flush tank that is operated to flush water closets". Note also IPC 202 definition for a flush tank, "A tank designed with a fill valve and <u>flush valve</u> to flush the contents of the bowl or usable portion of the fixture".

Cost Impact: The code change proposal will not increase the cost of construction.

PART I – IPC

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

PART II – IRC

Public Hearing:	Committee:	AS	AM	D

P154–09/10
608.16.3; IRC P2902.5.2

Proponent: Gary Kreutziger, City of San Antonio, Tx. representing the Planning and Development Services Department

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IPC COMMITTEE. PART II WILL BE HEARD BY THE IRC PLUMBING COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IPC

Revise as follows:

608.16.3 Heat exchangers. Heat exchangers ~~using an essentially toxic transfer fluid~~ in a potable water system shall be separated from the potable water by double-wall construction. An *air gap* open to the atmosphere shall be provided between the two walls. Heat exchangers ~~utilizing an essentiallly nontoxic transfer fluid~~ in a nonpotable water system shall be permitted to be of single-wall construction.

PART II – IRC

Revise as follows:

P2902.5.2 Heat exchangers. Heat exchangers ~~using an essentially toxic transfer fluid~~ in a potable water system shall be separated from the potable water by double-wall construction. An *air gap* open to the atmosphere shall be provided between the two walls. Heat exchangers ~~utilizing an essentiallly nontoxic transfer fluid~~ in a nonpotable water system shall be permitted to be of single-wall construction.

Reason: The purpose of the proposed code change is to provide clarification of Section 608.16.3 (IRC P2902.5.2) with out changing the intent. By eliminating the ambiguous language in this section such as "essentially non toxic" clarity and intent are achieved. The extra protection provided by a heat exchanger of double wall construction should be provided for all potable water systems regardless of the level of toxicity of the heat-transfer medium. The level of protection provided by a double wall heat exchanger is a cost effective method of ensuring that the publics water quality expectations are met, by reducing the possibility of introducing even "essentially nontoxic transfer fluid" into the potable water.

Cost Impact: The code change proposal will not increase the cost of construction.

PART I – IPC

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

PART II – IRC

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Kreutziger-P2-608.16.3

P155–09/10
310.2 (New), 310.4, 310.5, 405.3.2 (New), 405.3.3 (New), 405.3.4 (New)

Proponent: John T.E. Walters, Prince William County. VA., representing the Virginia Plumbing and Mechanical Inspectors Association (VPMIA)

1. Revise as follows:

~~**310.2**~~ **405.3.2 Location of fixtures and piping.** Piping, fixtures or equipment shall not be located in such a manner as to interfere with the normal operation of windows, doors or other means of egress openings.

~~**310.4**~~ **405.3.3 Water closet compartment.** Each water closet utilized by the *public* or employees shall occupy a separate compartment with walls or partitions and a door enclosing the fixtures to ensure privacy.

Exceptions:

1. Water closet compartments shall not be required in a single-occupant toilet room with a lockable door.
2. Toilet rooms located in day care and child-care facilities and containing two or more water closets shall be permitted to have one water closet without an enclosing compartment.
3. This provision is not applicable to toilet areas located within Group I-3 housing areas.

~~**310.5**~~ **405.3.4 Urinal partitions.** Each urinal utilized by the *public* or employees shall occupy a separate area with walls or partitions to provide privacy. The walls or partitions shall begin at a height not more than 12 inches (305 mm) from and extend not less than 60 inches (1524 mm) above the finished floor surface. The walls or partitions shall extend from the wall surface at each side of the urinal a minimum of 18 inches (457 mm) or to a point not less than 6

inches (152 mm) beyond the outermost front lip of the urinal measured from the finished backwall surface, whichever is greater.

Exceptions:

1. Urinal partitions shall not be required in a single occupant or family/assisted-use toilet room with a lockable door.
2. Toilet rooms located in day-care and child-care facilities and containing two or more urinals shall be permitted to have one urinal without partitions.

(Renumber subsequent sections)

2. Add new text as follows:

310.2 Location of fixtures and compartments. Plumbing fixture location and the requirements for compartments and partitions shall be in accordance with Section 405.3.

(Renumber subsequent sections)

Reason: By moving these sections, it will make it easier for the reader to find the necessary information and be closer to where it is really needed. Because the current Section 405 does not contain requirements for separate compartments or privacy (urinal partitions), the reader can easily forget or be unaware that partitions/compartments are required. This affects the layout of the fixtures covered in section 405.3.1. The knowledge concerning compartments/partitions is critical to the proper fixture location and needs to be in the same related section as the fixture clearance dimension. The new section 310.2 serves as a pointer for the reader to not miss the requirements of Section 405.3.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: WALTERS-P5-310.2

P156–09/10
312.3; IRC P2503.5.1

Proponent: Judson Collins, JULYCO, representing himself.

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IPC COMMITTEE. PART II WILL BE HEARD BY THE IRC PLUMBING COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I - IPC

Revise as follows:

312.3 Drainage and vent air test. Plastic piping shall not be tested using air. An air test shall be made by forcing air into the system until there is a uniform gauge pressure of 5 psi (34.5 kPa) or sufficient to balance a 10-inch (254 mm) column of mercury. This pressure shall be held for a test period of at least 15 minutes. Any adjustments to the test pressure required because of changes in ambient temperatures or the seating of gaskets shall be made prior to the beginning of the test period.

PART II – IRC

P2503.5.1 Rough plumbing. DWV systems shall be tested on completion of the rough piping installation by water or air with no evidence of leakage. Either test shall be applied to the drainage system in its entirety or in sections after rough piping has been installed, as follows:

1. Water test. Each section shall be filled with water to a point not less than 10 feet (3048 mm) above the highest fitting connection in that section, or to the highest point in the completed system. Water shall be held in the section under test for a period of 15 minutes. The system shall prove leak free by visual inspection.
2. Air test. Plastic piping shall not be tested using air. The portion under test shall be maintained at a gauge pressure of 5 pounds per square inch (psi) (34kPa) or 10 inches of mercury column (34 kPa). This pressure shall be held without introduction of additional air for a period of 15 minutes.

Reason:
PART I- Section 312.1 does not allow air to be used for testing any plastic piping plumbing system. Section 312.5 repeats the prohibition for water system testing. Section 312.3 does not. This proposal will identify the prohibition in Section 312.3.
PART II- The IRC should reflect the same concern for safety during testing as does the IPC.

Cost Impact: None

PART I – IPC

	Assembly:	ASF	AMF	DF

COLLINS-P7-312.3

P157–09/10
604.8, Chapter 13; IRC P2903.3.1, Chapter 44

Proponent: Abraham I. Murra, Canadian Standards Association, representing the Canadian Standards Association

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IPC COMMITTEE. PART II WILL BE HEARD BY THE IRC PLUMBING COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I - IPC

1. Revise as follows:

604.8 Water pressure reducing valve or regulator. Where water pressure within a building exceeds 80 psi (552 kPa) static, an *approved* water-pressure reducing valve conforming to ASSE 1003 or CSA B356 with strainer shall be installed to reduce the pressure in the building water distribution piping to 80 psi (552 kPa) static or less.

2. Add standard to Chapter 13 as follows:

CSA
B356-00(2005) Water Pressure Reducing Valves for Domestic Water Supply Systems

PART II - IRC

1. Revise as follows:

P2903.3.1 Maximum pressure. Maximum static pressure shall be 80 psi (551 kPa). When main pressure exceeds 80 psi (551 kPa), an approved pressure-reducing valve conforming to ASSE 1003 or CSA B356 shall be installed on the domestic water branch main or riser at the connection to the water-service pipe.

2. Add standard to Chapter 44 as follows:

CSA
B356-00(2005) Water Pressure Reducing Valves for Domestic Water Supply Systems

Reason: The acceptance of the proposed change will enable manufacturers with products certified to CSA B356 to have their products used as options to products that meet the requirements of ASSE 1003. This change will also allow the authorities having jurisdiction to allow the use of products that meet either CSA B356 or ASSE 1003.

Cost Impact: The code change proposal will not increase the cost of production.

Analysis: Review of proposed new standard, CSA B356-00(2005), for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IPC COMMITTEE. PART II WILL BE HEARD BY THE IRC PLUMBING COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IPC

Revise as follows:

504.8 Leak detector required. Upon water heater installation, an alarm device shall be installed in the drain pan. The alarm shall sense when the water level in the drain pan exceeds ½ inch in depth and shall produce an audible alert.

PART II – IRC

Revise as follows:

P2801.5.3 Leak detector required. Upon water heater installation, an alarm device shall be installed in the drain pan. The alarm shall sense when the water level in the drain pan exceeds ½ inch in depth and shall produce an audible alert.

Reason: Water Heaters are generally considered a maintenance-free appliance, but they are also one of the single most damaging appliances in the home. Because water heaters are continually under pressure, even small pressurized leaks can quickly flood and devastate a home. Whether at home or at work, these flooding events can go undetected for hours or even days.

It is a common occurrence that water heaters leak, especially near the end of their standard or expected life cycle. Leaking water heaters are usually found months or years after their initial installation with their associated damages. One common cause of leaking is when the first two to three courses of galvanized threads begin to deteriorate since water is in contact with the copper and galvanized piping. This corrosion at the connections into the water heater, eventually lead to leaks.

A slow leak can cause a water heater to rust and the surrounding floors and walls to decay. The price tag from such damage can be significant: water heater failures cost an average of more than $4,444 per incident. (http://www.disastersafety.org/text.asp?id=water_heaters)

Besides the frequently extensive damages to the surrounding building materials caused from the leaking water, there is also a very substantial loss of water occurring nationally and internationally from leaking hot water tanks. In just one county in Florida, i.e., Manatee County, it is estimated that there are currently 1,282 leaking water heaters, with a conservative water loss, (at one drop per second), of 2,700 gallons per year, per leaking water heater, or a total of 3,461,400 gallons of wasted water per year. At the ¼ GPM of loss rate, which given the pressurized water condition is frequently the case, the same number of leaking water heaters: (1,282) cause 572,351 gallons of lost water in one day; which extends to 208,908,229 gallons in a year.

On a national level, it is estimated that there are 957,788 leaking hot water heaters. At the ¼ GPM rate of leakage, that equals 156,058,166,261 gallons wasted in a year. One hundred and fifty six BILLION GALLONS of WASTED WATER.

The associated energy which was required to provide that wasted potable water is likewise, extensive.

Cost Impact: A simple to install audible alarm costs under $30.

PART I – IPC

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

PART II – IRC

P159–09/10
904.5; IRC P3103.5

Proponent: Guy McMann, Jefferson County Colorado, representing the Colorado Association of Plumbing and Mechanical Officials (CAPMO)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IPC COMMITTEE. PART II WILL BE HEARD BY THE IRC PLUMBING COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I - IPC

Revise as follows:

904.5 Location of vent terminal. An open vent terminal from a drainage system shall not be located directly beneath any door, openable window, or other air intake opening of the building or of an adjacent building, and any such vent terminal shall not be within 10 feet (3048 mm) horizontally of such an opening unless it is at least ~~2 feet (610 mm)~~ 3 feet (914 mm) above the top of such opening.

PART II - IRC

Revise as follows:

P3103.5 Location of vent terminal. An open vent terminal from a drainage system shall not be located less than 4 feet (1219 mm) directly beneath any door, openable window, or other air intake opening of the building or of an adjacent building, nor shall any such vent terminal be within 10 feet (3048 mm) horizontally of such an opening unless it is at least ~~2 feet (610 mm)~~ 3 feet (914 mm) above the top of such opening

Reason: This dimension is inconsistent with many of the other code books such as IMC-401.4 #3; IRC-G2427.6.6 and G2427.8 #1; IFGC-503.6.7; IFGC-618.5 and IFGC-503.8 #1. This 3-foot dimension has been around for years and was also found in the legacy codes. It's very important that the entire family of codes is consistent. It's important that sources of contamination don't make their way into building openings and 3 feet will best accomplish this.

Cost Impact: The code change proposal will not increase the cost of construction.

PART I – IPC

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

PART II – IRC

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

608.16.3; IRC P2902.5.2

Proponent: Gary Kreutziger, City of San Antonio, Tx. representing the Planning and Development Services Department

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IPC COMMITTEE. PART II WILL BE HEARD BY THE IRC PLUMBING COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IPC

Revise as follows:

715.1 Sewage backflow. Where ~~the flood level rims of~~ plumbing fixtures are installed on a floor with a finished floor elevation below the elevation of the manhole cover of the next upstream manhole in the *public sewer,* such fixtures shall be protected by a backwater valve installed in the *building drain*, or horizontal *branch* serving such fixtures. Plumbing fixtures ~~having flood level rims~~ installed on a floor with a finished floor elevation above the elevation of the manhole cover of the next upstream manhole in the *public sewer* shall not discharge through a backwater valve.

PART II – IRC

Revise as follows:

P3008.1 Sewage backflow. Where ~~the flood level rims of~~ plumbing fixtures are installed on a floor with a finished floor elevation below the elevation of the manhole cover of the next upstream manhole in the *public sewer,* such fixtures shall be protected by a backwater valve installed in the *building drain*, or horizontal *branch* serving such fixtures. Plumbing fixtures ~~having flood level rims~~ installed on a floor with a finished floor elevation above the elevation of the manhole cover of the next upstream manhole in the *public sewer* shall not discharge through a backwater valve.

Reason: The purpose of the proposed code change is to provide one consistent elevation for all fixtures on a floor that has an elevation less than the manhole cover of the next upstream manhole. This change will provide a substantial increase in the level of protection for some fixtures such as lavatories while having only a small increase in the level of protection a shower pan, floor drain, mop sink, but yet an overall increase in protection for the structure. The use of the finished floor elevation will eliminate the reliance on the seal between a floor flange and wax ring of a water closet to maintain a seal in a pressure situation in the direction of flow for which it is not intended. In an installation where a wax seal with the rubber boot is installed a backwater situation will force sewage between the boot and drain pipe and out through the floor flange. The cost will save on labor for installation due to only having to determine one elevation versus many.

Cost Impact: The code change proposal will not increase the cost of construction.

PART I – IPC

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

PART II – IRC

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Kreutziger-P3-715.1

P161–09/10
304.4

Proponent: Shawn Strausbaugh – Arlington County, VA representing Virginia Plumbing and Mechanical Inspectors Association

Revise as follows:

304.4 Openings for pipes. In or on structures where openings have been made in walls, floors or ceilings for the passage of pipes, ~~such openings~~ the annular space between the pipe and the sides of the opening shall be ~~closed and protected by the installation of approved metal collars that are securely fastened to the adjoining structure~~. sealed with caulking materials or closed with gasketing systems compatible with the piping materials and locations.

Reason: The new wording is the same as the requirements of the International Energy Conservation Code section 502.4.3 and coordinates this section with similar language. What is an approved metal collar and how do you securely fasten this to the adjoining structure. Is the intent of the code as written to require an escutcheon type metal collar at every piping penetration? How do you address the dissimilar materials when piping is touching the metal collar. If the collar is not touching the piping materials, how is it going to protect against the passage of rodents or vermin?

Cost Impact: The code change proposal will not increase the cost of construction

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: STRAUSBAUGH-P2-304.4

P162–09/10
403.3 (IBC [P]2902.3)

Proponent: Donald R. Monahan, PE, Walker Parking Consultants, representing the National Parking Association and the Automated & Mechanical Parking Association

Add new text as follows:

403.3 (IBC [P] 2902.3) Required public toilet facilities. Customers, patrons and visitors shall be provided with public toilet facilities in structures and tenant spaces intended for public utilization. The number of plumbing fixtures located within the required toilet facilities shall be provided in accordance with Section 2902.1 for all users. Employees shall be provided with toilet facilities in all occupancies. Employee toilet facilities shall either be separate or combined employee and public toilet facilities.

> **Exception:** Public toilet facilities shall not be required in open or enclosed parking garages. Toilet facilities shall not be required in parking garages where there are no parking attendants. Toilet facilities in buildings adjacent to parking garages shall be permitted to serve parking garage attendants provided that the location of the toilet facilities complies with Section 403.3.2.

Reason: Parking garages are not considered to be occupied buildings. Toilet facilities are generally provided in an adjacent building served by the parking garage. Public toilet facilities in particular can be a security and maintenance concern in parking garages as they are often vandalized during periods of low activity.

Cost Impact: There will be a significant cost savings not to install toilet facilities in parking garages as well as minimizing security concerns and potential vandalism.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: MONAHAN-P2-403.3

P163–09/10
911.3

Proponent: Richard Grace/Fairfax County/Virginia VA Plumbing and Mechanical Inspectors/VA Building and Code Officials

Revise as follows:

911.3 Slope and size of horizontal branch. The maximum slope of the vent section of the horizontal branch drain shall be one unit vertical in 12 units horizontal (8.3-percent slope). The entire length of the vent section of the horizontal branch drain shall be sized for the total drainage discharge to the branch.

Reason: The slope percent for 1 in 12 is 8.3, not 8. This correction provides consistency throughout all codes that reference this slope.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICC FILENAME:GRACE-P3-911.3 CCC

P164–09/10
903, 904, 906, 907, 908, 909, 910, 911, 912, 913, 914, 915, 916

Proponent: Robert G. Konyndyk, Chief, Plumbing Division, Bureau of Construction Codes, State of Michigan

Revise as follows:

SECTION ~~903~~ 904
OUTDOOR VENT EXTENSIONS
(Renumber sections not shown)

SECTION ~~904~~ 903
VENT TERMINALS
(Renumber sections not shown)

SECTION ~~906~~ 909
FIXTURE VENTS
(Renumber sections not shown)

SECTION ~~907~~ 910
INDIVIDUAL VENTS
(Renumber sections not shown)

SECTION ~~908~~ 911
COMMON VENTS
(Renumber sections not shown)

SECTION ~~909~~ 912
WET VENTING
(Renumber sections not shown)

SECTION ~~910~~ 913
WASTE STACK VENT
(Renumber sections not shown)

SECTION ~~911~~ 914
CIRCUIT VENTING
(Renumber sections not shown)

SECTION ~~912~~ 915
COMBINATION DRAIN AND VENT SYSTEM
(Renumber sections not shown)

SECTION ~~913~~ 916
ISLAND FIXTURE VENTING
(Renumber sections not shown

SECTION ~~914~~ 908
RELIEF VENTS--STACKS OF MORE THAN 10 BRANCH INTERVALS
(Renumber sections not shown)

SECTION ~~915~~ 907
VENTS FOR STACK OFFSETS
(Renumber sections not shown)

SECTION ~~916~~ 906
VENT PIPE SIZING
(Renumber sections not shown)

Reason: This proposal changes the order of the subject matter to read in an orderly, systematic manner. No changes are being made to the technical content within the sections Even though this seems like a bold move, the new order will make a great deal of sense to the design community. This is a similar to the reorganization of the legacy codes into the common code format that occurred several years ago. The resulting new order of Chapter 9 will be as follows:

SECTION 901
GENERAL

SECTION 902
MATERIALS

SECTION 903
VENT TERMINALS

SECTION 904
OUTDOOR VENT EXTENSIONS

SECTION 905
VENT CONNECTIONS AND GRADES

SECTION 906
VENT PIPE SIZING

SECTION 907
VENTS FOR STACK OFFSETS

SECTION 908
RELIEF VENTS STACKS OF MORE THAN 10 BRANCH INTERVALS

SECTION 910
INDIVIDUAL VENTS

SECTION 911
COMMON VENTS

SECTION 911 COMMON VENTS

SECTION 912
WET VENTING

SECTION 913
WASTE STACK VENT

SECTION 914
CIRCUIT VENTING

SECTION 915
COMBINATION DRAIN AND VENT SYSTEM

SECTION 916
ISLAND FIXTURE VENTING

SECTION 917
AIR ADMITTANCE VALVES

SECTION 918
ENGINEERED VENT SYSTEMS

SECTION 919
COMPUTERIZED VENT DESIGN

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: The proposal does not change the technical content of the chapter.

TENTATIVE ORDER OF DISCUSSION

2009/2010 PROPOSED CHANGES TO THE INTERNATIONAL PROPERTY MAINTENANCE/ZONING CODE

The following is the tentative order in which the proposed changes to the code will be discussed at the public hearings. Proposed changes which impact the same subject have been grouped to permit consideration in consecutive changes.

Proposed change numbers that are indented are those which are being heard out of numerical order. Indentation does **not** necessarily indicate that one change is related to another. Proposed changes may be grouped for purposes of discussion at the hearing at the discretion of the chair.

Z2-09/10

PM1–09/10
201.3

Proponent: Bob Eugene, Underwriters Laboratories, Inc.

Revise as follows:

201.3 Terms defined in other codes. Where terms are not defined in this code and are defined in the *International Building Code, International Fire Code,* International Residential Code, International Fuel Gas Code, *International Zoning Code, International Plumbing Code, International Mechanical Code* or NFPA 70, such terms shall have the meanings ascribed to them as stated in those codes.

Reason: The *International Property Maintenance Code* covers installations also addressed by the International Residential Code and the International Fuel Gas Code.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: EUGENE-PM1-201.3.DOC

PM2–09/10
202, 302.10, Chapter 8

Proponent: Mike Ennis, Single Ply Roofing Industry (SPRI), representing the Single Ply Roofing Industry (SPRI)

1. Add new text as follows:

SECTION 202
DEFINITIONS

VEGETATIVE ROOF SYSTEM: A Vegetative Roof System consists of vegetation, growth media, drainage system, and waterproofing over a roof deck.

302.10 Vegetative roof system maintenance. Vegetative Roof Systems shall be maintained to:

1. Provide vegetation that nominally covers the visible surface of the growth media as described in ANSI/SPRI RP-14;
2. Sustain the system keeping vegetative roof plants healthy; and
3. Keep dry foliage to a minimum.

Such maintenance includes, but is not limited to irrigation, fertilization, and weeding. Excess biomass shall be removed at regular intervals not less than two times per year. Provision shall be made to provide access to water for permanent or temporary irrigation. When wind scour occurs to an existing vegetative roof system and the scour is less than 50 square feet, the growth media and plants shall be replaced. For scour areas greater than 50 square feet, the vegetative roof design shall be upgraded a minimum of one system design level in accordance with Section 4.0 of ANSI/SPRI RP-14.

2. Add new standard to Chapter 8 as follows:

ANSI/SPRI
RP-14- 2009 Wind Design Standard for Vegetative Roofing Systems

Reason: The International Building Code added requirements (Section 1507.16) that include fire and wind resistance for vegetative roof systems. Proper maintenance of vegetative roof systems is important to ensure acceptable fire and wind performance of these systems. For this reason maintenance requirements for these systems are being proposed for addition to the IPMC. To support these requirements a definition for a vegetative roof system is being proposed.

Further, the International Building Code added a new section (Section 1507.16) that mandates performance requirements for vegetative roof systems, including fire and wind performance. The maintenance of the vegetation on these roofs is an important factor for the long-term wind and fire performance of these systems. Properly maintained vegetative roof systems have a long history of excellent performance with respect to fire and wind resistance. Keeping the plants alive and healthy and removing dead foliage will ensure the acceptable fire performance of these roof systems.

Healthy plants are also an important factor with respect to wind resistance because the root system of the plants acts to bind the system together preventing damage during high wind events. Another important key to maintaining the wind resistance of these systems is to inspect the roof periodically for signs of wind scour. If found these areas need to be corrected per the requirements of ANSI/SPRI RP-14.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: A review of the standard(s) proposed for inclusion in the code, ANSI/SPRI RP-14-2009, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: ENNIS-PM1 PM2-202 302.10.DOC

PM3–09/10
302.7

Proponent: Joseph R. Hetzel, Thomas Associates, Inc., representing the Door & Access Systems Manufacturers Association (DASMA)

Revise as follows:

302.7 Accessory structures. All accessory structures, including detached garages, fences and walls, shall be maintained structurally sound and in good repair. Doors and gates, including operator systems if provided, shall be maintained in proper operating condition.

Reason: The purpose of the proposed code change is to address maintenance of operational aspects of accessory structures not made clear in the first sentence under Section 302.7, to draw attention to such operational aspects such that they could continue to perform their intended functions while checking on the presence of any automated door/gate safety functions and whether they are working.

The current provisions are inadequate because they do not consider the increased positive effect on public safety by effectively maintaining large moving objects, i.e. doors and gates, versus stationary objects, i.e. garages, fences, walls. The proposed language fills this need, with code and legislative precedence for automated doors and gates helping define an effective evaluation for maintenance purposes. Automated garage doors are required to comply with UL 325 per the IBC, the IRC, and (for residential) Federal law. Automated vehicular gates are required to comply with UL 325 and ASTM F2200 per the IBC and the IFC, and a proposed code change has been submitted to incorporate provisions into the IRC.

Death and injury statistics are well established for individuals that have been entrapped by automated garage doors and automated vehicular gates not in compliance with the UL 325 and ASTM F2200 safety standards. The new provisions will be a preventive measure toward a reduction of death and injuries by encouraging regular inspecting of the door and gate systems particularly those that are automated.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: HETZEL-PM1-302.7.DOC

PM4–09/10
304.15

Proponent: Joseph R. Hetzel, Thomas Associates, Inc., representing the Door & Access Systems Manufacturers Association (DASMA)

Revise as follows:

304.15 Doors. All exterior doors, door assemblies, operator systems if provided, and hardware shall be maintained in good condition. Locks at all entrances to dwelling units and sleeping units shall tightly secure the door. Locks on means of egress doors shall be in accordance with Section 702.3.

Reason: The purpose of the proposed code change is to address maintenance of automated aspects of doors not made clear in the first sentence under Section 304.15. The phrase “operator systems if provided” draws attention to automated doors, for checking on the performance to their intended functions while checking on the presence of any automated door safety functions and whether they are working.

The current provisions are inadequate because they do not consider the increased positive effect on public safety by effectively maintaining automated door systems. The proposed language fills this need, with code and legislative precedence for automated doors helping define an effective evaluation for maintenance purposes. As an example, automated garage doors are required to comply with UL 325 per the IBC, the IRC, and (for residential) Federal law.

Death and injury statistics are well established for individuals that have been entrapped by automated garage doors not in compliance with the UL 325 safety standard. The new language will be a preventive measure toward a reduction of death and injuries by requiring regular inspecting of automated door systems including automated garage doors.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: HETZEL-PM1-302.7.DOC

PM5–09/10
304.19 (New)

Proponent: Joseph R. Hetzel, Thomas Associates, Inc., representing the Door & Access Systems Manufacturers Association (DASMA)

Add new text as follows:

304.19 Gates. All exterior gates, gate assemblies, operator systems if provided, and hardware shall be maintained in good condition. Locks at all entrances shall tightly secure the gates.

Reason: The purpose of the proposed code change is to address maintenance aspects of gates, and is patterned after Section 304.15. The phrase "operator systems if provided" draws attention to automated gates, for checking on the performance to their intended functions while checking on the presence of any automated gate safety functions and whether they are working.

The current provisions are inadequate because they do not consider the increased positive effect on public safety by effectively maintaining automated gate systems. The proposed language fills this need, with code precedence for automated gates helping define an effective evaluation for maintenance purposes. As an example, automated gates are required to comply with UL 325 and ASTM F 2200 per the IBC and the IFC.

Death and injury statistics are well established for individuals that have been entrapped by automated gates not in compliance with the UL 325 and ASTM F2200 safety standards. The new provisions will be a preventive measure toward a reduction of death and injuries by encouraging regular inspecting of automated gate systems.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: HETZEL-PM3-304.19.DOC

PM6–09/10
305.3

Proponent: Thomas P. Mahar, New York State Department of State – Codes Division

Revise as follows:

305.3 Interior surfaces. All interior surfaces, including windows and doors, shall be maintained in good, clean and sanitary condition. Peeling, chipping, flaking or abraded paint shall be repaired, removed or covered. Deteriorated lead-based paint shall be controlled using approved lead-safe working practices. Cracked or loose plaster, decayed wood and other defective surface conditions shall be corrected.

Reason: The basic IPMC document, in Section 305.3, devoted one sentence to "peeling, chipping, flaking or abraded paint shall be repaired, removed or covered." This section does not mention lead-based paint; however, the accompanying IPMC Commentary devotes well over a half-page of text on the hazards of lead-based paint. Because the commentary is not the official code text and also because many code officials do not obtain a copy of this document, they may not be aware of the significant threats posed by lead-based paint. The purpose of this code change is to add language which alerts the code official of the danger and also direct the code official to other areas where additional assistance is available.

The proposal is superior to the current provision because it provides some helpful information while the current code provision offers no information on the dangers associated with lead-based paint. The reason for including the helpful information here in this particular code section is that lead-based paint is and continues to be the most significant source of high-lead exposure for children in the United States. While the highest risk is for pre-1946 housing, there is continued high risk for all housing built before the federal ban on high-lead paint in 1977. Nationally, tens of millions of existing housing units were built prior to the ban and many of these units are in increasingly dilapidated condition. Exposure to lead is associated with a range of serious health effects on children, including detrimental effects on cognitive and behavioral development with serious personal and social consequences that may persist throughout their lifetime. Lead poisoning is a completely preventable condition. The proposed addition to this code section will alter the code official that older housing stock is a big potential source of lead and to educate the code official in considering effective solutions by coordinating efforts with other agencies.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: MAHAR-PM1-305.3.DOC

PM7–09/10
308

Proponent: Robert F. Hale, Jr., Town of Warrenton, VA, representing Virginia Building Code Officials Association

1. Revise section title as follows:

SECTION 308
RUBBISH AND GARBAGE AND OTHER MATERIALS

2. Add new text as follows:

308.4 Accumulation of other materials. Materials of any type shall not be accumulated within a structure so as to impede upon the safe occupancy or egress from the space or significantly alter its intended use.

When materials of any type are gathered together within a room or space so as to limit the space within the room anywhere between 2' and 6' above the finished floor to less than the required square footage specified in Section 404 of this code, then the room or space in question shall then be considered a storage area as defined in Section 311.2 or 311.3 of the *International Building Code* and subsequently a change of occupancy as specified in Section 3408 of the *International Building Code*.

If the materials stored within a room or space exceed the permitted floor loading, then the room or space in question shall then be considered a storage area as defined in Section 311.2 or 311.3 of the *International Building Code* and subsequently a change of occupancy as specified in Section 3408 of the *International Building Code*.

Reason: The accumulation of materials within dwelling units and other spaces is an unsafe practice that leads to blocked egress, super-imposed loads, non-functional spaces as well as being a potentially deadly fire hazard. This proposed code section permits the code official enforcement option where none existed before to deal with conversions of use to storage.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: HALE-PM1-308

PM8–09/10
404

Proponent: Jeffrey N. Gentile, PE, Upper Darby Township, representing Pennsylvania Association of Building Code Officials, Inc.

1. Revise as follows:

404.4 Bedroom ~~and living room~~ requirements. Every *bedroom* ~~and living room~~ shall comply with the requirements of Sections 404.4.1 through 404.4.5.

~~**404.4.1 Room area. Area** Every living room shall contain at least 120 square feet (11.2m^2) and every bedroom shall contain at least 70 square feet (6.5m^2).~~

404.4.1 Area for sleeping purposes. Every bedroom occupied by one person shall contain at least 70 square feet (6.5m^2) of floor area, and every bedroom occupied by more than one person shall contain at least 50 square feet (4.6m^2) of floor area for each occupant thereof.

404.5 Overcrowding. ~~The number of persons occupying a *dwelling unit* shall not create conditions that, in the opinion of the *code official*, endanger the life, health, safety or welfare of the *occupants*.~~ Dwelling units shall not be occupied by more occupants than permitted by the minimum area requirements of Table 404.5.

2. Add new text as follows:

404.5.1 Sleeping area. The minimum occupancy area required by Table 404.5 shall not be included as a sleeping area in determining the minimum occupancy area for sleeping purposes. All sleeping areas shall comply with Section 404.4.

404.5.2 Combined spaces. Combined living room and dining room spaces shall comply with the requirements of Table 404.5 if the total area is equal to that required for separate rooms and if the space is located so as to function as a combination living room/dining room.

TABLE 404.5
MINIMUM AREA REQUIREMENTS

SPACE	MINIMUM AREA IN SQUARE FEET		
	1-2 occupants	3-5 occupants	6 or more Occupants
Living room [a,b]	No requirements	120	150
Dining room [a,b]	No requirements	80	100
Bedrooms	Shall comply with Section 404.4		

For SI: 1 square foot = 0.929 m^2

a. See Section 404.5.2 for combined living room/dining room spaces.
b. See Section 404.5.1 for limitations on determining the minimum occupancy area for sleeping purposes.

Reason: This change puts specific occupancy numbers back into the property maintenance code as were outlined in the 2003 IPMC. These requirements were eliminated in the 2006 IPMC and this proposal puts them back in. The current wording puts too much onus on the code official to prove overcrowding and leaves the determination wide open to interpretation. Being able to determine specific occupancy limits makes it easier for the code official to determine whether a dwelling unit violates the overcrowding provisions of the code.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: Code change proposals PM8, PM9 and PM10 deal with minimum room area requirements. PM10 proposes placing minimum area requirements in an appendix. The committee needs to make its intent clear with respect to the location of these requirements, if approved.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: GENTILE-PM1-404.4.DOC

PM9–09/10

404.4.1, 404.5, Table 404.5 (New), 404.5.1 (New), 404.5.2 (New)

Proponent: Sean P. Farrell, Prince William County Virginia, representing Virginia Building and Code Officials Association

1. Revise as follows:

404.4.1 Room area. Every living room shall contain at least 120 square feet (11.2 m^2) and every bedroom shall contain at least 70 square feet (6.5 m^2) and every bedroom occupied by more than one person shall contain at least 50 square feet (4.6 m^2) of floor area for each occupant thereof.

404.5 Overcrowding. ~~The number of persons occupying a dwelling unit shall not create conditions that, in the opinion of the code official, endanger the life, health, safety or welfare of the occupants.~~ Dwelling units shall not be occupied by more occupants than permitted by the minimum area requirements of Table 404.5.

2. Add new table and text as follows:

TABLE 404.5
MINIMUM AREA REQUIREMENTS

SPACE	MINIMUM AREA IN SQUARE FEET		
	1-2 occupants	3-5 occupants	6 or more occupants
Living room[a, b]	120	120	150
Dining room[a, b]	No requirement	80	100
Bedrooms	Shall comply with Section 404.4.1		

For SI: 1 square foot = 0.093 m^2

a. See Section 404.5.2 for combined living room/dining room spaces.
b. See Section 404.5.1 for limitations on determining the minimum occupancy area for sleeping purposes.

404.5.1 Sleeping area. The minimum occupancy area required by Table 404.5 shall not be included as a sleeping area in determining the minimum occupancy area for sleeping purposes. All sleeping areas shall comply with Section 404.4.

404.5.2 Combined spaces. Combined living room and dining room spaces shall comply with the requirements of Table 404.5 if the total area is equal to that required for separate rooms and if the space is located so as to function as a combination living room/dining room.

Reason: Code officials need objective criteria in which to draw conclusions and make educated and calculated decisions. The current code language "in the opinion of" is as subjective as language and text can be. By adding the square footage table back into the code, the official has objective criteria based upon reasonable and normal household conditions that account for live and dead loading. In most cases, the numbers in the table are very liberal but are effective at dealing with true overcrowded rooms and structures. The reason the language was stricken from the code several years ago was to allow for a couple and their small child(ren) to occupy a single room less than 150 square feet. This option is still afforded to the code official by way of code modification. Additionally, a strict interpretation of the current language does not allow for individual overcrowded room situations, the code official must take the entire unit into consideration even when the occupants may not have rights to the entire unit. We feel that is an unnecessary limitation imposed on the code official trying to ensure the safety of the occupants.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: Code change proposals PM8, PM9 and PM10 deal with minimum room area requirements. PM10 proposes placing minimum area requirements in an appendix. The committee needs to make its intent clear with respect to the location of these requirements, if approved.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: FARRELL-PM1-404.4.1.DOC

PM10–09/10
Appendix B (New)

Proponent: John Morgan, City of Frontenac, MO, representing Missouri Association of Building Officials and Inspectors

Add new appendix as follows:

APPENDIX B
DWELLING UNIT OVERCROWDING

SECTION B101
OVERCROWDING

B101.1 Overcrowding. Dwelling units shall not be occupied by more occupants than permitted by the minimum area requirements of Table B101.1:

TABLE B101.1
MINIMUM AREA REQUIREMENTS

SPACE	MINIMUM AREA IN SQUARE FEET		
	1-2 occupants	3-5 occupants	6 or more occupants
Living rooms[a]	No requirements	120	150
Dining rooms[a]	No requirements	80	100
Bedrooms	Every bedroom occupied by one person shall contain at least 70 square feet (6.5 m^2) of floor area, and every bedroom occupied by more than one person shall contain at least 50 square feet (4.6 m^2) of floor area for each occupant thereof.		

a. Combined spaces: A dining room and living room may be combined if so designed to function as a combination space and if the total area is the combined area for the separate rooms from the above table.

Reason: The property maintenance code was changed in 2003 to remove an overcrowding requirement with relation to bedroom sizes. This has been a long standing requirement in at least one of the legacy property maintenance codes. The current wording is very subjective. A code official or fire official can determine if there is a structural hazard or fire hazard but how does one arbitrarily determine that there are too many people occupying a dwelling unit. In fact, section 404.6 of the code seems to contradict the very reasoning of section 404.5. How is it that an efficiency unit requires minimum occupancy requirements but other dwelling units do not? One could argue that the fuel load in an efficiency unit is less than that in other dwelling units and that there is safer egress from an efficiency unit. With regard to dwelling units; is a bedroom that is 15 feet by 10 feet with six bunk beds sufficient or is it overcrowding? Also, if a dwelling was constructed to an adopted code and the bedrooms meet the egress requirements and notification requirements of that code, based on the current wording of the property maintenance code a large number of people could technically sleep in the bedroom and there can be little to no legal argument otherwise. Is that what the maintenance code was intended to do? Some officials may want to take on that kind of liability, however we believe there needs to be some guidance for the code official and therefore we are recommending that an appendix A be added to the IPMC utilizing a long standing and well tested method of determining the occupant load for a single family dwelling. This way a jurisdiction could adopt the appendix or decide to make arbitrary decisions on occupancy limits as allowed in section 404.5. This appendix will provide the code official with the intent of preventing overcrowding utilizing a standard measurement.

After talking with the fair housing investigation unit in St. Louis, Missouri it was concluded that an arbitrary decision by a code official could in fact be considered discrimination in certain cases and that some type of standard measure is needed and that when discrimination cases have been investigated the bedroom square footage limits were considered reasonable, this is based partially on the Keating (HUD general counsel) memo of 1991 and subsequent court cases.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: Code change proposals PM8, PM9 and PM10 deal with minimum room area requirements. PM10 proposes placing minimum area requirements in an appendix. The committee needs to make its intent clear with respect to the location of these requirements, if approved.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: MORGAN-PM1-APPENDIX B.DOC

PM11–09/10
404.6

Proponent: Charles B. Campbell, Faulkner University, Jones School of Law, representing self

Add as follows:

404.6 Efficiency unit. Nothing in this section shall prohibit an efficiency living unit from meeting the following requirements:

1. A unit occupied by not more than one occupant shall have a clear floor area of not less than 120 square feet (11.2 m^2). A unit occupied by not more than two occupants shall have a clear floor area of not less than 220 square feet (20.4 m^2). A unit occupied by three occupants shall have a clear floor area of not less than 320 square feet (29.7 m^2). These required areas shall be exclusive of the areas required by Items 2 and 3.
2. The unit shall be provided with a kitchen sink, cooking appliance and refrigeration facilities, each having a clear working space of not less than 30 inches (762 mm) in front. Light and *ventilation* conforming to this code shall be provided.
3. The unit shall be provided with a separate *bathroom* containing a water closet, lavatory and bathtub or shower.
4. The maximum number of *occupants* shall be three.

Reason: The proposal would add a new sentence to IPMC § 404.6(1) relating to single-resident occupancy (SRO) in efficiency units. Current IPMC § 404.6(1) defines minimum square footage in efficiency units based upon an occupancy limit of either two or three. As such, the minimum clear floor area is based on an occupancy limit of two and requires 220 square feet (20.4 m^2).The section does not explicitly provide for single-resident occupancy, which should require less space.

Moreover, the 220-square-foot minimum (which excludes the kitchen and bath areas in § 404.6(2) & (3)) exceeds the 150-square-foot minimum gross floor area recommended for SROs by the *APHA-CDC Recommended Minimum Housing Standards*. If the kitchen and bath areas occupy only another 100 square feet, IPMC § 404.6 effectively requires a minimum of 320 square feet for single-resident occupancy.

A minimum of 120 square feet in § 404.6(1), plus the kitchen and bath areas, would ensure that SROs exceed the 150 square feet of gross floor area recommended by the APHA and CDC. Given the negative impact excessive minimum square footage requirements can have on affordable housing, IPMC § 404.6(1) should be amended to permit a smaller clear floor area for SROs.

Bibliography:

Eric W. Mood ed., *Housing and Health: APHA-CDC Recommended Minimum Housing Standards* § 9.02.01 (1986).
Cal. Health & Safety Code § 17958.1 (West 2006) (“a city or county may, by ordinance, permit efficiency units for occupancy by no more than two persons which have a minimum floor area of 150 square feet”).

Cost Impact: The code change proposal will not increase the cost of construction.

PM12 –09/10
504.3, 504.4 (New)

Proponent: Ronald L. George, Ron George Design & Consulting Services, representing self

THIS PROPOSAL IS ON THE AGENDA OF THE IPC CODE DEVELOPMENT COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THE IPC CODE DEVELOPMENT COMMITTEE.

Revise as follows:

504.3 Plumbing system hazards. Where it is found that a plumbing system in a structure constitutes a hazard to the occupants or the structure by reason of inadequate service, inadequate venting, cross connection, backsiphonage, improper installation, scald hazard. deterioration or damage or for similar reasons, the *code official* shall require the defects to be corrected to eliminate the hazard.

504.4 Scalding hazards. Every shower, bathtub or combination tub/shower shall be equipped with a temperature or pressure compensation shower valve conforming to ASSE 1016 or CSA B-125.1 with a maximum temperature limit stop adjustable to limit hot water temperatures to a maximum of 120 degrees F.

Exceptions:

1. A compensating type shower valve is not required if a properly sized master thermostatic mixing valve is installed at the hot water source conforming to ASSE 1017 or ASME A112.18.1/CSA B-125.1 and set to limit the hot water distribution temperature to a maximum of 120 degrees F.
2. A compensating type shower valve is not required if a properly sized thermostatic mixing valve conforming to ASSE 1070 or CSA B-125.3 is installed near the fixtures and set to limit the hot water distribution temperature to a maximum of 120 degrees F.
3. A compensating type shower valve is not required if a temperature actuated flow reduction device conforming to ASSE 1062 is installed on the shower arm and the tub fill spout.

Reason: Currently there is not any specific language guiding inspectors for safety hazards associated with plumbing and scalding hazards in older buildings. Scalding hazards are one of the most painful and most common injuries in older apartments, and rental properties with two-handled non-compensating type shower valves.

The proposed language is intended to address these life altering and very painful injuries which commonly occur in older buildings and apartments. The property maintenance code allows inspectors to correct hazardous conditions but does not specifically address one of the biggest hazards in a home, scalding.

Cost Impact: The code change proposal will cause a minimal cost increase.

Analysis: All standards referenced in this proposal are currently referenced in other I-Codes.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: GEORGE-PM1-504.4.DOC

PM13–09/10
506.3

Proponent: Sean P. Farrell, Prince William County Virginia, representing Virginia Building and Code Officials Association

THIS PROPOSAL IS ON THE AGENDA OF THE IPC CODE DEVELOPMENT COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THE IPC CODE DEVELOPMENT COMMITTEE.

Revise as follows:

506.3 Grease interceptors. ~~Where it has been determined that a grease interceptor is not being maintained and serviced as intended by this code and the manufacturer's instructions, an *approved* interceptor monitoring system shall be provided or a maintenance program shall be established with documentation submitted to the *code official*~~. Grease interceptors, grease traps and automatic grease removal devices shall be maintained in accordance with this code and the manufacturer's installation instructions. Grease interceptors, grease traps and automatic grease removal devices

shall be regularly serviced and cleaned to prevent the discharge of oil, grease, and other substances harmful or hazardous to the building drainage system, the public sewer, the private sewage disposal system or the sewage treatment plant or processes. All records of maintenance, cleaning and repairs shall be available for inspection by the code official.

Reason: The 2009 IPMC only requires a routine maintenance program after the code official determines that the grease interceptor is not being maintained. The revised text clarifies that grease interceptors, grease traps and automatic grease removal devices require on-going routine maintenance in order to perform their intended function. Any such maintenance should be in accord with the manufacturer's maintenance criteria. The proposed language is coordinated with the provisions of Section 1003.1 of the IPC which establishes when these devices are required to be installed. Failure to maintain these devices results in public health risks via sanitary sewer overflows into buildings, roads and streams and premature deterioration and failure of public and private sewage systems.

Cost Impact: The code change proposal will not increase the cost of construction

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: FARRELL-PM2-506.3.DOC

PM14–09/10
603.7 (New)

Proponent: Mona Casey, United Parents to Restrict Open Access to Refrigerant

Add new text as follows:

603.7 Existing HVAC systems. Refrigerant circuit access ports located outdoors shall be provided with locking-type tamper-resistant caps whenever the system is modified, serviced, or repaired.

Reason: The purpose of this code modification is to add new requirements to the Code. The existing code does not address the issue of accessibility to refrigerant by unauthorized individuals. Refrigerant is extremely dangerous and potentially lethal.

Facts:

- Refrigerant "can cause death without warning".
- Refrigerant is considered a gateway drug because users often progress from refrigerant use to drug and alcohol abuse.
- Refrigerant is not a cumulative substance where chances of dying from it increase as the dosage and number of use increases. It can kill on the 1st, 10th, 100th, or any other time. 33 percent of deaths resulting from refrigerant huffing occurred on the 1st use.
- Refrigerant, like other poisons, must be kept out of reach of children.
- Refrigerant theft is increasing.
- According to Mike Opitz, Certification Manager, LEED for Existing Buildings, U.S. Green Building Council, chlorine in CFCs and HCFCs destroy the ozone and depletes the Earth's natural shield for incoming ultraviolet radiation and absorb outgoing infrared radiation from the earth, functioning as potent greenhouse gases.

National Statistics:

- The National Institute on Drug Abuse reports that one in five American teens have used Inhalants to get high.
- According to Stephen J. Pasierb, President and CEO of The Partnership for Drug-Free America, 22% of 6th and 8th graders admitted abusing inhalants and only 3% of parents think their child has ever abused inhalants.
- An analysis of 144 Texas death certificates by the Texas Commission on Alcohol and Drug Abuse involving misuse of inhalants found that the most frequently mentioned inhalant (35%) was Freon (51 deaths). Of the Freon deaths, 42 percent were students or youth with a mean age of 16.4 years.
- Suffocation, inhaling fluid or vomit into the lungs, and accidents each cause about 15% of deaths linked to inhalant abuse.
- National Institute on Drug Abuse's 'Monitoring the Future' study reveals that inhalant abuse among 8th graders is up 7.7% since 2002.
- 55% of deaths linked to inhalant abuse are caused by "Sudden Sniffing Death Syndrome." SSDS can occur on the first use or any use. The

Inhalant causes the heart to beat rapidly and erratically, resulting in cardiac arrest.

- 22% of inhalant abusers who died of SSDS had no history of previous inhalant abuse. In other words, they were first-time users.

Collier County, FL Statistics:

- The use of inhalants in middle schools has doubled in two years
- The average age a child starts using drugs or alcohol is just 12½
- Every third day a child is taken to the hospital because of a drug overdose
- 85 percent of all juvenile criminal cases are substance related
- Deaths due solely to drug toxicity increased 76% between 1998 and 2005
- The modification of this code will have an immense positive impact on the safety and health of our citizens, especially our youth. It will reduce the number of deaths associated with Inhalant abuse and the number of injuries associated with Freon accidents and leaks.

Cost Impact: The code change proposal will increase the cost of construction by $25-$30.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: CASEY-PM1-603.7.DOC

PM15–09/10
604.3.1.1

Proponent: Bob Eugene, Underwriters Laboratories, Inc.

Revise as follows:

604.3.1.1 Electrical equipment. Electrical distribution equipment, motor circuits, power equipment, transformers, wire, cable, flexible cords, wiring devices, ground-fault circuit interrupters, surge protectors, molded case circuit breakers, low-voltage fuses, luminaires, ballasts, water heaters, appliances, electronic equipment, motors and electronic control, signaling and communication equipment that have been exposed to water shall be replaced in accordance with the provisions of the *International Building Code*.

Exception: The following equipment shall be allowed to be repaired where an inspection report from the equipment manufacturer or *approved* manufacturer's representative indicates that the equipment has not sustained damage that requires replacement:

1. Enclosed switches, rated 600 volts or less;
2. Busway, rated 600 volts or less;
3. Panelboards, rated 600 volts or less;
4. Switchboards, rated 600 volts or less;
5. Fire pump controllers, rated 600 volts or less;
6. Manual and magnetic motor controllers;
7. Motor control centers;
8. Alternating current high-voltage circuit breakers;
9. Low-voltage power circuit breakers;
10. Protective relays, meters and current transformers;
11. Low- and medium-voltage switchgear;
12. Liquid-filled transformers;
13. Cast-resin transformers;
14. Wire or cable that is suitable for wet locations and whose ends have not been exposed to water;
15. Wire or cable, not containing fillers, that is suitable for wet locations and whose ends have not been exposed to water;
16. Luminaires that are listed as submersible;
17. Motors;
18. Electronic control, signaling and communication equipment.

Reason: These additional items need to be replaced when exposed to water. Floodwater contaminants can create serious fire hazards if electrical wiring and equipment have been submerged in water. Even with professional cleaning and drying, sediments and toxins are difficult to remove. Corrosion and insulation damage can occur when water and silt get inside electrical devices and products. Water can also damage the motors in electrical appliances.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: EUGENE-PM2-604.3.1.1.DOC

PM16–09/10
605.2, 605.3, 605.4 (New)

Proponent: Bob Eugene, Underwriters Laboratories, Inc.

Revise as follows:

605.2 Receptacles. Every habitable space in a dwelling shall contain at least two separate and remote receptacle outlets. Every laundry area shall contain at least one grounded-type receptacle or a receptacle with a ground fault circuit interrupter. Every bathroom shall contain at least one receptacle. Any new bathroom receptacle outlet shall have ground fault circuit interrupter protection. All receptacle outlets shall have the appropriate faceplate cover for the location.

605.3 Luminaires. Every public hall, interior stairway, toilet room, kitchen, bathroom, laundry room, boiler room and furnace room shall contain at least one electric luminaire. Pool and spa luminaries over 15 V shall have ground fault circuit interrupter protection.

605.4 Wiring. Flexible cords shall not be used for permanent wiring, or for running through doors, windows, or cabinets, or concealed within walls, floors, or ceilings.

Reason: Missing or broken receptacle outlet covers should be replaced to prevent inadvertent contact with live parts within the outlet. Flexible cords are not evaluated for use as permanent wiring in a building and are not allowed by the IFC. GFCI protection of pool and spa luminaires is critical for the safety of the users.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

PM17–09/10
702 (New)

Proponent: Gregory J. Cahanin, Cahanin Fire & Code Consulting, representing the Michael Minger Foundation

1. Revise as follows:

Reorder the Sections in Chapter 7 to the same order found in the IFC for requirements covered.

Section 701 General
Section 702 Emergency Planning and Preparedness (New)
Section 703 Fire Resistance Ratings
Section 704 Fire Protection Systems
Section 705 Means of Egress

2. Add new section as follows:

SECTION 702
EMERGENCY PLANNING AND PREPAREDNESS

702.1 Fire safety and evacuation plans. Fire safety and evacuation plans shall comply with the provisions of Sections 702.1.1 through 702.1.4.

702.1.1 Where required. An approved fire safety and evacuation plan shall be prepared and maintained for the following occupancies and buildings.

1. Group A, other than Group A occupancies used exclusively for purposes of religious worship that have an occupant load less than 2,000.
2. Group B buildings having an occupant load of 500 or more persons or more than 100 persons above or below the lowest level of exit discharge.
3. Group E.
4. Group F buildings having an *occupant load* of 500 or more *persons* or more than 100 *persons* above or below the lowest *level of exit discharge*.
5. Group H.
6. Group I.
7. Group R-1.
8. Group R-2 college and university buildings.
9. Group R-4.
10. High-rise buildings.
11. Group M buildings having an occupant load of 500 or more persons or more than 100 persons above or below the lowest level of exit discharge.
12. Covered malls exceeding 50,000 square feet (4645 m^2) in aggregate floor area.
13. Underground buildings.
14. Buildings with an atrium and having an occupancy in Group A, E or M.

702.1.2 Contents. Fire safety and evacuation plan contents shall be in accordance with Sections 702.1.2.1 and 702.1.2.2.

702.1.2.1 Fire evacuation plans. Fire evacuation plans shall include the following:

1. Emergency egress or escape routes and whether evacuation of the building is to be complete or, where approved, by selected floors or areas only.
2. Procedures for employees who must remain to operate critical equipment before evacuating.
3. Procedures for assisted rescue for *persons* unable to use the general *means of egress* unassisted.
4. Procedures for accounting for employees and occupants after evacuation has been completed.
5. Identification and assignment of personnel responsible for rescue or emergency medical aid.
6. The preferred and any alternative means of notifying occupants of a fire or emergency.
7. The preferred and any alternative means of reporting fires and other emergencies to the fire department or designated emergency response organization.
8. Identification and assignment of personnel who can be contacted for further information or explanation of duties under the plan.
9. A description of the emergency voice/alarm communication system alert tone and preprogrammed voice messages, where provided.

702.1.2.2 Fire safety plans. Fire safety plans shall include the following:

1. The procedure for reporting a fire or other emergency.
2. The life safety strategy and procedures for notifying, relocating, or evacuating occupants, including occupants who need assistance.
3. Site plans indicating the following:
   - 3.1. The occupancy assembly point.
   - 3.2. The locations of fire hydrants.
   - 3.3. The normal routes of fire department vehicle access.
4. Floor plans identifying the locations of the following:
   - 4.1. Exits.
   - 4.2. Primary evacuation routes.
   - 4.3. Secondary evacuation routes.
   - 4.4. Accessible egress routes.
   - 4.5. Areas of refuge.
   - 4.6. Exterior areas of assisted rescue.
   - 4.7. Manual fire alarm boxes.
   - 4.8. Portable fire extinguishers.
   - 4.9. Occupant-use hose stations.
   - 4.10. Fire alarm annunciators and controls.
5. A list of major fire hazards associated with the normal use and occupancy of the premises, including maintenance and housekeeping procedures.
6. Identification and assignment of personnel responsible for maintenance of systems and equipment installed to prevent or control fires.
7. Identification and assignment of personnel responsible for maintenance, housekeeping and controlling fuel hazard sources.

702.1. 3 Availability. Fire safety and evacuation plans shall be available in the workplace for reference and review by employees, and copies shall be furnished to the fire code official for review upon request.

702.1.4 Posting of evacuation plan. A posted evacuation plan consisting of an actual floor plan layout identifying the available evacuation routes with room and space identifications such as areas of rescue assistance shall be provided within the hotel guest room or a resident room in dormitories in the proximity of the room entrance door.

702.3 Emergency evacuation drills. Emergency evacuation drills complying with the provisions of this section shall be conducted at least annually in the occupancies listed in Section 702.1.1 or when required by the fire code official. Drills shall be designed in cooperation with the local authorities.

702.3.1 Frequency. Required emergency evacuation drills shall be held at the intervals specified in Table 702.3.1 or more frequently where necessary to familiarize all occupants with the drill procedure.

TABLE702.3.1
FIRE AND EVACUATION DRILL FREQUENCY AND PARTICIPATION

GROUP OR OCCUPANCY	FREQUENCY	PARTICIPATION
Group A	Quarterly	Employees
Group B[c]	Annually	Employees
Group E	Monthly[a]	All occupants
Group F	Annually	Employees
Group I	Quarterly on each shift	Employees[b]
Group R-1	Quarterly on each shift	Employees
Group R-2[d]	Four annually	All occupants
Group R-4	Quarterly on each shift	Employees[b]
High-rise buildings	Annually	Employees

a. The frequency shall be allowed to be modified in accordance with Section 702.3.1.
b. Fire and evacuation drills in residential care assisted living facilities shall include complete evacuation of the premises to a selected assembly point. Where occupants receive habitation or rehabilitation training, fire prevention and fire safety practices shall be included as part of the training program.
c. Group B buildings having an occupant load of 500 or more persons or more than 100 persons above or below the lowest level of exit discharge.
d. Applicable to Group R-2 college and university buildings in accordance with Section 702.1.

702.3.2 Time. Drills shall be held at unexpected times and under varying conditions to simulate the unusual conditions that occur in case of fire.

702.4 Employee training and response procedures. Employees in the occupancies listed in Section 702.1 shall be trained in the fire emergency procedures described in their fire evacuation and fire safety plans. Training shall be based on these plans and as described in Section 702.1.2.1.

702.4.1 Frequency. Employees shall receive training in the contents of fire safety and evacuation plans and their duties as part of new employee orientation and at least annually thereafter. Records shall be kept and made available to the fire code official upon request.

702.4.2 Evacuation training. Employees shall be familiarized with the fire alarm and evacuation signals, their assigned duties in the event of an alarm or emergency, evacuation routes, areas of refuge, exterior assembly areas, and procedures for evacuation.

702.4.3 Maintenance. Fire safety and evacuation plans shall be reviewed or updated annually or as necessitated by changes in staff assignments, occupancy, or the physical arrangement of the building.

702.5 Use and occupancy-related requirements. Sections 702.5.1 through 702.5.2.3 shall apply to the specific occupancies contained therein.

702.5.1 General. An approved fire safety and evacuation plan shall be prepared and maintained for Group R-2 college and university buildings as noted in 702.1.2.1 and 702.1.2.2.

702.5.2 Group R-2. Group R-2 college and university buildings shall comply with the requirements of Sections 702.5.2.1 and 702.5.2.3.

702.5.2.1 Time of day. Emergency evacuation drills shall be conducted at different hours of the day or evening, during the changing of classes, when the school is at assembly, during the recess or gymnastic periods, or during other times to avoid distinction between drills and actual fires. In Group R-2 college and university buildings, one required drill shall be held during hours after sunset or before sunrise.

702.5.2.2 Emergency guide. A fire emergency guide shall be provided which describes the location, function and use of fire protection equipment and appliances accessible to residents, including fire alarm systems, smoke alarms, and portable fire extinguishers. The guide shall also include an emergency evacuation plan for each dwelling unit or sleeping unit.

702.5.2.3 Distribution. A copy of the emergency guide shall be given to each tenant prior to initial occupancy.

Reason: The initial change is to reorder the Chapter 7 Sections in the same order as the Chapter order in the International Fire Code (IFC) where most of the material is derived.

A new Section 702.1.4 on posting an evacuation plan near dorm room entrance doors is to be coordinated with an identical IFC proposal. The posting of a plan in a room will assist all occupants in an emergency, but in may be of particular assistance to individuals with special cognitive needs in determining alternative egress paths in an emergency.

The new text proposed is extracted from the IFC (404.3.1, 404.3.2,404.4, and 408) is proposed for inclusion in the IPMC in concert with the IPMC scope and intent. It is recognized that the provisions found within the IPMC are extracts from other international codes. The scope of the IPMC notes that these provisions shall apply to all existing residential and nonresidential structures and all existing premises and constitute minimum requirements and standards for premises, structures, equipment and facilities for light, ventilation, space, heating, sanitation, protection from the elements, life safety, safety from fire and other hazards, and for safe and sanitary maintenance; the responsibility of owners, operators and occupants; the occupancy of existing structures and premises, and for administration, enforcement and penalties. The intent of the IPMC is construed to secure its expressed intent, which is to ensure public health, safety and welfare in so far as they are affected by the continued occupancy and maintenance of structures and premises.

The IPMC when adopted by a community becomes a handbook of sorts for property owners in defining requirements they must adhere to for the safety of residents or occupants. Existing structures and premises that do not comply with these provisions shall be altered or repaired to provide a minimum level of health and safety as required herein. The proposed extracted text from the IFC addresses emergency planning and response requirements for occupants in the event of an emergency to ensure their safety. This inclusion in the IPMC document provides for additional means to define for the general population and building owner's requirements associated with occupants egress involved with fire evacuation plans and fire safety plans.

The submittal of this proposal and several others with the ICC is part of the work of the Michael H. Minger Foundation, as a result of a Department of Homeland Security Fire Prevention and Safety Grant to study how colleges and universities respond to and provide for students with physical and learning disabilities in a fire event. The study identified model practices being used by campuses regarding fire safety, housing and evacuation policies and procedures. The proposed changes to the IPMC lay the foundation for uniform fire safety planning in the campus environment in a nationally recognized document while also establishing a clear base for egress planning and performance in all types of occupancies.

The Michael H. Minger Foundation was established in 2005. The purpose of the Foundation is to improve fire safety standards and enhance fire safety systems on college and university campuses and to educate parents and students and raise awareness of the reality and risk of campus fires. This non-profit organization was founded to honor the life of Michael H. Minger, an outstanding young man, who lost his life in a college dormitory fire. The Michael Minger Act in Kentucky established a requirement for fire sprinklers in college housing. A governor's task force focusing on campus safety in Kentucky was lead by Gail Minger, the director of the Michael H. Minger Foundation.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: The maintenance of the technical content of proposed Section 702 will be the responsibility of the International Fire Code Development Committee. The need for and suitability of having the new section within the IPMC is a matter to be determined by the International Property Maintenance Code Development Committee.

ICCFILENAME: CAHANIN-PM1-702.DOC

PM18–09/10
Chapter 8 (New)

Proponent: Howard Asch, City of East Lansing, representing Michigan Association of Housing Officials

Add new chapter as follows:

CHAPTER 8
HEALTH

801
GENERAL

801.1 Scope. The provisions of this chapter shall govern the minimum conditions and standards for the health of persons at a premises.

801.2 Responsibility. The owner of the premises shall maintain the premises in compliance with these requirements, except as provided for in this code. A person shall not occupy as owner-occupant or permit another person to occupy or allow the public to use any premises which does not comply with the requirements of this chapter. Occupants of a dwelling unit, rooming unit or housekeeping unit or persons in control of any space are responsible for keeping the areas they occupy or control free from hazards to health.

801.3 Approved agency. An approved agency is an established and recognized agency regularly engaged in conducting tests or furnishing inspections services, when such agency has been approved by the code official. The code official shall accept a report from an approved agency as basis upon which to determine compliance in accordance with this chapter.

801.4 Testing. The code official is authorized to require the owner or occupant responsible for maintenance to provide findings from an approved agency when, in the opinion of the code official, it is likely that there exists a hazard to health in violation of the requirements of this chapter. The report of an approved agency shall be deemed sufficient to establish whether a premise is in compliance with the requirements of this chapter. The building owner or occupant responsible as set forth in section 801.2 shall pay the cost of inspection and testing by an approved agency.

801. Vacating. When an area is required to be vacated by this chapter, occupancy shall be prohibited except by persons actively engaged in removing a hazard to health. The code official shall order the area to be vacated in accordance with section 108 of this code.

802
EXCREMENT

802.1 Exterior accumulations. Excrement shall not accumulate in any yard area and shall be contained and disposed of in a safe and sanitary manner so as to control insects, vermin, odor and the spread of disease.

> **Exception:** Waste from animals raised for commercial purposes that is contained and safely disposed of in a manner consistent with general agricultural practices shall not be regulated.

802.2 Interior accumulation. Excrement shall not be allowed to accumulate in any dwelling unit except in an approved device which is properly maintained to contain excrement and control odor.

803
FRIABLE HAZARDOUS MATERIALS

803.1 Maintenance. Materials containing friable hazardous particles including but not limited to asbestos, lead, arsenic or crystalline silica shall be maintained in such a manner as to prevent friable particles from becoming airborne or ingestible.

803.2 Abatement. When exposed friable particles are determined by an approved agency to be present in hazardous quantities, the condition causing the material to become friable shall be abated and the exposed area shall be cleared of hazardous particles. The code official is authorized to order occupancy of the affected space to be prohibited until the contaminated area has been certified by an approved agency as safe for normal occupancy, and the cause of the material becoming friable has been abated or the friable material has been removed.

804
HAZARDOUS GASEOUS MATERIALS

804.1 Allowable levels. The following gaseous hazardous substances shall not exceed allowable specified levels within a dwelling unit:

> Carbon monoxide--35 PPM 8 hour time weighted average; 200 PPM maximum concentration
> Formaldehyde-- 0.5 PPM based on a 30 minute sampling period
> Radon-- 4 picocuries/liter

When another adopted standard conflicts with these allowable levels, the more restrictive shall apply.

804.2 Abatement. Gaseous hazardous substances determined by an approved testing agency to exceed the levels provided in section 804.1 shall be abated. The code official is authorized to order the affected area to be vacated until testing by an approved agency finds the area to be in compliance with section 804.1.

805
PESTICIDES

805.1 Storage. Pesticides shall be stored in the manner prescribed by the manufacturer and shall be used in areas and at concentrations in compliance with the labeling of the manufacturer.

805.2 Abatement. When a pesticide is determined by an approved agency to be in a location or at a concentration dangerous to human health and/or contrary to manufacturer labeling the code official is authorized to order the area containing such pesticide to be vacated until the hazard has been abated.

806
CHEMICAL CONTAMINATION

806.1 Vacating. When determined by an approved agency that a dwelling unit is contaminated by a chemical at a concentration and in such a condition as to be hazardous to human health after short term exposure the code official is authorized to order the dwelling unit to be vacated and remain vacated until the hazard has been abated.

806.2 Illegal Methamphetamine manufacturing sites. A dwelling unit declared by a law enforcement agency or health official to be a site of illegal Methamphetamine manufacture shall be vacated and shall not be occupied until certified by an approved agency as safe from hazardous materials related to the Methamphetamine manufacturing process.

807
BIOLOGICAL HAZARDS

807.1 Waterborne organisms. When determined by testing of an approved agency that the domestic water supply of a dwelling unit is contaminated with toxin producing bacteria, human parasite, or other organism deemed by an approved agency as dangerous to human health, the water supply shall be made safe. The code official is authorized to order the dwelling unit to be vacated until such time as the water supply is safe as determined by an approved agency. The code official is authorized to permit use of a water purification system capable of removing organisms or use of an alternative water supply on a temporary basis provided the water so supplied is safe for drinking and bathing.

807.2 Airborne organisms. Heating, air conditioning and ventilation systems shall be kept clean and maintained so as to prevent the growth of harmful organisms within the system.

808
AIR-BORNE CONTAMINATES

808.1 Air-borne contaminates. Spaces in which air borne contaminates are generated shall comply with the International Mechanical Code requirements for hazardous exhaust systems. Contaminated air shall not be circulated between tenant spaces or dwelling units. Tobacco smoke shall be considered a hazardous contaminate for purposes of this section. Air may be circulated between tenant spaces or dwelling units when properly installed and maintained equipment first removes any contaminate.

809
SANITARY CLEANUP

809.1 Sanitary cleanup. When an event occurs that makes occupancy of a space unsafe or unhealthful, the space shall not be occupied unless the unsafe conditions are removed in accordance with this section. Sewage spills and flooding shall be considered to make a space unsafe.

809.2 Approved agency. The code official may accept a report from an approved agency that certifies an unsafe or unhealthful condition has been eliminated as a basis for approving occupancy of a space.

809.3 Prescriptive methods. When the prescriptive methods contained in section 809.3.1 through 809.3.2 are used the hazard shall be deemed to have been abated.

809.3.1 Sewage spills. All water containing sewage and all sewage solids shall be removed and disposed of in a safe and sanitary manner. Every absorbent material in contact with sewage or water which contains sewage shall be removed. Every non-absorbent material in contact with sewage or water which contains sewage shall be cleaned with detergent and disinfected with a 10% solution of household bleach in water.

809.3.2 Flood damage. Any material that has been damaged or weakened by water shall be removed. Material saturated by water, such as insulation or gypsum board, shall be removed. All surfaces that support mold growth which have come in contact with water shall be removed or thoroughly dried and treated with a fungicide. All materials and systems required by this code and the International Building Code or the International Residential Code shall be replaced or restored to a dry condition and capable of performing the intended purpose. When flood water is known to be contaminated with harmful chemical compounds, the contamination shall be removed and the area shall be tested and found safe by an approved agency in addition to the other requirements of this section.

810
FOOD PREPARATION AREAS

810.1 Responsibility. The occupant of each space with a food preparation or storage area shall be responsible to maintain that area in accordance with this section.

810.2 Food preparation areas. Food preparation areas shall be maintained free of spoiled or rotting foodstuffs. Grease shall not be allowed to accumulate on surfaces in food preparation areas, including counters, walls, floors, ceilings, appliances and storage areas.

Reason: The code does not presently address health related concerns very well. The proposal clearly enumerates various health issues and describes minimum standards to enable the code official to have a more solid legal standing to address those issues.

There are no universally accepted standards for carbon monoxide, formaldehyde or radon in a dwelling unit. Standards have been proposed for work places and the proposed standards for exposure to these gasses are taken from NIOSH HSM 73-11000 for carbon monoxide, NIOSH DHEW 77-126 for formaldehyde, and the U. S. Environmental Protection Agency for radon. The code official is authorized to accept documentation from an approved agency to establish compliance with other hazards where technical knowledge is required, much in the fashion an engineer's report would be accepted for a structural concern in a building. A clear basis for a decision strengthens the code official's position when challenged on appeal or in court.

Cost Impact: The code change proposal will not increase the cost of construction.

TENTATIVE ORDER OF DISCUSSION

2009/2010 PROPOSED CHANGES TO THE INTERNATIONAL RESIDENTIAL CODE BUILDING & ENERGY

The following is the tentative order in which the proposed changes to the code will be discussed at the public hearings. Proposed changes which impact the same subject have been grouped to permit consideration in consecutive changes.

Proposed change numbers that are indented are those which are being heard out of numerical order. Indentation does **not** necessarily indicate that one change is related to another. Proposed changes may be grouped for purposes of discussion at the hearing at the discretion of the chair.

RB1–09/10
R202

Proponent: Maureen Traxler, City of Seattle, WA, representing the Department of Planning & Development

Revise definition as follows:

BASEMENT. ~~That portion of a building~~ A *story* that is ~~partly or completely below *grade*~~ not a *story above grade plane* (see "*Story above grade plane*").

Reason: This definition of "Basement" has been modified to be consistent with the 2009 IBC definition of "Basement." The reference to "Story above grade" has been replaced with "Story above grade plane" to be consistent with the updated definition in the 2009 IRC.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: TRAXLER-RB-3-R202

RB2–09/10
R202

Proponent: Diana M. Hanson, representing North American Deck and Railing Association, Inc.

Add new definition as follows:

PATIO. An exterior walking surface typically made of concrete, stone, slab, brick, or other masonry product laid over a base, supported directly by the grade beneath and located at grade level.

Reason: To distinguish a patio from a deck. Where both decks and patios are both considered walking surfaces, patios are typically supported by grade, while decks are supported by an elevated frame structure with a load path through various structural components.

We feel that an IRC definition of "patio" will greatly assist in making the distinction between decks and patios. The term "patio" is referenced several times in the IRC*, yet nowhere is it defined. Further, we are seeing jurisdictional instruction that refer to patios, when in actuality, they mean decks. An IRC definition of the term will be helpful to code officials and builders, as well as, clarify the difference between "deck" and "patio" for the general public.

**Instances of the term "patio" in IRC:*
(R506 Concrete Floors on Ground) Section R506.2.3 Vapor retarder.
(Chapter 24 Fuel Gas) G2415.14 (404.14) Location of Outlets
(Chapter 24 Fuel Gas) G2415.15.1 (404.15.1) Limitations
(Appendix H Patio Covers) AH105 Light and Ventilation/Emergency Egress (3 instances)

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: HANSON-RB-3-R202

RB3–09/10
R202

Proponent: Daniel J. Walker, PE, Thomas Associates, Inc., representing the National Sunroom Association

Add new definition as follows:

PATIO COVER. A one story structure not exceeding 12 feet (3657 mm) in height used for recreational, outdoor living purposes and not as carports, garages, storage rooms or habitable rooms. Enclosure walls shall be permitted to be of any configuration, provided the open or glazed area of the longer wall and one additional wall is equal to at least 65 percent of the area below a minimum of 6 feet 8 inches (2032 mm) of each wall, measured from the floor.

Reason: This information has long been included in Appendix H of the code. Although the term is defined in the Appendix, this information is not a mandatorily adopted part of the code. Because the term is used in the body of the code and no ordinarily accepted meaning exists, a specific definition is necessary.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: WALKER-RB-1-R202

RB4–09/10
R202

Proponent: Maureen Traxler, City of Seattle, WA, representing the Seattle Department of Planning & Development

Revise definition as follows:

STORY ABOVE GRADE PLANE. Any *story* having its finished floor surface entirely above *grade plane*, ~~except that a *basement* shall be considered as a *story above grade plane*~~ or in which ~~where~~ the finished surface of the floor next above ~~the *basement* meets any one of the following~~ is:

1. ~~Is~~ More than 6 feet (1829 mm) *above grade plane*.~~;~~ or
2. ~~Is more than 6 feet (1829 mm) above the finished ground level for more than 50 percent of the total building perimeter.~~
2~~3~~. ~~Is~~ More than 12 feet (3658 mm) above the finished ground level at any point.

Reason: The IRC and the IBC currently have different definitions of “story above grade plane.” These changes are intended to have the IRC definition match that of the IBC.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: TRAXLER-RB-2-R202

RB5–09/10
R202

Proponent: James Ranfone, American Gas Association

Revise definition as follows:

TOWNHOUSE. A separately owned single-family dwelling unit constructed in a group of three or more attached units in which each unit extends from foundation to roof and with open space on at least two sides.

Reason: To eliminate any potential misinterpretation that the townhouse definition is not to be applied to multifamily townhouse-like construction or developments. The States of Florida and Georgia are in the process of amending their adopted IRC in a similar manner.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: RANFONE-RB-1-R202

RB6–09/10
R202

Proponent: Dennis Pitts, American Forest & Paper Association

Revise definition as follows:

WOOD/PLASTIC COMPOSITE. A composite material made primarily from wood or cellulose-based materials ~~and~~ in combination with a smaller fraction of plastic(s) by weight.

Reason: This change is being put forward to coordinate the IRC definition with revisions under consideration for ASTM D 7032. The revision clarifies that the “primary” material in the composite is wood or other cellulose-based material with plastic(s) representing a smaller fraction of material.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: PITTS-RB-9-R202

RB7–09/10
R301.1.1, Chapter 44 (New)

Proponent: Julie Ruth, PE, JRuth Code Consulting, representing the American Architectural Manufacturers Association

1. Revise as follows:

R301.1.1 Alternative provisions. As an alternative to the requirements in Section R301.1 the following standards are permitted subject to the limitations of this code and the limitations therein. Where engineered design is used in conjunction with these standards, the design shall comply with the *International Building Code*.

1. American Forest and Paper Association (AF&PA) *Wood Frame Construction Manual* (WFCM).
2. American Iron and Steel Institute (AISI) *Standard for Cold-Formed Steel Framing—Prescriptive Method for One- and Two-Family Dwellings* (AISI S230).
3. ICC-400 *Standard on the Design and Construction of Log Structures*.
4. American Architectural Manufacturers Association/National Sunroom Association (AAMA) 2100 – *Specification for Sunrooms* for the construction of sunroom additions in areas of Seismic Design Category A and B only.

2. Add new standard to Chapter 44 as follows:

AAMA
2100-10 Specification for Sunrooms

Reason: The 2009 *International Residential Code* defines a sunroom as "A one-story structure attached to a *dwelling* with a *glazing area* in excess of 40 percent of the gross area of the structure's *exterior walls* and roof." These structures are typically constructed in one of two manners: 1) using typical wood framing techniques, or 2) using a stick system that consists of prefabricated framing of aluminum, fiberglass, wood or other materials, with glass or opaque wall or roof panels, and steel or aluminum connections.

The first technique can be done in accordance with the current provisions of the IRC for wood framed construction. There are not now, however, any provisions in the IRC for the second method of constructing a sunroom other than by engineering analysis or demonstrating equivalence to the current provisions of the *International Residential Code* by some other means. This proposal seeks to add testing of sunrooms to the provisions of AAMA/NSA 2100 - 10 *Specification for Sunrooms* to the available options for approval of sunroom construction in the IRC.

In 2002 the American Architectural Manufacturers Association, the National Sunroom Association and the National Patio Association published the first U.S. standard for the construction of sunroom – AAMA/NPEA/NSA 2100 – 02. The standard established five different categories of sunrooms based upon the intended use of the space, and established specific design criteria for them, based upon those same categories and intended end use. The document establishes specific parameters for a test structure, including minimum depth, width, slope of roof, etc., while relying upon documents such as the local building code and ASCE 7 to determine the minimum design loads that the testing is to be based upon.

As the document began to be used and proposed for inclusion in various codes (it is now referenced in the 2007 Florida Building Code) the members of the AAMA Sunroom Council became aware of improvements that were needed. These improvements included revisions that would bring the document more tightly in line with the requirements of AAMA/WDMA/CSA 101/I.S.2/A440 for the design, testing and labeling of windows, glass doors and skylights, and revisions that would bring the foundation requirements more closely in line with the requirements of the *International Residential Code*. AAMA/WDMA/CSA 101/I.S.2/A440 – 08 is referenced in the 2009 edition of the International Residential Code, International Building Code and International Energy Conservation Code for these products.

The standard is currently undergoing revision to incorporate the improvements mentioned above. If the revision is completed by the Code Development Hearings in Baltimore, we will ask the IRC Building and Energy Committee to approve it at that time. If not, we will have the revision complete and the next edition of the standard published and readily available before the 2010 Final Action Hearings for the 2012 International Residential Code for consideration by the active members of the ICC at that time.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: A review of the standard proposed for inclusion in the code, AAMA 2100, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: RUTH-RB-3-R301.1.1-CH 44

R301.1.4 (New), R301.1.4.1 (New), R301.1.4.2 (New), R301.1.4.3 (New), Figure R301.1.4 (New)

Proponent: Larry Wainright, Qualtim, Inc., representing the Structural Building components Industry

Add new text as follows:

R301.1.4 Building information sign. New buildings shall have a building information sign that shall comply with Sections R301.1.4.1 through R301.1.4.3.

R301.1.4.1 Sign location. The building information sign shall be required to be placed on each outside electrical meter box serving the structure. The sign shall be 3 ½ inches by 2 ½ inches and be made of reflective material.

R301.1.4.2 Sign shape. The sign shall consist of a symbol identifying three sections in a gable roof home. The top area shall indicate the construction type of the attic space while the bottom area shall indicate ceiling construction of the basement area. Multiple designations may be placed in each building information sign area, if applicable. Other designations may be used provided they are defined on the sign. See Figure R301.1.4.

R301.1.4.3 Sign designations. Designations shall be made based upon the construction type, and installed fire protection systems. The fire protection system installed in a building shall be designated in the center section of the sign as follows:

AS – Automated Fire Sprinkler System installed throughout
PS – Partial Automatic Fire Sprinkler System, and designate floor
NS – No system installed

T= Truss construction
E= Engineered lumber
C=Conventional Framing

FIGURE R301.1.4.
EXAMPLE OF BUILDING INFORMATION SIGN. (Labels may vary).

Reason: The purpose of this code change is to provide first responders with the information necessary to help facilitate fighting a residential fire. Information gleaned from this structural identification symbol will help first responders evaluate the construction of the building to determine how best to approach it. It is important that any labeling requirement assigned to residential structures be addressed in a manner that treats all construction methods equally, giving the firefighters the best information available.

Cost Impact: The code change proposal will not increase the cost of construction.

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. PART II WILL BE HEARD BY THE IFC COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IRC BUILDING/ENERGY

Add new text as follows:

R301.1.4 Structural identification marking. One and two-family homes utilizing light-frame construction, in structural components, shall be required to place an identification label on each outside electrical meter box serving the structure, or other conspicuous location as approved by the building official.

R301.1.4.1 Label form and content. The label shall be 3 ½ inches by 2 ½ inches and be made of reflective material. Each label shall include the following abbreviations, as applicable:

1. T to indicate Truss Construction
2. E to indicate Engineered Components
3. P to indicate the structural components are protected with a fire-resistant products
4. U to indicate the structural components are not protected by fire resistant products

R301.1.4.2 Label symbol and content. The label shall consist of a symbol identifying three sections in a gable roof home. The top shall indicate an attic space while the bottom third shall indicate basement area.

The abbreviations required by Section R301.1.4.1 indicating construction components shall be placed in the designated floor plan area, (i.e. T in the attic for Truss Roof, E in the basement to indicate Engineered Floors). Utilization of the middle area shall be approved by the local building official. See Figure R301.1.4.2.

FIGURE R301.1.4.2
EXAMPLE STRUCTURAL IDENTIFICATION LABEL

PART II – IFC

Add new text as follows:

316.6 Structural identification marking. One and two-family homes utilizing light-frame construction in structural components shall be required to place an identification label on each outside electrical meter box serving the structure, or other conspicuous location as approved by the fire chief.

316.6.1 Label form and content. The label shall be 3 ½ inches by 2 ½ inches and be made of reflective material. Each label shall include the following abbreviations, as applicable:

1. T to indicate Truss Construction
2. E to indicate Engineered Components
3. P to indicate the structural components are protected with a fire-resistant products
4. U to indicate the structural components are not protected by fire resistant products

316.6.2 Label symbol and content. The label shall consist of a symbol identifying three sections in a gable roof home. The top shall indicate an attic space while the bottom third shall indicate basement area

The abbreviations required by Section 316.6.1 indicating construction components shall be placed in the designated floor plan area, (i.e. T in the attic for Truss Roof, E in the basement to indicate Engineered Floors). Utilization of the middle area shall be approved by the fire code official. See Figure 316.6.2.

FIGURE 316.6.2
EXAMPLE STRUCTURAL IDENTIFICATION LABEL

Reason: On August 13, 2006 a Wisconsin fire fighter was killed, and a second fire fighter injured, when the floor they were operating on collapsed sending them into the basement. One fire fighter fell directly into the room of origin and was killed, the second fire fighter landed on the opposite side of a block wall and survived by shielding herself and making an escape through a rear window. They checked the floor to ensure it was safe and solid, just prior to collapse they heard a loud crack.

The floor they were operating on was unprotected lightweight construction that collapsed without warning. In the ensuing investigation, the National Institute for Occupational Safety and Health released report F2006-26[1]. One of the recommendations is to "modify current building codes to require that lightweight trusses be protected with a fire barrier". This should not only pertain to truss construction. There are additional forms of construction that can be determined to be lightweight, cold form steel, bar joists, wooden engineered I-beam, etc., the recent trend in residential construction is to use products that are financially beneficial. It is the belief of many of us in the fire service that as the industry engineers products to a more finite point we are losing our safety factors.

In their report 2007-12 released May 16, 2008, NIOSH[2] recommended "Ensure fire fighters are trained for extreme conditions such as high winds and rapid fire progression associated with lightweight construction". They further stated, "In this era of new lightweight construction, training procedures covering strategy and tactics in extreme operations conditions, such as high winds and lightweight building construction (i.e. materials and design) are needed for all levels of fire fighters. Lightweight constructed buildings fail rapidly with little warning, complicating rescue efforts. The potential for fire fighters to become trapped or involved in a collapse may be increased. There are twenty-nine actions for fire fighters can take to protect themselves when confronted with buildings utilizing lightweight building components as structural members. They range from looking for signs or indicators that these materials are used in buildings (such as, newer structures, large unsupported spans, and heavy black smoke being generated) to getting involved in newer building code development".

On September 27, 2007 NIOSH released report 2006-24[3]. The first recommendation of the report read "Ensure that fire fighters and incident commanders are aware unprotected pre-engineered I-joist floor systems may fail at a faster rate than solid wood joists when exposed to direct fire impingement, and they should plan interior operations accordingly". The discussion of the recommendation is quite lengthy but identifies the advantages of the construction industry using this type of construction but also relates the dangers to fire fighters, "The Illinois Fire Service Institute, at the University of Illinois, conducted tests to help determine the structural stability of sample floor systems. These studies suggest that engineered wooden I-beams can fail in as little as 4 minutes and 40 seconds under controlled test conditions". The report also states that weakened floors are difficult to detect from above as the floor surface may appear intact.

On November 16, 2007, NIOSH released report F2007-07[4]. In this Fire Fighter Death in the Line-of-Duty report, NIOSH recommends "building code officials and local authorities having jurisdiction should consider modifying the current codes to require that lightweight trusses are protected with a fire barrier on both the top and the bottom". The report further states "In this incident, the floor trusses for the first floor did not have any protection on the bottom cord, which immediately exposed the trusses to fire in the basement. Unfinished basements are very common throughout the country. Basements typically house additional fire exposures such as alternative heating sources, hot water heaters, clothes dryers, etc.. It is critical for trusses and lightweight engineered wood I-beams that are used in a load-bearing assembly to be protected with a thermal barrier such as gypsum wallboard. The function of the thermal barrier is a critical factor in the fire performance of the assembly".

In April, 2005, NIOSH released their report "Preventing Injuries and Deaths of Fire Fighters due to Truss System Failures"[5]. In their release they recommended the placement of a labeling system on buildings to indicate the type of construction. While this recommendation will probably not be acceptable to residents of a one or two family home, we can mandate that they increase the protection of the construction type to provide increased safety to the residents and the responding fire fighters.

In fact, NIOSH has been concerned enough with the performance of lightweight floors in fire conditions they released a Workplace Solutions report in February, 2009, *Preventing Deaths and Injuries of Fire Fighters Working Above Fire-Damaged Floors*[6]. Authors of the report recommend; "Builders, contractors, and owners should consider protecting all floor systems, including engineered wood I-joists, by covering the underside with fire-resistant materials".

Many of the opponents of this requirement have made claims that the fire service has failed to provide technical data to support our real world experiences with the lightweight products. Since the previous ICC code cycle there have been three specific reports released by three separate test groups performing tests for different reasons. I have included their results below.

The National Research Council Canada performed a series of tests in creating their report Fire Performance of Houses, Phase I: Study of Unprotected Floor Assemblies in Basement Fire Scenarios, released December 18, 2008. The goal of the report was "With the advent of new materials and innovative construction products and systems for use in construction of houses, there is a need to understand what impacts these materials and products will have on occupant life safety under fire conditions and a need to develop a technical basis for the evaluation of their fire performance"[7]. These tests were not intentionally conducted for fire fighter safety but rather to identify the dangers to the civilian occupants and their ability to self evacuate. The report states "With the relatively severe fire scenarios used in the experiments, the times to reach structural failure for the wood I-joist, steel C-joist, metal plate and metal wood truss assemblies were 35-60% shorter than that for the solid wood joist assembly". Additionally, "For the solid wood joist assemblies, the structural failure occurred after deflection of the floor, mainly in the form of OSB subfloor failure (burn through). For all other floor assemblies, after deflection of the floor, the structural failure occurred either in the form of complete collapse into the basement or in the form of a "V" shaped collapse due to joist or truss failure". In keeping with the intent of occupant safety the report also found "One engineered floor assembly, which gave the shortest time to reach structural failure in the open basement scenario, failed structurally in the closed basement doorway scenario before the tenability limits were reached for healthy adults of average susceptibility". This calls into question, if it can not give the occupant time to self evacuate how will it perform when a fire fighter is performing Search and Rescue for that specific occupant. In summarizing the various test results the report found "The time gap between the onset of untenable conditions and the structural failure of the floor assembly was smaller for the engineered floor assemblies than for the solid wood joist assembly used in the experiments". This is very serious for the responding fire fighter performing life saving Search and Rescue for occupants who have lost consciousness due to the untenable conditions. These victims may still be savable but, the performances of the lightweight assemblies indicate that, savable victims may not be reached due to floor compromise.

In 2008 Tyco Fire Suppression & Building Products performed a series of fire tests. The intent of these tests was to demonstrate the impact residential sprinklers will have in improving fire safety in one and two-family occupancies when lightweight construction is present. The results of these tests were released in 2008 as A Technical Analysis: The Performance of Composite Wood Joists Under Realistic Fire Conditions[8]. In the introduction of the report the author states, "One example of the difference in fire performance of a lightweight structural member compared to solid sawn lumber is the behavior of composite wood joists. When a composite wood joist is exposed to fire, the thin oriented strand board used as the web in the joist is quickly consumed, which results in an inability of the joist to carry the load and ultimately a failure of the supported floor assembly". Later in the introduction the report continues "Due to the greater mass per unit of surface area of the solid wood joist, it will support the floor assembly for much longer than its lightweight alternative when exposed to equivalent fire conditions". The first test involving an unsprinklered room fire led to flashover in 7:09 from ignition and floor assembly collapse at the 11:30 mark from ignition. That is roughly four minutes from flashover we had a collapse of almost the entire 16' x 16' floor area. The second test results reached flashover in only 5:15 from ignition, collapse in this test occurred at 8:34 from ignition, a stunning three minutes after flashover. This would be the time the fire fighters are entering the structure for suppression and Search and Rescue efforts.

These reports are still not enough for some critics so I am referencing a third report. Underwriters Laboratories, The Chicago Fire Department and the International Association of Fire Chiefs received a grant from the Department of Homeland Security to conduct a number of tests on various topics but the main issue was to conduct tests, and report the findings, to evaluate the performance of lightweight structural components when exposed to fire and if the components can be protected. They recently issued the subsequent report *Structural Stability of Engineered Lumber in Fire Conditions*[9]. Tests assemblies were subjected to the standards of the ASTM E119 Test Standard. Two assemblies did not include a ceiling, six of the assemblies included a ceiling consisting of ½ inch thick gypsum board and one assembly included a ¾ inch plaster ceiling. A load of 40 psf was placed along two of the four edges and two 300 lb fire fighter mannequins were applied to the floor assembly. Results from the tests indicated that unprotected 12" wooden I-joist reached structural failure at the 5:58 mark in the tests. The resulting failure covered a large area of the floor. The unprotected 2" x 10" wooden I-beams reached structural collapse at the 18:45 mark in the test, a difference of over twelve minutes. These twelve minutes are critical in Search and Rescue. Further tests demonstrated that when ½ inch gypsum was placed on the 12" I-joists the collapse did not occur until the 26:45 mark in the test. Just a simple ½ covering extended the collapse time approximately twenty minutes. When the ½ inch covering was applied to the wooden I-beams the collapse time was extended to 44:45 mark in the test. One important factor to point out regarding these tests is that the fire fighters are a dead load and not a live load. Would a simulated live load of fire fighters transferring additional psi with each step or crawl have contributed to an earlier collapse? When we review the Wisconsin fire where Engineer Arnie Wolf was killed, the fire fighters stated the floor felt solid but suffered a catastrophic collapse when they began their search pattern. These tests clearly outline the performances of the various construction practices and the dangers these performances present to fire fighters. Underwriters Laboratories and the Chicago Fire Department followed these tests with an online educational program, to view go to http://www.uluniversity.us/home.aspx, in an attempt to educate the nation's fire service on the hazards of operating in these environments.

This code change proposal is an attempt to provide a responsible means on residential construction. I have provided examples of fire fighters being killed in occupancies utilizing lightweight construction practices and the subsequent reports detailing the need to protect lightweight construction. I have also provided two reports generated by a neutral governmental agency recommending protection requirements for lightweight construction. These incidents, and others like them, have produced great hardships on the people involved, they have created widows, fatherless children, injured fire fighters and many who bear the pain of fatalities that could have been prevented. I strongly urge your support for this proposed code change.

While we are attempting to protect the structural elements of lightweight construction information is still critical to the Incident Commander and responding fire fighters. Identifying potential life threatening situations in a non-invading manner is a big step forward and can provide valuable and potentially lifesaving information.

For SI: 1 mile per hour = 0.44 m/s, 1 pound per square foot = 0.0479kPa, 1 foot = 304.8 mm.

a. Values have been reduced for 0.77 Importance Factor in accordance with Section R301.1.5.3.
b. Minimum design pressure shall be 10 psf in accordance with Section R301.1.5.1.
c. Loads are applicable to screen enclosures with a mean roof height of 30 feet or less. For screen enclosures of different heights the pressures given shall be adjusted by multiplying the table pressure by the adjustment factor given in Table R301.1.5(2).

d. For Load Case A flow thru condition the pressure given shall be applied simultaneously to both the upwind and downwind screen walls acting in the same direction as the wind. The structure shall also be analyzed for wind coming from the opposite direction. For the non-flow thru condition the screen enclosure wall shall be analyzed for the load applied acting toward the interior of the enclosure.
e. For Load Case B the table pressure multiplied by the projected frontal area of the screen enclosure is the total drag force, including drag on screen surfaces parallel to the wind, which must be transmitted to the ground. Use Load Case A for members directly supporting the screen surface perpendicular to the wind. Load Case B loads shall be applied only to structural members which carry wind loads from more than one surface.
f. The roof structure shall be analyzed for the pressure given occurring both upward and downward.

TABLE R301.1.5(2)
HEIGHT ADJUSTMENT FACTORS

MEAN	EXPOSURE	
Roof Height (ft)	B	C
15	1	0.86
20	1	0.92
25	1	0.96

Proponent: Gary Ehrlich, PE, National Association of Home Builders (NAHB)

Revise as follows:

R301.2.1 Wind design criteria ~~limitations~~. Buildings, and portions thereof, shall be constructed in accordance with the wind provisions of this code using the basic ~~limited by~~ wind speed~~, as defined~~ in Table R301.2(1)~~ and construction methods in accordance with this code. Basic wind speeds shall be~~ as determined from Figure R301.2(4). Where different construction methods and structural materials are used for various portions of a building, the applicable requirements of this section for each portion shall apply. Where ~~loads for wall coverings, curtain walls, roof coverings, exterior windows, skylights, garage doors and exterior doors are~~ not otherwise specified, the wind loads listed in Table R301.2(2) adjusted for height and exposure using Table R301.2(3) shall be used to determine design load performance requirements for wall coverings, curtain walls, roof coverings, exterior windows, skylights, garage doors and exterior doors. Asphalt shingles shall be designed for wind speeds in accordance with Section R905.2.6.

R301.2.1.1 Wind limitations ~~Design criteria~~. ~~In~~ The wind provisions of this code shall apply to the design of buildings ~~regions~~ where the basic wind speed~~s~~ from Figure R301.2(4) is less than ~~equal or exceed~~ 100 miles per hour (45 m/s) in *hurricane-prone regions*, or 110 miles per hour (49 m/s) elsewhere~~, the design of buildings shall be in accordance with one of the following methods. The elements of design not addressed by those documents in Items 1 through 4 shall be in accordance with this code~~.

Exceptions:

1. For concrete construction, the wind provisions of this code shall apply in accordance with the limitations of Sections R404 and R611.
2. For structural insulated panels, the wind provisions of this code shall apply in accordance with the limitations of Section R614.

Where the basic wind speed exceeds the limitations above, the design of buildings for wind resistance shall be in accordance with one or more of the following methods:

1. American Forest and Paper Association (AF&PA) *Wood Frame Construction Manual for One- and Two-Family Dwellings* (WFCM); ~~or~~
2. International Code Council (ICC) *Standard for Residential Construction in High-Wind Regions* (ICC-600); ~~or~~
3. *Minimum Design Loads for Buildings and Other Structures* (ASCE-7); ~~or~~
4. American Iron and Steel Institute (AISI), *Standard for Cold-Formed Steel Framing—Prescriptive Method For One- and Two-Family Dwellings (AISI 230).*
5. ~~Concrete construction shall be designed in accordance with the provisions of this code.~~
6. ~~Structural insulated panel (SIP) walls shall be designed in accordance with the provisions of this code.~~

The elements of design not addressed by the methods in Items 1 through 4 shall be in accordance with the provisions of this code.

R301.2.2.2.5 Irregular buildings. The seismic provisions of ~~Prescriptive construction as regulated by~~ this code shall not be used for irregular structures located in Seismic Design Categories C, D0, D1 and D2. Irregular portions of structures shall be designed in accordance with accepted engineering practice to the extent the irregular features affect the performance of the remaining structural system. When the forces associated with the irregularity are resisted by a structural system designed in accordance with accepted engineering practice, design of the remainder of the building shall be permitted using the provisions of this code. A building or portion of a building shall be considered to be irregular when one or more of the following conditions occur:

1. When exterior shear wall lines or *braced wall panels* are not in one plane vertically from the foundation to the uppermost *story* in which they are required.

   Exception: For wood light-frame construction, floors with cantilevers or setbacks not exceeding four times the nominal depth of the wood floor joists are permitted to support *braced wall panels* that are out of plane with *braced wall panels* below provided that:

   1. Floor joists are nominal 2 inches by 10 inches (51 mm by 254 mm) or larger and spaced not more than 16 inches (406 mm) on center.
   2. The ratio of the back span to the cantilever is at least 2 to 1.
   3. Floor joists at ends of *braced wall panels* are doubled.
   4. For wood-frame construction, a continuous rim joist is connected to ends of all cantilever joists. When spliced, the rim joists shall be spliced using a galvanized metal tie not less than 0.058 inch (1.5 mm) (16 gage) and 11/2 inches (38 mm) wide fastened with six 16d nails on each side of the splice or a block of the same size as the rim joist of sufficient length to fit securely between the joist space at which the splice occurs fastened with eight 16d nails on each side of the splice; and
   5. Gravity loads carried at the end of cantilevered joists are limited to uniform wall and roof loads and the reactions from headers having a span of 8 feet (2438 mm) or less.
2. When a section of floor or roof is not laterally supported by shear walls or *braced wall lines* on all edges.

   Exception: Portions of floors that do not support shear walls or *braced wall panels* above, or roofs, shall be permitted to extend no more than 6 feet (1829 mm) beyond a shear wall or *braced wall line*.

3. When the end of a *braced wall panel* occurs over an opening in the wall below and ends at a horizontal distance greater than 1 foot (305 mm) from the edge of the opening. This provision is applicable to shear walls and *braced wall panels* offset in plane and to *braced wall panels* offset out of plane as permitted by the exception to Item 1 above.

   Exception: For wood light-frame wall construction, one end of a *braced wall panel* shall be permitted to extend more than 1 foot (305 mm) over an opening not more than 8 feet (2438 mm) wide in the wall below provided that the opening includes a header in accordance with the following:

1. The building width, loading condition and framing member species limitations of Table R502.5(1) shall apply; and
2. Not less than one 2 × 12 or two 2 × 10 for an opening not more than 4 feet (1219 mm) wide; or
3. Not less than two 2 × 12 or three 2 × 10 for an opening not more than 6 feet (1829 mm) wide; or
4. Not less than three 2 × 12 or four 2 × 10 for an opening not more than 8 feet (2438 mm) wide; and
5. The entire length of the *braced wall panel* does not occur over an opening in the wall below.

4. When an opening in a floor or roof exceeds the lesser of 12 feet (3658 mm) or 50 percent of the least floor or roof dimension.
5. When portions of a floor level are vertically offset.

Exceptions:

1. Framing supported directly by continuous foundations at the perimeter of the building.
2. For wood light-frame construction, floors shall be permitted to be vertically offset when the floor framing is lapped or tied together as required by Section R502.6.1.

6. When shear walls and *braced wall lines* do not occur in two perpendicular directions.
7. When stories above-*grade* partially or completely braced by wood wall framing in accordance with Section R602 or steel wall framing in accordance with Section R603 include masonry or concrete construction.

Exception: Fireplaces, chimneys and masonry veneer as permitted by this code. When this irregularity applies, the entire *story* shall be designed in accordance withaccepted engineering practice.

R301.2.2.4 Seismic Design Category E. Buildings in Seismic Design Category E shall be designed to resist seismic loads in accordance with the *International Building Code*, except when the seismic design category is reclassified to a lower seismic design category in accordance with Section R301.2.2.1. Components of buildings not required to be designed to resist seismic loads shall be constructed in accordance with the provisions of this code.

R301.3 Story height. The wind and seismic provisions of this code shall apply to buildings with story heights not exceeding the following: ~~Buildings constructed in accordance with these provisions shall be limited to story heights of not more than the following:~~

1. For wood wall framing, the laterally unsupported bearing wall stud height permitted by Table R602.3(5) plus a height of floor framing not to exceed 16 inches (406 mm).

   Exception: For wood framed wall buildings with bracing in accordance with Tables R602.10.1.2(1) and R602.10.1.2(2), the wall stud clear height used to determine the maximum permitted *story height* may be increased to 12 feet (3658 mm) without requiring an engineered design for the building wind and seismic force resisting systems provided that the length of bracing required by Table R602.10.1.2(1) is increased by multiplying by a factor of 1.10 and the length of bracing required by Table R602.10.1.2(2) is increased by multiplying by a factor of 1.20. Wall studs are still subject to the requirements of this section.

2. For steel wall framing, a stud height of 10 feet (3048 mm), plus a height of floor framing not to exceed 16 inches (406 mm).
3. For masonry walls, a maximum bearing wall clear height of 12 feet (3658 mm) plus a height of floor framing not to exceed 16 inches (406 mm).

   Exception: An additional 8 feet (2438 mm) is permitted for gable end walls.

4. For insulating concrete form walls, the maximum bearing wall height per *story* as permitted by Section R611 tables plus a height of floor framing not to exceed 16 inches (406 mm).
5. For structural insulated panel (SIP) walls, the maximum bearing wall height per *story* as permitted by Section 614 tables shall not exceed 10 feet (3048 mm) plus a height of floor framing not to exceed 16 inches (406 mm).

Individual walls or walls studs shall be permitted to exceed these limits as permitted by Chapter 6 provisions, provided story heights are not exceeded. Floor framing height shall be permitted to exceed these limits provided the story height does not exceed 11 feet 7 inches (3531 mm). An engineered design shall be provided for the wall or wall framing members when they exceed the limits of Chapter 6. Where the story height limits of this section are exceeded, the design of the building, or the non-compliant portions thereof, to resist wind and seismic loads ~~an engineered design~~ shall be ~~provided~~ in accordance with the *International Building Code* ~~for the overall wind and seismic force resisting systems~~.

Reason: The purpose of this code proposal is to clarify the IRC limitations for wind and seismic design. Code users have expressed confusion over the current language of the wind limitations and other code limits on structural elements. Some builders and code officials believe that if a dwelling exceeds the wind limits of R301.2.1.1, the seismic limits of R301.2.2, or the story height limits of R301.3, the entire dwelling must be designed in accordance with the IBC, including the HVAC, electrical and plumbing systems and the provisions of the IBC for egress, fire rating, and other architectural elements.

This code proposal clarifies that it is only the structural design of the dwelling to resist wind loads or seismic loads, and the selection of certain critical components such as windows or roofing that is prone to wind damage, which must be performed in accordance with the IBC or the other alternate standards (e.g. the WFCM or the AISI standards). The remaining architectural, mechanical, electrical and plumbing provisions of the IRC still apply to the dwelling.

Section R301.2.1.1 is reorganized for better readability and flow. Its title is swapped with R301.2.1, since it is the larger paragraph above that actually provides design criteria and Section R301.2.1.1 that actually provides wind limitations. Section R301.3 is also revised as noted above to clarify it is the structural portions exceeding the story height limits that require an engineering design.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: EHRLICH-RB-1-R301.2.1

RB13–09/10
R301.2.1.1

Proponent: Gary Ehrlich, PE, National Association of Home Builders (NAHB)

Revise as follows:

R301.2.1.1 Design criteria. In regions where the basic wind speeds from Figure R301.2(4) equal or exceed ~~100 miles per hour (45 m/s) in *hurricane-prone regions*, or~~ 110 miles per hour (49m/s) ~~elsewhere~~, the design of buildings shall be in accordance with one of the following methods. The elements of design not addressed by those documents in Items 1 through 4 shall be in accordance with this code.

1. American Forest and Paper Association (AF&PA) *Wood Frame Construction Manual for One- and Two-Family Dwellings* (WFCM); or
2. International Code Council (ICC) *Standard for Residential Construction in High-Wind Regions* (ICC-600); or
3. *Minimum Design Loads for Buildings and Other Structures* (ASCE-7); or
4. American Iron and Steel Institute (AISI), *Standard for Cold-Formed Steel Framing—Prescriptive Method For One- and Two-Family Dwellings (AISI 230).*
5. Concrete construction shall be designed in accordance with the provisions of this code.
6. Structural insulated panel (SIP) walls shall be designed in accordance with the provisions of this code.

Reason: The purpose of this proposal is to restore the IRC scope limit for construction in high-wind areas to the original 110 miles per hour for all areas of the country. Without this revision, houses in areas along the Atlantic and Gulf coasts where the basic wind speed is 100 or 105 miles per hour will need to be engineered or designed to prescriptive requirements intended for areas at risk for Category 4 and 5 hurricanes.

As justification for the original code change made during the 2004-2005 Code Development Cycle (RB31-04/05) the Institute for Building and Home Safety (IBHS) cited four issues: roof sheathing nails, wind bracing requirements, toe-nailed uplift connections, and wall-to-wall connections at the floor line. In lieu of pursuing individual modifications to resolve these issues within the IRC, the proponent simply lowered the ceiling for using prescriptive design provisions along the Atlantic & Gulf coasts. We believe this is excessive and not supported by the observed performance of housing properly constructed to previous editions of the IRC in extreme wind events (hurricanes). At no time did the proponents ever provide documented evidence of failures of structures constructed to the previous IRC provisions. Nor did they provide technical justification in the form of engineering calculations or structural research to support their contentions. However, the 2004-2005 Code Development Cycle coincided with the four 2004 Florida hurricanes (Wilma, Ivan, Charley and Frances) and with Katrina and Rita in 2005. This led to significant political and emotional pressure on the code development community to increase the stringency of building codes, whether or not they were technically justified or appropriately targeted to the risk of severe wind events in those areas subject to the new provisions.

In the subsequent code development cycles, individual changes have been made to address all four issues raised by IBHS. The 2006 IRC increased the minimum roof sheathing nail size from 6d to 8d common nails for all roofs, and the gable and eave end zone nail spacing was tightened for dwellings in the 100mph region. The wall bracing provisions in the 2009 IRC have been reorganized, improved, and clarified and many new construction details provided. Most importantly, a new wind bracing table is provided which ties the required wall bracing for wind resistance to the wind loads determined using ASCE 7-05. Finally, a requirement for a continuous load path at the roof-to-wall, floor-to-floor, and floor-to-foundation connections at braced wall panels was added.

The 2009 IRC also provides requirements for wind resistance of exterior wood sheathing and for the installation of vinyl siding and foam sheathing. These new requirements further increase the resistance of structures built under the IRC to wind damage.

We question the age of the damaged structures used for justifying the code change reducing the IRC scope. The Federal Emergency Management Agency Summary Reports on Building Performance from the 2004 hurricane season and from Hurricane Katrina in 2005 indicated that structures built to the 2000 and 2003 IRC performed extremely well. The 2004 hurricane report stated (p.13), “no structural failures were observed to structures designed and constructed to the wind design requirements of…the 2000 IBC/IRC…” The Hurricane Katrina report stated (p.4-8), “Most structural failures observed…appeared to be the result of inadequate design and construction methods commonly used before IBC 2000 and IRC 2000 were adopted and enforced.” Finally, a study conducted by the Texas Windstorm Insurance Association after Hurricane Rita showed there was substantially less damage and substantially fewer insurance claims in those areas where the 2000 or 2003 IBC and IRC were adopted and enforced.

NAHB estimates show that complying with the ICC-600 Standard for Residential Construction in High Wind Regions or the AF&PA Wood Frame Construction Manual where required by the IRC can add as much as $10,000 to the cost of a home. We believe these additional requirements make it extremely difficult to construct affordable housing along the Atlantic and Gulf coasts and place an onerous burden on builders and homeowners, and particularly on first-time home buyers. This added cost of construction will have the effect of keeping residents of these areas in older homes which do not have the robust construction provided by the IRC prescriptive provisions and which will be substantially more susceptible to structural failures, water infiltration and damage to personal property in high wind events.

Cost Impact: The code change proposal will not increase the cost of construction.

R202, R301.2.1, Figure R301.2(4), Figure R301.2(4)A (New), R301.2.1.1, Figure R301.2(4)B (New), R301.2.1.2, Figure R301.2(4)C, R301.2.1.4

Proponent: James Rossberg, Structural Engineering Institute of ASCE

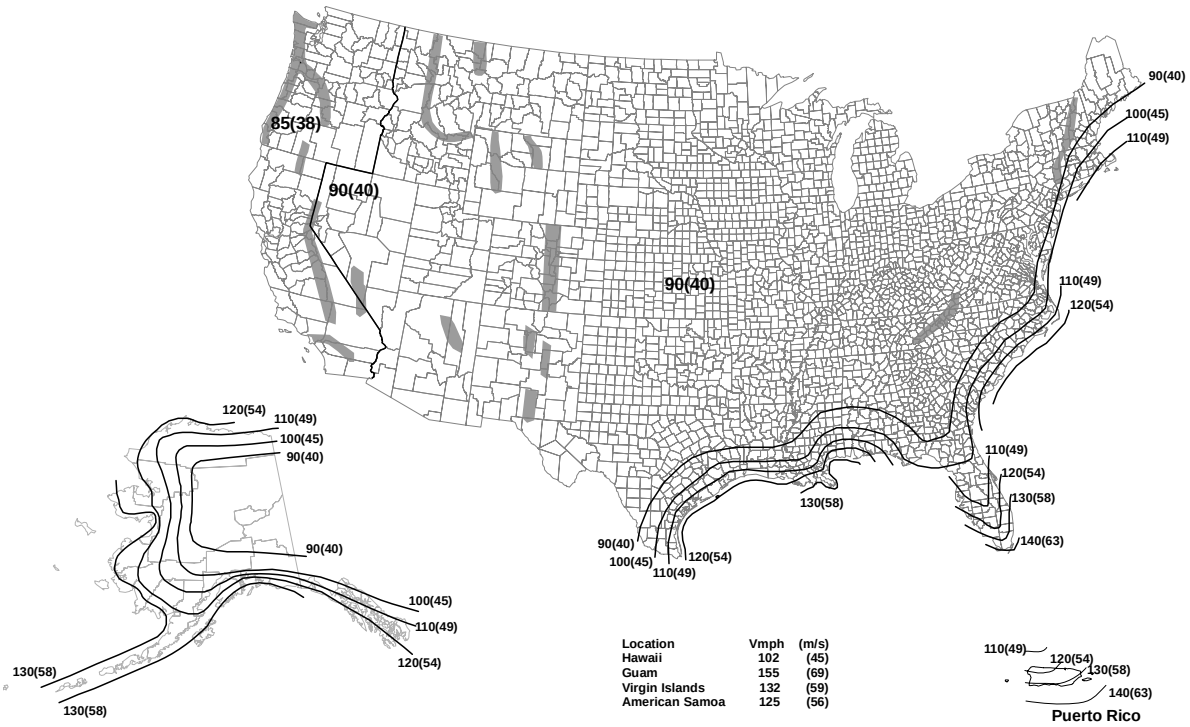
1. Revise as follows:

BASIC WIND SPEED. Three-second gust speed at 33 feet (10 058 mm) above the ground in Exposure C (see Section R301.2.1) as given in Figure R301.2(4)A.

WIND BORNE DEBRIS REGION. Areas within hurricane-prone regions as designated in accordance with Figure R302.1(4)C ~~within one mile of the coastal mean high water line where the basic wind speed is 110 miles per hour (49 m/s) or greater; or where the basic wind speed is equal to or greater than 120 miles per hour (54 m/s); or Hawaii~~.

R301.2.1 Wind limitations. Buildings and portions thereof shall be limited by wind speed, as defined in TableR301.2(1) and construction methods in accordance with this code. Basic wind speeds shall be determined from Figure R301.2(4)A. The structural provisions of this code for wind loads are not permitted where wind design is required as specified in Section R301.2.1.1. Where different construction methods and structural materials are used for various portions of a building, the applicable requirements of this section for each portion shall apply. Where loads for wall coverings, curtain walls, roof coverings, exterior windows, skylights, garage doors and exterior doors are not otherwise specified, the loads listed in Table R301.2(2) adjusted for height and exposure using Table R301.2(3) shall be used to determine design load performance requirements for wall coverings, curtain walls, roof coverings, exterior windows, skylights, garage doors and exterior doors. Asphalt shingles shall be designed for wind speeds in accordance with Section R905.2.6.

2. Delete Figure R301.2(4) and replace as follows:



Notes:
1. Values are nominal design 3-second gust wind speeds in miles per hour (m/s) at 33 ft (10m) above ground for Exposure C category.
2. Linear interpolation between contours is permitted.
3. Islands and coastal areas outside the last contour shall use the last wind speed contour of the coastal area.
4. Mountainous terrain, gorges, ocean promontories, and special wind regions shall be examined for unusual wind conditions.

FIGURE R301.2(4)A
BASIC WIND SPEEDS

3. Revise as follows:

R301.2.1.1 Wind design required ~~Design criteria~~. In regions where wind design is required in accordance with ~~the basic wind speeds from~~ Figure R301.2(4)B ~~equal or exceed 100 miles per hour (45 m/s) in *hurricane-prone regions*, or 110 miles per hour (49 m/s) elsewhere~~, the design of buildings for wind loads shall be in accordance with one of the following methods. The elements of design not addressed by those documents in Items 1 through 4 shall be in accordance with this code.

1. American Forest and Paper Association (AF&PA) *Wood Frame Construction Manual for One- and Two-Family Dwellings* (WFCM); or
2. International Code Council (ICC) *Standard for Residential Construction in High Wind Regions* (ICC-600); or
3. *Minimum Design Loads for Buildings and Other Structures* (ASCE-7); or
4. American Iron and Steel Institute (AISI), *Standard for Cold-Formed Steel Framing—Prescriptive Method For One- and Two-Family Dwellings* (AISI S230).
5. Concrete construction shall be designed in accordance with the provisions of this code.
6. Structural insulated panel (SIP) walls shall be designed in accordance with the provisions of this code.
7. *International Building Code*

When ASCE 7 or the *International Building Code* is used for the design of the building, the wind speed map and exposure category requirements as specified in ASCE 7 and the *International Building Code* shall be used.

4. Add new figure as follows:

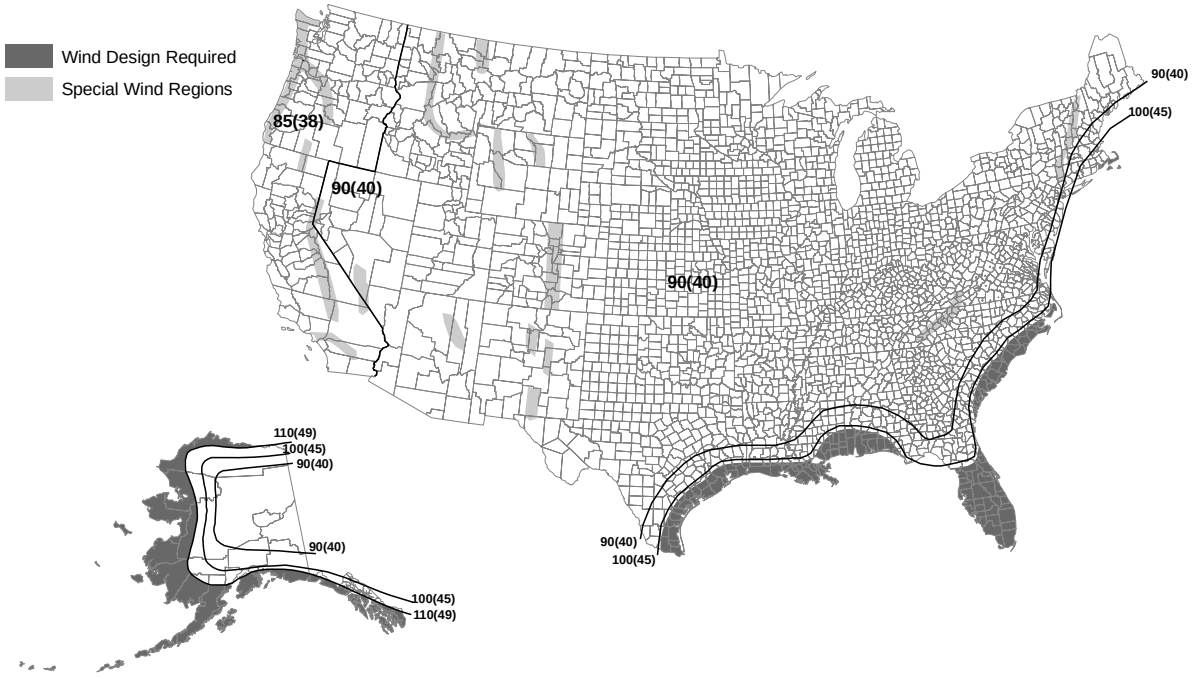


FIGURE R301.2(4)B
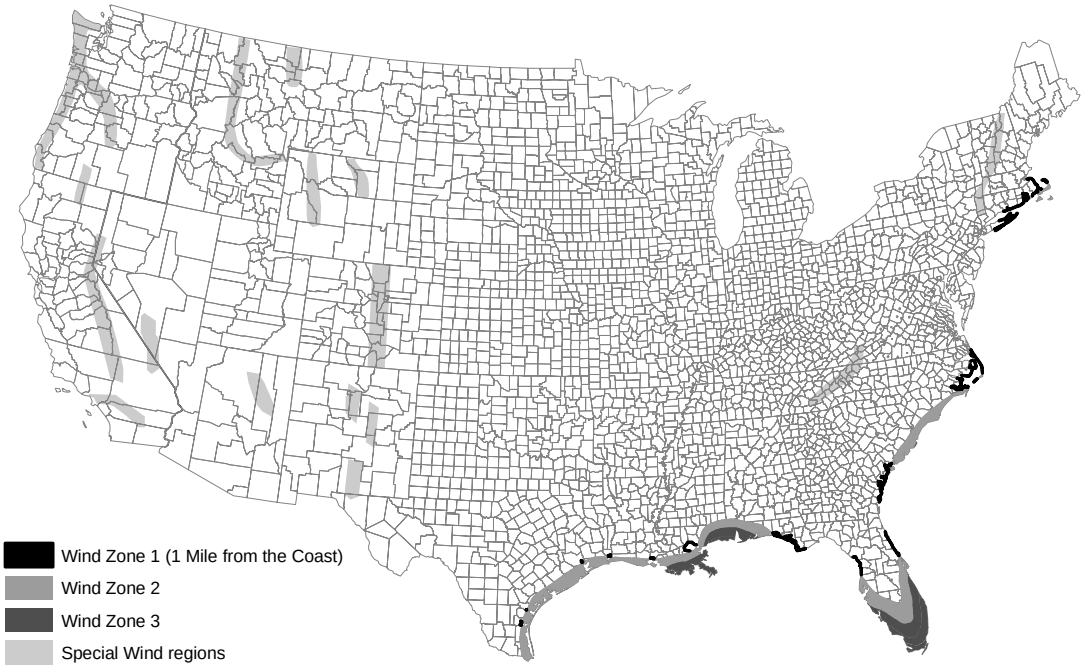
REGIONS WHERE WIND DESIGN IS REQUIRED

5. Revise as follows:

R301.2.1.2 Protection of openings. Glazing ~~Windows~~ in buildings located in windborne debris regions shall be ~~have glazed openings~~ protected from windborne debris. Glazed opening protection for windborne debris shall meet the requirements of the Large Missile Test of ASTM E 1996 and ASTM E 1886 referenced therein. The applicable wind zones for establishing missile types in ASTM E 1996 are shown on Figure R301.2(4)C. Garage door glazed opening protection for windborne debris shall meet the requirements of an *approved* impact resisting standard or ANSI/DASMA 115.

Exception: Wood structural panels with a minimum thickness of 7/16 inch (11 mm) and a maximum span of 8 feet (2438 mm) shall be permitted for opening protection in one- and two-story buildings. Panels shall be precut and attached to the framing surrounding the opening containing the product with the glazed opening. Panels shall be predrilled as required for the anchorage method and shall be secured with the attachment hardware provided. Attachments shall be designed to resist the component and cladding loads determined in accordance with either Table R301.2(2) or ASCE 7, with the permanent corrosion resistant attachment hardware provided and anchors permanently installed on the building. Attachment in accordance with Table R301.2.1.2 is permitted for buildings with a mean roof height of 33 feet (10 058 mm) or less where located in Wind Zones 1 and 2 in accordance with Figure R301.2(4)C ~~wind speeds do not exceed 130 miles per hour (58 m/s)~~.

5. Add new figure as follows:



Note:
Wind Zone 3 applies for:
Guam
Virgin Islands
American Samoa
Puerto Rico

Note: Wind Zone 3 applies in Wind Zone 2 areas that are within a mile of the coast

Note: Wind Zone 1 applies in Hawaii - Special Wind Regions

FIGURE R301.2(4)C
WIND-BORNE DEBRIS REGIONS

6. Revise as follows:

R301.2.1.4 Exposure category. For each wind direction considered, an exposure category that adequately reflects the characteristics of ground surface irregularities shall be determined for the site at which the building or structure is to be constructed. For a site located in the transition zone between categories, the category resulting in the largest wind forces shall apply. Account shall be taken of variations in ground surface roughness that arise from natural topography and vegetation as well as from constructed features. For a site where multiple detached one- and two-family dwellings, *townhouses* or other structures are to be constructed as part of a subdivision, master-planned community, or otherwise designated as a developed area by the authority having jurisdiction, the exposure category for an individual structure shall be based upon the site conditions that will exist at the time when all adjacent structures on the site have been constructed, provided their construction is expected to begin within one year of the start of construction for the structure for which the exposure category is determined. For any given wind direction, the exposure in which a specific building or other structure is sited shall be assessed as being one of the following categories:

1. Exposure A. Large city centers with at least 50 percent of the buildings having a height in excess of 70 feet (21 336 mm). Use of this exposure category shall be limited to those areas for which terrain representative of Exposure A prevails in the upwind direction for a distance of at least 0.5 mile (0.8 km) or 10 times the height of the building or other structure, whichever is greater. Possible channeling effects or increased velocity

pressures due to the building or structure being located in the wake of adjacent buildings shall be taken into account.

2. Exposure B. Urban and suburban areas, wooded areas, or other terrain with numerous closely spaced obstructions having the size of single-family dwellings or larger. Exposure B shall be assumed unless the site meets the definition of another type exposure.
3. Exposure C. Open terrain with scattered obstructions, including surface undulations or other irregularities, having heights generally less than 30 feet (9144 mm) extending more than 1500 feet (457 m) from the building site in any quadrant. This exposure shall also apply to any building located within Exposure B type terrain where the building is directly adjacent to open areas of Exposure C type terrain in any quadrant for a distance of more than 600 feet (183 m). This category includes flat open country~~,~~ and grasslands ~~and shorelines in hurricane prone regions~~.
4. Exposure D. Flat, unobstructed areas exposed to wind flowing over open water ~~(excluding shorelines in hurricane prone regions)~~ for a distance of at least 1 mile (1.61 km). Shorelines in Exposure D include inland waterways, the Great Lakes, and coastal areas of California, Oregon, Washington and Alaska. This exposure shall apply only to those buildings and other structures exposed to the wind coming from over the water. Exposure D extends inland from the shoreline a distance of 1500 feet (457 m) or 10 times the height of the building or structure, whichever is greater.

Reason: The purpose of this proposal is to update and coordinate the provisions of the 2012 IRC with those of the 2010 edition of ASCE 7 for the determination of wind loads, specifically to incorporate the effect of the new wind speed maps that have been adopted into ASCE 7.

Over the past 10 years, new data and research has been performed that indicates that the hurricane wind speeds provided in the current maps of the IBC-09 and ASCE-05 are too conservative and needed to be adjusted downward. Significantly more hurricane data have become available thereby allowing for substantial improvements in the hurricane simulation model that is used to create the wind speed maps.

These new data have resulted in an improved representation of the hurricane wind field, including the modeling of the sea-land transition and the hurricane boundary layer height; new models for hurricane weakening after landfall; and an improved statistical model for the Holland *B* parameter which controls the wind pressure relationship. The new hurricane hazard model yields hurricane wind speeds that are lower than those given in ASCE 7-05 and IBC-09 even though the overall rate of intense storms (as defined by central pressure) produced by the new model is increased compared to those produced by the hurricane simulation model used to develop previous maps.

In preparing the new maps, the ASCE 7 standards committee decided to use multiple ultimate event or strength design maps, based on the different Occupancy Categories in conjunction with a wind load factor of 1.0 for strength design – for allowable stress design, the factor was reduced from 1.0 to 0.6. Several factors that are important to an accurate wind load standard led to this decision:

(i) An ultimate event or strength design wind speed map makes the overall approach consistent with that used in seismic design in that they both map ultimate events and use a load factor of 1.0 for strength design.
(ii) Utilizing different maps for the different Occupancy Categories eliminates the problems associated with using “importance factors” that vary with category. The difference in the importance factors in hurricane prone and non-hurricane prone regions for Category I structures prompted many questions and have been removed from ASCE 7-10.
(iii) The use of multiple maps eliminates the confusion associated with the recurrence interval associated with the existing map - the map was not a uniform fifty year return period map. This therefore created a situation where the level of safety provided for within the overall design was not consistent along the hurricane coast.

Because of the prescriptive nature of the IRC and the considerable number of embedded wind speed triggers throughout the code, integrating the new wind speed map into the IRC necessitated a different approach than the change proposed for the IBC. For ease of the users of the IRC, it was decided to scale down the ultimate map or strength design map to a nominal or design level basic wind speed map. This proposed new map, Figure R301.2(4)A is the ultimate map in the proposed new edition of ASCE 7 with the wind speeds divided by the square root of the load factor ($V/\sqrt{1.6}$) with contours corresponding to whole numbers. The use of a scaled down map was necessary due to the significant number of wind speed triggers embedded throughout that IRC that are based on the old nominal or design level map. This map is offered as an easy means to transition the triggers in the IRC to the new ultimate maps during the next code change cycle. Another new map, Figure R301.2(4)B is introduced which indicates where wind design is required. This map replaces the 100 mph limit specified in Section R301.2.1.1 in the 2009 IRC and corresponds to 130 mph on the ultimate map for most of the hurricane prone region. Because the locations of wind-borne debris regions are tied to the ultimate maps in the proposed new edition of ASCE 7, a new map (Figure R301.2(4)C has been introduced to delineate the various wind borne debris regions for use with ASTM E1996 and E1886.

ASCE/SEI 7 has been a referenced standard of the IBC since its inception and as such it is well known to the building community. ASCE/SEI 7 is published and maintained by the Structural Engineering Institute of the American Society of Civil Engineers (SEI/ASCE). The document is a nationally recognized consensus standard developed in full compliance with the ASCE *Rules for Standards Committees*. The ASCE standards process is fully accredited by the American National Standards Institute (ANSI).

As of the submission date of this code change, the ASCE 7 Standards Committee is completing the committee balloting portion of the 2010 edition of ASCE/SEI 7. The document is designated ASCE/SEI 7-10 *Minimum Design Loads for Buildings and Other Structures* and it is expected that it will be completed and available for purchase prior to the ICC Final Action Hearings in May of 2010 . Any person interested in obtaining a public comment copy of ASCE/SEI 7-10 may do so by contacting the proponent at jrossberg@asce.org .

Cost Impact: The overall, national cost impact is believed to be neutral.

1. Add new text as follows:

R301.2.2.2.6 Masonry or concrete chimneys. Masonry or concrete chimneys shall be reinforced and anchored to the building in accordance with Sections R1001.3, R1001.4, R1003.3 and R1003.4

2. Revise as follows:

R1001.3 Seismic reinforcing. Masonry or concrete chimneys in Seismic Design ~~Category~~ Categories C, D_0, D_1 or D_2 shall be reinforced. Reinforcing shall conform to the requirements set forth in Table R1001.1 and Section R609, Grouted Masonry.

R1001.4 Seismic anchorage. Masonry or concrete chimneys in Seismic Design Categories C, D_0, D_1 or D_2 shall be anchored at each floor, ceiling or roof line more than 6 feet (1829 mm) above *grade*, except where constructed completely within the exterior walls. Anchorage shall conform to the requirements of Section R1001.4.1.

R1003.3 Seismic reinforcing. Masonry or concrete chimneys shall be constructed, anchored, supported and reinforced as required by this chapter. In Seismic Design ~~Category~~ Categories C, D_0, D_1 or D_2 masonry and concrete chimneys shall be reinforced and anchored as detailed in Section R1003.3.1, R1003.3.2 and R1003.4. In Seismic Design ~~Category~~ Categories A and B ~~or C~~, reinforcement and seismic anchorage is not required.

R1003.4 Seismic anchorage. Masonry ~~and~~ or concrete chimneys and foundations in Seismic Design ~~Category~~ Categories C, D_0, D_1 or D_2 shall be anchored at each floor, ceiling or roof line more than 6 feet (1829 mm) above *grade*, except where constructed completely within the exterior walls. Anchorage shall conform to the requirements of Section R1003.4.1.

TABLE R1001.1
SUMMARY OF REQUIREMENTS FOR MASONRY FIREPLACES AND CHIMNEYS

(Portions of table not shown remain unchanged)

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm, 1 square foot = 0.0929m^2.

NOTE: This table provides a summary of major requirements for the construction of masonry chimneys and fireplaces. Letter references are to Figure R1001.1 which shows examples of typical construction. This table does not cover all requirements, nor does it cover all aspects of the indicated requirements. For the actual mandatory requirements of the code, see the indicated section of text.

a. The letters refer to Figure R1001.1.
b. Not required in Seismic Design ~~Category~~ Categories A and B ~~or C~~.

Reason: The IBC Chapter 21 requirements for reinforcing and anchorage of masonry and concrete chimneys were extended to Seismic Design Category C by code change S193-07/08. That change appears in 2009 IBC Sections 2111.3 and 2111.4. This proposal intends to make the IRC minimum requirements for reinforcing and anchorage match the IBC because the effects of earthquakes and the risks to life safety from chimney collapse are independent of the code under which the chimney is permitted and constructed. Seismic Design Category C is defined in IRC Table R301.2.2.1.1 as the range of $0.33g < S_{DS} \leq 0.50g$ for soil Site Class D. Assuming soil Site Class D, this S_{DS} range represents a mapped short period (S_S) spectral response acceleration range of $0.32g < S_S \leq 0.55g$. Earthquakes generating these moderate levels of short period ground motion (e.g., Nisqually Washington Earthquake (2001), Napa California Earthquake (2000), Coalinga California Earthquake (1983) have repeatedly caused collapse or partial collapse of large numbers of unreinforced or unanchored masonry chimneys. In at least two earthquakes, Borah Peak Idaho (1983) and Landers California Earthquake (1992), masonry chimney and fireplace collapses have resulted in fatalities.

To accomplish this change, a new section R301.2.2.2.6 is added to specify that the masonry or concrete chimneys in Seismic Design Category C must comply with sections R1001.3, R1001.4, R1003.3 and R1003.4. In each of those four sections, Category C is added to the list of Seismic Design Categories where chimney reinforcing and anchorage is necessary.

In R1003.3, Category C is deleted from the list of Seismic Design Categories where chimney reinforcement and anchorage are not required.

In Table R1001.1, footnote "b" is revised to delete Seismic Design Category C to be consistent with the changes to sections R1001.3, R1001.4, R1003.3 and R1003.4. Footnote "b" is used at two locations in Table R1001.1, in item H (vertical reinforcing) and in item S (anchorage).

In R1001.3, R1003.3, and R1003.4 and Table R1001.1 footnote "b" an editorial change is made to correct the word "Category" to the plural "Categories" as is currently used in section R1001.4 when more than one category is listed. Another editorial change occurs in R1003.4 where the word "and" between the words "masonry" and "concrete" is changed to "or" to match the wording used in the other three sections.

Cost Impact: The code change proposal will increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Maiel-RB-3-R301.2.2.2.6-Ch 10

RB17–09/10
R301.2.4.1, R322.1.1

Proponent: Rebecca C. Quinn, RCQuinn Consulting, Inc., representing the Department of Homeland Security, Federal Emergency Management Agency

Revise as follows:

R301.2.4.1 Alternative provisions. As an alternative to the requirements in Section R322.3 for buildings and structures located in whole or in part in coastal high-hazard areas (V Zones) and Coastal A Zones, if delineated, ASCE 24 is permitted subject to the limitations of this code and the limitations therein.

R322.1.1 Alternative provisions. As an alternative to the requirements in Section R322.3 for buildings and structures located in whole or in part in coastal high-hazard areas (V Zones) and Coastal A Zones, if delineated, ASCE 24 is permitted subject to the limitations of this code and the limitations therein.

Reason: The IRC recognizes the Coastal A Zone as "flood hazard areas that have been delineated as subject to wave heights between 1.5 feet and 3 feet shall be designated as Coastal A Zones" (see R322.2). These conditions may be present immediately inland of coastal high hazard areas (V Zones) shown on Flood Insurance Rate Maps. Field research after numerous hurricanes and coastal storms indicates that waves in this range contribute to erosion and scour, and also damage conventional construction. The inland extent of the 1.5-ft wave may be delineated on FEMA's revised maps as the Limit of Moderate Wave Action.

This code change provides an alternative for buildings and structures in the Coastal A Zone, if delineated, to be designed and constructed according to the standard ASCE 24 *Flood Resistant Design and Construction*.

Cost Impact: The added cost, if any, of having a foundation designed according to ASCE 24 is offset by minimizing damage associated with scour and wave impacts in areas where wave heights between 1.5 feet and 3 feet are anticipated.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: QUINN-RB-4-R301.2.4.1

RB18–09/10
Table R301.7

Proponent: Stephen Kerr, PE, SE, Josephson Werdowatz and Associates

Revise table as follows:

TABLE R301.7
ALLOWABLE DEFLECTION OF STRUCTURAL MEMBERS ~~a, b, c, d, e~~

STRUCTURAL MEMBER	ALLOWABLE DEFLECTION
Rafters having slopes greater than 3:12 with no finished ceiling attached to rafters	L / 180
Interior walls and partitions	H / 180
Floors ~~and plastered ceilings~~ Ceilings with plaster or stucco finish	L / 360
All other structural members	L / 240
Exterior walls – wind loads [a] with plaster or stucco finish	H / 360
Exterior walls – wind loads [a] with other brittle finishes	H / 240
Exterior walls – wind loads [a] with flexible finishes	~~L~~ H / 120[d]
Lintels supporting masonry veneer walls [e]	L / 600

Note: L = span length, H = span height.

a. The wind load shall be permitted to be taken as 0.7 times the Component and Cladding loads for the purpose of the determining deflection limits herein.
b. For cantilever members, *L* shall be taken as twice the length of the cantilever.
c. For aluminum structural members or panels used in roofs or walls of sunroom additions or patio covers, not supporting edge of glass or sandwich panels, the total load deflection shall not exceed L/60. For continuous aluminum structural members supporting edge of glass, the total load deflection shall not exceed L/175 for each glass lite or L/60 for the entire length of the member, whichever is more stringent. For sandwich panels used in roofs or walls of sunroom additions or patio covers, the total load deflection shall not exceed L/120.
d. Deflection for exterior walls with interior gypsum board finish shall be limited to an allowable deflection of H/180.
e. Refer to Section R703.7.2.

Reason: This proposal contains several minor editorial changes to help clarify the information presented within the Table. These changes are intended to unify the Table. The proposed changes include the following:

- Footnote callouts a, d and e were removed from the title of the table to avoid confusion because they only apply to a sub-set of the entire table.
- The 'L' in the Exterior walls – wind loads with flexible finishes is changed to 'H' for consistency with the other wall structural members shown in this table.
- The word 'other' is added to Exterior walls – wind loads with brittle finishes to separate the plaster and stucco, which are brittle finish materials, from other brittle finish material which do not need the more restrictive deflection limitation.
- Stucco ceilings are added to the Floor and plastered ceilings category so that wording for the ceilings is consent with the wording of Exterior Walls. In addition, the referenced standard ASTM C926-98a Standard Specification for Application of Portland Cement-Based Plaster section Annex A2.1.6 states "Maximum allowable deflection for vertical or horizontal framing for plaster, not including cladding, shall be L/360."

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: KERR-RB-2-T. R301.7

RB19–09/10
Table R302.1

Proponent: Steven Orlowski, National Association of Home Builders (NAHB)

Revise table as follows:

TABLE R302.1
EXTERIOR WALLS

EXTERIOR WALL ELEMENT		MINIMUM FIRE-RESISTANCE RATING	MINIMUM FIRE SEPARATION DISTANCE
Walls	(Fire-resistance rated)	1 hour-tested in accordance with ASTM E 119 or UL 263 with exposure to both sides	<u>≤3</u> ~~5~~ Feet
	(Not fire-resistance rated)	0-Hours	<u>≥3</u> ~~5~~ Feet
Projections	(Fire-resistance rated)	1-Hour on the underside	<u>≤2</u> ~~4~~ Feet
	(Not fire-resistance rated)	0-Hours	<u>≥3</u> ~~5~~ Feet
Openings	Not Allowed	N/A	< 3 Feet
	25% Maximum of Wall Area	0-Hours	3 Feet
	Unlimited	0-Hours	5 Feet
Penetrations	All	Comply with Section R302.4	< 5 Feet
		None Required	5 Feet

Reason: The purpose of this proposed change is to retain the original fire separation distances to the dimensions used in *2003 International Residential Code*. During the 2004/2005 Code Development Cycle, the Code Committee disapproved this change given that the proponent failed to provide supporting evidence or data to sustain the increase in the fire separation distance. The committee's decision was overturned at the final action hearings without any additional substantiation being brought forth by the proponent. To this day, there are no known reports or studies that demonstrate the previously allowed 3 foot separation distance from the property line and 6 foot separation between structures failed to provide the minimum required safe distance for fire separation.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: ORLOWSKI-RB-4-T. R302.1

RB20–09/10
R302.1

Proponent: Don Davies, Salt Lake City Corporation, representing the Utah Chapter of ICC

Revise as follows:

R302.1 Exterior walls. Construction, projections, openings and penetrations of *exterior walls* of *dwellings* and accessory buildings shall comply with Table R302.1. <u>Structures without exterior walls at adjoining lot lines shall not have roof projections within 5'-0" of the lot line.</u>

Exceptions:

1. Walls, projections, openings or penetrations in walls perpendicular to the line used to determine the *fire separation distance*.
2. Walls of *dwellings* and *accessory structures* located on the same *lot*.
3. Detached tool sheds and storage sheds, playhouses and similar structures exempted from permits are not required to provide wall protection based on location on the *lot*. Projections beyond the *exterior wall* shall not extend over the *lot line*.

4. Detached garages accessory to a *dwelling* located within 2 feet (610 mm) of a *lot line* are permitted to have roof eave projections not exceeding 4 inches (102 mm).
5. Foundation vents installed in compliance with this code are permitted.

Reason: There are currently no provisions in the residential code to limit the roof projection for carports and patio covers where there is no exterior wall adjoining the lot line. Since carports and patio covers have openings exceeding 25% they must be placed at least 5 feet from the lot line as required in I.R.C. Table R302.1. Fire-resistance rating of the projections beyond the exterior walls is addressed in I.R.C. Table R302.1; but in the instance where there is no wall, rating a portion of the roof covering serves no useful purpose and is not addressed by Table R302.1 which deals with exterior walls.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: DAVIES-RB-1-R302.1

RB21–09/10
R302.1

Proponent: Maureen Traxler, City of Seattle, WA, representing the Seattle Department of Planning & Development

Revise as follows:

R302.1 Exterior walls. Construction, projections, openings and penetrations of *exterior walls* of *dwellings* and accessory buildings shall comply with Table R302.1.

Exceptions:

1. Walls, projections, openings or penetrations in walls perpendicular to the line used to determine the *fire separation distance*.
2. No protection is required for walls, projections, openings or penetrations in walls of structures located on the same lot where the *fire separation distance* is measured between a dwelling and a structure accessory to it. Garages shall comply with Section R302.6, ~~Walls of *dwellings* and *accessory structures* located on the same *lot*.~~
3. Detached tool sheds and storage sheds, playhouses and similar structures exempted from permits are not required to provide wall protection based on location on the *lot*. Projections beyond the *exterior wall* shall not extend over the *lot line*.
4. Detached garages accessory to a *dwelling* located within 2 feet (610 mm) of a *lot line* are permitted to have roof eave projections not exceeding 4 inches (102 mm).
5. Foundation vents installed in compliance with this code are permitted.

Reason: As written, exception #2 does not clearly indicate which walls are exempt from the requirements of Table R302.1, or whether it applies to penetrations or openings in the walls. For example, a large shed (which is not exempt from a permit) that is accessory to a dwelling may be within 3' of the lot line, but according to exception #2 the shed wall nearest the property line does not need to be protected, because it is on the same lot as the dwelling. That does not meet the intent of the code. This proposal better indicates which walls and wall elements the exception applies to, and provides a cross reference to the section that has requirements specific to garages, since garages requirements differ from those of Table R302.1.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: TRAXLER-RB-4-R302.1

RB22–09/10
R302.2, R302.2.4

Proponent: Michael Gardner, representing the Gypsum Association; Jason Thompson, PE, National Concrete Masonry Association (NCMA), representing the Masonry Alliance for Codes and Standards (MACS)

Revise as follows:

R 302.2 Townhouses. Each townhouse shall be considered a separate building and shall be separated by fire-resistance-rated wall assemblies meeting the requirements of Section R302.1 for exterior walls.

Exception: A common ~~1-hour~~ 2-hour fire-resistance-rated wall assembly tested in accordance with ASTM E 119 or UL 263 is permitted for townhouses if such walls do not contain plumbing or mechanical equipment, ducts or vents in the cavity of the common wall. The wall shall be rated for fire exposure from both sides and shall extend to and be tight against exterior walls and the underside of the roof sheathing. Electrical installations shall be installed in accordance with Chapters 34 through 43. Penetrations of electrical outlet boxes shall be in accordance with Section R302.4.

R 302.2.4. Structural independence. Each individual townhouse shall be structurally independent.

Exceptions:

1. Foundations supporting *exterior walls* or common walls.
2. Structural roof and wall sheathing from each unit may fasten to the common wall framing.
3. Nonstructural wall and roof coverings.
4. Flashing at termination of roof covering over common wall.
5. Townhouses separated by a common 1~~-hour~~ 2-hour fire-resistance-rated wall as provided in Section R302.2.

Reason: (Gardner) Lost in the outcome of last fall's debate on residential sprinklers was the impact it made on the common walls that are often used to separate townhouse units. One of the approved proposals that incorporated sprinkler systems into townhouses reduced the rating on the common wall that can be used between townhouse units from two hours to one hour. This proposal is intended to restore the two hour rating to the common wall.

The 2009 IRC permits townhouses a structural independence exemption if they are separated by a common one-hour rated wall that complies with Section 302.2. The 2009 IRC also contains no mandatory sound transmission requirements for common walls. As a consequence, the 2009 IRC will permit two adjacent three story townhouse units to be separated by a common wall that displays no structural independence characteristics and has an STC rating of approximately 33.

Because of the reduced rating, a fire that overwhelms the sprinkler system in a room abutting the common wall will display an increased potential to adversely impact the structural integrity of the common wall and the adjacent townhouse units. In addition, the lack of a robust sound barrier between units creates the potential for a less than acceptable living environment.

The 2006 IRC required the common wall to maintain a two-hour rating. While the 2006 IRC also contained a structural independence exemption, the common two-hour wall required by the code provided an obvious level of increased fire protection not evidenced in the 2009 IRC. The 2006 code, by mandating a two-hour rating, also required the use of a wall that would automatically display a minimum STC rating almost 10 points higher than the minimum wall required by the 2009 code.

The code has never permitted the common wall that may be constructed by the exception to R 302.2 to display a rating that is lower than the rating that would be achieved by the standard charging language in R302.2. That section has historically required townhouses to be evaluated as separate buildings and to be constructed with separate and parallel exterior walls that separate the two adjacent units. The 2009 IRC now permits the common wall to have a lower rating than the basic walls prescribed by the code and also permits the common wall to be constructed without the structural independence characteristics required by R302.2.

Reason: (Thompson) Code change RB66-07/08 required townhouses constructed in accordance with the International Residential Code to be provided with automatic sprinkler protection. While this new requirement added a fire safety feature to townhouses the code change also reduced the level of fire safety that existed in the code by reducing the fire resistance rating required for the common wall separating dwelling units in townhouses. This code change will restore the previous IRC code requirement that the common wall separating dwelling units in townhouses to have a minimum fire resistance rating of 2-hours. There are several reasons why the common wall fire resistance rating needs to be returned to 2-hours.

First, Code Change RB66-07/08 justified the addition of mandatory sprinkler protection for townhouses based on sprinklers being the best tool for providing additional fire safety in residential occupancies. Given that the 2006 IRC already had an established level of fire safety for residential occupancies utilizing townhouse construction with 2-hour fire rated construction for the common wall, the goal for improving fire safety with the addition of sprinkler protection was not fully achieved. The existing level of fire safety was diminished by the reduction in the fire resistance rating of the common wall from 2-hours to 1-hour.

Second, Code Change RB66-07/08 created an inconsistency in the IRC. If two separate one and two family dwellings are constructed on individual lots and each built at the property line, Section R302.1 and Table R302.1 will require the exterior wall of each structure to be built with a 1-hour fire resistance rating using a fire exposure from both sides. The net result is that both dwellings are separated from the other adjacent, closely located dwelling by wall construction with a total cumulative fire resistance of 2-hours. Yet, if these same two individual structures are physically connected at the property line by a common wall the code permits the fire resistance rating between townhouse units to be reduced to 1-hour. The level of fire safety for these two dwelling configurations is not consistent

This code change achieves the full level of fire safety provided for in residential occupancies through the use of sprinkler protection and built-in fire resistant construction. It also will eliminate the fire safety inconsistency in the IRC between dwelling units built at property lines and dwelling units constructed as townhouses and connected at property lines by a common wall.

Cost Impact: The code change proposal will increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: GARDNER-RB-3-THOMPSON-RB-1-R302.2

RB23–09/10
R302.2.1, Figures R302.2.1(1)-R302.2.1(2)-R302.2.1(3) (New)

Proponent: Larry Wainright, Qualtim, Inc., representing the Structural Building Components Association (SBCA)

1. Revise as follows:

R302.2.1 Continuity. The fire-resistance-rated wall or assembly separating *townhouses* shall have a fire-resistance rating that is ~~be~~ continuous from the foundation to the underside of the roof sheathing, deck or slab. The fire-resistance rating shall extend the full length of the wall or assembly, including wall extensions through and separating attached enclosed *accessory structures*. Where the fire-resistance-rated wall or assembly is not continuous, the fire resistance rating shall be deemed continuous provided one of the following conditions is met:

1. A minimum one hour fire-resistance rating is provided on the floor or roof assembly that interrupts the fire-resistance rated wall. Fireblocking shall be provided per Section R302.11 (see Figure R302.2.1(1)). Or
2. Where an unrated floor or roof assembly interrupts the fire-resistance rated wall, the fire-resistance rating shall be deemed continuous provided:
   2.1. Where two one-hour walls are provided, a minimum of one 2x full height fireblock shall be installed in each of the one-hour walls as shown in Figure R302.2.1(2).
   2.2. Where one two-hour wall is provided, a minimum of two 2x full height fireblocks shall be installed on each side of the two-hour walls as shown in Figure R302.2.1(3).

2. Add new figures as follows:

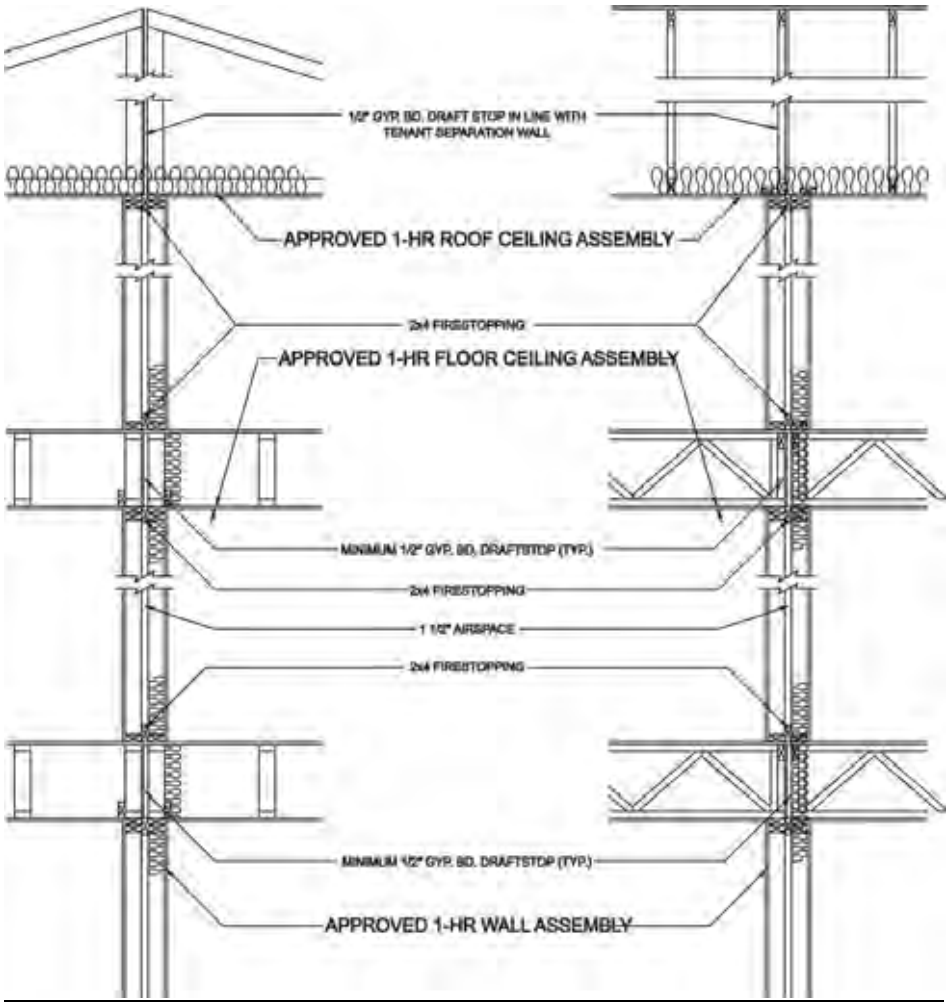

FIGURE R302.2.1(1)
Example assemblies that can be used to make up a one-hour rated system for separation between occupancies

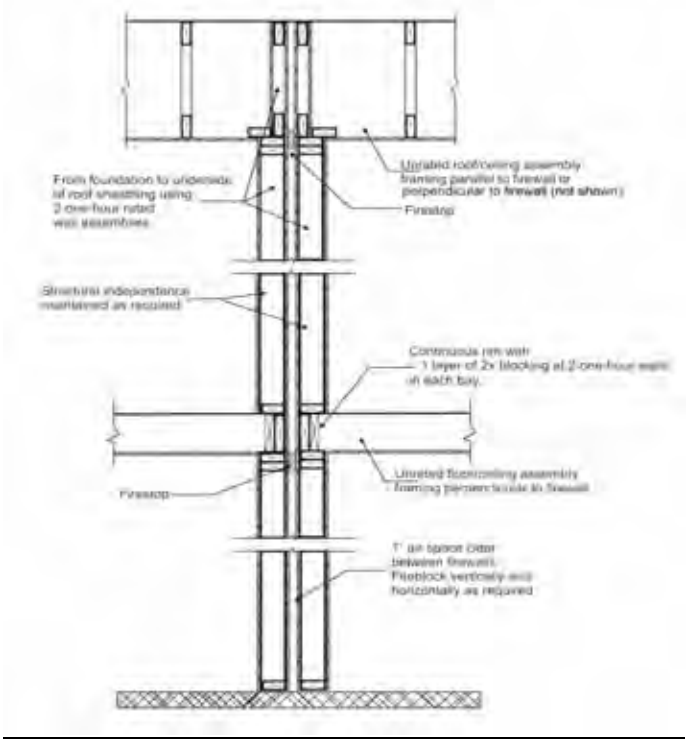

FIGURE R302.2.1(2)

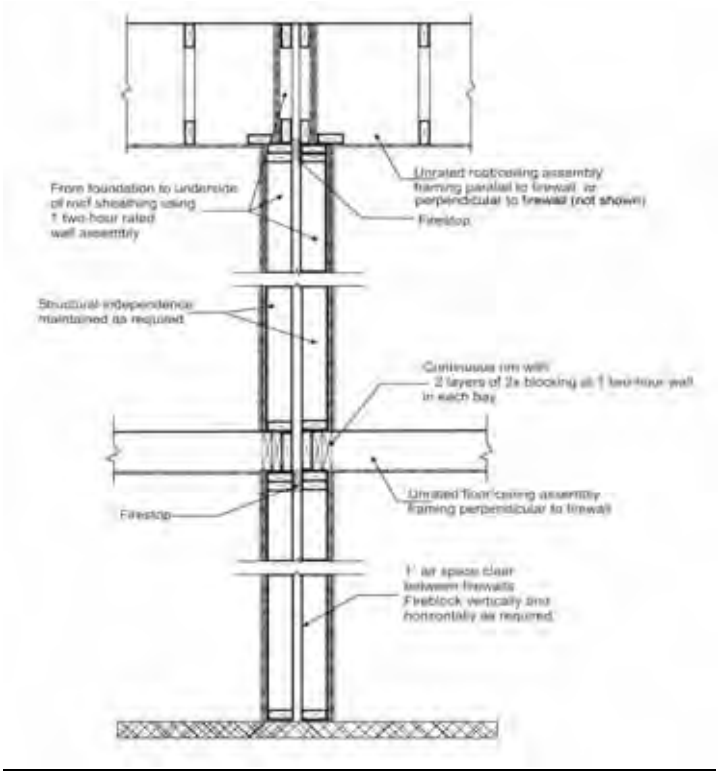

FIGURE R302.2.1(3)

Reason: The purpose of this code change is to clarify an existing provision within the code and to provide a prescriptive solution to that provision. First, it is necessary to clarify that is the fire-resistance rating of the wall assembly that needs to be continuous from the foundation to the underside of the roof sheathing, not necessarily the framing itself. Second, the prescriptive solution gives some guidance on one way the fire-resistance rating can be maintained, while allowing for framing members to bear on the wall. The use of full height blocking to attain the required fire-resistance rating is based on the use of sacrificial material and char rates based on ASTM E119 testing. Under ASTM E119 test conditions, lumber will char at a rate of 1 inch per 30-40 minutes. Therefore, at least 2 inches of sacrificial material is required to achieve the one hour rating. Likewise, 4 inches is required to achieve a 2 hour rating. Further information can be found in an article published and located at the following link: www.sbcmag.info/Archive/2006/sep/0609_code.pdf

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: WAINRIGHT-RB-3-R302.2.1

RB24–09/10
R302.2.2

Proponent: Jeffrey Anderson, representing the Chesterfield County Department of Building Inspections, Chesterfield, VA

Revise as follows:

R302.2.2 Parapets. Parapets constructed in accordance with Section R302.2.3 shall be constructed for *townhouses* as an extension of exterior walls or common walls in accordance with the following:

1. Where roof surfaces adjacent to the wall or walls are at the same elevation, the parapet shall extend not less than 30 inches (762 mm) above the roof surfaces.
2. Where roof surfaces adjacent to the wall or walls are at different elevations and the higher roof is not more than 30 inches (762 mm) above the lower roof, the parapet shall extend not less than 30 inches (762 mm) above the lower roof surface.

Exception: A parapet is not required in the two cases above when the roof is covered with a minimum class C roof covering, and the roof decking or sheathing is of noncombustible materials or *approved* fire-retardant-treated wood for a distance of 4 feet (1219 mm) on each side of the wall or walls, or one layer of 5/8-inch (15.9 mm) Type X gypsum board is installed directly beneath the roof decking or sheathing, supported by a minimum of nominal 2-inch (51 mm) ledgers attached to the sides of the roof framing members, for a minimum distance of 4 feet (1219 mm) on each side of the wall or walls and there are no openings or penetrations in the roof within 4 feet (1219 mm) of the exterior or common walls.

3. A parapet is not required where roof surfaces adjacent to the wall or walls are at different elevations and the higher roof is more than 30 inches (762 mm) above the lower roof. The common wall construction from the lower roof to the underside of the higher roof deck shall have not less than a 1-hour fire-resistance rating. The wall shall be rated for exposure from both sides.

Reason: This change is proposed to provide consistency between the IRC and the IBC. Specifically, to make IRC Section R302.2.2 consistent with IBC Section 705.11(4). This change would make townhouse construction consistent between both the IRC and the IBC for this type construction.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: ANDERSON-RB-1-R302.2.2

RB25–09/10
R302.3

Proponent: Steven Orlowski, National Association of Home Builders (NAHB)

Revise as follows:

R302.3 Two-family dwellings. *Dwelling units* in two-family dwellings shall be separated from each other by wall and/or floor assemblies having not less than a 1-hour fire-resistance rating when tested in accordance with ASTM E 119 or UL 263. Fire-resistance-rated floor-ceiling and wall assemblies shall extend to and be tight against the *exterior wall*, and wall assemblies shall extend from the foundation to the underside of the roof sheathing.

Exceptions:

1. A fire-resistance rating of 1/2 hour shall be permitted in buildings equipped throughout with an automatic sprinkler system installed in accordance with NFPA 13D or Section P2904.
2. Wall assemblies need not extend through *attic* spaces when the ceiling is protected by not less than 5/8-inch (15.9 mm) Type X gypsum board and an *attic* draft stop constructed as specified in Section R302.12.1 is provided above and along the wall assembly separating the *dwellings*. The structural framing supporting the ceiling shall also be protected by not less than 1/2-inch (12.7 mm) gypsum board or equivalent.

Reason: The purpose of this proposal is to reference the applicable residential fire sprinkler standard for one- and two- family dwellings, along with the relevant provisions within the *International Residential Code* regarding the installation of a plumbing based fire suppression system as referenced in Section P2904.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: ORLOWSKI-RB-5-R302.3

RB26–09/10
R302.5.1

Proponent: Sean DeCrane, Cleveland, OH Fire Department, representing the Cleveland Fire Department and the International Association of Fire Fighters

Revise as follows:

R302.5.1 Opening protection. Openings from a private garage directly into a room used for sleeping purposes shall not be permitted. Other openings between the garage and residence shall be equipped with solid wood doors not less than 13/8 inches (35 mm) in thickness, solid or honeycomb core steel doors not less than 13/8 inches (35 mm) thick, or 20-minute fire-rated doors equipped with a self-closing device.

Reason: There are times when proposed code submittals require a very lengthy substantiation, and then there are times when code change proposals just make sense. I would believe this is one of those times where a code change proposal makes a lot of sense. We are seeking a requirement to install items for very minimal costs yet great life saving potentials.

As we place greater amounts of thermoplastics in our homes and garages, especially kids' toys, we are increasing the fuel load and toxic by-products. The most obvious by-product of incomplete combustion is carbon monoxide. We know how deadly carbon monoxide is to the occupants of homes. Carbon monoxide is also a by-product of the internal combustion engine. Especially during the winter months the fire service responds to numerous cases of potential carbon monoxide incidents. With an open door between the living quarters and the garage, where the car is warming up for the trip to work, we are allowing the free flow of carbon monoxide from the garage into the home. Some may not believe there is a concern with this situation and may also point out some difficulty in reporting the data of exactly how many individuals were killed by these incidents. Creating and submitting code proposals is about the present but also the future. With the reversal of the code requirement of a self closing door we are allowing millions of homes to be built with a potential safety hazard. Carbon monoxide is a silent and deadly killer and in many incidents the victims do not realize they are slowly being exposed to potentially life threatening levels of carbon monoxide. This is one of the reasons the ICC membership voted to require the installation of carbon monoxide detectors.

We know that requirement of carbon monoxide detectors will save lives. In fact, I have seen numerous responses where a detector alerted an occupant to the presence of dangerous amounts of carbon monoxide, which in turn, allowed them to notify the fire department. With a lack of a requirement of a self closing door we have the potential of creating a Peter Cried wolf situation that will be played out across the country. A self closing door helps to protect the occupants of a home from the dangers in the garage. During the fall and winter months many occupants warm their car before leaving for work or to run an errand. With the increase use of remote starters many of these individuals are engaging their vehicle without visual contact. This creates a potential for the migration of carbon monoxide to the living quarters, even if this amount is not in a lethal range it will be in range to initiate a response from the CO detector, thereby, requiring a response from the local fire department. A response to requires fire fighters and equipment and incurs costs. It also places a responding company in emergency mode while responding increasing the risks to those fire fighters and other drivers at an increased risk. If the fire service downgrades responses to CO alarms then we risk the potential of placing citizens at risk who are truly experiencing a CO emergency. The argument is not to remove the detectors but to place an added protection of a self closing door between the living quarters and the garage.

Even if an individual does not believe that Carbon Monoxide is a true threat there are additional products of combustion that are far deadlier than CO. Hydrogen Cyanide is increasingly being identified as a potential life hazard in fire incidents. In a report published by the Cyanide Poisoning Treatment Coalition, it is reported when the National Institute of Occupational Safety and Health completed their studies of the tragic Station Night Club fire in Warick, RI they found "Within seconds of the ignition of the fire, concentrations of the toxic products carbon monoxide and hydrogen cyanide soared and oxygen levels plummeted to create conditions incompatible with sustaining life"[1]. The report noted "that hydrogen cyanide is approximately 35 times more toxic than carbon monoxide during acute exposure". In tests conducted and referenced by the report, "a series of experiments the Swedish National Testing and Research Institute (SNTRI), assessed the emission of hydrogen cyanide and carbon monoxide under both non-flaming (i.e. pyrolizing) and flaming (i.e. fire) conditions during burning of wool, nylon, synthetic rubber, melamine, and polyurethane foam. The results show that all of these substances liberated high quantities of cyanide when burned-particularly under pyrolizing conditions characterized by low oxygen". If we take a step back and look at most garages, when the garage door is closed, they are box structures that will allow smoke and the by-products of a fire to travel in the least restrictive path, the open door. An open door between the garage and living quarters allows the easy access for the highly toxic by-products of combustion.

To summarize, deadly by-products of combustion, accidental carbon monoxide poisonings from vehicles and needless nuisance alarms are strong, and compelling, arguments to support this code change proposal requiring self closing doors between the garage and living areas in one and two-family homes.

[1] *Smoke Perceptions, Myths and Misunderstandings*, Cyanide Poisoning Treatment Coalition

Cost Impact: The code change proposal will minimally increase costs of construction.

R302.4 (New)

Proponent: Daniel J. Kress, Town of Irondequoit, NY, representing Finger Lakes Building Officials Association

Add new text as follows:

R302.4 Decks. Except as required by Section R302.2.1, decks shall be permitted to be constructed without meeting the requirements of Sections R302.1, R302.2 and R302.3.

Reason: The purpose of this proposed code change is not to change, but rather to clarify, the existing provisions of this section of the IRC, which do not specifically mention decks or in any way differentiate between a deck and the exterior walls of a house. At present it is therefore not clear whether decks are subject to the same requirements for their location on the lot, or whether they are not subject to said requirements due to the fact that decks do not have walls. Such a requirement is already implied by Section R302.2.1 which presently requires common walls to be continuous "…including walls extending through and separating attached accessory structures." While decks are generally constructed of combustible materials, they do not present the same fire load as a structure with walls; therefore, proximity to the property line does not present the same potential fire hazard as a structure with walls. Where fire-rated construction is presently required, as in the case of townhouses and attached two-family dwellings, minimum distance separation or fire-rated construction will still be required. Clarification of this requirement will better enable consistent enforcement of these provisions.

Cost Impact: The code change proposal will not increase the cost of construction.

RB30–09/10
Table R302.6

Proponent: Joe Holland and Dave Bueche, Hoover Treated Wood Products

Revise table as follows:

TABLE R302.6
DWELLING/GARAGE SEPARATION

SEPARATION	MATERIAL
From the residence and attics.	Not less than ½ inch gypsum board or 5/8-inch fire-retardant-treated plywood or equivalent applied to the garage side.
From all habitable rooms above the garage.	Not less than 5/8-inch Type X gypsum board or equivalent
Structure(s) supporting floor/ceiling assemblies used for separation required by this section.	Not less than ½ inch gypsum board or 5/8-inch fire-retardant-treated plywood or equivalent applied to the garage side.
Garages located less than 3 feet from a dwelling unit on the same lot.	Not less than ½ inch gypsum board or 5/8-inch fire-retardant-treated plywood or equivalent applied to the ~~interior side of exterior walls that are within this area~~ garage side.

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm.

Reason: The building code does not give any indication as to why the gypsum board is necessary. One could assume that fire protection is an area of concern. The code currently states one can use an equivalent material. Table 721.6.2(1) contains the time in minutes that a material will contribute to the fire resistance of a floor/ceiling, roof/ceiling, and wall assembly. Listed are both ½ inch gypsum board and 5/8 inch wood structural panel. Their contribution to the fire resistance rating is identical: 15 minutes. Therefore from a fire rating perspective they are equivalent. Another reason for the requirement could be structural. Structurally, FRTW has the ability to resist a larger load than gypsum board. By providing a provision for FRTW it gives a user the ability to use another material.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: HOLLAND-BUECHE-RB-3-T. R302.6

RB31–09/10
R302.7 (New), R502.14 (New), Table R502.14 (New)

Proponent: Dennis Pitts, American Forest and Paper Association

Add new text and table as follows:

R302.7 Floors. Floor assemblies, not required elsewhere in this code to be fire resistance rated, shall be provided with a ½ inch (12.7 mm) gypsum wallboard ceiling membrane.

Exception:

1. Floor assemblies protected by an automatic sprinkler system in accordance with NFPA13, NFPA 13R, NFPA13D, or Section R313.
2. Floor assemblies having a minimum fire resistance of 15 minutes, supporting at least 50% of the full design load, and complying with one of the following:
   - 2.1. Tested in accordance with ASTM E119 or UL 263, or;
   - 2.2. Determined in accordance with *International Building Code* Section 721.
3. Floor assemblies located directly over a crawl space.
4. Floor assemblies complying with Section R502.14.
5. A portion of a floor assembly area not greater than 100 square feet per story.

R502.14 Fire resistant assemblies. Wood floor assemblies shall comply with the provisions of Section R302.7 or any one of the following:

1. Wood floor assemblies using dimension lumber equal to or greater than 2 inches in thickness by 8 inches in width, nominal.
2. Wood floor assemblies using structural composite lumber, complying with ASTM D5456, equal to or greater than 1 ½" in thickness by 7 ¼" in width.
3. Wood floor assemblies having a minimum fire resistance time of 15 minutes determined from any of the following options or the sum of the times from any combination thereof:
   - 3.1. Time assigned to a ceiling membrane or membranes in Table 502.14.
   - 3.2. Finish rating time for a ceiling membrane not listed in 502.14.
   - 3.3. Time to structural failure of framing members, supporting at least 50% of the full design load, and complying with one of the following:
     - 3.3.1. Tested in accordance with ASTM E119 or UL 263, or;
     - 3.3.2. Determined in accordance with *International Building Code* Section 721.

TABLE R502.14
TIME ASSIGNED TO CEILING MEMBRANES

DESCRIPTION OF FINISH	TIME (MINUTES)[A]
3/8" gypsum *board*	*10*
½" gypsum board	*15*
5/8" gypsum board	20
½" Type X gypsum board	25
5/8" Type X gypsum board	40
Double 3/8" gypsum board	25
3/8" wood structural panel	5
½" wood structural panel	10
5/8" wood structural panel	15

a. Times for individual membranes are additive.

Reason: The fire service has asked for minimum fire resistance of floor/ceiling systems equivalent to 2x lumber floor construction. The basis of the requirements assume that a floor/ceiling assembly constructed using 2x lumber and loaded to 50% of full design load will provide 15 minutes of structural fire resistance as confirmed by recent UL testing reported in *Structural Stability of Engineered Lumber in Fire Conditions*.

The proposed R302.7 provides a simple method of meeting this 15 minute requirement for all floor assemblies by requiring ½" gypsum wallboard as a protective ceiling membrane. Exceptions to this requirement are provided.

The proposed R502.14 provides additional methods of meeting this 15 minute requirement for wood floor framing, including different options for ceiling membrane protection recognized in IBC 721.6, finish ratings from approved ASTM E119 test reports, fire test results from ASTM E119 tests, structural fire resistance calculations per IBC 721.1, or any combination of these provisions.

The proposed Table R502.14 is taken from IBC Table 721.6.2(1).

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: PITTS-RB-3-R302.7-R502.14

RB32–09/10
R302.9, R302.9.1

Proponent: Joe Holland and Dave Bueche, Hoover Treated Wood Products

Revise as follows:

R302.9 Flame spread index and smoke-developed index for wall and ceiling finishes. Flame spread and smoke-developed index for wall and ceiling finishes shall be in accordance with Sections 302.9.1 through 302.9.4.

R302.9.1 Wall and ceiling finishes shall have a flame-spread index of not greater than 200. For new construction reduction of the flame-spread index shall not be permitted after installation of the material. For existing construction wall and ceiling finish shall be permitted to be treated with an approved fire-retardant coating in accordance with the manufacturer's instructions.

Exception: Flame spread index requirements for finishes shall not apply to trim defined as picture molds, chair rails, baseboards and handrails; to doors and windows or their frames; or to materials that are less than 1/28 inch (0.91 mm) in thickness cemented to the surface of walls or ceilings if these materials exhibit flame spread index values no greater than those of paper of this thickness cemented to a noncombustible backing.

Reason: To correlate the IRC with the IBC. There is concern with this class of products being used in inappropriate applications in new residential construction.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: HOLLAND-BUECHE-RB-1-R302.9

RB33–09/10
R302.9.4

Proponent: Marcelo M. Hirschler, GBH International, representing the American Fire Safety Council

Revise as follows:

R302.9.4 Alternate test method. As an alternate to having a flame-spread index of not greater than 200 and a smoke developed index of not greater than 450 when tested in accordance with ASTM E 84 or UL 723, wall and ceiling finishes~~, other than textiles,~~ shall be permitted to be tested in accordance with NFPA 286. Materials tested in accordance with NFPA 286 shall meet the following criteria:

~~During the 40 kW exposure, the interior finish shall comply with Item 1. During the 160 kW exposure, the interior finish shall comply with Item 2. During the entire test, the interior finish shall comply with Item 3.~~

~~1. During the 40kWexposure, flames shall not spread to the ceiling.~~
~~2. During the 160 kW exposure, the interior finish shall comply with the following:~~
~~2.1. Flame shall not spread to the outer extremity of the sample on any wall or ceiling.~~
~~2.2. Flashover, as defined in NFPA 286, shall not occur.~~
~~3. The total smoke released throughout the NFPA 286 test shall not exceed 1,000 m^2.~~

The interior finish shall comply with the following:

1. During the 40 kW exposure, flames shall not spread to the ceiling.
2. The flame shall not spread to the outer extremity of the sample on any wall or ceiling.
3. Flashover, as defined in NFPA 286, shall not occur.
4. The peak heat release rate throughout the test shall not exceed 800 kW.
5. The total smoke released throughout the test shall not exceed 1,000 m^2.

Reason: There are three changes being made here, for consistency with the IBC.
1. The maximum heat release rate criterion is being added, just like it is in the IBC: heat release rate maximum of 800 kW
2. Textile wall and ceiling materials are permitted to be tested to NFPA 286, just like in the IBC.
3. The remainder of the proposal is purely editorial and intended for simplification. Clearly the interior finish should fail the criteria if the material has flame spreading to the outer extremity of the sample (meaning all the way to the end of the room or ceiling) even before the burner is raised to 160 kW. Also, the material should fail the test is flashover occurs when the burner is still at 40 kW. The present language could be interpreted to mean that a material that burns completely within a minute and/or reaches flashover does not fail the test. That should not be the case.

Cost Impact: The code change proposal will not increase the cost of construction.

	Assembly:	ASF	AMF	DF

ICCFILENAME: HIRSCHLER-RB-2-R302.9.4

RB34–09/10
R302.10.1

Proponent: Jesse J. Beitel, Hughes Associates, Inc., representing The Extruded Polystyrene Foam Association

Revise as follows:

R302.10.1 Insulation. Insulation materials, including facings, such as vapor retarders or vapor permeable membranes installed within floor-ceiling assemblies, roof-ceiling assemblies, wall assemblies, crawl spaces and attics shall have a flame-spread index not to exceed 25 with an accompanying smoke-developed index not to exceed 450 when tested in accordance with ASTM E 84 or UL 723.

Exceptions:

1. When such materials are installed in concealed spaces, the flame spread index and smoke-developed index limitations do not apply to the facings, provided that the facing is installed in substantial contact with the unexposed surface of the ceiling, floor or wall finish.
2. Cellulose loose-fill insulation, which is not spray applied, complying with the requirements of Section R302.10.3, shall only be required to meet the smoke developed index of not more than 450.
3. Foam plastic insulation shall comply with Section R316.

Reason: Foam plastic insulations and their fire performance are regulated per IRC Section R316. This new exception provides a pointer to that section and clarifies the requirements for foam plastic insulation.

This is similar to that done in Section 719.1 of the IBC.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

RB35–09/10
R302.11, M1501.2 (New)

Proponent: Julius Ballanco, PE, JB Engineering and Code Consulting, P.C., representing In-O-Vate Technologies, Inc.

1. Revise as follows:

R302.11 Fireblocking. In combustible construction, fireblocking shall be provided to cut off all concealed draft openings (both vertical and horizontal) and to form an effective fire barrier between stories, and between a top *story* and the roof space.

Fireblocking shall be provided in wood-frame construction in the following locations:

1. In concealed spaces of stud walls and partitions, including furred spaces and parallel rows of studs or staggered studs, as follows:

   1.1. Vertically at the ceiling and floor levels.
   1.2. Horizontally at intervals not exceeding 10 feet(3048 mm).

2. At all interconnections between concealed vertical and horizontal spaces such as occur at soffits, drop ceilings and cove ceilings.
3. In concealed spaces between stair stringers at the top and bottom of the run. Enclosed spaces under stairs shall comply with Section R302.7.
4. At openings around vents, pipes, ducts, cables and wires at ceiling and floor level, with an *approved* material to resist the free passage of flame and products of combustion. The material filling this annular space shall not be required to meet the ASTM E 136 requirements.
5. For the fireblocking of chimneys and fireplaces, see Section R1003.19.
6. Fireblocking of cornices of a two-family *dwelling* is required at the line of *dwelling unit* separation.
7. At penetrations of walls by dryer exhaust duct at the dryer location in accordance with Section M1501.2.

2. Add new text as follows:

M1501.2 Dryer exhaust duct penetrations. Where a clothes dryer exhaust duct is located within a framed wall, the penetration of the wall membrane at the location of the dryer shall have the annular space sealed with noncombustible material, approved fire caulking, or a noncombustible dryer exhaust duct wall receptacle.

Reason: This change corrects the concerns expressed during the last cycle. I have modified the proposed change to remove penetration of rated walls, since such penetrations are not permitted by the Code. The remaining issues have been addressed as suggested by the Code Committee.

The difference between a dyer exhaust duct penetration and other penetration is that it is in close proximity to a fuel fired appliance or electric heating appliance. Dryers are more prone to fire than other appliances. To protect the structure, it is important to have a higher level of protection.

The language in this change is consistent with the requirements found in the International Mechanical Code.

The CPSC identified 15,600 fires associated with dryers in a single year. Studies have shown that metal ducts protect the structure from the spread of fire. Additionally, noncombustible material or fire caulk around the annular space prevents the fire from spreading into the wall or ceiling cavity. The same can be accomplished with manufactured noncombustible receptacles. The noncombustible receptacles also allow for the proper storage and recoil of the transition flexible duct to a metal duct.

Cost Impact: The code change proposal may increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: BALLANCO-RB-1-R302.11

RB36–09/10
R302.12

Proponent: Fire Chief Kevin A. Gallagher, Town of Acushnet, MA, representing the Fire Chief's Association of Massachusetts

Revise as follows:

R302.12 Draftstopping. In combustible construction where there is usable space both above and below the concealed space of a floor/ceiling assembly, draftstops shall be installed so that the area of the concealed space does not exceed ~~1,000~~ 500 square feet (~~92.9m2~~) (46.45m^2). Draftstopping shall divide the concealed space into approximately equal areas. Where the assembly is enclosed by a floor membrane above and a ceiling membrane below, draftstopping shall be provided in floor/ceiling assemblies under the following circumstances:

1. Ceiling is suspended under the floor membrane.
2. Floor framing is constructed of truss-type open web or perforated members.

Reason: Currently R302.12 requires draftstopping in void spaces created by a floor membrane above and ceiling membrane below if the area (length x width) is in excess of 1,000 square feet. The unit of measurement does not take into consideration the height of the void.

Prefabricated construction allows for the construction of both ceiling and floor assemblies in typical wood frame, "modular" residential residences. When the modular boxes are assembled on-site, the upper story boxes are laid to rest on the top of the lower level boxes. With each unit having a complete ceiling and floor assembly a void space is created between levels of useable space. It is not uncommon for these void spaces to be up to twenty (20) inches in height and encompass the full length and width of the modular boxes.

Two fires in Massachusetts in 2008 demonstrate the speed in which fire can spread once it penetrates the void space. Both fires occurred in two story homes of modular construction and entered the structure from the exterior. Both structures consisted of two, first level boxes measuring 48 feet by 14 feet joined at a marriage wall with two similar size boxes situated above and also attached at a marriage wall. The void spaces created by this assembly was 672 square feet in the front with a similar size void space in the rear. However, the distance between the floor and ceiling membrane measured 20 inches thus creating a void of 1,116 cubic feet.

It is common practice in the prefabricated home industry to utilize polyurethane foam structural adhesives on one side of the structural members that supports the gypsum board ceiling. Tests have shown that certain types of structural adhesives are easy to ignite, burn at a rapid rate, generate considerable heat energy and lose considerable amounts of mass. These adhesives are found inside the void space.

The area created by the void (672 square feet) in either of the two Massachusetts modular homes that were destroyed by fire did not trigger the Code requirement for draftstopping. Once the fire entered the void it spread -- in an unobstructed fashion -- the full length and width of the void space. The fire also destroyed the primary means of affixing the gypsum board to the ceiling membrane thus expedited ceiling collapse and exposing the lower levels to fire conditions.

Draft stops, as defined by Section R202 (Definitions) are designed to "restrict the movement of air within open spaces of concealed areas of building components. " Floor / ceiling assemblies are included in the stated list of qualifying building components. The free movement of superheated air, gases and other products of combustion pre-heats structural members within the void space. In the presence of flammable polyurethane structural adhesives, the spread of heat, gases and fire is increased. The collapse of the ceiling membrane, considerable distances from the location of the fire, is a very real possibility.

This Code change attempts to reduce the size of the void space found in multistory residences of modular construction by reducing the trigger for draftstopping from 1,000 square feet to 500 square feet. As currently written, the Code requires a reduction by 50% of void spaces in excess of 1,000 square feet. A void space meeting the draftstopping requirements and 1,001 square feet would be reduced to two void spaces each approximately 500 square feet in area. Changing the trigger for draftstopping to 500 square feet would capture those void spaces that range in size between 500 – 1,000 square feet.

This proposal substitutes new measurement criteria for current provisions of the Code.

FLOOR
CEILING

Cost Impact: The code change proposal may increase the cost of construction

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: GALLAGHER-RB-2-R302.12

RB37–09/10
R302.12

Proponent: Fire Chief Kevin A. Gallagher, Town of Acushnet, MA, representing the Fire Chief's Association of Massachusetts

Revise as follows:

R302.12 Draftstopping. In combustible construction where there is usable space both above and below the concealed space of a floor/ceiling assembly, draftstops shall be installed so that the ~~area~~ volume of the concealed space does not exceed 1,000 ~~square~~ cubic feet ~~(92.9 m^2)~~ (28.32 m^3). Draftstopping shall divide the concealed space into approximately equal areas. Where the assembly is enclosed by a floor membrane above and a ceiling membrane below, draftstopping shall be provided in floor/ceiling assemblies under the following circumstances:

1. Ceiling is suspended under the floor membrane.
2. Floor framing is constructed of truss-type open web or perforated members.

Reason: Currently R302.12 requires draftstopping in void spaces created by a floor membrane above and ceiling membrane below if the area (length x width) is in excess of 1,000 square feet. The unit of measurement does not take into consideration the height of the void.

Prefabricated construction allows for the construction of both ceiling and floor assemblies in typical wood frame, "modular" residential residences. When the modular boxes are assembled on-site, the upper story boxes are laid to rest on the top of the lower level boxes. With each unit having a complete ceiling and floor assembly a void space is created between levels of useable space. It is not uncommon for these void spaces to be up to twenty (20) inches in height and encompass the full length and width of the modular boxes.

Two fires in Massachusetts in 2008 demonstrate the speed in which fire can spread once it penetrates the void space. Both fires occurred in two story homes of modular construction and entered the structure from the exterior. Both structures consisted of two, first level boxes measuring 48 feet by 14 feet joined at a marriage wall with two similar size boxes situated above and also attached at a marriage wall. The void spaces created by this assembly was 672 square feet in the front with a similar size void space in the rear. However, the distance between the floor and ceiling membrane measured 20 inches thus creating a void of 1,116 cubic feet.

It is common practice in the prefabricated home industry to utilize polyurethane foam structural adhesives on one side of the structural members that supports the gypsum board ceiling. Tests have shown that certain types of structural adhesives are easy to ignite, burn at a rapid rate, generate considerable heat energy and lose considerable amounts of mass. These adhesives are found inside the void space.

The area created by the void (672 square feet) in either of the two Massachusetts modular homes that were destroyed by fire did not trigger the Code requirement for draftstopping. Once the fire entered the void it spread -- in an unobstructed fashion -- the full length and width of the void space. The fire also destroyed the primary means of affixing the gypsum board to the ceiling membrane thus expedited ceiling collapse and exposing the lower levels to fire conditions.

This Code change attempts to reduce the size of the void space found in multistory residences of modular construction by incorporating the height of the void thus changing the unit of measurement from square feet to cubic feet. Draft stops, as defined by Section R202 (Definitions) are designed to "restrict the movement of air within open spaces of concealed areas of building components. " Floor / ceiling assemblies are included in the stated list of qualifying building components. The free movement of superheated air, gases and other products of combustion pre-heats structural members within the void space. In the presence of flammable polyurethane structural adhesives, the spread of heat, gases and fire is increased. The collapse of the ceiling membrane, considerable distances from the location of the fire, is a very real possibility.

Applying this Code change to traditional, stick framed construction would yield the following results; a void space of 1,000 square feet which incorporates floor framing consisting of an open web truss system of 12" depth would calculate to 1,000 cubic feet resulting in no change from the current code. The same void space with an 18" depth to the open web truss would generate 1,500 cubic feet thus requiring draftstopping. A 24" open web truss would create a void space of 2,000 cubic feet thus requiring compartmentalization.

By reducing the overall size of the void, the lightweight engineered structural components found inside the void are offered protection under fire conditions.

This proposal substitutes new measurement criteria for current provision of the Code.

Cost Impact: The code change proposal may increase the cost of construction

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: GALLAGHER-RB-1-R302.12

RB38–09/10
R305.1

Proponent: Rick Davidson, City of Maple Grove, MN

Revise as follows:

R305.1 Minimum height. Habitable space, hallways, ~~bathrooms, toilet rooms,~~ laundry rooms and portions of basements containing these spaces shall have a ceiling height of not less than 7 feet (2134 mm). Bathrooms and toilet rooms shall have a ceiling height of not less than 6 feet 8 inches (2036 mm) including above a minimum area 30 inches (762 mm) by 30 inches (762 mm) at the showerhead in showers or tubs equipped with showerheads.

Exceptions:

1. For rooms with sloped ceilings, at least 50 percent of the required floor area of the room must have a ceiling height of at least 7 feet (2134 mm) and no portion of the required floor area may have a ceiling height of less than 5 feet (1524 mm).
2. ~~Bathrooms shall have a minimum ceiling height of 6 feet 8 inches (2036 mm) at the center of the front clearance area for fixtures as shown in Figure R307.1. The ceiling height above fixtures shall be such that the fixture is capable of being used for its intended purpose. A shower or tub equipped with a showerhead shall have a minimum ceiling height of 6 feet 8 inches (2036 mm) above a minimum area 30 inches (762 mm) by 30 inches (762 mm) at the showerhead.~~
2. The ceiling height above water closets and lavatories shall be permitted to be of any height.

Reason: First section R305.1 sets a minimum ceiling height for bathrooms and toilet rooms at 7 feet. Then Exception 2 reduces that ceiling height in bathrooms (but not toilet rooms) to 6'8" at the center of the front clearance area for fixtures shown in Figure R307.1 and in tubs and showers with showerheads. It is safe to assume that toilet rooms should have been included in this section. It is probably also safe to assume that ceiling heights in bathrooms and toilet rooms need only be 6'8" at any location in the room, not just in the most used areas of the room. It isn't reasonable to think that the ceiling heights in these rooms should be 7 feet but only 6'8" near the fixtures, but this is what the text implies. Since bathrooms and toilet rooms do not have "required floor areas" but rather "clearance area for fixtures", Exception 1 does not apply to bathrooms and toilet rooms. That exception only applies to required floor area. Therefore, Exception 2 is really not an exception to the charging language but is the charging language and should not be in an exception. This proposal corrects that flaw.

The third exception that states "The ceiling height above fixtures shall be such that the fixture is capable of being used for its intended purpose" is unenforceable and any attempt at enforcement would be arbitrary. It is unenforceable because "capable of being used for its intended purpose" is not defined and is subject to discretionary action. The converse would be what ceiling height is acceptable over a water closet? Is 5 feet acceptable? What about 5 ½ feet? Or, 6 feet? And, if in your opinion an acceptable height is 6 feet and you encounter a situation where the height is 5 ½ feet, how do you enforce your opinion? If it can't be enforced it shouldn't be in the code. There is no basis on which to write a correction order no matter what the height above the fixtures is. The language will result in a lack of uniformity. It will lead to confusion as to what is an acceptable height. It will create conflicts between building departments, contractors, and homeowners. The proposed language specifically calls out water closets and lavatories because those are the only fixtures illustrated in Figure 307.1 besides tubs/showers and there are specific height requirements for tub/showers that are retained. Because of the reasons stated and because the market will likely dictate what an acceptable height is, this proposal deletes the offending language and permits the homeowner to decide what height is most appropriate.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: DAVIDSON-RB-6-R305.1

RB39–09/10
R308.4

Proponent: William E. Koffel, Koffel Associates, Inc., representing the Glazing Industry Code Committee (GICC)

Revise as follows:

R308.4 Hazardous locations. The following shall be considered specific hazardous locations for the purposes of glazing:

1. Glazing in all fixed and operable panels of swinging, sliding and bifold doors.

   Exceptions:

   1. Glazed openings of a size through which a 3-inch diameter (76 mm) sphere is unable to pass.
   2. Decorative glazing.

2. Glazing in an individual fixed or operable panel adjacent to a door where the nearest vertical edge is within a 24-inch (610 mm) arc of the door in a closed position and whose bottom edge is less than 60 inches (1524 mm) above the floor or walking surface.

   Exceptions:

   1. Decorative glazing.
   2. When there is an intervening wall or other permanent barrier between the door and the glazing.
   3. Glazing in walls on the latch side of and perpendicular to the plane of the door in a closed position.
   4. Glazing adjacent to a door where access through the door is to a closet or storage area 3 feet (914 mm) or less in depth.
   5. Glazing that is adjacent to the fixed panel of patio doors <u>which is not required to be safety glazing by another section</u>.

3. Glazing in an individual fixed or operable panel that meets all of the following conditions:
   3.1. The exposed area of an individual pane is larger than 9 square feet (0.836 m2); and
   3.2. The bottom edge of the glazing is less than 18 inches (457 mm) above the floor; and
   3.3. The top edge of the glazing is more than 36 inches (914 mm) above the floor; and
   3.4. One or more walking surfaces are within 36 inches (914 mm), measured horizontally and in a straight line, of the glazing.

   Exceptions:

   1. Decorative glazing.
   2. When a horizontal rail is installed on the accessible side(s) of the glazing 34 to 38 inches (864 to 965) above the walking surface. The rail shall be capable of withstanding a horizontal load of 50 pounds per linear foot (730 N/m) without contacting the glass and be a minimum of 11/2 inches (38 mm)in cross sectional height.
   3. Outboard panes in insulating glass units and other multiple glazed panels when the bottom edge of the glass is 25 feet (7620 mm) or more above *grade*, a roof, walking surfaces or other horizontal [within 45 degrees (0.79 rad) of horizontal] surface adjacent to the glass exterior.

4. All glazing in railings regardless of area or height above a walking surface. Included are structural baluster panels and nonstructural infill panels.
5. Glazing in enclosures for or walls facing hot tubs, whirlpools, saunas, steam rooms, bathtubs and showers where the bottom exposed edge of the glazing is less than 60 inches (1524 mm) measured vertically above any standing or walking surface.

   Exception: Glazing that is more than 60 inches (1524 mm),measured horizontally and in a straight line, from the waters edge of a hot tub, whirlpool or bathtub.

6. Glazing in walls and fences adjacent to indoor and outdoor swimming pools, hot tubs and spas where the bottom edge of the glazing is less than 60 inches (1524 mm) above a walking surface and within 60 inches (1524 mm), measured horizontally and in a straight line, of the water's edge. This shall apply to single glazing and all panes in multiple glazing.
7. Glazing adjacent to stairways, landings and ramps within 36 inches (914 mm) horizontally of a walking surface when the exposed surface of the glazing is less than 60 inches (1524 mm) above the plane of the adjacent walking surface.

   Exceptions:

   1. When a rail is installed on the accessible side(s) of the glazing 34 to 38 inches (864 to 965 mm) above the walking surface. The rail shall be capable of withstanding a horizontal load of 50 pounds per linear foot (730 N/m) without contacting the glass and be a minimum of 11/2 inches (38 mm) in cross sectional height.
   2. The side of the stairway has a guardrail or handrail, including balusters or in-fill panels, complying with Sections R311.7.6 and R312 and the plane of the glazing is more than 18 inches (457 mm) from the railing; or
   3. When a solid wall or panel extends from the plane of the adjacent walking surface to 34 inches (863 mm) to 36 inches (914 mm) above the walking surface and the construction at the top of that wall or panel is capable of withstanding the same horizontal load as a *guard*.

8. Glazing adjacent to stairways within 60 inches (1524 mm) horizontally of the bottom tread of a stairway in any direction when the exposed surface of the glazing is less than 60 inches (1524 mm) above the nose of the tread.

   Exceptions:

   1. The side of the stairway has a guardrail or handrail, including balusters or in-fill panels, complying with Sections R311.7.6 and R312 and the plane of the glass is more than 18 inches (457 mm) from the railing; or
   2. When a solid wall or panel extends from the plane of the adjacent walking surface to 34 inches (864 mm) to 36 inches (914 mm) above the walking surface and the construction at the top of that wall or panel is capable of withstanding the same horizontal load as a *guard*.

Reason: After several attempts, Exception #5 was added to the 2009 Edition of the IBC. The rationale submitted in RB42-07/08 was that "it is unlikely that the sliding doors will be reversed by the owner and people are familiar with their home environments." There was not corresponding proposal submitted to address eh issue in the same manner within dwelling units covered by the IBC.

The original rationale is flawed for the following reasons:

1. The new language "patio doors" instead of the original language "sliding doors" extends the application to far more doors.
2. The assumption that the people are familiar with their home environment does not take into consideration guests and horseplay activities.
3. The exception is too broad in nature and could be read to override the other provisions. For example, what if the panel is part of a hot tub enclosure? What if the panel is less than 18 inches above the floor?
4. The proponent based the rationale in part on Exception No. 3 but that exception only applies when the wall is perpendicular to the door.

We do not have injury data to support this proposal since historically the panel was required to be safety glazing. However, there was no technical substantiation to the change proposed last cycle to eliminate the requirement for safety glazing.

Cost Impact: The code change proposal will increase the cost of construction.

R308.4

Proponent: Tim Pate, City and County of Broomfield, CO, representing the Colorado Chapter ICC Code Change Committee

Revise as follows:

R308.4 Hazardous locations. The following shall be considered specific hazardous locations for the purposes of glazing:

1. Glazing in all fixed and operable panels of swinging, sliding and bifold doors.

   Exceptions:

   1. Glazed openings of a size through which a 3-inch diameter (76 mm) sphere is unable to pass.
   2. Decorative glazing.

2. Glazing in an individual fixed or operable panel adjacent to a door where the nearest vertical edge is within a 24-inch (610 mm) arc of the door in a closed position and whose bottom edge is less than 60 inches (1524 mm) above the floor or walking surface.

   Exceptions:

   1. Decorative glazing.
   2. When there is an intervening wall or other permanent barrier between the door and the glazing.
   3. Glazing in walls on the latch side of and perpendicular to the plane of the door in a closed position.

4. Glazing adjacent to a door where access through the door is to a closet or storage area 3 feet (914 mm) or less in depth.
5. Glazing that is adjacent to the fixed panel of patio doors.

3. Glazing in an individual fixed or operable panel that meets all of the following conditions:
   3.1. The exposed area of an individual pane is larger than 9 square feet (0.836 m2); and
   3.2. The bottom edge of the glazing is less than 18 inches (457 mm) above the floor; and
   3.3. The top edge of the glazing is more than 36 inches (914 mm) above the floor; and
   3.4. One or more walking surfaces are within 36 inches (914 mm), measured horizontally and in a straight line, of the glazing.

   Exceptions:

   1. Decorative glazing.
   2. When a horizontal rail is installed on the accessible side(s) of the glazing 34 to 38 inches (864 to 965) above the walking surface. The rail shall be capable of withstanding a horizontal load of 50 pounds per linear foot (730 N/m) without contacting the glass and be a minimum of 11/2 inches (38 mm) in cross sectional height.
   3. Outboard panes in insulating glass units and other multiple glazed panels when the bottom edge of the glass is 25 feet (7620 mm) or more above *grade*, a roof, walking surfaces or other horizontal [within 45 degrees (0.79 rad) of horizontal] surface adjacent to the glass exterior.

4. All glazing in railings regardless of area or height above a walking surface. Included are structural baluster panels and nonstructural infill panels.
5. Glazing in enclosures for or walls facing hot tubs, whirlpools, saunas, steam rooms, bathtubs and showers where the bottom exposed edge of the glazing is less than 60 inches (1524 mm) measured vertically above any standing or walking surface.

   Exception: Glazing that is more than 60 inches (1524 mm),measured horizontally and in a straight line, from the waters edge of a hot tub, whirlpool or bathtub.

6. Glazing in walls and fences adjacent to indoor and outdoor swimming pools, hot tubs and spas where the bottom edge of the glazing is less than 60 inches (1524 mm) above a walking surface and within 60 inches (1524 mm), measured horizontally and in a straight line, of the water's edge. This shall apply to single glazing and all panes in multiple glazing.
7. Glazing adjacent to stairways, landings, and ramps within 36 inches (914 m) horizontally of a walking surface when the exposed surface of the glazing is less than 60 inches (1524 mm) above the plane of the adjacent walking surface.

   Exceptions:

   ~~1. When a rail is installed on the accessible side(s) of the glazing 34 to 38 inches (864 to 965 mm) above the walking surface. The rail shall be capable of withstanding a horizontal load of 50 pounds per lineal foot (730 N/m) without contacting the glass and be a minimum of 1 ½ inches (38 mm) in cross sectional height.~~
   ~~2~~ 1. The side of the stairway has a guard~~rail~~ or handrail, including balusters or in-fill panels, complying with Sections R311.7.6 and R312 and the plane of the glazing is more than 18 inches (457 mm) from the railing; or
   ~~3~~ 2. When a solid wall or panel extends from the plane of adjacent walking surface to 34 inches (863 mm) to 36 inches (914 mm) above the walking surface and the construction at the top of that wall or panel is capable of withstanding the same horizontal load as a guard and the plane of the glazing is more than 18 inches (457 mm) from the wall or panel.

8. Glazing adjacent to stairways within 60 inches (1524 m) horizontally of the bottom tread of a stairway in any direction when the exposed surface of the glazing is less than 60 inches (1524 mm) above the nose of the tread.

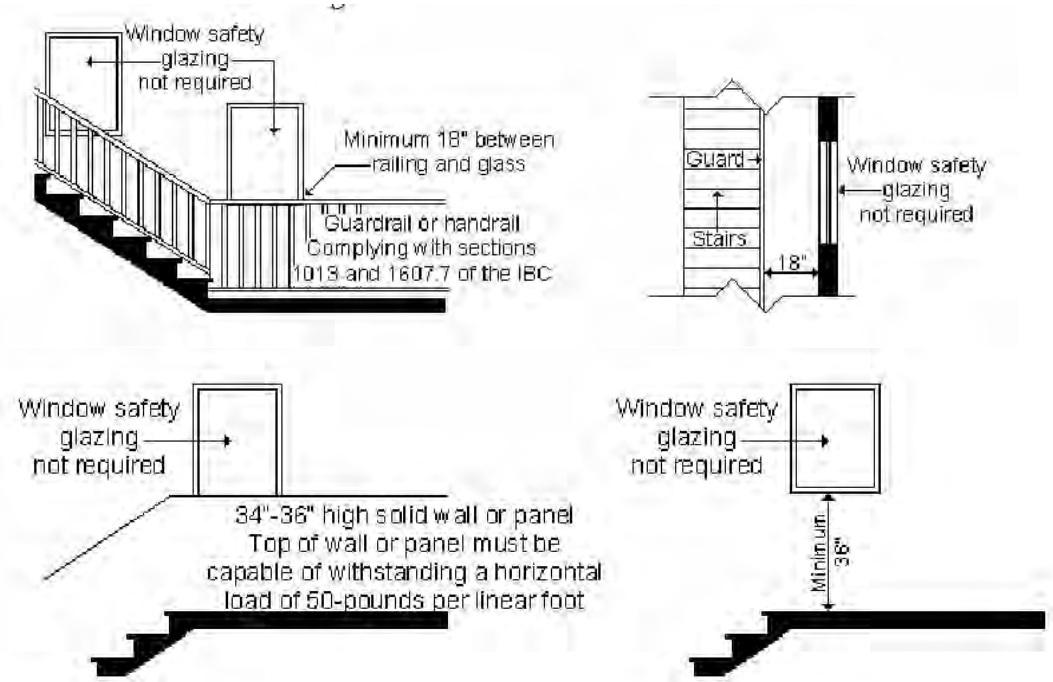
Exceptions:

1. The side of the stairway has a guard~~rail~~ or handrail, including balusters or in-fill panels, complying with Sections R311.7.6 and R312 and the plane of the glazing is more than 18 inches (457 mm) from the railing; or
2. When a solid wall or panel extends from the plane of the adjacent walking surface to 34 inches (864 mm) to 36 inches (914 mm) above the walking surface and the construction at the top of that wall or panel is capable of withstanding the same horizontal load as a guard <u>and the plane of the glazing is more than 18 inches (457 mm) from the wall or panel.</u>

Reason: Code change RB15-00 added exception 9 (9.1 and 9.2) which allowed the protective bar but also required the glazing to be at least 18" away from the stair and bar. Code change RB16-00 was also approved in the same code change cycle which added the reference in exception #5 which would allow the protective bar but not require the 18" separation. This created a direct conflict between the two exceptions in the 2003 IRC and the 2006 IRC. IRC Section R308.4 was modified for the 2009 IRC by reformatting the requirements and exceptions in order to make it more user friendly but no technical changes were made.

Stairs are inherently more dangerous for tripping hazards than normal walking surfaces. It does not make sense to a allow 1 ½" wide bar or a solid wall directly adjacent to stairs and landings and think this gives adequate protection for someone falling into glazing that is not safety glazing. Requiring the glazing to be at least 18" away would provide better protection if someone trips and falls which is exactly what 2009 IRC section R308.4 #7 exception 2 requires.

The following diagrams illustrates what R308.4 #7 exception 2 allows which is the guard or handrail but also the 18" separation which is in conflict with what is allowed in #7 exception 1 or 3 which allows a rail or solid wall but does not require the 18" separation.



I have also made a minor change to change the word guardrail to guard which has already been changed throughout the rest of the Code. Finally this overall code change will now make the IRC requirements exactly the same as the IBC requirements in Section 2406.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: PATE-RB-1-R308.4

RB41–09/10
R310.1

Proponent: Mike Rice, Maplewood, MN, representing the Association of Minnesota Building Officials

Revise as follows:

R310.1 Emergency escape and rescue required. *Basements,* habitable attics and every sleeping room shall have at least one operable emergency escape and rescue opening. Where *basements* contain one or more sleeping rooms, emergency egress and rescue openings shall be required in each sleeping room. Where emergency escape and rescue openings are provided they shall have a sill height of not more than 44 inches (1118 mm) measured from the finished floor to the bottom of the clear opening ~~above the floor~~. Where a door opening having a threshold below the adjacent ground elevation serves as an emergency escape and rescue opening and is provided with a bulkhead enclosure, the bulkhead enclosure shall comply with Section R310.3. The net clear opening dimensions required by this section shall be obtained by the normal operation of the emergency escape and rescue opening from the inside. Emergency escape and rescue openings with a finished sill height below the adjacent ground elevation shall be provided with a window well in accordance with Section R310.2. Emergency escape and rescue openings shall open directly into a public way, or to a *yard* or court that opens to a public way.

> **Exception:** *Basements* used only to house mechanical *equipment* and not exceeding total floor area of 200 square feet (18.58 m^2).

Reason: This change would clarify where the sill height is (at the bottom of the clear opening), providing uniformity and take away any confusion as to where that measurement is to be taken. The IRC Commentary describes this situation and I think it would complement the current section without a lot of change, taking away any question of where the sill height is.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: RICE (MIKE)-RB-3-R310.1

RB42–09/10
R310.1.5 (New)

Proponent: Rick Davidson, City of Maple Grove, MN

Add new text as follows:

R310.1.5 Identification. Windows installed as an emergency escape and rescue opening and meeting the requirements of Sections R310.1.1 thru R310.1.4 shall be identified as an "Emergency Escape and Rescue Opening". The identification shall be affixed to the frame or glass of the window as to be visible during inspection. The identification shall be of a type which once applied cannot be removed without being destroyed.

Reason: How do confirm that a window has safety glazing? You look for identification. How do you determine the grade of a floor joist? You look for a grade stamp. How do you confirm the R value of an insulation batt? You look for a label. Why, so the component can be identified in the field as meeting a specific standard or requirement. How do you identify whether or not a window meets emergency egress requirements? We might try measure it and then decide if it is compliant or require additional information from the contractor or window supplier. We don't require any identification for windows used as emergency escape and rescue openings like we do with most other building components. This makes it difficult to verify compliance in the field with egress requirements. Manufacturers identify windows that meet egress requirements in their catalogs. That can be verified at plan review. But a disconnect occurs when that window, or one that is close in size, is installed in the field. Field inspectors cannot carry with them the manufactures literature for the dozens or hundreds of window manufacturers. They can only rely on field measurements. Herein lays the problem. There are numerous windows specified by manufacturers as having clear openable areas that meet egress requirements or that are hundredths of a square foot greater or lesser than required. Field inspectors cannot measure these openings to the exactness necessary to determine if windows that are close to meeting requirements are of the appropriate size. We already require windows to be identified for safety glazing and energy compliance reasons. Placing identification on the window that it meets egress requirements will have a minimal increase in cost and will greatly improve timely validation and compliance in the field.

Cost Impact: The code change proposal will increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: DAVIDSON-RB-8-R310.1.5

RB43–09/10
R310.2.2 (New)

Proponent: Scott Dornfeld, City of Delano, MN, representing the Association Minnesota Building Officials

Add new text as follows:

R310.2.2 Drainage. Window wells shall be designed for proper drainage by connecting to the buildings foundation drainage system required by Section R405.1 or by an approved alternate method.

> **Exception:** A drainage system for window wells is not required when the foundation is on well-drained soil or sand-gravel mixture soils according to the United Soil Classification System, Group I Soils, as detailed in Table R405.1.

Reason: Although many builders are addressing window well drainage, there are those that do not. As an inspector, I have seen the damage caused from not having proper window well drainage and this code change proposal could eliminate that damage. Also when there is a problem with the window well drainage the emergency escape window now becomes a hazard to the occupants. The window may become inoperable, or even blow out into the occupied room causing serious injury. This code change may increase costs to those not currently addressing the issue; however, it may prevent serious injury and costly water damage repair.

Cost Impact: The code change proposal will increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: DORNFELD-RB-1-R310.2.2

RB44–09/10
R311.3

Proponent: Rick Davidson, City of Maple Grove, MN

Revise as follows:

R311.3 Floors and landings at exterior doors. There shall be a landing or floor on each side of each exterior door. The width of each landing shall not be less than the door served. Every landing shall have a minimum dimension of 36 inches (914 mm) measured in the direction of travel. Exterior landings shall be permitted to have a slope not to exceed 1/4 unit vertical in 12 units horizontal (2-percent).

> **Exception:** ~~Exterior~~ Doors, other than the required exit door, serving exterior balconies ~~less than 60 square feet and only accessible from a door are permitted to have a landing less than 36 inches (914 mm) measured in the direction of travel~~.

Reason: An arbitrary limit on the size of landings at balconies serves no purpose when they don't serve as the required exit door. There is also no reason to prohibit a window from opening onto one of these balconies ("only accessible from a door"). This amendment would eliminate unnecessary regulation and simplify the language.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: DAVIDSON-RB-2-R311.3

RB45–09/10
R311.3.2

Proponent: Homer Maiel, PE, CBO, City of San Jose, CA, representing the ICC Tri-Chapter (Peninsula, East Bay, Monterey Bay Chapters)

Revise as follows:

R311.3.2 Floor elevations for other exterior doors. Doors other than the required egress door shall be provided with landings or floors not more than 7 ¾ inches (196 mm) below the top of the threshold <u>provided the door does not swing over the landing or floor</u>.

> **Exceptions:** A landing is not required where a stairway of two or fewer risers is located on the exterior side of the door, provided the door does not swing over the stairway.

Reason: This revision is needed to make sure that Section R311.3.2 is consistent with Section R311.3.1. Tripping hazards will be equal regardless of whether a door is or is not a required egress door. The Exception to this section indicates that the door should not be swung over one-riser or two-riser stairway. However, the main body of the section fails to address that a door should not swing over a lower landing, as Section R311.3.1 clearly states.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: MAIEL-RB-4-R311.3.2

RB46–09/10
R311.7.4.1, R311.7.4.2, R311.7.4.2.1 (New), R311.7.4.3

Proponent: Rick Davidson, City of Maple Grove, MN

1. Revise as follows:

R311.7.4.1 Riser height. The maximum riser height shall be 73/4 inches (196 mm). The riser shall be measured vertically between leading edges of the adjacent treads. The greatest riser height within any flight of stairs shall not exceed the smallest by more than 3/8 inch (9.5 mm). <u>Risers shall be vertical or sloped from the underside of the leading edge of the tread above at an angle not more than 30 degrees (0.51 rad) from the vertical. Open risers are permitted provided that the opening between treads does not permit the passage of a 4-inch diameter (102 mm) sphere.</u>

> <u>**Exception:** The opening between adjacent treads is not limited on stairs with a total rise of 30 inches (762 mm) or less.</u>

R311.7.4.2 Tread depth. The minimum tread depth shall be 10 inches (254 mm). The tread depth shall be measured horizontally between the vertical planes of the foremost projection of adjacent treads and at a right angle to the tread's leading edge. The greatest tread depth within any flight of stairs shall not exceed the smallest by more than 3/8 inch (9.5 mm). Consistently shaped winders at the walkline shall be allowed within the same flight of stairs as rectangular treads and do not have to be within 3/8 inch (9.5 mm) of the rectangular tread depth. ~~Winder treads shall have a minimum tread depth of 10 inches (254 mm) measured between the vertical planes of the foremost projection of adjacent treads at the intersections with the walkline. Winder treads shall have a minimum tread depth of 6 inches (152 mm) at any point within the clear width of the stair. Within any flight of stairs, the largest winder tread depth at the walkline shall not exceed the smallest winder tread by more than 3/8 inch (9.5 mm).~~

2. Add new text as follows:

<u>**R311.7.4.2.1 Winder treads.** Winder treads shall have a minimum tread depth of 10 inches (254 mm) measured between the vertical planes of the foremost projection of adjacent treads at the intersections with the walkline. Winder treads shall have a minimum tread depth of 6 inches (152 mm) at any point within the clear width of the stair. Within any flight of stairs, the largest winder tread depth at the walkline shall not exceed the smallest winder tread by more than 3/8 inch (9.5 mm).</u>

3. Revise as follows:

R311.7.4.3 ~~Profile~~ Nosings . The radius of curvature at the nosing shall be no greater than 9/16 inch (14 mm). A nosing not less than 3/4 inch (19 mm) but not more than 11/4 inches (32 mm) shall be provided on stairways with solid risers. The greatest nosing projection shall not exceed the smallest nosing projection by more than 3/8 inch (9.5 mm) between two stories, including the nosing at the level of floors and landings. Beveling of nosings shall not exceed 1/2 inch (12.7 mm). ~~Risers shall be vertical or sloped under the tread above from the underside of the nosing above at an angle not more than 30 degrees (0.51 rad) from the vertical. Open risers are permitted, provided that the opening between treads does not permit the passage of a 4-inch diameter (102 mm) sphere.~~

Exceptions~~:~~

~~1.~~ A nosing is not required where the tread depth is a minimum of 11 inches (279 mm).
~~2. The opening between adjacent treads is not limited on stairs with a total rise of 30 inches (762 mm) or less.~~

Reason: Language related to risers is relocated from the section on "Profile" to the section on "Risers", which is more appropriate. This change is strictly cut and paste. The language on winder treads is made into its own subsection of Treads to enable the user of the code to more easily find that text. The purpose of this code change is to ease use of the code.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: DAVIDSON-RB-5-R311.7.4

RB47–09/10

R311.7.4.2, R311.7.4.2.1 (New), R311.7.4.2.2 (New)

Proponent: Jake Pauls, representing self

1. Revise as follows:

R311.7.4.2 Tread depth. The minimum tread depth shall be 10 inches (254 mm). The tread depth shall be measured horizontally between the vertical planes of the foremost projection of adjacent treads and at a right angle to the tread's nosing ~~leading edge~~. ~~The greatest tread depth within any flight of stairs shall not exceed the smallest by more than 3/8 inch (9.5 mm). Consistently shaped winders at the walkline shall be allowed within the same flight of stairs as rectangular treads and do not have to be within 3/8 inch (9.5 mm) of the rectangular tread depth. Winder treads shall have a minimum tread depth of 10 inches (254 mm) measured between the vertical planes of the foremost projection of adjacent treads at the intersections with the walkline. Winder treads shall have a minimum tread depth of 6 inches (152 mm) at any point within the clear width of the stair. Within any flight of stairs, the largest winder tread depth at the walkline shall not exceed the smallest winder tread by more than 3/8 inch (9.5 mm).~~

2. Add new text as follows:

R311.7.4.2.1 Uniformity of rectangular tread depths. The greatest tread depth, measured horizontally between nosings of treads as specified in R311.7.4.2 and including the top tread, within each flight of stairs shall not exceed the smallest by more than 3/8 inch (9.5 mm).

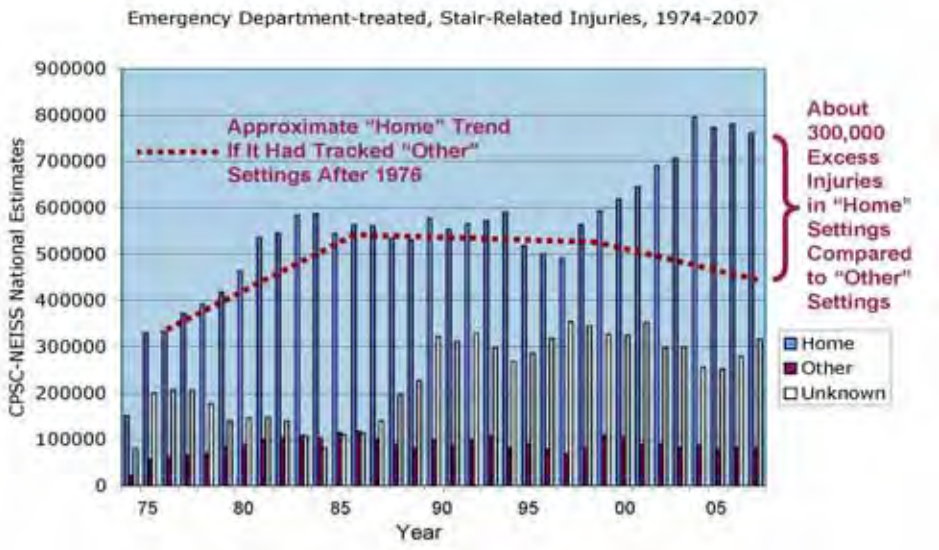
R311.7.4.2.2 Uniformity of winder treads. Consistently shaped winders at the walkline shall be allowed within the same flight of stairs as rectangular treads and do not have to be within 3/8 inch (9.5 mm) of the rectangular tread depth. Winder treads shall have a minimum tread depth of 10 inches (254 mm) measured between the vertical planes of the foremost projection of adjacent treads at the intersections with the walkline. Winder treads shall have a minimum tread depth of 6 inches (152 mm) at any point within the clear width of the stair. Within any flight of stairs, the largest winder tread depth at the walkline shall not exceed the smallest winder tread by more than 3/8 inch (9.5 mm).

Reason: There is no technical change to the requirement in this proposal. It is a clarification of intent by separating out and labeling the separate issues of tread depth and the uniformity of tread depths for rectangular and winder treads, the only two forms of tread addressed in the current code. This proposed change, along with another for R311.7.4.3, is intended to clear up what appears to be widespread confusion resulting in flawed design, inspection, and ICC training plus published guidance regarding the need for every step of a flight to have uniform tread depth (or run) dimensions, measured horizontally, nosing to nosing. (Note that the change also incorporates the change of term "leading edge of tread" to "nosing" as that term was defined in the last cycle and is the term used in R311.7.4.3.) For consistency and to utilize defined terms, "nosing" should be the standard term used here.

A far too common error in design and construction of stairways is the lack of attention to keeping all tread depths, especially the top one in a flight, uniform in size, particularly where projecting nosings are provided on a flight of stairs installed as a manufactured unit which does not include the top or landing nosing projection. ICC IRC guides for inspection and for the homebuilding industry (published by ICC in conjunction with NAHB) fail to even mention these important rules. These two ICC publications are listed in the Bibliography.

The resulting non-uniformities in tread depths, with a larger top tread followed by smaller treads in the flight make the stair flight orders of magnitude more dangerous for descent-direction users. This pervasive systemic defect has also become so concerning to leading stairway safety professionals such as myself that a special website page has been created simply to deal with this issue. See http://web.me.com/bldguse/Site/Stairways.html for information on this including the graph provided below as Figure 1 showing a large increase in the number of home stair-related injuries identified in the CPSC NEISS national estimates for the USA in the last several years. Excerpts of text from the Stairways website page are also quoted below as are excerpts from an American Society of Safety Engineers 2008 Professional Development Conference paper by Pauls and Harbuck. The full ASSE conference paper is freely accessible as a PDF download from the Downloads area of my website, http://web.me.com/bldguse/Site/Downloads.html. Generally, it is suspected that with recent greater use of manufactured stair flights, the incidence of systemic, top-of-flight non-uniformities has grown with resulting significant increases in home stair-related injuries.

Figure 1. Growth of Home Stair-related Injuries in USA in Recent Years.



On the Stairways website page, referenced above, is the following text and photograph (here identified as Figure 2) of a typical dwelling unit stairway with the systemic top-of-flight defect in tread depth non-uniformity. Below Figure 2 is an additional photograph, Figure 3, showing what a stair flight looks like it very likely conforms to the uniformity requirements but which should be properly measured, at least at the top three steps, to confirm that there is not a rare coincidence of both larger tread depth and larger rise dimensions at the top step. Here follows the text from the website which has been publicly available since May 2009.

"While more investigation is required, it appears that a major reason for the recent 'excess' injuries related to home stairs might be a systemic defect on many home stairways (as well as some in other settings) in the USA and Canada. This defect is a non-uniformity of the nosing projection at the top of stair flights; due to the omission of a $10 nosing piece, at the landing level, at the time of stairway construction. This makes the top tread below the landing effectively larger than all the steps below it.

This common defect greatly increases the risk of an 'overstepping misstep' on the second or third step down the flight. Such missteps can lead to a very serious fall down the stair flight, with resulting injuries.

This is why we should now give our stairways 'a second look.' Specifically we should perform the simple 'crouch and sight' test. Do this from the landing above the stair flight you wish to check. Crouch down so you are able to see all the stair nosings (the leading edges) line up. If the top, landing nosing does not line up with all the other step nosings, your stair likely has the systemic defect. Here is a home stairway with the systemic defect."

Figure 2. Typical Dwelling Unit Stairway with the Systemic, Top-of-Flight Defect.

The "Stairways" page of the website goes on to provide advice specifically for homeowners who perform the "crouch and sight" test and discover that their stairway has the systemic, top-of-flight defect.

"If your home stairway has this defect—which results from the non-uniformities of nosing projections and of what are called 'tread depth' or 'run' dimensions—and your home was recently constructed, call your local building inspection authorities and request that the stairway be re-inspected for building code compliance. Both the non-uniform nosing projection and the non-uniform tread depth or run are building code violations, for example under widely used codes in the USA.

If there has been a fall and significant injury on the non-uniform stair flight, you might also want to confer with an attorney (experienced in dealing with stair-related injury cases), especially if the home was recently constructed.

Much more information on this (and other) safety problems with stairways is found in the downloadable files associated with this website. See especially the latest papers and presentations by Jake Pauls on home stairways in the two most recently posted folders.

•Home Stairway Safety and Codes (Posted February 2009)

•Presentations at MUTN Conference in BC, Canada, April 2009

Also, in early summer 2009, watch this website for an announcement of the availability of an educational DVD package, based on the one-day workshop at the MUTN Conference in BC, Canada, in April 2009. (Contact Jake Pauls for purchase information.)"

Figure 3. Dwelling Unit Stair Very Likely Not Having the Systemic, Top-of-Flight Defect.

Any ICC chapter wishing to have their members participate in a one-day workshop (also slated for presentation in Eastern Canada on September 14, 2009) should contact Jake Pauls. It is available in a not-for-profit mode. Code authorities should be prepared to deal knowledgeably with consumers who, upon discovering the systemic defect in their homes (after performing their own "crouch-and-sight" test), contact their local building department and ask for a re-inspection of their home stairways. If there has been an injurious fall on such a stairway they should also be prepared to deal with resulting legal actions that might name the local building department as a third party defendant. They should know how to perform the measurements of the stair step geometry that are of a quality expected in such litigation actions. These measurement techniques,

usually requiring use of a spirit level or electronic level, are all described in the workshop materials posted on the above-mentioned website Downloads area and on the DVD of the Spring 2009 workshop noted above. These measurement techniques are consistent with the ICC requirements both as currently stated and as further clarified if this proposal is accepted.

In order to begin stopping all future misinterpretations of the IRC requirements for tread depth uniformity, it is hoped that all code enforcement authorities heed very carefully the current and clarified requirements of R311.7.4.2 as well as of R311.7.4.3.

ICCFILENAME: PAULS-RB1-311.7.4.2

RB48–09/10

R311.7.3 (New), R311.7.5

Proponent: David W. Cooper, Stair Manufacturing and Design Consultants, representing the Stairway Manufacturers'

1. Add new text as follows:

R311.7.3 Vertical rise. A flight of stairs shall not have a vertical rise larger than 12 feet (3658 mm) between floor levels or landings.

2. Revise as follows:

R311.7.5 Landings for stairways. There shall be a floor or landing at the top and bottom of each stairway. The minimum width perpendicular to the direction of travel shall be no less than the width of the flight served. The edges of landings may be curved or segmented. Landings used to turn the direction of travel less than 90 degrees but no less than 60 degrees shall not be considered winder treads provided the depth at the walk line is no less than 18 inches and the minimum depth is no less than 6 inches (152 mm). Where the stairway has a straight run the minimum depth in the direction of travel need not exceed 36 inches (914 mm).

Exception: A floor or landing is not required at the top of an interior flight of stairs, including stairs in an enclosed garage, provided a door does not swing over the stairs. ~~A flight of stairs shall not have a vertical rise larger than 12 feet (3658 mm) between floor levels or landings. The width of each landing shall not be less than the width of the stairway served. Every landing shall have a minimum dimension of 36 inches (914 mm) measured in the direction of travel.~~

Reason: There are certain attributes of landings that are intended to be or need to be regulated by the code but this section currently needs improvements to consistently determine the allowed dimensions or shape of landings. The common interpretations currently referenced in the commentary have been used to develop this proposal. Further the fractured arrangement of text following the exception is eliminated and prevents confusion of requirement and exception.

1. The **Vertical rise** section being added is actually relocated without change from below the exception in **R311.7.5**. The name and text is technically consistent with the IBC. The information in this section is needed to calculate the number of risers between levels, the riser height, and the tread depth of each flight or stair in a stairway. For this reason, if such a requirement is needed, it should be included with the essential elementary sections that precede the tread and riser sections to assure understanding and compliance.
2. The revision adds text to **R311.7.5** that clarifies what dimension is actually the width or widths of the landing. By stating that width is perpendicular to the direction of travel the shape of landings and the intent to allow curved and segmented corners as stated in the commentary is covered. The required sizes are not changed and remain the same.
3. Differentiation between angular shaped landings and winder treads is also needed and provided by the additional text. The text defines the minimum size that is comparable and slightly exceeds the minimum distance of travel the user experiences on the most common 90-degree landing. Please see figures 1, 2, and 3 attached. It is easy to see that the shape of the landing can be inconsequential to its width and its use in the stairway provided the minimum criteria suggested here are achieved. The clear differentiation between landings and winders stated here is important because landings separate flights and winders do not. Stair components regulated "within a flight" such as handrails, riser height, tread depth, dimensional uniformity, etc. are all dependent upon a determination that currently requires better description for consistent understanding.

R311.5.7 Stairway Landings

Figures 1,2, & 3 below illustrate the minimum dimensions proposed of a stairway landing that turns less than 90 degrees.
Note: The outside of each landing is shown with both segmented and curved options that would clarified if the minimum width of the landing described as "measured perpendicular to the line of travel" by this proposal is clarified.

Figure 1:
Proposed 60 degree minimum Landing. The critical area inside of the walk line is shaded.

Figure 2:
Convetional 90 degree Landing. The total area inside of the walk line is shaded

Figure 3:
The 60 and 90 degree landings are shown superimposed . The total area inside of the walk line of the 60 degree winder is clearly comparable to that of conventional landings when the suggested minimum dimensions are applied.

4. The needed exception remains in tact without change.
5. Please note all the text deleted following the exception has been incorporated within **R311.7.5** or relocated under **Vertical rise** as stated above.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: COOPER-RB-3-R311.7.3-R311.7.5

RB49–09/10
R311.7.7.1

Proponent: David W. Cooper, Stair Manufacturing and Design Consultants, representing the Stairway Manufacturers'

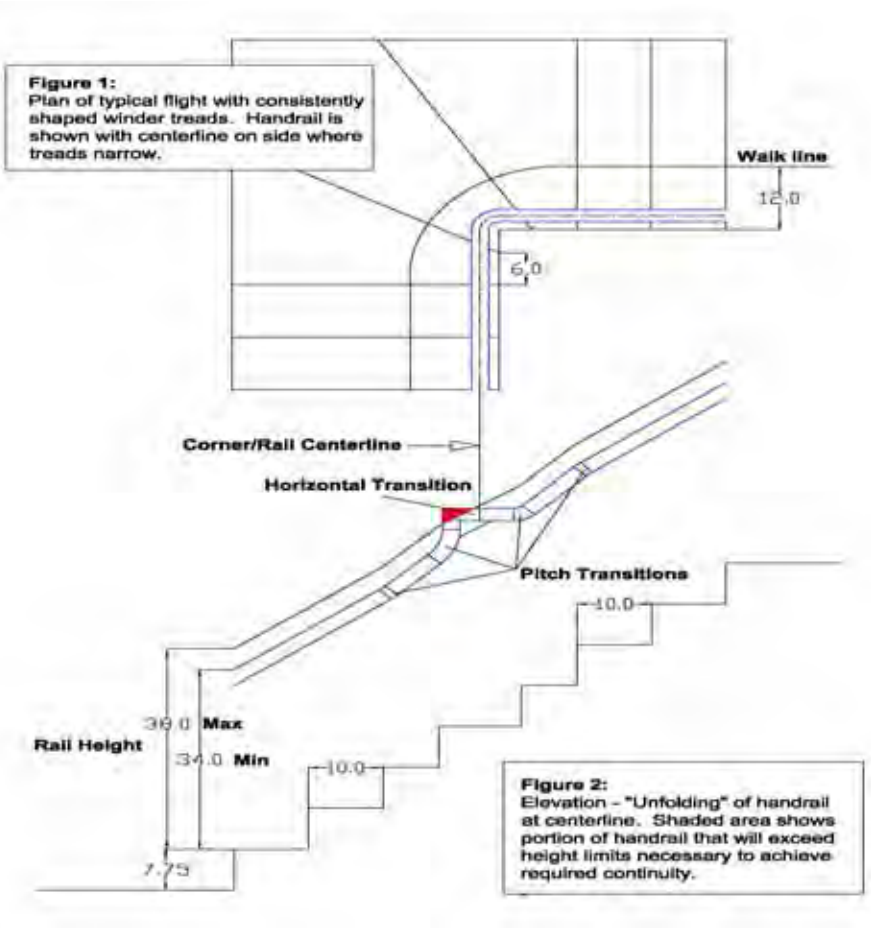
Revise as follows:

R311.7.7.1 Height. Handrail height, measured vertically from the sloped plane adjoining the tread nosing, or finish surface of ramp slope, shall be not less than 34 inches (864 mm) and not more than 38 inches (965 mm).

Exceptions:

1. The use of a volute, turnout, or starting easing shall be allowed over the lowest tread.
2. When handrail fittings or bendings are used to provide continuous transition between flights, transitions at winder treads, the transition from handrail to guardrail, or used at the start of a flight, the handrail height at the fittings or bendings shall be permitted to exceed the maximum height.

Reason: Winder treads do not separate flights and the handrail transitions that must occur above them are not considered included by the text of this exception. As the original proponent of this exception adopted in 2007 this was an oversight. When using readily available fittings and bendings to provide continuity of the handrail above winder treads, especially at the side of the stair where the treads are narrower the height of the handrail may exceed the limits of 34 to 38 inches. The radical changes of angle in the short distances are best understood by studying this condition in elevation. Figure 1 shows a typical stairway plan and Figure 2 illustrates the unfolding of the elevation of the handrail and stair geometry. This additional condition should be included as it is of the same nature as those conditions already recognized and cited in the exception.



Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: COOPER-RB-2-R311.7.7.1

RB50–09/10
R311.9 (New)

Proponent: Katherine Bang, City of Portland, OR, representing the City of Portland and Bureau of Development Services

Add new text as follows:

311.9 Exit Discharge. When walkways connecting the required exit door with the public right of way are less than 10 feet from the building and travel in front of other dwelling units or garages, the exterior walls shall have not less than 1-hour fire resistive construction for a distance of 10 feet above grade and openings shall be protected with 45 minute assemblies.

Exceptions:

1. Fully sprinklered buildings.
2. Exterior walkways allowing travel in two directions to either the public right of way or an area of refuge no less than 50 fifty feet from all buildings on the property.

Reason: Townhouses have become more common in recent years and in some instances the townhouses are oriented such that the exterior exit door faces an interior property line. The occupants are required to travel past other dwelling units to reach the public right of way. Since the residential code allows unprotected walls and openings within 3 feet of the property line, the path of exit discharge can be easily compromised. The residential code is silent about the path of exit discharge. This is becoming a fire and life safety concern with the code now allowing multiple dwelling units on the lot.

Cost Impact: There is potential cost impact from the proposed amendment.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: BANG-RB-1-R311.9

RB51–09/10
R312.1, R312.2

Proponent: Rick Davidson, City of Maple Grove, MN

Revise as follows:

R312.1 Where required. Guards shall be located along ~~open-sided walking surfaces, including~~ open sides of decks, porches, balconies, raised floor surfaces, stairs, ramps and landings~~,~~ that are located more than 30 inches ~~measured vertically to~~ above the floor or grade below ~~at any point within 36 inches (914 mm) horizontally to the edge of the open side. Insect screening shall not be considered as a guard.~~

Guards shall be provided on porches, balconies, and decks enclosed with insect screening when the porch, balcony, or deck floor is located more than 30 inches (762 mm) above the floor or grade below.

R312.2 Height. Required guards ~~at open-sided walking surfaces, including stairs, porches, balconies or landings,~~ shall be not less than 36 inches (914 mm) high ~~measured vertically above the adjacent walking surface, adjacent fixed seating or the line connecting the leading edges of the treads~~.

Exceptions:

1. Guards on the open sides of stairs shall have a height not less than 34 inches (864 mm) measured vertically from a line connecting the leading edges of the treads.
2. Where the top of the guard also serves as a handrail on the open sides of stairs, the top of the guard shall not be not less than 34 inches (864 mm) and not more than 38 inches (965 mm) measured vertically from a line connecting the leading edges of the treads.

Reason: The current language referencing "open sided walking surfaces" is vague, undefined and unenforceable. It isn't clear if this means ***any*** surface upon which someone could walk, defined walking surfaces, or only those surfaces that are part of a dwelling. One could interpret a driveway adjacent a stepped lot line being a regulated "open sided walking surface" and require a guard along its entire length. One could interpret the upper surface of a retaining wall as a walking surface requiring a guard. If a yard is a walking surface, one could interpret egress window wells as needing a guard. Is this what is intended? Conceivably we could have guards crisscrossing residential lots in willy nilly fashion whenever we have elevation changes. If a retaining wall exists on my neighbors property and there is a 3 foot drop from the top of this wall to the grade below and my driveway or my sidewalk is within 36 inches of this retaining wall, is a guard required even if the elevation change does not occur on my property? It would seem so! The code requires that I measure up to 36 inches away from the walking surface. Then, is it his responsibility to install the guard or is it mine? His lot creates the perceived hazard, not mine. If I install the guard on my property, there is still space on the other side of the guard to walk. Is the neighbor also required to install a guard? If my deck is 24 inches above grade below and 2 feet from my lot line and my neighbor has a 16 inch high retaining wall adjacent the lot line, does my deck require a guard? Is it me that creates the hazard or is it my neighbor? Who is responsible for the guard?

The new language addressing insect screening changes the original intent of these terms. When the code states that insect screening shall not be considered a guard, is it implying that windows must have fall protection and that screening does not constitute a guard? One must ask not just how a building official might interpret this language but how might a jury interpret this language if faced with a fall from a window that had only window screening. Might they conclude the code required additional protection?

Last, the code requires that guard height be measured from "adjacent fixed seating". How far must a fixed seat be from the edge of the surface in question before it isn't considered "adjacent"? Must it be in contact with the guard? If I say my house is adjacent to the park, do I mean my house is on the immediate border of the park or some short distance away? And, if I have a fixed seat next to the edge of a walking surface, is it an open walking surface that would require a guard or not? I can no longer walk on the surface near the elevation change.

This is a horribly worded code section that cannot be understood by the public and cannot be easily interpreted by the building official. The language is vague, ambiguous, and confusing. That is the worst kind of language to try to enforce.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: DAVIDSON-RB-7-R312.1

RB52–09/10
R312.3

Proponent: Tiffani Kerlik, Louisville, NE, representing self

Revise as follows:

R312.3 Opening limitations. Required *guards* shall not have openings from the walking surface to the required *guard* height which allow passage of a sphere ~~4 inches~~ 2 ½ inches (102 mm) in diameter.

Exceptions:

1. The triangular openings at the open side of a stair, formed by the riser, tread and bottom rail of a *guard*, shall not allow passage of a sphere ~~6 inches~~ 4 inches (153 mm) in diameter.
2. *Guards* on the open sides of stairs shall not have openings which allow passage of a sphere ~~4 3/8 inches~~ 2 ½ inches (111 mm) in diameter.

Reason: The current code is set at a maximum of 4 inches, this allows for small children to squeeze through, which could result in death, death by hanging, or serious injury of a small child. The code for crib rail spacing should be the model and should supersede any cost savings, aesthetically pleasing excuses to keep the unsafe spacing of 4 inches.

11/04/2007

11/04/2007

Cost Impact: The cost of balusters and spindle product costs and installation will increase and could double the original cost prior to this change.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: Kerlik-RB-1-R312.3

RB53–09/10
R313.1, R302.2, R302.2.4

Proponent: Rick Davidson, City of Maple Grove, MN

Revise as follows:

R313.1 Townhouse automatic fire sprinkler systems. An automatic residential fire sprinkler system shall be installed in *townhouses*.

Exceptions:

1. Townhouse groups containing six or fewer dwelling units and that are not more than two stories in height above grade plane.
2. An automatic residential fire sprinkler system shall not be required when *additions* or *alterations* are made to existing *townhouses* that do not have an automatic residential fire sprinkler system installed.

R302.2 Townhouses. Each *townhouse* shall be considered a separate building and shall be separated by fire-resistance-rated wall assemblies meeting the requirements of Section R302.1 for exterior walls.

Exception: A common ~~1-hour~~ 2-hour fire-resistance-rated wall assembly tested in accordance with ASTM E 119 or UL 263 is permitted for townhouses if such walls do not contain plumbing or mechanical equipment, ducts or vents in the cavity of the common wall. The wall shall be rated for fire exposure from both sides and shall extend to and be tight against exterior walls and the underside of the roof sheathing. Electrical installations shall be installed in accordance with Chapters 34 through 43. Penetrations of electrical outlet boxes shall be in accordance with Section R302.4.

R302.2.4 Structural independence. Each individual *townhouse* shall be structurally independent.

Exceptions:

1. Foundations supporting *exterior walls* or common walls.
2. Structural roof and wall sheathing from each unit may fasten to the common wall framing.
3. Nonstructural wall and roof coverings.
4. Flashing at termination of roof covering over common wall.
5. *Townhouses* separated by a common ~~1-hour~~ 2-hour fire-resistance-rated wall as provided in Section R302.2.

Reason: This proposal accomplishes two things. First, it interjects some reason into requirements for sprinkler systems for small townhouse developments. Small townhouse developments are common in smaller communities for elderly or low income housing. These communities often have limited water supplies available and the cost of sprinkler systems creates an economic hardship. By allowing unsprinklered townhouse groups with no more than six dwelling units and not more than two stories in height, some affordability will be reintroduced to the code. Townhouses have passive fire protection between each unit and do not have a history of unsatisfactory fire performance.

The second part of this code change eliminates the ability to use a 1 hour rated wall in townhouses with fire sprinklers. Townhouses are permitted to have separate water services for each dwelling unit. The recent mortgage crises has resulted in scattered townhouse units being foreclosed and water services in these dwelling units shut off by the water utility both for nonpayment and because the dwelling units are not heated, again possibly for non-payment. This is done without the knowledge of the local building departments and even if the building departments knew of the utility shut offs; they are powerless to require a utility to provide service to a nonpaying customer. This results in occupied townhouses separated from non-occupied townhouses that have no sprinkler protection and only a 1-hour fire wall between them. Unoccupied dwellings are presumed to have a higher fire risk due to the potential for arson or vandalism and allowing the reduction in passive fire protection is inappropriate, dangerous, and short sited.

Cost Impact: The code change proposal will increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: DAVIDSON-RB-9-R313.1

RB54–09/10
R313.1, R313.2, R313.2.1

Proponent: Steven Orlowski, National Association of Home Builders (NAHB)

Revise as follows:

R313.1 Townhouse automatic fire sprinkler systems. When provided, ~~A~~ an automatic residential fire sprinkler system shall be installed in townhouses in accordance with section R313.1.1.

Exception: An automatic residential fire sprinkler system shall not be required when additions, ~~or~~ alterations, or repairs are made to existing townhouses that do not have an automatic residential fire sprinkler system installed.

R313.2 One- and two-family dwellings automatic fire sprinkler systems. ~~Effective January 1, 2011,~~ When provided, an automatic residential fire sprinkler system shall be installed in one- and two-family dwellings in accordance with Section R313.2.1.

Exception: An automatic residential fire sprinkler system shall not be required for additions, ~~or~~ alterations, or repairs to existing buildings that are not already provided with an automatic residential fire sprinkler system.

Reason: The purpose of this proposal is to delete the reference of the mandatory requirement of residential sprinkler systems in all one- and two-family dwellings and townhouses and replace with language that explains the proper installation design and requirements of the system when it is provided. This change will provide the homeowner with the continued ability to choose whether or not a residential fire sprinkler system is appropriate for their situation.

NAHB strongly disagrees with the fire services perception of America's fire problem and the proposed solution to reduce the number of fire fatalities that occur each year. According to NFPA reports, the occupants chances of surviving a residential house fire without any life safety devices such as smoke alarms or sprinklers is 98.87%. By installing smoke alarms and insuring they are in operating condition, the chances of surviving a residential fire is increased to 99.45%. NFPA estimates that an additional 890 lives could be saved each year if smoke alarms were maintained in working condition.

In 1977, less than 0.008% of the housing market was affected by structure fires. In 2005, that number was reduced to less than 0.002%. Over the past three decades, there has a substantial decrease in the number of residential structure fires in relation to the growth of American housing. No one can predict when or where a fire will occur, but to require every home to be equipped with a residential sprinkler system based on the figures below is not cost-effective.

Consideration as to whether the requirement for fire sprinklers in dwellings be mandatory should remain a local issue. The sole purpose of an Appendix P in the 2006 International Code was to provide local jurisdictions with the means to adopt a code or standard that is applicable to their community. Not every jurisdiction agrees that radon resistant construction, patio coverings, and safety inspections of existing appliances need to be regulated or inspected . Contrary to the belief of some activists, several jurisdictions have decided that Appendix P (the provisions for residential sprinkler systems) is not applicable to their state or local jurisdictions. Of the 47 states that have adopted the International Residential Code, none have adopted the 2006 IRC with the inclusion of Appendix P. During the adoption process in six states, there was a proposal put forth to include appendix P in the formal adoption of the 2006 IRC and the proposal was voted down every time.

According to the U.S. fire administration more than half states in America are below the national fire death rate of 13.6 per million and over the past ten years the number of one- and two- family dwelling fires, deaths and injuries have fallen (6%, 18% and 26% respectively).

While the fire service and sprinkler advocates acknowledge that the median age of a home is 32 years, the connection between fire deaths and the age of the home is elusive. For several years data has been collected for several relevant facts about fires. The cause of the fire, whether smoke alarms were present and were working, type of smoke alarm present, whether the fire was confined and did not activate the sprinkler system.

While there have been no studies conducted to investigate whether fire fatalities are less likely to occur in newer homes, there is supporting evidence of this in reports issued by NFPA regarding the performance of smoke alarms. According to these reports, there is a significant difference in the number of fatalities and the number of fires when the smoke alarm present. This includes information regarding smoke alarms that were either battery operated, hardwired with battery backup or hardwired. According to April 2007 Report "U.S. Experience with Smoke Alarms and other Fire Detection/Alarm Equipment" by Marty Ahrens, 65% of the reported residential home fire deaths occurred in homes where there was no smoke alarm present (43%) or did not operate (22%). Of the 35% fire fatalities that occurred when a smoke alarm was present and operated, it was reported that two-thirds of the non-confined home structure fires occurred in dwellings with battery operated smoke alarms with the remaining third evenly divided between homes with hardwired and hardwired with battery backup.

Source	Code Cycle Required	# of Fires	# of Fatalities	# of Injuries	Property Damage in Millions
Battery only	Before 1982	88,300	1,230	5,850	$2,353
Hardwired Only	1982-1992	19,900	170	1,300	$743
Hardwire/Battery	1992- Present	18,000	210	1,490	$568

Reference: April 2007 Report "U.S. Experience with Smoke Alarms and other Fire Detection/Alarm Equipment" by Marty Ahrens

From this information we can see that as the requirements for smoke alarms have evolved, as well as other improvements in the methods used for passive fire protection construction, there are fewer fires and fewer fire fatalities in homes that are equipped with smoke alarms. Along with improvements to the power source, the *National Fire Alarm Code* has also increased the number of required smoke alarms in a one- and two- family dwelling over the years. In 1992 it required that all smoke alarms be interconnected. When you consider the advances made in the requirements of smoke alarms and look at the results in reducing the number of fire fatalities, the solution is educating the public about the importance of working smoke alarms and practicing proper fire prevention.

The most cost-effective means of reducing the loss life is through increasing the public's awareness on the use and maintenance of smoke alarms. According to NFPA reports an estimated 890 live could be saved annually if existing homes were equipped with working smoke alarms. 65% of the reported fire fatalities from 2000-2004 occurred in homes were smoke alarms were either not present or were present but failed to operate. CPSC surveys have shown that while 88% of the households screened had at least one smoke alarm, 72% of these smoke alarms were battery powered only.

Cost Impact: The code change proposal will not increase the cost of construction.

2. Add new text as follows:

APPENDIX P
AUTOMATIC FIRE SPRINKLER SYSTEMS

The provisions contained in this appendix are not mandatory unless specifically referenced in the adopting ordinance.

AP101 Fire sprinklers. An approved automatic fire sprinkler system shall be installed in new one- and two-family dwellings and townhouses in accordance with Section P2904 of the *International Residential Code* or Section 903.3.1 of the *International Building Code*.

Reason: The purpose of this proposal is to delete the reference of the mandatory requirement of residential sprinkler systems in all one- and two-family dwellings and townhouses and reinstate the provisional requirements of mandatory sprinklers into an adoptable Appendix P. Based on the large amount of negative response to the events in Minneapolis, NAHB is seeking to re-establish the adoptable language of Appendix P from the 2006 *International Residential Code* to allow each city, county, and state to determine for themselves whether residential sprinklers should be required. This proposed change will eliminate the need for jurisdictions amend the code and continue to provide communities with the ability to adopt a residential fire sprinkler ordinance when it is appropriate for their community.

NAHB strongly disagrees with the fire services perception of America's fire problem and the proposed solution to reduce the number of fire fatalities that occur each year. According to NFPA reports, the occupants chances of surviving a residential house fire without any life safety devices such as smoke alarms or sprinklers is 98.87%. By installing smoke alarms and insuring they are in operating condition, the chances of surviving a residential fire is increased to 99.45%. NFPA estimates that an additional 890 lives could be saved each year if smoke alarms were maintained in working condition.

In 1977, less than 0.008% of the housing market was affected by structure fires. In 2005, that number was reduced to less than 0.002%. Over the past three decades, there has a substantial decrease in the number of residential structure fires in relation to the growth of American housing. No one can predict when or where a fire will occur, but to require every home to be equipped with a residential sprinkler system based on the figures below is not cost-effective.

Consideration as to whether the requirement for fire sprinklers in dwellings be mandatory should remain a local issue. The sole purpose of an Appendix P in the 2006 International Code was to provide local jurisdictions with the means to adopt a code or standard that is applicable to their community. Not every jurisdiction agrees that radon resistant construction, patio coverings, and safety inspections of existing appliances need to be regulated or inspected . Contrary to the belief of some activists, several jurisdictions have decided that Appendix P (the provisions for residential sprinkler systems) is not applicable to their state or local jurisdictions. Of the 47 states that have adopted the International Residential Code, none have adopted the 2006 IRC with the inclusion of Appendix P. During the adoption process in six states, there was a proposal put forth to include appendix P in the formal adoption of the 2006 IRC and the proposal was voted down every time.

According to the U.S. fire administration more than half states in America are below the national fire death rate of 13.6 per million and over the past ten years the number of one- and two- family dwelling fires, deaths and injuries have fallen (6%, 18% and 26% respectively).

While the fire service and sprinkler advocates acknowledge that the median age of a home is 32 years, the connection between fire deaths and the age of the home is elusive. For several years data has been collected for several relevant facts about fires. The cause of the fire, whether smoke alarms were present and were working, type of smoke alarm present, whether the fire was confined and did not activate the sprinkler system.

While there have been no studies conducted to investigate whether fire fatalities are less likely to occur in newer homes, there is supporting evidence of this in reports issued by NFPA regarding the performance of smoke alarms. According to these reports, there is a significant difference in the number of fatalities and the number of fires when the smoke alarm present. This includes information regarding smoke alarms that were either battery operated, hardwired with battery backup or hardwired. According to April 2007 Report "U.S. Experience with Smoke Alarms and other Fire Detection/Alarm Equipment" by Marty Ahrens, 65% of the reported residential home fire deaths occurred in homes where there was no smoke alarm present (43%) or did not operate (22%). Of the 35% fire fatalities that occurred when a smoke alarm was present and operated, it was reported that two-thirds of the non-confined home structure fires occurred in dwellings with battery operated smoke alarms with the remaining third evenly divided between homes with hardwired and hardwired with battery backup.

Source	Code Cycle Required	# of Fires	# of Fatalities	# of Injuries	Property Damage in Millions
Battery only	Before 1982	88,300	1,230	5,850	$2,353
Hardwired Only	1982-1992	19,900	170	1,300	$743
Hardwire/Battery	1992- Present	18,000	210	1,490	$568

Reference: April 2007 Report "U.S. Experience with Smoke Alarms and other Fire Detection/Alarm Equipment" by Marty Ahrens

From this information we can see that as the requirements for smoke alarms have evolved, as well as other improvements in the methods used for passive fire protection construction, there are fewer fires and fewer fire fatalities in homes that are equipped with smoke alarms. Along with improvements to the power source, the *National Fire Alarm Code* has also increased the number of required smoke alarms in a one- and two- family dwelling over the years. In 1992 it required that all smoke alarms be interconnected. When you consider the advances made in the requirements of smoke alarms and look at the results in reducing the number of fire fatalities, the solution is educating the public about the importance of working smoke alarms and practicing proper fire prevention.

The most cost-effective means of reducing the loss life is through increasing the public's awareness on the use and maintenance of smoke alarms. According to NFPA reports an estimated 890 live could be saved annually if existing homes were equipped with working smoke alarms. 65% of the reported fire fatalities from 2000-2004 occurred in homes were smoke alarms were either not present or were present but failed to operate. CPSC surveys have shown that while 88% of the households screened had at least one smoke alarm, 72% of these smoke alarms were battery powered only.

Cost Impact: The code change proposal will not increase the cost of construction.

~~SECTION R313~~
~~AUTOMATIC FIRE SPRINKLER SYSTEMS~~

~~R313.1 Townhouse automatic fire sprinkler systems.~~ ~~An automatic residential fire sprinkler system shall be installed in *townhouses*.~~

~~Exception:~~ ~~An automatic residential fire sprinkler system shall not be required when *additions* or *alterations* are made to existing *townhouses* that do not have an automatic residential fire sprinkler system installed.~~

~~R313.1.1 Design and installation.~~ ~~Automatic residential fire sprinkler systems for *townhouses* shall be designed and installed in accordance with Section P2904.~~

~~R313.2 One- and two-family dwellings automatic fire systems.~~ ~~Effective January 1, 2011, an automatic residential fire sprinkler system shall be installed in one- and two- family *dwellings*.~~

~~Exception:~~ ~~An automatic residential fire sprinkler system shall not be required for *additions* or *alterations* to existing buildings that are not already provided with an automatic residential sprinkler system.~~

~~R313.2.1 Design and installation.~~ ~~Automatic residential fire sprinkler systems shall be designed and installed in accordance with Section P2904 or NFPA 13D.~~

Reason: In the run-up to the vote on residential sprinklers in Minneapolis, the reason statements published in the monographs were repeated over and over.

You heard that sprinkler systems won't freeze in cold climates (unfortunately that does happen); that there won't be any increase in water tap fees; that sprinklers add only a few hundred dollars to the cost of a home; that the public feels sprinklered homes are desirable; that more people die in older homes because there are more of them; that a shocking 45% of firefighter deaths occur on the fire ground at residential occupancies, almost always 1- and 2-family dwellings; that smoke alarms aren't reliable enough as they age to protect a home; that homes without a public water supply can always involve design changes to accommodate sprinklers; that use of fire hydrants, not residential sprinkler systems are the cause of some water contamination; that putting the rules in place will drive down the cost of sprinkler systems; that sprinkler systems are maintenance free; that there are plenty of trained installers and inspectors to install and monitor sprinkler systems; that sprinkler systems won't leak; and that moving sprinkler requirements from the appendix to the body of the code is necessary because municipalities aren't adopting the appendix chapter quickly enough. You also heard general statements that sprinkler systems save lives, that the annual loss of lives to fire is a catastrophe, and on and on…

Unfortunately, most of those arguments are speculative, based on anecdotal evidence, or downright false.

You heard "If sprinklers were installed in all new homes constructed in the US, the fire death rate would decrease by 50%". But there are no statistics to project how many lives could be saved in residential dwellings if sprinklers are required. Without some type of analysis, it seems the solution is to throw a bunch of the public's money at the problem, if there is one, and hope that it helps. If the fire death rate were to drop only 2% as a result of these expensive systems, is the solution cost effective in a minimum standard code?

You didn't hear why, if smoke alarms aren't as effective as they age or when they are disabled, the same wouldn't occur with sprinkler systems. And you didn't hear why the fire service doesn't engage in a nationwide effort to have operating smoke alarms in every home in the country. That could be accomplished for a fraction of the cost of installing residential sprinklers and have an immediate impact on fire deaths because there are numerous studies on the number of fire deaths that have occurred when smoke alarms were not present or failed to operate because of dead batteries or age.

You didn't hear projections that if sprinkler systems were installed in all new homes that the number of fires in residences would decline by any specific amount. Again, if there are no studies to support the effectiveness of a solution, isn't there a significant risk that the solution may not work and the money wasted? Doesn't the argument ignore the fact that homes built today are inherently more fire resistant than the homes built 50 years ago? According to the US Fire Administration, the number of fire deaths in residential structures in the US has dropped from 3250 in 1998 to 2895 in 2007, about an 11% reduction, this with an increasing population. Something right must be happening if the numbers are dropping so significantly when the population is on the rise.

You didn't hear how many firefighter lives would be saved if all new residential dwellings were sprinklered. By the way, the statement given by sprinkler proponents that 45% of fire fighter deaths occur at residential occupancies seems to be a gross error. The US Fire Administration has published the document "Firefighter Fatalities in the United States in 2005". The following is from that study:

> *"For the purposes of this study, the term "firefighter" covers all members of organized fire departments in all States, the District of Columbia, the Commonwealth of Puerto Rico, the Virgin Islands, American Samoa, the Commonwealth of the Northern Mariana Islands, and Guam. It includes career and volunteer firefighters; full-time public safety officers acting as firefighters; State, territory, and Federal Government fire service personnel, including wildland firefighters; and privately employed firefighters, including employees of contract fire departments and trained members of industrial fire brigades, whether full-or part-time. It also includes contract personnel working as firefighters or assigned to work in direct support of fire service organizations.*
>
> *Under this definition, the study includes not only local and municipal firefighters, but also seasonal and full-time employees of the U.S. Forest Service, the Bureau of Land Management, the Bureau of Indian Affairs, the Bureau of Fish and Wildlife, the National Park Service, and State wildland agencies. The definition also includes prison inmates serving on firefighting crews; firefighters employed by other governmental agencies, such as the U.S. Department of Energy; military personnel performing assigned fire suppression activities; and civilian firefighters working at military installations."*

An "on-duty death" is explained as:

> *"The term "on-duty" refers to being involved in operations at the scene of an emergency, whether it is a fire or nonfire incident; responding to or returning from an incident; performing other officially assigned duties such as training, maintenance, public education, inspection, investigations, court testimony, or fundraising; and being on call, under orders, or on standby duty, except at the individual's home or place of business. An individual who experiences a heart attack or other fatal injury at home as he or she prepares to respond to an emergency is considered on duty when the response begins. A firefighter who becomes ill while performing fire department duties and suffers a heart attack shortly after arriving home or at another location may be considered on duty, since the inception of the heart attack occurred while the firefighter was on duty."*

Given these explanations, the study goes on to state that 115 fire fighters died while on-duty in 2005. The following table breaks down the types of duty engaged in that caused the death. It is clear to see that 45% of the fire fighter deaths did not occur on the residential fire ground as was stated by sprinkler proponents.

Table 5. Firefighter Deaths by Type of Duty (2005)

Type of Duty	Number of Deaths
Fireground Operations	27
Responding/Returning	23
Other On Duty	24
Training	14
Nonfire Emergencies	6
After an Incident	21
Total	**115**

The study states that 27 of the 115 fire fighters deaths occurred during fire ground activities. Following is a description of each incident:

Fireground Operations
Twenty-seven firefighters died while engaged in activities at the scene of a fire in 2005:

- *Two New York City Fire Department firefighters were killed when they were trapped by fire progress in an occupied multiple dwelling. Firefighters were forced to make a five-story jump when their escape routes were cut off.*
- *Two Wyoming firefighters were killed when they were overcome by fire progress in a residential fire. The fire emerged from concealed spaces and extended rapidly.*
- *Thirteen firefighters suffered heart attacks at fire scenes in 2005:*
  - *Three of the heart attacks occurred at wildland fires.*
  - *Eight firefighters suffered heart attacks at fires in residential occupancies. Two of these fires had suspicious or arson-related causes.*
  - *A Delaware firefighter suffered a heart attack at an alarm activation incident.*
  - *An Arkansas firefighter suffered a heart attack at the scene of a car fire.*
- *Two firefighters were electrocuted at fire scenes in 2005:*
  - *A California firefighter was electrocuted when he came into contact with an energized wire at a residential structure fire.*
  - *A Kansas firefighter was killed after he called to report a wildland fire resulting from a lightning strike at his home. The firefighter went outside to investigate, contacted a live power line, and was fatally electrocuted.*
- *Two firefighters were killed when rapid changes in fire conditions trapped them. Both fires occurred in residential occupancies, one in New York and the other in Michigan.*
- *A Virginia firefighter was burned fatally as he fought a wildland fire. His body was discovered the next day, after he failed to return from his efforts.*
- *A Kentucky firefighter was killed when the fire apparatus he had driven rolled forward and crushed him at the scene of a residential structure fire.*
- *A North Carolina firefighter was killed when a fire-damaged tree limb crushed him as firefighters attempted to extinguish a fire in the tree.*
- *A Missouri firefighter became entangled in a man lift and was killed during a fire in a mill.*
- *A Texas firefighter was killed while advancing a hoseline in an abandoned residential structure. The roof of an addition collapsed under fire conditions and trapped the firefighter.*
- *A New York firefighter collapsed and died of a CVA that struck as he arrived on the scene of a working residential structure fire.*

Tragically, firefighter deaths occur. But 45% of the firefighter deaths do not occur at residential fires as the above statistics indicate. The statement is just plain false.

The reliability of sprinkler systems was argued to be superior and necessary because of the failure of smoke alarms. But the National Fire Protection Association published a report in June 2007 entitled *"U.S. EXPERIENCE WITH SPRINKLERS AND OTHER AUTOMATIC FIRE EXTINGUISHING EQUIPMENT"* by John R. Hall, Jr. In that report Mr. Hall states: *"Based on 2002-2004 fires reported to U.S. fire departments, when sprinklers cover the area of fire origin, they operate in 93% of all reported structure fires large enough to activate sprinklers. When they operate, they are effective 97% of the time, resulting in a combined effectiveness reliability of 90%."*

While 90% is certainly admirable, it is far from being perfect. It also points out the fallacy in allowing reductions in passive fire protection in lieu of sprinkler systems. A fire that may have been contained with passive systems may be a much more serious event when it occurs in a building with lesser passive protection and a failed sprinkler system.

And it is often argued that sprinkler systems require no maintenance. This has been stated many times by proponents. But that conflicts with NFPA 13D section 4.2 and the installation instructions from sprinkler head manufacturers such as Tyco and others who all state that certain maintenance activities should be performed.

The U.S. Fire Administration published the report "***U.S. Fire Administration/National Fire Data Center*** **Fatal Fires Topical Fire Research Series, Volume 5 – Issue 1** ***March 2005"*** in which it stated:

■ *The leading cause of fires that resulted in fatalities was arson (27%), followed by smoking (18%).*

■ *The leading areas of fire origin in fatal residential structure fires were sleeping (29%) and lounge (21%) areas.*

■ *Smoke alarms either were not present in 42% of residential fatal fires or alarms were present but did not operate in 21% of residential fatal fires.*

CAUSES OF FATAL FIRES
The leading cause of fatal fires in 2002 was incendiary/suspicious (arson), which accounted for 27% of fatal fires. Figure 3 compares the causes of fatal fires in all properties and in residential properties.
Smoking, long the leading cause of fatal fires, trailed as the second leading cause of all fatal fires at 18%. Arson was also the leading cause of the fatal residential structure fires (22%), but by a small margin over smoking (21%). This again is a departure from years past as smoking has long been the leading cause (by a wide margin) of fatal residential fires.
Multiple fatality fires in residential structures were most often caused by heating (26%), followed by arson (23%). By contrast, arson and smoking (each 22%) cause most single fatality residential structure fires.
Figure 4 shows the leading areas of fire origin in fatal residential structure fires. They started most frequently in sleeping (29%) and lounge areas (21%). Fires starting in kitchens account for another 15%.

SMOKE ALARM PERFORMANCE
Smoke alarm performance in fatal residential structure fires is shown in Figure 6. Although more than 90% of homes have smoke alarms today, no smoke alarms were present in 42% of residential structure fires where fatalities occurred. Smoke alarms were present in 58% of fatal residential structure fires, but only operational in 37% of those fatal fires.

This report raises several questions. If the leading cause of fatal fires is arson, would sprinkler systems impact those numbers if tampering is a possibility? And if smoking is a major cause of fire fatalities, should the vast majority of the public be forced to pay for protection made necessary in part by those who chose a particularly unhealthy lifestyle? The failure to have working smoke alarms in so many of the fatal fires is a national travesty. Why isn't more being done to correct this problem? At the very least, this information casts doubt on the validity of spending hundreds of millions (or billions) of dollars on systems that may not solve the problems they are intended to solve.

You also heard testimony on various polls that indicated that the public felt a sprinklered home was more desirable than one without sprinklers. I suspect that a similar poll would find that car owners would find a Cadillac to be more desirable than a Chevy as well. The polls didn't ask if someone would be willing to pay several thousand dollars more to have a sprinkler system installed.

Another argument that was trotted out recently was that having sprinkler requirements in the appendix, which may have been the foot in the door, wasn't sufficient because jurisdictions weren't embracing sprinklers at a pace to satisfy proponents. But those requirements first appeared in the 2006 IRC. The 2006 IRC had hardly been in print before activists began pushing to have the rules moved into the body of the code. Jurisdictions hardly had time to consider the impacts of residential sprinklers or adopt them.

You heard a lot of emotional testimony on this issue. But these decisions should not be based on emotion but on science and facts. And the facts tell a story contradicting the emotional testimony.

The housing industry is in a fragile state. Residential builders are struggling and failing as are building materials suppliers. Homes are appraising at less than the cost to construct them. Building department staff members are being laid off at alarming rates. This is not the time to impose costly and potentially ineffective building systems.

Please approve this code change.

Cost Impact: The code change proposal will not increase the cost of construction.

R314.1

Proponent: Bob Eugene, Underwriters Laboratories, Inc.

Revise as follows:

R314.1 Smoke detection and notification. All smoke alarms shall be listed and labeled in accordance with UL 217 and installed in accordance with the provisions of this code and the household fire warning equipment provisions of NFPA 72.

Reason: Only listed products that are labeled have been subjected to periodic, unannounced inspections during production.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: EUGENE-RB-10-R314.1

RB59–09/10
R314.4

Proponent: Lou Malattia, Clark County Building Safety Division, representing the Washington Association of Building Officials

Revise as follows:

R314.4 Power source. Smoke alarms shall receive their primary power from the building wiring when such wiring is served from a commercial source, and when primary power is interrupted, shall receive power from a battery. Wiring shall be permanent and without a disconnecting switch other than those required for overcurrent protection. Smoke alarms shall be interconnected.

Exception:

1. Smoke alarms shall be permitted to be battery operated when installed in buildings without commercial power.
2. Interconnection and Hard-wiring of smoke alarms in existing areas shall not be required where alteration or repairs do not result in removal of interior wall or ceiling finishes exposing the structure, unless there is an attic, crawl space, or basement available which could provide access for hard-wiring and interconnection without the removal of interior finishes. Physical interconnection of all alarms shall not be required where listed wireless alarms are installed and all alarms sound upon activation.

Reason: Although power may be accessible to hard wire one of the existing smoke detectors, it may be difficult to interconnect all of them. The requirement for interconnection being satisfied by a wireless activation isn't universally accepted, and in many jurisdictions this would not be accepted.

The UL Listed wireless interconnected smoke alarm system with AC ionization sensor hardwired would allow all of the smoke detectors to be interconnected without requiring hard wiring all of them. The technology is now available where it is not difficult to interconnect all the smoke detectors and thereby improving life safety.

Cost Impact: The code change proposal will not increase the cost of construction.

1. Delete without substitution:

~~**SECTION R315**~~
~~**CARBON MONOXIDE ALARMS**~~

~~**R315.1 Carbon monoxide alarms.** For new construction, an approved carbon monoxide alarm shall be installed outside of each separate sleeping area in the immediate vicinity of the bedrooms in *dwelling units* within which fuel-fired *appliances* are installed and in dwelling units that have attached garages.~~

~~**R315.2 Where required in existing dwellings.** Where work requiring a *permit* occurs in existing *dwellings* that have attached garages or in existing dwellings within which fuel-fired *appliances* exist, carbon monoxide alarms shall be provided in accordance with Section R315.1.~~

~~**R315.3 Alarm requirements.** Single station carbon monoxide alarms shall be listed as complying with UL 2034 and shall be installed in accordance with this code and the manufacturer's installation instructions.~~

2. Delete standard as follows:

UL
~~2034-2008 Standard for Single and Multiple Station Carbon Monoxide Alarms~~

Reason: A new rule should never be imposed unless it can be shown that there is a significant hazard posed that can be directly influenced by the rule. It is not the goal of the I-Codes, the stated purpose of which is to provide minimum standards, to eliminate all hazards such that no one will ever be killed or injured as a result of the design of or a defect in a building. It is simply too expensive and impractical to do so. Such is the case with the addition of carbon monoxide requirements in the IRC that nationwide will increase costs to homeowners in the hundreds of millions of dollars with a potentially negligible impact on CO deaths. Additionally, it requires that the alarms be installed any time work is done and a permit is required. This means if I have my house reroofed, I must install CO alarms (but not smoke alarms). I would be required to install them if I have an attached garage even when studies show the likelihood of carbon monoxide poisoning occurring from motor vehicles is extremely low and even if portions of the garage are permanently open to the outside.

Following are some excerpts taken from a publication by the Consumer Product Safety Commission entitled ***"Non-Fire Carbon Monoxide Deaths Associated with the Use of Consumer Products 2003 and 2004 Annual Estimates".***

P. 4 - During 2004, the most recent year for which nearly complete data are available, there were an estimated 162 carbon monoxide (CO) poisoning deaths associated with the use of a consumer product under the jurisdiction of the U.S. Consumer Product Safety Commission (CPSC). There were an estimated 154 fatalities in 2003. Carbon monoxide poisonings referred to in this report do not include those where the CO gas resulted from a fire or a motor vehicle, were intentional in nature or were directly work-related.

Comment: The number of CO deaths was often cited as being in the thousands, not 150-160, which is the accurate number.

\+ Data collection for 2003 and 2004 is incomplete. Italicized estimates may change in the future.

* No reports received by CPSC staff.

Source: U.S. Consumer Product Safety Commission / EPHA.
CPSC Death Certificate File, CPSC Injury or Potential Injury Incident File, CPSC In-Depth Investigation File, National Center for Health Statistics Mortality File, 1999 - 2004.

Note: Reported average percentages by product may not add to total due to rounding.

P. 6 - Of the 47 estimated deaths in 2003 and 2004 that were associated with LP gas heating systems, 32 (68%) involved unvented portable propane heaters. These unvented portable propane heaters were fueled by a propane tank and were not a component of an installed heating system. Unvented portable propane heaters were either camping heaters that used disposable propane tanks, one pound propane bottles, or tank top heaters that used bulk tanks larger than one pound.

Comment: Unvented portable propane heaters cannot be used as a primary heat source in a building. Therefore these incidents likely occurred when they were used for temporary heat or in locations outside a home such as a camping unit. Requiring CO alarms in homes will have no impact on CO deaths that occur in camping trailers and locations other than the home. Requiring CO alarms in homes because someone might bring an unvented heater into their house and improperly use it is unwarranted.

P. 6 - In 2003 and 2004, an estimated 11 CO deaths (3% of the 316 total consumer product estimate) were associated with charcoal or charcoal grills; an estimated eight deaths (3% of the total consumer product estimate) were associated with a gas water heater; gas grills, camp stoves and lanterns were associated with an estimated eight deaths (3% of the total consumer product estimate); gas ranges and ovens were associated with an estimated seven deaths (2% of the total consumer product estimate); and three deaths were either associated with consumer products that did not fit into the categories given above or there was insufficient detail to categorize the appliance. One fatality was associated with a propane-fueled refrigerator, one was associated with a product simply defined as a "propane appliance" and another as a "gas-fueled appliance". These incidents were categorized as "Other appliances". Additionally, in 2003 and 2004 an estimated 12 deaths were associated with multiple appliances (4% of the total consumer product estimate). The multiple appliances category included all incidents where multiple fuel-burning products were used simultaneously such that a single source of the CO could not be determined. Of the 12 multiple appliance fatalities, six were associated with a generator and another product. These other products were a kerosene heater (three deaths), an LP gas heater (two deaths) and a wood stove. Other fatalities where multiple products were simultaneously used and associated with a CO poisoning death involved a portable propane heater and a gas-powered snow thrower; a portable propane heater and a propane lantern; a kerosene heater and a propane heater; a natural gas heater and hot water heater; a propane furnace and a propane oven in a travel camper; and a natural gas furnace and natural gas oven.

Comment: While it may seem cruel, at times one needs to invoke the "any idiot rule". The code should not require CO alarms to deal with people operating charcoal grills or lawn mowers in their living rooms.

P. 6 - An estimated 112 CO poisoning deaths (35% of the estimated total from 2003 and 2004) were associated with engine-driven tools, which includes generators, riding mowers, a concrete cutter, a gas-fueled welder, power washers, a water pump, an air compressor and an ATV. Generator associated deaths comprise the majority of this category. There were an estimated total of 91 generator-related CO poisoning deaths in 2003 and 2004 (81% of all engine-driven tool fatalities and 29% of the total consumer product estimate).

P. 7 - Of the 123 liquid fueled appliance-related fatalities in 2003 and 2004, 112 (91%) were associated with all engine-driven tools (generators, lawn mowers, power washers, concrete saws, etc.). Generators accounted for 91 of the estimated 123 fatalities (74%) in the Liquid Fueled Appliances category.

P. 11 - Table 6 shows that in 2003 and 2004, an estimated 230 CO poisoning deaths occurred in homes, including manufactured and mobile homes. From 2002-2004, an annual average of 72 percent of CO poisoning deaths occurred in homes, including manufactured and mobile homes. In 2003 and 2004, an estimated 45 deaths took place in temporary shelters, such as tents, recreational vehicles, cube vans, seasonal cabins, and trailers (including horse trailers). In 2002- 2004, an annual average of 17 percent of CO poisoning deaths took place in temporary shelters. In 2003 and 2004, 25 of the 45 estimated deaths in temporary shelters were most commonly associated with portable gas or LP gas heating or cooking appliances. Generator usage in a temporary shelter was the second largest product category with an estimated 11 deaths in 2003 and 2004. Other scenarios included charcoal and charcoal grills, LP gas lanterns, kerosene heaters and a kerosene cooker. A consistently small percentage of deaths occurred in passenger vans, trucks, or automobiles in which victims were spending the night. For 2003 and 2004, of the estimated 13 CO fatalities in this category, nine were associated with portable LP gas heaters.

Comment: CO alarm requirements in the IRC would not impact incidents in mobile homes, tents, RV's, seasonal cabins, trailers, passenger vans, trucks, and automobiles.

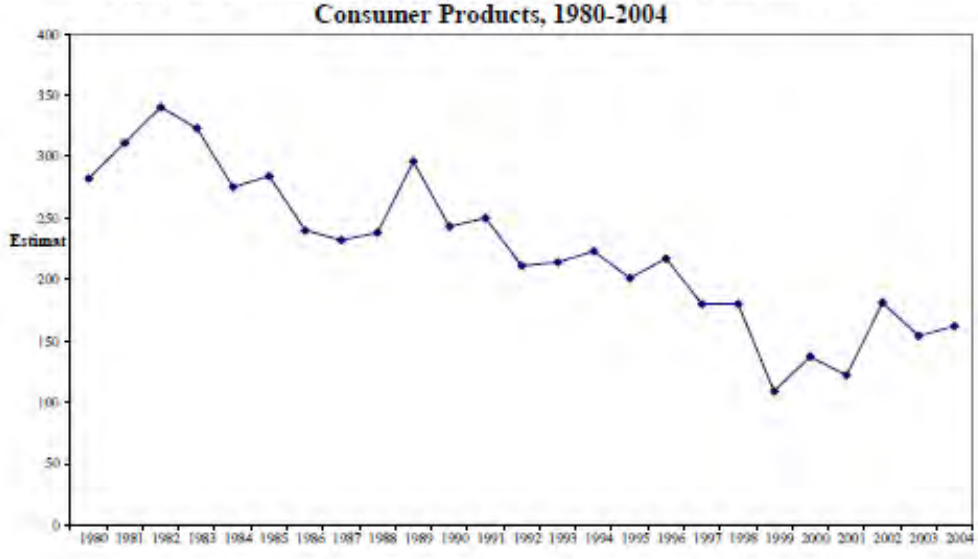
Figure 1: Estimated Non-Fire CO Poisoning Deaths Associated with Consumer Products, 1980-2004



Reading through even these brief excerpts, one wonders if requiring CO alarms would have any impact on CO related deaths at all given the circumstances surrounding most deaths. Furthermore, the number of deaths decreased without government regulation from 340 in 1982 to 162 in 2004. This decrease occurred during a time when the population increased from about 225 million to 296 million in 2004. The steadily decreasing number of deaths and their location doesn't indicate that requiring CO alarms would have any statistical impact on deaths.

Regarding the matter of CO deaths and attached garages, following are excerpts from an article entitled:
The Role of Catalytic Converters in Automobile Carbon Monoxide Poisoning[*] A Case Report by Bradley Vossberg, MD and Judah Skolnick, MD, FCCP
[*] From the Frazier Rehab Center, Jewish Hospital Health Network, Louisville, KY.

Inhaling motor vehicle exhaust fumes is a common method used by people attempting to commit suicide; however, the decreased carbon monoxide concentrations found in the exhaust of late-model automobiles equipped with catalytic converters are changing the clinical presentation of exhaust inhalation.

Closed-environment exposure to MVEGE from automobiles not equipped with catalytic converters can result in death within 30 min. The introduction of catalytic converters beginning with 1975 new-car models dropped CO emission rates to 6.00 g/min. By 1989, the average new-car

CO emission at idling was 0.22 g/min. The catalytic conversion process removes CO, hydrocarbons, and nitrogen oxide; the resultant emission is a more desirable mixture of nitrogen, CO_2, and water. Contemporary three-way catalytic converters eliminate > 99% of CO emissions.

Given the increased efficiency of modern catalytic converters, patients presenting with closed-environment MVEGE exposure may have much lower HbCO levels than would have been previously expected; in some cases, the HbCO level may be normal. Other important factors to be considered are the role of supplemental O_2 given at the scene and the time taken to obtain the HbCO level.

Attached garages do not pose a risk. By definition, an attached garage is three walls and a roof. A garage door is not required. There are no requirements that the garage be air tight or enclosed to a degree that would create any danger, even if CO levels were high.

Clearly, expecting CO alarms to have any positive impact on CO death rates is extremely optimistic and likely unrealistic. If we are going to require the public to spend their money on safety related devices, surely we can find a more productive area on which to spend it.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: DORNFELD-RB-2-R315

RB61–09/10

R316.4, R316.4.1 (New), R316.4.2 (New), Chapter 44 (New)

Proponent: Marcelo M. Hirschler, GBH International, representing the American Fire Safety Council

1. Revise as follows:

R316.4 Thermal barrier. Unless otherwise allowed in Section R316.5 or Section R316.6, foam plastic shall be separated from the interior of a building by an *approved* thermal barrier of minimum 1/2 inch (12.7 mm) gypsum wallboard or an *approved* finish material equivalent to a thermal barrier material ~~that will limit the average temperature rise of the unexposed surface to no more than 250°F (139°C) after 15 minutes of fire exposure complying with the ASTME 119 orUL263 standard time-temperature curve. The thermal barrier shall be installed in such a manner that it will remain in place for 15 minutes based on NFPA 286 with the acceptance criteria of Section R302.9.4, FM 4880, UL 1040 or UL 1715~~. The thermal barrier material shall comply with R316.4.1 or R316.4.2.

R316.4.1 The thermal barrier material shall comply with the requirements of the temperature transmission fire test and of the integrity fire test in NFPA 275, Standard Method of Fire Tests for the Evaluation of Thermal Barriers Used Over Foam Plastic Insulation.

R316.4.2 The thermal barrier material shall comply with the temperature transmission test in NFPA 275 and with the conditions of acceptance of FM 4880, UL 1040 or UL 1715 when tested in conjunction with the foam plastic insulation for a period of 15 minutes.

2. Add new standard as follows:

NFPA 275	Standard Method of Fire Tests for the Evaluation of Thermal Barriers Used Over Foam Plastic Insulation

Reason: NFPA 275 was specifically developed to clarify the test for thermal barrier materials to be used over foam plastic insulation. It contains two tests.

The temperature transmission fire test in NFPA 275 uses the ASTM E 119 (or UL 263) time-temperature fire curve to expose the thermal barrier specimen and it requires the following: "4.8.1 During the 15-minute test period, the average measured temperature rise above the average temperature at the start of the fire test for the thermocouples described in Section 4.3 shall not exceed 250°F (139°C), and the measured temperature rise of any such single thermocouple shall not exceed 325°F (181°C)." Therefore, the temperature transmission fire test in NFPA 275 corresponds to what the code requires now.

The integrity fire test in NFPA 275 requires that the thermal barrier material, together with the foam plastic insulation, be tested to NFPA 286 (which is a 15 minute test) and that the pass/fail criteria are identical to those used for NFPA 286 elsewhere in the code (for example Chapter 8).

The code should continue to recognize that thermal barrier materials tested, in conjunction with foam plastic insulation, to FM 4880, UL 1040 and UL 1715 and complying with the conditions of acceptance of these tests are equally acceptable. NFPA 275 also states that the integrity fire test can be conducted in accordance with these alternate test methods, when their pass/fail criteria are used.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: A review of the standard proposed for inclusion in the code, NFPA 275, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: HIRSCHLER-RB-1-R316.4

RB62–09/10
R316.5.3

Proponent: Rick Thornberry, PE, The Code Consortium, Inc., representing the Cellulose Insulation Manufacturers Association (CIMA)

Revise as follows:

R316.5.3 Attics. The thermal barrier specified in Section R316.4 is not required where all of the following apply:

1. Attic access is required by Section R807.1.
2. The space is entered only for purposed of repairs or maintenance.
3. The foam plastic insulation is protected against ignition using one of the following ignition barrier materials:
   - 3.1. 1 ½-inch-thick (38mm) mineral fiber insulation;
   - 3.2. ¼-inch-thick (6.4mm) wood structural panels;
   - 3.3. 3/8-inch (9.5 mm) particleboard;
   - 3.4. ¼-inch (6.4mm) hardboard;
   - 3.5. 3/8-inch (9.5mm) gypsum board; ~~or~~
   - 3.6. Corrosion-resistant steel having a base metal thickness of 0.016 inch (0.406mm)~~.~~;
   - 3.7. 1.5-inch thick (38mm) cellulose loose-fill insulation.

The above ignition barrier is not required where the foam plastic insulation has been tested in accordance with Section R316.6.

Reason: We are proposing the use of 1-1/2 inch thick cellulose loose-fill insulation as another acceptable material for use as an ignition barrier to satisfy the requirements of R314.5.3 for the protection of foam plastic insulation in attics as an alternate to the thermal barrier required by Section 314.4. We are basing this proposal on the equivalent performance to that of Item No. 1 of this section which allows 1-1/2 inch thick mineral fiber insulation that by definition includes both mineral wool and glass fiber. Presently, cellulose insulation is recognized as being equivalent to mineral fiber insulation for the purpose of providing an additional 15 minutes of protection to a fire-resistance rated wall assembly utilizing wood stud construction as specified in Table 721.6.2(5) of the 2009 International Building Code (IBC).

Furthermore, when the Cellulose Insulation Manufacturers Association (CIMA) conducted the full scale fire tests to validate the comparable performance of cellulose insulation in achieving a one-hour fire-resistance rating for wood stud wall assemblies faced with various thicknesses of gypsum wallboard, they also measured the heat transfer through the cellulose insulation within the wall cavity to determine its resistance to the movement of heat through the assembly during the ASTM E119 fire test exposure. The test data indicated that approximately 1-1/2 inches of cellulose insulation was capable of limiting the temperature increase to an average maximum temperature of 250^{o}F for a period of 15 minutes which is the same performance specified for a thermal barrier in Section R314.4.

Therefore, we believe that this proposal to include 1-1/2 inch thick cellulose loose-fill insulation as another material acceptable for an ignition barrier is appropriate.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: THORNBERRY-RB-2-R316.5.3

RB63–09/10
R317.4

Proponent: Dennis Pitts, American Forest & Paper Association

Revise as follows:

R317.4 Wood/plastic composite~~s~~ deck boards, stair treads, handrails and guardrail systems. Wood/plastic composites used in exterior deck boards, stair treads, handrails and guardrail systems used for load supporting purposes shall have performance ratings established and monitored in accordance with ASTM D 7032 and shall bear a *label* indicating the required performance levels ~~and demonstrating compliance with provisions of ASTM D 7032.~~, manufacturer or mill number, and the name or logo of the quality control agency.

Reason: To clarify the intended requirement to have performance ratings established and monitored in accordance with ASTM D7032. The addition of the words “manufacturer or mill number, and the name or logo of the quality control agency” is based on requirements for packaging and identification in D 7032 and is in addition to information contained under the definition of “label”.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: PITTS-RB-2-R317.4

RB64–09/10
R202 (New), R317.5 (New), R317.5.1 (New), Chapter 44 (New)

Proponent: Marcelo Hirschler, GBH International, representing the American Fire Safety Council

1. Add new text as follows:

PLASTIC LUMBER. a manufactured product made primarily from thermoplastic materials (filled or unfilled) and typically supplied in sizes that correspond to traditional lumber board and dimensional lumber sizes.

R317.5 Plastic lumber. Plastic lumber used in exterior deck boards shall bear a *label* indicating the required performance levels and demonstrating compliance with the provisions of ASTM D 6662 and ASTM D 7032.

R317.5.1 Plastic lumber decks shall be installed in accordance with the manufacturer's instructions.

2. Add new standard as follows:

ASTM
D 6662-09 Standard Specification for Polyolefin-Based Plastic Lumber Decking Boards

Reason: Numerous plastic lumber decks are used throughout the US, but the IRC and IBC do not reference them. Wood-plastic composite decks, complying with ASTM D 7032, are permitted in the IRC (section R317.4). This proposal adds plastic lumber decks, with the requirements from ASTM D 7032 and also the requirements from ASTM D 6662.

ASTM D 6662 is a specification for plastic lumber decking boards that requires the plastic lumber to comply with properties based on the following ASTM standards:
ASTM D 2565 Standard Practice for Xenon-Arc Exposure of Plastics Intended for Outdoor Applications
ASTM D 2915 Standard Practice for Evaluating Allowable Properties for Grades of Structural Lumber
ASTM D 4329 Standard Practice for Fluorescent UV Exposure of Plastics
ASTM D 6109 Standard Test Methods for Flexural Properties of Unreinforced and Reinforced Plastic Lumber and Related Products
ASTM D 6341 Standard Test Method for Determination of the Linear Coefficient of Thermal Expansion of Plastic Lumber and Plastic Lumber Shapes Between −30 and 140°F [−34.4 and 60°C]
ASTM E 84 Standard Test Method for Surface Burning Characteristics of Building Materials
ASTM G 151 Standard Practice for Exposing Nonmetallic Materials in Accelerated Test Devices that Use Laboratory Light Sources
ASTM G 154 Standard Practice for Operating Fluorescent Light Apparatus for UV Exposure of Nonmetallic Materials
ASTM G 155 Standard Practice for Operating Xenon Arc Light Apparatus for Exposure of Non-Metallic Materials

ASTM D 7032 (already referenced in the IRC) is a Standard Specification for Establishing Performance Ratings for Wood-Plastic Composite Deck Boards and Guardrail Systems (Guards or Handrails). It requires the material to comply with flexural properties (ASTM D 6109), accelerated decay (ASTM D 2017), Xenon-arc exposure (ASTM D 2565), resistance to termites (ASTM D 3345), structural lumber grade classifications (ASTM D 2915), and so on.

With regard to fire properties, ASTM D 6662 requires that plastic lumber meet ASTM E 84, Steiner tunnel test, with a flame spread index of no more than 200, with a material that is required to remain in place during the test. The wording with regard to ASTM E 84 flame spread testing in ASTM D 6662 is much more explicit than the wording in the test method itself. The following wording is included in the ASTM D 6662 standard:
"6.4.2 The test specimen shall either be self-supporting by its own structural characteristics or held in place by added supports along the test specimen surface. The test specimen shall remain in place throughout the test duration, without such severe sagging that it interferes with the effect of the gas flame on the test specimen. Test results are invalid if the bulk of the test specimen melts or drops to the furnace floor."

ASTM D 7032 also requires wood-plastic composite decks to comply with a flame spread index of no more than 200 when tested to ASTM E 84. However, ASTM D 7032 does not have the additional requirements that the material stay in place.

By requiring that plastic lumber comply with the requirements of ASTM D 6662 and ASTM D 7032 the code would include all physical property and fire test requirements associated with both types of decking materials. Just for information: wood normally complies with a flame spread index of no more than 200. ICC ES has an Evaluation criterion for thermoplastic composite lumber products (AC 109), based on ASTM D 7032, which is used for approving plastic lumber decks.

Structural plastic lumber combines the benefits of long lasting, weather resistant plastic lumber with the structural characteristic of dimensional wood lumber. It is made primarily from recycled plastics from post-consumer waste like plastic milk and detergent bottles. It then includes strengthening additives, UV–inhibited pigments, anti-oxidant processing aids and foaming agents for a highly stable material that is superior to wood lumber in some measures.

A few photographs of actual decks follow.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: A review of the standard proposed for inclusion in the code, ASTM D 6662-09, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: HIRSCHLER-RB-4-R202-R317.5

RB65–09/10
R318.4

Proponent: Greg Baumann, National Pest Management Association, representing the National Pest Management Association; Stephen V. Heller, representing Insulating Concrete Form Association (IFCA)

Revise as follows:

R318.4 Foam Plastic protection. In areas where the probability of termite infestation is "very heavy" or "moderate to heavy" as indicated in Figure R301.2(6), extruded and expanded polystyrene, polyisocyanurate and other foam plastics shall not be installed on the exterior face or under interior or exterior foundation walls or slab foundations located below *grade.* The clearance between foam plastics installed above *grade* and exposed earth shall be at least 6 inches (152 mm).

Exceptions:

1. Buildings where the structural members of walls~~,~~ and floors~~, ceiling and roofs~~ are entirely of noncombustible materials or pressure-preservative-treated wood; or the exterior wall envelop is entirely monolithic concrete walls, including flat-wall and waffle grid ICFs, with continuous concrete from the footings to the roofline.
2. When in *addition* to the requirements of Section R318.1, an *approved* method of protecting the foam plastic and structure from subterranean termite damage is used.
3. On the interior side of *basement walls*.
4. Exterior insulated foundation walls with barriers complying with Section R318.3 in addition to the requirements of Section R318.1 (1) or R318.1 (2).

Reason: (Baumann) Current language prohibits plastic foamboard on exterior walls below grade with exceptions based upon the areas of "very heavy" termite infestation using the code map R301.2(6), an antiquated map from the US Forest Service. This proposal updates the code language to illustrate that areas of "moderate to heavy" are also susceptible to termite attack of below grade foamboard. There are no studies which corroborate definitive borders on the map. Since the original code language was implemented, states outside of the "very heavy" areas, lacking IRC language, have modified state codes due to termite pressure. This leads to a patchwork of fixes state by state or locality by locality. Information collected from termite inspectors show damage to foamboard to be found commonly in "moderate to heavy" zones. In addition, there are measures which are available today, such as chemically treated foam, to protect the foam thus allowing an exception. The GIE *Handbook of Pest Control (2004)* notes the much wider use of foamboard since the original code was written. This proposal only restricts use below grade and can still be used above grade on exterior walls.

Exception 1. Clarifications - and recognition of concrete resilience to Termites.

Exception 4. Clarification for ICF foundations below grade, providing termite protection to prevent termites into above grade framed wall construction.

Reason: (Heller) This proposal acknowledges the protection of concrete construction from structural damage due to termites, and provide clarification for the protection available for exterior insulated foundation walls.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: BAUMANN-RB-1-HELLER-RB-1-R318.4

RB66–09/10
R321.4 (New)

Proponent: John England, MCO, England Enterprises, Inc.

Add new text as follows:

R321.4 Inspections. Elevators and platform lifts shall be inspected, tested and certified by a third party inspector before operating. A copy of the certification shall be on file with the building department. The inspector shall be approved by the Building Official before the elevator or lift is installed.

Reason: Most inspectors (department) do have the expertise or tools required to perform the proper inspector of elevators and/ or lifts. Since this is such a specialized field –the inspector should rely on a person who is an expert in the field.

Cost Impact: The code change proposal will increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: ENGLAND-RB-6-R321.4

RB67–09/10
R322.3.2, R322.3.3

Proponent: Rebecca C. Quinn, RCQuinn Consulting, Inc., representing the Department of Homeland Security, Federal Emergency Management Agency

Revise as follows:

R322.3.2 Elevation requirements.

1. All buildings and structures erected within coastal high hazard areas shall be elevated so that the lowest portion of all structural members supporting the lowest floor, with the exception of ~~mat or raft foundations,~~ piling, pile caps, columns, grade beams and bracing, is:
   1.1. Located at or above the design flood elevation, if the lowest horizontal structural member is oriented parallel to the direction of wave approach, where parallel shall mean less than or equal to 20 degrees (0.35 rad) from the direction of approach, or
   1.2. Located at the base flood elevation plus 1 foot (305 mm), or the design flood elevation, whichever is higher, if the lowest horizontal structural member is oriented perpendicular to the direction of wave approach, where perpendicular shall mean greater than 20 degrees (0.35 rad) from the direction of approach.
2. Basement floors that are below *grade* on all sides are prohibited.
3. The use of fill for structural support is prohibited.
4. Minor grading, and the placement of minor quantities of fill, shall be permitted for landscaping and for drainage purposes under and around buildings and for support of parking slabs, pool decks, patios and walkways.

   Exception: Walls and partitions enclosing areas below the design flood elevation shall meet the requirements of Sections R322.3.4 and R322.3.5.

R322.3.3 Foundations. Buildings and structures erected in coastal high-hazard areas shall be supported on pilings or columns and shall be adequately anchored to those pilings or columns. Pilings shall have adequate soil penetrations to resist the combined wave and wind loads (lateral and uplift). Water loading values used shall be those associated with the design flood. Wind loading values shall be those required by this code. Pile embedment shall include consideration of decreased resistance capacity caused by scour of soil strata surrounding the piling. Pile systems design and installation shall be certified in accordance with Section R322.3.6. ~~Mat, raft or other foundations that support columns shall not be permitted where soil investigations that are required in accordance with Section R401.4 indicate that soil material under the mat, raft or other foundation is subject to scour or erosion from wave-velocity flow conditions.~~ Slabs, pools, pool decks and walkways shall be located and constructed to be structurally independent of buildings and structures and their foundations to prevent transfer of flood loads to the buildings and structures during conditions of flooding, scour or erosion from wave-velocity flow conditions, unless the buildings and structures and their foundation are designed to resist the additional flood load.

Reason: The purpose of this code change is to clarify that an observed practice of using mat or raft foundations that are above eroded grade is not consistent with the regulations of the National Flood Insurance Program (NFIP) regarding foundations in coastal high hazard areas (V Zones). See §60.3(e)(4), below. The NFIP regulations require use of pile or column foundations in V Zones, and do not explicitly provide for use of mat or raft foundations. Note that ASCE 24 *Flood Resistant Design and Construction*, a referenced standard in the IRC, allows use of mat or raft foundations under limited circumstances; notably, it requires that such elements be at or below eroded grade. The language in R322.3.2 does not impose a limitation on the elevation of mats, and rafts and thus could lead to violations of the NFIP requirements which would also have significant cost implications for federal flood insurance premiums. ASCE 24 is permitted to be used as an alternate to the IRC provisions for coastal high hazard areas (see R301.2.4.1 and R322.1.1). In addition, designers may use ASCE 24 as guidance, even if not required.

44 CFR §60.3(e)(4) Provide that all new construction and substantial improvements in Zones V1-30 and VE, and also Zone V if base flood elevation data is available, on the community's FIRM, are elevated on pilings and columns so that . . . *[remainder not shown]*

Cost Impact: The code change proposal has no cost impact because it is consistent with local ordinances that are adopted by local jurisdictions for participation in the NFIP.

	Assembly:	ASF	AMF	DF

ICCFILENAME: QUINN-RB-5-R322.3.2

RB68–09/10
R322.3.3

Proponent: Rebecca C. Quinn, RCQuinn Consulting, Inc., representing the Department of Homeland Security, Federal Emergency Management Agency

Revise as follows:

R322.3.3 Foundations. Buildings and structures erected in coastal high-hazard areas shall be supported on pilings or columns and shall be adequately anchored to those pilings or columns. The space below the elevated building shall be either free of obstruction or, if enclosed with walls, the walls shall meet the requirements of Section R322.3.4. Pilings shall have adequate soil penetrations to resist the combined wave and wind loads (lateral and uplift). Water loading values used shall be those associated with the design flood. Wind loading values shall be those required by this code. Pile embedment shall include consideration of decreased resistance capacity caused by scour of soil strata surrounding the piling. Pile systems design and installation shall be certified in accordance with Section R322.3.6. Mat, raft or other foundations that support columns shall not be permitted where soil investigations that are required in accordance with Section R401.4 indicate that soil material under the mat, raft or other foundation is subject to scour or erosion from wave-velocity flow conditions. Slabs, pools, pool decks and walkways shall be located and constructed to be structurally independent of buildings and structures and their foundations to prevent transfer of flood loads to the buildings and structures during conditions of flooding, scour or erosion from wave-velocity flow conditions, unless the buildings and structures and their foundation are designed to resist the additional flood load.

Reason: The purpose of this code change is to improve consistency with the regulations of the National Flood Insurance Program (NFIP) regarding elevated buildings in coastal high hazard areas (V zones). See §60.3(e)(5), below. NFIP regulations require the space below elevated buildings to be either free of obstruction or have walls that meet certain requirements which are in the IRC at Section R322.3.4. Obstructions other than breakaway walls that are below elevated buildings contribute to damage by increasing loads on foundations or by contributing to the debris load during flood conditions. The NFIP's guidance on this requirement was revised in 2008, NFIP Technical Bulletin #5, *Free-of-Obstruction Requirements for Buildings Located in Coastal High Hazard Areas in accordance with the National Flood Insurance Program* (http://www.fema.gov/plan/prevent/floodplain/techbul.shtm).

44 CFR §60.3(e)(5) Provide that all new construction and substantial improvements within Zones V1-30, VE, and V on the community's FIRM have the space below the lowest floor either free of obstruction or constructed with non-supporting breakaway walls, open wood lattice-work, or insect screening intended to collapse under wind and water loads without causing collapse, displacement, or other structural damage to the elevated portion of the building or supporting foundation system. [emphasis added; remainder not shown]

Cost Impact: The code change proposal has no cost impact because it is consistent with local ordinances that are adopted by local jurisdictions for participation in the NFIP.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: QUINN-RB-8-R322.3.3

RB69–09/10
R401.3

Proponent: Jim Olk, City of Farmers Branch, TX, representing Building Officials Association of Texas

Revise as follows:

R401.3 Drainage. Surface drainage shall be diverted to a storm sewer conveyance or other *approved* point of collection that does not create a hazard. *Lots* shall be graded to drain surface water away from the building foundation ~~walls~~. The *grade* shall fall a minimum of 6 inches (152 mm)within the first 10 feet (3048 mm).

Exception: Where *lot lines*, walls, slopes or other physical barriers prohibit 6 inches (152 mm) of fall within 10 feet (3048 mm), drains or swales shall be constructed to ensure drainage away from the structure. Impervious surfaces within 10 feet (3048 mm)of the building foundation shall be sloped a minimum of 2 percent away from the building.

Reason: Over saturation of the soil adjacent to all types of foundations can cause differential soil movement which can lead to foundation failure. For this provision the term foundation walls needs to be expanded to include the perimeter of slab foundations in addition to other types of foundations. Adding the term "the building" and deleting the term "walls" make the provision applicable to all types of foundations.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: OLK-RB-2-R401.3

RB70–09/10
R403.1, Figure R403.1(1) (New)

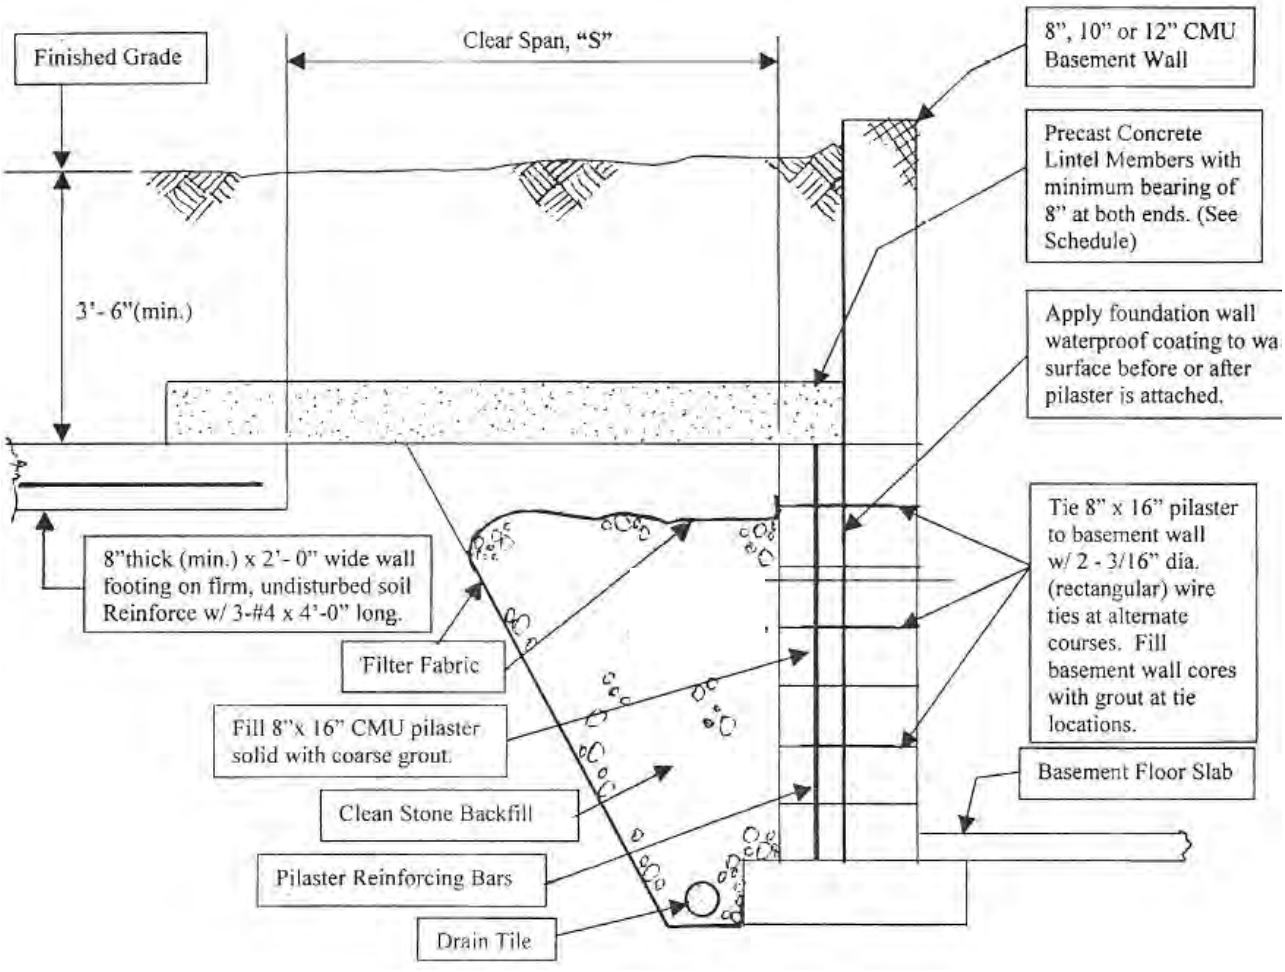
Proponent: Jason Thompson, National Concrete Masonry Association, representing the Masonry Alliance for Codes and Standards

1. Revise as follows:

R403.1 General. All exterior walls shall be supported on continuous solid or fully grouted masonry or concrete footings, crushed stone footings, wood foundations, or other *approved* structural systems which shall be of sufficient design to accommodate all loads according to Section R301 and to transmit the resulting loads to the soil within the limitations as determined from the character of the soil. Footings shall be supported on undisturbed natural soils or engineered fill. Concrete footing shall be designed and constructed in accordance with the provisions of Section R403 or in accordance with ACI 332.

At transitions between footings located at different elevations, precast concrete lintels complying with Figure R403.1(1) shall be permitted.

2. Add new figure as follows:



Required Reinforcement for Each 4 in. by 8 in. Lintel			Required Reinforcement for Each 6 in. by 8 in. Lintel		
Clear Span, S	Top Bar Size	Bottom Bar Size	Clear Span, S	Top Bar Size	Bottom Bar Size
4'-0"	No. 3	No. 3	4'-0"	No. 3	No. 3
4'-8"	No. 3	No. 3	4'-8"	No. 3	No. 3
5'-4"	No. 3	No. 3	5'-4"	No. 3	No. 3
6'-0"	No. 3	No. 3	6'-0"	No. 3	No. 3
6'-8"	No. 3	No. 3	6'-8"	No. 3	No. 4
7'-4"	No. 3	No. 4	7'-4"	No. 3	No. 5
8'-0"	No. 3	No. 5	8'-0"	No. 3	No. 5

1. All reinforcing bars shall comply with ASTM A615, Grade 60.
2. Minimum 28 day compressive strength of the lintel concrete shall be 3,000 psi.
3. The above lintels are designed to carry only the masonry apex area dead load above the lintel plus the lintel self-weight. The triangular masonry apex area is based on a 45-degree slope extended to the peak of the triangle from center of bearing at both ends of the lintel. No other loads on the lintel, within the triangular apex area, are considered in the above table.

FIGURE 403.1(1)
DISCONTINUOUS FOOTERS

Reason: Situations often arise in the field whereby it is not practical to have a continuous footing around the perimeter of a residence, such as at the transition between a basement wall and a stem wall below a garage, which is further complicated due to excavating around the basement. A common solution to this situation is to span between the stem wall footer and basement wall footer using a precast lintel to support surcharge loads applied from above.

This change proposes to introduce an alternative design and construction option to allow discontinuous footers when complying with the requirements of the proposed new Figure 403.1(1). Similar detailing has been used successfully for years in various regions of the country.

The detailing options presented here are applicable only to structures assigned to SDC A, B, and C. For higher seismic design categories, the provisions of Section R403.1.3 are still applicable.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: THOMPSON-RB-3-R403.1-F. R403.1(1)

RB71–09/10
R403.1, R404.6 (New)

Proponent: Dennis Pitts, American Forest & Paper Association

1. Revise as follows:

R403.1 General. All exterior walls shall be supported on continuous solid or fully grouted masonry or concrete footings, crushed stone footings, wood foundations, pier and beam foundations, or other approved structural systems which shall be of sufficient design to accommodate all loads according to Section R301 and to transmit the resulting loads to the soil within the limitations as determined from the character of the soil. Footings shall be supported on undisturbed natural soils or engineered fill. Concrete footings shall be designed and constructed in accordance with the provisions of R403 or in accordance with ACI 332.

2. Add new text as follows:

R404.6 Pier and beam foundations. Pier and beam foundations shall be permitted when of a design approved by the building official.

Reason: The IRC recognizes a number of different methods of foundation construction but is silent on pier and beam construction, a common construction method in some areas of the country. Although the proposed wording permits something already allowed by Section R104.11, *Alternate Materials, Design and Methods of Construction and Equipment*, it makes a clear statement about the acceptability of pier and beam foundations.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: PITTS-RB-10-R403.1-R404.6

RB72–09/10
R403.1.3

Proponent: Homer Maiel, PE, CBO, City of San Jose, CA, representing ICC Tri-Chapter (Peninsula, East Bay, Monterey Bay Chapters)

Revise as follows:

R403.1.3 Seismic reinforcing. Concrete footings located in Seismic Design Categories D_0, D_1 and D_2, as established in Table R301.2(1), shall have minimum reinforcement. Bottom reinforcement shall be located a minimum of 3 inches (76 mm) clear from the bottom of the footing.

In Seismic Design Categories D_0, D_1 and D_2 where a construction joint is created between a concrete footing and a stem wall, a minimum of one No. 4 bar shall be installed at not more than 4 feet (1219 mm) on center. The vertical bar shall extend to 3 inches (76 mm) clear of the bottom of the footing, have a standard hook and extend a minimum of 14 inches (357 mm) into the stem wall.

In Seismic Design Categories D_0, D_1 and D_2 where a grouted masonry stem wall is supported on a concrete footing and stem wall, a minimum of one No. 4 bar shall be installed at not more than 4 feet (1219 mm) on center. The vertical bar shall extend to 3 inches (76 mm) clear of the bottom of the footing and have a standard hook.

In Seismic Design Categories D_0, D_1 and D_2 masonry stem walls without solid grout and vertical reinforcing are not permitted.

> **Exception:** In detached one- and two-family *dwellings* which are three stories or less in height and constructed with stud bearing walls~~, plain concrete footings without longitudinal reinforcement supporting walls and~~ isolated plain concrete footings supporting columns or pedestals are permitted.

Reason: In seismic design categories D_0, D_1 and D_2, the flexural demands placed upon footings by the variety of braced wall panels configurations described in IRC Chapter 6, some of which require a hold-down device at one end or each end make the use of plain concrete footings unacceptable. The footing is an integral part of the seismic force load path and deserves to be constructed in as robust a manner as the braced wall panels it is supporting. The exception to use plain concrete isolated footing pads at columns or pedestals is retained because these are not use to support or anchor braced walls unless designed in accordance with accepted engineering practice per Section R602.10.7 Item 2.

Cost Impact: The code change proposal will increase the cost of construction.

	Assembly:	ASF	AMF	DF

ICCFILENAME: MAIEL-RB-2-R403.1.3

RB73–09/10
R202 (New), R403.1.6

Proponent: Gary Ehrlich, National Association of Home Builders (NAHB)

1. Add new definitions as follows:

SILL PLATE. A horizontal wood member anchored to the foundation and supporting floor joists.

SOLE PLATE. A horizontal wood member at the bottom of a wood stud wall, attached to a concrete slab.

2. Revise as follows:

R403.1.6 Foundation anchorage. Where wood sill and sole plates and cold-formed steel framed walls are supported directly on continuous foundation~~s~~ walls or monolithic slabs with integral footings required by the provisions of this code, they shall be anchored to the foundation in accordance with this section.

Wood sole plates at all exterior walls ~~on monolithic slabs~~, wood sole plates of *braced wall panels* at building interiors on monolithic slabs with integral footings, and all wood sill plates shall be anchored to the foundation with ½ inch (12.7 mm) diameter anchor bolts spaced a maximum of 6 feet (1829 mm) on center or approved anchors or anchor straps spaced as required to provide equivalent anchorage to the ½-inch-diameter (12.7 mm) anchor bolts. Bolts shall ~~be at~~

~~least ½ inch (12.7 mm) in diameter and shall~~ extend a minimum of 7 inches (178 mm) into concrete or grouted cells of concrete masonry units. A nut and washer shall be tightened on each anchor bolt. There shall be a minimum of two bolts per plate section with one bolt located not more than 12 inches (305 mm) or less than seven bolt diameters from each end of the plate section. Interior bearing wall sole plates on monolithic slab foundations with integral footings that are not part of a *braced wall panel* shall be positively anchored with *approved* fasteners. Sill plates and sole plates shall be protected against decay and termites where required by Sections R317 and R318. Cold-formed steel framing systems shall be fastened to wood sill plates or anchored directly to the foundation as required in Section R505.3.1 or R603.3.1.

Exceptions:

1. ~~Foundation anchorage, spaced as required to provide equivalent anchorage to 1/2-inch-diameter (12.7 mm) anchor bolts.~~
2. ~~2~~ 1. Walls 24 inches (610 mm) total length or shorter connecting offset *braced wall panels* shall be anchored to the foundation with a minimum of one anchor bolt located in the center third of the plate section and shall be attached to adjacent *braced wall panels* at corners as shown in Figure R602.10.4.4(1).
3. ~~3~~ 2. Connection of walls 12 inches (305 mm) total length or shorter connecting offset *braced wall panels* to the foundation without anchor bolts shall be permitted. The wall shall be attached to adjacent *braced wall panels* at corners as shown in Figure R602.10.4.4(1).

Reason: The purpose of this proposal is to revise the language for anchorage of light-frame wood and cold-formed steel stud walls to the foundations of the house. Without these revisions, we are concerned that the code will present an enforcement nightmare for plan reviewers and inspectors, and lead to anchor bolts and continuous footings being required where they are not necessary and have not traditionally been provided.

The ICC Ad-Hoc Committee on Wall Bracing revised this section during the 2007/2008 code cycle with the intent of insuring that sufficient anchorage is provided on braced wall lines and panels inside a dwelling to transfer lateral loads to either monolithic (thickened) slab foundations or continuous footings. While we agree that providing a continuous load path is important, the change was overly broad in its application and will present an enforcement problem. For instance, the first sentence of the 2009 IRC Section R403.1.6 effectively requires all light-frame walls to be provided with anchor bolts to the foundation. Thus, a non-bearing interior partition that is not part of a braced wall line but which just happens to sit atop a foundation wall or continuous foundation (e.g. at a partial basement, crawlspace, or interior knee wall) would be required to be fastened to the wall or footing below with 1/2" diameter anchor bolts at 6 foot spacing. We are also concerned the new language (in particular the change for walls on interior monolithic slabs) does not explicitly permit anchor bolts to be replaced by wedge anchors, expansion bolts, mudsill straps, or other equivalent anchorage, and also that it may require thickened slabs or continuous footings where they have not traditionally been provided or are not required by other sections of the IRC.

Further, there was no technical justification provided for the increased anchorage requirements. Whole-building structural tests have shown that our current methods of construction are stronger than current engineering practice and engineering design standards give them credit for. An actual house in the field tested by researchers in New Zealand performed 50% better than predicted by engineering design, even with sill plates attached only by single nails, rather than anchor bolts. We also note that the bottom plate of a braced wall line on the interior and supported on floor framing (including a raised floor system over a crawlspace or pier-and-beam foundation) can be attached to the framing with 3-16d nails at 16" spacing, but the same plate on a continuous footing will require 1/2" anchor bolts at 7" spacing. Thus, by implementing these new requirements for additional anchor bolts on braced wall lines inside our structures we are essentially contradicting 40 years of research into light-frame wood construction. We are not aware of any racking failures on interior braced wall lines that would justify adding bolts to these lines.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: EHRLICH-RB-5-R202-R403.1.6

RB74–09/10
R403.1.6

Proponent: Dennis Pitts, American Forest & Paper Association

Revise as follows:

R403.1.6 Foundation anchorage. Sill plates and walls supported directly on continuous foundations shall be anchored to the foundation in accordance with this section. Wood sill plates or wood bottom plates shall have full bearing on the foundation system.

Wood sole plates at all exterior walls on monolithic slabs, wood sole plates of *braced wall panels* at building interiors on monolithic slabs and all wood sill plates shall be anchored to the foundation with anchor bolts spaced a maximum of 6 feet (1829 mm) on center. Bolts shall be at least ½ inch (12.7 mm) in diameter and shall extend a minimum of 7 inches (178 mm) into concrete or grouted cells of concrete masonry units. A nut and washer shall be tightened on each anchor bolt. There shall be a minimum of two bolts per plate section with one bolt located not more than 12 inches (305 mm) or less than seven bolt diameters from each end of the plate section. Interior bearing wall sole plates

on monolithic slab foundation that are not part of a *braced wall panel* shall be positively anchored with *approved* fasteners. Sill plates and sole plates shall be protected against decay and termites where required by Sections R317 and R318. Cold-formed steel framing systems shall be fastened to wood sill plates or anchored directly to the foundation as required in Section R505.3.1 or R603.3.1.

Exceptions:

1. Foundation anchorage, spaced as required to provide equivalent anchorage to 1/2-inch-diameter (12.7 mm) anchor bolts.
2. Walls 24 inches (610 mm) total length or shorter connecting offset *braced wall panels* shall be anchored to the foundation with a minimum of one anchor bolt located in the center third of the plate section and shall be attached to adjacent *braced wall panels* at corners as shown in Figure R602.10.4.4(1).
3. Connection of walls 12 inches (305 mm) total length or shorter connecting offset *braced wall panels* to the foundation without anchor bolts shall be permitted. The wall shall be attached to adjacent *braced wall panels* at corners as shown in Figure R602.10.4.4(1).

Reason: Full bearing is required to prevent cross-grain bending stresses of the wood sill plate or wood bottom plate. Further, the *2001 Wood Frame Construction Manual (WFCM) for One- and Two-Family Dwellings*, which is adopted by reference in the IRC, states the following: "3.2.1.7 … Sill plates or bottom plates shall have full bearing on the foundation system."

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: PITTS-RB-16-R403.1.6

R403.1.9 (New)

Proponent: Daniel J. Walker, PE, Thomas Associates, Inc., representing the National Sunroom Association

Add new text as follows:

R403.1.9 Patio cover and screen enclosure footings. In areas with a frost line depth of zero as specified in Table R301.2 (1), a *patio cover* or *screen enclosure* shall be permitted to be supported on a slab on grade without footings, provided the slab conforms to the provisions of Section R506 of this code, is not less than 3.5 inches (89 mm) thick, and the columns support live and dead loads of less than 750 pounds (3.34 kN) per column.

Reason: This language has long been included in Appendix H of the code. The requirements are specific to this section and therefore should be included here.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: WALKER-RB-4-R403.1.9

RB77–09/10
R404.1.1, R404.1.2

Proponent: Robert Rice, Josephine County Building Safety, representing the Southern Oregon Chapter of ICC

Revise as follows:

R404.1.1 Design of masonry foundation walls. Masonry foundation walls shall be designed and constructed in accordance with the provisions of this section or in accordance with the provisions of ASCE 5 or NCMA TR68-A. Construction drawings shall state the standard used and shall show, with sufficient clarity, the detailed requirements of Section R404 or the applicable standard. When TMS 402/ACI 530, NCMA TR68-A or the provisions of this section are used to design masonry foundation walls, project drawings, typical details and specifications are not required to bear the seal of the architect or engineer responsible for design, unless otherwise required by the state law of the jurisdiction having authority.

R404.1.2 Concrete foundation walls. Concrete foundation walls that support light-frame walls shall be designed and constructed in accordance with the provisions of this section, ACI 318, ACI 332 or PCA 100. Concrete foundation walls that support above-grade concrete walls that are within the applicability limits of Section R611.2 shall be designed and constructed in accordance with the provisions of this section, ACI 318, ACI 332 or PCA 100. Construction drawings shall state the standard used and shall show, with sufficient clarity, the detailed requirements of Section R404 or the applicable standard. Concrete foundation walls that support above-grade concrete walls that are not within the applicability limits of Section R611.2 shall be designed and constructed in accordance with the provisions of ACI 318, ACI 332 or PCA 100. When ACI 318, ACI 332, PCA 100 or the provisions of this section are used to design concrete foundation walls, project drawings, typical details and specifications are not required to bear the seal of the architect or engineer responsible for design, unless otherwise required by the state law of the jurisdiction having authority.

Reason: Section R404 and the various standards contain different requirements and it should be made clear on the project drawings which standard are being used. In addition to the different requirements between standards, the requirements vary based on wall height, retained earth height, sill bolt anchoring, joist or blocking connection to sill, etc In order to do a plan check or inspection this information needs to be shown on the construction drawings.

Cost Impact: This proposal does not change the construction requirements of the code and will not change the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

Proponent: Stephen V. Heller, representing the Insulating Concrete Form Association (ICFA)

1. Revise as follows:

R404.1.2.3.6.1 Stay-in-place forms. Stay-in place concrete forms shall comply with this section.

1. Surface burning characteristics. The flame-spread index and smoke-developed index of forming material, other than foam plastic, left exposed on the interior shall comply with Section R302. The surface burning characteristics of foam plastic used in insulating concrete forms shall comply with Section R316.3.
2. Interior covering. Stay-in-place forms constructed of rigid foam plastic shall be protected on the interior of the building as required by Section R316. Where gypsum board is used to protect the foam plastic, it shall be installed with a mechanical fastening
system. Use of adhesives in addition to mechanical fasteners is permitted.
3. Exterior wall covering. Stay-in-place forms constructed of rigid foam plastics shall be protected from sunlight and physical damage by the application of an *approved* exterior wall covering complying with this code. Exterior surfaces of other stay-in-place forming systems shall be protected in accordance with this code.
4. Termite hazards. In areas where hazard of termite damage is very heavy in accordance with Figure R301.2(6), foam plastic insulation shall be permitted below *grade* on foundation walls in accordance with one of the following conditions:
   4.1. Where in addition to the requirements in Section R318.1, an *approved* method of protecting the foam plastic and structure from subterranean termite damage is provided.
   4.2. The structural members of walls, floors, ceilings and roofs are entirely of noncombustible materials or pressure-preservative-treated wood.
   4.3. On the interior side of *basement* walls.
5. Flat IFC wall system forms shall conform to ASTM E 2634.

2. Add new text as follows:

R611.4.4 Flat ICF walls systems. Flat ICF wall system forms shall conform to ASTM E 2634.

3. Add new standard to Chapter 44 as follows:

ASTM

E 2634—08	Standard Specification for Flat Wall Insulating Concrete Form (ICF) Systems

Reason: This proposal adds ASTM E2634 to the code to help users determine acceptance of Flat Wall ICF forming systems.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: A review of the standard proposed for inclusion in the code, ASTM E 2634-08, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: HELLER-RB-2-R404.1.2.3.6.1-R611.4.4-CH 44

RB79–09/10
R404.1.5.3

Proponent: Bruce D. Spicher, Orangeburg County, SC

Revise as follows:

R404.1.5.3 Pier and curtain wall foundations. Use of pier and curtain wall foundations shall be permitted to support light-frame construction not more than two stories in height, provided the following requirements are met:

1. All load-bearing walls shall be placed on continuous concrete footings placed integrally with the exterior wall footings.

2. The minimum actual thickness of a load-bearing masonry wall shall be not less than 4 inches (102 mm) nominal or 33/8 inches (92 mm) actual thickness, and shall be bonded integrally with piers spaced in accordance with Section R606.9.
3. Piers shall be constructed in accordance with Section R606.6 and Section R606.6.1, and shall be bonded into the load-bearing masonry wall in accordance with Section R608.1.1 or Section R608.1.1.2.
4. The maximum height of a 4-inch (102 mm) load-bearing masonry foundation wall supporting wood-frame walls and floors shall not be more than 4 feet (1219 mm).
5. Anchorage shall be in accordance with Section R403.1.6, Figure R404.1.5(1), or as specified by engineered design accepted by the *building official*.
6. The unbalanced fill for 4-inch (102 mm) foundation walls shall not exceed 24 inches (610 mm) for solid masonry or 12 inches (305 mm) for hollow masonry.
7. ~~In Seismic Design Categories D0, D1 and D2, prescriptive reinforcement shall be provided in the horizontal and vertical direction. Provide minimum horizontal joint reinforcement of two No.9 gage wires spaced not less than 6 inches (152 mm) or one 1/4 inch (6.4 mm) diameter wire at 10 inches (254 mm) on center vertically. Provide minimum vertical reinforcement of one No. 4 bar at 48 inches (1220 mm) on center horizontally grouted in place.~~

Reason: This section allows pier curtain walls in Seismic D zones up to a maximum height of 48" with pier spacing at 48". This leaves an area approximately 32" wide between piers and 48" in height. Note (2) calls for masonry curtain wall to be integrally bonded with piers as shown in Figure R404.1.5(1).

The area between the piers (32" x 48") has no vertical support or horizontal support. You cannot provide wall tie bonding as required by 608.1.2. Figure R404.1.5(1) is showing a strap similar to Simpson's PA51. The figure is showing this strapping running through the 3.5" masonry bonding units. To insert this strap through the hollow cavity of 3.5" masonry unit is impossible.

To construct this pier curtain wall in a Seismic D zone and meet all the requirements of the 2009 IRC for masonry foundation walls is not only impractical, it is impossible.

Cost Impact: As far as an increase in construction cost to move from pier curtain walls to a CMU wall with labor included, it is actually less expensive to install a CMU wall (concrete block 8 x 16) than it is to erect a pier curtain wall. As stated, you can meet all the requirements of the code with a CMU wall, where as a pier curtain wall in a Seismic D zone you cannot.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

R404.1.9 (New), R404.1.9.1 (New), R404.1.9.2 (New), R404.1.9.3 (New), R404.1.9.4 (New), R404.1.9.5 (New), R602.10.7

Proponent: Gary Ehrlich, National Association of Home Builders (NAHB)

1. Add new text as follows:

R404.1.9 Isolated masonry piers. Isolated masonry piers shall be constructed in accordance with this section and the general masonry construction requirements of Section R606. Hollow masonry piers shall have a minimum nominal thickness of 8 in. (203 mm), with a nominal height not exceeding four (4) times the nominal thickness and a nominal length not exceeding three (3) times the nominal thickness. Where hollow masonry units are solidly filled with concrete or grout, piers shall be permitted to have a nominal height not exceeding ten (10) times the nominal thickness. Footings for isolated masonry piers shall be sized in accordance with Section R403.1.1.

R404.1.9.1 Pier cap. Hollow masonry piers shall be capped with 4 inches (102 mm) of solid masonry or concrete, a masonry cap block, or shall have cavities of the top course filled with concrete or grout unless a sill plate of 2-inch (51 mm) minimum nominal thickness and bearing on two face shells is provided. The sill plate shall provide a minimum nominal bearing area of 48 square inches (30 865 square mm). Where required, termite protection for the pier cap or sill plate shall be provided in accordance with Section R318.

R404.1.9.2 Masonry piers supporting floor girders. Masonry piers supporting wood girders complying with Tables R502.5(1) and R502.5(2) shall be permitted in accordance with this section. Piers supporting girders for interior bearing walls shall have a minimum nominal dimension of 12 inches (305 mm) and a maximum height of 10 feet (3 048 mm) from top of footing to bottom of sill plate or girder. Piers supporting girders for exterior bearing walls shall have a minimum nominal dimension of 12 inches (305 mm) and a maximum height of 4 feet (1 220 mm) from top of footing to bottom of sill plate or girder. Girders and sill plates shall be anchored to the pier or footing in accordance with Section R403.1.6 or Figure R404.1.5(1).

R404.1.9.3 Masonry piers supporting braced wall panels. Masonry piers supporting braced wall panels shall be constructed in accordance with Figure R602.10.7.

R404.1.9.4 Seismic design of masonry piers. Masonry piers in all dwellings located in Seismic Design Category D0, D1, D2, and townhouses in Seismic Design Category C, shall be designed in accordance with accepted engineering practice.

R404.1.9.5 Masonry piers in flood hazard areas. Masonry piers for dwellings in flood hazard areas shall be designed in accordance with Section R322.

2. Revise as follow:

R602.10.7 Braced wall panel support. *Braced wall panel* support shall be provided as follows:

1. Cantilevered floor joists, supporting *braced wall lines*, shall comply with Section R502.3.3. Solid blocking shall be provided at the nearest bearing wall location. In Seismic Design Categories A, B and C, where the cantilever is not more than 24 inches (610 mm), a full height rim joist instead of solid blocking shall be provided.
2. Raise floor system ~~Elevated~~ post or pier foundations exceeding 4 feet (1 220 mm) in height and supporting *braced wall panels* shall be designed in accordance with accepted engineering practice. Raised floor system masonry pier foundations not exceeding 4 feet (1 220 mm) in height, and isolated masonry piers in basements, shall be permitted to be designed in accordance with Section R404.1.9.
3. Masonry stem walls with a length of 48 inches (1220 mm) or less supporting *braced wall panels* shall be reinforced in accordance with Figure R602.10.7. Masonry stem walls with a length greater than 48 inches (1220 mm) supporting *braced wall panels* shall be constructed in accordance with Section R403.1 *Braced wall panels* constructed in accordance with Sections R602.10.3.2 and R602.10.3.3 shall not be attached to masonry stem walls.

Reason: The purpose of this proposal is to introduce provisions for isolated masonry piers used as foundations for raised wood floor systems. Masonry pier foundations are a common construction method. However, besides a brief mention in R606.6, no other guidance is given for the construction of these piers, other than a reference in R602.10.6 calling for engineered design of piers supporting braced wall panels.

Language is proposed for Chapter 4 to provide prescriptive guidance for isolated masonry piers constructed inside a basement or crawlspace. The language proposed for R404.1.9 for masonry piers is based on the empirical design limits contained in the MSJC. The language is adopted from the paragraph on Foundation Piers in NCMA's TEK Note 5-3A: "Concrete Masonry Foundation Wall Details". Further limits are provided for piers supporting floor girders, braced wall panels, and for piers in high-seismic or flood hazard areas.

The language in R602.10.6 is modified and coordinated with the proposed R404.1.9 language to allow prescriptive design of short exterior masonry piers and of isolated interior masonry piers complying with R404.1.9. Taller masonry piers supporting an elevated deck, sunroom, or other substantially raised portion of a dwelling are relegated to engineered design. It was the original intent of R602.10.6 to address these full-height piers, not to require engineered design for every raised wood floor/crawlspace regardless of pier height.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: EHRLICH-RB-6-R404.1.9-R602.10.7

RB81–09/10
R404.4

Proponent: Robert Rice, Josephine County Building Safety, representing the Southern Oregon Chapter of ICC

Revise as follows:

R404.4 Retaining walls. Retaining walls that are not laterally supported at the top and that retain in excess of 24 inches (610 mm) of unbalanced fill shall be designed in accordance with accepted engineering practice to ensure stability against overturning, sliding, excessive foundation pressure and water uplift. Retaining walls shall be designed for a safety factor of 1.5 against lateral sliding and overturning. Concrete or masonry foundation walls that have permanent lateral support at the top and bottom shall be in accordance with R404.1.

Reason: This proposal is to clarify that the type of "Retaining walls" referred to in section R404.5 are designed as free-standing (cantilevered) retaining walls. This type of wall is very different from the "Concrete and masonry foundation" walls referred to in Section R404.1 where there is lateral support required at top and bottom. If the provisions of the two were combined it could result in a wall that is subject to failure. In the design provisions of the concrete or masonry foundation walls with lateral support at the top and bottom the vertical reinforcement, at distance "d" per Tables R404.1.1(2) through R404.1.1(5), is on the tension side of the wall which is the side away from the soil. In a retaining wall without support at the top, as referred to in R404.5, the reinforcement should be on the soil side. If, for instance, a cantilevered retaining wall was restrained at the top (especially prior to backfill) the tension side of the wall would be away from the soil side which is opposite of the wall design. In addition, there are no prescriptive provisions contained in the IRC for the design of this type of wall. An engineered design would be required for a free-standing cantilevered retaining wall.

Cost Impact: The intent of this proposal is to clarify the existing requirements and no new requirements have been added. There will be no increase in the cost of construction.

R405.1, R405.1.1 (New), R405.2, R405.2.1, R405.2, R405.2.2, R405.3

Proponent: James Jorgensen, PE, City of Lenexa, KS, representing the Metropolitan Kansas Chapter of ICC

1. Revise as follows:

R405.1 Concrete or masonry foundations. Drains shall be provided around all concrete or masonry foundations that retain earth and enclose habitable or usable spaces located below *grade*. Drainage tiles, gravel or crushed stone drains, perforated pipe or other *approved* systems or materials shall be installed ~~at or~~ below the floor level of the area to be protected and shall discharge ~~by gravity or mechanical means~~ into an *approved* drainage system in accordance with Section R405.3.. Gravel or crushed stone drains shall extend at least 1 foot (305 mm) beyond the outside edge of the footing and 6 inches (152 mm) above the top of the footing, be at least 12 inches deep, and be ~~covered~~ surrounded by ~~with~~ an *approved* filter membrane material. The top of open joints of drain tiles shall be protected with strips of building paper.~~, and~~ The drainage tiles or perforated pipe shall be placed on a minimum of 2 inches (51 mm) of washed gravel or crushed rock at least one sieve size larger than the tile joint opening or perforation and covered with not less than 6 inches (152 mm) of the same material. Perforated pipe drains shall be covered with an approved filter membrane or an approved filter membrane shall surround the gravel/crushed rock covering the drain. Drains shall be placed level or at a positive slope to the point of collection for removal from the structure.

Exceptions:

1. A drainage system is not required when the foundation is installed on well-drained ground or sand-gravel mixture soils according to the Unified Soil Classification System, Group I Soils, as detailed in Table R405.1.
2. Perforated pipe drains may be placed on top of a concrete footing in lieu of a bed of gravel or rock provided it is below the floor level of the usable space.

2. Add new text as follows:

R405.1.1 Perforated pipe drains. Perforated pipe drains and drain tile shall have a minimum interior diameter of 4 inches.

3. Revise as follows:

R405.2 Wood foundations. Wood foundations enclosing habitable or usable spaces located below *grade* shall be adequately drained in accordance with Sections R405.2.1 ~~through~~, R405.2.~~3~~2 and R405.3.

R405.2.1 Base. A porous layer of gravel, crushed stone or coarse sand shall be placed to a minimum thickness of 4 inches (102 mm) under the *basement* floor. Provision shall be made for automatic draining of this layer and the gravel or crushed stone wall footings. To drain the base layer, interior drains complying with Section R405.1 shall be provided below the base layer, around the perimeter of the enclosed area and connected to the drainage system.

R405.2.2 ~~Vapor retarder~~ Moisture barrier. A 6-mil-thick (0.15 mm) polyethylene ~~vapor retarder~~ moisture barrier shall be applied over the porous layer with the *basement* floor constructed over the polyethylene.

~~R405.2~~ R405.3 Drainage system. In other than Group I soils, an approved drainage system shall be provided to ~~a sump shall be provided to~~ drain the ~~porous~~ base layer and footings. The system shall discharge by gravity or mechanical means and shall be capable of removing any accumulated water and discharging it to an approved location to move water away from the structure. Where drainage is by mechanical means a sump shall be provided. The sump shall be at least 24 inches (610 mm) in diameter or 20 inches square (0.0129 m2), shall extend at least 24 inches (610 mm) below the bottom of the *basement* floor ~~and shall be capable of positive gravity or mechanical drainage to remove any accumulated water. The drainage system shall discharge into an *approved* sewer system or to daylight~~. For gravity drainage systems solid pipe shall be provided between the termination point and the connection at the structure and shall terminate in a manner to facilitate cleaning.

Reason: The foundation drainage requirements in the code need clarification to be a more effective component of the code. These requirements have not been updated for many years. A frequent complaint on existing homes is water infiltration into the basement areas. More and more basement areas are used as primary living space. Repairs to dwellings resulting from ineffective installation of the foundation drainage system are costly and is preventable. The codes lack of clarity on this issue leads to ineffective enforcement.

In R405.1 the location of the drains "at or below" the floor level allows for installations that may be ineffective at removing water from the foundation area by allowing water to enter the usable space before it can be drained away. Clarifying that the drains must be below the floor level (top of the floor surface) provides more clarity. Where gravel or crushed stone drains are used the code does not specify a depth of the drain, only that it extends 6 inches above the level of the footing. Since the minimum floor thickness is 4 inches the drain is above the level of the floor which is ineffective. Many standards that address drainage systems require that stone drains be completely enclose to prevent fines from clogging the drainage system. Simply covering the material with a filter membrane does not prevent fines from clogging the drains.

The term "approved filter membrane" does not provide good direction for code officials or builders. Although my research indicates that many roadway projects use AASHTO M288-00 for class 3 for use in drains and French drains I am not sure if this is what is commonly supplied with prefabricated socks for perforated drains. Clarification can be provided in a future code change.

The current code required gravel and stone drains to be covered with a filter membrane, however; the code is silent on the requirements for the protection of perforated drains. To prevent fines from penetrating the openings in the perforated pipe protection by a filter membrane is required around the pipe or around the stone/gravel covering the pipe.

The requirements for removal of water by gravity or mechanical means as been moved to the section on drainage where it can more comprehensively addressed.

The code does not specify a minimum size for drain tile therefore a minimum size of 4 inches interior diameter has been provided. Three inches may be acceptable for some smaller dwellings with short distances to the point of collection but the cost difference is minimal and 4 inches is more effective.

Drains should not have sharp rises or falls that provide for collection points for fine material leading to clodding of the drains over time, therefore a provision for providing a level or positive slope has been added. Section R405.2.1 has been modified to clarify that to drain the porous layer below the base drains complying the R405.1 are required and they shall be installed around the perimeter of the space and below the base layer. Drainage system R405.3. Current Section R405.2.3 only applies to wood foundations. R405.1 only requires that the drains from the protected area discharge to an approved location without clarifying the process. It is inconsistent for wood foundations to be very specific regarding the sump and drainage of the porous layer and have no clarity for concrete and masonry foundations. R405.3 includes the old language in R405.1 for drainage by gravity or mechanical means and adds clarification that for gravity drains the termination point should be such that it could be cleaned of any accumulated debris at the termination from the house to the termination point.

Cost Impact: There may be a slight increase in the initial cost of construction if a jurisdiction did not previously require that perforated drains or crushed gravel drains be protected with an approved filter membrane or provide a means of draining the base layer under basement floors.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: JORGENSEN-RB-1-R405.1

RB83–09/10
R408.3

Proponent: Jesse J. Beitel, Hughes Associates, Inc., representing the Extruded Polystyrene Foam Association

Revise as follows:

R408.3 Unvented crawl space. Ventilation openings in under-floor spaces specified in Sections R408.1 and R408.2 shall not be required where:

1. Exposed earth is covered with a continuous Class I vapor retarder. Joints of the vapor retarder shall overlap by 6 inches (152 mm) and shall be sealed or taped. The edges of the vapor retarder shall extend at least 6 inches (152 mm) up the stem wall and shall be attached and sealed to the stem wall <u>or insulation</u>; and
2. One of the following is provided for the under-floor space:
   - 2.1. Continuously operated mechanical exhaust ventilation at a rate equal to 1 cubic foot per minute (0.47 L/s) for each 50 square feet (4.7m2) of crawlspace floor area, including an air pathway to the common area (such as a duct or transfer grille), and perimeter walls insulated in accordance with Section N1102.2.9;
   - 2.2. *Conditioned air* supply sized to deliver at a rate equal to 1 cubic foot per minute (0.47 L/s) for each 50 square feet (4.7 m^2) of under-floor area, including a return air pathway to the common area (such as a duct or transfer grille), and perimeter walls insulated in accordance with Section N1102.2.9;
   - 2.3. Plenum in existing structures complying with Section M1601.5, if under-floor space is used as a plenum.

Reason: This code proposal gives the user and /or installer the option to tape or seal to the insulation rather than the stem wall. This option allows the foam to be installed first, then the vapor retarder. This will ease installation and provide greater flexibility without compromising the function of the vapor retarder itself.

A companion code proposal to the IBC is not required since the existing language is not in the IBC.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: BEITEL-RB-6-R408.3

RB84–09/10
R501.3 (New), Chapter 44 (New)

Proponent: Jeff Hugo, CBO, National Fire Sprinkler Association

1. Add new text as follows:

R501.3 Fire Protection. All new one and two family dwellings using floor framing components or systems composed of prefabricated I joists, trusses, and cold formed steel shall be fire sprinklered throughout according to NFPA 13, NFPA 13R, NFPA 13D or Section P2904.1.

2. Add new standard to Chapter 44 as follows:

NFPA
13R—07 Installation of Sprinkler Systems in Residential Occupancies Up to and Including Four Stories in height

Reason: Lightweight construction consisting of prefabricated I joists, trusses, and cold formed steel are excellent materials in many ways. They save labor, time, natural resources, and call backs. However, widespread fire experience shows that floors framed out of these materials do not have the same durability in the event of a fire as solid sawn lumber and are not only hazardous to the occupants evacuating the home, but especially to responding emergency personnel, such as fire fighters.

Several research studies have been performed showing the potential failures of these flooring assemblies during fires and the potential for floor collapse during fire fighter operations. Additional research has shown the ability of fire sprinklers to prevent the fire from reaching the point where it could cause the same kind of damage. This research shows that with fire sprinkler systems in the home, the prefabricated I joists, trusses and cold formed steel materials are safe to use. But without fire sprinklers, these materials could fail catastrophically during a fire.

This requirement is important to put into the IRC even if the requirement for sprinklers is maintained because there are many jurisdictions that will not accept the blanket requirement for sprinklers, but will maintain this option for using sprinklers with this specific type of construction.

Tyco Fire Suppression & Building Products. A Technical Analysis: The Performance of Composite Wood Joists Under Realistic Fire Conditions. 2008

Su, J.Z., N.; Bawaly, A.C.; Lougheed, G.D.; Taber, B.C.; Leroux, P.; Proulx, G.; Kashef, A.; McCarthey, C.; Thomas, J.R. Fire Performance of Houses, Phase I. Study of Unprotected Floor Assemblies in Basement Fire Scenarios, Summary Report. 12/15/2008

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: The proposed new standard, NFPA 13R, is currently referenced in the *International Building Code*.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: HUGO-RB-1-R501.3

RB85–09/10
R501.3 (New), Chapter 44 (New)

Proponent: Larry Wainright, Qualtim, Inc., representing the Structural Building Components Association

1. Add new text as follows:

R501.3 Fire Protection of Floors: Floors within dwelling units shall be protected on the underside by a minimum of 1/2" gypsum board applied in accordance with Section R702.3.

Exceptions:

1. Crawl spaces where the maximum clear height from the underside of the subfloor to the void space floor is 3 feet or less and is not intended for mechanical equipment use or storage.
2. The building is protected with an automatic sprinkler system designed to NFPA 13, 13D, 13R, or Section P2904 of this code.
3. Floors of any material or combination of materials achieving a 30-minute fire-resistance rating in accordance with ASTM E 119 or UL 263.
4. Floors that are protected by a material or combination of materials in accordance with the test procedures of ASTM E 84 or UL 723 that exhibits a flame spread index not exceeding 25, no evidence of progressive combustion and a flame front that does not progress more than 10 ½ feet (3200 mm) beyond the centerline of the burner at any time during an extended 30 minute test.

2. Add new standard to Chapter 44 as follows:

NFPA

13R—07 Installation of Sprinkler Systems in Residential Occupancies Up to and Including Four Stories in height

Reason: This proposal would require the underside of floors to be protected, providing a greater level of fire protection than unprotected floors. This would apply to all construction types, thereby creating no competitive advantage for specific building types.

Cost Impact: The code change proposal will increase the cost of construction.

Analysis: The proposed new standard, NFPA 13R, is currently referenced in the *International Building Code*.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: WAINRIGHT-RB-8-R501.3

RB86–09/10
R501.3 (New)

Proponent: Sal DiCristina, representing Code Solutions, Inc.

Add new text as follows:

R501.3 Fire floor protection: Floors within dwelling units utilizing light-frame construction shall be protected on the underside by a minimum of 5/8" gypsum board applied in accordance with Section R702.3.

Exceptions:

1. Crawl spaces where the maximum clear height from the underside of the subfloor to the void space floor is 3 feet or less and is not intended for mechanical equipment use or storage.
2. The building is protected with an automatic sprinkler system designed to NFPA 13D or Section P2904 of this code.
3. Floors in which the exposed materials are protected by materials achieving a 30-minute fire-resistance rating in accordance with ASTM E 119 or UL 263.
4. Floors in which the exposed materials on the underside are protected by a fire-retardant coating that shall have, when tested in accordance with ASTM E 84 or UL 723 in the form in which it is applied, a listed flame spread index of 25 with no evidence of significant progressive combustion when the test is continued for an additional 20 minute period. In addition, the flame front shall not progress more than 10 ½ feet (3200 mm) beyond the centerline of the burners at any time the test.

Reason: This proposal is essentially the same as a proposal submitted by Battalion Chief Sean DeCrane of the Cleveland Fire Department with the addition of an exception number 4. We support Chief DeCrane's objectives, however, we believe additional flexibility is needed to provide the required level of protection in the vast array of construction configurations that may be encountered in the field.

The purpose of this additional method of protection is to provide an economical method to protect the underside of a floor without the need to apply a covering membrane that would restrict access. This would be important for unfinished basement and lower levels, or crawl spaces that do not meet exception 1.

It is important to note that the parameters required in proposed Exception 4 prevents the underside of the floor from ignited for a period of at least 30 minutes which matches the level of protection Mr. DeCrane seeks in Section R501.3.

ASTM 84 and UL 723 are already utilized in the IRC in Section R302 Fire Resistant Construction, however, the parameters above exceed those in R302 to ensure that a minimum of 30 minutes of protection is provided to the underside of the floors.

Of greater note is that material meeting the requirements of exception 4 meet or exceed the level of protection provided by fire-retardant treated wood (FRTW) that is permitted by Sections R802.1 and R802.1.3 of the IRC for protected roof framing.

Cost Impact: The code change proposal will increase the cost of construction.

Proponent: Sean DeCrane, Cleveland, OH Fire Department, representing the International Association of Fire Fighters

Add new text as follows:

R501.3 Fire floor protection. Floors within dwelling units utilizing light-frame construction shall be protected on the underside by a minimum of 5/8" gypsum board applied in accordance with Section R702.3.

Exceptions:

1. Crawl spaces where the maximum clear height from the underside of the subfloor to the void space floor is 3 feet or less and is not intended for mechanical equipment use or storage.
2. The building is protected with an automatic sprinkler system designed to NFPA 13D or Section P2904 of this code.
3. Floors in which the exposed materials are protected by materials achieving a 30-minute fire-resistance rating in accordance with ASTM E 119 or UL 263.

Reason: On August 13, 2006 a Wisconsin fire fighter was killed, and a second fire fighter injured, when the floor they were operating on collapsed sending them into the basement. One fire fighter fell directly into the room of origin and was killed, the second fire fighter landed on the opposite side of a block wall and survived by shielding herself and making an escape through a rear window. They checked the floor to ensure it was safe and solid, just prior to collapse they heard a loud crack. T

The floor they were operating on was unprotected lightweight construction that collapsed without warning. In the ensuing investigation, the National Institute for Occupational Safety and Health released report F2006-26[1]. One of the recommendations is to "modify current building codes to require that lightweight trusses be protected with a fire barrier". This should not only pertain to truss construction. There are additional forms of construction that can be determined to be lightweight, cold form steel, bar joists, wooden engineered I-beam, etc., the recent trend in residential construction is to use products that are financially beneficial. It is the belief of many of us in the fire service that as the industry engineers products to a more finite point we are losing our safety factors.

In their report 2007-12 released May 16, 2008, NIOSH[2] recommended "Ensure fire fighters are trained for extreme conditions such as high winds and rapid fire progression associated with lightweight construction". They further stated, "In this era of new lightweight construction, training procedures covering strategy and tactics in extreme operations conditions, such as high winds and lightweight building construction (i.e. materials and design) are needed for all levels of fire fighters. Lightweight constructed buildings fail rapidly with little warning, complicating rescue efforts. The potential for fire fighters to become trapped or involved in a collapse may be increased. There are twenty-nine actions for fire fighters can take to protect themselves when confronted with buildings utilizing lightweight building components as structural members. They range from looking for signs or indicators that these materials are used in buildings (such as, newer structures, large unsupported spans, and heavy black smoke being generated) to getting involved in newer building code development".

On September 27, 2007 NIOSH released report 2006-24[3] The first recommendation of the report read "Ensure that fire fighters and incident commanders are aware unprotected pre-engineered I-joist floor systems may fail at a faster rate than solid wood joists when exposed to direct fire impingement, and they should plan interior operations accordingly". The discussion of the recommendation is quite lengthy but identifies the advantages of the construction industry using this type of construction but also relates the dangers to fire fighters, "The Illinois Fire Service Institute, at the University of Illinois, conducted tests to help determine the structural stability of sample floor systems. These studies suggest that engineered wooden I-beams can fail in as little as 4 minutes and 40 seconds under controlled test conditions". The report also states that weakened floors are difficult to detect from above as the floor surface may appear intact.

On November 16, 2007, NIOSH released report F2007-07[4]. In this Fire Fighter Death in the Line-of-Duty report, NIOSH recommends "building code officials and local authorities having jurisdiction should consider modifying the current codes to require that lightweight trusses are protected with a fire barrier on both the top and the bottom". The report further states "In this incident, the floor trusses for the first floor did not have any protection on the bottom cord, which immediately exposed the trusses to fire in the basement. Unfinished basements are very common throughout the country. Basements typically house additional fire exposures such as alternative heating sources, hot water heaters, clothes dryers, etc.. It is critical for trusses and lightweight engineered wood I-beams that are used in a load-bearing assembly to be protected with a thermal barrier such as gypsum wallboard. The function of the thermal barrier is a critical factor in the fire performance of the assembly".

In April, 2005, NIOSH released their report "Preventing Injuries and Deaths of Fire Fighters due to Truss System Failures"[5.] In their release they recommended the placement of a labeling system on buildings to indicate the type of construction. While this recommendation will probably not be acceptable to residents of a one or two family home, we can mandate that they increase the protection of the construction type to provide increased safety to the residents and the responding fire fighters.

In fact, NIOSH has been concerned enough with the performance of lightweight floors in fire conditions they released a Workplace Solutions report in February, 2009, *Preventing Deaths and Injuries of Fire Fighters Working Above Fire-Damaged Floor*[6]. Authors of the report recommend; "Builders, contractors, and owners should consider protecting all floor systems, including engineered wood I-joists, by covering the underside with fire-resistant materials".

Many of the opponents of this requirement have made claims that the fire service has failed to provide technical data to support our real world experiences with the lightweight products. Since the previous ICC code cycle there have been three specific reports released by three separate test groups performing tests for different reasons. I have included their results below.

The National Research Council Canada performed a series of tests in creating their report Fire Performance of Houses, Phase I: Study of Unprotected Floor Assemblies in Basement Fire Scenarios, released December 18, 2008. The goal of the report was "With the advent of new materials and innovative construction products and systems for use in construction of houses, there is a need to understand what impacts these materials and products will have on occupant life safety under fire conditions and a need to develop a technical basis for the evaluation of their fire performance".[7] These tests were not intentionally conducted for fire fighter safety but rather to identify the dangers to the civilian occupants and their ability to self evacuate. The report states "With the relatively severe fire scenarios used in the experiments, the times to reach structural failure for the wood I-joist, steel C-joist, metal plate and metal wood truss assemblies were 35-60% shorter than that for the solid wood joist assembly".

Additionally, “For the solid wood joist assemblies, the structural failure occurred after deflection of the floor, mainly in the form of OSB subfloor failure (burn through). For all other floor assemblies, after deflection of the floor, the structural failure occurred either in the form of complete collapse into the basement or in the form of a “V” shaped collapse due to joist or truss failure”. In keeping with the intent of occupant safety the report also found “One engineered floor assembly, which gave the shortest time to reach structural failure in the open basement scenario, failed structurally in the closed basement doorway scenario before the tenability limits were reached for healthy adults of average susceptibility”. This calls into question, if it can not give the occupant time to self evacuate how will it perform when a fire fighter is performing Search and Rescue for that specific occupant. In summarizing the various test results the report found “The time gap between the onset of untenable conditions and the structural failure of the floor assembly was smaller for the engineered floor assemblies than for the solid wood joist assembly used in the experiments”. This is very serious for the responding fire fighter performing life saving Search and Rescue for occupants who have lost consciousness due to the untenable conditions. These victims may still be savable but, the performances of the lightweight assemblies indicate that, savable victims may not be reached due to floor compromise.

In 2008 Tyco Fire Suppression & Building Products performed a series of fire tests. The intent of these tests was to demonstrate the impact residential sprinklers will have in improving fire safety in one and two-family occupancies when lightweight construction is present. The results of these tests were released in 2008 as A Technical Analysis: The Performance of Composite Wood Joists Under Realistic Fire Conditions.[8] In the introduction of the report the author states, “One example of the difference in fire performance of a lightweight structural member compared to solid sawn lumber is the behavior of composite wood joists. When a composite wood joist is exposed to fire, the thin oriented strand board used as the web in the joist is quickly consumed, which results in an inability of the joist to carry the load and ultimately a failure of the supported floor assembly”. Later in the introduction the report continues “Due to the greater mass per unit of surface area of the solid wood joist, it will support the floor assembly for much longer than its lightweight alternative when exposed to equivalent fire conditions”. The first test involving an unsprinklered room fire led to flashover in 7:09 from ignition and floor assembly collapse at the 11:30 mark from ignition. That is roughly four minutes from flashover we had a collapse of almost the entire 16’ x 16’ floor area. The second test results reached flashover in only 5:15 from ignition, collapse in this test occurred at 8:34 from ignition, a stunning three minutes after flashover. This would be the time the fire fighters are entering the structure for suppression and Search and Rescue efforts.

These reports are still not enough for some critics so I am referencing a third report. Underwriters Laboratories, The Chicago Fire Department and the International Association of Fire Chiefs received a grant from the Department of Homeland Security to conduct a number of tests on various topics but the main issue was to conduct tests, and report the findings, to evaluate the performance of lightweight structural components when exposed to fire and if the components can be protected. They recently issued the subsequent report *Structural Stability of Engineered Lumber in Fire Conditions*.[9] Tests assemblies were subjected to the standards of the ASTM E119 Test Standard. Two assemblies did not include a ceiling, six of the assemblies included a ceiling consisting of ½ inch thick gypsum board and one assembly included a ¾ inch plaster ceiling. A load of 40 psf was placed along two of the four edges and two 300 lb fire fighter mannequins were applied to the floor assembly. Results from the tests indicated that unprotected 12” wooden I-joist reached structural failure at the 5:58 mark in the tests. The resulting failure covered a large area of the floor. The unprotected 2” x 10” wooden I-beams reached structural collapse at the 18:45 mark in the test, a difference of over twelve minutes. These twelve minutes are critical in Search and Rescue. Further tests demonstrated that when ½ inch gypsum was placed on the 12” I-joists the collapse did not occur until the 26:45 mark in the test. Just a simple ½ covering extended the collapse time approximately twenty minutes. When the ½ inch covering was applied to the wooden I-beams the collapse time was extended to 44:45 mark in the test. One important factor to point out regarding these tests is that the fire fighters are a dead load and not a live load. Would a simulated live load of fire fighters transferring additional psi with each step or crawl have contributed to an earlier collapse? When we review the Wisconsin fire where Engineer Arnie Wolf was killed, the fire fighters stated the floor felt solid but suffered a catastrophic collapse when they began their search pattern. These tests clearly outline the performances of the various construction practices and the dangers these performances present to fire fighters. Underwriters Laboratories and the Chicago Fire Department followed these tests with an online educational program, to view go to http://www.uluniversity.us/home.aspx, in an attempt to educate the nation’s fire service on the hazards of operating in these environments.

This code change proposal is an attempt to provide a responsible means on residential construction. I have provided examples of fire fighters being killed in occupancies utilizing lightweight construction practices and the subsequent reports detailing the need to protect lightweight construction. I have also provided two reports generated by a neutral governmental agency recommending protection requirements for lightweight construction. These incidents, and others like them, have produced great hardships on the people involved, they have created widows, fatherless children, injured fire fighters and many who bear the pain of fatalities that could have been prevented. I strongly urge your support for this proposed code change.

ICCFILENAME: DECRANE-RB-1-R501.3

RB88–09/10
R502.14 (New), Chapter 44 (New)

Proponent: Joseph Fleming, representing the Boston Fire Department

1. Add new text as follows:

R502.14 Fire floor protection. Floors within dwelling units utilizing light-frame construction shall be protected on the underside by a minimum of 5/8" gypsum board applied in accordance with Section R702.3
Exceptions:

1. Crawl spaces where the maximum clear height is 3 feet or less and is not intended for use or storage.
2. The building is protected with an automatic sprinkler system designed to NFPA 13D or Section P2904 of this code.
3. Floors in which the exposed materials on the underside are protected by a Class A Fire-Retardant Coating as defined by NFPA 703.

2. Add new standard to Chapter 44 as follows:

NFPA
703-09 Fire-Retardant Treated Wood and Fire-Retardant Coatings for Building Materials

Reason: When the Building Codes in the US transitioned to lightweight components in order to provide the same structural support at lower costs it was a well intentioned idea. However, it has had tragic unintended consequences in many circumstances. The lightweight components, which provided equivalent performance, at lower cost of construction, to the previously used "heavier components" during normal use, did not provided equivalent performance during structural fires. It may have been assumed that the lighter weight components would survive long enough to let occupants escape but what about occupants who are elderly, handicapped, or trapped because of ineffective smoke alarms. In these cases, firefighters have to conduct search and rescue operations. Often firefighters arrive in the middle of the night with no information about the occupants and must assume that someone needs to be rescued. In these circumstances firefighter's lives, as well as the occupants they are searching for are being put at an unreasonable risk.

The lightweight construction was considered to provide the same "safety factor" as the older heavier construction because it performed in a similar manner under specific tests designed to measure its ability to support a load during normal conditions. However, it is important to keep in mind that these tests measured only one aspect, albeit a critical aspect, of the material's safety. (A design with little flexibility due to conservative or incomplete assumptions has little "*robustness*". A design with a lot of flexibility due to liberal and complete assumptions has a lot of "*robustness"*.) The older heavier construction was extremely "robust," in that it performed for a long time under fire conditions in the same manner that it performed under non-fire conditions. The same cannot be said for light weight construction. The lighter weight construction is not equivalent to the heavier constriction unless it is as "robust" as the heavier construction.

To correct mistakes of the past and to provide better assurance that the light weight construction is equivalent to and as "robust" as the older heavier construction we must provide extra protection to allow it to perform under fire and non-fire conditions in the same manner that heavier construction material performs.

Specific examples where fire fighters have died, or been injured, due to, structural collapse during fire because of the use of this "less expensive" design have been documented by NIOSH Firefighter Fatality Reports.

Cost Impact: The code change proposal will increase the cost of construction.

Analysis: The proposed new standard, NFPA 703, is currently referenced in the *International Fire Code*.

R502.1.3, R602.1.1, R802.1.2

Proponent: Dennis Pitts, American Forest & Paper Association

Revise as follows:

R502.1.3 End-jointed lumber. Approved end-jointed lumber identified by a grade mark conforming to Section R502.1 may be used interchangeably with solid-sawn members of the same species and grade. End-jointed lumber used in an assembly required elsewhere in this code to have a fire resistance rating shall have the designation "Heat Resistant Adhesive" or "HRA" included in its grade mark.

R602.1.1 End-jointed lumber. Approved end-jointed lumber identified by a grade mark conforming to Section R602.1 may be used interchangeably with solid-sawn members of the same species and grade. End-jointed lumber used in an assembly required elsewhere in this code to have a fire resistance rating shall have the designation “Heat Resistant Adhesive” or “HRA” included in its grade mark.

R802.1.2 End-jointed lumber. Approved end-jointed lumber identified by a grade mark conforming to Section R802.1 may be used interchangeably with solid-sawn members of the same species and grade. End-jointed lumber used in an assembly required elsewhere in this code to have a fire resistance rating shall have the designation “Heat Resistant Adhesive” or “HRA” included in its grade mark.

Reason: The American Lumber Standards Committee (ALSC) recently added elevated-temperature performance requirements for end-jointed lumber adhesives intended for use in fire resistance-rated assemblies. End-jointed lumber manufactured with adhesives which meet the new requirements is being designated as "Heat Resistant Adhesive" or "HRA" on the grade stamp. Heat Resistant Adhesives are required to be qualified in accordance with one of two new ASTM standards, *D7374-08 Practice for Evaluating Elevated Temperature Performance of Adhesives Used in End-Jointed Lumber* and *D7470-08 Practice for Evaluating Elevated Temperature Performance of End-Jointed Lumber Studs*. End-jointed lumber manufactured with a Heat Resistant Adhesive under an auditing program of an ALSC-accredited grading agency is allowed to carry the HRA mark on the grade-stamp. End-jointed lumber manufactured with an adhesive not qualified as a Heat Resistant Adhesive will be designated as "Non-Heat Resistant Adhesive" or "non-HRA" on the grade stamp. Lumber carrying the HRA mark is permitted to be used interchangeably with solid-sawn members of the same species and grade in fire-rated applications.

Cost Impact: The code change proposal will not increase the cost of construction.

Proponent: Dennis Pitts, American Forest & Paper Association

1. Revise as follows:

TABLE R301.5
MINIMUM UNIFORMLY DISTRIBUTED LIVE LOADS
(in pounds per square foot)

(No changes to table values)

a. through d. (No changes)
e. See Section ~~R502.2.2~~ R507.1 for decks attached to exterior walls.
f. through i. (No changes)

R311.7.4.4 Exterior wood/plastic composite stair treads. Wood/plastic composite stair treads shall comply with the provisions of Section ~~R317.4~~ R507.3.

R311.7.7.4 Exterior wood/plastic composite handrails. Wood/plastic composite handrails shall comply with the provisions of Section ~~R317.4~~ R507.3.

R312.4 Exterior wood/plastic composite guards. Wood/plastic composite *guards* shall comply with the provisions of Section ~~R317.4~~ R507.3.

2. Delete without substitution:

~~**R502.1.7 Exterior wood/plastic composite deck boards.** Wood/plastic composites used in exterior deck boards shall comply with the provisions of Section R317.4.~~

~~**R502.2.2.4 Exterior wood/plastic composite deck boards.** Wood/plastic composite deck boards shall be installed in accordance with the manufacturer’s instructions.~~

3. Add new sections with relocated text as follows:

SECTION R507
DECKS

~~**R502.2.2**~~ **R507.1 Decks.** Where supported by attachment to an exterior wall, decks shall be positively anchored to the primary structure and designed for both vertical and lateral loads as applicable. Such attachment shall not be accomplished by the use of toenails or nails subject to withdrawal. Where positive connection to the primary building structure cannot be verified during inspection, decks shall be self- supporting. For decks with cantilevered framing members, connections to exterior walls or other framing members, shall be designed and constructed to resist uplift resulting from the full live load specified inTableR301.5 acting on the cantilevered portion of the deck.

~~**R502.2.2.1**~~ **R507.2 Deck ledger connection to band joist.** For decks supporting a total design load of 50 pounds per square foot (2394 Pa) [40 pounds per square foot (1915 Pa) live load plus 10 pounds per square foot (479 Pa) dead load], the connection between a deck ledger of pressure preservative-treated Southern Pine, incised pressure-preservative-treated Hem-Fir or *approved* decay- resistant species, and a 2-inch (51 mm) nominal lumber band joist bearing on a sill plate or wall plate shall be constructed with 1/2-inch (12.7 m) lag screws or bolts with washers in accordance with Table ~~R502.2.2.1~~ R507.2. Lag screws, bolts and washers shall be hot-dipped galvanized or stainless steel.

TABLE ~~R502.2.2.1~~ R507.2
FASTENER SPACING FOR A SOUTHERN PINE OR HEM-FIR DECK LEDGER AND A 2-INCH NOMINAL SOLID-SAWN SPRUCE-PINE-FIR BAND JOIST[c, f, g]
(Deck live load = 40 psf, deck dead load = 10 psf)

(No change to table values)

a. through c. (No change)
d. Lag screws and bolts shall be staggered in accordance with Section ~~R502.2.2.1.1~~ R507.2.1.
e. through h. (No change)

~~**R502.2.2.1.1**~~ **R507.2.1 Placement of lag screws or bolts in deck ledgers.** The lag screws or bolts shall be placed 2 inches (51 mm)in from the bottom or top of the deck ledgers and between 2 and 5 inches (51 and 127 mm) in from the ends. The lag screws or bolts shall be staggered from the top to the bottom along the horizontal run of the deck ledger.

~~**R502.2.2.2**~~ **R507.2.2 Alternate deck ledger connections.** Deck ledger connections not conforming to Table ~~R502.2.2.1~~ R507.2 shall be designed in accordance with accepted engineering practice. Girders supporting deck joists shall not be supported on deck ledgers or band joists. Deck ledgers shall not be supported on stone or masonry veneer.

~~**R502.2.2.3**~~ **R507.2.3 Deck lateral load connection.** The lateral load connection required by Section ~~R502.2.2~~ R507.1 shall be permitted to be in accordance with Figure ~~R502.2.2.3~~ R507.3. Hold-down tension devices shall be installed in not less than two locations per deck, and each device shall have an allowable stress design capacity of not less than 1500 pounds (6672 N).

FIGURE ~~502.2.2.3~~ R507.2.3
DECK ATTACHMENT FOR LATERAL LOADS

(No change to figure)

~~**R317.4**~~ **R507.3 Wood/plastic composites.** Wood/plastic composites used in exterior deck boards, stair treads, handrails and guardrail systems shall bear a *label* indicating the required performance levels and demonstrating compliance with the provisions of ASTM D 7032.

~~**R317.4.1**~~ **R507.3.1** Wood/plastic composites shall be installed in accordance with the manufacturer's instructions.

Reason: The IRC is seeing an increasing number of deck-related revisions. Rather than scatter them throughout the code, particularly in inappropriate locations, it seems logical to create a deck-related section to provide a single location for the existing provisions. These revisions, which make no technical changes, are proposed for the following reasons:

1. The references in Table R301.5 and Sections R311.5.3.4, R311.7, and R312.3 are changed to reflect the relocation of the existing text in R319.4.
2. R502.1.7 and R502.2.2.4 are deleted because the requirements are repeated in the relocated text of the current R319.4.
3. Various subsections addressing decks are being relocated from the portion of the chapter dealing with general wood floor construction.
4. The text of the current R319.4 is now in a section dealing with protection from decay. There doesn't appear to be anything about the text of existing Sec. R319.4 that deals with that subject matter. It's being relocated unchanged to the new section on decks, a more appropriate place for it.

Cost Impact: The code change proposal will not increase the cost of construction.

R202 (New), R502.1.8 (New), R602.1.4 (New), R802.1.6 (New), Chapter 44 (New)

Proponent: Edward L. Keith, PE, APA-The Engineered Wood Association

1. Add new definition as follows:

STRUCTURAL COMPOSITE LUMBER. Structural members manufactured using wood elements bonded together with exterior adhesives. Examples of structural composite lumber are:

Laminated veneer lumber (LVL). A composite of wood veneer elements with wood fibers primarily oriented along the length of the member. Veneer thickness shall not exceed 0.25 in. (6.4 mm).

Parallel strand lumber (PSL). A composite of wood strand elements with wood fibers primarily oriented along the length of the member. The least dimension of the strands shall not exceed 0.25 in. (6.4 mm) and the average length shall be a minimum of 300 times the least dimension.

Laminated strand lumber (LSL). A composite of wood strand elements with wood fibers primarily oriented along the length of the member. The least dimension of the strands shall not exceed 0.10 in. (2.54 mm) and the average length shall be a minimum of 150 times the least dimension.

Oriented strand lumber (OSL). A composite of wood strand elements with wood fibers primarily oriented along the length of the member. The least dimension of the strands shall not exceed 0.10 in. (2.54 mm) and the average length shall be a minimum of 75 times the least dimension.

2. Add new text as follows:

R502.1.8 Structural composite lumber. Structural capacities for structural composite lumber shall be established and monitored in accordance with ASTM D5456.

R602.1.4 Structural composite lumber. Structural capacities for structural composite lumber shall be established and monitored in accordance with ASTM D5456.

R802.1.6 Structural composite lumber. Structural capacities for structural composite lumber shall be established and monitored in accordance with ASTM D5456.

3. Add new standard to Chapter 44 as follows:

ASTM

D5456-09	Standard Specification for Evaluation of Structural Composite Lumber Products

Reason: ASTM Standard D5456 09 is the standard by which structural composite lumber is evaluated. Structural composite lumber and this standard are already recognized in the 2006 IBC. Products manufactured to this standard are increasingly available in the market place and being used in residential construction even though not specifically recognized by the IRC. These products are being used as beams, headers, long length studs, floor and roof framing; and other applications where high strength, long length, and/or dimensional stability make sawn lumber unacceptable.

Recognition of the appropriate code-recognized standard on the identification marks required by the IRC will provide the designer, builder, plans examiner and building inspector with the assurance that structural composite lumber products are being manufactured with the appropriate quality control systems in place and that the design properties of the product are properly derived and maintained during production.

Cost Impact: The code change proposal will not increase the cost of construction.
Analysis: The proposed new standard, ASTM D 5456, is currently referenced in the *International Building Code*.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: KEITH-RB-6-R202-R502.1.8-CH 44

RB92–09/10
R502.2.2, R502.2.2.3

Proponent: Steven Winkel, FAIA, PE, Kelly Cobeen, PE, SE, Building Seismic Safety Council (BSSC) of the National Institute of Building Sciences, representing FEMA/BSSC Code Resource Support Committee

Revise as follows:

R502.2.2 Decks. Where supported by attachment to an exterior wall, decks shall be positively anchored to the primary structure and designed for both vertical and lateral loads ~~as applicable~~. Such attachment shall not be accomplished by the use of toenails or nails subject to withdrawal. Where positive connection to the primary building structure cannot be verified during inspection, decks shall be self- supporting. For decks with cantilevered framing members, connections to exterior walls or other framing members, shall be designed and constructed to resist uplift resulting from the full live load specified in Table R301.5 acting on the cantilevered portion of the deck.

R502.2.2.3 Deck lateral load connection. The lateral load connection required by Section R502.2.2 shall be permitted to be in accordance with Figure R502.2.2.3. Where the lateral load connection is provided in accordance with Figure 502.2.2.3, hold-down tension devices shall be installed in not less than two locations per deck, and each device shall have an allowable stress design capacity of not less than 1500 lb (6672 N).

Reason: Sections R502.2.2 and R502.2.2.3 are modified to clarify the intent in response to user comments. Section R502.2.2 is intending to clarify that vertical and lateral load design of decks is always required. Removing the words "as applicable" clarifies that it is always applicable. The second sentence of R502.2.2.3 is modified to indicate that the hold down device quantity and load capacity mentioned are only applicable when the Figure R502.2.2.3 detail is being used to meet the requirement of R502.2.2. If another connection detail is being used, then the connection quantity and load capacity are not applicable. These clarifications are believed to confirm the ICC staff interpretation on this topic.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: WINKEL-COBEEN-RB-1-R502.2.2

R502.2.2.1.1

Proponent: Dennis Pitts, American Forest & Paper Association

Revise as follows:

R502.2.2.1.1 Placement of lag screws or bolts in deck ledgers. The lag screws or bolts shall be placed not less than 2 inches (51 mm)in from the top of the deck ledger, ¾ inches (19 mm) from the bottom of the deck ledger, 2 inches (51 mm) from the bottom of rimboard, bottom or top of the deck ledgers and between 2 and 5 inches (51 and 127 mm) in from the ends of the deck ledger. The lag screws or bolts shall be staggered from the top to the bottom along the horizontal run of the deck ledger.

Reason: Placement provisions for lag screws and bolts in deck ledgers were added to the IRC last cycle; however, questions arose when designers compared the placement requirements with 2005 *National Design Specification*® (*NDS*®) *for Wood Construction* requirements for similar connections. The proposed changes bring the placement requirements into agreement with the minimum requirements in the 2005 *NDS*.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: PITTS-RB4-R502.2.2.1.1

RB94–09/10
R502.2.2.3, Figure R502.2.2.3

Proponent: Diana M. Hanson, representing North American Deck and Railing Association, Inc. (NADRA)

Delete without substitution:

~~**R502.2.2.3 Deck lateral load connection.** The lateral load connection required by Section R502.2.2 shall be permitted to be in accordance with FigureR502.2.2.3. Hold-down tension devices shall be installed in not less than two locations per deck, and each device shall have an allowable stress design capacity of not less than 1500 pounds (6672 N).~~

~~**FIGURE R502.2.2.3**~~
~~**DECK ATTACHMENT FOR LATERAL LOADS**~~

Reason: The language of R502.2.2.3 is ambiguous resulting in potential misinterpretation by builders of decks and code officials. The phrasing "may be permitted to be" when coupled with the referenced Figure R502.2.2.3, results in a misunderstanding that this *example* of how to meet the lateral load requirement of R502.2.2, is a requirement, when in fact it is not.

This section has been the cause of much confusion and misunderstanding since its adoption in 2007. The language of 502.2.2.3 and the related figure is merely a suggestion, not a prescription for the only way to achieve a compliant lateral connection, yet NADRA has had to field inquiries and hold discussions with many builders and code officials who understandably misinterpret this code section and figure.

R502.2.2.3 and related Figure R502.2.2.3 add needless complexity to the code, its enforcement, and application and is potentially prone to misinterpretation. Experience shows such figures have a propensity for taking precedent over actual code language, resulting in commonly accepted construction practices being overlooked, and onerous methods being mistakenly understood to be required by both the builder and the code official, raising the likelihood of increased costs to both materials and labor.

IRC 2009, R101.3 Purpose, states "The purpose of this code is to provide *minimum requirements* to safeguard the public safety…" [emphasis added]. The Figure 502.2.2.3 is taken directly from the FEMA 2007 publication which is specifically for seismic areas. Suggesting that good building practices should meet seismic area requirements is not in line with R101.3.

Further, the language of 502.2.2.3 stating "not less than two" hold-down tension devices makes little sense when the size of the deck being attached is not taken into account.

For the above stated reasons, we propose that Figure 502.2.2.3 and the language of R502.2.2.3 suggesting its use, be removed from the IRC.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D

R502.11.2, R505.1.3, R802.10.3, R804.3.7

Proponent: Larry Wainright, Qualtim, Inc., representing the Structural Building Components Industry

Revise as follows:

R502.11.2 Bracing. Trusses shall be braced to prevent rotation and provide lateral stability in accordance with the requirements specified in the *construction documents* for the building and on the individual truss design drawings. In the absence of specific bracing requirements, trusses shall be braced in accordance with the Building Component Safety Information (BCSI ~~1-03~~) Guide to Good Practice for Handling, Installing & Bracing of Metal Plate Connected Wood Trusses.

R505.1.3 Floor trusses. Cold-formed steel trusses shall be designed, braced and installed in accordance with AISI S100, Section D4. In the absence of specific bracing requirements, trusses shall be braced in accordance with the Cold-Formed Steel Building Component Safety Information (CFSBCSI)~~,~~ Guide to Good Practice for Handling, Installing & Bracing of Cold-Formed Steel Trusses. Truss members shall not be notched, cut or altered in any manner without an *approved* design.

R802.10.3 Bracing. Trusses shall be braced to prevent rotation and provide lateral stability in accordance with the requirements specified in the *construction documents* for the building and on the individual truss design drawings. In the absence of specific bracing requirements, trusses shall be braced in accordance with the Building Component Safety Information (BCSI ~~1-03~~) Guide to Good Practice for Handling, Installing & Bracing of Metal Plate Connected Wood Trusses.

R804.3.7 Roof trusses. Cold-formed steel trusses shall be designed and installed in accordance with AISI S100, Section D4. In the absence of specific bracing requirements, trusses shall be braced in accordance with the Cold-Formed Steel Building Component Safety Information (CFSBCSI) Guide to Good Practice for Handling, Installing & Bracing of Cold-Formed Steel Trusses. Trusses shall be connected to the top track of the load-bearing wall in accordance with Table R804.3, either with two No.10 screws applied through the flange of the truss or by using a 54 mil (1.37 mm) clip angle with two No.10 screws in each leg.

Reason: The purpose of this code change is to update the references to Building Component Safety Information (BCSI) Guide to Good Practice for Handling, Installing & Bracing of Metal Plate Connected Wood Trusses, to the most current version. The name of this document has changed, removing the "1-03" from the title and is now referenced simply as "BCSI".

For steel trusses, the references for bracing are updated to reflect the most current industry document, Cold-Formed Steel Building Component Safety Information, Guide to Good Practice for Handling, Installing & Bracing of Cold-Formed Steel Trusses. (CFSBCSI).

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: WAINRIGHT-RB-5-R502.11.2-R802.10.3

RB97–09/10
R505.2, R603.2, R804.2

Proponent: Bonnie Manley, representing the American Iron and Steel Institute

Revise as follows:

R505.2 Structural framing. Load-bearing cold-formed steel floor framing members shall comply with Figure R505.2(1) and with the dimensional and minimum thickness requirements specified in Tables R505.2(1) and R505.2(2). Tracks shall comply with Figure R505.2(2) and shall have a minimum flange width of 11/4 inches (32 mm). The size of the ~~maximum~~ inside bend radius used for the design of members shall be the greater of 3/32 inch (2.4 mm) minus half the base steel thickness or 1.5 times the base steel thickness.

R603.2 Structural framing. Load-bearing cold-formed steel wall framing members shall comply with Figure R603.2(1) and with the dimensional and minimum thickness requirements specified in Tables R603.2(1) and R603.2(2). Tracks shall comply with Figure R603.2(2) and shall have a minimum flange width of 11/4 inches (32 mm). The size of the ~~maximum~~ inside bend radius used for the design of members shall be the greater of 3/32 inch (2.4 mm) minus half the base steel thickness or 1.5 times the base steel thickness.

R804.2 Structural framing. Load-bearing cold-formed steel roof framing members shall comply with Figure R804.2(1) and with the dimensional and minimum thickness requirements specified in Tables R804.2(1) and R804.2(2). Tracks shall comply with Figure R804.2(2) and shall have a minimum flange width of 11/4 inches (32 mm). The size of the ~~maximum~~ inside bend radius used for the design of members shall be the greater of 3/32 inch (2.4 mm) minus half the base steel thickness or 1.5 times the base steel thickness.

Reason: This code change makes a minor modification to the determination of the appropriate inside bend radius in the three applicable places in the IRC. The purpose of this change is to correct a small oversight from last cycle and bring the IRC provisions into agreement with the underlying AISI documents – AISI S230-07, AISI S200-07 and AISI S201-07.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: MANLEY-RB-1-R505.2-R603.2-R804.2

RB98–09/10
R505.2, R603.2, R804.2

Proponent: Michael C. Kerner, representing Dietrich Industries, Inc.

Revise as follows:

R505.2 Structural framing. Load-bearing cold-formed steel floor framing members shall comply with Figure R505.2(1) and with the dimensional and minimum thickness requirements specified in Tables R505.2(1) and R505.2(2). Tracks shall comply with Figure R505.2(2) and shall have a minimum flange width of 11/4 inches (32 mm). ~~The maximum inside bend radius for members shall be the greater of 3/32 inch (2.4 mm) minus half the base steel thickness or 1.5 times the base steel thickness.~~

R603.2 Structural framing. Load-bearing cold-formed steel wall framing members shall comply with Figure R603.2(1) and with the dimensional and minimum thickness requirements specified in Tables R603.2(1) and R603.2(2). Tracks shall comply with Figure R603.2(2) and shall have a minimum flange width of 11/4 inches (32 mm). ~~The maximum inside bend radius for members shall be the greater of 3/32 inch (2.4 mm) minus half the base steel thickness or 1.5 times the base steel thickness.~~

R804.2 Structural framing. Load-bearing cold-formed steel roof framing members shall comply with Figure R804.2(1) and with the dimensional and minimum thickness requirements specified in Tables R804.2(1) and R804.2(2). Tracks shall comply with Figure R804.2(2) and shall have a minimum flange width of 11/4 inches (32 mm). ~~The maximum inside bend radius for members shall be the greater of 3/32 inch (2.4 mm) minus half the base steel thickness or 1.5 times the base steel thickness.~~

Reason: The modification of this particular requirement was brought forward incorrectly last cycle from the underlying AISI documents – AISI S230-07, AISI S200-07 and AISI S201-07. The sentence recommended for deletion should only apply to the design of the structural members, something that is not needed in the IRC, hence the request for the change.

Cost Impact: The code change proposal will not increase the cost of construction.

RB99–09/10
R506.1

Proponent: James R. Baty II, Technical Director for the Concrete Foundations Association, representing the Concrete Foundations Association, the American Concrete Institute and ACI Committee 332 – Residential Concrete

Revise as follows:

R506.1 General. Concrete slab-on-ground floors shall be designed and constructed in accordance with the provisions of this section or ACI 332. Floors shall be a minimum 3.5 inches (89 mm) thick (for expansive soils, see Section R403.1.8). The specified compressive strength of concrete shall be as set forth in Section R402.2.

Reason: ACI 332-10 has incorporated the design guidance for slabs-on-ground including post-tensioned slabs and should be an allowable reference for residential slabs in the IRC similar to reference for materials, footings and foundation walls.

Cost Impact: No projected cost impact to industry as practice required to meet the stated standards are within current guidelines.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: BATY-RB-1-R506.1

RB100–09/10
R506.2.3

Proponent: Rick Davidson, City of Maple Grove, MN

Revise as follows:

R506.2.3 Vapor retarder. A 6 mil (0.006 inch; 152 µm) polyethylene or *approved* vapor retarder with joints lapped not less than 6 inches (152 mm) shall be placed between the concrete floor slab and the base course or the prepared subgrade where no base course exists.

Exception: The vapor retarder may be omitted:

1. From ~~detached~~ garages, utility buildings and other unheated *accessory structures*.
2. For unheated storage rooms having an area of less than 70 square feet (6.5 m2) and carports.
3. From driveways, walks, patios and other flatwork not likely to be enclosed and heated at a later date.
4. Where *approved* by the *building official*, based on local site conditions.

Reason: When this code change was approved last year, the proponent argued that "attached garages have a high probability of being enclosed at a later date and converted to additional living space like a bedroom or den. These living spaces are typically conditioned which increases the temperature difference between the interior space and the ground below the floor slab which can contribute to moisture migration upward into the living space through the slab." High probability!!! While this may occur in homes built 30-40 years ago, there were no statistics or other supporting documentation to indicate this is occurring with homes built today. Three stall garages are by far the most common garage being constructed with new single family dwellings. These garages are 700 to 1000 square feet. Their size and location in the home do not lend themselves to conversion to living space. And if the space were to be converted to living space in the future, there is nothing to prevent an owner from placing a vapor retarder on top of the slab at the time of the conversion just like is done with a crawl space. Since the code does not require the floor to be concrete, only that it be noncombustible, the floor surface could be pavers, compacted sand, asphalt, or other materials that contained no vapor retarder because none would be required for these surfaces. Conversion of garages with these floor surfaces would present no more of a problem than a slab without a vapor retarder. Furthermore, to establish a rule (and spend the money) to address a conversion that in all likelihood will never occur is poor public policy and establishes a precedent that the IRC Committee should avoid at all costs. Besides the cost to the contractor in labor and materials, this requirement most often means an additional inspection by the building department which in turn will mean higher permit fees. The current code language serves no public purpose and warrants this change.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: DAVIDSON-RB-3-R506.2.3

RB101–09/10
R601.3, R601.3.1, Table R601.3.1, R601.3.2, R601.3.3, R703.1.3 (New), R703.1.3.1 (New), Table R703.1.3.1 (New), R703.1.3.2 (New), R703.1.3.3 (New)

Proponent: Gary Ehrlich, PE, National Association of Home Builders (NAHB)

Revise as follows:

<u>R703.1.3</u> ~~R601.3~~ Vapor retarders. Class I or II vapor retarders are required on the interior side of frame walls in Zones 5, 6, 7, 8 and Marine 4.

Exceptions:

1. *Basement walls*.
2. Below *grade* portion of any wall.
3. Construction where moisture or its freezing will not damage the materials.

R703.1.3.1 ~~R601.3.1~~ Class III vapor retarders. Class III vapor retarders shall be permitted where any one of the conditions in Table R601.3.1 is met.

TABLE R703.1.3.1~~R601.3.1~~
CLASS III VAPOR RETARDERS

(No change to table values or footnote)

R703.1.3.2 ~~R601.3.2~~ Material vapor retarder class. The vapor retarder class shall be based on the manufacturer's certified testing or a tested assembly.

The following shall be deemed to meet the class specified:

Class I: Sheet polyethylene, unperforated aluminum foil.
Class II: Kraft-faced fiberglass batts.
Class III: Latex or enamel paint.

R703.1.3.3 ~~R601.3.3~~ Minimum clear air spaces and vented openings for vented cladding. For the purposes of this section, vented cladding shall include the following minimum clear air spaces. Other openings with the equivalent vent area shall be permitted.

1. Vinyl lap or horizontal aluminum siding applied over a weather resistive barrier as specified in Table R703.4.
2. Brick veneer with a clear airspace as specified in Section R703.7.4.2.
3. Other *approved* vented claddings.

Reason: The purpose of this proposal is to editorially relocate (again) the provisions on vapor retarders to Section R703 which were moved from Chapter 11 last cycle. The overwhelming majority of the provisions in Chapter 6 deal with the structural resistance of various wall materials (e.g. wood, cold-formed steel, masonry) to gravity, wind, and seismic loads. Vapor retarders have nothing to do with structural capacity. Thus, it was inappropriate to place these requirements in Chapter 6. Moving the vapor retarder provisions to a new Section R703.1.3 will put them where the rest of the provisions for weather resistance and water resistance of exterior wall systems are located.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: EHRLICH-RB-7-R601.3-R703.1.3

RB102–09/10
R202 (New), R602.3

Proponent: Jay H. Crandell, PE, d/b/a ARES Consulting, representing the Foam Sheathing Coalition

1. Add new definition as follows:

EXTERIOR WALL COVERING. A material or assembly of materials applied on the exterior side of exterior walls for the purpose of providing a weather-resistive barrier, insulation or for aesthetics, including but not limited to, veneers, siding, exterior insulation and finish systems, architectural trim and embellishments such as cornices, soffits, fascias, gutters and leaders.

2. Revise as follows:

R602.3 Design and construction. Exterior walls of wood-frame construction shall be designed and constructed in accordance with the provisions of this chapter and Figures R602.3(1) and R602.3.(2) or in accordance with AF&PA's NDS. Components of exterior walls shall be fastened in accordance with Tables R602.3(1) through R602.3(4). When used as wall bracing in accordance with Section R602.10 or other structural framing purposes in accordance with this chapter, ~~Structural~~ wall sheathing shall be fastened directly to ~~structural~~ framing members~~. Exterior wall coverings~~ and, when placed on the exterior side of an exterior wall, shall be capable of resisting the wind pressures listed in Table R301.2(2) adjusted for height and exposure using Table R301.2(3). ~~Wood structural panel sheathing used for exterior walls shall conform to the requirements of Table R602.3(3).~~ Wall sheathing used only for exterior wall covering purposes shall comply with Section R703.

Studs shall be continuous from support at the sole plate to a support at the top plate to resist loads perpendicular to the wall. The support shall be a foundation or floor, ceiling or roof diaphragm or shall be designed in accordance with accepted engineering practice.

Exception: Jack studs, trimmer studs and cripple studs at openings in walls that comply with Tables R502.5(1) and R502.5(2).

Reason: The definition of "exterior wall covering" from IBC Chapter 14 is introduced to the IRC for appropriate and consistent usage regardless of building type or occupancy. The proposed revision to section R602.3 then applies this definition and, as an editorial proposal, helps to clarify requirements for sheathing installation on exterior walls. Wall sheathing that is used for structural purposes (e.g., bracing) is addressed in Chapter 6 Wall Framing while wall sheathing that is used solely for exterior wall covering purposes is appropriately addressed in Chapter 7 Wall Covering. The special reference to wood structural panels at the exclusion of listing specific requirements for other sheathing types is deleted because the requirements for applicable wall sheathing materials, including wood structural panels, are adequately addressed by reference to Tables R602.3(1) through R602.3(4). This change will help ensure consistent use of the terms "exterior wall covering" and "wall sheathing" in the IRC and better organize the code to address distinct requirements depending on the application or function of wall sheathing.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:				
	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: CRANDELL-RB-1-R202-R602.3

RB103–09/10
Table R602.3(2)

Proponent: Randall Shackelford, representing Simpson Strong-Tie Co.

Revise as follows:

TABLE R602.3(2)
ALTERNATE ATTACHMENTS TO TABLE R602.3(1)

NOMINAL MATERIAL THICKNESS (inches)	DESCRIPTION[a,b] OF FASTENER AND LENGTH	SPACING OF FASTENERS	
		Edges (inches)	Intermediate supports (inches)
Wood structural panels subfloor, roof [g] and wall sheathing to framing and particleboard wall sheathing to framing[f]			

a. through f. (No change)

g. Specified alternate attachments for roof sheathing shall be permitted for windspeeds less than 100 mph. Fasteners attaching wood structural panel roof sheathing to gable end wall framing shall be installed using the spacing listed for panel edges.

(Portions of table and footnotes not shown remain unchanged)

Reason: This proposal has two purposes.

1. Clarify that Table R602.3(2) is only to be used as alternate fastening for the locations listed in Table R602.3(1). The title of the table is altered to clarify that these alternate attachments only apply to the fastenings specified in Table R602.3(1). There are other fastening requirements in the IRC that do not use the same fastener size and spacing as in Table R602.3(1), so it needs to be clarified that these fastenings do not apply. For example, fastening of braced wall method ABW uses 8d nails at 6" o.c. for one story and 4" o.c. for first of two story buildings, methods PFH and CS-PF use two rows of 8d nails at 3" o.c., and method PFG uses 8d nails at 3" o.c. The alternates in Table R602.3(2) are only designed to be an alternate to 6d nails at 6" o.c. at edges and 12" o.c. at intermediate panel supports.
2. Add a footnote g to clarify that these alternate attachments are not to be used when the basic windspeed is 100 mph or greater. Refer to the calculations below. They show that two of the three methods specified for ½" roof sheathing do not provide adequate withdrawal resistance to withstand 100 mph winds.

Calculations:

Use the Component and Cladding suction pressures of Table R301.2(2) to calculate the demand pressures on roof sheathing fasteners. Use Roof Slope of >10 degrees up to 30 degrees (not worst case). Use Zone 3, 10 sq. ft. effective wind area.

Actual withdrawal demand will depend on fastener spacing. Table R301.2(2) specifies 6" and 8" spacing for fasteners to intermediate supports (highest demand fastener)

Calculated Demand (multiply pressure by support spacing by fastener spacing):

From Table R301.2(2), P = -34.8 psf.
Assume Trusses or rafters 24" o.c, Spruce Pine Fir species.
8" spacing: (-34.8)(2)(8/12)= -46.4 psf.
6" spacing: (-34.8)(2)(6/12)= -34.8 psf.

Pressure would be higher for lower slope roof (10 degrees or less) or for Exposure C location.

Use ICC-ES ESR-1539, Table 2 to calculate withdrawal capacity for the listed sheathing fasteners for sheathing up to ½" thick. Per Table 2, footnote 4, use the lesser of the actual penetration or 1.34 to calculate withdrawal capacity.

Fastener	Listed withdrawal	Calculation	Withdrawal Capacity	Fastener Spacing	Fastener Demand	OK?
Staple, 15 ga × 1¾"	23 lbs/in.	(23)(1.25)(1.6)=46 lbs.	46 lbs.	8"	-46.4 psf	**NO (?)**
Nail (2¼ × 0.099")	15 lbs/in	(15)(1.34)(1.6)=32.16 lbs.	32 lbs.	6"	-34.8 psf	**NO**
Staple, 16 ga × 1¾"	20 lbs/in	(20)(1.25)(1.6)= 40 lbs.	40 lbs.	6"	-34.8 psf	YES

Bibliography
ICC-ES ESR-1539, Table 2, http://www.icc-es.org/reports/index.cfm.

Cost Impact: The code change proposal could increase costs if these alternate fasteners were used in high wind areas. I do not know for sure because while larger fasteners will have to be used, fewer of them will be required so it may balance out.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

For SI: 1 inch=25.4 mm, 1 pound per square foot = 0.0479 kPa.

a. Spans are given in feet and inches.
b. Table is based on a maximum roof-ceiling dead load of 15 psf.
c. The header is permitted to be supported by an approved framing anchor attached to the full-height wall stud and to the header in lieu of the required jack stud.
d. The 20 psf ground snow load condition shall apply only when the roof pitch is 9:12 or greater. In conditions where the ground snow load is 30 psf or less and the roof pitch is less than 9:12, use the 30 psf ground snow load condition.
e. Building width is measured perpendicular to the ridge. For widths between those shown, spans are permitted to be interpolated.

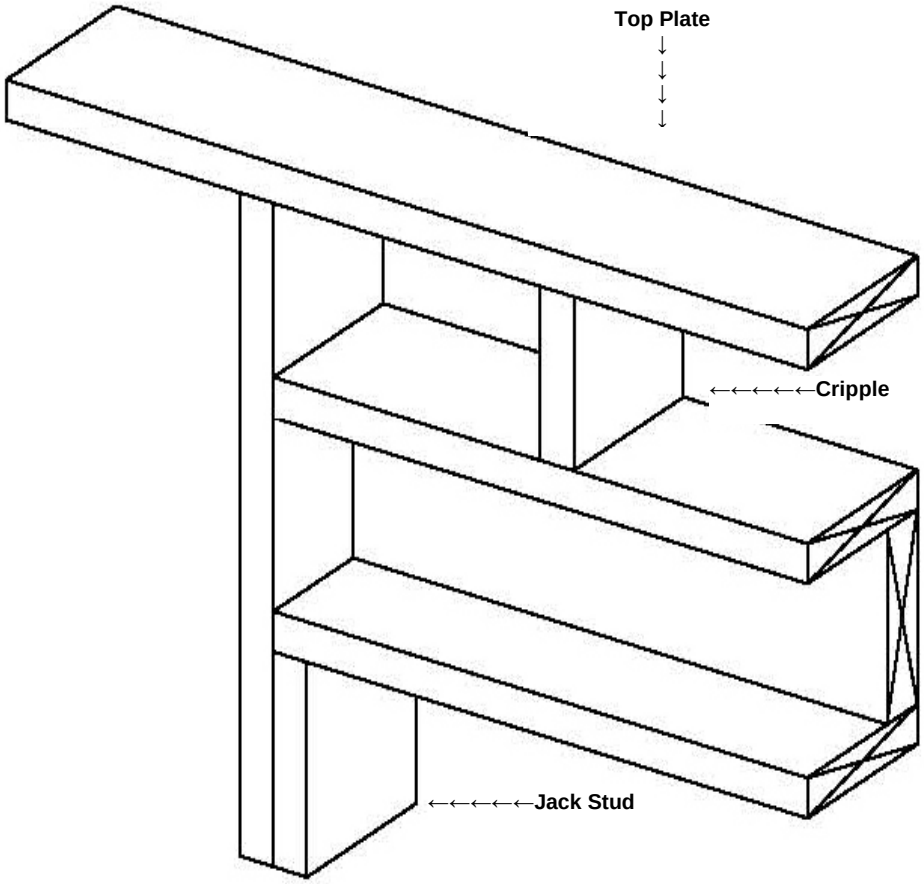

FIGURE R602.7.1(1)
SINGLE MEMBER HEADER IN EXTERIOR BEARING WALL

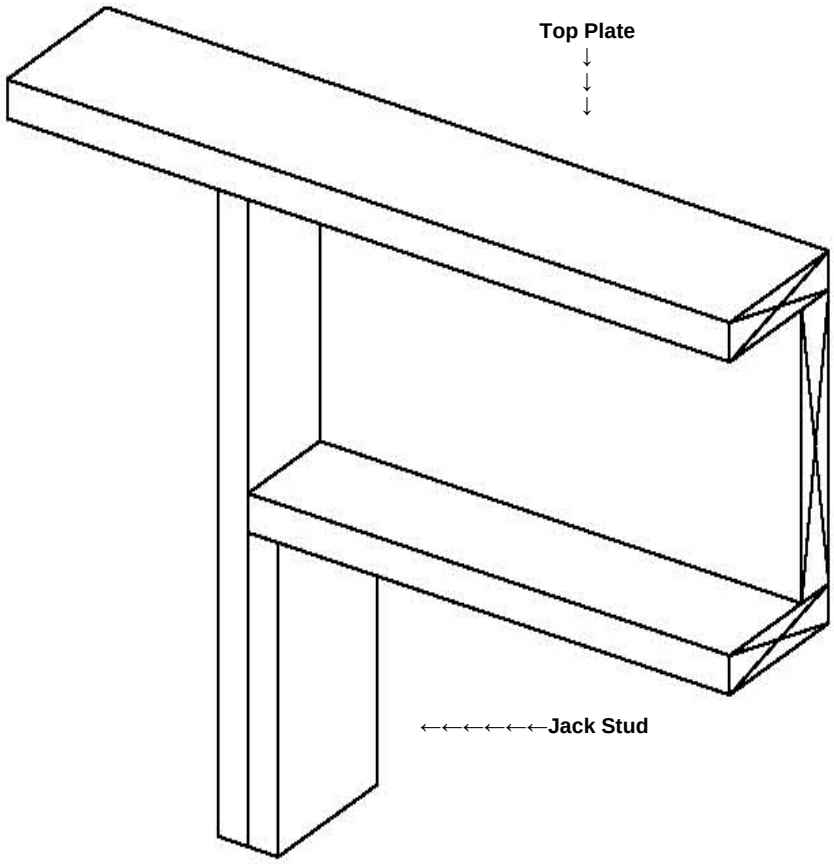

FIGURE R602.7.1(2)
ALTERNATE SINGLE MEMBER HEADER WITHOUT CRIPPLE

Reason: This proposal provides a means of implementing advanced, energy-saving wall construction practices for limited conditions where single headers can be used. Thus, insulation can be placed together with the single header to prevent heat loss through headers which otherwise create a thermal short-circuit in exterior walls. The table is evaluated in accordance with the NDS-2005 and ASCE 7-05 building loads. For ease-of-use, the table format is consistent with the principle header tables found in Chapter 5 of the code. The single header practice has been used successfully in thousands of homes since originally developed under the optimal value engineering "OVE" banner by the NAHB and HUD in the 1960's and more recently under the HUD/PATH and DOE Build America programs.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

Table R602.3(1), R602.3.5 (new), Section R602.10 (including figures and tables), Table R802.11

Proponent: Chuck Bajnai, Chesterfield County, VA, Chairman, ICC Ad-Hoc Committee on Wall Bracing

1. Revise Table R602.3(1) as follows:

TABLE R602.3(1)
FASTENER SCHEDULE FOR STRUCTURAL MEMBERS

ITEM	DESCRIPTION OF BUILDING ELEMENTS	NUMBER AND TYPE OF FASTENER [a,b,c]	SPACING OF FASTENERS
	Roof		
1	Blocking between joists or rafters to top plate, toe nail	3-8d (2 ½" x 0.113")	--
2	Ceiling joists to plate, toe nail	3-8d (2 ½" x 0.113")	--
3	Ceiling joist not attached to parallel rafter, laps over partitions, face nail	3-10d	--
4	Collar tie to rafter, face nail, or 1-1/4" x 20 gage ridge strap	3-10d (3" x 0.128")	--
5	Rafter to plate, toe nail	2-16d (3 ½ "x 0.135")	--
6	Roof rafters to ridge, valley or hip rafters: toe nail face nail	 4-16d (3 ½" x 0.135") 3-16d (3 ½" x 0.135")	 -- --
	Wall		
7	Built-up ~~corner~~ studs –face nail	10d (3" x 0.128")	24" o.c.
8	Abutting studs at intersecting wall corners, face nail	16d (3 ½" x 0.135")	12"oc
~~8~~ 9	Built-up header, two pieces with ½"spacer	16d (3½" x 0.135")	16" o.c. along each edge
~~9~~ 10	Continued header, two pieces	16d (3½" x 0.135")	16" o.c. along each edge
~~10~~ 11	Continuous header to stud, toe nail	4-8d (2 ½" x 0.113")	-
~~11~~ 12	Double studs, face nail	10d (3" x 0.128")	24" o.c.
~~12~~ 13	Double top plates, face nail	10d (3" x 0.128")	24" o.c.
~~13~~ 14	Double top plates, minimum 24-inch offset of end joints, face nail in lapped area	8-16d (3½" x 0.135")	-
~~14~~ 15	Sole plate to joist or blocking, face nail	16d (3½" x 0.135")	16" o.c.
~~15~~ 16	Sole plate to joist or blocking at braced wall panels	3-16d (3½" x 0.135")	16" o.c.
~~16~~ 17	Stud to sole plate, toe nail	3-8d (2 ½" x 0.113") or 2-16d (3½" x 0.135")	- -
~~17~~ 18	Top or sole plate to stud, end nail	2-16d (3½" x 0.135")	-
~~18~~ 19	Top plates, laps at corners and intersections, face nail	2-10d (3" x 0.128")	-
~~19~~ 20	1" brace to each stud and plate, face nail	2-8d (2 ½" x 0.113") 2 staples 1¾"	- -
~~20~~ 21	1" × 6" sheathing to each bearing, face nail	2-8d (2 ½" x 0.113") 2 staples 1¾"	- -
~~21~~ 22	1" × 8" sheathing to each bearing, face nail	2-8d (2 ½" x 0.113") 3 staples 1¾"	- -
~~22~~ 23	Wider than 1" × 8" sheathing to each bearing, face nail	3-8d (2 ½" x 0.113") 4 staples 1¾"	- -
	Floor		
~~23~~ 24	Joist to sill or girder, toe nail	3-8d (2 ½" x 0.113")	-
~~26~~ 25	Rim joist to top plate, toe nail (roof applications also)	8d (2 ½" x 0.113")	6" o.c.
26	Rim joist or blocking to sill plate, toe nail	8d (2 ½" x 0.113")	6" o.c.
~~24~~ 27	1" × 6" subfloor or less to each joist, face nail	2-8d (2 ½" x 0.113") 2 staples 1¾"	- -
~~25~~ 28	2" subfloor to joist or girder, blind and face nail	2-16d (3½" x 0.135")	-
~~27~~ 29	2" planks (plank & beam – floor & roof)	2-16d (3½" x 0.135")	at each bearing
~~28~~ 30	Built up girders and beams, 2-inch lumber layers	10d (3" x 0.128")	Nail each layer as follows: 32"o.c. at top and bottom and staggered. Two nails at ends and at each splice.
~~29~~ 31	Ledger strip supporting joists or rafters	3-16d (3½" x 0.135")	At each joist or rafter

(Remainder of table unchanged except item numbers)

2. Move existing Section R602.10.1.2.1 to new Section R602.3.5 and revise as follows:

R602.3.5 ~~R602.10.1.2.1~~ Braced wall panel uplift load path. Braced wall panels located at exterior walls that support roof rafters or trusses (including stories below top story) shall have the framing members connected in accordance with one of the following:

1. Fastening in accordance with Table R602.3(1) where:
   1.1. The basic wind speed does not exceed 90 mph (40 m/s), the wind exposure category is B, the roof pitch is 5:12 or greater, and the roof span is 32 feet (9754 mm) or less, or
   1.2. The net uplift value at the top of a wall does not exceed 100 plf (146 N/mm). The net uplift value shall be determined in accordance with Section R802.11 and shall be permitted to be reduced by 40 plf (57 N/mm) for each full wall above and 40 plf (57 N/mm) for each floor platform above.
2. Where the net uplift value at the top of a wall exceeds 100 plf (146 N/mm), installing approved uplift framing connectors to provide a continuous load path from the top of the wall to the foundation or to a point where the uplift force is 100 plf (146 N/mm) or less. The net uplift value shall be as determined in Item 1.2 above.
3. Wall sheathing and fasteners designed in accordance with accepted engineering practice to resist combined uplift and shear forces.

3. Delete footnote "f" as follows:

TABLE R802.11
REQUIRED STRENGTH OF TRUSS OR RAFTER CONNECTIONS TO RESIST WIND UPLIFT FORCES[a, b, c, e, ~~f~~]
(Pounds per connection)

(No change to table values)

a. through e. (No change)

~~f. For wall-to-wall and wall-to-foundation connections, the capacity of the uplift connector is permitted to be reduced by 100 pounds for each full wall above. (For example, if a 600-pound rated connector is used on the roof framing, a 500-pound rated connector is permitted at the next floor level down).~~

4. Delete Section R602.10 and replace with the following:

R602.10 Wall bracing. Buildings shall be braced in accordance with this section. Where a building, or portion thereof, does not comply with one or more of the bracing requirements in this section, those portions shall be designed and constructed in accordance with Section R301.1.

R602.10.1 Braced wall lines. For the purpose of determining the amount and location of bracing required in each story level of a building, braced wall lines shall be designated as straight lines on the building plan placed in accordance with this section.

R602.10.1.1 Length of a braced wall line. The length of a braced wall line shall be the distance between its ends. The end of a braced wall line shall be the intersection with a perpendicular braced wall line or an angled braced wall line as permitted in Section R602.10.1.4. In the absence of an intersecting braced wall line, the end shall be the farthest exterior wall of the building as shown in Figure R602.10.1.1.

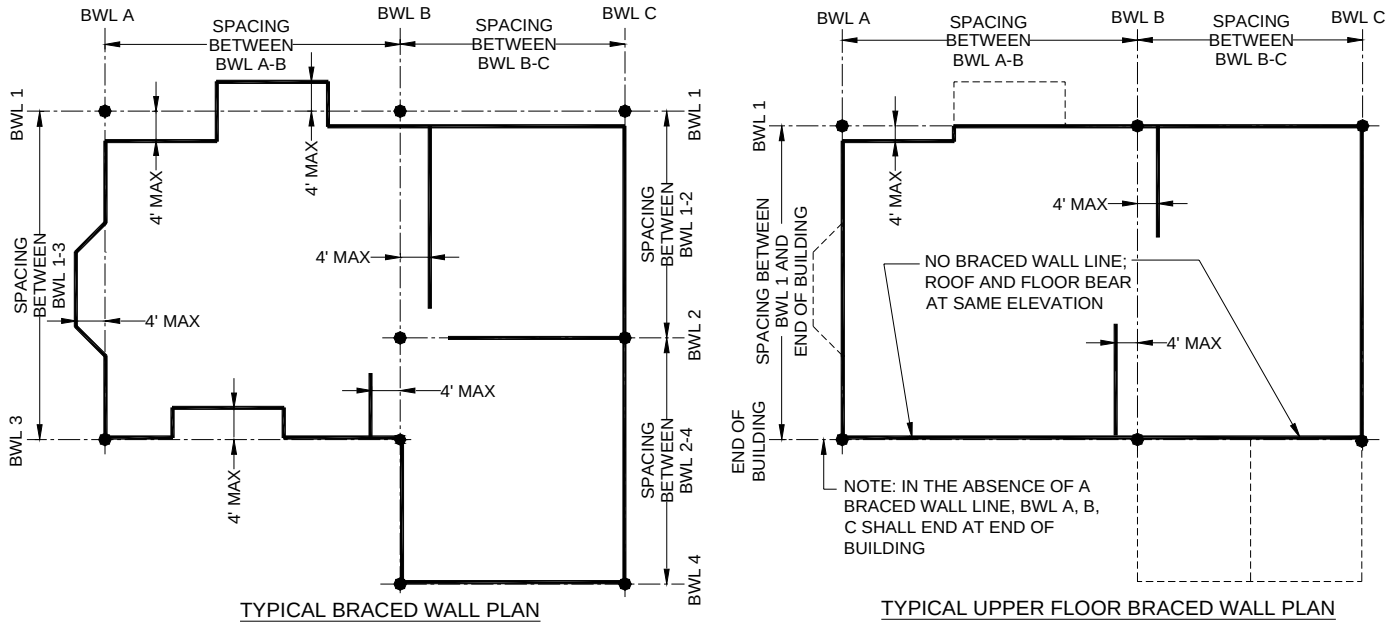

FIGURE R602.10.1.1
BRACED WALL LINES

R602.10.1.2 Offsets along a braced wall line. All exterior walls parallel to a braced wall line shall be permitted to offset up to 4 feet (1219 mm) from the designated braced wall line location as shown Figure R602.10.1.1. Interior walls used as bracing shall be permitted to offset up to 4 feet (1219 mm) from a braced wall line through the interior of the building as shown in Figure R602.10.1.1.

R602.10.1.3 Spacing of braced wall lines. There shall be a minimum of two braced wall lines in both the longitudinal and transverse direction as shown in Figure R602.10.1.1. Intermediate braced wall lines through the interior of the building shall be permitted. The spacing between parallel braced wall lines shall be in accordance with Table R602.10.1.3.

TABLE R602.10.1.3
BRACED WALL LINE SPACING

APPLICATION	CONDITION	BUILDING TYPE	BRACED WALL LINE SPACING CRITERIA	
			Maximum Spacing	Exception to Maximum Spacing
Wind bracing	85 mph to <110 mph	Detached, townhouse	60 feet	None
Seismic bracing	SDC A - C	Detached	Use wind bracing	
	SDC A – B	Townhouse	Use wind bracing	
	SDC C	Townhouse	35 feet	Up to 50 feet with adjustment of required length of bracing per Table R602.10.3(4)
	SDC D_0, D_1, D_2	Detached, townhouses, one- and two-story only	25 feet	Up to 35 feet to allow for a single room not to exceed 900 sq ft. Spacing of all other braced wall lines shall not exceed 25 feet.
	SDC D_0, D_1, D_2	Detached, townhouse	25 feet	Up to 35 feet when length of required bracing per Table R602.10.3(3) is adjusted in accordance with Table R602.10.3(4).

For SI: 1 foot = 304.8 mm

R602.10.1.4 Angled walls. Any portion of a wall along a braced wall line shall be permitted to angle out of plane for a maximum diagonal length of 8 feet (2438 mm). Where the angled wall occurs at a corner, the length of the braced wall line shall be measured from the projected corner as shown in Figure R602.10.1.4. Where the diagonal length is greater than 8 feet (2438 mm), it shall be considered a separate braced wall line and shall be braced in accordance with Section R602.10.1.

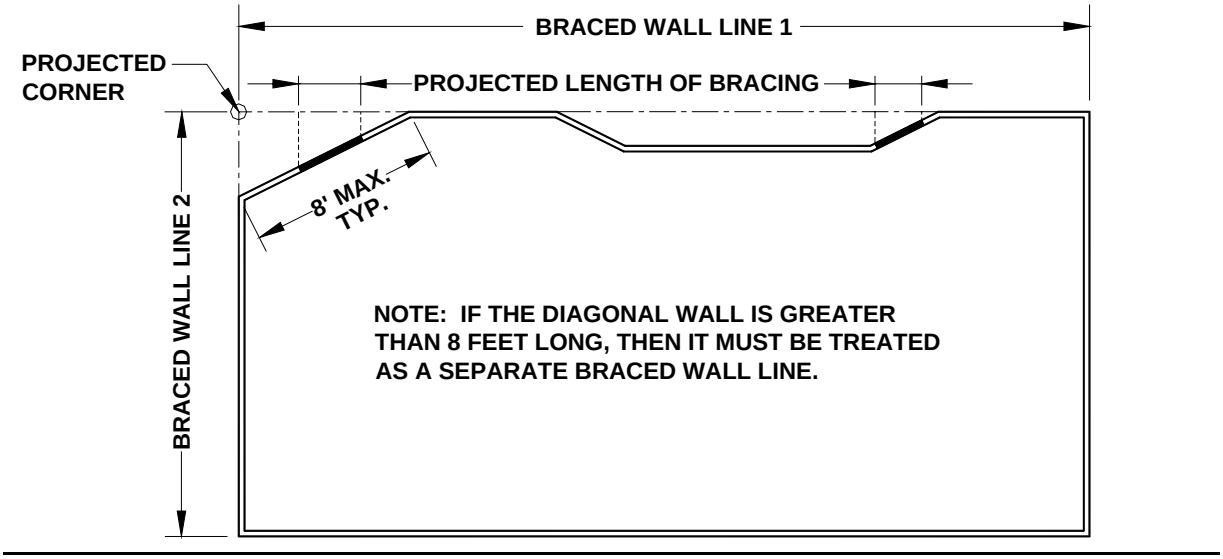

FIGURE R602.10.1.4
ANGLED WALLS

R602.10.2 Braced wall panels. Braced wall panels shall be full-height sections of wall that shall be continuous in the same plane. Braced wall panels shall be constructed and placed along a braced wall line in accordance with this section and the bracing methods specified in Section R602.10.4.

R602.10.2.1 Braced wall panel uplift load path. The bracing lengths in Table R602.10.3(1) apply only when uplift loads are resisted per Section R602.3.5.

R602.10.2.2 Locations of braced wall panels. A braced wall panel shall begin within 10 feet (3810 mm) from each end of a braced wall line as determined in Section R602.10.1.1. The distance between adjacent edges of two braced wall panels shall be no greater than 20 feet (6096 mm) as shown in Figure R602.10.2.2

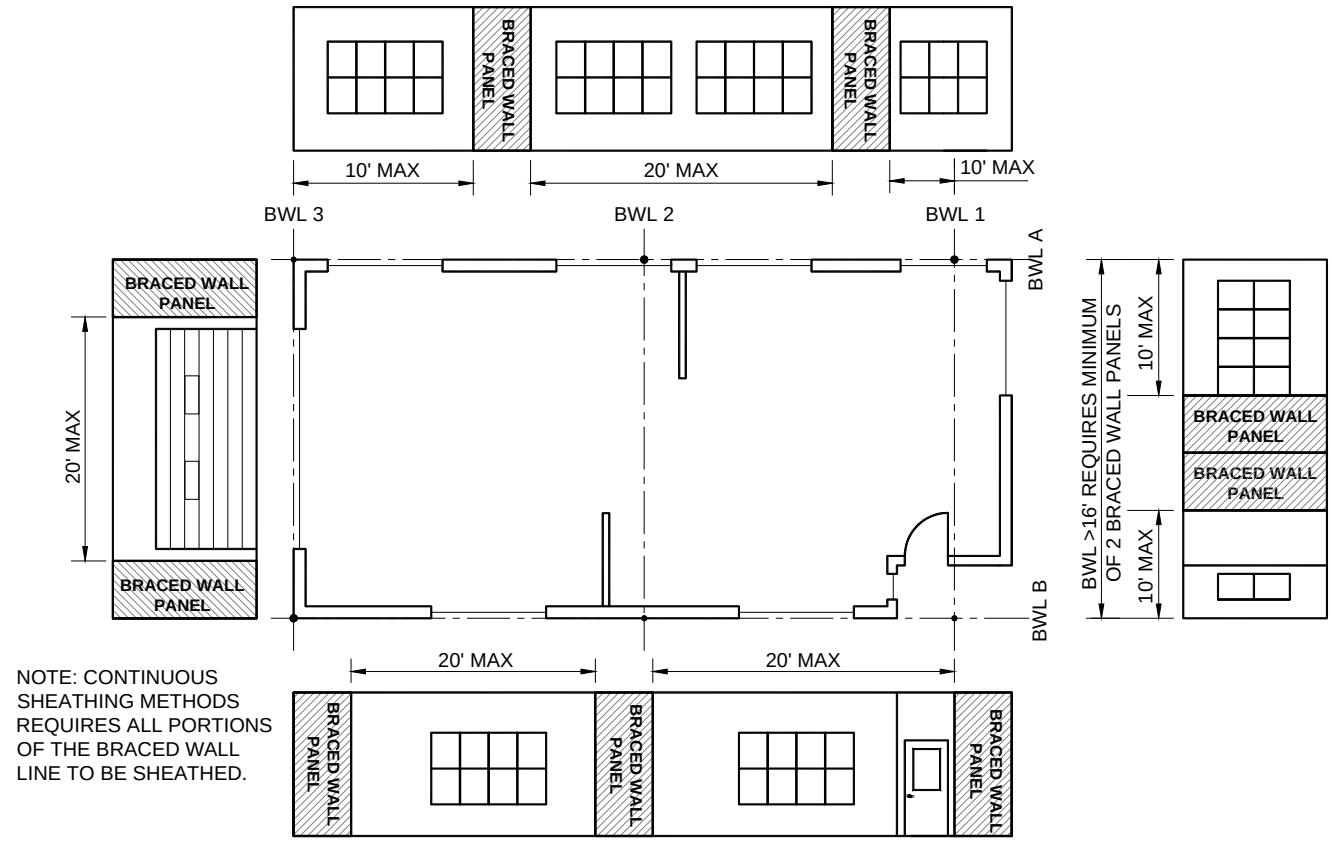

FIGURE R602.10.2.2
LOCATION OF BRACED WALL PANELS

R602.10.2.2.1 Location of braced wall panels in Seismic Design Categories D_0, D_1 and D_2. Braced wall panels shall be located at each end of a braced wall line.

Exception: Braced wall panels constructed of Methods WSP and continuous sheathing methods as specified in Section R602.10.4 shall be permitted to begin no more than 10 feet (3048 mm) from each end of a braced wall line provided each end complies with the following.

1. A minimum 24 in. wide (610 mm) panel for Methods WSP, CS-WSP, CS-G, CS-PF and 32 in. (813 mm) wide panel for Method CS-SFB is applied to each side of the building corner as shown in Condition 4 of Figure R602.10.7.
2. The end of each braced wall panel closest to the end of the braced wall line shall have an 1,800 lb (8 kN) hold-down device fastened to the stud at the edge of the braced wall panel closest to the corner and to the foundation or framing below as shown in Condition 5 of Figure R602.10.7.

R602.10.2.3 Minimum number of braced wall panels. Braced wall lines with a length of 16 feet (4877 mm) or less shall have a minimum of one braced wall panel. Braced wall lines greater than 16 feet (4877 mm) shall have a minimum of two braced wall panels.

R602.10.3 Required length of bracing. The required length of bracing along each braced wall line shall be determined as follows.

1. All buildings in Seismic Design Categories A and B shall use Table R602.10.3(1) and the applicable adjustment factors in Table R602.10.3(2).
2. Detached buildings in Seismic Design Category C shall use Table R602.10.3(1) and the applicable adjustment factors in Table R602.10.3(2).
3. Townhouses in Seismic Design Category C shall use the greater value determined from Table R602.10.3(1) or R602.10.3(3) and the applicable adjustment factors in Table R602.10.3(2) or R602.10.3(4) respectively.
4. All buildings in Seismic Design Categories D_0, D_1 and D_2 shall use the greater value determined from Table R602.10.3(1) or R602.10.3(3) and the applicable adjustment factors in Table R602.10.3(2) or R602.10.3(4) respectively.

Only braced wall panels parallel to the braced wall line shall contribute towards the required length of bracing of that braced wall line. Braced wall panels along an angled wall meeting the minimum length requirements of Tables R602.10.5 and R602.10.5.2 shall be permitted to contribute its projected length to the braced wall line as shown in Figure R602.10.1.4. Any braced wall panel on an angled wall at the end of a braced wall line shall contribute its projected length for only one of the braced wall lines at the projected corner. In no case shall the required length of bracing along a braced wall line after adjustments be less than 48 inches (1219 mm) total.

TABLE R602.10.3(1)

		60	NP	77.5	44.5	37.5

For SI: 1 inch = 25.4 mm, 1 foot = 305 mm.

a. Linear interpolation shall be permitted.
b. Method LIB shall have gypsum board fastened to at least one side with nails or screws per Table R602.3(1) for exterior sheathing or Table R702.3.5 for interior gypsum board. Spacing of fasteners at panel edges shall not exceed 8 inches (203 mm).
c. The length of bracing for Method GB is based on a double sided application. Where GB is used in a one sided application (or in combination of single sided and double sided application), the single sided GB shall only contribute half as much as the double sided GB towards the minimum required length of bracing in this table.
d. Method CS-SFB does not apply where the wind speed is greater than 100 mph.

TABLE R602.10.3(2)
WIND ADJUSTMENT FACTORS TO THE REQUIRED LENGTH OF WALL BRACING

ADJUSTMENT BASED ON	STORY/ SUPPORTING	CONDITION	ADJUSTMENT FACTOR [a,b] (multiply length from Table R602.10.3(1) by this factor)	APPLICABLE METHODS
Exposure category	One story structure	B	1.00	All methods

		50	NP	NP	NP	NP	NP

For SI: 1 foot 305 mm

a. Linear interpolation shall be permitted.
b. Wall bracing lengths are based on a soil site class "D." Interpolation of bracing length between the S_{ds} values associated with the Seismic Design Categories shall be permitted when a site-specific S_{ds} value is determined in accordance with Section 1613.5 of the International Building Code.
c. Method LIB shall have gypsum board fastened to at least one side with nails or screws per Table R602.3(1) for exterior sheathing or Table R702.3.5 for interior gypsum board. Spacing of fasteners at panel edges shall not exceed 8 inches (203 mm).
d. The length of bracing for Method GB is based on a double sided application. Where GB is used in a one sided application (or in combination of single sided and double sided application), the single sided GB shall only contribute half as much as the double sided GB towards the minimum required length of bracing in this table.
e. Method CS-SFB applies in SDC C only.

TABLE R602.10.3(4)
SEISMIC ADJUSTMENT FACTORS TO THE REQUIRED LENGTH OF WALL BRACING

ADJUSTMENT BASED ON:	STORY/ SUPPORTING	CONDITION	ADJUSTMENT FACTOR [a,b] (Multiply length from Table R602.10.3(1) by this factor)	APPLICABLE METHODS
Story height (Section 301.3)	Any story	≤10 ft	1.0	All methods
		>10 ft ≤ 12 ft	1.2	
Braced wall line spacing, townhouses in SDC C	Any story	≤35 ft	1.0	
		>35 ft ≤ 50 ft	1.43	
Braced wall line spacing, in SDC D_0, D_1, D_2 [c]	Any story	<25 ft ≤30 ft	1.2	
		>30 ft ≤ 35 ft	1.4	
Wall dead load	Any story	> 8 ft < 15 ft	1.0	
		<8 psf	0.85	
Roof/ceiling dead load for wall supporting	Roof only or roof plus one or two stories	<15 psf	1.0	
	Roof only	>15 psf ≤ 25 psf	1.2	
	Roof plus one or two stories	>15 psf ≤ 25 psf	1.1	
Walls with stone or masonry veneer	Any story	See Section R703.7		
Interior gypsum board finish (or equivalent)	Any story	Omitted from inside face of braced wall panels	1.5	DWB, WSP, SFB, PBS, PCP, HPS, CS-WSP, CS-G, CS-SFB

For SI: 1 psf = 47,8 N/m^2.

a. Linear interpolation shall be permitted.
b. The total length of bracing required for a given wall line is the product of all applicable adjustment factors.
c. The length-to-width ratio for the floor/roof *diaphragm* shall not exceed 3:1. The top plate lap splice nailing shall be a minimum of 12-16d nails on each side of the splice.

R602.10.4 Construction methods for braced wall panels. Intermittent and continuously sheathed braced wall panels shall be constructed in accordance with this section and the methods listed in Table R602.10.4.

TABLE R602.10.4
BRACING METHODS

	METHODS, MATERIAL	MINIMUM THICKNESS	FIGURE	CONNECTION CRITERIA [a]	
				Fasteners	Spacing
Intermittent Bracing Methods	**LIB** Let-in-bracing	1x4 wood or approved metal straps at 45° to 60° angles for maximum 16" stud spacing		Wood: 2-8d common nails or 3-8d (2 ½" x 0.113") nails	Wood: per stud and top and bottom plates
				Metal strap: per manufacturer	Metal: per manufacturer
	DWB Diagonal wood boards	¾" (1" nominal) for maximum 24" stud spacing		2-8d (2½" x 0.113") nails or 2 - 1¾" staples	Per stud
	WSP Wood structural panel (See Section R604)	3/8"		Exterior sheathing per Table R602.3(3)	6" edges 12" field
				Interior sheathing per Table R602.3(1) or R602.3(2)	Varies by fastener
	SFB Structural fiberboard sheathing	1/2" or 25/32" for maximum 16" stud spacing		1½" long x 0.12" dia. (for ½ " thick sheathing) 1 3/4" long x 0.12" dia. (for 25/32" thick sheathing) galvanized roofing nails or 8d common (2½"x0.131) nails	3" edges 6" field
	GB [d] Gypsum board (double sided)	1/2"		Nails or screws per Table R602.3(1) for exterior locations	For all braced wall panel locations: 7" edges (including top and bottom plates) 7" field
				Nails or screws per Table R702.3.5 for interior locations	
	PBS Particleboard sheathing (See Section R605)	3/8" or 1/2" for maximum16" stud spacing		For 3/8", 6d common (2"x0.113) nails For ½", 8d common (2½"x0.131) nails	3" edges 6" field
	PCP Portland cement plaster	See Section R703.6 for maximum 16" stud spacing		1½", 11 gage, 7/16" head nails or 7/16", 16 gage staples	6" o.c. on all framing members
	HPS Hardboard panel siding	7/16" for maximum 16" stud spacing		0.092" dia., 0.225" head nails with length to accommodate 1½" penetration into studs	4" edges 8" field
	ABW Alternate braced wall	3/8"		See Section R602.10.6.1	See Section R602.10.6.1
	PFH Portal frame with hold-downs	3/8		See Section R602.10.6.2	See Section R602.10.6.2
	PFG Portal frame at garage	7/16"		See Section R602.10.6.3	See Section R602.10.6.3
Continuous Sheathing Methods	**CS-WSP** Continuously sheathed wood structural panel	3/8"		Exterior sheathing per Table R602.3(3)	6" edges 12" field
				Interior sheathing per Table R602.3(1) or R602.3(2)	Varies by fastener
	CS-G [b,c] Continuously sheathed wood structural panel adjacent to garage openings	3/8"		See Method CS-WSP	See Method CS-WSP

METHODS, MATERIAL	MINIMUM THICKNESS	FIGURE	CONNECTION CRITERIA [a]	
			Fasteners	Spacing
CS-PF Continuously sheathed portal frame	$^{7}/_{16}$"		See Section R602.10.6.4	See Section R602.10.6.4
CS-SFB Continuously sheathed structural fiberboard	$^{1}/_{2}$" or $^{25}/_{32}$" for maximum 16" stud spacing		1½" long x 0.12" dia. (for ½ " thick sheathing) $1^{3}/_{4}$" long x 0.12" dia. (for $^{25}/_{32}$" thick sheathing) galvanized roofing nails or 8d common (2½"x0.131) nails	3" edges 6" field

For SI: 1 inch = 25.4 mm, 1 foot = 305 mm.

a. Adhesive attachment of wall sheathing, including Method GB, shall not be permitted in Seismic Design Categories C, D_0, D_1 and D_2.
b. Applies to panels next to garage door opening when supporting gable end wall or roof load only. May only be used on one wall of the garage. In Seismic Design Categories D_0, D_1, and D_2, roof covering dead load may not exceed 3 psf (0.14 kN/m^2).
c. Garage openings adjacent to a Method CS-G panel shall be provided with a header in accordance with Table R502.5(1). A full height clear opening shall not be permitted adjacent to a Method CS-G panel.
d. "Double sided" GB shall mean that a full length/full height panel of GB sheathing is applied to both sides of the stud wall. GB bracing panels are not required to be aligned back to back – they may be offset from each other so long as their length's comply with Table R602.10.5. Where all of the GB is on one side of the studs or where there is a combination of "double sided" GB and "single sided" GB, the single sided GB shall contribute half of its actual length towards the minimum required length (i.e. 96" of single sided GB is equivalent to 48" of double sided GB).

R602.10.4.1 Mixing methods. Mixing of bracing methods shall be permitted as follows:

1. Mixing intermittent bracing and continuous sheathing methods from story to story shall be permitted.
2. Mixing intermittent bracing methods from braced wall line to braced wall line within a story shall be permitted. Within Seismic Design Categories A, B and C or in regions where the basic wind speed is less than or equal to 100 mph, mixing of intermittent bracing and continuous sheathing methods from braced wall line to braced wall line within a story shall be permitted.
3. Mixing intermittent bracing methods along a braced wall line shall be permitted in Seismic Design Categories A and B, and detached dwellings in Seismic Design Category C provided the length of required bracing in accordance with Table R602.10.3(1) or R602.10.3(3) is the highest value of all intermittent bracing methods used.
4. Mixing of continuous sheathing methods CS-WSP, CS-G and CS-PF along a braced wall line shall be permitted.
5. In Seismic Design Categories A and B, and for detached one- and two-family dwellings in Seismic Design Category C, mixing of intermittent bracing methods along the interior portion of a braced wall line with continuous sheathing methods CS-WSP, CS-G and CS-PF along the exterior portion of the same braced wall line shall be permitted. The length of required bracing shall be the highest value of all intermittent bracing methods used in accordance with Table R602.10.3(1) or R602.10.3(3). The requirements of Section R602.10.7 shall apply to each end of the continuously sheathed portion of the braced wall line.

R602.10.4.2 Continuous sheathing methods. Continuous sheathing methods require structural panel sheathing to be used on all sheathable surfaces on one side of a braced wall line including areas above and below openings and gable end walls and shall meet the requirements of Section R602.10.7.

R602.10.4.3 Braced wall panel interior finish material. Braced wall panels shall have gypsum wall board installed on the side of the wall opposite the bracing material. Gypsum wall board shall be not less than ½ inch (12.7 mm) in thickness and be fastened with nails or screws in accordance with Table R602.3(1) for exterior sheathing or Table R702.3.5 for interior gypsum wall board. Spacing of fasteners at panel edges for gypsum wall board opposite Method LIB bracing shall not exceed 8 inches (203 mm). Interior finish material shall not be glued in Seismic Design Categories D_0, D_1 and D_2.

Exceptions:

1. Interior finish material is not required opposite wall panels that are braced in accordance with Method GB, ABW, PFH, PFG and CS-PF, unless otherwise required by Section R302.6.
2. An approved interior finish material with an in-plane shear resistance equivalent to gypsum board shall be permitted to be substituted, unless otherwise required by Section R302.6.
3. Except for Method LIB, gypsum wall board is permitted to be omitted provided the required length of bracing in Tables R602.10.3(1) and R602.10.3(3) is multiplied by the appropriate adjustment factor in Tables R602.10.3(2) and R602.10.3(4) respectively, unless otherwise required by Section R302.6.

R602.10.5 Minimum length of a braced wall panel. The minimum length of a braced wall panel shall comply with Table R602.10.5. For Methods CS-WSP and CS-SFB, the minimum panel length shall be based on the adjacent clear opening height in accordance with Table R602.10.5 and Figure R602.10.5. When a panel has an opening on either side of differing heights, the taller opening height shall be used to determine the panel length.

R602.10.5.1 Contributing length. For purposes of computing the required length of bracing in Table R602.10.3(1) and R602.10.3(3), the contributing length of each braced wall panel shall be as specified in Table R602.10.5.

TABLE R602.10.5
MINIMUM LENGTH OF BRACED WALL PANELS

METHOD		MINIMUM LENGTH [a] (in)					CONTRIBUTING LENGTH (in)
		Wall Height					
		8 ft	9 ft	10 ft	11 ft	12 ft	
DWG, WSP, SFB, PBS, PCP, HPS, GB [d]		48	48	48	53	58	Actual [b]
LIB		55	62	69	NP		Actual [b]
ABW	SDC A, B and C, wind speed < 110 mph	28	32	34	38	42	48
	SDC D_0, D_1 and D_2, wind speed < 110 mph	32	32	34	NP	NP	
PFH	Supporting roof only	16	16	16	18 [d]	20 [d]	48
	Supporting one story and roof	24	24	24	27 [d]	29 [d]	48
PFG		24	27	30	33 [e]	36 [e]	1.5 x Actual [b]
CS-G		24	27	30	33	36	Actual [b]
CS-PF		16	18	20	22 [f]	24 [f]	Actual [b]
CS-WSP, CS-SFB	Adjacent clear opening height (in)						
	≤ 64	24	27	30	33	36	Actual [b]
	68	26	27	30	33	36	
	72	27	27	30	33	36	
	76	30	29	30	33	36	
	80	32	30	30	33	36	
	84	35	32	32	33	36	
	88	38	35	33	33	36	
	92	43	37	35	35	36	
	96	48	41	38	36	36	
	100		44	40	38	38	
	104		49	43	40	39	
	108		54	46	43	41	
	112			50	45	43	
	116			55	48	45	
	120			60	52	48	
	124				56	51	
	128				61	54	
	132				66	58	
	136					62	
	140					66	
	144					72	

For SI: 1 inch = 25.4 mm
NP = Not permitted

a. Linear interpolation shall be permitted.
b. Use the actual length when it is greater than or equal to the minimum length.
c. As specified in Table R602.10.4, Method GB is intended to be double sided. Where all of the GB is on one side of the studs or where there is a combination of "double sided" GB and "single sided" GB, the single sided GB shall contribute half of its actual length towards the minimum required length (i.e. 96" of single sided GB is equivalent to 48" of double sided GB).
d. Maximum header height for PFH is 10' per Figure R602.10.6.2, but wall height may be increased to 12' with pony wall.
e. Maximum opening height for PFG is 10' per Figure R602.10.6.3, but wall height may be increased to 12' with pony wall.
f. Maximum opening height for CS-PF is 10' per Figure R602.10.6.4, but wall height may be increased to 12' with pony wall

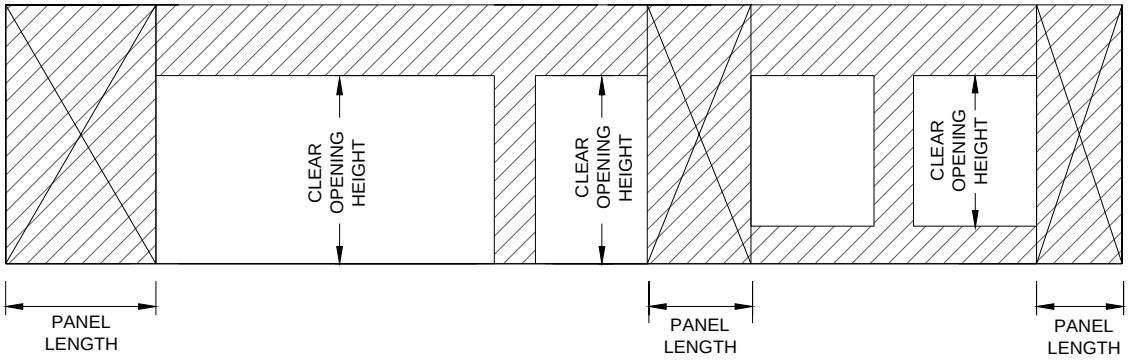

FIGURE R602.10.5
BRACED WALL PANELS WITH CONTINUOUS SHEATHING

R602.10.5.2 Partial credit. For Methods DWB, WSP, SFB, PBS, PCP and HPS in Seismic Design Categories A, B and C, panels between 36 inches and 48 inches in length shall be considered a braced wall panel and shall be permitted to partially contribute towards the required length of bracing in Table R602.10.3(1) and R602.10.3(3), and the contributing length shall be determined from Table R602.10.5.2.

TABLE R602.10.5.2
PARTIAL CREDIT FOR BRACED WALL PANELS LESS THAN 48 INCHES IN ACTUAL LENGTH

Actual Length of Braced Wall Panel (in)	Contributing Length of Braced Wall Panel (in) [a]	
	8 ft Wall Height	9 ft Wall Height
48	48	48
42	36	36
36	27	N/A

For SI: 1 inch = 25.4mm

a. Linear interpolation shall be permitted.

R602.10.6 Construction of Methods ABW, PFH, PFG and CS-PF. Methods ABW, PFH, PFG and CS-PF shall be constructed as specified in Sections R602.10.6.1 through R602.10.6.4.

R602.10.6.1 Method ABW: Alternate braced wall panels. Method ABW braced wall panels shall be constructed in accordance with Figure R602.10.6.1. The hold-down force shall be in accordance with Table R602.10.6.1.

TABLE R602.10.6.1
MINIMUM HOLD-DOWN FORCES FOR METHOD ABW BRACED WALL PANELS

SEISMIC DESIGN CATEGORY AND WIND SPEED	SUPPORTING/STORY	HOLD DOWN FORCE (lb)				
		Height of Braced Wall Panel				
		8 ft	9 ft	10 ft	11 ft	12 ft
SDC A, B and C Wind speed < 110 mph	One story	1800	1800	1800	2000	2200
	First of two story	3000	3000	3000	3300	3600
SDC D_0, D_1 and D_2 Wind speed < 110 mph	One story	1800	1800	1800	NP [a]	NP [a]
	First of two story	3000	3000	3000	NP [a]	NP [a]

For SI: 1 inch = 25.4 mm, 1 foot = 305 mm, 1 lb = 4.45 N
NP = Not Permitted.

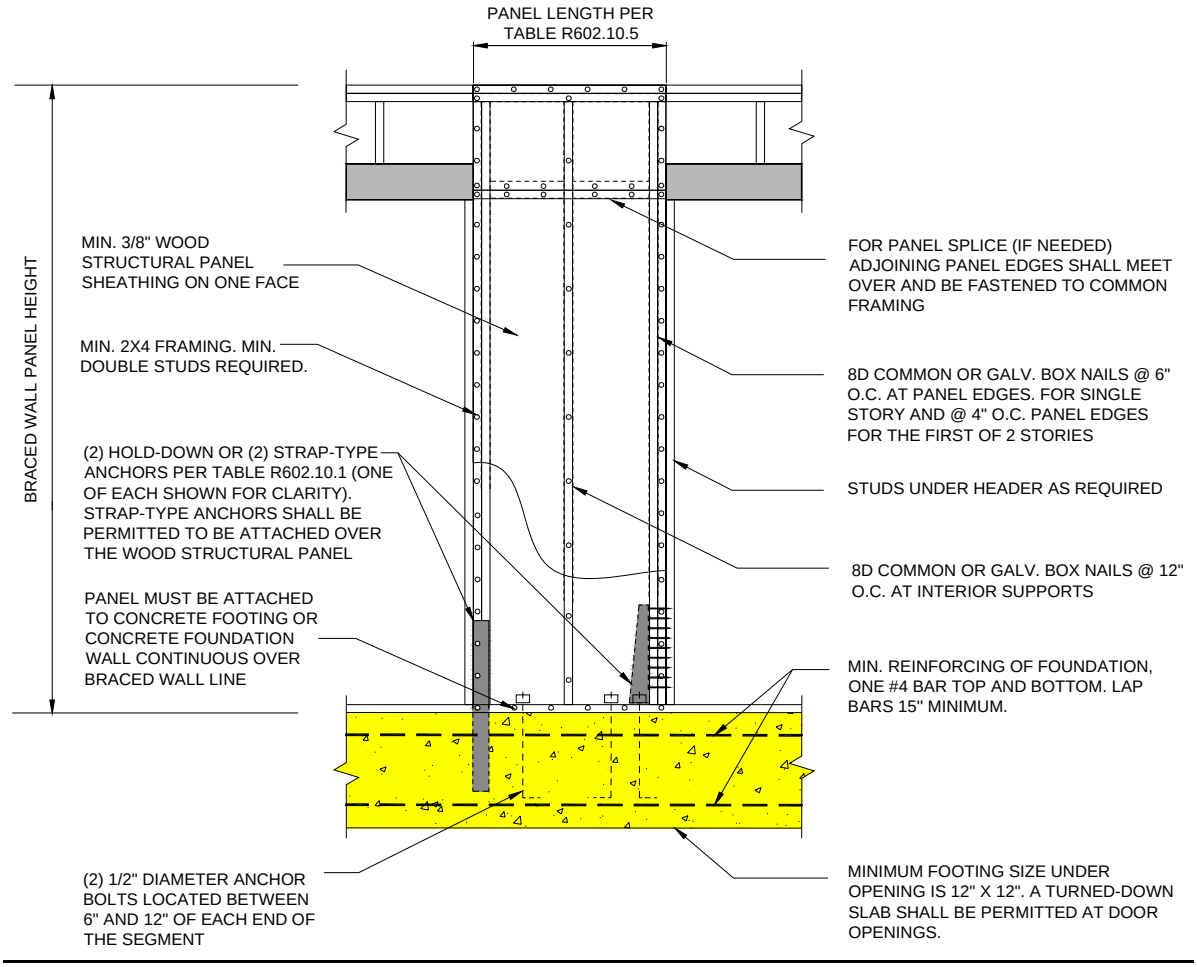

FIGURE R602.10.6.1
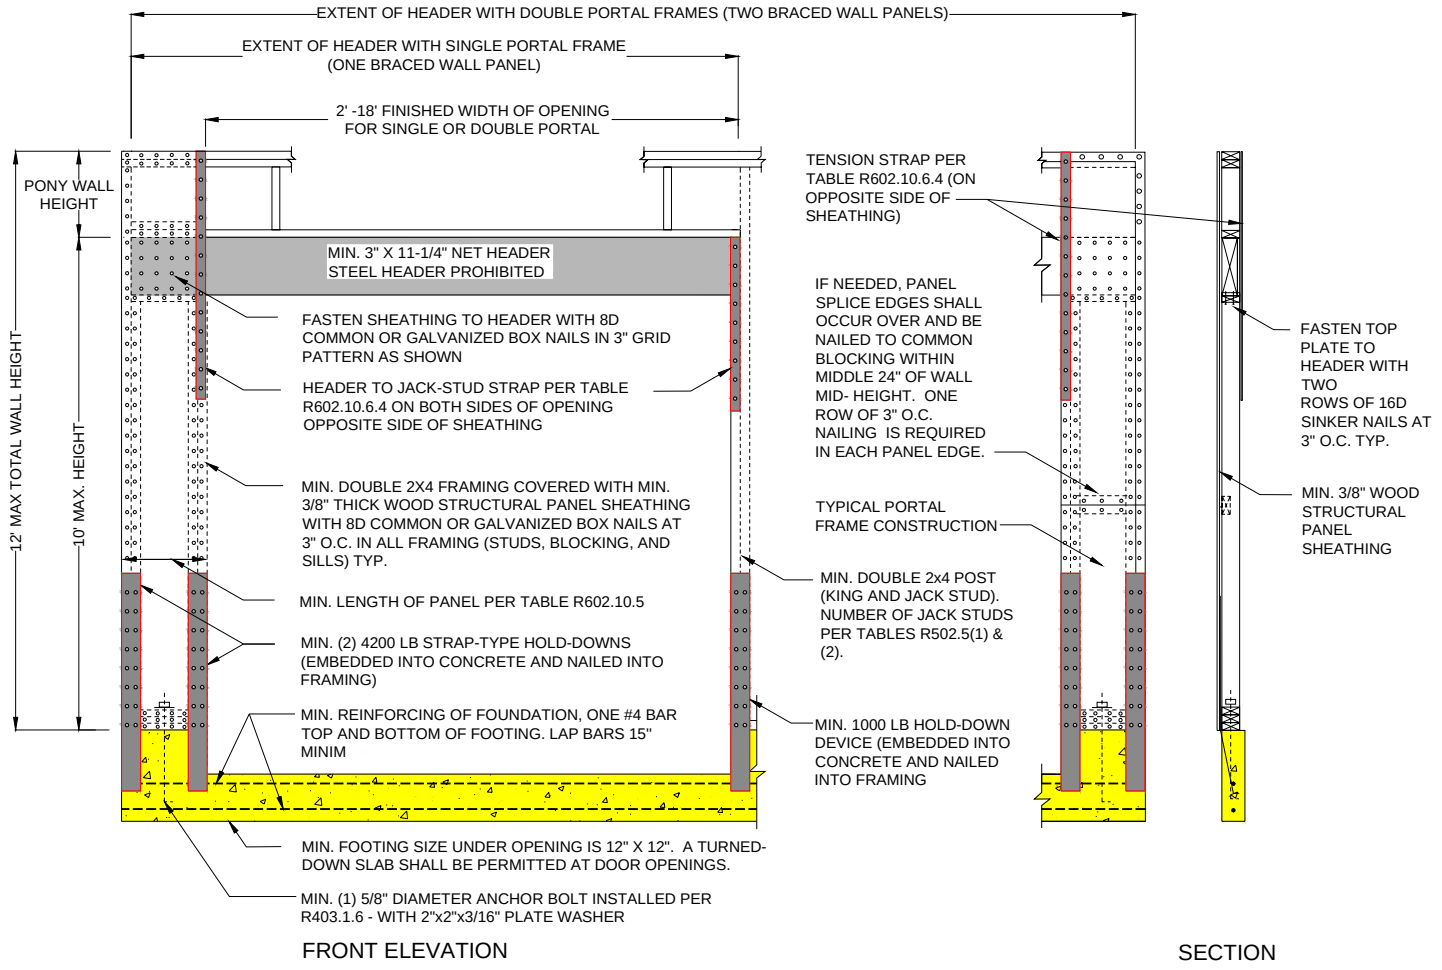
METHOD ABW: ALTERNATE BRACED WALL PANEL

R602.10.6.2 Method PFH: Portal frame with hold-downs. Method PFH braced wall panels shall be constructed in accordance with Figure R602.10.6.2.



For SI: 1 inch = 25.4 mm, 1 foot = 305 mm

FIGURE R602.10.6.2
METHOD PFH: PORTAL FRAME WITH HOLD-DOWNS

R602.10.6.3 Method PFG: Portal frame at garage door openings in Seismic Design Categories A, B and C. Where supporting a roof or one story and a roof, a Method PFG braced wall panel constructed in accordance with Figure R602.10.6.3 is permitted on either side of garage door openings.

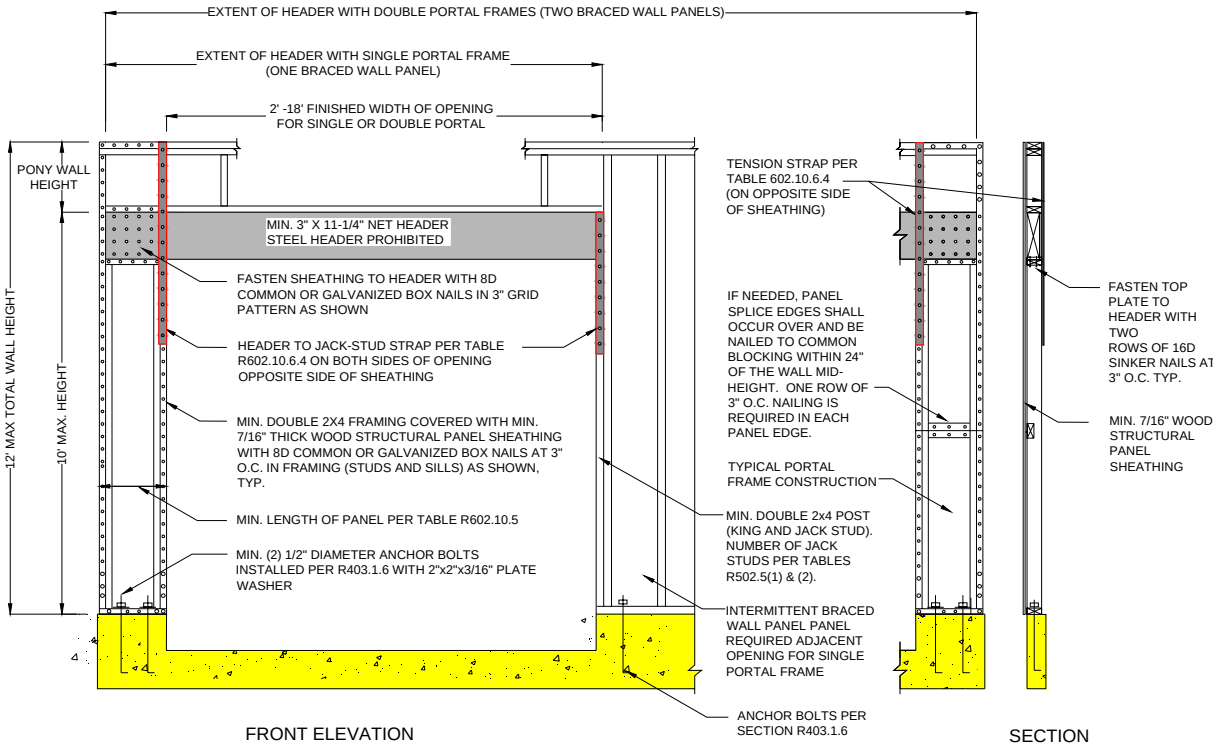


FIGURE R602.10.6.3
METHOD PFG: PORTAL FRAME AT GARAGE DOOR OPENINGS IN SEISMIC DESIGN CATEGORIES A, B AND C

R602.10.6.4 Method CS-PF: Continuously sheathed portal frame. Continuously sheathed portal frame braced wall panels shall be constructed in accordance with Figure R602.10.6.4 and Table R602.10.6.4. The number of continuously sheathed portal frame panels in a single braced wall line shall not exceed four.

TABLE R602.10.6.4
TENSION STRAP CAPACITY REQUIRED FOR RESISTING WIND PRESSURES PERPENDICULAR TO METHOD PFH, PFG AND CS-PF BRACED WALL PANELS

REQUIREMENTS

Return panel: 24" for braced wall lines sheathed with wood structural panels
32" for braced wall lines sheathed with structural fiberboard

Distance D: 24" for braced wall lines sheathed with wood structural panels
32" for braced wall lines sheathed with structural fiberboard

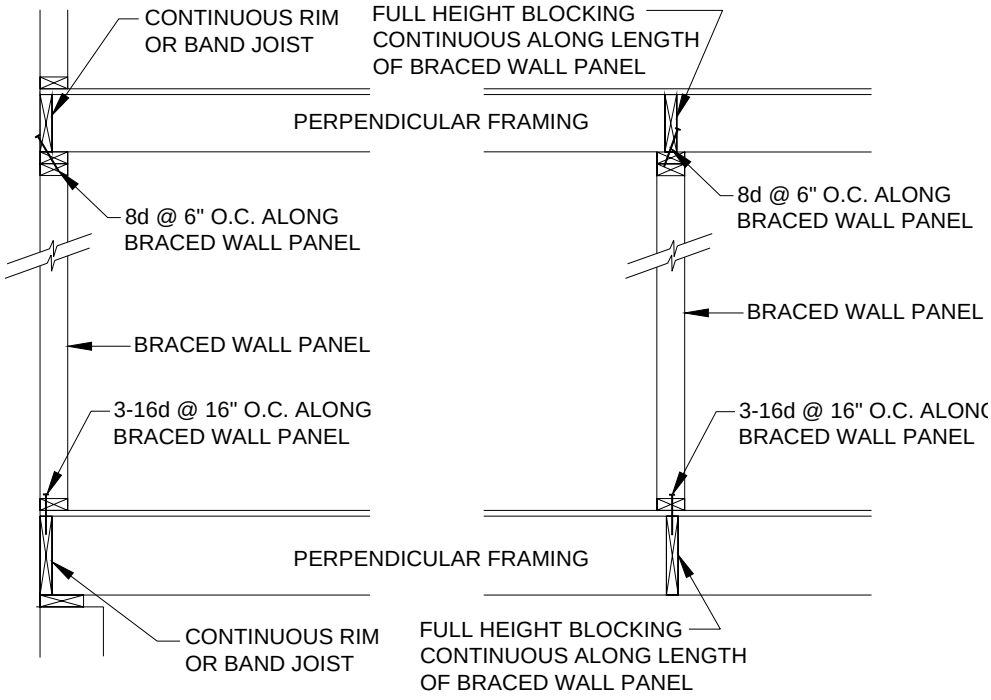
Hold-down device: 800 lbs capacity fastened to the edge of the braced wall panel closest to the corner and to the foundation or floor framing below

For SI: 1 inch = 25.4 mm, 1 foot = 305 mm, 1 lb = 4.45 N

FIGURE R602.10.7
END CONDITIONS FOR BRACED WALL LINES WITH CONTINUOUS SHEATHING

R602.10.8 Braced wall panel connections. Braced wall panels shall be connected to floor framing or foundations as follows:

1. Where joists are perpendicular to a braced wall panel above or below, a rim joist, band joist or blocking shall be provided along the entire length of the braced wall panel in accordance with Figure R602.10.8(1). Fastening of top and bottom wall plates to framing, rim joist, band joist and/or blocking shall be in accordance with Table R602.3(1).
2. Where joists are parallel to a braced wall panel above or below, a rim joist, end joist or other parallel framing member shall be provided directly above and below the braced wall panel in accordance with Figure R602.10.8(2). Where a parallel framing member cannot be located directly above and below the panel, full-depth blocking at 16 inch (406 mm) spacing shall be provided between the parallel framing members to each side of the braced wall panel in accordance with Figure R602.10.8(2). Fastening of blocking and wall plates shall be in accordance with Table R602.3(1) and Figure R602.10.8(2).
3. Connections of braced wall panels to concrete or masonry shall be in accordance with Section R403.1.6.



For SI: 1 inch = 25.4 mm

FIGURE R602.10.8(1)
BRACED WALL PANEL CONNECTION WHEN
PERPENDICULAR TO FLOOR/CEILING FRAMING

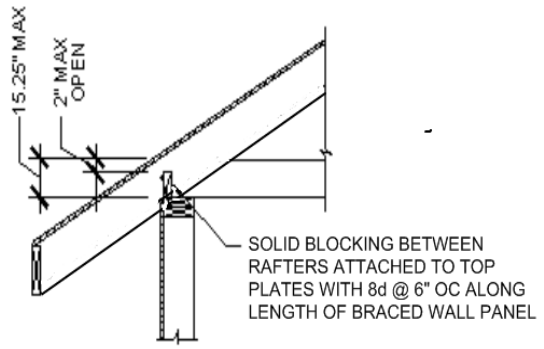
FIGURE R602.10.8(2)
BRACED WALL PANEL CONNECTION WHEN
PARALLEL TO FLOOR/CEILING FRAMING

R602.10.8.1 Braced wall panel connections for Seismic Design Categories D_0, D_1 and D_2. Braced wall panels shall be fastened to required foundations in accordance with Section R602.11.1, and top plate lap splices shall be face-nailed with at least eight 16d nails on each side of the splice.

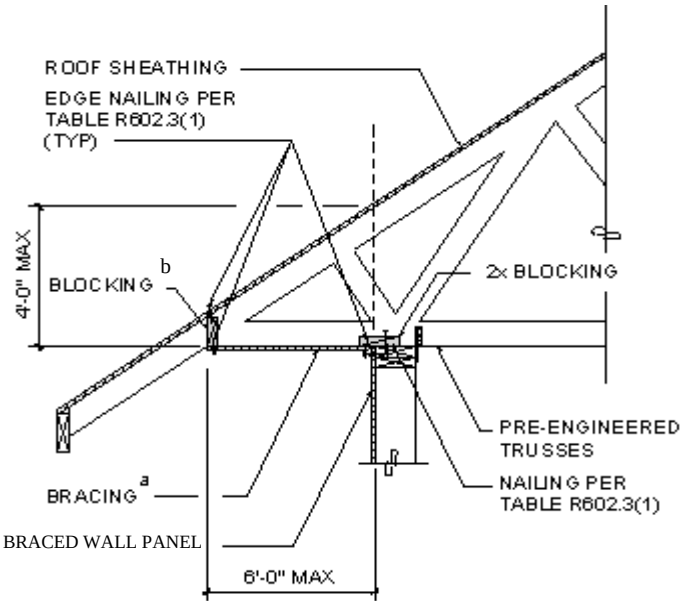
R602.10.8.2 Connections to roof framing. Exterior braced wall panels shall be connected to roof framing as follows.

1. Parallel rafters or roof trusses shall be attached to the top plates of braced wall panels in accordance with Table R602.3(1).
2. For Seismic Design Categories A, B and C and wind speeds less than 100 mph (45 m/s):
   - 2.1. Where the distance from the top of the rafters or roof trusses and perpendicular top plates is 9.25 inches (235 mm) or less, the rafters or roof trusses shall be connected to the top plates of braced wall panels in accordance with Table R602.3(1) and blocking need not be installed.
   - 2.2. Where the distance from the top of the rafters and perpendicular top plates is between 9.25 inches (235 mm) and 15.25 inches (387 mm) the rafters shall be connected to the top plates of braced wall panels with blocking in accordance with Figure R602.10.8.2(1) and attached in accordance with Table R602.3(1).
   - 2.3. Where the distance from the top of the roof trusses and perpendicular top plates is between 9.25 inches (235 mm) and 15.25 inches (387 mm) the roof trusses shall be connected to the top plates of braced wall panels with blocking in accordance with Table R602.3(1).
3. For Seismic Design Categories D_0, D_1 and D_2 or wind speeds of 100 mph (45 m/s) or greater, where the distance between the top of rafters or roof trusses and perpendicular top plates is 15.25 inches (387 mm) or less, rafters or roof trusses shall be connected to the top plates of braced wall panels with blocking in accordance with Figure R602.10.8.2(1) and attached in accordance with Table R602.3(1).
4. For all Seismic Design Categories and wind speeds, where the distance between the top of rafters or roof trusses and perpendicular top plates exceeds 15.25 inches (387 mm), perpendicular rafters or roof trusses shall be connected to the top plates of braced wall panels in accordance with one of the following methods
   - 4.1. In accordance with Figure R602.10.8.2(2),
   - 4.2. In accordance with Figure R602.10.8.2(3),
   - 4.3. With full height engineered blocking panels designed for values listed in American Forest and Paper Association (AF&PA) Wood Frame Construction Manual for One- and Two-Family Dwellings (WFCM). Both the roof and floor sheathing shall be attached to the blocking panels in accordance with Table R602.3(1).
   - 4.4. Designed in accordance with accepted engineering methods.
5. Lateral support for the rafters and ceiling joists shall be provided in accordance with Section R802.8.
6. Lateral support for trusses shall be provided in accordance with Section R802.10.3.



For SI: 1 inch = 25.4 mm

FIGURE R602.10.8.2(1)
BRACED WALL PANEL CONNECTION TO PERPENDICULAR RAFTERS

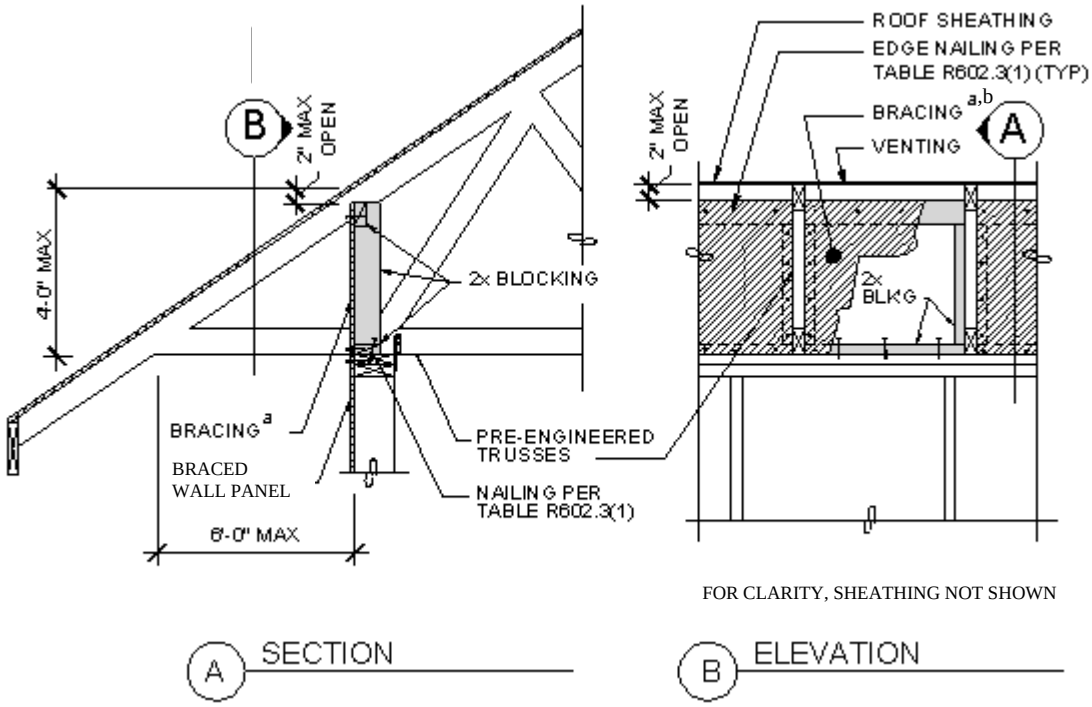


For SI: 1 inch = 25.4 mm

a. Methods of bracing shall be as described in Section R602.10.2 method DWB, WSP, SFB, GB, PBS, PCP OR HPS

b. Provide ventilation (not shown) per Section R806.

FIGURE R602.10.8.2(2)
BRACED WALL PANEL CONNECTION OPTION TO PERPENDICULAR RAFTERS OR ROOF TRUSSES



For SI: 1 inch = 25.4 mm

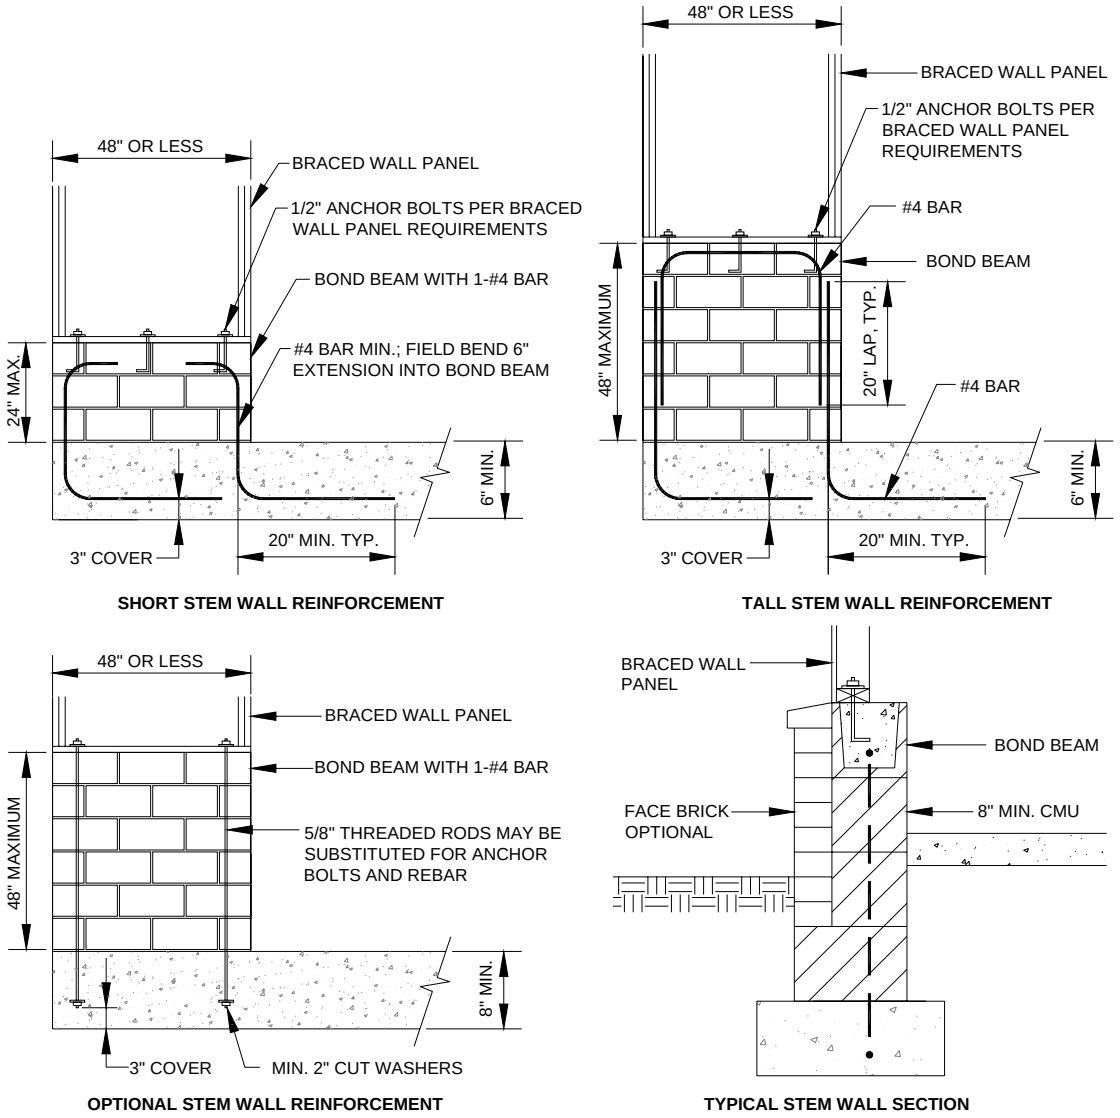
a. Methods of bracing shall be as described in Section R602.10.2 method DWB, WSP, SFB, GB, PBS, PCP OR HPS

b. Provide ventilation (not shown) per Section R608.

FIGURE R602.10.8.2(3)
BRACED WALL PANEL CONNECTION OPTION TO PERPENDICULAR RAFTERS OR ROOF TRUSSES

R602.10.9 Braced wall panel support. Braced wall panel support shall be provided as follows:

1. Cantilevered floor joists complying with Section R502.3.3 shall be permitted to support braced wall panels.
2. Elevated post or pier foundations supporting braced wall panels shall be designed in accordance with accepted engineering practice.
3. Masonry stem walls with a length of 48 inches (1220 mm) or less supporting braced wall panels shall be reinforced in accordance with Figure R602.10.9. Masonry stem walls with a length greater than 48 inches (1220 mm) supporting braced wall panels shall be constructed in accordance with Section R403.1 Methods ABW and PFH shall not be permitted to attach to masonry stem walls.
4. Concrete stem walls with a length of 48" or less, greater than 12 inches tall and less than 6 inches thick shall have reinforcement sized and located in accordance with Figure R602.10.9.



For SI: 1 in=305 mm

FIGURE R602.10.9
MASONRY STEM WALLS SUPPORTING BRACED WALL PANELS

R602.10.9.1 Braced wall panel support for Seismic Design Category D_2. In one-story buildings located in Seismic Design Category D_2, braced wall panels shall be supported on continuous foundations at intervals not exceeding 50 feet (15 240 mm). In two story buildings located in Seismic Design Category D_2, all braced wall panels shall be supported on continuous foundations.

Exception: Two-story buildings shall be permitted to have interior braced wall panels supported on continuous foundations at intervals not exceeding 50 feet (15 240 mm) provided that:

1. The height of cripple walls does not exceed 4 feet (1219 mm).
2. First-floor braced wall panels are supported on doubled floor joists, continuous blocking or floor beams.
3. The distance between bracing lines does not exceed twice the building width measured parallel to the braced wall line.

R602.10.10 Panel joints. All vertical joints of panel sheathing shall occur over, and be fastened to common studs. Horizontal joints in braced wall panels shall occur over, and be fastened to common blocking of a minimum 1-1/2 inch (38 mm) thickness.

Exceptions:

1. Blocking at horizontal joints shall not be required in wall segments that are not counted as braced wall panels.
2. Where the length of bracing provided is at least twice the required length of bracing from Tables R602.10.3(1) and R602.10.3(3) blocking at horizontal joints shall not be required in braced wall panels constructed using Methods WSP, SFB, GB, PBS or HPS.
3. When Method GB panels are installed horizontally, blocking of horizontal joints is not required.

R602.10.11 Cripple wall bracing. In Seismic Design Categories other than D_2, cripple walls shall be braced with a length and type of bracing as required for the wall above in accordance with Tables R602.10.3(1) and R602.10.3(3) with the following modifications for cripple wall bracing:

1. The length of bracing as determined from Tables R602.10.3(1) and R602.10.3(3) shall be multiplied by a factor of 1.15, and
2. The wall panel spacing shall be decreased to 18 feet (5486 mm) instead of 25 feet (7620 mm).

R602.10.11.1 Cripple wall bracing in Seismic Design Categories D_0, D_1 and D_2. In addition to the requirements of Section R602.10.11, where braced wall lines at interior walls occur without a continuous foundation below, the length of parallel exterior cripple wall bracing shall be one and one-half times the length required by Table R602.10.3(3). Where cripple walls braced using Method WSP cannot provide this additional length, the capacity of the sheathing shall be increased by reducing the spacing of fasteners along the perimeter of each piece of sheathing to 4 inches (102 mm) on center.

In Seismic Design Category D_2, cripple walls shall be braced in accordance with Tables R602.10.3(3) and R602.10.3(4).

R602.10.11.2 Redesignation of cripple walls. In any Seismic Design Category, cripple walls shall be permitted to be redesignated as the first story walls for purposes of determining wall bracing requirements. If the cripple walls are redesignated, the stories above the redesignated story shall be counted as the second and third stories respectively.

Reason: As the wall bracing section evolved, it has become more universal and flexible, but, as a result, it has grown in size and complexity. After the Ad Hoc committee's "engineering" work was complete and integrated into the 2009 IRC, we heard back from end users that this section of the code was extremely challenging. The committee therefore wanted to focus on making the 2012 IRC easier to read, easier to understand and easier to use.

The *BIG BANG*: To accommodate over 30 separate editorial and technical "simplification" proposals, the Ad Hoc Committee agreed to delete Section R602.10 in its entirety, and replace it with one single change - rather than try to strikeout and insert individual tables, code sections and figures. The decision to integrate all the individual code changes into a single change was due in part to the complexity and interconnectivity of the pieces, and the necessity to "visualize" the final product in its totality. **Everything in this single change had unanimous support among committee members and was deemed to be non-controversial in nature**.

There are several other changes being proposed by committee members that are being submitted independent of this integrated change because of their scope and nature. Some have the unanimous backing of the committee, but may generate discussion from the floor, and others are being offered separately by individual members of the committee because of their content.

Non-technical changes:
Many of the code changes are reorganizational in nature from the 2009 IRC; we moved similar ideas and concepts together to read more smoothly, we merged or deleted unnecessary or duplicated pieces, and made editorial clarifications and improvements.

Technical changes:
The significant technical changes incorporated into this new section are listed below.

- **Table R602.3(1):**
    - A new row was added to the table that incorporates the nailing requirements of 2009 IRC Figure R602.10.4.4(1) thus eliminating the large and complex figure. All other requirements of the eliminated figure are already covered elsewhere in the IRC. A new requirement for fastening the rim board to sill plate was added to complete the load path from braced wall panels to the foundation.

- **Section R602.10.1.1**:
    - A new figure was added to replace several less effective figures: it clarifies offsets, BWL spacing, and explains how to handle the situation when an intersecting braced wall line is not present to define the length of BWL – it now explains that the end of the building will determine its length.

- **Section R602.10.2.2 and R602.10.2.3:**
    - For consistency, the distance from the end of a BWL to the first BWP was unified at 10 feet for all SDCs and wind speeds.
    - The required summation of end distances was eliminated (2009 IRC Section R602.10.1.4); in its place, braced wall lines up to 16 feet in length may have only one braced wall panel.
    - BWP spacing was changed from 25' o.c.to a 20' edge-to-edge spacing to make it easier to measure.
    - Another new figure was introduced to better demonstrate how BWPs may be located along the walls of the house.

- **Section R602.10.3:**
    - The contribution from BWP on an angled wall was clarified.

- **Tables R602.10.3(1) and (3):**
    - Method GB was redefined as a <u>one sided, 4' application only</u>, because of the problem with interpreting what "double sided GB" meant. To compensate, the required length of bracing for a braced wall line with Method GB was doubled in these two tables.
    - Method CS-SFB was integrated into the tables as well.

- **Section R602.10.5:**
    - Section R602.10.5 was deleted and the provisions for the use of Continuous Sheathing- Structural Fiberboard Sheathing were placed in the appropriate sections
    -
- **Section R602.10.4.1, Item 5:**
    - The option to mix intermittent and continuous methods on a single braced wall line was provided. When a braced wall line begins on the exterior of the building and continues through the interior, the designer can brace the interior portions with intermittent methods and utilize the advantages of continuous sheathing on the exterior portions.

- **Figure R602.10.6.2:**
    - The option for a pony wall atop a PFH portal frame was added so that all portal frames (including PFG and CS-PF) allow the pony wall extension above the header.

- **Figure R602.10.7**:
    - A new end condition was added. Condition 3 allows no return panels or hold-downs if a 4 foot braced wall panel is located at the end of the braced wall line.

The uplift load path section, previously R602.10.1.2.1, was clarified, strengthened and moved to become Section R602.3.5.

Cost Impact: The code change proposal will not increase the cost of construction.

Proponent: Chuck Bajnai, Chesterfield County, VA, Chairman, ICC Ad-Hoc Committee on Wall Bracing

1. Revise as follows:

R602.9 Cripple walls. Foundation cripple walls shall be framed of studs not smaller than the studding above. When exceeding 4 feet (1219 mm) in height, such walls shall be framed of studs having the size required for an additional *story*.

Cripple walls with a stud height less than 14 inches (356 mm) shall be <u>continuously</u> sheathed on ~~at least~~ one side with ~~a~~ wood structural panel<u>s</u> ~~that is~~ fastened to both the top and bottom plates in accordance with Table R602.3(1), or the cripple walls shall be constructed of solid blocking.

<u>All</u> cripple walls shall be supported on continuous foundations.

TABLE R602.10.1.2(2)[a, b, c]
BRACING REQUIREMENTS BASED ON SEISMIC DESIGN CATEGORY

		50	NP	NP	37.5	31.9

(Portions of table not shown remain unchanged)

R602.10.9 Cripple wall bracing. ~~In Seismic Design Categories other than D2, cripple walls shall be braced with a length and type of bracing as required for the wall above in accordance with Tables R602.10.1.2(1) and R602.10.1.2(2) with the following modifications for cripple wall bracing:~~ Cripple walls shall be constructed in accordance with Section R602.9 and braced in accordance with this section. Cripple walls shall be braced with the length and method of bracing used for the wall above in accordance with Tables R602.10.1.2(1) and R602.10.1.2(2), except that the length of cripple wall bracing shall be multiplied by a factor of 1.15.

~~1. The length of bracing as determined from Tables R602.10.1.2(1) and R602.10.1.2(2) shall be multiplied by a factor of 1.15, and~~
~~2. The wall panel spacing shall be decreased to 18 feet (5486 mm) instead of 25 feet (7620 mm).~~

2. Delete and substitute as follows:

~~**R602.10.9.1 Cripple wall bracing in Seismic Design Categories D0, D1 and D2.** In addition to the requirements of Section R602.10.9, where *braced wall lines* at interior walls occur without a continuous foundation below, the length of parallel exterior cripple wall bracing shall be 11/2 times the length required by Tables R602.10.1.2(1) and R602.10.1.2(2). Where cripple walls braced using Method WSP of Section R602.10.2 cannot provide this additional length, the capacity of the sheathing shall be increased by reducing the spacing of fasteners along the perimeter of each piece of sheathing to 4 inches (102 mm) on center. In Seismic Design Category D2, cripple walls shall be braced in accordance with Tables R602.10.1.2(1) and R602.10.1.2(2).~~

R602.10.9.1 Cripple wall bracing for Seismic Design Categories D_0, D_1 and townhouses in Seismic Design Category C. In addition to the requirements in Section R602.10.9, braced wall panels for cripple walls shall be located no more than 18 feet (5486 mm) on center along a braced wall line.

Where braced wall lines at interior walls are not supported on a continuous foundation below, the adjacent parallel cripple walls, where provided, shall be braced with Method WSP per Section R602.10.2 or Method CS-WSP per Section R602.10.4. The length of bracing required per Table R602.10.1.2(2) for the cripple walls shall be multiplied by 1.5. Where the cripple walls do not have sufficient length to provide the required bracing, the spacing of panel edge fasteners shall be reduced to 4 inches (102 mm) on center and the required bracing length adjusted by 0.7. If the required length can still not be provided, the cripple wall shall be designed in accordance with accepted engineering practice.

R602.10.9.2 Cripple wall bracing for Seismic Design Category D_2. In Seismic Design Category D_2, cripple walls shall be braced in accordance with Tables R602.10.1.2(1) and R602.10.1.2(2).

3. Revise as follows:

R602.10.9.~~2~~3 Redesignation of cripple walls. ~~In any Seismic Design Category,~~ Where all cripple wall segments along a braced wall line do not exceed 48 inches in height, the cripple walls shall be permitted to be redesignated as ~~the~~ a first *story* wall~~s~~ for purposes of determining wall bracing requirements. Where any cripple wall segment in a braced wall line exceeds 48 inches in height, the entire cripple wall shall be counted as an additional story. If the cripple walls are redesignated, the stories above the redesignated *story* shall be counted as the second and third stories, respectively.

R602.11.2 Stepped foundations in Seismic Design Categories D_0, D_1 and D_2. In all buildings located in Seismic Design Categories D_0, D_1 or D_2, where the height of a required *braced wall line* that extends from foundation to floor above varies more than 4 feet (1219 mm), the *braced wall line* shall be constructed in accordance with the following:

1. Where the lowest floor framing rests directly on a sill bolted to a foundation not less than 8 feet (2440 mm) in length along a line of bracing, the line shall be considered as braced. The double plate of the cripple stud wall beyond the segment of footing that extends to the lowest framed floor shall be spliced by extending the upper top plate a minimum of 4 feet (1219 mm) along the foundation. Anchor bolts shall be located a maximum of 1 foot and 3 feet (305 and 914 mm) from the step in the foundation. See Figure R602.11.2.
2. Where cripple walls occur between the top of the foundation and the lowest floor framing, the bracing requirements of Sections R602.10.9, ~~and~~ R602.10.9.1 and R602.10.9.2 shall apply.
3. Where only the bottom of the foundation is stepped and the lowest floor framing rests directly on a sill bolted to the foundations, the requirements of Sections R403.1.6 and R602.11.1 shall apply.

Reason: This proposal clarifies and coordinates the basic cripple wall provisions in Section R602.9 and the cripple wall bracing provisions in Section R602.10.9.

The changes to Section R602.9 are largely editorial. The apparent intent of the provisions for cripple walls shorter than 14" is to require solid blocking or continuous sheathing. However, the current language calls for "a structural panel". Taken literally, that calls for one single sheet of plywood or OSB to be placed on the wall. The language is revised to clarify the apparent intent. Also, the continuous foundation requirement is moved to its own paragraph, as it clearly is intended to apply to all cripple walls, not just 14" and shorter ones.

The 75% minimum WSP bracing requirement for cripple walls in SDC D2 was mistakenly deleted from the reformatted seismic bracing table and is restored to Table R602.10.1.2(2). Consistent with the revisions last cycle, the percentage is converted into a foot length. The 15% reduction for continuous sheathing is also applied.

Section R602.10.9 and R609.10.9.1 are revised to divide the requirements into low-seismic (i.e. governed by wind) and high-seismic sections. The same calculation method and spreadsheet the ICC Ad-Hoc Wall Bracing Committee used to define the wind bracing table, was used to verify that the 1.15x multiplier is accurate for the wind bracing case as well as the seismic bracing case. The 18 foot braced wall panel spacing limit is applied only for high-seismic. There is no documentation of cripple wall failures in wind events, as there is for seismic events. Thus there is no technical justification to apply the additional limit for wind bracing.

The provisions regarding braced wall lines on interior walls not supported on continuous foundations are clarified. The 50% increase in bracing is applied to the adjacent cripple walls. It is noted these walls could potentially be either exterior or interior walls. Also, a complex house plan may have exterior cripple walls that are not adjacent to the unsupported wall (e.g. on an attached garage, den, or other feature) and do not inherit seismic loads from the unsupported wall. It would not then make sense to increase the bracing for those walls. Furthermore, it is clarified that the bracing for the adjacent cripple walls can be either Method WSP or Method CS-WSP. Finally, a specific factor is provided for the increased strength provided by the reduction to 4" edge nailing. Of course, for some plans, the reduction may still result in a required bracing length that exceeds the total length of the cripple wall. Obviously, an engineered solution would be required in that case,

The provision on re-designation of cripple walls is amended to require exterior cripple walls exceeding 48" in height to be considered a story. This is consistent with the calculation performed above to verify the 1.15 multiplier. The increase in bracing for taller cripple walls would begin to approach, and finally equal, the difference in bottom-floor bracing from the addition of a story. Thus, it would make sense to automatically re-designate these taller cripple walls as a story. This will also help clarify the determination of bracing for houses on sloped sites, where figuring out the bracing for the cripple walls occurring on the walls parallel to the slope has been an issue.

Finally, the section references in R602.11.2 are revised to include R602.10.9.2.

Cost Impact: The code change proposal may increase the cost of construction for houses with cripple walls exceeding 48" in height.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

Proponent: Chuck Bajnai, Chesterfield County, VA, Chairman, ICC Ad-Hoc Committee on Wall Bracing

1. Revise as follows:

R602.10.1.2 Length of bracing. The length of bracing along each *braced wall line* shall be the greater of that required by the design wind speed and *braced wall line* spacing in accordance with Table R602.10.1.2(1) as adjusted by the factors in the footnotes or the Seismic Design Category and *braced wall line* length in accordance with Table R602.10.1.2(2) as adjusted by the factors in Table R602.10.1.2(3) or *braced wall panel* location requirements of Section R602.10.1.4. Only walls that are parallel to the *braced wall line* shall be counted toward the bracing requirement of that line, except angled walls shall be counted in accordance with Section R602.10.1.3. In no case shall the minimum total length of bracing in a *braced wall line*, after all adjustments have been taken, be less than 48 inches (1219 mm) total.

Exception: The length of wall bracing for dwellings in Seismic Design Categories D_0, D_1 and D_2 with stone or masonry veneer installed per Section R703.7 and exceeding the first *story height* shall be in accordance with Section R602.10.3.5.

R602.10.1.4.1 Braced wall panel location in Seismic Design Categories D0, D1 and D2. *Braced wall lines* at exterior walls shall have a *braced wall panel* located at each end of the *braced wall line*.

Exception: For *braced wall panel* construction Method WSP or BV-WSP of Section R602.10.2, the *braced wall panel* shall be permitted to begin no more than 8 feet (2438 mm) from each end of the *braced wall line* provided one of the following is satisfied in accordance with Figure R602.10.1.4.1:

1. A minimum 24-inch-wide (610 mm) panel is applied to each side of the building corner and the two 24-inch-wide (610 mm) panels at the corner are attached to framing in accordance with Figure R602.10.4.4(1), or
2. The end of each *braced wall panel* closest to the corner shall have a hold-down device fastened to the stud at the edge of the *braced wall panel* closest to the corner and to the foundation or framing below. The hold-down
   device shall be capable of providing an uplift allowable design value of at least 1,800 pounds (8 kN). The hold-down device shall be installed in accordance with the manufacturer's recommendations, or
3. For Method BV-WSP, hold-down devices shall be provided in accordance with Table R602.10.3.5 at the ends of each *braced wall panel*.

TABLE R602.10.1.2(3)
ADJUSTMENT FACTORS TO THE LENGTH OF REQUIRED SEISMIC WALL BRACING[a]

ADJUSTMENT BASED ON:		MULTIPLY LENGTH OF BRACING PER WALL LINE BY:	APPLIES TO:
~~Walls with stone or masonry veneer in SDC C-D_2~~	~~See Section R703.7~~		
Walls with stone or masonry veneer, townhouses in SDC C[d,e]		1.0	All intermittent & continuous methods
		1.5	
		1.5	
Walls with stone or masonry veneer, detached one- and two-family dwellings in SDC D_0-D_2[d,e]	Any story	See Table R602.10.3.5	BV-WSP

(Portions of table not shown remain unchanged)

a. through c. (No change)

d. Applies to stone or masonry veneer exceeding the first story height. See Section R602.10.3.5 for requirements when stone or masonry veneer does not exceed the first story height.

e. The adjustment factor for stone or masonry veneer shall be applied to all exterior braced wall lines and all braced wall lines on the interior of the building.

TABLE R602.10.2
INTERMITTENT BRACING METHODS

METHOD	MATERIAL	MINIMUM THICKNESS	FIGURE	CONNECTION CRITERIA
BV-WSP[a]	Wood Structural Panels with Stone or Masonry Veneer (See Section R602.10.3.5)	7/16"	See Figure R602.10.3.5	Fasteners: 8d common (2½"x0.131) nails Spacing: 4" at panel edges 12" at intermediate supports 4" at braced wall panel end posts

(Portions of table not shown remain unchanged)

a. Method applies to detached one- and two-family dwellings in Seismic Design Categories D0-D2 only.

R602.10.2.1 Intermittent braced wall panel interior finish material. Intermittent *braced wall panels* shall have gypsum wall board installed on the side of the wall opposite the bracing material. Gypsum wall board shall be not less than 1/2 inch (12.7 mm) in thickness and be fastened in accordance with Table R702.3.5 for interior gypsum wall board.

Exceptions:

1. Wall panels that are braced in accordance with Methods GB, BV-WSP, ABW, PFG and PFH.
2. When an *approved* interior finish material with an in-plane shear resistance equivalent to gypsum board is installed.
3. For Methods DWB, WSP, SFB, PBS, PCP and HPS, omitting gypsum wall board is permitted provided the length of bracing in Tables R602.10.1.2(1) and R602.10.1.2(2) is multiplied by a factor of 1.5.

R602.10.3 Minimum length of braced panels. For Methods DWB, WSP, SFB, PBS, PCP, ~~and~~ HPS, and BV-WSP, each *braced wall panel* shall be at least 48 inches (1219 mm) in length, covering a minimum of three stud spaces where studs are spaced 16 inches (406 mm) on center and covering a minimum of two stud spaces where studs are spaced 24 inches (610 mm) on center. For Method GB, each *braced wall panel* and shall be at least 96 inches (2438

mm) in length where applied to one face of a *braced wall panel* and at least 48 inches (1219 mm) where applied to both faces. For Methods DWB, WSP, SFB, PBS, PCP, ~~and~~ HPS, and BV-WSP, for purposes of computing the length of panel bracing required in Tables R602.10.1.2(1) and R602.10.1.2(2), the effective length of the *braced wall* panel shall be equal to the actual length of the panel. When Method GB panels are applied to only one face of a *braced wall panel*, bracing lengths required in Tables R602.10.1.2(1) and R602.10.1.2(2) for Method GB shall be doubled.

Exceptions:

1. Lengths of *braced wall panels* for continuous sheathing methods shall be in accordance with Table R602.10.4.2.
2. Lengths of Method ABW panels shall be in accordance with Sections R602.10.3.2.
3. Length of Methods PFH and PFG panels shall be in accordance with Section R602.10.3.3 and R602.10.3.4 respectively.
4. For Methods DWB, WSP, SFB, PBS, PCP and HPS in Seismic Design Categories A, B, and C: Panels between 36 inches (914 mm)and 48 inches (1219 mm) in length shall be permitted to count towards the required length of bracing in Tables R602.10.1.2(1) and R602.10.1.2(2), and the effective contribution shall comply with Table R602.10.3.

TABLE R602.10.3.1
MINIMUM LENGTH REQUIREMENTS FOR BRACED WALL PANELS

SEISMIC DESIGN CATEGORY AND WIND SPEED	BRACING METHOD	HEIGHT OF BRACED WALL PANEL				
		8 ft.	9 ft.	10 ft.	11 ft.	12 ft.
SDC A, B, C, D_o, D_1 and D_2 Wind speed < 110 mph	DWB, WSP, SFB, PBS, PCP, HPS, BV-WSP and Method GB when double sided	4'-0"	4'-0"	4'-0"	4'-5"	4'-10"
	Method GB, single sided	8'-0"	8'-0"	8'-0"	8'-10"	9'-8"

For SI: 1 inch = 25.4 mm, 1 foot = 305 mm.

2. Delete Sections R602.12, R602.12.1, R602.12.1.1 and relocate to new Section R602.3.5 and revise as follows:

R602.10.3.5~~12~~ Wall bracing for dwellings with ~~and~~ stone and masonry veneer in Seismic Design Categories D_0, D_1 and D_2. ~~Where stone and masonry veneer is installed in accordance with Section R703.7, wall bracing shall comply with this section~~.

~~For all buildings in Seismic Design Categories A, B and C, wall bracing at exterior and interior braced wall lines shall be in accordance with Section R602.10 and the additional requirements of Table R602.12(1).~~

Where dwellings in Seismic Design Categories D_0, D_1 and D_2 have stone or masonry veneer installed in accordance with Section R703.7, and the veneer does not exceed the first *story* height, wall bracing shall be in provided accordance with Section R602.10.1.2.

~~For~~ Where detached one- or two-family dwellings in Seismic Design Categories D_0, D_1 and D_2 have stone or masonry veneer installed in accordance with Section R703.7, and the veneer exceeds the first *story height*, wall bracing ~~and hold downs~~ at exterior *braced wall lines* and ~~interior~~ *braced wall lines* on the interior of the building shall be constructed using Method BV-WSP in accordance with this section and Figure R602.10.3.5. ~~Sections R602.10 and R602.11 and the additional requirements of Section R602.12.1 and Table R602.12(2). In Seismic Design Categories D0, D1 and D2, c~~Cripple walls shall not be permitted, and required interior *braced wall lines* shall be supported on continuous foundations.

Townhouses in Seismic Design Categories D_0, D_1 and D_2 with stone or masonry veneer exceeding the first *story* height shall be designed in accordance with accepted engineering practice.

~~**R602.12.1 Seismic Design Categories D_0, D_1 and D_2.** Wall bracing where stone and masonry veneer exceeds the first story height in Seismic Design Categories D_0, D_1 and D_2 shall conform to the requirements of Section R602.10 and R602.11 and the following requirements.~~

R602.10.3.5.1~~12.1.1~~ Length of bracing. The length of bracing along each *braced wall line* shall be the greater of that required by the design wind speed and *braced wall line* spacing in accordance with Table R602.10.1.2(1) as adjusted by the factors in the footnotes or the Seismic Design Category and *braced wall line* length in accordance with Table R602.10.3.5~~12(2)~~. Angled walls shall be permitted to be counted in accordance with Section R602.10.1.3, and *braced wall panel* location shall be in accordance with Section R602.10.1.4. The seismic adjustment factors in Table R602.10.1.2(3) shall not be applied to the length of bracing determined using Table R602.10.3.5. In no case shall the minimum total length of bracing in a *braced wall line*, after all adjustments have been taken be less than 48 inches total.

3. Add new table as follows:

TABLE R602.10.3.5
METHOD BV-WSP WALL BRACING REQUIREMENTS

SEISMIC DESIGN CATEGORY	STORY	BRACED WALL LINE LENGTH (FT)					SINGLE STORY HOLD-DOWN FORCE (lb)[a]	CUMULATIVE HOLD DOWN FORCE (lb)[b]
		10	20	30	40	50		
		MINIMUM TOTAL LENGTH (FT) OF BRACED WALL PANELS REQUIRED ALONG EACH BRACED WALL LINE						
D_0		4.0	7.0	10.5	14.0	17.5	N/A	—
		4.0	7.0	10.5	14.0	17.5	1900	—
		4.5	9.0	13.5	18.0	22.5	3500	5400
		6.0	12.0	18.0	24.0	30.0	3500	8900
D_1		4.5	9.0	13.5	18.0	22.5	2100	—
		4.5	9.0	13.5	18.0	22.5	3700	5800
		6.0	12.0	18.0	24.0	30.0	3700	9500
D_2		5.5	11.0	16.5	22.0	27.5	2300	—
		5.5	11.0	16.5	22.0	27.5	3900	6200
		NP	NP	NP	NP	NP	N/A	N/A

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm, 1 pound per square foot = 0.479 kPa, 1 pound-force = 4.448 N.

a. Hold down force is minimum allowable stress design load for connector providing uplift tie from wall framing at end of braced wall panel at the noted story to wall framing at end of braced wall panel at the story below, or to foundation or foundation wall. Use single story hold down force where edges of braced wall panels do not align; a continuous load path to the foundation shall be maintained.

b. Where hold down connectors from stories above align with stories below, use cumulative hold down force to size middle and bottom story hold down connectors.

4. Add new figure as follows:

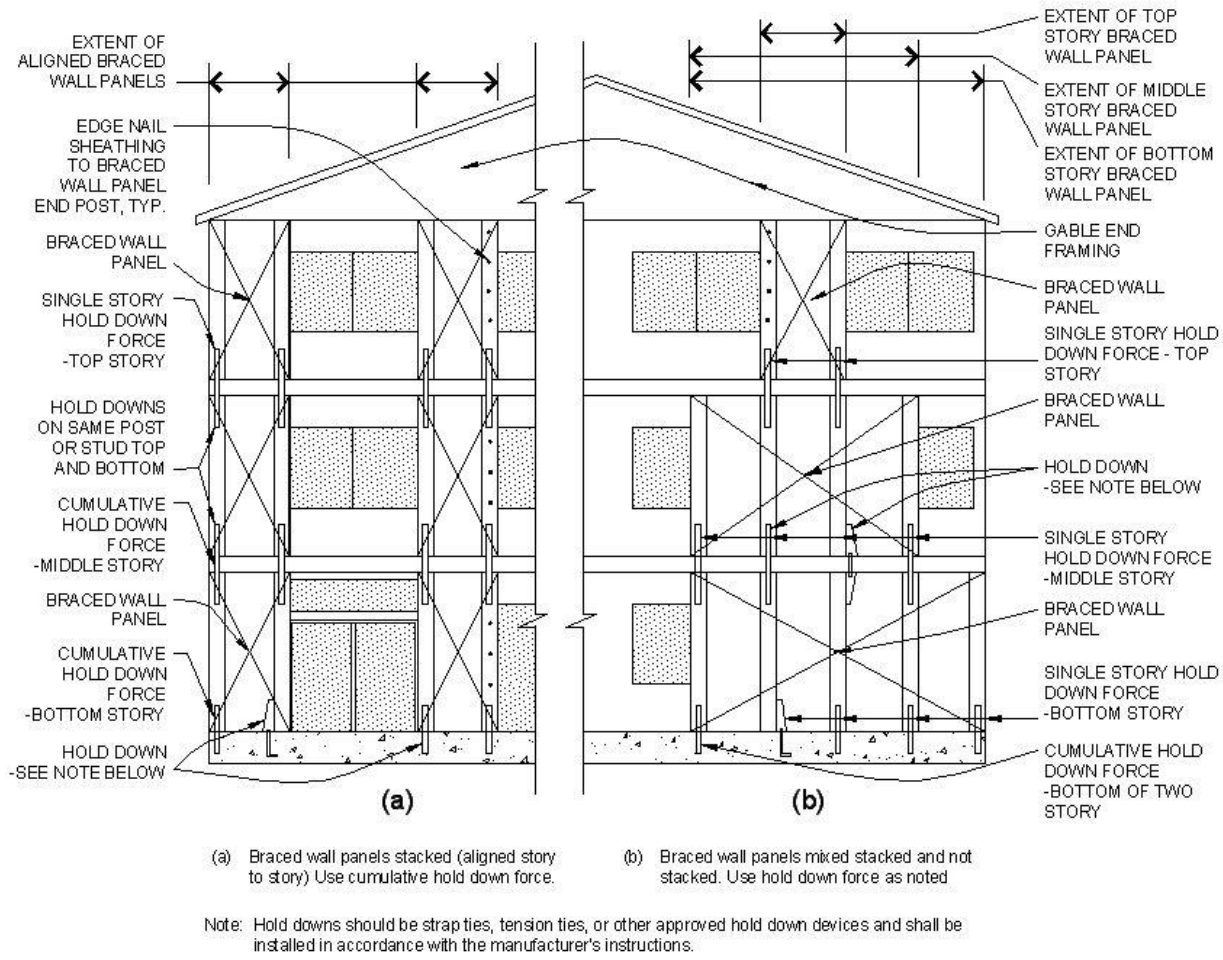

FIGURE R602.10.3.5
METHOD BV-WSP: WALL BRACING FOR DWELLINGS WITH STONE AND MASONRY VENEER IN SEISMIC DESIGN CATEGORIES D_0, D_1 AND D_2

5. Delete remainder of R602.12 as follows:

~~**R602.12.1.2 Braced wall panel location.** Braced wall panels shall begin no more than 8 feet from each end of a braced wall line and shall be spaced a maximum of 25 feet on center.~~

~~**R602.12.1.3 Braced wall panel construction.** Braced wall panels shall be constructed of sheathing with a thickness of not less than 7/16 inch nailed with 8d common nails spaced 4 inches on center at all panel edges and 12 inches on center at intermediate supports. The end of each braced wall panel shall have a hold down device in accordance with Table R602.12(2) installed at each end.~~ Size, height and spacing of wood studs shall be in accordance with Table R602.3(5).

~~**R602.12.1.4 Minimum length of braced panel.** Each braced wall panel shall be at least 48 inches in length, covering a minimum of 3 stud spaces where studs are spaced 16 inches on center and covering a minimum of 2 stud spaced where studs are spaced 24 inches on center.~~

~~**R602.12.1.5 Alternate braced wall panel.** Alternate braced wall panels described in Section R602.10.3.2 shall not replace the braced wall panel specification of this section.~~

~~**R602.12.1.6 Continuously sheathed wall bracing.** Continuously sheathed provisions of Section R602.10.4 shall not be used in conjunction with the wall bracing provisions of this section.~~

~~**TABLE R602.12(1)**~~
~~**STONE OR MASONRY VENEER WALL BRACING REQUIREMENTS,**~~
~~**WOOD OR STEEL FRAMING, SEISMIC DESIGN CATEGORIES A, B AND C**~~

~~**TABLE R602.12(2)**~~
~~**STONE OR MASONRY VENEER WALL BRACING REQUIREMENTS, ONE- AND TWO-FAMILY DETACHED DWELLINGS, SEISMIC DESIGN CATEGORIES D0, D1 AND D2**~~

~~**FIGURE R602.12**~~
~~**HOLD DOWNS AT INTERIOR AND EXTERIOR BRACED WALL PANELS**~~

6. Revise as follows:

R703.7 Stone and masonry veneer, general. Stone and masonry veneer shall be installed in accordance with this chapter, Table R703.4 and Figure R703.7. These veneers installed over a backing of wood or cold-formed steel shall be limited to the first *story* above-grade and shall not exceed 5 inches (127 mm) in thickness. See Section ~~R602.12~~ R602.10 for wall bracing requirements for masonry veneer for wood framed construction and Section R603.9.5 for wall bracing requirements for masonry veneer for cold-formed steel construction.

Exceptions:

1. For all buildings in Seismic Design Categories A, B and C, exterior stone or masonry veneer, as specified in Table R703.7(1), with a backing of wood or steel framing shall be permitted to the height specified in Table R703.7(1) above a noncombustible foundation.
2. For detached one- or two-family *dwellings* in Seismic Design Categories D_0, D_1 and D_2, exterior stone or masonry veneer, as specified in Table R703.7(2), with a backing of wood framing shall be permitted to the height specified in Table R703.7(2) above a noncombustible foundation.

Reason: Last cycle, the special wall bracing requirements for wood-framed buildings with stone or masonry veneer were moved from Section R703.7 to Section R602.12, so they would follow the rest of the wall bracing provisions. This was a substantial clarification to the code. However, with the changes introduced by the Ad-Hoc Wall Bracing Committee to introduce tables of seismic adjustment factors, bracing methods, and other improvements, an opportunity now exists to further simplify matters, bring the special veneer provisions into the main bracing section, and remove duplicated text. As such, this proposal implements the following changes:

1. A new intermittent method, BV-WSP, is defined. The basic sheathing and nailing requirements are relocated from Section R602.12.1.3 to a new row in Table R602.10.2. The hold-down requirement is relocated from Section R602.12.1.3 to Section R602.10.1.4. The reference to Table R602.3(5), the wood stud table, is no longer needed. Once this language was moved to Section R602, that table automatically governs.
2. A new exception is added to R602.10.1.2, replacing the original charging language for R602.12. The remaining SDC-specific requirements are incorporated into new Section R602.10.3.5.
3. A reference to Method BV-WSP is added to the high-seismic end panel location requirements of Section R602.10.1.4.1. The duplicate language in Section R602.12.1.2 is no longer required and can be deleted.
4. The adjustments for SDC A, B, and C are inserted directly into Table R602.10.1.2(3), the seismic adjustment factor. Table R602.12(1) is no longer required and can be deleted.
5. A reference to Method BV-WSP is added to the minimum braced wall panel length requirements of Section R602.10.3 and to Table R602.10.3.1. The duplicate language in Section R602.12.1.4 is no longer required and can be deleted.
6. A new Section R602.10.3.5 is added for the new Method BV-WSP. The requirements of R602.12, R602.12.1, and R602.12.1.1 are moved into the new section. A subsection, R602.10.3.5.1, is defined for the length of bracing, with language similar to Section R602.10.1.2. Figure R602.12 is moved to the new section.
7. Table R602.12(2) is moved to Section R602.10.3.5 and revised to convert the percentages to lengths, similar to Table R602.10.1.2(2).
8. Figure R602.12 is replaced by new Figure R602.10.3.5, which provides a number of clarifications regarding the location and type of hold-down devices
9. Since BV-WSP is now defined as its own separate intermittent bracing method, Sections R602.10.1.5 and R602.12.1.6 are no longer needed and can be deleted.

This change represents an editorial relocation and reorganization of the special wall bracing provisions for structures with veneer. Section R602.12 is effectively deleted and all of its provisions incorporated under the scope of Section R602.10. While the intent was purely editorial, two minor technical changes were made. First, the previous provisions do not indicate whether a gypsum board finish is required. But, Method BV-WSP is essentially a fully-restrained engineered shear wall segment, and typically the effect of finishes is not incorporated in such designs. Thus, we believe the interior finish is not required, and amend Section R602.10.2.1 accordingly. Second, in the new Table R602.10.3.5, which replaces Table R602.12(2), the hold-down requirements were combined as part of the reformatting to make the table look like Table R602.10.1.2(2). In the process, the 3200 lb and 5100 lb hold-downs for a bottom of two-story are now required to be 3500 lb and 5400 lb respectively. However, this does not change the actual required strap or hold-down size which a user would select from a connector manufacturer's catalog.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: BAJNAI-AHWB-RB-4-R602.10

RB108–09/10
R602.10.5.4

Proponent: Louis Wagner, representing the American Fiberboard Association

Delete without substitution:

R602.10.5.4 Continuously sheathed braced wall lines. Where a continuously-sheathed *braced wall line* is used in Seismic Design Categories D_0, D_1 and D_2 or regions where the basic wind speed exceeds 100 miles per hour (45 m/s), the *braced wall line* shall be designed in accordance with accepted engineering practice and the provisions of the *International Building Code*. Also, all other exterior *braced wall lines* in the same *story* shall be continuously sheathed.

Reason: During deliberations on 5/29/09 by the ICC Ad Hoc Committee on Wall bracing it was pointed out that limitations on the continuously sheathed method were inconsistent with limitations of other bracing methods in the IRC. For example, the same limitations are not applicable where walls are intermittently-sheathed. At the time this inconsistency was found, it was too late to correct the broader proposal being put forward by the ICC Ad Hoc Committee and therefore recommended to be submitted as a separate change proposal.

Cost Impact: The code change proposal will not increase the cost of construction.

R602.10.6.2, Figure R602.10.6.2(2), Figure R602.10.6.2(3)

Proponent: Gary Ehrlich, National Association of Home Builders (NAHB)

1. Revise as follows:

R602.10.6.2 Connections to roof framing. Exterior *braced wall panels* shall be connected to roof framing as follows.

1. Parallel rafters or roof trusses shall be attached to the top Top plates of exterior *braced wall panels* shall be attached to rafters or roof trusses above in accordance with Table R602.3(1) and this section. Where required by this section, blocking between rafters or roof trusses shall be attached to top plates of *braced wall panels* and to rafters and roof trusses in accordance with Table R602.3(1). A continuous band, rim, or header joist or roof truss parallel to the *braced wall panels* shall be permitted to replace the blocking required by this section. Blocking shall not be required over openings in continuously-sheathed *braced wall lines*. In addition to the requirements of this section, lateral support shall be provided for rafters and ceiling joists in accordance with Section R802.8 and for trusses in accordance with Section R802.10.3. Roof ventilation shall be provided in accordance with R806.1. .

2 1. For SDC A, B and C and wind speeds less than 100 miles per hour (45 m/s), where the distance from the top of the *braced wall panel* to the top of the rafters or roof trusses above and perpendicular top plates is 91/4 inches (235 mm) or less, the rafters or roof trusses shall be connected to the top plates of *braced wall lines* in accordance with Table R602.3(1) and blocking between rafters or roof trusses shall need not be installed required. Where the distance from the top of the *braced wall panel* to the top of the rafters above and perpendicular top plates is between 91/4 inches (235 mm) and 151/4 inches (387 mm) the rafters shall be connected to the top plates of *braced wall panels* with blocking between rafters shall be provided above the *braced wall panel* in accordance with Figure R602.10.6.2(1) and attached in accordance with Table R602.3(1). Where the distance from the top of the *braced wall panel* to the top of the roof trusses and perpendicular top plates above is between 91/4 inches (235 mm) and 151/4 inches (387 mm) the roof trusses shall be connected to the top plates of *braced wall panels* with blocking in accordance with Table R602.3(1) lateral load transfer shall be provided in accordance with Section R802.10.3.

3 2. For SDC D_0, D_1 and D_2 or wind speeds of 100 miles per hour (45 m/s) or greater, where the distance between from the top of the *braced wall panel* to the top of the rafters or roof trusses and perpendicular top plates is 151/4 inches (387 mm) or less, rafters or roof trusses shall be connected to the top plates of *braced wall panels* with blocking between rafters or roof trusses shall be provided above the *braced wall panel* in accordance with Figure R602.10.6.2(1) and attached in accordance with Table R602.3(1).

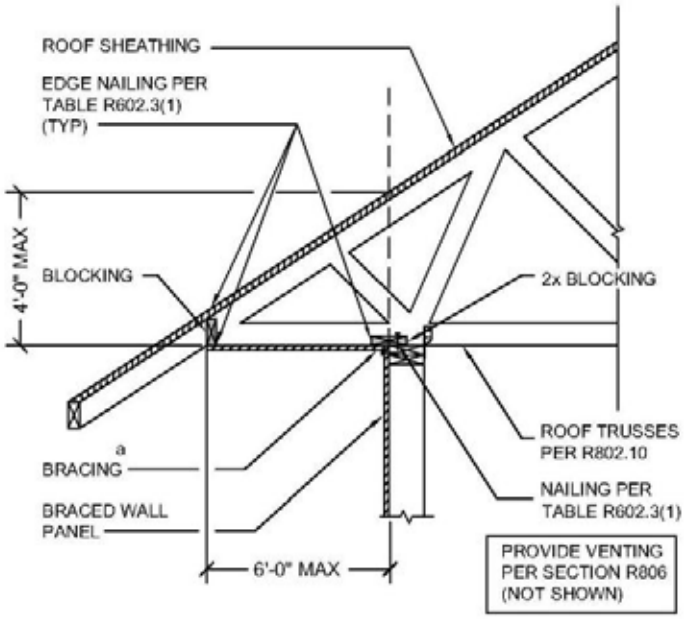
4 3. For all seismic design categories and wind speeds, Where the distance between from the top of the *braced wall panel* to the top of the rafters or roof trusses and perpendicular top plates exceeds 151/4 inches (387 mm), perpendicular rafters or roof trusses shall be connected to the top plates of the *braced wall panels* shall be connected to perpendicular rafters or roof trusses above in accordance with one or more of the following methods:

~~4~~ 3.1. Soffit blocking panels constructed in accordance with Figure R602.10.6.2(2),
~~4~~ 3.2. Vertical blocking panels constructed in accordance with Figure R602.10.6.2(3),
~~4~~ 3.3. ~~With f~~Full ~~-~~height engineered blocking panels designed ~~for values listed in~~ per the AF&PA WFCM ~~American Forest and Paper Association (AF&PA) Wood Frame Construction Manual for One- and Two-Family Dwellings (WFCM). Both the roof and floor sheathing shall be attached to the blocking panels in accordance with Table R602.3(1)~~.

~~4~~ 3.4. Blocking, blocking panels, or other methods of lateral load transfer ~~Designed~~ designed in accordance with accepted engineering ~~methods~~ practice.

~~Lateral support for the rafters and ceiling joists shall be provided in accordance with Section R802.8. Lateral support for trusses shall be provided in accordance with Section R802.10.3. Ventilation shall be provided in accordance with Section R806.1.~~

Replace Figure R602.10.6.2(2) with the following:



a. Methods of bracing shall be as described in Section R602.10.1.1~~R602.10.2 method DWB, WSP, SFB, GB, PBS, PCP OR HPS~~

For SI: 1 inch = 25.4 mm.

FIGURE R602.10.6.2(2)
BRACED WALL PANEL CONNECTION OPTION TO PERPENDICULAR RAFTERS OR ROOF TRUSSES

3. Replace Figure R602.10.6.2(3) with the following:

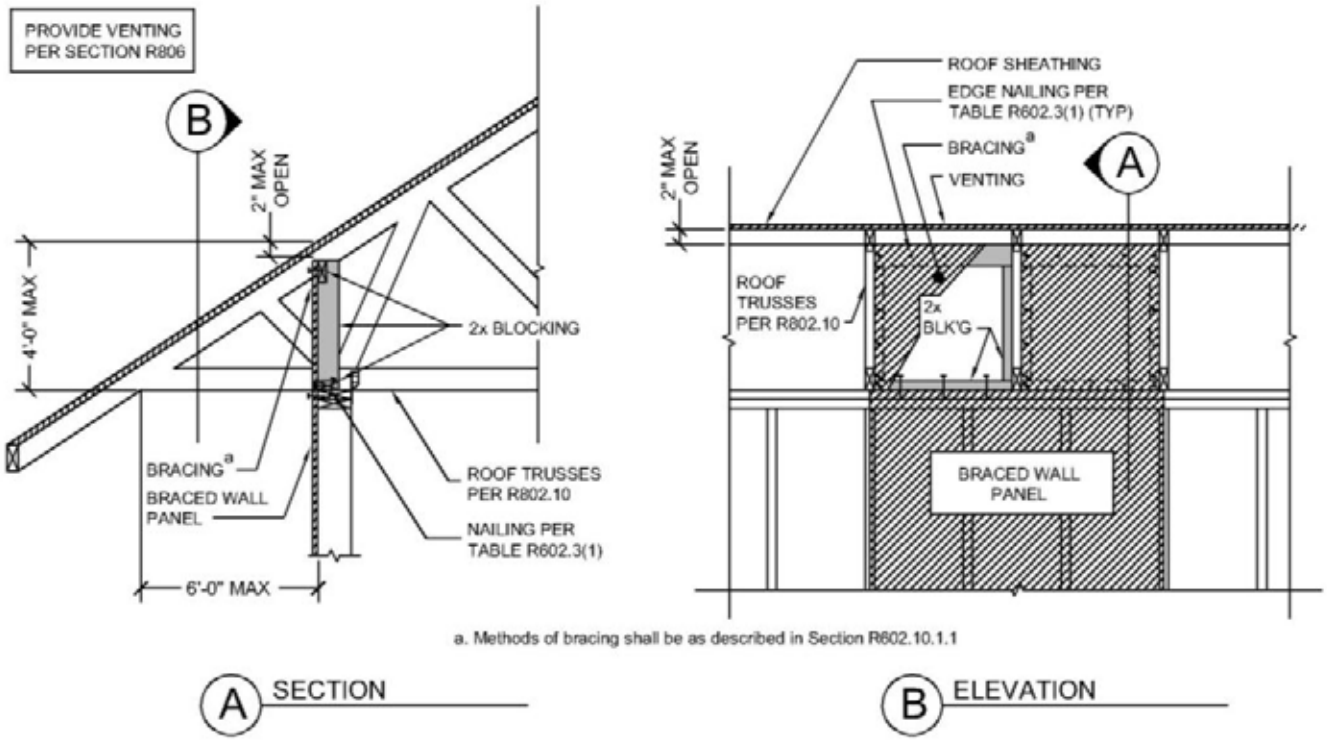


FIGURE R602.10.6.2(3)
BRACED WALL PANEL CONNECTION OPTION TO PERPENDICULAR RAFTERS OR ROOF TRUSSES

Reason: The purpose of this proposal is to amend and simplify the language for blocking between roof rafters and trusses over braced wall panels added during the 2007-2008 Code Development Cycle. The 2009 IRC language is incomprehensible and will create an enforcement nightmare. The change is primarily editorial, although minor technical changes have been introduced.

The terminology in the original code change is often unclear. Terms such as "parallel rafters or roof trusses" and "perpendicular top plates" leave it unclear as to what the framing members or top plates are parallel or perpendicular to. The statement that "blocking need not be installed" is permissive language. The text can even be taken to read that the BLOCKING is what's used to connect the rafter/truss to the top plate. To simplify the requirements, all of the references to "parallel" or "perpendicular" are removed, and the multiple references to Table R602.3(1) replaced with one comprehensive reference in the opening paragraph. Further, since this is the wall section, the blocking requirements and triggers are flipped so the braced wall panel is the point of reference, not the roof framing.

Language allowing a continuous rim board, rim joist, or truss in lieu of the blocking is added. This allows the distinction between "parallel" and "perpendicular" to be removed throughout the proposal, since providing a continuous member over the braced wall panels will be the obvious solution where roof framing direction is parallel to the panels and the framing depth is deep enough to require blocking.

Figures R602.10.6.2(2) and R602.10.6.2(3) are extensively revised. The details are clarified to indicate the blocking panel is only required at the braced wall panels, not along the entire braced wall line. The list of allowable methods is revised to point to Section R602.10.1.1, which includes all the allowable intermittent and continuous bracing methods, including the various alternate narrow wall panels and portal frames. Finally, the reference to "pre-engineered trusses" is replaced with a reference to R802.10, since roof trusses under the IRC are not required to be designed by an engineer.

NAHB asks for your support of this proposal.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: EHRLICH-RB-12-R602.10.6.2

RB110–09/10
R602.10.8

Proponent: Larry Wainright, Qualtim, Inc., representing the Structural Building components Association (SBCA)

Revise as follows:

R602.10.8 Panel joints. All vertical joints of panel sheathing shall occur over, and be fastened to common studs. Horizontal joints in *braced wall panels* shall occur over, and be fastened to common blocking of a minimum 11/2 inch (38 mm) thickness.

Exceptions:

1. Vertical joints of panel sheathing occurring over a double stud, fastened in accordance with Table R602.3(1), item 11, shall be permitted to be fastened to the adjoining studs.
~~1~~ 2. Blocking at horizontal joints shall not be required in wall segments that are not counted as *braced wall panels*.
~~2~~ 3. Where the bracing length provided is at least twice the minimum length required by Tables R602.10.1.2(1) and R602.10.1.2(2) blocking at horizontal joints shall not be required in *braced wall panels* constructed using Methods WSP, SFB, GB, PBS or HPS.
~~3~~ 4. When Method GB panels are installed horizontally, blocking of horizontal joints is not required.

Reason: Structures built with pre-manufactured wall panels are becoming more common. Typically, these panels are built with the structural sheathing flush with the edge of the wall section. When two of these sections are installed at the job site, the end stud of each panel is fastened to the abutting panel and the vertical sheathing panel joint is between the two adjoined studs. This common practice should be allowed within the code provided the adjoining studs are properly connected per Table R602.3(1). The result will be wall panels that are easier to manufacture, will result in a higher level of quality since the panels will be easier to keep square, and will incur less damage during transit and installation due to the panel edges being supported by the end studs.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: WAINRIGHT-RB-4-R602.10.8

RB111–09/10
R602.10, R602.12 (New)

Proponent: Chuck Bajnai, Chesterfield County, VA, Chairman, ICC Ad-Hoc Committee on Wall Bracing

1. Revise as follows:

R602.10 Wall bracing. Buildings shall be braced in accordance with this section or, when applicable, Section R602.12. Where a building, or portion thereof, does not comply with one or more of the bracing requirements in this section, those portions shall be designed and constructed in accordance with Section R301.1.

Exception: Detached one- and two-family *dwellings* located in Seismic Design Category C are exempt from the seismic bracing requirements of this section. Wind speed provisions for bracing shall be applicable to detached one- and two-family *dwellings*.

2. Add new section as follows:

R602.12 Simplified wall bracing. Buildings meeting all of the conditions listed below shall be permitted to be braced in accordance with this section as an alternate to the requirements of Section R602.10.

1. A rectangle circumscribing the entire enclosed building, as shown in Figure R602.12.3, shall have no side longer than 60 feet (18 288 mm), and the ratio between the long side and short side shall be a maximum of 3:1.
2. There shall be no more than two stories above the top of a concrete or masonry foundation or basement wall. Permanent wood foundations shall not be permitted.
3. Floors shall not cantilever more than 24 inches (607 mm) beyond the foundation or bearing wall below.
4. Wall height shall not be greater than 10 feet (2743 mm).
5. Interior walls shall not contribute toward bracing required in this section.
6. The building shall have a roof eave-to-ridge height of 15 feet (4572 mm) or less.
7. All exterior walls shall have gypsum board with a minimum thickness of 1/2 inches (12.7 mm) installed on the interior side fastened in accordance with Table R702.3.5.
8. The structure shall be located where the basic wind speed is less than or equal to 90 mph (40 m/s), and the Exposure Category is A or B.
9. The structure shall be located in Seismic Design Category of A, B or C for detached one- and two-family dwellings or Seismic Design Category A or B for townhouses.
10. Cripple walls shall not be permitted in two-story buildings.

When the bracing described in this section is used, the use of other bracing provisions of R602.10, except as specified herein, shall not be permitted.

R602.12.1 Sheathing materials. The following sheathing materials installed on the exterior side of exterior walls shall be used to construct a bracing unit as defined in Section R602.12.2. Mixing materials is prohibited.

1. Wood structural panels with a minimum thickness of 3/8 inch (9.5 mm) fastened in accordance with Table R602.3(3).
2. Structural fiberboard sheathing with a minimum thickness of 1/2 inch (12.7 mm) fastened in accordance with Table R602.3(1).

R602.12.2 Bracing unit. A bracing unit shall be a full-height sheathed segment of the exterior wall with no openings and a minimum length as specified below.

1. When all framed portions of all exterior walls are continuously sheathed in accordance with Section R602.12.1, Including areas between bracing units, above and below openings and on gable end walls, the minimum length of a bracing unit shall be 3 feet (914 mm).
2. When the exterior walls are braced with intermittent sheathing in accordance with Section R602.12.1 and infilled with other materials, the minimum length of a bracing unit shall be 4 feet (1219 mm).

R602.12.2.1 Multiple bracing units. Segments of wall compliant with Section R602.12.2 and longer than the minimum bracing unit length shall be considered as multiple bracing units. The number of bracing units shall be determined by dividing the wall segment length by the minimum bracing unit length. The number of bracing units provided by one or more compliant wall segments shall be added together and rounded down to the nearest whole number. Full-height sheathed segments of wall shorter than the minimum bracing unit length shall not contribute toward a bracing unit except as specified in Section R602.12.6.1.

R602.12.3 Number of bracing units. The number of bracing units required along each side of a building shall be determined by circumscribing a rectangle around the entire enclosed building for each story level as shown in Figure R602.12.3. Each side of the rectangle shall have, at a minimum, the number of bracing units per Table R602.12.3 placed on the parallel exterior walls facing the side of the rectangle. Bracing units shall then be placed using the distribution requirements specified in Section R602.12.4. Mixing intermittent and continuous sheathing shall not be permitted.

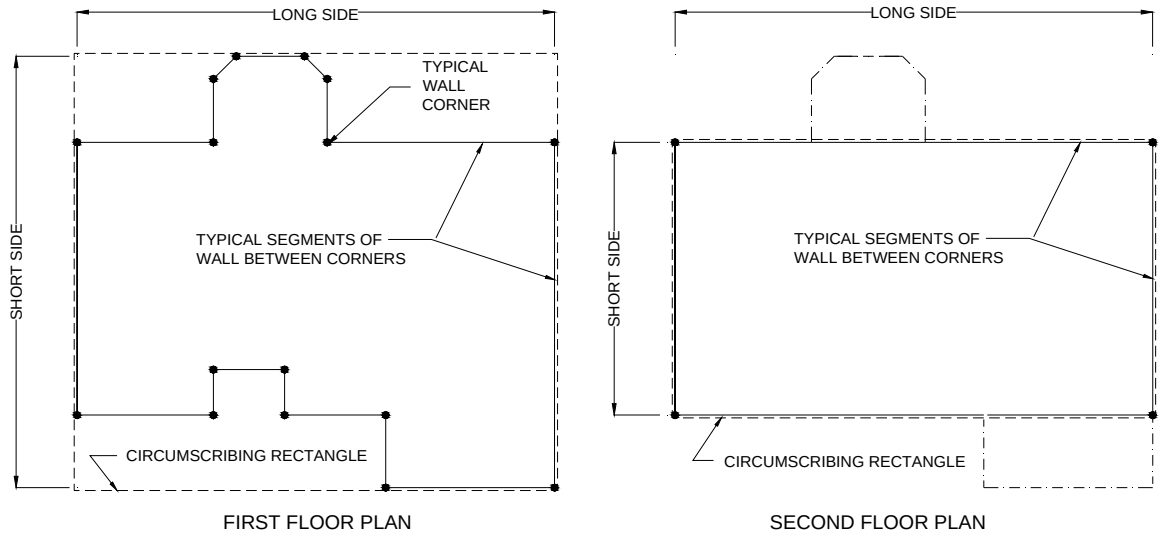

FIGURE R602.12.3
RECTANGLE CIRCUMSCRIBING AN ENCLOSED BUILDING

TABLE R602.12.3
MINIMUM NUMBER OF BRACING UNITS ON EACH SIDE OF A CIRCUMSCRIBED RECTANGLE

STORY LEVEL		EAVE-TO RIDGE HEIGHT (FEET)	MINIMUM NUMBER OF BRACING UNITS ON EACH LONG SIDE [a,b] Length of short side (ft) [c]						MINIMUM NUMBER OF BRACING UNITS ON EACH SHORT SIDE [a,b] Length of long side (ft) [c]					
			10	20	30	40	50	60	10	20	30	40	50	60
	One-story house or second floor of a two-story	10	1	2	2	2	3	3	1	2	2	2	3	3
	First floor of a two-story house		2	3	3	4	5	6	2	3	3	4	5	6
	One-story house or second floor of a two-story	15	1	2	3	3	4	4	1	2	3	3	4	4
	First floor of a two-story house		2	3	4	5	6	7	2	3	4	5	6	7

For SI: 1 ft = 304.8 mm

a. Interpolation shall not be permitted.

b. Cripple walls or wood-framed basement walls in a walk-out condition of a one-story structure shall be designed as the first floor of a two-story house.

c. Actual lengths of the sides of the circumscribed rectangle shall be rounded to the next highest unit of 10 when using this table.

R602.12.4 Distribution of bracing units. The placement of bracing units on exterior walls shall meet all of the following requirements as shown in Figure R602.12.4.

1. A bracing unit shall begin no more than 12 feet (3658 mm) from any wall corner.
2. The distance between adjacent edges of two bracing units shall be no greater than 20 feet (6096 mm).
3. Segments of wall greater than 8 feet (2438 mm) in length shall have a minimum of one bracing unit.

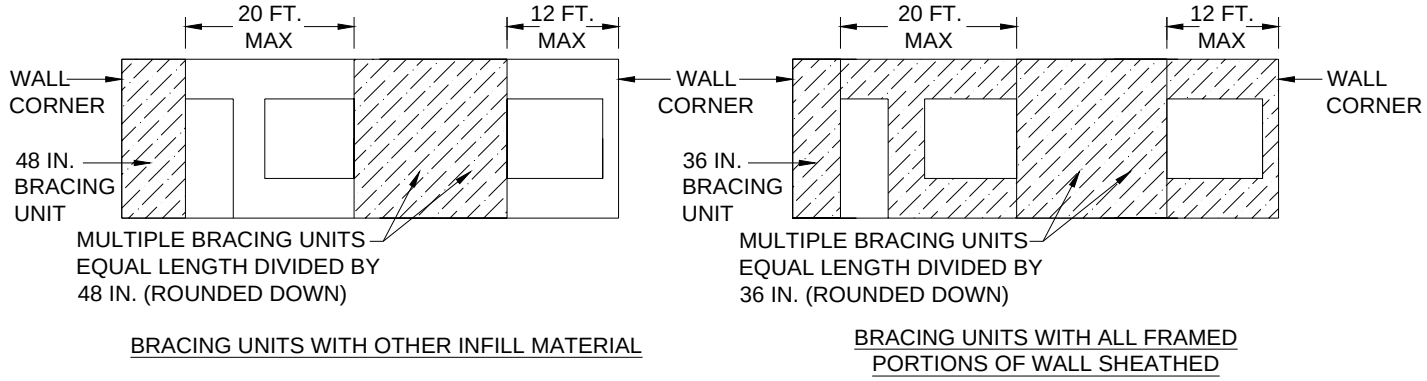

FIGURE R602.12.4
BRACING UNIT DISTRIBUTION

R602.12.5 Narrow panels. The bracing methods referenced in Section R602.10 and specified in Sections R602.12.5.1 through R602.12.5.3 shall be permitted when using simplified wall bracing.

R602.12.5.1 Method CS-G. Braced wall panels constructed as Method CS-G in accordance with Tables R602.10.4.1. and R602.10.4.2 shall be permitted for single story garages when all framed portions of all exterior walls are sheathed with wood structural panels. Each CS-G panel shall be equivalent to 0.5 of a bracing unit. Segments of wall which include a Method CS-G panel shall meet the requirements of Section R602.10.4.4.

R602.12.5.2 Method CS-PF. Braced wall panels constructed as Method CS-PF in accordance with Section R602.10.4.1.1 shall be permitted when all framed portions of all exterior walls are sheathed with wood structural panels. Each CS-PF panel shall equal 0.5 bracing units. A maximum of four CS-PF panels shall be permitted on all the segments of walls parallel to each side of the circumscribed rectangle. Segments of wall which include a Method CS-PF panel shall meet the requirements of Section R602.10.4.4.

R602.12.5.3 Methods PFH and PFG. Braced wall panels constructed as Method PFH and PFG shall be permitted when bracing units are constructed using wood structural panels. Each PFH and panel shall equal one bracing unit, and each PFG shall be equal to 0.75 bracing units.

R602.12.6 Lateral support. For bracing units located along the eaves, the vertical distance from the outside edge of the top wall plate to the roof sheathing above shall not exceed 9.25 inches (235 mm) at the location of a bracing unit unless lateral support is provided in accordance with Section R602.10.6.2.

R602.12.7 Stem walls. Masonry stem walls with a height and length of 48 inches (1219 mm) or less supporting a bracing unit or a Method CS-G, CS-PF or PFG braced wall panel shall be constructed in accordance with Figure R602.10.7. Concrete stem walls with a length of 48" or less, greater than 12 inches tall and less than 6 inches thick shall be reinforced sized and located in accordance with Figure R602.10.7

Reason: As the wall bracing section evolved, it has become more universal and flexible, but, as a result, it has grown in size and complexity. After the Ad Hoc committee's "engineering" work was complete and integrated into the 2009 IRC, we heard back from end users that this section of the code was extremely challenging. The committee therefore wanted to focus on making the 2012 IRC easier to read, easier to understand and easier to use.

The Ad Hoc committee strove to provide an easy, prescriptive procedure that would serve most users throughout the country. We defined the "majority of the country" as users in the 90 mph and SDC A and B areas.

The Committee developed a quick, prescriptive approach for those homes that fall within certain limitations. This simplified approach:

1. Eliminated all of the extra text provisions required for high seismic areas,
2. Eliminated the requirement for braced wall lines,
3. Quantified the amount of bracing using a simple table, and
4. Eliminated from the text the less-often utilized (and frequently the most verbose) bracing methods and concentrated on the most common bracing materials.

Simplified wall bracing incorporates intermittent and continuous sheathing methods (wood structural panels and structural fiberboard), but defines a braced wall panel and its minimum length as a "bracing unit." The minimum number of bracing units is determined by first drawing a rectangle around the building and then using its dimensions to select the total bracing from Table R602.12.3. Bracing units are also required to be placed per the distribution requirements in Section R602.12.4

This simplified method is intended as one easier to use option. Where homes do not qualify because they are located in higher wind or seismic zones, or are more complex in structure, or if the builder simply prefers it, the traditional "long" approach can still be used.

Cost Impact: The code change proposal will not increase the cost of construction.

Proponent: Charles Clark, Brick Industry Association, representing the Masonry Alliance for Codes and Standards (MACS)

Revise as follows:

R602.12 Wall bracing and stone and masonry veneer. Where stone and masonry veneer is installed in accordance with Section R703.7, wall bracing on exterior *braced wall lines*, and *braced wall lines* on the interior of the building, shall comply with this section. In Seismic Design Categories D_0, D_1 and D_2, cripple walls shall not be permitted, and required *braced wall lines* on the interior of the building shall be supported on continuous foundations.

For all buildings in Seismic Design Categories A and~~,~~ B, ~~and~~ for townhouses in Seismic Design Category C, and for one- or two-family dwellings in Seismic Design Category D_0, wall bracing ~~at exterior and interior *braced wall lines*~~ shall be in accordance with Section R602.10 and the additional requirements of Table R602.12(1).

For townhouses in Seismic Design Category D_0 and detached one- or two-family *dwellings* in Seismic Design Categories D_0, D_1 and D_2, wall bracing and hold downs ~~at exterior and interior *braced wall lines*~~ shall be in accordance with Sections R602.10 and R602.11 and the additional requirements of Section R602.12.1, ~~and~~ Table R602.12(2) and Figure R602.12. ~~In Seismic Design Categories D_0, D_1 and D_2, cripple walls are not permitted, and required interior *braced wall lines* shall be supported on continuous foundations.~~

R602.12.1 Townhouses in Seismic Design Category D_0 and one- or two-family dwellings in Seismic Design Categories ~~D_0,~~ D_1 and D_2. Wall bracing where stone and masonry veneer exceeds the first story height for townhouses in Seismic Design Category D_0 and one- or two-family dwellings in Seismic Design Categories ~~D_0,~~ D_1 and D_2 shall conform to the requirements of Sections R602.10 and R602.11 and ~~the following requirements~~ Sections R602.12.1.1 to R602.12.1.6.

R602.12.1.3 Braced wall panel construction. *Braced wall panels* shall be constructed of wood structural panel sheathing with a thickness of not less than 7/16 inch (11 mm) nailed with 8d common nails spaced 4 inches (102 mm) on center at all panel edges and 12 inches (305 mm) on center at intermediate supports. The end of each *braced wall panel* shall have a hold down device in accordance with Table R602.12(2) installed at each end. Size, height and spacing of wood studs shall be in accordance with Table R602.3(5).

a. Cripple walls ~~are~~ shall not be permitted in Seismic Design Categories D_0, D_1 or D_2.
b. Applies to exterior ~~and interior~~ braced wall lines~~,~~ and braced wall lines on the interior of the building. Required braced wall lines on the interior of the building shall be supported on a continuous foundation.
c. Comply with Figure R602.12. Hold down force is minimum allowable stress load for connector providing uplift tie from wall framing at end of braced wall panel at the noted story to wall framing at end of braced wall panel at the story below, or to foundation or foundation wall. Use single story hold down force where edges of braced wall panels do not align; a continuous load path to the foundation shall be maintained. ~~[See Figure R602.12].~~
d. Comply with Figure R602.12. Where hold down connectors from stories above align with stories below, use cumulative hold down force size middle and bottom story hold down connectors. ~~(See Figure R602.12)~~

FIGURE R602.12
~~HOLD DOWNS AT EXTERIOR AND INTERIOR BRACED WALL PANELS~~
STONE OR MASONRY VENEER WALL BRACING HOLD-DOWN REQUIREMENTS FOR SEISMIC DESIGN

(No change to figure)

R703.7 Stone and masonry veneer, general. Stone and masonry veneer shall be installed in accordance with this chapter, Table R703.4 and Figure R703.7. These veneers installed over a backing of wood or cold-formed steel shall be limited to the first *story* above-grade and shall not exceed 5 inches (127 mm) in thickness. See Section R602.12 for wall bracing requirements for masonry veneer for wood framed construction and Section R603.9.5 for wall bracing requirements for masonry veneer for cold-formed steel construction.

Exceptions:

1. For all buildings in Seismic Design Categories A, B and C, exterior stone or masonry veneer, as specified in Table R703.7(1), with a backing of wood or steel framing shall be permitted to the height specified in Table R703.7(1) above a noncombustible foundation.
2. For all buildings in Seismic Design Category D_0 and for detached one- or two-family *dwellings* in Seismic Design Categories ~~D_0,~~ D_1 and D_2, exterior stone or masonry veneer, as specified in Table R703.7(2), with a backing of wood framing shall be permitted to the height specified in Table R703.7(2) above a noncombustible foundation.

TABLE R703.7(1)
STONE OR MASONRY VENEER LIMITATIONS AND REQUIREMENTS, WOOD OR STEEL FRAMING, SEISMIC DESIGN CATEGORIES A, B AND C

SEISMIC DESIGN CATEGORY	NUMBER OF WOOD OR STEEL FRAMED STORIES	MAXIMUM HEIGHT OF VENEER ABOVE NONCOMBUSTIBLE FOUNDATION OR FOUNDATION WALL[a] (feet)	MAXIMUM NOMINAL THICKNESS OF VENEER (inches)	MAXIMUM WEIGHT OF VENEER (psf)[b]	~~WOOD OR STEEL FRAMED STORY~~

	3	20[c]	4	40
One- and two-family dwellings in SDC D_2	1	20[c]	3	30
	2	20[c]	3	30

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm, 1 pound per square foot = 0.479 kPa, 1 pound-force = 4.448 N.

a. Cripple walls ~~are~~ shall not be permitted in Seismic Design Categories D_0, D_1 and D_2.

b. Maximum weight ~~is~~ shall be installed weight and shall include~~s~~ weight of mortar, grout and lath, and other materials used for installation.

c. The veneer shall not exceed 20 feet in height above a noncombustible foundation, with an additional 8 feet permitted for gable end walls, or 30 feet in height with an additional 8 feet for gable end walls where the lower 10 feet has a backing of concrete or masonry wall. ~~See also~~ Comply with story height limitations of Section R301.3.

d. The veneer shall not exceed 30 feet in height above a noncombustible foundation, with an additional 8 feet permitted for gable end walls. ~~See also~~ Comply with story height limitations of Section R301.3.

Reason: This code change adjusts the overly conservative special wall bracing requirements for houses with masonry veneer in moderate to high-seismic regions. This adjustment is based on full-scale whole-building shake-table testing that has demonstrated that the in-plane shear performance of anchored masonry veneer can resist a portion its own seismically-induced load. It showed that the shear capacity of the veneer is significant and can effectively carry a portion of its load directly to the foundation. (Bibliography References 3 & 4 below)

This testing is substantiated by other full-scale tests on whole-houses in the United States, Australia, England, Japan and New Zealand. One study in the United States reported that a two-story split foyer dwelling had a maximum deflection of 0.04 inches (1 mm) at a uniform wind pressure of 25 psf. This deflection was significantly less than that predicted by conventional analysis. Numerous whole-house tests have also been conducted in Australia. These tests demonstrated that conventional residential construction (only slightly different than that in the United States) withstood 2.4 times to 4.75 times its intended design load without failure. In England, researchers have determined that shear loads transferred from veneer to wood-framed shear walls in a full brick-veneered building were reduced by as much as 45% for wind loads. In New Zealand, tests demonstrated that for masonry veneer on conventional wood-stud framing, the veneer can take up to 50% of the lateral in-plane load.

This code change effectively reduces the special wall bracing requirements for wood-stud framing behind masonry veneer in recognition that the veneer carries a significant portion of its own load in-plane.

STONE OR MASONRY VENEER WALL BRACING HOLD-DOWN REQUIREMENTS, ONE- AND TWO-FAMILY DETACHED DWELLINGS, SEISMIC DESIGN CATEGORIES D_0, D_1 AND D_2

(No change to figure)

Reason: The purpose of this proposal is to revise the overly conservative special wall bracing requirements for dwellings with stone or masonry veneer in moderate and high-seismic regions. A common application is for only the front wall of a dwelling to be provided with stone or masonry veneer. However, the provisions as currently stated require the specified bracing length to be increased for every braced wall in the dwelling (both exterior and on the interior), and in high-seismic conditions for hold-downs to be provided on every segment of every braced wall panel in the dwelling.

In recent testing at the University of Texas and UC San Diego, masonry veneer on individual wood-framed wall segments and on a full wood-framed building did not fail until subjected to peak ground accelerations well above the ground motions characteristic of Seismic Design Category D2. Thus, failure did not occur until well beyond the seismic limits of the IRC. Additionally, the major failure mode is veneer falling off the segments and building, rather than any damage to the wood framing back-up.

Additionally, testing at BRANZ in New Zealand of conventionally-braced structure with masonry veneer has shown that the masonry itself is capable of taking as much as 50% of the lateral load delivered in-plane to the wall. Further, the veneer showed good performance up to deflections of an inch. The allowable design capacities for bracing in the IRC result in deflections of around ½-inch, well within the range of good performance seen in the BRANZ tests.

There are no documented racking failures of a properly-braced house with stone or masonry veneer due to a seismic event. (Obviously, lack of veneer reinforcing and ties is an entirely different issue). Based on that fact and the UT, UCSD and BRANZ testing, the current requirement is not technically justified and clearly an onerous burden on masonry veneer construction. The proposed revisions will limit the increases in bracing and vertical load-path connections to just those walls that need to resist the seismic loads imparted to the structure by the masonry veneer.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: EHRLICH-RB-8-R602.12

RB114–09/10
R606.1, Table R606.1 (New)

Proponent: John England, MCO, England Enterprises, Inc.

1. Revise as follows:

R606.1 General. Masonry construction shall be designed and constructed in accordance with the provisions of this section or in accordance with the provisions of ACI 530/ASCE 5/TMS 402. Mortar types and uses shall be in accordance with Table R606.1.

2. Add new table as follows:

TABLE R606.1
MORTAR USES[a]

USE	Type M 2,500 PSI @ 28 days	Type S 1,800 PSI @ 28 days	Type N 750 PSI @ 28 days	Type O 350 PSI @ 28 days
Structural Masonry Units—exterior bearing –underground	X	X		
Structural Masonry Units—exterior bearing –aboveground	X	X	X[b]	
Structural Masonry Units—interior bearing	X	X	X[b]	
Structural Masonry Units—Interior non-bearing	X	X	X	X
Glass block (interior & exterior)		X	X	
Grout	X	X		
Brick Veneer (non-structural)	X	X	X	

a. This table is a summary of mortar types and uses specified in the following locations in this code:
   1. Table R404.1(1) Footnote a;
   2. Section R607.1;
   3. Section R609.1.1;
   4. Section R610.8.

b. Can only be used in Seismic Design Category A, B, or C. See Section R607.1.2.

Reason: This is a new table which will help inspectors, contractor, and design professionals quickly pick the correct mortar for the job at hand.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: ENGLAND-RB-7-R606.1

RB115–09/10
R606.6

Proponent: John England, MCO, England Enterprises, Inc.

Delete and substitute as follows:

~~**R606.6 Piers.** The unsupported height of masonry piers shall not exceed ten times their least dimension. When structural clay tile or hollow concrete masonry units are used for isolated piers to support beams and girders, the cellular spaces shall be filled solidly with concrete or Type M or S mortar, except that unfilled hollow piers may be used if their unsupported height is not more than four times their least dimension. Where hollow masonry units are solidly filled with concrete or Type M, S or N mortar, the allowable compressive stress shall be permitted to be increased as provided in Table R606.5.~~

R606.6 Isolated piers The unsupported height of unfilled hollow masonry piers shall not exceed four times their least dimension.

The unsupported height of solid or hollow masonry unit filled with concrete or Type M or S mortar shall not exceed ten times their least dimension.

Reason: This does not change the meaning. It was reworked to better understand it.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: ENGLAND-RB-8-R606.6

RB116–09/10
R606.6.1

Proponent: Gary Ehrlich, PE, National Association of Home Builders (NAHB)

Revise as follows:

R606.6.1 Pier cap. Hollow piers shall be capped with 4 inches (102 mm) of *solid masonry* or concrete, a masonry cap block, or shall have cavities of the top course filled with concrete or grout, unless a sill plate of 2-inch (51 mm) minimum nominal thickness and bearing on two face shells is provided. The sill plate shall provide a minimum nominal bearing area of 48 square inches (30 865 square mm). ~~or other *approved* methods.~~

Reason: The purpose of this proposal is to provide additional options for providing bearing at the top of masonry piers. No guidance is currently provided in the code for the common condition where the top of a masonry pier does not match the bottom of the floor framing. Even if the pier has been properly constructed with solid masonry or grouted cells, the code does not clearly require direct bearing, and this gap is often filled with shims or small blocks that are not adequate to transfer the reaction from the beam or girder to the pier. Language previously included in Section 1804.6.4 of the 1999 SBC requiring a nominal section of sill plate is added to R606.6.1. Also, a reference to a masonry cap block (or "FHA block") is added. These blocks have a solid top surface over hollow cores and are intended to be used at the top courses of masonry piers or walls. However, the "cap" is not 4" thick, hence the need for a separate reference.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

	S	1/2				—	—	1		
	S	—				—	1	—		
	N	—				—	—	1		
	O	—				—	—	1		

		PROPORTIONS BY VOLUME (cementitious materials)		
	Type	**Portland Cement or Blended Cement**	**Hydrated Lime[c] or Lime Putty**	**Aggregate Ratio (sand damp and loose)**
Cement Lime Mortar	M	1	1/4	Not less than 2 1/4 and not more than 3 times the sum of the separate volumes of cementitious materials
	S	1	Over 1/4 to 1/2	
	N	1	Over 1/2 to 1 1/4	
	O	1	Over 1 1/4 to 2 1/2	

	Type	**Portland Cement or Blended Cement**	**Mortar Cement or Masonry Cement**	**Type N**	**Aggregate Ratio (sand damp and loose)**
Mortar Cement or Masonry Cement	M, S, N, O	N/A	1	N/A	Not less than 2 1/4 and not more than 3 times the sum of the separate volumes of cementitious materials
	M	1	N/A	1	
	S	1/2	N/A	1	

For SI: 1 cubic foot = 0.0283 m3, 1 pound = 0.454 kg.

a. For the purpose of these specifications, the weight of 1 cubic foot of the respective materials shall be considered to be as follows:

Portland Cement	94 pounds	Masonry Cement	Weight printed on bag
Mortar Cement	Weight printed on bag	Hydrated Lime	40 pounds
Lime Putty (Quicklime)	80 pounds	Sand, damp and loose	80 pounds of dry sand

b. Two air-entraining materials shall not be combined in mortar.

c. Hydrated lime conforming to the requirements of ASTM C 207.

Reason: Easier to read and understand.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: ENGLAND-RB-3-T. R607.1

RB118–09/10
R607.3

Proponent: Charles Clark, Brick Industry Association, representing the Masonry Alliance for Codes and Standards (MACS)

Revise as follows:

R607.3 Installation of wall ties. The installation of wall ties shall be as follows:

1. The ends of wall ties shall be embedded in mortar joints. Wall ties shall have a minimum of 5/8 inch (15.9 mm) mortar coverage from the exposed face. ~~Wall tie ends shall engage outer face shells of hollow units by at least 1/2 inch (13 mm). Wire wall ties shall be embedded at least 11/2 inches (38 mm) into the mortar bed of *solid masonry* units or solid grouted hollow units.~~
2. Wall ties shall not be bent after being embedded in grout or mortar.
3. For solid masonry units, solid grouted hollow units, or hollow units in anchored masonry veneer, wall ties shall be embedded in mortar bed at least 11/2 inches (38 mm).
4. For hollow masonry units in other than anchored masonry veneer, wall ties shall engage outer face shells by at least 1/2 inch (13 mm).

Reason: This code change ensures that anchored masonry veneer, as defined by Section R703.7 as not exceeding 5 inches in thickness, is installed correctly when hollow masonry units are used. For Section R607.3 which addresses wall tie installation, hollow masonry units used in an anchored masonry veneer are distinguished from units that are used otherwise to ensure that wall ties and mortar are installed correctly.

In Item #1, the existing text on minimum tie embedment is deleted and items 3 and 4 are added to address embedment. A requirement for minimum mortar cover of 5/8 inch for wall ties is added. This requirement is the same as the requirement in the anchored masonry veneer provisions of the *Building Code Requirements and Specification for Masonry Structures* (TMS 402/ACI 530/ASCE 5). This document is a consensus standard overseen by three organizations and written under an ANSI-accredited, balanced process to ensure their objectivity. The minimum mortar cover requirements established within this document have been corroborated through this consensus body.

Item #3 is added and requires wall ties used with solid masonry units, solid grouted units or hollow units in anchored masonry veneer be embedded in the mortar bed at least 1½ inches. This is necessary to ensure that there is adequate bond of the mortar to the veneer ties. This embedment requirement is the same as the requirement in the anchored masonry veneer provisions of the *Building Code Requirements and Specification for Masonry Structures* (TMS 402/ACI 530/ASCE 5). This document is a consensus standard overseen by three organizations and written under an ANSI-accredited, balanced process to ensure their objectivity. The minimum embedment provision in this document has been corroborated through this consensus body.

Item #4 is added and requires that wall ties for hollow units used in other applications besides anchored masonry veneer embed the face shell by no less than ½ inch. This allows for the cells of the unit to be subsequently filled with grout.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: CLARK-RB-1-R607.3

RB119–09/10
R612.1, R703.8

Proponent: Jeff Lowinski, representing the Window and Door Manufacturers Association (WDMA)

Revise as follows:

R612.1 General. This section prescribes performance and construction requirements for exterior window and door assemblies installed in walls. Windows and doors shall be installed ~~and flashed~~ in accordance with the fenestration manufacturer's written installation instructions. Window and door openings shall be flashed in accordance with Section R703.8. Written installation instructions shall be provided by the fenestration manufacturer for each window or door.

R703.8 Flashing. ~~*Approved* corrosion-resistant flashing shall be applied shingle-fashion in a manner to prevent entry of water into the wall cavity or penetration of water to the building structural framing components. Self-adhered membranes used as flashing shall comply with AAMA 711. The flashing shall extend to the surface of the exterior wall finish. *Approved* corrosion-resistant flashings shall be installed at all of the following locations:~~ Penetrations and openings in exterior walls shall be flashed or sealed in such a manner that will inhibit entry of water into the wall cavity or penetration of water to the building structural framing components. Flashing components shall be applied shingle fashion and shall direct water to the surface of the exterior wall finish. Material and components used to flash penetrations and openings shall be water-resistant and corrosion-resistant. Self-adhered membranes used as flashing shall comply with AAMA 711. The following locations shall be flashed:

1. Exterior window and door openings. Flashing at exterior window and door openings shall extend to the surface of the exterior wall finish or to the water-resistive barrier for subsequent drainage.
2. At the intersection of chimneys or other masonry construction with frame or stucco walls, with projecting lips on both sides under stucco copings.
3. Under and at the ends of masonry, wood or metal copings and sills.
4. Continuously above all projecting wood trim.
5. Where exterior porches, decks or stairs attach to a wall or floor assembly of wood-frame construction.
6. At wall and roof intersections.
7. At built-in gutters.

Exterior wall plumbing penetrations shall be in accordance with Section P2606.

Reason: The revisions proposed for Chapter 6 clarify that it is window and door assemblies that are installed in walls, and removes the inappropriate flashing text in this chapter since flashing requirements for windows and doors are explicit in Chapter 7.

In Chapter 7, the proposed is intended to be editorial and improves the charging language for flashing. The proposal also directs the reader to the requirements in Section P2606 for exterior wall plumbing penetrations.

Cost Impact: The code change proposal will not increase the cost of construction.

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. PART II WILL BE HEARD BY THE IBC FIRE SAFETY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IRC BUILDING/ENERGY

Revise as follows:

SECTION R313
WINDOW SILLS

R313.1 ~~R612.2~~ Window sills. In dwelling units, where the opening of an operable window is located more than 72 inches (1829 mm) above the finished grade or surface below, the lowest part of the clear opening of the window shall be a minimum of 24 inches (610 mm) above the finished floor of the room in which the window is located. Operable sections of windows shall not permit openings that allow passage of a 4 inch (102 mm) diameter sphere where such openings are located within 24 inches (610 mm) of the finished floor.

Exceptions:

1. Windows whose openings will not allow a 4-inchdiameter (102 mm) sphere to pass through the opening when the opening is in its largest opened position.
2. Openings that are provided with window fall prevention devices that comply with Section R313.2 ~~R612.3~~.
3. Openings that are provided with fall prevention devices that comply with ASTM F 2090.
4. Windows that are provided with opening limiting devices that comply with Section R313.3 ~~R612.4~~.

R313.2 ~~R612.3~~ Window fall prevention devices. Window fall prevention devices and window guards, where provided, shall comply with the requirements of ASTM F 2090.

R313.3 ~~R612.4~~ Window opening limiting devices. When required elsewhere in this code, window opening limiting devices shall comply with the provisions of this section.

R313.3.1 ~~R612.4.1~~ General requirements. Window opening limiting devices shall be self acting and shall be positioned to prohibit the free passage of a 4-in. (102-mm) diameter rigid sphere through the window opening when the window opening limiting device is installed in accordance with the manufacturer's instructions.

R313.3.2 ~~R612.4.2~~ Operation for emergency escape. Window opening limiting devices shall be designed with release mechanisms to allow for emergency escape through the window opening without the need for keys, tools or special knowledge. Window opening limiting devices shall comply with all of the following:

1. Release of the window opening-limiting device shall require no more than 15 pounds (66 N) of force.
2. The window opening limiting device release mechanism shall operate properly in all types of weather.
3. Window opening limiting devices shall have their release mechanisms clearly identified for proper use in an emergency.
4. The window opening limiting device shall not reduce the minimum net clear opening area of the window unit below what is required by Section R310.1.1 of the code.

PART II – IBC FIRE SAFETY

1. Add new text as follows:

1013.1 (IFC [B] 1013.1) General. Guards and operable windows shall comply with this section. Guards shall comply with the provisions of Sections 1013.2 through 1013.7. Operable windows with sills located more than 72 inches above finished grade or other surface below shall comply with Section 1013.8.

2. Revise as follows:

~~1405.13.2~~ **1013.8 (IFC [B] 1013.8) Window Sills**. In Occupancy Groups R-2 and R-3, one – and two-family and multiple-family dwellings, where the opening of the sill portion of an operable window is located more than 72 inches above the finished grade or other surface below, the lowest part of the clear opening of the window shall be at a height not less than 24 inches above the finished floor surface of the room in which the window is located. Glazing between the floor and a height of 24 inches shall be fixed or have openings through which a 4-inch diameter sphere cannot pass.

Exception: Openings that are provided with window guards that comply with ASTM F2006 or F2090.

Reason: PART I - See the reason for the companion change to the IBC. Code users are missing this requirement. It is even more a problem in the IRC as the requirement is 'buried' on the 201st page of the Wall Construction Chapter.

PART II - The proposal simply moves the window opening protection provisions from Chapter 14 to place it among the other guard requirements of Chapter 10. The reason for Section 1405.13.2 is essentially a protection from fall requirement. That is the same reason that 1013 exists. Having this section located in Chapter 14 results in it being frequently overlooked by designers and building officials alike. Placing it in Chapter 10 will result in better compliance.

Cost Impact: The code change proposal will not increase the cost of construction.

PART I – IRC BUILDING/ENERGY

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

PART II – IBC FIRE SAFETY

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

RB121–09/10

R313 (New), R313.1 (New), R313.2 (New), R313.3 (New), R313.3.1 (New), R313.3.2 (New), R612.2, R612.3, R612.4, R612.4.1, R612.4.2

Proponent: Daniel E. Nichols, PE, New York State Division of Code Enforcement and Administration

Relocate to new section as follows:

SECTION R313
WINDOW FALL PROTECTION

~~R612.2~~ **R313.1 Window sills.** In *dwelling* units, where the opening of an operable window is located more than 72 inches (1829 mm) above the finished *grade* or surface below, the lowest part of the clear opening of the window shall be a minimum of 24 inches (610 mm) above the finished floor of the room in which the window is located. Operable sections of windows shall not permit openings that allow passage of a 4 inch (102 mm) diameter sphere where such openings are located within 24 inches (610 mm) of the finished floor.

Exceptions:

1. Windows whose openings will not allow a 4-inchdiameter (102 mm) sphere to pass through the opening when the opening is in its largest opened position.
2. Openings that are provided with window fall prevention devices that comply with Section R612.3.
3. Openings that are provided with fall prevention devices that comply with ASTM F 2090.
4. Windows that are provided with opening limiting devices that comply with Section R612.4.

~~R612.3~~ **R313.2 Window fall prevention devices.** Window fall prevention devices and window guards, where provided, shall comply with the requirements of ASTM F 2090.

~~R612.4~~ **R313.3 Window opening limiting devices.** When required elsewhere in this code, window opening limiting devices shall comply with the provisions of this section.

~~**R612.4.1**~~ **R313.3.1 General requirements.** Window opening limiting devices shall be self acting and shall be positioned to prohibit the free passage of a 4-in. (102-mm) diameter rigid sphere through the window opening when the window opening limiting device is installed in accordance with the manufacturer's instructions.

~~**R612.4.2**~~ **R313.3.2 Operation for emergency escape.** Window opening limiting devices shall be designed with release mechanisms to allow for emergency escape through the window opening without the need for keys, tools or special knowledge. Window opening limiting devices shall comply with all of the following:

1. Release of the window opening-limiting device shall require no more than 15 pounds (66 N) of force.
2. The window opening limiting device release mechanism shall operate properly in all types of weather.
3. Window opening limiting devices shall have their release mechanisms clearly identified for proper use in an emergency.
4. The window opening limiting device shall not reduce the minimum net clear opening area of the window unit below what is required by Section R310.1.1 of the code.

Reason: This proposal places the requirements for fall protection under the guard section. Designers and code officials alike are missing this section as it is within the wall construction section. Other requirements regarding window location, such as light and ventilation, fire separation prohibitions, and windborne debris are all in Chapter 3. This will assist the code users as all of the architectural concerns on window locations will be in the planning chapter.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

RB122–09/10
R612.2; IBC 1405.13.2

Proponent: Paul K. Heilstedt, PE, FAIA, Chair, representing ICC Code Technology Committee (CTC)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. PART II WILL BE HEARD BY THE IBC FIRE SAFETY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IRC BUILDING/ENERGY

Revise as follows:

R612.2 Window sills. In *dwelling* units, where the opening of an operable window is located more than 72 inches (1829 mm) above the finished *grade* or surface below, the lowest part of the clear opening of the window shall be a minimum of ~~24~~ 36 inches (610 mm) above the finished floor of the room in which the window is located. Operable sections of windows shall not permit openings that allow passage of a 4 inch (102 mm) diameter sphere where such openings are located within ~~24~~ 36 inches (610 mm) of the finished floor.

Exceptions:

1. Windows whose openings will not allow a 4-inchdiameter(102 mm) sphere to pass through the opening when the opening is in its largest opened position.
2. Openings that are provided with window fall prevention devices that comply with Section R612.3.
3. Openings that are provided with fall prevention devices that comply with ASTM F 2090.
4. Windows that are provided with opening limiting devices that comply with Section R612.4.

PART II – IBC FIRE SAFETY

Revise as follows:

1405.13.2 Window sills. In Occupancy Groups R-2 and R-3, one- and two-family and multiple-family dwellings, where the opening of the sill portion of an operable window is located more than 72 inches (1829 mm) above the finished grade or other surface below, the lowest part of the clear opening of the window shall be at a height not less than ~~24~~ 36 inches (610 mm) above the finished floor surface of the room in which the window is located. Glazing between the floor and a height of ~~24~~ 36 inches (610 mm) shall be fixed or have openings through which a 4-inch (102 mm) diameter sphere cannot pass.

Exception: Openings that are provided with window guards that comply with ASTM F 2006 or F 2090.

Reason: The ICC Board established the ICC Code Technology Committee (CTC) as the venue to discuss contemporary code issues in a committee setting which provides the necessary time and flexibility to allow for full participation and input by any interested party. The code issues are assigned to the CTC by the ICC Board as "areas of study". Information on the CTC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the following website: http://www.iccsafe.org/cs/cc/ctc/index.html. Since its inception in April/2005, the CTC has held seventeen meetings - all open to the public.
This proposed change is a result of the CTC's investigation of the area of study entitled "Child Window Safety". The scope of the activity is noted as:

> Study the incidence and mechanisms of falls from open windows by children and to investigate the necessity and suitability of potential safeguards and/or revisions to the current codes.

The intent of IBC Section 1405.13.2 and IRC Section R612.2 is clearly to provide safety mechanisms to reduce the possibility of children falling through a window. The CTC has determined that this can be realized in the code in three ways: window fall prevention devices; window opening control devices; or reducing the possibility of accessing the window by increasing the minimum sill height. The purpose of this code change is to reduce the potential hazard by increasing the sill height from 24 inches to 36 inches.

In response to the CTC studying the Climbability of Guards, the National Ornamental & Miscellaneous Metals Association (NOMMA) commissioned a paper entitled "Review of Fall Safety of Children Between the Ages of 18 months and 4 Years in Relation to Guards and Climbing in the Built Environment", referred to in this code change as "NOMMA paper". This paper is posted on the CTC website as noted below. The paper provides a summary of the building code requirements, a critical review of relevant per-reviewed scientific literature on guard research and injury data and includes a section entitled "Children's Interaction with the Built Environment". Included in this section is an analysis of falls from windows where it is noted that "Falls from windows are among the most common types of unintended injuries to children and they are a major health concern" (NOMMA paper page 30). The study efficiently places within a few pages the data on window fall incidents and the means of reducing the number of incidents.

U.S. Fall Injury Data
NOMMA report page 7: The 1,421,137 injuries reported by NEISS between 2002 and 2005, inclusive, correspond to a national average of 51,217,603 based on weighting data included with the record data. The average over the four years is 12,804,401. The weighted estimate of 1,117,278 incidents on average annually for children between the ages of 18 months and 4 years represents 8.7 percent of these incidents. For all the incidents to children between the ages of 18 months and 4 years, 5.6 percent involved stairs, 1.22 percent involved windows, and 0.87 percent involved porches, balconies, open-sided floors, and floor openings.

NOMMA paper page 30 – 33. The paper further cites reports which have been compiled in the table below:

Study	Location	Falls	% fatalities
Vish et al. (2005)	Chicago	11/yr	
Istre et al. (2003)	Dallas county	17/yr	
Benoit et al. (2002)	L.A. county	12/yr (11%)	4% (4 yrs old or less)
Stone et al. (2000)	Cincinnati	12/yr (6.3%)	4.7%
Benoit et al. (2000)	Northern Virginia	11/yr (11%)	

Center of Gravity
NOMMA paper page 11, Table 2: The standing center of gravity of children aged 2 to 3.5 years is 24.1 inches (50th percentile is 22.2 inches) and of children aged 3.5 to 4.5 is 25.2 (50th percentile is 23.6).

A reasonable expectation for the Code is that, absent any fall protection in the window opening, a minimum sill height will be required to reduce the ability of a child to climb onto the sill enabling the fall through the opening. Using a child target age of up to 4 years of age and the associated center of gravity, the code mandated height of 24" is not adequate. A child need only extend themselves on their toes, stand on modest stack of books or blocks or hoist themselves a matter of a few inches with their arms to be able to flop onto the sill and expose themselves to the window opening and the associated risk of falling.

The hazards associated with child window falls cannot be understated as evidenced by the following CPSC Press release dated May 15, 2008:

> NEWS from CPSC
> U.S. Consumer Product Safety Commission
> Office of Information and Public Affairs Washington, DC 20207
>

> **Window Falls Prompts CPSC to Issue Warning**
> WASHINGTON, D.C. - With the arrival of the warmer spring weather, families across the nation are opening their windows to let the fresh air in. This pleasant feeling can quickly turn tragic in households with small children. In recent weeks, several children have fallen from windows. The U.S. Consumer Product Safety Commission is warning parents and caregivers to take precautions to keep children from falling from windows.

"CPSC staff is aware of at least 18 falls from windows through media reports, including two deaths, involving small children since April," said CPSC Acting Chairman Nancy Nord. "We are issuing this warning so parents will take the necessary steps to prevent these incidents from happening."

These deaths and injuries frequently occur when kids push themselves against window screens or climb onto furniture located next to an open window.

From 2002-2004, CPSC staff received an average of 25 reports a year of fatalities associated with falls from windows. Children younger than five years of age account for approximately one-third of these reported fatalities. For all age categories, more males died from window falls than females.

To help prevent injuries and tragedies, CPSC recommends the following safety tips:
* Safeguard your children by using window guards or window stops.
* Install window guards to prevent children from falling out of windows. (For windows on the 6th floor and below, install window guards that adults and older children can open easily in case of fire.)
* Install window stops so that windows open no more than 4 inches.
* Never depend on screens to keep children from falling out of windows.
* Whenever possible, open windows from the top -- not the bottom.
* Keep furniture away from windows, to discourage children from climbing near windows.

To see this release on CPSC's web site, please go to:
http://www.cpsc.gov/cpscpub/prerel/prhtml08/08270.html

Cost Impact: The code change proposal will not increase the cost of construction.

PART I – IRC BUILDING/ENERGY

	Assembly:	ASF	AMF	DF

PART II – IBC FIRE SAFETY

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: HEILSTEDT-RB-2-R612-IBC 1405.13.2

RB123–09/10

R612.2, R612.3, R612.4, R612.4.1, R612.4.2; IBC 1405.13.2, 1405.13.2.1 (New)

Proponent: Paul K. Heilstedt, PE, FAIA, Chair, representing ICC Code Technology Committee (CTC)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. PART II WILL BE HEARD BY THE IBC FIRE SAFETY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IRC BUILDING/ENERGY

1. Revise as follows:

R612.2 Window sills. In dwelling units, where the opening of an operable window is located more than 72 inches (1829 mm) above the finished grade or surface below, the lowest part of the clear opening of the window shall be a minimum of 24 inches (610 mm) above the finished floor of the room in which the window is located. Operable sections of windows shall not permit openings that allow passage of a 4 inch diameter sphere where such openings are located within 24 inches of the finished floor.

Exceptions:

1. Windows whose openings will not allow a 4-inch-diameter (102 mm) sphere to pass through the opening when the opening is in its largest opened position.
2. ~~Openings that are provided with window fall prevention devices that comply with Section R612.3.~~
3. Openings that are provided with window fall prevention devices that comply with ASTM F 2090.
4. Windows that are provided with window opening ~~limiting~~ control devices that comply with ~~Section R612.4.~~ R612.3.

2. Delete without substitution:

~~**R612.3 Window fall prevention devices.** Window fall prevention devices and window guards, where provided, shall comply with the requirements of ASTM F 2090.~~

3. Renumber and revise Section R612.4 as follows:

~~**R612.4**~~ **R612.3 Window opening ~~limiting~~ control devices.** When required elsewhere in this code, window opening ~~limiting~~ control devices shall comply with ~~the provisions of this section.~~ ASTM F 2090. The window opening control device, after operation to release the control device allowing the window to fully open, shall not reduce the minimum net clear opening area of the window unit to less than the area required by Section R 310.1.1. The device or any portion thereof shall not project more than 1 inch into the required net clear opening for a length not exceeding 3 inches when the window is in the fully open position.

4. Delete without substitution:

~~**R612.4.1 General requirements**. Window opening limiting devices shall be self- acting and shall be positioned so as to prohibit the free passage of a 4.0-in. (102-mm) diameter rigid sphere through the window opening when the window opening limiting device is installed in accordance with the manufacturer's instructions.~~

~~**R612.4.2 Operation for Emergency Escape.** Window opening limiting devices shall be designed with release mechanisms to allow for emergency escape through the window opening without the need for keys, tools or special knowledge. Window opening limiting devices shall comply with all of the following:~~

1. ~~Release of the window opening-limiting device shall require no more than 15 lbf (66 N) of force.~~
2. ~~The window opening limiting device release mechanism shall operate properly in all types of weather.~~
3. ~~Window opening limiting devices shall have their release mechanisms clearly identified for proper use in an emergency.~~
4. ~~The window opening limiting device shall not reduce the minimum net clear opening area of the window unit below what is required by Section R310.1.1 of the code.~~

PART II – IBC FIRE SAFETY

1. Revise as follows:

1405.13.2 Window sills. In Occupancy Groups R-2 and R-3, one- and two-family and multiple-family dwellings, where the opening of the sill portion of an operable window is located more than 72 inches (1829 mm) above the finished grade or other surface below, the lowest part of the clear opening of the window shall be a minimum of 24 inches (610 mm) above the finished floor surface of the room in which the window is located. ~~Glazing between the floor and a height of 24 inches (610 mm) shall be fixed or have openings such that a 4-inch (102 mm) diameter sphere cannot pass through.~~ Operable sections of windows shall not permit openings that allow passage of a 4 inch diameter sphere where such openings are located within 24 inches of the finished floor.

Exception~~s~~:

~~Openings that are provided with window guards that comply with ASTM F 2006 or F 2090.~~

1. Windows whose openings will not allow a 4-inch-diameter (102 mm) sphere to pass through the opening when the opening is in its largest opened position.
2. Openings that are provided with window fall prevention devices that comply with ASTM F 2090.
3. Windows that are provided with window opening control devices that comply with Section 1405.13.2.1..

2. Add new text as follows:

1405.13.2.1 Window opening control devices. When required elsewhere in this code, window opening control devices shall comply with ASTM F 2090. The window opening control device, after operation to release the control device allowing the window to fully open, shall not reduce the minimum net clear opening area of the window unit to less than the area required by Section 1029.2. The device or any portion thereof shall not project more than 1 inch into the required net clear opening for a length not exceeding 3 inches when the window is in the fully open position.

Reason: The ICC Board established the ICC Code Technology Committee (CTC) as the venue to discuss contemporary code issues in a committee setting which provides the necessary time and flexibility to allow for full participation and input by any interested party. The code issues are assigned to the CTC by the ICC Board as "areas of study". Information on the CTC, including: meeting agendas; minutes; reports; resource documents;

presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the following website: http://www.iccsafe.org/cs/cc/ctc/index.html. Since its inception in April/2005, the CTC has held seventeen meetings - all open to the public.
This proposed change is a result of the CTC's investigation of the area of study entitled "Child Window Safety". The scope of the activity is noted as:

> Study the incidence and mechanisms of falls from open windows by children and to investigate the necessity and suitability of potential safeguards and/or revisions to the current codes.

This code change is a follow-up to code change RB173-07/08 last cycle. At the Final Action Hearings in Minneapolis, the membership approved RB 173-07/08 Part 1 (Public Comment 2) to the IRC to include prescriptive provisions for window opening limiting devices but failed to approve the corresponding and identical provisions to the IBC. The proposal corrects this inconsistent action as well as replaces the prescriptive provisions with a reference to a consensus standard which has been updated to specifically address these devices.

IRC/IBC coordination: The result of this two part code change will be consistency between the IBC and IRC in terms of requirements.
Updated standard ASTM F2090 – 08: Both the IBC and IRC currently reference the 2007 edition of the standard entitled "Specification for Window Fall Prevention Devices with Emergency Escape (Egress Release Mechanisms". This standard was updated in 2008 to address window opening control devices. However, it was not updated in time to be included by reference in the 2009 IBC and IRC. This standard includes the necessary window operational criteria which results in the window not being able to be opened beyond the 4 inch performance threshold which is currently found in IRC Section R612.4.1. This control device can be released to allow the window to be fully opened in order to comply with the emergency escape provisions in both the IBC (1029.2) and IRC (R310.1.1)

Cost Impact: The code change proposal will not increase the cost of construction.

PART I – IRC BUILDING/ENERGY

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

PART II – IBC FIRE SAFETY

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: HEILSTEDT-RB-1-R612-IBC 1405.13.2

RB124–09/10

R612.2, R612.3, R612.4, R612.4.1, R612.4.2, Chapter 44 (New)

Proponent: Julie Ruth, JRuth Code Consulting, representing AAMA Window Opening Control Device Task Group

1. Revise as follows:

R612.2 Window sills. In *dwelling* units, where the opening of an operable window is located more than 72 inches (1829 mm) above the finished *grade* or surface below, the lowest part of the clear opening of the window shall be a minimum of 24 inches (610 mm) above the finished floor of the room in which the window is located. Operable sections of windows shall not permit openings that allow passage of a 4 inch (102 mm) diameter sphere where such openings are located within 24 inches (610 mm) of the finished floor.

Exceptions:

1. Windows whose openings will not allow a 4-inchdiameter (102 mm) sphere to pass through the opening when the opening is in its largest opened position.
2. ~~Openings that are provided with window fall prevention devices that comply with Section R612.3.~~
3 ~~3~~ 2. Openings that are provided with fall prevention devices that comply with ASTM F 2090.
4 ~~4~~ 3. Windows that are provided with opening ~~limiting~~ control devices that comply with Section ~~R612.4~~ R612.3.

2. Delete without substitution:

~~**R612.3 Window fall prevention devices.** Window fall prevention devices and window guards, where provided, shall comply with the requirements of ASTM F 2090.~~

3. Renumber and revise as follows:

~~**R612.4**~~ **612.3 Window opening ~~limiting~~ control devices.** When required elsewhere in this code, window opening ~~limiting~~ control devices shall comply with the provisions of ~~this section~~ AAMA 909.

4. Delete without substitution:

~~**R612.4.1 General requirements.** Window opening limiting devices shall be self acting and shall be positioned to prohibit the free passage of a 4-in. (102-mm) diameter rigid sphere through the window opening when the window opening limiting device is installed in accordance with the manufacturer's instructions.~~

~~**R612.4.2 Operation for emergency escape.** Window opening limiting devices shall be designed with release mechanisms to allow for emergency escape through the window opening without the need for keys, tools or special knowledge. Window opening limiting devices shall comply with all of the following:~~

1. ~~Release of the window opening limiting device shall require no more than 15 pounds (66 N) of force.~~
2. ~~The window opening limiting device release mechanism shall operate properly in all types of weather.~~
3. ~~Window opening limiting devices shall have their release mechanisms clearly identified for proper use in an emergency.~~
4. ~~The window opening limiting device shall not reduce the minimum net clear opening area of the window unit below what is required by Section R310.1.1 of the code.~~

5. Add new standard to Chapter 44 as follows:

AAMA 909 Voluntary Specification for Window Opening Control Devices

Reason: The requirements of current Section R612.4 for window opening limiting devices does not provide adequate detail for their design. The 2008 edition of ASTM F2090 attempts to provide greater guidance, but as the members of the AAMA Window Opening Control Device task group, which was created specifically to respond to this new requirement in the International Codes, discovered when they began attempting to design devices to meet this standard, there are inconsistencies and confusion within ASTM F2090-08. Therefore, the members of the AAMA WOCD TG have begun the development of an AAMA standard for these devices, with a goal of completing the standard in time to be referenced in the 2012 International Residential Code.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: A review of the standard proposed for inclusion in the code, AMMA 909, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

Proponent: Jeff Lowinski, representing the Window and Door Manufacturers Association (WDMA)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. PART II WILL BE HEARD BY THE IBC FIRE SAFETY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IRC BUILDING/ENERGY

1. Add new text as follows:

R310.2 Window fall prevention devices. Window guards and window opening control devices, where provided, shall comply with ASTM F2090.

2. Delete without substitution:

~~**R612.3 Window fall prevention devices.** Window fall prevention devices and window guards, where provided, shall comply with the requirements of ASTM F 2090.~~

~~**R612.4 Window opening limiting devices.** When required elsewhere in this code, window opening limiting devices shall comply with the provisions of this section.~~

~~**R612.4.1 General requirements.** Window opening limiting devices shall be self acting and shall be positioned to prohibit the free passage of a 4 in. (102 mm) diameter rigid sphere through the window opening when the window opening limiting device is installed in accordance with the manufacturer's instructions.~~

~~**R612.4.2 Operation for emergency escape.** Window opening limiting devices shall be designed with release mechanisms to allow for emergency escape through the window opening without the need for keys, tools or special knowledge. Window opening limiting devices shall comply with all of the following:~~

1. ~~Release of the window opening limiting device shall require no more than 15 pounds (66 N) of force.~~
2. ~~The window opening limiting device release mechanism shall operate properly in all types of weather.~~
3. ~~Window opening limiting devices shall have their release mechanisms clearly identified for proper use in an emergency.~~
4. ~~The window opening limiting device shall not reduce the minimum net clear opening area of the window unit below what is required by Section R310.1.1 of the code.~~

PART II – IBC FIRE SAFETY

1. Add new text as follows:

1029.4.1 Window fall prevention devices. Window guards and window opening control devices, where provided, shall comply with ASTM F2090.

Exception. Window guards installed in windows located more than 75 feet above adjacent grade shall be permitted to comply with ASTM F2006.

2. Delete without substitution:

~~**1405.13.2 Window sills.** In Occupancy Groups R-2 and R-3, one- and two-family and multiple-family dwellings, where the opening of the sill portion of an operable window is located more than 72 inches (1829 mm) above the finished grade or other surface below, the lowest part of the clear opening of the window shall be at a height not less than 24 inches (610 mm) above the finished floor surface of the room in which the window is located. Glazing between the floor and a height of 24 inches (610 mm) shall be fixed or have openings through which a 4-inch (102 mm) diameter sphere cannot pass.~~

~~**Exception:** Openings that are provided with window guards that comply with ASTM F 2006 or F 2090.~~

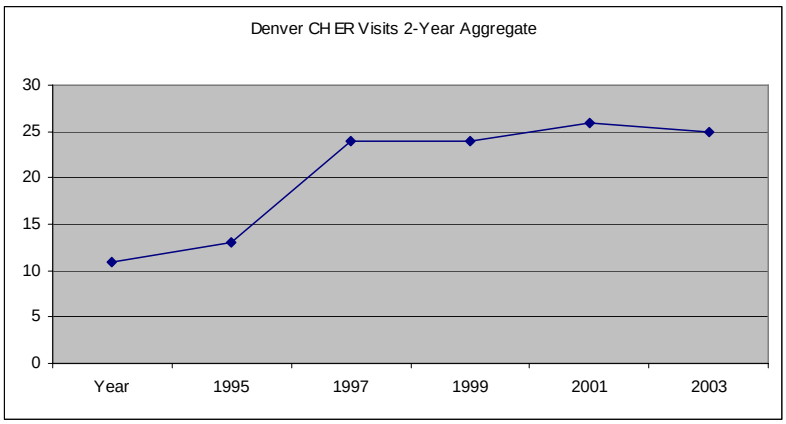
Reason: (Parts 1 and 2) The code contains requirements for minimum sill heights that were intended to reduce the likelihood of child window falls. According to the US CPSC, average annual child fall deaths have decreased from 32 to 14 between 1980 and 2000. In 2008, the CSPC reported that annual deaths dropped to less than 9 per year. This significant improvement in child fall safety is the result of the two-pronged approach of window safety education and window guard regulations enacted by local jurisdictions.

Despite this safety improvement, one large metropolitan MSA has bucked the trend. Denver Children's Hospital has shared data suggesting that ER visits resulting from child window falls have been increasing.

Denver is the only major MSA in the US that has required windows to be installed at a minimum sill height, yet the improved safety record reported by the CPSC does not apply in Denver.

WDMA believes that the continued reliance on a minimum sill height could result in more child falls as parents place furniture, including sofas, beds and cribs beneath open windows. Proponents of sill height minimums have continued to ignore the Denver scenario, but WDMA is concerned that this failure to study the issue could result in more injuries and deaths nationwide.

Approval of this proposal will remove the minimum sill height requirement, but mandate that window opening control devices and window guards comply with the appropriate ASTM standards.



Cost Impact: The code change proposal will not increase the cost of construction.

Proponent: Jeff Lowinski, representing Window and Door Manufacturers Association (WDMA)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. PART II WILL BE HEARD BY THE IBC FIRE SAFETY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IRC BUILDING/ENERGY

1. Add new text as follows:

R601.4 Windows. Where window rough openings are located higher than the first story above grade, the window rough opening sill shall be a minimum of 21 inches (533 mm) above the rough floor deck of the room in which the window is located.

Exceptions:

1. Windows above an exterior deck or balcony serving that story.
2. Fixed, non-operable windows.
3. Window openings that do not permit a 4" diameter sphere to pass through the opening in the lower half of the window.
4. Window openings with devices complying with ASTM F 2090.

2. Delete without substitution:

~~**R612.2 Window sills.** In *dwelling* units, where the opening of an operable window is located more than 72 inches (1829 mm) above the finished *grade* or surface below, the lowest part of the clear opening of the window shall be a minimum of 24 inches (610 mm) above the finished floor of the room in which the window is located. Operable sections of windows shall not permit openings that allow passage of a 4 inch (102 mm) diameter sphere where such openings are located within 24 inches (610 mm) of the finished floor.~~

~~**Exceptions:**~~
~~1. Windows whose openings will not allow a 4-inchdiameter (102 mm) sphere to pass through the opening when the opening is in its largest opened position.~~
~~2. Openings that are provided with window fall prevention devices that comply with Section R612.3.~~
~~3. Openings that are provided with fall prevention devices that comply with ASTM F 2090.~~
~~4. Windows that are provided with opening limiting devices that comply with Section R612.4.~~

~~**R612.3 Window fall prevention devices.** Window fall prevention devices and window guards, where provided, shall comply with the requirements of ASTM F 2090.~~

~~**R612.4 Window opening limiting devices.** When required elsewhere in this code, window opening limiting devices shall comply with the provisions of this section.~~

~~**R612.4.1 General requirements.** Window opening limiting devices shall be self acting and shall be positioned to prohibit the free passage of a 4-in. (102-mm) diameter rigid sphere through the window opening when the window opening limiting device is installed in accordance with the manufacturer's instructions.~~

~~**R612.4.2 Operation for emergency escape.** Window opening limiting devices shall be designed with release mechanisms to allow for emergency escape through the window opening without the need for keys, tools or special knowledge. Window opening limiting devices shall comply with all of the following:~~

1. ~~Release of the window opening-limiting device shall require no more than 15 pounds (66 N) of force.~~
2. ~~The window opening limiting device release mechanism shall operate properly in all types of weather.~~
3. ~~Window opening limiting devices shall have their release mechanisms clearly identified for proper use in an emergency.~~
4. ~~The window opening limiting device shall not reduce the minimum net clear opening area of the window unit below what is required by Section R310.1.1 of the code.~~

PART II – IBC FIRE SAFETY

Delete and substitute as follows:

~~**1405.13.2 Window sills.** In Occupancy Groups R-2 and R-3, one- and two-family and multiple-family dwellings, where the opening of the sill portion of an operable window is located more than 72 inches (1829 mm) above the finished grade or other surface below, the lowest part of the clear opening of the window shall be at a height not less than 24 inches (610 mm) above the finished floor surface of the room in which the window is located. Glazing between the floor and a height of 24 inches (610 mm) shall be fixed or have openings through which a 4-inch (102 mm) diameter sphere cannot pass.~~

~~**Exception:** Openings that are provided with window guards that comply with ASTM F 2006 or F 2090.~~

1405.13.2 Window rough openings. Where window rough openings are located higher than the first story above grade, the window rough opening sill shall be a minimum of 21 inches (533 mm) above the rough floor deck of the room in which the window is located.

Exceptions:

1. Windows above an exterior deck or balcony serving that story.
2. Fixed, non-operable windows.
3. Window openings that do not permit a 4" diameter sphere to pass through the opening in the lower half of the window.
4. Window openings with devices complying with ASTM F2090 or F2006.

Reason: (Parts 1 and 2) The current code requirement for minimum sill heights has caused some issues with builders after window installation and the minimum is triggered. By changing the requirement to a rough opening dimension that equates to a 24" sill opening, the construction process will be streamlined. This proposal also simplifies the trigger by removing the 72" dimension from adjacent grade and inserting instead a reference to location above the first story above grade. This change will not result in a material change in the height of window installations.
Removing the prescriptive requirements for window opening-limiting devices removes conflicts between the referenced standard and the code.

Cost Impact: The code change proposal will not increase the cost of construction.

R612.8, Chapter 44 (New)

Proponent: Jeff Burton, Director of Codes and Standards, representing Association of Millwork Distributors

1. Revise as follows:

R612.8 Other exterior window and door assemblies. Exterior windows and door assemblies not included within the scope of Section R612.6 or Section R612.7 shall be tested in accordance with ASTM E 330 or AMD SHEDS. Glass in assemblies covered by this exception shall comply with Section R308.5.

2. Add new standard to Chapter 44 as follows:

AMD Association of Millwork Distributors
10047 Robert Trent Jones Boulevard
Port Richey, FL 34655

SHEDS Side Hinged Exterior Door Standard

Reason: The code change proposal adds an additional requirement (option) to the code in that it includes a structural component interchangeability methodology that is prevalent in the side hinged exterior door (SHED) industry but is not addressed in the building codes or its current referenced standards. The addition of the AMD SHEDS (Side Hinged Exterior Door Standard), which is designed in accordance with the current industry ASTM E330 static pressure test, adds that needed structural component interchangeability option.

The current minimum code requirements for SHEDs adequately address concerns with public safety and protection of property, in that, to date, no empirical evidence or testimony has been provided to the ICC code development process proving that SHEDs are a significant failure relating to variable pressure from hurricanes force or high winds, in fact, the foremost leading post hurricane/building code experts provide no significant evidence of actual failures relating to SHEDs*. This lack of evidence supports current regulation and commonly used industry practices (component interchange) in place today. The current code is too restrictive in that it references SHED "system only" test standards and should allow for a SHEDs component interchange option similar to its allowances relating to fire rated doors.

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm.

Deflection criteria: L/240.
Roof load: 7 psf.
Ceiling load: 5 psf.
Second floor live load: 30 psf.
Second floor dead load: 10 psf.
Second floor dead load from walls: 10 psf.
Wind loads based on Table R301.2(2).
Strength axis of facing materials applied vertically.
N/A indicates not applicable.

Reason: The original Table R613.3.2 minimum properties for facing materials were established by the SIPs industry with a specific grade of wood structural panels. Since the adoption of these properties in the 2007 Supplement to the IRC, it has become evident that the panel properties for the wood structural panel facing materials do not reflect the facing materials commonly available in the marketplace, which typically have higher properties in the along direction and lower properties in the across direction.

As a result, the Structural Insulated Panel Association (SIPA) worked with APA – The Engineered Wood Association, a standard developer accredited by ANSI and a certification agency accredited under ISO Guide 65, to re-evaluate the performance of SIPs using the readily available facing materials. Results of this re-evaluation are documented in APA Report T2009P-28, which shows no performance difference for SIP applications covered in IRC R613 when using the new facing materials with higher properties in the along direction and lower properties in the across direction, as compared to the existing IRC. Therefore, Table R613.3.2 is suggested to be revised as proposed based on the properties benchmarked during the SIPs testing. While there were no performance issues, the assumptions used in generating Tables R613.5(1) and R613.5(2) were also reviewed by the SIPA Technical Advisory Committee, which suggested more stringent criteria by not allowing any load duration increase, including wind load, for SIPs. As a result, Tables R613.5(1) and R613.5(2) are suggested to be revised as proposed.

Copies of APA Report T2009P-28 have been provided to the committee and additional copies are available for free download at www.apawood.org.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: KEITH-RB-2-TABLES R613.3.2-R613.5(1)-R613.5(2)

RB129–09/10
R613.7

Proponent: Edward L. Keith, representing APA – The Engineered Wood Association

Revise as follows:

R613.7 Drilling and notching. The maximum vertical chase penetration in SIPs shall have a maximum side dimension of 2 inches (51 mm) centered in the panel core. Vertical chases shall have a minimum spacing of 24-inches (610 mm) on center. Maximum of two horizontal chases shall be permitted in each wall panel - one at 14 inches (360 mm) from the bottom of the panel and one at mid-height of the wall panel. The maximum allowable penetration size in a wall panel shall be circular or rectangular with a maximum dimension of 12 inches (300 mm). The minimum wall length for such a penetration shall be 20 feet (6100 mm) and only one such penetration shall be permitted in each full 20 foot (6100 mm) length of wall. Where multiple penetrations are to be located in a single wall line, they shall be placed no closer together than 20 feet (6100 mm) measured between adjacent edges of two penetrations. Overcutting of holes in facing panels shall not be permitted.

Reason: The existing R613.7 provides no limitation on the field-placement of these holes up to 12" x 12" in size. As such, the proposed language is added to clarify the limitation proposed in the original code proposal in 2006. From an engineering perspective, a hole this size will have minimal impact on the capacity of the wall system as long as the wall or the spacing between holes is sufficiently long (20 feet or longer).

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: KEITH-RB-1-R613.7

RB130–09/10
R614 (New), R614.1 (New)

Proponent: Daniel J. Walker, PE, Thomas Associates, Inc., representing the national Sunroom Association

Add new text as follows:

R614 General. This section prescribes the construction of *patio cover* walls.

R614.1 *Patio Cover* wall configuration. *Patio cover* walls shall be permitted to be open, or enclosed with (1) insect screening, (2) approved translucent or transparent plastic not more than 0.125 inch (3.2 mm) in thickness, (3) glass conforming to the provisions of Section R308, or (4) any combination of the foregoing.

Reason: The current Appendix "H", "Patio Covers" defines the allowable configuration of *patio cover* walls, but is not a part of the body of the code. The term *patio cover* is used in a number of places in the code, so further clarification of the requirements for the allowable wall configuration is necessary.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: WALKER-RB-7-R614

RB131–09/10
R702.2 (New), R702.2.1 (New), R702.2.2 (New), R702.2.3 (New), Chapter 44 (New)

Proponent: Michael D. Fischer, The Kellen Company, representing Kellen Technical Services

1. Add new text as follows:

R702.2 Cellulosic Insulation.

R702.2.1 Material. Cellulose insulation shall comply with the requirements of Chapter 11 of this code or the applicable provisions of the IECC. Cellulosic fiber stabilized thermal insulation shall bear a label indicating compliance with ASTM C1497. Cellulosic Fiber loose-fill thermal insulation shall bear a label indicating compliance with ASTM C739.

R702.2.2 Installation. Cellulosic fiber stabilized thermal insulation shall be installed in accordance with manufacturers installation instructions. Cellulosic Fiber loose-fill thermal insulation shall be installed in accordance with ASTM C1015 and manufacturers installation instructions.

R702.2.3 Drying time. Cellulosic fiber stabilized thermal insulation installed in wall cavities shall remain exposed for a minimum of 24 hours after application, and shall not be covered until the moisture level of the insulation material is 25% or less. The insulation installer shall record moisture measurements on the permanent certificate. The measurements shall include the date and time of installation, date and time of moisture content measurement, and recorded moisture content level. Moisture readings shall be taken from exterior walls in a minimum of three rooms.

2. Add new standards to Chapter 44 as follows:

ASTM

C739-08	Standard Specification for Cellulosic Fiber Loose-Fill Thermal Insulation
C1015-06	Standard Practice for Installation of Cellulosic and Mineral Fiber Loose-Fill Thermal Insulation
C1497-04	Standard Specification for Cellulosic Fiber Stabilized Thermal Insulation

Reason: The move towards more sustainable building practices has created opportunity for innovative products with environmentally-favorable attributes including recycled content. In the case of cellulose insulation, which has gained market share, many of the questions related to fire performance, defective or "settled" R-Value have been addressed in the IECC requirements.

This proposal sets minimum standards for product and installation in accordance with consensus ASTM standards as well as individual manufacturers' instructions. The proposal requires that cellulose insulation products be labeled to ensure that appropriate third-party oversight and quality control measures help to ensure that these systems will perform as intended.

The proposal also includes a requirement that addresses the issue of moisture content. Recommendations from individual manufacturers insist upon adequate drying time to ensure proper performance as well as to inhibit mold growth and other undesirable effects of excessive moisture in the wall cavity.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: A review of the standards proposed for inclusion in the code, ASTM C 739, C 1015 and C 1497, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: FISCHER-RB-7-R702.2-CH 44

RB132–09/10
R702.2.1, R702.3.1, Chapter 44 (New)

Proponent: Michael Gardner, representing the Gypsum Association

1. Revise as follows:

R702.2.1 Gypsum plaster. Gypsum plaster materials shall conform to ASTM C 5, C 22, C 28, C 35, C 37, C 59, C 61, C 587, C588, C631, C847, C933, C1032 andC1047, and shall be installed or applied in conformance with ASTM C 843 and C844. Plaster shall not be less than three coats when applied over metal lath and not less than two coats when applied over other bases permitted by this section, except that veneer plaster may be applied in one coat not to exceed 3/16 inch (4.76 mm) thickness, provided the total thickness is in accordance with Table R702.1(1).

R702.3.1 Materials. All gypsum board materials and accessories shall conform to ASTM C 22, C 36, C 79, C 475, C 514, C 630, C 931, C 960, C 1002, C 1047, C 1177, C 1178, C 1278, C 1395, C 1396 or C 1658 and shall be installed in accordance with the provisions of this section. Adhesives for the installation of gypsum board shall conform to ASTM C 557.

2. Add new standard to Chapter 44 as follows:

ASTM

C 22/C 22M-00 (2005)ε01	Specification for Gypsum

Reason: The IBC contains a reference to ASTM C22, *Specification for Gypsum*; however, the same reference has never been incorporated into the IRC. This proposal is intended to correct that oversight.

ASTM C 22 defines the basic parameters for the gypsum used to manufacture gypsum board and gypsum plaster.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: The proposed new standard, ASTM C 22, is currently referenced in the *International Building Code*.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: GARDNER-RB-1-R702.2-R702.3-CH 44

RB133–09/10
R702.4.2

Proponent: Barry Reid, Georgia-Pacific, representing Georgia Pacific Gypsum LLC

Revise as follows:

R702.4.2 Fiber-cement, fiber-mat reinforced cement, glass mat gypsum backers and fiber-reinforced gypsum backers. Fiber-cement, fiber-mat reinforced cement, glass mat gypsum backers, glass mat water-resistant gypsum panels, or fiber-reinforced gypsum backers in compliance with ASTM C 1288, C 1325, C 1178, C 1658 or C 1278, respectively, and installed in accordance with manufacturers' recommendations shall be used as backers for wall tile in tub and shower areas and wall panels in shower areas.

Reason: The purpose of this proposal is to add an ASTM material standard for current provisions of the IRC. The revision to section R702.4.2 provides another option of materials standards appropriate for use as a backer for wall tile in tub and shower areas and wall panels in shower areas. The current code provisions exclude ASTM C 1396 and ASTM C 630, product standards recognized in the industry as paper-faced gypsum wallboard and paper –faced water resistant gypsum backing board. Within ASTM C 1658 Section 7.1 is material manufactured for use as a glass mat water resistant gypsum panel.

A comparison of ASTM Standard Specifications for C 1658, glass mat water-resistant gypsum panel, and C1278, fiber-reinforced gypsum backers products reveals that C 1658, Section 7, product physical properties, for use as a water resistant gypsum backer board, are the same as C 1278 for all physical properties including water resistance and surface water absorption which is in the IRC. The inclusion of ASTM C 1658 will benefit the consumer by offering more choices without compromising the performance of the tile assembly

Referenced Standards (3.4 & 3.6):

ASTM Standard Specification C 1658

ASTM C 1658
1.1.3 Glass mat water resistant gypsum panel
7. Physical Properties of Glass Mat Water- Resistant Gypsum Panel

ASTM C 1278
6.1 Physical Properties of Water-Resistant Fiber-Reinforced Gypsum Backing Panels

Cost Impact: The code change proposal will not increase the cost of construction.

RB134–09/10

R202 (New), R703.1, R703.1.1, R703.2, Table R703.4, R703.6.2.1, R703.6.3, R703.8

Proponent: Joseph Lstiburek, Building Science Corporation

1. Add new definition as follows:

WALL ENCLOSURE. A system or assembly of exterior wall components, including the exterior wall finish materials and the water-resistive barrier, that provides environmental separation between the conditioned space and the exterior environment. Exterior wall components, including the exterior wall covering and the water-resistive barrier, provide protection of the building structural members, including framing and sheathing materials, from the detrimental effects of the exterior environment.

2. Revise as follows:

R703.1 General. ~~Exterior walls shall provide the building with a weather-resistant exterior wall envelope. The exterior wall envelope shall include flashing as described in Section R703.8.~~ The wall enclosure shall be designed and constructed in such a manner as to prevent the accumulation of water within the wall assembly by providing a water-resistive barrier behind the exterior veneer as required in section R703.2 and a means for draining water that enters the assembly to the exterior. The wall enclosure shall include flashing as described in Section R703.8. Protection against condensation in the exterior wall assembly shall be provided in accordance with Section R601.3.

~~**R703.1.1 Water resistance.** The exterior wall envelope shall be designed and constructed in a manner that prevents the accumulation of water within the wall assembly by providing a water-resistant barrier behind the exterior veneer as required by Section R703.2 and a means of draining to the exterior water that enters the assembly. Protection against condensation in the exterior wall assembly shall be provided in accordance with Section R601.3 of this code.~~

Exceptions:

1. ~~A weather-resistant exterior wall envelope shall not be required over~~ Concrete ~~or~~ and masonry walls designed in accordance with Chapter 6 and flashed according to Section R703.7 or R703.8.
2. Compliance with the requirements for a means of drainage, and the requirements of Section R703.2 and Section R703.8, shall not be required for a wall enclosure ~~an exterior wall envelope~~ that has been demonstrated through testing to resist wind-driven rain ~~through testing of the exterior wall envelope~~, including joints, penetrations and intersections with dissimilar materials, in accordance with ASTME 331 under the following conditions:
   2.1. ~~Exterior wall envelope~~ Wall enclosure test assemblies shall include at least one opening, one control joint, one wall/eave interface and one wall sill. All tested openings and penetrations shall be representative of the intended end-use configuration.
   2.2. ~~Exterior wall envelope~~ Wall enclosure test assemblies shall be at least 4 feet (1219 mm) by 8 feet (2438 mm) in size.

2.3. ~~Exterior wall assemblies~~ Wall enclosure test assemblies shall be tested at a minimum differential pressure of 6.24 pounds per square foot (299 Pa).

2.4. ~~Exterior wall envelope~~ Wall enclosure test assemblies shall be subjected to the minimum test exposure for a minimum of 2 hours.

The ~~exterior wall envelope~~ wall enclosure design shall be considered to resist wind-driven rain where the results of testing indicate that water did not penetrate control joints in the exterior wall envelope, joints at the perimeter of openings penetration or intersections of terminations with dissimilar materials.

R703.1.1 ~~R703.2~~ Water-resistive barrier. One layer of No. 15 asphalt felt, free from holes and breaks, complying with ASTM D 226 for Type 1 felt or other approved water-resistive barrier shall be applied over studs or sheathing of all exterior walls. Such felt or material shall be applied horizontally, with the upper layer lapped over the lower layer not less than 2 inches (51 mm). Where joints occur, felt shall be lapped not less than 6 inches (152 mm). The felt or other approved material shall be continuous to the top of walls and terminated at penetrations and building appendages in a manner to meet the requirements of the ~~exterior~~ wall ~~envelope~~ enclosure as described in Section R703.1.

Exception: Omission of the water-resistive barrier is permitted in the following situations:

1. In detached accessory buildings.
2. Under exterior wall finish materials as permitted in Table R703.4.
3. Under paperbacked stucco lath when the paper backing is an approved water-resistive barrier.

TABLE R703.4
~~WEATHER-RESISTANT SIDING~~ WALL COVERING ATTACHMENT AND MINIMUM THICKNESS

(No change to table or footnotes)

R703.6.2.1 Weep screeds. A minimum 0.019-inch (0.5 mm) (No. 26 galvanized sheet gage), corrosion-resistant weep screed or plastic weep screed, with a minimum vertical attachment flange of 31/2 inches (89 mm) shall be provided at or below the foundation plate line on exterior stud walls in accordance with ASTM C 926. The weep screed shall be placed a minimum of 4 inches (102 mm) above the earth or 2 inches (51 mm) above paved areas and shall be of a type that will allow trapped water to drain to the exterior of the building. The ~~weather~~ water-resistant barrier shall lap the attachment flange. The exterior lath shall cover and terminate on the attachment flange of the weep screed.

R703.6.3 Water-resistant ~~resistive~~ barriers. Water- resistant ~~resistive~~ barriers shall be installed as required in Section R703.2 and, where applied over wood-based sheathing, shall include a water-resistant ~~resistive vapor-permeable~~ barrier with a performance at least equivalent to two layers of Grade D paper.

Exception: Where the water-resistant ~~resistive~~ barrier that is applied over wood-based sheathing has a water resistance equal to or greater than that of 60 minute Grade D paper and is separated from the stucco by an intervening, substantially nonwater-absorbing layer or designed drainage space.

R703.8 Flashing. *Approved* corrosion-resistant flashing shall be applied shingle-fashion in a manner to prevent entry of water into the wall cavity or penetration of water to the building structural framing components. Self-adhered membranes used as flashing shall comply with AAMA 711. The flashing shall extend to the surface of the exterior wall finish. *Approved* corrosion-resistant flashings shall be installed at all of the following locations:

1. Exterior window and door openings. Flashing at exterior window and door openings shall extend to the surface of the exterior wall finish or to the water-resistant ~~resistive~~ barrier for subsequent drainage.
2. At the intersection of chimneys or other masonry construction with frame or stucco walls, with projecting lips on both sides under stucco copings.
3. Under and at the ends of masonry, wood or metal copings and sills.
4. Continuously above all projecting wood trim.
5. Where exterior porches, decks or stairs attach to a wall or floor assembly of wood-frame construction.
6. At wall and roof intersections.
7. At built-in gutters.

Reason: The current language of the building code is inconsistent with terms in the engineering, scientific, technical, educational, building science and "common use" communities. In fact terms and language within the code itself are inconsistently used. "Codespeak" makes it difficult to communicate appropriate requirements and concepts. The I-Codes are likely the most effective educational documents used in the construction industry. It behooves us to use the language in them correctly. If you don't call "things" by their proper names how can you expect users of the

documents to execute the actions correctly. The changes proposed in this code change do not change the intent of any of the sections nor do they change any specific requirement they only fix bad terms and language and bad physics. Note that the current IRC does not define exterior wall envelope. The order of two sections are flipped by renumbering. Furthermore, these changes provide consistency to the terms used in this Chapter. Throughout the chapter "water-resistant barrier" is used. In these sections "water-resistive" is used. This change provides consistence. Additionally, vapor permeable is not defined anywhere in the IRC. Vapor permeable membrane is defined but not used. In any event, vapor-permeable is not necessary in the language of R703.6.3 due to the equivalency requirement to Grade D paper.

Cost Impact: The code change proposal will not increase the cost of construction.

ICCFILENAME: LSTIBUREK-RB-4-R202-R703.1

RB135–09/10
Table R703.4

Proponent: Jay H. Crandell, PE, d/b/a ARES Consulting, representing the Foam Sheathing Coalition

Revise table as follows:

TABLE R703.4
WEATHER–RESISTANT SIDING ATTACHMENT AND MINIMUM THICKNESS

SIDING MATERIAL	NOMINAL THICKNESS[a] (INCHES)	JOINT TREATMENT	WATER-RESISTIVE BARRIER REQUIRED	TYPE OF SUPPORTS FOR THE SIDING MATERIAL AND FASTENERS [b,c,d]					
				WOOD OR WOOD STRUCTURAL PANEL SHEATHING INTO STUD	FIBERBOARD SHEATHING INTO STUD	GYPSUM SHEATHING INTO STUD	FOAM PLASTIC SHEATHING INTO STUD	DIRECT TO STUDS	NUMBER OR SPACING OF FASTENERS

(Portions of table not shown remain unchanged)

a. through c. (No change)
d. Nails or staples shall be aluminum, galvanized, or rust-preventative coated and shall be driven into the studs where ~~for~~ fiberboard, ~~or~~ gypsum, or foam plastic sheathing backing is used. Where wood or wood structural panel sheathing is used, nails shall be driven into studs unless otherwise permitted to be driven into sheathing in accordance with the siding manufacturer's installation instructions.
e. through z. (No change)

Reason: For many cases with siding attached over wood or wood structural panel sheathing, insufficient fastener penetration is provided if siding nails required by Table R703.4 are driven only into the sheathing. Only in cases where specific fastening instructions are provided for use of sheathing as a nail base should such a practice be permitted. In general, this will require a closer fastener spacing than currently required in Table R703.4 to account for the reduced withdrawal resistance of the siding nails installed in sheathing only (which may be no thicker than 3/8"). The change to the column heading for 'wood or wood structural panel sheathing' and footnote 'd' in Table R703.4 is needed to address this issue and avoid a common source of confusion resulting in potentially inadequate siding installations.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: CRANDELL-RB-4-T. R703.4

RB136–09/10
R703.5.1

Proponent: Jay H. Crandell, PE, d/b/a ARES Consulting, representing the Foam Sheathing Coalition

Revise as follows:

R703.5.1 Application. Wood shakes or shingles shall be applied either single-course or double-course over nominal 1/2-inch (13 mm) wood-based sheathing or to furring strips over nominal 1/2-inch (13 mm) nonwood sheathing. A ~~permeable~~ water-resistive barrier shall be provided in accordance with Section R703.2 ~~over all sheathing, with horizontal overlaps in the membrane of not less than 2 inches (51mm) and vertical overlaps of not less than 6 inches (152 mm)~~. Where furring strips are used, they shall be 1 inch by 3 inches or 1 inch by 4 inches (25 mm by 76 mm or 25

mm by 102 mm), shall be preservative treated or naturally durable wood in accordance with Section R317, and shall be fastened horizontally to the studs with 7d or 8d box nails with corrosion resistance in accordance with Section R317. ~~and~~ Furring strips shall be spaced a distance on center equal to the actual weather exposure of the shakes or shingles, not to exceed the maximum exposure specified in Table R703.5.2. The spacing between adjacent shingles to allow for expansion shall not exceed 1/4 inch (6 mm), and between adjacent shakes, it shall not exceed 1/2 inch (13 mm). The offset spacing between joints in adjacent courses shall be a minimum of 11/2 inches (38 mm).

Reason: This proposal references the water resistive barrier requirements in Section R703.2 and thus allows redundant WRB requirements to be deleted from this section which addresses wood shakes and shingles. In addition, language is added to require furring strips to be preservative treated or naturally decay resistant, including complimentary requirements for corrosion-resistant fasteners in treated furring strips. When placed in a horizontal direction as required for wood shakes and shingles, wood furring strips create a water stop behind the siding and it would be especially important to require greater moisture durability of the furring strips and their attachments. This change proposal is intended to compliment and be consistent with separate proposals addressing installation of various sidings over foam sheathing, including the use of furring strips with wood shakes and shingles.

Cost Impact: The code change proposal will increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: CRANDELL-RB-5-R703.5.1

RB137–09/10
R703.7

Proponent: Kimdolyn Boone, representing DuPont Building Innovations

Revise as follows:

R703.7 Stone and masonry veneer, general. Stone and masonry veneer shall be installed in accordance with this chapter, Table R703.4, ~~and~~ Figure R703.7, Section R703.6.3 and Sections 6.1 and 6.3 of ACI 530/ASCE 5/TMS-402. These veneers installed over a backing of wood or cold-formed steel shall be limited to the first *story* above-grade and shall not exceed 5 inches (127 mm) in thickness. See Section R602.12 for wall bracing requirements for masonry veneer for wood framed construction and Section R603.9.5 for wall bracing requirements for masonry veneer for cold-formed steel construction.

Exceptions:

1. For all buildings in Seismic Design Categories A, B and C, exterior stone or masonry veneer, as specified in Table R703.7(1), with a backing of wood or steel framing shall be permitted to the height specified in Table R703.7(1) above a noncombustible foundation.
2. For detached one- or two-family *dwellings* in Seismic Design Categories D0, D1 and D2, exterior stone or masonry veneer, as specified in Table R703.7(2), with a backing of wood framing shall be permitted to the height specified in Table R703.7(2) above a noncombustible foundation.

Reason: Clarification of current requirement of the code. The requirements are currently listed in the Table 703.4 and footnotes. Adding the reference to the text makes both the table & text agree.

Cost Impact: The code change proposal will not increase the cost of construction.

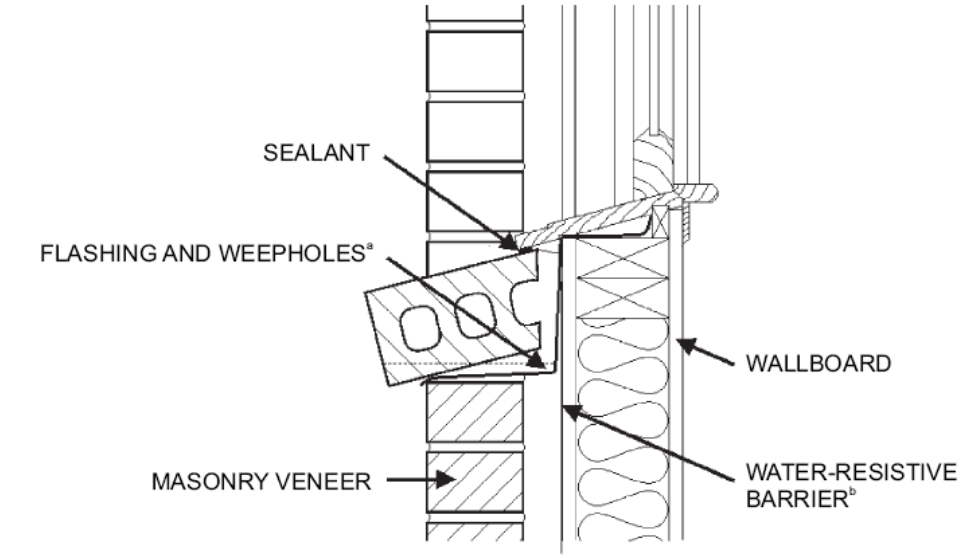
Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

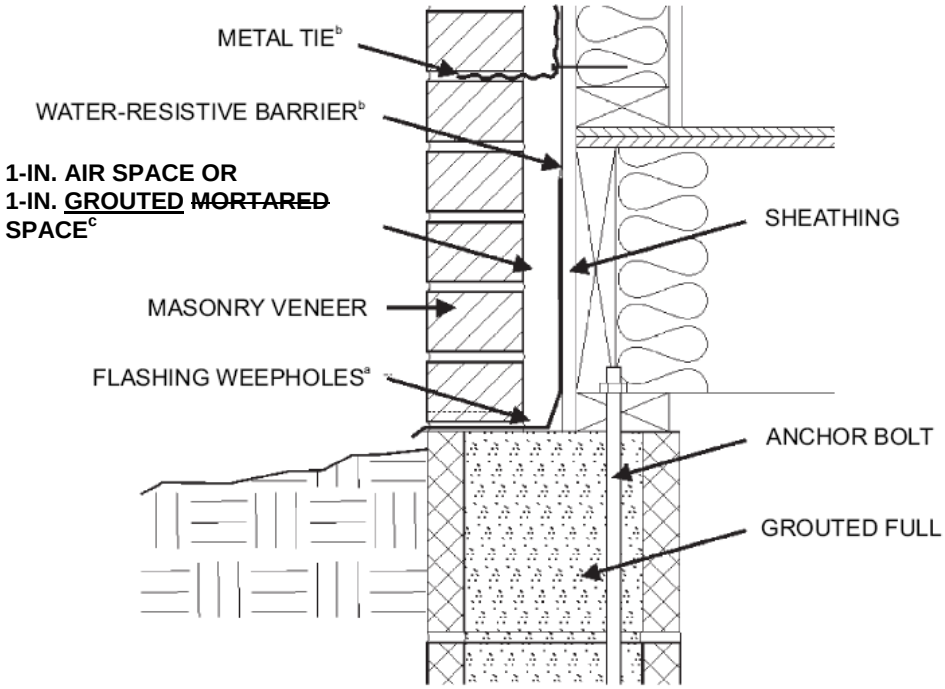
ICCFILENAME: BOONE-RB-1-R703.7

RB138–09/10
Figure R703.7, R703.7.4.3

Proponent: Charles Clark, Brick Industry Association, representing the Masonry Alliance for Codes and Standards (MACS)

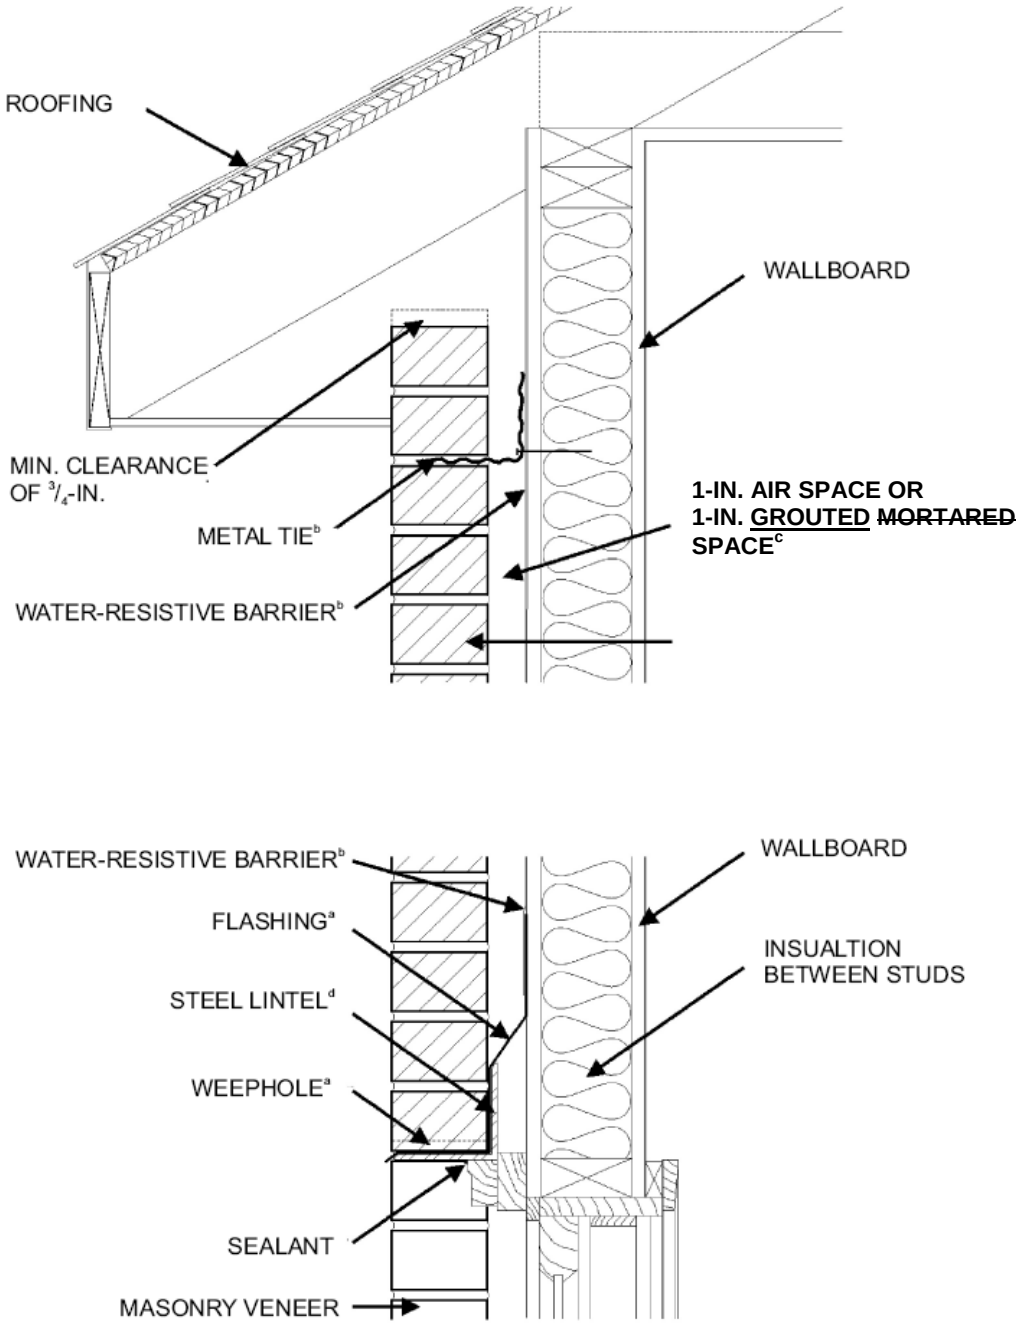
Revise as follows:





For SI: 1 inch = 25.4 mm.

FIGURE R703.7
MASONRY VENEER WALL DETAILS
(continued)



For SI: 1 inch = 25.4 mm.
a. See Sections R703.7.5, R703.7.6 and R703.8.
b. See Sections R703.2 and R703.7.4.
c. See Sections R703.7.4.2 and R703.7.4.3.
d. See Section R703.7.3.

FIGURE R703.7 – continued
MASONRY VENEER WALL DETAILS

R703.7.4. 3 ~~Mortar or~~ Grout fill. As an alternate to the air space required by Section R703.7.4.2, ~~mortar or~~ grout shall be permitted to fill the air space .When the air space is filled with ~~mortar~~ grout, a water-resistive barrier is required over studs or sheathing. When filling the air space, replacing the sheathing and water-resistive barrier with a wire mesh and *approved* water-resistive barrier or an *approved* water-resistive barrier-backed reinforcement attached directly to the studs is permitted.

Reason: This code change is a follow-up to RB189-07/08 which was approved during the previous code cycle to remove from TABLE R703.4 WEATHER-RESISTANT SIDING ATTACHMENT AND MINIMUM THICKNESS the footnote allowing an air space to be filled with mortar or grout.

An anchored masonry veneer wall is designed and intended to incorporate an air space behind the wall to allow water that penetrates the masonry veneer to drain down the air space and then through flashing and weep holes at the bottom to get the water out of the wall. The Brick Industry Association has never recommended the practice of slushing the air space behind a single wythe of brick veneer with mortar. This is because doing so results in the following:

1. **Restricts water flow -** Allowing mortar to intentionally be "slushed" or flung into the air space from the mason's trowel as the veneer is constructed constricts the flow of water down the back of the veneer. A single layer or wythe of masonry veneer is not designed or intended to act as a water-resistive barrier. It needs to have a functioning air space which serves to drain the water from wind-driven rain to the outside of the wall.
2. **Creates pockets that hold water -** Invariably, pockets of air within the slushed mortared space, as shown in the attached photograph, allow a place for water to linger within the wall and significantly increase the possibility that it will make its way into the typically wood or cold-formed steel backing substrate wall behind it.
3. **Prohibits air flow** - This mortar inhibits air flow through the air space and increases the amount of time necessary for moisture to evaporate from the masonry and other components of the wall.

Continuing to allow mortar to be slushed into the air space behind anchored masonry veneer only invites water to linger in a wall and potentially cause problems. While a low slump grout can provide a uniform barrier to water, mortar slushed in an air space cannot provide equivalent protection and should not be allowed. It is time we removed this provision from the code.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: CLARK-RB-6-F. R703.7-R703.7.4.3

RB139–09/10

R703.7.3.2, Table R703.7.3.2 (New)

Proponent: Charles Clark, Brick Industry Association, representing the Masonry Alliance for Codes and Standards (MACS)

1. Revise as follows:

R703.7.3.2 The allowable span shall not exceed 18 feet 3 inches (5562 mm) and shall be constructed to comply with Figure R703.7.3.2 and the following:

1. Provide a minimum length of 18 inches (457 mm) of masonry veneer on each side of opening as shown in Figure R703.7.3.2.
2. Provide a minimum 5 inch by 31/2 inch by 5/16 inch (127 mm by 89 mm by 7.9 mm) steel angle above the opening and shore for a minimum of 7 days after installation.
3. Provide double-wire joint reinforcement extending 12 inches (305 mm) beyond each side of the opening. Lap splices of joint reinforcement a minimum of 12 inches (305 mm). Comply with one of the following:
   3.1. Double-wire joint reinforcement shall be 3/16 inch (4.8 mm) diameter and shall be placed in the first two bed joints above the opening.
   3.2. Double-wire joint reinforcement shall be 9 gauge (0.144 inch or 3.66 mm diameter) and shall be placed in the first three bed joints above the opening.
4. Provide the height of masonry veneer above opening per Table R703.7.3.2.

2. Add new table as follows:

TABLE R703.7.3.2
HEIGHT OF MASONRY VENEER ABOVE OPENING

MINIMUM HEIGHT OF MASONRY VENEER ABOVE OPENING (IN)	MAXIMUM HEIGHT OF MASONRY VENEER ABOVE OPENING (FT)
13	**< 5**
24	**5 TO < 12**
60	**12 TO HEIGHT ABOVE SUPPORT ALLOWED BY SECTION R703.7**

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm

Reason: This code change is a follow-up to RB196-07/08 which was approved during the previous code cycle. This table refers to Figure R703.7.3.2 and indicates the minimum and maximum height of masonry veneer allowed over the opening. These are shown on Figure R703.7.3.2 at the edge of the opening and at the center of the opening respectively.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: CLARK-RB-2-R703.7.3.2-T. R703.7.3.2

RB140–09/10
R703.7.4, R703.7.4.2, R703.7.4.3, Table R703.7.4 (New)

Proponent: Charles Clark, Brick Industry Association, representing the Masonry Alliance for Codes and Standards (MACS)

1. Revise as follows:

R703.7.4 Anchorage. Masonry veneer shall be anchored to the supporting wall with corrosion-resistant metal ties embedded in mortar or grout and extending into the veneer a minimum of 11/2 inches (38 mm), with not less than 5/8 inch (15.9 mm) mortar or grout cover to outside face. Masonry veneer shall conform to Table R703.7.4. ~~Where veneer is anchored to wood backings by corrugated sheet metal ties, the distance separating the veneer from the sheathing material shall be a maximum of a nominal 1 inch (25 mm). Where the veneer is anchored to wood backings using metal strand wire ties, the distance separating the veneer from the sheathing material shall be a maximum of 41/2 inches (114 mm). Where the veneer is anchored to cold-formed steel backings, adjustable metal strand wire ties shall be used. Where veneer is anchored to cold-formed steel backings, the distance separating the veneer from the sheathing material shall be a maximum of 41/2 inches (114 mm).~~

2. Delete without substitution:

~~**R703.7.4.2 Air space.** The veneer shall be separated from the sheathing by an air space of a minimum of a nominal 1 inch (25 mm) but not more than 41/2 inches (114 mm).~~

3. Revise as follows:

R703.7.4. 3 Mortar or grout fill. As an alternate to the air space required by ~~Section R703.7.4.2~~ Table R703.7.4, mortar or grout shall be permitted to fill the air space .When the air space is filled with mortar, a water-resistive barrier is required over studs or sheathing. When filling the air space, replacing the sheathing and water-resistive barrier with a wire mesh and *approved* water-resistive barrier or an *approved* water-resistive barrier-backed reinforcement attached directly to the studs is permitted.

4. Add new table as follows:

TABLE R703.7.4
TIE ATTACHMENT AND AIR SPACE REQUIREMENTS

BACKING AND TIE	MINIMUM TIE	MINIMUM TIE FASTENER [A]	MINIMUM AIR SPACE	MAXIMUM AIR SPACE
Wood Backing with Corrugated Sheet Metal	22 U.S. gage (0.0299 in.) x 7/8 in. wide	8d common nail [b]	Nominal 1 in. between sheathing and veneer	Nominal 1 in. between sheathing and veneer
Wood Backing with Metal Strand Wire	W1.7 (No. 9 U.S. gage; 0.148 in.) with hook embedded in mortar joint	8d common nail [b]	Nominal 1 in. between sheathing and veneer	4½ in. between backing and veneer
Cold-Formed Steel Backing with Adjustable Metal Strand Wire	W1.7 (No. 9 U.S. gage; 0.148 in.) with hook embedded in mortar joint	No. 10 screw	Nominal 1 in. between sheathing and veneer	4½ in. between backing and veneer

For SI: 1 inch = 25.4 mm.

a. In Seismic Design Category D_0, D_1 or D_2, the minimum tie fastener shall be an 8d ring-shank nail or a No. 10 screw, 2 ½ inches long.
b. All fasteners shall have rust inhibitive coating suitable for the installation in which they are being used, or be manufactured from material not susceptible to corrosion.

Reason: This code change adds a table to the anchored masonry veneer provisions that accomplishes the following:
1) Makes the code easier to use by having minimum requirements for tie and tie fastener in a tabular form. The table also includes minimum and maximum air space requirements.
2) Footnote a) adds a requirement that a ring-shank nail is to be used when the veneer is constructed in a Seismic Design Category D_0, D_1 or D_2. Recent full-scale building shaking-table testing conducted at the University of California San Diego found that "fasteners on one side of the specimen failed by extraction of nails under dynamic tensile loads, at levels of shaking less than the Design Basis Earthquake (DBE). This behavior is not consistent with performance objectives for veneer. Current IRC requirements for the attachment of connectors to wood-stud backing need improvement in Seismic Design Category D_0 and above. (See references in Bibliography below)
3) Footnote b) requires that the fasteners be able to resist corrosion. This text is very similar to existing text in Section R603.2.4 on fastening requirements.

Bibliography:

1. Klingner, Richard E., Shing, P. Benson, McGinley, Mark W., McLean, David I., Okail, Hussein, and Jo, Seongwoo, "NSF NEES Small-Group Project on Performance-based Design of Masonry and Masonry Veneer: Overview and Preliminary Results," *TMS Journal*, The Masonry Society, Boulder, Colorado, December 2008 (date submitted for publication).
2. Klingner, Richard E., "Behavior of Anchored Masonry Veneer with Light Wood Stud-Framing or Masonry Backing in Full-Scale Whole-Building Shaking-Table Tests," *TMS Journal*, The Masonry Society, Boulder, Colorado, June 2009 (date submitted for publication).

Cost Impact: The code change proposal may slightly increase the cost of anchored masonry veneer construction in Seismic Design Categories D_0, D_1 and D_2.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: CLARK-RB-4-R703.7.4

RB141–09/10
R703.7.4.1

Proponent: Charles Clark, Brick Industry Association, representing the Masonry Alliance for Codes and Standards (MACS)

Revise as follows:

R703.7.4.1 Size and spacing. Veneer ties, if strand wire, shall not be less in thickness than No. 9 U.S. gage [(0.148 in.) (4 mm)] wire and shall have a hook embedded in the mortar joint, or if sheet metal, shall be not less than No. 22 U.S. gage by [(0.0299 in.)(0.76 mm)] 7/8 inch (22 mm) corrugated. Each tie shall support not more than 2.67 square feet (0.25 m^2) of wall area and shall be spaced not more than ~~24 inches (610 mm)~~ 32 inches (813 mm) on center horizontally and 24 inches (635 mm) on center vertically ~~and shall support not more than 2.67 square feet (0.25 m2) of wall area~~.

Exception: In Seismic Design Category D_0, D_1 or D_2 or townhouses in Seismic Design Category C or in wind areas of more than 30 pounds per square foot pressure (1.44 kPa), each tie shall support not more than 2 square feet (0.2 m2) of wall area.

Reason: This code change accomplishes the following:
1) Moves the unmodified text indicating the maximum wall area that can be supported by a tie ahead of the tie spacing requirements. This provides more clarity since the tie spacing used on a specific project may be established by dividing the maximum wall area by either the maximum horizontal or vertical spacing requirement which follows next.
2) Changes the tie spacing requirements to match those found in the anchored masonry veneer provisions of the *Building Code Requirements and Specification for Masonry Structures* (TMS 402/ACI 530/ASCE 5). This document is a consensus standard overseen by three organizations and written under an ANSI-accredited, balanced process to ensure their objectivity. The maximum spacing requirements for ties established within this document have been corroborated through this consensus body.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: CLARK-RB-3-R703.7.4.1

RB142–09/10
R703.7.4.1

Proponent: Jay H. Crandell, PE, d/b/a ARES Consulting, representing the Foam Sheathing Coalition

Revise as follows:

R703.7.4.1 Size and spacing. Veneer ties, if strand wire, shall not be less in thickness than No. 9 U.S. gage [(0.148 in.) (4 mm)] wire and shall have a hook embedded in the mortar joint, or if sheet metal, shall be not less than No. 22 U.S. gage by [(0.0299 in.)(0.76 mm)] 7/8 inch (22 mm) corrugated. Each tie shall be spaced not more than 24 inches (610 mm) on center horizontally and vertically and shall support not more than 2.67 square feet (0.25 m2) of wall area. <u>The tie shall be fastened to wall framing using a minimum 10d common nail in each tie or an approved fastener in accordance with the tie manufacturer's installation instructions.</u>

Exception: In Seismic Design Category D_0, D_1 or D_2 or townhouses in Seismic Design Category C or in wind areas of more than 30 pounds per square foot pressure (1.44 kPa), each tie shall support not more than 2 square feet (0.2 m^2) of wall area.

Reason: The code is currently silent in regard to the required fastener size for installation of veneer ties to wood wall framing. The proposed 10d common nail should provide a minimum 2-1/2" penetration into framing when applied over a typical ½" thick sheathing. This attachment will provide adequate withdrawal resistance to address the IRC scope of wind speeds (up to 110 mph, Exposure D). While past industry practice has permitted an 8d common nail, the proposed 10d common nail better addresses the scope of the IRC, including the exception statement regarding tie spacing in higher wind and seismic conditions. This proposal is a needed improvement to address an omission in the current code and to be consistent with separate proposals addressing appropriate siding connections over foam sheathing, including masonry and stone veneer.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: CRANDELL-RB-2-R703.7.4.1

RB143–09/10
R703.7.7 (New)

Proponent: Tim A. Fleming, Code Solutions, Inc.

Add new text as follows:

<u>R703.7.7 Corner movement flashing.</u> <u>Corner movement flashing shall be located beneath the first course of masonry and the concrete foundation at each outside corner to prevent adhesion of the masonry veneer to the foundation. Corner movement flashing shall be of rigid noncorrosive material 1/16" or 16 gauge in thickness and extend a minimum of 16" along each wall surface from the outside corner. Corner movement flashing shall be installed in addition to the flashing required in sections R703.5 and R703.8.</u>

Reason: The purpose of this code change is to prevent foundation failures due to reduced coverage or exposed concrete reinforcement or exposed post tensioning cable ends. The proposed additional language is necessary because the current wording of the code is intended to only prevent water infiltration and does not specifically address differential movement of the masonry veneer and the foundation. Masonry walls expand and contract at a different rate than concrete foundations buried into the ground. The thin plastic flashing required by section R703.7.5 used for water protection is normally omitted at the outside corners. This thin flashing cannot prohibit adhesion when the foundation has an irregular surface. Without a rigid piece of flashing the first mortar bed joint adheres to the exposed or irregular surface of the foundation. When the masonry expands it does so at a greater rate than the concrete foundation. The masonry that is adhered to the corner of the foundation then breaks the corner of the foundation off, many times exposing reinforcement or post tension cable ends to the environment.

Below are some photographs of this condition commonly referred to as “corner pops”

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

RB144-09/10

R202 (New), R703.8, Chapter 44 (New)

Proponent: Jeff Lowinski, representing the Window and Door Manufacturers Association (WDMA)

1. Add new definition as follows:

PAN FLASHING. Corrosion-resistant flashing at the base of an opening that is integrated into the building exterior wall to direct water to the exterior and is pre-manufactured, fabricated, formed or applied at the job site.

2. Revise as follows:

R703.8 Flashing. *Approved* corrosion-resistant flashing shall be applied shingle-fashion in a manner to prevent entry of water into the wall cavity or penetration of water to the building structural framing components. Self-adhered membranes used as flashing shall comply with AAMA 711. The flashing shall extend to the surface of the exterior wall finish. *Approved* corrosion-resistant flashings shall be installed at all of the following locations:

1. Exterior window and door openings. Flashing at exterior window and door openings shall extend to the surface of the exterior wall finish or to the water-resistive barrier for subsequent drainage. Flashing at exterior window and door openings shall be installed in accordance with one or more of the following:
   1.1. The fenestration manufacturer's installation and flashing instructions, or for applications not addressed in the fenestration manufacturer's instructions, in accordance with the flashing manufacturer's instructions. Where flashing instructions or details are not provided, pan flashing shall be installed at

the sill of exterior window and door openings. Pan flashing shall be sealed or sloped in such a manner as to direct water to the surface of the exterior wall finish or to the water-resistive barrier for subsequent drainage. Openings using pan flashing shall also incorporate flashing or protection at the head and sides.

1.2. In accordance with the flashing design or method of a registered design professional.

1.3. In accordance with other approved methods.

1.4. In accordance with ASTM E 2112.

2. At the intersection of chimneys or other masonry construction with frame or stucco walls, with projecting lips on both sides under stucco copings.
3. Under and at the ends of masonry, wood or metal copings and sills.
4. Continuously above all projecting wood trim.
5. Where exterior porches, decks or stairs attach to a wall or floor assembly of wood-frame construction.
6. At wall and roof intersections.
7. At built-in gutters.

3. Add new standard to Chapter 44 as follows:

ASTM

E 2112-07 Standard Practice for Installation of Exterior Windows, Doors, and Skylights

Reason: The purpose of this proposal is to leverage the proposed revisions to the window and door flashing requirements of a separate WDMA proposal and add the mandatory option of flashing windows and doors to ASTM E2112. This proposal introduces a new reference standard to the IRC, ASTM E2112. As with the previous proposal, this proposal identifies alternate flashing methods for windows and doors that complement the requirements of Section R703.8 and includes mandatory options for window and door flashing depending on the conditions of the project.

WDMA supports installing and flashing windows and doors to ASTM E2112 as one mandatory option for window and door installation and flashing, as presented in this code proposal.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: A review of the standard proposed for inclusion in the code, ASTM E 2112, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: LOWINSKI-RB-6-R202-R703.8

RB145–09/10
R202 (New), R703.8

Proponent: Jeff Lowinski, representing the Window and Door Manufacturers Association (WDMA)

1. Add new definition as follows:

PAN FLASHING. Corrosion-resistant flashing at the base of an opening that is integrated into the building exterior wall to direct water to the exterior and is pre-manufactured, fabricated, formed or applied at the job site.

2. Revise as follows:

R703.8 Flashing. *Approved* corrosion-resistant flashing shall be applied shingle-fashion in a manner to prevent entry of water into the wall cavity or penetration of water to the building structural framing components. Self-adhered membranes used as flashing shall comply with AAMA 711. The flashing shall extend to the surface of the exterior wall finish. *Approved* corrosion-resistant flashings shall be installed at all of the following locations:

1. Exterior window and door openings. Flashing at exterior window and door openings shall extend to the surface of the exterior wall finish or to the water-resistive barrier for subsequent drainage. Flashing at exterior window and door openings shall be installed in accordance with one or more of the following:

1.1. The fenestration manufacturer's installation and flashing instructions, or for applications not addressed in the fenestration manufacturer's instructions, in accordance with the flashing manufacturer's instructions. Where flashing instructions or details are not provided, pan flashing shall be installed at the sill of exterior window and door openings. Pan flashing shall be sealed or sloped in such a manner as to direct water to the surface of the exterior wall finish or to the water-resistive barrier for subsequent drainage. Openings using pan flashing shall also incorporate flashing or protection at the head and sides.

1.2. In accordance with the flashing design or method of a registered design professional.
1.3. In accordance with other approved methods.

2. At the intersection of chimneys or other masonry construction with frame or stucco walls, with projecting lips on both sides under stucco copings.
3. Under and at the ends of masonry, wood or metal copings and sills.
4. Continuously above all projecting wood trim.
5. Where exterior porches, decks or stairs attach to a wall or floor assembly of wood-frame construction.
6. At wall and roof intersections.
7. At built-in gutters.

Reason: This proposal identifies alternate flashing methods for windows and doors that complement the requirements of Section R703.8 and includes mandatory options for window and door flashing depending on the conditions of the project.

Window and door manufactures are required, by Section R613.1, to provide installation instructions for each window and door. Most window and door manufacturers require installation per their instructions and many window and door manufacturers are incorporate a pan flashing in their window and door installation instructions. Window and door manufacturers create installation and flashing instructions for a wide variety of wall conditions but are unable to create installation instructions for every conceivable wall condition. The 2nd and 3rd flashing methods identified in this proposal allows necessary flexibility while retaining the performance requirements of Section R703.8.

This proposal also introduces a definition of pan flashing into the code.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: LOWINSKI-RB-5-R703.8

RB146–09/10
R703.8

Proponent: Mike Rice, Maplewood, MN, representing the Association of Minnesota Building Officials

Revise as follows:

R703.8 Flashing. *Approved* corrosion-resistant flashing shall be applied shingle-fashion in a manner to prevent entry of water into the wall cavity or penetration of water to the building structural framing components. Self-adhered membranes used as flashing shall comply with AAMA 711. The flashing shall extend to the surface of the exterior wall finish. *Approved* corrosion-resistant flashings shall be installed at all of the following locations:

1. Exterior window and door openings. Flashing at exterior window and door openings shall extend to the surface of the exterior wall finish or to the water-resistive barrier for subsequent drainage.
2. At the intersection of chimneys or other masonry construction with frame or stucco walls, with projecting lips on both sides under stucco copings.
3. Under and at the ends of masonry, wood or metal copings and sills.
4. Continuously above all projecting wood trim.
5. Where exterior porches, decks or stairs attach to a wall or floor assembly of wood-frame construction.
6. At wall and roof intersections. Kick out flashing shall be installed where the lower portion of a sloped roof stops within the plane of an intersecting wall cladding in such a manner as to divert or kick out water away from the assembly.
7. At built-in gutters.

Reason: This change would complement the current code addressing wall and roof intersections and further prevent water from entering the wall cavity or penetrating to the structural building components. Step flashing at wall and roof intersections is incomplete without the kick out flashing, where the lower portion of a sloped roof stops within the plane of an intersecting wall. The water must be diverted away or it will find a way behind the water-resistive barrier and the siding or, in some cases, it will go through the siding. The benefit of adding the kick out flashing would far exceed the cost, as the cost would be little.

Cost Impact: The code change proposal will increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

Proponent: Dennis Pitts, American Forest & Paper Association

1. Revise as follows:

TABLE R703.4
WEATHER–RESISTANT SIDING ATTACHMENT AND MINIMUM THICKNESS

Siding Material	Nominal Thickness[a] (inches)	Joint Treatment	Water-Resistive Barrier Required	Type of Supports for the Siding Material and Fasteners b,c,d					
				Wood or wood structural panel sheathing	Fiberboard sheathing into stud	Gypsum sheathing into stud	Foam plastic sheathing into stud	Direct to Studs	Number or spacing of fasteners
Vinyl siding[l]	0.035	Lap	Yes	0.120 nail (shank) with a .313 head or 16 gage staple with 3/8 to 1/2-in. crown[y,z]	0.120 nail (shank) with a .313 head or 16 gage staple with 3/8 to 1/2-in. crown[y]	0.120 nail (shank) with a .313 head or 16 gage staple with 3/8 to 1/2-in. crown[y]	~~0.120 nail (shank) with a 0.313 head per~~ See Section R703.11.2	Not allowed	16 inches on center or as specified by the manufacturer instructions or test report

(Portions of table and footnotes not shown remain unchanged)

2. Delete and substitute as follows:

~~**R703.11.2 Foam plastic sheathing.** Vinyl siding used with foam plastic sheathing shall be installed in accordance with Section R703.11.2.1, R703.11.2.2, or R703.11.2.3.~~

~~**Exception:** Where the foam plastic sheathing is applied directly over wood structural panels, fiberboard, gypsum sheathing or other *approved* backing capable of independently resisting the design wind pressure, the vinyl siding shall be installed in accordance with Section R703.11.1.~~

R703.11.2 Backing material. Vinyl siding certified per D 3679 is rated for use where the vinyl siding is directly applied over wood structural panels, structural fiberboard, exterior gypsum sheathing, or other approved backing material capable of independently resisting the design suction wind loads in Table R703.11, Case 1. For vinyl siding over foam plastic sheathing or other backing material not approved to independently resist the design wind loads, the vinyl siding must be rated for the design suction wind loads in Table R703.11, Case 2 or 3.

3. Delete without substitution:

~~**R703.11.2.1 Basic wind speed not exceeding 90 miles per hour and Exposure Category B.** Where the basic wind speed does not exceed 90 miles per hour (40 m/s), the Exposure Category is B and gypsum wall board or equivalent is installed on the side of the wall opposite the foam plastic sheathing, the minimum siding fastener penetration into wood framing shall be 11/4 inches (32 mm) using minimum 0.120-inch diameter nail (shank) with a minimum 0.313-inch diameter head, 16 inches on center. The foam plastic sheathing shall be minimum 1/2-inch-thick (12.7 mm) (nominal) extruded polystyrene per ASTM C578, 1/2 inch thick (12.7 mm) (nominal) polyisocyanurate per ASTM C1289, or 1-inch-thick (25 mm)(nominal) expanded polystyrene perASTMC578.~~

~~**R703.11.2.2 Basic wind speed exceeding 90 miles per hour or Exposure Categories C and D.** Where the basic wind speed exceeds 90 miles per hour (40 m/s) or the Exposure Category is C or D, or all conditions of Section R703.11.2.1 are not met, the adjusted design pressure rating for the assembly shall meet or exceed the loads listed in~~

~~Tables R301.2(2) adjusted for height and exposure using Table R301.2(3). The design wind pressure rating of the vinyl siding for installation over solid sheathing as provided in the vinyl siding manufacturer's product specifications shall be adjusted for the following wall assembly conditions:~~

~~1. For wall assemblies with foam plastic sheathing on the exterior side and gypsum wall board or equivalent on the interior side of the wall, the vinyl siding's design wind pressure rating shall be multiplied by 0.39.~~
~~2. For wall assemblies with foam plastic sheathing on the exterior side and no gypsum wall board or equivalent on the interior side of wall, the vinyl siding's design wind pressure rating shall be multiplied by 0.27.~~

~~**R703.11.2.3 Manufacturer specification.** Where the vinyl siding manufacturer's product specifications provide an *approved* design wind pressure rating for installation over foam plastic sheathing, use of this design wind pressure rating shall be permitted and the siding shall be installed in accordance with the manufacturer's installation instructions.~~

4. Add new table as follows:

TABLE R703.11
REQUIRED NEGATIVE (SUCTION) WIND LOAD RATINGS (psf) FOR VINYL SIDING CERTIFIED PER ASTM D 3679[a,b]

Case	Backing Material	Wind Exposure	Basic Wind Speed (mph - 3 second gust)				
			85	90	100	105	110
1	Exterior Side: Wood structural panels, structural fiberboard, exterior gypsum sheathing, or other approved backing capable of independently resisting the design wind load. Infill materials are permitted between the vinyl siding and the backing material if the minimum fastener penetration is maintained.	B	17.4 [c]	19.5 [c]	24.1 [c]	26.6 [c]	29.1 [c]
		C	24.4 [c]	27.3 [c]	33.7	37.2	40.7
		D	28.9 [c]	32.4	40.0	44.2	48.3
2	Exterior Side: Foam plastic sheathing or other backing material not approved to independently resist the design wind loads. Interior Side: Gypsum wallboard or equivalent on interior side of wall.	B	45.1	50.6	62.5	69.0	75.4
		C	63.2	70.8	87.5	96.5	105.6
		D	74.9	83.9	103.7	114.5	125.2
3	Exterior Side: Foam plastic sheathing or other backing material not approved to independently resist the design wind loads. Interior Side: None	B	64.4	72.2	89.3	98.5	107.8
		C	90.2	101.1	125.0	137.9	150.9
		D	107.0	119.9	148.2	163.5	178.9

NOTES:
a. The tabulated wind load ratings are based on a 30' mean roof height. For other mean roof heights, multiply the tabulated wind load ratings for Exposure B by the Adjustment Coefficients in Table R301.2(2).

b. The vinyl siding shall be attached directly to the studs. If the manufacturer requires the vinyl siding to be attached to the backing material to achieve higher wind load ratings, the backing material shall be the same material as tested.

c. Vinyl siding certified to ASTM D 3679 has been rated for at least 29.1 psf negative (suction) wind load. For higher wind load ratings, contact the manufacturer.

Reason: Vinyl siding is required to be certified per ASTM D3679 which includes negative (suction) wind testing to set a design wind rating. This wind rating is based on tests conducted with OSB or plywood used as backing material and assumes that the vinyl siding will be applied over similar backing material that can independently resist the negative wind loads. During the last cycle, provisions were added to IRC 703.11 to address the common condition where vinyl siding is installed over foam sheathing. Under this condition, the vinyl siding must resist the full wind load since the foam sheathing does not resist the negative wind loads.

At the final hearings, a new provision was added that provided a prescriptive solution for the case where the basic wind speed does not exceed 90 mph, the Exposure Category is B, and gypsum wallboard or equivalent is installed on the side of the wall opposite the foam plastic sheathing. In support, the following data was provided:

WIND PRESSURE TESTING OF WALL ASSEMBLIES
WITH FOAM SHEATHING AND VINYL SIDING PRODUCTS

(NAHB Research Center Report #4107003013108)

	Backing Material	Ult. Test Capacity (psf)	Wind Load resisted by Vinyl Siding	Safety Factor on Vinyl Siding	Wind Rating (psf)	Reference
Low Capacity Vinyl Siding	**CONTROL:** Vinyl Siding test (OSB backing material perforated per D 3679)					
	(none)	22.7	36%	1.50	42.1	D 3679
	Vinyl Siding + Foam Sheathing test (Solid foam sheathing backing material)					
	3/8" EPS	29.1	100%	2.00	14.6	2009 IRC
	1/2" ISO	41.1	100%	2.00	20.6	2009 IRC
	1/2" XPS	41.6	100%	2.00	20.8	2009 IRC
High Capacity Vinyl Siding	**CONTROL:** Vinyl Siding test (OSB backing material perforated per D 3679)					
	(none)	81.9	36%	1.50	151.6	D 3679
	Vinyl Siding + Foam Sheathing test (Solid foam sheathing backing material)					
	3/8" EPS	77.0	100%	2.00	38.5	2009 IRC
	1/2" ISO	86.1	100%	2.00	43.1	2009 IRC
	1/2" XPS	89.5	100%	2.00	44.7	2009 IRC

For the CONTROL case, the vinyl siding was wind rated at 42.1 psf using the procedures in D 3679. This rating was determined from the ultimate test capacity of the vinyl siding acting alone, divided by 0.36 in recognition that the backing material is resisting most of the wind load and by a safety factor of 1.5 since the vinyl siding is serving primarily as an exterior covering. The ultimate test capacity of the vinyl siding backed by solid foam sheathing was divided by 1.0 in recognition that the vinyl siding attachment must resist the wind load and by a safety factor of 2.0 since the vinyl siding is now acting as a structural sheathing to protect the building envelop. For the low capacity vinyl siding, the vinyl siding backed by 3/8" EPS was not capable of resisting the minimum wind loads in the IRC; however, ½" ISO and ½" XPS were capable of resisting the 19.5 psf negative wind loads associated with 90 mph, Exposure B. This case was selected as the basis of the current prescriptive provisions in R703.11.2.1.
Upon further study of the CONTROL case in the previous table, it can be seen that the low-capacity vinyl siding used in the tests would have a wind rating of 42.1 psf, not the minimum of 29.1 psf permitted by D 3679. A re-analysis was conducted to see what the result would be if minimum vinyl siding was used over foam sheathing:

	Backing Material	D 3679 min. Capacity (psf)	Wind Load resisted by Vinyl Siding	Safety Factor on Vinyl Siding	Wind Rating (psf)	Reference
D 3679 min. Vinyl Siding	OSB	15.7	36%	1.50	29.1	D 3679
	3/8" EPS	15.7	100%	2.00	7.9	2009 IRC
	1/2" ISO	15.7	100%	2.00	7.9	2009 IRC
	1/2" XPS	15.7	100%	2.00	7.9	2009 IRC

In order for the vinyl siding to resist the full wind load, this re-analysis suggests that it would take a medium grade of vinyl siding to meet the minimum negative wind loads and a high grade of vinyl siding and attachment to meet the moderate negative wind loads. For this reason, it is recommended that Section R703.11.2 and R703.11.2.1 be deleted and replaced with wind Table R703.11. Also, the prescriptive fastening in Table R703.4 should be replaced by a reference to the general section since the fastening schedule is linked to the wind rating.

Section R703.11.2.2 was previously added to provide an adjustment to the D 3679 wind ratings for cases where foam sheathing is used as the backing material. It requires the user to multiply the D 3679 wind ratings provided by the vinyl siding manufacturer in literature or an Evaluation Report, with a factor associated with the construction. In this proposed change, Section R703.11.2.2 was deleted and the adjustment factors were incorporated as increases in the required wind ratings in a new Table R703.11. Until D 3679 is modified to provide a means of determining wind ratings using the actual backing materials, this method should be used to prevent confusion and aid the user in selecting the proper vinyl siding.

Section R703.11.3 was added to provide guidance on the use of data for combined vinyl siding and foam sheathing tests. However, no standardized test procedure exists and any information developed by the vinyl siding manufacturer should be evaluated carefully prior to approval. This section is redundant with Section R104.11 and is, therefore, recommended for deletion.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: PITTS-RB-5-T. R703.4-R703.11

RB148 –09/10
R202 (New), R703.13 (New), Chapter 44 (New)

Proponent: Marcelo M. Hirschler, GBH International, representing the American Fire Safety Council

1. Add new definition as follows:

POLYPROPYLENE SIDING. A shaped material, made principally from polypropylene homopolymer, or copolymer, which in some cases may contain fillers and/or reinforcements, that is used to clad exterior walls of buildings.

2. Add new text as follows:

R703.13 Polypropylene siding. Polypropylene siding shall be certified and labeled as conforming to the requirements of R703.13.1, of R703.13.2 or of R703.3 by an approved quality control agency. Polypropylene siding shall be installed in accordance with the manufacturer's installation instructions.

R703.13.1 Flame spread index. The polypropylene siding material shall comply with the requirements of ASTM D 7254. The certification shall be accompanied by a test report stating that all portions of the test specimen ahead of the flame front remained in position during the test in accordance with ASTM E 84 or UL 723.

R703.13.2 Heat release. The polypropylene siding material shall comply with the requirements of ASTM D 7254 and a 4 foot by 8 foot (1.22 x 2.44 m) section of the polypropylene siding material shall exhibit a peak rate of heat release not exceeding 100 kW when tested in accordance with NFPA 289 using the 20 kW ignition source at the thickness intended for use.

R703.13.3 Fire separation distance. The polypropylene siding shall comply with all the requirements of ASTM D 7254 and the fire separation distance between a building with polypropylene siding and the adjacent building shall be no less than 10 feet (3.05 m).

3. Add new standards to Chapter 44 as follows:

NFPA

289 Standard Method of Fire Test for Individual Fuel Packages (2009)

ASTM

D 7254 Standard specification for polypropylene (PP) siding

Reason: Polypropylene siding is being used in construction now although the IBC does not permit it. Therefore, it is important to regulate the use of polypropylene siding in a way that it can be used safely. The new sections are similar to the existing sections on vinyl siding, except for the fire testing. Vinyl siding is known to have adequate fire performance since the siding needs to be made of rigid (unplasticized) PVC in accordance with ASTM D 3679. Polypropylene is known not to have adequate fire performance unless properly fire retarded.

A new standard specification has been issued for polypropylene siding, ASTM D 7254. The specification addresses many of the key requirements for the material. Unfortunately the fire test requirement in ASTM D 7254 is not explicit enough. ASTM D 7254 does not require that, when fire testing is conducted in the ASTM E 84 (Steiner tunnel), the test specimen must remain in place during the test and flaming drips and falling test specimens are not allowed to happen. This requirement is critical for materials that are used exposed so that the flame spread index assesses actual surface flame spread on the material surface. The standards committee responsible for the ASTM E 84 fire test (ASTM E05) decided that this issue should be addressed in the code rather than in the standard itself. Polypropylene that has not been appropriately fire retarded will release abundant amount of heat, much more than other combustible sidings permitted by the code, such as wood siding or vinyl (PVC) siding, and spread fire through flaming drips. Such flaming drips will contribute to ignite mulch and debris found near the building and spread the fire. Table 1 shows such results.

Recent fire tests were also conducted in the Steiner tunnel, ASTM E 84, on a rigid PVC material 0.06 in. thick; it exhibited a flame spread index of 10. Under the same test conditions, a fire retarded polypropylene material 0.15 in. thick exhibited a flame spread index of 50. These are both very adequate values, in view of the fact that both the polypropylene material and the PVC material remained in place during the ASTM E 84 test and did not generate flaming drips.

Table 1: Results of Steiner Tunnel Tests (ASTM E 84)

Material	Flame Spread Index	Maximum Flame Front Advance (ft)	Time to Max. Flame Front Advance (min:s)	Flaming on Floor (Duration) (min:s)
PVC	10	4.6	7:48	None
FR Polypropylene	50	19.5	6:24	4:18

This shows that it is possible to use fire retarded polypropylene materials that give very adequate flame spread values and also very adequate heat release values, without flaming drips. Consequently, polypropylene siding should only be used when it is shown to exhibit the appropriate fire performance.

When polypropylene siding material (which does not have the appropriate fire performance) is tested in ASTM E 84 (Steiner tunnel) the test specimen will often fall ahead of the arrival of the flame giving incorrect results.

Table 2 shows new results of cone calorimeter heat release tests with polypropylene and PVC:

Table 2: Results of Cone Calorimeter (ASTM E 1354) Tests					
Material	**Peak Heat Release Rate**	**Total Heat Released**	**Time to Ignition**	**Effective Heat of Combustion**	**Fire Performance Index**
	kW/m^2	MJ/m^2	s	MJ/kg	$s\ m^2/kW$
PVC	186.8	16.7	36	9.2	0.19
Non FR Polypropylene	768.3	47.2	23	40.3	0.03

Table 3 shows some earlier results with polypropylene, PVC and wood materials in the cone calorimeter:

Table 3 - Cone Calorimeter Data on Plastics and Douglas Fir					
	Flux 20 kW/m^2				
Material	**Pk HRR**	**THR**	**TTI**	**EHC**	**FPI**
	(kW/m^2)	**(MJ/m^2)**	**(s)**	**(MJ/kg)**	**($s\ m^2/kW$)**
PVC Rigid, Custom Inj. Mold.	40	3.0	5159	1.4	1343
PVC Rigid, Extrusion	102	2.9	3591	7.3	31.4
PP Non FR	1170	231.3	218	72.0	0.19

Douglas Fir	237	46.5	254	13.1	1.10
	Flux 40 kW/m^2				
PVC Rigid, Custom Inj. Mold.	175	24.3	73	5.1	0.42
PVC Rigid, Extrusion	183	90.8	85	13.3	0.46
PP Non FR	1509	206.9	86	42.1	0.06
PP FR	243		80	23.9	0.33
PE Non FR	1408	221.0	159	46.6	0.06
XLPE FR	192	126.2	105	24.2	0.55
Douglas Fir	221	64.1	34	17.6	0.15
	Flux 70 kW/m^2				
PVC Rigid, Custom Inj. Mold.	191	93.0	45	12.7	0.24
PVC Rigid, Extrusion	190	96.5	48	10.8	0.25
PP Non FR	2421	231.1	41	43.1	0.02
PE Non FR	2735	227.5	47	42.6	0.02
XLPE FR	268	129.2	35	24.7	0.13
Douglas Fir	196	50.0	12	13.5	0.06

Table 3 shows that, when tested in the cone calorimeter, ASTM E 1354, under the same conditions, it was found that non fire retarded polypropylene exhibits a peak heat release rate of 1509 kW/m^2, while a non fire retarded PVC material exhibits a peak heat release rate of 183 kW/m^2, and a Douglas fir material exhibits a peak heat release rate of 221 kW/m^2. Such a very high heat release rate is unacceptable for a siding material. Testing in the cone calorimeter, including the testing above, is normally conducted in the horizontal orientation with radiant heat exposing the test specimen from above, thus capturing any flaming drips and assessing their effects.

Table 4 shows that wood materials, when not fire retarded, will usually exhibit flame spread index values that are less than 200 and will correspond to Class B or Class C categories. At the same time rigid PVC (vinyl) materials will generally exhibit flame spread index values less than 25. Neither wood nor PVC materials will cause flaming drips or molten material burning on the ground.

Table 4. Steiner tunnel (ASTM E 84) Data for Wood and Vinyl Materials					
Material/Product	Flame Spread Index		Material/Product	Flame Spread Index	
	Low	High		Low	High

Ponderosa pine A	170	230	Yellow birch	105	110

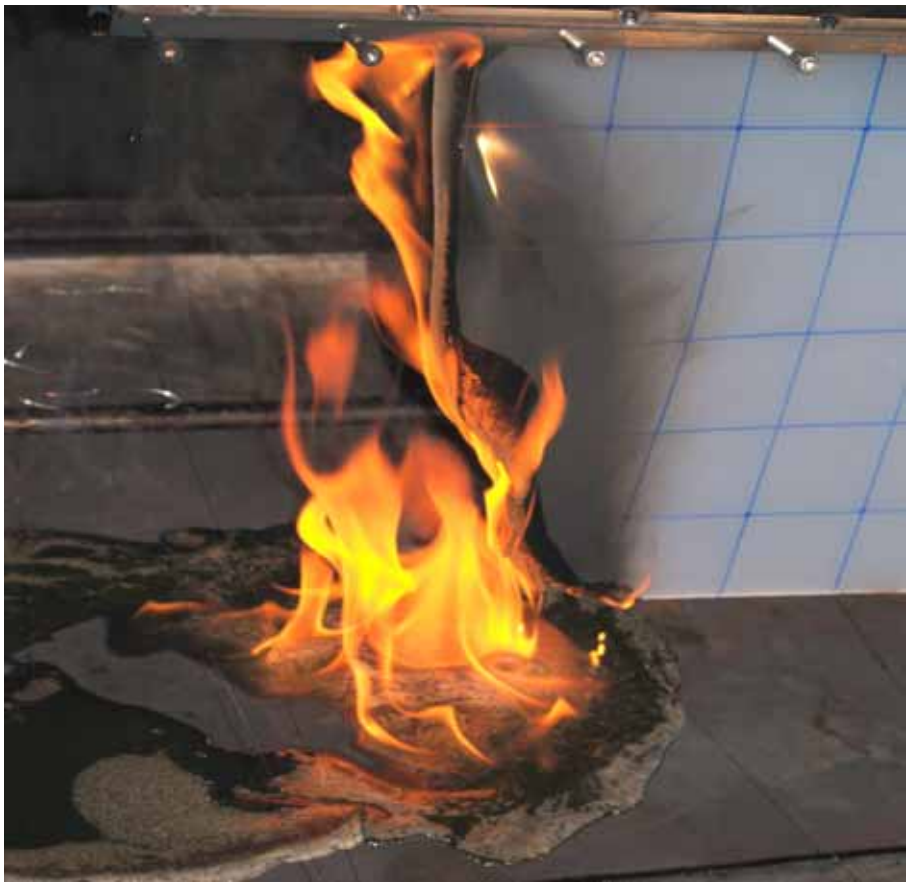
Figure 1 shows char from a PVC siding fire (no foam backing): the material softened, charred and burned but is still substantially intact. Figure 2 shows a vertical PP sheet melting and resulting in flaming drips on the floor.

The reason that heat release rate and floor flaming are important issues is because it has been shown that the heat radiated by siding is a major contributor to the ignition of neighboring houses, as is the spread of fire along the ground, particularly when there are loose combustibles present.

That is the reason that the third option allows polypropylene siding to be used, but with a larger separation distance, when the results of the ASTM E 84/UL 723 (Steiner tunnel) test are based on a test specimen that is not self supporting and falls to the floor of the tunnel during the test. The standard ASTM E 84 states: "1.4 Testing of materials that melt, drip, or delaminate to such a degree that the continuity of the flame front is destroyed, results in low flame spread indices that do not relate directly to indices obtained by testing materials that remain in place." Therefore valid test results require the test specimen to stay in place ahead of the exposing flame.

Figure 1 – Remains of vinyl siding fire

Figure 2 Polypropylene siding melting and flaming on the floor.



NFPA 289 was developed to test individual fuel packages and is similar in concept to UL 1975, already widely used in the ICC codes.

Cost Impact: The code does not at present allow the use of polypropylene siding. In order to safely use polypropylene siding construction costs would have to increase either by using materials that would meet test requirements for adequate fire safety or by increasing fire separation distances.

Analysis: A review of the standards proposed for inclusion in the code, NFPA 289 and ASTM D 7254, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

RB149–09/10
R801.3

Proponent: Jim Olk, City of Farmers Branch, TX, representing Building Officials Association of Texas

Revise as follows:

R801.3 Roof drainage. In areas where expansive or collapsible soils are known to exist, all *dwellings* shall have a controlled method of ~~water disposal~~ drainage from roofs in conformance with Chapter 4 or provide a system that will collect and discharge roof drainage to the ground surface at least 5 feet (1524 mm) from the building foundation ~~walls~~ or to an *approved* drainage system.

Reason: Over saturation of the soil adjacent to all types of foundations can cause differential soil movement which can lead to foundation failure on all types of foundations.

This proposal will allow proper grading as well as drainage system to comply with the intent of the code.

Bibliography:

Letter dated March 13, 2009 from MLAW Consultants and Engineers, Kirby T. Meyer, P.E. to the Building Officials Association of Texas President, Scott McDonald, in support of this proposal.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: OLK-RB-1-R801.3

RB150–09/10
R802.3.2

Proponent: Dennis Pitts, American Forest & Paper Association

Revise as follows:

R802.3.2 Ceiling joists lapped. Ends of ceiling joists shall be lapped a minimum of 3 inches (76 mm) or butted over bearing partitions or beams and toenailed to the bearing member. When ceiling joists are used to provide resistance to rafter thrust, lapped joists shall be nailed together in accordance with Table ~~R602.3(1)~~ R802.5.1(9) and butted joists shall be tied together in a manner to resist such thrust. When the joists are not resisting thrust they shall be permitted to be nailed in accordance with Table R602.3(1).

Reason: This corrects a conflict between R802.3.2 and R802.3.1. Table R805.1(9), mentioned in R802.3.1, addresses nailing of ceiling joist lap splices in situations where the ceiling joists resist the outward thrust of rafters. Table R602.3(1) addresses the situation in which lapped ceiling joists are not resisting rafter thrust, typically joists not attached to rafters.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

Proponent: Dennis Pitts, American Forest and Paper Association

1. Revise as follows:

R802.7 Cutting, drilling and notching. Structural roof members shall not be cut, bored or notched in excess of the limitations specified in this section.

R802.7.1 Sawn lumber. Cuts, notches, and holes, ~~Notches~~ in solid lumber joists, rafters, blocking and beams shall ~~not exceed one-sixth of the depth of the member, shall not be longer than one-third of the depth of the member and shall not be located in the middle one-third of the span. Notches at the ends of the member shall not exceed one-fourth the depth of the member. The tension side of members 4 inches (102 mm) or greater in nominal thickness shall not be notched except at the ends of the members. The diameter of the holes bored or cut into members shall not exceed one-third the depth of the member. Holes shall not be closer than 2 inches (51 mm) to the top or bottom of the member, or to any other hole located in the member. Where the member is also notched, the hole shall not be closer than 2 inches (51 mm) to the notch~~ comply with the provisions of R502.8.1 except that cantilevered portions of rafters shall be permitted in accordance with Section R802.7.1.1.

R802.7.1.1 Cantilevered portions of rafters. ~~**Exception:**~~ Notches on cantilevered portions of rafters are permitted provided the dimension of the remaining portion of the rafter is not less than ~~4~~ 3-1/2-inch ~~nominal~~ (~~102~~ 89 mm) and the length of the cantilever does not exceed 24 inches (610 mm) in accordance with Figure R802.7.1.1.

2. Add new figure as follows:

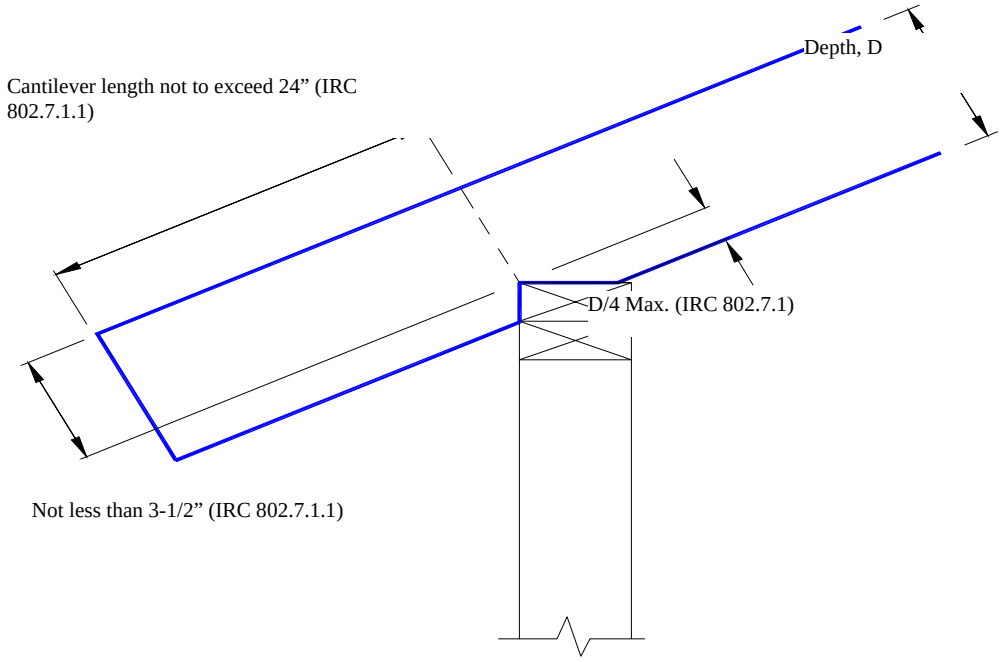

FIGURE R802.7.1.1
RAFTER NOTCH

3. Add new text as follows:

R802.7.1.2 Ceiling joist taper cut. Taper cuts at the ends of the ceiling joist shall not exceed one-fourth the depth of the member in accordance with Figure R802.7.1.2.

4. Add new figure as follows:

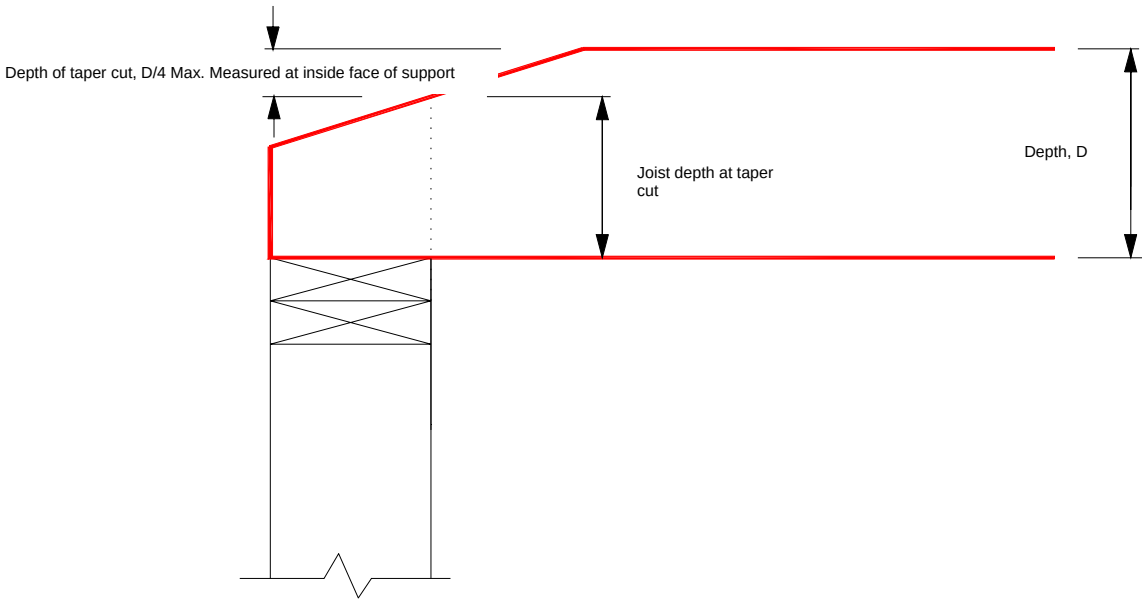

FIGURE R802.7.1.2
CEILING JOIST TAPER CUT

Reason: The revision simplifies text by referencing material elsewhere in the code. The exception is re-written as a section on cantilever portions of rafters and includes a figure to clarify the intent. The actual dimension "3-1/2 inch" replaces "4-inch nominal" to clarify the minimum dimension remaining after the notching. "Nominal" is typically used to describe standard sizes. The section on ceiling joist taper cut is added to clarify application of the D/4 provision to a ceiling joist taper cut.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: PITTS-RB-6-R802.7

RB153–09/10
R802.10.2.1

Proponent: Larry Wainright, Qualtim, Inc., representing the Structural Building Components Industry

Revise as follows:

R802.10.2.1 Applicability limits. The provisions of this section shall control the design of truss roof framing when snow controls for buildings not greater than 60 feet (18 288 mm) in length perpendicular to the joist, rafter or truss span, not greater than 36 feet (10 973 mm) in width parallel to the joist, rafter or truss span, not more than three stories above *grade plane* in height, ~~not greater than two stories in height with each *story* not greater than 10 feet (3048 mm) high,~~ and roof slopes not smaller than 3:12 (25-percent slope) or greater than 12:12 (100-percent slope). Truss roof framing constructed in accordance with the provisions of this section shall be limited to sites subjected to a maximum design wind speed of 110 miles per hour (49 m/s), Exposure A, B or C, and a maximum ground snow load of 70 psf (3352 Pa). For consistent loading of all truss types, roof snow load is to be computed as: 0.7 *p*g.

Reason: The purpose of this code change is to harmonize the language used within the IRC. This change harmonizes this section with the scope of the IRC, Section R101.2:

> **R101.2 Scope.** The provisions of the *International Residential Code for One- and Two-family Dwellings* shall apply to the construction, *alteration*, movement, enlargement, replacement, repair, equipment, use and occupancy, location, removal and demolition of detached one- and two-family dwellings and townhouses not more than three stories above *grade plane* in height with a separate means of egress and their *accessory structures*.

and also with the scope of the steel roof Section R804.1.1

R804.1.1 Applicability limits. The provisions of this section shall control the construction of cold-formed steel roof framing for buildings not greater than 60 feet (18 288 mm) perpendicular to the joist, rafter or truss span, not greater than 40 feet (12 192 mm)in width parallel to the joist span or truss, less than or equal to three stories above *grade* plane and with roof slopes not less than 3:12 (25-percent slope) or greater than 12:12 (100 percent slope). Cold-formed steel roof framing constructed in accordance with the provisions of this section shall be limited to sites subjected to a maximum design wind speed of 110 miles per hour (49 m/s), Exposure B or C, and a maximum ground snow load of 70 pounds per square foot (3350 Pa).

This change removes a competitive disadvantage wood trusses currently have with steel trusses. As much as is possible, materials should be subject to the same requirements within the code.

Cost Impact: The code change proposal will not increase the cost of construction.

R301.2.1, Table R602.3(1), R802.10.5, R802.11.1, R802.11.1.2 (New), R802.11.1.3 (New), Table R802.11

Proponent: T. Eric Stafford, PE, representing the Institute for Business and Home Safety

1. Revise as follows:

R301.2.1 Wind limitations. Buildings and portions thereof shall be limited by wind speed, as defined in Table R301.2(1) and construction methods in accordance with this code. Basic wind speeds shall be determined from Figure R301.2(4). Where different construction methods and structural materials are used for various portions of a building, the applicable requirements of this section for each portion shall apply. Where loads for wall coverings, curtain walls, roof coverings, exterior windows, skylights, garage doors and exterior doors are not otherwise specified, the loads listed in Table R301.2(2) adjusted for height and exposure using Table R301.2(3) shall be used to determine design load performance requirements for wall coverings, curtain walls, roof coverings, exterior windows, skylights, garage doors and exterior doors. Asphalt shingles shall be designed for wind speeds in accordance with Section R905.2.6. A continuous load path shall be provided to transmit the applicable uplift forces in Section R802.11.1 from the roof assembly to the foundation.

TABLE R602.3(1)
FASTENER SCHEDULE FOR STRUCTURAL MEMBERS

ITEM	DESCRIPTION OF BUILDING ELEMENTS	NUMBER AND TYPE OF FASTENER[a,b,c]	SPACING OF FASTENERS
5	Rafter or roof truss to plate, toe nail	~~2~~3-16d box nails (3½"x0.135") or 3-10d common nails (3"x0.148")	2 toe nails on one side and 1 toe nail on opposite side of each rafter or truss[j]

(Portions of table not shown remain unchanged)

a. through i. (No change)

j. Where a rafter is fastened to an adjacent parallel ceiling joist in accordance with this schedule, provide two toe-nails on one side of the rafter and toe-nails from the ceiling joist to top plate in accordance with this schedule. The toe-nail on the opposite side of the rafter shall not be required.

2. Delete without substitution:

~~**R802.10.5 Truss to wall connection.** Trusses shall be connected to wall plates by the use of *approved* connectors having a resistance to uplift of not less than 175 pounds (779 N) and shall be installed in accordance with the manufacturer's specifications. For roof assemblies subject to wind uplift pressures of 20 pounds per square foot (960 Pa) or greater, as established in TableR301.2(2), adjusted for height and exposure per Table R301.2(3), see section R802.11.~~

3. Revise as follows:

R802.11.1 Uplift resistance. Roof assemblies shall have uplift resistance in accordance with Sections R802.11.1.2 and R802.11.1.3 ~~which are subject to wind uplift pressures of 20 pounds per square foot (960 Pa) or greater shall have roof rafters or trusses attached to their supporting wall assemblies by connections capable of providing the resistance required in Table R802.11. Wind uplift pressures shall be determined using an effective wind area of 100 square feet (9.3 m2) and Zone 1 in Table R301.2(2), as adjusted for height and exposure per Table R301.2(3).~~

Where the uplift force does not exceed 200 pounds, rafters and trusses spaced not more than 24 inches on center shall be permitted to be attached to their supporting wall assemblies in accordance with Table R602.3(1).

Where the basic wind speed does not exceed 90 mph, the wind exposure category is B, the roof pitch is 5:12 or greater, and the roof span is 32 feet or less, rafters and trusses spaced not more than 24 inches on center shall be permitted to be attached to their supporting wall assemblies in accordance with Table R602.3(1).

~~A continuous load path shall be designed to transmit the uplift forces from the rafters or trusses to the foundation.~~

4. Add new text as follows:

R802.11.1.2 Truss uplift resistance. Trusses shall be attached to supporting wall assemblies by connections capable of resisting uplift forces as specified on the Truss Design Drawings. Uplift forces shall be permitted to be determined as specified by Table R802.11, if applicable, or as determined by accepted engineering practice.

R802.11.1.3 Rafter uplift resistance. Individual rafters shall be attached to supporting wall assemblies by connections capable of resisting uplift forces as determined by Table R802.11 or as determined by accepted engineering practice, Connections for beams used in a roof system shall be designed in accordance with accepted engineering practice.

5. Delete existing Table R802.11 and replace as follows:

	48	508	442	626	545	882	767	1166	1014

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm, 1 mph = 0.447 m/s, 1 pound = 0.454 kg.

a. The uplift connection forces are based on a maximum 33 foot mean roof height and Wind Exposure Category B or C. For Exposure D, the uplift connection force shall be selected from the Exposure C portion of the table using the next highest tabulated basic wind speed. The Adjustment Coefficients in Table R301.2(3) shall not be used to multiply the above forces for Exposures C and D or for other mean roof heights.
b. The uplift connection forces include an allowance for roof and ceiling assembly dead load of 15 psf.
c. The tabulated uplift connection forces are limited to a maximum roof overhang of 24 inches.
d. The tabulated uplift connection forces shall be permitted to be multiplied by 0.75 for connections not located within 8 feet of building corners.
e. For buildings with hip roofs with 5:12 and greater pitch, the tabulated uplift connection forces shall be permitted to be multiplied by 0.70. This reduction shall not be combined with any other reduction in tabulated forces.
f. For wall-to-wall and wall-to-foundation connections, the uplift connection force shall be permitted to be reduced by 60 plf for each full wall above.
g. Linear interpolation between tabulated roof spans and wind speeds shall be permitted.
h. The tabulated forces for a 12” on center spacing shall be permitted to be used to determine the uplift load in pounds per linear foot.

Reason: The issue of roof uplift connections, the limits of conventional nailed connections, and the point at which pre-engineered metal clips or straps are required has been a topic of much debate over the last several code cycles. A 200 pound maximum capacity for conventional rafter-to-wall or truss-to-wall connections has been suggested, based largely on capacities calculated directly from AF&PA's NDS. At the same time, the existing Table R802.11 has not been updated in some time and is overly conservative for many typical houses. The uplift loads are based on low-slope (4:12 pitch or less) roofs. The table does not account for the reduction in uplift loads that occur on higher-slope (5:12 pitch or greater) roofs or on hip roofs per ASCE 7. Thus the code does not encourage the use of high-slope roofs, which have been shown to experience significantly less damage in high-wind events. The triggers proposed by the insurance industry, coupled with the current table, would subject many houses in low-wind areas to a requirement for roof-to-wall ties (not to mention continuous straps to the foundation) that is not justified by the actual performance of roof systems in low-wind areas. This requirement is particularly unjustified on higher-slope roofs where the uplift loads can be substantially reduced through a detailed analysis using ASCE 7.

This proposal rolls together elements of several proposals concerning roof uplift connections (RB132-07/08, RB206-07/08, and RB207-07/08) from the last cycle. First, three options are provided for selection of the roof uplift: Table R802.11, the truss designer, or an engineered approach. In many jurisdictions (particularly rural ones), an engineered truss design is not required and the local truss fabricator will run the software from the plate company. These jurisdictions may also have limited or no plan review. Thus, there is less opportunity to insure the proper wind speed, building dimensions, mean roof height, etc. are used, and a possibility that overly conservative roof uplift loads will be generated on the truss design drawing. Hence, the ability to determine an uplift load from Table R802.11 even when there are truss drawings must be preserved. However, to address issues previously raised by code officials in relation to this section, we have introduced language to limit the use of Table R802.11 to roof rafters and single-ply trusses within the applicability limits of R802.10.1.1, and to clarify that and girder trusses and roof beams require engineered connections and/or use of the truss design drawing values.

Second, this proposal replaces the current Table R802.11 with a new table based on Table 2.2A of the WFCM, which is based on the latest ASCE 7 wind load provisions. The new table expands upon both the existing IRC table and the WFCM table by incorporating values for high-slope roofs. These factors were derived using the ASCE 7 wind provisions and the calculation method used to develop Table 2.2A of the WFCM. A factor for hip roofs is also added, as hip roofs have seen similar improved performance in high-wind events. This table was proposed as part of the public comment to RB207-07/08. The failure of the public comment was due to concerns over the triggering language. The technical content of the proposed table was unchallenged; in fact a number of industry groups including IBHS, SBCA, AF&PA, and the Foam Sheathing Coalition who are not often in agreement with each other spoke in favor of the proposed revisions.

By introducing clarity to the trigger language for uplift connectors and providing this revised table, the IRC provisions for roof uplift connections will be substantially improved. Builders and building officials will have improved direction for when pre-engineered metal connectors are actually required. Additionally, the use of hip roofs and high-slope roofs will be encouraged, as designers, engineers and builders will be able to appropriately reduce uplift loads and avoid triggering uplift connector requirements for building locations and for roof configurations where the requirements are not justified.

Cost Impact: The code change proposal will increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

RB155–09/10

R802.10.5, R802.11.1, R802.11.1.2 (New), R802.11.1.3 (New)

Proponent: Larry Wainright, Qualtim, Inc., representing the Structural Building Components Association

1. Delete without substitution:

~~**R802.10.5 Truss to wall connection.** Trusses shall be connected to wall plates by the use of *approved* connectors having a resistance to uplift of not less than 175 pounds (779 N) and shall be installed in accordance with the manufacturer's specifications. For roof assemblies subject to wind uplift pressures of 20 pounds per square foot (960 Pa) or greater, as established in TableR301.2(2), adjusted for height and exposure per Table R301.2(3), see section R802.11.~~

2. Delete and substitute as follows:

R802.11.1 Uplift resistance. ~~Roof assemblies which are subject to wind uplift pressures of 20 pounds per square foot (960 Pa) or greater shall have roof rafters or trusses attached to their supporting wall assemblies by connections capable of providing the resistance required in Table R802.11.Wind uplift pressures shall be determined using an effective wind area of 100 square feet (9.3m2) and Zone 1 inTableR301.2(2), as adjusted for height and exposure per Table R301.2(3).~~

~~A continuous load path shall be designed to transmit the uplift forces from the rafter or truss ties to the foundation.~~

Connections to resist uplift forces on trusses and rafters shall be designed in accordance with sections R802.11.1.2 and R802.11.1.3. Where the uplift force does not exceed 200 pounds, rafters and trusses shall be permitted to be attached to their supporting wall assemblies in accordance with Table R602.3(1). Where the basic wind speed does not exceed 90 mph (40 m/s), the wind exposure category is B, the roof pitch is 5:12 or greater, and the roof span is 32 feet (9754 mm) or less, rafters and trusses shall be permitted to be attached to their supporting wall assemblies in accordance with Table R602.3(1).

3. Add new text as follows:

R802.11.1.2 Truss uplift resistance. Trusses shall be attached to supporting wall assemblies by connections capable of resisting uplift forces as specified on the Truss Design Drawings. Uplift forces shall be permitted to be determined as specified by Table R802.11, if applicable, or as determined by accepted engineering practice.

R802.11.1.3 Rafter uplift resistance. Individual rafters shall be attached to supporting wall assemblies by connections capable of resisting uplift forces as determined by Table R802.11 or as specified by accepted engineering practice, Connections for beams used in a roof system shall be designed in accordance with the uplift forces as determined by accepted engineering practice

For wall framing connections to resist uplift load, refer to Section R602.10.2.1, Table R602.3(1), AF&PA/WFCM, or as determined by accepted engineering practice .

Reason: The general requirement of Section R801.2 states:

"…Roof and ceiling construction shall be capable of accommodating all loads imposed according to Section R301 and of transmitting the resulting loads to the supporting structural elements."

Chapter 6, wall construction, provides the requirements for connecting wall top plates to roof framing in Table 602.3(1) and with the addition of Section 602.10.1.2.1, braced wall panel uplift load path, during the last code cycle, the continuous load path language in Section R802.11 is redundant. Further, Section R602.10.1.2.1 establishes the connection in Table R602.3(1) as good for 100 plf.

R602.10.1.2.1 Braced wall panel uplift load path. *Braced wall panels* located at exterior walls that support roof rafters or trusses (including stories below top *story*) shall have the framing members connected in accordance with one of the following:

1. Fastening in accordance with Table R602.3(1) where:

   1.1. The basic wind speed does not exceed 90 mph (40 m/s), the wind exposure category is B, the roof pitch is 5:12 or greater, and the roof span is 32 feet (9754 mm) or less, or

   1.2. The net uplift value at the top of a wall does not exceed 100 plf. The net uplift value shall be determined in accordance with Section R802.11 and shall be permitted to be reduced by 60 plf (86 N/mm) for each full wall above.

2. Where the net uplift value at the top of a wall exceeds 100 plf (146 N/mm), installing *approved* uplift framing connectors to provide a continuous load path from the top of the wall to the foundation. The net uplift value shall be as determined in Item 1.2 above.

3. Bracing and fasteners designed in accordance with accepted engineering practice to resist combined uplift and shear forces.

This is in conflict with R802.10.5 which states:

R802.10.5 Truss to wall connection. Trusses shall be connected to wall plates by the use of *approved* connectors having a resistance to uplift of not less than 175 pounds (779 N) and shall be installed in accordance with the manufacturer's specifications. For roof assemblies subject to wind uplift pressures of 20 pounds per square foot (960 Pa) or greater, as established in TableR301.2(2), adjusted for height and exposure per Table R301.2(3), see section R802.11.

This proposal accomplishes to things.

1. It replaces the continuous load path requirement in R802.11.1 with a pointer back to the more detailed requirements of R602.10.2.1
2. It deletes Section R802.10.5, which has truss to wall connection requirements that are in conflict with R602.10.2.1
3. Coordinates the 100 plf trigger found in R602.10.1.2.1 with the rafter and truss connections in R802.11.

Cost Impact: The code change proposal will not increase the cost of construction.

Proponent: Gary Ehrlich, PE, National Association of Home Builders (NAHB)

1. Revise as follows:

TABLE R602.3(1)
FASTENER SCHEDULE FOR STRUCTURAL MEMBERS

ITEM	DESCRIPTION OF BUILDING ELEMENTS	NUMBER AND TYPE OF FASTENER[a,b,c]	SPACING OF FASTENERS
5	Rafter or roof truss to plate, toe nail	~~2~~3-16d box nails (3½"x0.135") or 3-10d common nails (3"x0.148")	2 toe nails on one side and 1 toe nail on opposite side of each rafter or truss[j]

(Portions of table not shown remain unchanged)

a. through i. (No change)

j. Where a rafter is fastened to an adjacent parallel ceiling joist in accordance with this schedule, provide two toe-nails on one side of the rafter and toe-nails from the ceiling joist to top plate in accordance with this schedule. The toe-nail on the opposite side of the rafter shall not be required.

R602.10.1.2.1 Braced wall panel uplift load path. *Braced wall panels* located at exterior walls that support roof rafters or trusses (including stories below top *story*) shall have the framing members connected in accordance with one of the following:

1. Fastening in accordance with Table R602.3(1) where~~:~~
   ~~1.1. The basic wind speed does not exceed 90 mph (40 m/s), the wind exposure category is B, the roof pitch is 5:12 or greater, and the roof span is 32 feet (9754 mm) or less, or~~
   ~~1.2.~~ The net uplift value at the top of a wall does not exceed ~~100~~ 115 plf. The net uplift value shall be determined in accordance with Section R802.11 and shall be permitted to be reduced by 60 plf (86 N/mm) for each full wall above.
2. Where the net uplift value at the top of a wall exceeds ~~100~~ 115 plf (146 N/mm), installing *approved* uplift framing connectors to provide a continuous load path from the top of the wall to the foundation. The net uplift value shall be as determined in Item 1.2 above.
3. Bracing and fasteners designed in accordance with accepted engineering practice to resist combined uplift and shear forces.

2. Delete without substitution:

~~**R802.10.5 Truss to wall connection.** Trusses shall be connected to wall plates by the use of *approved* connectors having a resistance to uplift of not less than 175 pounds (779 N) and shall be installed in accordance with the manufacturer's specifications. For roof assemblies subject to wind uplift pressures of 20 pounds per square foot (960 Pa) or greater, as established in TableR301.2(2), adjusted for height and exposure per Table R301.2(3), see section R802.11.~~

3. Delete and substitute as follows:

~~**R802.11.1 Uplift resistance.** Roof assemblies which are subject to wind uplift pressures of 20 pounds per square foot (960 Pa) or greater shall have roof rafters or trusses attached to their supporting wall assemblies by connections capable of providing the resistance required in Table R802.11.Wind uplift pressures shall be determined using an effective wind area of 100 square feet (9.3m2) and Zone 1 inTableR301.2(2), as adjusted for height and exposure per Table R301.2(3). A continuous load path shall be designed to transmit the uplift forces from the rafter or truss ties to the foundation.~~

R802.11.1 Uplift resistance. Individual rafters and trusses shall be attached to supporting wall assemblies by connections capable of resisting uplift forces as determined by one of the following methods:

1. as specified in Table R802.11; or
2. as specified on the Truss Design Drawings; or
3. as specified by a registered design professional.

Where the uplift force does not exceed 230 pounds, rafters and trusses shall be permitted to be attached to their supporting wall assemblies in accordance with Table R602.3(1).

Connections for girder trusses and roof beams shall be designed in accordance with the uplift forces specified on the Truss Design Drawings or as determined by a registered design professional.

~~**TABLE R802.11**~~
~~**REQUIRED STRENGTH OF TRUSS OR RAFTER CONNECTIONS TO RESIST WIND UPLIFT FORCES**~~[a, b, c, e, f]
~~**(Pounds per connection)**~~

TABLE R802.11
RAFTER OR TRUSS UPLIFT CONNECTION FORCES FROM WIND (POUNDS PER CONNECTION)

Rafter or Truss Spacing	Roof Span (feet)	Exposure B				Exposure C			
		Basic Wind Speed (mph)				Basic Wind Speed (mph)			
		85	90	100	110	85	90	100	110

	42	209	285	449	630	454	558	786	1040
	48	232	318	502	706	508	626	882	1166

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm, 1 mph = 0.447 m/s, 1 pound = 0.454 kg.

a. The tabulated uplift connection forces are based on a maximum 33 foot mean roof height, and Wind Exposure Category B or C. For Exposure D, the uplift connection force shall be selected from the Exposure C portion of the table using the next highest tabulated basic wind speed. The Adjustment Coefficients in Table R301.2(3) shall not be used to multiply the above forces for Exposures C and D or for other mean roof heights. Linear interpolation between tabulated roof spans and wind speeds shall be permitted.
b. The tabulated uplift connection forces include an allowance for roof and ceiling assembly dead load of 15 psf.
c. The tabulated uplift connection forces are limited to a maximum roof overhang of 24 inches.
d. The tabulated uplift connection forces shall be permitted to be multiplied by one of the reduction factors listed in the table below. Tabulated reduction factors shall not be combined.

Roof Type	Roof Pitch	Connection Location	Adjustment Factor
Any	Any	Within 8 feet of building corners	1.00
		8 feet or more from building corners	0.75
Monoslope or gable roof	5:12 or greater	Within 8 feet of building corners	0.87
		8 feet or more from building corners	0.75
Hip roof	5:12 or greater	Within 8 feet of building corners	0.70
		8 feet or more from building corners	0.75

e. The tabulated forces for a 12" on center spacing shall be permitted to be used to determine the uplift load in pounds per linear foot.

Reason: The purpose of this proposal is to provide sensible and simplified requirements for roof uplift connections. The issue of roof uplift connections, the limits of conventional nailed connections, and the point at which pre-engineered metal clips or straps are required has been a topic of much debate over the last several code cycles. The insurance industry and others have been trying to mandate a 200 pound maximum capacity for conventional rafter-to-wall or truss-to-wall connections, based largely on capacities calculated directly from AF&PA's NDS. At the same time, the existing Table R802.11 has not been updated in some time and is overly conservative for many typical houses. The uplift loads are based on low-slope (4:12 pitch or less) roofs. The table does not account for the reduction in uplift loads that occur on higher-slope (5:12 pitch or greater) roofs or on hip roofs per ASCE 7. Thus the code does not encourage the use of high-slope roofs, which have been shown to experience significantly less damage in high-wind events. The triggers proposed by the insurance industry, coupled with the current table, would subject many houses in low-wind areas to a requirement for roof-to-wall ties (not to mention continuous straps to the foundation) that is not justified by the actual performance of roof systems in low-wind areas. This requirement is particularly unjustified on higher-slope roofs where the uplift loads can be substantially reduced through a detailed analysis using ASCE 7.

This proposal is similar to a companion proposal which rolls together elements of several proposals concerning roof uplift connections (RB132-07/08, RB206-07/08, and RB207-07/08) from the last cycle. The key difference is the proposed trigger of 230 pounds in this proposal. This value is consistent with the capacities seen in uplift testing of both individual components and roof assemblies conducted by the NAHB Research Center, Clemson University, State Farm, and others. It is a modest increase from the 200 pound capacity previously proposed by IBHS. The benefit in this small yet technically-justified increase is an ability to simplify the proposed code language by including a house with a 32' span low-slope roof in 90mph Exposure B in the scope of conventional connections. This will allow the prescriptive kick-out for the 32' high-slope condition to be removed and the overall table to be simplified.

By introducing clarity to the trigger language for uplift connectors and providing this revised table, the IRC provisions for roof uplift connections will be substantially improved. Builders and building officials will have improved direction for when pre-engineered metal connectors are actually required. Additionally, the use of hip roofs and high-slope roofs will be encouraged, as designers, engineers and builders will be able to appropriately reduce uplift loads and avoid triggering uplift connector requirements for building locations and for roof configurations where the requirements are not justified.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: EHRLICH-RB-10-T. R602.3(1)-R602.10.1.2.1-R802.10.5-R802.11.1

RB157–09/10
R806.1, R806.2, R806.3 (New)

Proponent: Michael Fischer, The Kellen Company, representing the Roof Attic Ventilation Coalition

1. Revise as follows:

R806.1 Ventilation required. Enclosed *attics* and enclosed rafter spaces formed where ceilings are applied directly to the underside of roof rafters shall have cross ventilation for each separate space by ventilating openings protected against the entrance of rain or snow. Ventilation openings shall have a least dimension of 1/16 inch (1.6 mm) minimum and 1/4 inch (6.4 mm) maximum. Ventilation openings having a least dimension larger than 1/4 inch (6.4 mm) shall be provided with corrosion-resistant wire cloth screening, hardware cloth, or similar material with openings having a least dimension of 1/16 inch (1.6 mm) minimum and 1/4 inch (6.4 mm) maximum. Openings in roof framing members shall conform to the requirements of SectionR802.7. Required ventilation openings shall open directly to the outside air.

R806.2 Minimum area. The total net free ventilating area shall not be less than 1/150 of the area of the attic or rafter ~~space ventilated except that reduction of the total area to 1/300 is permitted provided that at least 50 percent and not more than 80 percent of the required ventilating area is provided by ventilators located in the upper portion of the space to be ventilated at least 3 feet (914 mm) above the eave or cornice vents with the balance of the required ventilation provided by eave or cornice vents~~. As an alternative, the net free cross-ventilation area may be reduced to 1/300 when a Class I or II vapor retarder is installed on the warm-in-winter side of the ceiling.

2. Add new text as follows:

R806.3 Cross-ventilation. At least 40 percent and not more than 50 percent of the required ventilating area shall be provided by ventilators located in the upper portion of the attic or rafter space. Upper ventilators shall be located no more than 3 feet (914 mm) below the ridge or highest point of the space, measured vertically, with the balance of the required ventilation provided by eave or cornice vents.

Exception. Where the location of wall or roof framing members conflicts with the installation of upper ventilators, installation more than 3 feet below the ridge or highest point of the space shall be permitted.

Reason: The code sets minimum requirements for ventilated attics. This proposal establishes an appropriate requirement for cross-ventilation as the default condition instead of allowing a reduction in ventilation for what is the most commonly recommended practice for ventilated attics. An exception for conditions where framing might preclude cross-ventilation to the specific location required allows some design flexibility for non-typical roof/wall assemblies. The proposal further clarifies that ventilators open to outside air, as opposed to adjacent attic or rafter spaces or some other interior space.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: FISCHER-RB-5-R806.1

RB158–09/10
R806.2

Proponent: Joseph Lstiburek, Building Science Corporation

Revise as follows:

R806.2 Minimum area. The total net free ventilating area shall not be less than ~~1/150~~ 1/300 of the area of the space ventilated where ~~except that reduction of the total area to 1/300 is permitted provided that~~ at least 50 percent and not more than 80 percent of the required ventilating area is provided by ventilators located in the upper portion of the space to be ventilated at least 3 feet (914 mm) above the eave or cornice vents with the balance of the required ventilation provided by eave or cornice vents. ~~As an alternative, the net free cross-ventilation area may be reduced to 1/300 when~~ In climate zones 5, 6, 7 and 8 a Class I or II vapor retarder ~~is~~ shall be installed on the warm-in-winter side of the ceiling.

Reason: This language is now more consistent with the IBC, which only allows one ventilation ratio. It also is consistent with the appropriate building science/physics.

The previous wording encouraged installing vapor retarders in ceilings in hot humid climates in order to reduce ventilation areas. That is very bad in terms of the governing physics. This wording fixes that.

Vapor retarders are required in cold climates regardless of ventilation area. This wording makes that clear as well.

Bottom line: if you choose to vent a roof this language says vent it according to the 1:300 ratio everywhere. In cold climates you need to add a vapor retarder. The language relating to vapor retarders is now consistent with the vapor retarder changes made to wall assemblies in the two previous code cycles.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: LSTIBUREK-RB-3-R806.2

RB159–09/10
R806.2

Proponent: Michael D. Fischer, The Kellen Company, representing the Roof-Attic Ventilation Coalition

Revise as follows:

R806.2 Minimum area. The total net free ventilating area shall not be less than 1/150 of the area of the space ventilated except that reduction of the total area to 1/300 is permitted provided that at least 50 percent and not more than 80 percent of the required ventilating area is provided by ventilators located in the upper portion of the space to be ventilated at least 3 feet (914 mm) above the eave or cornice vents with the balance of the required ventilation provided by eave or cornice vents. ~~As an alternative, the net free cross-ventilation area may be reduced to 1/300 when a Class I or II vapor retarder is installed on the warm-in-winter side of the ceiling.~~

Reason: The code sets minimum requirement for ventilated attics. This proposal removes an allowable reduction in ventilation if vapor retarders are installed on the warm-in-winter side of the ceiling assembly. While this practice may function in some climate zones, it does not justify a reduction in ventilation area across all climate regions.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: FISCHER-RB-6-R806.2

RB160–09/10
R806.4 (New)

Proponent: Michael D. Fischer, The Kellen Company, representing the Roof-Attic Ventilation Coalition

Add new text as follows:

R806.4 Installation and weather protection. Ventilators shall be installed in accordance with manufacturer's installation instructions. Installation of ventilators in roof systems shall be in accordance with the requirements of R903. Installation of ventilators in wall systems shall be in accordance with the requirements of Section R703.1.

(Renumber subsequent sections)

Reason: The code sets minimum requirements for ventilated attics. This proposal requires that ventilators be installed in accordance with the manufacturers' installation instructions. This requirement is essential if ventilation systems are to provide proper cross-ventilation and perform as intended. The proposal further clarifies that the weather protection requirements applicable for roof and wall penetrations, including flashing requirements, are considered.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: FISCHER-RB-4-R806.4

RB161–09/10
R806.4

Proponent: Joseph Lstiburek, Building Science Corporation

Revise as follows:

R806.4 Unvented attic assemblies. Unvented *attic* and unvented enclosed rafter assemblies (spaces between the ceiling joists of the top *story* and the roof rafters) and unvented enclosed rafter assemblies (spaces between ceilings that are applied directly to the underside of roof framing members/rafters and the structural roof sheathing at the top of the roof framing members/rafters) shall be permitted if all the following conditions are met:

1. The unvented *attic* space is completely contained within the *building thermal envelope*.
2. No interior class I vapor retarders are installed on the ceiling side (*attic* floor) of the unvented *attic* assembly or on the ceiling side of the unvented enclosed rafter assembly.
3. Where wood shingles or shakes are used, a minimum1/4 inch (6 mm) vented air space separates the shingles or shakes and the roofing underlayment above the structural sheathing.
4. In climate zones 5, 6, 7 and 8, any *air-impermeable insulation* shall be a class II vapor retarder, or shall have a class II vapor retarder coating or covering in direct contact with the underside of the insulation.
5. Either Items 5.1, 5.2 or 5.3 shall be met, depending on the air permeability of the insulation directly under the structural roof sheathing.
   - 5.1. *Air-impermeable insulation* only. Insulation shall be applied in direct contact with the underside of the structural roof sheathing.
   - 5.2. Air-permeable insulation only. In addition to the air-permeable installed directly below the structural sheathing, rigid board or sheet insulation shall be installed directly above the structural roof sheathing as specified in Table R806.4 for condensation control.
   - 5.3. Air-impermeable and air-permeable insulation. The *air-impermeable insulation* shall be applied in direct contact with the underside of the structural roof sheathing as specified in Table R806.4 for condensation control. The air-permeable insulation shall be installed directly under the *air-impermeable insulation*.

5.4 Where preformed insulation board is used as the air-impermeable insulation layer, it shall be sealed at the perimeter of each individual sheet interior surface to form a continuous layer.

Reason: The main reason for this change is to allow unvented roof construction for both attics and cathedral ceilings. The current language does not explicitly allow unvented roof construction for cathedral ceilings. Attics and ceilings are similar – the governing physics are identical - so the requirements will work for both. The language defining cathedral ceilings comes directly from similar language in the IBC Section 1203.2.

When the changes to vapor retarder definitions were made in the previous two code change cycles this section was inadvertently not changed. This proposed change inserts the new terminology and the appropriate specific class of vapor retarder.

The new note 5.4 acknowledges that rigid insulation sheets do meet the material properties of air-impermeable insulation directly. However, they are an air-impermeable insulation if their edges are not sealed to provide a continuous plane of airtightness. This new note clarifies the use of rigid insulation sheets.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: LSTIBUREK-RB-2-R806.4

RB162–09/10

R903.2.1

Proponent: Mike Rice, Maplewood, MN, representing the Association of Minnesota Building Officials

Revise as follows:

R903.2.1 Locations. Flashings shall be installed at wall and roof intersections, wherever there is a change in roof slope or direction and around roof openings. Kick out flashing shall be installed where the lower portion of a sloped roof stops within the plane of an intersecting wall cladding in such a manner as to divert or kick out water away from the assembly. Where flashing is of metal, the metal shall be corrosion resistant with a thickness of not less than 0.019 inch (0.5 mm) (No. 26 galvanized sheet).

Reason: This would be consistent with the code change proposal of R703.8 This change would also complement the current code addressing wall and roof intersections and prevent water from entering the wall cavity or penetrating to the structural building components. Step flashing at wall and roof intersections is incomplete without the kick out flashing, where the lower portion of a sloped roof stops within the plane of an intersecting wall. The water must be diverted away or it will find a way behind the water-resistive barrier and the siding or in some cases, it will go through the siding. The benefit of adding the kick out flashing would far exceed the cost, as the cost would be little.

Cost Impact: The code change proposal will increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: RICE-RB-1-R903.2.1

RB163–09/10

R903.5, R903.5.1, R903.5.2, Figure R903.5, R907.3

Proponent: Michael D. Fischer, The Kellen Company, representing the Asphalt Roofing Manufacturers Association

1. Delete without substitution:

~~**R903.5 Hail exposure.** Hail exposure, as specified in Sections R903.5.1 andR903.5.2, shall be determined using FigureR903.5.~~

~~**R903.5.1 Moderate hail exposure.** One or more hail days with hail diameters larger than 1.5 inches (38 mm) in a 20-year period.~~

~~**R903.5.2 Severe hail exposure.** One or more hail days with hail diameters larger than or equal to 2.0 inches (51 mm) in a 20-year period.~~

~~**FIGURE R903.5**~~
~~**HAIL EXPOSURE MAP**~~

2. Revise as follows:

R907.3 Recovering versus replacement. New roof coverings shall not be installed without first removing all existing layers of roof coverings where any of the following conditions exist:

1. Where the existing roof or roof covering is water-soaked or has deteriorated to the point that the existing roof or roof covering is not adequate as a base for additional roofing.
2. Where the existing roof covering is wood shake, slate, clay, cement or asbestos-cement tile.
3. Where the existing roof has two or more applications of any type of roof covering.
4. ~~For asphalt shingles, when the building is located in an area subject to moderate or severe hail exposure according to Figure R903.5.~~

Exceptions:

1. Complete and separate roofing systems, such as standing-seam metal roof systems, that are designed to transmit the roof loads directly to the building's structural system and that do not rely on existing roofs and roof coverings for support, shall not require the removal of existing roof coverings.
2. Installation of metal panel, metal shingle and concrete and clay tile roof coverings over existing wood shake roofs shall be permitted when the application is in accordance with Section R907.4.
3. The application of new protective coating over existing spray polyurethane foam roofing systems shall be permitted without tear-off of existing roof coverings.

Reason: This proposal removes the hail hazard map (Fig. R903.5), the definitions of hail exposure, and the current re-roofing limitation for asphalt shingles in some regions. The IRC requirement for reroofing is posed as a solution to minimize damage to asphalt shingles from hail events, but there is no data that concludes that limiting the application of asphalt shingles to a single layer provides appropriate cost savings to the homeowner. While this requirement may provide some benefit to insurers, that does not justify its inclusion in the IRC.

The reroofing section provides for limitations where the roof system is damaged and will not support an additional layer of shingles. This performance requirement should outweigh an arbitrary and universal ban on reroofing over an existing layer of asphalt shingles. The limitation is also vague in that it does not specify if the ban applies to the existing layer or to the reroof material. For example, would installation of metal roofing over an existing layer of asphalt shingles be allowed under this requirement in hail exposure areas? If so, the requirement unfairly provides preferential treatment of one type of roof covering without technical justification. The additional and often unnecessary expense of tear-off and disposal can result in delays of reroofing as homeowners struggle to decide what home maintenance they can afford. As the reroofing is delayed, additional water intrusion may cause other problems for occupants.

The current requirements are based upon a 20-year return period as contained in the definition of moderate and severe exposure conditions. Design requirements for other products, including resistance from windborne debris, are based upon a 50-year mean recurrence and annual probability of 2%. Using a 20-year standard suggests that this requirement is not intended to protect the structure or its occupants, but mitigate property loss by asking the consumer to pay more for re-roofing.

Requiring removal of an existing layer of asphalt shingles creates a significant impact on environmental issues. While many states and local jurisdictions have appropriate recycling programs in place, in many areas the tear-off materials end up in landfills. According to the US EPA, 11 million tons of asphalt shingles are manufactured and disposed of each year, and make up about 8% of the total building waste stream. The impact on landfills is an important consideration. Building materials take up significant space, and asphalt roofing products can encapsulate other landfill materials and delay the process of decay and degradation. Removing this requirement will allow local governments to buy time and implement programs that will provide for the re-use of asphalt shingles in roadways and other applications.

Figure R903.5 was introduced into the IRC during final action in Detroit on a Sunday afternoon with only a handful of governmental voting members present. These requirements were approved despite the fact that the map does not represent the work of any consensus body, the concept provided no technical or economic justification, and the proposal was disapproved by the IRC code development committee. Attempts to expand the use of this concept to new installations have been disapproved by the ICC in subsequent code cycles. Approval of this proposal will allow all stakeholders to properly address concerns in hail-prone regions through the development of consensus-based codes and standards, will have a positive impact on the environment and our landfills, and will provide a significant cost benefit for homeowners seeking to properly maintain their property.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: FISCHER-RB-3-R903.5

RB164–09/10
R905.1

Proponent: W. Harvey Cappel, PE, Racelectric Engineering

Revise as follows:

R905.1 Roof covering application. Roof coverings shall be applied in accordance with the applicable provisions of this section and the manufacturer's installation instructions. Unless ~~otherwise specified in this section,~~ specifically waived by a listed exception in the appropriate code section, roof coverings shall be installed to resist the component and cladding loads specified in Table R301.2(2), adjusted for height and exposure in accordance with Table R301.2(3).

Reason: The term “otherwise specified” without a definition basically means “anything specified” which makes this Section R905.1 meaningless and basically void. The original intent here is to require roof coverings to be installed to resist specific wind loads. With this undefined “otherwise specified” loophole the intent of R905.1 is cancelled. We want roof coverings to be installed to resist the wind loads so let’s be clear about what we want.

Cost Impact: There will be no cost impact (as compared to the original intent of the Code) related to this proposed code change.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: CAPPEL-RB-3-R905.1

RB165–09/10
R905.2.4.1

Proponent: W. Harvey Cappel, PE, Racelectric Engineering

Revise as follows:

R905.2.4.1 Wind resistance of asphalt shingles ~~s~~ adhesive strips. Asphalt shingles shall be tested for wind resistance of the adhesive strips (required to secure the shingle tabs) in accordance with ASTM D 7158. Asphalt shingles shall meet the classification requirements of Table R905.2.4.1 (1) for the appropriate maximum basic wind speed. Asphalt shingle packaging shall bear a label to indicate compliance with ASTM D 7158 and the required classification in Table R905.2.4.1 (1).

Exception: Asphalt shingles not included in the scope of ASTM D 7158 shall be tested and labeled to indicate compliance with ASTM D 3161 and the required classification in Table R905.2.4.1 (2).

Reason: The referenced test standards test the adhesive and its resistance to failure due to wind loads (test simulated) on the upwind side of the roof. These tests do not test fasteners or the resistance of fasteners to withdrawal from the wood deck. The tests aren’t even (test simulated) on the correct side of the roof (downwind) required for testing the fasteners. Mr. Mike Noone, Chairman of ASTM Subcommittee D08-02 (the authors of ASTM D 3161 and similar test codes) will confirm this. The problem with the current wording is that it is misleading causing some to believe that use of the manufactures' nail standard during this test is a test of the nails and therefore the standard nailing required, for these shingles, on any roof for winds up to the test standard wind speeds. This is not true. For high wind areas (110 mph or greater) the fasteners must be designed for the wind speed, mean roof height and exposure. Fasteners are not tested nor do they need to be. Sufficient data is already available to Engineers for the design of fastener systems.

Cost Impact: The only impact this code change proposal will have on cost is to those that have been wrongly interpreting the intent of the Code. In this case the cost of only a few more nails per shingle will be insignificant especially as compared to the cost of a failed shingle system cause by inadequate nailing.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: CAPPEL-RB-1-R905.2.4.1

RB166–09/10
R905.2.5

Proponent: W. Harvey Cappel, PE, Racelectric Engineering

Revise as follows:

R905.2.5 Fasteners. Fasteners for asphalt shingles shall be galvanized steel, stainless steel, aluminum or copper roofing nails, minimum 11 gage (0.1205 (3mm) ~~12 gage (0.105 inch (3mm))~~ shank with a minimum 3/8-inch (10 mm) diameter head, ASTM F 1667, of a length to penetrate through the roofing materials and penetrate through the minimum required roof sheathing or penetrate to an equivalent embedment into the thicker than minimum required roof sheathing. ~~a minimum of ¾ inch (19 mm) into the roof sheathing. Where the roof sheathing is less than ¾ inch (19mm) thick, the fasteners shall penetrate through the sheathing.~~ Fasteners shall comply with ASTM F 1667.

Reason: 1) The 12 gage nails are rarely if ever used anymore and in many cases inadequate. The outdated standard is copied from the typical manufacturer’s installation instructions (also outdated). The minimum standard needs to be updated.

2) The current Section wording is outdated (copied from the typical shingle manufacturer’s installation instructions, also outdated) and ambiguous. It implies an either or standard with the in between not in compliance with the Code. This is ridiculous. If a 3/8 inch penetration is in compliance with the Code then all greater penetrations and embedment’s up to and including the other Code required ¾ inch penetration are also in compliance with the Code. The problem with this incorrect wording is that it is being used as evidence of non compliance, which is senseless.

Cost Impact: 1) Probably no cost impact at all to go to the new 11 gage nail since the 12 gage nail isn't normally being used anyway, but even where it is, the cost impact will be minimal.

2) There will be no cost impact related to this proposed Code change; only less confusion and potentially a cost savings.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: CAPPEL-RB-2-R905.2.5

RB167–09/10
R905.2.6

Proponent: W. Harvey Cappel, PE, Racelectric Engineering

Revise as follows:

R905.2.6 Attachment. Asphalt shingles shall have the minimum number of fasteners required by the manufacturer, but not less than four fasteners per strip shingle or two fasteners per individual shingle. Where the roof slope exceeds 21 units vertical in 12 units horizontal (21:12, 175 percent slope), or where the basic wind speed is equal to or exceeds100 mph shingles shall be installed as required by the manufacturer, but with not less than six nails per shingle and as required to comply with Section R905.1.

Reason: The current code is being misinterpreted (mainly because of a misunderstanding of the ASTM D 3161 test [it only tests adhesives] requirement for high wind areas) regarding the fastening requirements to resist wind loads. This proposed change will help reinforce the known requirement that additional fasteners are required in high wind areas. The shingle manufacturers cannot be relied on for this requirement since they cannot and do not take responsibility for fastening design or fastening installation in high wind areas. Their wind related limit of warranty and responsibility typically stops with assurance against manufacturer's defects and compliance with one of the ASTM adhesive tests standards. Knowing that four nails per shingle are typically inadequate in high wind areas, here is an opportunity to set a minimum standard for high wind areas. The extreme number of shingle failures as a result of recent hurricanes Rita and Ike with wind speeds well below the typical coastal design standards, should be sufficient motivation to make a change in our shingle installation codes. What we have in force now, (basically four nails per shingle everywhere) is not working.

Cost Impact: There will be no cost impact (as compared to the original intent of the Code) related to this proposed Code change. Even if this change causes some construction projects to use six nails per shingle instead of the incorrect four nails per shingle, the additional cost will be minimal, especially as compared to the cost of an inadequate and failed shingle installation.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: CAPPEL-RB-4-R905.2.6

RB168–09/10
R905.2.8.3

Proponent: Gary Ehrlich, PE, National Association of Home Builders (NAHB)

Revise as follows:

R905.2.8.3 Sidewall flashing. Flashing against a vertical sidewall shall be ~~by the step flashing method. The flashing shall be~~ a minimum of 4 inches (102 mm) high and 4 inches (102 mm) wide~~. At the end of the vertical sidewall the step flashing shall be turned out in a manner that~~ and shall direct~~s~~ water away from the vertical sidewall ~~and~~ onto the roof and/or into the gutter. Where siding is provided on the vertical sidewall, the vertical leg of the flashing shall be continuous under the siding.

Reason: The purpose of this proposal is to clarify the requirements for the use of flashing at a vertical wall-to-roof intersection. The use of "step flashing" is fine for masonry wall construction; but to use it where siding is provided is incorrect. Walls with siding should be provided with continuous "J"-shaped sections of flashing, with the vertical leg continuous under the siding. A "J" turn back lip on the horizontal leg of the siding controls the water and directs it down the roof to the gutter. Step flashing does not have the return lip. "J"-shaped flashing sections are continuous, requiring fewer joints, look much better, and also reduce the opportunity for water to have multiple points of possible entry.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: EHRLICH-RB-11-R905.2.8.3

RB169–09/10
R905.2.8.3.1 (New); IBC 1405.2.1 (New)

Proponent: Edward L. Paxton, Salt Lake County, UT, representing the Utah Chapter of ICC

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. PART II WILL BE HEARD BY THE IBC FIRE SAFETY COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IRC BUILDING/ENERGY

Add new text as follows:

R905.2.8.3.1. Counter-flashing. A 6" tall counter-flashing with drip edge shall be installed on the sidewall, overlapping the step flashing a minimum of 2 inches. Required weather barrier/building paper or house wrap and exterior coverings shall overlap the counter-flashing. Vertical sidewall exterior coverings with any required weep screed or drip edge shall terminate a minimum of 4" above the finished roof surface.

PART II – IBC FIRE SAFETY

Add new text as follows:

1405.2.1 Termination above roof surfaces. All exterior wall coverings installed on vertical surfaces shall terminate a minimum of 4" above any intersecting roof surface, or as required by roofing manufacturer. Flashing and water resistive barriers shall be installed as to allow replacement of the roof covering with required flashings without removal of the exterior wall covering.

Reason: Building finishes on vertical surfaces are regularly installed tight to roofing surface. This does not allow for proper drainage of installed building exterior coverings. The result is improper drainage which leads to mold growth, covering failures and leaks. When roof replacement is necessary, the ability to properly install new step flashing is not possible without removing and repairing building exterior coverings. Alternatively, the new step flashing is often improperly installed over top of the exterior wall covering, trapping moisture that drains out of the bottom of the exterior covering weep or drip edge.

The minimal increase in cost to add an extra counter-flashing is minimal when compared to the cost to repair damage wall covering or to properly replace the roof when necessary.

Cost Impact: The code change proposal will increase the cost of construction.

PART I – IRC BUILDING/ENERGY

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

PART I – IBC FIRE SAFETY

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: PAXTON-RB-1-R905.2.8.3.1- FS1-1405.2.1

RB170–09/10
R905.2.8.5 (New)

Proponent: Logan G. Sauter, Salt Lake City Corporation, representing the Utah Chapter of ICC

Add new text as follows:

R905.2.8.5 Drip Edge. Provide drip edge at eaves and gables of shingle roofs. Overlap to be a minimum of 2 inches (51 mm). Eave drip edges shall extend 0.25 inch (6.4 mm) below sheathing and extend back on the roof a minimum of 2 inches (51 mm). Drip edges shall be mechanically fastened a maximum of 12 inches (305 mm) o.c.

Reason: Unlike the IBC, the IRC does not include drip edge requirements for shingle roofs. This new text brings the IRC into uniformity with the IBC, reflects manufacturers' requirements for shingle roof installations, and uses identical wording and placement as found in IBC 1507.2.9.3.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: SAUTER-RB-1-R905.2.8.5

RB171–09/10
R907.3

Proponent: Robert McCluer, RMc Code Consulting, representing the Metal Construction Association (MCA)

Revise as follows:

R907.3 Re-covering versus replacement. New roof coverings shall not be installed without first removing all existing layers of roof coverings where any of the following conditions occur:

1. Where the existing roof or roof covering is water-soaked or has deteriorated to the point that the existing roof or roof covering is not adequate as a base for additional roofing.
2. Where the existing roof covering is wood shake, slate, clay, cement or asbestos-cement tile.
3. Where the existing roof has two or more applications of any type of roof covering.
4. For asphalt shingles over existing asphalt shingles, when the building is located in an area subject to moderate or severe hail exposure according to Figure R903.5.

Exceptions:

1. Complete and separate roofing systems, such as standing-seam metal roof systems, that are designed to transmit the roof loads directly to the building's structural system and that do not rely on existing roofs and roof coverings for support, shall not require the removal of existing roof coverings.
2. Installation of metal panel, metal shingle, and concrete and clay tile roof coverings over existing wood shake roofs shall be permitted when the application is in accordance with Section R907.4.
3. The application of new protective coating over existing spray polyurethane foam roofing systems shall be permitted without tear-off of existing roof coverings.

Reason: The purpose of this code change is only to clarify the application of the current text of item 4 of Section R907.3. This change is needed since the current text is not clear and could be misapplied.

The purpose of item 4 is to address the behavior of more than one layer of asphalt shingles on a roof located in a moderate or severe hail exposure. This condition results in a "sponge" effect in the top layer of the shingles that reduces the impact resistance of the roof. Thus the top layer is more susceptible to penetration by hailstones that increases the potential for water penetration under the roof covering.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: MCCLUER-RB-1-R907.3

RB172–09/10
R907.5

Proponent: Rick Davidson, City of Maple Grove, MN

Revise as follows:

R907.5 Reinstallation of materials. Existing slate, clay or cement tile shall be permitted for reinstallation, except that damaged, cracked or broken slate or tile shall not be reinstalled. ~~Existing vent flashing, metal edgings, drain outlets, collars and metal counter flashings~~ Any existing flashings, edgings, outlets, collars, vents or similar devices that are a part of the roof assembly shall ~~not be reinstalled where~~ be replaced when rusted, damaged or deteriorated. Aggregate surfacing materials shall not be reinstalled.

Reason: The current language states that only specific items cannot be reused if damaged. This implies that those items not listed may be reused even if damaged. The proposal also makes it clear that damaged components must be replaced even if they are not "reinstalled" but simply reused in-place.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: DAVIDSON-RB-1-R907.5

RB173–09/10
R1004.3

Proponent: Jim Buckley, Buckley Rumford Co., representing the Masonry Alliance for Codes and Standards (MACS) and Clay Flue Lining Institute (CFLI)

Revise as follows:

R1004.3 Decorative shrouds. Decorative shrouds shall not be installed at the termination of <u>air-cooled</u> chimneys for factory-built fireplaces <u>listed to UL 127</u> except where the shrouds are listed and *labeled* for use with the specific factory-built fireplace system and installed in accordance with the manufacturer's installation instructions.

Reason: Add the words "air-cooled" and "listed to UL127" as non listed decorative shrouds can interfere with the air flow of air-cooled metal chimneys listed to UL 127 for factory-built fireplaces. There is no problem, however, adding decorative shrouds to insulated factory-built chimneys listed to UL 103 that are used for masonry fireplaces, stoves, furnaces and many other appliances. The language here should be specific to aircooled UL 127 chimneys and distinguished from insulated Class A chimneys specified in Section R1005.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: BUCKLEY-RB-2-R1004.3

RB174–09/10
1005.2

Proponent: Jim Buckley, Buckley Rumford Co., representing the Masonry Alliance for Codes and Standards (MACS) and Clay Flue Lining Institute (CFLI)

Revise as follows:

R1005.2 Decorative shrouds. ~~Decorative shrouds shall not be installed at the termination of factory-built chimneys except where the shrouds are *listed* and *labeled* for use with the specific factory-built chimney system and installed in accordance with the manufacturer's installation instructions.~~ <u>Decorative shrouds shall comply with the provisions of R1003.9.</u>

Reason: There is no problem adding decorative shrouds to insulated factory-built chimneys listed to UL 103 that are used for masonry fireplaces, stoves, furnaces and many other appliances provided they comply with the general provisions for chimney terminations in Section R1003.9.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: BUCKLEY-RB-3-R1005.2

RB175–09/10
AG101.2

Proponent: Lorraine Ross, Intech Consulting, Inc., representing the Association of Pool and Spa Professionals

Revise as follows:

AG101.2 Pools in flood hazard areas. Pools that are located in flood hazard areas established by Table R301.2(1), including above-ground pools, on-ground pools and in-ground pools that involve placement of fill, shall comply with Sections AG101.2.1 or AG101.2.2.

> **Exception:** Pools located in riverine flood hazard areas which are outside of designated floodways <u>and pools in flood hazard areas not directly connected to a watercourse</u>.

Reason: The 2009 IRC adopted new provisions regarding pools located in flood hazard areas. This proposed revision is intended to clarify that the exception applies to pools in flood hazard areas not directly connected to a flowing body of water, which is called a watercourse in other parts of the National Flood Insurance Program (NFIP) regulations.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. PART II WILL BE HEARD BY THE IBC GENERAL COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IRC BUILDING/ENERGY

1. Delete and substitute as follows:

~~**AG106.1 General.** Suction outlets shall be designed and installed in accordance with ANSI/APSP-7.~~

AG106.1 General. Suction outlets shall be designed to produce circulation throughout the pool or spa. Single-outlet systems, such as automatic vacuum cleaner systems, or multiple suction outlets, whether isolated by valves or otherwise, shall be protected against user entrapment.

2. Add new text as follows:

AG106.2 Suction fittings. Pool and spa suction outlets shall have a cover that conforms to ANSI/ASME A112.19.8.

Exception: Surface skimmers

AG106.3 Vacuum relief system required. Pool and spa single- or multiple-outlet circulation systems shall be equipped with a vacuum relief system should grate covers located therein become missing or broken. All pool and spa single- or multiple-outlet circulation systems shall be equipped with an approved or engineered vacuum relief system of the type specified herein, as follows:

1. Safety vacuum release system conforming to ASME A112.19.17 or ASTM F 2387; or
2. An approved gravity drainage system.

AG106.4 Dual drain separation. Single or multiple pump circulation systems shall be provided with a minimum of two suction outlets of the approved type. A minimum horizontal or vertical distance of 3 feet (914 mm) shall separate the outlets. These suction outlets shall be piped so that water is drawn through them simultaneously through a vacuum relief-protected line to the pump or pumps.

AG106.5 Pool cleaner fittings. Where provided, vacuum or pressure cleaner fitting(s) shall be located in an accessible position(s) at least 6 inches (152 mm) and not more than 12 inches (305 mm) below the minimum operational water level or as an attachment to the skimmer(s).

3. Add new standards to AG108 as follows:

ANSI/ASME

A112.19.8a-08	Suction Fittings for use in Swimming Pools, Wading Pools, Spas and Hot Tubs
A112.19.17-09	Manufactured Safety Vacuum Release Systems (SVRS) For Residential and Commercial Swimming Pool, Spa, Hot Tub and Wading Pool Suction Systems

ASTM

F 2387-04 Standard specification for manufactured safety vacuum release systems, swimming pools, spas and hot tubs

PART II – IBC GENERAL

1. Delete and substitute as follows:

~~**3109.5 Entrapment avoidance.** Suction outlets shall be designed and installed in accordance with ANSI/APSP-7.~~

3109.5 Entrapment avoidance. Suction outlets shall be designed to produce circulation throughout the pool or spa. Single-outlet systems, such as automatic vacuum cleaner systems, or multiple suction outlets, whether isolated by valves or otherwise, shall be protected against user entrapment.

2. Add new text as follows:

3109.5.1 Suction fittings. Pool and spa suction outlets shall have a cover that conforms to ANSI/ASME A112.19.8.

Exception: Surface skimmers

3109.5.2 Vacuum relief system required. Pool and spa single- or multiple-outlet circulation systems shall be equipped with a vacuum relief system should grate covers located therein become missing or broken. All pool and spa single- or multiple-outlet circulation systems shall be equipped with an approved or engineered vacuum relief system of the type specified herein, as follows:

1. Safety vacuum release system conforming to ASME A112.19.17 or ASTM F 2387; or
2. An approved gravity drainage system.

3109.5.3 Dual drain separation. Single or multiple pump circulation systems shall be provided with a minimum of two suction outlets of the approved type. A minimum horizontal or vertical distance of 3 feet (914 mm) shall separate the outlets. These suction outlets shall be piped so that water is drawn through them simultaneously through a vacuum relief-protected line to the pump or pumps.

3109.5.4 Pool cleaner fittings. Where provided, vacuum or pressure cleaner fitting(s) shall be located in an accessible position(s) at least 6 inches (152 mm) and not more than 12 inches (305 mm) below the minimum operational water level or as an attachment to the skimmer(s).

3. Add new standards to Chapter 35 as follows:

ANSI/ASME

A112.19.8a-08 Suction Fittings for use in Swimming Pools, Wading Pools, Spas and Hot Tubs

A112.19.17-09 Manufactured Safety Vacuum Release Systems (SVRS) For Residential and Commercial Swimming Pool, Spa, Hot Tub and Wading Pool Suction Systems

ASTM

F 2387-04 Standard specification for manufactured safety vacuum release systems, swimming pools, spas and hot tubs

Reason: During the last code change cycle the proponents of APSP-7 made representations that the APSP standard would bring the IRC into consistency with the Virginia Gramme Baker Pool and Spa Safety Act. This is a false statement as to I-Code models were utilized as the model for the safety prescription contained in the Act.

The incorporation of the APSP-7 standard removed the prescription for body and limb entrapment safety. The adverse affect of incorporation of the APSP-7 standard is that the liability for safe pool and spa construction was shifted away from the APSP constituent-manufacturers and placed squarely on the back of the installer, designer and/or the authority having jurisdiction.

By incorporating the safety prescription above installers, designers and the authority having jurisdiction can readily determine code compliance and more important if the pool or spas is as safe as possible.

Cost Impact: There may be an increase in costs associated with installing the proper safety equipment in pools and spas in the neighborhood of $500.00 – $2,000.00 dependant on the system used to achieve compliance with the safety prescription.

Analysis: A review of the standards proposed for inclusion in the code, ANSI/ASME A112.19.8a, A112.19.17 and ASTM F 2387, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

PART I – IRC BUILDING/ENERGY

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

PART II –- IBC GENERAL

Public Hearing:	Committee:	AS	AM	D

AG106.2 (New), AG108 (New), Chapter 44 (New); IBC 3109.51 (New), Chapter 35 (New)

Proponent: Jesse J. Beitel, Hughes Associates, Inc., representing the Pool Safety Council

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IRC BUILDING/ENERGY COMMITTEE. PART II WILL BE HEARD BY THE IBC GENERAL COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IRC BUILDING/ENERGY

1. Add new text as follows:

AG106.2 Vacuum relief system required. All pool and spa single- or multiple-outlet circulation systems that incorporate submerged suction outlet fittings shall be equipped with an approved or engineered vacuum relief system as follows:

1. Safety vacuum release systems conforming to ASME A112.19.17 or ASTM F 2387; or
2. An approved gravity drainage system.

2. Add new standards to Chapter 44 and AG108 as follows:

ANSI/ASME

A112.19.17-09	Manufactured Safety Vacuum Release Systems (SVRS) For Residential and Commercial Swimming Pool, Spa, Hot Tub and Wading Pool Suction Systems

ASTM

F 2387-04	Standard Specification for Manufactured Safety Vacuum Release Systems (SVRS) For Swimming Pools, Spas, Hot Tubs

PART II – IBC GENERAL

1. Add new text as follows:

3109.5.1 Vacuum relief system required. All pool and spa single- or multiple-outlet circulation systems that incorporate submerged suction outlet fittings shall be equipped with an approved or engineered vacuum relief system as follows:

1. Safety vacuum release systems conforming to ASME A112.19.17 or ASTM F 2387; or
2. An approved gravity drainage system.

2. Add new standards to Chapter 35 as follows:

ANSI/ASME

A112.19.17-09	Manufactured Safety Vacuum Release Systems (SVRS) For Residential and Commercial Swimming Pool, Spa, Hot Tub and Wading Pool Suction Systems

ASTM

F 2387-04	Standard Specification for Manufactured Safety Vacuum Release Systems (SVRS) For Swimming Pools, Spas, Hot Tubs

Reason: This code change provides a final layer of protection against potential entrapments. While the APSP-7 provides partial protection against entrapment, it does not protect swimmers or waders in the event that problems occur with improperly designed pools, some types of blocked drains, etc. These events can and do occur and when they occur, this proposal provides a mechanism to help prevent entrapment.

Cost Impact: The code change proposal will increase the cost of construction.

Analysis: A review of the standards proposed for inclusion in the code, ANSI/ASME A112.19.17 and ASTM F 2387, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

R202 (New), Appendix G, R324 (New), R325 (New), R326 (New), Chapter 44

Proponent: Tom Neltner, National Center for Healthy Housing, representing National Center for Healthy Housing and Alliance for Healthy Homes

1. Add new definitions as follows:

ABOVE-GROUND/ON-GROUND POOL. See "Swimming pool."

BARRIER. A fence, wall, building wall or combination thereof which completely surrounds the swimming pool and obstructs access to the swimming pool.

HOT TUB. See "Swimming pool."

IN-GROUND POOL. See "Swimming pool."

RESIDENTIAL. That which is situated on the premises of a detached one- or two-family dwelling or a one-family townhouse not more than three stories in height.

SPA. A structure intended for recreational bathing, in which all controls, water-heating and water-circulating equipment are an integral part of the product. A spa may be either a nonportable spa or a portable spa.

SPA, NONPORTABLE. See "Swimming pool."

SPA, PORTABLE. A nonpermanent structure intended for recreational bathing, in which all controls, water-heating and water-circulating equipment are an integral part of the product.

SWIMMING POOL. Any structure intended for swimming or recreational bathing that contains water over 24 inches (610 mm) deep. This includes in-ground, above-ground and on-ground swimming pools, hot tubs and spas.

SWIMMING POOL, INDOOR. A swimming pool which is totally contained with a structure and surrounded on all four sides by the walls of the enclosing structure.

SWIMMING POOL, OUTDOOR. Any swimming pool that is not an indoor swimming pool.

2. Delete Appendix G in its entirety without substitution:

~~**APPENDIX G**~~
~~**SWIMMING POOLS, SPAS AND HOT TUBS**~~

3. Add new text as follows:

SECTION R324
SWIMMING POOLS, SPAS AND HOT TUBS

R324.1 General. The provisions of this section shall control the design and construction of swimming pools, nonportable spas and hot tubs installed in or on the lot of a one- or two-family dwelling.

R324.2 Pools in flood hazard areas. Pools that are located in flood hazard areas established by Table R301.2(1), including above-ground pools, on-ground pools and in-ground pools that involve placement of fill, shall comply with Sections R324.2.1 or R324.2.2.

Exception: Pools located in riverine flood hazard areas which are outside of designated floodways.

R324.2.1 Pools located in designated floodways. Where pools are located in designated floodways, documentation shall be submitted to the *building official*, which demonstrates that the construction of the pool will not increase the design elevation at any point within the *jurisdiction*.

R324.2.2 Pools located where floodways have not been designated. Where pools are located where design flood elevations are specified but floodways have not been designated, the applicant shall provide a floodway analysis that demonstrates that the proposed pool will not increase the design flood elevation more than 1 foot (305 mm) at any point within the jurisdiction.

R324.3 In-ground pools. In-ground pools shall be designed and constructed in conformance with ANSI/NSPI-5 as listed in Chapter 35.

R324.4 Above-ground and on-ground pools. Above-ground and on-ground pools shall be designed and constructed in conformance with ANSI/NSPI-4 as listed in Chapter 35.

R324.5 Pools in flood hazard areas. In flood hazard areas established by Table R301.2(1), pools in coastal high hazard areas shall be designed and constructed in conformance with ASCE 24.

R324.6 Permanently installed spas and hot tubs. Permanently installed spas and hot tubs shall be designed and constructed in conformance with ANSI/NSPI-3 as listed in Chapter 35

R324.7 Portable spas and hot tubs. Portable spas and hot tubs shall be designed and constructed in conformance with ANSI/NSPI-6 as listed in Chapter 35.

SECTION R325
BARRIER REQUIREMENTS

R325.1 Application. The provisions of this chapter shall control the design of barriers for residential swimming pools, spas and hot tubs. These design controls are intended to provide protection against potential drownings and near drownings by restricting access to swimming pools, spas and hot tubs.

R325.2 Outdoor swimming pools. An outdoor swimming pool, including an in-ground, above-ground or on-ground pool, hot tub or spa, shall be surrounded by a barrier which shall comply with the following:

1. The top of the barrier shall be at least 48 inches (1219 mm) above grade measured on the side of the barrier which faces away from the swimming pool. The maximum vertical clearance between grade and the bottom of the barrier shall be 2 inches (51 mm) measured on the side of the barrier which faces away from the swimming pool. Where the top of the pool structure is above grade, such as an above-ground pool, the barrier may be at ground level, such as the pool structure, or mounted on top of the pool structure. Where the barrier is mounted on top of the pool structure, the maximum vertical clearance between the top of the pool structure and the bottom of the barrier shall be 4 inches (102 mm).
2. Openings in the barrier shall not allow passage of a 4-inch-diameter (102 mm) sphere.
3. Solid barriers which do not have openings, such as a masonry or stone wall, shall not contain indentations or protrusions except for normal construction tolerances and tooled masonry joints.
4. Where the barrier is composed of horizontal and vertical members and the distance between the tops of the horizontal members is less than 45 inches (1143 mm), the horizontal members shall be located on the swimming pool side of the fence. Spacing between vertical members shall not exceed 1 ¾ inches (44 mm) in width. Where there are decorative cutouts within vertical members, spacing within the cutouts shall not exceed 1 ¾ inches (44 mm) in width.

5. Where the barrier is composed of horizontal and vertical members and the distance between the tops of the horizontal members is 45 inches (1143 mm) or more, spacing between vertical members shall not exceed 4 inches (102 mm). Where there are decorative cutouts within vertical members, spacing within the cutouts shall not exceed 1 ¾ inches (44 mm) in width.
6. Maximum mesh size for chain link fences shall be a 2 ¼ - inch (57 mm) square unless the fence has slats fastened at the top or the bottom which reduce the openings to not more than 1 ¾ inches (44 mm).
7. Where the barrier is composed of diagonal members, such as a lattice fence, the maximum opening formed by the diagonal members shall not be more than 1 ¾ inches (44 mm).
8. Access gates shall comply with the requirements of Section R325.2, Items 1 through 7, and shall be equipped to accommodate a locking device. Pedestrian access gates shall open outward away from the pool and shall be self-closing and have a self-latching device. Gates other than pedestrian access gates shall have a self-latching device. Where the release mechanism of the self-latching device is located less than 54 inches (1372 mm) from the bottom of the gate, the release mechanism and openings shall comply with the following:
   8.1. The release mechanism shall be located on the pool side of the gate at least 3 inches (76 mm) below the top of the gate: and
   8.2. The gate and barrier shall have no opening larger than ½ inch (12.7 mm) within 18 inches (457 mm) of the release mechanism.
9. Where a wall of a dwelling serves as part of the barrier, one of the following conditions shall be met:
   9.1. The pool shall be equipped with powered safety cover in compliance with ASTM F 1346; or
   9.2. Doors with direct access to the pool through that wall shall be equipped with an alarm which produces an audible warning when the door and/or its screen, if present, are opened. The alarm shall be listed and labeled in accordance with UL 2017. The deactivation switch(es) shall be located at least 54 inches (1372 mm) above the threshold of the door; or
   9.3. Other means of protection, such as self-closing doors with self-latching devices, which are approved by the governing body, shall be acceptable as long as the degree of protection afforded is not less than the protection afforded by Item 9.1 or 9.2 described above.
10. Where an above-ground pool structure is used as a barrier or where the barrier is mounted on top of the pool structure, and the means of access is a ladder or steps;
   10.1. The ladder or steps shall be capable of being secured, locked or removed to prevent access; or
   10.2. The ladder or steps shall be surrounded by a barrier which meets the requirements of Section R325.2, Items 1 through 9. When the ladder or steps are secured, locked or removed, any opening created shall not allow the passage of a 4-inch-diameter (102 mm) sphere.

R325.3 Indoor swimming pool. Walls surrounding an indoor swimming pool shall comply with Section R325.2 Item 9.

R325.4 Prohibited locations. Barriers shall be located to prohibit permanent structures, equipment or similar objects from being used to climb them.

R325.5 Barrier exceptions. Spas or hot tubs with a safety cover which complies with ASTM F1346, as listed in Chapter 35, shall be exempt from these barrier requirement provisions.

SECTION R326
ENTRAPMENT PROTECTION FOR SWIMMING POOL AND SPA SUCTION OUTLETS

R326.1 General. Suction outlets shall be designed and installed in accordance with ANSI/APSP-7.

4. Add new standards as follows:

ANSI/NSPI

ANSI/NSPI-3-99	Standard for Permanently Installed Residential Spas.
ANSI/NSPI-4-99	Standard for Above-ground/On-ground Residential Swimming Pools.
ANSI/NSPI-5-2003	Standard for Residential In-ground Swimming Pools.
ANSI/NSPI-6-99	Standard for Residential Portable Spas.

ANSI/APSP

ANSI/APSP-7-06	Standard for Suction Entrapment Avoidance in Swimming Pools, Wading Pools, Spas, Hot Tubs and Catch Basins.

ASCE

ASCE/SEI-24-05	Flood Resistant Design and Construction.

ASTM

ASTM F 1346-91 (2003)	Performance Specifications for Safety Covers and Labeling Requirements for All Covers for Swimming Pools, Spas and Hot Tubs.

UL

2017-2000	Standard for General-purpose Signaling Devices and Systems-with Revisions through June 2004.

Reason: In December 2007, the National Center for Healthy Housing (NCHH) and the U.S. Centers for Disease Control and Prevention (CDC) convened an Expert Panel consistent with National Institute of Health guidelines to assess the effectiveness of various interventions to make homes healthier and safer. NCHH and CDC published the report of the experts in January 2009. See www.nchh.org/LinkClick.aspx?fileticket=2lvaEDNBIdU%3d&tabid=229 for the full report.

The Expert Panel reviewed the peer-reviewed research on the topic and concluded that that 4-sided isolation pool fencing significantly reduces childhood drowning, and that this type of fencing performs significantly better than 3-sided perimeter fencing. The studies showed the following:

- The risk of drowning in a fenced pool was about three times lower, compared to an unfenced pool (Fergusson DM, Horwood LJ. 1984. Risks of Drowning in Fenced and Unfenced Domestic Swimming Pools. New Zealand Medical Journal 97(767): 777–779. Fergusson and Horwood 1984). See also Pitt WR, Balanda KP. 1991. Childhood Drowning and Near-Drowning in Brisbane—The Contribution of Domestic Pools. Medical Journal of Australia 154(10): 661–665.)
- Four-sided isolation fencing is about five times more effective than three-sided perimeter fencing (Intergovernmental Working Party on Swimming Pool Safety. 1988. Pre-School drowning in private swimming pools. Perth: Health Department of Western Australia.

One study (Morgenstern H, Bingham T, Reza A. 2000. Effects of pool fencing ordinances and other factors on childhood drowning in Los Angeles County, 1990-1995. American Journal of Public Health 90(4): 595–601) failed to show that an ordinance requiring pool fencing in Los Angeles reduced drowning significantly. It is possible that this study was confounded by a public education campaign, the fact that the legislation only required 3-sided fencing, possible inadequate enforcement, and other factors.

Consistent with the Expert Panel conclusion, this code change proposal brings the requirements for swimming pools, spas and hot tubs out of Appendix G and into the body of the code text. Safety requirements for pools should not be optional they need to be mandatory.

Cost Impact: The code change proposal will increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: NELTNER-RB-1-R324-R325-R326

RB179–09/10

New Chapter

Proponent: Lorraine Ross, Intech Consulting, Inc., representing the Association of Pool and Spa Professionals

Add new chapter as follows:

Move current **APPENDIX G SWIMMING POOLS, SPAS AND HOT TUBS** into the body of the IRC by establishing a new chapter. Number accordingly.

Reason: This code change recognizes the importance of utilizing national consensus standards for the design and construction of residential swimming pools, spas and hot tubs. Provisions for construction of swimming pools, spas and hot tubs have been in the IRC as a non-mandatory appendix for many years. With the increased attention to pool safety, as illustrated by the 2009 IRC adoption of *ANSI/APSP-7 Standard for Suction Entrapment Avoidance in Swimming Pools, Wading Pools, Spas, Hot Tubs, and Catch Basins*, this is the opportune time to move the requirements of Appendix G into the main body of the code.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: ROSS-RB-1-NEW CHAPTER

RB180–09/10

R202 (New), R325 (New), Appendix F

Proponent: Jane Malone, Alliance for Healthy Homes, representing National Center for Healthy Housing and Alliance for Healthy Homes

1 Add new definitions as follows:

DRAIN TILE LOOP. A continuous length of drain tile or perforated pipe extending around all or part of the internal or external perimeter of a basement or crawl space footing.

RADON GAS. A naturally-occurring chemically inert, radio-active gas that is not detectable by human senses. As a gas, it can move readily through particles of soil and rock and can accumulate under the slabs and foundations of homes where it can easily enter into the living space through construction cracks and openings.

SOIL-GAS-RETARDER. A continuous membrane of 6-mil (0.15 mm) polyethylene or other equivalent material used to retard the flow of soil gases into a building.

SUBSLAB DEPRESSURIZATION SYSTEM (Active). A system designed to achieve lower sub-slab air pressure relative to indoor air pressure by use of a fan-powered vent drawing air from beneath the slab.

SUBSLAB DEPRESSURIZATION SYSTEM (Passive). A system designed to achieve lower sub-slab air pressure relative to indoor air pressure by use of a vent pipe routed through the conditioned space of a building and connecting the sub-slab area with outdoor air, thereby relying on the convective flow of air upward in the vent to draw air from beneath the slab.

SUBMEMBRANE DEPRESSURIZATION SYSTEM. A system designed to achieve lower-sub-membrane air pressure relative to crawl space air pressure by use of a vent drawing air from beneath the soil-gas-retarder membrane.

2. Add new text as follows:

SECTION R325
RADON CONTROL METHODS

R325.1 General. The following construction techniques are required to resist radon entry and prepare the building for post-construction radon mitigation in areas designated by the jurisdiction as having high and moderate potential risk of radon exposure. The determination for designating such areas shall be made using the map contained in Figure R325.1, the list contained in Table R325.1, or locally available data.

R325.2 Subfloor preparation. A layer of gas-permeable material shall be placed under all concrete slabs and other floor systems that directly contact the ground and are within the walls of the living spaces of the building, to facilitate future installation of a sub-slab depressurization system, if needed. The gas-permeable layer shall consist of one of the following:

1. A uniform layer of clean aggregate, a minimum of 4 inches (102mm)thick. The aggregate shall consist of material that will pass through a 2-inch (51mm)sieve and be retained by a 1/4-inch (6.4 mm) sieve.
2. A uniform layer of sand (native or fill), a minimum of 4 inches (102 mm) thick, overlain by a layer or strips of geotextile drainage matting designed to allow the lateral flow of soil gases.
3. Other materials, systems or floor designs with demonstrated capability to permit depressurization across the entire sub-floor area.

R325.3 Soil-gas-retarder. A minimum 6-mil (0.15 mm) [or 3-mil (0.075 mm) cross-laminated] polyethylene or equivalent flexible sheeting material shall be placed on top of the gas-permeable layer prior to casting the slab or placing the floor assembly to serve as a soil-gas-retarder by bridging any cracks that develop in the slab or floor assembly and to prevent concrete from entering the void spaces in the aggregate base material. The sheeting shall cover the entire floor area with separate sections of sheeting lapped at least 12 inches (305 mm). The sheeting shall fit closely around any pipe, wire or other penetrations of the material. All punctures or tears in the material shall be sealed or covered with additional sheeting.

R325.4 Entry routes. Potential radon entry routes shall be closed in accordance with Sections R325.4.1 through R325.4.10.

R325.4.1 Floor openings. Openings around bathtubs, showers, water closets, pipes, wires or other objects that penetrate concrete slabs or other floor assemblies shall be filled with a polyurethane caulk or equivalent sealant applied in accordance with the manufacturer's recommendations.

R325.4.2 Concrete joints. All control joints, isolation joints, construction joints and any other joints in concrete slabs or between slabs and foundation walls shall be sealed with a caulk or sealant. Gaps and joints shall be cleared of loose material and filled with polyurethane caulk or other elastomeric sealant applied in accordance with the manufacturer's recommendations.

R325.4.3 Condensate drains. Condensate drains shall be trapped or routed through nonperforated pipe to daylight.

R325.4.4 Sumps. Sump pits open to soil or serving as the termination point for sub-slab or exterior drain tile loops shall be covered with a gasketed or otherwise sealed lid. Sumps used as the suction point in a sub-slab depressurization system shall have a lid designed to accommodate the vent pipe. Sumps used as a floor drain shall have a lid equipped with a trapped inlet.

R325.4.5 Foundation walls. Hollow block masonry foundation walls shall be constructed with either a continuous course of solid masonry, one course of masonry grouted solid, or a solid concrete beam at or above finished ground surface to prevent passage of air from the interior of the wall into the living space. Where a brick veneer or other masonry ledge is installed, the course immediately below that ledge shall be sealed. Joints, cracks or other openings around all penetrations of both exterior and interior surfaces of masonry block or wood foundation walls below the ground surface shall be filled with polyurethane caulk or equivalent sealant. Penetrations of concrete walls shall be filled.

R325.4.6 Dampproofing. The exterior surfaces of portions of concrete and masonry block walls below the ground surface shall be dampproofed in accordance with Section R406 of this code.

R325.4.7 Air-handling units. Air-handling units in crawl spaces shall be sealed to prevent air from being drawn into the unit.

Exception: Units with gasketed seams or units that are otherwise sealed by the manufacturer to prevent leakage.

R325.4.8 Ducts. Ductwork passing through or beneath a slab shall be of seamless material unless the air-handling system is designed to maintain continuous positive pressure within such ducting. Joints in such ductwork shall be sealed to prevent air leakage. Ductwork located in crawl spaces shall have all seams and joints sealed by closure systems in accordance with Section M1601.4.1.

R325.4.9 Crawl space floors. Openings around all penetrations through floors above crawl spaces shall be caulked or otherwise filled to prevent air leakage.

R325.4.10 Crawl space access. Access doors and other openings or penetrations between basements and adjoining crawl spaces shall be closed, gasketed or otherwise filled to prevent air leakage.

R325.5 Passive submembrane depressurization system. In buildings with crawl space foundations, the following components of a passive sub-membrane depressurization system shall be installed during construction.

Exception: Buildings in which an approved mechanical crawl space ventilation system or other equivalent system is installed.

R325.5.1 Ventilation. Crawl spaces shall be provided with vents to the exterior of the building. The minimum net area of ventilation openings shall comply with Section R408.1 of this code.

R325.5.2 Soil-gas-retarder. The soil in crawl spaces shall be covered with a continuous layer of minimum 6-mil (0.15mm) polyethylene soil-gas-retarder. The ground cover shall be lapped a minimum of 12 inches (305 mm) at joints and shall extend to all foundation walls enclosing the crawl space area.

R325.5.3 Vent pipe. A plumbing tee or other approved connection shall be inserted horizontally beneath the sheeting and connected to a 3- or 4-inch-diameter (76 mm or 102 mm) fitting with a vertical vent pipe installed through the sheeting. The vent pipe shall be extended up through the building floors, terminate at least 12 inches (305 mm) above the roof in a location at least 10 feet (3048 mm) away from any window or other opening into the conditioned spaces of the building that is less than 2 feet (610 mm) below the exhaust point, and 10 feet (3048 mm) from any window or other opening in adjoining or adjacent buildings.

R325.6 Passive subslab depressurization system. In basement or slab-on-grade buildings, the following components of a passive sub-slab depressurization system shall be installed during construction.

R325.6.1 Vent pipe. A minimum 3-inch-diameter (76 mm) ABS, PVC or equivalent gas-tight pipe shall be embedded vertically into the sub-slab aggregate or other permeable material before the slab is cast. A “T” fitting or equivalent method shall be used to ensure that the pipe opening remains within the sub-slab permeable material. Alternatively, the 3-inch (76 mm) pipe shall be inserted directly into an interior perimeter drain tile loop or through a sealed sump cover where the sump is exposed to the sub-slab aggregate or connected to it through a drainage system. The pipe shall be extended up through the building floors, terminate at least 12 inches (305 mm) above the surface of the roof in

a location at least 10 feet (3048 mm) away from any window or other opening into the conditioned spaces of the building that is less than 2 feet (610 mm) below the exhaust point, and 10 feet (3048 mm) from any window or other opening in adjoining or adjacent buildings.

R325.6.2 Multiple vent pipes. In buildings where interior footings or other barriers separate the sub-slab aggregate or other gas-permeable material, each area shall be fitted with an individual vent pipe. Vent pipes shall connect to a single vent that terminates above the roof or each individual vent pipe shall terminate separately above the roof.

R325.7 Vent pipe drainage. All components of the radon vent pipe system shall be installed to provide positive drainage to the ground beneath the slab or soil-gas-retarder.

R325.8 Vent pipe accessibility. Radon vent pipes shall be accessible for future fan installation through an attic or other area outside the habitable space.

> **Exception:** The radon vent pipe need not be accessible in an attic space where an approved roof-top electrical supply is provided for future use.

R325.9 Vent pipe identification. All exposed and visible interior radon vent pipes shall be identified with at least one label on each floor and in accessible attics. The label shall read: “Radon Reduction System.”

R325.10 Combination foundations. Combination basement/crawl space or slab-on-grade/crawl space foundations shall have separate radon vent pipes installed in each type of foundation area. Each radon vent pipe shall terminate above the roof or shall be connected to a single vent that terminates above the roof.

R325.11 Building depressurization. Joints in air ducts and plenums in unconditioned spaces shall meet the requirements of Section M1601. Thermal envelope air infiltration requirements shall comply with the energy conservation provisions in Chapter 11. Fireblocking shall meet the requirements contained in Section R302.11.

R325.12 Power source. To provide for future installation of an active sub-membrane or sub-slab depressurization system, an electrical circuit terminated in an approved box shall be installed during construction in the attic or other anticipated location of vent pipe fans. An electrical supply shall also be accessible

Insert Figure AF101 and renumber as Figure R325.1 follows:

a. pCi/L standard for picocuries per liter of radon gas. EPA recommends that all homes that measure 4 pCi/L and greater be mitigated.

The United States Environmental Protection Agency and the United States Geological Survey have evaluated the radon potential in the United States and have developed a map of radon zones designed t assist building officials in deciding whether radon-resistant features are applicable in new construction.

The map assigns each of the 3,141 counties in the United States to one of three zones based on radon potential. Each zone designation reflects the average short-term radon measurement that can be expected t be measured in a building without the implementation of radon control methods. The radon zone designation of highest priority is Zone 1. Table **R325.1 of this section** lists the Zone 1 counties illustrated o the map. More detailed information can be obtained from state-specific booklets (EPA-402-R-93-021 through 070) available through State Radon Offices or from U.S. EPA Regional Offices.

FOR FOUR FOUNATION TYPES

3. Delete Appendix F Radon Control Procedures.

~~**APPENDIX F**~~
~~**RADON CONTROL METHODS**~~

Reason: The purpose of this requirement is to protect occupants from deadly exposure to radon gas. In the current code, provision for radon control, commonly known as radon-resistant new construction, is contained in the optional Appendix F. This proposal to elevate radon control to a requirement in areas documented to have potential for exposing occupants to radon is in response to the dramatic impact of radon exposure. Radon is the second leading cause of lung cancer – second only to smoking – and more significant than secondhand smoke. In the US alone, 18,000-21,000 lung cancer deaths each year are caused by radon exposure. The World Health Organization estimates that between 6% and 15% of lung cancer cases worldwide are caused by radon exposure.

Radon is a tasteless, colorless and odorless gas that is a decay product of uranium and occurs naturally in soil and rock. The main source of high-level radon pollution in buildings is surrounding uranium-containing soil such as granite, shale, phosphate and pitchblende. Radon enters a home through cracks in walls, basement floors, foundations and other openings.

Cost Impact: The code change proposal will increase the cost of construction.

1. Add new text as follows:

SECTION R325
RADON CONTROL METHODS

R325.1 General. The following radon-resistant new construction techniques are intended to prevent radon entry as required in areas designated by the jurisdiction as having high or moderate potential risk of radon exposure. Such areas shall be designated as high potential (Zone 1) or moderate potential (Zone 2) using the map contained in Figure R325.1, the list contained in Table R325.1, or locally available data.

R325.1.1 Active sub-slab soil depressurization radon reduction (fan-powered). An active sub-slab soil depressurization system (fan powered) shall be provided in accordance with ASTM E 1465 where areas are designated as high radon potential (Zone 1).

R325.1.2 Passive sub-slab soil depressurization system. A passive sub-slab soil depressurization system shall be provided in accordance with ASTM E 1465 where areas are designated as moderate radon potential (Zone 2).

Insert Figure AF101 and renumber as Figure R325.1 as follows:

a. pCi/L standard for picocuries per liter of radon gas. EPA recommends that all homes that measure 4 pCi/L and greater be mitigated.

The United States Environmental Protection Agency and the United States Geological Survey have evaluated the radon potential in the United States and have developed a map of radon zones designed t assist building officials in deciding whether radon-resistant features are applicable in new construction.

The map assigns each of the 3,141 counties in the United States to one of three zones based on radon potential. Each zone designation reflects the average short-term radon measurement that can be expected t be measured in a building without the implementation of radon control methods. The radon zone designation of highest priority is Zone 1. Table **R325.1 of this section** lists the Zone 1 counties illustrated o the map. More detailed information can be obtained from state-specific booklets (EPA-402-R-93-021 through 070) available through State Radon Offices or from U.S. EPA Regional Offices.

~~TABLE AF101(1)~~ TABLE R325.1
HIGH RADON POTENTIAL (ZONE 1) COUNTIES[a]

(No change to table contents)

2. Add new standard to Chapter 44 as follows:

ASTM

E1465-08a Standard Practice for Radon Control Options for the Design and construction of New Low-Rise Residential Buildings

Reason: The purpose of this requirement is to protect occupants from deadly exposure to radon gas. In the current code, provision for radon control, commonly known as radon-resistant new construction, is contained in the optional Appendix F. This proposal to elevate radon control to a requirement in areas documented to have high or moderate potential for exposing occupants to radon is in response to the dramatic impact of radon exposure. Radon is the second leading cause of lung cancer – second only to smoking – and more significant than secondhand smoke. In the US alone, 18,000-21,000 lung cancer deaths each year are caused by radon exposure. The World Health Organization estimates that between 6% and 15% of lung cancer cases worldwide are caused by radon exposure.

Radon is a tasteless, colorless and odorless gas that is a decay product of uranium and occurs naturally in soil and rock. The main source of high-level radon pollution in buildings is surrounding uranium-containing soil such as granite, shale, phosphate and pitchblende. Radon enters a home through cracks in walls, basement floors, foundations and other openings.

Under this proposal, the most recently updated ASTM consensus standard for radon control would be added to the code. Among the advantages of the more health protective ASTM standard over the optional Appendix F is its specification for an active fan-powered radon control system. The US Environmental Protection Agency recommends this standard as the approach for radon resistant new construction; through agreement with ASTM, EPA can provide a free copy of the standard - see http://www.epa.gov/radon/pubs/index.html.

Cost Impact: The code change proposal will increase the cost of construction.

Analysis: A review of the standard proposed for inclusion in the code, ASTM E 1465, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

Appendix R (New)

Proponent: Diana M. Hanson, representing the North American Deck and Railing Association, Inc. (NADRA)

Add new text as follows:

APPENDIX R
DECKS

SECTION AR101
GENERAL

AR101.1 Scope. Decks shall conform to the requirements of this appendix chapter.

SECTION AR102
DEFINITIONS

AR102.1 General. Decks include exterior floor systems that are supported by attachment to at least one exterior wall and/or are self-supporting

DECK. An exterior floor system supported on at least two opposing sides by an adjoining structure and/or post, piers, or other independent supports.

ATTACHED DECKS. Decks that are supported by attachment to one or more exterior walls of a dwelling or accessory structure and/or the ground or grade.

FREE STANDING DECKS. Decks that are self-supporting and are not structurally dependant on support from an attachment to a dwelling or accessory structure.

MANUFACTURED DECKING MATERIALS. Deck boards, railings, balusters, posts, and all other guards, which are made of other than sawn lumber; such as wood/plastic composites, plastic, metal, glazed materials and the like.

SECTION AR103
PERMITTED USES

AR103.1 General. Decks shall be permitted to be attached to or detached from dwelling or accessory structures. Decks shall be used only for recreational, outdoor living purposes and not as storage rooms or habitable rooms.

SECTION AR104
PERMITTING

AR104.1 General. Permits are required for decks unless exempted under Section R105.2 of this code.

SECTION AR105
DESIGN LOADS

AR105.1 General. Decks shall be designed and constructed to sustain, within the stress limits of this code, dead and live loads in accordance with Table R301.5.

SECTION AR106
MATERIALS AND CONSTRUCTION

AR106.1 Columns. Where decks are designed to include columns, they shall comply with Section R407.

AR106.2 Deck boards.

AR106.2.1 Common lumber species deck boards. Decks which are designed with Common Lumber Species Deck Boards shall be installed to comply with Table AR106.2.1 of this Appendix R:

Table AR106.2.1
Wet Service Deck Board Span Tables

Species	Dimension	Perpendicular to Joist	Angled to Joist
Southern Pine or Douglas Fir	5/4 x 6	16"	12"
	2 x 4	24"	16"
Redwood or Cedar	5/4 x 6	16"	12"
	2 x 4	24"	16"
	2 x 6	24"	16"
Mahogany or Ipe	1 x 4	20"	16"
	5/4 x 6	24"	16"

AR106.2.2 Manufactured deck boards. Decks which are designed to include Manufactured Deck Boards shall be designed and installed in accordance with the provisions of this code, and the manufacturer's installation instructions.

AR106.2.3 Treated wood deck boards. Decks which are designed to include preservative-treated wood shall be of a type, and installed in accordance with R317.

AR106.3 Fasteners. Where decks are designed to use preservative-treated wood, fasteners shall comply with Section R317.3 of this code.

AR106.4 Footings. Footings shall comply with Section R403 of this code.

AR106.5 Joist spans. Joist spans for decks shall comply with Table AR106.5 of this Appendix R.

Table AR106.5
Wet Service Joist Span Table[a, b]

Joist Dimension (inches)	Species	On-center Joist Spacing	Live Load 40 psf	Live Load 60 psf	Live Load 100 psf
2 x 6	Hem Fir	12"	9-6	8-4	6-10

a. The following assumptions have been made to perform the calculations used to create these spans:
   Joist material #2 Grade or better
   10 psf dead load
   Southern Pine wood of 0.55 Specific Gravity
   Hem Fir wood of 0.43 Specific Gravity
   Adjustment factors applied for wet service on both woods. Incised factor applied to Hem Fir.
   Deflection is limited to span in inches divided by I/360 on live load.

b. For species and dimensions not included in this table, see AF&PA Maximum Span Calculator for Joists and Rafters online at http://www.awc.org/calculators/span/calc/timbercalcstyle.asp

AR106.6 Ledger connections. Attached Decks shall comply with Section R502.2.2 of this code.

AR106.7 Manufactured decking materials. Decks which are designed with manufactured decking materials shall be installed according to manufacturer's specifications, and shall comply with the applicable standard(s) in accordance with this code. Manufactured decking materials shall consist of:

1. Wood/plastic composites complying with ASTM D7032.
2. Glazed material complying with CPSC 16 CFR 1201, or ANSI Z97.1.
3. Other approved manufactured material.

AR106.7.1 Wood/plastic composites shall be labeled according to R317.4 of this code.

AR106.7.2 Treated wood. Decks which are designed to include preservative-treated wood shall be of a type, and installed in accordance R317.

SECTION R107
FLASHING

AR107.1 General. Attached decks shall comply with Section R703.8 of this code.

SECTION AR108
GLAZING

AR108.1 General. Where decks are designed near or adjacent to glazing, they shall comply with Section R308.4 of this code.

SECTION AR109
GUARD REQUIREMENTS

AR109.1 General. Where decks are designed to include guards, they shall comply with Section R312 of this code, and Table R301.5.

SECTION AR110
STAIRWAYS

AR110.1 General. Where decks are designed to include stairways, they shall comply with Section R311.7 of this code.

Reason: This proposal to add Appendix R to the IRC is to rectify a deficiency currently existing with respect to decks. While many of the components of a deck are addressed the IRC, since a deck is not a house and is sometimes detached, it is at best difficult for the code official and the builder to find and use the correct IRC sections, or specified prescriptive detailed direction on decks that are required to be engineered and certified for the design when done. As a result, approving plans and performing inspections on decks is a frustrating experience for even the most IRC-fluent code official. In addition, because the IRC is written with respect to houses, not everything required of a deck for safe building is contained in the IRC.

All of the above puts the decking industry in a similar situation as both the awning and the pool and spa industry, which already have appendices in the IRC, namely Appendix G *"Swimming Pools, Spas and Hot Tubs"* and Appendix H *"Patio Covers."* We are simply looking to use a tool that has been used before, to address specific areas related to decking.

North American Deck and Railing Association, Inc. (NADRA) is a trade organization whose membership is comprised of approximately 2/3rds deck builders, with the remaining members being manufacturers and suppliers of goods and services to the decking industry. NADRA is committed to encouraging safe deck building, and educating the consumer. While NADRA is the proponent of Appendix R, understand that its undertaking involved input from areas outside of our organization including seasoned code officials, engineers, and representatives from other trade organizations, to build an Appendix useful not only the code professional, but to the builder and consumer as well.

While a central function of model codes is to create uniformity in building safety practices, such uniformity is not possible for deck builds due to the complicated way decks are currently referenced in the IRC. The result of this deficiency is that many jurisdictions adopt their own sets of deck regulations. Such locally created regulations routinely contradict each other, are not all based on the IRC, but rather on that jurisdiction's ideas of good building practices; and some even prescribe name brand product. Granting Appendix R a place in the IRC will curb the growing number of single jurisdiction instructions, and will continue the ICC purpose of uniform building safety practices.

Proposed Appendix R directly addresses attached and detached deck builds by indexing specific deck related IRC sections, and standards in one location. It also includes reputable source guidelines to address deficiencies such as wood floor joists rated for outdoor use.

The two wood span tables in proposed Appendix R originate from IRC tables, but include a wet service factor calculation. This is an area of serious frustration for builders and code officials since the IRC does not address exterior use of the types and shapes of wood necessary for safe deck building. Table AR106.5 allows for quick verification of compliance without doing the lengthy math, which is the basis for the wood span tables currently in the dry section of the main body of code. The wet service calculation for Table AR106.5 (joists) comes from AF&PA Maximum Span Calculator for Joists and Rafters. Table AR106.2.1 (deck boards) is based on good building practices within the industry.

Proposed Appendix R provides the reference for basic deck construction. We estimate that this will cover 75 – 80% of the decks being built now. Other more complicated designs will, appropriately, continue to need engineering. However, without the approval of Appendix R, even the most simple prescriptive deck can be said to need an engineer's stamp for a permit. Certainly, proposed Appendix R is an improvement to the code, and will additionally reserve a location for further deck specific code as model code continues to evolve.

ICCFILENAME: HANSON-RB-1-APPENDIX R

RB183 –09/10
Appendix R (New)

Proponent: Joseph R. Hetzel, PE, Thomas Associates, Inc., representing Door & Access Systems Manufacturers Association (DASMA)

Add new text as follows:

APPENDIX R
AUTOMATIC VEHICULAR GATES

SECTION AR101
GENERAL

AR101.1 General. The provisions of this appendix shall control the design and construction of automatic vehicular gates installed on the lot of a one- or two-family dwelling.

SECTION AR102
DEFINITIONS

AR102.1 General. For the purposes of these requirements, the terms used shall be defined as follows and as set forth in Chapter 2.

VEHICULAR GATE. A gate that is intended for use at a vehicular entrance or exit to the lot of a one- or two-family dwelling, and that is not intended for use by pedestrian traffic.

SECTION AR103
AUTOMATIC VEHICULAR GATES

AR103.1 Vehicular gates intended for automation. Vehicular gates intended for automation shall be designed, constructed and installed to comply with the requirements of ASTM F 2200.

AR103.2 Vehicular gate openers. Vehicular gate openers, when provided, shall be listed in accordance with UL 325.

SECTION AR104
ABBREVIATIONS

AR104.1 General

ASTM – ASTM International
100 Barr Harbor Drive
West Conshohocken, PA 19428

UL – Underwriters Laboratories, Inc.
333 Pfingsten Road
Northbrook, IL 60062-2096

SECTION AR105
STANDARDS

AR105.1 General

ASTM
F2200-05 Standard Specification for Automated Vehicular Gate Construction…..AR103.1

UL
325-2006 Door, Drapery, Gate, Louver, and Window Operators and Systems…..AR103.2

Reason: The purpose of the proposed code change is to address an omission in the IRC by including an Appendix section on Automatic Vehicular Gates, and to also harmonize the IRC with the IFC and the IBC regarding the subject. The 2009 IFC utilizes the proposed language in Sections 503.5 (required gates or barricades), 503.6 (security gates) and Appendix D103.5 (fire apparatus access road gates). The 2009 IBC utilizes the proposed language in Section 3110. The only deviation from the language in the IBC is the definition of "automatic gate" which has been modified to fit the scope of the IRC.

The current Code provisions are inadequate because public safety needs are not addressed regarding automatic operation of vehicular gates. Protection is needed from potential entrapment of individuals between an automatically moving gate and a stationary object, or surface, in close proximity to such gate. Gates intended for automation require specific design, construction and installation to accommodate entrapment protection to minimize or eliminate certain excessive gate gaps, openings and protrusions identified as contributing to the hazard of entrapments that have historically caused numerous serious injuries and deaths.

The Code will be improved by including provisions referencing UL 325 and ASTM F 2200. UL 325 is an ANSI recognized safety standard containing provisions governing gate openers. Gate openers listed to the requirements of UL 325 provide the public with assurance that safety requirements have been met for such openers. ASTM F 2200 is a consensus document containing provisions governing the construction of vehicular gates intended for automation, and has been harmonized with the applicable provisions of UL 325.

Death and injury data does exist associated with automated vehicular gates. A previous related proposal on the topic, submitted in 2002 by the Consumer Product Safety Commission and designated as E34-02, pointed out the following information compiled by the CPSC from 1985 to that time:

1. Reports of 32 deaths relating to automatically operated vehicular gates were received, many as a result of entrapment between a moving gate and a stationary object.
2. Data from the National Electronic Injury Surveillance System estimated that approximately 2,000 people are treated annually in hospital emergency rooms due to injuries in such gates. Many of these injuries have been identified as serious, involving amputation, broken arms and broken legs.

Cost Impact: The code change proposal will increase the cost of construction. However, the resulting safety benefits will outweigh the increased cost.

Analysis: A review of the standard proposed for inclusion in the code, ASTM F2200 and UL 325, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

RE1 –09/10

N1101.2, N1101.2.1 through N1101.9, N1102, N1103, Appendix R (New)

Proponent: Bill Fay, Efficient Codes Coalition; Brian Dean, ICF International

1. Revise as follows:

N1101.2 Compliance. Compliance shall be demonstrated by ~~either~~ meeting the requirements of the *International Energy Conservation Code* ~~or meeting the requirements of this chapter. Climate zones from Figure N1101.2 or Table N1101.2 shall be used in determining the applicable requirements from this chapter~~.

2. Delete Sections N1101.2.1-N1101.9, N1102 and N1103 in their entirety (including all tables).

3. Add new text as follows to the appendix to the International Residential Code:

APPENDIX R
INTERNATIONAL ENERGY CONSERVATION CODE

(This appendix excerpts sections of the *International Energy Conservation Code* relevant to buildings regulated by the *IRC*. This appendix is informative and is not part of the code; however, note that section N1101.2 requires building regulated by the *IRC* to meet the requirements of the *IECC*.)

Reprint the following sections of the *International Energy Conservation Code* as Appendix R:

***(1) IECC* Chapter 1 Administration (all Sections, except Sections 101.1-101.2, 101.4.6, and 101.5)**
***(2) IECC* Chapters 2-4 and Chapter 6.**

Reason: This proposal is intended to permanently resolve the growing inconsistencies between the *IECC* (which is also referenced in the IBC) and the *IRC* by referencing a single set of energy efficiency requirements for all three codes (the *IECC*) and, for ease of reference, including the requirements in new Appendix R of the *IRC*. The proposal also makes code compliance and enforcement more uniform and streamlined.

The Problem. The problem of an inconsistent *IRC* and *IECC*, where the *IRC* energy provisions are weaker and less rigorous than the *IECC*, is well-known. The *IECC* and *IRC* are reviewed by two different code development committees. Proposals must be heard twice (using substantially more resources and prolonging the hearings by days), and the outcome is frequently different. It is then up to the code officials at the Final Action Hearing to sort through the two committees' differing opinions and decide on the best course. As long as there are two codes and two committees, inconsistency will continue to grow, creating problems for jurisdictions that seek to implement a single set of energy efficiency requirements for residential buildings.

The Solution. This proposal presents the best long-term solution for code consistency and uniform enforcement. Just as *IBC* Chapter 13 references the *IECC* for its energy efficiency requirements, *IRC* Chapter 11 would reference the *IECC*. To preserve the convenience of a single-volume residential code, ICC would reprint the relevant sections of the *IECC* in a new Appendix at the end of the *IRC*. In subsequent cycles, as the *IECC* is updated, the *IRC* Chapter 11 would be automatically (and identically) updated by virtue of the reference to the *IECC*. Because Chapter 11 would already require compliance with the IECC, jurisdictions would not need to specifically adopt the new appendix in order for the IECC to be effective.

The general approach of replacing the *IRC* energy chapter with the *IECC* has already been tested in several states. In fact, the *IRC* already references the *IECC* for the performance path (N1101.2), so any state that adopts the *IRC* already automatically adopts the requirements of the *IECC* as a compliance option. Several states have already taken the step suggested by this proposal by exclusively referencing the *IECC* for energy efficiency requirements. The new appendix will add even more convenience to this solution.

The *IECC* Is the Best Single Energy Efficiency Standard. The *IECC* is recognized in federal law and nationwide as the comprehensive model energy code for all residential and commercial buildings. More than two thirds of states have adopted the *IECC* as their mandatory statewide energy code. National, state and local policymakers are demanding a substantially improved level of energy efficiency in building energy codes to meet the nation's security, environmental and energy cost needs. At the same time, building officials demand uniformity and consistency in the International family of codes.

Under the federal Energy Policy Act of 1992, the US Department of Energy (DOE) is required to review each new version of the *IECC* and determine if it is an improvement in energy efficiency over previous versions. (*IRC* Chapter 11 does not undergo such a rigorous assessment by DOE, so it is not clear whether it would meet the same high standard for energy efficiency improvement.) States are also required by federal law to undertake a review of the state energy code and determine whether state energy efficiency requirements meet the stringency of the *IECC* every time the Department of Energy makes a determination on the updated *IECC*.

The *IECC* also serves as the basis for federal tax credits for energy efficient homes, energy efficiency standards for federal buildings, and qualification for FHA mortgages. The *IECC* is also referenced in LEED and many other state and federal programs.

Most recently, the adoption of the 2009 *IECC* was designated by Congress as a threshold requirement for states to receive $3.2 billion in State Energy Program funds through the American Recovery and Reinvestment Act (Stimulus Bill). None of these programs even references the *IRC*. For all these reasons, the *IECC* is the logical selection as the single energy efficiency standard for the International Codes.

The Benefits of the *IECC* as the Single Energy Efficiency Standard

- **True Consistency**. This proposal fixes inconsistencies between the *IRC* and the *IECC*/*IBC* that have developed over time, and ensures consistency in the future. Even if all code change proposals in the current cycle were 100% consistent, the *IECC* and *IRC* would still be different because of changes made in earlier editions, and would likely be different in the future because two separate committees are reviewing the same code language.

This proposal does not expand or reduce the number of compliance options available to builders. It simply consolidates them in the most reasonable place. The energy efficiency requirements of the *IBC*, *IRC* and *IECC* would be unified into a single set of requirements that comply with all three codes and ensures that all three codes meet the same energy efficiency and building quality standards in the future.

- **Proposals Reviewed and Approved By a Balanced Committee of Experts.** The *IECC* is currently developed by a committee that it is populated by experts in building energy efficiency and where no organization has more than one voting seat.

- **Streamlined Enforcement**. Once all three I-codes have a unified set of energy efficiency requirements, enforcement will become much simpler. A builder complying with the *IRC* Chapter 11 will automatically meet the requirements of the *IBC* and *IECC*. Builders will only need to follow one set of requirements, and code officials can enforce a single set of requirements.

Less Complicated Code Hearings. This proposal would eliminate a good deal of redundancy in the current code development process by centralizing the energy efficiency requirements in a single committee. Rather than force proponents and code officials to endure hours – even days – of the same testimony before two different committees, this proposal would streamline the process and yield a more consistent result.

Cost Impact: The code change proposal will increase the cost of construction.

ICCFILENAME: FAY-RE-1-N1101.2-APPENDIX R

RE2 –09/10

N1101.2-N1101.9, N1102 and N1103

Proponent: Jeff Harris, Alliance to Save Energy and Ronald Majette, US Department of Energy

1. Revise as follows:

N1101.2 Compliance. Compliance shall be demonstrated by ~~either~~ meeting the requirements of the *International Energy Conservation Code* ~~or meeting the requirements of this chapter. Climate zones from Figure N1101.2 or Table N1101.2 shall be used in determining the applicable requirements from this chapter~~. For consistency and convenience, the relevant administrative provisions, supplemental definitions, prescriptive and mandatory requirements of the *IECC* applicable to buildings regulated by this code are reprinted below. For the Simulated Performance Alternative, buildings regulated by this code shall comply with *IECC* Section 405. Solely for the purpose of compliance with this section, in the event of any conflicts in definitions or referenced standards between the *IECC* and *IRC*, the respective definition or referenced standard from the *IECC* shall control.

2. Delete Sections N1101.2.1-N1101.9, N1102 and N1103 in their entirety (including all tables), and reprint the following sections of the IECC, coordinated with the section numbering of the IRC:

(1) IECC Chapter 1 Administration (all Sections, except Sections 101.1-101.2, 101.4.6, and 101.5)
(2) IECC Chapter 2 Definitions (all Sections)
(3) IECC Chapter 3 Climate Zones (all Sections)
(4) IECC Chapter 4 Residential Energy Efficiency (Sections 401-404)
(5) IECC Chapter 6 Referenced Standards (All Standards).

Reason (Harris) : This proposal is intended to permanently resolve the growing inconsistencies between the *IECC* (which is referenced by the *IBC*) and the *IRC* by referencing a single set of energy efficiency requirements for all three codes (the *IECC*) and reprinting those requirements directly in Chapter 11 of the *IRC*. The proposal also makes code compliance and enforcement more uniform and streamlined.

The Problem. The problem of an inconsistent *IRC* and *IECC* , where the *IRC* energy provisions are weaker and less rigorous than the *IECC*, is well-known. The *IECC* and *IRC* are reviewed by two different code development committees. Proposals must be heard twice (using substantially more resources and prolonging the hearings by days), and the outcome is frequently different. It is then up to the code officials at the Final Action Hearing to sort through the two committees' differing opinions and decide on the best course. As long as there are two codes and two committees, inconsistency will continue to grow, creating problems for jurisdictions that seek to implement a single set of energy efficiency requirements for residential buildings.

The Solution. This proposal presents a reasonable long-term solution for code consistency and uniform enforcement. Just as *IBC* Chapter 13 references the *IECC* for its energy efficiency requirements, *IRC* Chapter 11 would reference the *IECC*. To preserve the convenience of a single-volume residential code, ICC would reprint the relevant sections of the *IECC* in chapter 11 of the *IRC*. In subsequent cycles, as the *IECC* is updated, the *IRC* Chapter 11 would be automatically (and identically) updated by virtue of the reference to the *IECC*.

The general approach of replacing the *IRC* energy chapter with the *IECC* has already been tested in several states. In fact, the *IRC* already references the *IECC* for the performance path (N1101.2), so any state that adopts the *IRC* already automatically adopts the requirements of the *IECC* as a compliance option. Several states have already taken the step suggested by this proposal by exclusively referencing the *IECC* for energy efficiency requirements. The new appendix will add even more convenience to this solution.

The *IECC* Is the Best Single Energy Efficiency Standard. The *IECC* is recognized in federal law and nationwide as the comprehensive model energy code for all residential and commercial buildings. More than two thirds of states have adopted the *IECC* as their mandatory statewide energy code. National, state and local policymakers are demanding a substantially improved level of energy efficiency in building energy codes to meet the nation's security, environmental and energy cost needs. At the same time, building officials demand uniformity and consistency in the International family of codes.

Under the federal Energy Policy Act of 1992, the US Department of Energy (DOE) is required to review each new version of the *IECC* and determine if it is an improvement in energy efficiency over previous versions. (*IRC* Chapter 11 does not undergo such a rigorous assessment by DOE, so it is not clear whether it would meet the same high standard for energy efficiency improvement.) States are also required by federal law to undertake a review of the state energy code and determine whether state energy efficiency requirements meet the stringency of the *IECC* every time the Department of Energy makes a determination on the updated *IECC*.

The *IECC* also serves as the basis for federal tax credits for energy efficient homes, energy efficiency standards for federal buildings, and qualification for FHA mortgages. The *IECC* is also referenced in LEED and many other state and federal programs.

Most recently, the adoption of the 2009 *IECC* was designated by Congress as a threshold requirement for states to receive $3.2 billion in State Energy Program funds through the American Recovery and Reinvestment Act (Stimulus Bill). None of these programs even references the *IRC*. For all these reasons, the *IECC* is the logical selection as the single energy efficiency standard for the International Codes.

The Benefits of the *IECC* as the Single Energy Efficiency Standard

- **True Consistency**. This proposal fixes inconsistencies between the *IRC* and the *IECC*/*IBC* that have developed over time, and ensures consistency in the future. Even if all code change proposals in the current cycle were 100% consistent, the *IECC* and *IRC* would still be different because of changes made in earlier editions, and would likely be different in the future because two separate committees are reviewing the same code language.
  This proposal does not expand or reduce the number of compliance options available to builders. It simply consolidates them in the most reasonable place. The energy efficiency requirements of the *IBC*, *IRC* and *IECC* would be unified into a single set of requirements that comply with all three codes and ensures that all three codes meet the same energy efficiency and building quality standards in the future.
- **Proposals Reviewed and Approved By a Balanced Committee of Experts.** The *IECC* is currently developed by a committee that it is populated by experts in building energy efficiency and where no organization has more than one voting seat.
- **Streamlined Enforcement**. Once all three I-codes have a unified set of energy efficiency requirements, enforcement will become much simpler. A builder complying with the *IRC* Chapter 11 will automatically meet the requirements of the *IBC* and *IECC*. Builders will only need to follow one set of requirements, and code officials can enforce a single set of requirements.
-

Less Complicated Code Hearings. This proposal would eliminate a good deal of redundancy in the current code development process by centralizing the energy efficiency requirements in a single committee. Rather than force proponents and code officials to endure hours – even days – of the same testimony before two different committees, this proposal would streamline the process and yield a more consistent result.

Reason (Majette): The proposed change is intended to eliminate inconsistencies between the IECC and IRC, the two primary codes that relate to residential buildings, and reduce the significant burden of maintaining two similar but not quite identical codes in the ICC's code development process. It does so by eliminating the nearly duplicative provisions of IRC Chapter 11 and replacing them with a reference to the IECC.

This approach is consistent with the way the IBC (Chapter 13) references the IECC for energy efficiency requirements, but to accommodate residential builders' need for a single-volume code solution, the portions of the IECC relevant to one- and two-family dwellings and townhouses three stories or less above grade will be reprinted for convenience in place of the current Chapter 11 text.

The consolidation of the ICC's two residential energy efficiency codes around the IECC is appropriate for the following reasons:

- The IECC is the unambiguous standard of reference that DOE, by Congressional mandate, establishes for its energy code determinations. The Energy Policy Act of 1992 (EPAct-92) requires DOE to evaluate each new version of the IECC to determine whether it will save energy in residences. Because the IRC energy chapter differs in substantive ways from the IECC, DOE is unable to recognize it as an equivalent code.

- The IECC is the unambiguous standard of reference for DOE's evaluations of state energy codes. EPAct-92 requires that states, following any DOE determination that a new version of the IECC saves energy, certify to DOE whether it is appropriate to upgrade their code(s) to meet or exceed that new IECC version.
- The IECC is the predominant residential building energy code in the U.S. About two-thirds of the states reference or are based on some version of the IECC.
- The IECC is the predominant standard of reference for residential above-code programs in the U.S. It serves as the baseline for federal tax credits for energy efficient homes, energy efficiency standards for federal buildings, and qualification for FHA mortgages. It is also referenced in LEED and many other state and federal programs and has been used as the primary source for baseline assumptions in RESNET's home energy rating systems.
- The IECC is the unambiguous threshold for states seeking State Energy Program funds made available by the American Recovery and Reinvestment Act of 2009.
- Because the IRC currently lags behind the IECC in overall energy efficiency, DOE cannot provide compliance tools and support for states that adopt it.
- Maintaining both the IECC and the IRC energy chapter in the ICC's code development process represents a near doubling of efforts by interested parties and ICC staff, with the typical outcome that the IRC energy chapter cannot be used in any of the programs listed above.

This proposal would eliminate the duplicative efforts, eliminate confusion within state governments, streamline code enforcement and the necessary training and tool development, lessen the bureaucratic load on the U.S. DOE, guarantee true consistency between the IECC and the IRC, and sustain the availability of the IRC as a single-volume residential code.

Cost Impact: The code change proposal will increase the cost of construction.

	Assembly:	ASF	AMF	DF

ICCFILENAME: HARRIS-RE-1-MAJETTE-RE-1-N1101.2, N1101.9

RE3–09/10
Chapter 11

Proponent: Guy Tomberlin, Fairfax County, VA, representing Plumbing and Mechanical Inspectors/VA Building and Code Officials and ICC Region 7

Delete and substitute as follows:

Delete existing Chapter 11 in its entirety. Replace with Chapter 4 of the International Energy Conservation Code.

Reason: The process has become far too cumbersome trying to keep these two documents coordinated. There should not be two different sets of rules, that simply goes against the foundation of the energy code. Unfortunately, giving control of Chapter 11 to the IECC Code Development Committee cannot be accomplished in a code change proposal, but this would certainly be the ideal situation. This proposal is a fresh approach at starting over and "clearing the slate." It will allow a new beginning with the two documents containing the exact same provisions. Making Chapter 11 of the IRC identical with Chapter 4 of the IECC, right now, will establish total consistency and encourage them to remain parallel in the future.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: TOMBERLIN-RE-1-CHAPTER 11

RE4–09/10
Chapter 11

Proponent: Guy Tomberlin, Fairfax County, VA, representing Plumbing and Mechanical Inspectors/VA Building and Code Officials and ICC Region 7

1. Delete without substitution as follows:

Delete the current text of Chapter 11 in its entirety with the exception of Section N1101.1.

2. Add new text as follows:

N1101.2 Requirements. Buildings shall be designed and constructed in accordance with Chapter 4 of the *International Energy Conservation Code*.

Reason: The process has become far too cumbersome trying to keep these two documents coordinated. The there should not be two different sets of rules, that simply goes against the foundation of the energy code. The International Code Council already has a similar situation as this recommended practice set in place and it is working quite well with the International Fuel Gas Code and the International Residential Code Chapter 24 provisions. Maintaining consistency between the commercial and residential provisions should not be a membership function and it is not

reasonable for the members to be responsible for this administrative task. It has become extremely time consuming, not to mention nearly impossible, just trying to cover all the changes applicable to both codes and then come back the next code cycle and attempt to coordinate. In the current process one code or the other is behind a complete cycle while proponents work feverishly to try to catch up. Now with the new policies in place, for the code development hearings between print editions, the current system will equal 3 years of inconsistent regulations. The make–up of the IECC Code Development Committee could easily be altered to accommodate all the interested parties. An added benefit to this proposal would be the time savings during the code change process by just by having a single committee hear all the energy proposals.

Cost Impact: The code change proposal will not increase the cost of construction.

RE5–09/10
N1102.3.7 (New)

Proponent: Garrett A. Stone, Brickfield Burchette Ritts & Stone, representing Cardinal Glass Industries

Add new text as follows:

N1102.3.7 Maximum fenestration U-factor and SHGC. The area-weighted average maximum fenestration U-factor permitted using trade-offs under this code shall be 0.48 in Zones 4 and 5 and 0.40 in Zones 6 through 8 for vertical fenestration, and 0.75 in zones 4 through 8 for skylights. The area weighted average maximum fenestration SHGC permitted using trade-offs under this code in Zones 1 through 3 shall be 0.50.

Reason: This proposal will make the *IECC* and *IRC* consistent by inserting the trade-off maximum from the IECC into the *IRC*.

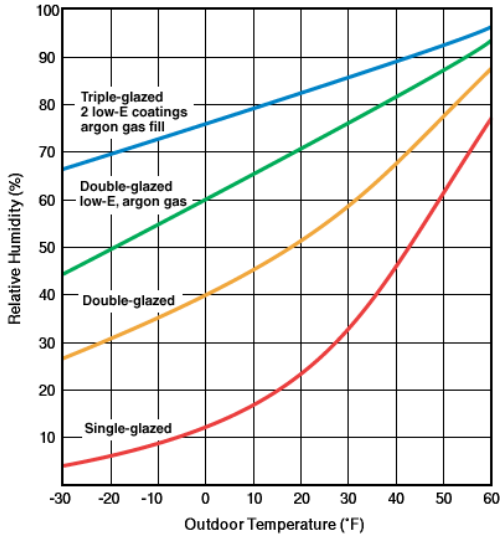
Given that windows are the weakest energy efficiency link in the building envelope, it is critical that we get windows right in homes. The best windows are typically about R-3 – less efficient than an un-insulated wall. The fenestration trade-off maximums proposed here are simple, mandatory limits that ensure all new homes contain high-quality, cost-effective windows. This objective is important to save energy and reasonably preserve comfort in all climate zones. These limits will result in windows that resist condensation in colder climates and block unwanted solar gain in warmer climates. Peak demand and HVAC sizing will also be reduced. In short, the limits are necessary to make sure that reasonable windows are not traded away with enormous unintended negative consequences.

The Limits Allow Sufficient Flexibility: The proposed provision allows considerable flexibility for builders to install decorative glass, glass block, and other fenestration products, while maintaining a baseline performance for the home's overall glazing – this flexibility comes from the fact that the provision is satisfied based on area-weighted average SHCG or U-factor. As a result, not all products need to individually meet the limits; only the area weighted average of all products in the home is required to meet the designated limit. Flexibility is further enhanced because the limit in each climate zone is one value – in northern climates the limit is based on U-factor and in southern climates on SHGC. Thus, there is substantial room and flexibility for the builder to use products that are exceptions. The limits are modest numbers that are achievable by most glazing products currently on the market in each climate zone. The *IRC and IECC* currently employs a number of other mandatory measures (including a mandatory maximum fenestration air leakage number) to ensure that the minimum code house is reasonably constructed –this proposal is no different.

The Limits Facilitate Ease of Compliance: These trade-off limits are effective and easy to understand and comply with. They have been successfully applied under the *IECC* for the past few years. All states that have already adopted the 2006 or 2009 *IECC*s have adopted these maximums without amendment. They are also already built in "under the hood" for compliance software such as REScheck.

The Limits Protect the Consumer and Builder. The trade-off limits are a key safety net and homeowner protection in a code that allows unlimited glazing area in the Prescriptive and Total UA compliance paths (indeed, the adoption of the maximums in the first place was in part a response to the elimination of glazing restrictions in 2004). By ensuring good windows, consumers are protected from higher energy bills, condensation and discomfort – while builders are protected from call-backs on these fronts.

The Limits Result in Improved Condensation Resistance. Efficient windows as required by the proposed limits will improve condensation resistance. The following chart is found on the Efficient Window Collaborative (EWC) website (www.efficientwindows.org). It shows the condensation potential for different window types.

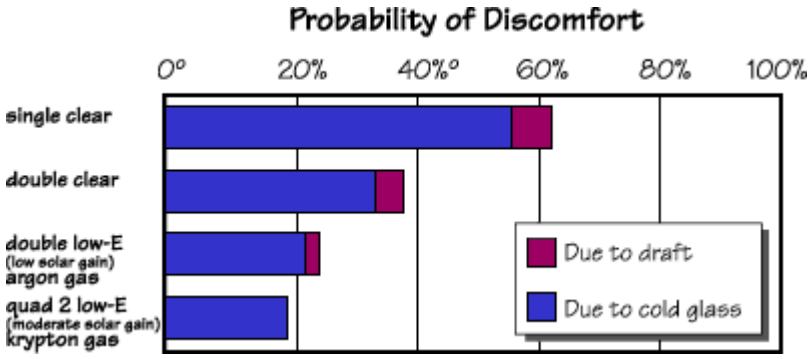


Note: Condensation occurs above the lines for each product type

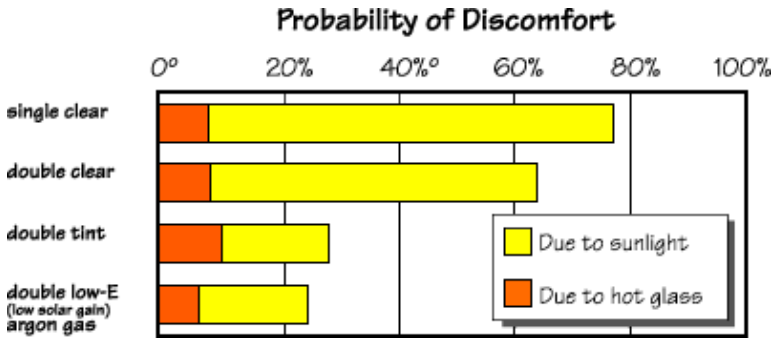
According to the chart, a typical double-glazed low-e window can withstand a 0 degree outdoor temperature and 60% relative humidity inside before condensation will begin to collect. By contrast, a regular double-glazed window can only withstand 40% humidity at the same outdoor temperature. In other words, a low-e window has a 50% more effective ability to resist condensation. A single-glazed window is far worse – it can withstand less than 15% humidity at the same temperature – a virtual guarantee of damaging condensation. The fenestration maximums substantially reduce the likelihood of condensation in the colder months, reducing call-back and consumer dissatisfaction and enhancing durability and long-term benefits for the homeowner.

The Limits Result in More Comfortable Homes and Less Energy Use. Without adequate occupant comfort, any perceived energy savings will be instantly lost when an occupant adjusts the thermostat to correct their discomfort. Relatively small changes in window U-factors and SHGCs can have a disproportionate impact on occupant comfort. Everyone has experienced discomfort at some point due to poor windows. Hot spots created by high solar gain in the summer and cold or drafty glass in the winter months can force an occupant to adjust the thermostat to compensate. The charts below, again displayed on the EWC website, show that the likelihood of significant occupant discomfort can double or triple, depending on the type of glass installed.

For example, the following graph shows the probability of discomfort during winter from poorer windows ranging from over 60% with single pane clear windows and almost 40% with double pane clear windows. This risk declines to almost 20% with a low-e window as specified by the limits for northern climates. This problem is due to the cold window -- at zero degrees outdoors, the single pane glass is less than 20 degrees on the inside surface, the double clear glass is slightly over 40 degrees, while the low-e glass is approaching 60 degrees. Obviously, the warmer the interior glass surface, the less likelihood of discomfort.

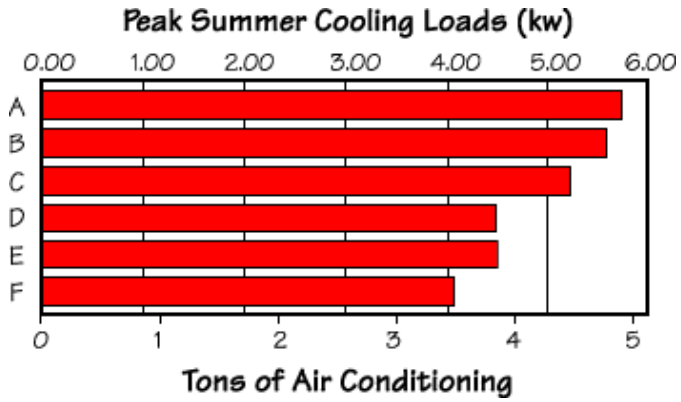


Similarly, the following graph from the same source shows the probability of discomfort during summer from sunlight and hot glass. The potential comfort problem from bad windows is even worse in the summer. The summertime probability of discomfort ranges from almost 80% with single clear and over 60% with double clear declining to almost 20% with windows as specified by the proposed limits.



The Limits Reduce Peak Demand and HVAC Sizing. By requiring efficient windows, the limits create immediate cost savings for the builder by permitting the downsizing of heating and cooling equipment. On a national policy level, high-quality windows can help reduce the strain on both the electric grid and gas transmission system and delay the need to build peak generation.

The following chart, also from the EWC website, shows the potential for saving peak demand and reducing HVAC sizing for different window types. Window F is the low SHGC, low U-factor window that would satisfy the window maximums across the country (by contrast, window A is a single pane window). As is readily apparent, improved windows are crucial to lower peak cooling loads and smaller HVAC sizes (with lower costs). Trade-offs against other building components, even if one believed that they saved the same amount of energy, would clearly lose these benefits.



As shown above, the fenestration limits in the *IECC* serve an important role in ensuring residential energy efficiency and meeting national policy goals. We recommend that the fenestration maximums be adopted in the *IRC* to correct the *IRC*/*IECC* inconsistency.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: STONE-RE-1-N1102.3.7

RE6–09/10
N1102.4.5

Proponent: Alex Bosenberg, National Electrical Manufacturers Association, representing the Luminaire Product Section

Delete and substitute as follows:

N1102.4.5 ~~Recessed lighting.~~ ~~Recessed luminaires installed in the *building thermal envelope* shall be sealed to limit air leakage between conditioned and unconditioned spaces. All recessed luminaires shall be IC-rated and *labeled* as meeting ASTM E 283 when tested at 1.57 psi (75 Pa) pressure differential with no more than 2.0 cfm (0.944 L/s) of air movement from the *conditioned space* to the ceiling cavity. All recessed luminaires shall be sealed with a gasket or caulk between the housing and the interior wall or ceiling covering.~~

Recessed luminaires. Recessed luminaires installed in contact with the building thermal envelope shall be sealed to limit air-leakage between conditioned and unconditioned spaces. When installed in contact with the building thermal envelope, recessed luminaires shall be Type IC rated and certified to have no more than 2.0 cfm (0.944 L/s) air movement from the conditioned space to the ceiling cavity. The luminaire shall be tested at or 1.57 lbs/ft^2 (75 Pascals) pressure difference and have a label attached, showing compliance with this test method. All recessed luminaires in contact with the building thermal envelope shall be sealed with a gasket or caulk between the housing and the interior wall or ceiling covering.

Reason: The proposed changes clarify that only those recessed luminaires that are in contact with the thermal envelope need to be sealed, IC rated, and be tested to the air leakage requirement as described in ASTM E 283. Many recessed luminaires are installed in unconditioned spaces, or in walls or ceilings between similarly conditioned spaces, and no benefit is gained by adding these requirements where they are unnecessary. Further, IC rated luminaires are allowed to be buried in insulation and could be installed in the building thermal envelope without compromising the envelope or reducing the efficiency. Only those that are installed in contact with the envelope where there is a clear difference in temperature between the two spaces present the potential for energy loss. The current language could be interpreted to require application of this section for all recessed luminaires even if they are installed far from the building thermal envelope.

The recessed luminaires that are built to be compliant with this section are already tested and marked by the manufacturer as complying with the requirement. ASTM E283 is a standard for air leakage for windows, curtain walls, and doors between spaces of similar temperature and humidity, and it is inappropriate to require any product to be listed to a standard that was developed for a different purpose. The revised language makes it clear that those products installed through the building thermal envelope must have a visible marking verifying compliance with the air leakage requirement to aid in inspection. Requiring these products to be "Labeled", per the definition in the IECC, means tested and certified by a third party testing laboratory, usually for very specific applications. There was no substantiation given in the proposal for the 2009 Edition to add this requirement, and none was offered in testimony at either the Code Development Hearings or the Final Action Hearings. The only problem cited by the submitter was poor workmanship by installers. Adding the cost of third-party listing and labeling of the product to the ASTM air leakage standard will do nothing to improve the construction of the product or the quality of the installation. Adding this requirement will drive up the cost of these products, and the cost of construction, with no benefit in efficiency. (Note that these products are already listed by a recognized testing laboratory for electrical and fire safety.)

Cost Impact: The code change proposal will reduce the cost of construction by eliminating requirements where there is no benefit, and will maintain an equal standard of energy efficiency compared with the 2009 Edition of the IECC.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: BOSENBERG-RE-1-N1102.4.5

RE7–09/10
N1103.4

Proponent: John R. Addario, PE, NYS Department of State-Division of code Enforcement and Administration

Revise as follows:

N1103.4 ~~Circulating~~ Hot water <u>supply temperature maintenance</u> systems. All circulating service hot water <u>and heat traced</u> piping shall be insulated to at least R-2. ~~Circulating~~ Hot water systems shall include an automatic or *readily accessible* manual switch that can turn off the hot water circulating pump <u>or heat trace system</u> when the system is not in use.

Reason: The intent of this section is to require systems that maintain system hot water temperature to be properly insulated. Heat traced systems, like circulating systems, should be required to limit the amount of energy they consume by requiring a minimum amount of insulation. This proposed change includes heat trace systems within the intent of the code and renames the title to include both types of systems.

Cost Impact: The code change proposal will not increase the cost of construction.

TENTATIVE ORDER OF DISCUSSION

2009-2010 PROPOSED CHANGES TO THE INTERNATIONAL RESIDENTIAL CODE

PLUMBING/MECHANICAL

The following is the tentative order in which the proposed changes to the code will be discussed at the public hearings. Proposed changes which impact the same subject have been grouped to permit consideration in consecutive changes.

Proposed change numbers that are indented are those which are being heard out of numerical order. Indentation **does not** necessarily indicate that one change is related to another. Proposed changes may be grouped for purposes of discussion at the hearing at the discretion of the chair.

RP1–09/10
P2503.5.1

Proponent: Michael Cudahy, Plastic Pipe and Fittings Association (PPFA) for Plastic Pipe and Fittings Association (PPFA).

Revise as follows:

P2503.5.1 Rough plumbing. DWV systems shall be tested on completion of the rough piping installation by water or, for piping systems other than plastic, by air with no evidence of leakage. Either test shall be applied to the drainage system in its entirety or in sections after rough piping has been installed, as follows:

1. Water test. Each section shall be filled with water to a point not less than 10 feet (3048 mm) above the highest fitting connection in that section, or to the highest point in the completed system. Water shall be held in the section under test for a period of 15 minutes. The system shall prove leak free by visual inspection.
2. Air test. The portion under test shall be maintained at a gauge pressure of 5 pounds per square inch (psi) (34 kPa) or 10 inches of mercury column (34 kPa). This pressure shall be held without introduction of additional air for a period of 15 minutes.

Reason: To carry over the language on air testing of plastic piping systems from the IPC to the IRC. This change would correct an oversight in the IRC section. IPC Section 312.1 "Required tests", contains the specific language: **"**All plumbing system piping shall be tested with either water or, for piping systems other than plastic, by air. After the plumbing fixtures have been set and their traps filled with water, the entire drainage system shall be submitted to final tests." The reason for this language is that under some conditions, air testing poses additional risks for installers. The IRC should reflect the same language as found in the IPC.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Cudahy-RP1-P2503.5.1

RP2–09/10
Table P2701.1

Proponent: Abraham I. Murra, Canadian Standards Association, representing the Canadian Standards Association

Revise table as follows:

TABLE P2701.1
PLUMBING FIXTURES, FAUCETS AND FIXTURE FITTINGS

MATERIAL	STANDARD
Macerating toilet systems and related components	ASME A112.3.4, CSA B45.9

(Portions of table not shown remain unchanged)

Reason: The acceptance of the proposed change will enable manufacturers with products certified to CSA B45.9 to have their products used as options to products that meet the requirements of ASME A112.3.4. This change will also allow the authorities having jurisdiction to allow the use of products that meet either CSA B45.9 or ASME A112.3.4. The standard is already referenced in IRC Section P3007.5.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Murra-RP6-TP2701.1

RP3–09/10
P2702.1, P2706.1

Proponent: Guy McMann, Jefferson County Colorado, representing the Colorado Association of Plumbing and Mechanical Officials (CAPMO)

Revise as follows:

P2702.1 Plumbing fixtures. Plumbing fixtures, other than water closets, shall be provided with approved strainers.

Exception: Hub drains and standpipes.

P2706.1 General. Every waste receptor shall be of an approved type. Plumbing fixtures or other receptors receiving the discharge of indirect waste pipes shall be shaped and have a capacity to prevent splashing or flooding and shall be readily accessible for inspection and cleaning. Waste receptors and standpipes shall be trapped and vented and shall connect to the building drainage system. A removable strainer or basket shall cover the waste outlet of waste receptors. Waste receptors shall be installed in ventilated spaces. Waste receptors shall not be installed in bathrooms or in any inaccessible or unventilated space such as a closet. Ready access shall be provided to waste receptors.

Exceptions:

1. Open hub waste receptors shall be permitted in the form of a hub or pipe extending not less than 1 inch (25 mm) above a water-impervious floor, and are not required to have a strainer.
2. Clothes washer standpipes shall not be prohibited in bathrooms.

Reason: Hub drains and standpipes simply do not need to have strainers and there is no harm or technical justification to disallow a cloth washer in a residential bathroom

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: McMann-RP-3-P2702.1

RP4–09/10
P2709.1

Proponent: Shawn Martin, Plumbing Manufacturers Institute, representing the Plumbing Manufacturers Institute

Revise as follows:

P2709.1 Construction. Shower receptors shall have a finished curb threshold not less than 1 inch (25 mm) below the sides and back of the receptor where provided. The curb shall be not less than 2 inches (51 mm) and not more than 9 inches (229 mm) deep when measured from the top of the curb to the top of the drain. The finished floor shall slope uniformly toward the drain not less than ¼ unit vertical in 12 units horizontal (2-percent slope) nor more than ½ inch (13 mm), and floor drains shall be flanged to provide a water-tight joint in the floor.

Reason: Market research and discussions with focus groups, builders and contractors indicate that consumers are showering much more frequently than bathing. Research also indicates that baby boomers that are nearing retirement age and are planning for life's remaining years at home are looking for home solutions that limit safety hazards by providing no hindrance in entering the showering. A barrier exists because an elderly person requiring the use of a walker or confined to a wheelchair cannot access the shower because of the threshold, curb or dam height requirements. We are therefore proposing that the threshold, curb or dam height be optional.

Cost Impact: This code change will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: MARTIN-RP3-2709.1

RP5–09/10
P2709.1

Proponent: Eric Gundersen, Masco Bath representing Masco Bath

Revise as follows:

P2709.1 Construction. Where ~~S~~shower receptors have a finished curb threshold it shall ~~have a finished curb threshold~~ be not less than 1 inch (25mm) below the sides and back of the receptor. The curb shall be not less than 2 inches (51mm) and not more than 9 inches (229mm) deep when measured from the top of the curb to the top of the drain. The finished floor shall slope uniformly toward the drain not less than ¼ unit vertical in 12 units horizontal (2-percent slope) nor more than ½ unit vertical per 12 units horizontal (4-percent slope) ~~inch (13mm) per foot~~, and floor drains shall be flanged to provide a water-tight joint in the floor.

Reason: Not all shower receptors have a finished curb threshold. Those used in accessible buildings are not required to have one, and with an ageing population, the need to eliminate thresholds over which people need to step is important. As long as the shower receptor has adequate provisions to drain the water into the waste system, there should be no need for such a threshold. The IPC does not include such a requirement. To rectify an editorial error in the slope statement.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Gunderson-RP1-P2709.1

RP6–09/10
P2711.5 (New), P2714.3 (New)

Proponents: Ronald L. George, CIPE, CPD, President of Ron George Design and Consulting Services, Amy Acton of The Phoenix Society for Burn Survivors, Angela Mickalide of the Home Safety Council

Add new text as follows:

P2711.5 Hot Water Temperature Limit. Hot water delivered from a lavatory faucet shall not exceed 120°F (49°C). A water heater thermostat shall not be used as a temperature limiting device to comply with the requirement of this section.

P2714.5 Hot Water Temperature Limit. Hot water delivered from a sink faucet shall not exceed 120°F (49°C). A water heater thermostat shall not be used as a temperature limiting device to comply with the requirement of this section.

Reason: Water heater thermostats cannot properly control the water temperatures to a domestic hot water system. All water heater thermostats have an allowable tolerance plus or minus 11 to 15 degrees Fahrenheit that allows temperature swings in the domestic hot water system up to 30 degrees from the burner or heating element "on" temperature setting to the burner or heating element "off" temperature setting. Coupled with thermal layering in un-circulated storage type water heaters, the temperature variation can be as much as 50 degrees in an un-circulated storage type heater. Instantaneous heaters have temperature fluctuations as the flow changes. A thermostatic mixing valve installed in the hot water piping downstream of the water heater will mix cold water with the varying hot water temperatures to deliver a relatively constant and safe temperature of hot water to the domestic hot water system.

Many children are scalded every year because of scalding hazards in a home. These injuries are very preventable with a small thermostatic mixing valve located at the water heater or on the branch to fixtures used for bathing and washing.

Water Heater Thermostats

The reason the water heater thermostat for burner "on" and burner "off" control is being used to control how water system temperatures is there is nothing mandating thermostatic controls to be installed on hot water systems. Although water heater manufacturers are recommending that installers set thermostats at 120 to 125 degrees F, and most of them ship the water heaters at lower temperature settings.
Plumbing engineers continue to recommend hot water systems be designed with the intended storage temperatures for several reasons.

1. The water heater is sized based on 140 degrees Fahrenheit so if you turn down the temperature you will most likely run out of hot water during peak periods.
2. Higher temperatures reduce the threat of Legionellae bacteria growth in the water heater tank.
3. Using 140 degree hot water and mixing down to a safe delivery temperature around 120-125 degrees Fahrenheit allows a constant hot water delivery temperature.
4. If a water heater burner control thermostat is turned down to a lower temperature, the water heater has a reduced capacity to deliver hot water.

As a result, when users run out of hot water and the water heater thermostat is then re-adjusted to a temperature above 120 degrees F, there is a chance the water thermostat can be turned even higher. If the maximum temperature limit stop is not readjusted, then everyone is in danger of being scalded.

Water Heater Burner Control Accuracy

Water heater thermostats were never intended to provide precise temperature controls for hot water system temperatures. For example: The thermostat dial calibration test of ANSI Z21.10.1-1998, which is the applicable standard for gas-fired water heaters, allows the temperature to vary 10 degrees above or below the thermostat setting. I have talked to water heater manufacturers and factory engineers that have indicated the controls can vary as much as 15 to 18 degrees Fahrenheit above or below the set point. The thermostat is inserted into the lower portion of a water heater tank and turns the fuel supply to the water heater "on" and "off" . There is no way to know what the temperature in the tank is with most water heater thermostat dials.

Many children are scalded every year because of scalding hazards in a home. I investigate many scald injuries every year and find through a variety of reasons, a child can find their way up onto the counter where there is a lavatory and they are amused by the water. These young children do not understand how the faucet controls work and are often scalded when they turn the faucet to the hot setting and the hot water temperatures are dangerously high. (Above 120 degrees F.) These injuries are very preventable with a small thermostatic mixing valve located at the water heater or on the branch to fixtures used for bathing and washing. The thermostatic valve can be adjusted to a setting that provides a safe and useable temperature of hot water.

Theoretically, if the water heater thermostatic element is set at 120 degrees Fahrenheit, the burner would come on when the temperature at the thermostat reaches about 105 degrees Fahrenheit. The burner stays on until the water around the thermostatic element (near the bottom of the heater) reaches about 135 degrees Fahrenheit then it turns the fuel supply to the burner or heating element off. (15 degrees F above the set-point of the thermostat). The maximum temperature limit test of ANSI Z21.10.1 gas water heater standard allows the outlet water temperature of the water heater to rise about 30 degrees F above the thermostat setting. This provision accounts for the phenomenon known as "stacking" or "layering" of hot water in the top of a water heater. Stacking or layering occurs when hot water rises to the top of the water heater due to recurring short duration heating cycles caused by a frequent number of small quantity hot water uses which draws cold water into the bottom of the heater. Although the above example addresses gas water heaters, this phenomenon can also occur in other types of storage water heaters. So at the top of a water heater that is theoretically set for 120 degrees Fahrenheit, the outlet hot water temperatures can easily reach 165 degrees Fahrenheit.

This is why we should mandate a thermostatic mixing valve conforming to ASSE 1017 or CSA B-125.3 on the outlet piping of a water heater to limit the hot water distribution temperatures to a maximum safe delivery temperature of 120 to 125 degrees Fahrenheit. If high temperature hot water uses are required for a process application a thermostatic mixing valve conforming to ASSE 1070 can be installed on the local branch piping serving a fixture or group of fixtures. Additional supporting information is shown on my website at: www.rongeorgedesign.com

Cost Impact: Minimal

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: GEORGE-RP3-P2711.5 NEW

RP7–09/10
P2713.3

Proponent: Sally Remedios, Delta Faucet Company, representing Delta Faucet Company.

Revise as follows:

P2713.3 Bathtub and whirlpool bathtub valves. The hot water supplied to bathtubs and whirlpool bathtubs shall be limited to a maximum temperature of 120°F (49°) by a water-temperature limiting device that conforms to ASSE 1070 or CSA B125.3, except where such protection is otherwise provided by a combination tub/shower valve in accordance with Section P2708.3.

Reason: This alternate standard is already referenced in the 2009 IPC and it was an oversight not to include it in the IRC at the same time.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Remedios-RP2-P2713.3

RP8–09/10
P2709.2

Proponent: Pat Clark, Colorado Association of Plumbing and Mechanical Officials (CAPMO)

Revise as follows:

P2709.2 Lining required. The adjoining walls and floor framing enclosing on-site built-up shower receptors shall be lined with one of the following materials.

1. Sheet lead,
2. Sheet copper,
3. Plastic liner material that complies with ASTM D 4068 or ASTM D 4551,
4. Hot mopping in accordance with Section P2709.2.3 or
5. Sheet-applied load-bearing, bonded waterproof membranes that comply with ANSI A118.10.

The lining material shall extend not less than ~~3 inches (76 mm)~~ 2 inches (51 mm) beyond or around the rough jambs and not less than ~~3 inches (76 mm)~~ 2 inches (51 mm) above finished thresholds. Sheet-applied load bearing, bonded waterproof membranes shall be applied in accordance with the manufacturer's installation instructions.

Reason: This is inconsistent with IPC Section 417.5.2 which calls for 2 inches. There is no technical justification for a 3 inch dimension and brings uniformity to the two documents.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Clark-RP1-P2709.2

RP9–09/10
Section 2904 (New)

Proponent: Guy Tomberlin, Fairfax County, Virginia representing the Virginia Plumbing and Mechanical Inspectors Association (VPMIA) and the Virginia Building and Code Officials Association (VBCOA)

Add new text as follows:

SECTION 2904
HOT WATER SUPPLY SYSTEMS

2904.1 Where required. Hot water shall be supplied to all plumbing fixtures and equipment utilized for bathing, washing or culinary purposes.

P2904.2 Hot water supply temperature maintenance. Where the developed length of hot water piping from the source of hot water supply to the furthest fixture exceeds 40 feet (12192 mm), the hot water supply system shall be provided with a recirculating pump system to maintain hot water temperature to a point that is not further than 40 feet (12 192 mm) in developed pipe length from any fixture.

P2904.2.1 Piping insulation. Circulating hot water system piping shall be insulated in accordance with Section N1103.4.

P2904.2.2 Hot water system controls. Circulating hot water system pump controls shall be in accordance with Section N1103.4.

2904.2.3 Recirculating pump. Where a thermostatic mixing valve is used in a system with a hot water recirculating pump, the hot water or tempered water return line shall be routed to the coldwater inlet pipe of the water heater and the cold water inlet pipe or the hot water return connection of the thermostatic mixing valve.

Reason: Current IRC provides no guidance for the hot water piping installed in a dwelling unit. Several hundred feet of hot water piping can be installed with no regard to energy conservation. Water heaters are being installed in remote locations based on space allotment. Significant water and energy are wasted waiting for the hot water to get to the fixture. These are similar to the provisions that have always been included in the IPC .

Cost Impact: This code change proposal could increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Tomberlin-RP3-P2904 NEW

RP10–09/10
P2904.1

Proponent: Philip A. Brown, American Fire Sprinkler Association

Revise as follows:

P2904.1 General. Where installed, residential fire sprinkler systems, or portions thereof, shall be in accordance with NFPA 13D or Section P2904, which shall be considered equivalent to NFPA 13D. Section P2904 shall apply to stand-alone and multipurpose wet-pipe sprinkler systems that do not include the use of antifreeze. A multipurpose fire sprinkler system shall supply domestic water to both fire sprinklers and plumbing fixtures. A stand-alone sprinkler system shall be separate and independent from the water distribution system. A backflow flow preventer shall ~~not~~ be required to separate a stand-alone sprinkler system from the water distribution system.

Reason: Backflow prevention is normally required by local water purveyors to separate non-flowing water systems from flowing systems.

Cost Impact: The code change proposal will increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: BROWN-RP2-P2904.1

RP11–09/10
P2904.1

Proponent: Julius Ballanco, P.E./JB Engineering and Code Consulting, P.C. representing himself

Revise as follows:

P2904.1 General. ~~Where installed,~~ The design and installation of residential fire sprinkler systems~~, or portions thereof,~~ shall be in accordance with NFPA 13D or Section P2904, which shall be considered equivalent to NFPA 13D. Partial residential sprinkler systems shall be permitted to be installed only in buildings not required to be equipped with a residential sprinkler system. Section P2904 shall apply to stand-alone and multipurpose wet-pipe sprinkler systems that do not include the use of antifreeze. A multipurpose fire sprinkler system shall provide domestic water to both fire sprinklers and plumbing fixtures. A stand-alone sprinkler system shall be separate and independent from the water distribution system. A backflow flow preventer shall not be required to separate a stand-alone sprinkler system from the water distribution system.

Reason: The first sentence clarifies that this section regulates the design and installation of residential sprinklers, and does not mandate residential sprinkler systems. The addition of the second sentence emphasizes that it would be permissible to install a partial system when residential sprinklers are not required. The reason for adding such wording is so that the section can stand on its own whether sprinklers are mandated or not. When mandated by Chapter 3, partial system can still be installed in existing residential units.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: BALLANCO-RP2-2904.1

RP12–09/10
P2904.1

Proponent: Richard J. Prospal, on behalf of The American Society of Sanitary Engineering

1. Revise as follows:

P2904.1 General. Where installed, residential fire sprinkler systems, or portions thereof, shall be in accordance with NFPA 13D or Section P2904, which shall be considered equivalent to NFPA 13D. Section P2904 shall apply to stand-alone and multipurpose wet-pipe sprinkler systems that do not include the use of antifreeze. A multipurpose fire sprinkler system shall supply domestic water to both fire sprinklers and plumbing fixtures. Installers of multipurpose fire

sprinkler systems shall meet the requirements of ASSE 7010. A stand-alone sprinkler shall system shall be separate and independent from the water distribution system. A backflow preventer shall not be required to separate a stand-alone system from the water distribution system.

2. Add standard to Chapter 44 as follows:

ASSE
7010 - 2008, Professional Qualifications Standard for Plumbing-Based Residential Fire Protection Systems Installers for One and Two-Family Dwellings

Reason: The installers of multipurpose residential fire sprinkler systems must be qualified and pass a certification process assuring the general public of their knowledge of NFPA 13D and Section P2904.

Cost Impact: This code change proposal will not increase the cost of construction.

Analysis: Review of proposed new standard, ASSE 7010-2008, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before September 24, 2009.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Prospal-RP-1-P2904.1

RP13–09/10
P2904.2.4.2, Table P2904.2.4.2 (New)

Proponent: Ron Coleman/IRC Fire Sprinkler Coalition/IRC Fire Sprinkler Coalition

1. Revise as follows:

P2904.2.4.2 Obstructions to coverage. Sprinkler discharge shall not be blocked by obstructions unless additional sprinklers are installed to protect the obstructed area. Additional sprinklers shall not be required where the sprinkler separation from obstructions ~~shall comply~~ complies with the greater of the minimum distance indicated in Table P2904.2.4.2 and the minimum distances specified in the sprinkler manufacturer's instructions.

2. Add new table as follows:

TABLE P2904.2.4.2
MINIMUM SEPARATION FROM OBSTRUCTION

Pendent Sprinklers	Distance from Deflector to Plane at Bottom of Obstruction (a) (inches)	Minimum Distance to Obstruction (b) (feet)
1	1-1/2
3	3
5	4
7	4-1/2
9	6
11	6-1/2
14	7

Sidewall Sprinkler Side Obstruction	Distance from Deflector to Plane at Bottom of Obstruction (a) (inches)	Minimum Distance to Obstruction (b) (feet)
1	1-1/2
3	3
5	4
7	4-1/2
9	6
11	6-1/2
14	7
Sidewall Sprinkler Forward Obstruction	Distance from Deflector to Plane at Bottom of Obstruction (a) (inches)	Minimum Distance to Obstruction (b) (feet)
1	8
2	10
3	11
4	12
6	13
7	14
9	15
11	16
14	17

Reason: To allow Section P2904 to stand alone as an installation standard, specific requirements regarding the minimum spacing to obstructions need to be added. Although some manufacturers provide detailed information regarding spacing with respect to obstructions in their installation instructions, there are some that currently just rely on NFPA 13D. This change will add general obstruction requirements that are consistent with NFPA 13D, while still permitting greater flexibility when permitted by installation instructions (which are required to be approved by UL or other approved listing agencies). The proposed addition will also provide a useful tool to the code official during inspection.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: Coleman-RP1-P2904.2.4.2

RP14–09/10
P2904.3.1, P2904.8.1

Proponent: Julius Ballanco, P.E./JB Engineering and Code Consulting, P.C. representing himself

Revise as follows:

P2904.3.1 Nonmetallic pipe and tubing. ~~Nonmetallic pipe and tubing, such as CPVC and PEX, shall be listed for use in residential fire sprinkler systems.~~ CPVC pipe, PEX tubing, PEX-Al-PEX tubing, and PE-AL-PE tubing shall be third

party certified as conforming to one of the standards listed in Table P2905.4. CPVC pipe, PEX tubing, PEX-Al-PEX shall be certified for a pressure rating of not less than 130 psi (8.9 bar) at 120°F (49°C)

P2904.8.1 Pre-concealment Inspection. The following items shall be verified prior to the concealment of any sprinkler system piping:

1. Sprinklers are installed in all areas as required by Section P2904.1.1.
2. Where sprinkler water spray patterns are obstructed by construction features, luminaires or ceiling fans, additional sprinklers are installed as required by Section P2904.2.4.2.
3. Sprinklers are the correct temperature rating and are installed at or beyond the required separation distances from heat sources as required by Sections P2904.2.1 and P2904.2.2.
4. The pipe size equals or exceeds the size used in applying Tables P2904.6.2(4) through P2904.6.2(9) or, if the piping system was hydraulically calculated in accordance with Section P2904.6.1, the size used in the hydraulic calculation.
5. The pipe length does not exceed the length permitted by Tables P2904.6.2(4) through P2904.6.2(9) or, if the piping system was hydraulically calculated in accordance with Section P2904.6.1, pipe lengths and fittings do not exceed those used in the hydraulic calculation.
6. Non-metallic piping that conveys water to sprinklers is ~~listed~~ certified for ~~use with fire sprinklers~~ a pressure rating of not less than 130 psi (8.9 bar) at 120°F (49°C).
7. Piping is supported in accordance with the pipe manufacturer's and sprinkler manufacturer's installation instructions.
8. The piping system is tested in accordance with Section P2503.6

Reason: The requirement for plastic pipe is that it meets the appropriate ASTM standard regulating the pipe or tube. In addition, NFPA 13D specifies the minimum pressure and temperature rating when used in a residential sprinkler system. There is no fire testing required by NFPA 13D for plastic pipe. Since Section P2904 is very specific regarding the type of sprinkler system used, the requirements for plastic pipe should provide the applicable requirements. The intent was always to parallel the requirements for water distribution systems. The pipe must meet the requirements for water distribution pipe.

It should be noted that Section P2904 does not permit the use of a fire department connection. The piping system is piped as a part of the plumbing system with the same pressure limitations. Hence, there is no justification for any higher ratings.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Ballanco-RP-3-P2904.3.1

RP15–09/10
P2904.6.1

Proponent: Philip A. Brown, American Fire Sprinkler Association

Revise as follows:

P2904.6.1 Method of sizing pipe. Pipe supplying sprinklers shall be sized using the prescriptive method in Section P2904.6.2 for nonlooped tree systems only or by hydraulic calculation in accordance with NFPA 13D. The minimum pipe size from the water supply source to any sprinkler shall be 3/4 inch (19 mm) nominal. Threaded adapter fittings at the point where sprinklers are attached to the piping shall be a minimum of 1/2 inch (13 mm) nominal.

Reason: The flow and pressure requirements for a sprinkler system are strongly affected where piping systems are interconnected (looped/gridded). The use of the Tables P2904.6 (2) through P2904.6 (9) as discussed in Step 8 of Section P2904.6.2.2 is for a straight flow (non-looped) system.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: BROWN-RP1-P2904.6.1

RM1–09/10
Chapter 14, M1401.2, M1401.3, M1401.4

Proponent: Sam Dardano, City of Boulder, CO, representing the Colorado Association of Plumbing and Mechanical Officials (CAPMO)

Revise as follows:

CHAPTER 14
HEATING AND COOLING EQUIPMENT AND APPLIANCES

M1401.2 Access. Heating and cooling equipment and appliances shall be located with respect to building construction and other equipment and appliances to permit maintenance, servicing and replacement. Clearances shall be maintained to permit cleaning of heating and cooling surfaces; replacement of filters, blowers, motors, controls and vent connections; lubrication of moving parts; and adjustments

Exception: Access shall not be required for ducts, piping, fittings or other components intended for concealment.

.

M1401.3 Sizing. Heating and cooling equipment and appliances shall be sized in accordance with ACCA Manual S based on building loads calculated in accordance with ACCA Manual J or other approved heating and cooling calculation methodologies.

M1401.4 Exterior installations. Equipment and appliances installed outdoors shall be listed and labeled for outdoor installation. Supports and foundations shall prevent excessive vibration, settlement or movement of the equipment. Supports and foundations shall be ~~level and conform to the manufacturer's installation instructions~~ in accordance with Section M1305.1.4.1.

Reason: This is a simple fix to include appliances in the text as it's obvious that this is the true intent. Appliances are mentioned throughout Chapter 14. The definition of **Equipment** excludes appliances. The exception recognizes that by definition, equipment includes the mentioned items and not all parts of systems necessarily need to be accessible at all. A pointer has been installed to direct the user to the proper section for ground clearance.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Dardano-RM-5-M1401

RM2–09/10
M1403.2

Proponent: Guy McMann, Jefferson County, CO, representing the Colorado Association of Plumbing and Mechanical Officials (CAPMO)

Delete without substitution:

~~**M1403.2 Foundations and supports**. Supports and foundations for the outdoor unit of a heat pump shall be raised at least 3 inches (76 mm) above the ground to permit free drainage of defrost water, and shall conform to the manufacturer's installation instructions~~.

Reason: This is redundant language which is already covered in M1305.1.4.1.This applies to all equipment and appliances.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: McMann-RM-9-M1403.2

RM3–09/10
M1405.1, Chapter 44 (New)

Proponent: Bob Eugene, Underwriters Laboratories, Inc.

1. Revise as follows:

M1405.1 General. Electric baseboard convectors shall be installed in accordance with the manufacturer's installation instructions and Chapters 34 through 43 of this code. Electric baseboard heaters shall be listed and labeled in accordance with UL 1042.

2. Add new standard to Chapter 44 as follows:

UL 1042 –94 Electric Baseboard Heating Equipment – with revisions through February 2008

Reason: UL 1042 includes a comprehensive set of construction and performance requirements that are specifically used to evaluate and list electric baseboard heaters. Over a dozen companies have electric baseboard heater listings.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Eugene-RM-3-M1405.1-Ch 44

RM4–09/10
M1406.1, M1406.5, Chapter 44 (New)

Proponent: Bob Eugene, Underwriters Laboratories, Inc.

1. Revise as follows:

M1406.1 General. Electric radiant heating systems shall be installed in accordance with the manufacturer's installation instructions and Chapters 34 through 43 of this code and shall be listed for the application. Electric radiant heating panels and heating panel sets shall comply with UL 1693. Electric space heating cables shall comply with UL 1673.

2. Delete without substitution:

~~**M1406.5 Gypsum panels.** Where radiant heating systems are used on gypsum assemblies, operating temperatures shall not exceed 125°F (52°C).~~

3. Add new standards to Chapter 44 as follows:

UL 1673-96 Electric Space Heating Cables – with revisions through July 2003
UL 1693-02 Electric Radiant Heating Panels and Heating Panel Sets

Reason: UL 1673 and UL 1693 include a comprehensive set of construction and performance requirements that are used to evaluate and list electric space heating cables and electric radiant heating panels. Over 20 companies currently have heating cables and radiant heating panels listed. UL 1673 and UL 1693 do not require a temperature rating to be marked on the surface of the product or in the instructions. Instead, the product is specifically evaluated to the application and surfaces to which it is to be in contact. The instructions detail the surface (e.g. in concrete, on gypsum, above subfloor covered in tile, etc.). Note also that different surfaces have different temperature allowances in accordance with the standard, so all of these applications would all need to be itemized if temperatures limits are to continue to be maintained.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Eugene-RM-5-M1406.1-Ch 44

RM5–09/10
M1406.3

Proponent: Bob Eugene, Underwriters Laboratories, Inc.

Revise as follows:

M1406.3 Installation of radiant panels. Radiant panels installed on wood or steel framing shall conform to the following requirements:

1. Heating panels shall be installed parallel to framing members and secured to the surface of framing members or mounted between framing members.
2. ~~Panels~~ Mechanical fasteners shall ~~be nailed or stapled~~ penetrate only ~~through~~ the unheated portions provided for this purpose. ~~and~~ Panels shall not be fastened at any point closer than ¼ inch (7 mm) to an element. Other methods of attachment of the panels shall be in accordance with the panel installation instructions.
3. Unless listed and labeled for field cutting, heating panels shall be installed as complete units.

Reason: Item 2 only addresses nails and staples as the only means to fasten the panels. The penetration of screws into the heating elements is also a concern. Various systems use other means of attachment (such as clips or adhesives), which are evaluated as part of the listing of the panels. Proposed revision is to provide guidance on how to secure the panels to the wood framing.

Cost Impact: The code change proposal will not increase the cost of construction.

RM6–09/10
M1408.1

Proponent: Bob Eugene, Underwriters Laboratories, Inc.

Revise as follows:

M1408.1 General. Oil-fired vented floor furnaces shall ~~conform to~~ comply with UL 729 and shall be installed in accordance with their listing, the manufacturer's installation instructions and the requirements of this code.

Reason: To clarify that UL 729 is only applicable for oil-fired floor furnaces.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Eugene-RM-11-M1408.1

RM7–09/10
M1409.1

Proponent: Bob Eugene, Underwriters Laboratories, Inc.

Revise as follows:

M1409.1 General. Oil-fired vented wall furnaces shall ~~conform to~~ comply with UL 730 and be installed in accordance with their listing, the manufacturer's installation instructions and the requirements of this code.

Reason: To clarify that UL 730 is only applicable for oil-fired wall furnaces.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Eugene-RM-2-M1409.1

RM8–09/10
M1412.1

Proponent: Bob Eugene, Underwriters Laboratories, Inc.

Revise as follows:

M1412.1 Approval of equipment. Absorption systems shall be installed in accordance with the manufacturer's installation instructions. Absorption equipment shall comply with UL 1995.

Reason: UL 1995 includes a comprehensive set of construction and performance requirements that are used to evaluate and list absorption equipment, and is already adopted by reference in other sections of the IRC.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Eugene-RM-4-M1412.1

RM9–09/10
M1413.1

Proponent: Bob Eugene, Underwriters Laboratories, Inc.

Revise as follows:

M1413.1 General. Cooling equipment that uses evaporation of water for cooling shall be installed in accordance with the manufacturer's installation instructions. Evaporative coolers shall be installed on a level platform or base not less than 3 inches (76 mm) above the adjoining ground and secured to prevent displacement. Openings in exterior walls shall be flashed in accordance with Section R703.8. Evaporative cooling equipment shall comply with UL 1995.

Reason: UL 1995 includes a comprehensive set of construction and performance requirements that are used to evaluate and list evaporative cooling equipment and is already adopted by reference in other sections of the IRC.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME:Eugene-RM-6-M1413.1

RM10–09/10
M1501.1, M1506, M1506.2 (New), M1507.2

Proponent: Guy McMann, Jefferson County, CO, representing the Colorado Association of Plumbing and Mechanical Officials (CAPMO)

1. Revise as follows:

M1501.1 Outdoor discharge. The air removed by every mechanical exhaust system shall be discharged to the outdoors in accordance with Section M1506.2. ~~Air shall not be exhausted into an attic, soffit, ridge vent or crawl space~~.

Exception: Whole-house ventilation-type attic fans that discharge into the attic space of dwelling units having private attics shall be permitted.

SECTION M1506
EXHAUST DUCTS AND EXHAUST OPENINGS

2. Add new text as follows:

M1506.2 Exhaust openings. Air exhaust openings shall terminate not less than 3 feet (914 mm) from property lines; 3 feet (914 mm) from operable and non-operable openings into the building and 10 (3048 mm) feet from mechanical air

intakes except where the opening is located 3 feet (914 mm) above the air intake. Openings shall comply with Sections R303.4.2 and R303.5.

3. Revise as follows:

M1507.2 Recirculation of air. Exhaust air from bathrooms and toilet rooms shall not be re-circulated within a residence or to another dwelling unit and shall be exhausted directly to the outdoors. ~~Exhaust air from bathrooms and toilet rooms shall not discharge into an attic, crawl space or other areas inside the building.~~

Reason: The logic in this proposal is consistent with the approval of M-22 last cycle which concluded that ventilation openings belong in the ventilation chapter and exhaust openings belong in the exhaust chapter. This handles all exhaust that would be encountered in residences and includes nothing new.
The stricken text in M1501.1 and M1507.2 is redundant and not needed as it will be covered under M1506.2.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: McMann-RB-2-R303.4.2-M1501-M1506

RM11–09/10
M1502.4.4.1

Proponent: Don Surrena, CBO, National Association of Home Builders (NAHB)

Revise as follows:

M1502.4.4.1 Specified length. The maximum length of the exhaust duct shall be ~~25~~ 35 feet (~~7620mm~~) (10,668mm) from the connection to the terminus of the transition duct from the dryer to the outlet terminal. Where fittings are utilized, the maximum length of the exhaust duct shall be reduced in accordance with Table M1502.4.4.1.

Reason: The purpose of this proposal is to reinstate the 35 foot maximum length of a dryer duct, and to more clearly define how to measure the duct length. This proposal will also help minimize any misinterpretation by code officials and correlate the same provisions with the IMC and IFGC.

During the 2007-2008 code development cycle, there was a proposal submission error made by the proponent that inadvertently changed the permitted length of duct from 35 feet to 25 feet in the IRC. There was no data produced at the hearing that showed the permitted 35 foot length was dangerous. However research has shown, dryer manufactures indicate 35 feet is an acceptable length according to their installation instructions. The 35 foot length allows more flexibility in design allowing for increased energy savings and allowing for more versatile utilization of green building practices. In addition this proposal adds the term "terminus" to clarify and prevent confusion on the part of the inspector as to where to start measuring the "dryer duct," and to not include the "transition duct." (The duct connection from the appliance to the exhaust duct)

We encourage the adoption of this proposal to reinstate the 35 foot maximum length for dryer duct. The requirements of the IRC, IMC and the IFGC, should be consistent in regard to Dryer Duct Length.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Surrena-RM-2-M1502.4.4.1

RM12–09/10
M1502.4.4.1

Proponent: Guy Tomberlin, Fairfax County, VA, representing the Virginia Plumbing and Mechanical Inspectors/Virginia Building and Code Officials

Revise as follows:

M1502.4.4.1 Specified length. The maximum length of the exhaust duct shall be ~~25~~ 35 feet (~~7620mm~~)from the connection to the transition duct from the dryer to the outlet terminal. Where fittings are utilized, the maximum length of the exhaust duct shall be reduced in accordance with Table M1502.4.4.1.

Reason: This is an attempt to correct an error that occurred last code cycle. The entire section of M1502 was re-written for clarity and better usability. The previous IRC 2006 edition included the 35 foot allowance. Unfortunately, during the re-write the 35 feet was inadvertently changed

back to 25 feet. Substantial data was presented to support the additional 10 feet during the 03 to 06 cycle which illustrated that the majority of clothes dryers manufactured today have no problem complying with the 35 length and the reductions for changes in direction.

Cost Impact: (None given)

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Tomberlin-RM-2-M1502.4.4.1

RM13–09/10
M1503.1

Proponent: Robert Adkins, Prince William, VA, representing Virginia Plumbing & Mechanical Inspectors Association/Virginia Building and Code Officials Association

Revise as follows:

M1503.1 General. A range hood or a down-draft exhaust system shall be provided for each range or cooktop. Range hoods and down-draft exhaust systems shall discharge to the outdoors ~~through a single-wall duct~~. The duct serving the hood shall have a smooth interior surface, shall be air tight and shall be equipped with a backdraft damper. Ducts serving range hoods shall not terminate in an attic or crawl space or areas inside the building.

> ~~**Exception:** Where installed in accordance with the manufacturer's installation instructions and where mechanical or natural ventilation is otherwise provided, listed and labeled ductless range hoods shall not be required to discharge to the outdoors.~~

M1503.3 Kitchen exhaust rates. ~~Where~~ domestic kitchen ~~cooking *appliances* are equipped with ducted~~ range hoods ~~or~~ and down-draft exhaust systems~~, the fans~~ shall ~~be sized in accordance~~ comply with Section M1507.3.

Reason: This ties all the requirements for residential range hoods together in one place and requires exhaust to the outdoors for each cooking appliance. Current text fails to require a hood and only addresses them where they are chosen to be installed. Most range manufacturers recommend the installation of hoods. Range hoods are necessary to achieve proper kitchen ventilation..

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Adkins-RM-1-M1503.1

RM14–09/10
M1503.1

Proponent: Forrest Fielder, City of Surprise, AZ, representing the Arizona Building Officials

Revise as follows:

M1503.1 General. Range hoods shall discharge to the outdoors through a single-wall duct. The duct serving the hood shall have a smooth interior surface, shall be air tight and shall be equipped with a backdraft damper. Changes in duct size or direction shall be accomplished with pre-manufactured transition fittings. Ducts serving range hoods shall not terminate in an *attic* or crawl space or areas inside the building.

> **Exception:** Where installed in accordance with the manufacturer's installation instructions, and where mechanical or natural *ventilation* is otherwise provided, *listed* and *labeled* ductless range hoods shall not be required to discharge to the outdoors.

Reason: The taped connections allowed by the Code fail quickly in the event of a grease fire occurring when the exhaust is operating, and taped connections are recognized as non-durable. Without mechanical connections to keep the exhaust system intact, flame can be fan-forced into unprotected attics in the event of fire. Under normal (non-emergency) circumstances, taped connections will fail, and allow exhaust directly into attics. This change clarifies the code's intent that these connections be made permanently, reliably intact.

Cost Impact: This code change will not increase the cost of construction.

RM15–09/10

M1503.1, M1503.3, Table M1507.3

Proponent: Steve Ferguson, American Society of Heating, Refrigerating, and Air-Conditioning Engineers

Revise as follows:

M1503.1 General. Range hoods shall discharge to the outdoors through a single-wall duct. The duct serving the hood shall have a smooth interior surface, shall be air tight and shall be equipped with a backdraft damper. Ducts serving range hoods shall not terminate in an attic or crawl space or areas inside the building.

Exception: Where installed in accordance with the manufacturer's installation instructions, and where mechanical ~~or natural ventilation~~ exhaust is otherwise provided in accordance with Section M1503.3, listed and labeled ductless range hoods shall ~~not~~ be permitted ~~required to discharge to the outdoors~~.

M1503.3 Kitchen exhaust ~~rates~~. ~~Where domestic kitchen cooking appliances are equipped with ducted range hoods or down draft exhaust systems, the fans shall be sized in accordance with Section M1507.3.~~ In each dwelling unit, not less than one range or cooktop shall be provided with a ducted range hood or down-draft fan that discharges to the outdoors. Such hoods and down-draft fans shall comply with Section M1507.3.

Exception: Range hoods and down-draft exhaust systems are not required where other mechanical exhaust systems serve the kitchen and provide continuous exhaust in accordance with Section M1507.3.

TABLE M1507.3
MINIMUM REQUIRED EXHAUST RATES FOR ONE- AND TWO-FAMILY DWELLINGS

AREA TO BE ~~VENTILATED~~ EXHAUSTED	**~~VENTILATION~~ EXHAUST RATES**[a]
Kitchens	100 cfm intermittent or ~~25 cfm continuous~~5 air changes per hour continuous based on total kitchen volume
Bathrooms, ~~Toilet~~ Water Closet Rooms	~~Mechanical exhaust capacity of~~ 50 cfm intermittent or 20 cfm continuous

For SI: 1 cubic foot per minute = 0.4719 L/s.

a. Equipment shall be tested and rated in accordance with HVI 916.

Reason: The purpose of this proposal is to strengthen the requirement for kitchen ventilation by increasing the stringency for allowable systems.

The existing provisions allow the use of windows for the intended purpose of exhausting contaminants produced by kitchen appliances. These systems are not able to remove kitchen contaminants from new housing. This change will improve the code by assuring that kitchen contaminants are exhausted outdoors and not simply redistributed in the home. It allows the use of ductless range hoods when either a down-draft or other wall- or ceiling-mounted fan that provides at least 5 ACH is installed. The reference to HVI 916 is provided to ensure that fans comply with industry standards for air flow verification. As a point of reference, MN state code 7672.1000 currently references HVI 916. HVI 916 is a consensus standard that is also referenced by Energy Star's Ventilation Fan Specification for measurement and verification of fan flow rates (note that NO on-site measurement or verification is required).

Substantiation: Cooking and other kitchen activities produce large quantities of indoor air quality contaminants such as moisture, organic compounds and a wide spectrum of particles. These contaminants can lead to condensation on cold building materials, leading to mold, discoloration, and damage. Modern houses with low infiltration and window use rates do not have sufficient ventilation to be able to cope with kitchen contaminants being dispersed throughout the home These contaminants cannot be filtered out and must be removed to avoid health problems and damage to the home. Windows do not always exhaust air; air just as often comes in as goes out. IF windows are open, roughly half the time they do not serve to exhaust kitchen contaminants but push them into the rest of the house. Windows are generally not used often enough to be depended upon and many occupants never open their windows for a number of reasons. Similarly, down-draft appliances of 50-100 cfm cannot capture significant amounts of contaminants, which rise due to buoyancy. The values in Table M1606.3 are effective when used with vented range hoods, which have good capture efficiency because of their shape. For down-draft or room-based exhaust systems, the capture efficiency is poor, and five room air changes of exhaust are necessary to keep contaminants from dispersing into other rooms.

Cost Impact: This proposal will increase the cost of construction in those cases where a vented range hood costs more to install than a ductless range hood or if down-draft ventilation capacity needs to be increased to meet the 5 ACH requirement. However, NAHB has indicated that 70-80% of new homes have ducted range hoods or down-draft fans, so the overall cost impact is minimal.

Proponent: Steve Ferguson, American Society of Heating, Refrigerating, and Air-Conditioning Engineers

1. Add new definition as follows:

BATHROOM. A room containing a bathtub, shower, spa, hot tub, or other bathing fixture.

2. Revise as follows:

R303.3 Bathrooms. Bathrooms, water closet ~~compartments~~ rooms and other similar rooms shall be provided with aggregate glazing area in windows of not less than 3 square feet (0.279 m2), one-half of which must be openable. Bathrooms shall be mechanically exhausted in accordance with Section M1507.

Exception: The glazed areas shall not be required where artificial light is provided and a mechanical ~~ventilation~~ exhaust system in accordance with Section M1507 ~~are~~ is provided. ~~The minimum ventilation rates shall be 50 cfm (23.6 L/s) for intermittent ventilation or 20 cfm (9.4 L/s) for continuous ventilation.~~ ~~Ventilation~~ Exhaust air from the space shall be exhausted directly to the ~~outside~~ outdoors.

M1507.1 General. Kitchens ~~Where toilet rooms~~ and bathrooms shall be ~~are~~ mechanically exhausted ~~ventilated,~~. T~~t~~he ~~ventilation~~ exhaust equipment shall be installed in accordance with this section.

M1507.2 Recirculation of air. Exhaust air from kitchens, bathrooms and water closet ~~toilet~~ rooms shall not be recirculated within a residence or to another dwelling unit and shall be exhausted directly to the outdoors. Exhaust air from kitchens, bathrooms and water closet ~~toilet~~ rooms shall not discharge into an attic, crawl space or other areas inside the building.

M1507.3 ~~Ventilation~~ Exhaust rate. ~~Ventilation~~ Exhaust systems shall be designed to have the capacity to exhaust the minimum air flow rate determined in accordance with Table M1507.3.

TABLE M1507.3
MINIMUM REQUIRED EXHAUST RATES FOR ONE- AND TWO-FAMILY DWELLINGS

AREA TO BE ~~VENTILATED~~ EXHAUSTED	~~VENTILATION~~ EXHAUST RATES[a]
Kitchens	100 cfm intermittent or ~~25 cfm continuous~~5 air changes per hour continuous based on total kitchen volume
Bathrooms, ~~- Toilet~~ Water Closet Rooms	Mechanical exhaust capacity of 50 cfm intermittent or 20 cfm continuous

For SI: 1 cubic foot per minute = 0.0004719 m3/s.
a. Exhaust equipment shall be tested and rated in accordance with HVI 916.

3. Add new standard to Chapter 44 as follows:

HVI Home Ventilating Institute
1000 North Rand Road
Suite 214
Wauconda, IL 60084

HVI
916-09 Airflow Test Procedure

Reason: The purpose of this proposal is to strengthen the requirement for bathroom exhaust ventilation by disallowing the use of windows as the primary exhaust means. Water closet rooms and similar rooms do not have to be mechanically exhausted if they have operable windows.

The existing provisions allow the use of windows for the intended purpose of exhausting of moisture created by the bath, shower or other activities. Windows are not able to directly remove moisture from new housing. This change will improve the code by assuring that bathroom moisture is exhausted outdoors and not simply redistributed in the home. Odors can sometimes be vented using windows, depending on the design of the house, the weather, and the occupants, and is "self-induced". But moisture is a much bigger concern.

Substantiation: Bathing and other bathroom activities produce large quantities of moisture, as well as a wide spectrum of other contaminants. Modern houses with low infiltration and low-window use rates do not have sufficient ventilation to be able to cope with moisture being dispersed throughout the home, especially the moisture created due to bathing. This is especially true in humid climates and severe climates. Moisture must be removed to avoid health problems and damage to the home such as those that might be caused by molds. Even if opened, windows do not always exhaust air; air just as often comes in as goes out. So for roughly half the time windows are opened, the windows do not exhaust moisture but push it into the rest of the house. Further, a study commissioned by the California Air Resources Board and California Energy Commission found that of 1,448 new households, 29% did not open their windows at all during the winter, demonstrating that installation of operable windows does not in itself provide a reliable method for moisture control.

The reference to HVI 916 is provided to ensure that fans comply with industry standards for air flow verification. As a point of reference, MN state code 7672.1000 currently references HVI 916. HVI 916 is also referenced by Energy Star's Ventilation Fan Specification for measurement and verification of fan flow rates (note that NO on-site measurement or verification is required).

Proponent: Mike Moore, Newport Ventures, Inc., representing Broan NuTone

1. Add new definitions as follows:

LOCAL EXHAUST. An exhaust system that uses one or more fans to exhaust air from a specific room or rooms within a dwelling

WHOLE-HOUSE MECHANICAL VENTILATION SYSTEM. An exhaust system, supply system, or combination thereof that is designed to mechanically exchange indoor air for outdoor air for the purpose of diluting and removing indoor air contaminants within a dwelling. The system is designed to provide ventilation air continuously or through a programmed intermittent schedule to satisfy the ventilation rates required for the whole house. Local exhaust or supply fans can serve as such a system.

2. Revise as follows:

R303.1 Habitable rooms. All habitable rooms shall have an aggregate glazing area of not less than 8 percent of the floor area of such rooms. Natural *ventilation* shall be through windows, doors, louvers or other *approved* openings to the outdoor air. Such openings shall be provided with ready access or shall otherwise be readily controllable by the building occupants. The minimum openable area to the outdoors shall be 4 percent of the floor area being ventilated.

Exceptions:

1. The glazed areas need not be openable where the opening is not required by Section R310 and ~~an *approved* mechanical *ventilation* system capable of producing 0.35 air change per hour in the room is installed or~~ a whole-house mechanical *ventilation* system is installed ~~capable of supplying outdoor *ventilation* air of 15 cubic feet per minute (cfm) (78 L/s) per occupant computed on the basis of two occupants for the first bedroom and one occupant for each additional bedroom~~ in accordance with Section M1507.

2. The glazed areas need not be installed in rooms where Exception 1 above is satisfied and artificial light is provided capable of producing an average illumination of 6 footcandles (65 lux) over the area of the room at a height of 30 inches (762 mm) above the floor level.
3. Use of sunroom *additions* and patio covers, as defined in Section R202, shall be permitted for natural *ventilation* if in excess of 40 percent of the exterior sunroom walls are open, or are enclosed only by insect screening.

R303.3 Bathrooms. Bathrooms, water closet compartments and other similar rooms shall be provided with aggregate glazing area in windows of not less than 3 square feet (0.3 m2), one-half of which must be openable.

Exception: The glazed areas shall not be required where artificial light and a ~~mechanical ventilation~~ local exhaust system are provided. The minimum local exhaust ~~ventilation~~ rates shall be determined in accordance with Section M1507.4. ~~50 cubic feet per minute (24 L/s) for intermittent ventilation or 20 cubic feet per minute (10 L/s) for continuous ventilation~~. ~~Ventilation~~ Exhaust air from the space shall be exhausted directly to the ~~outside~~ outdoors.

M1507.1 General. Where local exhaust or whole-house mechanical ventilation is provided ~~toilet rooms, and bathrooms are mechanically ventilated,~~ the ~~ventilation~~ equipment shall be designed in accordance with this section.

3. Add new text and tables as follows:

M1507.3 Whole-house mechanical ventilation system. Whole-house mechanical ventilation systems shall be designed in accordance with Sections M1507.3.1 through M1507.3.3.

M1507.3.1 System design. The whole-house ventilation system shall consist of one or more supply or exhaust fans or a combination of such and associated ducts and controls. Where local supply or exhaust fans are used as part of such a system, they shall be tested and rated in accordance with HVI 916, and the fans' rated flow at 0.25 in w.c. static pressure shall equal or exceed the required ventilation rate determined by Section M1507.3.3. Outdoor air ducts connected to the return side of an air handler shall be considered to provide supply ventilation.

M1507.3.2 System Controls. The whole-house mechanical ventilation system shall be provided with controls that enable manual override.

M1507.3.3 Mechanical ventilation rate. The whole-house mechanical ventilation system shall provide outdoor air at a continuous rate not less than that determined in accordance with Table M1507.3.3(1).

Exception: The whole-house mechanical ventilation system is permitted to operate intermittently where the system has controls that enable operation for not less than 25% of each 4 hour segment and the ventilation rate prescribed in Table M1507.3.3(1) is multiplied by the factor determined in accordance with Table M1507.3.3(2).

TABLE M1507.3.3(1)
CONTINUOUS WHOLE-HOUSE MECHANICAL VENTILATION SYSTEM AIRFLOW RATE REQUIREMENTS

Dwelling Unit Floor Area (square feet)	Number of Bedrooms				
	0-1	2-3	4-5	6-7	>7
	Airflow in CFM				
<1500	30	45	60	75	90
1501-3000	45	60	75	90	105
3001-4500	60	75	90	105	120
4501-6000	75	90	105	120	135
6001-7500	90	105	120	135	150
>7500	105	120	135	150	165

TABLE M1507.3.3(2)
INTERMITTENT WHOLE-HOUSE MECHANICAL VENTILATION RATE FACTORS[a, b]

Run-Time Percentage In Each 4 Hour Segment	25%	33%	50%	66%	75%	100%
Factor[a]	4	3	2	1.5	1.3	1.0

a. For ventilation system run time values between those given, the factors are permitted to be determined by interpolation.
b. Extrapolation beyond the table is prohibited.

4 Revise as follows:

M1507.43 Local exhaust rates ~~Ventilation rate~~. Local exhaust ~~Ventilation~~ systems shall be designed to have the capacity to exhaust the minimum air flow rate determined in accordance with Table M1507.43.

TABLE M1507.43
MINIMUM REQUIRED LOCAL EXHAUST RATES FOR ONE- AND TWO-FAMILY DWELLINGS

AREA TO BE ~~VENTILATED~~ EXHAUSTED	~~VENTILATION~~ EXHAUST RATES
Kitchens	100 cfm intermittent or 25 cfm continuous
Bathrooms—Toilet Rooms	Mechanical exhaust capacity of 50 cfm intermittent or 20 cfm continuous

For SI: 1 cubic foot per minute = 0.4719 L/s.

Reason: This proposal is intended to provide clear guidance to builders and code officials on the design and specification of mechanical ventilation systems for homes IF such systems are installed. Instead of mandating mechanical ventilation, it provides much needed guidance on both whole-house mechanical ventilation systems and local exhaust, including definitions of the same. The language proposed serves to streamline the code by placing all requirements for mechanical ventilation systems within the current M1507, which is aptly titled "Mechanical Ventilation".

Language that is proposed for M1507 is basically a distilled version of ASHRAE 62.2. The proposed language is intended to take ASHRAE's ten page standard and reduce it to the nuts and bolts of mechanical ventilation that are simple and straightforward. ASHRAE has issued a copyright release for the table of whole-house ventilation rates. Not only are these the same rates in ASHRAE 62.2, but they are also the same rates that are now referenced in the state building codes of California and Maine as well as being referenced within the National Green Building Standard.

Similarly, the intermittent multipliers are sourced from ASHRAE 62.2 and are included to provide builders with more options for delivering equivalent ventilation.

Cost Impact: Because this language does not require whole house mechanical ventilation or local exhaust, it will not in itself increase the cost of construction.

6001-7500	90	105	120	135	150
>7500	105	120	135	150	165

TABLE R303.4.1(2)
INTERMITTENT MECHANICAL VENTILATION RATE FACTORS[a, b]

Ventilation System Percent Run-Time Based on a 24 Hour Period	25%	33%	50%	66%	75%
Factor	4	3	2	1.5	1.3

a. Interpolation between entries is permitted.
b. The ventilation system run time shall be not less than 25%.

R303.4.2 System design. The required whole-house ventilation system shall consist of one or more supply or exhaust fans or a combination thereof and associated ducts and controls. Where local supply or exhaust fans are used as part of such a system, they shall be tested and rated in accordance with HVI 916, and the fan airflow rate shall be taken at 0.25 in w.c. static pressure. Outdoor air ducts connected to the return side of an air handler shall be considered to be supply ventilation where the manufacturer's requirements for minimum return air temperature for the air handler are met.

R303.4.3 System Controls. The mechanical ventilation system shall be provided with controls that enable occupant override.

3. Add new standard to Chapter 44 as follows:

HVI Home Ventilating Institute
1000 North Rand Road
Suite 214
Wauconda, IL 60084

HIV 916-09 Airflow Test Procedure

Reason: The purpose of this proposal is to provide modest levels of continuous mechanical ventilation in detached one- and two-family houses and low-rise townhouses in order to provide minimum levels of ventilation.

For health and safety reasons, minimum ventilation is necessary to provide acceptable indoor air quality. Modern homes are much tighter than the building stock and do not provide adequate ventilation through air leakage or infiltration. Occupants do not operating windows to provide minimum ventilation levels. Providing continuous mechanical ventilation is required to provide minimum ventilation rates in current construction.

Substantiation: Ventilation is used to control pollutant concentrations in buildings. These pollutants are emitted from building materials, consumer products, and from occupants themselves. Continuous mechanical ventilation reduces these large concentrations and reduces the large exposures for building occupants.

Because of the effects it has on health, comfort, and serviceability, indoor air quality in our homes is becoming of increasing concern to many people. According to the American Lung Association elements within our homes have been increasingly recognized as threats to our respiratory health. The Environmental Protection Agency lists poor indoor air quality as the forth-largest environmental threat to our country. Asthma is leading serious chronic illness of children in the U.S. Moisture-related construction defects and damage are on the increase in new houses. A 2007 California study revealed formaldehyde exposure in most new homes is beyond limits recommended by the California Air Resources Board. Minimum residential ventilation can improve many of these indoor air quality problems.

ASHRAE Standard 62.2-2007 is the only national consensus standard on residential ventilation rates. ASHRAE, the American Society of Heating, Refrigerating and Air-conditioning Engineers, has been setting minimum ventilation rates for buildings for over 100 years in order to provide acceptable indoor air quality. The rates in this proposal are the minimum rates as incorporated in the current version of Standard 62.2. As an ANSI standard, these rates represent the consensus of a balanced committee and have undergone extensive public review.
Sherman and Hodgson (2002) have shown that the rates in this proposal are barely sufficient to dilute the typical amount of formaldehyde emitted in typical new construction. The consensus of knowledgeable and balanced experts supports the ventilation rates in Standard 62.2-2007. As of the drafting of this proposal, several states have adopted similar ventilation requirements (e.g. MN, VT, WA, CA, ME). Of these, California and Maine have now adopted ASHRAE 62.2 by reference.

Price and Sherman (2006) have shown that occupants of new homes do not operate their windows and doors sufficiently to meet minimum ventilation requirements through controlled openings. While there are 20% of the population who would manage their windows effectively during mild periods, the vast majority of occupants keep their windows closed most of the time and do not get sufficient ventilation from window and door operation.

Sherman and Chan (2006) have reviewed air tightness data. New houses are substantially tighter than the existing stock and do not get enough ventilation through air infiltration and air leakage to meet minimum rates. Walker and Sherman (2006) have shown that the energy costs of meeting ASHRAE Standard 62.2 would be substantially higher for a house that was leaky enough to meet it through infiltration.

The reference to HVI 916 is provided to ensure that fans comply with industry standards for air flow verification. As a point of reference, MN state code 7672.1000 currently references HVI 916. HVI 916 is a consensus standard that is also referenced by Energy Star's Ventilation Fan Specification for measurement and verification of fan flow rates (note that NO on-site measurement or verification is required).

Cost Impact: The proposal will increase the cost of construction modestly by requiring a mechanical fan system rated for continuous operation.

Analysis: The proposed exception to Section R303.4.1 provides no definition or criteria for the required run cycle. For example, if 25% run time is chosen, the system would have to run 6 hours a day, but, it is not indicated how that 6 hours is to be distributed across the required number of cycles.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Ferguson-RB-1-R303.1-R303.5

RM19–09/10
R303.4.1

Proponent: Guy McMann, Jefferson County, CO, representing the CO Association of Plumbing and Mechanical Officials (CAPMO)

Revise as follows:

R303.4.1 Intake openings. Mechanical and gravity outdoor air intake openings shall be located a minimum of 10 feet (3048 mm) from any hazardous or noxious contaminant, such as vents, chimneys, plumbing vents, streets, alleys, parking lots and loading docks, except as otherwise specified in this code. Where a source of contaminant is located within 10 feet (3048 mm) of an intake opening, such opening shall be located a minimum of ~~2~~ 3 feet (~~610~~ 914 mm) below the contaminant source.

For the purpose of this section, the exhaust from *dwelling* unit toilet rooms, bathrooms and kitchens shall not be considered as hazardous or noxious.

Reason: This dimension is inconsistent with many other code books such as IMC-401.4 #3; IRC-G2427.6.6 and G2427.8 #1; IFGC-503.6.7; IFGC-618.5 and IFGC-503.8 #1. This 3-foot dimension has been around for years and was also found in the legacy codes. It's important that sources of contamination don't make its way into building openings and there have still been issues where 2 feet doesn't work. This dimension was also changed last cycle in M22. Also, proposals have been submitted to the plumbing to complete the transition.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

RM20–09/10
M1601.1, M1601.1.1

Proponent: Sam Dardano, City of Boulder, CO, representing the Colorado Association of Plumbing and Mechanical Officials (CAPMO)

Revise as follows:

M1601.1 Duct design. Duct systems serving heating, cooling and ventilation equipment shall be ~~fabricated~~ installed in accordance with the provisions of this section and ACCA Manual D or other approved methods

M1601.1.1 Above-ground duct systems. Above-ground duct systems shall conform to the following:

1. Equipment connected to duct systems shall be designed to limit discharge air temperature to a maximum of 250°F (121°C).
2. Factory-made air ducts shall be constructed of Class 0 or Class 1 materials as designated in Table M1601.1.1(1)
3. Fibrous duct construction shall conform to the SMACNA Fibrous Glass Duct Construction Standards or NAIMA Fibrous Glass Duct Construction Standards.
4. Minimum thickness of metal duct material shall be as listed in Table M1601.1.1(2). Metallic ducts shall be fabricated in accordance with *SMACNA Duct Construction Standards Metal and Flexible*. Galvanized steel shall conform to ASTM A 653.
5. Use of gypsum products to construct return air ducts or plenums is permitted, provided that the air temperature does not exceed 125°F (52°C) and exposed surfaces are not subject to condensation.
6. *Duct systems* shall be constructed of materials having a flame spread index not greater than 200.
7. Stud wall cavities and the spaces between solid floor joists to be used as air plenums shall comply with the following conditions:
   - 7.1. These cavities or spaces shall not be used as a plenum for supply air.
   - 7.2. These cavities or spaces shall not be part of a required fire-resistance-rated assembly.
   - 7.3. Stud wall cavities shall not convey air from more than one floor level.
   - 7.4. Stud wall cavities and joist-space plenums shall be isolated from adjacent concealed spaces by tight fitting fire blocking in accordance with Section R602.8.

Reason: Ducts are not fabricated according to Manual D, they are installed according to that standard. Ducts in general are fabricated according to the SMACNA Standard. This is a simple clarification.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Dardano-RM-1-M1601.1

RM21–09/10
M1601.1.1

Proponent: Sam Dardano, City of Boulder, CO, representing the Colorado Association of Plumbing and Mechanical Officials (CAPMO)

Revise as follows:

M1601.1.1 Above-ground duct systems. Above-ground duct systems shall conform to the following:

1. Equipment connected to duct systems shall be designed to limit discharge air temperature to a maximum of 250°F (121°C).
2. Factory-made air ducts shall be constructed of Class 0 or Class 1 materials as designated in Table M1601.1.1(1)
3. Fibrous duct construction shall conform to the SMACNA Fibrous Glass Duct Construction Standards or NAIMA Fibrous Glass Duct Construction Standards.
4. Minimum thickness of metal duct material shall be as listed in Table M1601.1.1(2). Galvanized steel shall conform to ASTM A 653.
5. Use of gypsum products to construct return air ducts or plenums is permitted, provided that the air temperature does not exceed 125°F (52°C) and exposed surfaces are not subject to condensation.
~~6.~~ ~~*Duct systems* shall be constructed of materials having a flame spread index not greater than 200.~~
~~7~~6. Stud wall cavities and the spaces between solid floor joists to be used as air plenums shall comply with the following conditions:

   ~~7.1~~. 6.1. These cavities or spaces shall not be used as a plenum for supply air.
   ~~7.2~~. 6.2. These cavities or spaces shall not be part of a required fire-resistance-rated assembly.
   ~~7.3~~. 6.3. Stud wall cavities shall not convey air from more than one floor level.
   ~~7.4~~. 6.4. Stud wall cavities and joist-space plenums shall be isolated from adjacent concealed spaces by tight fitting fire blocking in accordance with Section R602.8.

Reason: # 6 is broken. It doesn't say or qualify what kind of duct system it's referring to. This is a great example of poor code language that's not enforceable or able to be explained with any certainty. What makes this stand out is that it does not have to meet a 25 flame-spread rating as # 2 requires?

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Dardano-RM-4-M1601.1.1

RM22–09/10
Table M1601.1.1(2)

Proponent: Guy McMann, Jefferson County, CO, representing the Colorado Association of Plumbing and Mechanical Officials (CAPMO)

Revise as follows:

TABLE M1601.1.1(2)
GAGES OF METAL DUCTS AND PLENUMS USED FOR HEATING OR COOLING

	Galvanized		Aluminum
DUCT SIZE	**Minimum thickness inches and (mm)**	**Equivalent galvanized ~~sheet~~ gauge no.**	**Minimum thickness (in.)**
Round ducts and enclosed rectangular ducts			
14" or less	.0157 (.3950 mm)	28	~~.0175~~ .0145
16 and 18 inch	.0187 (.4712 mm)	26	.018
20 inch and over	.0236 (.6010 mm)	24	.023
Exposed rectangular ducts			
14" or less	.0157 (.3950 mm)	28	~~.0175~~ .0145
Over 14" [a]	.0187 (.4712 mm)	26	.018

For SI: 1 inch = 25.4 mm.

a. For duct gages and reinforcement requirements at static pressures of 1/2 inch, 1 inch and 2 inches w.g., SMACNA *Duct Construction Standard*, Tables 2-1; 2-2 and 2-3 shall apply.

Reason: This is to correct an error. The maximum was typed instead of the minimum.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: McMann-RM-3-T. M1601.1.1(2)

RM23–09/10
1601.4.1

Proponent: Sam Dardano, City of Boulder, CO, representing the Colorado Association of Plumbing and Mechanical Officials (CAPMO)

Delete and substitute as follows:

~~**M1601.4.1 Joints and seams.** Joints of duct systems shall be made substantially airtight by means of tapes, mastics, liquid sealants gasketing or other approved closure systems. Closure systems used with rigid fibrous glass ducts shall comply with UL 181A and shall be marked "181A-P" for pressure-sensitive tape, "181 A-M" for mastic or "181 A-H" for heat-sensitive tape. Closure systems used with flexible air ducts and flexible air connectors shall comply with UL 181B and shall be marked "181B-FX" for pressure-sensitive tape or "181B-M" for mastic. Duct connections to flanges of air distribution system equipment or sheet metal fittings shall be mechanically fastened. Mechanical fasteners for use with flexible nonmetallic air ducts shall comply with UL 181B and shall be marked 181B-C. Crimp joints for round metal ducts shall have a contact lap of at least 1½ inches (38 mm) and shall be mechanically fastened by means of at least three sheet-metal screws or rivets equally spaced around the joint. Closure systems used to seal metal ductwork shall be installed in accordance with the manufacturers' instructions~~.

~~**Exceptions:**~~

1. ~~Spray polyurethane foam shall be permitted to be applied without additional joint seals.~~
2. ~~Where a duct connection is made that is partially inaccessible, three screws or rivets shall be equally spaced on the exposed portion of the joint so as to prevent a hinge effect.~~
3. ~~Continuously welded and locking type longitudinal joints and seams in ducts operating at static pressures less than 2 inches of water column (500 Pa) pressure classification shall not require additional closure systems.~~

M1601.4.1 Joints, seams and connections. All longitudal and transverse joints, seams and connections in metallic and nonmetallic ducts shall be constructed as specified in SMACNA HVAC Duct Construction Standards—Metal and Flexible and NAIMA Fibrous Glass Duct Construction Standards. All joints, longitudinal and transverse seams, and connections in ductwork shall be securely fastened and sealed with welds, gaskets, mastics (adhesives), mastic-plus-embedded-fabric systems or tapes. Closure systems used to seal flexible air ducts and flexible air connectors shall comply with UL 181B and shall be marked "181 B-FX" for pressure sensitive tape or "181 B-M" for mastic. Duct connections to flanges of air distribution system equipment shall be sealed and mechanically fastened. Mechanical fasteners for use with flexible nonmetallic air ducts shall comply with UL 181B and shall be marked 181B-C. Closure systems used to seal metal ductwork shall be installed in accordance with the manufacturers' instructions. Round metallic ducts shall be mechanically fastened by means of at least three sheet metal screws or rivets spaced equally around the joint. Unlisted duct tape shall not be permitted as a sealant on any duct.

Exceptions:

1. Spray polyurethane foam shall be permitted to be applied without additional joint seals.
2. Where a duct connection is made that is partially inaccessible, three screws or rivets shall be equally spaced on the exposed portion of the joint so as to prevent a hinge effect.
3. Continuously welded and locking type longitudinal joints and seams in ducts operating at static pressures less than 2 inches of water column (500 Pa) pressure classification shall not require additional closure systems.

Reason: This text is being replaced with that of the IMC. The IMC language is more concise and complete. The language covering contact lap is deliberately deleted as it is inconsistent with the SMACNA Standard which calls for a one inch lap. Also language covering unlisted tape is not present in the IRC text. This is strictly editorial in nature with no new content.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Dardano-RM-2-M1601.4.1

RM24–09/10
M1601.4.1

Proponent: William Easterling, Sr., Grand Haven, MI

Revise as follows:

M1601.4.1 Joints and seams. Joints of *duct systems* shall be made substantially airtight by means of tapes, mastics, liquid sealants, gasketing or other *approved* closure systems. Closure systems used with rigid fibrous glass ducts shall comply with UL181A and shall be marked 181A-P for pressure-sensitive tape, 181A-M for mastic or 181 A-H for heat-sensitive tape. Closure systems used with flexible air ducts and flexible air connectors shall comply with UL 181B and shall be marked 181B-FX for pressure-sensitive tape or 181B-M for mastic. Duct connections to flanges of air distribution system *equipment* or sheet metal fittings shall be mechanically fastened. Mechanical fasteners for use with flexible nonmetallic air ducts shall comply with UL 181B and shall be marked 181B-C. Crimp joints for round metal ducts shall have a contact lap of at least 11/2 inches (38 mm) and shall be mechanically fastened by means of at least three sheet-metal screws or rivets equally spaced around the joint. Closure systems used to seal metal ductwork shall be installed in accordance with the manufacturer's installation instructions.

Exceptions:

1. Spray polyurethane foam shall be permitted to be applied without additional joint seals.
2. Where a duct connection is made that is partially inaccessible, three screws or rivets shall be equally spaced on the exposed portion of the joint so as to prevent a hinge effect.
3. Continuously welded and locking type longitudinal joints and seams in ducts operating at static pressures less than 2 inches of water column (500 Pa) pressure classification shall not require additional closure systems.
4. Cleats and other mechanical lap joints of metal duct systems that are not located in a garage, that operate at static pressures less than 2 inches of water column (500 Pa) pressure classification and that are located on the conditioned side of the building thermal envelope shall not require additional closure systems.

Reason: As acknowledged by the duct tightness test exception found in IRC N1103.2.2, duct systems located within the conditioned space should not be held to the same tightness requirements as duct systems located outside of the conditioned space. Additionally cleats and mechanical lap joints should be defined as a recognized approved closure system in this application.

Cost Impact: Should reduce the unnecessary cost of applying mastics and tapes to duct system joints located within the conditioned space.

Analysis: It may not be generally understood what is meant by "cleat and mechanical lap joints".

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Easterling-RM-1-M1601.4.1

RM25–09/10
M1601.4.8 (New), Chapter 44 (New)

Proponent: Steve Ferguson, American Society of Heating, Refrigerating, and Air-Conditioning Engineers

1. Add new text as follows:

M1601.4.8 Duct leakage. HVAC systems that include air handlers located in a garage or return air ducts located in a garage or both, shall have a total system air leakage of not more than 6% of the total fan airflow when measured at 0.1 in w.c. (25 Pa) static pressure using test method B of ASTM E 1554. The test shall be conducted with the garage door open to the outdoors and the supply and return leakage results shall be added to get the total system air leakage.

2. Add new standard to Chapter 44 as follows:

ASTM E 1554-03 Standard Test Methods for Determining External Air Leakage of Air Distribution Systems by Fan Pressurization

Reason: The purpose of this proposal is to add requirements to prevent the migration of contaminants (including carbon monoxide) from attached garages to occupiable spaces.

Garages attached to residences may contain numerous sources of air contaminants. These contaminants can be transported into the residence through either leaks in the separating walls or through leaky air handlers and ducts. This change will improve the code by reducing the potential for contaminant transport from garages into residences.

Substantiation: Many pollutant sources are commonly stored or used in residential attached garages such as gasoline-fired engines (automobiles, lawnmowers, etc.), paints, and solvents. Pressure differences across air leakage paths between the garage and adjoining living space can result in the transport of these contaminants to the living space. Factors influencing this transport include temperature differences, wind, the placement of the air handler or ducts in the garage, duct leakage, and equipment operation, such as exhaust fans and vented combustion appliances. A recent literature review (Emmerich et al. 2003) found substantial evidence that transport of contaminants from garages has the potential to negatively impact residential indoor air quality in either an acute or chronic manner.

Traditional practice assumed that garages were leaky structures and that infiltration would keep garages adequately ventilated. However, conventional construction practice for garages today result in significantly tighter structures with little infiltration and elevated contaminant concentrations in the garage. In fact, recent field measurements (Emmerich et al. 2003) have found that the envelopes of modern attached garages can be as tight as the envelopes of houses. Additionally, houses with HVAC system air handlers and ducts in the garage provide another potential pathway for pollutants to travel from garages to living spaces. Many studies have found that typical HVAC systems and their ductwork can be very leaky. Limiting the leakage of such systems located in garages will reduce the potential for contaminants to be transported into houses via this pathway. A simple test is needed to verify that air handlers and ductwork in garages is not excessively leaky.

Note that per Interpretation IC 62.2-2004-3 of ANSI/ASHRAE Standard 62.2-2004, test method B of ANSI/ASTM E1554-03 is considered to be an equivalent test method to the California Title 24 method which is currently listed in Standard 62.2.

Bibliography:
ANSI/E1554-03 (2003) *Standard Test Methods for Determining External Air Leakage of Air Distribution Systems by Fan Pressurization*.

Cost Impact: This proposal will increase the cost of construction in those cases where ducts or air handlers are located in garages thus requiring an air leakage test.

Analysis: The proposed text does not indicate which total fan airflow rate to use for the 6% leakage limit calculation. Residential system airflow rates differ between heating and cooling modes.

M1804.2.6, Chapter 44 (New)

Proponent: Bob Eugene, Underwriters Laboratories, Inc.

1. Revise as follows:

M1804.2.6 Mechanical draft systems. Mechanical draft systems shall comply with UL 378 and shall be installed in accordance with their listing, the manufacturer's installation instructions and, except for direct vent appliances, the following requirements:

1. The vent terminal shall be located not less than 3 feet (914 mm) above a forced air inlet located within 10 feet (3048 mm).
2. The vent terminal shall be located not less than 4 feet (1219 mm) below, 4 feet (1219 mm) horizontally from, or 1 foot (305 mm) above any door, window or gravity air inlet into a dwelling.
3. The vent termination point shall not be located closer than 3 feet (914 mm) to an interior corner formed by two walls perpendicular to each other.
4. The bottom of the vent terminal shall be located at least 12 inches (305 mm) above finished ground level.
5. The vent termination shall not be mounted directly above or within 3 feet (914 mm) horizontally of an oil tank vent or gas meter.
6. Power exhauster terminations shall be located not less than 10 feet (3048 mm) from lot lines and adjacent buildings.
7. The discharge shall be directed away from the building.

2. Add new standard to Chapter 44 as follows:

UL 378-06 Draft Equipment

Reason: UL 378 includes a comprehensive set of construction and performance requirements that are used to evaluate and list draft equipment. Five companies currently have draft equipment listed.

Cost Impact: The code change proposal will not increase the cost of construction.

M1901.1

Proponent: Bob Eugene, Underwriters Laboratories, Inc.

Revise as follows:

M1901.1 Clearances. Freestanding or built-in ranges shall have a vertical clearance above the cooking top of not less than 30 inches (762 mm) to unprotected combustible material. Reduced clearances are permitted in accordance with the listing and labeling of the range hoods or appliances. Installation of a listed and labeled cooking appliance or microwave oven over a listed and labeled cooking appliance shall be in accordance with Section 1504.1. Clearances for a domestic open-top broiler unit shall be in accordance with Section M1505.1.

Reason: Section M1504.1 provides specific direction on the appropriate vertical clearance for microwave ovens over a cooking top as part of the Listed and labeled appliance investigation. Section M1505.1 further limits the vertical clearance for domestic open broilers to materials above.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Eugene-RM-14-1901.1

RM31–09/10
M1901.2, Chapter 44 (New)

Proponent: Bob Eugene, Underwriters Laboratories, Inc.

1. Revise as follows:

M1901.2 Cooking appliances. ~~Household~~ Cooking appliances shall be listed and labeled for household use and shall be installed in accordance with the manufacturer's installation instructions. The installation shall not interfere with combustion air or access for operation and servicing. Electric cooking appliances shall comply with UL 1026 or UL 858. Solid-fuel-fired fireplace stoves shall comply with UL 737.

2. Add new standards to Chapter 44 as follows:

UL 737-07 Fireplace Stoves
UL 858-05 Household Electric Ranges – with revisions through November 2007
UL 1026-07 Electric Household Cooking and Food Serving Appliances

Reason: UL 858 is already referenced in Section 917.1 of the International Mechanical Code. UL 737, UL 858 and UL 1026 all include a comprehensive set of construction and performance requirements that are used to evaluate and list cooking equipment specifically for use in dwelling units.

Cost Impact: The code change proposal will not increase the cost of construction.

M1903.1, Chapter 44 (New)

Proponent: Bob Eugene, Underwriters Laboratories, Inc.

1. Revise as follows:

M1903.1 General. Stationary fuel cell power plants having a power output not exceeding 1,000 kW, shall ~~be tested in accordance~~ comply with ~~ANSI Z21.83~~ ANSI/CSA America FC 1 and shall be installed in accordance with the manufacturer's installation instructions and NFPA 853.

2. Add new standard to Chapter 44 as follows:

ANSI/CSA America FC1-03 Stationary Fuel Cell Power Systems

Reason: The standard ANSI Z21.83 has been superseded by ANSI/CSA America FC 1. This change would correlate the IRC with IMC Section 924.1 and IFGC Section 633.1. Changing to the FC1 standard also harmonizes with NFPA 853. The standard establishes construction and performance requirements.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Eugene-RM-13-1903.1-Ch 44

RM35–09/10
M2001.1.1, Chapter 44 (New)

Proponent: Bob Eugene, Underwriters Laboratories, Inc.

1. Revise as follows:

M2001.1.1 Standards. Oil-fired boilers and their control systems shall be listed and labeled in accordance with UL 726. Electric boilers and their control systems shall be listed in accordance with UL 834. Solid-fuel-fired boilers shall be listed and labeled in accordance with UL2523. Boilers shall be designed and constructed in accordance with the requirements of ASME CSD-1 and as applicable, the ASME *Boiler and Pressure Vessel Code* , Sections I and IV. Gas-fired boilers shall conform to the requirements listed in Chapter 24.

2. Add new standard to Chapter 44 as follows:

UL 2523-09 Outline of Investigation for Solid Fuel-Fired Water Heaters and Boilers

Reason: The UL Subject 2523 Outline of Investigation includes a comprehensive set of construction and performance requirements that are used to evaluate and list factory built manually and/or automatically fueled solid fuel-fired boilers.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Eugene-RM-15-M2001.1.1-Ch 44

RM36–09/10
M2005.1

Proponent: Bob Eugene, Underwriters Laboratories, Inc.

Revise as follows:

M2005.1 General. Water heaters shall be installed in accordance with the manufacturer's installation instructions and the requirements of this code. Water heaters installed in an attic shall ~~conform to~~ comply with the requirements of Section M1305.1.3. Gas-fired water heaters shall ~~conform to~~ comply with the requirements in Chapter 24. Domestic electric water heaters shall ~~conform to~~ comply with UL 174 ~~or UL 1453~~. ~~Commercial electric water heaters shall conform to UL 1453.~~ Oiled-fired water heaters shall ~~conform to~~ comply with UL 732.

Reason: The scope of the IRC does not include commercial installations. UL 1453 permits tanks larger than 120 gallons and to be equipped with temperature-regulating controls that permit a water temperature of more than 85°C (185°F). UL 174 limits tank capacity to 120 gallons, and requires a temperature-regulating thermostat having no marked dial setting more than 77°C (171°F) and provided with a stop to prevent adjustment to a higher setting.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Eugene-RM-22-M2005.1

RM37–09/10
M2006.1

Proponent: Bob Eugene, Underwriters Laboratories, Inc.

Revise as follows:

M2301, M2301.1, M2302 (New), M2302.1 (New), M2302.2 (New), M2302.2.1 (New), M2302.2.2 (New), M2302.2.3 (New), M2302.2.4 (New), M2302.3 (New), M2302.4 (New), Chapter 44

Proponent: Bob Eugene, Underwriters Laboratories, Inc.

1. Revise as follows:

SECTION M2301
THERMAL SOLAR ENERGY SYSTEMS

M2301.1 General. This section provides for the design, construction, installation, alteration and repair of equipment and systems using thermal solar energy to provide space heating or cooling, hot water heating and swimming pool heating.

2. Add new text as follows:

SECTION M2302
PHOTOVOLTAIC SOLAR ENERGY SYSTEMS

M2302.1 General. This section provides for the design, construction, installation, alteration and repair of photovoltaic equipment and systems.

M2302.2 Installation. The installation of photovoltaic systems shall comply with the manufacturer's installation instructions, Sections M2302.2.1 through M2302.2.4 and NFPA 70.

M2302.2.1 Access. Photovoltaic panels, modules, inverters, converters, and combiner boxes shall be accessible for inspection, maintenance, repair and replacement.

M2302.2.2 Roof-mounted panels and modules. Where photovoltaic panels and modules are installed on roofs, the roof shall be constructed to support the loads imposed by such modules. Roof-mounted photovoltaic panels and modules that serve as a roof covering shall conform to the requirements for roof coverings in Chapter 9. Where mounted on or above the roof coverings, the photovoltaic panels and modules and supporting structure shall be constructed of noncombustible materials or fire-retardant-treated wood equivalent to that required for the roof construction.

M2302.2.3 Roof and wall penetrations. Roof and wall penetrations shall be flashed and sealed in accordance with Chapter 9 to prevent entry of water, rodents and insects.

M2302.2.4 Ground-mounted panels and modules. Ground-mounted panels and modules shall be installed in accordance with the manufacturer's installation instructions.

M2302.3 Photovoltaic panels and modules. Photovoltaic panels and modules shall be listed and labeled in accordance with UL 1703

M2302.4 Inverters. Inverters shall be listed and labeled in accordance with UL 1741. Systems connected to the utility grid shall use inverters listed for utility interaction.

3. Add new standards to Chapter 44 as follows:

UL 1703-02	Flat-Plate Photovoltaic Modules and Panels – with revisions through April 2008
UL 1741-99	Inverters, Converters, Controllers and Interconnection System Equipment for Use With Distributed Energy Resources – with revisions through November 2005

Reason: The purpose of the code change is to distinguish between two types of solar systems – thermal and photovoltaic – and provide basic safety requirements for photovoltaic systems.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: Eugene-RM-19-2301-2302-Ch 44

2009/2010 PROPOSED CHANGES TO THE INTERNATIONAL WILDLAND-URBAN INTERFACE CODE

Proposed changes to the *International Wildland-Urban Interface Code* are heard by the International Fire Code Committee. See the tentative order of discussion for the International Fire Code Committee on page F2.

WUIC1–09/10
403.4.1

Proponent: Lawrence Brown, CBO, National Association of Home Builders

Revise as follows:

403.4.1 Sign construction. All road identification signs and supports shall be of noncombustible materials. Signs shall be 6 inch (152 mm) minimum in height. ~~have minimum 4-inch-high (102 mm) reflective~~ Letters shall be 4 inch (102 mm) minimum in height with a 1/2 inch (~~12.7~~ 13 mm) minimum stroke. Letters shall be of the reflecting type and be on a contrasting background color. ~~6-inch-high (152 mm) sign~~. Road identification signage shall be mounted ~~at a height of~~ 7 feet (2134 mm) in height measured from the road surface to the bottom of the sign.

Reason: This is an editorial change related to format of text, and to provide clarity as to the intent of the provision. The term "background color" adds clarity as to *contrasting* with the reflective letters. The term "minimum" is added to height for mounting the sign. Without the term "minimum" the height is absolute at 7 feet (cannot be more or less).

Cost Impact: The code change proposal will not increase the cost of construction

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: BROWN-WUIC1-403.4.1.DOC

WUIC2–09/10
501.3 (New), Chapter 7

Proponent: Marcelo M. Hirschler, GBH International, representing American Fire Safety Council

1. Add new text as follows:

501.3 Fire-resistance rated construction. Where this code requires 1-hour fire-resistance-rated construction, the fire-resistance rating of building elements, components or assemblies shall be determined in accordance with the test procedures set forth in ASTM E 119 or UL 263.

2. Add new standards to Chapter 7 as follows:

ASTM

E 119-2008a	Standard Test Methods for Fire Tests of Building Construction and Materials

UL

263-03	Standard for Fire Test of Building Construction and Materials

Reason: In several locations in Chapter 5 of the IWUIC there are requirements for 1-hour fire-resistance-rated construction but the corresponding test methods are not explicitly stated. Throughout the ICC codes fire resistance ratings are assessed based on ASTM E 119 or UL 263, which are basically equivalent standards.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: ASTM E119 and UL 263 are currently referenced in the IBC.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: HIRSCHLER-WUIC1-501.3.DOC

WUIC3–09/10
503.2, Chapter 7

Proponent: John Scott, Roxul, Inc.

1. Revise as follows:

503.2 Ignition-resistant building material. Ignition-resistant building materials shall comply with any one of the following:

1. Extended ASTM E 84 testing. Materials that, when tested in accordance with the test procedures set forth in ASTM E 84 or UL 723, for a test period of 30 minutes, comply with the following:
   1.1. Flame spread. Material shall exhibit a flame spread index not exceeding 25 and shall show no evidence of progressive combustion following the extended 30 minute test.
   1.2. Flame front. Material shall exhibit a flame front that does not progress more than 10 1/2 feet (3200 mm) beyond the centerline of the burner at any time during the extended 30 minute test.
   1.3. Weathering. Ignition-resistant building materials shall maintain their performance in accordance with this section under conditions of use. Materials shall meet the performance requirements for weathering (including exposure to temperature, moisture and ultraviolet radiation) contained in the following standards, as applicable to the materials and the conditions of use:
      1.3.1. MethodA"Test Method for Accelerated Weathering of Fire-Retardant-Treated Wood for Fire Testing" in ASTM D 2898, for fire-retardant-treated wood, wood-plastic composite and plastic lumber materials.
      1.3.2. ASTMD7032 for wood-plastic composite materials.
      1.3.3. ASTM D 6662 for plastic lumber materials.
   1.4. Identification. All materials shall bear identification showing the fire test results.
2. Noncombustible material. Material that complies with the requirements for *noncombustible* materials in Section 202.
3. Fire-retardant-treated wood. Fire-retardant-treated wood identified for exterior use and meeting the requirements of Section 2303.2 of the *International Building Code*.
4. Fire-retardant-treated wood roof coverings. Roof assemblies containing fire-retardant-treated wood shingles and shakes which comply with the requirements of Section 1505.6 of the *International Building Code* and classified as Class A roof assemblies as required in Section 1505.2 of the *International Building Code*.
5. Roof Insulation. Roof insulations that comply with the requirements for Class NC (noncombustible core) in accordance with the requirements of FM 4470.

2. Add new standard to Chapter 7 as follows:

FM Factory Mutual Global Research
Standards Laboratories Department
1301 Atwood Avenue, P.O. Box 7500
Johnston, RI 02919

4470 (2009) Approval Standard for Class 1 Roof Covers .

Reason: To introduce a new type of Ignition-resistant building material into the IWUIC, based upon testing and conformance with the newest edition (2009) of FM 4470 Approval Standard for Single-Ply, Polymer-Modified Bitumen Sheet,Built-Up Roof (BUR) and Liquid Applied Roof Assemblies.

The 2009 edition of FM Approval Standard 4470 has introduced a new category of roofing insulation defined as Class "NC" non-combustible core.

In order for a roof insulation material to be classified as "NC", the roof insulation must meet the following stringent criterion:

1. ASTM D482, Standard Test Method for Ash from Petroleum Products
2. ASTM E2058, Standard Test Methods for Measurement of Synthetic Polymer Material Flammability Using a Fire Propagation Apparatus (FPA)
3. ISO 1716:2002 Reaction to Fire Tests for Building Products - Determination of the Heat of Combustion

The first test acceptance criteria used by FM for these materials is very stringent, and includes a minimum total solids content of 90% per ASTM D 482.

In addition, during the ASTM E2058 test, no visible flaming of the insulation is permitted for the full 15 minute duration, and the test is extended beyond 15 minutes in duration if there is any evidence of the sample still exhibiting mass loss and/or visible vapors being emitted. The test is continued until the mass loss and/or visible vapors have also ceased.

The third test method is ISO Standard 1716 which is used for determination of the Heat of Combustion of building materials. The insulation core must have a maximum heat of combustion of 2.0 kJ/g (860 BTU/lb).

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: FM 4470 (1992) is currently referenced in the IBC.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

ICCFILENAME: SCOTT-WUIC1-503.2.DOC

WUIC4–09/10
503.2, Chapter 7

Proponent: John Woestman, The Kellen Company, representing the Composite Lumber Manufacturers Association (CLMA)

1. Delete Section 503.2 and replace with the following:

503.2 Ignition-resistant building material. Ignition-resistant building materials shall comply with 503.2.1, 503.2.2, 503.2.3, or 503.2.4.

503.2.1 Composite materials and plastic materials. Composite materials and plastic materials shall comply with 503.2.1.1, 503.2.1.2, and 503.2.1.3.

503.2.1.1 Minimum standards. Wood-plastic composite deck boards, stair treads, handrails and guardrail systems shall comply with ASTM D 7032, and plastic lumber deck boards shall comply with ASTM D 6662.

503.2.1.2 Fire testing. Composite materials and plastic materials shall comply with one of following fire tests after exposure to weathering required by section 503.2.1.1.

1. ASTM E 84 or UL 723. Materials tested in accordance with ASTM E 84 or UL 723 for a test period extended to 30 minutes shall exhibit a flame spread index not exceeding 25 and shall show no evidence of progressive combustion following the 30 minute test period and shall exhibit a flame front that does not progress more than 10 ½ feet (3200 mm) beyond the centerline of the burner at any time during the 30 minute test period.
2. ASTM E 1354. Materials complying with ASTM D 7032, shall be tested in accordance with ASTM E 1354 for a 40 minute test observation period with a maximum net peak heat release of 25 kW/sq ft.

503.2.1.3 Identification. Materials shall be labeled or be identified with a manufacturer's designation on the material, assembly, or its packaging.

503.2.2. Noncombustible material. Material that complies with the requirements for *noncombustible* materials in Section 202.

503.2.3. Fire-retardant-treated wood. Fire-retardant-treated wood meeting the requirements of Section 2303.2 of the *International Building Code*.

503.2.4. Fire-retardant-treated wood roof coverings. Roof assemblies containing fire-retardant-treated wood shingles and shakes which comply with the requirements of Section 1505.6 of the *International Building Code* and classified as Class A roof assemblies as required in Section 1505.2 of the *International Building Code*.

2. Add new standard to Chapter 7 as follows:

ASTM

E 1354-09 Standard Test Method for Heat and Visible Smoke Release Rates for Materials and Products Using an Oxygen Consumption Calorimeter

Reason: The IWUIC will benefit from a re-write of Section 503.2.

With this proposal, Section 503.2 has been reformatted for ease of understanding.

And, what used to be Item 1 - now Section 503.2.1 - has been titled to reflect the materials intended to be regulated in this section, and these materials are now explicitly required to comply with the appropriate standards (ASTM D 7032 or ASTM D 6662).

In proposed section 503.2.1.2, the language requires weathering prior to the fire testing per the standards referenced in proposed section 503.2.1.1. Both these standards require aggressive weathering to comply with the standard. The technical requirements of the fire test (ASTM E84 / UL 723) have not changed while the language has been revised for ease of understanding.

ASTM E1354 testing for materials complying with ASTM D7032 has been included as a fire test for the IWUIC. ASTM E1354 has been demonstrated as a valid fire test for determining the heat release rate of construction materials. The maximum net peak heat release of 25 kW/sq ft required of the ASTM E1354 test is consistent with current WUIC material test requirements set forth in California's WUIC, a state which has used input from the scientific community and stakeholders alike in developing its WUIC language applicable to these building materials.

The identification language of proposed section 503.2.1.3 has been revised to be explicit as to what is required. The remaining sections have only been reformatted with section numbering for consistency.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: ASTM E1354 is currently referenced in the IBC.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: WOESTMAN-WUIC1-503.2.DOC

WUIC5–09/10
504.2.1 (New), Chapter 7

Proponent: John Scott, Roxul, Inc.

1. Revise as follows:

504.2.1 Roof insulation. Roof insulations that comply with the requirements for Class NC (noncombustible core) in accordance with the requirements of FM 4470.

(Renumber subsequent section)

2. Add new standard to Chapter 7 as follows:

FM Factory Mutual Global Research
Standards Laboratories Department
1301 Atwood Avenue, P.O. Box 7500
Johnston, RI 02919

4470 (2009) Approval Standard for Class 1 Roof Covers .

Reason: To introduce a new Class of Ignition-resistant building material into the IWUIC, based upon testing and conformance with the newest edition (2009) of FM 4470 Approval Standard for Single-Ply, Polymer-Modified Bitumen Sheet,Built-Up Roof (BUR) and Liquid Applied Roof Assemblies.

The IWUIC has very stringent expectations for Class 1 Ignition Resistant Construction. While the definitions in Section 202 addresses "Noncombustible Roof Coverings", this really only applies to the weathering membrane on the exterior surface of the roof (i.e. such as shingles, sheets, and tiles), rather than the potentially high fuel loads coming from some combustible insulation materials beneath them. Consequently, there is a need to further restrict the use of combustible roof insulations where required.

The 2009 edition of FM Approval Standard 4470 has introduced a new category of roofing insulation defined as Class "NC" non-combustible core.

In order for a roof insulation material to be classified as "NC", the roof insulation must meet the following stringent criterion:

1. ASTM D482, Standard Test Method for Ash from Petroleum Products
2. ASTM E2058, Standard Test Methods for Measurement of Synthetic Polymer Material Flammability Using a Fire Propagation Apparatus (FPA)
3. ISO 1716:2002 Reaction to Fire Tests for Building Products - Determination of the Heat of Combustion

The first test acceptance criteria used by FM for these materials is very stringent, and includes a minimum total solids content of 90% per ASTM D 482.

In addition, during the ASTM E2058 test, no visible flaming of the insulation is permitted for the full 15 minute duration, and the test is extended beyond 15 minutes in duration if there is any evidence of the sample still exhibiting mass loss and/or visible vapors being emitted. The test is continued until the mass loss and/or visible vapors have also ceased.

The third test method is ISO Standard 1716 which is used for determination of the Heat of Combustion of building materials. The insulation core must have a maximum heat of combustion of 2.0 kJ/g (860 BTU/lb).

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: FM 4470 (1992) is currently referenced in the IBC.

Z1–09/10
503.1 (New)

Proponent: Craig Conner, Building Quality, representing self

Add new text as follows:

CHAPTER 5
RESIDENTIAL ZONES

SECTION 503
ORIENTATION

503.1 Lot orientation. A minimum of 70% of the lots within a residential zone shall be designated with the primary face of the building facing within 20 degrees of South or North.

Exception: Where the building official or planning commission determine local conditions make this requirement impractical.

Reason: When it is practical, building orientation is one of the most cost-effective forms of energy efficiency. Properly oriented buildings increase the effectiveness of a number of solar and day lighting design strategies.

Cost Impact: The code change proposal will note increase the cost of construction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: CONNER-Z1-503.1 NEW

Z2–09/10
801.4.3 (New), Chapter 14

Proponent: Stephen V. Skalko, PE, representing Portland Cement Association

1. Revise as follows:

801.4 Design of parking facilities. The design of parking facilities shall be in accordance with Sections 801.4.1 through ~~801.4.7~~ 801.4.8.

801.4.1 Driveway width. Every parking facility shall be provided with one or more access driveways, the width of which shall be the following:

1. Private driveways at least 9 feet (2743 mm).
2. Commercial driveways:
   2.1. Twelve feet (3658 mm) for one-way enter/exit.
   2.2. Twenty-four feet (7315 mm) for two-way enter/exit.

801.4.2 Driveway and ramp slopes. The maximum slope of any *driveway* or ramp shall not exceed 20 percent. Transition slopes in driveways and ramps shall be provided in accordance with the standards set by the code official and the jurisdiction's engineer.

2. Add new text as follows:

801.4.3 Minimum pavement design. The design of ground supported pavement for parking facilities shall comply with Sections 801.4.3.1 through 801.4.3.3

Exceptions:

1. Concrete pavements designed in accordance with ACI 330R.
2. Asphalt pavements designed in accordance with IS-181.

801.4.3.1. Sub-base. The soil supporting the pavement for parking facilities shall have a minimum California Bearing Ratio (CBR) of 3 determined in accordance with ASTM D1883 and a minimum resistance value (R) of 6 determined in accordance with ASTM D2844.

801.4.3.2 Concrete surfaces. The minimum compressive strength of the concrete (f'_c) for concrete pavements shall be 4000 psi. The minimum thickness of the concrete pavement shall be 4.0 inches

801.4.3.3 Asphalt concrete surfaces. The asphalt pavement shall comply with Section 801.4.3.3.1 or 801.4.3.3.2.

801.4.3.3.1 Full depth asphalt pavement: Where full depth asphalt pavements are constructed using asphalt concrete and emulsified asphalt base mixes the minimum thickness of the asphalt pavement shall be one of the following:

1. A minimum of 1 inch of asphalt concrete for the top surface and 3.5 inches of asphalt concrete or Type I emulsified asphalt mix for the base.
2. A minimum of 2 inches of asphalt concrete for the top surface and 2.5 inches of Type II emulsified asphalt mix for the base.
3. A minimum of 2 inches of asphalt concrete for the top surface and 4.5 inches of Type III emulsified asphalt mix for the base.

801.4.3.3.2 Asphalt pavement with untreated aggregate base and sub-base: Where asphalt pavements are constructed using asphalt concrete placed over untreated aggregate bases and sub-bases the thickness of the asphalt pavement shall be a minimum of 1 inch of asphalt concrete for the top surface, 2.5 inches of asphalt concrete base and 4.0 inches of untreated aggregate base. The untreated aggregate base shall comply with ASTM D2940.

(Renumber subsequent sections)

2. **Add the following standards to Chapter 14 as follows:**

ACI

330-08	Guide for the Design and construction of Concrete Parking Lots

AI

IS-181-81	Asphalt Pavement Thickness Design. A simplified and Abridged Version of 1981 Edition AI Thickness Design Manual

ASTM

D1833-87 (2007)	Standard Test Method for CBR (California Bearing Ratio) of Laboratory-Compacted Soils
D2844-07	Standard Test Method for resistance R-value and Expansion Pressure of Compacted Soils
D2940-03	Standard Specification for Graded Aggregate Material for Bases or Sub-bases for Highways or Airports

Reason: The *International Zoning Code* provides the minimum requirements for the design of parking facilities. However, the provisions are not complete without specifying the minimum requirements for the pavement thickness. This proposal places requirements for concrete and asphalt pavement thicknesses into the IZC to make it more complete for parking facilities and to give jurisdictions guidance on the commonly used pavement sections.

The provisions were based on the pavement design procedures in ACI 330R-08, *Guide for the Design and Construction of Concrete Parking Lots,* published by American Concrete Institute, and *Asphalt Pavement Thickness Design,* 2nd Edition, January 1983 by The Asphalt Institute. The design assumed minimum acceptable soil conditions for the sub-base (CBR = 3 and R = 6). In addition, the designs assumed a light volume of heavy truck traffic (Traffic Category A for concrete and Traffic Class I for asphalt).

The minimum compressive strength of the concrete was set at 4,000 psi to insure a minimum level of durability for the pavement.

Cost Impact: The code change proposal should not increase the cost of construction if proper pavement design is presently followed in a jurisdiction.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFILENAME: SKALKO-Z1-801.4.3
